and had received promises of several important papers, but he wished to impress upon the Institute that they ought not to be dependent on extraneous aid, but should look to themselves for support. The youngest members might do something : the elder members could of course do much, and although their time and attention were doubtless much absorbed, they might surely find a moment of leisure to communicate a point of experience. Even trifles in the aggregate become important. There was one subject in connection with the well-being of the profession, on which he thought strongly, and would say a few words. The close connection with foreign countries, effected by improved facilities of communication, opened the way for the more free adoption of modes of decoration from abroad than heretofore, and he thought that the younger members of the profession should bear this in mind, and not consider matters of fittings and adornments beneath their notice. The architect who thinks his duty done, when the building is covered in and plastered, does wrong, and throws much into the hands of otbers, upholsterers, paperhangers, and decorators, which ought to be decided on by himself. Moreover, continued the president, if the result be a failure, the blame, as a matter of course, falls on the poor architect, but if the contrary, the decorator takes all the credit. He was satisfied that architects acted unwisely who thought such matters beneath their notice, and so did not give that study to them which was required. The architect, continued the president, must study many things. He had been invited, as president of the Institute, some time since, by the Lord Mayor, to meet the follows of the Royal Society and the Royal Academicians (such were the words of the invitation); these represented science and art; and it occurred to him, when called on to return thanks on the part of the Institute, that the architect was the connection between the purely scientific man and the artist. The man of science might be great in his department, and be quite ignorant of art: the supremest painter might know nothing of science; but the architect who would be great must have a knowledge of both; -science to found and construct; art to proportion, ornament, and produce beauty; knowledge of materials, their qualities and uses; acquaintance with the science of numbers; taste to produce fine forms and harmonious proportions. A skill in the use of colour sometimes did much for an architect, perhaps too much; he would mention a laughable instance. He was standing amongst the designs for the Nelson monument, when they were exhibited, contemplating one which pleased him less than many, when two ladies approached, and one of them, pointing to it, said, "Oh! how beautiful; I hope they will choose that. Look at the soldiers, Laura!" "Yes, Lucy," said the other, "but will the soldiers always be there?" Now Laura and Lucy represented a number of people in this world, and the incident served to show how far a little bit of red sometimes went. His lordship added, he would not then occupy their attention longer than to say, that whatever difference of opinion there might be as to the governing regulations of the body, he trusted that, as all had one object, these would be sunk in an effort to extend still further the reputation of the Institute-already worthily known all over Europe. Let the maxim be " bear and forbear."

Mr. Tite, who often contrives to find a rhyme to illuminate other people's reason, said, there were two or three lines by Cowper

which so fully set forth one point urged by the president, that he could not avoid quoting them. They were these:—

"It is not timber, lead, and stone,
An architect requires alone,
To finish a fine building,—
The palace were but half complete,
If he could possibly forget
The carring and the gilding."

Professor Donaldson announced that Signor Canina had sent the two first volumes of his great book on the "Ancient Edifices of Rome," saying, in the letter of thanks for the royal medal which accompanied the present, that the work was probably the largest now publishing during these troublous times in Europe, and on that account deserved some protection. The Signor added, that he hoped soon to publish two other volumes, if the means did not fail bim. A long list of other donations was announced, consisting principally of the transactions of other bodies, amongst which we were glad to find those of the Archæological Society of Athens, and to learn that it is still pursuing its useful labours.

The Signor Antolini, architect, professor at the Academy of Fine Arts at Bologna; the Abate Antonio Magrini, and the Signor Miglioranza, architect, of Vicenza; the Signor Vantini, architect, of Brescia; and Mynheer J. B. Weening, architect, director of the academy at the Hague, were elected honorary and corresponding members. And Professor Cockerell, Mr. Bunning, and Mr. G. G. Scott, were proposed for election as fellows hereafter.

This brought us to the paper of the evening, "Remarks on the earlier and later Gothic Architecture of Germany," by the Rev. Dr. Whewell, master of Trinity.

It is of the greatest importance to the art that such men as Dr. Whewell should be led to apply their tutored minds to the elimination of guiding principles, and our best tbanks are due to him for his contribution on this occasion. He came forward, he said, but as an amateur. To determine the progress of styles, to trace their growth, seemed to him an important object, and to aid in this it was that he strove. ductions from the examination of existing monuments would not of themselves suffice .these must be confirmed by reference to history. He had already put forth the theory, founded mainly on the churches of the Rhine, that the leading features of Gothic architecture had grown out of the necessities of structure, and his object on this occasion was to carry his theory a little further, treating of the tendencies which had changed the character of buildings in the later Gothic period. He should be assisted in this by the works of some recent German writers, who had pursued the investigation to a considerable extent. The Rev. Dr. then proceeded to discriminate what he considered the three important principles concerned in the formation of the Gothic style, namely, the principle of frame-work; the principle of tracery,-which he thought quite distinct from frame-work; and the principle of wall-work; but the inquiry was sufficiently subtle to prevent us from attempting to convey now a general notion of it in few words: we may perhaps be able to refer to it at greater extent bereafter. He spoke at considerable length of what he called the principle of upward growth. Speaking of unconstructive forms of the later Gothic, Dr. Whewell said that the outer portion of Strasburgh spire would not hold itself together: the joints, as he had ascertained, were vertical, and could not stand; but there were internal ribs rightly constructed, which really did the work.

Mr. Tite said the suggestive character of the paper read gave it, in his eyes, great value. We were able now to copy details correctly, but we did not realize the principles which produced them; this literal copying, indeed, was the sin of the day. If the principles of frame-work, wall-work, and spire-growth, had been kept in mind, some great mistakes in modern buildings would have been avoided. We should remember that Gothic buildings grew out of the wants of their time, and hore in all respects its impress. He did not consider it was always the best suited for modern requirements: at all events, it should be adapted to new circumstances by thought and study.

At the close of the evening a letter was read from Mr. Mocatta, asking advice as to the means of ridding a house of a great and increasing nuisance, the domestic ant. The annoyance is one of great magnitude in London, and applications are constantly being made to us to learn the hest mode of getting rid of them.—The Dean of Westminster thought poison the only remedy.—Several members said they had failed in all endeavours to cradicate them.—Cajeput oil and jalap have both heen mentioned in our pages before now as being destructive to them.

The evening passed pleasantly and harmoniously, and we will not run the risk of making the tone of our notice otherwise, by discussing now the report of the council, which is about to come hefore the members.

ON THE PRESENT STATE AND PROS-PECTS OF ARCHITECTURE,

Many minds are now directed to the discovery of the defects in present architectural practice, and to their various remedies; but what is most encouraging, tongues and pens are growing bold on the subject. The ice is broken, and many, too timid before, will now bend their energies to the exposure of the various errors into which the art has heen betrayed. The important truth has at length been distinctly spoken, that we must have architecture of our own, suited to our climate and liabits,—to our social and political position: and, as a natural consequence, the cultivation of the æsthetic faculty will again he considered essential to the architect, and obtain that attention in future to which it is entitled.

And certainly, it is high time that the art should resume its place among the means of intellectual manifestation,—put itself into harmony with the constitution of things, and pass into the regions of truth. It is high time that its professors should regain their mental independence, and take possession of their own place and time. Too long have we heen displaying architecture out of unison with the spirit of the age, that finds no echo in the breasts of the present generation. Selections and combinations from ancient buildings, without reference to absolute grace or originality, with frequent sacrifice of what is required by the exigencies of our habits and climate, and the preservation of obselete features and ornaments, which have no meaning that can now be read or understood, and in which, consequently, none can find pleasure, have been leading characteristics of the architecture of the present century. The architecture of the present century. The architecture of the present century. The architecture of the present century as well as a knowledge of the characteristics and chronology of styles, belongs to the true votary of the art; a cultivation of the imaginative and creative faculties, as well as those of delineation and construction;—that his works, to he valuable, must be invested with a character of their own, not with one of a past day;—that English buildings, in whatever style, should he a free outpouring of native feeling, and exhibit the natural bent of the author's own mind, which should be learned in the principles of natural

design, and imbued with all the heauty of the foregone.

foregone.

But the evils of the day cannot be traced exclusively to that devotion to the conventionality of a particular age to which I have alluded; as many late erections do not display even that freedom of thought that would consist, with the most slavish adherence in design, to the style or manner of any period or place. Many churches, for instance, lately erected in various parts, seem a collocation of parts or masses of ancient edifices, brought together merely to afford an example of a certain date, and illustrate a step in the past progress of the art, without any respect to present or local circumstances. Now, it is possible for an architect, even restricted as before mentioned, that is to say, confined to a given style, to produce a whole that would strike the beholder as an original production, and totally different to any extant work.

and totally different to any extant work.

England has had her independent school of architecture, and it will not be unprofitable to look back for a moment, and to search into the manner and practice of those who last upheld it. We have had men who, in their respective days, supported almost singly the reputation of England for this branch of art. They produced works which their country calls its own, and some light is afforded us by their example. Inigo Jones, Wren, and Vanbrugh, we do not find fettering their genius to the style or manner of some single edifice in Italy or elsewhere; they took the elements of the elassic styles, increased in richness by the Italians, and only imitated the latter in the broad principles upon which they worked in using them; preserving the freedom of their own minds, listening to the dictates of nature, and exercising reason, sentiment, taste, and judgment in the execution of whatever task they were appointed.

These masters were not equal in taste. Wren and Vanbrugh were sometimes led into violations of natural propriety and the breach of laws which are of eternal obligation; but Inigo Jones, though beautiful and picturesque, can scarcely be charged with licentiousness, and when he visited Italy it was to imbue his and when he visited trally it was to imbue his mind with classic beauty and study Italian principle only. Wren had the difficult task, in reference to his churches, of providing for a new form of worship; and in many of them he has been eminently successful. His mode of adapting the classic or Italian detail to those Gothic forms and features which could not be dispensed with, evince his originality and independence of mind. The application of Italian detail to Gothic principles of composition had been made before his time by the Elizabethan builder; but his manner of doing it, in reference to the towers and spires of his churches, show the master unfettered by precedent and example; and from the union of the styles in this important feature of the English church has resulted some of the most beautiful objects that adorn the metropolis and other towns of the kingdom. Many of them are more or less deficient in the higher qualities of design and composition (concentration for instance), and exhibit too much of the monotony in form and character of the Chinese pagoda or Turkish minaret, but there are others which display the purest taste, though the best are but faint indications of that fairy magnificence that might be produced by the architect in whom is combined freedom of mind and fertility of imagination with purity of taste and solidity of judgment, if the style were taken up and pursued in the present day.

and pursued in the present day.

Of the striking beauty of which this union of principles is capable, I could instance as examples two or three of Wren's steeples as deserving of distinct notice, would time and space permit; but one by Dean Aldrich, at All Saints Church, Oxford, is worthy of more particular attention, as possessing qualities which are generally wanting in works of the kind, and might serve as a good subject of study. Its parts are all admirably adjusted, and the architect that examines this steeple must be led to confess that the designer has hit the true proportion that should exist between the tower and spire—a most important point in these structures, the difference of the elassic proportion from that of the Gothic, in reference to this matter, being the chief thing to he observed. The great fault of the classic campanile, generally, is the disproportion of

those parts, the spires being too large in most instances (a fault of St. Martin's-in-the-Fields), the latter should be considerably smaller at the base when springing from a classic tower than when surmounting the Gothic, for reasons which could readily be shown.

sons which could readily be shown.

We are not altogether in the dark with these examples hefore us; Inigo Jones las left works which have been renowned through Europe; and Wren, in many of his churches, has been eminently successful in evoking the spirit of the beautiful. 11c has produced works which properly belong to and characterize the age and country in which they were built; we behold him adopting the hest elements with which he was acquainted, and for which his genius was fitted, to respond to the call of his time. He took the best materials that time had bequeathed him, and worked truly with them, according to the lessons of nature and enlightened taste, duly influenced, but not fettered, by precedent: not that his taste was always pure; my encomium is di-rected to the mode in which he wrought, the independent manner in which he worked up his materials, and the boldness which characterized his career, rather than to the uniform grace or merit of his productions. Vanbrugh worked in the same spirit, exercised the same broad principles, with similar success, in another department of the art.

But other monitors might be summoned to yield their admonitions on this subject; there are many old huildings in London and other ancient cities, in various styles, or in no style, and by architects unknown, that could, if we would heed them, yield very useful lessons as regards some important qualities of art. The buildings I allude to have very little pretension to architectural character, yet they evince truth, sincerity, and independence of mind, and mirror to us something of the true method of art.

A glance at the great architects of Italy will not be less profitable than the review we have just made of our own. To their manner and practice a great deal more of attention is probahly due, than has ever been paid. At the period of the revival, we find them exerting every faculty of mind; combining genius with energy and practical skill, to rescue the art from the thraldom of ignorance and barbarism into which it had sunk; and at a later period their characteristic independence did not forsake them. We find Palladio, Vignola, and others exercising the same energy and original and creative power that had characterized their predecessors. From all we know of Palladio, he made the ancients the vehicles merely for the expression of his own thoughts and feelings, and moulded all that Greece and Rome had left him to his own purposes. Through all obstacles we find him struggling to the illustration of his own ideas, unburthening himself of the great image,—" the nymph of his soul." How far he consulted the exact of his sour. From ar he constitute the estate wants of his own times, is not for me to say; but his independent habit of mind, which manifests itself everywhere in his works,—his manner of using the antique elements as mere words for the utterance of ideas, is certainly worthy of notice, and must be full of interest for the lovers of true art. His works stand out even at the present day, from all others, by the heautiful harmony of their parts and proportions, and evince, both in their construction and decoration, the most original and stirring genius of design. It was his conviction that the architecture of the ancients was of universal application, and might be com-pletely adapted to the various circumstances of different ages and nations; that such adapta tion they themselves have authorized and suggested, in the modifications which may be discovered in their works. But let us look into the ancient art itself. What was the architecture of the Greeks? "A second nature," says an eminent writer, " made to work for social opinion with the same than the same transfer of the same t for social objects,—such was the architecture of the ancients;" and true art is the same today - a union of man's feeling and imagination with the requirements of necessity and dictates of nature, with respect to climate, soil, popular condition, and other circumstances True art yields not up the reins to precedent. Man is the creator of the arts, and their great maxims and principles are written on his own breast. The Creator of the Universe may be said to have left off his work at the point

where man's capabilities might begin to operate in the way of art, and it is the duty and the privilege of the latter to take it up, and so continue it. "Art itself is nature," as Shakscontinue it. "Art itself is nature," as Shaks-peare says; as nature, on the other hand, might be called the art of the Supreme Artist. Art is nature wrought in the alembic of the mind and reproduced in hrick, and stone, and wood; and the heauty of artistic creations is designed to have the same salutary influence upon the mind as the stream, the meadow, and the

grove.

I have seen it remarked, that to some nations taste is denied,—which may be true, as nations might he pointed to in whose works or remains it would be impossible to trace the footsteps of the beautiful. This, however, caunot he said of ours. England, as I said before, had her independent school of architecture. Why may she not again? Are the fountains of design exhausted? Is thought spent? Have Jones, Wren, and Chambers, worn out design and invention? To create is unquestionably the province of all the fine arts. If the power to create is exhausted, the art is defunct. Let its death be registered, art is defunct. Let its death be registered. Let the next paper on the subject in these pages he its functal requiem. But he has meanly estimated the resources of nature, and meanly estimated the resources of nature, and of genius—her pupil and high priest, who would reply to these questions in the affirmative. Architecture can no more perish than poetry: they are alike indestructible: it is not in their nature to die: both have their resources in the human heart, and while that is unfathomed their immortality remains. The wish to create, to produce the unique, is instinctive in the human mind; and, though weak in many, in a chosen few it is ever active, while the power to gratify it is inherent also. By our improvement in physical and constructive science, the advantages of modern weaking and the interest of the contractive science, the advantages of modern machinery, and the increase of natural materials adapted to building, we have means of outstripping all past achievement,—of produc-ing grander effects, more magnificent forms and combinations, than ever emhellished any ancient city. Never, in some respects, had the architect better opportunity,—never had he such abundance of elements for the realization of the beautiful put into his hand. All he wants is the power to use them; judgment to point out the right track; and courage to pursue it. The credit due to the inventor of study and approach the large tracks. sue it. The credit due to die in this state is styles can never be his. Indeed, the arts arose so naturally and gradually out of circumstances, that but little merit of the kind prostances, that but little merit of the kind prostances are successful. bably ever belonged to an individual. But there is still work for the very highest faculties of mind. Invention itself need not lie dormant in applying ancient architecture to our purposes; and, in applying it with our in-creased constructive resources, we may vie with Rome itself. The Greek architecture, for with Rome itself. The Greek architecture, for its own purposes,—that is to say, tempie architecture,—is above criticism, at least at present, but its application by the Romans and moderns, at any period, is what we need not shrink from emulating. In the manifold materials which have come down to us, there are, I am convinced, graces yet slumbering undisturbed, that but await the call of genius to come forth. In adopting any ancient or foreign style, we need not enter into its character as peculiar to the time and country of its to spin syles, we feet into their most character as peculiar to the time and country of its origin, but merely use its elementary principles with the same regard to our wants that its inventors paid to theirs. The modifications which we are called upon to make of ancest architecture is nothing near than what went architecture, is nothing more than what would have been found amongst the Greeks themhave been found amongst the Greeks themselves, had their circumstances so far changed, or had new conditions arisen. Let us be their genuine successors, and make the same application of their principles that they would themselves, were they to live again, and exercise their art in the present country and time. The architecture of the Greeks, like its poetry and sculpture, hears exquisite traces of the creative faculty. It is the production of a people that spent a greater portion of their time in the free air, under the blue vault of heaven, in intimate communion with nature.

heaven, in intimate communion with nature, than we, in our northern damps, may devote,— who studied nature, not only in the midst of the most beautiful scenery, in a most genial climate, but in an age of great literary deve-lopement. Of Greek art "the Graces rocked the cradle, and Love taught her to speak,"

The Greeks were far more susceptible of impressions of the senses than the Romans, who were less given to the poetic contemplation of nature and the idealizing of her works. The Roman genius spoke more in colossal magni-ficence than in exquisite forms of beauty, like their predecessors and masters; but the architheir predecessors and masters; but the archi-tecture of the Greeks is a version of nature characterized hy all the elegance and grace which they in everything displayed. Of archi-tecture so formed, so high-born, we cannot have too high a hope. The writer of this essay cannot divest his mind of the impression that, notwithstanding all the praise lavished on it, the Greek architecture has never been duly appreciated or had its capabilities of assureing it, the Greek architecture has never been duly appreciated, or had its capabilities of answering our modern purposes fully understood; consequently, that its heauties are but partially revealed, that there are untold parts yet to come, vens of beauty not yet explored, which, when called into play, will lead to results different from, and superior to, anything that now exist. The Italians have done wonders, but greater thinge he appeared to be a presented by now exist. The Italians have done wonders, hut greater things, he suspects, remain to be done, and may be achieved by us, if we work in the right spirit.

Our duty, in reference to the antique architecture, is thoroughly to investigate its principles, and to naturalize it in our own country, and these can both he done. But, sure I am, that its truthful and constant adaptation to new wants will result in the constant develop-ment of new beauties. New circumstances and conditions—the inevitable changes in the economy of mankind, will ever, while it conforms itself to them, extract from it new treasures of expression and power; and unique and happy combinations, beyond anything yet unveiled, may result, under a favourable concurrence of may result, under a favourable concurrence of circumstances, from a natural and truthful manner of treating it. Besides, there are advantages in the materials or elements themselves. Whilst using a medium of expression in itself so transcendent, the designer may, as is said in the case of some languages, he carried, as it were, beyond his own horizon, and convey more to the heart of the spectator than he intended, exciting ideas beyond what the sought to embody in the design, which will he sought to embody in the design, which will again lead on to other and more brilliant

again feat of to there and have imaginings.

With such views, I do not participate in that feeling of hopelessness relative to the future destiny of architecture in England expenses. I have no agree with others, who future destiny of architecture in England expressed hy some, nor agree with others, who, in the choice of a style, would give up the classic styles, and adopt some Romanesque version of them. The latter I would not agree to, even in favour of our native architecture. However proud of this last—however extensive may hecome its readoption in future—the classic styles in England will never be abandoned. There are those who would as soon pluck out an eye! As soon should we give up the literature as the architecture of the ancients. We are proud of Milton and Shakspeare; but who has dreamt of parting with Homer and Virgil? Instead of taking up some foreign modification, let us take up the pure styles themselves, and work out our own version of them.*

THE COMPETITION QUESTION.

You have blown the trumpet, Sir, and the hlast has been heard; nay more, has been responded to, and by whom? the very power I foretold. Time, and plenty to hoot, was given the "Institute" for arraying its forces, for dragging out and putting in order its rusty arms. But still the "lion slept;" and, like the lazy bird, it has lost the early worm. The Architectural Association prepared themselves as a "bady Association prepared themselves as a "body of reserve," to allow the elder members to lead the "forlorn hope;" and it now remains for them to storm the breaches. That their assault will be a successful one, there can be no doubt; let them proceed with singleness of lieart, and the victory is certain. Many thanks to you, Sir, for this state of things. You have

to you, Sir, for this state of things. You have raised the hanner, put yourself forward, and have gained the support of your readers.

The following copy of a letter, received in reply to a request for particulars respecting the proposed new church at Hawes, is so different from the majority, that I am induced to send it you for insertion in The Bullder, con-

* To be continued.

vinced that you will willingly give publicity to a fair-looking example :-

"Hawes, Yorkshire. "Agreeahly to your request, I send you par ticulars respecting our proposed new church at

Hawes is a small market town situated in the upper part of Wensley Dale, in an exposed

and hilly country.

1. The stone is of an excellent description, about 14 mile from Hawes; easy to quarry, and, as it is given, the only cost will be the getting, which may he 3d. per load (or if at so much per yard, 6d).

2. Flags may he got two miles off, at about

2. Plags may be got to be less per yard.
3. The free stone probably will have to be brought 12 or 13 miles, about 3d. per foot.
4. The slate will have to come from Kendal, 28 miles (half the distance by rail), 50s. per 28 miles (har the distance by ran), 50s, per ton; and will cover about 33 yards.
5. Plastering costs about 3d, per yard.
6. Lathing, about 1d, per yard.
7. Walling, from 10d, to 1s, per yard.
8. The wood will have to come 15 or 16

9. A place for an organ. Perhaps the church may have to be enlarged

Perhaps the church may have to be emarged at some future time.

We intend applying to the "Incorporated" and the "Ripon Diocesan" Church Building Societies; they require the seats to be a certain width, &c., which you may learn hy their respective reports. I have not got any by me, but doubtless they may he easily procured in

THOMAS LODGE.

P.S. The usual commission will be given to the one whose design is selected; but no pre-mium to any other. Plans to be forwarded on or before the 15th December, according to the advertisement."

Contrast the above, Sir, with that received from Bradford, respecting the new workhouse, and then you will duly estimate the difference.

One correspondent suggests,—"That the selection of designs should not be made by the building committees who advertise for them, and that a society should be formed in London for this special purpose, with suitable accommodation provided for the reception and exhibition of designerand heritages. exhibition of designs, and having a secretary who will undertake the management of the society's business. The society to be formed of the principal members of the profession residing in London and elsewhere, who shall he invited to co-operate in this plan for the protection of their junior brethren and the maintenance of their rights, and to put an end to the shameful system of partial dealing which encourages evil and shuts the door against true merit!"

ENGINEERING REMUNERATION UNDER HEALTH BILL.

In several towns the Public Health Bill is being gradually introduced. At Croydon, Taunton, Warwick, Worcester, and Carmar-then, local boards of health have been appointed. In the first-mentioned towns officers have been elected,—at Worcester the appoint-

At Warwick and Carmarthen the local boards have advertised for plans for the water supply, drainages, house improvements, and in the former town, a premium of 50% has been offered for the most approved plans for been offered for the most approved plans for carrying out the entire works contemplated under the Health Bill, and which will prohably cost from 18,000l. to 20,000l., and yet they have the modesty to invite parties to design works to this amount, and receive, if successful, the munificent sum of 50l. for compensation, or ahout ‡ per pent. on the estimated outlay. Why this sum would not even cover the expenses of the preliminary inquiry, with the inspector at 3l. 3s. per day, and his and other expenses attending it, while the more important works, the practical plans and the details, requiring even greater engineering ahility and skill than the preliminary inquiry, are to he rewarded with the paltry sum above uamed.

what engineer of standing and talent would undertake such works on such terms? Surely it is necessary for engineers to bestir them-selves in support of their professional interests, and take warning by the fate of the architects, and not quietly submit to be ridden over rougbshod by local boards or central autho-

The consequence of this niggardly system I can readily foresee. It will bring inexperienced men into the field, and it will result in defecmen into the field, and it will result in detective, if not useless work. At Carmarthen, the system is changed: they advertise for contracts, for the plans, &c., and the following are the particulars of the contract:—

" A survey on a scale of 40 feet to the inch, showing streets, alleys, yards, houses, and all onthouses, privies, pumps, cesspools, drains, in fact every thing of a permanent character actually on the ground, with the depth of the sewers

A copy of ditto.

Sections of all streets, yards, &c., and sewers.

Water Supply.—Plans of land round reservoir, about 15 acres, on 40 feet scale. Complete cross sections. Trial pits to ascertain the character of the soil, and where clay for puddle may be obtained.

Reservoir designs, drawings, and specifi-cations, showing the quantities of earthwork, fencing, brickwork and masonry, drains, filter-

ing tank, &c., for reservoir of three acres.

Main Piping. — Plans and specifications, showing depth, position, dimensions, and cost of laying the main pipes, fire plugs, &c., throughout the town.

throughout the town.

Sewerage.—Plans and specifications for a complete system of street sewers, gully grates and traps, outfalls, and paved gutters for removal of rain water.

Private or House Improvements.—Water serving pipes, &c., drains, privies, or water closets, sinks, rain pipes, dust-bins, and yard paving, &c."

And then come the general conditions:—

"A contract to be entered into specifying.

"A contract to be entered into, specifying the work to be done, and the price to be paid to be affixed to each item in the enclosed schedule; also the time within which the contract is to be performed, and in case the terms are not dill performed. are not duly performed, a pecuniary penalty to be imposed, guaranteed by sufficient secu-

rity!!"

And all this, forsooth, for probably the munificent sum of something less than 50%, judging from the population, Carmarthen being about the same as Warwick. As you always make a gallant stand for the interest of the architects, pray with brotherly feeling spread your editorial mantle over the poor civil enineer.

PROPOSED SITE FOR THE NEW BRIDGE AT WESTMINSTER — IMPROVEMENTS IN THE NEIGBOURHOOD.

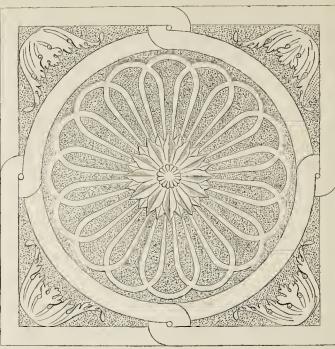

By a misprint in our paragraph on this subject a fortnight ago, the line of the proposed improvement is rendered somewhat unintelligible. It states, after describing the site of the new bridge and its approaches, "It will be requisite to open Charles-street to the south of Great Governs there," it schould have been requisite to open Charles-street to the south of Great George-street;" it should have been to the width of Great George-street, having an outlet to St. James's-park; the intention being to form, from the proposed site of the new bridge, a direct thoroughfare to St. James's-park for the traffic going to Belgravia; thus leaving Great George-street more free as an access to the Houses of Parliament. By the opening of Charles-street to the required width, the south frontage for the national records depót would be obtained; and by the removal of the houses between Charles-street and Downing-street, ample space afforded for the of the houses between Charles-street and Downing-street, ample space afforded for the entire structure, having the west side of Kingstreet for a frontage to the great street of Whitehall. On the Surrey side, the line of Communication would be hy a wide road running obliquely southward, and terminating opposite Astley's theatre, and the west corner of Stamford-street, and another road, running northward, into Stamford-street, as an approach to the South-Western Railway.

Whatever may be the arrangement ulti-mately made, care must be taken not to lessen the value, unnecessarily, of private property.

That the matter should be settled is most important for the owners of adjacent property. Some of our correspondents write very

ITALIAN ORNAMENTATION.

FROM PALACE VENDRAMINI CALERGHI, VENICE.

LAING S

anxiously on the subject, and assert, that if the decision be further delayed by the authorities, ruin will be the result to many.

One says,—" Pray do not abandon this

subject, a large number of persons look to you for assistance.

you for assistance.

"If any thing is to be left for us, the proprietors of small estates, to perform, we must be governed by this new measure, and, above all things, should know as speedily as may be the fate of our future. Hitherto all has been shrouded in darkness, and this has caused

much suffering and anxiety. In the name, therefore, of all interested, particularly south of the Thames, do not forget us."

ORNAMENT.

PALACE VENDRAMINI CALERGIII, VENICE.

The palace from which the above ornament has been drawn is called Palazzo Vendramini Calerghi; it is situated on the Grand Canal, Venice, and was built in 1483, at the expense of the Doge, Andrea Loredano, by the architect, Pietro Lombardo. It is one of the finest of the Venetian palaces, and is an important specimen of the Cinquescent paried. In 1681 of the Venetian paaces, and is an importan-specimen of the Cinque-cento period. In 1681 it was sold to the Duke of Brunswick for about 30,000*l.*, and by the latter, not long afterwards, to the Duke of Mantua. Since 1844 it has become the residence of the Duchess de Berri and her son.

The ornament which we here represent is on the landing, in front of the entrance door. The darker part of the engraving is intended to show that the ground is tooled to a rough surface, about one-sixteenth of an inch below the smooth face.

NEW MARKETS, DONCASTER.—The statue of Ceres was elevated to its destined situation, on the summit of the blocking over the middle

NOTES IN THE PROVINCES.

The provinces.

The pews in the parish church of St. Peters, Mancroft, Norwich, are in an inconvenient state, and a desire bas arisen for improvement by substituting sittings of a more ecclesiastical character, and affording more accommodation. The incumbent and some of the churchwardens appear to take an active part in the promotion of this good work, which will require about Sool. to 1,000l., of which 220l. have been subscribed by parisbioners and others.—Several of the largest gas consumers in the city, says the Lincoln Times, "having felt themselves aggrieved that they should have to pay for the enlargement of the company's works, from time to time, in addition to 10 per cent. per annum upon the subscribed capital, have beld a meeting, at which it was agreed that the annum upon the subscribed capital, have beld a meeting, at which it was agreed that the company should be respectfully requested to lower the price to 5s. per 1,000 feet. This memorial, although signed by 110 gas consumers, was not deemed worthy of a reply; consequently, at another meeting, held on Wednesday last, it was unanimously resolved to form a new company, with a capital of to form a new company, with a capital of 1,600 shares of 5*l*, each. This proposal has been most warmly responded to by gas consumers, and arrangements are in progress which will accomplish the object sought for without the aid of an Act of Parliament, and ere the winter closes, the present company will be relicved of some of their dissatisfied consumers." The maximum price, it is estimated, will not he maxinum price, it is estimated, will not be more than 2s. 6d. per 1,000 feet.—The parish minister and other authorities of Little Maplestead are engaged in an endeavour to restore this edifice, which is regarded with veneration as one of the four round churches remaining in England huilt but the Krichte. NEW MARKETS, DONCASTER.—The statue of Ceres was elevated to its destined situation, on the summit of the blocking over the middle entrance of the principal front of this building, in the afternoon of Monday, the 5th inst., in presence of the Mayor and several of the corporation. The statue is from the chisel of Mr. Thomas Stenton, of Doncaster. The stone used is from the quarries of Rocbe Abbey.

whole edifice is now considered to be complete except the tower. The whole of the restorations have been carried out according to the design of Mr. Carpenter, in the Early Decorated style. The roof and walls are all of stone,—the former in thin laminæ. The material, however, it is feared, will not be very durable. The chief window of the chancel represents the crucifixion; there is also a stained window in the south aisle. The roof, interiorly, is an onen one of timber: and the interiorly, is an open one of timber; and the stalls, &c., are carved. Most of the woodwork is oak. The north aisle is not yet pewed. On Saturday week the foundation stone of a new school-house was laid at Wimborne, for the Queen Elizabeth Grammar School boys. The school and masters' houses are to boys. The school and masters' houses are to be in the Tudor style, and they stand on the old site.—A mural monument to Richard Davies, Bishop of St. David's nearly three centuries ago, has been sculptured by Mr. E. Davies. The prelate is represented with a pen and lexicon, intended to denote the process of translating.—The new church of Ganerew, near Monmouth, was consecrated on Thursday week before last. The old church had fallen to decay, and the widow of the late Major week before last. The old church had fallen to dccay, and the widow of the late Major Marriott offered funds for a new structure, as the best possible monument to the memory of her husband. Mr. Pritchard, who is engaged in the restoration of Llandaff Cathedral, is the architect employed. The edifice is in the transition style, between Early English and Decorated. The cost exceeds 1,500l.— The main building destined for the cattle-show in Lower Essex-street, Birmingham, will be 320 feet long, and 100 feet wide, with sub-divisions. The area will be surmounted with a roof in one span, with a cupola running the whole length of the building, 6 feet above the roof; and there will also be thirty-eight large sky-lights in the roof. The building will be lighted throughout with gas. The ground is being enclosed under the superintendence of Mr. Samuel Briggs.—St. Jude's Church, Moorfields, Sbeffield, the foundation-stone of which was laid on Monday week, will be erected from a design by and under the superintendence of Mr. Mitchell. The style will be Early English, and the plan will form a cross, con-sisting of nave, 36 feet by 19 feet; transepts, 19 feet by 12 feet; chancel, 24 feet by 19 feet; aisles on each side of nave and chancel, 12 feet wide. At the intersection of base and chancel with the transept an octagon lantern tower, 19 feet by 19 feet, will be introduced, surmounted by a spire in wood covered with zinc plates. This tower and spire will rise 120 feet, affording light to the centre of the church. The bell-turrets will be at west end of nave. From the description, the arrangement would seem to follow that of Mr. Godwin's church at Brompton. The chancel will be laid in a plain pattern of Minton's tiles; and the pulpit (the steps to which will wind round one of the tower pillars) will be in Roche Abbey stone. The church will accommodate 600 persons on the ground-floor, and 350 adults and children in galleries.—The Sheffield Times has been authorized to present its readers with a detailed attorized to present its readers with a accounter report on the main features of the drainage scheme for the town, lately noticed in The BUILDER. The two main severs, or great drains, with all their adjuncts, are estimated by Messrs. Harrison and Holmes to cost 11,304? The dam, tanks, &c., for precipitating it in a deodorized state, would be a separate expense, amounting to 8,070l., made up of—land, 1,933l.; dam, sump, tanks, &c., 2,253l.; engines and machinery, &c., 3,000l.; engine-houses, cottage and offices, &c., 500l.; incidentals, 384l.—A Downham Market correspondent intimates to us that this town was lighted with gas for the first time on 5th inst. The works just completed have been under the superintendence of Mr. Child, of Southwold. The present charge is 8s. 4d. per 1,000 feet, to be measured by the company's meters alone.——Stow Bardolph Church, two miles from Downham Market, is now being restored by Mr. Raphael Brandon, architect. Several paintings were found on the walls.—A new doorway is were found on the walls.—A new doorway is about to be put into Downham Church, south side of chancel.—The buyers of the great bell at York Minster, astonished at the continued silence of their protégé, memorialized the Dean and Chapter lately on the subject, according to the Gateshead Observer, praying that it might be used in striking the hours—

the dwellers in the cathedral yard assuring their reverences that their ears would not be annoyed reverences that their ears would not be annoyed by the sound. The prayer was granted; but with this proviso—"That each residentiary be considered at liberty to stop the striking of the bell in the night during his residence, if the same be found an annoyance to himself or to any of bis family,"—The Woods and Forests have served notices claiming the land taken in from the river by the Cork, Blackrock, and Passage Railway Company, and have written to say that a valuator is instructed to come over and value the property for their lordships. over and value the property for their lordships. The corporation of Liverpool, too, have completed a compromise with them by consenting to pay to their credit a sum of 160,000l. for land they took in from the river there.—On Wednesday week before last the neighbourhood of Meath-street and Thomas-street, Dublin, was alarmed by the unexpected fall of two houses, Nos. 1 and 2, Hanbury-lane, occupied by a crowded population of poor tenants. Three persons passing were unhappily crushed beneath the falling mass. The inmates were, with few exceptions, all injured, some fearfully bruised and cut.

BISHOP STILL'S ALMSHOUSE, WELLS.

THE south-castern elevation of the almshouse at Wells, given in your last number but one, is stated to be that of Bishop Still, which is not the case. It was founded by Mr. Walter Brick as an almshouse for decayed burgesses in the year 1638. The almshouse which bears the name of Bishop Still is opposite the west end of Brick's almshouse, and the doorway in your engraving abuts upon the corner of it. Still's almshouse is a very plain building (for six inmates), having three doorways, over each of which is a freestone slab, containing (in the three) the following inscription :

iohn still late lorde bishop of this sea for the pretval releefe of the poore of this hospital gave $500^{\rm L}$ wuerwith

NATHANIEL STILL ESQR HIS SONNE PVRCHASED THIS HOVSE FOR 6 POORE MORE TO THE OTHER 24 POOR AND

FAITHFVLLY PEORMED HIS WILL IN THIS CHARITABLE WILL IN THE ANNO DNI I614.

The almshouse, therefore, was purchased and converted to its present use. Bubwith's almshouse, called the "old almshouse," adjoins to Brick's, and has, during the last few years, been partly rebuilt, and the interior re-arranged, thereby, of we will be a second to the thereby affording greater space and comfort for the inmates. The chapel at the east end has lately been restored, and the east window filled with stained glass, in which are em-blazoned the arms of the city as owners of the building; the arms of Bishops Bubwith, Still and Wiles as chapers and the fewers building; the arms of Bishops Bubwith, Still, and Willes, as donors, and the figure of St. Andrew from the seal of the dean and St. Andrew from the seal of the dean and chapter, as also the arms of the present bishop, as patrons. The borders and quarries are copied from Bishop Still's library windows over the cloisters. The pews will be restored in accordance with the original ones. The public are indebted to the zeal and exertions of Mr. Edmund Davies, the governor, for these restorations, he having taken upon himself to procure subscriptions for carrying out the same.

OXFORD ARCHITECTURAL SOCIETY.

A MEETING of the Oxford Architectural Society was held at Oxford on the 24th ult.; the Rev. W. Sewell in the chair. Among other communications, a letter was read from the parish priest of Broughton Gifford, stating that an inscription in Lomhardic characters had been discovered in one of the church bells, and requesting advice as to the best method of taking an impression of the same, and he had been advised to use warmed gutta percha, which, when allowed to cool, would form a mould from which a cast might be taken in

It was announced that a second series of It was announced that a second series of elementary lectures on church architecture were in contemplation. Mr. J. H. Parker read a paper on the chief points of difference between the Early French style and the Early English style of Gotline architecture. The French churches of the thirteenth century are

churches of the same period; and, in consequence, the buttresses are much more massive and important, and in the flying buttresses there are generally two arches, one over the other. The pillars are also much more heavy other. The pillars are also muon more neavy than the Early English pillars, and are fre-quently plain round masses, with classical capitals, and bases resembling the usual late Norman base. The early French churches have almost invariably an apse at the east end, and the windows of the apse are usually lancet-shaped, while the side windows are of two or more lights, with folial circles over them. In England, the east end is usually flat, with either three lancet windows, or a large window with foliated circles in the bead, and single lancet windows on the sides. A particular early kind of tracery is used much more abundantly in France than io England, and apparently a few years earlier.

The president stated, that a plan had been

discovered for warming churches with gas, by means of which all flues and smoke were

Mr. Parker mentioned an ancient fire-place of the fifteenth century in a cburch at Salisbury, the chimney of which was carried up a buttress.

RAILWAY JOTTINGS.

FOURTEEN brick arches of a viaduct in course of construction, near Preston, by Mr. M'Cormick, for the East Lancashire line to Preston, fell suddenly a fortnight ago, "in consequence of the Ribble having overflowed its banks from the recent heavy rains." Two men were on the works at the moment, but both escaped. One jumped to the ground from a height of 30 feet, yet escaped unhurt. The resident engineer, Mr. Sturges Mcek, writing to the Albion says—"I have this day examined these works, and find that the accident is not to he attributed to any fault in the execution of the fallen portion of the viaduct, but to the sub-contractors having in the about the sub-contractors having in the sub-contractors. men were on the works at the moment, but but to the sub-contractors having, in the ab-sence of any authority, withdrawn the centres from some of the arches before the mortar was properly set; the effect of the late heavy rains upon which has been to bring them down, together with others on each side of them."—On Wednesday week the temporary viaduct over the river Calder was much damaged, it is said, by the heavy flood of the previous night. The water, by washing over the ma-sonry of the newly-commenced stone bridge, a little above, and intended to replace the temporary viaduct, had so loosened and displaced the gravel in the bed of the river, at the foot of the piling, that several of the piles were thrown out of the perpendienlar, and the whole fabric are such in the perpendienlar, and the whole fabric was much injured, and became insecure even for foot passengers. A foot-bridge, 3 feet in breadth, has since been constructed, and a new bridge for the railway is far advanced.

A reduction, it is said, of some 10,000/L or 12,000/L will be effected this half-year in the locomotive expenses of the southern division of the London and North-Western line.

It is thought by some, says Herapath, that this is a favourable time for Railway Companies to purchase up their shares in the market, with surplus receipts or profits. Thus a Company whose shares are at an equivalent discount, could huy a million of capital for, say 500,000', and so for half a million, reduce the capital receiving dividend by a million, in other words, save half a million for the benefit of the legitimate holder.—The Chinese Exhibition is to be removed by rail, from Huil to Newcastle and Ediaburgh, on a plan matured by the pro-prietor, and at a cost one-sixth only of the sum necessary in the usual way by horses on the old roads, sixty of which, at a cost of 900l. would have been requisite, cost of 900l. would have been requisite. An experimental trip has been made with one half of the collection. The entire train will consist of an engine and tender, with seventeen gigantic exhibition vans, suspended between eighteen trucks, and followed by a first and a second-class carriage, with horse-boxes and luggage-waggon. Each van is about 11 feet 3 inches high, and 9 feet 3 inches broad. Their average length is about 20 feet—two of them being about 25 and others 18. The tops will be 12 feet above the upper edge of the rails, between which and English style of Gothic architecture. The representation of the vehicles will be a space of 9 generally much more lofty than the English inches. Each van will be supported by four

iron rods, one at each corner, attached by joints to linges secured to the bottom of the frame of the van. The entire length of the train will be one-eighth of a mile. We believe this is the first time any such exhibition has been conveyed by rail.—Mr. J. W. Hackworth, son of one of the late Mr. Stephenson's competitors for the locomotive premium run for at Rainhill some twenty years since, now offers, in the Mining Journal, to contest the palm with Mr. Stephenson, in the construction and economy of modern locomotives, with the view of testing the limits of the present possible reduction in the locomotives, with the view of testing the limits of the present possible reduction in the expense of working them. — The Great Southern and Western Irish line was opened, with great ceremonial, on Thursday in week before last, by the Lord Lieutenant and Lord Chancellor of Ireland, and other members of the Irish Government. The Lord Lieutenant knighted the company's chairman after dinner. — Trains have begun to run right into and out of the more central terminus of the Caledonian extension line, at Buchanan-street. out of the more central terminus of the Cale-donian extension line, at Buchann-street, Glasgow. The wooden erections used as yet as offices, however, are not quite finished. A goods station has been reared of brick at a short distance. The whole area for buildings is not less than 15 acres. The line enters on a level with the street, the high arches level with the Garnkirk line having been entirely removed though nearly completed. This extension line is that on which the tunnel under the Monkland canal and over the tunnel on removed though nearly completed. This extension line is that on which the tunnel under the Monkland canal and over the tunnel on the Edinburgh and Glasgow line has been constructed. This tunnel is 400 yards in length. The arch is formed of bricks, a mixture of fire and common clay, and an inverted arch has also been formed below the rails of same material. The brick lining, which is continuous throughout the length of the tunnel, forms an elliptical arch, similar to that of a common sewer. About the middle of the tunnel an eye has been opened, perhaps for ventilation, as the tunnel being quite straight a stream of light passes through it. Considerable difficulty was experienced in this part of the work, by the breaking in of water from the caula above. On emerging from the tunnel at the west end, the line is carried between two walls of massive masonry of about 300 yards in length, and averaging 40 feet in height. At the west end of the walls they are 8 feet, and at the east end 10 feet in thickness, with buttresses behind. In order to prevent this high embankment from pressing on the roof of the Edinburgh tunnel, arches have been formed in each wall of nearly 70 feet span, thus throwing the weight of this tremendous wall upon the solid earth on each side of the Edinburgh and Glasgow tunnel. The expense of this portion of the work must have been enormous. The works have been executed under the inspection and superintendence of Mr. Timperly.—The number of persons employed on the railways of the United Kingdom, according to a recent return, are 52,688, on 4,252 miles, with 1,321 stations open for traffic, and 188,177 on 2,938 miles in course of construction. On the former there are 95 engineers, and on the latter 405; on the former there are 95 engineers and on the latter 405; on the former there are 95 engineers and on the 2,958 miles in course of construction. On the former there are 95 engineers, and on the latter 405; on the former 1,752 engineemen and 1809 firemen.—The papal triumvirate, says the Railway Times, have decided that the railway to Naples is a useless scheme, 'tending to immdate Rome with worthless foreigners;' they have, therefore, definitively suspended the works, and thereby thrown thousands out of employment.—This is how cardinals encourage railways. conrage railways.

CARVED CHIMNEY-PIECE.

MR. HOPE'S HOUSE, PICCADILLY.

IN OUT account of Mr. Hope's mansion in Piccadilly, we mentioned with praise the chimney-piece in the small dining-room next Down-street. The accompanying engraving is a representation of it. The material is the pierre de tonnerre,—a fine-grained stone, which exhibits sharply every touch of the chisel, and it is the work of a very clever chisel which it has here to show: the fruit and flowers around the circular opening, intended

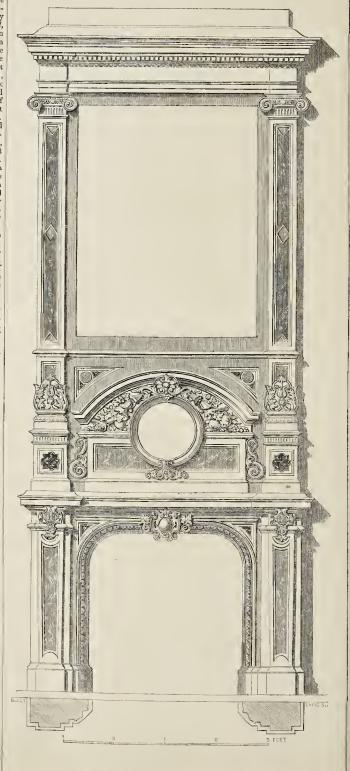

flowers around the circular opening, intended for a dial, are beautifully executed.

The panels are filled in with varied marbles, —marbre de Languedoc, Vert de Mer, &c.; with which, also, the front slab is inlaid.

The upper panel is intended to receive a painting.

CARVED CHIMNEY-PIECE, Mr. HOPE'S HOUSE, PICCADILLY.

MESSES. DUSILLION AND DONALDSON, ARCHITECTS.

LECTERNS.

THE two small reading desks or lecterns are copied from the sculptures which ornament the spandrils of the tomb of Archbishop Meopham, at Canterbury Cathedral. The tomb is early Edward the Third's style, and it is one of the finest in the cathe-dral. Ancient representations of church furniture are always valuable, and the two here shown are well worthy of notice. Ancient small lecterns are common enough in our churches, but we have no specimen left of a large one, like that in our example, intended a tage one, the that in our example, inclined apparently for a whole company of priests. In Mr. Roberts's Spanish sketches one such is represented, in the view of the chapel of the nunnery at Carmina during the service of the vigils by the sisterhood.

R.

FORMATION AND MAINTENANCE OF ROADS FOR GREAT TRAFFIC.

Some time since a series of questions on the subject of pavings were sent to the City of London Commissioners of Sewers, by the Metropolitan Sanitary Commission, and were replied to by Mr. W. Haywood, the surveyor to the City Commissioners. Some of the replies give information which may be generally useful.

The City Commission are said to have tied almost every description of carriageway.

The City Commission are said to have tried almost every description of carriageway pavement: they progressed from the common pebble paving with which London was originally paved, through stones 8 inches, 6 inches, and of nearly every width, they have had stones 8 inches wide, and from 10 inches to 20 inches in least heavy fewer feel discourses and these inches wide, and from 10 inches to 20 inches. in length (superficial dimensions), and they have now down in the public way a specimen of pavement, of which the stones are but about 3 inches by 5 inches, or 3 inches by 4 inches

(superficial dimensions). They have laid in their streets granite from Guernsey, Herm, Devonshire, Cornwall, Leicestershire, and Scotland, and given macadamized roads and wooden pavements a fair trial, with the view of determining the important question of which was the best and cheapest pavement.

"It is rather difficult to say which is the best, taking into consideration these somewhat

antagonistic qualities, for that paving which is composed of the largest stones is the cheapest in first cost and of the greatest durability (I in first cost and of the greatest durability (I do not allude to the difference of granite), but is the least safe for carriage or equestrian traffic, and that which is formed of stones of small superficial dimensions, and is the dearest in first cost and the least durable, is the safest for carriage traffic. The 3-inch cubes at present down in many of the principal City streets are but an introduction of late years, and it will yet take the experience of a few more years to determine their durability and cost of maintenance relatively to the larger stones (thus the proper stones that the safe is the safe to the larger stones that the safe is the safe to the larger stones that the safe is the determine their durability and cost of maintenance relatively to the larger stones (that of the larger stones being pretty accurately ascertained). It is probable they will be a greater expense taking them over a term of years, but they form by far the safest pavings which have yet been laid down, and have given the most satisfaction to the public, both equestrian and pedestrian. Taking then the question in all its bearings, I should say that the narrow or 3-incb stones, with certain restrictions in length, being the safest pavement, is the best paving for carriageways of large towns and of great traffic, even although its cost should be greater (within certain limit); for any slight additional cost must be more than saved to the additional cost must be more than saved to the public by the decreased strain upon horses, the diminution of wear and tear of vehicles, and the general comfort experienced by all.

At the same time I may remark, that as there will in all probability be an increased

expense in the maintenance of streets paved expense in the maintenance of streets paved with these small stones, it is obviously desirable to lay down stones of as large a dimension as the requisite safety to the carriage traffic will admit of, and the City Commission are now laying down in some leading thoroughfares 4-inch cubes with certain limitation in length (this size not having hitherto been laid to any extent), to enable them to judge of the value of a pavement formed of such sized stones.

stones.

The granite which has for the most part been used is Aberdeen, and has hitherto been deemed the best, taking into account the various heads of first cost, durability, and absence from slipperiness."

Theoretically, the paving with the least quantity of joint is most easily kept clean; but no increased difficulty appears to be felt in practice in keeping pavements of 3-inch cubes clean than in keeping pavements of 6-inch cubes clean, although there is double the amount of joint in one than in the other. A tramway keeps cleaner than a pavement A tramway keeps cleaner than a pavement wholly composed of the ordinary paving stones, as it partakes in character of the flag footway pavements.

"The ease with which pavements are kept clean greatly depends upon their state of repair; a pavement in good condition, with an even surface, can be cleansed with but little labour, whereas, a pavement in a bad state it is difficult to keep in a state of proper cleanliness; refuse, water, &c., &c., if thrown upon the one will be speedily removed, by finding its way to the street gullies; hut if upon the other, the depression and irregularities in surface retain it until removed by manual labour; in fact, if a pavement is in a very bad condi-tion, it is impossible to keep it clean with any ordinary care or attention."

The first cost of the different kinds of pave-

ment varies considerably according to the nature of the pavement laid down, both as respects size of stone and nature of granite, and also according to the price of granite in the market. They may be estimated at from 11s. to 17s. per yard, superficial, if formed of stones 9 inches deep.

The average of the cost of the repairs of thirty-six streets may he taken at about one penny per yard per annum up to the period at which it was estimated.

The stones of these carriageways were 9 inches deep, 6 inches wide, and from 9 to 15 inches long; this, therefore, will not give the probable amount of charge for annual reparation of the pavements (of 3-inch cubes) now laid in the City of London.

now laid in the City of London.

The usual material for footpaths is York stone, the thickness usually laid down is 3 inches, its cost has varied from about 6s. to 6s. 6d. per yard.

3 inches, its cost has varied from ahout os. to 6s. 6d. per yard.

The average cost of reparation of the footways of Coleman-street, Bread-street, Fenchurch-street, Fleet-street, Lombard-street, Tower-street,—Great and Little, and Woodstreet, taken over the period of the whole time they were lying in the streets, is about one penny per yard per annum."

WROUGHT-IRON WATER PIPES.

I OBSERVE in your number for Oct. 27th a letter from Messrs. Fox, Henderson, and Co., on the above subject, and as the statements therein are entirely erroneous, and calments therein are entirely erroneous, and cui-culated to do a valuable patent (of which I hold a share) considerable injury, may I beg the favour of heing permitted to put the mat-ter in its true light. There are two patents for wronght-iron pipes in this country, as well as in France; viz., M. Ledru's and M. Chame-roy's; and that the public may have an oppor-tunity of undoing of the intriview value of each roy s, and that the public may have an opportunity of judging of the intrinsic value of each, I will endeavour to show in what each consists. M. Ledru's system consists in drawing a plate of charcoal iron, by a machine, to any length up to 10 or 12 feet, in section, of a circular constant of the const length up to 10 or 12 feet, in section, of a circular form, with its edges curved in, as at A, while another piece of charcoal iron, of the same length, having been drawn of the form as at B, is by a third operation drawn into the pipe, as at C, by which process they are so firmly rolled together that they become almost one entire piece of iron. The pipe thus manufactured possesses these advantages, viz., that it is entirely closed throughout its whole it is entirely closed throughout its whole length, without a single hreak, and is capable of resisting any strain, either from the interior or exterior. These pipes, when made, are galvanized, the zine running into and entirely filling up the smallest interstices that by any accident may occur, and the onter seam is then soldered the entire larget the continuous control of the control o soldered the entire length, which, although considered perfectly unnecessary, is done as an additional security. M. Chameroy's system (vide patent) originally consisted in cutting out of plate iron a series of dovetails, at certain distances, and bending the plate into a circular form, and then, by solder, endeavouring to fix these dovetails in their places, vide D; but as this scheme proved a failure it was abandoned, and the present makers of M. Chameroy's patent in England only rivet the pipes with small rivets at certain distances, as at E, and, I believe, then solder down the joint, which system I humbly conceive is no patent at all, and that any one would be at liberty to make pipes in this manner. M. Chameroy's system also includes the covering of the pipe, when also includes the covering of the pipe, when made, with bitumen; this is also common to M. Leduu's system, so that, in this respect, the soldered the entire length, which, although M. Ledru's system, so that, in this respect, the one has no advantage over the other. Messrs. II. and M. D. Grissell are the manufacturers II. and M. D. Grissell are the manufacturers of M. Ledru's patent in this country, which system unfortunately happens to be an opposing one to that of M. Chameroy. Each pipe as made by Messrs. Grissell is, before delivery, proved with its joint complete, to a pressure of water equal to a column of 300 feet, but the pipe will of course always bear considerably more before fracture. It also, from its peculiar form of abutting joint (therehy keeping its perfect circle), will bear a loaded waggon to he drawn over it, and is guaranteed qual to any perfect circle), will bear a loaded waggon to he drawn over it, and is guaranteed equal to any cast-iron pipe, when placed in the same situa-tion as pipes usually are. I am not aware to which system the article in your valuable paper of the 29th September last refers, but I have A B C C E

the permission of the Messrs. Grissell to say that they will have much pleasure in showing you the manufacture, and in proving my assertions to their fullest extent, should you favour their manufactory with a visit. However, in answer to Messrs. Fox and Co.'s letter, I can, as one of the proprietors of the patent, affirm that M. Ledru has not had to pay any damages to M. Chameroy for infringements, and, as far as I recollect, the trial in question went against M. Chameroy, and not M. Ledru.

I am quite willing to prove, by experiment, that, first, M. Ledru's pipes are equal to the external as well as the internal pressure. Look at the two sections A and E, and let any practical man say which is most likely to sustain pressure. Second, the pipes made according to M. Ledru's system do not depend upon being soldered; it is only an additional security. Third, whatever liability there may be of the outside coating of asphalte being destroyed—of which I think there is very little chance—the liability is equal in both systems, as each party covers his pipes with bitumen if desired. As we galvanize all our pipes, we consider this coating of bitumen quite unnecessary, except in some very peculiar situations, and we do not advise our friends to incur this additional cost. Our pipes are made from half an inch diameter npwards, and are equally applicable for household purposes as for the purpose of drainage and water pipes. Messrs. Fox and Co.'s agent for their pipes is, I think, quite in error in "confirming their impression," however strong that impression may be, relative to the defects alluded to. I am informed that, instead of M. Chameroy having to complain of infringements, it is M. Ledru who has had to complain. Messrs. Fox, Henderson, and Co.'s opinion with respect to M. Ledru's system being "valueless" is, however, of little importance. I need only say that I do not fear my pipes will suffer anything hy being placed alongside those of any maker in the kingdom. The question that the public will have to settle is—who can produce the best pipe at the least cost?

As regards the screw joint, of which Messrs. Fox and Co., with so much emphasis, say that "their screw joints are not soldered on like Ledru's, but are cast (?) upon the body of the pipe, in such a manner as not to he liable to be detached;"—true, they are not soldered on like Ledru's, but they omit to mention that the metal of which these said joints are composed so nearly assimilates to solder itself, that no practical difference can be discovered; whereas the joints I recommend are made either of cast-iron, or of malleable cast-iron, which is as strong as wrought-iron itself. These joints are then galvanized, rivetted on

to the pipes, and afterwards soldered as well. My object is not to depreciate Messrs. Fox and Co.'s pipes—they are fair pipes; but I cannot suhmit to their assertions without asking the public to judge which of the two systems is the best—M. Chameroy's or M. Ledru's; and I think Messrs. Fox would have shown much better taste had they not so freely made use of a competitor's name to raise the value of their own article. In conclusion, I can only say that I will guarantee every one of my pipes for the term of seven years, whenever required to do so, and thus allow time alone to test their value.*

JOSEPH THOMAS.

Miscellanea.

BITS OF THE PAST.—A portion of Roman walling, we are told, has been discovered in Chelmsford. "The walls exposed are 3 ft. thickness, and 4 ft. 8 in. in depth, and are formed of Roman bricks about 12 in. by 11 (of which there are twenty rows), mixed with fragments of curved roof-tiles, similar in form to those now used on Italian villas."—At Llando, Wales, the miners have broken into a cavern supposed to have been formed in Roman times: benches, stone hammers, &c., were found.—At Richborough, according to the Literary Gazette, the outer wall of a very extensive amphitheater has been discovered and traced by Messrs. C. R. Smith and Rolfe.—La Presse mentions the discovery, on the walls of La Sainte-Chapelle, adjoining the Palace of Justice, Paris, of a rude painting of the thirteenth century, on a preparation of yellow chalk, and represents the annunciation. The figures are ahout 4 ft. (French) in height, and consist of an angel presenting a hranch of lily to the Virgin, who holds a book in her hand. Above is a medallion of the Virgin, with the infant Jesus on her knees, and two angels offering incense.—A marble statue, almost entire, and supposed to represent either Apollo or Meleager, has been found during excavations that are being made for antiquities in Rome.

Galvanized Iron Company.—We have heen requested to correct the misapprehension of a contemporary relative to this company, quoted in our last. The manager, Mr. Tupper, states that the affairs wound up were those of the old company, and that the present company are fully prepared to develop the process to the utmost.

* Having now allowed both parties to state their case, any further communication can appear only as an advertisement.—En.

PROJECTED WORKS.—Advertisements have been issued for tenders, by 17th instant, for rebuilding the Corn Exchange at Ipswich; by 10th December, for the work required to be done in building a new bridge of stone over the river Weaver at Frodsham, and making road approaches to same; by a date not specified, for the erection of the Deptford Literary Institution; by 15th inst., for the works to be done in erecting and completing a dispensary and dwelling-house adjoining the Ratcliff workhouse; and by 12th, for shifting 25,000 cubic yards of spoil on the Monkland Canal.

IMPROVEMENT OF DWELLINGS IN LAM-

BETH.-The Lambeth Anti-Cholera Dwellings Improvement Committee have issued an advertisement, calling on all concerned in raising the status of the poorer classes to aid, by con-tributions, the good work they have in hand, namely, the expense of forwarding a Bill in Parliament for the improvement of dwellings Parliament for the improvement of wearings for the labouring classes, of adopting measures for the obtainment of a cheap, pure, and abundant supply of water for the whole parish, and of baths and washhouses for the poor. We trust that the success of this appeal will be a compared to the control of the con give such an impetus to these cognate objects as will not only lead to the complete fulfilment of them in the present instance, but render it an example to the whole country as the rudiment of a complete domiciliary and sanitary reform. A draft of the proposed Dwelling Improvement Bill has been forwarded to us. Improvement bill has been to wanted to us, the world authorize the parish and union authorities to construct, or hire, whenever needed, by means of the parish rates, proper dwellings for the labouring population, and devote the profits thereof to the parish funds and the diminution of the poor-rate. It stipulates that each dwelling shall possess an ahundant supply of pure water, a decent wholesome water-closet, and every other essential accommodation, at a specified list of charges; such as Is. 6d. a week for a single room 12 feet square and 9 feet high, &c. the preamble, the object of thus and otherwise making the people a healthful, orderly, contented, and peaceable community is held up to view as one reason for the Act, and the consequent decrease of workhouses, infirmaries, hospitals, &c., might have been equally dwelt on as another. The suggestion that parishes should obtain the power of providing such dwellings originated, we believe, in our pages.

An Enormous Chimney has been erected for the Counterslip Sugar Works, Bristol. According to the newspapers, and which our own observation of the work in progress leads us to believe correct, the foundation of the stack is about 25 feet square, with piles driven to a depth of 20 to 25 feet from the level of the ground, the 5 feet nearest the surface being a bed of concrete, about 23 feet square. The diameter of the stack at the bottom is 20 feet; and it tapers gently to a height of over 200 feet, the diameter at its summit being 4 feet 8 inches. In the construction of the stack 220,000 bricks were used, and the entire weight of the mass on the piles is 580 tons. "With such almost unprecedented nicety," adds our authority, "has the stack been constructed, that the final trial with the plumb did not show a deviation of an eighth of an inch from the true perpendicular." It may be useful, however, to add to this account a notice of the circumstance that this is the second time the chimney has been put up; the work failed on the first occasion before it was quite finished, and was taken down, of course at no small cost. This disastrous accident was ascribed, we believe, mainly to the prevalence of wind and rain from one quarter; we should ourselves rather attribute it to the fact that no architect was employed.

Abergaxeny Lunaric Asylum.—In the

ABERGAVENY LUNATIC ASYLUM.—In the provincial notes of the last number but one of your widely-circulated paper appeared a notice of the above building, and since that time I have been inundated with letters and prospectuses from various tradesmen; but as your notice merely said Mommouth, without describing the town in which the building is being erected, I shall feel obliged if you will take an early opportunity of stating that it is being built at Abergaveny. The building is to be in the Early English style, and to accommodate the pauper lunatics of four counties, viz., Monmouth, Radnor, Hereford, and Brecon.

THE KENILWORTH-STREET SEWER QUES-THE REVILWORTH-STREET SEWER QUESTION.— Dr. Playfair has issued a supplementary report on his part, reiterating his results not only without any retractation, but strengthened by the statement that he is supported in these results by "several of the most eminent chemists in London, among whom," he says, "I may mention Professors Graham and Williamson, as well as Dr. Hoffman, of and Williamson, as well as Dr. Hoffman, of the Royal College of Chemistry." Dr. Ure has thus arrayed against him a somewhat formidable evidence, amongst whom he himself before enumerated the two Government chcmists, and the two chemists of King's and University Colleges. Dr. Playfair appears good-naturedly to suggest that Dr. Ure's ex-periments may be strictly accurate, if the sewer water used in his experiments were taken "from the open trench, where plenty of gas lime had fallen in;" but Dr. Urc regudiates that idea in a new report since issued, in which he appears to have lost all temper, and com-plains that he has been exposed to "a tempest of passion, prejudice, and invidious contra-diction," and "vulgar vituperation," &c., and not very obscurely insinuates that the sewer has been tampered with, as, in three specimens has been tampered with, as, in three specimens taken for further verification of bis results, he finds that the prussic acid, "the witness he (the tamperer) intended to destroy, exists no longer indeed in the fluid," but has been found in the mud, in the shape of inert Prussian blue, so that "the wicked is snared in the work of his own hands." This is a serious charge if seriously entartisized and recorded work of his own hands." This is a serious charge, if seriously entertained and regarded. Dr. Ure even specifies copperas as the precise form in which the iron and sulphur destroying the poison bas been thrown into the sewer. There seems to be a less odious way of accounting for the presence of iron and sulphur in the mud of a sewer, and especially of the Kenil-worth sewer, than this, even granting that the poisonous hydrocyanic acid did exist in the fluid, and above all, in the gaseous, sewage (for this latter, be it ever recollected, is the question after all, and hence we presume no one ever had yet thought of groping in the mud for neutral inert and destroyed poison). But it is not for us to reply to such a charge. We only could not think of affording the influence of our circulation to the naked propagation of such a charge against any man, even in the meantime, without something like a reasonable ineanume, without sometime like a reasonable or charitable qualification, which we do not find in Dr. Ure's report, while yet we have not Dr. Playfair's own defence or reply. One thing is clear, however, namely, that Dr. Ure himself admits that the sewage water does not now contain any prussic acid or other poisonous compound of cyanogen. And as for the mud, the compounds now alleged by Dr. Ure to have been found in it are admittedly not poisonous either. The source of these latter compounds, if they do exist, is of course still an open question.

Compensation, Spitalfields. — Hyde and Co. v. Commissioners of Woods.—On the alst ult. a writ of inquiry was entered into at the Sheriff's Court, Red Lion-square, London, to estimate the amount of compensation to which the plaintiffs, Messrs. Hyde, solicitors, of Ely-place, Holborn, were entitled to, for the loss of a piece of freehold land and two houses, situated in Vine-court, Spitalfields. The premises were required by the Commissioners for the completion of the new street leading from Spitalfields Church to Shoreditch. The only question in the case was one of value: the plaintiffs claimed 1,2004, the defendants offered 4004. Evidence was adduced on the part of the plaintiffs, from which it appeared that the property had been let on lease in a greengrocer for the term of forty years, which expired at Midsummer in the present year, at a rent of 301, per annum, and some time before the expiration of the lease Mr. Chapman, the tenant, offered to take a new lease at an advanced rent of 401. a-year. Mr. Todd, builder, and Mr. Nelson, architect, proved that the property was worth 1,2004. (the freehold of the land included), allowing 1204, for the old materials, as a site for stables. The Attorney-General, in behalf of the Commissioners, contended that the property was not worth more than 4204. He did not call any witnesses. The jury gave 8504.

AUSTRALIAN COPPER.—Ten tons, the first ever smelted in Australia, were sold at Sydney, some time since, at 81*l*. per ton.

TAORMINA AND MOLA, FROM THE ANCIENT THEATRE.—Mr. W. Linton's picture of Ætna and Taormina, painted for Mr. Richard Ellison, of Sudbrooke Holme, has been lithographed by Mr. F. W. Hulme, we suppose for publication. Mr. Linton delights in classic scenery, and ever treats it with power and beauty. His great merits are scarcely so widely recognized as they deserve to be. The ancient city of Taormina was one of the three most renowned in Sicily during the classic agges. Aqueducts, baths, cisterns, a gymnasium, a stadium, and naumacbia, with sepulchres, and mosaic pavements, the ruins of temples, porticoes, and piazzas, are among the numerous remains which evidence its ancient splendour. Many of our readers know the beauty of the scene. The proscenium of the theatre constitutes the principal object in the foreground with its arches and broken columns. "It is encrusted," says Mr. Linton, "with white marble, as were the benches of the coilon. The plan of the theatre is Greek, and the Greek inscriptions which have been discovered on some of the broken seats are evidence of its having been originally built by those colonists. It was afterwards rebuilt and subsequently restored by the Romans, as its remains testify." Mr. Hulme has transferred it to stone witb great delicacy. If we offered any objection, it would be that the parts in shadows are too dark, and contrast too cuttingly with the remainder, suggesting the idea that the latter has yet to be worked up, and therefore giving the effect in some degree of incompleteness.

BIRMINGHAM BATHS AND WASHHOUSES. The foundation-stone being laid on Monday week, by the Mayor, at the site in Kent-street, Bromsgrove-street, a déjeuner took place in the evening, when the Mayor, in congratulating the friends of the institution on the event of the morning, remarked that he hoped that at no distant day the other part of the arrangement for the recreation of the working classes would be carried out. There was the park at Aston, with a classic huilding, associating with it the idea of Hampton Court. Then there were the parks of Edgbaston, and Soho, at Handsworth, which were exceedingly desirable for such an object. The Rev. J. C. Miller followed in an exemplary clergyman's speech, in which he observed that they had heard much said about the new gaol and lunatic asylum, and also about the new poor-house. Now, unalso about the new poor-house. Now, unquestionably, all these buildings were accounted necessary, and yet with all of them some painful or melancholy feeling was connected. But he thought that scarcely any painful feeling could be associated with the event of that morning. Then, with regard to the bearing of the undertaking on the moral character of the people of Birmingham, he believed it was a matter of no slight importance to turn a dirty man into a clean one. He believed that so long as our poor were in a state of squallid filth, and their houses wretched, we might use our religious appliances and our police appliances, but we should use them to a great extent in vain. He had no great hope of a man so long as his person was dirty, and he revelled in filth; and whatever induced him to cleanse his skin and cleanse his clothes was an important

aid to the minister of religion.

Fall of Mooltan Fort in a War of the Elements.—This renowned fortification, which, with all its bomb-proof dependencies, so long withstood the cannon hail showers of Britain, has been razed to the ground by the still more potent showers of Nature's ordnance—the soft and simple rain, which, pouring down in torrents, and rushing on in floods, till building after building fell before it in rapid succession, has reduced the fort to a mere defenceless ruin. The river Chenaub at length covered the whole country during the moonsoon, and has everwhere done much damage.

soon, and has everywhere done much damage.

CHANCEL DILAPIDATIONS.— We are obliged by your frequent notes respecting builders' differences, but it is a pity to let surveyors altogether escape. In central Norfolk a valuation has recently been made of clerical chancel dilapidations by three persons, to the following effect:—

How we build Railway Bridges.—
Passing through Isleworth the other day, we were surprised "above a bit," as they say in the west, to see workmen busily employed in taking down a brick bridge of three arches, which carries, or is to carry, if they can ultimately make it strong enough, the Staines and Richmond Railway, not yet opened. A well-known horticulturist of the neighbourhood, who happened to be passing at the moment, must have noticed the surprise with which we viewed the proceeding, for he stopped his grey horse, and said, "You will be more astonished when I tell you that this bridge has already been built twice, and if this be the way they manage the works on this railway, I may thank my stars I hold no shares." Some of those who do, may perhaps think it pertinent to inquire who pays for these arch-waggeries, the engineer, the builder, or the shareholders? It is a trap-ball regulation that "slips go again," but whether or not this hold good in railway works when the "going again" costs money, deponent knoweth not.

HULL CORN EXCHANCE COMPETITION.—
Three designs were submitted to the Committee appointed to carry out the execution of the new Corn Exchange, namely, from Messrs, Lockwood and Mawson, Mr. C. Brodrick, and Mr. Niemann. The Committee had stipniated that the architects should confine themselves to designs for converting the present corn market into a fish market, and for erecting a corn exchange over the poultry and butter market; and required that there should be double staircases of easy access, both from Blackfriargate and Fetter-lanc, with all convenient offices for such a market upon the same floor as the exchange. The plan selected was the one furnished by Messrs Lockwood and Mawson, of Hull, and of which the following are some of the principal features:—The corn exchange is a parallelogram, measuring 185 feet by 40 feet, but by a recess obtained by projection over the fish market, the width, along one-third of the entire length, is increased to 50 feet. The light, introduced entirely from the north, is obtained by dividing the roof into nine compartments, placed across the building and supported by cast-iron arched girders. The fish market has a range of columns dividing the shops, and supporting a caved ceiling, with light in the centre. Air is introduced by open arches springing from the columns, as well as by apertures left in the ceiling and roof. A fountain occupies the centre of the market, to cool and purify the atmosphere. The estimated cost of Messrs. Lockwood and Mawson's plan was 3,800/.; but by suggestions of the committee the cost is to be reduced to 3,500/.

New Schools, St. Dunstan's In-The-West, London.—The plot of ground at the Fleet-street end of Fetter-lane is to be occupied by schools for the parish of St. Dunstan-in-the West. The first stone of the new building was laid by the (late) Lord Mayor, Sir James Duke, on the 3rd inst. The building is to be faced with red brick, and the door-ways of Portland stone. It is to consist of two floors and an attic over. The school on the ground-floor is intended to accommodate 100 infants, and that on the first story forty boys; while the attic will be fitted up with all necessary conveniences, in order to make it a comfortable residence for the infant schoolmistress. The plans have been prepared by Mr. John Shaw, and the builders are Messrs. Locke and Nesham.

How Ironfounders differ.—To show that builders are not the only blind ones in estimating for work, I hand you a list of tenders that were sent in for the erection and completion of a gasholder, tank, and purifier, at lifford. Essex.

Edinburgh Philosophical Institution.—Professor Wilson, the president, opened this institution in Queen-street Hall on Tuesday week, with an elequent address, in which he deprecated the unqualified meaning usually put upon those celebrated sayings, the one, of Pope, that a little knowledge is a dangerous thing, and the other, of Baeon, that it inclines man to atheism. In the former he showed that Pope alluded to critics, and in the latter that Baeon alluded to the exclusive study of second causes. Yet Baeon "is not undervaluing them, provided they are conducted in a proper spirit; he says that if there is danger at all, it is in over-little—a most different view that from that generally taken of it." In conclusion, the professor referred to a great deal having been said of the re-action of knowledge on the human faculties; and he at once admitted that re-action was not always good; that where it led to self-exaltation it was positively bad; but that where it made the mind greater and better, and led an individual to attribute all his gifts and attainments to the Almighty—the bestower of all blessings—it was decidedly good.

greater and better, and led an individual to attribute all his gifts and attainments to the Almighty—the bestower of all blessings—it was decidedly good.

Hertford Corn Exchange.—In consequence of the great inconvenience arising from the want of proper accommodation for the merchants, farmers, and others attending the corn-market here, it was thought desirable by a majority of the town council and influential inhabitants to provide a commodious corn-exchange. The building (which we have not seen) is situate in the principal street (Fore-street), and near to the Shire Hall. The design was furnished by Mr. D. Hollingsworth, the borough surveyor, and the building was contracted for by Lawrence, Son, and Castle, of Hertford, for the sum of 391£, exclusive of the fittings, &c., for the merchants. The dimensions of the building, according to our informant, are as follows:—Length, 66 feet 6 inches; width, 43 feet 6 inches; height, 15 feet to the under side of girders. In the centre is a lantern 40 feet by 15 feet (supported by eight hollow cast-iron columns), and constructed upon upright sashes, furnished with Hurwood's patent apparatus. Ventilation is effected by the sashes in the lantern, and six large skylights in the sides of the roof, the whole of which is covered with rough plate glass. The exchange was opened on the 20th inst. Out of thirty-eight stands, thirty-two have been let at various rents, from 3½, 3s. to 4½. 10s. per year.

THE CARDS OF INVITATION AND ADMISSION TO THE COAL EXCHANGE shewed considerable care, and some taste. The first, a solid enamelled card, presented an engraved view of the exterior of the new building (perspective of which, by the way, was questionable), and the admission ticket forwarded on the invitation being accepted, was on lace paper, with a coloured group of fossils in the centre, and a map of part of the city on the back, to guide such of the west-enders as were ignorant of Billingsgate. We bave to thank Mr. John Wood, the active chairman of the committee, for more attention than we have heretofore received from city authorities.

PLAYINGON THE PIPES, BY THE "TIMES."

—Pipes appear to be the order of the day.
Pipes to let pure water in—pipes to carry foul
water out;—pipes for warming — drainage—
ventilation;—pipes to bring in gas for burning—pipes to carry off the products of combustion. Pipes to the rich man's marble bathroom—pipes to the poor man's hrick-paved
kitchen;—pipes for the fountains of St. James,
and pipes for the stinking cesspools of St.
Giles. For ornament and pleasure—for economy and cleanliness—for health and comfort
—for arresting conflagration, and extinguishing
pestilence—pipes! The whole sanitary question, indeed, may be regarded as little more
than a question of pipes.

DISINFECTING POWER OF CHLORINE GAS.—With reference to Collins's disinfecting powder, the inventor asserts that, having a glass globe holding about 900 cubic inches of air, he added to this air one cubic inch of sulphuretted hydrogen gas; he then placed a sparrow in it, which was deprived of life almost instantly.* He then introduced into this poisoned atmosphere of the globe about

half a tea-spoonful of his disinfecting powder (the properties of which are derived from its evolving free chlorine by the simple absorption of moisture), and at the expiration of two minutes introduced another sparrow, and after this had remained in the globe ten minutes it was withdrawn, and found to have suffered no injury from its exposure to this atmosphere.

migury from its exposure to this atmosphere.

THE VERNON CLUB.—The formation of an artistical and literary club under the above title is in agitation. If under good auspices, and well managed, the scheme could scarcely fail to succeed.——Behnes has just finished the bust of Mr. Vernon intended for the vestibule of

the National Gallery.

The Preservation of Life from Fire.

—As a means of preserving life and property from fire, I would suggest attaching an air-pump to a fire-engine, to be worked at the same time, or as occasion might require. To this pump I would attach a light elastic tube, to be fixed to a fireman's hood or covered helmet, in order to enable him to enter a room when filled with a dense suffocating smoke, to rescue persons who would otherwise have perished, or save valuable property from the flames. The fireman's dress and helmet I would form of asbestos, or some other material which should be impervious to fire; as also the elastic tube, which should be cased with a similar material, to prevent its being affected by the fire, and it could be made of any length. On mentioning my suggestion to others, I was informed a similar plan had been invented by Mr. Deans and Col. Paulin. The same simple contrivance might be adopted for entering a foul sewer, which at all times is exceedingly dangerous, but by means of a small air pump, with a coil of tubing, it might at all times be made available, and at a trifling cost.

W. Westmacott,

*** The suggestion as respects entering sewers was made in our columns some time since.

MEETINGS OF SCIENTIFIC BODIES

Held during the ensuing week.

Tuesday, Nov. 13.—Freemasons of the Church, 8 p.m.

Thursday, 15.—Society of Antiquaries, 8 p.m.

No. CCCLIV.

SATURDAY, NOVEMBER 17, 1849

RECISION and clearness in specifications, on which contracts are to be made, are absolutely necessary. We have before now urged this, and

have pointed out that great differences between the tenders of different individuals for the same work, are sometimes owing to the looseness and defectiveness of the specification. A curious case has been recently settled which illustrates the necessity of this precision very rigorously, and it may he quoted with the less hesitation, because it does not necessarily involve the imputation of that want of care in drawing up the specification to which we have alluded. The matter is in other respects instructive, and may he usefully set forth: we will premise, however, that when we applied to the contractors concerned, for such papers as would establish the correctness of the information we had obtained from various quarters, they thought themselves bound to refuse it, and we mention the circumstance, that they may not be considered privy to this publication; small praise, however, according to our notions. And we would here take the opportunity of remarking, that if there were more willingness on the part of architects, builders, and arbitrators, than is often observable, to giving publicity to questions of practice which come before them, advantage to all would result. We may find an occasion, however, to enlarge on this text, and to say a word or two to some of our architectural friends individually, which they may or may not like,-just as they please.

The justices of the peace for Hampshire have recently huilt, as our readers know, a county prison at Winchester ;-it is scarcely finished yet, we believe. Mr. C. J. Peirce, is the architect, and Messrs. Locke and Nesham the contractors. In the contract it was a stipulation that Professor Hosking should determine any question which might arise between the parties in respect of the works; and in the specification which formed the hasis of the contract was the provision, that all the windows in certain garts of the building should " be glazed with HOUGH PLATE, 1/4 inch thick." Nothing to the half-learned mind could seem clearer, - one provision was as understandable as the other, -the identity of our acute friend the professor, and of rough plate, appeared equally unmistakeable,-the difficulty of seeing through wither equally great: and yet what followed? We shall learn.

Well, the windows were glazed,—had been so for some time hy the way,—when the magistrates one fine morning discovered that the glass with which these windows were filled, was not the "rough plate" which they looked for, namely, that thick cast glass recently introduced, with a roughened surface, through which roughness there is no transparency, although the glass remains translucent,—and which indeed is the condition of all cast plate glass hefore it is ground and polished. The glass really used was plain on the surface, exceedily transparent, and, as admitted by the contractors, was produced by blowing. The

contractors denied that the term, "rough plate," is applied exclusively to rough cast plate, and alleged that the glass objected to was known as "rough plate," and that it was commonly sold under that designation before cast plate came into the market in its rough or unpolished state. Further, as to the propriety of applying the term "plate" to a blownglass, that although the glass in question is blown, the cylinder into which it is hlown is at once cut down and flattened on a plate,—that it is susceptible of heing ground and polished, and has heen for many years so treated and sold for all the purposes of plate glass. Some few of the windows in the prison, we should have mentioned, are glazed with the rough cast plate.

The question then was, has the quoted provision in the specification been complied with? and to determine this, Mr. Hosking was called in, and took evidence.

The question of thickness was waived or withdrawn by the justices, so that the only point of inquiry was, -is the glass used "rough plate?" On the part of the magistrates, Mr. James Hartley, of Sunderland, a well-known manufacturer, stated positively that the glass used was not rough plate, hut sheet glass manufactured to imitate it, one side being slightly hurnt to diminish its transparency. This witness, as we gather, set forth some particulars which may interest our readers. He said that all the various descriptions of window glass are manufactured from the same materialssand, soda, and lime-the various qualities of glass being produced by the differing proportions and purity of these substances. Glass is formed into flat surfaces in three different ways:-1. By blowing it into a globular form and then throwing it into a flat plane, - this is crown glass. 2. By forming cylinders, which are cut open and then flattened,-this is called cylinder glass, broad glass, blown plate glass, &c.: and 3. By pouring melted glass upon a metallic surface, and passing over it a heavy roller, to reduce it to an even thickness,-this is termed rough plate glass, cast plate glass, rolled glass, &c. It is the contact with the cold surface on which it is cast that causes the roughness, by unequal contraction.

Mr. Hartley asserted that the glass in dispute helonged to the second process, and that the term "rough plate" had never been applied to such by the trade. He was astonished that any person conversant with the glass trade could call the glass used "rough plate," or that there could be any difference of opinion as to a material now so much used and so well known. Mr. Hartley also quoted other specifications, containing precisely the same description, "rough-plate $\frac{1}{4}$ inch thick," for which, as a matter of course, the cast glass had been supplied.

Mr. Fincham, of Ravenhead, St. Helen's, said the glass in question was not "rough plate." Rough plate had been introduced hy him, as manager of the British Plate-glass Company, ten years ago, for the express purpose of giving light where the glass was not to be seen through. German sheet, blown in cylinders, had been polished and sold under the denomination of patent plate-glass; and the glass in question was this description of glass, before polishing, that is in its rough state; but no dealer would accept the one for the other, although, for some purposes, the "rough patent plate" might be preferable.

Mr. Souper, secretary of the Thames Plate-

* It is necessary to specify thickness, this and consequent price varying up to 1 inch.

glass Company; Mr. Christie, agent for the Union Plate Company; Mr. Hetley, of Sohosquare; Mr. Millington, of Bishopsgate-street; Mr. Wilson, of the British Plate-glass Company; and Mr. Goslett, of Soho Plate-glass Warehouse, all denied that the material used could be called "rough-plate," or hore any resemblance to it.

Now, let us look at the other side of the picture—or, rather, of the glass,—and we shall see that there are other doctors who differ besides Ure and Playfair.

Mr. Young, of St. Martin's-lane, had no hesitation in saying the glass in question had always been considered by the trade rough plate, and, though in the business fifty years, had never seen or heard of any other description of glass so called. Mr. Swinhurne, of Thames-street, said it was "blown rough plate-glass." Mr. Brackman, a practical man of many years' standing, had sold it as "rough plate" when foreman of the London Works. Mr. Chater, of St. Dunstan's-hill, had supplied both cast and blown as "rough plate" for thirty-six years. Mr. R. Cobhett, of Northumberland-street, considered both kinds "rough-plate." Messrs. Foord, who hold the contract for glaziers' work under the Office of Woods, considered that both cast and blown were equally entitled to be called rough-plate, and thought that the specification would be strictly followed out by supplying either one or the other. The blown rough-plate was made in this country before cast rough-plate, and was therefore more entitled to the term. They said, moreover, that as there was no difference in the price, the contractors had no motive to use one in preference to the other beyond that, for smaller sizes (under 40 inches by 20 inches), the hlown could be obtained more quickly than the cast.

Professor Donaldson, who appeared on the same side, referred to the volume in "Lardner's Cyclopædia," on porcelain and glass, in the introduction whereof two descriptions of plateglass, blown and cast, are recognized.

Messrs. Piper, Messrs. Lawrence and Son, Messrs. Haward and Nixon, Mr. W. Cuhitt, considered that the glass fully met the requirement of the specification, and Mr. G. Pownall said it was "rough plate-glass," and that it could not be described in any other way.

In considering his award, Mr. Hosking properly declined to consider, as not within the question before him, an argument on the part of the contractors, that any objection to the glass ought to have heen taken when it was first put into the work, and one on the part of the justices that "rough-plate" was specified for the express purpose of obtaining absence of transparency, while the greater part of the glass used is transparent. The justices had put their objections on three grounds, thus expressed :-First. That the words rough and plate in the specification were to be held each to have a certain meaning; secondly, that the article objected to did not come under the description, inasmuch as it was hlown glass, smooth on both sides, but afterwards slightly roughened on one side; and thirdly, that it was not what is ordinarily understood and known in the trade hy the term rough plate.

The arhitrator shaped his award to meet these heads; and set forth—"First, that the words rough and plate in the specification are not to be held to have each a certain meaning, but that they are to be taken together, as denoting a certain condition of plate glass—that is to say, in its unground and unpolished state; secondly, that inasmuch as the glass

objected to possesses the characteristics of plate glass, and is made and used as and for the purposes and under the name of plate glass, the circumstance of its being produced by blowing and having a smooth surface when first produced does not prevent it from coming under the description given in the specification; and thirdly, that the article objected to -that is to say, blown plate glass in its unground and unpolished state-though not universally known in the trade by the term "rough plate," is so far known by that term in the glass trade and among builders, the immediate consumers of plate, sheet, and other glass, as window glass, as to justify its recognition by that

And he therefore determined that the glass objected to is within the terms employed in the specification.

We give the particulars of this curious case (without reference to the decision), because of the positive information it contains, and as an instance of the necessity of precision in specifications, which we hope will not be disregarded. A considerable expenditure was at stake.

DECORATIVE ART IN GLASS-

In concluding his historic review of middle-age art, delivered of late at the School of De-sign, Somerset House, Mr. Wornum proceeded nn Friday, the 2nd, to treat of stained and painted glass, as in a manner supplementary to Gothic art, since hitherto almost exclusively practised in Gothic buildings. But whatever prestige such exclusive application may have given rise to, said the lecturer, it will be our business rather to destroy than to encourage; for we must spread the beautiful in all directions, extend it to every province,—at least we will

extend it to every try to do so.

The old Egyptians have not yet been surpassed, if even approached, by the moderns in the art of staining glass; but we know nothing the art of staining glass; but we know nothing of stained windows earlier than the eighth century, and have no remains of a period earlier

than the twelfth.

The ancients, however, did glaze their windows not only with common panes of glass, but with ground plate glass, to keep inquisitive eyes out: a window of this kind was discovered to the best of the common panes.

eyes out: a window of this kind was discovered in a bath at Pompeii, but the glass was all broken to pieces. In the baths of the villa of Diomedes similar glass was found. The Grecks called glass 'hyalos,' from the Coptic: it was introduced from Egypt.

In mere coloured ornamental glass the resources of the ancients were surprising. There was no marble, no precious stone, which they did not successfully imitate. They had every variety of cup and wase made of this beautiful material. Glass drinking vessels were common variety of cup and vase made of this beautiful material. Glass drinking vessels were common in the time of Hadrian, and some of them, of rarer quality, displayed all the prismatic colours, variously in various lights. These were of Egyptian manufacture. With the art of glass blowing, as may be conceived, the ancients were well acquainted.

With all the means such example insula

With all the means such examples imply, the absence of coloured plate glass for windows amongst the ancients should strike us as more amongst the ancients should strike us as more singular than the discovery of any such remains; especially as it was the custom to decorate entire walls with plates of glass and polished marbles; and as the marbles were invariably coloured (and as they knew well how to imitate marbles, as already remarked by the lecturer), it is highly improbable that the glass was invariably white. Yet the pure crystal glass was considered the most valuable by the Romans. Talc was also used by the ancients for windows, having this great advantage for Romans. Tale was also used by the ancients for windows, having this great advantage for a hot climate, that it excludes the heat while it admits the light of the sun. As to the burdents having had glazed windows there can be no question, and this fact ascertained, it would be very strange if with their elaborated systems of decoration, they did not colour them. We shall probably yet find some examples before the excavations of Pompeii are completed. completed.

The notices of windows are more frequent as we approach the middle ages. St. Sophia's, of Constantinople, was conspicuous for the number of its glass windows; and, from the many-coloured rays which the Greek poet describes as penetrating them, it would seem that they were of stained glass. This was in the sixth century, and it appears to have been then a general practice in the southern parts of Europe to glaze the church windows. In Euroland they were not so profected till a cen-The notices of windows are more frequent England they were not so protected till a cen-

England they were not so protected till a century later.

The first positive historical notice of stained glass decorations, the lecturer believed to be that of the adornment of the old church of St. Peter's, at Rome, with stained glass windows, by Leo III., in the eight century. Painted glass we first read of in the eleventh century, when mosaic workers from Constantinople adorned the chapter, boyse of the celeprated adorned the chapter-house of the celebrated Neapolitan Monastery of Montecasino, with windows of painted glass. These were leaded, and supported by iron frame work, as in modern times.

This mention of the mosaic workers, while it constitutes one of those interesting facts which point so decidedly to the capital of the which point so decidedly to the capital of the Eastern empire, as the great preserver and promoter of all middle-age art, seems also to indicate, with some certainty, the original source of stained-glass windows in the glass tesselations, the opus Grecanicum of the Byzantines. With this class of art the Italian churches were richly decorated, and the passage from the inlaid glass of the walls and pulsate of the leader days of the windows was pits to the leaded glass of the windows, was not a very great step. This is all the more probable from the circumstance, that while these glass tesselations were common as mural decorations, pieces of talc were still used for windows, as in the church of San Miniato, at Florence, of the early part of the eleventh cen-tury; and if these be the original windows, which there is no reason to doubt, they are the oldest in Europe, or at least in the west, and are about 100 years older than the carliest remains of stained-glass windows—those of the cathedrals Angers and St. Denis.

Many of the glass tesselations, according to

Theophilus, were actually destroyed for the sake of getting coloured glass for windows. They were of course remelted and cast into small plates, according to the practice of the time. Theophilus also says, that the French were particularly clever in converting the old pagan glass vessels, of many colours, into fine tables, that is panes, of glass, for windows. There would have been more reason for praising their ingenuity if they had preserved the pagan bottles and rivalled their composition by original glass of their own. But such passages as these open our eyes to the way in which ancient ornamental works have so greatly disappeared; and they should teach us to be cautious how we discredit statements we find in ancient authors, simply because we meet with no examples of such works as we occa-

sionally read of in their writings.

The ancient process of making a stained class window is thus described by Theophilus. The design was first made on a chalked board, a kind of cartoon. On this the outlines and general markings were well defined, and the general markings were well defined, and one colour each part was destined to be was written in its place. Then a piece of glass of the required colour, large enough to cover that portion of the cartoon inscribed with its name, was placed over it; the exact form of the space was braced on the decrease of fault, it was was placed over it; the exact form of the space was traced on the glass; and finally, it was shaped with the heated iron then used in place of the diamond. The pieces were then all fitted close together on the cartoon, and the lines and sbadows were carefully painted in enamel brown. The introduction of ornaments, such as we find in the illuminated manuscripts, is then directed by Theophilus, a circumstance which points most decidedly manuscripts, is then directed by Theophilus, a circumstance which points most decidedly to the source of the general ornamentation of glass. He concludes by minute instructions how the pieces of glass are to be fired in the furnace, some colours requiring more heat than others: the white, yellow, and purple may be thrust far into the furnace, but green and sappline, or blue, must be kept near the orifice, as they will not stand so great heat. When sufficiently fired, the various pieces were leaded together, and the various pieces were leaded together, and the picture thus completed. Theophilus describes many kinds of ornamental glass, including

gold and silver tints, and designates nearly every remarkable specimen Greek.

every remarkable specimen Greek.

The great point of the directions given by this author is, that he clearly describes the enamelling of glass, however simple; not the mere composition of an ornamental design in coloured glass, or what is commonly called pot-metal—glass coloured bodily while in the melting pot; but the enamelling confined to drawing and shading. The great value, however, of Tbeophilus's treatise, is affected by the doubts as to its precise date—according to the doubts as to its precise date—according to some as early as the tenth, to others as late as the thirtcenth century.

All the ancient specimens of stained glass preserved are pot-metal; and the earliest middle-age windows were doubtless of this same description; it is to this nature, perhaps, that they owe their name of mosaic glass, if not to the fact of being made out of old glass

In the fourteenth century this practice of using pot-metal was in great part superseded by the use of superficially stained or coated glass. This is made either by flushing or floating an enamel stain upon the glass, and then firing.

In the sixteenth century, a third process was introduced,—that of actually painting in enamel, similar, exactly, to the modern process of

porcelain painting.

Enamel, as many of you know, is glass mads opaque by oxide of tin, and fusible by oxide of lead. This gives a white, hut you may make lead. This gives a white, hut you may make any colour by mixing the various mineral oxides with an enamel flux, commonly compared of 2 ports diverges 1.2 ports of the part of oxides with an enamel flux, commonly composed of 32 parts flint glass, 12 pearl ash, and 2 of borax. With this flux you grind up your colour, and then mix it with a little oil of lavender; lay on the colour with a sable pencil, exactly as in oil painting, then pass the picture through the fire and the whole vitrifies and becomes indelible. The metallic oxides being enveloped in the flux are preserved from contact with the atmosphere, and thus become contact with the atmosphere, and thus become permanent.

The lecturer then proceeded to review some examples of these three kinds of stained or painted glass, interspersing his descriptions with much interesting matter, which we regret to be obliged to pass over. In allusion to the monk Theophilus's idea, that tan colour constituted the proper flesh tint, he inferred that stutted the proper ness unit, he interred that this little circumstance would appear to throw some light on the moot point of the country to which he belonged. Both the Germans and the Italians, he remarked, have claimed bim, but the tawny flesh seems fairly to give him to the Italians. With regard to the sombre mellowness of tint in old coloured glass, the lecturer regarded the taste in its favour as an acquired one, to which it was but little entitled. acquired one, to which it was but little entitled, considering that it was merely produced by the dirt from which modern glass is more thoroughly cleansed in the process of ma-nufacture. But from whatever cause produced it remains to be considered whether or not such a sombre and mellow effect be not the best adapted to ecclesiastical purposes. On the subject of harmony in juxta positions of colour, he considerably enlarged, producing a host of evidence in illu-tation from the heavitied planears of hinds. tration from the beautiful plumage of birds in the British Museum and elsewhere. Perhaps in no species of art, he remarked, is it more in no species of art, he remarked, is it more necessary to observe the laws of harmony in colours than in glass painting. By the physical organization of the eye it requires all the primary colours to satisfy it—red, yellow, blue: the secondaries—orange, green, and purple—too, are very important. No combinations are good which are not in accordance with the natural laws of colour, and the chief

condition is, that all must be present in every composition and properly balanced.

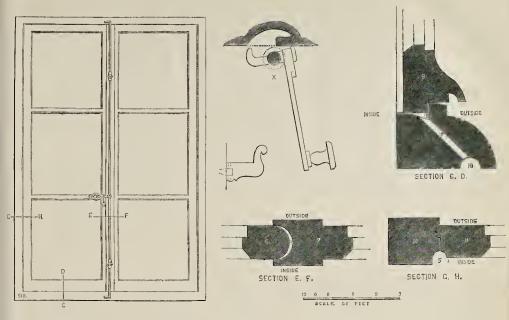

Having explained the three methods of glass painting, the lecturer then proceeded to point out the various characters of design prevalent

with the natural laws of colour, and the chief

in the different periods.

In the early period, down to the fourteenth century, when the mosaic method exclusively prevailed, the windows consisted of diaper grounds, containing panels with figure sub-jects, scriptural and domestic; the whole being geets, scriptural and domesuc; the whole being surrounded by a foliaged or geometrical bor-der; the prevailing ornaments and the panels being of a Byzantine character, and in all respects similar to the MSS. There is not much early glass in England. The most per-

DETAILS OF A FRENCH CASEMENT.

fect examples are the celebrated Five Sisters, at York, of thirteenth century. At the close of this century isolated figures were introduced, surnounted by simple canopies and without foliations. The variety of design, therefore, as a could be a constant of the control of the applied to glass, even at this early period, was

very great.

In the second period, all these varieties were In the second period, all these varieties were preserved, but the mere Mosaic patterns are no longer prominent; the damask and geometrical designs on white glass gradually superseded them. Some of the finest windows of this style are a geometrical design, with a belt of canopied figures; the execution of the figures, foliage, the interested design paces that the second design are set to the second design and architecture keeping paces.

of canopied figures; the execution of the figures, foliage, and architecture keeping pace with the generally improved development of style and execution. Heraldic designs now common; and in the fifteenth century prevail. It was in the sixteenth century, however, coincident with the development of Cinquecento art, that glass painting appeared with all its technical exuberance. Its limits were now the limits of the art of painting itself. The Mosaic process was almost wholly discontinued for a time, and glass painting became literally painting pictures on glass; butitdid not combine any improved character in its ornaments. The increased recourse to figure pieces and pictures, and the excessive display of armorial bearings which characterize the windows of this period, seem to have left little opportunity for the development of ornament itself. The celebrated windows of the Crabeths at Gouda, in Holland, are a remarkable monument of that period, but they are literally mere Dutch pictures on glass; some of them, as well as the magnificent windows of Liege, have been lately published by Mr. Weale, in two volumes, entitled, "Divers Works of Early Masters."

On styles, added the lecturer, in conclusion.

Weale, in two volumes, entitled, "Divers Works of Early Masters."

On styles, added the lecturer, in conclusion, I have yet a few remarks to make. Early mosaic glass has been recently designated Early English glass, as it was the style practised during the prevalence of the Early English Gothic. It was practised, however, a hundred years or more before the Early English Gothic was developed and was at all times. hundred years or more before the Early Eng-lish Gothic was developed, and was at all times far more universally practised on the conti-nent than in England. The same objection lolds with regard to the terms Perpendicular, Decorated, and Cinque-cento glass. These architectural terms, as applied to glass, have not a characteristic but a chronological value only; and as to "Early English" glass, it is necessary support.

searcely good taste to give an exclusively English name to a style of art for which we must look abroad for all the fine examples.

Any style of ornamental design may be executed in any one of the three methods of glass rainting just described—the means the manner of the style of the style

painting just described,—the mosaic, the mosaic stain, and the enamel. We must not confound the method of execution and the style of ornament. Every design will, by its ornaments, itself proclaim to what style it between the style of the state of the style of the style it between the style is the style in the style is the style in the style in the style is the style in the style is the style in the style in the style is the style in the style in the style in the style in the style is the style in the style

style of ornament. Every design will, by itsonaments, itself proclain to what style it belongs, if to any one in particular; and if not, it will require no name beyond the technical description of what it contains,—as coloured disper, flowered quarry, reticulated damask, medallion, figure, canopy, &c.

In designing a stained glass window, therefore, first consider whether it be ecclesiastical, palatial, or domestic; then its architectural style. Introduce the characteristic ornamental forms into your design; if a figure window, into the general arrangement. For a Greek or Roman building, use Greek and Roman ornaments; for an Italian—Renaissance, or Cinquecento forms; and for a Romanseque, or Gothic, the Byzantine and Gothic forms. Your figure subjects will be, of course, for a church, scriptural; for a palace they may be historical, with armorial designs; and, for a private dwelling-house, armorial and sententious designs, or illustrations of proverbs, are very applicable. There need be no closer limitation of style, and these designs may be executed indifferently, to individual predilection, or means, either in the mosaic, in the mosaic stain, or in the enamel method. either in the mosaic, in the mosaic stain, or in the enamel method.

There will be demurrers to these opinions.

CORRUGATED IRON ROOFING.—With reference to the memorandum of the cost of roof coverings, taken from Mr. Dean's "Essays," I would observe, that if the covering of corrugated iron be made circular it will require no other aron be made circular it will require no other support than at the extremities or springings, whereas in all the other kinds mentioned a price must be provided in addition for rafters and battening. Curved roofing of corrugated iron is self-supporting (the springings of course being secure); the other kinds require a construction of timber wood-work to support them; there-fore, before the cost of curved galvanized cor-rugated iron roofing can be compared with that of others, a price must first be added for their PETER.

THE accompanying drawing has been obtained from Paris, expressly for the purpose of affording accurate and sufficient information to work by. The description will be some-what minute, to make it, if possible, perfectly intelligible.

It will be understood that the window consists of two halves, hung upon hinges, closing together like a pair of folding doors, and opening inwards; also, that the window is supposed to be viewed from the inside.

The means of fastening the window (and which it is important to attend to) consist of a round bar of iron, B, running from the top to the bottom, and hung in two rings, O, at the points o. These rings are fixed on the inside, in the wood of the right hand casement, or half of the window. The bar must be capable of turning in them to an extent afterwards explained.

plained.

Figure A represents a handle fixed on the bar at A, as will be seen in the figure; it is fixed on a projection from the bar, and must be moveable, circularly, in a vertical direction, the axis of the circular movement being the point where it is fixed to the projection. The lar terminates at each end in a hook, 3 and 4. In the head and cill, 1 and 2, of the outer, or fixed frame of the window, holes must be chiselled out at 3 and 4, to receive these hooks, which will help to fasten the window, in the manner afterwards explained. Figure M is a kind of hook fixed in the wood of the left hand light, at the point M. Its purpose is to receive the handle A, when the window is closed, as will be explained. It must be hinged, and thus have the capability of moving, borizontally, right and left (to an

must be ninged, and thus have the capability of moving, borizontally, right and left (to an extent afterwards explained), as will be understood by the figure. Figure g h represents a horizontal section of the casement at g h, 10 being the frame, and 11 the casement. In a window of the size given in the drawing three horizon (ordinary, third) at least the size of the size of the size given in the drawing three horizon (ordinary third) at least the size of the si

ing, three binges (ordinary kind) at least should be used for each of the halves; they will be placed in the hollow 5. E F is a horizontal section of the casements at E F, where they meet, when closed, 6 being the left band, and 7 the right hand light 13 was small appearance. and 7 the right band light 12 is a small space left between the two frames, in order that they may close without difficulty. C D shows 544

a vertical section of the cill and inner frames, a vertical section of the chand that takes, at C D, s being the cill, and 9 the casement. 17 is a circular hole, bored through the cill, at the point 14, for the escape of any water that may get into the space 15. 16 is a groove, or inverted gutter, for carrying off the water. The exact forms of all these sections must

The exact forms of all these sections must be particularly attended to in execution.

When it is desired to close the window, the two halves are pushed together, and the convex surface of 0 fits into the hollow in 7. It will be found that these parts will touch hefore the window is fairly closed, and that, by the exertion of a little force, they are, as it were, slipped or snapped, the one into the other. The handle A is moved from the right to the left, and lifted over and into the hook.

M and this book M being at hust such a pro-M, and this hook M heing at just such a proand this mook at heigh at just such a projection from the frame, as to cause the handle to fit tightly into it, the forcing down of the latter upon the hook at P jams or locks together the two halves. At the same time, the moving of the handle A from right to left will two the locks and the hooks and the hooks and the same time. turn the har, and the hooks 3 and 4 will enter the holes prepared for them in the head and cill. These hooks, before the handle was turned, would show in a section of the bar and

turned, would show in a section of the bar and wood, as in figure X.

The window will then be securely closed. It will be observed that, besides the excellent adaptation of all the joints to resist weather, the advantage of this mode of fastening consists in this, viz., that by a single movement, each of the halves is holted in three places, and indeed firmly secured to the other half throughout the whole height of the window, and that, also by a single movement, both and that, also by a single movement, both halves are set at liherty; whereas, upon the ordinary principle of folding doors or windows, the left hand half alone is secured at top and bottom, and the right hand one depends for its fastening upon the single holt or latch which connects it with the other half. and this imperfect fastening of the halves, moreover, requires three separate movements to complete it, or to set it at liberty, the practical consequence of which is, that to avoid trouble, the right hand half alone is

avoid trouble, the right hand half alone is opened.

With respect to the extent of movement respectively of the har B, the handle A, and the hook M, it will be easily understood after due consideration of their respective purposes.

The turning of the har, being for the sake of the movement it communicates to the hooks 3 and 4, that purpose will be amply answered by a power of turning in a quarter of a circle.

The hinging of the hook M appears to be contrived to give the play necessary to assist the jambing or locking before mentioned. The handle A may of course be placed in the most the jambing or locking before mentioned. The handle A may of course be placed in the most convenient situation for the hand, depending upon the height of the window from the ground. In windows of a larger size than the one represented in the drawing, a rail or transom rons across each of the halves, at ahout the think of the halves, at ahout two-thirds of their height from below, giving the whole the appearance of a cross. Hence, the whole the appearance of a cross. the French word croisée for a window.

A prejudice exists with English people against casements, as not being wind and water tight; and it is true, that what are understood by French windows in England, that is, French windows made in the English way, are, generally speaking, as imperfect and unsatisfactory contrivances as can be imagined. But the real French window, as made in France, and made well, is perfectly secure against weather. against weather.

Its advantages are great. When open, the whole space made available for the purpose of admitting light is also made so for the admitting of air; whereas, in a sash window, one-half of the space of the same of t half of that space must necessarily be always

The view through it is uninterrupted; whereas, in sash windows of the ordinary size, the main bar, where the sashes join, is about on a level with the eye. The inconvenience of on a level with the eye. The inconvenience of stooping the body to look out of the window is also avoided. From the necessity of this posture, with the sash hanging over the neck, the French call sash windows fendires it la

the French call sash windows fenctres à la guillotine, or guillotine windows.

The strength shown on the drawing is, perhaps, hardly sufficient for any but small sized windows, or where tough woods are used.

found to answer well in France, where this kind of window has been used, it may be safely said, for a century at least, universally, and in buildings of a superior class, for upwards of 200 years; for, in that country, leaded lights were disused much earlier than in England. French windows have hitherto failed for the most part in England, merely for want of accurately copying the model which has been proved to succeed in France.

In France almost all windows have wooden blinds fixed outside; and in some situa-tions in England these might be found useful. When combined with the French window they afford the means of admitting an abundance of air, and at the same time ex-cluding the glare and heat of the sun.

IMPROVEMENT OF BROADWAY, NEW YORK.

From the lattery almost to Union-square this grand promenade of our transatlantic brethren has of late heen renovated and improved in its huildings, its pavements, and its side walks; indeed, its buildings have hear or are heiner or the union of the property of the prop been or are being so throughout the whole of its length, so that many old land-marks are vitally altered or altogether gone. No. 1—General Washington's house—has been converted into "The Washington" Hotel. On the site of Bunker's mansion and adjoining properties six extensive stores are being erected, five stories high, with brown stone fronts, and iron shutters and floor columns. The brown stone is in general a mere facing of two-inch slabs on brick. Mr. C. S. Warner is the architect. Four new stores are in process of erection on the site of the old City Hotel. Mr. J. French is the architect of the whole of this block hetween Cedar and Thames-street. The frontage of the stores is 102 feet, depth 142. They are to be five stories in height, and to cost 100,000 dollars. The fronts will also be of brown stone, and the first story ornamented with fluted columns and pilasters, with Corinthian caps and medallion cornies; the windows trimmed with architraves and cornices. Opposite, on the site of the old National Hotel, a 'splendid' silk warehouse is National Hotel, a 'splendid' silk warehouse is in eourse of erection. The front is to be in the Elizabethan style, and the material West Chester marble, in blocks 3 feet thick. The lower story will be faced with a series of ornamental columns, standing on strong plinths in front of piers supporting a frieze and cornice. On these will stand other pilasters with intervening pedestals, elliptical arches with ornamented keystones over the windows in vening pedestals, elliptical arches with ornamented keystones over the windows in each story, the whole to he surmounted with a cornice and elahorately carved open parapet, ornamented with pedestals and urns, resting on corbels and brackets. The central portion of the parapet will be elevated above the rest, and terminated by solid marble balls. The floors will be supported by wrought-iron beams, and each floor will present an unbroken surface of nearly will present an unbroken surface of nearly ported by wrought-iron beams, and each floor will present an unbroken surface of nearly 5,000 feet, the building being 140 feet deep, and 37½ feet front on Broadway. The architect, Mr. Joseph Wells, expects to complete the building by 1st December, at the estimated cost of 40,000 dollars. Various other stores, chiefly faced with brown stone, are at present in progress, and near Chamber-street, 'a very tasty and elegant structure,' according to the local statements, is being formed for the Chemical Banking Company, at a cost of some 15,000 to 20,000 dollars. Messrs. T. Thomas and Son are the architects. The style is called the 'Romanistic,' with an claborate entrance and heavy truss cornice. The banking room will the Komanistic, with an emborate channel and heavy truss cornice. The banking room will be 17 feet in height, with a frescoed dome ceiling. Part of the street is heing laid with 'Russ pavement,' by Messrs. Russ and Reid, who estimate the cost of laying the whole street with blocks of this species of pavement at

also avoided. From the necessity of this sture, with the sash hanging over the neck, e French call sash windows feattres à la illotine, or guillotine windows.

The strength shown on the drawing is, peraps, hardly sufficient for any but small zed windows, or where tough woods are sed.

The drawing comprehends what has been the drawing comprehends what has been the store of the cause, Mr. R. Brown's intimation, through our advertising columns, that he has opened a Drawing Academy in Knightsbridge deserves to be pointed out. He numbers amongst his many pupils of former days some of the leading architects and builders of the metropolis.

THE MOVEABLE TIME-TABLE OF THE EASTERN COUNTIES RAILWAY.

WE have been asked to inquire what, in the name of all that is erratic and unbusiness-like, can lead the directors of the Eastern like, can lead the directors of the Eastern Counties Railway to perplex poor travellers as they do by altering backwards and forwards the hours of train departures? Our own experience fully justifies the inquiry. A fortnight ago we travelled to the far-distant Shoreditch, in time for the half-past ten train, to Hertford, and, getting there twenty-five minutes too soon, as we fancied, found we were nevertheless five minutes too late, the train having started at ten, and so we had to train having started at ten, and so we had to wait till half-past eleven for the next chance. On Saturday last we were compelled to retread the ground, and took care to be there before ten, when lo, and behold! the time was again changed to half-past ten; and forty more precious minutes had to he spent in the drafty station-house.

Surely the good-natured and sensible secretary of the company, Mr. Roney, can have no voice in these vexatious vagaries, made seemingly for the fun of the thing. To occupy an hour and twenty minutes and oftener an hour and a half in doing twenty-six miles is bad enough, without throwing out one's whole day by such vacillating misarrangements as these.

KENILWORTH-STREET SEWER.

SIR,—In your number of to-day you refer to the extraordinary charge of Dr. Ure, made against me by implication, that I added copperas to the sewer water, for the purpose of removing the prussicacid. You seem to think that I should day this informatic horizon is the particle. deny this infamous charge, if it be untrue. I have not done so, because I thought that the spirit in which it was made would prevent any person giving the least credence to so mon-strous an accusation. But I bow to your strous an accusation. But I bow to your opinion, as I should he sorry that a single honest man could believe me guilty of such an act. I therefore state that I have not the most remote knwledge, either directly or indirectly, of such a sophistication having been made. I further express my disbelief that this act has been perpetrated by any one.

I cannot conclude without expressing my

astonishment that any scientific man, even in the tumults of the most uncontrolled temper, could have insulted his profession or the public hy a calumny so inconceivable and preposterous.—I am, Sir, &c.,

November 10th. LYON PLAYFAIR.

** We hope Dr. Playfair does not imagine that our credence is so easily accorded as he would seem to fear. But however unworthy of notice such a charge may be generally held of notice such a charge may be generally held to be, an indignant denial at least renders it impossible for a party capable of propagating a false or reckless charge, to make any equally wrong use of the fact of its not being denied. Dr. Ure, without waiting, we may here remark, for any such denial, has issued a fourth report, as to which we do not see any necessity for further notice, unless it he to remark, that the sudden death of the man Grosse, in Long Acre, seems entirely to refute his assertion in it, that "an inhalation of pressive weigh vanour mixed." "an inhalation of prussic acid vapour mixed with sulphuretted hydrogen alone could cause such an awful catastrophe." But for all that, we do not doubt the probability that other of the "hydras dire" than mere sulphuretted, phosphoretted, or even cyanuretted hydrogen or prissic acid may occasionally pervade the heterogeneous ahomination of sewers. Indeed, to any one at all acquainted with the still more to any one at all acquanted with the still more recondite, and one might have almost said rare, hydride of selenium, or seleniuretted hydrogen, and its very peculiar odour, even that might fairly have been included, however unaccountably, in the list just particularized. We may here add by the way, that Mr. Cubitt, though no tangible charge was made against him touching the construction of this sewer. bim touching the construction of this sewer, has addressed the commissioners in an expla-natory letter, regarding which all we need say is, that we think the commissioners should, as Mr. C. requests of them, distinctly state that everything which was required of him had been

SHALL ARCHITECTS BE DIPLOMA'D.

I AM glad to see that the columns of THE BUILDER are still occupied in reminding the Council of the Institute of British Architects of the necessity for amending the laws which govern their body. The observations in answer to your correspondent, "W. X. W.," were very just, and are, I imagine, pretty nearly the feelings of three-fourths of the profession; but I was somewhat surprised, on reading through the article on the amendment of the Institute of Architects (knowing the interest you take in the welfare of the profession), to find that you seemed to throw cold water on the proposal to obtain a legislative enactment for-bidding any architect or engineer to practise without a diploma. Now, Sir, I am fully persuaded that this is the only means whereby to ensure proper and qualified practitioners in

ensure proper and qualified practitioners in our art.

You seem to reason, Mr. Editor, that "it is not desirable." I consider that if architects have to erect buildings and works, and are thereby entrusted with the lives and property of her Majesty's subjects, they should be compelled to take out a diploma of capability authorizing them to practise as such, in the same way as gentlemen of the law, medical men, and even chemists and druggists, have to do, before they can practise in either of their respective capacities. It would not nave to do, before they can practise in either of their respective capacities. It would not only render the profession more respectable, but it would give a dignity to its practitioners. The public would look at its members as duly qualified and honourable men, and not dissented to the profession of regard our talents, as they evidently do at the present, as may be proved by the most disgraceful and shameful way in which competitions are conducted; in fact, if diplomas were granted, then none but men properly schooled into the profession would be among

its members.

You remark also that "it is opposed to the spirit of the times." I am sure no opposition would be met with in the majority of the profession of architects themselves,—they are really yearning for such a movement, and I could almost speak positively that if a petition were set on foot for such purpose, it would be signed by at least three-fourths of the members of the hold. If opposition to this dillorm as cheme of the body. If opposition to this diploma scheme be meant in your remark to refer to the public, I think it is no more than in accordance with reason that they would feel satisfied to know, that no person could practise as an architect or engineer without being duly qualified to act in such capacity; 1st. For the reasons abovementioned; and 2ndly. It would prevent their employing any incompetent person, or mere quack, who would, in all probability, injudiciously expend their clients' property.

X. X.

1st. You say, "that a diploma in architecture is by no means likely, even if it were in all respects desirable." Now, as to the likelihood of the renovation,—I believe the time is not far distant when we shall see it brought about; but as to the desirableness of such a about; but as to the desirableness of such a scheme, every architect who has the least love for his profession must desire it, if only to rid us of the innumerable set of quack draughtsmen who are now being quarterly manufactured at the low rate of ten guineas. My constitution is likely beinged by them trying office, Sir, is literally hesieged by them, trying to obtain employment; yet they cannot draw a straight line. Again, many architects have now in their offices young men, without any premiums being given, who have no love for the profession they are unfortunately placed in the beauty if you are unfortunately placed. in, but because it was a good opening they must become architects, not considering that an architect must have a mind. What is the con-sequence? Why, at the end of their articles they cannot explain the ruling principles that they cannot explain the ruling principles that exist either in Grecian or Roman architecture; they may know the five orders when placed before them, hut, Sir, in many cases that is the utmost, and I am fully aware from experience I am not exaggerating. Yet when their articles are concluded, they expect and ask for the same remuneration as clever draughtsmen, swell the number of that class, and in many cases have unhapping conceptualities given them. swent the number of that class, and many cases have unhappily opportunities given them of piling up living monuments of their ignorance, to disfigure the face of this glorious land and disgust the eyes of every beholder; whereas the experienced, fully qualified, and

clever man, is thrown aside. I will not speak of the injurious system of employing builders as architects, because that would soon die away if we bad a properly qualified body of professional men. You say the spirit of the time is directly opposed to such a restriction. Then, Sir, how do you reconcile the establishment of the Pharmaceutical Society for the exment of the Pharmaceurear Society for the ex-amination and granting diplomas, even to druggists? If it can be done in one case, it can in another; if it be desirable, do not talk of the spirit of the times being against us, but let us try and obtain it; the greater the diffi-culties the greater the glovy in yiming culties, the greater the glory in winning.

A PRACTITIONER.

It has often appeared to me a sad mistake that a profession like that of architects should be split into several societies (no one of which is sufficiently powerful to carry with it the feeling of the whole body, nor the acquiescence of the public), instead of having one grand and comprehensive scheme of union for its memcomprehensive sensence of amount of its intensers, which should indeed improve, exalt, and raise their own character, and at the same time command the esteem of the public. Nothing short of a College can be expected to have this desirable effect

To make the profession respected, and its To make the profession respected, and its professors respectable; to rescue the calling of an ennobling pursuit from the grasp of the mere adventurer; to give a tone to public taste, to instruct, enlighten, and improve, would be the praiseworthy (and successful) endeavours of a college established by the general consent of the profession. In a few words one may state some of the advantages which would attach to an architectural college of enlarged membership under a charter; a school of instruction, not to interfere with private tuition. struction, not to interfere with private tuition, but rather to complete the education-a comprehensive library—a museum—a collection of models of ancient and modern buildings—experiments in different arts-laws to establish precedents—periodical meetings for lectures and discussion—a thorough understanding of the position of architects—a court of appeal in all matters of dispute or etiquette, and a provision for decayed members, their widows, or orphans.

G. R. FRENCH.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

PUBLIC MEETING, NOVEMBER 9, 1849.

MR. PETTIGREW, Vice-President, in the

cbair.

Mr. Purland exhibited a collection of rubbings of some of the most interesting brasses in the churches of Norwich, accompanied by some descriptive remarks.—Mr. Waller observed that the greater part of these brasses belonged to civilians, which was to be accounted for by the extent to which the clothing trade was carried on in the eastern counties. He likewise drew attention to a brass, of the latter part of the fifteenth century, belonging to a part of the fifteenth century, helonging to a knight, the inscription attached to which is about a century later, and relates to another person. He remarked that many of these brasses showed a peculiar mode of forming the features used in Norfolk and Suffolk, and some were evidently Flemish. Much has been said about the destruction of brasses during the features but a few greates have here been civil wars, but a far greater havor has been committed in modern times. He had sought in vain in many of the churches of Norfolk and Suffolk for brasses figured in Cotman and other authors.—Mr. W. A. Combs exhibited a other authors.—Mr. W. A. Combs exhibited a small brass plate bearing the following inscription:—" Henry Bullayen the sone of Sir Thomas Bullayen." Mr. C. stated that he had ascertained that it belonged to Hever Church, Kent, and that its original place (to which he intended to restore it) was close to the tomb of Sir Thomas Bolleyn, the father of Anne, Queen of Henry VIII. He expressed his inability to discover the relationship of the person here commemorated, as Sir Thomas does not appear to have had any son of that name. He presumed, judging from the size of the stone, the person must baye been a child.

Mr. Price stated that in the neighbouring church of Penshurst there is a similar small brass cross and inscription plate to the memory of "Thomas Bullayen, the sone of Sir Thomas Bullayen;" and that probably, from neither of

them being mentioned in the Bolleyn pedigree, they both died in their infancy. He had no doubt they were the brothers of the ill-fated queen. Mr. Price added that the Hever brass had been stolen years ago, and he rejoiced to find that at the least some portion of it was in existence, and likely to be restored to its proper place.

Dr. Jesson forwarded for exhibition a brass Dr. Jessop forwarded for exhibition a brass seal, bearing two matrices: the smaller one represents the head of a hull, the other the same emblem, with a legend of a very curious character, and which forms the subject of a paper displaying antiquarian and philological research. Mr. Price furnished a brief abstract, observing that, although the seal was probably not older than the fifteenth century. abstract, observing that, although the seal was probably not older than the fifteenth century, the legend was doubtless copied from some antique gem or amulet, and judging from its resemblance to some of the mystic legends and doctrines of the Gnostics, was referable to a very early period of the Christian era. The inscription is as follows:—"+R TO ONN RI CION OOIC," which Dr. J., reading it SERAPIS TO ONOMA AI ZION (the last four letters being merely a vocalic exclamation), interprets "Scrapis, the great name ever divine, O hail!" The inscription commences with the first and last letters of the mation), interprets "Scrapis, the great name ever divine, O hail!" The inscription commences with the first and last letters of the Hebrew alphabet, the cross being the ancient form of the tau. These characters, from their extreme position, were thought symbolical of the whole compass of language, and expressive of universality. The word aleph means captain or leader, also a bull. Tau is a limit or boundary, and from its form was considered by the Egyptians as typical of horns. In de-scribing at some length the various modifications of the cross, Dr. J. remarks, that at the destruction of the temple of Serapis (the bull-headed deity of the Egyptians), certain cruciform characters were found engraven on stones. These, both Christians and idolators claimed as symbols of their respective creeds. Traces of this emblem have been discovered in the of this emblem have been discovered in the ruins of Nineveh (vide Layard), and they abound in the sculptures of Egypt. The Gnos-tics blended some of the superstitions of, Egypt with their mysteries. They adopted the bull, or its head, as an emblem of Christ.

RATING ST. MARY'S, WHITECHAPEL. FIXTURES AND FIXED MACHINES.

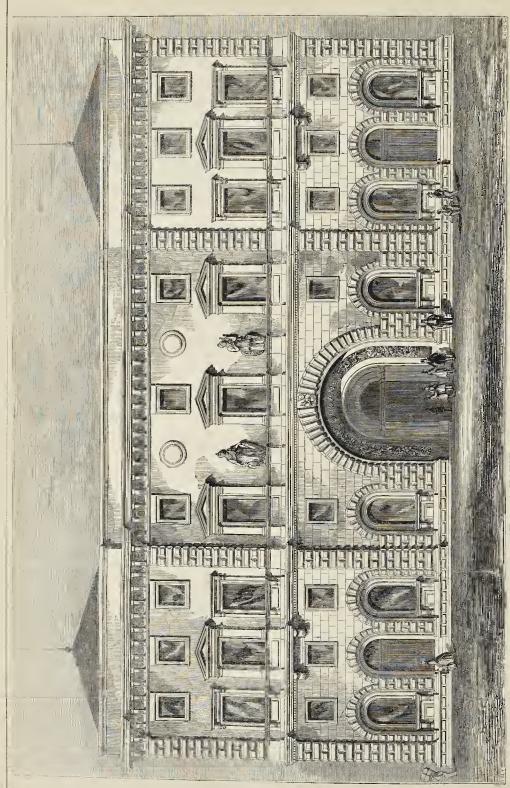

A MEETING of the parishioners of St. Mary's, Whitechapel, was held last week, for the pur-pose of receiving a report from a committee appointed to investigate the question as to the rating of machinery and other fixtures con-nected with property within the parish.

The report stated that, considering the importance of the matters submitted for their portance of the matters submitted for their consideration, they had prepared a case, and submitted it to the consideration of the Attorney-General and Mr. Bodkin, who had given it as their opinion that all fixed machines, as well as all fixtures, in houses and shops within the parish, were liable to be rated for the support of the poor. The committee were therefore of opinion that all the parish rates raised under the authority of the local Act should be levied in terms of that finding,—that the vestry should, by means of committees. should be levied in terms of that finding,—that the vestry should, by means of committees, carry out the assessment of the parish under that system of rating,—and that notice should be given to the Middlesex magistrates and the property-tax commissioners of the change which had taken place in consequence of adopting the system recommended in the opinion referred to.

The record having been received, it was

The report having been received, it was further resolved that as a just and equitable assessment could not be made without a survey assessment could not be made without a survey of all the rateable property in the parish, including machinery, and fixtures in shops and dwelling-houses, competent professional surveyors be appointed to survey all the property in the parish, so that the rates might be made on a sound and legal basis. This would be all very well if other parishes adopted the same course, but it should he remembered, so long as this is not the case, that inasmuch as the police and other taxes are taken on the same rating, the inhabitants of St. Mary's, Whitechapel, will have to pay a larger proportion of these latter than their neighbours.

Vol. VII.—No. 354.]
THE CUSTOM HOUSE, ROUEN.

THE Custom-bouse at Rouen, situated, as some of our readers will recollect, on the quay, towards the south, was built from the designs of Mons. Edouard Isabelle, of Paris. It was commenced in 1835, and completed in 1848. The annexed engraving is a geometrical representation of the entrance front. The doorway is a striking feature, and the rustication exceedingly bold and effective. The sculptured figures are about 8 feet high.

WHAT SHALL WE DO WITH OUR DEAD?

As it is to be feared lest the retreat of the pestilence from the country should be the signal for the retreat of all thoughts of the odious practice of burying in towns and churches from the public mind, it is the duty of every one that has the opportunity to endeavour to keep the attention of the public so fixed upon this subject, as to insure a reformation. Now, it appears to me that we have not made sufficient appears to me that we have not made state use of antiquity in this matter, for had we glanced hackward at the practice of our fore-fathers, I think we should not have had reason to deplore the existence (in our midst) of so many "consecrated cesspools." The politest nations of antiquity had two distinct modes of treating the dead, viz., burning and embalming, the first of which was practised by the refined Greeks, and by them imparted to the Romans; and the second was and is, I believe, to this day the custom of the Egyptian, the Persian, and the Jew. We also note another to this day the custom of the Egyptian, the Persian, and the Jew. We also note another circumstance, which is, that the Romans, who at one part of their history buried the dead, had laws to prevent this being done within the precincts of the city; and from what we know of the other nations, the rites of sepulture appear to have invariably been performed "without the walls." We cannot, therefore, find anything internative tracely. out the walls." We cannot, therefore, find anything in antiquity to act as a precedent to our present practice. In this the ancients were our present practice. In this the ancients were wiser than arc we. They saw the evils arising from intramural burial, and recognized from the beginning, what we have at last felt, that there is a bad air engendered by the decom-posed bodies of the dead, which, if enclosed within the circumscribed space of a city burialground, will possess sufficient malignity to in-duce disease; and therefore it was that they burned or buried their dead in the open country. At last having, as I have said, felt this, we know it to be true, and therefore are beginning to cry out for cemeteries and country hurials, and would place the bodies of the dead in the ground, amid country scenes and air, where the gases might have space enough so to disseminate as to lose their death-giving pungency. This is a decided improvement in the feelings of our countrymen, and will doubtless lead to much that is good in the practice of burying; but for my own part, Sir, I cannot see why the more wholesome practice of burning the dead should not be again re-vived: indeed it would be a hard matter to give any reason why it should have been discontinued. I know that the above sentence continued. I know that the above sentence will meet with much opposition from the fastidious, who, with abhorrence strongly marked in their faces, will doubtless cry "How shockingly inhuman a practice," and How shockingly inhuman a practice, will, sans doute, set me down as a great bar-barian for saying that I like it. Let me ask them, however, why it is that they prefer the element of earth to that of fire? Is it because the latter is so quick and clean in its destructions? Verily, I, for my own part, should look forward with far more pleasant thoughts to a sepulture amid flames, than to a spot in any of our over-crowded grounds, and would as soon commit a friend's dead body to the quick consuming element of fire, as to the moulder-ing element of earth, with its attendant, the slowly-devouring worm. Aye; and I with say sooner, for let it be observed that in the latter case my dead friend might, if I lived near his resting-place, be the death of me, whereas, in the former there could be nothing of this kind to fear. I would, then, instead of having cemeteries made in the outskirts of London, which, look you, may in time become intra-mural, and must at any rate soon surround with the circle of death the habitations of the

living-light up once more the funeral torch. and again kindle the funeral pile, and would do this in a place set apart for the purpose in the country. By this means the deau would be far more speedily and healthily reduced to ashes than they at present are. Whether we alter our mode of sepulture or not, we must at once alter the places. Town burials must be at once abolished, and all town burial-grounds at once and for ever closed. The mere closing them from further additions is not sufficient; there has been enough added this summer of itself to breed a pestilence next. Cholera may not be to breed a pestilence next. Cholera may not be contagious amid the living, but I should think that, of all things, the gas escaping from the decomposed bodies of persons that have died of that disease is most likely to impart it to the living who imbibe it. To prevent this, it is necessary first to give our hurial-grounds a layer of some disinfecting material, and after that to cover it with concrete or asphalte. Economy must be thought of; but let no niggardliness prevent the people of London from doing that which may avert from us another visitation of the pestilence, which is now departing; and, moreover, it will not do to pay too much attention to the interests of the few,these must succumb to the health of the many. LE FEU.

RAILWAY JOTTINGS.

A WOODEN station, of awretched description, it is said, has been provided by the North Midland Company for Bingley, a town containing 7,000 inhabitants. "It consists, says a contemporary," of a clerk's room, about three yards square at one end, a small open bod in the widdle and of the other and a shed in the middle, and at the other end room similar to the clerk's, dignified with the name of the 'Ladies' waiting-room.' wet weather the clerks transact business with umbrellas over their heads, to protect themselves from the rain dropping through the roof. In the open shed are buddled together 1st, 2nd, and 3rd class male and female passengers, sometimes for nearly an hour, exposed to all kinds of weather. 'The Ladies' waiting-room' is avoided from the dread of cholera, for the stench arising from the conveniences, only separated by thin boards, is dreadful." The era of railway economy seems to be superseding that of extravagance with a vengean all allowance here, for probable exaggeration, to the contrary, notwithstanding.—A more excusable instance, it may he, of real economy appears in the reduction of salary effected in York and North Midland, at 300l. a-year, in place of Mr. Hudson's élève at 1,200l. There werc 137 applicants for the reduced rate of income.—We regret to learn that the scheme for removing the Chinese Exhibition by rail Edinburgh, already described, was not altogether successful,—indeed, an alleged, but, we should think, somewhat over-estimated damage, to the extent of 1,500l. to 2,000l., was occasioned by the striking of two of the vans on a bridge near Berwick, and the crushing of their contents thereby. The rails had been altered, too, so as to allow of the train passing right under the crown of the arch, but passing right under the crown of the arch, out it was scarcely to be expected that vans of so unusual a size should safely pass through railway arches, which are but too often reduced to such close cutting and dangerous dimensions, that a railway guard himself often dares not stretch his neck even a very little beyond the breadth of his train without the imminent risk of having his brains dashed out—a catastrophe which has actually more than once occurred.—The Railway Clearing House Committee, at which all the leading railway companies are represented by their chairman or other delegate, bave, it appears, at the suggestion of Capt. Huish, urged upon the railway companies the importance of giving ratiway companies the importance or giving facilities for the guards walking safely along trains when in motion, by which means, as we have long and perseveringly pointed out, a great variety of accidents may be averted. The Railway Commissioners, in 1847, themselves adopted it, out of a multitude of other suggestions, as the system of communication best promising success. It is to be honed that it will promising success. It is to be boped that it will now be generally carried out. In the event of a carriage or truck catching fire, of an axle a carriage or truck catching nie, or an anne heating, a door flying open, a cry of help from

a carriage, from whatever cause arising, or in any case where there may be even a suspici that something is wrong, the guard should be able to get to any part of a train at once.—

It has been suggested that there is great need of accommodation for invalids in a reclined position, while on the way to hospitals, &c., for medical assistance, or surgical operation as on fractured limbs. Even independent of humanity as an object, doubtless the additional traffic in transfer of invalids, to towns not otherwise reachable for medical advice, would well repay all the little expense of fitting up a carriage or two for such a purpose. On American lines there are sofas, or seats for re-Atterieus inter are sons, or seats for re-clining on, even for the use of passengers limb-free, and in perfect health.—The gene-ral specification lately issued of stores required by the London and North-Western for 1850, shews the vast amount of materials required for working the traffic of this the most important railway in the world. The "specification" extends over 25 pages of foolscap, and particularizes the stations at which the required amounts of stores are to he delivered. Of "brass and brass work" 352 cwt. of castings are required; 144 gross of screws and 59 tons of locomotive tubes. Of "copper" 8,960lb. of locomotive tubes. Of "copper" 8,960lb. of bolts from ½ to 1½ inch diameter, 11,200lb. of sheet of various thicknesses and dimensions, and 12,768lb. for fire-hoxes $\frac{3}{4}$ and $\frac{1}{2}$ inch thick. Of "coal" 18,104 tons. Of "crucibles for moulding brass," 2,539. Of "colours, dry-saltery," 110,000 leaves of gold leaf. Of "iron and iron-works," 35 tons of axle-guards, 50 tons of patent shaft har-iron, 190 tons of fire bar-iron, 422 tons of bolts, 13 tons of nuts. fire bar-iron, 42½ tons of botts, 13 tons of muts, 102 tons of eastings, 48 tons Lowmoor or Bowling iron, 100 cwt. of nails, 69 cwt. of rivets, 6,360 gross of screws, 1,343 tons Staffordshire iron, and 120 tons Yorkshire iron. Of "timber and wood work," the Company require tonders for 10.367 feat of adders pany require tenders for 19,367 feet of alder planks, 145 loads of beech planks, 10,000 fect of baywood boards, 91,000 feet of dcal boards,

NOTES IN THE PROVINCES.

St. Michael's Church, Cambridge, has been considerably injured by fire. The con-gregation were assembling on Sunday morn-ing last, when smoke was observed to be issuing from the roof on the south side. The huilding was speedily vacated, and the fire broke forth through the slates and raged with great fury. The gownsmen acted like men at the buckets and engines, and the destruction was at length arrested. The roof was totally was at length arrested. was at length arrested. The roof was totally destroyed. Some damage was also done to the organ in removing the pipes and by the play of the engines. Nearly 1,000*l*, it is estimated, will be necessary for repairs. The building is not insured, but there is a small fund for repairs, though much exhausted of late. The accident is attributed to negligence in repairaccadent is attributed to negligible in repair-ing flues and stoves.—A new church has been erected at Newgate-street hamlet, Hat-field, at the expense of Mr. Mills, of Tolmers. It is called St. Mary's, and is a small building in the Pointed style, without pews, and has a stainedglass window over a gallery.—In removing some old panelling at the south end of Norwich Grammar School, a piscina has been discovered. The style is Early English. Mr. Ninham, of Norwich, has executed a drawing of it. of it. The work of purification has also dis-closed several heads and foliage, &c., in the capitals of the arches.—The new corn excapitals of the arches.—The new corn ex-change to he erected at Brigg, was contracted for on Thursday week. Several tenders were offered, but the one accepted was that of Mr. Margisson, huilder, Hull, at 1,227l.: difference between highest and lowest offer, some 320l. The site selected is at the hack of the "Angel" inn. On 24th ult., the parish church of St. Candida, of Whitechurch Canonicorum, Dorset, was reopened, after having undergone extensive repair and restoration, under the direction of Mr. Butler, of Chichester, including the rebuilding of the north aisle, roofed with English oak covered with lead, and affording 100 additional sittings, the restoration of the stonework and tracery of twenty windows, some of large dimensions, and the erection of additional sittings in solid oak. The old seating bas been reduced in height, and the scats throughout are open, Amongst

the decorative restorations are the removal of plaster and whitewash from an open oak root of fifteenth century, ornamented with moulded ribs and bosses, painted in red and yellow; the introduction of Powell's quarries in eastern triplet of chancel, the floor of which is decorated with encaustic tiles from Messrs. Cham-berlain's manufactory, Worcester. The altar step consists of veined Devonshire marble, surrounding encaustic tiling. The reredos is formed of carved oak panelling of great antiquity, brought from Rouen, gilt and painted.
The walls of sanctures of gilt and painted. The walls of sanctuary are powdered with golden stars and fleur-de-lys, and the roof is covered with white and vermilion painting, in imitation of fan tracery on a blue ground with golden stars at intervals, — a design copied from chapter house of Exeter Cathedral. The windows throughout the church are stencilled in patterns, from ancient models, in initiation of flowered quarries. The original circular semi-Norman font, with column and base of Purbeck marble, had been removed and broken, but now stands restored near principal trance. — In addition to the fortifications lately completed at Bovisand, Picklecombepoint, and Drake's Island, as defences for Stonehouse harbour, a new fort has been erected just above the site of the old Longerected just above the site of the old Long-room Barracks, at the Victualling-yard point, which will render complete the defence of the Sound and the entrance to Hamoaze. The new building is called "The Prince of Wales' Redoubt," The external walls, towards the land, are 7 feet thick, and musket proof, and, instead of being built up perpendicularly from the ditch, are curved. On the sea-side the walls are 8 feet thick, and considered to be bomb-proof. The fort has been two years in erection, and the total cost will be about 15,000%. It is constructed principally of dressed lime-stone. The cheeks of the emhrasures, piers of entrance-gates, and other parts, are of dressed granite. Mr. George Roach, of Plymouth, is the contractor, and the work has proceeded under the inspection of Mr. Frederick Burgoyne, Government foreman of works. Improvements have been made in Ramsey, Isle of Man, by the extension of the quay inwards 100 yards, to accommodate wind-bound vessels. — On Wednesday week, Trinity Church, Runcorn, after having been heautified and enlarged, was re-opened. A chancel and a stained-glass window have been presented by Sir R. Brooke, Bart.——The laying of first stone of bridge over lake at Welbeck Abbey took place on Thursday week. The arch is of iven with in a british and the state of the sta iron, with iron battlements upon stone but-tresses. The building is undertaken by Mr. Bell. The first stone was laid by Viscountess Shannon: present, the Duke of Portland and others.—At a meeting of the Ashton guardians on Thursday last, the huilding committee recommended that the amount to be expended on their new workhouse be fixed prior to advertising for plans, and that the board employ the architect to carry out his plans at the the architect to carry out his plans at the rate of 5 per cent, ou the outlay: no premium for second best. They recommended that the sum to be expended be limited to 6,000l. Mr. Ousey cunningly suggested that it would be better to give a premium for the plans; "they would be able to manage the erection quite as economically as though the architect were employed to carry ont his own plans." Resolution to that effect lost hy a majority of one. Agreed that the sum -Notice has been given of an applio,000.—Notice has been given or an appli-cation to Parliament, by the Carlisle corpora-tion, to take possession of the gas works there, and to work them for the benefit of the city. The Bill, says the local journal, will most likely pass without opposition, and it will undoubtedly confer a benefit on the inhabitants of Carle .- The town councils of Dumfries and Maxwelltown are to bring a Bill into Parliament authorizing a supply of water from Loehrutton. Mr. Gale, of Glasgow, was elected engineer, and Mr. Newall, local engineer. The new schools at Elson, near Gosport, were opened on Thursday last, on which occasion full service was performed at the church, and the new organ was played for the first time The schools and master's house cost rather more than 500l. in building, and will afford room for 130 children. The parsonage-house will shortly be commenced. The architect is Mr. John Colson, who also designed the case for the organ.

SPANISH TOWN CATHEDRAL, JAMAICA.

WE inserted a communication from a correspondent in August last (p. 377), headed, "Architects and Architecture in Jamaica," setting forth that a gentleman who came to the island as an organist, music-master, &c., not finding his success so great as was anticipated, had turned architect and civil engineer, and was engaged in erecting a chancel to the cathedral church. It further said, "it has now cathedral church. It further said, the said of the leaked out that our architect has been, and still is, extracting from the pockets of the builder either 5 or 7½ per cent., besides the commission he receives from the parish." In reply to this we have received a letter (previously the further of the furth addressed to us in the Jamuica Despatch) signed "J. Calvert, superintending architect of the cathedral, Jamaica," enclosing a declaration signed, "Richard Cowan, sole contractor for signed, "Richard Cowan, sole contractive masonry; James Campbell, sole contractor for carpenter's and joiner's work; James Jones, carpenter; and Joseph Waldron, Jones, carpenter; and Joseph Waldron, builder;" denying that the architect has ever demanded, or received from them, any comoission or allowance. Mr. Calvert says:— One could scarcely believe your corresponmission or dent had read Vitruvius's requisites for an architect, or he would remember he says, among other things, he should be 'a musician' - the head and front of my offending.' When the immortal astronomer Herschel could no longer eke ont an existence as a poor organist and musician, did his knowledge of that heavenly art, music, render him blind to the glorious harmony of the starry world?

I sent in designs in competition with the whole island, without friendship or favour, and regret I had no assistance whatever, as he insinuates I had. The building is nearly up to the roof, and is about 50 feet long by 50 feet wide, with side aisless and clerestory windows, on moulded arches and clustered columns, with carved stone corbel angels supporting an elahorately carved roof. The whole on a founelahorately carved roof. elahorately carved root. The whole on a roun-dation of great strength, 15 fect deep, and I trust will stand when my enemies are forgotten, and 1 a 'musician' in the choir above. I refer you to the declaration, in denial of

the assertion of my 'extortion,' and wish you could but enjoy with me a few days superintendence of negro workmen, on a building in Jamaica, with the pleasant warmth of a midday sun at least 107 degrees Fahrenheit; you would find, without any clerk of the works, 5 per cent. on an average expenditure of 20% a-week, a splendid remuneration for the entire occupation of your utmost exertions, and I doubt not would soon grow fat, and become the envy of every hungry architect, as is sup-posed to be—Your humble servant."

By the same mail we received a statement from our former correspondent, containing the grounds of his assertion, hut we cannot give place to it in the face of the rigorously worded declaration referred to.

DESIGN IN MANUFACTURE.

JUSTLY does your correspondent, E. M.," in a late number of your joint a late number of your joint and the state of the st number of your journal, condemn the prodigious floral ornamentation of the various articles in the Birmingham exhibition, executed as like unto nature as their various materials will permit. This error, arising from an imperfect education in art, and an injudicious striving after novelty, is the evident characteristic of the so-called "artmanufactures" of the day. It requires but little study, and less design, to copy the first plant that comes to hand, without adaptation, whether suitable are plant that comes to hand, without adaptation, whether suitable or not to the purpose required. It is the work of a mechanic, and not of an artist, and elevated but in the degree of execution above that of the savage South Sea Islands, to carve the handle of a knife into the semblance of a spike of maize, and when the noble task has been accomplished, the implement is hut rendered perfectly unfit for its purpose. I remember not long since to have seen engraved with commenda-tion a "high art" salt-cellar, which reflected no great credit on its compiler (for design it eannot be called), as it consisted merely of a sea-shell reversed and mounted upon a piec coral. Too often is practical utility disregarded, and all purity of outline lost in an unpruned luxuriance of foliage. Nor is it only with

botanical specimens that every domestic utensil is bedizened, under the mistaken idea of ornament; but the human figure and animals, executed in the worst style, are crowded into every possible position, opportunity of degrading them should be lost. It does not seem to be generally understood, that art is a conventional treatment of nature, and not a literal imitation of her forms; for while she must be foiled if she attempt to rival their delicacy and compete on the same ground, yet there is a character and dignity of her own with which she may invest them,—an impress of thought which should be stamped

upon the types of her choice.

It is to be hoped, then, that this botanical fever will soon subside, or at least cease to be preached to the people as the noblest realization " high art." J. P. SEDDON.

MASTERS AND WORKMEN.

In a recent case the defendant, Mr. Brass, a builder in the city, was sued in the Sheriff's Court by four of his workmen (carpenters) named Lockyer, Goddard, Payne, and Thomas, under the following circumstances :-

The plaintiffs stated that they were discharged on the Saturday, and being unable to get their tools they went for them on the Monday morning; they accordingly claimed a quarter of a day's wages for fetching them, and a quarter of a day for grinding them—the latter heing a custom adopted throughout the trade. They also contended that Mr. Brass had no right to discharge them, as they were taken on by his foreman, who said it was his own job.

The plaintiff said he resisted this claim entirely on principle. He discharged the plain-tiffs for neglect of duty. They left off at four o'clock, and were paid their full wages up to half-past five; they had ample time, therefore, to collect their tools.

His Honour said, although the foreman might be authorized, as the agent, to take on workmen, that did not take away the right of the master to discharge them; and with regard to the sum claimed for grinding tools, although such a principle might exist in some instances, there was no such custom in law. The plaintiffs must therefore be nonsuited.

EXPOSITION OF FRENCH INDUSTRIAL ART.

No.13, George-street, Hanover-square, with its adjacent premises, contains at this moment a beautiful and costly exposition of French industrial art, sufficient to make our manufacturers tremble for the probable expatriation of some of the prizes proposed to be given in 1851. Mons. Sallandrouze de Lamornaix, a manufacturer of distinguished position in France, projected and arranged this exhibition with the view of showing the English manufacturers who their opponents will be.

Tapestry, china, oak earvings, bronzes, carare amongst the works exhibited, and will demand our notice. We would merely remark now, to those who would institute comparisons with works at home, that the price, and the circumstances under which many of these extraordinary things were manufac-tured, should not he left out of view. They not, for example, ask where we can parallel that magnificent piece of Gobelin's tapestry, presenting an incident in the life of Gustavus Vasa, if we mistake not, or the large flower-painted vase in the centre,—without remembering that the price put on the latter is six hnndred pounds—the price of the first, four thousand pounds, and that Government took the risk of their production.

THE "SAINTE CHAPELLE," PARIS .-During the last week an immense crowd has assembled day after day at the Palais de Justice, to view the restored decorations of the Sainte Chapelle. From ten in the mornin till four in the afternoon they were slowl From ten in the morning passing in, ranged in files, each in the order of arrival. From 3,000 to 4,000 persons daily have had admittance. On Sunday last the President, in another chamber of the building, distributed the prizes awarded at the late

METROPOLITAN COMMISSION OF SEWERS.

WHEN the court determined that the business should be examined and arranged by the general committee, previous to each meeting, so that "any discussion which was necessary for the information of the public would take place in court," or rather as they ought to have said, "so that no discussion necessary for the information of the public may take place in court;" we saw what would be the result, and pointed it out.

To say that the commission hold an open court now is not true: the public meeting is simply proformd, a blind and a pretence, and without assuming that any but the most careful and intelligent management is being pursued, we at once formally protest against the system as being full of evils, and certain to lead to an unsatisfactory state of things.

At a meeting held on the 9th, Lord Ebrington in the chair, and other commissioners present, the following resolutions were passed without dis-

cussion:—

"1. That it appears that the plan submitted by Mr. Cubitt to the Commissioners for Westminster in November, 1847, and on the recommendation of their surveyor, Mr. Phillips, approved by them, which provided an escape for the sewage through the outfall there shown into St. George's sewer, was not executed. That the officers of the commissioners charged with the superintendence of the work allowed the said plan to be materially deviated from; that they allowed the sewer to be blocked up with a wall, in what was there described as the direction of its outfall, and an outfall to be opened into Warwick-street sewer, where none was described in the said plan. That for these alterations and deviations no authority is to be found in the records of the court.

direction of its outfall, and an outfall to be opened into Warwick-street sewer, where none was described in the said plan. That for these alterations and deviations no authority is to be found in the records of the court.

"2. That the heat thanks of the court be given to Professor Lyon Playfair, for his very valuable services, rendered gratuitously to the commissioners, in the chemical examination he made, with so much skill and judgment, in reference to the lamentable accident that occurred in the sewer in Kenilworth-street.

Kenilworth-street.

"3. That though the commissioners have not sanctioned, and do not sanction, the application made to Dr. Ure for his opinion on the subject of the accident in the Kenilworth-street sewer, Pimico, yet, as it appears that one of their officers did, during the interval which elapsed between the termination of the old commission and the first meeting of the present, apply to bim and request a chemical examination of the contents of the sewer, they, under the circumstances, will not object to pay Dr. Ure some reasonable remuneration for this first analysis so requested by their officer on his own reasonability.

responsibility.

"4. That the commissioners be summoned, and the city commissioners be requested to attend the next court, for the purpose of taking into consideration the plans sent in for the drainage of the metropolis."

Adjourned to Friday, the 23rd.

Miscellanea.

EFFECT OF BAD DRAINAGE.—The verdict given by the juries of the coroner's inquests held on recent cases of cholera in Hertford County Gaol, attributed the ravages of the epidemic to the total want of drainage, and requested the coroner to write to the visiting magistrates, drawing their attention to the subject. It appears that the soil-drains connected with the gaol run into two large close cesspools, one of which is within and the other witbout the walls, and that the prisoners are exposed to the injurions effects of the noxious gases generated in those cesspools. The coroner, therefore, in compliance with the wish of the jury, drew the attention of the visiting magistrates to these facts, and suggested that the cesspools should be done away with, and a proper system of sewerage established. We had the impression that a large sum of money had been spent here recently in putting things right.

SHEET METALS.—Mr. T. D. Jackson, of Brooklyn, New York, has patented an improvement in alloys for sheet metals, consisting of—Copper, 64 oz., zinc, 22 to 26 oz., India tin, 1 to 4 oz. The inventor claims as his invention or discovery, "the application of the manipulations employed for compounding an alloy of unctals in the proportions and of the materials mentioned for a new sheet metal, which shall be capable of being wrought in the cutting press, with dies," &c.

PROJECTED WORKS.—Advertisements have been issued for tenders, by 3rd December, for the works required in construction of a quay and sidings near Arundel, for the London, Brighton, and South Coast Railway; by 11th December, for the erection of a new savings bank at Witham; by 12th December, for the erection of a new pauper lunatic asylum, for 250 patients, at Bracebridge, near Lincoln; by 3rd December, for the construction of two reservoirs near Langley, Prestbury, with other works connected therewith,—also a filter bed and service reservoir,—and for laying about 24 miles of pipes, all for the Macclesfield borough water-works; by 24th inst., for gas fittings in the Brentford Town-ball; by 27th inst., for 2000 tons of Barlow's patent wrought iron rail, for the Midland Railway Company; by a date not specified, for the erection of some small houses at Itchen (Southampton); by 21st, for a supply of British iron for the East-India Company; and by 18th December, for a supply of pumps and water closets for the navy.

DRAINAGE OF TOWNS ON TIDAL RIVERS. DRAINAGE OF TOWNS ON TIDAL RIVERS.

—A suggestion for the drainage of London has been made to us by Professor Hann, on the part of Mr. Goldsworthy Gurney.

"The current of the Thames, in round numbers, at London-bridge," he remarks, it undown 7 hours and up only 5 every tide; in winter more, in summer less, the control of the control depending on the amount of river water. runs at a rate of about from 5 to 7 miles per hour (no matter what the speed; let us suppose it to run at the same rate up and down for our present purpose). It is plain that anything thrown into, and forming part of the Thames at high water, would, in seven hours. be carried more than 40 miles down the river On the return of tide, in five hours, the full time of flow, it will only have come up 30 miles, and at the time of high water would be 12 miles below the bridge. The next ebb would carry it 42 miles further down the river, or 54 miles below London-bridge. At the return of next high water it would be left 24 miles down the river, thus descending 24 miles in 24 hours, until it went clear into the sea. If, on the contrary, anything be thrown in at low water, it will go up with the tide for five hours, be five hours more in returning to the same spot, have only two hours ebb before it meet the flood coming up, and of course would return with it, go again up the river, and be seen probably every day for a week." Mr. Gurney suggests, therefore, that the sewage of London be collected, and only allowed to run into the Thames at high water, so that it may be at once got rid of. All this, however, is not quite so clear as it looks.

VENTILATED SEWERS, CHESTER .- I observe, at page 482, of your journal, that Mr. Thorpe, of Hull, states that he has adopted the plan of connecting the rain-water spouts in the fronts of the houses in that town with the sewers, for the purpose of ventilating them. beg to state that system has been adopted at Chester for some years, and that I suggested it nearly three years ago in the pages of your journal. Although probably not so effective in its nature as Dr. Gurney's steam jet, it is a simple expedient, inexpensive and effectual in its operation. At the heads of our sewers, when we have what is termed dead ends, I have had vertical shafts or manholes carried up, for the purpose of securing self-acting flushing tanks, in principle resembling Hosmer's, and I purpose obtaining a supply of water from the main, so that whether the supply of water be constant or intermittent (as it is in this case), the sewers will be regularly and effectually flushed at stated intervals. When the flushing apparatus is complete, I connect the shafts with pipes to the fronts of houses, so that when in action, the regular downward current of the flushing waters will create an upward current of what little foul gas may be generated in the sewers; so that it will pass on through the ventilating shaft at the head of the sewer, and be disseminated in the atmonerated in the sewers; so that it will pass off

TESTIMONIAL TO MR. CUBITT.—Mr. G. R. Ward has been selected by the committee to engrave, for distribution to the subscribers, Mr. Pickersgill's excellent and life-like portrait of Mr. Thomas Cubitt. It is to be executed in the mixed style, and finished in June next.

THE SAMARITAN SOCIETY OF ENGLAND. This society, which originated in a paragraph published last year in our paper, proposes to establish cheap lodging-houses and dormitories for the necessitous poor under the arches of the metropolitan railway viaducts, open to all, at all seasons. "The arches in each district The arches in each district at all seasons. will be formed into first, second, and third class compartments for men; first and second for women. These tenements will be warmed ith hot water, lighted with gas, be well tilated, and be placed under the supervision of the police. The first class will be furnished with iron bedsteads, flock mattrasses, blankets, &c., and the charge will be 2d. per night, or 1s. per week. The second class will be fitted up with slanting boards, such as are used by soldiers in their guard-rooms, with pillows and warm rugs; and the charge will be 1d. per night. The third class will be merely furnished with clean straw, and will be accessible to all, at all times of the night, without charge. These will be opened only in the winter. Five arches will at first be rented in each district. The centre arch will be furnished with a boiler, and will be used as a lavatory. The two arches on either side will be converted into first and second class wards,—those on the right for men—on the left for women; and each tenement will shelter 30 individuals. Each district will thus furnish 120 beds; and it is confidently expected that they will be self-supporting when once established." The sosupporting when once established. The so-ciety have views beyond this, such as opening schools in the day time, and to assist in re-claiming prisoners, but these are less immediately practicable. As the winter is approaching, now is the time to begin the work. Plans, we understand, have been prepared; and it is estimated that each arch may be fitted up for about 60l. Rightly managed, this society may do an immense amount of good at small cost.

SURVEYOR'S TENDERS: ISLEWORTH ASSESSMENT.—I frequently see in your paper
the heading "Blind Builders." There are,
however, other men who are sometimes equally
blind. As a professional man, I cannot account
for such discrepancies. In this parish (Isleworth) we have 3,128 acres of land, varying in
rental value from 2s, 6d. an acre to 101. 10s.
an acre, and including about 1,500 houses. It
has been determined to have a re-assessment.
Advertisements have appeared from the board
of guardians for making such re-assessment. Advertisements have appeared sent in. You
must excuse my not giving you the names of
the different candidates; the lowest, however,
is 50t., and the highest 420t. Such things are
monstrous. I cannot think either Cocker or
Columbine can have been consulted.—W. A.

Shop Door Bolts.—With reference to the

Shor Door Bolts.—With reference to the circumstance that a watchmaker was robbed of two watches a few days ago by a pretended customer, who darted out of the shop with the property while he turned his back to get other goods to show him, a correspondent suggests the use of a sort of double night bolt, which may, by the application of ordinary hellhanging work, be made to drop down from over the double inside doors when shut (or a single bolt for one door) of any shop where small valuables are sold, at the will of the person behind the counter, and altogether unseen by the party presenting themselves, and thus effectually prevent the escape of any one with the goods.

INSTITUTION OF CIVIL ENGINEERS.—In accordance with a new arrangement, the session of the institution commenced on Tuesday evening last—Mr. Joshua Field, president, in the chair—instead of, as heretofore, in the middle of January. The paper read was a "Description of the Coffer-dam at the Grimsby Docks," by Mr. Charles Neate. The length of the coffer-dam was 1,500 feet, supporting at high water a head of water of 25 feet, whilst the excavation behind it was carried to 11 feet below low-water. The form of the dam was that of a circular curve, with a versed sine of 200 feet, or nearly one-fifth of the span.

THE ROYAL PAVILION AT BRIGHTON,— It is understood that the Pavilion at Brighton has been purchased for a sum nearly amounting to 60,000l. The valuables of the interior bave been removed, and it is expected that the place will be converted into purposes for the improvement of the town.

LEEDS MECHANICS' INSTITUTE. annual festival of this institution was held on Friday last in the Stock Exchange; Lord Mahon in the chair. His lordship made a fluent and interesting speech. In course of it he with truth said, that if it be true that know-Iedge is power, it is not less true that knowledge is pleasure,—pleasure with no bounds or limits on this earth. The boundlessness of knowledge his lordship aptly illustrated by the discoveries of the telescope, on the one hand, and the microscope, on the other. Our discoveries seem only limited in depth, if not in breadth, by the imperfection of the instruments we yet use; the extreme limit is probably almost as far removed as ever. But depend on it, he said, that pleasure is not to be found in mere superficial acquirements. Yet of this I am persuaded, that there was great truth in the remark I once heard from that accom-plished and experienced man Prince Talleyrand :- "Depend on it there is no such thing as labour lost. Depend on it, whatever branch of study you pursue, and however recondite or its utility may seem, a time may come, and when you least expect it, that you will derive practical advantage from it, and see the good effects of having turned your minds to it." His Lordship's speech was followed by the proposal and adoption of various reeolutions in favour of the objects of such by Mr. R. M. Milnes, M. P., to the effect, that "To impart a taste for artistic beauty, and to give familiarity with the principles on which it rests, should be one of the objects of popular education." Mr. Roebuck wound up the eloquence already expended with no less eloquence of his own. "All the great advances of knowledge," he remarked, in one part of his speech, "have not been done by the leisure class, hut by the lahouring, working for their livelihood, and bringing habits of industry to the acquirement of knowledge; using those stern habits in the race with the dilettanti, pressing upon and outstripping him, because the latter is as dilatory in his modes of pur-suing knowledge as in his habits of pleasure. An institution like this makes us all entertain right notions of true equality; it teaches us to have those sympathies which nature intended, and which you have always felt vehemently; it makes us all understand each other as true men; it is the bond of knowledge—the tie which shall unite us to each other.... As this is a mechanics' institution, I hope that it will be the means of doing what it does not at present-of bringing the artisan amongst us, and introducing a close alliance between all classes of society, without which there is no safety; and that we shall be with them in the brotherhood of knowledge and of feeling, and make this what it now calls itself, but which, I fear, it has not been—a mechanics' institute."

Public Slaughten-houses .- Mr. R. B. FUBLIC SLAUGHTER-HOUSES,—MI. R. D. Grantham, whose work on the 'Abattoirs of France we noticed some time ago, has published a proposition for establishing public slaughter-houses in the principal towns of England. He submits that the butchers, and these interacted in the convented trades schematics. those interested in the connected trades, should unite, and erect, under an Act of Parliament, suitable buildings, with land sufficient for layerage and pasture, in a locality approved of by the local anthorities. "They ought to he the undertakers," he says, "as most interested the theereactes, ne says, as more meeting in the matter, and should take the lead, for they may depend upon it that the time is not far distant when these arrangements, or something very like them, will be carried out, and they will have to submit to the control of other persons, instead of keeping it in their own hands."

RAILWAY RATING.—In an appeal before the magistrates at Manchester against an against an assessment of about a mile of the South Junction line, helonging to the London and North-Western Company, it was stated for the respondents, that value of land prior to building on it was 62,787L, and rateable value 2,960.: present value of whole, 300,000l. The company proved the receipts for August and September last to have been 2641, 11s, 2d., and the working avenues 251, 20,664. Septembri last to have been 2044. Its. 2d., and the working expenses 251l. 9s. 6d., leaving a profit of 13l. 1s. 8d., being at the rate of 7sl. 10s. per annum. The magistrates, however, confirmed the rate. The appellants intimated an appeal to quarter sessions.

SHEFFIELD ATHENÆUM AND MECHA-NICS' INSTITUTE.—To the formal opening of this combined institution the Earl of Carlisle, Mr. Roebuck, M.P., and other celebrities, Mr. Koeduck, M.P., and other celebrities, gave their countenance, those named personally, and others, such as Lord Mahon, by letter. The chairman, Mr. Alderman Dunn, explained the objects of the new establishment with lishment, which comprehends a news-room, coffee-room, and library, class-rooms, and hall for lectures, &c. The whole cost of the building, including site, has been 6,500l., part of it not yet raised. The first stone was laid about not yet raised. two years since hy Lord Arundel and Surrey. The Athenæum department was opened in the beginning of the present year, and the institu-tion class rooms on 1st October last. The pupils are now taught reading, writing, arithmetic, grammar, and geography, and other classes are to be opened. In speaking of the purposes of such an establishment, and while deprecating the idea that duty alone, apart from the memories of 'auld lang syne,' as in the present instance, should lead him to run about and foist his presence wherever there a mechanics' institution or an Athenæum to be founded, Lord Carlisle remarked, with a quiet apology for what might be regarded as smelling a little of his shop—the Board of Health—that "it is not from the languid bed of sickness, from the troubled couch of fever, from the gloomy chambers of death that we can expect to derive hopeful votaries of intellectual and mental progress. The vigorous excr-cise of the judgment, the buoyant play of the fancy, the elastic impulses of the soul, require healthy and undiseased organs for their full display and development. The mind and body will almost in every case—though there are brilliant exceptions—be found to re-act upon each other, and those who promote the enlightened care of the physical health will most truly advance the use and enjoyment of the rational and moral faculties. drained alley, the unventilated room, the impure atmosphere, will but serve to irritate the tempers for which we trust here serene enjoyment, and to clog and debase the energies for which we shall endeavour here to furnish fit opportunity and congenial nurture.'

SOCIETY OF ARTS.—At the opening meeting, 7th November, Mr. W. Tooke, F.R.S., Vice-President, in the chair, Mr. Dight Wyatt read a voluminous report upon the Eleventh French Exposition, which has been published for public use. The report commenced y allusion to the attention paid by the French government to the development of the manufactures of that country by precept, example, public exhibition, &c., to the traditional excellence of early French productions, and to the modern restoration of that supereminence hy the means before-mentioned, now persevered in with few interruptions for fifty years. Mr. Wyatt then gave a minute descrip-tion of the building erected for the exhibition in 1849, which was situated on the Carré de Marigny, on the Champs Elysées. The es-timated cost of the building was, in

To the cost of this year must be added 2,000l. for the agricultural shed;—making the whole estimate about 18,000l. The cost of the building per square foot was, in

1839. 2s. 2d. 1844. 1s. 3id. 1849. 1s. 2sd.

The building had the defect of containing no one great hall, whereas on the occasion of distributing the prizes a great assemblage might take place. The writer believed that a better building might be erected in England at a less cost, probably by one fourth. The gist of the report having previously appeared in the Athenaum, it came rather second-hand. On the 15th a paper was read by Mr. II. H. Russell on the "Construction of Suspension-bridges, with especial reference to a new mode of pre-venting Vibration."

ST. THOMAS'S CHURCH, NEWPORT.-We understand that there are about thirty sets of designs sent in for the re-building of St. Tho-mas's Church at Newport, Isle of Wight, which are on exhibition at the assembly-rooms

IRON.—A patent has been taken out at New York, by a Mr. M. S. Salter, for making hammered wrought-iron from the ore, by a process, and within two hours! Can it be posprocess, and within two hours! Can it be possible that we have here already an exemplification of the practicability of Mr. Mushet's heterodox prophecy against puddling? The cost of wrought-iron, it is said, will be less than half the usual cost, prepared on Mr. Salter's process. Anthracite is to be used under this patent.—Little business is doing in the iron trade. Prices were lately giving way, but appear to have since become a little firmer. It is declared, however, that "the minimum at which iron can be produced in Staffordshire has been already reached." and a withdrawal has heen already reached." has been already reached," and a withdrawal of capital is anticipated.

THE CHURCH AT SARAWAK, BORNEO.— The first beam of the first church (English) ever erected in this new dependency of the British empire was laid on 28th August last in presence of Sir James Brooke, the Rajah of Sarawak, and suite. The foundation sleeper was an enormously heavy block of iron-wood, which was slung into a trench by the Rajah. The work had then been for some time in progress, but there had been great difficulties to overcome in collecting, preparing, and carrying the heavy materials, and in levelling the hill

for the site.

COLONNADES ARE "Our,"-The removal of the colonnade, forming the right-hand side of the outlet leading from High-street, Cheltenham, into the promenade, street, Chettennam, into the promenade, has been commenced, and in a few days the entire mass of building which rests upon it, and projects 10 or 12 feet into the street, will be brought down, and the houses thrown back to the Imperial-circus line of frontage. The colonnade was built thirty years ago, when such arrangements were in fashion.

THE READING ROOM AT DRURY-LANE THEATRE appears to be a considerable attraction, especially to foreigners, who have few opportunities in London to see the papers of their respective countries. Many appear to go their respective continues. Many appear to go to the theatre solely for this feature. We were glad to find The BULDER in request there when we looked in: and that it was being pondered amidst the learned beauties of "Tbe Propbet," and the clash of the "Row"

PROPOSED PROVIDENT INSTITUTION OPERATIVES.—We are glad to find that this suggestion is germinating. Professor Cockerell as addressed a strong letter on the subject to The Builders' Society," urging them to move immediately in the matter, and we have reason to believe it will receive the attention due to it, and that the builders will soon afford proofs of their heartiness in the service. We have some communications on the matter, to which we shall give early consideration.

ST. ALBAN'S ARCHITECTUNAL SOCIETY.—
A meeting of this society was held on Wednesday in last week, at the Town Hall, St. Albani The attendance was numerous, and the Earl of Verulam, president, occupied the chair. The vertiam, president, occupied the chair. The following papers were read—"On the Tapestry of Bayeux," by the Rev. T. Lee (honorary secretary); "On the Rise and Progress of the Art of Coining," by Mr. J. Evans; "On Verulam and the adjacent Antiquities," by Mr. R. G. Lowe.

THE BRISTOL AND WEST OF ENGLAND THE BRISTOL AND WEST OF ENGLAND ARCHITECTURAL SOCIETY.—The report of this society, just now published, is illustrated by drawings of the south doorway, sedilia, &c., in the Holy Trinity Church, Westburyon-Trym, and the proposed elevation of the Bristol High Cross, accompanying a paper on that subject. The doorway of Westbury Church was sectional at the coverage of the society.

was restored at the expense of the society.

THE QUEEN'S COLLEGE, CONK, built from
the design of Sir Thomas Deane, and illustrated by us some time ago, was opened on the 7th inst. The position of the building and its

7th inst. The position of the building and its general effects are described as being admirable. We shall re-produce our view in the forthcoming number of "Buildings and Monuments." To DESTROY ANTS.—I have never known a solution of alum and potash in hot water to fail as a cure for ants in timber, but it must be applied builting but—C. W. ORKERD. applied boiling hot .- C. W. ORFORD.

^{*} Readers of The Builder may serve us by making known this work to friends who might not care to be sub-scribers to the journal, and yet would take "Buildings and Monuments," if they knew its scope and contents. It will be completed in eight parts, and will form, we venture to thinks, an interesting volume.

No. CCCLV.

SATURDAY, NOVEMBER 24, 1849.

T is no exaggeration to affirm, says Mr. Simon, the medical officer of health to the city of London, that the unrestricted supply of water "is the first essential of

decency, of comfort, and of health; that no civilization of the poorer classes can exist without it; and that any limitation to its use in the metropolis is a barrier, which must maintain thousands in a state of the most unwholesome filth and degradation."* In the metropolis at present (we ought to say in England), the supply of water is but a fraction of what it should be; and its quality is for the most part infamously bad. Thousands and thousands of the population have no supply of it at all to their houses, and where it is laid on, the quantity is wholly insufficient, and the cost improperly great. For the sewers there is none, and without it there can be no effectual drainage. We have already suffered severely in consequence, and causes are in operation, especially in the metropolis, which will increase the evils at a fearful rate.

The connection between disease and bad water is established beyond cavil: the effect which the contamination of wells had in producing cholera in many places, is proved beyond the shadow of a doubt. The high rate of mortality on the south side of the Thames may he ascribed mainly to the fact, that the water-works for that part of London draw their supply from a spot in the Thames horridly polluted by sewers, and that many of the private wells are made poisonous by the cesspools, which are nearly as deep as the wells, and often close to them.

We must at any cost have pure water, and plenty of it,—a supply not intermittent, but constant and universal.

A glance at the daily papers will show how general this feeling is: notices of application to Parliament for powers to obtain and sell water, and reports of public meetings to consider the subject, meet the eye everywhere. Manchester, Salford, Salisbury, Southampton, and other provincial towns, are in the field. For the metropolis there are half-a-dozen schemes, without saying anything of the applications by the New River Company, the Kent Water-works, and the Lambeth Water-works Company, for extended powers.

One Company proposes to supply London from the Thames at a point near Mapledurham Lock, county of Oxford, with reservoirs at Caversham.

The "Thames Chalk Filtered Company" desires "to divert a portion of the water of the river Thames from its present channel; to convey it by aqueducts to shafts sunk on the bank of the river, into the chalk stratum of the London Basin; and to form such shafts, with accompanying shafts, and other necessary works, into filters for purifying, by means of the chalk, the Thames water so conveyed."

The "London Spring-water Company" is projected "for the purpose of procuring a supply of pure water from the chalk formation, by means of shafts to be sunk in the neighbourhood of Watford, which water is proposed to be lifted into reservoirs on Stanmore-common, to the respective heights of 400 and 490 feet above the Trinity high-water mark at London-bridge, and brought to London and the suburbs in capacious pipes along the Edgeware-road."

And the intention of "The Henley-on-Thames and London Aqueduct Company," to which we have before referred, is shown in their name. They propose the appointment of commissioners, to whom the execution of the Act, when obtained, is to be entrusted; to have five reservoirs around the metropolis; and to buy up existing water companies.

The public stir on this subject is further shown by the attendance on the General Board of Health of various deputations, including Archdeacon Sinclair, churchwardens Bellworthy and Collins, and other parisbioners of Kensington, who set forth the very defective supply of water to that parish. The Archdeacon pointed out, that close to where the water was taken for the Southwark and for the Chelsea Company there was a current emptying itself into the river, which was of such a character as necessarily to injure the surrounding water. A large portion of that must necessarily remain with the other; and although the company he had mentioned took pains to filter the water. the evil could not be thereby at all thoroughly remedied.

Mr. Chadwick, in the explanation which he gave to each deputation seriatim, stated that the Metropolitan Sanitary Commission had the subject in hand, and that certain principles had been laid down by the "Health of Towns Commission," which would, without doubt, regulate the Metropolitan Commissioners; as, for example, that the supply of water should be constant and not intermittent. It might be settled and taken that the works of watersupply and drainage works should be under one and the same management, and that management a public one. It had been shown recently, that while houses and neighbourhoods were made damp by the water pumped in, for the removal of which suitable drains were not provided, where drains were provided decomposed refuse accumulated, from the want of water being properly applied to cleanse them. Unless cesspools were abolished, no crowded neighbourhood could continue to be healthy, and cesspools could only be abolished when supplies of water were available. At every step the necessity and practical importance of the conclusion, for the sake of economy, as well as efficiency, that the watersupply and drainage must be under one and the same administrative management, and that management a public one, whatever it might be, was demonstrated. Another principle established was, that there had been, and could be, no public gain by the so-called competition of several or numerous capitals on the same field of supply. It had likewise been shown that private companies, which had to depend for their returns on voluntary custom, could not afford to supply water at so low a charge as might be done by a universal rate if properly managed.

Another indication of public interest in the question was afforded by the rooms of the Institute of British Architects, on Monday evening Iast, when the Very Rev. Dr. Buckland delivered an address on Artesian Wells.

There were 197 members and visiters present, and those who know the meeting rooms will not require to be told that they were inconveniently crowded.*

We had prepared a nearly verbatim report of the Dean's address, but the morning papers having given unusually full reports, it would come as a twice-told tale to many of our readers, and we therefore condense it. The Dean began by observing, that the architecture of the globe was a subject which he thought ought not to be foreign to the consideration of the members. for he must submit that no architect could perfectly understand his profession, unless he had acquired some knowledge of the materials with which he had to deal; and he believed no one would deny that, had their ancestors known as much as they did now touching the durability of various kinds of stone employed in the construction of ecclesiastical and castellated buildings, they would not have to deplore the ruin of so many of these edifices (?). It would be his duty that night to direct their attention to the architecture of that particular portion of the earth which they themselves inhabited-a subject possessing an interest literally of vital importance. It was, as had been proved by the events of the last six months, a question of life or death to thousands and tens of thousands in this great metropolis, whether they should have the means of obtaining an abundant supply of fresh water. It was, unfortunately, too notorious that the supply of water was at the present time awfully defective, and the last month had been fertile in schemes for supplying that defect. He rebutted the taunts which had been thrown out against bim as a non-practical man by such practical men as, in 1825, persuaded the Earl of Abingdon to spend large sums of money in digging for coal in the Oxford clay, a folly, in exposing which he at the time went so far as to say he would willingly be burnt in the broad street with the first cart-load of coal they obtained. But the auto da fé did not take place, for there he was unscathed. He had studied the subject of Artesian wells for years, and had said, in his Bridgewater Treatise, thirteen years ago, all that he knew even at this time. There was nothing theoretical about his statements, the deductions followed as surely from sections of the earth. which had heen made foot by foot, as from the section of a building. If those persons who are concerned in the subject were not acquainted with what he had said, it was to their shame-London and Paris were each of them situated on a basin of impervious clay, which rested upon strata of porous gravel and chalk. There was no imaginary central abyss which would furnish, if it once were reached, an everlasting supply of water. It was now admitted that the only source of fresh water was the sea, from which it was indirectly conveyed by means of evaporation to the earth, on which it fell from the clouds in fertilizing showers. If rain water was then of such primary consequence, the question was, where, in the neighbourhood of London, was there the most of it.

^{*} We are glad to see that the "Report on the Sanitary condition of London, for the year 1819," by Mr. Simon, is printed in a separate form. It contains nothing new, it is true,—little but what will be found in our pages urged and treuge,—but the various points in the inquiry are sensibly and calonly stated, and all being brought together in this disturbance of the state of the component of t

^{*} Amongst them, in addition to those named hereafter, were Lord Ebrington, Mr. H. T. Hope, M.P., Mr. Mangles, M.P., Mr. J. F. Stanford, M.P., Mr. Walpole, M.P., Dr. Arnott, Rev. H. Milman, Capt. Charles, Williams, Judec, Eales, Nicholl, Burn, Woodthorpe, Bury, Tarring, Hotchins, glusson, Williams, Udec, Eales, Nicholl, Dobson, Eddrup, Lockyer, Deane, Hencker, Clayton, Brand, M. Waring, C. Barry, Jun, Boyce, G. Vulliamy, W. S. Gawtern, Wyatt Papworth, Gotto, Phillips, Borthewick, Hakewell, Severn, Dr. Bett, Messrs, Pope, Wigrann, Page, Fred. Peel, Poter, Coleman, Rickman, Allason, Wills, Burnell, Woolrych, Johnstone, Hussey, Gregory, Dighton, Christian, Snell, P. Baly, C. Manby, Thomson, Rerr, York, George Rennie, Gooch, Coleman, Saltin, Porter, E. W. Brayley, Geo. Godwin, &c. &c.

and where was it the most available? This really was a question of great importance, since, in the central parts of Essex, not more than 18 inches of rain fell, while upon the highlands of Oxfordshire, running on to the Cotteswold Hills, the fall was 26 inches. It had been proved, by experiments made by M. Arago, that one-third of the fall is conveyed by rivers to the sea, one-third is lost by evaporation, and the remainder went to the sustentation of animal and vegetable life, or was absorbed by the different porous strata. The portion with which he proposed to deal was that which descended into the earth, and was given out day by day for the sustentation of the little streamlets which trickled through every valley, forming rivulets and rivers; and with the supplies of water which were said to be underneath the metropolis, and available for the supply of the 2,200,000 persons by whom it was inhabited. This was a false assertion, and he would prove it. The average depth now to the water in such wells in London was 60 feet; in 1875, it would be 120 feet down. Could we, then, look to this source for supply? He declared that there was not at the present time a single Artesian well, which could be properly so called, within three miles of St. Paul's. An Artesian well was one which flowed over naturally; they were so called from Artesium, the Roman name for the province of Artois, in France, where such wells were first formed. The London clay having been pierced in so many places, the porous beds below, which had to be supplied from the places where they outcropped, became less able to supply them all, and year by year the water grew less. The fountains in Trafalgarsquare were an imposition; so far were they from being Artesian wells, that the water did not rise to within 80 feet of the surface, and it had to be pumped up by a costly steamengine, which was more expensive than it would be to supply the fountains from the Chelsea Waterworks, and the same water was pumped up over and over again, times innumerable, - but who knew that? The brewers were now boring one against the other: to talk of getting a supply of water for London by Artesian wells was ridiculous. The expense of them, too, was enormous: one near Swindon, which was 320 feet deep, cost 1,0007.

The Dean then examined the various areas of land which supply the Coln, the Brent, and the Thames, and came to the conclusion that the latter river, near Henley, was the best source we could look to. It was a dead level the whole distance, and it was proposed to make a canal, which, having a natural fall of 3 feet, and in its whole course no engineering difficulties to render an inch of tunnelling or embanking necessary, would bring the water into a valley north of Paddington, which was 105 feet above the high-water mark. This would be high enough to supply two-thirds of the metropolis by the force of gravitation; and a portion being forced to a reservoir on Primrose-hill, the whole metropolis, even if it were twice its present size, which God forbid, might have a full and cheap supply in every house, both poor and rich.

After a statement from Mr. Clutterbuck, confirmatory of the correctness of the sections,

Mr. Tite said the Dean had spoken warmly of those who had taunted him with being a mere theorist. Ignorance was always presumptuous, and no class of men found this out so fully as architects. Every man, woman, and child was an architect by nature, or thought so, and

always knew his (the speaker's) business better than himself. As to the subject of the evening. He had not been aware before that an Artesian well was one that was constantly overflowing: he thought the term simply distinguished water obtained by boring. But of this there could be no doubt, that what were called Artesian wells required frequent deepening, and were a source of constant expense. He sincerely hoped that the Government would take up the supply question. It ought to be looked upon as a national question; for a large city like this, containing so immense a population, ought not to be left dependent for the supply of so important and necessary an article as water upon private companies or individual speculators. He would not express any opinion as to the means by which a sufficient supply of water should be obtained, but he believed that a public discussion of this nature would be attended with very beneficial results. The object was to obtain the greatest amount of good with the least private injury. The best science of the country ought to be called in to aid the inquiry.

M. Robert Stephenson, M.P., had listened with gratification to Dr. Buckland's remarks, and though he did not feel himself in a position to express any precise opinion on the subject, he would say he had some doubts as to the desirability of obtaining the supply in the manner pointed out. The usefulness of a river so greatly depends on the quantity of water flowing through it, that it seemed doubtful if we could abstract so much from the Thames without interfering with the navigation. This should be inquired into. If we could take it from the tributary streams at high level, abstract it from what went to form floods, would it not be better? This was a view that had occupied his mind for some time. He quite concurred with the Dean in the belief that a proper supply for London could not be had from Artesian wells.

Mr. Homersham considered that the chalk held larger quantities of water than the Dean asserted was the case, and that when the fissures containing it were reached, the other wells were not necessarily lowered, but water was forthcoming which otherwise would run to waste in the sea.

Mr. Horn and Mr. Reid, both owners of Artesian wells; Mr. Stanford, M.P.; Mr. Dickenson; and Mr. Foggo, made each a few observations; and Mr. T. Piper said that the point to be remembered, as it seemed to him, was,-that, of the water which fell as rain, and which was alone available, one-third goes to the river, one-third to the ground, and onethird to supply waste by evaporation, &c.; and that the one-third which goes to the river is more easily got at than that which goes to the ground.

THE OLD CHURCH SPIRE AT BIR-MINGHAM has been declared, by a majority of architects and surveyors, to be decidedly unsafe and liable to fall down if not taken down. is to be hoped, however, that whether the latter or the former, such an ancient landmark as St. Martin's spire will be at once restored; for in a place like Birmingham, where all is new and without associations, -every ancient landmark passing away one after another,—so prominent a monument of the olden time can ill be spared. The question has been started whether the church should not be entirely rebuilt; but however identical in form position, it may be a second question, subtle and profound as that of the identity of Sir John Cutler's silk stocking and profound John Cutler's silk stockings darned with worsted till no silk remained,—whether such a rehuilding would constitute a restoration of the ancient fabric of St. Martin's. PROPOSED OPERATIVES' PROVIDENT INSTITUTION. BUILDING SOCIETIES.

Besides the classes you have addressed in urging the establishment of the proposed institution, there is another, the members of which are awakened to a sense of its necessity—I mean the artificers themselves. You have already shown it to be alike the duty and interest of the employers to assist in carrying out the benevolent measure, but I think its startling need cannot be too strongly dwelt upon.

Few were prepared for the disclosures which were made to the Parliamentary Committee on the "Friendly Societies Bill." This report reveals a state of things lamentable to contemplate, and each page of the evidence which accompanies it shows the necessity of the the necessity of the timely interference of the masters in such a more forcibly than any comment

Friendly societies are divided into two classes the enrolled and unenrolled: one with, the other without, the protection of the law. In order to be entitled to enrolment, the tables are required to be certified by an actuary, and if they are at all reasonable, the certificate is the certificate is given,—it being acknowledged that, of necessity, their safety cannot be guaranteed, as localities materially affect their accuracy little difference is made with regard to them. But it appears that even this slight restraint is cast off, for an eminent actuary stated that cannot certify more than one society's tables in ten, which are sent him for that purpose, and that the nine form themselves into pose, and that the limit of the threaters into the liliegal associations. In the evidence the reader is startled by the frequent recurrence of the term "young blood," and discovers that most of the clubs are indebted to it for existence. The subscriptions of young en-tering members are appropriated to pay the claims of the old ones, who can be regarded in no other character than as decoy-ducks, and the system which gives rise to such practices as a perpetual fraud of the old on the young. It there appears that 14,000 of these institutions have been enrolled; that a greater number have been formed and not enrolled; that very many have been broken up, and that a vast majority of those still remaining in existence are insolvent.

It appears that most of the town clubs are formed by publicans, to extend their business. Advantage is taken of the working man's ignorance of statistics, and the tahle are made such as to draw customers; indeed, it is a branch of the trade, and there being opposition, a rivalry exists to underbid each

other.

In these societies members are exposed not only to unsound tables and acts of injustice, but in the unenrolled ones to direct fraud, and must suffer without having any remedy. officers may rob with impunity, yet the law cannot touch them. We read of a secretary coolly "keeping" 501., and walking about the streets laughing at his dupes; of another who embezzled 5,0001, and although tried and pronounced by the judge to be morally guilty, yet he could neither be convicted nor deprived of

Most disastrous consequences have resulted from the spread of these societies. Ministers, visiting the dwellings of the poor, and noting the prevailing misery, having inquired the cause of such distress, learned that it arose in many instances from the breaking in of clubs; and a clergyman who examined the inmates of the Birmingham workhouse, found that of the 152 who had been driven to claim the pauper's crust, 79 had belonged to sick clubs, which had all failed at the time their as-sistance was needed. A member of the committee truly said, "There had been a very general confiscation of the property of the

No doubt there are clubs respectably conducted, but, like railways, until they are generally reformed the poor man will blindly speculate, in selecting one worthy of his confidence, and there are serious evils connected with the best conducted which ought never to exist in institutions of the kind; usual practice of meeting on Saturday evenings in a public-house. In order to gain a good the member is subjected to such bad influences as will lead to the abuse of it when

ttained. The time has really come when the forkman will willingly sacrifice the pleasure form and the secret signs of Odd-fellowship, to ecure the more ordinary benefits which the resent measure would bring within his reach. There are other societies which are held in

There are other societies which are held in igh estimation in many quarters, and which re constantly being recommended to the riisan, as enabling him to obtain a dwelling-touse on advantageous terms, and thus concerning on him political rights,—viz., building ocieties. I am fully sensible of the great mportance of the workman possessing a nouse, but an examination into the operations of these societies, which profess to give him one, will convince the inquirer that they are much more adapted for men who have ther resources than their lahour. Nothing can be more excellent than the object, but how is it carried out?

han be more excellent that the object, but now is it carried out?

I have made inyself acquainted with their working, and think they may succeed if they are respectably managed, and do not get involved in litigation. But who will benefit by

their success?

their success?

By paying 10s. monthly, for twelve years, or for a shorter or longer period, according to the prosperity of the society, the member is promised 120l.; or if he wisles to obtain his share in advance, he can receive it, subject to a large discount (in the first year the minimum fixed by the rules is 65l., and is usually about 78l.), so that he will have to be content with 42l. in ready money, and bind himself to continue subscribing 10s. a-month until the termination of the society, which will take place mination of the society, which will take place mination of the society, which will take place when every unadvanced share reaches the value of 120*l.*, which being calculated at twelve years, would amount to 72*l.*, besides fines, fees, and other charges. From this, it is clear who has the advantage, the borrower or depositor. Indeed, it will scarcely be credited, that people blindly borrow money of these societies at a higher rate of interest than it observed on vivise leans, in effecting which these societies at a inguer rate of interest that is charged on private loans, in effecting which there is less risk and expense. Yet such is the fact, for in the first yearly report of one of these associations—the respectability of which is above suspicion—which is selected, because is above suspicion—which is selected, because the directors "cordially congratulate their fellow members upon the pre-eminent success which has attended their efforts,—a success which they confidently believe will signalize it among the numerous similar societies now in operation," we read that "the rate of discount given by the members to obtain their shares in advance has averaged 771. 9s. 3d. (for round figures, I will say 781.), so that each of the shares of the ultimate value of 1201. has been satisfied, by means of 421. advanced in ready money." Now, for this 421 the borrower is liable for 721. (if not more), besides the heavy charges; whereas the same amount, if othercharges; whereas the same amount, if othercharges; whereas the same amount, if other-wise horrowed, for twelve years, at 5 per cent, would make, with the interest, only 67l. 4s., showing a clear balance of 4l. 16s. in favour of the latter mode, and which would allow the use of the 42l. throughout, instead of having to refund a seventh part of it annually. To suppose that these building societies are what their name denotes, is little else than a popular error. They are in reality mere loan societies, with the difference that they advance money on real are in reality mere loan societies, with the difference that they advance money on real property only, and at a more extravagant rate of interest; and as loan societies, they would be shunned by the poor man, did not the bills announce that the cash has to be "sold;" it before he fully comprehends the nature of the transaction.

The statement of the accounts of the society already alluded to, shows a progressive advance of upwards of 17t. on each existing share (on which 6t. has been paid), towards its ultimate realization of 120t.: that is to say, its ultimate realization of 1200.: that is to say, the 61, has been so lucratively employed, as to have produced upwards of 111. in twelve months, and which is at the rate of 3501, per cent. on the gradual payment. This appears encouraging, but almost too much so. How has such an enormous profit arisen? Some one must have suffered, and I fear it has been the norm than the page. the poor borrower, whose benefit was alone contemplated by the Legislature, when it authorized the establishment of these societies.

But if a man wise enough to be an investing member desires to realize this profit, or any fair proportion of it, he is told that it is all prospective, and that there is no interim benefit. It is not surprising that he begins to count the cost and loses heart.

and loses heart.

While these societies were originally projected and sanctioned by Parliament, for the good of the labouring population, they are in reality so conducted as to prove a source of profit principally to others than those intended. A great proportion of members belong to the middle classes; and in some cases public companies have subscribed for a large number of shares. The poor man who pays on one or two shares, labours under serious disadvantages. He may be thrown out of employment, or be otherwise unable to continue his payor be otherwise unable to continue his pay-ments; then fines are incurred, which begin small but wax large, and which, according to the scale, if allowed to accumulate by his remaining long in arrear, will soon exceed the amount subscribed, which then becomes for-

True, it is provided that deposits may be withdrawn, but the rules usually allow only a limited number of such applications to be granted; and unfortunately so many, either from necessity or want of confidence, wish to retire, that several months frequently elapse hefore the payment of a claim, and then after being considerably lessened by the deduction of fines, to which he continued liable in the meanwhile. Thus the society ultimately falls into the hands of capitalists, who will reap the profits arising from the very lucrative system of advancing money, and from the forfeiture of the subscriptions of the poorer members, if it be not taken under the protection of the Court of Chancery, and then it (or rather its capital), will soon be numbered amongst the

One litigious member has all the others at his mercy. Some who have had advances have, at the expense of the "parent society," disputed the validity of the mortgage by which they are secured; and although this has not been done successfully, yet questions have arisen calcu-lated to fill the minds of those interested with doubt and alarm. In one case (Cuthill v. Kingdom) it was contended that the constitu-Angoon) it was contenued that the constitu-tion of a building society, duly enrolled, &c., was illegal, on the ground that it allowed each of its members to hold several shares, but in-asnuch as the objection had not been taken at the right time, it did not prevail; but the observations of the Barons of the Exchequer were such as to lead a writer in the Law Maga-zine, who is evidently friendly to, and thinking well of such associations in general, to say, "it is impossible to doubt that if the point had been taken in time the society would bave been held illegal, or at least not within the protection of the Act; so that if the doctrine in those dicta be law, it may be said there is scarcely at present a single benefit building society in the present a single benefit building society in the kingdom legally and properly constituted, and enrolled under the Act 6 & 7 Wm. IV., c. 32." And I find that the registrar, acting on the remarks of the judges, now refuses his certificate to any rules which do not limit the interest of a member to 150l. It is certainly prudent to constitute new societies in accordance with the interpretation put on the Act of Parliament by the three Barons of the Exchequer; but what of those previously in existence, in not one of which has there been the slightest restriction as to the number of shares?

one of which has there been the slightest restriction as to the number of shares? In another case (Mosley v. Baker) the question related to the terms on which a member who had borrowed money and given a mortgage security on real estate should be allowed to redeem. The judgment of the Vice-Chancellor has been appealed against; but the appeal heing not yet heard, the operations of the society must in the meanwhile be much circumscribed.

Another case is now pending, in which the

Another case is now pending, in which the society actually insists on the member paying interest on a loan after the whole amount bor rowed has been refunded, and continuing to do so till the termination of the society!

It may be asked, however, seeing that friendly clubs cannot be relied on, and that building societies are not adapted to meet the

society, and this cannot be wondered at, as it promises him a specific sum weekly during sickness, and a certain payment at death, and there is much in the nature of these benefits to commend themselves to his notice, although in so manyinstances they have never been enjoyed. And it is by thus attending to his peculiar requirements that real service can be rendered him. He does not call on his master to support him in illness or old age by systematic almsgiving, but to institute means on which he can rely, by which he may himself provide for his own necessities. This is the most urgent object: a more purely charitable one may be embodied with it, but the priaciple is helping and encouraging the poor man to help himself, and while other branches of the lower classes have the benefit of institutions recognized by their immediate employers, shall not the worthy building artisan be directed to a proper mode for making a provision? so many instances they have never been enjoyed. vision?

I can gather from your paper that the pro-I can gather from your paper that the pro-moters of the present movement do not in-voke private benevolence, always ready to be bestowed on worthy objects, but ask for the exercise of that influence which will inspire confidence, and that co-operation of the masters of the class which will insure success. Nothing of the class which will insure success. Nothing further is required to put into force the plan which has been proposed by Professor Cockerell; and looking at the actual want of the measure, it is to be hoped that such assistance will not be long withheld. The honest working man has strong claims on his employers, and the property of the control of t and generally they are kindly discharged; but another duty still remains,—shall he be allowed, without a timely warning, to be robbed of his earnings, or to invest them injudiciously? His hours of toil are perhaps saddened by forebodings, that he may end his days a wandering mendicant. Animate them by the prospect of a calm, comfortable old age; let then the master builders say, "We are disposed to sanction and direct an institution holding out definite and attainable results, to be insured to our employés on suitable conditions, at a certain time, and in sickness or misfortune," and that kindly intelligence, which originally of his earnings, or to invest them injudiciously? and that kindly intelligence, which originally suggested its establishment, will, I am sure, be ready to arrange the details of its formation.

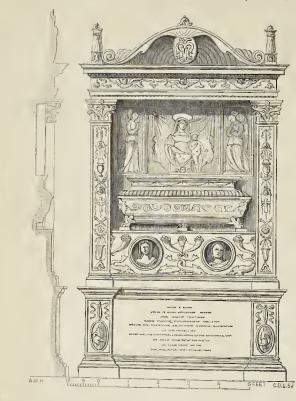

The workman who has had bitter experience of irresponsible societies, and from his connection with them has, in a sense, to commence life again, and he who cautiously remained aloof from them, will both desire to benefit by aloof from them, will both desire to settled by eminent actuaries. There is a rising distrust of incredible gains, which have to flow into the pocket it is not known how, and a growing contentment with the moderate but sure products of investments in Government or other stable securities. The great object is cer-tainty, let there be no indefinite prospects held out; the poor man cannot afford to spe-culate; if he loses, it is his all. And by carryculate; if no loss, it is man. And by early ing out this benevolent scheme, a way of providing for the evil day will be opened which will not compel him to frequent an ale-house, to talk politics, to foster moody thoughts of his relation to his master, and to grow morose; but it will, on the contrary, remove the temp-tation to intemperance and disaffection, encou-rage him to improve his mind, and teach him to see in his employer his support for the pre-sent, and in the stability of the institutions of his country his guarantee for the future.

CITY IMPROVEMENTS.—An Act is to be applied for by the London City authorities in the ensuing session of Parliament, for making a new street (in continuation of the new street a new street (in continuation of the new street from Cannon-street to the east side of Queen-street) commencing on the west side of Queen-street, crossing Bow-lane, Bread-street, Friday-street, Little Dietsff-lane, and Old Change, and terminating on the south side of St. Paul's Churchyard; for widening and improving the west end of Gresham-street West, formerly called Maiden-lane; for widening and improving Threadmedle-street; and for extending to this Act the provisions of the London Act the provisions of the London th may be asked, however, seeing that to friendly clubs cannot be relied on, and that building societies are not adapted to meet the poor man's want, why does he not take advantage of savings banks?

But there is a decided preference on his part to make a provision through a friendly Billingsgate market, to this

^{*} When it exceeds this time, which will be the case with many of them, this amount will, of course, be more.

THE TOMB OF THE BONZI FAMILY, ROME.

THE TOMB OF THE BONZI FAMILY IN THE CHURCH OF SAN GREGORIO, ROME.

The tomh of the Bonzi family in the church of San Gregorio, at Rome, is a production of the "cinque-cento" period. Monuments of this description abounding in Italy, are very numerous in Florence, the capital of that portion of the world in which a love for the truly heautiful in art was first rekindled. In this work, evidently the fruit of one mind, sculpture and architecture are combined, while a painter's feeling is infused into the composition by means of the figures in low relief introduced in the heat ground about the composition.

hy means of the figures in low rener introduced in the hack ground above the sarcophagus.

So intense was the feeling for art at its dawn in Italy, and for a long period subsequently in that country, that the triple power of painter, sculptor, and architect centred not unfrequently in one single being; nor is there an instance on record of an artist of that period excelling solely in one hranch of art. In dwelling, then, upon the works of a period celebrated for the growth of art, it is well to mark the course pursued by artists whose works have given so much dignity to a particular epoch: this study may lead us to adopt salutary measures to remedy the languid state of art—of architecture particularly—in our own age and country. Amongst the various reasons which may he assigned for the unsatisfactory state of architecture in England, there is, perhaps, no one more weighty than the erroneous position of the architect himself. With us the architect's defective education isolates him from the painter and sculptor: he who professes an art which receives so much of its lustre from the united charms of painting and sculpture has no fellowship with the followers of those intellectual pursuits. With us the architect's very place of study has changed its character and its name,—there should be more of the studio and less of the office. An architect should he an artist, not dipping his tiny salhe hair quill into pretty water colours, but in delineating the heautiful and varied forms of nature in a manner

which shall entitle him to a diploma amongst the fraternity of artists: with this knowledge, and mind and reasoning powers informed and guided by the study of geometry, intellect and thought strengthened and refined by an intimacy with the Greek and Roman tongues, sound architecture will be produced. This was the path trodden by those whose works we delight to extol: the same path will lead to the same goal; hut unless we pursue it, how can we expect to overtake those whom we strive to emulate; how enter the field against heings so armed, we ourselves heing hut half equipped? By pursuing this path architecture will recover her long-lost dignity, and present herself once nore accompanied by the sister graces, painting and sculpture. Nor does it matter much what style an architect thus fortified chooses to follow; but the orders should not he despised. By pursuing the path so palpably traced out for us, we of this age might, with our increased advantages, present to posterity something fraught with even more lasting vitality than is possessed by those cherished relics of antiquity which have lived so long.

The Greeks of the age of Pericles, and the telegrape of the filterned of

The Greeks of the age of Pericles, and the Italians of the fifteenth and sixteenth centuries, are our masters; it will not suffice merely to admire their works, we must also fall in with their mode of working.

A. W. HAKEWILL.

St. Gabriel's Church, Pimlico.—An Act is to be applied for in the ensuing session of Parliament to authorize the erection of this church on a site helonging to the Marquis of Westminster, and the raising of a fund on the credit of its pew rents, to defray the expense of huilding.

huilding.

THE NEW STREET FROM SPITALFIELDS TO SHOREDITCH.—Parliament is to be applied to for an Act to continue and amend the Act of 9th and 10th Victoria, for enabling the Woods and Forests to carry out this projected improvement.

LEICESTER-SQUARE AND PUBLIC WORKS.

Notwithstanding the immense outlay which has been lavished with unsparing hand on great national edifices, and the talent displayed in many localities of London in clearing away sinks of squalor and disease to make way for open and architectural thoroughfares, the wayfarer of the town cannot fail to observe how many majestic sites are wholly neglected, how many are illustrated by structures of only ambiguous merit, and how many slums of the metropolis have been selected for the most colossal examples of modern art.

colossal examples of modern art.

Perhaps in no city of the world is there a nobler position for a classic pile than that cocupied by the great conservatory of art (or that which ought to serve such purpose), the National Gallery

National Gallery.

In the centre from which the most important thoroughfares radiate, here was a locale for illustration hy native talent,—a largo in front almost equal to the Forum Romanum; an esplanade in the perspective revealing consecutive palaces; and in the distance all that is venerable within our precincts—the Westminster Cathedral: planted on an elevation suited to the highest aspirations of a Vitruvius, we find a long line of hlanked paries, exhibiting certainly three nohle pillared porticoes, hut surmounted hy domes of so 'mesquin' a character, as to be only adapted for the belfry of a stable!

Perhaps few will find fault with the proportions of the columns, or the details of the more ornate parts of this performance; but, unfortunately for the architect, his production, however meritorious, sinks into insignificance when the range of view, passing from left to right, is arrested by one of the finest porticoes which any city can present, the classic tympanum of St. Martin's Church. I am not aware that the rampant arms of England make it the less classic, although doubtless an inept emblem for that position, in which some insignia of the Faith would he more accordant with the general character of the house of prayer. Restriction to design—restriction to space—restriction to space—restriction above all in outlay, may have here cramped a genius, capable of better things, within the houndaries of dictation, of had taste, or chill penury.

It is unnecessary to particularize the one gorgeons evidence of misplaced profusion, or to refer to the example which appears a problem and puzzle, as signal as that which young academicians denominate in mathematics, "the asses' hridge." But few there are who have regarded the "instar monster," and who afterwards give thereupon an unbiassed opinion, although, albeit, filled with British pride at the unity of design, heauty of detail, and elahorateness of finish, and who say not with regret, "We must speak of the bridge as we pass it."

My theme is not this, for it is an episode, short and trite, from the scene of review—a part of which is Trafalgar-square. I am aware it is the fashion to slight the fountains, which give their intermittent trihute to the leaky hasins in the centre, merely hecause they are less than those of the Palais Royal, or the Place de la Concorde, hut these jets (the only examples in London), are pretty,—the hasins and vases in good taste,—and the whole effect at the same time animating to the scene and sedative to the mind.

It is gratifying to learn that something is to he done to remedy the main default of the National Gallery; and that an additional huilding is to he constructed in the rear for the merited exhibition of the Vernon hequest, and the contributions of other patriotic and highminded individuals.

The space allocated to the Nelson testimonial is sacred, and now advances towards completion: for the rest, a suitable halustrade completes the design, save that a pedestal occupies in repose the opposite angle to that on which George IV. rides slipshod. Would not this, Mr. Editor, be a glorious position for an equestrian statue of her Most Gracions Majesty? So far, the design, though naked, would be complete. Ample space would then remain for ornamental statuary, and I can conceive no plan more worthy the authorities who are the arbiters of such matters than to dedicate this only (we cannot call it solitary) grand

place as a FORUM BRITTANICUM for the consecration of beroes and statesmen, for the encouragement of sculptural art (alas! too lan-

guid), and for the elevation of public taste.

Now, Sir, I have but one word to say of Leicester-square: this second open space, a point of confluence from various quarters of the town, bas lain for years open, defiled, and a disgrace. Can this not be remedied? Some say it is private property; others that it cannot be built over. A peripatetic may sometimes see a mode of application for such a centre which will not occur to the parties beneficially concerned, as the looker-on at a game often perceives the errors of the players. Whether it be public or private property, it is clear that the opportunity should not be lost of converting it to an use equally profitable to those interested and beneficial to the panting denizens of this confined region.

It is to be hoped that the improvements meditated behind the National Gallery may include the design of a grand stradu from that point to Leicester-square, which might then become, not only a great mart for commerce, in which it is making rapid strides, but the space itself be transformed into an ornament comporting in character with the magnificence which should be allied to the recollections of Trafalgar.

recollections of Iralalgar.
With the view of some such appropriation, allow me to suggest the wayward jotting of an idler. It is this. Exeavate the whole square to a depth of 6 feet; sell the gravel—for such it is—at only two shillings a-load. The area is a trapezium, or figure of four unequal sides, presenting a frontage of nearly 700 feet; yet still the inequality would be perceptible only to an architectural eye.

Leave a sunken canseway, 13 feet wide, approached by descending flights, two at every angle. Build on every side a row of shops or stores, with ornate elevation rising 5 feet or 6 feet above the level of the adjacent street. Give to each a depth of at least 30 feet, with an area of 8 feet or 10 feet in the rear; and still in the centre you will have a parallelogram unappropriated of 50 feet by 90 feet. Cover these ranges with flagging or asphalte; raise suitable balustrades around; and here you have at once a distinguished plateau 40 feet wide, available for public recreation, susceptible of any decoration in statuary, conservative of the public health, and tributary to the increasing appetencies of prosperous trade.

In the centre, the statue (at least time honoured) might rest on its renewed and, perhaps, more elevated base; and water-works contribute to the enjoyment of the saunterer or the valetudinarian. It is manifest that the elevation of handsome ranges of shop-front and facia would not obstruct light, air, or view, wbilst sufficient to indicate the emblems of business; and that the raised causeway, approached by steps and balustered bridges (one on each side) would lighten the general design.

design.

Trusting that you will pardon the verboseness of what some may (at this fall) call my sybilline leaves, and impressed with the truth of an axiom derived from high authority, "A word spoken in due season, how good is it!" I venture at the present season on one hin more to the authorities on whom I have so often poured my unavailing advice. It is this:—The new parks have been purchased and inclosed,—aye, three years inclosed,—but not yet planted! Primrose-hill, the solace of the weary artisan, three years paled, is yet naked! Why not expend only one one HUNDRED pound-note in adorning with flowers, and shrubs, and forest trees, this only possible airy resource for the indigent, pent-up, Sunday-emancipated son or daughter of labour? It will not only gratify but humanize the million, as the contemplation of floral nature can soften neglected minds, and raise their souls to rational devotion.

Possibly, like other appeals to officials, this may be spurned; and, not being an employé, it may even be said—"What is that to thee:" nevertheless, again it is repeated, on the principle that what concerns the public is everybody's business, and of the oft-repeated maxim, "nibil alienum mihi puto qui sit," &c.

THE NEW CHURCHES IN WESTMINSTER.

ON the 8th instant, the foundation-stones of two new churches were laid in Westminster, to be dedicated respectively to St. Matthew and the Holv Trinity.

the Holy Trinity.

St. Matthew's will stand at the junction of Great Peter-street and St. Anne's-lane. The position presents no ordinary difficulties, being a site of very irregular form, literally buried in very miserable houses, and only offering very narrow frontages to two very poor streets. The tower, when built, will show in Peterstreet, the east end of chancel in St. Anne's-lane. It was necessary entirely to cover the ground, and the largest practicable nave with ordinary aisles being insufficient, the architect, Mr. Scott, was obliged to add a second aisle on the south side, which must contain a small gallery for children. The accommodation is for 1,200 persons. The cost, exclusive of tower, 6,000d.; inclusive of the tower, 7,500d. or 8,000d. Mr. Myers is the builder. The materials are Kentish rag and Bath stone. The style is Transitional, between the geometrical and flowing, perhaps that of about 1310. On the north side can be no windows, owing to building nearly up to boundary. The light will be obtained chiefly from the end windows and the clercstory. The east window is of five lights, the west of six, the latter of considerable dimensions.

The chancel, which will face St. Anne's-lane,

The chancel, which will face St. Anne's-lane, will be internally 40 feet by 23 feet 6 inches, and will be lighted by the east window of five lights, and by three windows on the south and one on the north side, the remainder of that side being occupied by a chancel, aisle, and vestry. The nave, with its aisles, will be internally 84 feet by 57 feet 6 inches, and will be of five bays, or arches, in length, and he height lighted from the clerestory and from the large west window which obtains light from above the surrounding houses. The principal entrance is through the tower, which projects again southward from the third aisle, and faces Peter-street. There are also a western entrance and one from St. Anne's-lane.

Notwithstanding the lowness of the estimate there are as yet no funds for the tower beyond the ground story, though, in such a situation, the tower is more than ordinarily needed to show the church from a distance and prevent its being absolutely lost; and, being the nearest church (St. Margaret's excepted) to the Abbey, it ought to have a steeple of some dignity. We have not seen the design, but understand the steeple proposed is somewhat more than 200 feet in height.

It presents a curious contrast between public and individual munificence that, while in the same parish two other churches are being erected, one costing 25,000l. and the other 10,000l., each paid for by private individuals, this, which trusts to public liberality, and only costs 8,000l., after receiving from societies more than 4,000l., if not 5,000l., is to be left minus its tower for want of funds! The inhabitants of Westminster seem ready recipients but niggard dispensers of charity.

The Church of the Holy Trinity is to be erected on a plot of ground called Besborough Gardens, at the junction of the Belgrave and Vauxhall-bridge roads, at the sole expense of the Rev. W. H. E. Bentinck, archdeacon and Prebendary of Westminster. Mr. Pearson is the architect, and Messrs, Smith and Appleford are the builders.

We are told that this is to be a cross church, with transepts, chancel, and porches, the vestibule being at the north-east of the chancel. The style is Early Decorated, of the time of Edward I. and II. Length of the nave, including the tower, 84 feet; width, 19 feet 3 inches; across the transepts, extreme width, 72 feet; inside length of chancel, 40 feet 6 inches; width, 20 feet 9 inches; height under the nave from the floor to the point of the roof, 51 feet; chancel, 48 feet high, and transepts same height. The space within the tower is groined over in stone at the height of about 54 feet; having three windows, which are seen from the church, and throw a light into it, forming a lantern. The height from the ground line to the top of the tower is 93 feet; height to top of the cross from the spire, which springs from the tower, 100 feet; making a total of 193 feet high. There will be sedilia in the cbancel on

the south side. The eastern windows have seven lights, the western windows six lights, and the transept windows five lights each. The dressings are of Bath stone. The walls are externally faced with Bargate stone from the neighbourhood of Godalming. The roofs are constructed in deal, and covered on the outside with Staffordshire tiles of a brown colour. The seats in the nave will be all open, made of deal, and all free. The cost of the edifice will be about 10,000%. The cburch will accommodate \$50, including about 400 children, all upon the ground, there being no galleries. It appears that it was necessary to dig for the foundation 20 feet deep from the surface.

THE LATE SIR R. MORRISON, ARCHITECT.

SIR RICHARD MORRISON, President of the Irish Institute of Architects, died on the 31st of October, at the age of 82, and was buried on the 7th inst. The funeral was attended by the members of the Institute and a large number of friends. He was the son of John Morrison, the architect, of Cork, and was originally intended for the church; ultimately, however, he was sent to Dublin, and became the pupil of Gandon, the well known architect of the courts of law, the custom-house, and other buildings in that city. Through his god-father, the Earl of Shannon, he obtained a Government appointment in the Ordnance department, but retained it only a short time, in consequence of reductions. He soon, however, got into practice, and executed a considerable number of buildings. His son, William Vitruvius Morrison, who died at the early age of 44, was for a time in partnership with him.* Sir Richard was last employed for Lord Long-ford, on a design for a Gothic mansion, and was also suprintending some alterations for the Earl of Howth. He has left considerable property, including an extensive library of architectural works. He was knighted by Earl de Grey.

LANDLORD AND TENANT. MIDDLETON v. NASH.

This was an action brought in the White-chapel County Court to recover a quarter's rent for apartments occupied by the defendant at a rental of 30t. a-year. The tenancy commenced at Michaelmas, 1848, and in March the defendant, in accordance with the terms of his agreement, gave a quarter's notice to quit. The notice was not objected to, and the plaintiff paid his rent up to Midsummer, and left the premises two months previous to the expiration of that quarter; but the landlor dreinsed to accept the key, and now sought to recover a quarter's rent up to Michaelmas, still bolding the defendant liable for the next twelve months. The defendant observed, that he thought it a case of extreme oppression, more particularly as the plaintiff had refused to accept a tenant; and, upon referring to a 'cheap' abstract of the Landlord and Tenants' Act, submitted that, if the notice was informal, the landlord was bound to object to it at the time.—His Honour: Not at all. There is no doubt it was intended that a quarter's notice should at any time be sufficient to put an end to the tenancy; but the legal construction of the agreement is, that the tenancy does not expire till the end of the year.

The defendant said the plantiff had put a bill up in shop window to let the apartments, and wished his bonour to inform him if that was not an admission of the legality of the potice?

His Honour—Certainly not: it is so much the better for you. If he lets the apartments you are no longer liable.—The plaintiff said he would be satisfied if the defendant would pay half the ensuing quarter in addition to the present claim.—His Honour advised the defendant to accede to these terms, observing that it was a case of great hardship, but the law was against him.

Ordered that the present claim be paid at 3l. a quarter.

QUONDAM.

^{*} A memoir of the late Mr. W. Vitruvius Morrison will be found in Wesle's " Quarterly Papers on Architecture," with a list of the buildings executed by himself, and in conjunction with his father.

CHAPEL IN ST. MARY'S CHURCH, GUILDFORD.

ST. MARY'S CHURCH, GUILDFORD.

The chapel here represented (now used as a vestry-room) is situated on the north side of the altar; the end is semicircular, and the vaulting was once richly painted; the prevailing colours are red and green, with an occasional intermixture of black and yellow. The subjects appear to give a history of the soul; on the right hand, above the front arch, is represented an angel with the scales in his hand, the soul, in an attitude of prayer below, awaiting its doom; the arch enemy of man is disputing with the angel being turned towards it, re-assures it. On the left are two lumman figures carried captive by two devils: the angel turning his head away from them assures their condemnation; this painting is much obliterated.

On the six panels are represented,—1st. The

on: this painting is much obliterated.

On the six panels are represented,—1st. The burial of the body, the clergy wrapping the grave clothes around it. 2nd. Two dead Christians are lying at the foot of a scribe, who seems to be entering their names in a book, probably the book of life: a figure behind is receiving a cup, from which he drinks (the

waters of regeneration). 3rd. and 4th. Represent the sufferings of the saints—boiling in a cauldron, decapitation, &c. &c., with the kings of the earth triumphing over them. 5th. The baptism of death into a new life. 6th. The judgment of the wicked—the king and executioners of the fourth compartment are drawn by two devils before a saint, and the martyr is praying for his intercession for them.

by two devils before a saint, and the martyr is praying for his intercession for them. Over the two centre compartments sits a large figure of the Saviour, and above each of the other tablets an angel kneels. The above paintings are extremely rude, but are evidences of judgment in ecclesiastical garniture, teaching by pictures, and causing the mind unconsciously to reflect.

Worknen and Masters.—We have received the names of two or three builders who considerately paid their men in full on the "Thanksgiving-day," but as doubtless others did so, too, of whom we have not heard, it would be invidious to mention them. An act of this sort will not be disregarded by the men. The amount paid, in some cases considerable, is of course all out of the pocket of the master.

DR. WHEWELL ON THE GROWTH OF STYLES.

THE following is a summary of Dr. Whewell's "Remarks on the Gothic and After-Gothic Architecture of Germany," referred to in our last number but one:

The object was to trace the transition from the complete Gothic to the After-Gothic, and the consequent dissolution of the Gothic style on pripringles of the care him of the control of

The object was to trace the transition from the complete Gothic to the After-Gothic, and the consequent dissolution of the Gothic style, on principles of the same kind as those by which the author formerly attempted to trace the formation of the Gothic style and the disappearance of Romanesque architecture. In the formation of the complete Gothic style there operated chiefly three principles, the principle of framework (with a subordinate principle of framework (with a subordinate principle of tracery), the principle of wallwork, and the principle of spire-growth. For the idea of a framework of piers, arches, windows, vaulting shafts, vaulting ribs, buttresses, and flying buttresses, is the leading distinctive principle of Gothic buildings. This principle may be followed out by itself (and this is in a great measure done in England, producing the Early English of Salisbury); the notion of framework, however, not excluding considerable masses of wall.

ST. MARY'S, GUILDFORD.

But to obtain the complete Gothic we require further the principle of tracery, and the principle of lateral cohesion, or of wallwork, which gives a new character to the mouldings (as in the English Decorated style); and these latter principles, in Germany and France, are developed at the same time with the principle of framework; so that the complete Gothic is, in those countries, the first fully formed pointed style. The principle of upward growth in the parts adds to the style several other features, as pinnacles, crockets, finials, and spires; and thus the complete Gothic is formed.

These principles may be conceived as having

reatures, as pinnacles, crockets, finials, and spires; and thus the complete Gothic is formed.

These principles may be conceived as having carried on a struggle, as it were, which was brought to a kind of balance in the complete Gothic, but which produced the After-Gothic, when the equilibrium of these principles is lost—for instance, when the principle of wall-work predominated over the principle of framework. But the principle of wall-work modified the principle of frame-work, long before it affected it injuriously. It did this indeed, as has been said already, very conspicuously in the Decorated style in England; giving to the vertical mouldings different forms and values from those of mere framework, making some members broad, some narrow, and so on. We are not, therefore, to consider buildings as showing the svidence of a corruption of style, merely because there are vertical moulded vaulting shafts, which are too slight to support vaulting; as in King's College Chapel, Cambridge, the architecture of which has been condemned on this account. Even considered as frame-work, we must take into consideration the whole bundle of mouldings, and not one member alone: but in fact, the principle of wall-work operates theoretically as well as practically in all such cases, and prevents us from regarding the shafts in the moulded wall as separate supports. The two ideas, that of frame-work and that of wall-work, are both present to the mind; and it is their combined concords and discords which produce that species of harmony in which architecture peculially rejoices.

But in the course of time the principle of framework was violated and rejected; and the

But in the course of time the principle of framework was violated and rejected; and the wallwork, the real structure of a large portion of the building, became more and more predominant. One main occasion of this was an ambition of architects, which prevailed from a nearly period, both in Germany and in France, and extended into later ages, to build very lofty churches. This attempt, pursued in the Gothic style, made the framework of buttresses and flying buttresses too massive to

be agreeable to the eye; and this blemish led at last to the plan of supporting the roof at a great height without any decorative manifestation of the framework externally. The organic connection of the parts being thus destroyed, the ornamentation of separate parts was pursued as an exercise of fancy and invention. The vaulting ribs sprang from piers with discontinuous imposts; the buttresses stopped short of the top of the wall; and the roof seemed to be supported, like a baloon, with a buoyancy within, not to be thrown up by a universal tendency of upward growth. At the same time, the principle of upward growth of one form out of another gave rise to the notion of the interpenetration of one form by another; the tracery became capricious and unconstructive, as in the flamboyant of France and the stunp-tracery of Germany; while the perpendicular tracery of England, though less flowing in form, was more pleasing to the architectural eye, from the manifest operation of the principle of masonry which it exhibited. And thus, the organization of the Gothic edifice was broken up, and the parts disbanded; each part was ornamented by itself, without connection with the rest; and this being the character of German After-Gothic, when the Italian style was revived, it was easy to apply the edifice.

THE CHURCH OF TREYFORD, ST. PETER, SUSSEX.

The style of this building, just completed under the superintendence of Mr. Ferrey, is Early Decorated. The church consists of a chancel, with north and south aisles extending half its length; nave, with north and south aisles; south porch; and steeple at the west end of north aisle. It is built of stone found on the spot, and termed the Malme Rock, among which is contained, in small quantities, a species of blue limestone rag; of this latter, the tower is constructed. The spire, windows, and dressings throughout are of Caen stone. The roofs are of English oak, open boarded also with oak, and covered with red tiles laid upon dry hairfelt; the tiles being treated with a mixture of oil and soot or lamp black. The extreme length of the church, chancel, and steeple, is 116 feet; the interior of chancel, 32 feet by 16 feet; nave, 52 feet by 22 feet; aisles, 55 feet by 10 feet; beight of chancel, 46 feet; nave, 52 feet.

The nave is of four bays, with north and south aisles. This roof is equilateral. The aisle roofs are lean-tos, the principals springing

from stone brackets. A four-light window, with flowing tracery, occupies the west end: under which is the west door, of oak, clenched, and decorated with binges of scroll iron work. The stone beench, peculiar to the churches of the neighbourhood, is carried along the walls of the nave and chancel aisles, which are otherwise unoccupied with any fixed seats. The nave is fitted with seats kept very low, with square cnds of oak plank 3 inches thick, fixed with small buttresses, and capped with trefoil moulding, all of the like substance. The old plain square First Pointed font has its elaborate cover, 14 feet in height, suspended from an iron crane fixed in the wall of the north clerestory, opposite the south door. A low stone pulpit is placed against the south pier of the chancel arch; on the opposite side of which stands the open reading desk, of oak, the front panels of which are filled with crimson velvet, with gold-worked floriated crosses. The Bible desk, or lectern, rising from an octagonal shaft of buttresses, is placed in front of the chancel steps, immediately before the pulpit, on the south of the chancel entrance.

The chancel is entered by two stems under a supplementation.

trance.

The chancel is entered by two steps under a screen carved in oak. Three other steps lead to the altar table, placed upon a flooring of encaustic tiles, with a border of vine leaves upon a bright blue ground. The east window of three trefoil-headed lights with tracery, forming a trinity of trefoils, is placed high up in the gable, leaving room beneath its sill for a reredos of seven arches worked in chalk. Four trefoil-headed and varied single windows occupy the north and south sides. Under these on the south side are inserted three sedilia, worked in the native or Malne atone—a species of grey-coloured marble, which is also used for the interior facing of the lower portion of the walls, the upper part being of chalk—as are also the splays, shafts, and interior mouldings of the east window. The pricst's door is a copy from Wells of a cinquefoiled canopied doorway, with crockets, finial, and bosses.

The steeple consists of a disengaged tower, surmounted by a hrooch spire, at the west end of the north aisles, of three unequal stages, flanked by square-set buttresses of four stages, the upper stage diminishing and dying into the tower a few feet below the spire cornice. The brooch spire rises from the cornice, charged with ball flowers, and has the gussets or haunches springing from the angles carried high up the diagonal faces of the octagon.

THE DIPLOMA QUESTION.

SEEING that the question of making architects legally diplomaed is being mooted in your journal, I beg to send in my earnest and most hearty adherence to any good system adopted to obtain that end, and would propose that you should invite all our professional brethren to do the same: we then should see how strong we are. Perhaps the Institute might be jealous of such a proceeding, and if so, rather than not obtain the assistance and co-operation of so powerful a body, let us entreat them to take this praiseworthy object in their own hands, for social distinction is the absorbing end and aim of the mass of Englishmen; and it is most desirable it should be so. Now, at present the architect is in a most anomalous position: he is by the great mass of the community looked on as something between the professional man and the tradesman, and with justice, since his function is so often usurped by the builder, and by unqualified and inferior men. Is it not most irritating that a man, who for years and years has studied architecture, not only as a compilation of brick, wood, and mortar, but as a fine art, and who appreciates the beauties, and knows the difficulties of such study, should be superseded by one who cannot possess his qualifications? Is there not a broad gap between the drug seller and the drug prescriber, the druggist and the physician? There is and ought to be; but it is mainly owing to the diploma that it is so; and such should be the case with architects and builders. I consider that the superior education in art, and the study requisite to make an architect, give him a just, reasonable, and legal right to assert his superiority and have it allowed; and that his

present position is inferior to what he is properly entitled to hold, once having been recognized as duly qualified, and enrolled into a legalized body. In no occupation are there more quacks than in architecture; and to destroy this set of men what live amount the brains. stroy this set of men, who live upon the brains, the talent, the heart-breakings of the educated but poor or unassisted, I am sure a diploma is necessary. How many architects take pupils and send them out in the world after three or five years, almost as ignorant as they took and how many would dare to do this them? if they thought that the efficiency of their instruction would, at the end of that time, be tested by a legalized examination? In fine, everything seems to me to demand this innovation. It is to seems to me to demand this inhovation. This of the interest of ourselves, and the public as well, that we should be incorporated into a legal profession, and that it should be done quickly.

J. B. WARING. quickly.

I have read with much satisfaction Mr. French's observations on the education of an architect, and the advantages that would and must arise from an establishment such as he must arise from an establishment state as he proposes. At present, the young men of the day enjoy hut few more advantages than they did fifty years ago. A young man is put into an architect's office (perhaps with a large premium) for six or seven years, and during that period he has little or no attention paid by the principal to his education as an architect, or to qualify him for one. He has seldom an opportunity of visiting buildings to study construction or the finishing of an edifice; he is left to draw out the orders, and find the best way of accomplishing this; he has seldom any explanation given, either in this or any other portion of the routine of business; and is it to be wondered at that, when he is out of his time, he knows so little? After he quits the office there is no institution open to him of an evening for practical instruction, - no general architectural library, - no collection of working models or drawings to refer to, -no models of modes of drawings to reter to,—no modes or buildings,—no practical experiments, or lectures in a lecture-room. It has hitherto been urged, and it cannot be too often repeated, that the Institute of the British Architects does not hold out sufficient encouragement, or combine sufficient advantages, for the rising generation. Till this is done, a young man must and would lahour under great disadvan-tages in taking a diploma in architecture,—a point very desirable to render the profession what it ought to he, both respectable and effi-

HERTFORD GAOL-DRAINAGE.

WITH reference to a paragraph in our last number, headed, "Effect of Bad Drainage," mentioning the verdict of a jury which attributed the ravages of the cholera in Hertford County Gaol to the want of drainage there, and that Gaol to the want of drainage there, and that the coroner had, in accordance with their request, drawn the attention of the justices to the fact,—we have received a letter from Mr. Thomas Smith, the architect, couched in terms which might have been more courteous, expressing astonishment that we "should be capable of publishing and adopting as our own opinion [which we did not do] the sapient notions of a country corpore's intra without notions of a country coroner's jury, without inquiring into facts;" and calling on us to reprint the following paragraph from the Herts Mercury of the 17th inst:—" In consequence Mercury of the 17th inst.:—" In consequence of the letter addressed to the magistrates by the coroner, and forwarded to the Secretary of State, a careful investigation has been made by the inspector of prisons, the result of which is that no certain conclusion can he arrived at as to the cause of the disease. The drainage of the prison has heen completely renewed since the cholera prevailed in January last, and Dr. Davies is decidedly of opinion that the drainage is not the cause of the recent attack. Every possible effort to improve the drainage of the gaol has been made for many years past; and we believe that further improvement is under consideration; but the difficulties in the way of making a perfect drainage (from local circumstances) is very great, and hitherto have been insurmountable."

informant, simply mentioned an occurrence, informant, simply mentioned an occurrence, confirmed in every particular by Mr., Smith himself, and so far from desiring to be "guilty of the bad taste of indirectly casting a stigma on him," whom we did not mention or refer to in the slightest degree, or indeed on any person, we added a couple of lines showing we could scarcely reconcile the readiet with our impression that improveverdict with our impression that improve-ments had recently been made in the prison. We should be the last to give currency to an erroneous statement affecting any architect, but it is not usually necessary to inquire into the correctness of the verdict of a jury hefore publishing it. We should be quite satisfied if all architects had the same consideration for us that we have for them.

NOTES IN THE PROVINCES. A NEW dock (the Sidon) has just been com-

pleted and opened at Portsmouth. It is the seventh in the establishment, and constitutes arm of the new hasin for steamers. length is 305 feet, hreadth of entrance 80 feet, depth 32 feet, containing 21 feet of water at lowest spring tide. The materials used in its construction are stated by a Hampshire contemporary to have comprised 52,800 cubic feet of beech timber; 20,800 cubic feet of Purbeck tone, 16,600 tone, 45 chirals 11,220 and stone, 16,660 tons of shingle; 10,300 cubic feet of Portland stone; 2,954,300 hricks; 119,960 cubic feet of granite; 1,018 cwt. of iron, in pile shoes, &c. The actual cost of the dock is 67,000. The inlet docks (other arms dock is 67,000l. The inlet docks (other arms of the great basin, opposite the Sidon dock), now in part built, also under Mr. Rolt's contract, and for which an immense amount of material is on the ground, will be proceeded with next year.—The visiting justices of the county of Worcester have received tenders for erecting their pauper lunatic asylum. They have accepted the estimate of Mr. They have Haines, whose tender was 23,500l.-Thos. The Bristol iron-works have been sold piece-meal by auction. The sale commenced on 22nd and was to conclude on Friday. breaking up of these extensive works com-menced with the sale of tools and materials, in which were many of the most improved ma-chines hy Nasmyth, Fairbairn, Hicks, Whit-worth, Fox, Morgan, Haley, Sharp, Roberts, and other makers; then followed the machinery of the old erecting-shop, forge-shop fitted with steam-engines, life-hammers, anvils, &c., smiths' shops, anchor-smiths' shops, brass smiths snops, anenor-smiths snops, brass foundry, copper-smith's shops, millwrights' shop, saw-mills, iron-foundry, &c. The sale throughout, according to the Bristol Journal, has been well attended by buyers from most of the engineering firms in Great Britain and the continent, and the lots have been well contested, and brought in most cases a fair value. The freehold and premises were sold for 11,4701.—Some improvements are in pro-11,4701.—Some improvements are in progress at Buxton, particularly a pile of buildings to be called "Winster-place," with first class hotel and shops, forming a frontage of 150 feet, on the site of the old Angel Inn and other premises. Mr. Worth, of Sheffield, supplied the design.—It is intended to erect a memorial window in Chester Cathedral in honour of the late Mr. G. E. Anson, son of the Dean of Chester.—At the Liverpool Police Court, lately, a builder, Mr. William Clegg, appeared in an information preferred against him by Mr. Rishton, the building surveyor, for erecting a store-room to premises veyor, for erecting a store-room to premises veyor, for erecting a store-room to premises occupied as an eating-house, in Presson's-row, in contravention of the Act of Parliament, and without notice given to the surveyor. The defendant excused himself by saying that his men erected the building, and he was ignorant of it until it was completed. The surveyor said, that on former occasions the defendant blamed his men. The slove in outsettor was blamed his men. The place in question was built over the privies and ash-pits. Mr. Rushton fined the defendant 5l., adding that no man permitted his servants to work at places and not know what they were doing. The erection will be taken down. — Trinity Church, Runcorn, has been re-opened after its enlargement and other improvement. A new chancel and a stained glass window have been been insurmountable."

The tone assumed by Mr. Smith in list letter was quite uncalled for, and would have justified its consignment to the paper basket. The new church of St. Mark, Ocker-hill Tipton, was consecrated on Tuesday week. It will accommodate 640 persons. The windows are filled with stained glass, by Messrs. Chance, of Birmingham. The font is of Caen stone, by Mr. Peter Hollins, of Birmingham. The chancel is floored with Minton's encaustic tiles. This church was erected by grants from the Lichfield Diocesan Church Extension Society. The contractor was Mr. J. E. Hall, of Nottingham. In the original design a spire surmounts ham. In the original design a spire surmounts the building, but the funds are short 250l., even without this addition.—The first stone of a new national school for the labouring classes was laid at Spofforth, on Wednesday week. The cost will be about 650l., of which Colonel Wyndham has presented 400l., besides the site. The plan was supplied by Mr. Parsons, of Harewood.—About 2,500l. have been subscribed for the erection of a new church at Ambleside, to cost about 4,000l., exclusive of east window, organ, &c. Wordsworth her contributed 30l. Lady Le Fleming weath her contributed 30l. Lady Le Fleming. exclusive of east window, organ, &c. Words-worth has contributed 30l., Lady Le Fleming 500l., and Mr. Benson, the clergyman (who has already built a parsonage), 1,000l. more.

The extension of the Leith pier, and the construction of the spacious new harbour, are in active progress, together with a line of railway to meet the low-water pier, whence the largest steamers will sail at all times of tide.

THE PARIS AND STRASBURG RAILWAY STATION.

Cannor you give us the name of the archi-tect of the new railway station at Paris, shown in a recent numher? As to that design, there is something striking and good in it; but a little more study in working out the ideas, and working up the composition, would have ren-dered the good a great deal better, if only by weeding out some defects, among which is the intolerably gross solecism and palpable absurdity of a balustrade placed upon the sloping sides of a gable or roof. If the architect has "thought for himself" in other respects, he was surely not thinking at all when he was surely not thinking at all water he due that,—for, besides being an absurdity, it is such a deformity also, that it discredits his taste no less than his judgment. The plan being a mere diagram, it is impossible to un-derstand from it how the central portice or arcade is disposed internally, and whether there are other arches and columns behind those seen in front. Another matter which requires explanation is the large arch,—it not being apparent from the engraving whether it forms a semi-dome within, or a semi-cylindrical

, We believe that the architect of the station is Mons. Duquesneit. There are other arches and columns behind those seen in front. The large arch is simply in the thickness of the front wall. The huilding has an iron roof, of which we shall probably speak again. The zinc covering was laid by the Vieille Montagne Zinc Mining Company.

PARSONAGE HOUSES.

Ar a meeting of the Oxford Architectural Society held last week, Mr. J. Billing read a paper on "Parsonage Houses," of which the following is a summary:—The parsonage should be within view of the church, and in strict accordance with those feelings which its consecrated character calls forth. Old English domestic architecture, with its high-pitched roofs and substantial character, is best suited to fulfit this condition: it is also capable of being adapted to the peculiar materials of the respective localities, which should always be made adapted to the peculiar materials of the respec-tive localities, which should always be made use of if possible, for economy and to avoid singularity, at the same time this style need not have the appearance of poverty. There are but few early examples of parsonage houses, for until the Reformation, the clergy houses, for until the Reformation, the clergy lived mostly in abbeys and other religious houses; hence no trace is found of isolated residences, erected prior to that period, which will accord with the parsonage of the present day. The half-timbered houses at first prevailed from motives of economy, but their unsubstantial character was soon discovered, and extract the resuse but

Servile adhesion to ancient models cannot be required, and in the use of mediaval domestic architecture there will be found no sacrifice of any of the comforts which the wants and wishes of the present generation demand. The points to be attended to for a parsonage are—Its position near the church, hecause of the associations before alluded to, and for the convenience of the clergyman. 2. The immediate site should not be on too retentive a soil: the non-absorbent qualities of clay render a house built thereon uncomfortable, and to a certain degree unhealthy. 3. The materials and style as before stated. 4. The size should not he always suited to the family which is intended primarily to inhabit it: it is hull for succeeding generations, and therefore should not he too large for the pastor's means,—generally a good dining-room, drawing-room, study, and waiting-hall, with offices, and seven hed-rooms, at a cost of 1,100/. or 1,200/., is sufficient. The parsonage, in its external effect, and in its internal arrangement, should he a place for calm and holy meditation, without unnecessary decorations, where want or sorrow must often in its application for pity grudge the expenditure which might have given rehef. It should, on the contrary, be the permanent comfort of the locality outwardly evidencing, as well as nurturing within its walls, those devout sympathies which are peculiarly a pastor's privilege and delight.*

ST. STEPHEN'S, WALBROOK, LONDON.

I went on the 15th to the beautiful church of St. Stephen, at Walhrook. The day heing one of the most memorable I had ever known—a day of thanksgiving hy a Christian people for divine mercy in the withdrawal of a plague, I felt desirous of hearing a great Christian orator on so signal an occasion. I thought the preacher there would he equal to it, and so he was, as far as human powers could make him so. For in the nohle discourse he delivered, seemingly without any notes or hints, Dr. Croly never faltered once for a word, and anything grander than that oration you would look for in vain, either in Barrow, Bossnet, Blair, Massillon, or Rohert Hall. What a chain of argument! What fine images! What harmony of diction!

ine images! What harmony of diction!
But, Sir, when I looked up and ahout me, and saw that gem of architecture, in which the orator stood, how I hlushed for my country! I shall not attempt to describe the precocious decay of that exquisite temple: the walls, the pillars, the ceiling, the heautiful dome itself, the whole is getting hlack with grime, and injured by the weather, so that the very light of heaven seems to come sparingly into the house of God, and to frown upon the harharity of our citizens. Let me entreat you, Sir, to do something to awaken their sympathy, if not their shame.

J. T. S.

their shame.

*** More than two years ago (vol. v., p. 273) we pointed out the miserable condition of this church, in an article which excited some attention at the time, but led to nothing, in consequence of the involved state of the parish accounts. Since then, however, if we understand rightly, the differences have been arranged, so that there seems less reason why the church should be suffered to go to ruin or remain in dirt and degradation.—ED.

Fall of Railway Arches, Camden Town.—On Sunday morning, the 18th, seven large brick arches, being part of the East and West India Dock and Birmingham Junction Railway, in the Kentish-Town-road, fell to the ground. We had written a notice of the occurrence, hut in consequence of two (perhaps erroneous) letters, are led to postpone it. It is a very serious matter, and should be inquired into rigorously. We would suggest that the coroner should summon a jury to determine the cause.

Books.

The Ecclesiastical and Architectural Topography of England. J. H. Parker, Oxford and London.

The new Part of this amplification of Rickman's notices is appropriated to Buckinghamshire, and has heen prepared chiefly from the notes of Mr. W. Caveler. The publisher proposes to abandon the alphahetical arrangement of the counties, and to issue them in such order as will best consist with the making of each diocese complete, before entering on another. It will form a very valuable book for reference when finished.

Antiquarian Gleanings in the North of England. Drawn and etched by W. B. Scott. No. 2. London: Geo. Bell. This second part has ten plates, including an ancient pulpit, formerly belonging to Jarrow Church, a pastoral staff, the frith stool of Hexham, &c. The pulpit is an interesting example, and would seem to be of foreign work; the staff is of the Early English period. Mr. Scott bas scarcely the same mastery of Gothic forms as of Italian.

Choice Examples of Art Workmanship, Mediaval and Modern. Bogue, and Cundall. No. 1. The intention of this serial is to give representations of works of skill in the manufacture of metals and pottery, carvings of wood and ivory, &c. Beauty, not singularity, is to he the guide in the selection. Let the editor adhere to this, and the collection will be really valuable. The metal canopy, by George Syrlein, is fanciful and elegant.

Miscellanea.

GAS-LIGHTING. - The Salford Council Committee in management of the Corporation Gas Works report, that notwithstanding the reduction of charges for gas from 6s. and 5s. to 5s. and 4s. 6d. a thousand cuhic feet (or rather in consequence of that reduction it might have heen said), the gas rental shows an increase over previous returns, and "they are confirmed in their previous opinion, that a very large increase in the consumption of gas will he the result of the reduction in the price." The rental in 1848 was 12,770l. odds, price." The rental in 1848 was 12,770l. odds, —in 1849 it rose to about 15,000l. The consumption in private houses, the committee believe, would be still further and greatly increased by hiring out meters at a small quarterly charge. The populons district of Old Trafford and the west-end of the Stretford roads is about to have the henefits of the Gas Act network to its consultration. Act extended to it, according to the Manchester Spectator.—We hear somewhat contradictory reports as to the introduction of the hydro-carbon gas into Southport. Several postponements, arising from an insufficiency of gas to fill the pipes, are said to have occaof gas to fill the pipes, are said to have occasioned some disappointment, but the Liverpool Standard states, that though on trial the gas at first appeared very dim, it at length was got to hurn with hrilliancy. The lighting of gas at first appeared very dim, it at length was got to hurn with irilliancy. The lighting of Belfast under this patent depends, it seems, on the result of the Southport experiment.

—Downham-market is being lighted with gas, not only in its streets and shops, but in many of its private dwellings. The church has also been lighted.——The Central Gas Conquerer, Congruence for Light and Congruence. Consumers' Company for lighting the City of London and its liberties, &c., is quietly mustering its forces. Notice has been given of the intention to apply for an Act of incorporation in the ensuing session of Parliament, with all necessary powers. The directors are said to have entered into formal written engagements for delivery of gas of superior purity and illuminating power into the company's gas-holders, at 1s. 4½d, per 1,000 cubic feet, and 4,680 extensive consumers within the city are said to have already contracted to take 270,000,000 feet, at a maximum price of 4s. 270,000,000 feet, at a maximum price of 48, per 1,000. When the consumption from the company reaches 750,000,000, they promise to reduce their charge to 38, per 1,000, and in either case to clear a dividend of 10 per cent. A company of gas engineers and contractors, we observe, are offering to manufacture gas, either on a small scale or a large, so as to be saleable in all cases at 3s, per 1,000 cubic

PROJECTED WORKS.—Advertisements have heen issued for tenders by 11th December for the re-erection of Lianfihangel-yr-Arth-bridge, over the river Troy; hy 28th instant, for the erection of an iron shed, 80 feet by 18 feet, for the Commercial Gas Company, Stepney; hy 15th December, for the erection of a hanking-house at Northampton; by same date, for the erection of the Northampton Exchange; by 1st December, for alterations and additions to Chelsea workhouse; by 31st December, for alterations and additions to Chelsea workhouse; by 31st December, for 10,000 feet of 3-inch York paving, and 700 yards run of 6 by 12 Aberdeen granite curb; hy 30th instant, for the erection of schools at Brymbro (Wrexham), for 300 children, with teachers' house; hy same date, for the erection of schools at Minera (Wrexham) for 300 children, with teachers' house; hy same date, for the erection of schools at Minera (Wrexham) for 300 children, with teachers' house; hy same date, for the erection of schools at Minera (Wrexham) for 300 children, with teachers' house; hy same date, for the erection of the Great Western Railway,—also of 14 miles of same,—also for the maintenance and working of cranes, weigh hridges; by 28th inst., for the erection of a dwarf wall with palisades at Sheffield; hy 26th, for additions to and alterations of a farm-house and offices at Barham, Hunts; by 11th December, for the discussion of the Lincolnshire County Lunatic Asylum; and hy 4th December, for the erection of the Lincolnshire County Lunatic Asylum; and hy 4th December, for cutting pipe trenches and carting pipes for the Manchester Corporation Waterworks.

Competitions.—Advertisements have been issued for plans, &c., with estimates, by 20th December, for an enlargement of the Leicester workhouse,—premium 80t., or commission, as advertised; and hy 5th January, 1850, for a general map with design for drainage of district of St. Thomas the Apostle,—premiums twenty guineas and five guineas, as advertised.

Erron of Dwelling by Parishes.

—You state in your last number hut one that the inhabitants of Lambeth are about to apply to Parliament for powers to erect habitations for the working classes, and it would seem that the proposed Act is to be a local one, not a general one, enabling all parochial hodies to avail themselves of it, without necessitating the great expense of a separate Act in each case. As the latter was the idea which I wished to convey in my communication which appeared in your paper of Oct. 6, I again address you, in order to make myself quite clear. The suggestion to which I then referred is contained in a little pamphlet by Mr. C. Cochrane, entitled "How to Improve the Homes of the People," and is as follows:—"In my opinion, we cannot have an effectual remedy without the aid of the legislature; and I would suhmit that it is very desirable that parish authorities should, by Act of Parliament, he invested with the power to regulate the dwellings of the tradespeople and labouring classes,—that is to say, wherever they do not reach a certain standard of essential comfort at reasonable charges, and which must he considered the standard of civilization, or of a fit social state; then the parish authorities should have the right to erect or lease houses, to he let out to the tradespeople and working classes, and the right to erect or lease houses, to he let out to the tradespeople and working classes, and the right to erect or lease houses, to he let out to the tradespeople and working classes, and the right to erect or lease houses, to he let out to the tradespeople and working classes, and the right to erect or lease houses, to he let out to the tradespeople and working classes, and the right to erect or lease houses, to make the right to erect or lease houses, to he let out to the tradespeople and working classes, and the right to erect or lease houses, to he let out to the tradespeople and working classes, and the right to erect or lease houses, to he let out to the tradespeople and working class

PROPOSED NATIONAL GALLERY FOR SCOT-LAND.—We understand that Mr. Playfair's final plans for the contemplated National Gallery to he erected in Edinhurgh, have been transmitted to the Lords of the Treasury. The design is said to be Grecian, and the site of the structure will he south-east of the Royal Institution.

^{*} A paper on "Parsonage House," by the late Mr. Bartholomew, will be found in one of our early numbers. —Chever Chimneys.—At the same meeting Mr. Parler stated that he had received a letter from Saliabury, with reference to the old fire-place mentioned at the lat meeting, and that it appeared that the opening was originally a down any and staircase to the rood loft, and was being restored to its proper use. He also stated that the ornamental chimneys used in domestic architecture were the best for carrying up flues in a church. The President stated that a fire-place in some remote corner of the church, with a brick flue going through the building, was the best method for warming it,

JESUS COLLEGE CHAPEL, CAMBRIDGE. On All Saints' day the choir was re-opened. The series of Early English arches in the triforium of the tower is no longer concealed from view from below by the flat ceiling above the great pier arches. A north aisle bas been built to the choir and north transept on the foundations of one existing during the time of the nunnery, and communicating with the the nunnery, and communicating with the choir by two arches, found complete downlet downlet downlet downlet have the south side), embedded in the masonry of the wall. According to the local press, other arches, communicating with the north transept, were discovered and opened, but have been filled with stone screen-left for the select of strength. In the choir work for the sake of strength. In the choir itself, the east window, a modern one with glass Willement, has been removed, and a lancet of three lights and two panels, supposed to he an exact reproduction of the original, substi-tuted. The side walls have heen brought down to their ancient height, and a high-pitched roof of trussed rafters of early character raised on them. It is divided into square panels, varnished and decorated with green, vermilion, The aisle roof is blue, with white, and gold. stars in white, and the rafters oak colour, the principals relieved with vermilion. The floor is of black and red tiles between the stalls, and of black and white marble, mixed with encaustic tiles, in the sacrarium, three black marble steps forming the ascent to the altar. There is a lectern of brass in the centre of the stalls, and two brass candlesticks stand on the altar steps. The organ in the north aisle is built ontheold models, by Messrs. Bishop, of London. Painted windows for the east end are in pre-paration, and money is ready for placing stained glass also in the two south windows of the choir. Without the screen the tower piers have been repaired and cleaned, as likewise

THE LATE WILLIAM ETTY, R.A .- Many of our readers will have already heard with regret of the death of this eminent artist at York, his native city, on Tuesday in last week. From his early childhood Mr. Etty gave manifestations of his future genius. The first panels on which he drew, as he himself states, were the boards of his father's shop floor,—his first crayon a farthing's worth of white chalk; and crayon a farthing's worth of white chair; and this at a time when scarcely able to walk with-out leading strings. He died as he lived -still learning. Indeed, it may be said with truth that he has fallen a victim to perpetual toil. A hard day's work with brusb and palette was but a part of his professional occupation during the four and twenty hours. No sooner did he lay down the implements of the master, than he took up those of the student in an attendance at the life schools as regular and industrious as that of any youth engaged there in learning the elements of his art. An agreeable autobiography of Mr. Etty will be found in a late number of the Art-Journal. His beautiful and well-known works are so numerous, that if put together, as he remarked, they would nearly cover the walls of Westminster Hall. The exhibition of his collected works at the Adelphi seems to have been an ominons prelude to his own dissolution, though in these he may be said still to live with us in honour, notwithstanding he has passed away from us in flesh.

"DEFAILS OF A FRENCH CASEMENT."—
We are sorry to find that some of the figures and letters of reference on the diagrams last week do not show. We are disposed to think, however, that the whole is understandable, parentheles when looked into. nevertheless, when looked into.

A NOTE OF ACKNOWLEDGMENT.—Sir: I have often been much impressed with the great advantage your valuable paper is to the building trade, and to the architectural and sur-veying professions. I bave no doubt others have been equally so, and I think they should not merely let you know it now and then, but try and extend the circulation of the paper in return. I give you berewith a proof of one advantage to me. I received your last number this morning, and at my breakfast table, as is my usual custom, I overlooked it a little, and my usua custom, I overlooked it a little, and read your leading article. In the afternoon I received the (enclosed) letter as to rough plate glass, and in answering it, should prohably have committed myself but for your leading article.

Ringwood. SYDNEY PONTIFEX.

IMPROVEMENT OF CHELTENHAM .- The report of Mr. Cresy upon the sewerage, supply of water, and health of the inbabitants of Cheltenham, has just been issued. The in-spector recommends the establishment of a local Board of Health, the laying down a system of main sewers at the backs of all houses, the draining all houses by tubular drains, establishment of water closets, abolishing cesspools, &c., preventing sewage water from conthe streams flowing around the taminating town, regulating lodging-houses, markets, &c., establishing one general slaughter-house out of establishing one general standarder-those of the town, laying down pipes and reservoirs for distributing the sewage waters, regulating the width of courts and streets; also, "To maintain the burial-grounds in a proper state, and provide for additional interments out of the town. To remove more frequency of the property of the proper quently the decomposing refuse from the yards and areas of the inhabitants, to collect all the manure, dust, ashes, and sewer-waters, which are valuable to the farmer, and to dispose of them for the benefit of the inhabitants. To drain a sufficient area of land for the purpose of obtaining an abundance of pure wholesome water, to construct reservoirs, and lay down mains for the constant supply of water to every householder."

Another Boiler Explosion .- The report of one of these fatalities is ever echoing through the press, while another, and another still, is heard of booming in the distance. The last we have now to re-echo occurred at Stock port on Tuesday week. A workman was scalded to death, the skin peeling off his body in the attempt to extricate him from the ruins while yet alive. The inquest-jury have directed the coroner to give Sir George Grey what will now least a second warning of evil to come. The following is the resolution adopted on the present occasion: — "That, with a view to avoid as much as possible such accidents, a copy of these depositions be laid before Sir George Grey, with a request that he will be take means for arranging that certificates of the capability of those undertaking the charge of steam engines be lodged with the inspectors of factories in their several districts, hefore the overseers of steam engines be

allowed to employ them."

Fires in Nonlemen's MANSIONS. Cliefden House, near Maidenhead, lately pur-chased from the late Sir George Warrender's executors by the Duke of Sutherland, was destroyed by fire on Friday in last week, the wings and out-buildings only being saved by the demolition of the intervening colonnades. The premises burnt extended in one direction to nearly 100 feet in length, and were 60 feet in height. A large portion of the valuable and interesting contents were lost, but several of the more choice of the immense collection of paintings were saved, together with much costly furniture, musical instruments, &c. Some workmen were employed in the library when the fire took place, and blame is attri-buted to them, but there is some ground for believing that it arose from bond timbers truning into one of the flues. The mansion is said to have been fully insured.—Blenheim Palace has escaped a like fatality, originating in a building at the back of the stables, but discovered just in time to save the palace. -The Duke of Buccleuch's Palace at Dalkeith has run the same risk from a fire discovered in a servants' room, but attributed to

those old offenders the plumbers, who were repairing the roof, and allowed their embers to melt the lead and fire the woodwork beneath.

INSTITUTION OF CIVIL ENGINEERS.—
The meeting on Tuesday, November 20, was whelly cognised by a renewed discussion wholly occupied by a renewed discussion upon the Grimsby Dock. It was closed by the Dean of Westminster giving an example of the Dean of Westminster giving an example of the urgency for engineers becoming geologists; and on Mr. Rendel stating, that the clay at Leith was so hard as to require to be blasted, and yet that, when exposed to a small current of water, it was completely dissolved within a fortnight,—he at once explained it, as arising from the presence of a multitude of minute particles of mica, whose non-adhesive proper-ties produced the speedy disintegration of the mass

ARCHITECTURAL ASSOCIATION. — At a meeting held on Friday, the 16th, Mr. J. K. Colling read a paper on "Architectural Botany." A brisk discussion followed.

OXFORD COLLEGE-BUILDINGS.—Extensive improvements have been effected on the Corpus Christi College-huildings this year. the eastern boundary, adjoining the entry to Christ Church meadow, have been pulled down and entirely rebuilt. In the interior of the college a new common room is being fitted up. At Merton College a new drain is in course of construction, for which earthenware pipes, 18 inches in diameter, are to be laid down to the river. The chief ornamental work of the summer has been in the chapel of this college. The transept was re-roofed some three or four years since, under the direction of Mr. Blore; but the society have now placed them-selves in the hands of Mr. Butterfield; and under his management a new oak roof has been placed on the choir, of the original high pitch, some unsightly monuoriginal high pitch, some unsignity monu-ments removed, and the sedilia restored. The stone-work has been also cleaned and the walls fresh plastered. At St. John's College a new set of rooms is being formed in a sec-tion of the quantrangle forming the range to the right of the tower which surmounts the main entrance from St. Giles's-street. The tower over the principal gateway is also being refaced. In Magdalen Hall, at one side of the quadrangle bounded by New College-lane, the quadrangle bounded by New College-lane, the buildings are being heightened, at the expense of the principal. At New College they are slating the cloisters. At Magdalen College, in the space adjoining the Grove and fronting High-street, men have been employed in clearing out the foundation for the erection of the new grammar-school, &c. At Oriel Col-lege also, and St. Mary Hall, restorations have been in progress during vacation. The re-facing of the theatre is also being proceeded with. We could not speak well of all that has been done.

SHERBORNE CHURCH RESTORATION Pew Property.—In restoring the nave of Sherborne Church, a large pew in the 'Leweston Aisle' was lately knocked down by the workmen, whereon a question arose as to the workmen, whereon a question arose as to the proprietorship, when it appeared that the Leweston Aisle, or St. Catherine's Chapel, was granted, on 12th Jauuary, 1587, to the fitz-James family, by intermarriage in which, the Leweston family came into possession, and held it till the Leweston estate fell into the hands of Mr. R. Gordon. The vestry, in absence of the vicar, waiving the point of whether the heir or the assignee of the Fitz-James family, or the parish by lapse of heir-ship, were the right proprietor, resolved that Mr. Gordon be authorized to repair and use the aisle as possessor of the Leweston estate. The demolition had been effected without the

No. CCCLVI.

SATURDAY, DECEMBER 1, 1849.

MONGST a pile of books with which we would make our readers acquainted is one, still wet from the press, by Lord Alhert Denison (late Conyngham),

whose recent accession of wealth, with his new name, will be hailed with lively satisfaction by all who know his lordship's kind feelings, liheral views, and enlightened tastes. It is entitled, "Wanderings in Search of Health," and is the journal, written with a running pen, of recent hasty travels in Greece and Italy, made with his amiahle lady, between November of last year and May of this. As it is published for private circulation only, it will fall into few hands, and we shall therefore give some abstracts from it relating to those matters which more immediately interest our circle.

When in Malta, the author visited the colossal church building at Musta, on the plan of the Pantheon at Rome. The village contains only 6,000 inhabitants, almost all of the poorer classes; and this enormous building arises from a native of the village, a poor priest, Don Felice Calleja, having celebrated his first mass in the Panthcon. "The thought then suddenly struck him of raising a similar temple in his own native village. Upon his return to Malta and to Musta, appointed parish priest, he laboured hard in the accumulation of wealth, and laid by money with the most scrupulous care. Unable to carry out his darling plan in his life-time, he left his property by will for the purpose of erecting a round temple like the Pantheon. Even after his death, the strongest opposition arose to this building. The hishop, as well as the general opinion in the island, opposed the construction of a round temple, upon the plea that round temples, though used for heathen worship, are not adapted for that of Christians." The hishop insisted on a plan heing drawn hy his own architect, in the form of a Greek cross. The inhabitants, however, were so pleased by a plan presented to them by M. Grognet, an enthusiastic lover of his profession, residing in Malta, that they petitioned the governor: objections were overruled, and the first stone was laid on May 30th, 1833. The funds left by the parish priest, 30,000 scudi, being quite inadequate to the object in view, subscriptions were raised, and lahour being the principal expense, the church bestows indulgencies upon those who work there gratuitously on Sundays. From two to three hundred volunteers have been seen labouring there on the same day; and the church is thus progressing gradually, though slowly, towards completion. "The total height of the edifice, when finished, will be 200 feet. The main body of the edifice consists of a circle of about 200 feet in extreme diameter: it has two projections, at opposite sides; one, a portico of 125 feet long by 60 feet high, with a double now of columns, between two bell towers: here are three entrance doors. The other and opposite projection is ornamented with pilasters, and contains sacristies or vestries, with an upper story of rooms, for a certain number of priests to be attached to the church. The edifice surrounds a church already existing

upon the spot, which will he removed as soon as the new one is completed. This building is astonishing, when the slender means of those who commenced and are finishing it are taken into consideration."

The new cathedral at Boulogne, mentioned by us some time ago, is similarly the result of the determination of an individual, and assists in showing how much any one man can accomplish if he set himself determinedly to the task. Will goes farther than power.

When Lord Albert reached Athens, he of course hurried to the Acropolis,-at once, as Wordsworth says, "the fortress, the sacred inclosure, the treasury, and the museum of art of the Athenian nation;" and which. though it has suffered in every possible manner, remains unrivalled "as a concentration of wonders in architecture and sculpture." 'Alas!" says Lord Albert, "that the illdirected zeal of the Athenians of the present day should be disfiguring it more than the hands or weapons of earlier harbarians. In searching for inscriptions, or those statues and works of art, that may be buried under the accumulated rubbish of the whole Christian era, they tumble all the mould and stuff cleaned away down the sides of the rock, instead of carting it away, and are actually changing the bold features of the rock. In vain I have lifted my voice against such Vandalism. I feel that it is useless." What is the Athenian Society of Antiquaries about?

Our author did not find any really first-rate works of antiquity for sale. By law, half of everything found belongs to the Government, and half to the proprietor of the soil. The proprietor has the option of receiving his moiety of the value in money, and to hand the thing found to the authorities, or to pay the half and retain it himself, but in this case must give security for its safety. The exportation of antiquities is absolutely forbidden, but this goes for nothing. Individuals who find anything know that if they yield it to Government they will never receive payment for it, and the result, therefore, is, that they sell it to some foreigner, who hribes the Custom-house officers to shut their eyes.

Speaking of the Choragic monument of Lysicrates, the writer says, "every sort of ahomination must now be waded through to view it."

Of the Temple of Theseus, he remarks,—" It will be remembered that only four metopes on the southern, and four on the northern side are sculptured; the remaining metopes on those sides being destitute of ornament. M. Pittaky suggested to me that this might arise from their having been painted,—Micon, who ornamented this temple, having been a painter, as well as sculptor. The whole of this temple, like the Parthenon, inclines inwards. This has most materially added to the strength and durability of their construction. Its lines, also, are curved, like those of the Parthenon."

The palace at Athens is "a huge, two-storied, white building, measuring 300 feet hy 280: it has a portico in front, and a colonnade in the rear. These, with the window-frames, cornices, angles, plinths, &c., are formed of Pentelic marble; the walls heing of limestone, faced with cement. It is undoubtedly an unsightly building. The window-frames are so flat and plain, as to give it the appearance of a manufactory."

The number of small churches and chapels in Greece, as compared with the population, is a striking feature. In those that are near any temple, the marble objects of ancient art are

placed for preservation, and portions are built into the walls. The former Cathedral of Athens, now deserted, is a curious and interesting example of this. Our author was told that there are no less than seventy deserted cburches and chapels in Athens, and that all these are to he pulled down, with the exception of the ancient cathedral, to supply funds, by the sale of the sites and materials, for the new cathedral now building.

The bed of the Ilissus is dry!

Corinth, Mycenæ, Marathon, &c., were visited; and, in returning, they saw revolutionized Naples, Baia (with its ruined haths), Herculaneum, &c.; and they paced,

"with reverent tread,
O'er hushed Pompeii's long-forgotten dead.

The railway has greatly changed the aspect of Pompeii: it is no longer wholly "a city of the dead." It is still, however, a spot which speaks to the beart. As Mr. Michell says, in his charming volume, "Ruins of Many Lands,"—

"A buried city meets the curious gaze, Charms while it awes, and wraps us in amaze. Called from the grave of dim Letbean years, Her graceful form again Pompeii rears— Reveals her winding streets, her frescoed walls, Gods on her hearths, and pictures in her halls."

Of Pæstum, Lord Alhert says little, and we are tempted to supply a picture from the poet we have just quoted, who exclaims,—bere

'—— Pæstum's giant temples—lift thine eyes— In all their stern and columned grandeur rise. Pause! trav'ller, pause! say, doth not wonder thrill

Thy creeping veins, and awe tby bosom fill? Wrestling with Time, the hoary brethren stand, Superbly graceful, and severely grand.
Their style of rival countries seems to speak, In strength Egyptian, and in beauty Greek. Built ere Minerva's shrine on Athens gazed, Or by wild Tiber Rome's rude walls were raised: Three thousand years these structures fail to bow, Massive when Christ was born, and massive now."

We must here, however, leave Lord Albert; and we sincerely hope that in his "wanderings" he has found health, as we have found pleasure.

Mr Weale's Rudimentary Series is going on satisfactorily. The last part issued is a portion of a "Dictionary of Terms used in Architecture, Art, Engineering, &c.," hy the puhlisher himself. It forms a volume equal in size to two of those on other subjects already issued, and will extend to a third. It appears to be carefully compiled, and will be found very useful to a large number of persons. It would be easy to make a long list of words not to be found in it, but a fair reply to this would be,-proposed limits. We give one of his definitions,- Esthetics, "the power of perception hy means of the senses: the word implies the perception and the study of those qualities which constitute the beautiful and artistic, and form the finer essence of all productions of fine art. It carries with it, therefore, a more exact and philosophic meaning than the word 'taste.' In its adjective form, in which it more frequently occurs, it is particularly useful, as no adequate epithet can be substituted for it. Thus we speak of the 'æsthetic sense,' of 'æsthetic feeling,' or study,' or 'principles,' &c.; but we cannot correctly say the 'tasteful sense,' or 'tasteful

The treatise on "Drainage and Sewage of Towns and Buildings," by G. D. Dempsey, in the same series, would not have had our commendation if we bad looked no further than the introduction. In this the author proposes to drain the metropolis, on the converging principle proposed by Mr. Austin, into 800 enormous cesspools or "sumpts," at 200

with the sewage when it is there), and then, in speaking of the two plans hrought forward by the officers of the late Metropolitan Commission, coully dismisses that by Mr. Austin, in a few lines, saying that, "as far as yet explained, it appears to consist in the formation of district receptacles, called 'sumpts,' for the sewage.

The essay itself, however, contains a considerable amount of information, and will be found of service by all engaged in drainage operations, not excepting those who amhition the gross provision in this respect for the whole metropolis.*

Messrs. Dwyer and Laugher, whose names will be remembered by our readers in connection with the Decorative Art Society, are publishing a series of "Free Hand Studies," intended chiefly for the use of Schools of Design, by supplying examples for the hest practice of pupils. Three are before us. The first is an illustration of a means of producing a certain class of effects by lines of similar flexure, and may he considered as the "pothooks" in the art. The "Cyclanthus" offers an instance of contrary flexures, to the right hand and to the left hand, or "pothooks and hangers;" and the "Robinia" presents curves of extensive variety and direction. These studies should be practised in a free, quick manner, in larger and smaller scales, with chalk, on a black hoard, until a facility of approximating the examples he acquired. This system is found less impeding and irksome to the progress of a pupil than the general system of insisting upon time-taking but imperfect attempts at an exact imitation only, although the necessity of acquiring the power of exact representation must not be lost sight of. In the sister art, music, a course of practice involving failures and repetitions innumerable is alone conducive to skilful manipulation; and in drawing-schools both masters and pupils would find advantages from adopting black hoards, which admit of such repetition in an easy and inexpensive manner. These "Free-hand Studies" are designed with especial reference to such a valuable, but too much neglected course of study, and they have been accordingly published at a very low price.

Speaking of decoration, we will take this opportunity to mention a work recently published, containing representations of ornaments in all styles, executed in papier maché and carton pierre, by Messrs. Jackson, of Rathbone-place, the majority of which are excellent in character. We have hefore now spoken of the facilities for rapid artistic ornamentation which Messrs. Jackson's establishment affords, and the publication of this book renders application to it more easy.

With the intention of treating the arts of decorative design practically, Mr. R. Robson has commenced a work under the title of " Decorative Art, exhibiting the Development of its Natural and Geometrical Elements," &c. +

stations (without saying what is to be done | The first fasciculus contains sixteen plates, besides letter-press, comprising examples of enriched mouldings, leaves from nature as the elements of enrichments in various styles, diagrams illustrating the geometry of the Greeks, as applied to the formation of mouldings, &c. It promises to be useful.

> And what is this pretty white-bound volume, suggesting kid-gloves and orange blossoms, which peeps out amidst pamphlets on drainage and essays on style?-" Holy Matrimony,' illuminated by Owen Jones.*

> And how has Mr. Jones done it,-how has he set forth and embellished with cunning pen that solemn and tight-tying service, which begins with "dearly beloved," and ends with amazement,"-a type, may we venture to say, of the change which occasionally takes place in the condition of mind of those on whom its gentle powers bave been exercised. He bas done it as it should be done, enticingly, and in colour of rose. A genial glow, soft and hlushing, is spread over each tiny leaf; flowers enwreath every passage; the promise of feminine obedience brings "heart's-ease," and manly protection is promised amidst myrtle and passion flowers. For this pleasant and pretty disguise,-this gilding of gold and painting of the lily,-much is owen, O Jones, to thee, and many are the soft slippers, fringed urn-rugs, and ottomans worked in Berlin wool (sweet devices to enable the idle to fancy themselves industrious), which will come to thee in grateful acknowledgment from the female world! A damsel, willing to throw her graceful self away, may present this pretty book to the blind or thoughtless favoured one, with the full assurance that it will suggest to bis mind, none other than charming ideas of the flowery path she would have him tread, and the beauty and value of the budding hopes which require but his will and word to ripen into full fruition.

> Had it come to us from such hands, it is impossible to say what would have been the consequence!

"MODEL" TOWN HOUSES FOR THE MIDDLE CLASSES.

OBSERVATIONS ON ORDINARY LONDON DWELLING-HOUSES, WITH AN ATTEMPT TO SUGGEST AN IMPROVEMENT ON THEIR USUAL PLAN.

OF the many subjects that in the present day agitate the public mind, few are more engrossing than that of the sanitary arrangement and construction of dwelling houses. In London especially, visited as it has lately been by that fearful scourge, the cholera, whose direst ravages the neglect of this important question is said to invite and foster, portant question is said to invite and foster, the question of sanitary reform may he said to he just now uppermost in the public mind. It is now that the philanthropist comes forward with a definite plan for the construction of "model towns," and companies or associations spring up on every side of the metropolis, formed for the object of erecting "model" lodging-houses, or dwellings for the labouring classes. The very titles given to such projects as these, are, one would think, indicative of the startling fact that our ordinary dwellings are not merely unsatisfactorily constructed, hut actually arranged upon a false plan.

Looking at the metropolis alone, it will he found that the evils of the present method of arranging town dwellings are by no means limited to what is usually meant hy sanitary reform, or the mere preservation of its inhahitants in corpore sano, but that the mens sana, the healthy mind, the mental comfort and culture, and the moral deportment of the Londoners, are greatly affected by these evils. If we reflect a little on what are termed "our hearths and homes," we shall find that, for

* Published by Longman and Co. 1849. † Read at a meeting of the Architectural Association, October 19, 1849.

the most part, the dwelling-houses of London, as now inhabited, realize very little if anything of an Englishman's ideas of a hearth or home; and that, in the metropolis at least, e vaunted relation of the Englishman's firethe vanued relation of the Englishman's nre-side to a castle, is a meaningless monentity in-deed. The observation is not only applicable to the dwellings of the lahouring class,—its truth may he urged with equal force as it re-gards that other important section of our population, the middle class of society, on whose well-being the dignity of the nation may he said mainly to depend.

To allude more explicitly to the principal defect in our present method of arranging houses in the metropolis, I cannot do hetter than refer to a paper* read at the Architectural Association last May hy one of the members, Mr. F. Chamhers. It was entitled "The Architectural Advantages and Deficiencies of London," and takes, what it is surprising so few architects bave taken, a glance at the causes of that signal want of architectural effect common to almost all our long drawn, densely peopled thoroughfares. It would be well worth while to consider whether it he not practicable to devise some plan of erecting town-dwelling-houses at at least their present usual cost (when substantially huilt), and the present usual superficial area assigned to them, which shall he free from the objections very justly urged against their ordinary system of construction.

The paper in question contains the surprising statement, that "only one-fourth of the dwelling-houses in the metropolis are occupied by one family each:" the remainder, though constructed to he similarly tenanted, are ("common" or uncommon, as the case may he), mere lodging-houses-sham private dwellings, which they are not, -ill-arranged, uncomfortable lodgings, which they were never built to he. A married Londoner with a family, should his means exclude him from the happy number who make up the 25 per cent of separate householders, has no power to exempt himself from the remaining 75 per cent of lodgers or from the remaining 75 per cent. of lodgers or lodging-house keepers; he must either take his station among the former, and with them confine himself to some limited few of the rooms in the house, in daily fear lest the halliff should sweep off his (so-called) household furniture for arrears of rent, or dehts of any kind contracted hy his landlord, for whose pecuniary stability he is ever responsible; or he must, if a person to whom a residence in a tolerably fashionable neighbourhood is indispensable, rent a house twice or thrice as large as he absolutely requires for his family, and pass his ne absolutely requires for his family, and pass his life in it, alternately grumbling over the heavy rent and taxes his empty apartments entail on him, or hewailing the galling absence of all dignity or privacy, the due regularity and con-trol of his household, to which their hired occupancy hy strangers must more or less subject him. Who can fail to imagine the moral evils attendant on either of these alternatives? How can such a state of things he reconciled to the master's love of home, the mistress's pride in its neatness and cleanliness, the often prized, and never too highly appreciated bome-education of children, and appreciated bome-education of children, and though last not least, the due control and exemplary training of servants. Is the master of the house a man of quiet, studious habits?—his "first floor," as the phrase goes, is a good musician; or a married couple, fond of inviting their friends to an occasional dance. Is he solicitous for the health of his family?—his injunctions to have doors opened and sashes let down are either restricted to certain rooms in his house, or positively interdicted by his lodger, who has a horror of "draughts." Is he a religious man ?-his efforts to rightly educate his children are rendered nugatory hy their inevitable intercourse with the family of his sceptical neighbour up stairs. In fine, is the master or mistress precise and cleanly? -the couple who lodge above are dirty and slovenly, and hate "particular people." Has the one family a refractory servant?—the other has family a retractory servant—the other has a rehellious "marchioness" who alets her; and, with all these and very many more dis-agreeables than we have time to discuss, the united, but not "happy" families, have to put up with each other as they best can Thwarted in all her efforts to preserve a neat

and orderly dwelling, is it surprising if the lady of the house settle down to the slovenly standard of her lodgers, or the lodgers to the lady's, as the case may be, to the scandal of their respective country cousins? It is by no means an uncommon thing to hear of a promeans an uncommon thing to hear of a professional man in practice renting at upwards of eighty or a hundred pounds a-year a large house, and occupying it, with his wife and children, one male and a couple of female servants; with a pair of lodgers on his first floor, a married couple on his second, and a single lodger on his third floor. Imagine a state of existence more undignified, unreal, or uncomfortable than this,—or the advent of typhus into such a dwelling!

As to the construction of metropolitan

typhus into such a dwelling!

As to the construction of metropolitan dwelling-houses, totally irrespective of their unsuitable arrangement or plan, it has been shown by many writers to be truly detestable: deprive them of but one good quality (secured to them by Act of Parliament), their non-liability, by the possession of compulsorily sound party and external walls, to ignite one another, and it is scarcely possible to conceive any thing more defective. Strength they have not (of course there are exceptions in this as in every rule), for even the vulgar element of equilibrium is denied them; walls rest not on walls nor even partitions on partitions, though, strange to say, roofs do; in fact, as respects the word walls (save as it relates to the before-mentioned circumscribing brickworkrequired by the in every rule), for even the vulgar element of equilibrium is denied them; walls reat not on valls (see as it relates to the before-ment tioned circumscribing brickworkrequired by the Legislature), it and the word "foundation" right will be expunged from our house builders' vocabulary. Thus, to say nothing of durability, the absence of which we perhaps owe to the testence of short leases, your ordinaty London dwelling is even deficient in safety,—as may be seen from the awful frequency and rapidity with which their necessarily wooden states as a speculation in the parts of them to the will adverted to, let us look at Manchester, next to the metropolis the most important, most populous city we have. Here, in the

construction subjects them to total demolition by fire. In these cases the salvage of furniture, or such like property, is out of the question, the oft recurring sacrifice of human life shocking to contemplate. I myself have seen in two cases—that of Raggett's Hotel, in Dover-street, and of Professor Farey's house, in Guildford-street, the window blinds and curtains of the gutted house fluttering next day from the windows,—a sad evidence of the sudden rapidity with which, in each case, the destruction of tife and property was effected. Indeed, not only is it often that these fires are attended with loss of life, but really seldom that they occur without it; and, meantime, as any one may see around the outskirts of the metropolis, we go on building on the very same plan as before, with deal staircases and quarter partitions, side by side, admirably contived—to burn; and at the close of each day tall ghost-like fire-escapes, which, by-the-bye, construction subjects them to total demolition tall ghost-like fire-escapes, which, by-the-bye, do not always escape combustion themselves, traverse the streets; dismally reminding one of the probability there is that, ere the sun return, some hapless dweller in their allotted district, who has entered his abode by the street door, may have to make his exit by an upper window,

cases of mill or warehouse property, conflagrations the most appalling occur; and yet the destruction of dwelling-house property i pared with what we experience in London, signally rare. Mr. Rose, for very many years the able comptroller of the Manchester Fire Brigade, has kindly favoured me with the folorigade, has kindly favoured me with the fol-lowing statement, in reply to two questions put to him. He says—"I do not know of more than one instance where a building, solely occupied as a dwelling-house, was entirely destroyed by fire during a period of twenty years; and such fires are very rarely attended with the death by fire of any of the immates."

It would applied to the contract of the property of the

It would avail little to dilate on the un-architectural external appearance architectural external appearance of our houses, which, though very greatly induced by the infrequency with which architects are called in to design and direct their construction, is in some measure attributable to their tion, is in some measure attributable to their eichnographic arrangement; nor, however consistent it might be with the practice of modern criticism, would it be fair to close these observations, without making some attempt to suggest a remedy for the evils complained of, Before doing this, however, it will be well to briefly notice one or two efforts lately made with this laudable object: I allude particularly to the "model lodging-houses for the labouring classes."

A large stack of these has lately been

with the old system, is highly appreciated by the tenants, themselves, be it observed, a superior class of persons to that for whose accommodation the huilding was originally projected. There seems only one substantial objection to the same plan being carried out on a handsomer scale for the middle classes; and that is the repetition, here adopted, of the and that is the repetition, here adopted, of the ordinary common staircase to each separate block of dwellings. These means of ascent and descent should, I conceive, be not only far more spacious, far better lighted and ventilated, than by such repetition it is possible to contrive them; but, in lieu of the pernicious comparative privacy thus imparted to them, the architect should adopt every means to make them as nearly as possible assimilate in pub-licity to the streets, to and from which they are intended as the media of communication.

In the parish of St. Giles, another some-

what analogous project has been carried into execution, in the erection of a pile of club chambers, with separate dormitories and a common dining-room, library, and reading-room. If I mistake not, they are simply intended for the occupation of casual nightly low night lodgingtenants, in lieu of the low night lodging-houses about London; but as some such arrangement as this has been often suggested for the permanent occupation of the poor, a doubt may here he hazarded as to its desirable-Such institutions must have a tendency to hreak up society into clubs and coteries, to the destruction of that domestic comfort and independence so conducive to the well-being

Another pile of model dwellings to which allusion should be made, is now in course of erection in Bloomsbury, from the designs, and under the direction of Mr. Henry Roberts. The plan comprises a stack of nine dwelling-houses on each floor; approached, not from the confined landings of a small pent-up staircase, common to a single block of chambers one above another, but from spacious galleries, open to the air,—themselves approached by one large stone staircase, common to the entire stack, under the control of a resident porter. An illustrated account of this huilding* is contained in the present volume of THE BUILDER. This is a great advance upon the ordinary plan : if only to mention one obvious advantage it possesses,—the means pro-vided for the prevention of the spread of contagion from house to house.

In Liverpool, Glasgow, † and elsewhere, piles of this description of property are springing up, but enough has been said of what is doing in London to denote the restlessness of the public mind in relation to the improvement of

town dwellings.

It will be seen that all the plans here described have for their object the abandonment of the present system of housing the labouring classes in the thickly peopled dis-tricts of the metropolis; and having already shown that the very reasons that have conjured them into being, apply with, if anything, greater force to the middle classes, I ask at once, why cannot a more consistent class of dwellings he contrived for their use? The question is by no means singular, and has been more than once put by non-professional querists, as may be seen in this journal.

rists, as may be seen in this journal, The plan I yenture to propose is described in the accompanying illustrations. It has been mainly suggested by seeing the description of Mr. Roberta's mode of arrangement already referred to. The lower houses are proposed to the entered fee nearly at once from the steep to be entered (as now) at once from the They might be constructed with or without a hasement story, in the former case retaining the usual sunk area, and departing somewhat the usual sunk area, and departing somewhat from the general plan, or, if laid out as shops or offices, be brought forward to the street payement, as shown by the light partion of the ground plan annexed. The upper houses would be entered from the street by open galleries or colonnades, accessible at the extremities of each row or terrace by a well-lighted spacious double stone staircase, of publicity equal to that of the street itself, on every landing of which the surveillance of a resident porter or keeper could be directed, for its orderly

security and neatness of condition. The subordinate offices are placed in front, looking on to the colonnades or galleries: these might have the glazing of their windows obscured, or the windows themselves placed at such a or the windows themserves placed at such a height from the floor as to secure them from being overlooked by the passers-by. The principal living and lodging-rooms are placed at the rear, and are intended to overlook a spacious square or garden, common to the two stacks of terraces: it is presumed that the usual superficial area assigned to the private back yards or gardens of an ordinary house will, with the fence walls dispensed with, amply provide for such spacious common garden a here described. It would be planted and laid out as a promenade for such of the families in each terrace as might be willing to pay a small annual fee for the privilege. Property like this would of course, as at present, have its more expensive tenements and its more distingue tenants on the lower flats or terraces; and if carried up many stories high, which, when the infrequency of its occupants journeys up and down stairs is considered, it might very well be, would perhaps exhibit a great discrepancy between the condition of its denizens on the first and that of those on its uppermost terraces; but I conceive the presence about the grounds of an artisan from the topmost terrace, who possessed refinement enough to induce him to the yearly payment of a guinea for the healthy recreation of his family, ought not to disturb the equanimity of the most fastidious tenant below. However, should this be found a difficulty, the roofs might be formed into one large exercising terrace for the occupants the upper flats or terraces only, leaving the gardens for the use of those on the lower ter-

Should objections be raised to the collision of different classes or sexes on the staircases, the fact of each flight being a double one amply lighted by day and night, and open to the ken of its parallel neighbour, as also that of the keeper and his family, should be borne in mind: and to such as may be urged against the novel necessity hereby created for postmen, milkmen, &c. &e., ascending and descending to and from the upper houses, a moment's reflection on the greater evil that would be thus avoided, viz., the continual daily travel-ling of servants and females up and down stairs in our already lofty houses, an evil that seriously militates against their cleanliness and order, will, it is assumed, be enough to prove the greater convenience of the plan proposed.

Of no small moment in the

no small moment in the consideration of any plan of this description is the name of, or address that can be given at, each respective dwelling; as any one who reflects on the present artificial condition of the middle classes of the metropolis will perceive. Thus, in the plan proposed, each street might have, independently of its own name, its locality denoted hy the name of the square or pleasure ground attached to the houses in it; the dwellings on the ground floor being, of course, designated as at present. Whatever might be the number of each house on the ground floor might (for the convenience of cab-drivers, &c., drawing up to the nighest staircase) apply also to the houses above its individual site; and "Third-terrace," "Second-terrace," and "First-terrace," inight represent the positive, comparaand superlative degrees of gentility.

The plan represents the extremity of one row or stack of terraces, comprising two blocks of dwellings, and one of the double stone stair-cases intended to be placed at the corners of cases intended to be placed at the corners of each street, or in very long thoroughfares at smaller intervals, as the intelligence of the builders might suggest. Over the piazzas leading from each street are landings, conducting at once to the open galleries on each terrace or flat. The porter's office attached has a private staircase, two or three hed-rooms above, and an office again on the topmost story. The remaining dark action of the story. The remaining dark portion of the plan shows the arrangement of each block of plan shows the arrangement of each block of dwelling-houses, assuming the non-existence of a basement story, and is, of course, repeated for that description of property throughout the stack. The superficial area occupied by each dwelling-house, devised merely as a sample of an average class, is equivalent to that allowed to a second-rate house, according to the provisions of the Metropolitan Buildings' Act. The walls and par-

titions are, as in all model dwellings, super-incumbent from bottom to top; thus the buildings would readily be constructed fireproof, or the partitions formed at least of brick nogging, with the floors sound-hoarded and pugged. Each house has a dust-shaft, with a coal place on an intermediate floor; the coals for each dwelling being delivered into a shoot from the gallery or terrace overhead, placed some five feet above the level of such gallery floor,

deviation from the dwelling-house plan shown by etching the second block is merely introduced for the sake of exemplifying the mode in which, without greater violation to the ordinary rules of construction than we are now guilty of, the ground stories are capable of being originally built as, or subsequently

altered into, shops or offices.

Fresh air for each dwelling could, of course, be supplied by air bricks or revolving valves; and vitiated air discharged, by perforations or centre flowers in the ceilings of each room, into air trunks or drains, built between each floor, and terminated at their two extremities hy air bricks, so as always to secure a brisk arrent throughout their extent from front to back: a system, this, similar to that adopted by the Poor-Law Commissioners.

Many other suggestions might be added, as, for instance, the introduction of large lifts or "hoists" for heavy goods, or even sick persons, and many details gone into, to which the plan is not only capable of accommodation, but in many cases solely so. To these, however, for the sake of simplification, it will be to avoid allusion.

Whatever may be thought of the popularity of such a plan as is here proposed, and (knowing John Bull's respectable aversion to all fireside innovations) I must confess to some doubts on that head,—there can, it is presumed, be no doubt whatever of its superiority to ordinary dwelling-house arrangements, which three-fourths of the inhabitants now enjoy, whether on the score of sound construction, safety from fire and the spread of contagious fevers, or general comfort and privacy.

One advantage of such a plan of housebuilding is its greater economy of space, if not of actual outlay on the building itself, consequent on the omission of the separate staircases now required for each block of dwellings. A saving in ground rent in London is a matter of no trifling import; and when it is recollected that a staircase, with its ordinary mahogany handrail, &c., is one of the most expenfeatures of a modern house, it is at least questionable whether the open galleries pro-posed to supersede them can fairly be objected to as costly features over and above what are

incurred hy the ordinary plan.

Nor must the facility thus afforded for building even loftier houses than we now do, though cursorily alluded to already, be omitted from the list of advantages that would accrue from such a plan as this. Omnibuses, as we now employ them, are, it is true, a mode of transit from eorner to corner of town which would indeed surprise our grandsires, could they retraverse our streets; but, whoever considers the rapidity with which our modern Babylon, with its "two millions," is diverging brick and mortar into the suburhs, admit that these vehicles will soon-in fact, have already—become intolerable. Omnibuses "for the million" are not enough, and how to move about town is really hecoming a serious pro-blem for solution.

That such a plan would, if adopted, supply another desideratum, a means for designing houses architecturally, or at least symmetrically, and thus perchance rid London of its tawdry bedizenment, applied the thickest where our façades are the most lop-sided, there can I conceive be little doubt. Richly designed conceive be little doubt. Richly designed shop façades, if introduced in streets built on such a plan, would no longer present wide gaping chasms of plate glass, sustaining (some-how or other imperceptibly to the spectator), an overwhelming mass of superineumbent wall four or five stories in height; but pier would stand over pier, and void over void; a thing impossible by our present mode of construc-tion; and the density of our population, by rendering some such kind of street architecture imperative upon us, would, with the now seldom-sought aid of the architect, to not merely design but control their structure, be

^{*} See page 327.

the means of transforming our monotonous fronts with their (to use the words of Mr. Elmes), "two windows, iron railing, and a door, two windows, iron railing and a door," into façades of palatial aspect, by the simple presence of the long continuous array of varied columns, arches, and cantalivers, which would be actually demanded for their bond fide con-struction. WILLIAM YOUNG.

FALL OF RAILWAY ARCHES, CAMDEN TOWN.

THE desirability of our suggestion as to a judicial inquiry into the causes of the fall of the arches over the Kentish-Town-road, has been largely recognized, but it is to be feared that it will fall to the ground.

It is certainly important to the reputation of English engineers, that some measures be taken to put a stop to the failures which take place upon railway works every week. At present information can be obtained only by an examination by some unofficial person, who brings the matter in a very irregular manner before the public. His sources of information neare the public. His sources of information are of course imperfect; the results almost useless: a discussion arises perhaps in the papers, and then the affair is forgotten, to be merely another proof of official carelessness, recklessness, or johbery.

What unknown problems are there in viaduct What unknown problems are there in viaduct building which remain to be solved at the present day? What more do we require to learn about the foundations to be met with near any of our large towns? Yet we can hardly ever take up a railway paper without meeting with the account of some viaducts having fallen. It is high time a stop should be put to this. In the present case, why does not the Railway Company institute a searching not the Railway Company institute a searching inquiry into the cause of the accident? It will be long before public opinion can be reassured as to the safety of the remainder of their road. At any rate the shareholders should be informed as to who is to pay for the

new works. As far as can be learned from a casual inspection (and we are bound to say the huilder, Mr. Hicks, showed every desire that we should be fully informed on the matter), there are no

conditions in the superstructure to account for the fall of the arches. The dimensions of the the fall of the arches. The dimensions of the piers and of the arches seem sufficient. The piers are 4 feet wide at one end, 3 feet 11 inches at the other, being on a curve; 27 feet long and 17 feet high to springing. The arches are segments, 8 feet rise and 27 feet span. The work and materials appear to be of a rather superior quality. The bricks used look like good sound stocks; the mortar of the piers was made of ground stone lime, which, indifferent as it is, is still the best usually employed in London; the arches are all apparently executed in cement upon this portion of rently executed in center, upon this potential the line, those still in place as well as the fallen ones being thus executed. On a prima facie view of the case, therefore, we are justified in supposing that the cause of failure must be sought for in the foundations. And, in the ne sought for in the foundations. And, in the neighbourhood, common report says that one of the piers was built upon an old drain, unconsolidated, untouched, left just as it was found, with all the made ground around it.

If this bc the case, the onus of investigation would seem to rest with the engineer. He had accepted to have been consistent to the case, the onus of investigation would seem to rest with the engineer.

no right to build a viaduct in such a position, with one of its piers on such a foundation. The footings were 1 foot 3 inches below the ground,

and the concrete about 1 foot 9 inches deep.

A remark to be made in passing is, that it is very injudicious to execute a long range of arches without introducing occasionally a pier of extra thickness, to form an intermediate abutment. Here we have about 16 or 17 arches anutment. Here we have about 100 Tratelies in a row, and so constructed that if one pier fall all the others must follow like a pack of cards. Seven arches fell; more would have fallen if the interruption had not existed, in fact, from the stout abutment of the large arch over the

the Kentish-town-road ought to have been divided into at least three bays, with a stouter pier at each division.

ERRORS IN ORNAMENTAL DESIGN.

Most heartily do I agree with those correspondents of The Bullder who depreade that mistakenly extravagant taste for excessive decoration, which was manifested in the pattern productions at the Birmingham exhibition, and which appears to be one of the manias of the present day, although it is one in quite an opposite direction from most of them. We appear to take the reverse of wrong for right.

After having affected almost Quaker-like plainness in our buildings, our houses, and furni-ture, we are now running into the contrary extreme, and are applying embellishment—or what should be embellishment—to everything alike, and to every part of everything, till "we can't see the wood for the trees." Our apartcan't see the wood for the trees." Our apartments are beginning to smack of the toy-shop and show-room. To be comme if faut, every piece of furniture must ostentatiously solicit prece of furniture must ostentations y solicit evanination; everything must be be-carved or he-patterned, even to satiety; and the same kind of patterns are applied nearly alike to everything,—to book-covers and to table-covers, to the borders of envelopes and titlecovers, to the Dorders of eleveropes and the-pages, and to the borders of rooms, to carpets, and to walls. With very much more than enough of ornament, we get very little variety of it: no proper distinction is observed in the of it: no proper distinction is observed in the application of it; and with so little of artistic discretion and reserve is it frequently bestowed, that it conceals or else disguises what it is intended to set off; and human figures and animal forms—nay, even "creeping things"—are introduced, as decoration, in such a preposterous manner as to become only so many childish conceits. You see snakes twining themselves round your candlesticks, and sidereal dwarfs perched on the tan of your fire-types; you gat your strawthe top of your fire-irons; you eat your straw-berries off leaves of crockery, and sip your wine out of flower-shaped devices. Should this taste prevail much longer, the furniture of our drawing-rooms will pretty much resemble that of Noah's ark, with the addition of a hortus that of Noan sark, with the author of a norther siccus. It may, perhaps, be in conformity with that "study Nature" doctrine which many have now in their mouths—though what they mean by it they do not say, notwithstanding that it requires very careful explanation; but the mail is easily to pertake largely of the antic to me it seems to partake largely of the antic and unnatural, and to accuse those who design and manufacture ornamental wares of gre lack of invention. That the direct imitation of natural objects—whether human figures, animals, or flowers, &c .- ought to be entirely exploded from decorative design, I will not say; but it certainly ought to be resorted to very sparingly,—whereas it is now made use of so indiscreetly, that, unless checked, it will soon become stale and common-place, if not

Contrary to what has been said again and again as to refined taste being compatible with economy, inasmuch as it may be made to exhibit itself by means of very little more than elegance of forms and well-considered artistic design, for more pains are bestowed on mere super-fluous ornament and elaboration, than study is given to beauty of general composition. Many of the articles in the Birmingham exhibition attested this very strongly, they being very uncouth and tasteless,—some of them decidedly ugly, yet at the same time expensive on account of yet at the same time expensive in account of the workmanship thrown away upon them. Several of the articles of furniture seemed to be, if not actually brought out from lumber rooms and brokers' shops, modelled after the household antiquities which may any day be discovered in such repositories. There were spider-legged tables, and plenty of crinkum-crankums, and such superlative novelties as small looking-glasses, with sconces, all which small looking-glasses, with sconees, an which are rather symptoms of relapse, than of improvement or advance in taste. Although the mill which is said to grind old ladies into young ones is altogether fabulous, a mill there does appear to be which grinds old fashions into spick-and-span new ones. Of bond fide

somewhat justified in saying this, because, although I do not actually practise that branch of design, I have given some earnest attention to it, and so far with success as to have devised several quite fresh and unedited contrivances. Among them is what I call a Pinacotheca, which piece of furniture I have had made, and it is now before me. What it exactly is, I am not bound here to discloss but exactly is, I am not bound here to disclose, but exactly is, I am not bound here to disclose, but its purpose may be partly guessed from the name I have given it. As it serves a double purpose, it is exceedingly convenient as well as ornamental,—nevertheless nothing wonderful, the only strange part of the matter being, that the same idea should never have presented itself to any of those who manufacture articles of furniture, and whose interest consequently it is to bring and whose interest consequently it is to bring and whose interest consequently it is to bring out, if they can, novel contrivances. The exhibition which is to take place in 1851, will perhaps now cause them to set their wits to work. I myself somewhat doubt it, but nous

If French taste and skill are fairly represented at the "Exposition" in George-street, I should say that the admiration generally professed for them is not over creditable either to our discernment or our patriotism. is it particularly patriotic on the part of those who have got up that speculation, to attempt to pass off the collection as the very cream of to pass off the collection as the very cream of that branch of French industrie, for if such it be, what sort of stuff must its skimmed milk be? Mr. Graham's letter, however, in the Times of last Saturday, flatly contradicts that assertion, informing us, that so far from such being the case, many of the articles are "old shopkeepers," which it is now attempted to get rid of by a novel scheme.

There is a great deal of geway showings.

There is a great deal of gewgaw showiness, but very little evidence of refinement and careful artistic study. Of many of the productions the chief merit seems to be their extravagant costliness, a merit which may recommend them to the purse-proud and nouneaux riches, to those who possess far more money than judgment, and who pique themselves upon scorning the home-spun John Bullish productions of our English artisans and manufac-

There is, indeed, one article in the "Exposition" which is calculated to excite if not which is calculated to excite, if not exactly admiration, supreme astonishment at its truly surprising absurdity and utter bathos, namely, an atrociously vile picture, with the face of a watch stuck into it to represent a clock in a church tower, and with several figures which, when the chimes strike, jerk their arms most unnaturally. Such a specimen of French taste would hardly be tolerated in an English pothouse.

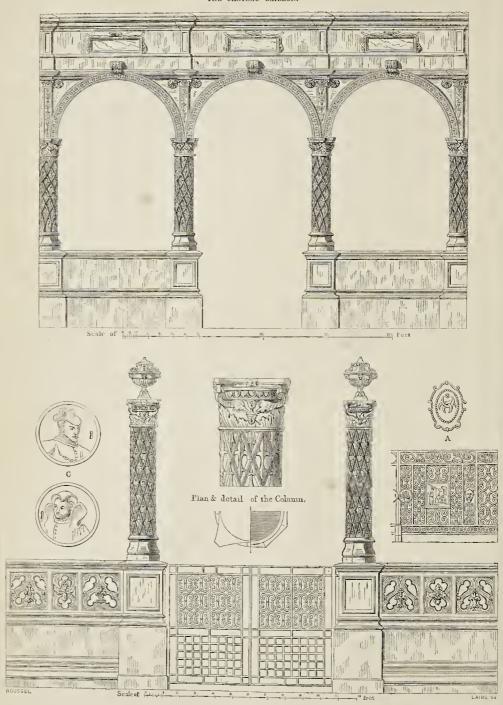

In an engisin pointouse.

The newspapers talk of its being likely that her Majesty will visit the Exposition. Let us hope that her Majesty will do no such thing; for she might just as well visit any other bazaar or auction-room, where she would be likelier to find many specimens of better taste.

*** The French Exposition.—We have allowed our correspondent (with a few reservices) vations), to state his own opinion on the collection in Great George-street; and we may add that it represents that of several other persons who have addressed us upon it. Our persons who nave addressed as upon to do own opinion we have already expressed, namely, that the collection contains many beautiful works, which demand the careful inspection of our manufacturers. The mistake made by the friends of the undertaking, and which has raised ill-will against it, has been the endeavour to give a wrong character to what is in fact (and this is nothing against it) a pecuniary speculation.

THE BEDFORDSHIRE ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETY had a meet-AND ARCHAEOLOGICAL SOCIETY had a meet-ing on Tuesday week, when a resolution was passed, inviting the St. Alban's Society to meet this Society at Dunstable in the ensuing spring. Office bearers were elected, and some road on one side, and from the centres being left in the arches of similar span on the other. Many viaducts, such as the Greenwich railway, have stood, with thirty or more similar arches in a row; but it is running an unfair, a useless risk, as we see in this case, and as was proved by the fall of the Barentin viaduct. The distance between the Hampstead-road and

PALAIS DES BEAUX ARTS, PARIS. THE CHATEAU GAILLON.

THE PALAIS DES BEAUX ARTS, PARIS.

THE Chateau Gaillon, in Normandy, an ancient residence built in the decadence of the Gothic art, belonged to the celebrated Cardinal d'Amboise: it is now a prison. Mons. Albert Lenoir, the director of the Museum of the Museum of the court of the consideration of the pupils. In

BUILDING SOCIETIES.

In a former number* was noticed, at some length, the very important case of Walker v. Giles, decided in the Court of Common Pleas, in which it was held that mortgages and other securities given to the trustees of building societies, established under the Building Societies Act (6 & 7 Wm. IV., c. 32), are exempt

from stamp duty.

Perhaps some of the readers of this journal can recall to mind that we then took upon ourselves to declare that this was sound 'law, and that a stamp duty on such mortgages would he entailing on the mortgagor an unnecessary expense. It was only, however, after giving much attention to the case and the construction of the Acts upon which the judgment struction of the Acts upon which the judgment was based that we ventured to arrive at this conclusion, knowing, as we then did, that many practitioners had objected to dispense with the stamp duty, as they doubted the correctness of the decision; and also that a legal contemporary† went so far as to say, "We feel it to be our duty to warn the trustees and advisers of building societies against acting on that decision."

acting on that decision."

We were right. The Court of Common Pleas have reconsidered and affirmed that decision in the case of Barnard and Others v. Pilsworth (14 Law T. 132). In this case the plaintiffs were the trustees of the Amicahle Building Society, and the defendant rented the house of one Hinton, who had mortgaged the house to the plaintiffs as trustees of the house to the plannins as the control of the huilding society. This action was brought to recover a year's rent, and was tried before Wilde, C.J., at the sittings in London after last term. The mortgage deed had no stamp upon it, and it was objected to as inadmissible for want of a stamp. The objection was overruled, and the jury gave the plaintiffs a verdict for the rear's rent. for the year's rent.

Channel, Serjt., moved to set aside the verdict, and enter it for the defendant, on the ground that the mortgage deed required a

Stamp.

We have seen that the practice of having these mortgage deeds stamped has been still adhered to, from a supposition that the question had not been finally settled in Walker v. We find this opinion to he at once gratuitous and erroneous; for after the argument of the learned serjeant, Maule, J., said, ment of the learned serjeant, Maule, J., sad, —"I helieve there have been some observations in a legal journal‡ reflecting on that decision (Walker v. Giles), on the presumption that the whole of the Friendly Societies Acts, 10 Geo. IV., c. 56, and 5 & 6 Wm. IV., c. 40, is not incorporated in the Building Societies Acts, but only so much as relates to the making and altering of the wides. Lower these observations did not of the rules. I own these observations did not convince me our decision was wrong. Our decision is a recent one, and we meant to decide that the whole of the Friendly Societies Acts in question were incorporated, so far as they were applicable to building societies, and that building societies' mortgages were exempt from stamp duty."

The rest of the court concurring, rule refused,
Mortgages and other securities given to
building societies are exempt from stamp duty,
and on this subject there can no longer rest the
shadow of a doubt. The majority of these
mortgagors have acquired their savings by too much labour to afford to fritter any portion of them away in unnecessary legal expenses; and if, therefore, they continue to be charged stamp duty (and these mortgages belong to that class which is liable to the highest rate), their solicitors should at once refuse to pay it.

We have heard nothing more of an Act limiting the present exemption from stamp duties in these cases. We are strongly inclined to believe that no such statute is really con-templated. It is only necessary to refer to the preamble of the Building Societies Act to see that its object was to afford encouragement and protection to these associations: surely, then, the legislature would not act so inconsistently as to grant a reasonable privilege and then abolish it by a subsequent enactment.

Inner Temple. W. Ll. T.

ECCLESIASTICAL DILAPIDATIONS.

THE discrepancy lately mentioned in the valuation of the three persons employed to value the chancel dilapidations in central Nor-Value the charlet diagnatation in certain tools folk, is one of the most singular circumstances I have ever heard of: apparently two of the three persons must be ignorant of what is, or what is not, a dilapidation. The only points to be scttled, beyond substantial repairs, in estimating ecclesiastical dilapidations, are, whether the waste or want of painting, papering, whitewashing, and colouring inside are dilapi-dations? I will admit that papering is more a dations? I will admit that papering is more a matter of ornament and luxury than utility and necessity, but I am of opinion that plain painting is both useful and necessary, as much so as the plastering to walls, and that it is absolutely necessary for the decent accommodation of the new incumbent. If a new parsonagehouse is about to be erected, it is a part of the specification that all the wood-work usually painted shall be painted three or more coats in good oil colour; then, I ask, why introduce this clause if it be not hoth useful and necessary? It is true that in that celebrated case of "Wise v. Metcalfe," it is stated that "painting, whitewashing, and such part of the paper-ing as is not required to preserve wood from decay, by exposure to the external air, are rather matters of ornament and luxury than utility and necessity." I think the master to whom it was referred thought otherwise, and that painting was really necessary; for it will be observed that estimate, including painting, papering, &c., amounted to 3991. 188. 6d., exclusive of painting, &c., 3101, and the master allowed 3694. 18s. 6d., being 594. 18s. 6d. more than the lowest estimate, which makes it evident that he considered painting, whitewash. ing, and colouring necessary to he done for the decent accommodation of the new comer in, and that papering was more an ornament and luxury than useful and necessary.

With deference I suggest that the profession generally cannot do better than act upon the opinion of Mr. Baron Garrod, given some years ago at the Hertford assizes, where his lordship stated "that it was not sufficient to leave the rectory-house and adjacent premises wind and water tight, but to leave them fit for the im-mediate occupation of the new comer in, some reference being had to the value of the living, which, I presume, means where the house is of a suitable size for the living.

answer to a question by the Lord Bishop of Worcester (some years ago), Sir William Scott stated that "there can be no doubt that painting is a dilapidation in such a case; if painting is good, it is not necessary that fresh painting should be applied, hut if painting is in such a state that it must be renewed for the decent accommodation of the new comer-in, it must he done at the expense of the last occu-pier or his representatives."—Yours, &c.,

JNO. JAQUES.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

AT a meeting held November 23rd, Mr. Pettigrew in the chair, Mr. Williams exhibited a drawing of the hypocaust and other Roman remains, at Cirencester.—Mr. Purland exhibited a collection of interesting bronze Roman antiquities from Reculver, belonging to Mr. F. Fillinham.

Mr. Keate read some remarks on drawings, Mr. Reate read some remarks on crawings, made by his son, of the remains of a large huilding at Verona, which he supposed was a Naumachia, or place for exhibiting aquatic fights and games, the savage diversions of tyrant emperors and a brutal mob. Although there were as many as six of these buildings in Rome, erected by various emperors, he believed that hut few remains of them were now to be found. These interesting excavations had heen carried on principally hy one spirited though not rich individual.

Dr. Bell read a paper on the two-faced figure of Janus, on a British coin. He first shewed the superior position Janus held in the religions of Italy, hefore the intrusions of Homeric deities and Grecian myths. Also from the conformity of the derivations of the name Janus from Janua and Thor, signifying even in modern German a gate, the parent of our English word door, he inferred the identity of hoth. Thor, however, must be the most

ancient denomination from its meaning, he of yore, or in the more emphatic phraseology of Scripture, the "Ancient of days." The figure Scripture, the "Ancient of days." The figure most prohably took its form from a proprietor fixing a pillar or post to mark his boundary, and his neighbour placing a similar one at its back. From the sacredness with which property was regarded, these posts became gods, as Termini and Hermes; and increasing veneration, and the inborn asthetic feelings of Italy, gradually fashioned these into the Italy, gradually fashioned these into the human face divine, and a cross piece made them real Thors or gates. This would account for the sancity of lintels and entrance posts, subsequently transferred to their representatives, the wands, in all ages. The fact was adduced, that the colony which settled Iceland took the door-posts of their temple from Norway, and when approaching settled Iceland took the door-posts of their temple from Norway, and when approaching land threw them overboard, that they might learn from augury of these deities the proper place to disembark, and found a city where they drifted on shore. Maces are but smaller and more ornamented posts, and the wand of ceremony or magic, though in German it now their formal back without the proposition of the control of th signify wall, bears evidence that it was brought over when walls, like those of Greenstead Church, Essex, were built of posts. One of the circles of Stonehenge consists of trigliths— what are these but an aggregation of Thors or Januses? where their position and repetition made the holy most holy.

NOTES IN THE PROVINCES.

THE tenders for improvement of the Ipswich Corn Exchange have been opened, and Mr.W. Ribban's, at 1,070l., the lowest, accepted. The huilding will have a stone portico, of the Corinthian order, fronting the Corn-hill. The interior will consist of a room 66 feet hy 78 feet, and 22 feet high, with a lantern in the centre. It will make a public hall for the use of the town, as also for scientific lectures, concerts, &c., &c. The building will be erected under the superintendence of Mr. Woolnough, of Legach architect.—The Southampton of Ipswich, architect.—The Southampton council have determined to construct a new gaol rather than enlarge their old one, and have given a committee authority to advertise for a site. The council have been compelled to this site. The commen have been compensed to this course unwillingly by the stringency of the law and the fear of the loss of Government countenance, and expense in transferring prisoners to fitting accommodation elsewhere. -In course of the discussion on the ahove —In course of the discussion on the above question, one of the committee stated that from information received from the governor of the county prison of St. Augustine's, near Canterbury, to which a new wing has heen added, it appeared that the Government estimate of the cost of 701. to 801, per cell, as a separate part of the building, or 1301. to 1501, including the cost of chapel, kitchen, and all necessary erections, seemed to be borne out by the results of the contract of St. Augustine's graol. From the information furnished, he gaol. From the information furnished, he found that the total amount of the contract

				3,248

Warming and ventilating apparatus

The new building was an additional wing within the boundary wall of the prison, containing 40 cells, and the cost was 871, per cell. The cells were 13 feet long, 7 feet wide, and 10 feet in height. The thickness between the cells was 14 inches; the outer wall 1 foot 10 inches, and 2 feet 3 inches at bottom; the width of gallery, 12 feet: size inside the walls, 59 feet 6 inches by 38 feet. The 40 cells are in three stories, besides underground offices.—The barracks at the Portland convict establishment are now almost completed, as are the arrange-ments for the speedy transit of the breakwater materials from the quarries adjoining, so that materials from the quarries adjoining, so that a large number of convicts will shortly be employed in the construction.—A subscription of 30,000*l*. has heen opened with sums amounting to 8,000*l*., for the erection and establishment of a new college at Oxford for poor scholars.—The Salishury Gas Company

^{*} The Builder, August 18, 1849. † The Jurist, July 14, 1849. ‡ The Jurist, July 14, 1849.

are said to be preparing measures for pushing the sale of their gas amongst private families: toe saie of their gas amongs private families: low price and pure quality ought, of course, to be the main measures for the realization of the increased consumption of gas anticipated by the Company. — Several plans have been submitted to the Dover Harbour Board for deepening the harbour and preventing the fur-ther encroachment of the sea at the site of the esplanade. The Duke of Wellington presided at the board, and is said to have declared, that during his life he would do all he could to prevent the town from being washed away The new committee-rooms, offices, and warehouses on the wharf at Stourbridge, for warenouses on the whart at Stourbridge, for the Stourbridge Canal Company, are now completed. Mr. Robinson was the architect, and Mr. John Thompson (of Kidderminster) the contractor.—We are glad to hear from our contemporary, the Sheffield Times, that there are " sundry unmistakeable symptoms indicative of a revival in the leading branches of the Sheffield trade."—A marble bust of Mr. Rushton, of Liverpool, stipendiary magistrate, has been completed, at the expense of his brother magistrates, and will be placed in St. George's Hall.—An attempt has been made to find a foundation at the Herd, South Shields, for a pier and docks. Nothing but sand, according to the Gateshead Observer, has been come to, after reaching a depth of four fathoms. -The winter series of accidents hy explosion, arising from the stupid practice of taking lighted candles to see where the gas is escaping, has already begun. It is to be hoped that our contemporaries will prevent their frequent recontemporaries will prevent their frequent re-currence, by pointing out the danger, as well as absurdity, of such a practice, and advising trust in the nose, instead of the eye.—The rock in the Grange quarry, near Edinburgh, so now blasted by voltaic agency. The other day now blasted by voltaic agency. The other day a slice of freestone was detached by the simula slice of freestone was detached by the simultaneous discharge of six deposits of powder, without any very loud explosion. The mass was 63 feet long, 31 broad, and 40 deep, and tis estimated weight is 5,508 tons.—No less than 20,000 families, or, on an average 100,000 persons, are supplied, it is said, by the Glasgow Water Company without the payment of any rates.—The Glasgow Bridge trustees propose to build a new bridge across the Clyde at Stockwell-street. The footpaths of Hutcheson's bridge are said to want widening.—A new tank is to be constructed near the loss. A new tank is to be constructed near the hospital at Portobello barracks, Dublin, to contain 10,000 gallons of water. The estimate amounts to 2201, 13s, 8d.

RAILWAY JOTTINGS.

Some large wooden sheds erected for engines and carriages at the Scottish Central's station at Perth, gave way and fell, on Tuesday week, while workmen were engaged in taking the sides, as they were supplied by walls of brick. A plumber was severely injured.—
Since we lately alluded to the occurrence of accidents from the extreme want of clear dimensions in the construction of railway bridges, another death has occurred from the like cause. On the Lancashire and Yorkshire line a passenger, by merely putting his head out of the window of a carriage while in transit, had his skull mortally fractured by a cast-iron pillar, supporting a bridge crossing the line on horizontal heams of iron. He died in a few hours. It is but fair to state, however, that a substitute for so dangerous a nuisance was in course of erection; but the inquest jury expressed an opinion that unnecessary delay had occurred in its completion. its completion .- Another tube for the Britannia-bridge at Menai, is to he floated to its destination on 3rd inst. A serious accident lately occurred to one of the cylinders. The supports gave way, the cylinder was precipitated to the bottom of the channel, and two men were killed, and others wounded. Next day the cylinder was fished up for further duty. Mr. Fairbairn visited the Next day the cylinder was usued up for further duty. Mr. Fairbairn visited the tubes the other day, along with some German engineers, who are said to he engaged with him in the work of constructing a similar fabric. across the Rhine. A wind gauge is reported to have indicated not the least deflection in the have indicated not the least deflection in the placed tubes during a heavy gale of wind lately. Loopholes, or oval windows, 5 incbes in diameter, and 12 feet apart, are to be cut out in the outer sides of the tubes, to admit

the light and "show the landscape" to passengers as they fly through the tube. ——In Chancery, on Saturday week, the case of North-Western Railway Company v. Crouch, the carrier, came on. The defendant had claimed against the company for lost parcels and over-charges, and brought an action to recover above 2001. Thereon the company filed a bill of discovery, 710 folios in length. The defendant filed an answer, which extended to 3,200 folios, and the company now objected to five passages, as unnecessary. Master Senior allowed one of the exceptions, amounting to about twelve folios, and overruled all the others, with proportionate costs. So that the lawyers are to have the kernel, and the litigants the shells, as was threatened or anticipated. —A farmer was lately fined 11, with 13s. costs, at York Castle, for making use of a return ticket issued to another who had already gone half his distance with it. The fine, however, was ostensibly for having travelled withoutany ticket at all. —A railwaytunnel is to be cut under part of the town of Algiers. What would the venerable old Dey have said to such a doing in days of yore?

CORRECT ESTIMATING.

Being of opinion that by exposing in the pages of your valuable journal all tenders for work in which any striking difference appears, you will eventually succeed in crushing a system calculated, in my opinion, to injure the building community generally, I herewith forward you a specimen of honest trading, feeling assured you will, on perusal, agree with me that no proprietor can (after this) be reasonably expected to place faith in professional estimating. I enclose my card. A. B.

The architect's estimate was 1,000*l*., and the majority of the Corporation determined against accepting any tender far below it.

CARPENTERS' HOURS.

MASTERS AND MEN.

There is a dispute now pending between the operative joiners of Liverpool and their employers, respecting the hours of labour during the months of November, December, January, and February. Fornerly we worked from light to dark during this period, with a reduction of 2s. per week in our wages, which appears to have given satisfaction to both parties until the present time, when our employers are endeavouring to break through our established rules, and alter the hours of labour;—a strong desire being evinced to force upon us what they term the London rules, namely, that we work from six to six o'clock, using torch lights in uninclosed buildings, or otherwise to carry our tools from the building to the shop, and to work there until hreakfast time, then back to the shop in the evening, with an understanding that we are to have summer wages. Such are said to be the London hours of labour. It may be so in what are termed the derry shops,

" Accepted

where all the cheap novices of the country are employed, who require the assistance of the torch light to enable them to do a fair day's work for a low day's wages, but we cannot believe that the respectable building establishments have adopted such rules. If you will either authenticate this arrangement, or state what are the London hours of labour at the present time, you will much oblige the Liverpool carpenters and joiners.

An Operative.

"a." On inquiry we do not find that the arrangement proposed by the Liverpool masters is generally adopted in the larger London establishments. Probably, however, many of the men would be glad it it were, as it would enable them to earn the same wages as in summer, which is not now the case. At Mr. Thomas Cubitt's, men working in the shops and enclosed buildings, where a light can be used, make up the time by candle or gaslight, working from six in the morning till half-past five in the evening. Carpenters, working out of doors, or putting joists in buildings in course of erection, would be paid nine hours per day instead of ten. From 9th of November to 14th February their time is from seven till half-past four, with half-an-hour to dinner; during the dead of winter they can scarcely see to do anything at the commencement and close of day, but are paid for nine hours. The same arrangement is made at Messrs. W. Cubitt and Co.'ss, and we believe at Mr. Grissell's. We understand that the men at one of these establishments last week made a request to be allowed to make up the time by candlelight.

DESTRUCTION OF WORKS OF DESIGN.

MR. HOPE'S HOUSE.

SIR,—Some people contend that wanton destruction is no longer perpetrated on works of design or art. Permit me to record the last of several instances which have occurred within my knowledge. About a week since, the workmen completed and left the doorway of my new house, No. 116, Piccadilly: this doorway, with its portico, contains a great deal of elaborate carving and metal-work,—more than I should have adopted had I not been guided by the advice of muchesteemed and very able professional advisers. Last night a metal door-handle was wrenched off and carried away, and force was used to destroy another. These handles had no value except such as belonged to their pattern, and must have been coveted for that, or destroyed from mere wantonness. In either case, this is an instance of the reception given in London to novelties of art manufacture.—I am, Sir, &c., HENRY THOS, HOPE.

116, Piccadilly, Nov. 28, 1849.

*** We shall be glad if the publicity thus given to this wanton outrage should lead to the discovery of the infamous perpetrator of it.

EXTENSION OF LONDON.

Owing primarily to the establishment of omnibuses, many thousand families of limited income have left the City to reside in the suburbs, which, if they were suburban villages, would be indeed advantageous; but as landlords have laid out the ground in small four, six, or eight-roomed tenements, with but small gardens attached to them, this advantage is mostly lost, for thereby has London increased in the present age more horizontally than vertically in proportion to former times (when the great mansions were deserted to be occupied in floors by the inferior orders), causing a proportionally excessive increase in sewerage, gas pipes, water pipes, and above all, instead of concentrating the smoke at the height of 40 feet above the pavement, spreading it out at the height of 20 to 30 feet. Better had it out at the height of 20 to 30 feet. Better had it been if large houses, on a more commodious plan than the model St. Paneras one, had been erected in the suburbs (e. g. Islington), leaving the City-road hordered by fields as before.

And, indeed, even now, much might be done by throwing the front railings of front gardens back to the house fronts, in long avenues (e. g. City-road, Kennington-road, &c.), planting two or three rows of trees on this space between the pavement and the houses, which forms a most agreeable promenade. Unluckily, the

demand for shops induces landlords to build over these foregardens. Quiet, straight streets (e. g. Gower-street) parallel to a great thorough-fare might be here and there planted with trees, to relieve the monotonous view of the houses.

It would be a great improvement if all the streets were numbered as in Paris, or as our Regent-street, viz., the odd numbers on the one side, and the even on the other, which might save many a useless crossing in muddy weather.

Suburhan roads, when completed, ought to be numbered consecutively, leaving it to the fancy of the individual house-owner to call his house by any fanciful name.

LONDINENSIS.

METROPOLITAN COMMISSION OF SEWERS.

Another crisis is in course of preparation here, or we shall be surprised: the rate-payers are already beginning to stare, and ask, what next?.

On Friday in last week a general court was held at the office in Greek-street, Lord Ebrington in the chair, when several resolutions were brought forward by the chairman, to the effect that Mr. Frank Foster be appointed as principal engineer to the commission, with entire control over the surveyors and their operations, and at a salary of 1,500l. a-year, including 200l. for travelling expenses; and that a hye-law to that effect he submitted for con-firmation to a special court of sewers, to be holden at the expiration of a month at least from the court

Sir J. Burgoyne supported the propositions. Previously, he said, a number of surveyors had been appointed to carry on the engineering duties of the appointed to carry on the engineering duties of the establishment. These surveyors acting independently of each other, reporting and doing all their other duties independently, the Board became the controlling engineer, and it was needless to point out how incompetent a court constituted like theirs was for the discharge of such duties. He did not mean to charge any individual with impropriety of conduct. He referred only to the system. There were some very valuable men among their body of surveyors; and he was not sensible of any their body sensible of some very variable men among their body of surveyors; and he was not sensible of any particular act which made them liable to reprehension in any direct degree. The commission too had a chief surveyor and a consulting engineer who were only so by name and not in reality. They were called to make separate reports sometimes, and at other times they were associated with the other surveyors, but only to consult with reality. They were called to make separate reports sometimes, and at other times they were associated with the other surveyors, but only to consult with, and not to guide, control, or check them. Thus a spirit of antagonism arose among the officers; and it was a matter of public notoriety that the chier engineer and surveyor were at open warfare, while the commissioners were confounded between the two, and never knew how to act, or what judgment to form, in the matters brought before them. It was quite impossible that things could go on in that way. One of the most energetic governments that had ever existed was that of the Emperor Napoleon; and there was one part of his system from which he thought the court might take a lesson. When Napoleon determined on any measure he did not lay down ten or twelve principles, and direct that the execution of each should he entrusted to separate hands, but he said, "Mr. So-and-so is charged with the execution of this decree." The noble chairman was aware that this matter had here early pressed upon their notice after the reorganization of the commission, and the members came to the understanding that, as they could not decide for themselves, they would place the question in the hands of the two eminent engineers, Messrs. Stephenson and Rendel, requesting them to take the matter in hand. These two gentlemen thought that they would wish to have a third person associated with them, in order that there might not be ropose that he should join them, which he did. They had deliherated on the subject, and were perfectly uniform in their opinions, and he thought that they might congratulate themselves that there refertly uniform in their opinions, and he thought that they might congratulate themselves that there refertly uniform in their opinions, and he thought that they might congratulate themselves that there feetly uniform in their opinions, and he thought that they might congratulate themselves that there was every mark of approval from the whole body of commissioners when their decision was intimated

to them.

Mr. Stephenson rc-echoed Sir J. Burgoyne's

to them.

Mr. Stephenson re-echoed Sir J. Burgoyne's remarks on the necessity of a change of system, and the propriety of the choice pointed out in the resolutions. He took upon himself the responsibility of recommending Mr. Foster.

Sir H. De la Beche said it was obvious that while the commission was responsible to the public, they required some one as chief engineer, who should he responsible to them for the works which it was necessary to carry out. A single person only could be so appointed, and therefore the creation of the office had been recommended. At the same time, looking to the structure of the commission, he be-

lieved that the great principles of drainage for the metropolis might fairly be considered by the members of it themselves, and he trusted that the public would have confidence in their deliberations.

Mr. T. Hawes was of opinion that, with very little care in overbauling the accounts, the proposed salary would be much more than saved to the rate-

salary would be much more than saved to payers.

Mr. Hardwicke complained of the insubordination and want of agreement amongst the officers, arising from the want of one great head.

Lord Ebrington drew attention to the constitution of the former Commission of Sewers, and stated that, in issuing the last commission, the necessity of appointing a responsible officer, such as was now proposed, had been foreseen and approved of by the Legislature, it being considered that the large area of the metropolis, with the exception of the city, should be considered as one district.

The resolutions were then put, and carried unanimously.

unanimously.

Miscellanea.

GOODRICH COURT .- Sir :- As architect to Mr. Meyrick, the present owner of Goodrich Court, I will thank you to allow me an opportunity of publicly contradicting, in the most unqualified terms, that part of a paragraph, contained in The Bullder of the 3rd inst, as to the removal of the armour, and which was copied from a local paper. There is no was copied from a local paper. There is no truth whatever in the statement. Not only is it Mr. Meyrick's intention to preserve the en-tire collection "intact," but to make such arrangements as will afford the public increased facilities for viewing it at all times: and I quite agree with you, Mr. Editor, that Goodrich Court may be considered, to some extent, as "national in its character."—HENRY HARRISON. 29, Bedford-square, Nov. 29, 1849.

SMOKY CHIMNEYS. - Observing two paragraphs in your paper on smoky chimneys, I would offer a few remarks. As to the first plan (p. 489, ante), I have adopted it for my temporary office (being clerk of works) in some cases by the hedge-side, and in others in some corner crowded by lofty buildings, being of opinion that a space like that mentioned was necessary to retain the compressed smoke, to presary to retain the compressed smoot, to pre-vent its blowing out into the room. But I bave not found it succeed in all cases, like your correspondent, and if it did so the larger space could not be properly cleansed by the sweep's broom. In the second paragraph the author has stated facts and remedial measures. But I bave something further to offer on this subject, and in the spirit of your paper let us all lend a helping hand, and so perhaps arrive at the remedy for so long-felt an evil. First, I have always taken care to avoid any space, but what needs be, from the register stove flap, or other fire grate, to the throat of the flue, and where I have the opportunity, I use 10-inch round pottery ware pipe, say from the throat of the flue to 3 feet above it, taking care to make the joints quite flush, and from thence gradually increasing the flue to 12 inches of the same material, and so continue 12 inches of the same material, and so continue it to within say 6 feet of the chimney-pot, and diminishing it in the same manner as at the throat. The chimney-pot, too, should be the same size, viz., 10 inches throughout within, whatever its form may be without, for architectural appearance, and should always terminate tural appearance, and smouth aways terminate so as to prevent rain water getting into the flue, and also to assist the up draft by the wind. I have superintended the erection of a great many such chimneys, and never found them to smoke. But to construct flues of this size, it being of less area than that allowed by the Building Act, so much of the Act must be repealed (and why not?), since the original size was to afford room for climbing boys. It may he observed that the smoking of chimneys arises from a variety of circumstances; and, first, too often from irregular or bad construc-tion. I have known the same chimney flue tion. I have known the same chimney nue vary from 9 in. by 9 in. to 2 ft. 6 in. by 9 in., more or less (a mere hole); and, secondly, the chimney top so loosely stacked together, as to allow the rain water to saturate it for several feet down, thereby providing a complete condenser to the rarified smoke, and, as a matter of course, areaduring down-draft. The paraland, as a mac. denser to the rather since, and, as a matter of course, producing down-draft. The parallelogram 14 by 9, generally used, on account of its being consistent for the bond of the brick work, and also in accordance with the Building Act, is inconsistent with the natural shape assumed by smoke or rarified air .- J. KNIGHT.

PROJECTED WORKS.—Advertisements have been issued for tenders by 5th December for the reseating of Bridgewater parish church; by 31st, for the supply of 2½ inch Yorksbire stone for paving footways in St. Marylebone; by Thursday next, for the erection of workshops at Bow; by 11th, for the erection of a savings hank at Witham; by 3rd, for the erection of a public house and two sale shops at Sheffield; by a date not specified, for the Sheffield; by a date not specified, for the working of iron-stone quarries at Staubope-in-Weardale; by 11th, for making new line of road in Worcestershire; by a date not specified, for the purchase of about 70 miles of pipes, with bends, branches, &c.—also, for gasholders, condensers, purifiers, retorts, &c., all for an extensive gas-work for the Great Central Gas Consumers' Company; by 12th December, for locomotive stores, carringes, waggon stores, and general stores, for the Great Western Railway; and by 18th, for miscellaneous stores for the Lancashire and Yorkshire Railway.

Competition.—An advertisement has been issued for plan and specification, by 1st Feb., 1850, for a new Wesleyan chapel at York premium 351.

Society of Arts. — November 21st:
Mr. T. Webster in the chair. The Assistant-Secretary read a paper on Flexible Break-waters and Lighthouses, by Mr. W. II. Smith, C. E. The paper, after alluding to the losses and amount of property annually sacrificed on our coasts, referred to various efforts that have been made by means of floating break-waters to affect an accompanied having breakwaters to effect an economical barrier to the sea. The principle of Mr. Smith's pro-posed breakwater is to give elasticity to the structure. The models exhibited were formed of a long wall of open piles, divided into separate sections, each having an independent motion at the top, but secured, and pivoted at the bottom on the screw pile. The braces (with counterbalance weights at the centre), extending seawards from each side, are also affixed by the screw pile. The sections on being struck by the sea yield to it, thereby eluding violence, and the waves passing through the close grating are disseminated. The structure recoils when it becomes in equilibrium with the waves.

THE NEW COAL EXCHANGE has been pened for business. We mentioned the disopened for business. We mentioned the dis-satisfaction of the factors with the way in which they were treated at the State-opening. A limited number of tickets were sent to them, the day preceding that of the ceremony, for the gallery next the roof, which they politely returned. A professional joke is circulating on the subject, to the effect that the corporation tried to put the coal sellers in the attic,

EDINBURGH ADORNERS .- Good Mr. Editor. ENINBURGH ADDRINERS.—Good Mr. Editor,—It is a curious fact that the architectural interests of "Modern Athens" appear to have been made over by her citizens to the tender mercies of tailors. The dean of guild, whose duty it is, as ædile, to preside over the buildings of the city, and at whose instance the venerable mansion of the Scottish reformer is at present threatened with description is not at present threatened with destruction, is—not an architect, nor a man skilled in architectural matters, but—a tailor! and the memorial which has just been addressed to the Lords of matters, out—a tanor; and the memorial which has just been addressed to the Lords of the Treasury, for effecting the demolition of the Register-house Screen, is signed, in name of the committee, by a tailor as chairman, and another tailor as secretary. Far be it from me to join in the wholesale abuse of a class, which must necessarily he unjust, but it would seem that certain sons of the craft find as little compunction in adapting the works of an old-fashioned architect to the notions of modern "utility," as in turning an old coat, or in reducing the voluminous integuments of the parental nether-man to the schoolby dimensions of a new generation. "Ne sutor ultra crepidam," say I; and it is well that the citizens of the classic metropolis of the north can rely in such matters upon the good taste and proper feeling of their representative in Parliament, who is also a Lord of the Trea-Parliament, who is also a Lord of the Treasury, and who is not likely, upon the representation of a few interested, or unskilful, or indifferent persons, to lend his countenance to such innovations, without being thoroughly persuaded and convinced of their necessity.
No Cobbler,

COMING.—An "Artist's Almanac" for 1850, edited by an artist, which is to combine with an almanac a hand-book for artists and amateurs.—"Eight Views of the Church of St. Mary, at Stafford, in its present Restored State." From damines tables has been been set of the state." from drawings taken by the late Mr. Masfen, Jun. The drawings were made by Mr. Masfen, with the desire of assisting in the Mr. Masten, with the desire of assisting in the decoration of the church, by appropriating the proceeds to the purchase of a painted window for the edifice. It pleased God to remove him before his work was complete, but his friends mean to carry out his intention by subscription.—It is proposed to issue a series of "Health Tracts," in aid of the sanitary moved. ment, by the Tower Hamlets Association, and they are inviting parties to submit such to

them for publication.

FIRE ESCAPES.—After reading the letter in your journal, signed "P. W. H.," written with a very benevolent object to encourage the direction of the attention of mechanicians and engineers to the invention of fire-escapes,—the figure of a spiral or cylindrical spring was presented to my imagination, and it struck me, upon reflection, that from the compressibility of such a power into a small compass, it might possibly form the best principle for a con-trivance of the nature required, whether used by suspension from a window, or from with-out, in the manner of the toy called "the jack-in-a-hox," if sufficient elasticity for the required weight can be obtained, to allow of its rising from its platform, on the ground, when relieved from pressure, to the ordinary height of our third-floor windows. Two other prin-ciples have since occurred to me as applicable to the same object: one, applicable to a window, to the same object; one, applicable to a window, or from the ground, consisting of a number of metallic tubes, partially elastic across their diameters, and contained one within another, like a portable fishing-rod; the other, to be used from a platform on the ground, and to be formed on the principle of the "lazybones," or multiplied scissars. These three inventions, or, more properly speaking, conceptions, placed on a platform, would occupy small compaon a platform, would occupy small comparative space, and be drawn by a horse, when placed upon wheels, with much greater facility than the long fire-escape ladders. The platform might move upon axles, so as to be inclined right or left to any window, when the machine was raised.—JOHN PERCEVAL, Kensington.

MODEL DWELLINGS FOR LABOURERS IN FRANCE.—La Presse publishes "a novel list of shareholders," containing the names of containing the names upwards of 1,100 persons of every rank and condition of life, who have taken shares of condition of life, who have taken snares of 25 to 1,000 francs each in a society called "La Société des Cités Ouvrières," which has for its object to build improved lodging-houses for the poor, not only in Paris, but apparently in every large city of the republic. The capital of this society is to be six millions of francs, or 240,000l. sterling. It is under the patronage of the president, who is said to have con-tributed largely to it, and to take a lively interest in its success. The scheme is clearly based on that of our own model dwellings, but comprises also arrangements for work-rooms, and for the care of young children; a plan of providing furniture, to become the tenant's purchase by small weekly instalments; the arrangement of a hall, or meeting room, whereby coals and candles are saved to the tenant; and a register of working men and servants. One of the lodging-houses is already in course of erection in the second arrondissement. The rents are to be exceed-

THE BRITTON CLUB recommenced their THE BRITTON CLUB recommenced their social meetings on the 20th, when Mr. Cubitt was host, and Mr. Britton, Mr. Tooke, F.R.S., Mr. Humfrey, Q.C., Mr. Grissell, Mr. W. Cubitt, M.P., Mr. C. Hill, Mr. Cunningham, Mr. Jerdan, Mr. Gibbons, Dr. Conolly, and others, were present. The Autobiography in preparation for the subscribers to the Testimonial is more than half in tyne.

monial is more than half in type. monial is more than half in type.

Proposed Architectural Lending
LIBRARY.—The intention of establishing an
architectural lending library in London, advertised for some time in our pages, and which
seemed to promise advantage to students, has
been abandoned; the number of persons who
signified their intention to subscribe being too
insignificant to justify the proprietor in makinsignificant to justify the proprietor in making the necessary arrangements.

ELECTRO - TELEGRAPHIC PROGRESS. list has been published, emhracing all the principal towns in England and Scotland, and to all of which telegraphic communication is said now to extend from the two central stations at Lothbury and St. Martin's-le-Grand, the office, Strand, or the branches at Eustonsquare, Shoreditch, Waterloo-bridge, and Paddington.—The company have caused a criminal information to be issued against Messrs. Willmer and Smith, the Liverpool correspondents of the Morning Herald, and, if we mistake not, the promoters of a competitive electro-telegraphic company, for a libel published in the Morning Herald of 11th October last.—The celebrated American telegraph case of Morse v. O'Reilly has just heen decided by the Supreme Court of the United States, in favour of Mr. Morse. A correspondent of a contemporary says—"Mr. Bain's projects will also be endangered by a suit brought against him by Mr. Morse, as well as the originality of his invention for making marks by the action of the electric fluid on paper prepared with a chemical solution. The ground is, therefore, narrowed down here to Morse and House, and these will, probably, share the public favour equally. Both in Morse's and House's system, the action of the recording instruments is simple and unmistakeable. The other day, some of our telegraphic operators amused themselves by beating the time of various tunes at the distance apart of several hundred miles, and they did it with such accuracy that they were perfectly intelligible, even to the bystanders. In a very short time we shall have a continuous line from New York to Halifax, and as long as the Cunard steamers stop there it will be of great advan-tage to the newspaper press on both sides of the water. The telegraph has now become a most important agent of communication in this country, and large amounts of business are transacted by its means. I think the time is very near at hand when the American systems supersede all the others now in use. The telegraph between Berlin and Stettin has been laid in gutta percha tubing, which it appears is no more able to withstand the inroads of those little land sharks—the mice, than we thought it possible that it might be to withstand the action of the ocean tribes in submarine telegraphs; for we find it reported that on a recent occasion, "the communication having been found to be interrupted, search was made for the cause, when a mouse's nest, with a little brood, was discovered in the gutta percha tube, which it appeared that the little animal had contrived to gnaw through, and so disturb the wires."

THE 1851 EXPOSITION. -The gentlemen who are managing this matter must be careful, or they will raise a feeling against the project which, notwithstanding the excellence of the idea itself, and the machinery which has heen cleverly put into motion, will yet wreck it. It is the subject of considerable dissatisfacto the sunject of considerable dissatisfac-tion, very generally expressed, that appoint-ments at large salaries are being made, and that the contract for the erection of the tempo-rary building is actually entered into with a builder, without the concurrence or knowledge of the public, or a recognition of their right to be represented in the matter. Our caution is meant as a friendly one, and we hope it will be

THE WESTERN LITERARY INSTITUTION, THE WESTERN LITERARY INSTITUTION, LEICESTER-SQUARE.—The glee concerts here have been very successful, and, better still, very creditable to the parties engaged.

A HINT TO THE FREEMASONS OF THE WEST OF FROMWING A think of the

WEST OF ENGLAND .- At the dinner of the stone of the new works was laid, -said he had heard there was a disposition on the part of the craft to connect themselves with the restoration, and he suggested that they should set tion, and ne suggested that they should set a-foot a subscription and undertake some special portion of the fabric. This would indeed be a return on the part of the craft to the good ways of their mediæval predecessors.

ST. PETER'S CHURCH, BELMONT. - A church and school situated at the village of Belmont, in the parish and about 5 miles from the town of Bolton-le-Moors, have just now been completed under the direction of Mr. J. been completed under one direction of Mr. J.

E. Gregan, architect. Both were erected from a sum of money left for the purpose by the late Thomas Wright, Esq., of Belmont, and the land for the sites of both buildings has been given by the present possessor of the property.

The church consists of chancel, nave, and sails were transcent coverant evise and south end. aisles, western tower and spire, and south porch, with a vestry on the south side of the chancel, and an organ aisle on the north. The style is Early English; the roofs are all open, and there are no galleries whatever. The seats are low, of red deal, and afford accommodation for 500 worshippers. The chancel was originally designed to be of greater length, but for various reasons was curtailed. The church has all the advantages of a heautiful, although somewhat situation, and is a conspicuous object in the valley. The contract for church and schools, with their fence, walls, &c., amounted to 3,650l. The church will shortly be consecrated by the Bishop of Manchester.

NEW PANORAMA OF THE NILE.—The

Panorama of the Nile, painted by Messrs. Bo-nomi, Warren, and Fahey, mentioned by us some time ago, is now being exhibited in New York, and a fresh one has been painted by these gentlemen for London, and is now open to the public in the Egyptian Hall, Piccadilly. The artists have flattered us so far as to adopt both the suggestions we threw out in our notices of the first. It is not now a transparency, as the first was, but is lighted from the front, and they have in one place left the river to give a nearer view of one of the larger buildings, the great temple of Karnak, the result of which is the most effective and striking tableau in the whole series. We strongly advise our readers to visit this most instructive as well

beautiful panorama.

THE KENTISH TOWN LITERARY INSTI-TUTION is making satisfactory progress, and its projectors already begin to look forward to the possibility of erecting a building specially for its wants. A concert was given on Wednesday by the choral class, which ambitiously comprised Haydn's "Creation!"

THE HALL OF COMMERCE, Threadneedle-

street, was knocked down at auction the other day for 44,900l. The site alone (9,000 feet) is said to have cost 35,000l.

THE CHESTER AND HOLVHEAD RAILWAY. -There is a strong impression that this railway must be shut up in consequence of its not paying. This line has certainly been most unfortunate, and most unfairly dealt with; fortunate, and most uniarly users with, unfortunate in the extravagant cost of the Conway and Britannia bridges, which is several times above the estimate;—unfortunate in the unlucky position of Ireland, the trade of which has been destroyed by the free-trade principles,—unfairly dealt with by the Government withholding the 30,000*l*, for carrying the mails, merely because the Britannia-bridge is not complete, and further unfairly as breachests. fortunate, by a branch of that very Government (the Admiralty) running their boats against them.—Herepath's Journal.

No. CCCLVII.

SATURDAY, DECEMBER 8, 1849.

R. CHOWNE'S "air-syphon" system of ventilation, mentioned hy us in some previous numbers of this journal, has excited the curiosity of many of our readers,

who appear to expect from us a fuller development of its nature. The importance of an efficient, cheap, and simple method of ventilation cannot he over-rated, and claims for every scientific and honest endeavour to provide it the fullest protection, careful and candid consideration, and the most liheral encouragement.

In the specification of his patent, Dr. Chowne sets it forth as follows :-

"My invention consists of applying a principle which I have found to prevail in the atmosphere of moving up the longer leg of a syphon and of entering and descending in the shorter leg, and this without the necessity for the application of artificial heat to the longer leg of a syphon. And in order that my invention may he most fully understood, and readily carried into effect, I will proceed to describe the means pursued by me; and in doing so I will, in the first place, enter more at large into the principle on which the invention is hased,

"I have found that if a hent tube or hollow passage he fixed with the legs upwards, the legs heing of unequal lengths, whether it he in the open air or with the shorter leg communieating with a room or other place, that the ir circulates up the longer leg, and it enters and moves down the shorter leg, and that this action is not prevented by making the shorter eg hot whilst the longer leg remains cold, and no artificial heat is necessary to the longer leg of the air-syphon to cause this action to take place; thus is the direction of the action of ir in a syphon the reverse of that which takes place in a syphon, or like hent passage or tuhe, when used for water and other liquid, wherein he water or other liquid enters and rises up n the shorter leg and descends or moves down n the longer leg. And my invention consists of applying this principle when ventilating cooms or apartments, such as those of a house or ship, or other building or place.'

He then goes on to describe the invention s applied to the rooms of a house where there re chimneys opening into such rooms, and ays, in these cases "I employ the chimney as he longer leg of the air-syphon, which I rrange in order to ventilate a room, and I am nahled to use the chimney whether for the ime heing there is or is not a fire lighted in he fireplace of the room; hut I prefer, when here is no lighted fire, that the fireplace should e closed either hy a register stove heing shut, one he used, or if not, hy a close chimneyoard, or by other convenient means, nd I form a passage or channel either then constructing the building, or hy cutting avay if not previously constructed, or I otherrise form such channel or passage, or more nan one, from the upper part of the room or ear the ceiling of the room, and cause it to sescend and to enter the chimney at a point pove the top of the fireplace, when it is an pen fireplace, and it may he lower down

the upper part of the room may be in communication with such descending passage or channel leading to the chimney, I form a hollow cornice sufficiently open to allow of the atmosphere at or near the upper part of the room to flow into the same, and owing to the atmospheric syphon which will thus he formed, there will he a constant flow of the air in a direction from the upper part of the room down the descending channel or passage, which will represent the shorter leg, and thence into the chimney and away up the chimney, which will constitute the longer leg of the airsyphon."

When fixed gas-burners or lamps are used, then he prefers that a tube or hollow passage should he conducted down to form the shorter leg of the air-syphon, in any convenient direction, and he caused to enter the chimney as before described, or such channel or passage may be of metal or other material projecting from the walls of the huildings, or it may he down pillars or channels independent of the walls, where the architecture or ornamental portion of the walls or other parts will admit of it; and, so far from its heing necessary that there should he any hell over the chimney of a gas-hurner or other lamp, the patentee has found that having, close to the top of the glass chimney, a lateral tube opening into the shorter leg of the syphon, is hy far the most effectual way of getting rid of the heated air from the lights: the products, in place of rising up and hecoming diffused in the room, pass rapidly through the lateral tube into the shorter leg of the syphon. Of this, however, we will speak again presently.

At the risk of repetition, we will mention something of what we have seen at the patentee's residence, in illustration of the principle involved. At the hack of his house the Doctor bas fixed a small zinc pipe, running from the level of the ground to over the roof of the house, and turning up at the hottom three or four feet, to form a syphon. The smoke of burnt paper, brought near to the mouth of this short end, gave evidence, hy its rapid descent, of the current through the pipe. When the hend of the syphon, next the ground, was made to extend the whole length of the garden, and there to turn up the three or four feet as hefore, the action was the same, and so it was when a jacket of hot water was placed around the short arm of the pipe,

This arrangement is in the open air, it must be remembered; and the patentee states that in all seasons and at all times, -in the middle of a July day with a hot sun on the pipe, or at midnight in December when it is cased with ice,-the current is always the same, with the exception only that sudden gusts of wind will occasionally cause a partial return of it.

In the room wherein the patentee has carried on his experiments, filled with tortured and convulsed pipes, and as many gas-lights as would illuminate a chapel, we were able to see the practical application of the simple fact established hy the pipe outside. Here the chimney formed the long leg of the syphon, a chimney-hoard filled the opening of the fireplace (there being no fire in the grate), and the shorter legs of the syphon (for there were several, all connected with the one longer leg, either through the chimney-hoard or by an opening ahove the register direct into the flue), consisted of pipes hrought from different parts of the room. The mouth of one pipe opened close under the ceiling, the mouth of another

through each equally there the current was made manifest when the smoke of hurnt paper was applied. Some seats around the room had a rude channel formed heneath them hy means of stout paper, which was loosely connected, at one extremity, with an upright open-mouthed tube in an angle of the room, ahout the height of a man, and at the other, equally slightly, with the chimney. The force of the current produced was extraordinary

It is scarcely necessary to point out the means thus afforded for ventilating large assemblies. Busts on pedestals might be made to contain pipes, or the pipes might be let into the walls and partitions. In sick rooms a flexible tuhe might he suspended over the person and bed, and then he conducted in such a manner as to descend and enter a chimney, which would produce a constant flow of the atmosphere of the room through the tuhe, and so away.

A supply of fresh air, to take the place of the vitiated air removed, must he provided, hut this does not enter into the present patent. The doctor seems to content himself "with the pure air, which is constantly flowing into the room hy the door or other openings,"-but this is an inartificial and inefficient mode of supply, which should not he depended on under other than very ordinary circumstances.

A second syphon, perhaps, might he usefully employed, having the short end outside the house, and the opening of the long end near the ceiling of the apartment within, thus reversing the action, and hringing in fresh air in such a manner that it might he spread throughout the room without producing

The patentee further proposes to apply his system to ventilate the goaf of a mine:-" In such a case," he says, " one or more pipes, or channels, being laid therein, and carried as high up as possible, the other end of such passage is to he carried up one of the shafts of the mine to the surface of the earth, and opened into a chimney, which would become the longer leg of the atmospheric syphon, hy which arrangement the gases and atmosphere of the goaf, in place of from time to time getting into the mine, would be constantly carried away. And if desired, the whole of the mine may he ventilated in this manner, for in place of having a furnace in the upcast shaft, as now practised, it will he only necessary to raise a tall chimney over the upcast shaft, so that the downcast shaft and the mine helow shall he made the shorter leg of the atmospheric syphon, and the chimney and upcast shaft the longer leg of the syphon, and thus a constant ventilation will go on.3

And now as to the gas-lights: we consider the establishment hy Dr. Chowne of the fact that to take away the heat and deleterious products of comhustion the opening should he not over, hut close to and forming a right angle with the top of the glass chimney, one of the most valuable results of his experiments. In the room to which we have referred there is an upright hollow pillar communicating at the hottom with the chimney, and hearing around the upper part of it a number of gas-hurners. Just ahove each glass chimney is a short tube ahout 2 inches diameter, projecting laterally from the hollow pillar into which it opens, and just touching the lip of the glass. A thermometer was suspended within the pillar, and on lighting the gas this rose in a very few minutes from 65 deg. to 100 deg., while the apartment remained cool. The effect of the then closed; and in order that the whole of balf way up the height of the room, but lateral tube is made evident in this, - that

while the tuhe is open a piece of paper may he held with safety over the chimney of the gaslight, hut when the tuhe is closed it inflames instantaneously,-showing to what extent the heat is carried off hy the tuhe.

We will not disguise our fear that the Doctor is not likely to reap that pecuniary return to which his ingenuity and perseverance justly entitle him. One of our correspondents, whose letter (p. 499 ante) was founded to some extent on a misconception of the system, considered that Dr. Chowne had simply asserted a principle, and that a patent for it could not be maintained. Let us inquire

Mr. Carpmael, in his book " On the Law of Patents for Inventions," is very explicit in distinguishing hetween a patent for all applicacations of a principle and the application of it to any particular object. In reference to the law of gravitation, Mr. Carpmael says, p. 16, "It would have been an absurdity to suppose, that a patent for all applications of the principle of this natural law could have been granted." But he further says, p. 16, "although a principle in itself cannot be the subject of a patent, the newly combining or applying a known principle to a machine or in a manufacture, wherehy it becomes in any way improved, is an invention suitable to he protected by a

In Messrs. Billing and Prince's "Law and Practice of Patents," the opinion of some of the judges on this point is quoted. Mr. Justice Buller has said, "A patent cannot he maintained for an idea or principle alone." "A principle reduced into practice means a practice founded upon principle, and that practice is a thing done or made, or the manufacture which is invented." Mr. Justice Heath has said, "There can he no new patent for a mere principle; hut for a principle so far emhodied, and connected with corporal substances, as to he in a condition to act, and to produce an effect in any art, trade, &c., a patent may be granted." In other words, it may be asserted that a law of nature, or property of matter, cannot he patented, but a mode of turning this to account in the operations of life can he,-and this is exactly what Dr. Chowne may claim.

There would seem, however, to be a difficulty in preventing any individual from putting up such pipes as might he necessary for himself, and it would prohably even he shown that the same arrangement had been often made by others many years ago. We ourselves did so seven or eight years ago, without a precise idea perhaps of the exact mode of its operation heyond forming a vent. The circumstances were these. At a large silk merchant's establishment, at the west-end of London, three stout healthy young countrymen, who had come into the house one after the other to act as cashier, had died. The countinghouse was a close room, without a window, and in which, consequently, gas was always hurning. We were engaged ahout the house professionally when the last man died, and were requested to "do some little thing" towards ventilating the room. The step we took was to place all round the walls, immediately under the ceiling, a 3-inch pipe of perforated zinc (a pipe full of 3-inch pipe or periorated and to prove innumerable small holes), both ends of which were connected in one corner with a tuhe that came down the angle, and was taken under the floor into a flue. An amazing improvement in the atmosphere of the room was effected, and its after-occupants remained perfectly healthy,

albeit it ever will be a melancholy den for a man who loves sunlight, to spend the days of his youth in. This was precisely Dr. Chowne's arrangement of pipes: others have probably done likewise, and might maintain their right to do so again.

We shall be sorry if our anticipations prove correct, because we consider that those who, at cost of time and thought, to say nothing of money, evolve a new truth, and show how it may be applied for the advantage of their fellows, are honestly entitled to reward. It seems exactly one of those cases which ought to be met from a public fund.

ON THE PRESENT STATE AND PRO-SPECTS OF ARCHITECTURE.*

With regard to our native styles I yield to none in sincere admiration of their heauty; they have, whether altogether from inherent power, or partly by association, the most thrilling influence on the mind, and are potent to touch the very highest notes of feeling; but it is unfair, in my opinion, to judge of the re-lative merits of the Gothic and Classic styles by a comparison of the former, as perfected in England, with the imperfect adaptations of the antique architecture which we see around us. Gothic architecture was cultivated and reared to its perfection in the ecclesiastical rearcu to us perfection in the ecclesiastical edifices, for the solemn purposes of which it was pre-eminently, if not exclusively fitted; and the complex arrangement and multifarious requirements of these buildings called out at once all its powers of expression and beauty. The antique, on the contrary, has only heen carried to its acme of grandeur in the ancient temples, the most simple of all arrangements, while of its further applications, its adaptation to other and modern purposes, we have good reason to doubt the perfection. If these ancient orders, or rather the elements that com-pose them, have never had their full signifipose them, have never had their full signifi-cance in modern works, and such I helieve is the fact, the comparison of the two styles is unjust. For the production of picturesque magnificence of effect, the capabilities of their exquisite profiles, their lines of grace and grandeur, have, perhaps, never been completely shown, even by the Italians. There is no degree snown, even by the Italians. There is no degree of richness, or minute delicacy of ornament, exhibited by the Gothic, or by the Mahomedan or Oriental styles, which the Classic is not capable of equalling in the hands of an architect who thoroughly understands its principles and motives. We have no building in Europe that is a fair specimen of its power. Its resources are not adequately drawn upon in the great huildings which are the chief boast of the style, particularly as regards their interiors. St. Peter's and St. Paul's and the chef d'œuvres of Paris fall far short of what may be imagined to arise, under concurrence of every favourable circumstance, as a Phœnix from the ashes of

Of this high reach of art in future, I found my hope upon the new light that is every where breaking, as to its real end and influence. But it pre-supposes, likewise, the apence. But it pre-supposes, likewise, the appearance of talented professors, with the occasional visit of genius. Of the first we have no reason to doubt; and of the latter we need not despair. The truth will set us free, and if we commence in the right spirit, our perception of the true and right will become stronger. With the legitimate exercise of our faculties we may expect new power to he horn; and there will he hut little danger of repetition; while sincere, independent thought will shed a ray over the meanest subject and rudest ray over the meanest subject and rudest material. No man knows what his power of invention is until it is called into play; there are, I suspect, in most men, if not in every man, intellectual capacities which, for want of favourable opportunity, have never heen developed. In some who have entered the profession, the needful powers may, unfortunately, be weak, or altogether lacking; hut the deficiency of individuals in creative energy, cannot alter the nature of art. The man who is content to copy only, or who possesses ability for nothing higher, is a mechanic; hut hy no accumulation of means over the meanest subject and rudest

or examples can true architecture ever become a mechanical employment. Genuine works of architecture, like those of nature, have a architecture, like those of nature, have a purpose, as we have hefore seen, heyond their ministry to the senses. They do not appeal to the eye alone, any more than music does to the ear; they have an interest for the understanding, and for the moral perceptions; and this high moral object is a link that unites ours to all the other fine arts. They administer to the grafification of the inner sense, which is to the gratification of the inner sense, which is our loftiest enjoyment, and the most worthy of humanity. The architect of the present day has, therefore, his work in the spiritual department of the world, as well as his predecessors. He has his ideas to express as well as then; and the language is vouchsafed unto him also. What is chiefly wanting, is self-dependence,—a turning inward into his heart, and looking a turning inward into his heart, and looking, round him into nature, for ideas and images, instead of going backward for example and authority. Architects must learn to walk by their own strength, if they would produce works that will characterize the age, and show the "height of the human soul" in the nincteenth century. "There is at this moment," teenth century. "There is at this moment," to quote an eminent living author, "there is for me an utterance bare and grand as that of the colossal chisel of Phidias, or trovel of the Egyptian, or the pen of Dante, but different

from all these." At the same time it must be admitted, that the study and practice of a legion of styles, will ever produce distraction among professors; that it must result in stagnation to the art; and that it is a chief cause of the evils under which we groan; as, under such circum-stances, no one style can be cultivated with the stances, no one style can be spirit and energy essential to its perfection. Architecture is said to require the devotion of a life; but if so many styles are to he used, a life-time is too short. This must be remedied. nee-time is too short. This must be remedied. Certainly one language is sufficient for the expression of our ideas of the heautiful and the true. Inigo Jones's solecism, in attaching a Corinthian portico to old St. Paul's, and Wren's expressed contempt for the beautiful monuments of the middle ages, are not without their lesson to us when read aright; they show the lesson to us when read aright; they show the devotion of these masters to the one style, the secret of their success in it. Let him who would excel in the Classic styles, like them devote himself to the remains of antiquity; study the spirit of the laws involved in them; embue his mind with their heauty; and trace their principles of design and application through the works of the great masters of Italy. Like them, let him confine his imitation to their principles, and not extend it their designs. This is the only way in which he can hope to rival them in the production of editices, that shall he admired as works of the age. Correctness of style is not, as has too age. Correctness of style is not, as has too often heen supposed, the all-important point Whatever may be said on that head, certain it Whatever may be said on that head, certain it is, that truth of conception, sincere operation of thought, attention to the great principles derived from nature and reason, will cove a multitude of faults, such as have been charged upon buildings by certain late critics, who undertake to pronounce upon the productions of art, whilst ignorant of its real nature and numbers.

who underlane to plant the standard of art, whilst ignorant of its rean ature and purpose.

This truth of expression, to which I have frequently adverted, is but another word for heauty. Physical heauty of form is the material expression of truth; it is truth, as far a matter can express it. Beauty in architecture therefore, is truth; and between the forme and moral beauty, there is more than analogy Physical heauty, there is more than analogy Physical heauty, is a reflection of moral beauty or rather the issue and result. "But if truthe heauty," some might answer, "all buildings while true, must be equally heautiful." Not so "Why, then," it might be asked, "is a we'designed church more pleasing than a market place or hospital?" Because it expresses higher purpose, a loftier truth. Why is the market-place pleasing at all? hecause it true. It is part of a great whole, and exists it true relation and harmony with the univers. As no one object in nature is completely beat ifful, viewed apart from the rest; as part of the property of the property of its relations and the property of its relations. tiful, viewed apart from the rest; as part it is beauty consists in the harmony of its relations, so must an object of art he individual tions, so must an object of are he marked and relatively true, and harmonize with it rest of nature and life, to be perfect. The architect's task is, in fact, to co-operate with nature in her inventions, and his works a

* See page 530 ante.

each to be an expression of distinct thought and sentiment, the offspring of a truthful mitation of nature, and of pure ereation in his own mind; and he should remember that great works need not be the only significant ones; that the beautiful is not only unfettered to the style of any one age or country, but that it is not confined to any particular class of edifice. Any materials he may obtain from ancient or foreign sources, or gather from other minds, through the medium of books or otherwise, he

must, before applying, bring into his own mind, and subject to the operation of his own powers; that which has been merely appropriated by the hand and eye, which is not so digested, or that he cannot make to blend with the previous stores and images of his mind

is not entitled to make use of, for it is not his.

Taste and judgment united to fertility of imagination, an eye practised to quiek per-ception of the beautiful, and some artistic power of delineation, should, therefore, characterize the architect, who should also have a passionate love for the art, and consecrate to it all his powers. He must free his mind from prejudice, and look on nature with unscaled eyes, if he would fathom her mysteries of beauty, and discover the principles on which she produces her wonders of effect. They have no exaggerated idea, but true conceptions of the art, who look upon its professor as a poet. In a real piece of architecture the spirit of its author beams forth, as does the soul through the eyes of the hody, and one source of pleasure with which we look upon such a work is the communion of mind with mind: enshrined in stone and wood, perchance, we discover a kindred spirit. As a work of art, it is the beaming of thought in the building that is to be prized, not the building itself, however rich its materials. The end and design of physical is moral beauty; and the secret of its effect upon us is its sympathy with something within. The soul of man is so connected with nature that every new phenomenon, whether tions of the art, who look upon its professor as within. The soul of man is so connected with nature that every new phenomenon, whether of nature or art, excites a corresponding idea or feeling; this constitutes the charm in or teeing; this constitutes the charm in some pictures by the old masters, there is the beaming of a soul in their Madonnas and saints which transfixes the beholder, and on which one could look for hours and think for years.

This beauty is the highest food of the soul; a genuine perception of it has been termed the master key of the mind, and its effect thereon, whether however, the master key of the mind, and its effect thereon, whether however, the master has been defined as the master key of the mind, and its effect thereon, whether however, the master has been defined as the ma

whether beaming from external nature or through the medium of art, is inexpressible. through the medium of art, is inexpressible. Its agency is of the most subtle and spiritual nature. It tends silently to unfold the flowers of our existence, and the highest fruits of virtue are of its producing. It is the duty and the privilege of all to become acquainted with and to cultivate a love for the beautiful; to the artist it is peculiarly necessary. He must imbibe it in order to impart it; be must edu-cate the eye and the inner sense, and strengthen the faculty of conception ere he can communi-

eate it by embodying it in art.

If I am correct in my definition of beauty,

truth of expression, or, in other words, consistency of character in building, is of infinitely more value than any other exterior quality, more value than any other exterior quality, any numeraning prettiness, that could be given in its absence. It has evidently been the sole aim in the exterior design of some public buildings, to render them an ornament to the neighbourhood by a superior style of decoration, heedless of the loud call of common sense, which dictates that, above all things, they should express their use, by having their exterior aspect in harmony with their destination. Their projectors have been forgetful of the indissoluble connection between beauty and truth; and that whatever between beauty and truth; and that whatever charms a building so designed may possess in itself, to every well-formed mind it would have charms a building so designed may possess in itself, to every well-formed mind it would have been infinitely more pleasing if distinguished by truth. Of this great error I could give numerous examples, and they are to be found chiefly among the erections of the last half century. One that will well illustrate this subject, may be seen in the Liverpool Infirmary (I choose examples from Liverpool merely for convenience). No stranger could suppose that building, with its chaste, cold colonnade, and harsh mural and fenestral character, to be an institution of benevolence, an asylum for the afflicted. It is in itself a respectable structure, worthy of the town, but without the least

accord between its architectural character and the humane object of its foundation.

The same striking absence of fitness may be observed in another important building in the neighbourhood,—the prison at Kirkdale; from the front of which not the slighest intimation of its real purpose is conveyed to the specta-tor, who might easily mistake it, with its Ionic portice as its most prominent feature, and neatly dressed sash windows, for a nobleman's or gentleman's country seat. Certainly it be-trays no symptom of the gaol; and a stranger might conclude, upon being told its real cha-racter, that it had been deemed necessary, for some reason, to disguise it. The true aim, I suspect, has been at a handsome and respectable character, forgetful that the art possesses abic character, forgettul that the art possesses the power to speak, and that dumbness is not a necessary deprivation in any building. The Liverpool Borough Gaol is, on the contrary, a building which broadly declares its office, of the ungracious nature of which none could remain in doubt for an instant; and is perhaps not inferior to Newgate, London, in this im-

These examples of vacant or erroneous expression are to be found, as I remarked before, chiefly among later erections: many of the old ones, in regard to this quality, are, on the contrary, objects of just admiration; some of the older institutions of London, and some of the older institutions of London, and the older towns and cities, lightly deemed of, and that many would gladly see replaced by very different erections, are gens in the eyes of all true judges. Hospitals of various kinds might be named, which, with scarce any pretensions to architectural character at all, have that hospitable, warm, and comfortable, yet withal dignified air and mien, which tell the observer what they are: there is a sympathy with suffering in their look; their very gateways shed a balm upon the mind; and though the softening and subduing hand of time is the softening and subduing hand of time is concerned in this effect, yet such are the powers of expression inherent in the art, that it could be given to any erection in the present day by an architect possessed of true poetic feel-iog,—that feeling which draws, like the Muses ing,—that feeling which draws, like the whole round Apollo, into one magic circle the whole

But, whilst adapting architecture to every new circumstance, it must be borne in mind that it has principles which do not alter with these circumstances: through all eircumstances of climate and material of construcstances of climate and inaterial of construc-tion, the great principles are the same. Archi-tecture has true, invariable laws,—as fixed, as unchanging, as those of the physical creation from which they are derived; and, without obedience to these laws, we can no more pro-duce a work that will answer the great ends of duce a work that will answer the great ends of art, than we can maintain life and health whilst violating the organic laws of our being. What is chiefly to be kept in view is the exact value of precedent; and, to fix that in the mind, we must remember that it can only be recognized so far as it is acknowledged by nature,—so far as the rules it develops are tracable to that source. What we have to do is to penetrate into the snift of the ancient is to penetrate into the spirit of the ancient masters, ascertain their meaning, and carry out their principles to new circumstances, under the same unerring guidance by which they

themselves were led.

It should here be observed that I do not propose to confine the application of the antique elements within any particular limit of design. Such limit as Palladio, Vignola, or the Italians generally assigned themselves, for instance, I would not make the houndary of their modification for church and other purposes; the style might diverge from the tra-beated system, and run into the Romanesque; but in favour of Romanesque, or any other, I would not abandon our own beautiful styles.

will harmonize with one another. A harmony will exist, in short, between buildings, in whatever style they are erected, if nature—that is to say, true principles of art—be followed.

Strict attention to those principles which are of eternal authority in architecture, involves are of eternal authority in architecture, involves no sacrifice of real beauty; and, on the other hand, what is really beautiful, that satisfies the eye of taste, may generally be defended when cited to the bar of rigid principle and judgment. A great deal has been written on the subject of modern architectural practice, of a nature tending greatly to cramp the art, and to exclude from the student many legitimate sources of variety and invention. The practice, for instance, of piling column upon column, along with many other very natural combinations of the classic features, has been condemmed. with many other very natural combinations of the classic features, has been condemned. Now, against two orders or heights of columns in a façade, there is no statute in the code of good taste. An objection, urged by a living writer, that it reminds one of the different stages of a temporary scaffolding, is futile. The Greeks did it in one instance, and there is nothing in the practice to lead us to suppose that they would not have resorted to it under the same circumstances which led the moderns the same circimistances which led the moderns to adopt it. I have no objection to what is called "purity of style;" that is to say, to the Greek elements being used in the same, or nearly the same relation, and fulfilling the same office they held in the ancient temple, when such can be done with propriety,—when such "purity" is not obtained to the exclusion of fitness and survey life view labels. sof fitoess and every life-giving quality. Pure, solemn Greek, such as the temples present, may serve for purposes of a kindred nature in solem Greek, such as the temples present, may serve for purposes of a kindred nature in England; but, assuredly, a Greek temple for municipal purposes, in the midst of a mannfacturing town, is a solecism. I am not objecting to this purity; I am only recommending a purity of another and a higher kind; one not dreamt of in the philosophy of some,—a purity of source. With the greatest purity and truth of style a building may not be pure; the latter is mere purity of initiation. But art to be pure must draw from a pure source, through a pure channel. We want works based upon nature, and stamped in the mind of their author with his own image, and also the impress of the time and country. If each new age has not something new, something peculiar to itself, and beyond its predecessors to express in its works, human progress is but a dream. If to copy is that province of the architect, the imaginative powers, the faculties of genius, exist in vain; for in such labour they are not required.

But human progress is something more than

But human progress is something more than a dream; and no just reason can be assigned why we should not, with all other votaries of art, in obedience to the law of progress, extend to the utmost our sphere of thought, and enrich the architecture of the day with fresh ideas and feelings. Our works must be an exponent of the age. The age should speak through them, and the religion, character, habits of the people, and spirit of the national institutions, should in them, as in a mirror, be wantifacted with undisquired that. nanifested with undisguised truth. To mere fashion and whim we must allow no influence; but take especial care, under each circumstance, to preserve those great principles which are applicable to every condition, and to all styles of the art.

Forward! is the natural watchword of genius: Forward: Is the natural watchword of genus:
the man who possesses that sublime gift is
never satisfied with present attainment, nor
reposes on past achievement. Contempt is, I
believe, generally the strongest feeling in his
mind for all his finished works,—conscious how
far they fall short of uttering what is within, and, in his eagerness to attempt the untried, the unseen-

In concluding, I trust that no remarks I have made will be deemed an ineitement to disobedience of just rule, or to contempt of all precedent. I would merely add one more voice to the loud call now making for freedom voice to the four call now making for freedom from unnatural shackles, and join with those who admonish the student to obey no rule but what can be traced to nature and judg-ment. I would not yield up the art to ill-guided and unrestrained powers of imagination. I would not undermine authority, but point out the true one.

SAMUEL HUGGINS.

DOORWAY, VILLA BORGHESE, FRASCATI.

The Villa Taverna (now Borghese), at Frascati, was built in the 16th century, by Cardinal Taverna, from the designs of Girolamo Rainaldi. It was the favourite residence of Pope Paul V. The engraving represents the entrance doorway from the terrace.

PROPOSED ENLARGEMENT OF THE SCOPE OF THE ROYAL INSTITUTE OF ARCHITECTS.

Our readers know that at the annual general meeting of the Institute, held in May last, a resolution was adopted, requesting the council to inquire into the present position and prospects of the Institute, to ascertain to what extent the views of its original founders have been carried out, viz., that of "Cultivating its many branches of science, and diffusing the knowledge of the principles of architecture with credit to its members, and with advantage to the noble art which they have the honour to profess;" also to inquire "if any and what changes in the bye-laws may be desirable, to enlarge the scope of the Institute, and increase its usefulness."

The main object of the supporters of the resolution was to obtain the relaxation of a bye-law, which enumerates among the grounds for the expulsion of a fellow, his "having engaged since his election in the measurement, valuation, or estimation of any works undertaken by any building artificer, except such as are proposed to be executed, or have been executed, under the member's own designs or directions, except as referee or arbitrator."

On the 26th ult., a special meeting was held to consider the report of the council in reply to this. The report contained several recommendations, which were agreed to,* but on the question of relaxation, the council had come to the conclusion that the terms of the bye-law should not be altered, and further, they proposed as a special motion, an alteration in the form to be signed by associates, the effect of which was to make the restriction on this class of members more

the bye-law should not be altered, and further, they proposed as a special motion, an alteration in the form to be signed by associates, the effect of which was to make the restriction on this class of members more obvious and unmistakeable than it now is.

After a long and animated discussion, it was resolved, on the motion of the mover and seconder of the original resolution, that this proposition, together with the question of omitting the words of the bye-law quoted, should be referred back to the council for reconsideration; a vote tantamount of course to the expression of the affirmative on the part of the meeting. We have already expressed our opinion of the injustice and impolicy of the regulation in question, and sincerely hope that an alteration will now be made.

THE ANT PLAGUE.—A correspondent of the Mining Journal says,—Dust the floors and shelves with pounded quicklime; and if that should not completely succeed, "water" the floors with the ammoniacal liquor of gas-works, when the ammonia would be instantly disengaged by the quicklime, and this is destructive to insect life.

USE OF GUTTA PERCHA IN REPAIRS.

Ir is a well-known and admitted fact, that most of our small modern dwelling-houses in or near the metropolis are built of inferior materials, with bad workmanship, yet readily find purchasers, or at least tenants. It requires, however, but a short tenancy to find out the miseries to be endured; woodwork shrinking, and thereby the rooms becoming filled with draughts, smoky chimneys, thin walls, weak floors, with the vibration so great that you are afraid to see the children run about, and the joints of the floor boards so wide apart, that the space between becomes the recoptacle for dit, dust, pins, needles, and halfpence, besides the impossibility of properly cleaning the floor, without injuring the ceiling beneath.

The greatest evil results, perhaps, from the timber employed in the joiner's work not being

The greatest evil results, perhaps, from the timber employed in the joiner's work not being sufficiently seasoned, and hitherto the remedy to make good the defects occasioned by the shrinking, &c., as in the floor boards, has been to let in between the joints slips of wood? putty, &c.; but this cannot be depended upon, as in case of further shrinking it drops through, neither is it waterproof. I propose that gutta percha be used. Thus:—warm the gutta percha be used. Thus:—warm the gutta percha till it become glutinous, then with a heated iron or chisel point all along the join, and it will be found that the adhesiveness of gutta percha is such, after two or three minutes, that the whole surface becomes as one board, the great merit being that there is no occasion to use any solution or cement to make the gutta percha unite to the woodwork, as is the case when applied to leather and other purposes; but there exists such an affinity between the two, that, for example, supposing a hole 6 inches square were cut in the flooring, with nothing underneath for support, and to make good the same a new piece werelet in, well set all round in gutta percha, it will so unite with the boards, as to enable that portion to bear as great a weight as any other part. What has been said of making good the space between the floor boards, will equally apply to all sinke in them has hitherto been without any effectual remedy. Also to the skirting running round the rooms, which is often to be found leaving the floor boards, &c. &c.

leaving the floor boards, &c. &c.

The great feature gained is, that gutta percha
not only fills up the space, but at the same
time hardens and unites the whole.

F. Cross.

DESIGN AS APPLIED TO CALICO PRINTING.

A LECTURE on the conditions of design, as applied to calico printing, was delivered at the School of Design, Somerset House, on Friday, the 23rd of November, by Mr. George Wallis, formerly head master of the Manchester School, whose resignation, in 1846, was amongst the earliest symptoms of the change which has since taken place in that institution. The lecture was the first of a course of three which the Board of Trade have engaged Mr. Wallis to deliver,—the other two being on design as applied to silk weaving by the Jacquard loom, and on embroidery by hand and by machinery. In the lecture on calico printing, the technical conditions of design, as involved in the various modes of production, were pointed out, the nature of mordants, resists, and discharges, and their peculiar bearing on the artistic effect produced in printing, both as regards colour and light and shadow, explained; whilst form was shown to be dependent on the mechanical rather than on the chemical conditions of production. The various methods of block printing, machine printing by cylinder, and the metal types first used for calicoes, and now adapted to carpets, were rapidly gone over. The distinctive results, as seen in madder and steam prints, required a larger amount of explanation than one lecture enabled the lecturer to give, but the leading difference between the two methods, as exemplied in the mousseline de laines, as examples of steams, and the calicoes, known as "Hoyle's" prints, as specimens of madders, was clearly shown. The various methods of engraving the paterns on copper cylinders, and the conditions these methods imposed upon the designer, formed a valuable feature of the lecture, and

^{*} Onc is, "That all members, whether associates or fellows, shall within twelve months after their election deliver an original paper to the council, on some subject connected with architecture, or make a donation to the library or collection."

models of a cylinder, with a mill or tool, used for engraving cylinders, after such mill has been raised from a hand engraved die, were exhibited. The lecturer showed that the conditions of design as to artistic effect, were not so limited as might be at first inferred, and that range of colour was one of the chief limitations in the ordinary class of printed goods: that range of colour was one of the chef limitations in the ordinary class of printed goods; but in the special cases of mill-work or machine engraved cylinders, smallness of repeat was shown to be essential. In furnitures, cost alone limited the design, since almost every effect of light, shadow, and colour, could be re-produced in this department of calico printing; and Mr. Wallis suggested that the historie styles of comment could that the historic styles of ornament could scarcely be more legitimately employed, cer-tainly not in textile fabrics, than in the embellishment of furniture chintzes. In conclusion, the lecturer urged upon the students not to consider these conditions as fetters to their consider these conditions as fetters to their artistic powers, but as the means to an end; and quoted the well-known aphorism of Sir Joshua Reynolds, first communicated in the room in which they were then assembled, that "rules were not fetters to men of genius, but fetters only to men of no genius."

CHURCH BUILDING NEWS.

WE learn that Christ Church, Clifton, has had some stained-glass chancel windows presented to it, "To the glory of God and in re-memberance of a near relative," by Mrs. and Miss Miles, of Manilla Hall. According to Miss Miles, of Manila Hall. According to our authority, six compartments contain full beight figures of Christ glorified, St. John the Baptist, with four Evangelists, with other smaller scriptural subjects; ornamented beneath all, as if jewelled with gems of amber, emerald, and amethyst, on a transparent ground of hyacintb blue. It would be a good thing if this kind of monument were oftener put up, as it not only shows our respect and love for departed relatives, but adds grandeur to an departed relatives, but adds grandeur to an edifice, of which the due adornment ought to be ever in our mind.—As it is, we are bappy to have to record, on the present occasion, another instance of the same commendable spirit, and nearly in the same quarter of the country, too An ornamental window has been placed in the An ornamental window has been placed in the north side of the communion aisle, in Heavitree Church (near Exeter), by Mr. R. Ford, of the Albambra, as a memorial to his deceased wife. The figures of St. Mark and St. James are de-The figures of St. Mark and St. James are depicted on it in coloured glass from Italy, arranged by Mr. Kenshole, builder, Heavitree.—The chief stone of the new church erected at the expense of Dr. Nicholl, M.P., in Merthyr-Mawr, was laid by Lady Mary Cole on 13th instant. The building is in the pointed style of fourteenth century.—The rebuilding of the church of Burmington, near Shipton on Stour, has been completed. near Shipton-on-Stour, has been completed, and the edifice was consecrated on Tuesday week.—The new meeting house in Waterlooand the edifice was conscious.

week.—The new meeting house in Waterloostreet, Tipton, has been opened. It is a plain building with about 300 sittings, erected at a cost of about 650!.—The new parish church of St. Matthew, Wolverhampton, was consecrated on Tuesday week. It is in the first pointed style, with clerestoried nave and aisles and a chancel: cost, with warming apparatus, fencing, &c., about 3,300l, beades site 1,200l. more. The stained glass, font, and altar furniture, &c., were gifts. Deficiency still 200l. and upwards.—The intermitted restorations of the Mary's, Leicester, having been proniture, &c., were gifts. Deficiency still 2001. and upwards.—The intermitted restorations at St. Mary's, Leicester, having been proceeded with, the north aisle, with its Norman doorway, has now been restored in hewn stone, and lighted by four windows with tracery in place of the ugly one heretofore disgracing it.—The master and seniors of Trinity College Cambridge, having at once offered to lege, Cambridge, having at once offered to repair the chancel of St. Michael's church in repair the chancel of St. Michael's church in whatever way an architect named, viz., Mr. Scott, might advise, unless with sufficient cause to the contrary, and on condition of the concurrence of the churchwarders and vestry asked and obtained, with the understanding that the parishioners restore the rest in harmony therewith,—a meeting was accordingly held, when the resolution proposed was negatived by an amendment, seconded by a Cambridgian breeches-maker, and carried by a majority of 10 to 6, that it be ascertained to whom the property belongs. The incumbent had, nevertheless, explained that "no

reasonable doubt could exist that the obliga-tion to repair the church (exclusive of the chancel, which Trinity College had at once undertaken), rested upon the parishioners. The common law of the land was perfectly clear common law of the land was perietrly clear upon this point, and no lawyer would dispute it for a moment. In the ten or twelve thou-sand churches in this country, it bad never in one single case been pretended that the patron, and not the parish, was bound to repair." The vestry then proceeded to appoint a committee, vestry then proceeded to appoint a conder of the when it was proposed that the seconder of the amendment, and its mover, Mr. Smith, do constitute the Committee of Inquiry on this knotty point in ecclesiastical law. This proknotty point in ecclesiastical law. This proposal, says the Cambridge Chronicle, either alarmed or confused the poor seconder, who alarmed or confused the poor seconder, who begged to withdraw from the perilous honour intended for him, and a lawyer's name was added, with further "power to add to their number." Doubtless, the vestry felt this to he "rather too much of a farce, and so rejected the motion by 8 to 6." Determined on obstruction and delay, however, they rejected, hy a majority of 9 to 6, the reference to an architect's advice, and so the final understanding, failing the appointment of any precise or definite authority to carry out the object of their own amendment, was, that till the next week any one who should choose might make what inquiries he should choose, at whatever place he should choose, choose, at whatever place he should choose, and report thereon at the next meeting. On and report thereon at the next meeting. On the re-assemblage, the chairman and incumbent, Professor Scholeficld, pointed out to the dissentients, that if they felt inclined to throw on other parties the responsibility to repair the church, they would have to consider whether such responsibility did not vest the property in the hands of the same body, and entitle them to take the church into their own hands, and shut it up or exclude the parishioners. Then the latter would doubtless be called upon by the proper authorities to build a church for themselves. Besides, if they thought that other parties were in justice bound to repair—and parties were in justice bound to repair—and he should be the last to advise them to aban-don an indisputable right—then they must be prepared for protracted and expensive law proceedings. Of these the expenses must be paid, for the law was not to be trifled with; and whether they were ultimately successful or not in establishing the liability of other parties, these expenses must fall upon the ratepayers. If unsuccessful, then they must expect to have to repair the church, after all, without any external help whatever. This peculiar line of argument seems to have shed a new light on the whole subject, for the proposal to the whole subject, for the proposal to acquiese in the offer of Trinity College, and call on the architect to furnish plans, was again put, and carried by a majority of 21 to 7.— The new church of All Saints', Habergham, was consecrated by the Bishop of Manchester was consecrated by the Bishop of Manchester on 17th inst. It will accommodate 700 persons, and has been erected mainly by a gift of 3,000*l*. from Messrs. Dugdale, manufacturers, and one of 1,000*l*., besides the site, from Mr. Kay Shuttleworth and his wife.—The roof and ceiting of Horsforth Church have been repaired, and the building reopened.—Kirk Deighton Church, near Wetherby, has been restored and reopened. The architects employed were Messrs. Perkin and Backhouse, of Leeds. The works have been executed by of Leeds. The works have been executed by Mr. Joseph Woodhead, of Leeds, builder; Mr. Iredale, stonemason; Messrs. Wood and Mr. Iredale, stonemason; Messrs. Wood and Son, painters. The warming apparatus was provided by Messrs. Nelson and Son, of Leeds.

—A Roman Catholic chapel has been built at Morpeth, at a cost of 2,000l. The Earl of Carlisle subscribed. The style is Early English, with nave and chancel, vestry, belfry, and spire: length of nave, 66 feet: breadth, 26: length of chancel, 20 feet; breadth, 15: altitude of spire, 115 feet. The building is lighted by twenty-nine windows, sixteen of

aisle, 49 feet by 10 feet 6 inches; south aisle, 56 feet 6 inches by 10 feet 6 inches; tower, 19 feet 8 inches square, externally; height of nave to ridge, 57 feet; height of spire, 153 feet. The building is warmed by the hot-air apparatus of Mr. Walker, of Manchester; and ventilated under the superintendence of Mr. Alfred Higginson. The contractors are Messrs. Furness and Kilpin. Mr. Gibbs executed the polychrome decoration, and Mr. Rossiter the carving. The architects are Messrs. Barry and Brown, under whose superintendence the whole has been executed. Mr. H. W. Chantrell (a son of the architect) was clerk of works. The first stone of the building was laid on 9th May, 1848.—It is proposed to build a new church at Balsall-heath, Birmingham, for which 'very handsome sums' have been already subscribed. aisle, 49 feet by 10 feet 6 inches; south aisle, handsome sums ' have been already subscribed. mandsome sums have been already subscribed.

—An anonymous donor presented to the church of St. Nicholas, Worcester, on the late thanksgiving day, the sum of 2,500l., for such enlargement and improvement of this church as shall ultimately be decided upon. The following the state of the stat as shall intimately be decided upon. The lot-lowing memoranda accompanied the gift:— The donor has no desire for his name to be blazoned abroad. Without imposing positive stipulations, he has expressed the following wishes, viz.:—1. That as many free sittings as practicable shall be made, on the ground as practicable shall be made, on the ground floor.—2. That, if any pews he erected, in any new part of the church, they may, by faculty from the Lord Bishop of the diocese, be made over, as rentable property, to the rector of the parish for the time being.——A memorial, in the Pointed style, with tablet, has been erected in the Abbey Church at Shrewshury, recording the various restorations and other improvements effected by the late. and other improvements effected by the late Rev. Richard Scott, B.D., in the churches of the Abbey and St. Giles. The design was furthe Abbey and St. Giles. The design was furnished by Mr. J. Carline, and executed by Mr. Dodson, of Shrewsbury.—During the recent alterations in Brooke Church, says the Norfolk Chronicle, several wall-paintings were discovered, under repeated coats of whitewash and colouring. The parable of the Prod.gal Son was represented in detail. In an arcade beneath, the ecclesiastics of St. Edmundshury. beneath, the ecclesiastics of St. Edmundshury, who, no doubt were the limners, had figured the Deadly Sins, not as in Catfield Church, but in the act of descending into the open jaws of the monster of hell. These paintings, with others in different parts of the church, whose subjects are not known, are supposed to date from fourteenth century. Tracings and drawner of the whole limits and descending the state of the whole limits and the state of from fourteenth century. Tracings and drawings of the whole, by Mrs. Beal, were exhibited at the Thetford aggregate meeting of the Norfolk and Suffolk Archæological Associa-

581

ALMANACS.

"The British Almanac" with "The Com-panion" (C. Knight), contains its usual large amount of information, comprising articles on amount of information, comprising articles on ancient and modern usage in reckoning, on fisheries, public libraries, railways, connection with India, coal trade, water supply, &c., besides its section appropriated to public improvements, and architecture. The illustrations of this portion ought to be better: that of Mr. Hope's house is a caricature. —The almanac of the "Art-Union of London" has the "meetings of societies" under each date in the calendar; so that on looking at the day of the month, it is seen at the process where the same when looking at the day of the month, it is seen at once what meetings are to be held on that day.

"Pounch's Pocket Book" (85, Fleet-street), has a great deal of good fun in addition to all that is looked for in a pocket book. The illustrations of the first half are far superior to those of the second.—"The Artist's Almanae" (Ackerman), has the novel feature of lists of artists architects, engravers designers, &c. of artists, architects, engravers, designers, &c., &c. This and other parts should have careful revision for next issue: they show signs of haste. — "Bogue's (Waistcoat) Pocket Diary" is a compact little companion.

WREXHAM .-- A correspondent urges us to point out the great and increasing demand for point out the great and increasing demand va-detached houses of respectability in the imme-diate neighbourhood of Wrexham, a market town situated in a healthy district, and sur-rounded by picturesque scenery. There is a rounded by picturesque scenery. There is a station of the Shrewsbury and Chester Rail-way within a few minutes' walk of the town.

ALTAR SCREEN, ST. ALBAN'S ABBEY, HERTS.

ST. ALBAN'S ABBEY, HERTS.

ST. ALBAN'S ABBEY, HERTS.

St. Alban was born at Verulam, in Hertfordshine, in the third century, and went to Rome, where he served seven years as a soldier, under Dioclesian. He afterwards returned to England, became a Christian, and

the present time of any of the Saxon huilding. This question is one on which it is difficult to come to a satisfactory conclusion. But if even we cannot prove to a certainty But if even we cannot prove to a certainty the existence of the remains of the original church, this venerable and in many respects impressive building has great claims for our consideration; amongst the most prominent, is the circumstance that the Abbey of Saint Albans is almost entirely built with the remains of the Roman city of Verulam, and that it contains, to a remarkable extent, varied examples of the most rude and early styles, as well as the more recent and elaborate peculiwell as the more recent and elaborate peculi-

arities of the more recent periods.

The east screen, of which we subjoin an en-The east screen, of which we subjoin an engraving, was intended to conceal the saint's shrine from the vulgar, and was probably designed by Abbot Wheathamsted, and finally erected by Wallingford: its north and south ends abut against the centre of two arches on the sides of the choir; along the top of it, defended hy a slight balustrade, is a passage from one side of the building to the other. Clutterbuck, in his "History of Hertford," gives an engraving of this screen, in which he shows a considerable portion of the front covered by carved woodwork. This had procovered by carved woodwork. This had pro-bably been placed to cover the bare apbably been placed to cover the bare appearance which is caused by the removal of the representation of our Saviour on the Cross which is engraved in Dr. Stukely's "Itinerarium Curiosum." This woodwork, which was probably crected about the middle of the last century, has been removed and has exposed a sad extent of dilapidation; indeed, the whole of the screen and many portions of the church require prompt attention. We believe the utmost possible use is made of all available means, and that a praiseworthy spirit is shown means, and that a praiseworthy spirit is shown by the rector to preserve objects of interest, but we fear that it will require more than the present exertions to save many portions of this interesting relic from destruction. It might of imagination, but it seemed be the effect that the fracture in the south wall of the nave had increased in extent since the writer visited this place five years ago.*

BUCKINGHAM PALACE—THE MARBLE ARCH.

SOMETIMES at the relief of guard and other excuses for idlers to congregate, one catches a remark which, though not artistic, denotes that the people are not insensible to the general

fect as well as the objects of architecture. Before the new front of Buckingham Palace Before the new front of Duckingmain Fanace, the other day, one young man, a mechanic, observing the figures on the top, said to his companion (a sailor), "Jack, them ere figures is too high, particularly the family of small is too high, particularly the family of small children to the right; they never give us any statuse seen with our walk, where one might see their proportions." "Yes," replied Jack, "I likes that party to the starhoard, which is no doubt our good queen's little family; but the prince on the larboard has very little clothes on. But, Jem," replied the tar, "how are they going to get in? there's but one gate—but I spose it's to save another porter in these hard times." "Well," said the mechanic, "I don't nohow like the situation; it's low and damp, besides it's all closed in and no ventilation—quite as bad as Gough-square, where the insanatory

bad as Gough-square, where the Commission visited me and my little uns, and insisted on a back current of air and the stopping up of the cesspools. Will they do nothing with the twenty-acre-cesspool in the gardens behind?"

dens behind?"
"Lord love you," rejoined the tar, "ber
Majesty knows how we manage at sea: depend
on it she 'll rig some poles and hoist a windsail—that's our way to give a stiff breeze in the hold: but what are they going to do with that other gate—the marble companion abaft the main hatchway?"

main hatchway?"

That was just the point I was considering at the moment, and having given you some crotchets already as to its disposal, perhaps as it is now going—just a-going, and will very soon be gone—you will allow me to refer to one of my former suggestions, which was

to place it in the grand causeway which should opened from Portland-place to the long walk, Regent's-park. This was the design of George IV. when the long walk was planted. The arch should stand on the verge of the inner park and New-road, and would at the same time give a most appropriate and elegant entrance to the park created by royal taste, and present a grand coup-d'œil, as viewed from Portland-place, disclosing a vista of great extent and beauty, terminating on the Highgate-hill: as none of our thorough-fares have any affinity to the picturesque, this

would be a very apposite commencement.

Report once stated that it was destined to stand as an entrance to the long walk at Windsor! What allinity can exist between the fine Gothic pile of the Castle and this ornate Roman composition?*

The modern taste for the composite is very prevalent, but what can we say to this under-taking? It reminds me of an undertaker to whom it was referred to make a pageant for a middle-aged lady,—he mixed the plumes black

and white.

But apart from jesting, is there not some truth in the remark—"They never give us any statues even with our walk?" Abroad, the people are familiarized with art, and particularly sculpture: in the gardens of the Tuileries—Ho Giardino at Naples—in all the repositories of ancient taste and treasure, free access is never deaded are to the methodic and these them. denied even to the mechanic; and there they are as capable of discoursing on the perfect examples of ancient and modern masters, as they are of singing the music by their composers in harmony or parts.

It is to be hoped that the improved taste for

arts at home will extend to the commonalty such advantages as the illustrious productions of art cannot fail to confer on the public mind; for they elevate vulgar tastes, and lead them from the contemplation of the suhlime and beautiful up to the rational worship of Nature's QUONDAM.

DESTRUCTION OF WORKS OF DESIGN. ROBBERY AT MR. HOPE'S HOUSE

No one can regret this occurrence more than I do; but it appears to me hardly to justify Mr. Hope's inferred conclusion against the general security of works of art publicly ex-

That they may be so exhibited is said (by those who are of that opinion), to be insured by several circumstances; by the class of visiters they attract; their desire to deserve the confidence voluntarily shown them; the publication of the confidence of the confide licity with which robbery must be committed, and the consequent chance of its author being detected. These securities are thought suffi-cient to prevent the kindness of the public benefactor being abused. But the robbery at Mr. Hope's not being guarded against by any of these, affords no analogy to those cases which would be so guarded. The property stolen from him was without any of the peculiarities. liarities of a voluntary exhibition, and agreed in one particular with every other kind of property, while it was placed (as all outside fittings must be placed), in a situation to alford inducement and security to any dishonest person who walks the street by day or night. Neither does it appear that any thing would follow from the stolen article being a work of art, except that lovers of such works are especially distionest; and this conclusion is too unjust for Mr. Hope to intend. The fact is, that that which increased its artistic value added to its marketable value, and made it could be one of the concept. it equal to any other temptation of the same intrinsic amount. Further, spite may have had something to do with this injury.

Mr. Hope has so much power to do good in matters relating to the fine arts, that I should be sorry if he were to remain under a wrong impression. I hope he will think, in opposition to the unfortunate occurrence he relates, such to the unfortunate occurrence he relates, how very few cases there are in which publicly exhibited property has not been respected even in this country; how still fewer they are on the continent, where the frequency of such exhibitions, by adding to their general estimation, adds also to their security and to the respect felt for those who are the authors of them. H. W. them.

* It is now stated, that the arch is to be taken to pieces and the materials sold.

DRAINAGE OF HERTFORD GAOL

In late numbers of your journal paragrapha have appeared headed "Effects of Bad Drain-age," and "Hertford Gaol Drainage," each having a reference to the other. The county surveyor, a respectable architect, has thought fit, in very marked terms, to show the contempt he entertains for his fellow-townsmen, who have heen lately but too frequently called upon to exercise the very painful, but important duties, and to express, as the surveyor is pleased to word it, "the sapient notions of a country coroner's jury." Between the 29th of October and the 6th of November inquests were held by the coroner upon no less than nine prison-ers, who died of cholera, and more than one of the juries, consisting of individuals as respectable and as intelligent as the surveyor himself, did not hesitate to express an opinion, founded upon the evidence produced before them, that the drainage of the gaol was so bad that it required the immediate attention of her Majesty's Secretary of State for the Home Department, An inquiry took place, and I only wish, Sir, that a bond-fide report of the depositions made to the "country coroner's jury" were published, and then I think it would be at once admitted that the "notions" of the juries upon the subject, were far more "sapient" than the plan in operation for effecting the drainage of the gaol. You have been referred to an able and respectable "country" editor's "notion" of what has been done, or what can be done, to improve the drainage, and the whole tenor of the paragraph admits it to be insufficient, though indeed it may not have been proved to the inspector sent down by the Government to the inspector sent down by the Government to have been the cause of the fresh outbreak of cholera. Surely, Sir, if the difficulties of draining this gool are insuperable, it ought to be abandoned, and no more livea risked by

be abandoned, and no more livea risked by confinement in such an unhealthy place.

As a public reflection has been made in your journal by a public officer upon a most respectable body of men, who endeavoured to discharge a very sad and painful public duty as faithfully and as inoffensively as they could, I call on you, in justice, to publish this contradiction, and I assert, without hesitation, that the details furnished to you of the catastrophe at Hertford Gaol were properly included under at Hertford Gaol were properly included under the head of "Effects of Bad Drainage."

A HERTFORD MAN

* The writer has forwarded a description ** The writer has forwarded a description of the means of drainage at present in operation there, but no good end would be answered hy publishing it, even if we could afford space. Our object in printing his letter is twofold—to exonerate ourselves from the imputation of improperly inserting an erroneous statement, and to direct attention, not merely to whatever may be defective in Hertford Goal, but to the drainage of many other of ford Gaol, but to the drainage of many other of our prisons.

COMPETITIONS ADVERTISED LAST WEEK.

In your last number I see three advertisements for public competitions, the terms of all of which are really too absurd and ridiculous to be passed over unnoticed. In the first, which is for a design for a union workhouse at Stockton, the guardians estimate the labour and time required for furnishing such at the enortime required for furnishing such at the enormous sum of 101, and say, that if the architect whose plans are selected likes it, he may become the clerk of the works during the erection of the building, at, I suppose, the tempting salary of 21. a-week, provided he is never absent from the spot! Liheral-minded men! they ought really to have a public testional gratum for them but the professional. monial got up for them by the profession at

large, for their extreme generosity.*
The second, for a Wesleyan chapel, goes a little beyond the Stockton extravagance, and offers a premium of 35*l*. for the best plans; but then, fearful lest the architect who furnishes them should make too rapid a fortune by ob-taining, after bis risk, the usual commission for

^{*} A plan, &c., with some curious particulars of the Abbey Church at St. Albans, will be found in our Vol. V., p. 542, in a notice of Measrs, Buckler's interesting History of this building.—Ed.

^{*} This advertisement is an insult to the profession and a disgrace to the Stockton board of guardians. We trust it will meet with the reception it deserves. The arbitects who submit designs in reply to it, should there be any, will aid in the insult. We shall be anxious to have their names. A correspondent from Manchester says,—"It would suggest to these guardians, by way of an addendum, that the person who may be so fortunate as to be second on the list for promotion be allowed to carry the bricks!"—ED,

superintending the work, reserves to itself the power of keeping the drawings, and "not employing the architect whose plan is preferred;" which is virtually saying, "We've got another man (probahly a carpenter) who will superintend the works for a good deal less than the usual five per cent."

The third, for enlarging the Leicester Union, offers a fair premium enough, but says, that if the architect whose plans are selected should be appointed to superintend the works, "the premium is to merge in a

the works, "the premium is to merge in a commission upon the outlay, hereafter to be fixed;" which means pretty nearly the same thing as the Wesleyan chapel, as there can be little doubt that a smaller commission than five per cent. will be fixed, and unless the fortunate architect succumbs to it, his drawings will be kept and carried out by some-body else, who will be dirty enough to act is another appears.

in such a way.

With these three specimens hefore me, I with these three specimens hefore me, I am really puzzled to think what the public generally consider to be the meaning of the word "architect," and whether any previous education is thought necessary to entitle a man to such a name. That architecture is the nyelecture and architecture is the nyelecture of a conditionary the tecture is the profession of a gentleman, the first specimen clearly denies; and one would imagine, from reading the other two, that even if it is held to be a profession at all, it must be one with no settled or recognized rules and

I sincerely hope and trust that all your I sincerely nobe and trust that an your readers who may turn their attention to these competitions, and feel inclined to enter the field with such paltry inducements as are therein held out, will first pause for a moment, and consider whether they will not be doing a lasting injury to the profession by allowing such absurdities to be recognised, and to be responded to by men calling themselves architects and artists. It only affords an additional process of the processity of somethicking in the proof of the necessity of something in the shape of a diploma being required by Government before any one may practise as an architect,—a matter which I see hy your journal is being brought forward, and which I should hope would be strongly supported by all who are anxious that a proper estimate should be formed of the position in society which an architect ought to hold.

" Φως."

REPAIR OF ST. STEPHEN'S, WALBROOK.

Your remarks on St. Stephen's, Walhrook, em to call for some reply from me, who may fairly claim to be more anxious for its restoration than any man, except, perhaps, the great Christian orator who preaches in this dila-pidated but yet beautiful temple. After a six years' hattle for the means of its restoration, I, years nature for the means of its resonators, i, on Wednesday last, as the result of my triumph, laid on its vestry-table a deed assigning to eight trustees, chosen by the parish, a rent-roll of upwards of 700l. a-year, and about 2,500l. present cash, accumulated during my

struggle.

The tardy movements in Chancery, and the ohstacles to justice in that atrocious court, " may yet occasion a month or two's delay; hut I have confident hope that this short time will put at the disposal of a committee a thousand pounds, which I think is sufficient to stay decay, to restore all the original ornament, and to put the fahric in at least a respectable temporary state of repair.

I am of course very anxious that this little sum be applied to the greatest possible advan-tage, and request the favour of advice from any of Wren's admirers, and especially replies to the following queries :-

Is it desirable to restore the centre eastern

window, and remove West's picture to the northern side, which has been proposed?

In what manner should the interior be coloured? If, as I presume, of one colour, what colour would be the best?

WM. F. ROCK.

Walhrook, Nov. 28.

THE BRITANNIA-BRIDGE. - The second tuhe has been safely floated into its position ready for hoisting.

Would that the whole kingdom would shout the same expression,—"that atrocious court,"—we might hope then for some reformation of its monstrous abuses,—En.

BATHS, PUBLIC AND PRIVATE.

Many years ago eminent physicians endea-voured to draw the attention of the Government votred to draw the attention of the Government to the importance of public haths, and of countenancing their use by every aid and example. It was but lately that the first public baths were erected, and now we are aware of their benefits. In the eastern and northern nations their prevalence is universal, and we may lament that even now they are so little used in this country. I hardly know any act of benevolence more essential to the comfort of the community than that of establishing, by public henefaction, baths for the poor in all our cities and manufacturing towns. Dr. Clarke tells us, that in England haths are Dr. Clarke tens us, that it bugiant considered only as articles of luxury; yet, throughout the vast empire of Russia, through all Finland, Lapland, Sweden, and Norway, there is no cottage so poor, no but so destitute, but it possesses its vapour bath, in which all its inhabitants every Saturday at least, and every day in cases of sickness, experience comfort and salubrity. The illustrious Bacon lamented the disuse of baths among us; we have certainly since then made rapid strides, but there yet remains great room for improvements. According to a printly before were sublicited. Among the ancients baths were public edifices, under the immediate inspection of the Government. Rome, under her emperors, had nearly a thousand such buildings, and they were then considered as institutions which owed their origin to absolute necessity, as well as to decency and cleanliness. England, by as to decency and cleanmess. Ingland, by its ancient remains, even now bears testimony to what importance the Romans considered, for the preservation of health, the use of hathing. It is true with us now, the first-rate buildings generally have attached to them a private bath; but the use of them among the middle class is not so general as might he. the middle class is not so general as might he. In America a bath-room is a part of every modern dwelling, and no one will occupy a house without one,—the bath itself being provided with hot water from a peculiar and ingenious kind of cooking stove, somewhat like those used in the houses of our nobility, hut on a more economical plan. In the suburban districts of London, the houses generally erected have not these conveniences supplied, hat it is owing to the bad management of the speculating builders—it is a meral duty they owe to all, to supply these deficiencies. Builders themselves must hear in mind, that during the progress of the huilding, a bath-room might be huilt at half the cost, when the materials and labour are there on the spot; and, that after a house is finished, few are willing to incur such an additional trouble and expense. If cement were less used for external effect, which even in the hands of a skilful architect is rarely treated successfully, that additional expense would he successfully, that additional expense would as aved, and the conveniences internally might he more generally attended to; and the saving in this respect might be employed for the exection of a hath-room. W. P.

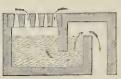

ST. JUDE'S CHURCH, POYNTZ POOL, BRISTOL.

The new church dedicated to St. June, which we briefly mentioned some time since, was consecrated a few days ago. It was erected from the designs of Mr. Gabriel, architect, and is in the Decorated or Middle Pointed style of the fourteenth century (Edward II.), consisting of nave, 65 feet, by 28 THE new church dedicated to St. Jude, ward 11.), consisting of nave, 65 feet, by 28 feet 6 inches; and chancel, 28 feet 6 inches, by 23 feet 6 inches; with sacristy on the north side of the chancel. The tower is at the west side of the chancel. The tower is at the west end, 13 feet square within, 82 feet in height, and consists of four stages, having a deeply-recessed doorway; above this is a three-light window. The helfry story has four two-light windows, and is surrounded by a parapet of wavy and quatrefoil tracery, having a pinnacle at each angle, with buttresses set diagonally. The nave has a south doorway: there is also a priest's door in the south woll of the charge. The nave has a south doorway: there is also a priest's door in the south wall of the chancel. The whole of the windows, except the east and west, are of two lights, and each of different tracery. The east window consists of five lights. The whole of the seats are open. The lectern is of oak: the pulpit, which is on the north side of the nave, is of stone. The upper part of the tower arch is open, with a door

beneath; the lower story of the tower forms an entrance vestibule to the body of the church. The roof of the nave is open to rafters, and with foliage. The chancel arch is crossed by a screen of oak. On each side of the chancel arch is crossed by a screen of oak. On each side of the chancel is a row of four stalls; further eastward to south are sedilia and piscina; and in the thickness of north wall the table of prothesis is south are setting and piscing; and in the unex-ness of north wall the table of prothesis is in-troduced. The chancel is vaniled over with wood,—the two easternmost bays being co-loured, the square compartments blue pow-dered with stars the morthed ribe disposed dorred, the square compartments once pow-dered with stars, the moulded ribs diapered with bosses gilt. The floors are laid with tiles: the doors are of oak. The walls are built of Hanham stone, with freestone coverings; the roof is covered with stone slahs (from Tetbury).

LOWE'S STENCH TRAP GRID.

THE advertisement of this trap, on another page, deserves the attention of our readers. It has the great advantage over the ordinary bell trap, that the grating may be raised to allow a more rapid passage through it without, of necessity, an escape of bad air. The only fault we have to find with our otherwise good little housemaid is, that the bell trap in the sink is universally left out and the house poisoned; and in saying this we express the complaint of hundreds. The annexed section will explain the construction of Mr. Lowe's

JENNINGS'S INDIA-RUBBER TUBE CLOSETS.

WE have been often asked by correspondents to give our opinion of Jennings's patent watercloset, but were then not in a position to do so confidently. For some time past, however, we have had one in operation, and we feel it is hut purpose very efficiently. The peculiarity of it is (as many of our readers may have observed in our advertising columns), that the communication between the pan and the trap is hy means of a short length of India-ruhher tube, which, when the handle is down, is compressed by two metal flaps, and so holds the water. Having neither the usual metal pan nor valve, no chamber is required, which prevents a displacement of impure airwhenused, an evil justly complained of in some other closets. The raising plained of in some other closets. The raising of the handle suddenly discharges the contents of the basin with all its force through the India rubber pipe direct, flushing the trap and soil-pipe each time the closet is used. Further, this closet in its action is perfectly silent, as the metal flaps fall without noise against the India-rubber tuhe, and it is so free from com-plication, that a fresh piece of India-rubber tuhe, if ever needed, will make the closet as good as new

Mr. Jennings has very ingeniously applied India-rubher in the manufacture of cocks, and for the joints of pipes. India-ruhber gutta percha are quietly revolutionizing many branches of our manufactures.

The shop-shutter shoe and fastener, hy the same patentee, has been noticed by us before, and is now coming into very general use.

METROPOLITAN IMPROVEMENTS. - According to the last report of the Commissioners of Woods and Forests, printed a few days back, it appears that the amount of purchase-money paid by them for property required for the metropolitan improvements is 727,968 k., comprising the various items,—in the line from Oxford-street to Holborn, 290,327l. 4s. 10d.; in the line from Bow-street to Charlotte-street, Bloomsbury, 96,408l. 11s.; in the line from London Docks to Spitalfields Church, 139,341l. 5s. 6d.; in the line from East Smithfield to Rosemary-lane, 22,247l. 15s.; making the sum already stated.

Miscellanea.

Instrutution of Civil Engineers.—On the 27th, the paper read was a "Description of the Old Southend Pier-head, and the extension of the pier; with an inquiry into the nature and ravages of the Teredo Navalis, and the extension of the pier, and a minute description of the pier, and a minute description of the pier-head, were given, showing the means adopted by the use of iron piles, and by scupper-nailing the inner piles, to preserve, the structure from decay. As to the Teredo, the conclusions arrived at were, that the ravages of the marine worm were not prevented by any chemical application, and that nothing but mechanical means could ever prove completely successful: studding with broad-headed nails was considered to be the most effectual remedy.—On the 4th inst. the discussion was continued on Mr. Paton's paper. The "Tholas" was shown to have been in active operation upon certain rocks from the earliest periods, but never upon Portland stone. Hence it was argued, that kind of stone should be used for breakwaters and other works exposed to the action of the sea. This hearing of the discussion induced remarks upon the ravages of the white ant of India; which, however, appeared to bave been little studied, and less understood, as far as attempting to arrest, or to prevent its inroads. Specimens of piles from Lowestoft harhour, whose waters were notoriously full of worm, showed that timber in a natural state was in a few months thoroughly perforated by "Teredo" in the centre, and "Limnoria" on the surface; hut that piles, which had heen properly saturated according to Bethell's system, in exhausted receivers, and subjected to such pressure as insured the absorption of about ten pounds' weight of the crossote, or oil of coal tar, hy each cubic foot of the timber, were perfectly preserved from attacks of marine animals of any kind.

RAILWAY JOTTINGS .- A pontoon, or floating landing-stage, 400 feet long by 50 wide, and weighing 600 tons, has been constructed by Messrs. E. B. Wilson and Co., locomotive engine manufacturers, of Leeds, and is shortly to be launched at Goole. This platform is twice the length of a ship of the line, and will be launched broadside. It is made of plate-iron, except the deck, which is of wood. It is intended for a pier at New Holland, on the Humber, opposite Hull, for landing passengers from steamers, communicating with one of the Lincolnshire railways. Two covered ways, called girders, made at same works, of plate-iron, on the principle of the tubular bridges, and 142 feet in length, will extend from the pontoon to the station on the pier. -In an arbitration case respecting the of a viaduct at Knaresborough, the arbitrator had found that the loss amounted to 8,450l. As, the amount to be made up in this way—3,291. 7s. 10d. to be paid by the Leeds and Thirsk Railway Company, 2,3191. 12s. by the East and West Yorkshire Junction Company, East and West Yorkshire Junction Company, and 2,3191.4s. by the contractors, but the contractors only to pay 1,833l. in money, giving up all claim to the ruins and plant of the viaduct. A rule nisi to set aside this award was lately hrought before Mr. Justice Erle, in which it was contended that the arbitrator had no power to make such award,—that the arbitrator who was the arbitrator by the very the arbitrator. trator, who was the engineer to the Company, and to the vice of whose plan the accident in the viaduct was attributed, had directed that the viaduct should be rebuilt by independent parties on a new plan, which he clearly had no power to do, inasmuch as the contractors were under agreement to complete the viaduct and under agreement to complete the viaduct and maintain it for a given space of time,—but supposing the arbitrator had such power, that his award was bad for not being find. It did not dispose of the covenant and responsibilities the contractors had rendered themselves liable to by signing the deed. On these grounds it was insisted that the award was invalid and ought to be set aside. - Mr. Justice Erle granted the rule upon all points.

PROVIDENT INSTITUTION FOR ARTISANS.
A meeting of gentlemen interested in the success of Mr. Cockerell's proposal will be held at the Guildhall, London, on Tuesday next.

PROJECTED WORKS.—Advertisements have been issued for tenders by 8th January, 1850, for the erection of the subscription haths and other works at Wolverhampton; by 10th December current, for various works at Rock Leaze Estate, near Bristol; hy 13th, for the erection of coke ovens, coal stores, and other works, at the Strood terminus of the North Kent Railway; by 19th, for putting in new windows in aisles of Isleworth Church; hy 15th, for the erection of the Northampton Corn Exchange; by 12th, for the construction of a fence wall at the new goods warehouses of the York, Newcastle, and Berwick Railway, at Newcastle, and a retaining and fence wall along Forth-street; hy 22nd January, 1850, for files and steel for the navy; and hy 11th inst., for twenty tons of lignum vitæ for the navy.

THE ARCHITECT-MAYOR OF LANCASTER.—We mentioned that Mr. Edmund Sharpe, the author of "Architectural Parallels, or the Progress of Ecclesiastical Architecture in England," had been elected Mayor of Lancaster. His year of office has now expired; and we are glad to find the local Gazette, in a leading article, bearing witness to the value of his efforts in that position, especially with regard to the sanitary improvement of the town.

LIVERPOOL ARCHITECTURAL SOCIETY.—A meeting of this society was held on Wednesday evening last week. On the suggestion of Mr. Reid, the secretary, it was agreed that a prize should be given to the student member of the association, at the end of the session, who made the greatest number, and the best, sketches on subjects to be given out by the council at each fortnightly meeting. The subject for that evening would be a lodge, the size, style, and design being left entirely to the students. A conversation took place upon the best method of "plugging" floors, by which sound was prevented from communicating to the lower apartments. One said the best way of destroying sound in floors was by flags above the joists, boarded over, the boards heing fastened to battens. Another method of destroying sound was with battens and laths, a coat of plaster, and the space well filled up with engine-ashes, lime, and sand, compounded together, to the thickness of about three inches, within an inch and a half of the top of the joists, and, when that had dried, all the crevices to be filled up with a thin coat of mortar. The way in which the floors of St. George's-hall are plugged is this. There are felts on each side the joists, and three-quarter boards over the felts, the remaining space being filled up with a composition, principally consisting of plaster, to within about an eighth of an inch of the surface of the joists. A paper was read by Mr. Barry on "Monumental Brasses."

The Fallen Archies Ar Kentes Ar Kentish-Town.—Your observations on this mishap

appear to be well founded and important: all who are acquainted with the site traversed by that viaduct,—the course of the old Fleet Ditch, and the ill-drained flat that still engenders typhus and influenza,—must he astonished at the small depth and substance of the foundations of the piers, as given in The Builder of last Saturday; and they must agree with you, that in such cases an inquest ought to be held, even when no life is lost on the occasion. cases of fire, such inquiry is sometimes made; and surely, where an awful risk of human life is incurred, and the interests of science and of the public are at stake, as in this event, the expense and inconvenience would be nothing in comparison with the adwould be nothing in comparison with the advantages to be derived from a fair, judicious, and strict inquiry. By way of suggestion as to additional or incidental causes of accident in bridges recently constructed and imperfectly set, I submit the following occurrence. On the 5th of November last, passing under this very bridge, I observed to a friend that I never felt satisfied with a bridge or archange of several rims of bridge of the server of t made of several rims of bricks of the same size and not honded, and I pointed to several instances of the lines all running into each other, instead of overlaying each other's joints, and reminded him of various examples on the Richmond and South-Western lines, where the filtration of water is consequently increas-ing to an alarming degree. Before a coroner's such hints might lead to improvements: without inquiry we need not expect any unless through your excellent journal.

AN OBSERVER.

PICTORIAL MAPS. — Acting on a hint honourably quoted from The Builder, on a proposal made at the Geographical Society, for constructing large and uniform maps in the new Houses of Parliament, to he traced and depicted on the walls, Mr. S. Bannister has published a letter addressed to Mr. Eastlake, R.A., on the possibility of greatly amplifying this idea in the establishment of "Pictorial maps of the land, the sea, and the heavens, georamas, and lectures on geography," for behoof of the people at large, in London and the chief cities and towns throughout the country. Mr. Bannister has here accumulated a great deal of interesting learning on kindred topics, both ancient and modern; and suggests the possibility of forming a new society for carrying out the objects set forth in the proposal. He draws attention to the peculiar adaptability of the domes and walls of the Brighton Pavilion (lately sold to the town of Brighton) to begin with; and notices the fact that it is proposed to place a georama, or large concave globe or map of the earth, of 40 feet diameter, in the city Hall of Commerce, also lately sold,—the funds to be raised by subscription. Various other feasible proposals and suggestions are contained in this little pamphlet which we hope will prove to be the fructifying germ of many more goodly leaves and branches.

PROVINCIAL.—A monument to Nelson is to be erected at Norwich, the capital of his native county. It is proposed to be in the form of a statue, on a pedestal in the centre of the market-place, with four gas lamps at the corners of a palisade surrounding it.—Plans of a town-hall for Knighton, says the Hereford Times, have been prepared. They specify a hall on one part, and on the other a hotel. There will also be shops and an iron gate opening on the market-place.—The Duke of Cleveland has offered to subscribe 50/. towards the erection of a central ragged schoolhouse in Wolverhampton.—The great wooden huilding at Birmingham for the exhibition of cattle, &c., has been completed. The full dimensions are 330 feet in length hy 100 feet, increased at one end to 150 feet. The cattle-stalls are all separated by hurdles, and provided with feeding-troughs. The whole is fitted by with see

Itted up with gas.

IMPORTANT TO GLAZIERS AND OTHERS.

—In a case, "Hodgton against Malloch's executors," the question was—When work is sent to a glazier, without any specific price or time being stipulated, and the glazier delays in order to take advantage of a subsequent reduction in the duty on glass, is he entitled to charge the price current at the date of the order, or merely the reduced price at the date of delivery? The second division (of the Court of Session) have decided that he can charge the former price, the majority of them apparently on the specialty that no time for finishing the glass was stipulated, and no complaint ever made of the delay. The decision is of course applicable to other trades,—

Edinburgh Register.

LANDLORD AND TENANT.—With reference to your article, "Landlord and Tenant," in The Builder of the 24th ult., I, who was the defendant in the case, would mention that in the ninth line from the top, "plaintiff paid his rent," &c., should have been, "defendant paid his rent," &c. should have been, "defendant paid his rent," &c. The abstract of the Landlords and Tenants Act alluded to, is published by Walwyn, Hatton Garden; and in reference to "notice to quit premises," at page 7, it reads thus:—"If notice be given up to a wrong time, or a quarter instead of half-a-year, such warning should be objected to as soon as possible. Where three months' notice to quit has been given where six was in strictness necessary, and no objection made to it at the time, the notice was deemed good and binding on the party accepting it."—1 Esp. Ca. 266. This information, coupled with the recommendation of the solicitor employed to defend the case, assuring me that the plaintiff could not claim a farthing, induced me to place myself in that position, and thereby incur the costs. His honour would have had greater reason to call it a "case of great hardship" to me, if I had told him how I had been treated by one who was paid to defend the case. So much for law books and solicitors: for the future, I throw them to the moles and bats.

GEO. NAISH.

EXHIBITION OF THE WORKS OF INDUSTRY OF ALL NATIONS. — The report to Prince Albert by Messrs. Cole and Fuller, who were Afford by Messrs, Cole and Fuller, who were deputed to confer with the manufacturers in various towns, and collect opinions and suggestions as to this great exhibition, has been printed, and is now before us. Amongst the points more particularly discussed were the general expediency of such exhibitions, the questions whether their scope should be universal, whether they ought to be supported by subscriptions or by Parliamentary aid, also as to willingness to exhibit, as to prizes, Some doubts appear to have been expressed as to the propriety of awarding prizes in certain branches of manufacture; but very few sug-gestions of anything like importance seem to have been made. Mr. Redgrave, A.R., is of opinion that collections of the most rare and choice works, produced by the skill of past ages (such as our museums and societies of antiquaries and archeologists could so well supply), should form centres to the various groups of manufactures to which they relate.

And certainly such collections would give a stimulus to new efforts.

CITY OF LONDON LITERARY INSTITUTION. -A conversazione was given at this institution on Wednesday evening, when the Rev. Dr. Croly read a beautiful address on the value of knowledge, and, in the courseof it, referred to the various nations of antiquity for proofs of the great fact, that in proportion as knowledge was cultivated amongst them so did they flourish in wealth and power; in conclusion expressing a fervent hope that the youth of expressing a fervent hope that the youth of England would continue to seek knowledge with the same ardour they had begun to display in these days, and thus contribute to maintain their country's greatness. A variety of works of art, sculpture, drawings, &c., were exhibited in the rooms, and large crowds filled every part of the building. Mr. Sheriff Lawrence, the Rev. Dr. Mortimer, Mr. George Cruikshank, and others were on the platform, Music and recitations by the elocution class filled up the evening. This institution has proved its claims to the support of the neighfilled up the evening. This institution has proved its claims to the support of the neighbourhood, and will, we hope, continue to receive it.

BUILDERS' BENEVOLENT INSTITUTION. The first election of this institution took place on the 29th ult, at the London Tavern, Bishopsgate-street, for the purpose of electing five pensioners from a list of eleven candidates. Mr. George Bird, the treasurer, took the chair on the occasion, and, on opening the business of the day, said he was happy to find this their first election so numerously attended by the friends of the institution—an institution which had progressed more favourably than its most sanguine friends could have anticipated. It had been established but little more than two years, and the funded property already amounted to 1,400l., of which 500l. had been subscribed towards the erection of almshouses. The annual subscription had now reached 350l.; there was a balance of more than 2001. at the bankers, and the society was wholly free from debt. The ballot was then proceeded with, and shortly after its close the successful candidates were announced.

THE IRON TRADE continues in a favour-THE IRON TRADE continues in a favourable state for purchasers; but the London, Manchester, and Liverpool dealers and merchants have of late been shy of giving orders unless at a concession of price. Aris's Gazette quotes bars delivered at 51. 15s., and hoops at 6l. 15s., which, says this manufacturers' friend, with carriage and usual allowance could scargely have realized 51. 15s. and ance, could scarcely have realized 5l. 15s. and 6l. 5s. at the works. In every branch, adds the same authority, underselling is complained of. Glasgow pigs, however, are reported, on same side, to be looking up, from 45s. to 48s., cash; for mixed Gartsherrie, and for g. m. b., tbree months open.

THE MANCHESTER ATHENEUM. - This building was recently offered for sale, at the Auction Mart. A mortgage debt of 6,000l. had heen secured upon the freehold property, paying 4 per cent. interest, the principal recoverable at a twelvemonth's notice, which verable at a twelvemonth's nouse, which has been given. The building is stated to have cost 18,000l, in erection, and is subject to a rent-charge of 310l, more than covered by the rent paid by the Bankruptcy Courts. It was sold, we are told, for 5,550l.

BATTERSEA PARK.—The Commissioners of BATTERSEA PARK.—The Commissioners of Woods and Forests, in their report just issued, state that their proceedings for the acquisition of the property to form Battersea-park have been impeded by the want of funds, the delay being manifestly injurious to the interests of the Crown, and productive of frequent com-plaints from the owners of the property and other persons having interests affected by the formation of the intended park; that great loss and inconvenience are occasioned to them hy the uncertainty that exists as to the period of settlement of their respective claims. The commissioners have borrowed 50,000l., and under a recent statute charges can be given for property purchased on the land revenues of the Crown, and up to the date of the report the had paid in money for property commissioners 23.1971, 10s. 3d.

LIGHTING CHURCHES .- The difficulty of lighting efficiently, extensive and lofty buildings of Gothic architecture, without the means employed becoming obtrusive to the eye, has long been acknowledged, and prompts to various expedients. A new mode of employing gas for the purpose is being tried at All Saints, Learnington: it consists of a continuous set of jet burners, each in the form of a trefoil, running under the clerestory windows on each side of the nave and chancel, and the great rose window of the northern transept, whereby a diffused light, it is expected, will be thrown over the whole of the edifice, without the disfigurement of hanging chandeliers, gaspipes, &c.

EXCAVATIONS AT NINEVER.—Letters have been received from Dr. Layard (according to the Athenæum), dated Mosul, October 15 this date he had about 60 workmen exploring the ruins; and many bas-reliefs-of which the store seems inexhaustible-were discovered. Amongst them is a representation of the re-moval of one of the gigantic bulls, showing that they were sometimes, if not always, moved to the palace after being carved. An immense number of men draw a sledge which runs upon rollers, impetus being given to it behind by an enormous lever worked by cords. A cast will be made of this very curious subject in the event of its being found impossible to remove it. It is probable that the fine pair of colossal lions still standing at Nimrud will be moved during the present expedition,

THE NEW CORN EXCHANGE AT EDIN-BURGH was to be formally opened on Wed-As our readers may recollect, we gave them a view of this edifice as designed by Mr. Cousin, the city architect, with parti-culars, in vol. vi., p. 294 of The BULLDER. The interior of the hall is fitted up with stalls for the grain merchants, ranged round the east, west, and south sides, and it is intended to have a row of offices on the west outside, as retiring apartments to the stalls on the western side, opening through the main wall. Rents of these, 171. 10s. each, stalls included; of the others, 10l. cach, or 5s., as sample dues, for a single occasion. The lighting of the hall from roof is through patent tile glass: area, 14,060 feet.

Tidal Survey .- "A Tide-table and Section, on a half scale, of Standard Marks on the Banks of the Thames, showing their Values above Mean Water at Sheerness and Liverpool," has just been prepared by Mr. Liverpool," has just been prepared by Mr. Joseph Smith, Assistant Surveyor to the Metropolitan Commission of Sewers, and printed for the use of the commission. It comprises, among other details, observations and calculations mainly agreeing with those already presented to our readers in an article (page ante) on a series of tidal observations made in the Tbames in connection with the Metropolitan Survey. It appears to be an important and creditable production.

"THE ART OF LANDSCAPE PAINTING IN OIL COLOURS." *—Under this head the amateur is offered, for the small contribution of a twelve-penny, sufficient elementary instruction to enable him to commence experimenting in oil vehicle with success. The information gathered in this little book of fifty pages has been gleaned from the ready communications of many artists, with whom the Publishers, in the course of their professional pursuits, are intimately connected.

* Winsor and Newton, London,

METROPOLITAN SEWERS COMMISSION On the 30th ult., a special court was held at Greek-street, to determine on the course to be adopted with reference to the plans for drainage of London, which had been received by the commission. Lord Ebrington was in the chair, and Sir H. de La Beche, moved that it be re-ferred to a committee of the whole body of the commissioners, with the Lord Mayor, and four other members of the City Commission, who should consider the course to be adopted. The resolution was seconded by Mr. Deputy Peacock, and unanimously adopted. It was also agreed that the fifteen additional plans presented since the 3rd of October should be received.

JOHN O'GAUNT'S PALACE, LINCOLN.— The oriel window, lately advertised for sale, has been purchased by the Lord-Lieutenant of the ty, Earl Brownlow, and presented by his lordship to the county magistrates for preservation in the castle, as an appropriate site, from having been one of Prince John's official residences.

MR. CAREW'S BAS-RELIEF on the south side of the pedestal of the Nelson monument in Trafalgar-square is completed. It represen "The Death of Nelson," and is 14 feet high, and 13 feet 7 inches wide. More, anon.

ABANDONMENT OF THE LONDON-BRIDGE RAILWAY ENTENSION.—At a meeting of the South Western Railway Company, held at Nine Elms last week, it was all but unanimously resolved to abandon the proposed ex-tension line from Waterloo-road to Londonbridge.

New Hall.—Our contemporary, the Morning Post, announces that a bequest of 10,000l. for the erection of a workman's free hall in the metropolis has been made by a Mr. Jenkins. Another friend of the people is to furnish a library of 1,000 volumes to begin with, and Mr. Hall, the geologist, is to present hi museum to it when the building is completed

THE LETTER-BOXES.—As the management of the post-office is at present an engrossing topic, allow me to point out, that most of the openings of the letter boxes of the district offices in London, are so small, that they will not conveniently take in a newspaper, and I have frequently observed them sticking in the mouths of the letter-boxes, so that they could be easily extracted. This should be

No. CCCLVIII.

SATURDAY, DECEMBER 15, 1849.

REAT efforts to ameliorate the condition and raise the character of the working classes are, undeniably, being made in England at this moment, and

will, there is every reason to believe, ultimately effect much good. The direction which these efforts are taking seems a right one, and if those whom it is sought to benefit embrace warmly and ingenuously the means which are offered to them, and strive vigorously to elevate themselves, the most important results to all classes of society will follow, and in a rapidly increasing ratio. Without their own cooperation-(self-discipline and education, the acquirement of habits of regularity and foresight)-nothing effectual will be done: with it, and extended knowledge, on the part of the upper classes, of our mutual duties and rights, it is scarcely possible to say how

The provision of well-ordered homes, of neat, commodious, and healthy lodgings, as one most important first step, we bave long and anxiously advocated, and have given our humble aid to every well-meant endeavour to further it. *

With this feeling we are desirous to bring prominently before our readers the large lodging-house in Spitalfields, opened on Wednesday the 12th, by the "Metropolitan Association for Improving the Dwellings of the Industrious Classes," under the title of THE ARTI-SANS' HOME: and a range of dwellings for married people closely adjoining, but not yet quite finished. These are situated in Albert-street, Spicer-street, a short distance to the north of the Whitechapel-road, and have been constructed under the superintendence of Mr. William Beck, architect, by Mr. S. Grimsdell, the builder. Five architects, it may be remembered, furnished designs in competition, and we gave, in our sixth volume (p. 387), a review of their several characteristics. The " Home " provides accommodation for 234 single men,+ each (to speak generally, in the first instance) having a separate sleeping compartment, 8 feet by 4 feet 6 inches,—the use of a spacious and handsome coffee-room, kitchen, a lectureroom, and a reading-room.

But let us go a little into detail. The building is five stories in height. It occupies three sides of a square the whole height: the space aclosed by the three sides is covered to the height of the ground floor only, and forms there the coffee-room. The basement contains baths and washhouses, with the requisite appurtenances,‡ cellarage, and space

for workshops. On the ground floor the entrance hall is commanded by the superintendent, whose apartments are on the left, while on the right the store room and cooks' apartments occupy about the same space. Immediately in front of the entrance are the stairs (of fire-proof construction), which lead to the three stories of sleeping berths. On the left of the stairs is a good-sized lavatory for day

The Coffee-room, 45 feet by 35 feet, faces the entrance hall, and extends to the back of the building, having communication on one side with a large reading-room, and on the other with a kitchen for the use of the inmates, It is lofty, and divided into aisles by iron columns supporting an open roof of stained timbers, stop-chamfered,-lighted by a large central window, two smaller side windows, and sbeets of rough plate glass in the whole extent of the roof. This room, a very handsome apartment, is fitted up with boxes round three sides, containing tables and seats, and is warmed by hot-water pipes. A cook's bar opens into a coffee-room, for the supply of coffee, &c. The Reading-room, 60 feet by 21 feet 9 inches, is warmed by open fires, and has the Library at one end : it will be furnished with some of the daily papers and popular periodicals.

The Kitchen, 45 feet by 21 feet 9 inches, contains two ranges, and hot-water tanks, a sink supplied with cold water, and the common apparatus for cooking purposes. The floor is formed of the metallic lava. From this kitchen a stone staircase leads to a portion of the basement containing 234 small larders or safes, with lock on each; they are raised on brick piers, and placed in ranges back to back, with space for ventilation. The key, in each case, fits the locker in the bed compartment bearing the same number.

The Cook's Shop is connected with the men's kitchen by a bar, where it is intended that cooked provisions may be obtained at almost any hour of the day by those who do not care to cook their own.

The Three Upper Stories are fitted with sleeping compartments on each side of a central corridor, formed by framing of sufficient height; each compartment measures 8 feet by 4 feet 6 inches, and is lighted by half a window; the upper portion opens, and this is hung on centres: each contains an iron bedstead, and suitable furniture; a locker for linen and clothes, with a false bottom, between which and the floor is a space for the admission of fresh air, that can be regulated at pleasure. The door of each compartment is secured by a spring latch lock, of which each lodger has the key.* On each floor are lavatories, fitted up with cast iron enamelled basins set in slate fittings; also water-closets for night use. The partitions forming the sleeping compartments are kept below the ceiling, for the purpose of ventilation, and the central passage has a window at each end, to insure a thorough draft when necessary.

For the general ventilation, the principal agent is a shaft, which rises nearly 100 feet: into this several of the smoke flues of the building are conveyed, and by this means a powerful upward current is maintained. The sleeping apartments and other principal rooms are connected by vitiated air flues with the ventilating shaft, and the current is to be regulated at pleasure by means of dampers placed under the control of the superintendent.

* These locks are so constructed that in no one wing do two keys fit.

There are large cisterns in the roof, and smaller ones in other parts of the building, to afford an ample supply of water to every part of the premises; and every floor has an opening, secured by an iron door, into a dust shaft, communicating with a dust cellar in the basement. The whole building is lighted with gas. The amount of the contract was 9,560l. The building appears to be an honest, sound construction, creditable alike to Mr. Beck and the contractor.

We should mention that the rent to be paid by each lodger in advance is 3s. per week, for which each in pate, besides his sleeping apartment, will have the use of the coffee-room, reading-room, and the public kitchen, where he may cook his own food; or, as we have said, he can obtain ready-dressed provisions from the cook. Every lodger has free access to the washhouse at certain times of the day, and can, by the payment of a small sum, bave a hot or cold

Of the adjoining range of buildings for sixty families, now in course of erection, we may take another opportunity to speak.

It is surprising to those who do not know how often the public must be told a thing before they will hear it, that after the length of time which has elapsed since the Association was established, and the expense incurred in advertisements, it should still be little known, and that all houses of the description hitherto erected should be termed only as "models," and erected "with funds raised from the donations of the charitable." It does not seem understood that this association partakes quite of the commercial character, being a Joint-stock Company, having a capital of 100,000l., in 4,000 shares of 251. each, though, at the same time, the interest of the class sought to be benefited is protected by the charter, limiting the dividends at any time to be paid to 5%, per cent., any surplus being directed to he applied in extension of the object,-a direction which goes to fortify the investment. The association has already paid one dividend.

From a statement forwarded to us by Mr. Charles Gatliff, the secretary of the association, it seems that the Société des Cités Ouvrières. now beginning operations in Paris, have grown

We shall look to "the Artisan's Home" with much solicitude, and trust to find it work out as beneficially as we anticipate it will. It offers to its inmatcs all those advantages, and more, on a scale suited to their means, which a west-end club affords to those in a higher walk. We are not quite satisfied with the name given to the lodgings, because we do not think it likely to make them so popular as we wish. Our artisans are a sturdy, independent race (and we like them the better for being so), who would not live under any roof which implied the receipt of charity. It is most important, therefore, to avoid the possibility of such a notion attaching in the remotest degree to the Spicer-street lodgings, and we would rather, therefore, that they had been called "Carlisle-street," "Ebrington-buildings," or " Howard-place," giving every inbabitant bis own number.

Every man who thinks of moving there to live may feel assured that he is going to pay fairly, we will even say amply, for the advantages afforded, and that he simply has a Company for landlord instead of an individual. This, we think, cannot be too generally understood. The same advantages will presently be given, we have little doubt, for even less

* A meeting was held last week, in the parish of St. Mardin-in-the-Fields, the Rev. H. Mackenzie, the vicar, in the
half, "for the purpose of considering the encessity of
aking measures for promoting the improvement of the
aking measures for promoting the improvement of the
half, "state of the land the consideration the safe of the land the consideration the safe of the land t

† The engineer for hoiler, warming apparatus, &c., was

rent, and yet pay those who risk their capital

in the speculation.

We hope the directors will not be afraid of a little decoration. We should like to see the walls of the coffee-room, reading-room, &c., covered with good prints, maps, &c., silently teaching,-and sending men out of a morning with a pleasant feeling, or a good thought, to dwell upon. "Is there, truly considered, any calamity more grievous, that more deserves the best good will to remove it, than this,-to go from chamber to chamber, and see no beauty?"

ARCHITECTURAL PROPOSITIONS.

The following propositions are deduced from observation and study, and I beg leave to submit them for the consideration of others. It seems to me that these and other consequent propositions, if carried out, give not only defined and reasonable principles for architectural fined and reasonable principles for arcontectural design, which at present are nowhere distinctly explained, but must lead to the proof of the necessity of a new style, and the practical means we have for systemizing it.

I. That all art expresses three distinct qualities or ideas—grandeur, beauty, pic-

turesqueness.

2. That each of these qualities is subdi-2. That each of these qualities is subdividable into three other qualities, whose difference is less distinct—beauty sliding off on one side to strength, on the other to grace—grandeur on one side to sublimity, on the other to strengtb—picturesqueness on the one side to grandeur, on the other to fancifulness.
3. That these three distinct qualities are subdividable in themselves to infinity, as seen in all created nature.
4. That they arise van almost imperceptible

4. That the variety and almost imperceptible graduation of change thus produced is incapable of being expressed by single verbal explanations, but that enough is given by the explanations, dut that enough is given by the three before-mentioned qualities, to form standards of character for the artist's purpose. 5. That there are three powers or principles placed under the control of the artist for the

elimination of those qualities-form, shadow,

and ornament.

6. That these three powers are resolvable into one—form. From form the two other powers are generated; on form they are dependent, and consequently subordinate.

7. That shadow is the first-born of form, and dependent on that alone, consequently has the next where the present of the statement of the statement of the statement of the statement where the statement of the statement where the statement of the state

has the next place of honour.
8. That ornament is dependent on both, and consequently inferior to each, and subor-

9. That either one of these powers, by itself, is capable, in a greater or less degree, of ex-pressing each of the three qualities before defined

10. That form, as the superior power, is

10. That form, as an another than the most capable.

11. That ornament, dependent on form and shadow as the inferior power, is least capable.

12. That that form is most perfect which is the most perf

most varied in its parts, and most harmonious in combination.

- 13. That there are definable and distinct forms productive of the distinct qualities of proposition No. 1,—every variation of which form produces a variation in the quality, idea, or character, -these three words being synonymous.
- 14. That so far these propositions are true and explanatory of visible art in general.

 15. That substances are the architects means

of producing form, sbadow, and ornament.

16. That the nature of a substance deter-

mines the nature of its construction.

17. That each difference of construction expresses a different quality or character. That each system of construction is the base and exponent of a character peculiar to itself,

which we term style.

18. That there is one style for the grand, one for the beautiful, and one for the pic-

The each such style has the three particles of variation, with all their rate made. Afterences, mentioned in propopition No. 2 in itself.

20. That each such style has not the power of expressing the three distinct qualities of proposition No. 1 in itself—at least, not to the

proposition No. 1 in itself—at least, not to the most perfect production of each. 21. That each system of construction is grounded on a different and distinct form. 22. That such a form must simply, or in

combination, extend and harmonize throughout the entire mass.
23. That such a form, if made the un-

changeable standard of a particular construc-tion, is the unchangeable standard of its tion, is the unchangeable standard of its quality or character.

21. That, of curves, the circular expresses the

character or quality of grandeur:
25. The ovoid, that of beauty:

26. And the combined segments of either, the picturesque.

Of angles (a line being expressive only in combination),—
28. The right angle expresses grandeur:

29. And the acute angled triangle, pic-

turesqueness.
30. That direct imitation in architecture

destroys it as an art.

31. That it is an art, in so far as it produces change, in either form, shadow, or or-

nament, and however slightly.
32. That as an art it is eminently pro-

33. That it has standard or fixed principles,

but not standard rules.

34. That it is true art in so far as it ex presses the spirit of the time in which it is produced.

35. That practically, utility covers a multitude of sins.

WOODS AND FORESTS-SHIP TIMBER.

YEAR back sundry commentaries were published in THE BUILDER on this subjectone of some importance as regarding the supply of oak for naval purposes, and which supply of oak for havar purposes, and which has since that period been treated by several of the journals. Already have the delinquencies and defalcations been laid (however uneritedly) at the door of her Majesty's Commissioners of Woods and Forests; and the public eye has been directed to the absorbing thems of our woods are very a well as a total the proof of our woods and some public eye has been directed to the absorbing thems of our woods are well as a well as the fact of the second some public to the theme of our wooden walls, as well as to the maladministration and waste of hundreds of thousands of acres which might and ought to furnish employment, food, and profit to 100,000 denizens of the workhouse.

It has been shown how small an extent even of the New Forest (itself but a tithe of Royal domain lands) is really occupied by growing timber for naval purposes; how little of that timber has ever found its way to the national arsenals; and how much was left desert; and, moreover, that such waste land was and continues to be most pernicious to the habits of the agrestic population, since it can only serve for the range of a herd of deer, the walk of the warrener, the beat of the poacher, or the prowl

of the timber dropper.

In the reflections which such a condition of things suggested, it occurred to the writer that the navy, the State, and the community might profit by viewing these estates in pretty much the same light as though they had been private domain lands, and by converting them to a source of income, bappiness, and plenty. Not to touch the Royal appanage of Windsor-park,—
the Forests of Dean and Whichwood, Epping,
and others present a wide width of fertile and
convertible farms; and probably if his Grace
of Sutherland's estates were compared, tested,
and valued as to the staple and quality of the
soil, the former would preserve in a large of the soil, the former would prove in no degree in-ferior. One has been managed with a view to private (and therefore to public) benefit; the other would appear to be "no man's land." From the one springs up and renews annually afixed revenue of at least 12s. average return per acre,—from the other less than nil, for the balance has been set down on the wrong side of the folio, and what "the canker worm corroded not, the Palmer worm devoured!"

not, the Palmer worm devoured!"

The remedy proposed in The Builder men might with equal advantage he introduced to the supervision of forests.

A private estate with an extensive range of wood is sure to be under the superintendance of a wood in an ordinarily short treatise, it may have passed with little observation; therefore, it may not be out of place to repeat it, even at the risk of an imputation of

tautology; for a good thing, if ungrateful, may

this, then, was our panacea: take an estimate and survey of all those portions whereon stands mature or growing timber for the navy; fence in and demarcate them; again, estimate what other parts (in sections) are adapted for the growth of young plantation, and having ascertained, according to Cocker and a very reasonable essay in the Times of 29th ult., the total number of acres requisite for the perpetuation of a supply to the naval arsenals, fence that in also, and plant it with the most ap-proved species of oak and Spanish chesnut. Thus, according to rule, a fair security may

he attained against any dearth of product for succeeding generations; and if the calculations referred to be correct, that 36,000 loads of timher per annum will suffice to keep up a war armament, and that 60 loads (at only one load of 50 cubic feet per stick) be the yield of an of 50 cubic feet per stick) be the yield of an acre, then a range of under 10,000 acres of forest will suffice for the object. But supposing that 20,000 acres of free growing oak timber (at the same time that I regard Spanish chesnut as equally servicalle and more tenacious) were required for these occasions, then nearly 300,000 acres of improvable land would remain unappropriated. The whole of the residue should, and ought to be, subdued, cultivated, replenished, and devoted to increased and increasing demands of a progress. creased and increasing demands of a progress-

ively multiplying population.

Having got rid of the question of supply, and secured nurseries for future fleets, there would still remain scattered over the excluded forests, in groups, bosquets, rows, and detached trees, an immense number of standard oaks; and these, perhaps, the most appropriate for kelsons, knees, and compass scantlings. What forbids that the rule of private estates should not obtain here too? When a farm is leased to the tenant of a landlord, it is usual, nay, the rule is invariable, to mark, number, and register the trees growing and standing thereon; and such tenant would no more dare to cut and carry, nor even to lop one of such, than he would think of pulling down and devastating the farm house, or of ploughing up old traditional pastures.

Why not so enumerate, mark, and register the outstanding trees on the royal forests? Why not lease out the expletive and waste lands to improving tenants for fructification, and why not increase the breadth of cereal crops, already too scant?

erops, already too scant?
300,000 acres, leased at only 5s. an acre,
would produce 75,000\(lambda\). a-year; and this withont any diminution of courtly splendour, save
that the 729 fat bucks distributed at Christmas might cause a dish the less on the festive
board now instant upon us.

A recompense for this short-coming might
however present itself in the stimulus given to
agriculture, in the busy emuloyment of thou

agriculture, in the busy employment of thou-sands of Hants and Dorsetshire labourers now awaiting deportation, or on the questionable limits and chill subsistence in the workhouse. A wholesome impetus to trade, and architec-A wholesome inpetus to hade, and a telescenture in particular, would be imparted by the erection of cottages, farms, hoxes, and mansions, not to speak of the incessant demand for lahour in the reclaiming of lands, the location of the most industrial elements of rural labour, and, not least, the so far increased independence of foreign grain. Many whose amor patriæ make them regard emigration as transportation would still adhere to their native soil even in sterility, and would apply their native nerve and energy to the advancement of the commonweal in independence. That every rood of ground should maintain its man is neither desirable nor necessary, but that many an acre teeming with fertility should lie neglected is a prodigality and a crime towards that Providence which commanded "that man replenish the earth."

Supposing, however, that the woods and forests remain in statu quo, that the chaces and fen domains be still maintained, it occurs to observers that something of private manage-ment might with equal advantage he intro-duced to the supervision of forests.

increase and progress of the crop; he knows its metings and its value; he can tell at a glance the quantity and contents of any tree; and can determine which is to be fallen, both for profit in the product and benefit to the reserved timber. How is it in royal property? The official is an officer of state, mayhap a member of the senate; if he is not above the business he is not equal to it; the chief part of the duty is to receive a heavy stipend (much too large for an operative), and the supervision is left to local agents.

is left to local agents.

Thus it is that in national property malversation is easy, the delegated duty is performed without check, and no principal can be expected to undertake more than the audit and accentance of accounts. habilement raisonnés.

expected to undertake more than the audit and acceptance of accounts, habilement raisonnés. In territorial concerns of such magnitude, riding surveyors, not addicted to any particular trange, might be a wholesome restraint; and even in the event of the sale of all useless wastes, and the retention of only timber producing soils, such officers (and they are employed in the postal departments) at a moderate salary, with travelling allowances, might be a salutary gnard on spoliations and robbery such as have been brought to light.

No further evidence is required to prove the necessity of some precaution than the report of Mr. G. W. Fletcher, timber merchant, of Millbrook, Southampton, which was presented to Lord Duncan, and to which the prosecution of the Reades was altogether owing:—" Such

No further evidence is required to prove the necessity of some precaution than the report of Mr. G. W. Fletcher, timber merchant, of Millbrook, Southampton, which was presented to Lord Duncan, and to which the prosecution of the Reades was altogether owing:—"Such was the mismanagement in the Forests, and so deeply were the royal servants implicated in systematic plunder and corruption of every kind!—so multifarious were the parties concerned init, that a public fund was collected to defend prisoners!! and that for this reason it was next to impossible to find a jury to convict!!!"—See Times, Nov. 29.

There is no argument for a total change and disafforestment of royal demesnes if this be

There is no argument for a total change and disafforestment of royal demesnes if this be mot one; yet this is only a fragment of what has come to light,—for it appears that in Whichwood countless thousands have been lost to the public, the timber wasted, and the delinquent has been suffered to escape.

Reserving for another occasion some proofs of facts in aggravation of gross mismanagement,

as also some remarks as to the inexhaustible stores of durable or nearly imperishable timber which can be supplied by the colonies of Australasia, together with the facility of carrying home those products in suitable scantling, or of even building ships in our colonies of a vastly superior material, I shall now conclude with the remark that the redundant population might be placed in a position of happiness for themselves, and advantage for the parent 'state, by sending them to wide fields of industry, and by taking, in return, the blue and tarart gum tree, the mahogany, and other timbers, the clearance whereof would give them a location, and confer on Britain an enceinte fortifiée.

Quondam.

PECULIAR FEATURE IN STOWE BARDOLPH CHURCH.

Annexed is a view taken in September last, of the south wall of the chancel of Stowe Bardolph Church. With the exception of the doorway, all the arches were bricked up and entirely concealed by a thin deal partition; the steps and floor are of course not in their original position, they will be altered when the restoration is complete. The whole of this wall was in such a ruinous condition that it was obliged to be taken down, but it has been rebuilt precisely as it formerly was.

The window or opening eastward of the piscina is worthy of notice. I believe its position to be

The window or opening eastward of the piscina is worthy of notice. I believe its position to be unique, at any rate I have never met with one so situated before out of nearly 3,000 churches that I have inspected: it has no appearance of ever having been glazed, nor are there any traces of hooks for the hinges, as are generally found when such openings have been closed with shutters. The clear dimensions of the opening are 2 feet 1½ inch by 4½ inches. The walls of this church were almost entirely covered with paintings, among which were two very large ones of St. Christopher, reaching from the floor to the roof; the lower portions of these had been destroyed by an enormous gallery, which extended over more than half the length of the church; there were other paintings re-

presenting the martyrdom of St. Edmund the crucifixion; two figures, the one of the blessed Virgin, and the other, holding a book, probably intended for St. Ann, over the centre of the chancel, and two angels holding a shield, with the emblems of the passion, with the figure of our Saviour above: in other parts the walls were diapered with the sacred monogram. These paintings were mostly very rudely executed, and in so bad a state as to preclude the possibility of their being restored; but before they were quite lost, I took careful drawings of the most interesting.

but before they were quite lost, I took careful drawings of the most interesting.

The church consists of chancel, with mortuary chapel on the north, nave, and west tower.

I should be very glad to hear from some of your numerous contributors or readers, whether an aperture, similar to the one referred to in the accompanying sketch, is to be met with in any other church in a similar position.

ther an aperture, similar to the one referred to in the accompanying sketch, is to be met with in any other church in a similar position.

The restorations now going on comprise the rebuilding the south walls of the nave and chancel; new windows throughout the church; new oak roofs over nave and chancel, the former open to the ridge, the latter panelled; new oak chancel screen and stalls; new paying throughout; new north porch, and new doors to the nave and chancel. All the windows will be filled with stained glass. New altar, font and pulpit. The seating to the nave will be partly new; the remainder being the old seats (date, 1625).

RAPHAEL BRANDON.

Inish Schools of Design.—The Government School at Belfast was to be opened on Thursday in last week. Lord Dufferin, the president, announced by letter his intention to offer a prize of 50*l*. for the most approved design, for a damask table cloth. Copies of the design when approved of, his lordship suggested should be distributed to the most celebrated damask manufacturers in the neighbourhood of Belfast, with the view of being manufactured in linen, to be submitted to the inspection of competent judges, and the piece most approved of to be sent to the exhibition of nations in 1851, as a specimen of the staple manufacture of the north of Ireland,

UNION IS STRENGTH.

THE ARCHITECTURAL SOCIETIES.

THE attention of the architectural profession, and of other persons—and happily they are not few who take an interest in all that relates to architecture—is at this moment are not rew who take an indectanguage relates to architecture—is at this moment drawn to the consideration of applying, as well a remedy for the abuses which have crept into a nohle pursuit, as of affording encourage. ment to those individuals who have entered it with high aspirations after fame, and a praise-

with high aspirations after lame, and a phase-worthy wish to run a noble career.

Having deprecated the want of union which exists among the institutions into which the profession is divided, I ventured to express an opinion that a remedy for this and many other ills might be found through the instrumentality of an architectural college, if well supported by architects, and by those who are either strongly engaged by collateral ties or by inclination, in upholding just and correct views of a profession which influences so largely the coinforts, wants, and tastes of society.

I now proceed to show that an institution

I now proceed to show that an institution already exists, which might, either with modifications or with additions, be made to serve as a groundwork for a general, comprehensive, and well-organized scheme. In alluding to the "College of the Freemasons of the Church," I cannot do better than quote the very first law, to show its extensive scope and high

purpose.
"The college was founded on Advent eve, in the year of our Lord and Saviour one thousand eight hundred and forty-two, 'for the recovery, maintenance, and furtherance of the true principles and practice of architecture; for the sanction of good principles of building, and for the condemnation of bad ones; for the exercise of scientific and experienced judgment in the choice and use of the most proper ma-terials; for the infusion, maintenance, and advancement of science throughout architecture; and, by developing the powers of the college upon a just and beneficial footing, to raise architecture from its present vituperated condition, and to bring around it the same unquestioned honour which is at present enunquestioned bonour which is at present enjoyed by almost every other profession; and further, for the charitable assistance of those and their families over whom it shall please Providence, after a life devoted to the service and practice of architecture and its dependent arts, that need shall fall.' And whereas, with the ancient freemasons, who were indeed of the church, architectural construction was carried to so wonderful a degree of prefettion, that to so wonderful a degree of perfection, that, by the science of co-gravitation, vast and heautiful fabrics were erected to endure, though composed even of small masses of mean and perishable materials,—therefore this institution, intended for the cultivation and growth of the highest class of scientific constructive

OF THE FREEMASONS OF THE CHURCH."
Such is the language with which the college sets forth its endeavour to bring the wisdom and experience of the past to bear upon the present and the future,—language whose justice every candid mind must recognize as founded in a sound and far-seeing love of art and artists, and as placing concisely before the profession the evils which afflict it on the one hand, and on the other, the remedy which may

architecture, shall be intituled "THE COLLEGE

be applied To the the late estimable and gifted Alfred Bartholomew is to be ascribed the chief title of founder of this college, which he was not permitted to see fully carried out; and his early departure from a profession which he loved and adorned, may he reckoned as one main cause that the institution has not made that rapid progress which its excellent intentions deserve. Of the eighty-eight laws which at deserve. Of the eighty-eight laws which at present form the guidance of the members, it may be sufficient to quote law 3, which will serve to show the wide and popular basis upon which the institution was to be established.

Law III. The memhers of the college shall

consist of five classes, viz.:1st. Architectural fellows, who shall he gentlemen who have been educated to the pro-fession of architecture or of civil engineering, and who are not under the age of twenty-four

students in practical architecture, or in civil engineering in connection with architecture, under the age of twenty-four years, and who, on arriving at the age of twenty-four years, shall be eligible as architectural fellows.

3rd. Clerical fellows, who shall be clergymen of the United Church of England and Ireland. 4th. Lay fellows, who shall he gentlemen, or respectable persons who are not architects, nor civil engineers, nor clergymen of the United Church of England and Ireland.

5th. Honorary fellows, who shall be persons eminent for science or for learning, or for antiquarian or for architectural knowledge, or who, from station or through other means, have the power of furthering or patronizing

practical architecture."

It will be seen that these classifications are sufficiently clear in their objects, admitting within the pale all members of the profession, within the pale all members of the profession, yet not excluding any persons who, without pretending to a knowledge, may have a great love of art, and an anxious desire to be joined with artists in promoting and elevating those pursuits to which their feelings in common are drawn, a union which cannot fail to be productive of as much pleasure to the amazeur. are drawn, a union which cannot fail to be productive of as much pleasure to the amateur, as of encouragement to the artist, who has too many drawbacks in his career not to require and appreciate the sympathy of well-informed and well-judging men. It is far from my wish to have it supposed for one moment that, in holding out an invitation to the profession in its different branches to join the College of the Freemasons of the Church, I would insist, in the first place that its laws and regulations are the first place, that its laws and regulations are perfect, or, in the second, that already existing Institutions, especially if of older date, can be expected to belong to the college without some concession on its part. Yet it is to be hoped that existing institutions, and why need I scruple to name them?—that the elder Institute of British Architects, the younger Architectural Association, and that still more recentlyestablished society, for the laudable purpose of publishing architectural works, may one and all, setting aside every feeling but the ennobling one—zeal for the common good, consent to make common cause with the Freemasons of the Church, in whose name I am privileged to state that on their side every just concession will he made, every private feeling will be sacrificed to promote the desirable objects set forth in the heading of their laws. For my own part, I am prepared to surrender into the hands of any other architect more gifted than myself—and such a one is easily to he found in the ranks of my noble profession,—the distinction conferred upon me by the college, much as I prize it, and retire into the ranks, a humble but zealous follower. On the side of the college, therefore, there would be no obstacle in the way of meeting other institutions with the open hand of fellowship; and if it be asked why do not its members rather fuse into other societies, than expect to be joined by those whose date is older, or whose numbers are greater than their own, the reply is simply this,—that, without casting the slightest dis-respect upon any other society, or doubting its usefulness, it is their conscientious helief that only in their own hody is to be found a well-digested code of laws for every occasion behtting the artist, the gentleman, and the Christian, a well-considered provision for every branch of art or science connected with archithe college, limited hitherto in its fellow-

ship, and, consequently, in its means of use-fulness, has not altogether been idly or un-profitably employed. Its meetings have taken place every month—one sign of activity—and the papers read on various subjects have appeared in the periodical devoted to the pro-fession. Of the value of these papers it is not for me to pass an opinion; such as they are they were freely contributed to the general treasury of knowledge. The restoration of St. John's Gate, Clerkenwell, is chiefly owing to the intervention of the college.

It now remains to he seen whether this

years, or who have heen in the actual practice of the profession of architecture or civil engineering during five years.

2nd. Architectural associates, who shall be

prosperous career, should yet bestow thought for the rising generation,—from those who are even now struggling in their onward path to fame,—from those also, who, wishing to aid in working out the great truths of art, have not hitherto had the proper opportunity,— from all, in short, who desire the advancement of a and in short, who desire the advancement of a science, whose results are seen to cover the length and breadth of a land, of which they ought to be the noblest monuments for taste, skill, and judgment. Such would be the case were architects led to emulate those master. were architects left to eminate mose master builders (doga-risrovec, — Bible translation) of former days, the Freemasons of the middle ages, who developed the beauties of their art equally in the cottage and in the palace, in the humble parish church as in the stately minster. But these men formed a community; and if we imitate their example we may hope to im-bibe some portion of their spirit, and thus we also expect to see in a country where building is carried on to so great an extent, more attention paid to architectural construction, so necessary to the preservation, and, therefore, true economy, of either public or private structures.

G. R. FRENCH.

** At the request of the committee of this *** At the request of the committee of this society we give insertion to this appeal, and we do so readily, because it proposes what we have personally for some time advocated, viz.,—UNION,—the drawing together into one body of all who are engaged in the study of architecture, connected with it, or anxious for its advancement, and for the well-being of its reference —a body which would then indeed its advancement, and for the well-being of its professors,—a body which would then indeed be powerful for good. It is necessary, however, that we should say, we do not participate in the belief that the Royal Institute of British Architects, is at all likely to "fuse" into the Freemasons of the Church: this is of course out of the question. What is wanted is such an alteration in the laws and regulations of the Institute, and its charter, too, if the alterations Institute, and its charter, too, if the alterations cannot be made without, as will enable it to include the other bodies, and effect with power all the good that they, and the best wishers of the art, are aiming at.

AWARD OF THE ROYAL ACADEMY MEDALS.

On Monday, the 10th inst., the medals, &c., on Montay, the four instances are the Royal Academy. Mr. Geo. Jones, the Keeper, in the absence of Sir Martin Archer Shee, presided, and expressed his great regret that the president, through indisposition, was unable to attend. Gold medals were presented to Mr. J. A. Vinter, for the best historical painting; to Mr. E. J. Physick, for the hest historical basso relievo; and to Mr. Arthur Allom, for the best architectural design. Amongst the recipients of silver medals was Mr. A. F. Young, for the best drawings of the south portico of St. Paul's Cathedral.

Cathedral.

At the close Mr. Jones in a few words expressed his deep regret at the death of Mr. Etty, and urged the students to follow the example of perseverance and study which he had set them. He said they should help one another in all things, and not give way to envy: expressing his high satisfaction at the good conduct of the students,—Mr. Jones said he could not speak well enough of it.

I have just returned slowly and sadly from the award of the Royal Academy Medals. And for what were they awarded? For that merit which any labourer's son, properly educated in drawing, might deserve, —immense lahour—cor-rect and properly adjusted copyism. The medals must, it seems, he given; but surely they had better be withheld than given for the enbetter be withheld than given for the encouragement (I allude particularly to architecture) of that spirit which has raised the York, the Nelson, and the thousand and one other columns of the same kind over our noble country—the British Mnseum—the National Gallery—the Russell Institution—St. Pancras, and its numberless senseless imitations—the statues of Trafalgar-square and the Exchange, the Duke and the George. Wonderful, indeed, and god-like was the spirit of beauty which informed the eye, and directed the hand of the Grecian artist,—consistent with itself—consistent with all nature around it! Gloriously does it remain emhalmed in the temples and statues of its age—its creed—its character—its home. But is ancient Greece modern England? In what does our religion—our literature—our climate—our life resemble it. Those who would retain the architecture, should retain the dress. The whole thing is a falsity—an imposition—a palpable lie—an absurdity, and for the encouragement of this, our professors award medals. Do they cavil at those who would revive Gothic, or Norman, or Elizabethan? They do. I have heard, myself, just and severe sarcasms, these very words indeed, levelled against the revival of either of these styles, by the very men who would revive a style antecedent to them by centuries, and foreign to our land. Sir, I do not expect you will care to publish this. My words are strong; but I feel strongly, deeply, degradingly, the want of true art among us, be it in Gothic, or Byzantine, or Italian, or Egyptian, or Grecian, or Roman, for all seem practised. I see with sorrow and disgust, had copies, senselses revivals, false construction, and wretched taste. Sir, no new style can be born in a year, nor fifty, nor, may be, a hundred. But surely the medals might be awarded to the explorers of art, in preference to the imitators — the clever imitators of the past. But we must expect nothing else—it has ever been so.

We live, however, in a Protestant country—Protestant against the trammels of any unreasonable authority. We live among an energetic and persevering race—a nation of thinking men. May we not hope with Mackay,

"There's a good time coming?"

It is truly a consummation devoutly to be wished.

Kunops.

TASK-WORK AMONGST BRICKLAYERS.

In your journal a short time since I perceived an article on task-work, signed "A Plastere," in which was very truly described the evil consequences arising out of the system; but I can assure your correspondent that his is not the only trade in which the system is practised, and I would refer him to his next door neighbours, the bricklayers. To such an extent is task-work, or sub-letting, carried on in that trade, that not only is the trade much injured, but the life and limbs of those employed, and in some instances of the public, are placed in jeopardy. Scarcely a week passes over our beads but we hear of the fall of arches on some railway, and the tumbling down of houses which are being built. In most cases the elements are blamed for the accidents—the wind, the wet, &c.; of course these delinquents cannot be punished for their wild freaks; occasionally inquiries are made in respect to the workmanship, but that is invariably decided in favour of the contractors; it is very difficult to judge of the workmanship in a heap of ruins, and yet one might come to a speedy conclusion, that if the workmanship was of a good kind the ruins would not have been there.

I will endeavour to make a few remarks on task-work as it is practised in our trade. A man who is not over particular as to the language he uses to his men, generally takes this work of a contractor at a very low price; he then procures two or three men of the same stamp as himself; these men receive 6d. per day above the usual wages, and are usually called "drivers;" one of them is put to work on a line with four or five other men, and as each man has an equal portion of the work to perform, the object of the driver is to run his piece along as quickly as possible, paying very little regard as to how it is done; but should another man, who is not used to scamping his work, he a little behind with his part, the line will at once be struck on him, and he will be work, he a little behind with his part, the line will at once be struck on him, and he will be discharged as incompetent to do his work. On most large jobs, such as railways, an inspector is employed, whose duty it is to see that the work is done properly; but as he cannot always be at one place, having other parts of the railway to attend to, every facility is afforded to carry on the scamping system; and in his absence a quantity of labourers are employed in throwing in the bricks, without any regard to the order of bond or any other order, except that of putting them out of sight. A good look-out is always kept for the inspector; and should a hat or a coat, or anything like the aspect of the supposed party be seen in the

distance, the joints are flushed up, the labourers take to their hods, and things go on pretty well till the inspector goes, when the old plan of proceeding is again commenced.

Incredible as these facts may appear to those

Incredible as these facts may appear to those of your readers who are not acquainted with these matters, they will he no less astonished at the plan which is adopted by these task-masters to force, as it were, their men to spend their wages. On task-jobs, where a considerable number of men are employed, the task-master gets a number of round pieces of tin of two sizes; they are usually stamped with his initials; the smaller size is equivalent to a sixpence, and the larger to a shilling. The task-master then enters into a contract with some public-house keeper, and orders him to supply his men with whatever refreshment they require on the production of this tin money. The publican allows the master 2s. 6d. for every sovereign he receives in this way; therefore, considerable pickings are made. I need not add, that refreshments purchased in this way are usually of the worst description. Not satisfied with the advantage he derives by this abominable system—this denoralizing evil—the master almost always contrives to keep his men waiting for their money till nine or ten o'clock on a Saturday night, with what view it is unnecessary to say.

with what view it is unnecessary to say.

Can nothing be done to prevent these evils?

Such a system ought to he held up to universal reprobation; but it seldom happens that these proceedings meet the eyes of those who would be disposed to lay them before the public; none but those who are actually engaged in doing this work are witnesses of it. I saw something in True Builders some time ago about the incompetency of mechanics: is it likely, when the majority, or I might say almost all the large jobs in and around London, are task-work, that we should have competent mechanics? No, Sir; for when a man gets into such a system of working as is practised on these jobs, it is not very easily departed

I think, Sir, by giving publicity to these facts, good may he done, for it would open the eyes of those who are in the habit of huilding; and I think that railway companies and other parties who have extensive works in progress, by being initiated into the mysteries of task-work, may be led to adopt a remedy.*

A BRICKLAYER.

RAILWAY JOTTINGS.

The autumn rains are still, as heretofore, revealing the humiliating fact that sufficient estimation of their power and extent has by no means always been taken into account in the planning and construction of our railway works. The disruption of culverts, the fall of bridges, and the sweeping away of embankments, have been but too frequent of late, as on the Trent Valley, the Lincoln, and other lines of railway.—Near the Wolverhampton station of the Shrewsbury and Birmingham and Stour Valley line, a bridge, recently constructed over a canal, suddenly gave way, and fell into ruins on Monday week. The centres had been removed more than a month before, and no crack or other appearance of instability, it is said, had been noticed prior to the fall. The span of the bridge was between 40 and 50 feet.—A mail-train engine, on Friday last, fairly crushed into wreck the brickwork abutments of one of the numerous wooden bridges near Collungham, on the Nottingham and Lincoln line. The engine, however, may he said to have leaped over the chasm, but the coupling chains snapped, and the carriages rehounding were driven with a crash on each other, and, after rocking dreadfully, fell into the flood heneath. The coupées were crushed into 'fire-wood,' and every carriage and van smashed, but bappily the train contained not a single passenger, and, strange to say, no one seems to have lost his life.—Mr. Brassey, the contractor, has entered into work that line, and to advance the sum of 200,0000. On the security of its rolling stock.—Several Companies have issued advertise-

ments inviting public competition in the supply of stores and materials. The result of this system, says Herapath, is the saving of many thousands a-year in money, and the repair of morals by the riddance of jobbing.—The following important decision was given by Lords Brougham and Campbell, in the House of Lords, in the matter of the Forth Marine Insurance Company:—"Dividends are supposed to be paid out of profits only, and when Directors order a dividend to be paid where no such profits have heen made, without expressly saying so, a gross fraud is practised; and the Directors are not only civilly liable to those whom they have deceived and injured, but are guilty of a conspiracy for which they are liable to he prosecuted."——An appeal by the London and North-Western Company has been heard before the special session at Manchester, against a rate demanded by the overseers of Barton-on-Irvell, on a portion of the old Liverpool and Manchester line. The case was decided against the Company, on the ground that they did not apply in reasonable time. The amount assessed on the railway, which only occupies 42 acres of hog land, is \$,909L, or one-fifth of the entire rate levied on the township for the 1-250th part of it occupied by the railway. The land was purchased by the Company at 40L per acre, and the Directors had consented now for nineteen years to pay nearly as much annually as the purchase cost originally; the former being at the rate of 34L per acre per annum.——On Wednesday week, the wires of the telegraph between Birmingham and London were broken in two different places, by contraction produced by frost.

ANCIENT MORTAR.

On reading a day or two ago the works of Codinus, "De Originibus Constantinopolitanis," I met with a passage which may be interesting to your readers. I am not aware that the precise composition of the mortar used by the ancients, concerning which, on account of its wonderful hardness, so much has been said, is known to modern architects and builders; but it seems to me that the following conveys a hint which, in proper bands, may produce results very useful to the public.

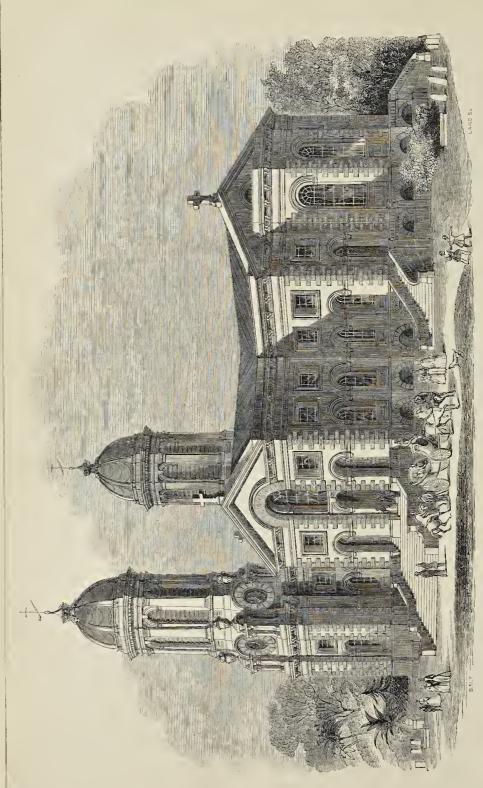

The Emperor Justinian built the temple, which was dedicated to St. John the Baptist, and he employed upon it no less than ten thousand workmen, with one hundred μαίστορες, or over-lookers. "Five thousand men were employed upon the right, and five thousand on the left of the building, and every effort was made that it might be completed as soon as possible. An angel revealed to the emperor during sleep the form which the temple was to assume. There was a certain workman who had acquired great renown in building temples. He boiled in large pots a quantity of barley, and mixed the liquor μετά τοῦ ἀσβίστου καὶ τοῦ ἀστράκου. [Whether the first means what we now term asbestos, I am unable to determine: the second I take to be powdered shell]. The barley-liquor he mixed warm with these things instead of water. They cut up also some elm bark, and mixed it up with the asbestos, and made a kind of paste (καὶ ἐποίουν μάζαε), which was applied neither too hot nor too cold, but tepid, hecause it adhered the better, and made the stones stick together with the strength of iron."

The above passage between inverted commas is a literal translation from the Greek. I shall be obliged if any one of your readers will inform me what the word $\tilde{\alpha}\sigma\beta\iota\sigma\tau\sigma_{0}$ as here used really means. A. G.

ART-UNIONS IN AMERICA.—A controversy, which appears to excite great interest, is going on in New York, between the Home Journal and the Mirror, concerning the constitution of the "American Art-Union." In this association the pictures are all purchased by a committee; and Mr. N. P. Willis, in the first-named paper, is maintaining that the position and character of artists have been materially lowered by this mode of proceeding. He asserts that the society has been made "into a throne of personal consequence, by which artists can be tyrannized over, and true art discouraged."

^{*} I have heard on good authority that, from information which was forwarded to the clerk of the works of a large task job, now in progress about four miles from London, he has condemned and taken down upwards of 70 rods of brickwork.

THE CATHEDRAL AT ANTIGUA.

This building, dedicated to St. John, and which was designed to withstand the hurricanes and earthquakes so prevalent in the West Indies, is placed upon the site of the old cathedral, which was destroyed by the earthquake in February, 1848. The corner-stone of the new building was laid October 10th, 1845, and the first sermon preached in it on exactly that day twelvement; but the towers and exterior were not preached in it on exactly that day twelve-month; but the towers and exterior were not entirely completed and service permanently commenced until August, 1847;—the whole building being completed in two years, at a cost of 36,000*l.*, from the designs of Mr. Thomas Fuller, architect.

There was not any contractor, but the men were paid, and the building works carried out, by Mr. W. Rone, of Bristol, who, by the efficient manner in which he performed the whole of his arduous duties, his general abilities, and conduct, gave the greatest satisfaction to the architect and all parties concerned. There were a few English workmen sent out, but the greater nortion of the work sent out, but the greater portion of the work was performed by the natives.

The plan is cruciform, with two square towers at the west end, finished with octagonal cupolas; at the east end is a semi-octagonal apse; the building accommodates 2,200 persons, the extreme length being 160 feet, the breadth 53 feet 9 inches; the depth of each transent 26 feet, the breadth 47 feet 6 inches. It is divided into nave and aisles by octagonal columns, having moulded caps and bases and an enriched entablature running through-out, with semi-elliptical arches between the columns, moulded archivolts, corbels, and keys. The ceiling over the nave is coved and panelled, and that over the aisles flat and panelled; the whole of the roof is carried on a strong framework of hard wood, quite inde-pendent of the stone walls. The roof is of pitch pinc, and the whole of the interior is lined with pitch pine (not painted), obtained from America, all timbers being cut there to the sizes required, and the boarding ready planed, grooved, and feathered. The walls are built of magnesian limestone,

of very fine quality, which was obtained from the north side of the island; the floors of the aisles were laid with sanded blue lias stone, the space underneath being used as cold air flues. The floor of the chancel is of polished flues. The floor of the chancel is of polished lias, which, together with that used in the aisles, was obtained from Mr. Treasure, of Bath. The windows are filled in with thick glass in large panes, supplied by Messrs. Dix and Williams, of Bristol. The three east windows were made in England, filled with stained glass, by Mr. Willement, of London.

The roofs were covered with the patent galvanised tinned iron tiles, by Messrs. Morewood and Rogers, of Upper Thannes-street, London, who sent out a person to superintend the fixing. This description of roofing is stated to be peculiarly adapted for the situation, on account of its being readily fixed by inexperienced workmen, and from its not being liable to be disturbed by the hurricanes which occasionally visit these islands.*

visit these islands.*

The pulpit, reading-desk, bishop's throne, and stalls, were made of mahogany, carved in Bristol; the font was also sent out from Bristol. The building, which is approached by bold flights of steps, with balustrades, &c., stands on an elevated situation, commanding a view of the town and bay; it was severely tested in the late lutricage, but the only damage of income. late hurricane, but the only damage of importance sustained was to the stained-glass windows at the cast end, and to the vane of one of the towers. Several buildings in the country and some of the other churches were severely

damaged or destroyed.

It is due to the architect to state that the style of the building was determined by the

Committee.

The organ was sent out by Mr. Walker, of

THE LIFE ACADEMY in Margaret-street, Regent-street, held a conversazione on the 11th inst., and exhibited some interesting works.

NOTES IN THE PROVINCES.

THE Wesleyans are collecting funds for the erection of a new chapel at Luton.—Rolling mills are to be erected at Woolwich Dockyard, where stringent measures of economy are being where stringent measures or economy are being carried out. Old wrought iron is to be used up in place of being sold for a trifle as beretofore, so that many thousands of pounds, it is expected, will even thus alone be saved. A set of machines for turning treenails is to be substituted for hand work, and in the black-mith. smiths' department the men are to be put to their mettle in shape of piece-work. Pity many sinecure pensioners, as well as poor men, were not put on piece-work, by "no work no pay" heing made the general order of the day. The Customs landing-waiters, are now day. The Customs landing-waiters, are now again being bled, and by the way, for behoof of the sinecurists,—to save whom seems to be the grand end and aim of the saving system at all times.—The Southampton Board of Waterworks lately secured a "cheap contract for iron pipe," regarding which they have just received a letter from Bory College Iron-works, in which Messrs, Rayne and Barns state their grant at having made a great mixstate their regret at having made a great mistake in their calculation for the supply of the pipes, by taking yards as feet, and thus making 1001. difference. They would execute the order, and throw themselves on the generosity of the commissioners. Several of these, however, they they have the product of the commissioners. ever, thought that it would not be just to the other parties who had tendered to give any compensation forsuchamistake,—but for which the accepted tender would have been very considerably higher than the rest. The letter, siderably higher than the rest. The letter, meantime, was referred to the general committee.—The wardens of St. Martin's, Birmingham, are directing their attention to the mingham, are directing their attention to the state of the fabric of the old church, and will shortly be prepared with a definite plan for the consideration of the parishioners, ascertaining which of the courses that are open to them will be most likely to secure approbation and co-operation. "It is evident," says the local Journal, "that there is a strong feeling in the mind. is a strong feeling in the minds of many in The Odd Fellows' Hall, Temple-street, Birmingham, was opened on Monday week. It has been erected by Messrs. Branston and Gwyther, after designs by Messrs. Coe and Goodwin. The building presents externally a plain appearance. On the second floor, and occupying nearly the whole area of the building, is the principal hall, which is lighted from the roof, and will contain about 1,000 persons. A gallery extends along the hall over the entrance. The whole will cost nearly 3,000*l*.—St. Michael's Church, Worcester, has been recently 'beautified' by the erection of tablets, with the commandments illuminated on wine plates in worldstead. illuminated on zinc plates, in moulded oak frames, placed on each side of the east window. Work executed by Mr. G. Rogers, of Worcester, who has also recently executed some stained glass for windows in Thornbury Church, Gloucestershire.——The foundation-stone of St. Paule Charlestony periods of St Gloucestershire.—The foundation-stone of St. Paul's, Charlestown, parish of St. Anstell, was laid on Tuesday week. The style of the building is Early English, with tower and spire rising to 70 feet in height. The plan is cruciform, with nave, north and south aisles, and transepts, with north porch. The nave will be lit by a elerestory. The walls are to be of blue slate stone with granite quoins, plinth, water tables, jambs, &c. The interior dimensions will be 100 feet from east to west, and 42 feet from north to south, height of and 42 feet from north to south; height of nave 34 feet, separated from transepts and nave 34 fcet, separated from transepts and chancel by arches 28 feet in height; chancel, 25 feet in depth, ascended by three steps. The roofs are open, with collars and arch ribs springing from circular engaged shafts and capitals between the windows of the clerestory. The vestry is on the north side of the chancel. All the woodwork is to be stained in oak; accommodation on floor for 570, all free. The amount necessary for completion is, we understand the state of the completion is, we understand the completion of the completion is the state of the completion of the completion of the completion is the completion of the completion amount necessary for completion is, we understand, far from being fully guaranteed by subscriptions. — Several architects having complained that the time allowed for plans for the Leicester new workhouse to be sent in was too limited, the clerk was requested to write to the commissioners for an extension of time for three weeks. During this discussion, Mr. Woodward suggested that the guardians should

they might as well apply at once to have the question adjourned for other six months.—
It is proposed to lay down a glass culvert for the main sewers of Rugby. This bas been recommended on account of economy (?) and smoothness of surface in the dates. smootbness of surface in the glass.—The Manchester Waterworks Committee report "that about 10th September last the com-mittee received tenders from forty different parties for the construction of the Godley service reservoir, from forty-three parties for the construction of the Denton reservoirs, and from thirty-one parties for the masonry work connected with the Broomstairs-bridge; and on 15th accepted the three several tenders sent in by Mr. David Bellhouse, of Manchester, for the execution of the three works. The committee have arranged for the purchase of all the land required, and been enabled to give posand required, and been changed to give possession to the contractors. The prices to be paid for the land have been arranged without arbitrators or a jury, except in the case of the trustees of Lord Wilson: price asked 16,289/.
3s. 4d., offered 4,000/., awarded 5,941/. 6s.; and of land belonging to Mr. Wrigley: verdict layers are the contract of the case of the contract of land belonging to Mr. Wrigley: verdict layers are the case of t by consent 2,975*l*., amount asked 3,820*l*. 10s., offered 2,720*l*. The Woodhead contractors have already nearly repaired the damage from have already nearly repaired the damage from floods at their own expense. Ahout 1,892 tons of pipes have heen got ready. They are dipped before being laid down, as they are proposed to be first at Hulme, Chorlton-on-Medlock, and Ardwick. The report of Mr. Bateman, the engineer, showed that the works under seven different contracts are now going on steadily and satisfactorily. — The parish church of Kirk Deighton, Yorkshire, has been lately repewed. Improvement has been made in the internal and external appearance of this in the internal and external appearance of wenerable building by the removal of windows that did not correspond with the style, and by replacing them with suitable windows. This work has heen accomplished through the exertions and liberality of the rector, the Rev. exertions and liberality of the rector, the Rev. James William Geldart, LL.D. The church was 're-opened on 20th ult.——In Aberdeen the streets are swept every day, at an annual cost of 1,0001, and the refuse brings in 2,0001, a year. In Perth the scavenging cost 1,3001, per annum, and the mannure sells for 1,7301.—The new building erected at Reading, during the present year, for the use of the savings bank, was opened on the 11th instant. It is in the Italian style, and consists of a spacious bank office, board-room, waiting-room, &c., with a notice's residence strong-room, &c., with a porter's residence. The contract was undertaken at the estimate of the architect, Mr. Jno. Billing.

SUCCESS TO THE GAS MOVEMENT.

PETITIONS from the City gas consumers having been presented in showers to the City Sewers Commissioners, in favour of the Great Central Gas Consumers' Company, the com-mission have seen the propriety of resolving, by a majority of 35 to 11, to allow that com-pany to lay their pipes throughout the City. This, too, the commission has felt impelled to having been presented in showers to the City do, although the old City companies, in order to burke the new, had previously announced their resolution to reduce their own price to 4s.—the maximum to which the new will be limited. The old companies even bound them-selves in honour to continue the reduced price named, whether the new should now realize its intentions or not. It was somewhat amusing, however, to note the curious struggle of their advocates, on the one hand, to cast discredit on those estimates of their opponents on which the idea of the possibility of selling the article at 4s. at all was founded, while they themselves, at the very same moment, were offering it at that very price, and broadly hint-ing at the possibility of still further reduc-tions. Nevertheless, previous to March last, they had insisted that it was perfectly impossible to sell it at less than 6s., to which they had shortly sen it at less than 0s, to when they had shortly before reduced it from 7s, a price that had also been declared to be the lowest possible. It has been stoutly insisted, too, that the quality of the gas will be deteriorated in consequence of such reductions. Now, we will undertake very easily to show that it must, on the conthree weeks. During this discussion, Mr. Woodward suggested that the guardians should apply for an extension of the period to the last day of Hilary Term; but it was thought that

^{*} We are told that in a hurricane which occurred on the island last year, and which carried away the roofs of from 1,000 to 1,200 houses, those that were covered with this ma-terial were not disturbed.

sumption IN PRIVATE DWELLINGS will constitute their grand field of profitable operations, and with all our hearts we will second their efforts in this direction; for that is the real goal of all our past exertions in this good cause, But to this anticipated and almost illimitable diffusion in private dwellings—from hall to kitchen, from kitchen to parlour, and from parlour to drawing-room and bed-chamber, -purity-extreme purity is absolutely essential. There can and will be no such diffusion without it, and hence the bringing of the price within reach of all classes in domestic life, will inevitably be accompanied by an increase, not by a deterioration, of purity. Moreover, the advancement of chemical economy is rendering this very purification itself a self-compensatory and profitable branch of the manufacture.

ARCHITECTS' TROUBLES.

AT the Whittington Club, in the Strand, on the 29th ult., Mr. Wightwick delivered a lecture on "Architectural Practice." We get the following outline from the Weekly Gazette, published by this society. The lecturer commenced by giving a metaphorical outline of a young architect's career, and then a more serious account of the duties of the practising architect. A house may be built without an architect; many complex and costly residences may he put up by the unprofessional, much to the profit of the mason and builders. But the use of an architect, in sober truth, is to do that better which may, it is admitted, be done well by the non-professional. He (the architect) will give not more decoration—perhaps less but such as is fitting in degree, and appropriate in kind. He will convert neglected corners and accidental spaces into picturesque ornaand accidental spaces into picturesque orna-ments. He will not give you a mere pile of building, but a piece of art. The lecturer then illustrated the above by a dramatic dialogue, showing how, of all the fatiguing and nervous occupations, that of an architect is the most so -detailing the task of "making a specifi-cation"—how an architect's wife always knows by her husband's temper when it is by her husband's temper when it is "specifi-cation day" (?) — how the specification is finished at last, much to the joy of the poor architect; when suddenly the post brings a letter from Mr. Briggs (the party who is about investing his money in a new house) desiring that "further operations" may be suspended, as, in his "travels through the neighbouring counties, he bas seen many newly-built mansions, and had the benefit of much good and friendly advice." Once of much good and trendly advice." Once again, however, upon Mr. Briggs's return, is a new plan determined upon, including a "brewbouse," a "bakehouse," a "laundry," and a "vaulted cellar,"—again is the "specification" completed, and again is Mr. Briggs of the Mr. Briggs of control Mr. Briggs of control Mr. Briggs (not Mrs. Briggs, of course) dissatisfied—again is the specification and estimated cost reduced, and again does Mr. B. think 2,800l. too much: once again is a still more moderate specification prepared, and at last is the house actually commenced-ground staked out, and foundations marked,-labourers, masons, and builders actually at work. During the operation of building, the following scene takes place, between Mrs. and Mr. B., and the

architect.

Mrs. B. (viewing the progress of the huilding), "Al, what's that?" "That, madam, is the halcony." "Balcony! balcony indeed! do you suppose I'm going to allow that thing hefore my bed-room window? Here, Briggs, Briggs, I say (Mr. Briggs was purposely looking at some other interesting process), look here—what is that?" bere. - what is that ?"

bere,—what is that?"

"My dear, that of course is the balcony."

"Well, well! I don't care; I shan't have it—
it only shuts out the light from above, and
obstructs the view from below; I won't allow
it." And forthwith the "balcony" vanishes;
the lady carries the day (as she ought), and
this, with other numerous "alterations," renders, the architects, miseries complete. In ders the architect's miseries complete. short, my advice to the young architect (the lecturer continued) is this: above all things, in designing a house, consult the cook, make the hutler your friend, gallant it a little with the housekeeper, and a little more with the housemaid, make positive love to the lady's-maid, be deferential to the footman, be sub-missive to the boy, and make each believe that

the whole bouse is built in subjection to the particular part of it in which each one is interested. Conciliate the servants' hall, and you have, as it were, the public press in your favour, by which the tyranny of the drawing-room will be unconsciously subdued. Neglect room will be unconsciously suddined. Fregect this policy, and chimneys will smoke, plate will tarnish, cobwebs will prevail, and preserves will grow mouldy. We are disposed to hope that this outline does not give a correct general notion of the

discourse.

POPULAR ERROR AS TO THE NELSON COLUMN.

As the remarks you have already done me the favour to insert in your journal, on the subject of the relievos, may have been serviceable in promoting the appreciation of bronze for such uses, I now seek, through the same or sile uses, now see, who are the dearner, to correct a widely-circulated error respecting the proportion of the column itself. The opponents of a columnar monument, it may be recollected, urged the insecurity of

Corinthian proportions; and, in a consequent report by Sir Richard Smirke and Mr. Walker e engineer, it was recommended that a considerable diminution in the proposed height of the work should be made. This recommendathe work should be made. This recommenda-tion was followed; but the impression that the clumsy expedient of chopping the re-quired length off the shaft, and thereby violating the just proportion of the order, was adopted, is entirely without foundation,—though up to the present moment "going," as it is termed, "the round of the papers." Thus, the Times of Thursday last pronounces the "shaft too short for the product of the the "shaft too short for the pedestal, and the capital too heavy and massive for the shaft."

I have gone to the best source for my in-

formation, and find the height of the column as built, from the top of the pedestal to the as out, from the top of the bedward of the top of the abacus, to be 101 feet 6 inches; the lower diameter 10\frac{1}{2} feet, and the upper diameter 9 feet. On referring to "Taylor and Cresy's Rome," where the Mars Ultor example Cress stone, where the 1888 consequence is carefully given, the height of the ancient example is 55 feet, and the upper diameter a fraction less than 5 feet 2 inches, and as these dimensions are in the exact ratio of 101 feet to feet, it is evident the classic proportion bas been strictly maintained.

The capital was very skilfully modelled by Mr. C. H. Smith (afterwards engaged on those of the Royal Exchange), whose ability is well MODERATOR.

A FOUNTAIN OF ERROR—BRISTOL.

A SHORT time ago, wandering in Bristol, we found ourselves accidentally in Somerset-square, a quiet locality close to Redcliffe Church where we saw signs of unwonted activity that promised well: the old wall which had enclosed the central area was giving place to an iron railing, and preparations were making for an ornamental fountain, apparently of Gothic design, in the centre. They told us it was all being done at the expense of one spirited individual to whom many of one spirited individual to whom many of the houses belonged, and we said, "Praise be to him: we will look how he gets on the next time we visit the ancient city." And so we did, and we cannot say how much we were annoyed by what we did see. The founwere amoyed by what we asset. The following train is completed, and this is the shape it has taken: the basement is Gothic, with foliated panels; on this is a circular Italian peristyle of small columns, theo a nondescript ornament from an indiction of the control of the cont small columns, theo a nondescript ornament from an indistinct recollection of that on the Tower of the Winds, and, crowning all, a curiously-postured figure of Neptune with a jet-pipe out of the top of his head, leading to the conclusion that he is bereafter to be afflicted with water on the brain.

When we say that this fountain is all of stone and uprears itself a considerable height, it will be seen that it must have cost a considerable sum of money, sufficient, under good direction, to have raised a creditable work of rection, to have raised a creditable work of rate; and all must grieve that a good and liberal art; and all must grieve that a good and liberal and pleasure, from their place of business. It is a picturesque estate, with wood at similar waste elsewhere, and not with the view of causing annoyance to the proprietor, or raising a smile, that we mention the matter.

The figure of Neptune appears to have been copied from a large statue of the god near and one by Bailey.

the Temple Church in Bristol, a public fountain, but apparently not now supplied with water. There are so few fountain-statues in our streets, or indeed statues of any kind, that we would suggest to the authorities the con-servancy of this last-named Neptune. Apropos servancy of this last-named Neptune. Appropose of running water, we noticed not far from the last named place, in Temple-street, a small stone inscribed "To the poor. Protect this pipe." We must suppose that it once gave forth water, but it is now dry as—our article some may perhaps say. some may perhaps say.

ROMAN TESSELATED PAVEMENTS, ALDBOROUGH.

MR. H. ECKROYD SMITH, of York-an enterprising young puhlisher,—has just now issued three very excellent lithographs of pavements discovered (one of them, as it seems, chiefly through the instrumentality of the publisher) on the estate of Mr. Andrew Lawson, Aldborough, the Roman Isu-Brigantum, in Yorkshire. No. I., one of the most perfect in Britain, consists of borders of guilloches and frets, with a double star on a white ground as a centre-piece. The third border from the outside, "unlike every other plain border known in this country," varies in its width on each side. On one side it is nine tesseræ in width, on the second seven, on the third five, and on the fourth three. Counting two parallel sides together, the numbers are equal, namely, twelve,—the nine ranging with the three, and the seven with the five.

In the pavement shown by Plate II., the frets, with a double star on a white ind as a centre-piece. The third bor-

In the pavement shown by Plate II., the centre has been occupied by an animal, pre-sumed to be a lion reposing under a tree. Amongst the small cuts which fill the margins of the prints are shown two rooms of the hypocaust, and a circular-sided building immediately within the city wall, "in all prohability one of the more recent Roman erections." The third plate shows four pavements. They are all very neatly drawn by Mr. W. Bowman, and lithographed hy Mr. W. Monkhouse.

DEFECT IN PATENT LAWS.

ALLOW me, as a very old subscriber, to call ALLOW file, as a very oin subscriber, we can your attention to the law of patents and registration as now by law established the costs of these processes quite precludes the poor man and mechanic exercising that gift and ahility which the Almighty has given. I know of my own knowledge very given. I know of my own knowedge very many valuable designs and patents thrown on one side, because, as I observed, the projector of the invention is, from the exorbitant cost, entirely shut out. I trust, Sir, you will, in your invaluable publication, endeavour to call the attention of the proper authorities to the fact; and I mention it now because of the proposed industrial exhibition in 1851. From this the English head is mainly excluded by our patent laws. I will ask you wbo will put his mind to work when he is not paid for it? the law he the same as the law in France, the protection be estimated at a rental, and so long as the inventor, or his family, pay up that rental yearly, let the poor man have the advantage.—W. J. Bray.

SOHO PARK, BIRMINGHAM.

BOLTON and Watt made Soho Factory famous throughout Europe, and it was long a centre of enormous manufacturing industry. Its hammers are now nearly quiet; the stream has taken another channel. But the same place is now to offer a field for exertion to another kind of activity. Soho park, attached to the residence, has been laid out for hullding on, and, with proper management, can scarcely fail to be successful.

The park is about a mile and a half from the busy part of Birmingham, on the road to Wolverhampton, and will doubtless become the retreat of wise townsmen, studious of health

PROPOSED PROVIDENT INSTITUTION FOR BUILDING OPERATIVES.

A VERY influential meeting of architects, contractors, and others, to consider Professor Cockerell's suggested Institution, was held at the Guildhall, London, on Tuesday, the 11th, when the scheme, it will he seen, was fairly

By the unanimous vote of the meeting

By the unanimous vote of the meeting Mr. Cockerell was called to the chair, and opened the proceedings at considerable length in an admirable address, expounding the project already familiar to our readers, and disclaiming any personal merit as the originator of the scheme. He dwelt particularly on the importance he attached to the support of the architects and engineers, in addition to that of the master builders, and concluded by soliciting suggestions from the gentlemen present. As Mr. Cockerell's views are already fully hefore our readers, it is unnecessary here to reiterate them.

them.

Mr. Tite said that many thanks were due to Mr. Cockerell for his exertions, but whilst he (Mr. Tite) approved of his suggestions in the main, he thought the present meeting was not sufficiently informed upon the subject to take any definite proceedings in existence at the Excise-office, all the servants in which establishment contributed to a life assurance and benevolent fund. The system was also about to be introduced on an extensive scale amongst the men employed by the great railway companies. There would be some difficulty in dealing generally essentially democratic, and it was well known that they liked to govern themselves. It was also necessary to guard carefully against anything of an eleemosynary character in the proposed scheme. Of the general advantages of the plan there could he no doubt; but he would rather, in the first instance, solicit the opinions of his friends Mr. T. and Mr. W. Cubitt, Mr. Baker, and others around bim, as to the practicability of adopting a general system of the kind. In order that the project should go on, he hegged leave to move that a committee should be appointed to inquire carefully into the whole subject, and collect the statistical and other information so much required.

Mr. Hardwick briefly expressed his cordial and Mr. Tite said that many thanks were due to Mr.

Mr. Hardwick briefly expressed his cordial and entire approval of the measure, and bis concurrence in Mr. Tite's suggestion. Mr. Higgins seconded the motion, as Mr. Hard-

entire approval of the measure, and bis concurrence in Mr. Tite's suggestion.

Mr. Higgins seconded the motion, as Mr. Hardwick had omitted to do so.

Mr. T. Cubitt said it appeared to him the subject was an exceedingly difficult one. He feared the number of masters, architects, and engineers, would hear a very small proportion to the immense hody to be hencified by the plan. It was important to ascertain what sums the men could spare, and whether these sums would realize an adequate provision for old age. That plan could not come into full operation for many years, and it should be considered how far the gentlemen present could bind their successors to carry it out, if adopted. He did not think so much sympathy and aid would be extended by the higher ranks of society to builders' workmen as to domestic servants, to whom allusion had been made; and there were other points on which information, statistics, and calculations, were greatly needed. He concurred in the appointment of a committee of inquiry, and in the gratitude expressed, and which every gentleman must feel, to the chairman, for his proposal, and sincerely hoped it would be carried out.

Mr. Sheriff Lawrence regarded the scheme as one of such magnitude that no Government would venture to undertake it—it was, in fact, national—embracing, as it did, so many thousands of individuals. The cases of the excise and railway officials and the domestic servants would not apply to artisans of all ages and conditions, who must he dealt with under very different circumstances. A general with under very different circumstances. A general context such as a private building concern. Much depended on the statistics of life amongst artisans, on which point the existing tables were very defective. He thought the workmen ought to be the prime movers in such a scheme, but feared the majority of them were not prepared for that sacrifice of present enopyment to remote advantages, which was the foundation of its success. They should, at all events.

were not prepared for that sacrifice of present enjoyment to remote advantages, which was the foundation of its success. They should, at all events, he enabled at any time to withdraw their savings; whilst, on the other hand, he feared, from the vici-situdes of trade, they would too often avail themselves of that privilege. The cost of management should certainly he paid for them, but without interference with their love of self-government, which he regarded as a laudable feeling.

Mr. Baker trusted the meeting would not be deterred by the difficulties referred to. From his experience of workum, he differed with the worthy sheriff, and felt assured that they only required to he put in the right way, and that there were thousands of them quite prepared to avail themselves of this project. The power of withdrawing their

deposits would convince the men the scheme was intended solely for their benefit, and remove all suspicion from their minds. The immense number suspicion from their minds. The immense number of workmen in London ought to be no obstacle, for but a limited number could be expected to avail themselves of the plan; and if only one-third of them could be benefited their object would be simply answered. He hoped and believed, for the honour of the profession, that Mr. T. Cubitt's anxiety as to the support of their successors, was unfounded. Useful societies never lacked support: if well established, this society must succeed.

Mr. Ansell, actuary, being ampealed to, said

if well established, this society must succeed.

Mr. Ansell, actuacy, being appealed to, said he was well acquainted with the excise and railway schemes which had been alluded to, but did not think either very analogous to that now proposed. The number of persons said to be connected with building and engineering in London, 300,000,must be rather an exaggerated estimate, including their families, and others dependent on them. He suggested the desirability of adding to the Committee some of the operatives themselves, well knowing that unless the recipients of the advantages of friendly societies had a share in their management, these societies always worked badly. It was advisable not to encumber the plan with too many apparent advantages. He a share in their management, these societies always worked badly. It was advisable not to encumber the plan with too many apparent advantages. He approved of a provision for old age and sickness, and a payment on the workman's death, but not the provisions for widows and orphans, on which point the statistics were far from perfect. He should feel great pleasure in giving the project every aid and information in his power.

Mr. Neison concurred with Mr. Ansell: He had no misgivings whatever of the practice, it would be impossible to fall into any scrious mistake. The exitting Friendly Societies were badly managed, hut a statisting Friendly Societies were badly managed, hut a

isting Friendly Societies were badly managed, but a happier period was dawning on the country, and it was from these societies, that the elevation of the working classes was to be looked for.

Mr. Piper thought, when his friend Sheriff Law-

Mr. Piper thought, when his friend Sheriff Law-rence had spoken, he was giving a history of the in-firmities of human nature, instead of describing the habits and dispositions of the working classes, for he (Mr. Piper) believed the latter, as a hody, to be as provident, as thoughtful, and as intelligent, as any class of the community. He had always found them ready to receive and adopt any suggestions sincerely made for their benefit. Some time ago he had ascertained that one-tenth of the whole number of claimants upon the Orphan Asvigums of the metrohad ascertained that one-tenth of the whole number of claimants upon the Orphan Asylums of the metropolis, were connected with the building trade in its various branches. The only doubt that could now be suggested was, whether the public mind was prepared for the ample scheme of Mr. Cockerell. He helieved the intended meeting of the Builders' Foremen, was a favourable indication, and that a large number of workmen were willing to adopt it. Much information was necessary as to details, for the meeting ought to he prepared to submit some definite statements to the operatives, and aid them in every possible way. He fully approved of Mr. Tite's proposition.

Mr. Lee expressed his warm approbation of the

Mr. Lee expressed his warm approbation of the heme, and his conviction that the difficulties

attending it might and ought to be overcome.

The motion was then put and carried as follows: The motion was then put and carried as ronows. "That a committee be appointed to inquire carefully into the subject of the Provident and Benevolent Society, suggested and proposed by Mr. Cockerell, in connection with the huilding branches; and to collect facts and statistics relating thereto; and that the subject is a distribution of the subject in the subject is a distribution of the subject in the subject is a distribution of the subject in the subject is a distribution of the subject in the subject is a distribution of the subject in the subject is a subject in the subject in the subject is a subject in the subject in the subject in the subject is a subject in the subject is subject.

collect facts and statistics relating thereto; and that such committee do report to a further meeting of the parties present, and such other friends as may take an interest in the matter."

Mr. Cockerell, Mr. Hardwick, Mr. Tite, Mr. Roberts, Mr. Bunning, and Mr. Angell (architects); Mr. Ald. Lawrence, Mr. T. Cubitt, Mr. W. Cubitt, Mr. Lee, Mr. Piper, and Mr. Baker (builders), were then constituted a committee in accordance with the abeae resolution, with nower to add some were then constituted a committee in accordance with the above resolution, with power to add some engineers to their number,* and to call in one or two intelligent workmen to aid their deliberations. Mr. Wales was appointed honorary secretary; and a vote of thanks to the chairman having been carried unanimously, the meeting separated.

THE OPENING OF MARYLEBONE BATHS AND WASHHOUSES took place on Monday last. They stand on the site of the late tea-gardens of the Yorkshire Stingo. Mr. Christopher Eales is the architect. The cost of the whole will he very nearly 20,0001. The Christopher Eales is the architect. The cost of the whole will he very nearly 20,0001. The huildings are of red brick, and contain 107 haths, besides shower and vapour baths and two swimming haths. The washing department is fitted up for 84 persons washing. We shall make a dip into these baths hefore long. What is a Foremann—in the Court of Exchequer, on Tuesday, a builder's scaffolder described a foreman as "a man who walks about and does nothing, and orders everyhody else to work."

else to work.

⁶ Mr. Rennie and Mr. Field were named as favourable to

MEETING OF BUILDERS' FOREMEN ON PROPOSED BUILDING ARTIFICERS' PROVIDENT SOCIETY.

THE Institution of Builders' Foremen held a meeting on Wednesday evening last, to consider the advantages to be derived from the scheme set forth in The Builder of 15th September last, by Professor Cockerell; Mr. Kay, the president, in

Professor Cockerell; "Mr. Kay, the president, in the chair.

After a few remarks on the kindly feeling of the proposer, and his earnest desire to promote union and good fellowship among all classes of the building trades, the president pointed to the more immediate object in view, namely, to make his scheme for the well-being of all, familiar to the members and their friends, to court inquiry into its merits, and to elicit suggestions for its practical realization, or its adaptation to their particular benefit, as well as to that of others.

or its adaptation to their particular benefit, as well as to that of others.

It was then moved by Mr. Hawking, seconded by Mr. Allard (the secretary), and carried unanimously,—" That, as the happiness of a nation must necessarily depend on the prosperity of its people, it hecomes a primary duty, on all whose dependencies rest on industry, to use their most streamous exertion to secure a provision for old age and infirmities before the tide of life begins to ebb; and that any scheme or ono sed for such a purpose is entitled.

firmities before the tide of life begins to ebb; and that any scheme proposed for such a purpose is entitled to the fullest and most deliberate consideration of those for whose benefit it is professedly intended."

The mover said that the statistical details which had heen given were, he conceived, very satisatory; and if domestic servants, he observed, were countenanced and supported in their provident endeavours, as a society of theirs has heen, by Prince Albert and others, why should not the building artisans, he asked, meet with equal favour and countenance? Their claims were equally great, and equally appealed to them from those hearths and homes which building artificers provided for them. countenance? Their claims were equally great, and equally appealed to them from those hearths and homes which huilding artificers provided for them. If the members, one and all, of the huilding trades themselves, at all events, could only he brought to see the necessity of uniting more together, it would be greatly to the advantage of all, and he would ask them to remember the example set them at Guild-hall yesterday by the leading architects and huilders. Mr. Taylor gave his cordial adhesion to the reso-

lution as not only unobjectionable, but good-giously good.

The second resolution, moved by Mr. Watmough id seconded by Mr. Tuckwell, was as follows:— The second resolution, moved by Mr. 's annough and seconded by Mr. Tuckwell, was as follows:
'That this meeting having considered the plan submitted to the huilding trades by Professor Charles Rohert Cockerell, and partially developed in The Builder of September 15, 1849, are of opinion that it contains much which is calculated, a granulanch (subjusted to medifigation and as a groundwork (subjected to modification and addition), to effect so desirable an object, for the hencit of a very great number of all classes employed in the building trades: "o arried unanimously.

A resolution was then moved by Mr. Locke,

A resolution was then moved by Mr. Locke, expressing the opinion of the meeting that the proposed institution was calculated to effect much good, and pledging themselves to assist in making its importance felt. He urged them to receive the suggestion in good part and in the spirit with which it was offered, and great social henefit to the building trades could not but result from it. Let them also never forget that God helps them who help themselves. themselves

In seconding the resolution, Mr. Taylor said,-In seconding the resolution, Mr. Taylor said,— Union is strength—can any one deny that good saying? A house divided against itself cannot stand. He had heen both workman and employer, and be knew that unless both parties go on plea-santly, and hand in hand, neither will go on well. Every man would find it for his own interest to promote the welfare of those above him as well as

below him.

Mr. Allard, in speaking to the resolution, said that he had had the honour of an interview with Mr. Cockerell, and was deeply impressed with the kind feeling manifested by him, and his sense of the importance of such a feeling and of friendly union hetween employer and employed. He hoped his fellow foremen would appreciate the motives of those gentlemen who had now come forward with the friendly hand of union presented to them. There was great need of it in the present time, as the bitter experience of many of them could attest. It was a duty to themselves, their families, and their child ren, to be provident, even apart from all other considerations.

tions.

The resolution was then carried unanimously, as was the next, namely, "That a deputation of three members he appointed to wait on Mr. Cockerell to express to that gentleman the general feeling of this meeting to co-operate in carrying out his views." It was then resolved, "That the thanks of this meeting are due and are hereby given to Professor Cockerell, for the trouble and anxiety he bas taken in the matter. And also for the very courteous and friendly manner in which he has on all occasions received and communicated with this institution." Further,—"That the thanks of this meeting are due and are hereby given to Mr. George Godwin for his exertions in his public capacity to forward the same object."

Miscellanea.

MANCHESTER ROYAL LUNATIC Hos-MANCHESTER ROYAL LUNATIC HOS-PITAL.—This edifice was opened last week for patients. It is built of red brick, with stone mullions, and is in the Elizabethan style of architecture. It has a frontage of 350 feet, the central projecting front taking up 50 feet. The brick was made on the ground. There are two stories, and a basement, with an attic in the centre front, and a small tower in the centre of the roof, for smoke and ventilation. Each corridor is lighted with eight windows, along a passage 114 feet long. There are ranges of apartments furnished for different are ranges of apartments furnished for different classes of patients, and a day-room and dining-room, on the ground floor, supplied with numerous articles of comfort and amusement. Along all the passages ventilation is secured by iron grids in the skirting-boards. The upper story chiefly consists of dormitories, with beds of polished birchwood, There are altogether 252 rooms, exclusive of cellars and store-rooms. The building is lighted with gas from a work about a quarter of a mile distant, with a gasometer for 8,500 cubic feet of gas, or four days' supply. The heating apparatus is a series of pipes for hot air from the engine-house. Water is supplied from a well of 60 feet in depth, by aid of a small engine, capable of lifting 4,000 gallons a-day. There are also a number of cisterns in the roof with capacity for 70,000 gallons of rain-water for distribution to the washhouse, &c., and in case of fire. There are baths and lavatories with ready supplies of hot, tepid, and cold water. The kitchen, under the chapel, is fitted up with approved apparatus. There is to be an organ gallery in the chapel. The roof is groined. The area of the site is 52 statute acres with pleasure and airing grounds, howling-green, and kitchen garden. The avenue and grounds contain 18,000 trees and shrubs. There is accommodation in all for 100 patients,

male and female, in separated departments, HONTON RAGGED SCHOOLS,—On the 11th inst. the foundation-stone of this establishment was laid by Lord Ashley, who addressed a large assemblage of spectators on the advantage of the state of the sta tages of such institutions. The architect, on whose designs the huilding is to be constructed, is Mr. John Tarring; and Mr. Silas Honeywill is the builder to whom it is intrusted. The structure is to be plain but intrusted. The structure is to be plain but spacious, and in the Tudor style; the material spacious, and in the futor syrje; the material brick, with stone dressings. Its extreme height will be 30 feet, depth 70 feet, width 20 feet, giving school-room for the accommodation of 400 children, and private rooms for the master and mistress. The interior has an open roof of stained wood, and the building is

to be completed by February 1, 1850.
WESTMINSTER IMPROVEMENTS — COMPENSATION CASE.—Some weeks since you raised the curiosity, as well as the surprise of your readers, by an account of an award made by Mr. Shaw, in the matter of the Westminster Improvement Commissioners and the parishes of St. Margaret and St. John's, Westminster, when you stated that 21,000l, had been awarded for the workhouse upon an offer of 10,000l, and you named very correctly high reputations in the profession in array on the conflicting side. I believe every member of our profession must feel a regret when such differences occur among authorities because they tend to throw an uncertainty on the issue of inquiries, for which the public believe we have at least proximately agreed and conventional formulæ. I was therefore tempted to overcome my reluctance to figure in public correspondence, and to allay by explanation whatever of inisconception may have been caused by the paragraph; but apprehending what has since resulted, that a rule nisi would be granted to set aside this award, and that your readers would gain more by a report of the arguments on the case in court, the arguments on the case in court, than I should be likely to supply by ex-parte statement, I determined to await the issue of an application to the court, which, having now been successfully made, will leave you the opportunity of informing your readers on the subject, when I am sure all parties engaged will maintain the reputation they have enjoyed, and my friend Mr. Hunt will show good cause why he asked me nearly double what I considered his clients were entitled to receive.

HENRY ROBERT ABRAHAM.

HENRY ROBERT ABRAHAM.

PROJECTED WORKS .- Advertisements have PROJECTED WORKS.—Advertisement have been issued for tenders by 20th January, 1850, for taking down and rebuilding the Stockwell bridge at Glasgow; by 8th January, for the erection of the Subscription Baths and other works at Wolverhampton; by 24th December, for masons', carpenters', joiners', plumbers', slaters', plasterers', and painters' works, for Leeds-terrace, Low Harrogate; by 17th December, for cortain largetimes and cember, for certain alterations and repairs at Manor-house, Bishopstoke, Hants; and by 18th, for building sewers in Green Dragon-court, Cloyster-court, Jackson's-court, Canterbury-court, and other places in the City of London.

NEWSPAPER FOLDERS .- A gentleman once resident in Liverpool, says the Albion, has perfected plans for a machine precisely similar in its aim to one recently announced in a Brussels journal, but superior in practical value. We have had the pleasure of inspecting the draughtsman's sketches, and we are assured that consultation with an eminent mechanician has evoked a highly favourable opinion in regard to the novelty and practicability of the design. The invention, it is anticipated, and fold at least 3,000 copies per hour,—a speed much higher than that of the continental more considerable than and much more considerable than machine, and much more considerable than that of the majority of presses employed in provincial newspaper offices; and, whilst the motive power necessary is comparatively light and easy of appliance, the labour required whilst the machine is in action is trifling in the extreme. The cost, -an essential point,is said to be comparatively small.

THE IRON TRADE. - On Wednesday week a numerous assemblage of engineers, moulders, millwrights, smiths, and other mechanics, met at Blackburn, to discuss "matters of the greatest importance to the trade generally." A deputation consisting of Mr. Brandon, of London, Mr. J. Rawlinson, of Manchester, and Mr. Newton, of London, urged the meeting to prevent, hy co-operation, the great reduction of wages which was expected to take place. Resolutions were unanimously adopted .—" That the men out of employment, caused by a reduction of wages at the works at the South-Western Railway, be supported, and that a Committee be formed for that purpose."—
"That the meeting appoint a Committee to form a Central Committee, for the purpose of co-operating with similar societies in other terms."

ARCHITECTURAL ASSOCIATION .- We are glad to see that subjects of a practical nature are occupying the attention of this association, the last paper read being on the supply and discharge of water to buildings, by Mr. Calvert Vaux. The artesian and aqueduct principles, and the advantages of the plan of constant supply at high pressure, were referred to details of arrangement in which the responsibility of the architect is more especially involved, were made the chief points for consideration, and the merits of various plans and inventions, amongst others those of Bunnett and Corpe, Mr. Smith, and Mr. Jennings, were discussed. The paper concluded with a few sensible remarks on the feasibility of a central and permanent exposition of inventions connected with practical architecture.

A SURVEYOR BY TENDER. GOING GONE!—According to advertisement in THE BUILDER of the 1st instant, the office of surveyor of highways for Ealing was tendered for on the 4th, by the following candidates, and at the annexed salaries.

Institution of Civil Engineers.—At a meeting on Tuesday, December 11th, Mr. Joshua Field, president, in the chair, a paper was read, "On the facilities for a Ship Canal Communication between the Atlantic and Pacific Oceans, through the Isthmus of nama," by Lieut.-Colonel Lloyd. The chief point insisted on by the author was the great field opened in the Isthmus for emigration, for the surplus population of this country. He contended, that it was far preferable to the Canadas, where the poor, but industrious and honest mechanic, or labourer, on arriving, found that the rich land he had heard of could only be reached by a weary journey and after such hardships, in a severe climate, as his limited means and broken strength rendered impossible for him to bear.
CHELTENHAM CHURCH COMPETITION,—

[Dec. 15, 1849.

Forty-seven designs were submitted in compefor the new church at Cheltenham, from which the committee selected three,—those of Mr. Ordish, Mr. Raffles Brown, and Messrs. Coe and Goodwin. The decision has ulti-mately been in favour of Mr. Ordisb's design, the tender of a builder having been produced within the stipulated sum. The design is Middle Pointed, with chancel and chancel aisle, nave, north and south aisles and north and south transepts, sonth porch, and sacristy. North of chancel there is a tower with plain broach spire west of nave. The roofs are of high pitch, and there is a clerestory of plain character. It is to be regretted that the tran-

character. It is to be regreted that the than septs contain galleries,—an almost necessary evil under the circumstances.

CHINESE BUILDERS IN CALIFORNIA.—
The Chinese have emigrated to San Francisco in large numbers, and it is remarked that from early morn until late in the evening, these in-dustrious men are engaged in their occupation of house builders, and the quietness and order, cheerfulness, and temperance of their habits, is noticed by every one. The buildings brought from China are generally 20 feet square, one story in height, and 12 feet from the floor to story in height, and 12 refer from the floor of the ceiling, and the price of them, including the erection, is 1,500 dollars. They are brought from Hong-Kong.

To Destroot CRICKETS.—In reply to the

inquiry how to destroy crickets?" mix together about two-thirds of dry pounded loaf sugar with one-third of arsenic, and put it in those places infested with them. I have never known this remedy to fail.—J. C.

LONDON SEWAGE.—The tunnel sewer now in course of formation across Ludgate-hill, from Ave Maria-lane to Creed-lane, is for the purpose of bringing down sewage matter to the works now constructing at Puddle Dock, where it will be treated by the method patented by Mr. Higgs.

The Bradford Workhouse Plans. Sixteen competitors having lodged their plans, the guardians proceeded on Tuesday week to consider them, when seven or eight were rejected, either from the estimates being beyond the sum limited, namely, 6,000l., or for other the sum limited, namely, 0,000%, or for other reasons. On the following day the whole were reduced to three, which, says the local Observer, were to be submitted to the guardians on the Friday,—the advice of two practical men, namely, Mr. B. Illingworth and Mr. Mawson, being at same time called for.

METROPOLITAN SEWERS COMMISSION. A court was ordered to be held on the 7th instant, but a quorum could not be obtained. Some little business, however, was afterwards done. The new commission seems to be subsiding into a state of great quiescence, so far

as the public are informed.

IMPROVEMENT IN NAIL MACHINES. — Mr. Coose, of Birmingham, claims, for patent, the employment and construction of a spring nipper in addition to nail-making machines, for causing the partially-formed nail to make

part of a revolution.
"IMPERVIOUS STONE."—With reference to an advertisement in our paper of the 10th, headed, "A M. l'Editeur du Journal THE BUILDER," we have been called on by the professional advisers of M. Teychenne, to apologize for certain statements therein reflecting on bis character. To apologize for statements of which we know nothing is, of course, out of the question. We can simply say, and we do this very readily, that we in no de-gree participate in making them, and must leave the parties to their remedy against each other.

No. CCCLIX.

SATURDAY, DECEMBER 22, 1849.

N the 26th of this month, the new Olympic Theatre, in Wychstreet, Strand, built under the direction of Mr. Frederick W. Bushill, architect, will be opened

for dramatic representations, under the management of Mr. W. Watts, the late manager of the "Marylebone Theatre," which was the work of the same architect. We give a plan of the new theatre, and a general view of the interior,* and next week we shall add a working section, showing the whole construction.† Drury-lane appears to have had its name from a house built there by Sir William Drury, a commander in the Irish wars, in the time of Queen Elizabeth, and who afterwards fell in a duel through a quarrel about precedency. Before "Drury House" was built, the old name for the lane was Via de Aldewych, and we have still the continuation of it, called Wych-street in consequence. Drury-lane was for some time an aristocratic quarter, but lost this character early in the reign of William III., ‡ and soon became celebrated for quite other inhabitants. Goldsmith, in his lines on a poet's lodging, speaks of "the drabs and bloods of Drury-lane;" and Pope uses the same term in the line-

"Paltry and proud as drabs in Drury-lane;"

Love of alliteration may have had something to do in suggesting it to both.

Drury House, in the seventeenth century, came into the possession of Lord Craven, afterwards Earl Craven, celebrated for his efforts to stay the ravages of fires, then so frequent in London, who rebuilt it, as Craven House, This underwent various changes, and was ultimately taken down. In August, 1805, Earl Craven granted a lease of the premises to the late Philip Astley, who covenanted to build "a good and substantial theatre, or amphitheatre, for the acting of pantomimes and other performances." This lease was sold to Elliston, and afterwards assigned to John Scott, the former proprietor of the Sans Pareil (the Adelphi), and is now vested in Mr. John Cavell, of Guildford-street, who married a daughter of Scott,

The old theatre, opened by Astley as the "Olympic Pavilion," September 18, 1806, was constructed principally of wood, from the timbers of an old man-of-war, La Ville de Paris the ship William the Fourth went out in as nidshipman), which was given by George the Third to Astley, who had been the ridingmaster to the younger branches of the royal family, and was a great favourite of the old xing. The king also gave the chandelier.

On the 29th March, 1849, the theatre was entirely destroyed by fire. The building was nsured in the County Fire Office for 2,500l.§ On the 30th June, in the same year, the first brick of the new house was laid; but it was not until the beginning of August that the excavation was completed, and the bricklayers were fairly at work.

The new building is on the site of the old theatre,-an irregular plot of ground, averaging about 100 feet deep by 75 feet wide, with frontages to Wych-street (south-west front), Maypole alley, and Craven-passage, and running back in the rear of the bouses in Wychstreet and Craven-buildings. The stage occupies the whole width of the ground at the north-west end, by about 44 feet deep; the remaining portion is used for orchestra and the audience.

The basement is a half-sunk story. The part under the stage is used for the purposes of the machinery connected with the stage, traps, sliders, &c., and communicating with it is a dock for scenery on one side; a musicroom, a property-room, and a gas-room, on the Under the back part of the pit, and the principal entrances, are four large and three smaller dressing-rooms, separate waterclosets, &c. The dressing-rooms have fireplaces, and sinks with water laid on. The remaining portion of the basement is used for stowage and coals.

On the Ground Floor (and shown on the plan), are the principal entrances-those to the boxes and pit being in Wych-street, and those to the gallery and stage in Cravenpassage; and there are additional fire-proof ways out, both from gallery and pit, -- important in the event of fire; also the pit and pit-stalls, with separate entrances to stalls; two proscenium boxes and two private boxes, a refreshmentroom, water-closet, &c.; the orchestra, proscenium and stage, green room, porters' room, and entrance to stage, with separate way for horses and scenery.

On the Box Floor are six private boxes, three on each side; four tiers of dress and two tiers of hack seats, in the centre of the house; a corridor at back of boxes, with separate staircases to slips and private boxes; a small salon, ladies' cloak-room, separate water-closets, urinal, &c.

On the Gallery Level are two private (proscenium) boxes and four slip boxes, a spacious gallery, with refreshment place, carpenters' store-rooms, &c. Over the sides and back of the stage are the flies and painting-room; and there are two best dressing-rooms, closet, &c., over the green-room and stage entrance.

In the roof, over pit and gallery, is the carpenter's workshop, 40 feet long by 45 feet wide, communicating with the flies and painting room.

At Q on the plan, is a fire-proof passage communicating with the manager's house in Craven-buildings, which contains some additional dressing rooms.

With respect to construction, there is a single span queen roof 56 feet bearing, in clear of walls; the tie beams (in one length) are 14 inches by 61 inches; the queen posts, 9 inches by 61 inches; the principal rafters and collar, 9 inches hy 61 inches; the purlins, 91 inches by 5 inches, and the plates, 9 inches by 6 inches.

The main walls are 31 bricks thick up to pit : 3 bricks above.

The gallery and box floors are framed with girders, 12 inches hy 12 inches, one end into granite corbels in walls, the other end supported by iron columns, 4 inches by 5 inches diameter. To prevent the thrust inwards, from the great inclination of the floors (the gallery timhers rising three feet in five), the ends of the

girders have been secured by iron ties and granite bond, 6 inches by 4 inches, built in the walls, flush outside, and the whole floor is framed on the principle of a horizontal truss, with abutments from the longitudinal walls.

There are two fire-proof (stone) staircases to the gallery, one for entrance and both for exit, already referred to. There are also two ways out of pit, and separate way from stalls and boxes, so that the house may be cleared in a few minutes. The whole of the entrances, passages, &c., including staircases (slate) to the private boxes and slips, are fire-proof. The floor of lobby round back of boxes is of slate on pugging.

The house is ventilated by an air shaft over the chandelier through the roof, a large ventilator through the roof at the back of the gallery, a tier of semi-circular windows between gallery floor and ceiling. There are also air flues in all the walls, communicating with various parts of the house, and four internal air shafts from the back of the pit and boxes through the roof; the upper part of each of these shafts is rarified by gas burners, which at the same time light the back of gallery.

The stage and machinery were designed and executed by R. J. Stracban, the well-known stage-machinist, who, as he tells us, has designed and constructed the machinery of eight of the principal London theatres.

The stage, 55 feet wide and 45 deep, is so arranged that any portion can be removed singly or altogether, as occasion may require. These movements are effected by means of multiplying windlass barrels placed on each side of the basement-floor, adjusted by a new species of machinery, by which the level of the stage is depressed into inclined grooves, wrought in the sides of the principal timbers of the stage, and thereby drawn off to any distance required; in point of fact, the whole of the practical surface of the stage may be cleared, leaving nothing but the skeleton, in two minutes; so that, if required to show a gulph or chasm in scenic arrangement, the means of effect are very great. The stage is an inclined plane, of $\frac{1}{2}$ inch to the foot, and is arranged with four entrances, with working grooves for wings and flats, the whole made practicable. The traps are worked by graduated balance-weights, so that any degree of velocity can be obtained by setting them accordingly. The gas battens are the whole length of the proscenium, and are also hung with balance-weights. The borders are bung in a similar manner. The painting-room is at the back of the stage, ahove the "flies," and there is a frame working down on to the stage, on which the scenes can be placed, and taken up and painted with the least possible trouble. The scene repository, at the north-west angle, on the site of the old painting-room, will hold sixty pairs of flats.

The form of the theatre is an elongated horse shoe, with but few projections, so as not to present any interruption to sight or sound. The endeavour of the architect has been to get a well formed theatre, of good proportions and harmonious lines, with little extraneous ornament. It may be observed that the pit seats are circular on plan, so that each person looks directly to the centre of the stage. The ceiling and proscenium are match boarded, and canvassed for decorations.* The height from the pit floor to the highest part of the ceiling is about 36 feet. The stalls contain 38 sittings, the pit will hold from 800 to 850 persons, the boxes about 200, and the gallery 700 to 750.

* See page 606 in our present number.

^{*} The boarding was first desiccated.

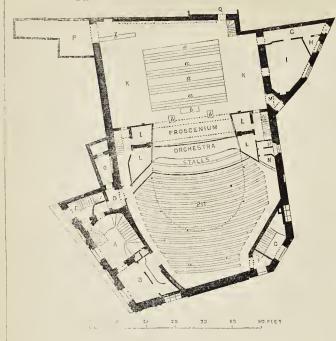

See page doo in our present number.

I no ther numbers of THE BUILDER will be found rews and particulars of the Royal Italian Opera House; he Theatre Royal, Druy-lane; the Theatre Royal, Lyceum; the Theatre Royal, Lyceum; the number of the new Manchester Turner, the Prince's Theatre, Glargow, &c., are also given.

"" Handbook of London."

is The writer had a pleasant recollection of the old plympic Theatre. It was here in younger days that he first senentrated the mysteries of the coulisses, to superintend the production of a farce, and waited, breathless, in a slide box, o hear what reception the public would give, on the first sight, to "The Last Day,"

which were entrusted to Mr. Aglio, and executed by him and his son, Mr. Aglio, jun.*

The ceiling is divided into four compartments, representing the Seasons,—each compartment being separated by ornamental designs in the Arabesque style, connected in the centre in an ornament giving apparent support to the chandelier. Under each of these four compartments are panels with Arabesque ornaments on gold ground, in the centre being introduced, in chiaro-scuro, the sign of the Zodiac marking the entrance of each season. These panels form a hand enclosing the circle, and are surrounded by a bordure, in chiaro-scuro, on blue ground, which connects the two spandrils, formed by the On these spandrils are introduced two groups, allegorical of Music and Poetry.

The front of the gallery and box tiers is divided into seven compartments, by the gilded and bronzed columns supporting the boxes and gallery. Each compartment in the gallery tier is decorated with Arabesque ornaments, within which are introduced masks, musical instruments, and cameos, in chiaro-scuro, on gold ground. Those of the box tier are decorated with richly-worked Arahesques, on gold and coloured grounds. A general symmetry is preserved in the decoration of these compartments, but no subject is repeated. Chiaroscuro figures of Cupid, on blue ground, form caryatides over and under the columns of the

We have now to speak of the decorations, boxes. Of the general effect when lighted, we have not yet had an opportunity to judge.

The proscenium is intended simply to form frame to the decorations of the stage,—the predominant colours white and gold. The ornaments of the arch are in chiaro-scuro; in the centre of these are represented the Muses, with their appropriate attributes. The upper proscenium boxes are decorated with groups of masks, allusions to Tragedy and Comedy; the lower ones with cameos of poets, on gold ground, surrounded by light-coloured arabesques. The pilasters supporting the arch are decorated with arabesque ornaments, in three divisions; in the centre are introduced the crests of the proprietor of the land, Lord Craven, and of the theatre, Mr. Cavell. In circle closing with the arch of the proscenium. the composition of the caps the artist has introduced the phænix. The decorations were designed and painted in the short space of seven weeks.

> The front of the house is lighted by a large chandelier, manufactured by Mr. Apsley Pellatt. The gas fittings were put up by Mr. J. Palmer, jun., and present several useful precautionary measures, which we will note in our next

The entrance front of the building, which is formed in cement, is simple and unpretending. It presents a large cornice with low attic above. There is a series of five windows filled in with iron guards of ornamental pattern, and below is an arcade of five arches, three of which are entrances, and two blanks.

The exact cost of the theatre has not been arrived at, but it is stated by the architect as

under 10,000l., including the cost of purchasing some adjoining property. There was not time to obtain competition tenders, and Mr. Holland was employed as the builder at a fixed scale of prices. The work was measured monthly, and 85 per cent. of the work executed paid for on the 1st of each month. The work is very well done, and all parties seem satisfied one with another.

The act drop, partly shown in our view, representing an "Italian loggia opening on a cortile," was painted by Messrs. Daycs and Gordon, and is a very creditable work.

BUILDING SOCIETIES.

The writers who have addressed us in reply to some observations in a recent number of to some observations in a recent number of our journal (p. 554 ante), all assume as certain a variety of issues, which are more than doubtful. Many who still maintain that these societies, if well managed, would greatly benefit the provident classes, are obliged to admit that the result in practice will be very different in certain cases from what they anticipated. ticipated.

One well informed correspondent says,-

It seems to me that huilding societies are founded upon true principles, and are calculated, if well managed, to be of the utmost benefit to the provident classes. But I quite agree with the writer in THE BULDER, that in practice they have not answered the expecin practice tuey have not answered me expec-tations formed of them, more particularly with reference to the interests of the "working-man," This arises, I believe, principally from bad management. It unfortunately happens bad management. It unfortunately happens that the majority of societies are got up by needy professional men, and, in many cases, from interested motives. Such men have no inducement to bring the operations of the society to an early conclusion, but rather the reverse, as the longer the society lasts the more they make out of it.

Such a state of thing convertes much

Such a state of things operates most prejudicially against societies of an inferior class, dicially against societies of an interior class, as the members are generally working-men, without education, and are consequently entirely led by the managers of the society, whom they trust implicitly, as possessing superior knowledge; and if the trust is abused the society gets saddled with inferior or bad property, which altogether frustrates the objects of the members. With the hetter class of With the hetter class of the members. societies this objection does not apply with so much force,—the members are generally better educated, and capable of looking after their own interests. I think very few building societies will be found to work out in a satissocieties will be load of those who do so the number will be very small of that class to which the "working-man" generally belongs.

In several such societies which we have been In several such societies which we have been watching, the solictors and the surveyors connected with them, have performed their duties so ill, that confusion is inevitable; deeds on which much depended are found valueless, and houses taken as securities are turning out positive mill-stones. The mere recital of some facts within our own knowledge would utterly that the authorities of these forcinals. blast the reputation of three professional men. Not long ago we were requested, as an act of personal friendship, by a director of a building society, to give a confidential opinion as to the value of a property offered to them, as he said. It was a house of business in London, held for a long term, at ninety pounds per annum, on a stringent lease, and let to a tenant-at-will for 140l. per annum. The premises were will for 1406, per annum. The premises were not in good repair, the situation declining, and after going over the house our reply was, as many readers will guess, that the assignment of such a property would be worse than no security at all. We then learned that it had been valued as an assured income of 30l, per

annum, for the unexpired term, and accepted by the society for a loan of 500l.

The house is now on the hands of the society unlet, and in its present state, we venture to assert, will not command a tenant at the rent the society are bound to pay.

We most seriously urge gentlemen acting as surveyors for such societies, to exercise the greatest care in estimating the value of sccuri-

^{*} We hear with regret that Mr. Aglio is suffering from a paralytic seizure, and lies in a very precarious state.

ties offcred to them, and, knowing the want of judgment which has been shown in many cases, and the large interests at stake, we would awaken the attention of Directors to the would awaren the attention of breezers with importance of this point, and exhort them to be assured of competent advice. An immediate review of the securities in their hands might be serviceable. We speak with seriousness, because with knowledge.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

Ar an ordinary meeting, held on the 3rd inst., Mr. Bellamy in the chair, the following members were elected:—Messrs. J. B. Buning, C. R. Cockerell, R.A., G. G. Scott, and W. C. Stow, as Fellows; and Messrs. R. P. Pope, and M. D. Wyatt, as Associates. A paper was then read "On the Ancient Architecture of Scotland," by Mr. R. W. Billings, of which we give an abstract.

of which we give an abstract.

At a meeting on the 17th instant, Mr. S.

Smirke in the chair, Messrs. R. Hesketh and R. W. Mylne were elected fellows; and Mr. II. H. Burnell, associate. A brief memoir of the late Mr. Pocock, fellow, was communicated. Mr. Donaldson, honorary secretary, then read a paper "On the Manufacture of Glass, and its application to Architectural purposes," a paper "On the Manuacure of Glass, and its application to Architectural purposes," to which we shall revert hereafter. In the course of it the lecturer described plate-glass as both cast and blown, and alluded to the "rough-plate glass" case, as set forth in The BUILDER.

BUILDER.

Mr. Tite said he thought that speaking of plate-glass as both blown and cast was likely to lead to confusion. He knew nothing of blown plate himself, and wished to know where it is now made. Mr. Tite mentioned the introduction of "French and German plate," and the manufacture, by Mr. Chance, of what he called "patent plate," to meet this. When polished, this could scarcely be discriminated from plate-plass proper. It was necessary to from plate-glass proper. It was necessary to call this "patent plate" in specifications, or a different material was furnished. After men-tioning the characteristics of glass in various conditions, he said (to maintain his character of laureate)

"Honour's like the glassy bubble
Which costs philosophers much trouble!
The least part cracked the whole doth flie,
And wits are cracked to find out why."

Mr. Swinburne, as a practical man, said in reply to the question, that blown plate was made here before the last speaker was born, and continued in use till six or seven years before the duty was repealed. At one time little could be obtained but blown plate.

Mr. Jennings denied that blown glass was

plate glass.

Mr. Billings thought that the use of glass and iron ought to have produced a new style of architecture, and that it would have done

so but for the folly of Governments.

The Chairman alluded to the indestructibility of glass when quite pure, and showed how it corrodes when this is not the case and metallic oxides are present. Some means of ascertaining with certainty the purity of glass

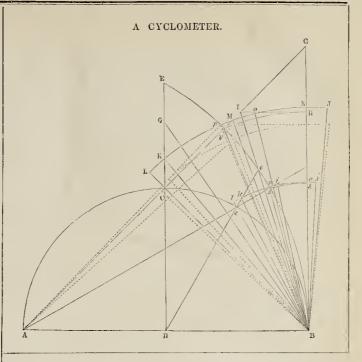

e much to be desired.

Mr. C. H. Smith thought it might be useful to mention, that, finding some 1½-inch glass slabs, 5 feet by 4 feet, which were about to be laid in connection with pavement at St. Katherine's Docks, had not a fair edge to make a joint to, he had sought to have them made square by the dealer, and failing in that, had successfully squared them with the chisel in the same way as a piece of marble would be squared. Slabs might be divided by a plain-

squared. States linguistic divided by a plant-edged saw.

Mr. G. R. Burnell mentioned, with respect to the size of looking-glasses, that at the late Exposition in Paris a plate was shewn 13 feet 9 inches by 8 feet 8 inches, price 140l.; and a concave reflector, 4 feet 7 inches square.

INIGO JONES.—The Shakspeare Society have just now issued an interesting contribution to architectural biography, in the shape of a small volume containing a life of Inigo Jones, by Mr. P. Cunningham, and remarks on some of his sketches for masques by Mr. Planché, The life gives some new aud interesting matter, and we shall take an early opportunity to place it prominently before our readers,

A CYCLOMETER.

DESCRIBE the semicircle ABC. With radius DESCRIBE the semicircle ABC. With radius AB describe the arc BE. Draw the secant DCE at right angles to AB. Draw the secant ACFG, making the arc BF equal to the arc BC. Draw the tangent BG, the chord BC, and the chord BF, bisecting the angle CBG. With radius BF describe the arc FH. Draw HI parallel to AB. Make the angles HBJ and and CBK equal to the angle FBI. With radius BK describe the arc LKMNI. Draw BM bisecting the angles LBJ, KBN, and FBI. Then BM is to the arc BF as BK is to the arc BF as BK is to the arc BC, which is as much as saying that the two equal right lines BM and BK are equal in length to the two equal arcs BF and

equal in length to the two equal area. Bc.

Take any other arc of the quadrant, as Bc, proceed as before, and extend Bm, meeting the arc LJ in o, then Bm: arc Bf:: Bk: arc Bc:: mo: arc Cc.

If a right line Bp be given, and an arc equal to it in length is required, proceed according to the dotted lines to find the points F and C, taking care that the angle on either side of FB is equal to half the angle on either side of FB is equal to half the angle on either side of CB, for it is obvious that the construction cannot be true, unless the different angles vary together from greatest to least in a constant ratio either of one to one or of two to one,

It is also evident if we conceive the line BQ to coincide with the chord BC, and BI with the chord BF, and the angles CBQ and FBI to increase together from zero in the ratio of two to one; that since BC is less than BF, and BQ is greater than BI, there can be only two lines (determined by this law) between the limits CB and QB and FB and IB which can he equal to each other, like the arcs BC and BF.

J. P. W.

IMPROVENENTS IN TUNNELLING.—Mr. Samuel Dunn, of Doncaster, has secured a patent for an improved arrangement for tunnelling under rivers, and other similar purposes. He employs a moveable shield similar to the one used by Mr. Brunel at the Thames Tunnel. The fore part is constructed of iron in the form of a plough, the point being of stall divided into steel, divided into compartments, which are steel, divided into comparaments, which are filled with compressed air, to a degree to equal the outside pressure: the working part is separated from the plough by an air and watertight partition, fitted with a tube communicating with a pump.

ON THE ANCIENT ARCHITECTURE OF SCOTLAND.

THE following is the substance of Mr. Billings's paper, already mentioned:-

"As a preliminary remark it was observed, that although the principal monuments of both England and Scotland may be identical in minute details, yet, at the same time, great changes and varieties occurred in various leading features, so as to produce a distinct indi-viduality in the character of the Scottish

The beautiful little church of Lenchars, in Fife, by some reputed as of Saxon origin, is a fine Norman specimen, with an apsidal east end. The cathedral at Elgin is a beautiful edifice, and the arcaded streets of that town inost interesting, somewhat resembling those of Chester, the arcade, however, being on a level with the street, and constructed of stone. level with the street, and constructed of stone. At three miles from Eigin is a curious old fire-proof house, at Coxton, in which the alternate stories are arched, with semi-vaultings, the upper one, however, being pointed. The turrets of Cawdor Castle, near Inverness, are curious, being circular in the lower part and octagonal above.

Mr. Billings considered the first Scotcharchi-Mr. Dilings considered the first Scotch archi-tectural era to have ranged as in England from 1066 to 1200. The Abbey and Palace of Dun-fermline, and the Cathedral of Kirkwall, are gigantic examples of that period, and they bear a striking affinity to Durham Cathedral, the solid cylindrical columns in the two being identical; and history informs us that Malcolm identical: and history informs us that Malcolm the Third in 1093 assisted in laying the foundation of Durham Cathedral, and soon after his return from that place, founded the Abbey of Dunfermline, the first monks of which were from Canterbury. The smaller Scotch buildings of the Norman period approach nearer in beauty to those of England. Among the most beautiful and perfect specimens are the churches beautiful and perfect specimens are the churches at Leuchars and Dalmeney. An endless variety of detail was presented in Scottish architecture. most remarkable; when not only animals and foliage were introduced, but even the signs of the Zodiac. At the period of the transition to the Early Pointed or Lancet, the mouldings of the Scotch building became so minute, as to excite almost a feeling of pity for the workman who had to accomplish such a task. Some of the capitals at Holyrood chapel are a verification of this,—the quality of the ornament was, however, equal to the quantity. At a later period, the system became the term a later period, the system became the very reof the arch, however, being moulded. The Cathedral of Dunblane is an extraordinary example of the great effect produced by the judi-

cious use of limited means.

Had the ancient friendship between Scotland and England continued to exist, there is little doubt but that the architecture of both would have remained nearly identical; but the complete severance of all friendly ties between the two kingdoms, and the endless feuds among the various claus and even families of Scotland, compelled the lairds to make their houses strongholds of defence, both against their English foes, and the attacks of their own countrymen. This state of things gained own countrymen. This state of things gained for Scotland at least this advantage, that of possessing what no other country can boast of a complete series of castellated architecture. Not only did the clannish constitution of society in Scotland at this time divide the population into very small parties, but the very disposition of the people was averse to large congregations; this may easily be proved by congregations; this may easily be protein by the small size of the ancient portion of Scot-land's capital, and of Stirling,—the approaches being defended by a strong fortress. The politi-cal changes of society have, however, grad ally had their effect in Scotland, and the application of steam and machinery have almost entirely changed the state of the country in this respect. Ancient mansions have been deserted and dismantled, and detached houses of the lower classes, and many "towns," as they are called, have been allowed to decay and fall.

It is very singular that Scotland does not now possess one recognizable specimen of a Norman castle, although, close to her borders, so many are to be found, such as Norham, Bamborough, Newcastle, and Durham. that such castles did exist, there can be but little doubt; and the only mode of accounting for their disappearance is the supposition that they were sold by the magistrates as quarries, out of which so many of her abbeys were constructed. So determined seems this desire to have been for the destruction of old castles in Scotland, that Caerlaverock is the only example earlier than 1350, and it still retains its corbelled parapet. Kildrummie, in Aberdeenshire, appears to be the first recognizable Scotch castle, and was built about 1270 or 1300, belonging to the Early English style. One side is exceedingly singular, forming the end of a church with three lancet windows; and of a church with three lancet windows; probably so constructed in the expectation that any attacking force would respect the place of worship. The early Scotch castles appear to date with the time when the Bruces and Baliols left their English castles and occupied Scotch cases. pied Scotch ones.

During the fourteenth and fifteenth centuries there existed a considerable affinity hetween the Ecclesiastical and the Castellated architectural decorations: thus, the hanging tracery of Rosslyn Chapel and the west front of Holyrood is found in the court-yards Linlithgow Palace and Stirling Castle. T projecting turrets, so peculiar a feature in Scotch castellated architecture, are wonderfully constructed, many of them being infi-nitely more massive and weighty than the walls to which they are attached. This is the case at Kirkwall, where the bishop's palace is a fine ecclesiostical fortress residence. This edifice and the abbey of Crossraguel are mag-nificent specimens. In fact, the latter is a nificent specimens. In fact, the latter is a fortified abbey, with all the requirements of a cathedral establishment.

Some of the old castles appear to have been elaborately painted in what has been called fresco: but, from the fact of the paint peeling off, it was evidently never incorporated with the plaister or wood. In their plans the castles varied considerably, and this must be attributed to the most natural of causes, the architects in those days invariably suiting their plan to the nature of the ground on which they were about to huild. Caerlaverock Castle may be mentioned as one of the most singular in plan, being triangular, with round towers at two of the angles, and at the third double towers with a gateway between them. This is the only fortress in Scotland retaining a moat: the portcullis room, too, is very complete. Inigo

verse, and more effect was produced without mouldings by the use of the chamfer, the splay of the arch, however, being moulded. The Cathedral of Dunblane is an extraordinary excentury. The construction of the statecase is well worthy of notice, with its steps 16 feet

After the general introduction of gunnery on a large scale, by means of which the re-duction of any fortress by a regular invest-ment became only a question of time, the Scotch prudently defended their buildings against attacks by small arms, the only means that flying parties of marauders could have at command. This system was of great importance in developing architecture, for it did not prevent the addition of ornament to the castellated house. The decorated terminations of the massive walls in some of these buildings, form a highly picturesque and pleasing con-trast. It was, however, upon the old walls of keep towers that the turrets, windows and roofs of the domestic character are raised; and this will account for the disappearance of many of the old castles. Glammis, Castle Fraser, and others, are striking instances of the extent and uniers, are surking instances of the extent to which the turreted style prevailed through the kingdom; nearly all the o'd keeps receiving new tops, some of them being of a highly ornamental character.

In the early part of the fourteenth century was introduced another mixed style, in which the Ecclesiastical and Domestic architecture were combined, as at Dunfermline, where the history of Domestic architecture is carried back to the Norman time; for in the windows of the basement, the bold arches of Malcolm's palace surmount the windows of a later period. As the first to notice this, Mr. Billings recommended its being preserved jealously, as the only known specimen of Domestic architecture in Scotland of the Norman period.

We now pass to the revival of the Italian styles, which, beginning about the year 1580, continued for a full century, producing num-berless buildings in a style romantically pic-turesque, and which hear strong evidence of the architectural ability of that period: in-deed, this may be called the flowery period of Scotch architecture. The mansions madivided into three classes of design:-The mansions may be where the chimney shafts, crow steps, and open parapets appear in combination, as at Wintoun House, near Tranent; 2ndly, where a combination of turrets and square chimney shafts exists, as at Newark; and 3rdly, who the chimneys become quite secondary, the main feature of design being high roofs with dormer windows, crow steps and turrets. Here the court-yard of Heriot's Hospital may be cited as an example. Dalpersic, in Aberdeenshire, is the link between the Castellated and Domestic styles.

The Domestic architecture of Scotland bears evidence of the great attention paid by the architects to details. Thus, the window heads and other ornaments of Heriot's work are a complete school of design; for in that build-ing only one case of repetition occurs in the ornaments surmounting the windows: indeed this cdifice, as a colossal example of one date, is unequalled. Two sides of Linlithgow courtyard are of a corresponding style of architecture, the remaining two forming an interesting example of the Domestic architecture of the fifteenth century. In Scotch houses the opposite sides generally present a striking contrast in style: this peculiarity is fully illustrated in an example at Newark, on the Clyde. On the river front of this building, the combination of threats in this extraction of the combination of turrets, jutting staircases, and square chimneys, is prominent; while on the court-yard side a turret is to be seen, and the dormer window forms the main feature of tion. The old keep tower to which these domestic buildings have been attached, alone enables one to recognize the fronts as belong-ing to the same building.

There is strong reason to believe that the original combination of jutting turrets and corbelled staircases is to be awarded to Scotland alone, in spite of what may be called foreign types. Their conical tops may possibly have arisen from the staircase or recesses called oratories, which frequently occur in street architecture of the Gothic period on the

required size; but the corbelled bases of the Scotch turrets belong to the early period of castellated architecture, the variety and quaint-ness of decoration in their windows and mouldings marking them unmistakeably as Scotch. The general picturesque appearance of the small round turrets so peculiar to Scotland is much heightened by their contrast with the opposite forms of square massive chimney afts, as may be seen at Newark.
Whosoever formed the school of design,

which lasted during the whole of the seven teenth century, deserves the highest credit. Schaw, who rebuilt one of the western towers at Dunfermline, died in 1602; and although the mixture of Italian and Gothic did not pre-dominate until the seventeenth century, yet many of the Aberdeenshire castles bear evidence of its advent towards the end of the sixteenth, and Schaw was most undoubtedly practising successfully at this time. The principal baronial buildings were built, how-ever, after Schaw's death, and generally bear

their own dates about 1650.

their own dates about 1650.

An interesting fact, discovered by Mr. Billings, proves that Wintoun House, Moray House, the Great Hall at Glammis, and Craigievar Castle, are works of the same architects and builders: nearly all the plaster work of these are cast from the same moulds. As an excellent example of the architecture of the middle of the seventeenth century, when it became the fashion to introduce the Doric, Ionic, and Corinthian orders, surmounting one another, the body of Holyrood Palace may be cited. Although Inigo Jones has always had the credit of designing Heriot's hospital, and his name has been identified with Glammis and with one side of Linlithgow Palace, it is singular that his name never appears on the records of the building, such as contracts or hills giving minute particulars, which are still in existence. There is, however, such a strong affinity between many of that great master's works in London and some of the northern the northern buildings, that in the absence of proof positive to the contrary, they may safely be attributed to his genius.

The elegance and variety of design in the ornamental portions of the buildings of this period must not be passed over in silence; they bold and vigorous determination to evince a accomplish something original, carrying art as far beyond the meagre Italian types as it was Wintoun House may here be mentioned as standing pre-eminent in the quality of its work. The design and execution of all its detail is perfection of the style. The artistic window-heads,—quite distinct from the Italian style, the elaborate geometric foliated ceilings, the chimneys and their stacks, are all equally admirable; presenting together, perhaps, the most impressive specimen of Scotch Domestic architecture. It should be mentioned as being unique among Scotch houses in not possessing corbelled turrets. In Craigievar Castle, in Aberdeenshire, the ceilings throughout are very similar to those at Wintoun, but infinitely more varied among themselves; and even the furniture partakes of the architectural character of the building: it offers a fine example of its time (1620).

Having shown how prominent the details stood in most of the buildings mentioned, it must be observed, that one of the great causes of success in the domestic or baronial architecture of Scotland was the comprehensive study of situation, and the composition of designs to suit these. The jutting turrets, gahles, hroken forms of detached roofs and surmounting towers, and, in short, all the playfully picturesque forms of Scotch architecture, essentially agree with its landscape, and the fitful forms of its ever-changing clouds; and is as completely in harmony with the country, as are the stately unbroken forms of Greek and Roman temples with the cloudless skies of the countries to which they belong.

After the relinquishment of regular fortin-

cation, the Scotch did not give up its external appearances, for stone cannon in hundreds of orms, as gurgoyles, or water-spouts, and more often as mere ornaments, are to be seen upon the more modern castles. In some of the old castles the formidable-looking port-Jones is said to have imitated the plan in Longford House, Wilts, helonging to Lord Radnor. Fivie Castle is another, quite pecubine. The picturesque gateway at Linlithgow may be instanced as an example, being almost a sham armament. This innate love for fighting, which the Scotch at all times possessed induced them to carry out their emblens of strife beyond the buildings in which they secured themselves; even the flower gardens being made to partake of a military character as at Stirling. After the Reformation had shaken the foundations of ecclesiastical domination in Scotland, it was to castles and houses that the abilities of the architects were turned and here is the golden age of Scotland's building fame. In other countries the invention of gunpowder put an end to castellated architec-ture. It is scarcely to be doubted that archi-tecture in Scotland would have become more interesting but for well-defined causes,-the divided power of the monarch and the great feudal lords, and the still more disastrous one, the English interference, beginning with Ed-

ward the First. ward the First.

The variety of triforia in Scotland forms a curious feature, differing from those of England in the varied dimensions of the columns, in which must be recognised a spirit of deter-

mination to produce new effects

The profusion of niches also, and their elaborate details, must be considered as a distinct feature in Scotch architecture. Bishop Kennedy's monument, at St. Andrew's, is one of the most elaborate examples of monumental art in the world.

With regard to the arch in Scotland it cannot, with the exception of a few instances, be considered, as in other countries, an index to the style or date of buildings. The circular arch, only used in Norman architecture elsewhere, was always in general use north of the Tweed. was always in general use north of the Tweed. A doorway of a later date than 1400, in the High-street, Edinburgh, the western door and the tower windows of Haddington, the doorway inserted in the seni-Norman wall of Holyrood chapel, are all cases in point; their details proving them to be of a date later than their first appearance would imply. All kinds of arches are common to Scotland, excepting the four-central regulist to the English Parsen. four-centred, peculiar to the English Perpendicular; the only approach to this style out of England is to be seen in the east end of Stirling Church. It is rather, then, to their foliated detail of capitals, bases, and mouldings that we for the type of the time in which Scotch buildings were erected; and by these means the difficulty of distinction ceases. This is a remarkable feature in the Scotch architec ture, a tenacity of retaining forms of styles while detail was degenerated. Thus, in Fifeshire, Dairsie Church and Michael Kirk have all the main features of early decorated build-ings, and at a distance would be mistaken as belonging to that style, but the detail is decidedly dehased in character, and the date upon each confirms the style from 1620 to 1630.

In the same manner that Scotch architects mingled styles, Scotch poetical epitaph-makers adopted mixed languages, thus—

" Here lies the Laird of Lundic, Sic transit gloria mundi.

"Hic jacet Johannes Spencis,
Qhua biggit this Kirk Yaird Dyke at his ain ex-

England undoubtedly adopted the classical styles more readily than Scotland, and when the orders of architecture once had a hold they retained it, and our own styles became a dead letter. Scotland on the contrary, ever cau-tions, adopted the orders very charily, and it was not until a comparatively recent date (1660) that the three orders were seen surmounting one another in Holyrood Palace. It is to this position that the Scotch castles and houses owe much of their interest, for the architects of the time only adopted so much of the detail of Italian architecture as left the spirit of their buildings entirely Gothic.

STAINED GLASS, ST. JOHN'S, ANTIGUA.

—We are asked to state that Mr. Wilmshurst was the artist who painted the glass in the windows of St. John's, Antigua, not Mr. Wilmshurst has recently completed a window for the Foundling Hospital, London. The date of the destruction of the first church at Antigua was misprinted 1848

NOTES IN THE PROVINCES.

The repairs of the shire hall at Chelmsford are still in progress. The prisoners' cells are completed, and the county room is being painted, repaired, and fitted up with gas.— A committee is in course of formation for the collection of funds towards the restoration of St. Michael's, Cambridge.——St. Martin's Church, Salishury, was opened on Friday last. A huge mass of pews and unsightly erections has been removed, and the divisions of chancel, choir, and nave, side aisles, &c., disclosed. The debased eastern window has been replaced by one in the style of the chancel, and filled with stained glass. The altar reredos has been emblazoned in gold and colours by Mr. Osmond, jun. The choir has been screened off from the aisles with light and open oak screens, and the organ placed at the end of the north aisle, thus throwing open the western window heretofore blocked up. The body of the church has heen much increased in accommodation by low open seats. The extensive stone work restorations have been executed by Mr. Osmond, the carpentry by Mr. R. Hale. Mr. Wyatt was the architect.—An appeal is heing made to churchmen on behalf of Frocester made to churchmen on behalf of Frocester Church, now almost in ruins. — The spire of St. John's Church, Wednesbury, has just been completed: Messrs. Horton the architects, and Mr. Highway, of Walsall, the builder. — The erection of an infant school, in the district of St. Andrew, Birmingham, has been commenced on a site in the Greenlanes. The plans have been furnished by the surveyor of the association, Mr. C. W. Orford, and the contract taken by Mr. Hardwick. The building is intended for two hundred children, with class-rooms, &c. This will make the fifth school erected through the instrumentality of this association, aided by the Privy Council this association, aided by the Privy Council and the National Society.—We understand that it has just been determined upon to build new Roman Catholic church hampton, at the cost of ahout 10,000l. One of the most eligible sites in the town has been of the most eligible sites in the town has been fixed upon, and the land, about an acre, purchased, which will be required for the church, presbytery, and schools.—

The west window of Melton Mowbray Church has now been filled with stained glass, hy Wales, presented by Mr. T. Clarke and family.——A monument bas been erected in the cemetery at Stocknort to the memory of Mr. cemetery at Stockport to the memory of Mr. Orrell, a late notable in the borough. The design consists of two bases, a pedestal, pyramid, and cap. Upon the front panel of the pedestal, which is of the Ionic order, is an inscription. The pedestal is surmounted by a frieze and cornice, and on it stands an Egyptian pyramid, 7 feet 4 inches high. On each of the four panels of the pyramid is carved the representation of a lighted torch carvet the representation of a lighted toren reversed, and the whole is surmounted by a cap and urn, on the apex of which is another representation of light, typical of the consuming "torch of time." The extreme height of the monument is 17 feet 8 inches, its weight is the article of the capture of the monument of the capture of the monument of the capture of the is about ten tons, the pyramid being hewn from a stone weighing at least two tons. The list of theofficers and committee who had the superintendence and completion of the work was placed in a cavity in the upper base, under the pedestal. The stone was furnished from the Stypenson quarry, on the estate of Mr. Leigh, at Adlington. The design and execution were by Mr. J. Hough, foreman at the Stypenson quarry. The work-people employed at Travis Brook Mill have thus evinced their respect for the memory of a late employer.—The board of guardians (says the Bradford Observer) have not as yet made any selection of the three plans before them, nor have they decided to send them to the Poor-law Board. They have met several times since our last, and have spent much time in examining the details of each being very anxious to secure the most eligible.

—The new church of St. Matthew, Bank Foot, Bradford, which is in the Decorated style, is of the following dimensions:—Nave, 65 feet by 21 feet 2 inches. 9 feet by 21 feet 2 inches; aisles, 65 feet by 9 feet 4 inches; chancel, 22 feet by 16 feet, vestry, 10 feet by 8 feet. The contractors were: -Masons : Messrs. Patchett and Co., Queens. head; Joiner and carpenter: Mr. Ives, Shi ley; Glaziers: Messrs. Firth, Halifax; Salte Messrs. J. and H. Hill, Bradford; Painter: Mr. Peel, Bradford; Clerk of works: Mr. Mawson.

The architects were Messrs. Mallinson and Healey, Bradford. The building will accommodate 490 persons. The east window of chancel and west of nave are filled with Powell's cast and stained glass, and are a gift of Mr. C. Hardy, of Ordsall House. The building is roofed with grey slates, and surmounted with a cruciform bell turret, octagonal above with a small spirlet, terminating in a weather vane-cock as an emblem of watchfulness in the house of prayer.—The foundation-stone of Captain Cook's memorial school was laid at Marton, in Cleveland, near Middlesborough, Yorkshire, on 29th ultimo. The contractor (for the foundations at least) is Mr. Matthew (for the foundations at least) is Mr. Matthew Bowser, of Stockton-on-Tees. The building will not be proceeded with till spring of next year. In this little village, which boasts of the great captain as a native, two other considerable improvements have of late been effected, namely, an extension of its Norman Church into cruciform restoration, under the management of Mr. J. B. Rudd, and with the advice of Mr. Car-Rudd, and with the advice of Mr. Car-penter, architect, and an enlargement of the vicarage house, on a plan furnished by Mr. C. Brodrick, of Hull, architect.—We regret to state that Mr. G. T. Page, civil engineer, acting at the dock improvements at Leith, walks Mr. Readell met with an accident on under Mr. Rendall, met with an accident on Thursday week, while inspecting the inner dock wall, and died in a few hours, after dock wall, and died in a rew hours, after falling 20 feet, and fracturing his skull.—"The legatees of the late Sir Gabriel Wood have paid the sum of 38,000L. to trustees for the erection and endowment of a hospital for decayed shipmasters of Greenock and its vicinity. vicinity.

THE ROYAL ACADEMY MEDAL DRAWINGS.

DISPOSED as I am to agree with "Kunops" in bis deprecation of copyism in architecture, I think it was somewhat ungracious and un-generous in him to found his remarks upon Academy, and to leave it to be inferred that none of those who obtained medals had shown more than very ordinary common-place ideas. However objectionable the system adopted by the Academy for the annual concours among the students may be, it is what the students cannot correct; and, quite sure I am, that had any one aimed at striking and determined originality in the department of architecture, he would have deprived himself of even the chance of obtaining a medal; for his design would have been put hors du combat at once, as being altogether non-descript, fanciful, and

Quite unreasonable is it to look for sterling originality—and unless it be such it is hardly worth having-from those who are compara tively mere novices and heginners in their art. For talent of that kind we ought to look not to students but to musters—to those whose status in the profession invests them with a certain degree of authority in the opinion of the public, and whose practice supplies them with opportunities of putting forth fresh ideas far more effectively than upon paper.

All that can fairly be expected from students competing for the academy medals is such indication of talent as promises well for their future career; and, in my opinion, the architectural design which has this year obtained the gold medal decidedly makes such promise, and that very forcibly. The general composition shows more than ordinary artistic feelsition shows more than ordinary artistic feeling; it is equally noble and picturesque; nor is it deficient in new ideas, for the mode in which sculpture is introduced, where it would show itself distinctly to the eye, is one which, obvious as it is, has not yet been practised. Much ingenious contrivance is also shown in the arrangement of the interior, and in the manner of admitting light into the rooms of the lower floor without showing any windows. the lower floor, without showing any windows there externally.

Thosewho cannot perceive any thing particularly noticeable or praiseworthy in that design must be quite at a loss to discern any merit—I will not say in the British Museum, but in the Assize Courts at Liverpool, or, in fact, in any of the modern examples of the classical style.

THE OLYMPIC THEATRE, LONDON, Mr. F. W. Beshill, Architect.

ADVERTISED COMPETITIONS.

You will be delighted to hear, Mr. Editor, that your remarks in this matter have not been without effect: the Stockton guardians have amended their offer, and here it is:—

TO ARCHITECTS. COMPETITION !!!

The committee are desirous of receiving designs : to the author of the one they shall consider first in merit, a premium of

TEN POUNDS!

will be given, with the option of acting as clerk of the works! To the second in point of merit they will present

A SUIT OF NEW CLOTHES!!

and the third and fourth will be allowed to contend by climbing a well-greased pole * for the prize of A LARGE LEG OF MUTTON!!!

This you will admit is far more likely to attract the eye than the one they have chosen. But, Sir, leaving them and their fellows to

the contempt they deserve, is it not high time that architects should endeavour to check such proceedings as these? Already have your pages heen chosen as the medium for putting forth suggestions for an organization of the profession; and I am sorry that the matter has not yet taken shape, as I think some mea-sure of the kind must be adopted to secure fairness in this, the surest, if not the only way of raising the architectural reputation of this or raising the architectural reputation of this country,—the only way for success to the young architect without influence. Should success be accorded to any movement that may be made, it is to you, Sir, that our warnest thanks will be due for your advocacy of justice, and condemnation of unfairness in these proceedings, and for the uniform interest you have taken in the subject.

Q.

Sin,-In your useful publication of the 8th instant, I was very pleased to observe a letter, headed "Competitions advertised last week," descanting upon the paltry remuneration offered to the successful candidate as architect.

Pray continue to draw public attention to the manner, so little likely to produce beneficial or efficient results, in which in several cases the important subject of the "drainage and sanitary improvement of provincial towns" is conducted by the local authorities.

Two examples will be sufficient to illustrate my meaning. In your paper of the 11th August last, an advertisement appeared, headed "Chippenham, Wilts," setting forth that the Commissioners of the Chippenham Improvement Act required a plan and report upon the left med of designing the true of the commissioners. best mode of draining the town, and the effi-cient discharge of such drainage into the river Avon; such plan and report to specify the courses and levels at which such drains should be made, and how far the existing drainage may be available; and they will pay a competition premium of 20l. for the plan and report they deem the hest. It further states the commissioners are to be at liberty to act upon the plan and report approved of, at their discretion, without further payment; but they are not liable to any expense, or subject to any charge whatever, in connection with any plan

or report not adopted or approved by them.

To this tempting offer I endeavoired to respond, by trying to form an association of professional men who should contribute two guineas each, towards the preliminary expenses of procuring the map and taking the levels, but even that small sum was more than (with but even that small sum was more than the exception of about three) any respectable engineer or surveyor would hazard in the engineer or surveyor would hazard in the undertaking, and consequently I abandoned

undertaking, and consequently I abandoned the proposition.

The second specimen, to which I would draw your attention, appeared in your paper of the 27th October, under the heading "Warrwick Public Health Act." It states that a premium of 50L will be awarded by the local board of health, for the best plans and specifications for the entire deraining and supply of board of health, for the best plans and specifications for the entire draining and supply of water for the town of Warwick, with an estimate of the probable cost of the same: persons competing are to furnish an entire plan of the several streets of the town, including the parishes of St. Mary and St. Nicholas; showing the direction of all intended pipes and drains, with the sizes, sections, and all other

necessary details, and are to prepare sections of the several levels, and proposals for flushing the sewers, carrying off all waste water, and trapping drains; also the best method of forming the sewers and collecting the sewage manure. The whole to show a scheme of perfect drainage and an abundant supply of water. The approved plans to become the property of the corporation, on the premium being awarded and paid.

and paid.

Surely, Sir, the attention of these local authorities and the public needs only to he properly directed to the subject, to convince them that no professional man of any respectability or standing would, or ought to be expected to the property of the property pected to, undertake so great an amount of work, requiring many years of previous pracwork, requiring many years of previous practical and laborious experience, and present devotion of time and pecuniary outlay, upon the chance that his plan will be considered the best by the local authorities, and in that case, and in that only, to he scantily remuncrated

by the paltry premium offered.

But, on the other hand, it must be patent to every sensible man, that this class of advertisements will be responded to by a description of persons of whom a number are to be found at the fag end of every profession, whose only hope of success is, the certainty that, in the absence of more skilful competitors, some plan must he pronounced the best, however ineffi-cient it may be for the purpose, and consequently entitled to the premium.

Since writing the above, another instance, more ludicrous than either of the two mentioned, has just been pointed out to me, in your paper of the 24th November, headed, "St. Thomas 'the Apostle, Devon," offering a premium of twenty guineas for the best, and five guineas for the second best design for draining that district,—the map exhibiting which is to be drawn on a scale prescribed by the General Board of Health in London. This scale, heing about 40 feet to the inch, very frequently, in the case of towns of any size, requires mounted paper of the value of 4l. or 5l. to plot the map on, to say nothing of the drawing table and office, which are indispen-sahly necessary to the accurate construction of the map.

Can we be surprised at such offers as these from parties who know little or nothing of the skill and attainments required by an architect or engineer, and who daily see in the newspapers advertisements from persons who pretend to teach the whole science and practice of engineering, architecture, surveying, and a host of qualifications, in the space of six weeks, and for the sum of 10*l*.2 Can we wonder, then, that while such emanations as these are constantly before our eyes, attainments should be thought so little of? Although by many these are appreciated at their true value, yet in the eyes of some, and as appears not a few, they will have the effect of bringing down the profession to a ruinously low standard?

ALPHA.

In the remarks made by your various correspondents relative to the conduct of those soi-disant architects who compete for 101. premiums, and advertise their services on the most reasonable terms, one class has been overlooked, i. e. those who injure their professional brethren (if we may admit the term), by designing for builder architects, who, not satisfied with the profits arising from their own calling, avail themselves of the services of the class alluded to for further aggrandizement. You may not perhaps be aware of the extent to which this system is carried in country towns; and it is to me surprising that the parties employing these builder architects cannot see the net into which they must inevitably fall. Verily, what with engineering architects, and builder architects, the legitimate professional man has but a sorry chance in these days. It is, indeed, highly desirable that some effort should be made to raise the profession to that position which it is fully entitled to occupy in society, and, at the same time, to put an end to that degrading system of competition which is now practised.

As a constant reader of your excellent periodical, I have bad much pleasure in perusing the letters of those gentlemen who have addressed themselves to the subjects above named; but there has been in all cases one

fatal omission. Nothing, in these times, can be done without money. Let those who are anxious for the welldoing of the profession not anxious for the welldoing of the profession not only unite, but put their hands in their pockets, and subscribe towards obtaining the desired objects. There is always a difficulty in commencing an agitation of this kind. My plan mencing an agitation of this kind. My plan would be simply this:—Let a subscription be entered into, a room in some central situation obtained, a provisional committee organized; obtained, a provisional committee organized; let circulars be addressed to all members of the profession, calling their attention to the existing evils, and public meetings beadvertised simultaneously in London, Birmingham, Liverpool, and York, or any other towns that may be thought preferable; let a series of resolutions be prepared and also circulated, with a request to each architect to express his apprayal, dissent or amenduent. By these proval, dissent, or amendment. By these means the general feeling would be obtained, and such alterations might then be made in the resolutions as would tend to meet the views of nearly all parties, and thereby ensure their unanimous adoption.

A COUNTRY ARCHITECT.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

public meeting on December 14th, Mr. Pettigrew, V.P., in the chair, a paper from Mr. Joseph Clarke was read, giving an account of the discovery of Roman remains, on the property of Mr. Stephens, at Upham, he-tween Winchester and Bishop's Waltham, consisting chiefly of the lower parts and foundations of walls, occupying a considerable space, the length in one direction being 120 space, the length in our three is reason to believe that these are the remains of habitations, as coloured plaster was found adhering to the walls in many In a passage which was cleared to a places. In a passage which was cleared to a considerable distance, were found fragments of coarse pottery, and other evidences of Roman occupation, but in no part of the space any trace of Samian ware. In the enclosures slabs of stone, of a hexagonal shape, were

slabs of stone, of a hexagonal shape, were discovered, and from their shape, and the discovery of nails still remaining in some of them, they are supposed to have been used for roofing.

Mr. Planché read a very elaborate paper on the tilting helmet, tracing its history from the pointed and rude defence used by the Normans, through the many cylindrical and allied forms of the succeeding period, to the more elegant kind in use, during the fifteenth and sixteenth centuries, and well known in the heraldic devices of that and succeeding times. Allusion was made to several kinds of these Aliusion was made to several kinds of these

Allusion was made to several kinds of these helmets exhibited at former meetings of the association. Mr. Planché's remarks were illustrated by a long series of well-executed diagrams, drawn by Mr. C. Baily; also by plates of monumental effigies, and other standard works.

Mr. G. Wright produced some rubbings of a crowned M, and curious collar, having upon it alternately a rose, and what appears to he a letter r,—existing in an old vault, beneath Belvoir Castle, the seat of the Duke of Rutland. Mr. Planché considered the M to be placed there as the initial letter of the M to be placed there as the initial letter of Manners, and the r that of Roos, both of which names helonged to the families of the Earls of Rutland.

BEDFORDSHIRE-CHURCH PROGRESS.

-The alterations here, though not all that could be wished, are improvements. The all that could be wished, are improvements. The pulpit and reading pew have been removed from the very singular position they occupied, and placed in their right situations. The pews, alas! though lowered, are pens still. It is said the fastidious taste of the congregation would not hear of open sittings, though we have reason to believe that this improvement, as well as what has been effected would have nave reason to deleve that this improvement, as well as what has been effected, would have been at the expense of the noble Duke in whom the presentation is vested.

Cranfield.—The restoration here is on a bold

and liberal scale; those who knew the church in its miserable state a few years ago, will hardly believe what has been done. We believe, also, that almost all has been at the ex-pense of the reverend incumbent and his friends. No calf pens here; and painted glass has been contributed in a very handsome manner. Your readers should see it, especially country churchwardens.

country churchwardens. Eversholt.—A very little step indeed has been taken here; the roof of one aisle has been soundly restored; why the reparation of the other was not carried out equally well we cannot explain. A crazy deal painted pulpit stuck against one of the columns has been happily removed. But the tuh that has been placed nearly in its proper site is most awful, its size preposterous, and manufactured from some old mahogany, which, with its Pagan ornaments, once disfigured the east end of the chancel, which last is unhappily elogged upwith some recently erected miserable closed sittings, for which here was no necessity,—owing to the difficulty centy-rected miscanic constanting and which there was no necessity,—owing to the difficulty with the occupants of some intrusive pews. The pulpit and reading desk, though greatly improved from their last position, are yet incorrectly located. But worse than all is an incorrectly located. novation on the open sittings of the lumble part of the congregation, by the churchwardens appropriating two portions, and enclosing them appropriating two portions, and enclosing them with doors, for the gratification of private parties: it is hoped that the Archdeacon, when he comes, will "visit" them for this ontrage. On cleaning the walls of Eversholt Church a mural painting was brought to light, representing St. Peter ushering into the realms of the blessed departed spirits. The churchwardens covered it up with eager haste, but fortunately a tracing of the same size was obtained, and has been preserved.

Tingrith.—By the noble spirit of the ladies of the manor and owners of the property in the village, the church has been restored in a good

way. Thus you see, Sir, improvement, desperately required, is creeping on in this county.

ANCIENT MORTAR.

In reply to the inquiry of "A. G." in your last number, I will observe that appearog, in technical Greek, means unslucked lime; and I conceive it most probable that such is its meaning in the passage quoted.

Cambridge.

Annhoge.

In reply to your correspondent, "A. G.'s" question, about the meaning of the terms usignify the component parts of an ancient mortar, I beg to state that the former signifies "quick lime" and the latter "pounded earthenware," two very probable materials to be mixed up in a cement, which is more than can be said of the substance now known as "asbestos." That στρακου is "earthenware," and not "pounded shell," as suggested by your correspondent, is probable, first, because such is the most common signification of the such is the most common signification of the word, and secondly, because we know that the ancients used carthenware (burntearth)as an ingredient in cement. Vitruvius says (I quote Gwilt's translation), that "if to river or sea-sand potsherds ground and passed through a sieve in the proportion of one-third part, be added, the mortar will be better for use. Pavement made of this material was called οστρακοκουια, and by the Latins purimentum testaceum. Any of your readers can satisfy themselves that the meanings given above are correct by looking out the words in Liddell and Scott's lexicon, so that, taking it for granted that "A. G.'s" translation is correct in other respects, the translation is correct in other respects, the mortar in question was compounded of lime, pounded earthenware, and elm bark, mixed with bot water in which barley has been boiled, and it only remains for some of your practical readers to make a harley cake (µaza) of bits description, and see whether or not it causes stones to stick together with the strength of iron.

A. M. C.

SCARBOROUGH INDEPENDENT CHAPEL Competition,—This was not an open competition; but a limited number of architects were selected as competitors. The plans were sent in on the 1st December, and Mr. Raffles Brown has been declared the successful architect. A correspondent, Mr. John Petch, states to us that he was expressly informed the names of competitors were to be in sealed letters, and yet that the selected design was signed by the architect and accompanied by testimonials.

THE CRYSTAL CURTAIN AT DRURY-LANE THEATRE,

THE interior of old Drury was brilliantly fitted by Mr. Frederick Gye for Jullien's masked ball. The circle of chandeliers low masked ball. The circle of chandeliers low down and beyond the central light, and the garlands of flowers suspended by butterflies, which filled the upper part of the house, produced a charming effect. What we have to notice, however, as new in decoration, and it is scarcely possible to go any where without finding something which may he usefully mentioned to our readers, is the "crystal curtain," as it was called, which "ringed the upper part of the proscenium. This was formed wholly of chandelier drops, or spangles, with gas in devices behind, and when we mention that its width was 42 feet, and that it descended 16 feet at the sides and 11 feet in the middle; it will be seen that it must have in the middle; it will be seen that it must have swallowed up an enormous number of them. The ground-work took as nearly as possible Ine ground-work took as nearly as possible 100 to the square foot, but adding the drapery, lines, tassels, &c., which were formed by other layers on the surface, and then the fringe, which was represented by a quantity of "lobs" as they are called, commonly used to surround was light better for the surround was surround to the surround surround the surround was surround to the surround su surround wax-light lustres for chimney-pieces,

the number cannot have been less than 80,000.
It seems that Mr. Gye obtained the greater number of them from Bohemia-finding they number of them from Bohemia—finding they could be had cheaply there—without any precise intention, but simply with the idea that by different arrangements they might be made useful in decoration, and this was his first and very successful attempt with them.

NEW WESLEYAN CHAPEL, LIVERPOOL-ROAD, LONDON.

THE chapel is crected on the angle of The chapel is crected on the angle of ground at the Islington end of the Liverpool-road, and consists, on the basement floor, of a morning chapel, 75 feet by 35 feet, and seven vestries. The whole of the ground floor of the chapel is fitted up with pews and free seats, side aisles, and communion, which, together with the side and end galleries, will accommodate 1,500 persons. The chapel measures 90 feet long by 54 feet wide. The height from floor to apex of roof is 50 feet measures 90 feet long by 34 feet while. In the height from floor to apex of roof is 50 feet, and the height from outside ground line to top of turret on front gable is 75 feet. We have not yet seen the building, but a correspondent has handed to us the following

particulars.

The chapel is designed in the decorated style of Gothic architecture. The centre of the west front is occupied by a recessed and moulded doorway, beneath a large window, filled in its upper compartments with flowing tracery; buttresses divide the centre from the wings of this elevation, which contain a centre window, and are flanked by double angle buttresses. In the sides of the chapel are five windows, occupying spaces of equal width between buttresses: a clerestory, having the same numbetween buttresses; a clerestory, having the same number of windows, the walls of which, with those of the side aisles, are surmounted with a parapet pierced with trefoils and quartefoils. The clerestory is supported by arches springing from octangular columns, with foliated capitals, over which are inserted carved corbels, from whence spring the curved rihs of the roof, with carved spandrils supporting the principal rafters. The timhers of roof are

principal raters. The timbers of roof are moulded on the underside and stained. At the south-east angle of the building an octangular turret is attached, the lower portion of which serves as a staircase to side gallery, and the upper part is occupied by flues, which carry off the vitiated air from all parts of the carry off the vitiated air from all parts of the building, the warm air being supplied from the circulation of hot water in pipes laid in the basement, and conveyed by a warm air culvert to the open space under the pew floors. Openings are made in the upright face of the steps to the pews, and covered with gauze wire, which allows the warm air to disseminate itself throughout the building. An entrance for cold air communicates with the apparatus in the hasement, so that in summer it may be admitted through the same channels as the warm. Openings are left in the inner soffit of the be admitted through the same connects as the warm. Openings are left in the inner soffit of the roof, to give the vitiated air access to the space between it and the slate surface, which space is in immediate connection with the ventilating tower, containing a fire-place, that will he put

in use when the peculiar state of the atmo-sphere needs its assistance to cause the required current of air. The walls of the chapel are built of Kentish rag-stone; and the asblar and carvings are executed in Bath stone. Its entire cost is stated to be about 6,000l. It was erected from the designs of Mr. James Wilson,

BANK ARCHITECTURE,*

The proper situation of a hank is a matter of some importance. It should be situated in what is deemed the most respectable part of the town. If it be placed in an inferior locality, approachable only by narrow and disagreeable streets, and surrounded by buildings the seats of smoky and dirty trades, it is not likely to be so much frequented, nor to acquire so large a business, as though it were more pleasantly situated. Another point to be observed is, that the bank itself should be a handsome building. The necessary expenditure for this purpose is no sin against economy: it is an outlay of capital to be repaid by the profits of THE proper situation of a hank is a matter outlay of capital to be repaid by the profits of the business that will thus be acquired. A portion of the building will probably be set apart for the private residence of the manager, or of some other officer of the establishment; it is desirable that this portion should be en-tirely separated from the office. The commu-nication should be only by a single door, of which the manager should keep the key. The building should be so constructed that what the kitchen, or the nursery, or the drawing-room, should not he heard in the hank. The office being thus isolated must then be fitted up in the way that will most effectually pro-mote the end in view; and here are three points to be considered—space, light, and ventilation.

A chief consideration is space. A banker should take care that his clerks have room enough to do their work comfortably. accountant knows that he can often work faster if he can have two or more books open at the same time; but if his space be so confined that he must shut up one book and put it away before he can use another, he will get on more slowly. The cashiers, too, will be much impeded if they are obliged to stand too close to each other, and the public will be huddled together, and will often count incorrectly the money given to them, and thus take up the cashier's time to make them right. Want of space will necessarily occasion errors, from the confusion it workness and force are alrest. the confusion it produces, and from one clerk being liable to interruption from the noise or vicinity of the others. A banker should there-fore take care that his office is large enough for his husiness, and that it will admit of being enlarged in case his business should increase. Ample space is also conducive to the health of the clerks, as there will be more air to hreathe, and the atmosphere is less likely to become polluted by the burning of lamps and candles.

Another consideration is light. It is well known in every London bank, that fewer mistakes are made by the clerks in summer than in winter. Ahundance of light prevents mis-takes, and saves all the time that would he employed in the discovery of errors. Light is also of great importance to the cashiers in detecting forged signatures and bad or coun-terfeit money. Thieves are also less likely to terfeit money. Thieves are also less likely to attempt their robheries in a light office than in a dark one. Faint or illegible handwriting can he more easily read, and hence mistakes are less likely to occur. The clerks, too, perform their duties with more quickness and cheer-fulnates. The clear the reads of the control of the contro fulness; the gloominess of an office throws a gloom over the mind, but "light is sweet, and gloom over the mind, but "Ignt is sweet, and a pleasant thing it is for the eyes to behold the sun." The lightest part of the officeshould be devoted to the clerks. We have observed sometimes a violation of this principle. The entrance door has been placed in the middle of the front, with a window on each side, and the counter thrown across the room, so that the lightest part of the office has been given to the public. It is better that the entrance be placed at the right or left corner, and the counter be made to run from the window to the opposite wall; the light will thus fall lengthways on the counter, and the space behind the counter will be occupied by the clerks.

^{*} From "Gilbart's Practical Treatise on Banking."

Ventilation .- Volumes have been written by medical men upon the advantages of and on the unwholesome atmosphere of crowded cities. If the air that circulates in the streets of towns and cities be impure, what must be the state of those offices or rooms where twenty or thirty persons are breathing close together during the whole of the day, and gas lights are burning during the evening? In such cases we are told that a person afflicted with consumption of the lungs may communicate sumption of the lungs may communicate the complaint to others, as they must inhale a portion of the atmosphere which he has breathed out. The air in a close office is not only rendered impure by the number of people that breathe it and by the burning of gas, but it also contains very frequently particles of that breathe it and by the burning of gas, but it also contains very frequently particles of dust arising from the floor, through the number of people constantly walking in and out. It is almost impossible for persons so circumstanced to enjoy for a length of time even moderate health. A portion of this evil may he mitigated by a good system of ventilation. To obtain this should be regarded as an object of the first inpure are. If a hanker do not insist first importance. If a banker do not insist npon the architect performing this in the most effectual manner, he must be content to be often put to inconvenience through the illness and consequent absence of his clerks.

ARTISANS' HOME, &c.

The interest I feel in all that relates to the "Artisans' Home" (described and commented upon in your leader of Dec. 15) induces me to offer an idea or two as to a mode of decorating the interior of establishments of the relationship of the control of the relation of ments of this nature, so that they might prove to be, at the same time, highly useful to all those protected under their walls, whose minds may have a tendency to artistic pursuits. In addithe reading-room and library, but appertaining thereto, I would appropriate a well-lighted and well-ventilated room for the benefit of those individuals. Towards the upper part of the walls, and at proper distances for observation, I would place a few good casts of observation, I would place a few good casts of figures, some on revolving pedestals, their contours heing relieved by a light blue coloured ground. I would also have cheap but well-executed human or other compositions or single forms, painted in chiaro-scuro. The lower division of the walls should be stuccoed white, with a trowelled surface (to admit of the charged delineations heing result effect here. charcoal delineations being easily effaced by a sponge), affording ample space whereon the artisan might practice, and exercise his hand and eye in drawing, whether in copying the models before him, or designing from his own fancy. The addition of this studie to the own largy. The addition of this stand to the artisan's home would be a great improvement, combining with the comforts of a lodging-house the advantages of a school of design.

Real, although undeveloped talent, thus exercised, would reward the operative, giving him a greater power over the materials on which he worked, and whilst it shed refinement over him and his labours, it would reflect honour upon the nation.

The task would of course be one entirely undertaken from a pure love for art, fostered by a desire on his part to raise himself to eminence. The experiment (not an expensive eminence. The experiment (not an expensive one) I think worth a trial, on account of the degree of emulation it might safely be predicted it would create amongst labouring men, designers of patterns, ornamentists, whom we wright discourt more or less helmood to the signers of patterns, ornamentists, whom we might discover more or less belonged to the inventive race,—men, at all events, actuated with the wish not only fully to carry out, but to improve, and add a grace to, the conceptions of others,—to give satisfaction to their employers,—to deserve, by superior talents, if they cannot command, higher wages,—and to qualify themselves to become one day efficient masters and employers.

F. LUSH. masters and employers. F. Lush.

PUBLIC RIGHTS AND PUBLIC HEALTH. —The "North London Anti-Enclosure and Social and Sanitary Improvement Society," are moving again in their useful work. Efforts are being made to establish "A Primrose Hill Park Library," on a respectable scale, and make other arrangements conducive to the interests of the society, which is henceforth to hold its meetings regularly on the evening of the first Monday of every month, at the Primrose Tavern, Hampstead.

Miscellanea,

Institution of Civil Engineers.—
The annual general meeting of the Institution was held on Thesday evening, December 18th (Mr. Field in the chair), when Mr. W. Cubitt, C.E., was elected president. Messrs. Brunel, Rendel, Simpson, and R. Stephenson, M.P., vice-presidents; J.F. Bateman, G.P. Bidder, J. Cubitt, J. E. Errington, J. Fowler, C. H. Gre. Cubit, J. E. Errington, J. Fowler, C. H. Gregory, J. Locke, M.P., I. R. M'Clean, C. May, and J. Miller, members; and J. Baxendale and L. Cubitt, associates of council. The report of the council, which was read, alluded to the past season of unexampled depression in the engineering world, but at the same time held out hopes of improvement, on account of the agitation of the subjects of better supplies of toward and gas, the sewerage and drainage of towns, the construction of abattoirs, and other sanitary questions; whilst the improvement of canals, in their struggle with the railways for the heavy traffic, the construction and amelioration of harhours, the embanking and improving of rivers, the recovery of marsh-lands from the sea, and numerous other works, which had been neglected on account of the more attractive railways, would resume their former importannee, and eventually afford ample employment for the majority of the members of the profession. Telford medals were presented to Lieut-Colonel Harry D. Jones, R.E., Mr. R. B. Dockray, and Mr. J. T. Harrison; Council premiums of hooks to Messrs, J. T. Harrison and J. Richardson, and T. J. And T. Harrison and J. Richardson, and T. J. T. Harrison. and J. Richardson; and Telford premiums of books to Messrs. R. B. Grantbam, T. R. Crampton, W. Brown, and C. B. Mansfield.

RATING OF ENETER HALL.—An appeal against an increase of charge by the parish of S. Marting, in the Fig. 1997.

against an increase of charge by the parts of St. Martin's-in-the-Fields, for poor rates, from the annual rateable value of 1,500l. to 2,500l., on the ground of the Wednesday Concert success, was heard at the Middlesex Sessions on 11th inst. Mr. Bodkin, for the appellants, stated that the proprietors of the hall were stated that the proprietors of the hall were limited by their deed to the receipt of 5 per cent. on their shares, but that they had never yet reached even that. Last year the rate had been already increased, on, from 1,000l., the annual rated value for seven years, to 1,500l., on the ground of a little success in more frequent letting; and dread of law expense alone, he said, prevented resistance even to that in-The rateable value has since been suddenly raised to 2,500*l*, whereas even the gross revenue for the last three years had averaged only 3,382*l*., from which must be deducted 211*l*., on which Messrs. Daukes and Co. must pay rates. Other deductions, such as 204l. for gas, 150l. for repairs, &c., left only 2,144l., from which further deductions for interest on expenditure in moveable stock, depreciations, &c., must be made, leaving 964l. only as the absolute rateable value. The judge decided that 2,000l. be the rateable value. His lordship expressed a doubt whether concerts were within the provisions of the deed of proprietorship, though education in musical scieoce, with musical illustration, clearly was. In course of the discussion, evi dence was given that the receipts had amounted in the year ending April, 1842, to 3,284l. odd; April, 1843, to 4,241l. old; April, 1844, to 3,016l. old; April, 1844, to 2,908l. old; April, 1845, to 2,908l. old; April, 1846, to 2,598l. old; April, 1847, to 3,018l. old; April, 1848, to 2,947l. old; April, 1849, to 4,181l. old.

Soho Park, Birmingham. In your last paper you justly remark that the Soho Park might be made one of the most beautiful places in England;" but, alas! the great idea in laying it out appears to bave been ground rent, and a number of ill-huilt and ill-arranged houses have sprung up, very much to the dis-figurement of what was once the most beaungurement of what was once the most deau-tiful entrance into Birmingham. One portion, let to a man who, I understand, is subletting, is completely denuded of trees. On public points I think it but right you should have all practicable information: let this idea be my

practicable information: let this idea be my N. N. ** We are quite aware that an error was committed at starting, land being let without the retention of sufficient control; but the management of this property is now placed in other hands, who appear to have made up their minds to conserve carefully the beauties of the place, and allow none but good houses to be built on the land.

PROJECTED WORKS .- Advertisements have been issued for tenders by 10th January, 1850, for the rebuilding and enlargement of New Castle Church, Glamorganshire; by 5th January, 1850, for the construction of a tank, filter beds, filter tunnels, service reservoir, and other works, for the Derby Water Works Company; hy a date not specified, for the erection of a small block of farm buildings near Southampsmall block of farm buildings near southampton; by 28th inst., for carpenters', slaters', and bricklayers' works for St. Marylebone guardians; by 27th inst., for a supply of soft melting iron for the navy, and by same date, for 350 tons of English tough cake copper for Chatham dockyard; and by 27th inst, for the construction of huildings required for the Great Western station at Banhury, and at the minor stations on the Oxford and Rugby line of railway, also for the construction of a goods shed at Thatcham, on the Berks and Hants line—separate tenders.

SIR MARC ISAMBARD BRUNEL.—This able

and distinguished engineer expired on the 12th inst., at his house in St. James's-park, in the 81st year of his age. Though by birth a Frenchman, of Norman descent, his life has Prenchman, of Norman descent, his life has almost wholly heen spent in England, to which he came from the United States, where he had emigrated at the height of the first French Revolution, in 1792, being Royalist in principle and in danger of his life. He was concerned in setting up the block-making machinery which has ever since been in active operation at Portsmouth for naval purposes. He was the inventor of the circular venering He was the inventor of the circular veneering saw, also still in use the same as ever. To him the manufacturing world is indebted for the elegant little machine for winding cotton thread into balls, which has so greatly extended its consumption. He invented machinery for shoemaking for the army. But the great work of the elder Brunel was the realization of the Thames Tunnel, an arduous work with the accomplishment of which is work, with the accomplishment of which, in 1843, after nineteen years of perseverance in the midst of difficulties and reverses, his energies were literally exhausted in the advent of incipient paralysis. His work was done. He may be said to have since remained with us only to contemplate and to assure himself of the permanency of the results of his several labours. Sir M. I. Brunch will ever hold a high place amongst the engineers of England. And his geniu shas heen long fully appreciated. During Lord Melbourne's administration he received the honour of knight-He was voted a vice-president of the hood. He was voted a vice-president of the Royal Society, a corresponding member of the Institute of France, and a vice-president of the Institution of Civil Engineers. He was also made a chevalier of the French Legion of Honour: so that he has died full of honours as of years.

OXFORD ARCHITECTURAL SOCIETY .a meeting of this society, held on the 28th ult., the report was read by Mr. Portal, B.A., secre-tary, which stated that since the last meeting application had been made by Mr. Floke, P.P., of Plymstock, near Plymonth, for a design for stalls, which he proposed to place in his chancel. A pen and ink sketch of a stall had been forwarded to him hy Mr. Wilmot, secretary, and also one of the society's sheets

secretary, and also one of the society's sheets of bench ends, by the aid of which it was hoped he would be able to carry out his plan. Surely this is a step out of the province of the society. Mr. Portal then read a paper "On the use of screens in churches."

Lead - shot Towers. — Mr. D. Smith, of New York, lead manufacturer, claims for patent the application of an ascending artificial current of air to a descending current of metal in the manufacture of leaden shot. This he in the manufacture of leaden shot. This he proposes to effect hy employing a tower shaped at top like a funnel and at bottom like a tr cated cone, with an annular hollow vessel resting on a reservoir of water at the bottom. annular pouring vessel is to be perforated with holes at top, through which an artificial cur-rent of air is to be forced up the tower by a fan or other blowing machine. The metal falls through the hollow centre of the annular vessel into the water reservoir, which is furnished with a shoot to conduct the metal to a suitable reservoir. suitable receptable. Or, the artificial current may be created by exhausting from the top of the tower, and allowing the air to flow in at bottom, in which case the hollow annular vessel will be dispensed with.

GAS .- A tremendous explosion took place at the Sheffield workhouse, on Saturday with extensive damage to the building throughout. Some account of the origin of the accident, as described in the local Times, may be instructive, from the warning it conveys. The committee room is lighted by a sliding pendant attached to the ceiling. The vertical tube is filled with water to prevent escape of gas, and ought to be kept full, otherwise when drawn down there is an escape of gas. The office cleaner, when she lighted the gas, drew this pendant quite down, and, the water being deficient, the consequence was a copious escape of gas, which accumulated at the top of the room till it reached the gaslight below, and then exploded. The climax was most probably expedited by the admission of atmospheric air the moment, the woman having just opened be room door. The best mode of detecting a the room door. deficiency of water in a sliding pendant once every three months or so to draw the slide quite down. A bubbling noise occasioned by the air in the lower part of the tube ascending through the water is a sure sign of danger from want of water. A lead gas-pipe, exfrom want of water. A lead gas-pipe, extending between the floor of the board-room and the ceiling of the committee-room was also found slit on one side, and it is suspected that an escape of gas had been going on there for some time. If so, the space beneath the floor of the ceiling would probably be full of gas, ready to ignite the moment that the explosion took place. Had the pipe not been enclosed, the smell of the escaping gas would bave given timely warning of the leakage. This disaster, following on the alarming explosion in the vegetable market in this town, and the destrucexplosion at Masbrough, ought to induce habits of greater caution and circumspection among consumers of gas generally. competent to form an opinion thought that the necessary repairs to the workhouse could not cost less than a hundred pounds.— The spirits of light and darkness, says Felix Farley, are struggling at Taunton, in the shape of gas and anti-gas partisans. This populous town was again left on Tuesday night in a state of utter darkness; our public functionaries having failed to effect an arrangement to obviate this dangerous annoyance.—A deficiency of gas is also complained of at Newcastle and Gateshead, where there is often a scarcity of coals (!), as we once more particularly explained to our readers. In the present instance, however, mere annoyance to the consumers is alleged to there annoyance to the consumers is alleged to be the cause of the deficiency. The complaint, according to the Gateshead Observer, is very general throughout both towns, and a rival establishment is threatened.——In Hardepool, says a contemporary, 6s. 8d. per 1,000 feet is charged to private consumers, whilst at Durham the price is from 3s. to 4s., according to quantity, and at Sunderland, 4s. net. The as consumers at Hartlepool are endeavouring to effect a reduction to the Durham rates. The lecturing campaign is recommencing. The recentling campaign is recommencing. At the Portsmouth Athenseum, on Monday last, Mr. G. Garnett addressed an assemblage of gas consumers and others on the subject of gas-light, when he "took the opportunity," says the Hants Independent, "of explaining and demonstrating the misconcretic properties. and demonstrating the misapprehension exist-ing as to the interest of the gas manufacturers being the supplying of an inferior article at an exorbitant price, and endcayoured to prove on the contrary that it was the interest of the latter to supply the very best article at the lowest possible price—for by doing so alone could the manufacturer hope for an increased demand." THE BIRMINGHAM EXPOSITION OF MANU-

The Birmingham Exposition of Manifertees and Art has closed. During the last week the rooms were visited by nearly 19,000 persons, and the total number of visiters since the commencement exceeds 100,000. The receipts have been about 3,0654. There will, doubtless, after payment of all expenses, be a handsome surplus; and we again express a hope, in which we are joined, we see, by the local press, that it may be devoted to the establishment, in the shape of a Museum of Art, of a permanent and classified Exposition of Birmingham Manufactures.

BULDERS' BEREVOLENT INSTITUTIONS

BUILDERS' BENEVOLENT INSTITUTION.

—It has heen determined by the directors of this Institution, to have a second anniversary ball in aid of their funds, and a committee has heen appointed to obtain stewards, and make other arrangements.

A GATESHEAD CONTRIBUTION TO A TURKISH MOSQUE.—When Mr. W. L. Harle was discoursing of "progression and improvement," before Salih Effendi and the Gateshead Mechanics' Institute, and Mr. Wornum was dilating in the lecture-room of the Lit. and Phil. on the magnificence of the mosque of I'mi, on the magnificence of the mosque of Amrou, few were aware that we had "cunning workmen in brass" employed on the Tyne in the construction of a gas-chandelier for a Turkish mosque in Constantinople. Mr. Thomas Crawford, of the Walker ironworks, acting on behalf of his brother, Mr. James Crawford, of Beshicktash, Constantinople, nov manager of the gas-works in the Turkish capital, lately handed the order for it to Messrs. Abbot and Co., of Gateshead Park ironworks. We have seen it lighted up, with its twelve lamps of ground glass, and think that our Mahomedan brethren will agree with us that it does credit to old Gateshead. The circle on which the lights are fixed is 8 feet in diameter. The dome of the mosque rises 65 feet from the floor, and the diameter is 40 feet. In accordance with instructions, the design is plain, yet elegant. The material is brass, French-bronzed. The ornamental work consists wholly of foliage. Crosses or glass drops-figure of man or beast-Messrs. Abbot were forbidden to introduce. Additional burners and glasses are to be sent, with several yards of caoutchouc or gutta percha tubes (another illustration of "progression and improve-ment")—from which we may infer that move-able lights are wanted. Thus, then, not only in the Gateshead Mechanics' Institute, but also in the mosques of the East, the sons of men have emerged from the obscurity of "tallow candles" into "gas and grandeur." -Gateshead Observer.

AN IRISH ECCLESIOLOGICAL SOCIETY has been established. The president is the Rev. Charles W. Russell, D.D., Maynooth; and Lords Bellew and Arundel and Surrey, and Lords Bellew and Arthuder and Surrey, Sir W. Lyons, and several of the prelates and priesthood, and other members of the Roman Catholic Church, have joined the society. At the opening of its proceedings, the president gave an inangural address in which, speaking of its object and design, he said, "To regulate the true principles of Christian Art, especially in the building and decoration of churches, is the object of the science of ecclesiology. For though in its more limited application, and in the more strictly technical sense of the name, it might seem to be confined to one particular department, that of architecture, it is under-stood, nevertheless, to embrace all that relates to the externals of religion, and to comprise not alone architecture, but also painting, sculpture, church decoration, ecclesiastical costume, glass-staining, music, engraving, illuminations, and some ornamental typography in adapta-tion of sacred uses. Such, I may add, are the objects to which our society proposes to devote its humble labours." The Amateur is of opinion that in Ireland "there is ample room and verge for several such societies, each suited to the religious temperature of their respective communions, but all tending to encourage a closer connection of art with Christianity, and thus raising it to the highest purposes of its mission, as an element in the service of the Creator, and leading the mind to the highest and boliest thoughts." and holiest thoughts.

THE BRISTOL AND WEST OF ENGLAND ARCHITECTURAL SOCIETY, held a general meeting on the 10th inst., the Archdeacon of Bristol, in the chair, when the secretary, the Rev. E. J. Carter, read the minutes of the previous meeting, and after some formal business, the Rev. Mr. Ellacombe communicated a paper on Church Bells and Belfrys, in which he went into their origin, and exhibited various illustrations of the large bells of some of the principal churches in England and on the Continent. His remarks were also illustrated by the model of a church bell. Mr. Ellacombe discountenanced the popular supposition respecting the baptism of bells, and thought the water used at the time of their being put up was merely for the purpose of washing them. He thought the ceremony used, which he had with him, implied merely a benedictive consecration. He afterwards went into some interesting particulars respecting the weights of the various large bells in Europe and the manner of fixing and ringing them, and also enlarged upon the subject of peal ringing

as practised in England. He then read some remarks on bell-ringers and their conduct, which he was sorry to say was very bad, and he thought ought to be brought under the notice of the authorities.

[Dec. 22, 1849.

The Metropolitan Commission of Sewers had meetings on Friday and Saturday last, at which the only public business done consisted in the dismissal of Mr. Hale, C.E., an officer of the court, for allowing an article, headed "Experiments on the discharge of Water through Pipes," to appear in the pages of a contemporary beforethe commissioners had had an opportunity of considering the same, or the results of the same experiments, which had been instituted at the expense and order of the commission. The court then formed itself into a committee (at which the majority of the city representatives were present) "to consider the course to be adopted respecting the plans sent in to the commissioners for the drainage of the metropolis."

THE LIVERFOOL ARCHITECTURAL SO-CIETY, —The fortnightly meeting of this society was held on Wednesday evening, last week; Mr. J. A. Picton occupying the chair. The architectural designs for the student's prize were suspended on the walls. Mr. Reed, the secretary, exhibited a model, and made some observations as to the method of deafening floors adopted by Fox and Barrett. Mr. Howard offered some remarks on decoration, the laws of proportion, and the various styles of ornamenting in general use.

styles of ornamenting in general use.

MARSDEN'S STENON THAP.—This trap is so constructed that it is always shut, and it will carry off any dirt or rubbish which may fall through the grating over it. It consists mainly of a cylinder, divided into four chambers, which turns on a pivot below the receiver, and is made air-tight by means of vulcanized India rubber. On receiving water from above, the cylinder revolves, bringing beneath the receiver another division, and emptying the first. The inventor suggests that, by means of a stream of water and a pipe from the gulley-hole to the top of an adjoining house, the cylinder, in revolving, would serve to ventilate the sewer.

Mr. Robert Stephenson, the engineer, has been made a Knight of the Order of the Legion of Honour.

STEALING FROM THE VATICAN.—A great sensation has been caused in Rome by the discovery that no less than 137 valuable medals have been stolen out of the museum of the Vatican. Some of these medals were of great rarity, and their loss is a public misfortune.

RAILWAY JOTTINGS. - The springing of some arches was observed on Tuesday week, at the new station, at Liverpool, of the Lancashire and Yorkshire and East Lancashire Company. The pressure of a heavy wall, by which they are surmounted, is blamed. bers were immediately prepared, and applied as buttresses to the wall and centres to the arches, and the wall itself is in course of renewal.—A contractor for excursion trains has announced his intention of taking passengers, "first-class travelling at less than a halfocnny a mile, and second-class for about a penny a line; and declared farthing." From Leeds to Birmingham, 238 miles, the fare is to be—first-class, 8s. 6d., and second-class, 5s. 6d., allowing six hours in Birmingham, or the privilege of returning on the following day for an extra shilling. At the ordinary rates of travelling, the journey could not be accomplished for less than between 3l and 4l, and at a penny a-mile, would amount to a few pence short of 11.— The new directors of the York, Newcastle, and Berwick Railway have adopted the principle of public competition, in the appointment of three general managers; one for passengertraffic, at 500l. per annum; a second, for mineral traffic, at 400l.; and a third, for merchandise, at 4001, each manager's salary to be increased pari passu with the Company's profits.—The masonry of the piers in the increased part passu with the Company of profits.—The masonry of the piers in the bridge across the Tweed, at Berwick, was completed on Thursday week by Messrs. J. Graham and G. Storrar, sub-contractors, under Messrs. M'Kay and Co.—The remarkable feat of effecting a communication between London and Paris in eight-and-a-balt hours, head hear accomplished. The Times of Tueshas been accomplished. The Times of Tues-day week was delivered in Paris at half-past one p.m., along with the Paris intelligence of Monday.

EXHIBITION OF ALL NATIONS .- A Royal Commission will be issued in a few days, for the purpose of inquiring how the great exhibition of the works of industry of all nations, in 1851, may be best carried into effect. It is likely that the commissioners will consist of the heads of all political parties, some members of the present and past administrations, and some eminent in agriculture, science, art, commerce, and manufactures. In addition, we believe, the commission will provide for the appointment of local commissioners, both at appointment of local commissioners, both at home and abroad, to any extent that may be thought desirable. The contract on the part of Messrs. James and George Munday, for providing the building and taking the risk of the exhibition as a financial speculation is now before the public. We have received a number of letters on the subject, but cannot at this moment or into the matter. moment go into the matter.

No. CCCLX.

SATURDAY, DECEMBER 29, 1849.

UR seventh volume is closed today, and we avail ourselves of the licence afforded on such occasions, to blow egotistically a quiet flourish of very small

trumpets in reviewing briefly its contents,while we express, in less measured tone, our thanks to friends and assistants, and appeal earnestly to all our readers for their kind consideration, sympathy, and support. We may again say, without fear of contradiction, as in former years, that we have kept our promise to improve, and that the present volume is far better than any of the preceding volumes. That it contains a great amount of instructive and pleasant reading,-has given early and correct information on all matters interesting to its varied classes of readers, and is illustrated by a large number of excellent engravings, none can deny: that it has been conducted with honesty, fearlessness, and an anxious desire to spread as much knowledge and effect as much good as came within our means, we unhesitatingly assert. To advance the art of Architecture and the science of Building,-to improve the position of architects and other artists,-to give the earliest intimation of matters interesting to builders, and afford them the means of communicating with the public,-to raise the character of our operatives, urging upon them the value of true education, whereby man is

" Made quick to recognise
The moral properties and scope of things,"

—to show employers, whether of the architect, the contractor, or the workmen, that they have duties as well as rights,—and further, to remove feelings of antagonism existing between classes, and to bring them together as mutually connected and dependent,—assisting and assisted,—portions of a great hrotherhood,—have been to us objects of anxious and unceasing desire. If to be earnest in striving, as Ilumboldt says, is to have half achieved our purpose, we have done something; and it will not be our own fault if we do not, hereafter, effect more.

The artist, the man of creative mind, does not receive that consideration in England to which he is justly entitled. But the true artist who finds in the exercise of his art—the discharge of his duty—his hest reward, will not be discouraged by this. Remember Wordsworth's sonnet to Haydon:—

"High is our calling, Friend! Creative art (Whether the instrument of words she use, Or pencil pregnant with ethereal hues), Demands the service of a mind and heart Heroically fashioned,—to infuse Faith in the whispers of the lonely muse, While the whole world seems adverse to desert."

And yet it is these minds which, in truth, form and rule the world. "All revolutions," says a modern writer, "are begun in the higher regions of thought. It was no idle fable of the ancient world, that all great eras on earth were heralded by commotions in the aerial world, portents and prodigies in the heavens, gleaming squadrons of celestial combatants, and all the shock and thunder of society; and there, high up in its serener regions, where earth's poets and prophets

dwell, the battle is fought and decided, before practical men on earth begin to brace themselves for the war."

The great architect is an artist and something more; he expresses his ideas in stone, and his works affect society, and influence the mind and feeling of the times, much more powerfully than is thought for.

Let him have honour in the degree of his

The architect holds just now but a poor place in public opinion, and the profession have themselves, in a great measure, to thank for it. At one time a poet felt obliged to say, that.—

"When a stately pile we raise,
You never hear the workman's praise,
Who used the lime and worked the stones,
But all give praise to Inigo Jones."

Now, however, both workman and architect are in the same position. When a church is consecrated, a theatre opened, alms-houses inaugurated, or a new school finished, the "liberal proprietor," or "active committeeman," who gives the breakfast, stands a much better chance of being named to the world next morning than he who, with thought and labour (more or less, it must be admitted), has imagined and carried out the structure. This, with its remedy, however, is too large a subject to be treated here, and is carrying us away from our purpose. Suffice it at this moment that we remind our brother architects that much rests with ourselves, and that "God helps those who help themselves." If we cannot command success, we may deserve it. Before the public will respect architects, architects must respect themselves.

In the present volume we have set before our readers a considerable number of new buildings; we will venture to reliearse the principal amongst them :- Sir B. Heywood's Bank, Manchester, by Mr. Gregan; the Liverpool Branch Bank of England, by Mr. Cockerell; the New Hall, Pemhroke College, Oxford, by Mr. Hayward; the Lime-street Station, Liverpool, by Mr. Tite; the Cavendish-street Schools, Manchester, by Mr. Walters; St. Barnabas's College, Pimlico, by Messrs. Cundy; a Park Lodge, at Streatham, by Mr. Roumieu; the Dispensary, Cleveland-place, Bath; St. George's Hall, Liverpool, by Mr. Elmes; the British Museum, by Sir Robert Smirke; the New Gaol, Boston, U.S., by Mr. Bryant; the Great Hall, Euston Station, and the General Meeting Room, hy Mr. Hardwick; the Roman Catholic Church, Farm-street, London, by Mr. Scoles; the Printers' Almshouses, by Mr. W. Wehb; St. Mary's, West Brompton, by the Editor; Free Schools, Yarmouth, by Messrs. Brown and Kerr; St. Paul's Church, Derby, by Messrs. Barry and Brown; Model Houses, Bloomsbury, by Mr. Roberts; the City of London Workhouse, by Mr. R. Tress; the Roman Catholic Church, at Greenwich, by Mr. Wardell; a French Riding School; Schools in St. Martin's-in-the-Fields, London, by Mr. Wild; the Interior of the London Coal Exchange, by Mr. Bunning; the Strasbourg Railway Station, Paris, by Mons. Duquesneit; Mr. Hope's Mansion, Piccadilly, by Messrs. Dusillion and Donaldson; the Custom House at Rouen, by M. Isabelle; the Artisans' Home, by Mr. Beck; St. John's, Antigua, by Mr. Fuller; and the Olympic Theatre, London, hy Mr. F. W. Bushill.

Amongst the examples of ancient art, will be found the North Porch of Redeliffe Church, Bristol; an Altar Tomb, Exeter Cathedral; Greensted Church, Essex; the Palazzo Rezzonico, Venice; Bishop Alcock's Chapel, Ely

Cathedral; the House of François Premier, Paris; Roslin Chapel, Edinburgh; the Farnesian Gardens, Rome; Stoke Gregory Church; the East-end of Lincoln Cathedral; Montacute Honse; Open Roof, Ware Priory; the North Porch of Salisbury Cathedral; the Chapter House, Chester: Bradenstoke Priory, Wilts; Romsey Abbey Church; Southwell Minster; the Cathedral of Andernach; the Stone Pulpit at Chester; the Tomb of the Bonzi Family, at Rome; St. Mary's Church, Guildford; the Hall at Bowood; St. Dunstan's-in-the-East; the Altar Screen in St. Alban's Abbey; the Chateau Gaillon, Paris, and others. We may also mention a valuable series of suggestive details and decorations from Rome, Bologna, Parma, Venice, Catania, and other places abroad.

In the letter-press will be found essays on the position of Architects; the better administration of Competitions; professional Remuneration; Fire-proof Floors; on the importance of a knowledge of the Principles of Art; on the Condition of Workmen now and in earlier times; the History of Ecclesiastical Architecture in England; Sir Balthazar Gerbier's "Counsel to all Builders;" on Internal Ecclesiastical Decoration; on Monumental Architecture; Mr. Cockerell's last series of Lectures (no where else reported so far as we know); additional papers on Caen Stone; on the Rights and Responsibilities of Architects; on the Cure of Damp; the Topography of Jerusalem; on Laundry Drying-closets; on Roman Architecture; Gas Reform; on the use of Hollow Bricks; on the Metals used in Building; Notes in Italy; on the Architectural Advantages and Deficiences of London; the Improvement of the Working Classes; on the Building Materials employed in Paris; on the London Fever-stills, called graveyards and vaults; the History of the Pointed Arch; on the Principles of Architectural Effect in reference to streets; on the connection of the Greek Doric and Egyptian Architecture; London; the Drainage of London; on Style in Architecture; the Pottery and Iron Floors of France; on Chester and Chester Cathedral; on Salisbury Cathedral; on the Arrangement of Colours in Decorative Art; on the Removal of Smithfield Market; on other sanitary arrangements; on the Basilicas of Christian Rome; a Week in Birmingham; Tidal Observations in the River Thames; on the State and Prospects of Architecture; the Formation of Roads; Decorative Art in Glass; Water Supply; on Civil Engineering; on the Air Syphon, and on many other subjects, besides exclusive reports of the proceedings at the Institute of Architects; the Metropolitan Sewers Commission; Mr. Wornum's Lectures on Art, at the School of Design; Awards of the Official Referees; and the proceedings at meetings held with a view to the establishment of a Provident Institution for Building Operatives, -an important movement, to which we would give all the aid in our power.

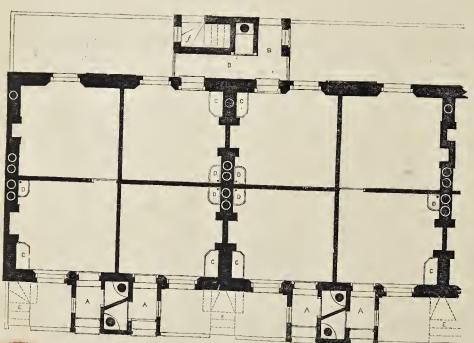

In the ensuing year no efforts will be wanting on our part to render The Bullder still more worthy of the countenance which has been given to it: of our views and intentions in this respect we shall speak next week. We have now but to reiterate our warm thanks for friendly offices rendered, and our earnest appeal for renewed co-operation. In our good intentions we ask belief, and for our shortcomings we solicit the kind consideration of all our readers.

A DESIGN FOR BUILDING HOUSES FOR THE POOR.

Ar a time of the year when every man's hearth is, or is supposed to be, surrounded by his family, and where good cheer should prevail, although in thousands of instances the very reverse is the case, I may presume that any thing that has a tendency to improve those wretched dens (for they are entitled to no other appellation) of the poor will not be unacceptable, for in looking at their deplorable dwellings one cannot be surprised at their equally miserable and squalid appearance, since in many cases a whole family of five or six, and too frequently children grown up, of both sexes, are crowded together in one room, and in thousands of cases two or three families have joint occupation, hy being located in the corners of one small room. Upon an average, where the poor reside, six or seven families occupy one small house—using one front door, one passage, one staircase, one small yard, and one privy. Thus the quiet and the noisy, the one privy. I has the quiet and the noisy, the industrious and the lazy, the sober and intemperate, the virtuous and the licentious, the honest and the dishonest, the clean and the slovenly, are indiscriminately huddled together, and so, from constant intercommunication, the good can hardly fail soon to acquire the habits good can hardly fail soon to acquire the habits and imbibe the principles of the bad. There is usually very inadequate supply of water, for an hour or less only three times a-week, to a small butt in the yard, open at the top at all times and seasons, and probably not cleaned out once in a year, and therefore receiving a constant increase of mud, slime, and rubhish, full of insects, blacks and filth from the houses, from insects, blacks and fifth from the houses, from which the water is taken for all domestic pur-poses; the back yard a receptacle for all kinds of refuse, filth, and damp, besides a constant pestilential odour escaping from the cesspool and privy, placed near and in sight of the windows, so that it cannot be resorted to in private. Every drop of water nsed throughout the house has to be carried up one, two, or three flights of stairs, and together with every description of dirt, is returned by the same route. With all these evils to contend against, it becomes well nigh impossible for the occupants to keep themselves either clean, in health, or free from the contaminating influence of the evils by which they are surrounded, and without any means being provided for the admission of fresh air, or the escape of the foul

from the rooms.

Looking at all the accumulated evils to which the inmates of these wretched houses are exposed, one cannot be astonished at their seeking comfort in the gin palace, the public house, or crowding together in the street, or elsewhere; whereas, if they had well drained, well ventilated, and comfortable houses, where they could rest and sleep in comfort, without being disturbed by their noisy neighbours or vermin, they would take a pride in what they now loathe; during their day's toil they would be buoyed up with the thought that at the end of their labour they had a home where they could rest in peace and comfort.

Any further dissertation would be superfluous, since it must be obvious to the most casual observer, that dwellings of that loath-some description, can be but little better than hot-beds for every sort of vice, ciime, and misery. The good effects of our many institutions, which have in view the amelioration of the poor, are far outbalanced by the evils attendant on this system of indiscriminate crowding together. As a remedy, it is proposed to build houses on an entirely new arrangement (as shown in the accompanying plans), by which the poor man's comforts would be increased, his energies roused, and his whole moral character elevated in a greater degree than can be at present by our charitable insti-

increased, his energies roused, and his whole moral character elevated in a greater degree than can be at present by our charitable institutions—good and numerous as they are.

To give a full description of their construction would occupy too great a space here; the full particulars have been already published in a pamphlet, a copy of which I shall be most happy to furnish to any one desirous of carrying some of the designs out; they can be built in single blocks of 24 rooms each (which would be equal to four six-roomed bouses), with a street front and back, so as to have them thrown quite open on both sides. On the parlour floor would be arranged the single rooms, four to each block, and ten pair of

double rooms; they would be of a uniform size of 11 feet 6 inches by 10 feet 6 inches, and 8 feet 6 inches high, from floor to ceiling. I purpose letting the double rooms at 2s. 6d., and the single at 1s. 6d. per week, and at those very low rates they would pay from 7 to 8 per cent. for the outlay, which of course would be reduced by the rates and taxes, and the expense in collecting the rents.

reduced by the rates and taxes, and the expense in collecting the rents.

In arranging these plans, the great object has been to bring two rooms within the reach of the poor man, and to separate the families as much as possible, in order to do away with the present system, which is so very objectionable, and so injurious to morals, bealth, and comfort, where so many families are crowding in and out of one door, up and down over one staircase,—where constant disputes and contentions of every sort must take place; and to ensure, as much as practicable without incurring agreat expense, athorough ventilation, by throwing the houses open front and back which is in a great measure achieved, and means provided for the constant admission of fresh air to the rooms, and a free passage for the escape of all noxious gases. In throwing the houses open front and back, the whole of the exterior will be open to the inspection of the passers by, which will tend to do away with all secret corners of filth for breeding disease, &c., which are not all the advantages to be derived by this system of building, as space is economized to a very considerable extent; for equal to 17 six roomed houses can be built on an acre of ground more by this plan of building than can be by the present system.

equal to 17 six roomed houses can be built on an acre of ground more by this plan of building than can be by the present system.

It is hoped that by this description, however imperfect, the advantages and comforts arising from the proposed system of chailding houses for the very poor labouring classes, compared with the old, will be readily seen. To provide such for them would be like taking a man from the mire, and placing him where he can stand in safety, ease, and comfort, and without the fear of being molested,—wherehe can have free ingress and egress without being in any way interfered with,—where he will be enabled to make and call his two rooms his castle, and have the comforts of a clean and healthy home, without being obliged to associate against his inclination with those he is surrounded by,—and that a rent within the compass of his means.*

ROBERT NETHERWAY.

RECOLLECTIONS OF PETER NICHOLSON.

Anour the year 1812, Peter Nicholson called at my house in Wells-street, Cavendish-square, where I kept an architectural drawing-school, and without mentioning his name, said he wanted to place his son with me, and wisbed to see some of my copies on carpentry, which I showed him. In the course of conversation on the good and bad construction of roofs (for we had both, like Inigo Jones, originally been brought up to the building business), he alluded to the roof of Islington Church, which he said he once drew; and on my asking him what induced him to do it after its defects had been pointed out by Peter Nicholson, in his "Carpenters' New Guide," he said he was Peter Nicholson limself! and bluntly apologized for not having mentioned his name at first. On this anouncement, I said, Yes he does, and I am desirous of becoming acquainted with you; and bere our intimacy began.

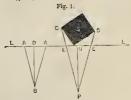

He now informed me he was come to London to draw some plates for Dr. Rees' Cyclopedia, and to arrange with the publisher, Barfield, of Wardour street, for a MS. Architectural Dictionary, which he had sold him. This work, he observed, was to have been a joint production between himself and a person of the name of Webster (whom I knew), but we bad contributed no materials towards it. Webster had originally drawn the ornaments for Nicholson's "Principles of Architecture," published by Cardner, of Princes-street, Cavendish-square. He left the MS. of the Dictionary with me to look over, or as much as he

had then written, to add whatever words I found had been omitted, even provincialisms, which were very numerous. The plan of the work I at once saw had evidently been suggested by that of Sheraton's folio Cabinet Dictionary, or rather Encyclopædia, which had been published a short time before.

Mr. Nicholson now became an immate and

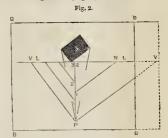

Mr. Nicholson now became an inmate and boarder in my house, for some months, where he drew many of his plates for the above works, which were devised in the day-school. Here we often exercised each other in the solution of architectural diagrams, both theoretically and practically, for the mutual benefit of each other, some of which diagrams were afterwards published.

The following question in perspective was proposed by me:—As it is generally allowed that twice the width of the picture is the best distance for the point of view, how is this distance to be ascertained? P. N.'s answer: Let S, on Fig. 1, be the seat of a house, and

LL the line of the picture; on this line form the isoscelestriangle, AAB, making DB equal to twice the width of AA, then draw the two extreme visual rays, CCP, parallel to the two sides of the isosceles triangle, and the object sought will be obtained, EE being once the width of the picture, and OP that of twice.

The following question in perspective was proposed by one of my pupils, Clarke Ramping, now an architest and surveyor at Birkenhead:—I want, says he, to ascertain the distance of the vanishing points of a building on the plan, when I am prevented by the narrowness of the drawing-board, without adding an additional piece of board or a book on each side. My reply: Let BBBB be the size of the drawing-board (Fig. 2), S the seat of the

house, P the station point, and LL the line of projection; divide the direct visual ray, P2 into two equal divisions; draw the line 1N parallel to the right hand side of the plan, and 2N will be half the distance of the vanishing point V. If the left hand side be divided into the like number, or in three or more divisions, it will show the operation very clearly.—Q. E. D.

number, or in three or more divisions, it will show the operation very clearly,—Q. E. D. Proceeding with my narrative: At this time I remember alluding to Nicholson's first publication, that of the "Carpenters' New Cude," which title, it appears, was given to the work on the following occasion: William Paine was at this time publishing a work on carpentry, called, "The Carpenters' Guide," on which Nicholson was rather severe in his animaely ersions, wishing to have the field to himself, for he never could bear a rival. In the "Carpenters' New Guide" he first offered a method of springing the mahogany plank, as it was termed, but more properly canting the plank on its edge, when finding the face moulds for cutting out the hand-rail of a staircase, so as to save wood. The former method had required the plank of mahogany to he 3 inches, thick, it now required to be but 2½ inches. What gave rise to it was this: Craham, a celebrated staircase-hand at this time called on Nicholson one afternoon, when publishing his "Carpenters' New Guide," and told him there was no doubt if the plank was turned on its

^{*} The cross walls would be built of cement-concrete, with cast-iron standards; the floors would be formed with iron girders, corrugated iron, and concrete; the ceilings of topmost floors would be of iron.

edge, in a way shown, there would be a great saving of wood by a thinner plank. This struck Nicholson as being practical, and the next morning the lines were devised, laid down, and presented to Graham this circumstance I was informed by Nichol-

son and Graham themselves

The work entitled, "The Joiners' Assistant," which followed, Nicholson informed me, owed its existence to the following circumstance, He had, he said, involved himself in debt during the publication of the "Carpenters" New Guide," and was thrown into prison New Guide," and was thrown into prison in consequence. To extricate himself from "durance vile," he applied to the late Mr. Taylor, the architectural publisher and book Taylor, the architectural promised to pay the seller, in Holborn, who promised to pay the debt on his engaging to publish "The Joiners' Assistant," which he did, and was again set at

The small octavo work on the "Five Orders of Architecture," a useful didactic production, published by Taylor, soon after followed.

The next work he brought out was wha he has called the "Principles of Architecture," in three octave volumes. The first contains geometry and mensuration—the second, ornaments and rules for projecting shadows, which latter appears to have been suggested by Thomas Malton's work on "Perspective:"— Thomas Malton's work on "Perspective:"—
the third contains examples of the orders
of architecture, from Desgodetz, a French
author, and Stuart, an English one, which latter
threatened to punish both author and publishers, Byfield and Gardner, for plagiarisms.
Soon after the completion of this work Peter
Nicholson left London in embarrassed circumstances for his native city, Glasgow, where he
commenced as an architect with a person of
the name of Reed, to whom he left the concern the name of Reed, to whom he left the concern some years after, and again started for London.

During the time he was at my house the late Thomas Telford, the eminent engineer, was at my house the wrote P. Nicholson a letter from Carlisle, saying he did not know his circumstances, but that he had recommended him to the magistrates as the fittest person for the architect and surveyorship of the county of Carlisle, at a salary of 300l. a-year, as the place was then vacant. Nicholson advised with me on the salary of 300% subject, and I recommended him to accept it, which he did. He held it but a short time before he was supplanted by another person, for what reason must remain a secret. He now again returned to London, and set up an architectural drawing-school in Oxford-street, architectural drawing-senool in Oxford-street, and commenced the publication of his "Architectural Dictionary," which came out in 7s. parts. The copyright he had sold to Barfield, the publisher, in Wardour-street. After the Dictionary was completed he engaged with Mr. Kelly, the publisher, and hooksaller in Pater. Kelly, the publisher and bookseller in Pater-Reny, the publisher and dookseller in rater-noster-row, for the publication of the "Prac-tical Builder," which work Mr. Kelly himself suggested, and in which be wished to have incorporated some of the plates of "Carter's Architectural Work," which he had by him in two thick quarto volumes. This is the best of Peter Nicholson's works, as he has here embodied all that was valuable in his former publications, most of which were transcripts.

heations, most of which were transcripts.

Although Nicholson had bound himself not to take any of the plates from the "Architectural Dictionary" for any other publication (which he was too much in the habit of doing), (which he was too much in the habit of doing), he here violated his agreement, and a Chancery suit was the consequence, brought on by Mr. Byfield against Nicholson and Kelly. Mr. kelly, who made affidavit that he was ignorant of the plagiarisms, was obliged to discontinue Nicholson's name to his work, and Nicholson suffered severely in packet from the law suit. suffered severely in pocket from the law suit

The last time I saw Peter Nicholson was in Holborn, much depressed in spirits, was in Holborn, much depressed in spirits, when he told me he was going to leave London for Northumherland, to lay out some building ground which had been purchased by his brother-in-law, and that he was going to conduct the erection of the buildings. How long he was engaged there I am unal to say; however, he afterwards removed to Carlisle, where I have been informed he became a co-partner with a schoolmaster, and there a co-partner with a schoolmaster, and there ended his days some years back. Since this his son, Michael Angelo Nicholson, who had been keeping an architectural drawing-school in Euston-crescent, New-road, in London, has

Nicholson in his person was rather large

and strong made, and well calculated for enduring fatigue. He was not acute nor ready otion, being always absorbed in He seemed dull at first, but never conception, thought. thought. He seemed dun at mist, out never ceased his inquiries with those persons who had discovered something in mechanics which he did not know; but whenever he understood it, he never afterwards lost sight of it, and by publishing these discoveries made them his own, Some of his works were formed by this means, and the remainder was the result of labour and intense application. Sundays and week-days were alike to him. "There is no rest to the wicked," he often used to say, "and that he had always gone to work in his studies like a blacksmith on his anvil." Nicholson had no taste for a grand or fine building as a whole; which is evident to the meanest capacity if inspect those designs in Architectural Dictionary, under the head of House. Nor did he understand the different styles of architecture, or he would not have introduced a heterogeneous compound church of his son Michael Angelo's design into Kelly's which he there describes as being in the Grecian style, the same having a polygonal spire on a tower, which spire is of the Plantagenet period. Construction of the anatomical parts of a building was Nicholson's forte; he was a good mechanic and mathematician, but an indifferent architect; he introduced too much geometry into those of his best works, and his lines for tracing the face moulds for the hand-rails of staircases are unnecessarily crowded. Staircase work he much delighted in, which he has developed in every possible form, and on this improvement in joinery his fame mainly depends; but there is much yet in staircase-work for the young operative mechanic to learn, which is well known to those who are now practising in the large builders' shops in London, Manchester, Liverpool, and Leeds.

As objects of invention are objects of our regard, I shall, in concluding this characteristic sketch, observe, that the method of forming the riser of the curtail step, by Peter Nicholson, now in general use, he copied, by request, from a school-drawing of mine, which he has since published in his works on which he has since published in his works on stairs, and also another of mine, showing how, by a simple method, the scroll of the hand-rail may be increased or diminished in the revolutions, both without either my consent or his acknowledgment.

Queen's-buildings. R. Brown.

THE STANDING OF ARCHITECTS.

Various suggestions have been made in the columns of The Builder" to regulate the management of competitions. It has been proposed to hind architects down not to send designs where the premium offered was miserably inadequate, or where the free action of the architect was so restricted and hampered, as is but too often the case. pered, as is but too often the case. A ques-tion has been raised, too, as to architects being diplomaed. Now, from these several points, it is evident that there is a very general feeling amongst architects to elevate the standard of the profession—to stamp architecture as a gentlemanty calling. At the same time, it is more than questionable that same time, it is more than questionable that the means proposed will conduce to that end One thing seems to be quite certain—all idea of coercion must be completely and entirely abandoned. Instead, Mr. Editor, of architects thinking it necessary to write dissuasive letters for your columns, on the announcement of competitions, it should be taken for granted that the profession will not be content to throw away their time and money upon the bare chance of ohtaining a slender premium, or upon terms that would derogate from the dignity and self-respect of gentlemen. At all events, if they are disposed to do so, in pity's

name set them.

That a number of persons call themselves architects who are not entitled to the name by any right of education is pretty notorious. However, such are usually employed upon the lower class of buildings, which, if truth must be told are not integenently the most remube told, are not infrequently the most remu-nerative, on account of the insignificant number of details and working drawings required. Against competition with these individuals diploma would be hut of slight use. F

Mr. A. being about to build a factory, or Mr. B. a warehouse, naturally looks about bim to see by whom he can get his plans made at the cheapest rate. His motto through life has been to "buy in the cheapest markets and to been to "buy in the cheapest markets and to sell in the dearest." He cares not a fig about been to sell in the dearest. The cares not a ing about the man being properly qualified to practise. He wants a huilding of a certain number of stories, with such and such rooms for warehousing and other purposes. A joiner or a mason will readily furnish plans at a very trifling cost

It is evident, then, that architects cannot compete with men who are perfectly satisfied if they give up the whole of their time for 30s. per week. So that, however much a diploma may be wanted to mark the distinction between accredited and non-accredited practitioners, the possession of it would not operate very differently to the present system. If architects are bent upon achieving a position in society, it must be done, not by angry and indignant philippics against committees and boards of guardians (as the sending or not sending of designs is a purely optional matter) - not by dictatorial arrogance and petty narrow-minded restrictions, - but by so cultivating their talents as to show themselves really superior to pseudo-architects in intelligence, good breeding, taste, and refinement.

In the higher branch of architecture (that is to say, ecclesiastical), to whom are we mainly to say, ecclesiasucally to whom are we mainly indebted for literary efforts? To whose guidance, critical acumen, and judgment, do we owe the most? Not to professional architects, but to the Hopes, Petits, and Paleys—the Freemans and Pooles of architectural societies. I by no means think of underrating the value of the illustrated works that are constantly emanating from the press, under the editorship of the profession. Still, useful as these works are, and indicating, as they do, a very proper desire on the part of their authors to advance the interest and enlarge the know-ledge of the science of which they are votaries, more than this is required to render visible the elaims of architecture to be styled a liberal calling. An architect should be something calling. An architect should he something more than a living pencil, or a compendium of mouldings and details. He should be remarkable for his intellectual attainments, as well as his refined taste, in all matters connected with art. Let the rising generation (if I may be allowed the expression) of architects cultivate their minds at the same time as they are perfecting themselves in mere artistical execution of their drawings. Let the example of the amateurs of architectural societies exe in them an honourable emulation to be equally well versed in the theory of architecture. architects contribute no less by their pens than by their pencils to the expansion and development of the science we all love.

Then may we indeed hope that architecture, Then may we indeed nope that activation, having attained a literary position, may also have a place assigned her in the ranks of the learned professions, which, instead of being three, as at present, will become then a partie quarrée.

P. P. C.

I believe the profession generally would concur in the opinion of your correspondents, that some step should be taken to promote the respectability and responsibility of its practitioners; but I do not think that they are by any means unanimous as to the manner in which these objects are to be attained. convert the profession into a guild, or close corporation, would not only he contrary to the spirit of the times, but would be full of practical injustice to such men as Rickman, who educate themselves for the profession and serve no apprenticeship to it The might be assisted to the selection of their advisers, by the institution of examinations, and the award of diplomas; but the want of success which attends the exclusive privileges of attorneys and medical men does not encourage

any similar attempts amongst ourselves.

The subject of professional charges is, perhaps, of primary importance; and these should be independent of the amount expended, but in proportion to the work done; something, I fancy, after the manner of the attorney's bill of costs; but, if the architect's estimate is exceeded, then a pro rata deduction should be made for the amount of his charges. It is the earelessness of the profession (to use no harsher term), in the preparation of their

estimates, which most deeply affects the respectability of the body, and for this I see no other remedy than the publication of the estimated cost and the actual cost of every erection throughout the country. An annual and authentic return of this kind would be much more valuable than many blue books, and would exercise a useful check upon the wilful imaginations of artistical architects, who excel in the preparation of pretty pictures for competitions, but are above all such grovelling considerations as are involved in the calalistical characters of £. s. d. B.

As a vast deal has been said relative to architects being compelled to take a diploma before they should be permitted to practise, and, as some suppose, a great benefit would arise to the profession in consequence of such a movement, and as all have argued nearly in the same strain, allow me to ask the supporters of this question if they have taken into con-sideration that, although lawyers and doctors must take a diploma before they can practise, there are members who do practise and who are any thing but clever or efficient men, a fact well known to every one who has taken the trouble to consider the subject, and therefore the diploma has not produced that benefit to the community which its supporters and prothe diploma has not produced that benefit to the community which its supporters and pro-moters supposed that it would; nor do I believe that it has yielded that good to the professions which it was at first believed it would do; but to the point. Would a diploma prevent false estimates? would it prevent architects taking practice at a lower rate than 5 per cent.? or teach them to pause before they responded to every call in the shape of an advertisement made by church or chapel building committees or boards of

or chapel building committees or boards of guardians? I say, no!

Who have been the authors of all the enormities complained of? who have brought a host of indignities upon the architectural profession? have they been brought on by men not properly schooled into it, or quack draftsmen? No! none of these; the culprits are its own sons, those who have been trained in the used who readers in the control of the seal of the sea the usual way, men who are qualified and who could not be prevented from taking a diploma if they should ever be called upon to do so, aye, men from whom better things might have

been expected.

Is the Small Pox Hospital, which was guaranteed to be executed for 12,000l, and which will exceed 20,000l. when completed, or the new Lunatic Asylum at Colney Hatch, estimated at 80,000*i*., the lowest real estimate for which was 135,000*i*, or the Edmonton Union Workhouse, erected a few years hack at a cost of 16,000*l*. when the guardians were led to suppose that 9,000*l*. were sufficient for the same? Arc these unusual occurrences, ing the public, as they do, to think lightly of architects? No! sad to say, there are many, architects? No! sad to say, there are many, many such instances—too numerous to particularize, yet too important to pass by unnoticed; and is it not notorious that two gentlemen who were formerly in partnership brought themselves into public notice by undertaking practice at 2½ or 3 per cent., and securing jobs by false estimates? Has the Birmingham Union affair fallen into oblivion? Have not the architects undertaken to carry out their designs for less than the usual remuneration? designs for less than the usual remuneration? I say, no! for the profession will still number amongst its members those very men who have brought these justly censurable evils into existence. Look over the whole catalogue of competitions, and you will find that 95 of every 100 have heen obtained, not by quack drafts-men or inefficient men, but by men of standing who have had friends at court, and who have secured the selection of their designs by the influences of dear Mr. Splitfig, the grocer, Mr. Gingham, the umbrella-maker, Mr. Can-dlewick, the tallow chandler, and others, who diewick, the tailow chandler, and others, who composed the committee, and who were all friendly to Mr. Lines, the architect, and in consequence of their friendly votes and kind co-operation have been favoured by other friends of the architects with an order either for a new umbrella or an extra quantity of candles or tea. Would a diploma stop this? No! Further, does not the law with respect to competitions lay in your own hands? Certainly it does. Don't compete unless upon fair terms; refuse to carry out your designs

for less than the usual commission; resist all unfair offers or actions; and the consequence will be that committees will find out that they must come forward and meet you with proper terms and in a proper spirit, or they will per-ceive that they cannot obtain the assistance they seek. Veritas.

THE EVILS OF SHORT LEASES.

The universal centralization of property in Great Britain is the bane of society, the curse of the State, and the sure prelude to antagonism in classes, if not of assured decadence Various articles published in THE BUILDER on the subject of short leases, last year, treated on the singer of short leases, has year, treated this subject in extenso; it was shown that the tendency of fixed capital in houses rapidly concentered in the comparatively few ground landlords; that all the houses (the only fixed landiords; that all the houses the only have capital) in all the cities and towns of England were falling, as a tontine, into the proprietary and possession of such as the Marquis of Westminster, the Dukes of Bedford and Portland, Lords Northampton, Southampton, Fitzhardinge, Portman, and some others in the metropolis; that the terms of leases are becoming shorter as mankind multiplies; - that the longest lease is now ninety years, and most usually but sixty years!—that on the greatest urban estates, one half the whole capital expended by generations passed away has already fallen into the lap of plethoric wealth, whilst fallen into the lap of plethoric wealth, whilst the moderate classes are wholly excluded! That in one more generation one-half of the remainder must fall into the same Maelstrom of cupidity, and that in two more generations it must swallow all !!

A remedy for such spoliation of the masses was at the same time suggested, which, by a perfectly equitable procedure, might be carried out. It was this:—To make it eligible for any tenant of a building on long lease (above twenty years), to serve notice on his landlord that he designed to purchase the interest in that he designed to purchase the interest in perpetuity, always reserving to such lord his head rent. For this purpose (as in cases where lands are required for railways), a notice should be served that perpetnity of tenure was re-quired; a valuation jury should be summoned, and their award should be binding on both parties: that is, that the amount assessed as the representative value should be tendered and paid to the lessor, and that such payment

and award should create a tenure in perpetuity.

If only one-fourth of the tenements on the first-mentioned nobleman's metropolitan estates were so enfranchised, then, on that section alone, one thousand householders must become proprietors, have a fixed interest in the polity of the State, a sympathy with the poor, and a stake in the empire! Whereas, on the lapse of private interest, and their mergence into the swollen rentals of the aristocracy, those middle classes, perhaps without a possession in the soil, must be thrown amongst the floating elements of a dislocated society, and, in so far as they are treacherously dealt with, add to the too prevalent discontent at the exceeding wealth of the rich and the exceeding misery of the poor.

Many are the examples of men unwise in their generation, who have huilded up houses, and exhausted fortunes, on a favoured residence, and exhausted northes, on anyoured residence, or good standing for trade: in two genera-tions all pass away, and are absorbed by the insatiate Manmon of riches; the widow im-poverished, the children beggared, may deplore the reckless waste of improvident forefathers. Their lease is expired; they must vacate, unless prepared to pay a rack rent, increased from three to tenfold!

There is no alternative for the remedy of an evil which is growing in magnitude, under a cunningly devised and solid compact of the great against the small, other than that which is here propounded. Let it go on, and the bonds of society are rent asunder. Those who have are banded against those who have not; aggrandizement is exaggerated, until magnates become superhuman, and until the multitude is debased, whilst the laws of a bountitude is debased, whilst the laws of a boun-teous Providence, that poised the world and its conditions in a balance, are set at nought. Thus it is that the very prosperity of a State tends to its downfall, for what can thrive with the proud "who devour widow's houses?"

The theories here alluded to, so published in THE BUILDER, were shown to several popular

members of Parliament, such as Mr. Horsman, Lord Dudley Stuart, and others, who approved them. All architects and builders who clearly discerned the beneficial influence who clearly discerned the beneficial influence that perpetuated tenures must have on arts and architecture, approved them. All benevolent men actuated solely by public interests and the common weal approved them. Not so the great proprietors. They calculate on "adding house to house, until there be no place left." They cannot, in case of an enfranchisement, preserve to their own multiplied receivery multiplied states with Palliamentary. posterity, multiplied estates, with Parliamentary and fixed interests to each and every of their heritors; therefore they dread the alternation of fixed capital into the possession of middle orders, and the acquirement to themselves of only the representative value in funded stocks;

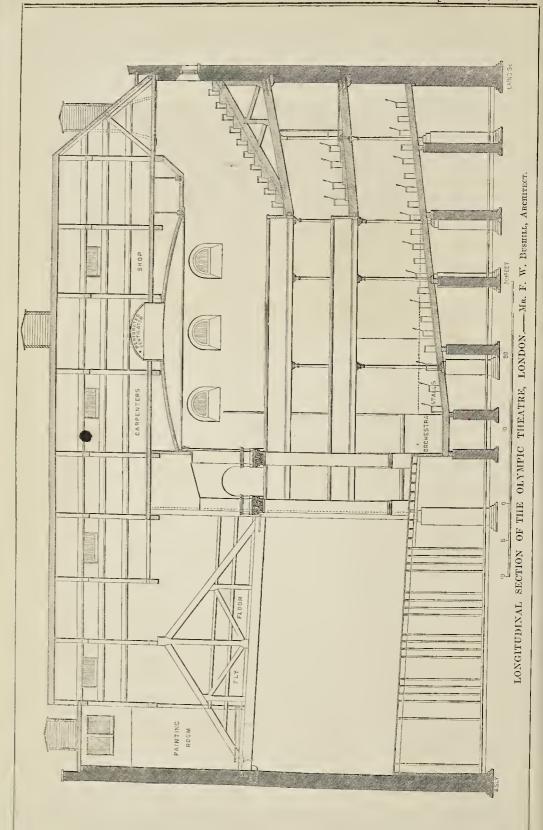

only the representative with in turnes orders with legislative or representative power.

As a specimen of the temper in which such suggestions are regarded by landlords, take the reply of a member for a bome county, who returned the printed copies on perpetuity of leaseholds, with this note:—"I see nothing in your plan hat one for leaseholders to rob landlords; they have obtained possession of a piece of land on certain conditions, and for certain purposes,—that is, a lease for 90 years, on which they have built houses calculated to last that time, and then to tumble down; and you propose to make this a pretext for robbing the owners of their land in perpetuity, under the mild term of a transfer,—just as a pick-pocket transfers your handkerchief from your pocket to his."

'Tis as unnecessary to observe the disingenuousness of the arguments, as to comment on the style, of such a reply to a proposition for fair purchase,—one at least as fair as that by which the Legislature authorized the appropriation of freeholds for railroads on valuation, of common and waste lands, on requiting the lords of manors, or of the extinction of debts owing to tradesmen of six years' due. However, the Legislature being owners of parks, wisely made a reservation in their own favour, that, although railroads might take their course through farms, paddocks, closes, and gardens, still parks should be sacred, and only attainable on the valuation of the proprietors them-

The plain and practical mode of meeting a great social evil as here detailed is simple and honest, and is appreciated, as a known fact, in a 'known tongue.' It is certain that attention, first aroused by The Builder, is awake to the imperious necessity of a change; and equally sure that some of the able and liberal members of the House will give a momentum to the theory which, although started recently against a long-enduring evil, may prove per-haps as efficacious and as electric in its effects, producing benefits and intelligence hitherto unsuspected, as the almost magic transmission of intelligence by wire. Many latent proper-ties of nature are still hidden from the apprehersions of man; accident or the occasion may reveal them, and when they are called into action, the human family is clevated. England is the only country in the earth where men will huild on transitory and evanescent terms. glance at the magnitude and solidity of manstons in other lands, demonstrates this. Look at Paris: there the sites of houses are in free-hold, and there architecture is fostered—so at noid, and there are intecture is fostered—so at least in private ahodes—for the great structures there are for the most part in perpetuity. The ill-contrived, paltry, and mean character of a street or lane in London will almost demarcate the duration of the lease of the foundation; it is calculated to last the term, as the shell of the engineer when projected from a mortar, has its elevation more aloft to clear mortar, has its elevation indication to clear space in a parabola, so the frail structure is erected to endure for a time equable with the interest of the builder. QUONDAM.

Newport Church Competition.—We understand that six designs have been selected from the thirty that were exhibited, from which the select committee are to submit the one they determine on as the most desirable to the hody of subscribers. The designs of Mr. Dawes and Mr. Johnson had an equal number of votes; Mr. Stratton, jun., came next, and Messrs. Fuller and Gingell, and Mr. Frances, were the other selected competitors,

DOORWAY OF CHENEY CHURCH, BELGIUM

THE OLYMPIC THEATRE, WYCH-STREET, STRAND.

THE accompanying longitudinal section of the new Olympic Theatre, through pit and stage, in connection with our article and illusstage, in connection with our article and illustrations last week, serves to show the whole construction of the building, the position of the carpenters' shop and painting room, the mode of carrying the "fly floor," and the way in which the timbers that support the gallery and box floors are secured. In this particular Mr. Bushill has successfully departed from the usual course. usual course.

usual course.

It has hitherto been the general practice to form the interior of a theatre independently of the external walls; i.e. to build the enclosing valls and to roof the building, in the first instance, and afterwards to construct and fit in the "horse-shoe," with the several floors and internal works. Now this, in the first place, is a more expensive process; and secondly, would seem to be a less secure mode of construction than that which has been adopted here, viz., framing and fixing all the internal work in connection with the walls as the brickwork was carried up, whereby the whole is work was carried up, whereby the whole is bonded together. The section shows the ends of the timbers in iron shoes resting on the granite corbels, and the iron ties securing the ends of each timber to a second piece of gra-nite about 5 feet long, 6 inches by 4 inches, which is securely built into the wall. Still further to counteract the thrust inwards, the floor is ingeniously framed, as already men-tioned, on the principle of the horizontal truss, the side walls and the areas real. the side walls and the cross walls at the prosce-nium serving as abutments.

The stage is lighted at night from the top,—
"wing-lights," the source of much danger,
being avoided. There are for this purpose five
"battens," each with seventy lights, which can
be raised or lowered to the extent of 10 feet by

independent of the metre, only to be used in the event of accident to it,—a useful provision, for want of which we have known a theatre left in darkness for some time.

DOORWAY OF CHENEY CHURCH, BELGIUM.

This curious doorway is the principal entrance to the church of the village of Cheney, one of the stations on the railway from Tournay to Monscrou, the frontier town of the northern line with Belgium. The church is said to be of very old foundation, but the modern plasterer and painter have been at their "dirty work again," and have left little to admire.

Lille.

*** Judging from the sketch, we should attribute this doorway to not earlier than the sixteenth century. It is one of those architectural vagaries oftener found abroad than at

ONE ORDER OF ARCHITECTS.

LIKE Dame Quickly, you know not where to have him,—neither with the surgeon, ever out and on the move,—nor with the attorney, all day at the desk: he partakes of the character of each. He is the uncertain omnipresent; his the authors here there are there of annext the part of the p and day at the decision in partiakes of the chinacter of each. He is the uncertain omnipresent; his, the neither here nor there of avocations, You shall call on him one day, and be told he is at York: send off a letter (important, of course) instanter, and passing his door next morning see him smoking his chihouk under the friendly shade of his domestic banian. He may say, with Hoby and Stultz, that his business is only with such as "have two gowns and everything handsome" about them: his business is with the wealthy and the titled. This imparts an aristocratic appearance highly admirable to his person, and a beautiful tone to his moral character. As his calling is half a fine art, half a trade,—half noble, half mechanic,—an amphibious calling, so is he the crocodile of the human race: as a youth, he devours medals,—as a man, pupils; with tears be raised or lowered to the extent of 10 feet by means of leather connections. It is much to be desired in stage lighting that the "float," as it is still called from its nature originally, could be got rid of, or at all events be more protected than it now is. The death of Miss Clara Webster, some time ago, and the accident at the Marylebone Theatre quite recently, afford sufficient evidence of its danger.

The stops for turning off the battens, chandleier, float, &c. (all separately) are so arranged as still to leave a small escape of gas, even when shut off close, so as to avoid the possibility of fresh lighting being required. At each meter (there are two, one for the front of the house and one for the stage) there is a side junction between the main and the supply pipe,

occasion of receiving sundry medals. On this point he is insatiable: coin Golconda, and he still cries, "Give, give." His dreams of things, men, and houses, are made up of them; he would wish a suit of armour fashioned out of them: with all this,—for such trifles, professedly, he cares nought. The pretty prattler talks of fame,—he works for reputation; and from his mouth proceed such dulcet sounds as "Parthenon, Palladio, Wren, chaste, ve-ry claste, elegant, ve-ry sweet." He looks on his calling as requiring the most extensive knowledge, the most consummate taste,—on this count he has a chaos of a library, and patronizes the fine arts. He exhibits at the Academy, and revels in a brightly-tinted landpatronizes the fine arts. He exhibits at the Academy, and revels in a brightly-tinted land-scape, as Utopian as his design. He is a constant attendant at his Institute, where he is gently garrulous, and gives a mysterious approving smile of recognition when some pedantic member quotes Latin. He has published a work, and begot children. He has visited Rome, and is delighted with everything "classical,"—considering other styles as passing whims. His house is always clean and neat; sometimes he labels it with a few statues, and an ornamental chimney-pot pining in silent solitude down the area. However little he really knows of the arts, he loves everything relating to them. He is a great stickler for workman's knowledge,—principally because he is entirely ignorant of it. He can tell you he exact fall of the steps of the Parthenon, and builds a house which is a Pandora's box to the owner. Notwithstanding all these little peculiarities we admire and love the man, and so will analyze him no further, for—he gives constant attendant at his Institute, where he is so will analyze him no further, for—he gives famous dinners. J.

Public Funds and Public Works.—It is now believed, in well-informed quarters, that the practice of annually voting large grants for public buildings will be abandoned, and that a fund, redeemable at a certain period, will be created specially for carrying on works sanctioned by Parliament; that it will be managed independently of the office of Woods, &c. The interest of the debt, and such further interest as will secure its redemption, will be annually voted by Parliament; thus securing a more complete check on estimate and expenditure. The impolicy of taxing the present generation, for works intended for many ages, is at length admitted: under the new system, works to a admitted: under the new system, works to a large amount, giving employment to thousands of artisans, may be carried on, to the great benefit of the community at large, and with a burthen easy to be borne.

SALTER'S PATENT FOR FLUSHING DRAINS.

WE have recently examined an arrangement We have recently examined an anagorated for rendering the flood-gates of sewers self-acting, invented by Mr. Salter, which appears well calculated to effect the object in view. According to the mode now in use, flood-

gates are placed across the sewers, in order to produce a head of sewage water equal to their height, and are kept closed by means of an iron neight, and are kept closed by means of all from bar, which is removed periodically by an attendant to allow the pent-up water to rush forth and clear all before it. The flushing, therefore, takes place only when the attendant is present to set the flood-gates free, and it follows that the gates must after versus allowed. follows that the gates must often remain closed long after they ought—consistently with the purpose of their construction—to be closed. To make the flushing system perfect, the flood-gates should open the instant the necessary quantity of flushing water has accumulated hehind them, and this it is which Mr. Salter has accomplished.

The inventor hooks the end of an iron strut to the ordinary gate, and, at an angle of about 45°, inserts the other end into a strong staple 45°, inserts the other end must a strong scape firmly fixed in the brickwork of the sewer. The gate is thereby made perfectly fast; but in the centre of the strut there is a weighted joint, which, when acted on in the following manner, instantly sets it free. When the collected water has attained the given height, it is conveyed by an overflow-pipe from one side of the gate to the other into an iron basin which works on an axis, to which is attached a lever, extending beneath the joint in the strut, when the gravity of the water in the basin overcomes the weight of the lever, and the joint of the strut is suddenly lifted upwards, on which the accumulated body of water forces the gate open, and the strut becomes content of the structure of tracted into the form of a reversed V. the water is rushing through the sewer, the basin, by being inverted, emptics itself and rcturns to its former position; and when the current has slackened so as to be of no farther service for flushing, the preponderating weight of the strut being upwards, it gradually falls back to its original position, and the gate is

It has been applied with much success in the great sewer which runst hrough St. Giles's; the sewer is kept as clean by it as if it were swept. The patentee has a simple and efficient swept. The patentee has a simple and enterent apparatus for flushing house drains. Apropos of flushing, what is the result of the inquiry ordered by the late Commission of Sewers (on the motion of Mr. Leslie) into the enormous expenditure on flushing made by the officers of that commission, during a certain period of time.

SUPPLY OF WATER TO SOUTHAMPTON.

Ar the last meeting of the Southampton Board of Water, a statement was read from Serjeant Campbell, showing that the town might be amply supplied with water from the Otterbourne Springs. In these days of "sanitary improvement" every instance of the misappropriation or the misdirection of the resources of towns by their municipal authorities is not without its use, if held up as a warning to others.

warning to others.

In the case of Southampton it would be difficult to find a more flagrant example of misdirection than the hitherto fruitless search misdirection than the Intherto runners search for water affords. Within the last few years about 45,000l, have been expended for this object, nearly the half of which sum has been expended itterally sunk in the Artesian well on the common, and the remainder has been expended thrown away would perbaps be a more appro-priate term—in boring other wells, and in constructing drains and reservoirs for collecting the surface-water of the upper part of the common. The result of all up to the present time is an insufficient, intermitting, supply of dirty water to the town.

The report seems to show, that if a proper examination had taken place before commencing these expensive and unprofitable works, ing these expensive and unpromaine works, an abundant supply of the purest water could have been had within seven or eight miles of the town, which could be brought into it for less than half the cost that bas actually been incurred. The town authorities, however, are so, reluciant to retrease their middlessed states.

that they have given notice of their intention to move for a new bill in the next session of Parliament, to confer upon them an extension Parliament, to comer upon their present supply of their powers to eke out their present supply of water, with an additional supply much the same quality from the rivers and canals in the vicinity of the town.

A number of the rate-payers have memorialized the Board of Health to send down an

assistant-commissioner to investigate the sanitary affairs of the town.

WORKS IN CHESTER.

THE tower of St. Peter's Church, Chester, the tenders for erecting which showed so much difference, is now completed. It was commenced in May last. The style aimed at by the architect, Mr. James Harrison, is that of the transition from the Decorated to the Perpendicular. The tower is 19 ft. 6 in. square, and 75 ft. high; it is ornamented with four gur-goyles and eight pinuacles. The erection is divided into three stories; the upper one forming the helfry. The entrance doors leading into the church and tower are cut out of one of the oak bearers taken from the old building; the doors are hung on ornamental binges. The ceiling under the tower in the passage The ceiling under the tower in the passage through the rows is panelled. Mr. Morris is the contractor, and executed the carving himself. One of the local papers, to show Mr. M.'s expertness, says he commenced and finished the carving of three heads in one hour and forty minutes! We advise him on another occasion not to be in such a hurry.

The arrangement of the buttresses to this tower is peculiar, and to our eyes not pleasing. The main buttresses have other smaller but-tresses set against them obliquely. The archi-tect is to be praised for having avoided the use of the red sand stone, as originally intended, and to which we objected at the time. The stone used is from Minera, near Ruabon, and costs about 2½d. per foot cuhe.

St. Peter's Church has heen repaired and

re-arranged, internally, under the same archi-tect. Some of the ugly galleries have been set back, but a new one on the south side has set back, but a new one on the south side has been erected, which is to be regretted. When we were in Chester the bosses of roof were coloured hlue and white, and had a ghastly effect. We hope these have been altered. The builders were Bellis and Williams; the mason, Morris. A curious painting was found on the north-east pillar of tower.

At the Chester cennetery, beautifully situated, the entrance-lodge is late Tudor, the chapel Norman, and the dissenters' chapel Elizabethan, if we may so term it. The architect is Mr. Penson.

The iron girder-bridge over the Dee, close by, to which the accident happened some time since, is strengthened by wooden struts.

THE MARBLE ARCH.

PERMIT an ex-architect, through the medium FERMITAIN ex-architect, through the medium of your widely circulating columns, to offer a suggestion on the destiny of the marble arch. It is reported that, instead of removing it to some other site, it is the intention of the Government to sell it as old materials. This I cannot believe; I do not think they would venture to commit such a vandalism. The arch is affirmed to have cost an extravagant sum, and this is another reason why we ought not to be deprived of it. It is, moreover, our only one: the French have several such in their one: the French date seekep what we have got, it will appear that we did not think ourselves worthy even of this. My suggestion is, selves worthy even of this. My suggestion is, that it be brought down and placed in front of the landscape garden interior of St. James's-park, to which it would serve as a royal entrance, and would still seem to keep up a entrance, and would still seem to keep up a connection with the palace, which would be seen in the distance heyond it. Placed here, in the vicinity of the House Guards and Admirally, it would also serve exceedingly well as an arch commemorative of the valorous doings of our army and navy, and would occupy an analogous position to the arch of the Tuileries at Paris. Our glorious Nelson has his monument, and our great living hero his, but where is the monument to our soldiers and sailors so reluctant to retrace their misdirected steps

European war that grew out of the French European war that give out of the French revolution? A good opportunity now presents itself for performing an act of justice which has too long been delayed. By the addition of some trophy on the top, and a suitable inscription in front, the unfortunate arch, which seems to create such embarrassment, might be converted into a lasting memorial of British valour, and the money it has cost, and still may, will never be regretted.

H. C. BARLOW, M.D.

SCENERY AT THE LYCEUM THEATRE.

A MORE extraordinary and beautiful piece of stage decoration and invention, than that which forms the closing scene to Mr. Planche's Christmas extravaganza at the Lyceum Theatre, was never witnessed. It is difficult to under-stand how such brilliant effects of colour are obtained. In previous scenes, especially an Italian ball-room scene, architecturally correct, and a landscape with the foliage of the passion flower spanning the stage, Mr. Beverly had shown his admitted skill as a stagevery nat shown his admined same as stage-painter; but the tour de force was reserved for the wind-up, and carried the house by storm. The business of the scene goes on in front of a vast cluster of palm leaves, which, front of a vast cluster of palm leaves, which, when the climax approaches, opens, each leaf showing its golden lining as it bends towards the stage, and discovers a circle of nymphs bearing aloft the "crown jewels." As a morning contemporary remarks, to say what the jewels are made of, what the nymphs are dressed in, is impossible,—it was a blaze of light and colour. Mr. Planché, as a matter of light and colour. course, has done his part well-Madame Vestris, hers; and the result is a perfect whole. shall look in at the other houses next week.

A REMEDY FOR DAMP WALLS.

So often are your readers annoyed by the intrusion of damp into walls, and the disfigu-ration thereby of paper-hangings, decorations, &c., that you and they will forgive our calling &c., that you and they will forgive our calling their attention to a means of obviating the evil, and one which we can with confidence recommend. We do not suggest any plan for preventing damp occurring in walls (its existence, arising from a variety of causes, is generally first made manifest by its effects), but to prevent its being visible, or doing any injury when too late to remove it.

when too late to remove it.

The remedy is this: - Coat the part of the wall affected by damp, and for some distance wait anceted by damp, and for some distance around it, with knotting composition—the same article used by builders for priming the knots in wood. It should be applied upon the bare plaster, and however damp this may be, the composition, from its rapidly drying pro-metry will in a few minutes from the property, will in a few minutes form a smooth and very tough coating, or skin. Two coats should be given, which will prove quite impermeable to damp, and upon which the most delicate papers may be put immediately without fear of injury. The idea occurred to us about a year ago, and we accordingly tested it upon a wall where the damp arose from the ground, and likewise upon a staircase wall, which was always duanp from an imperfect joint in a leaden water-pipe behind the plaster. The result is very satisfactory, as it is impossible to detect the slightest damp either by the sight or touch. We are not aware that knotting composition has ever been applied to this purpose before, and we therefore make this communication for the benefit of the trade.

Mander, Brothers.

Wolverhampton.

THE INVENTOR OF THE BLOCK MACHINERY.—Some of your contemporaries in their notice of the late Sir M. I. Bruncl, have claimed too much for him. The original inventor of the block machinery was Walter Taylor, an Englishman. He took ont a patent for it, and for years supplied the navy with blocks. When his patent expired be tried to get an extension of it, and, on failing, Government employed Brunel to set it up at Portsmouth. He improved and added to it, but he has not the least right to the credit of the original invention. If this be questioned, you shall have a full statement from the hest anthority.

N. R. THE INVENTOR OF THE BLOCK MA-

WATER SUPPLY.

NEW YORK AN EXAMPLE TO LONDON.

THE Croton aqueduct and water-works bave cost more than three millions sterling, although New York is only about the size of Glasgow, with a population of not much more than one-third of a million, the mere miscellaneous third of a million, the mere miscellaneous gatherings of the surplus population of this and other countries during the present half of a century almost alone. Let us hear no more misgivings then, on the head of expense, however great, in the adequate supply of pure and healthful water to a population of six times the amount in our own metropolis.

The following details of the construction of the noble water-works of New York were colthe noble water-works of New York were col-lected by a correspondent of the Reformers' Gazette from authentic American documents and publications. The dam constructed to supply the aqueduct is about six miles above the mouth of the river Croton, and about forty miles from the city of New York. It is elevated 38 feet above the level of the river, and is 250 feet in length. The masonry is 8 feet thick at top, and 65 feet at base. It sets the water back about six miles, forming what is called the fountain reservoir, which is estimated to the fountain reservoir, which is estimated to cover an area of 400 acres. The width of the lake varies from a quarter of a mile to about one-eighth. The height of the interior of the lake varies from a quantity of the interior of the one-eighth. The height of the interior of the aqueduct is 8 feet 5½ inches, and the greatest width is 7 feet 5 inches. The foundation is formed with concrete, the side walls of stone: the bottom and sides of the interior are faced with brick, and the top is covered with an arch of brick. Thus constructed, it is carried over the other part of the par valueys and through mins, a distance of sinry-eight miles, to the receiving reservoir in the island of New York. From the receiving reservoir the water is conveyed in two miles of iron pipes to the distributing reservoir, in which the surface of the water is 115 feet above

which the surface of the water is 115 feet above the level of mean tide.

The aqueduct, 12\frac{3}{2} miles from the Croton dan, crosses the Mill river 72 feet helow its previous level hy a culvert, the arch of it through which the river crosses being 172 feet through which the river crosses being 172 feet long, all within the foundation breadth on which the aqueduct rests. The valley of the Harlem river (or branch of the sea), a quarter of a mile in breadth, and descending 120 feet helow the previous level of the bottom of the aqueduct, was always regarded as by far the most formidable work to be encountered in the construction of this aqueduct. Various plans most formidable work to be encountered in the construction of this aqueduct. Various plans were proposed to accomplish this object, comprising an aqueduct stone bridge, resting on piers and abutments, so as to continue the aqueduct at the same elevation; an inverted syphon of iron pipes; a suspension bridge of wire cables, supported at intervals on stone piers, and carrying the water across in iron pipes without descent.

It was at length resolved to combine the two ideas of a stone bridge and an inverted syphon of pipes, and this plan was in progress when an act of the Legislature of the State was passed, requiring that either a tunnel should be carried under the hed of the river, or that a structure should be erected of which the arches should be at least 80 feet span, and 100 feet from the level of high water to the under side of the crown. It was at length resolved to combine the two

of the crown. The history of the Thames tunnel deterred the engineers from attempting a similar work, 300 feet in length, under the bed of the Har-lem, and finally it was resolved to construct an aqueduct bridge of exactly the altitude required. This being only 100 feet above high water level, an inverted syphon of iron pipes was still necessary.

COLOURING BRICKS.—A patent has been granted at New York, to Mr. C. B. Doty, Cortlandt, Westchester county, N.Y., for a "peculiar process and manipulations of mixing colouring materials with the moulding sand for the surface of bricks, and the pressing the same upon and into the surface, so as to produce bricks of a surface, so as to produce bricks of a surface, so same upon and into the surface, so as to produce bricks of a uniform colour upon the surface, as well as of a uniform shape and smoothness, the same being effected with greater economy than hy mixing a sufficient quantity of colouring matter to colour the whole body of the brick; and this, regardless of any particular colouring matter or especial of any particular colouring matter or especial colour to be produced when the bricks are burned."

Miscellanea.

THE GAS QUESTION.—Wardmotes have been held throughout the City districts, at almost all of which congratulations have been voted on the immediate prospect of an abundant supply of cheap and good gas. They ought to have passed votes of thanks to The Builder. A meeting of the Cen-THE BUILDER. A meeting of the Central Gas Consumers Company has also been held, to consider the clauses of their bill, which is based ou the model for the constant of the con bill, which is based ou the model Gas Act, limiting dividends to 10 per cent., and compelling further reductions in price to the extent of all surplus profits. At this meeting, or rather a meeting of ward committees and gas consumers into which it resolved itself, Mr. Pearson announced his resignation as a director,—stating, at the same time, that the other day he found the corporation split into other day he found the corporation split into parties and sections on this question; and as he was dependent on it, and found his duties inconsistent with any further official connection with a company forming the subject of such party spirit in the corporation, he felt obliged to announce his resignation, although, extra-officially, he would still forward its interests as earnestly as ever. At this meeting also a determination was expressed that the next object after the was expressed that the next object after the successful issue of the present shall be to attack successful issue of the present shall be to attack the water companies, whose charges were also far too high. A rumour that the new gas company meant to supply their own gas fittings was expressly contradicted. One speaker, Mr. Lowe, said that the old companies had asserted that they had not divided more than 10 per cent unofit and that therefore, their profits cent. profit, and that, therefore, their profits were quite reasonable; but these gentlemen had forgotten to state that, in addition, they had also obtained no less than from 70. to had also obtained no less than from 70% to 100% bonus per share at frequent intervals. He himself was acquainted with an old lady wbo had received a bonus of 80% per share.

— The Chartered Gas Company have now reduced their price to 5s, per 1000 feet.

— The Surrey Consumers Gas-light and Coke Company are now again astir. They have already commenced their works, with consent of the parochial authorities of Lambeth, St. George's, Southwark, Camberwell. consent of the parochial authorities of Lambeth, St. George's. Southwark, Camberwell, Peckbam, Rotherhithe, and various other districts south of the Thames to open roads and lay pines, &c. A reduction of their proposed price of 5s. (too high, as we said at its outset) to 4s. 6d., with share of profits, or 4s. without share of profits, has also been announced, and they expect to be supplying customers by contract or meter early in the ensuing year. — The Salisbury Gas Company are to reduce their price 1s. athousand cubic feet at the opening of the new year.

year.

Society of Arts.—At the meeting on 19th instant,—Mr. T. Uwins, R.A., in the chair,—Mr. Highton read a short supplementary paper on "The Application of Electricity to the Arts and Sciences." A number of new specimens of electrotype were exhibited, among which was some iron tubing coated with a which was some iron tubing, coated with a deposit of cadmium to prevent oxidation; also depost of cadmium to prevent oxidation; also iron covered with a deposit of brass, hitherto deemed impossible, the brass being a deposit of copper and cadmium, instead of copper and zinc. The construction of chronometer balances, on which a deposit of copper on the steel remains instead of brass without fusion, the temperature of the steel remaining the same as that of the atmosphere was also exhibited. as that of the atmosphere, was also exhibited. The remaining specimens, which were of re-The remaining specimens, which were of remarkable beauty, were supplied chiefly by Capt. Ibbotson, Mr. Elkington, Mr. Collis, and Mr. Ackermann; those of the last-named gentleman being from the royal manufactory at Berlin. The paper concluded with a further explanation of the philosophical part of the subject. A paper on Pox and Barrett's method of constructing huidings fire proof was read

subject. A paper on Fox and Barrett's method of constructing buildings fire-proof was read.
WOLVERTON MECHANICS' INSTITUTE.—
A very agreeable meeting of 1,400 to 1,600 persons took place at a soirée on 21st inst., at Wolverton, in support of the institute for railway mechanics established there. Mr. Glyn, Captain Huish, Sir Harry Verney, the Mayor of Birmingham, Mr. Cruitshank, the artist, and Mr. Mt.Connel. the superintendent, and others Mr. M'Connel, the superintendent, and others addressed the meeting, and theutmost harmony and good will to its objects were displayed by all present.

PROJECTED WORKS .- Advertisements have been issued for tenders, by 5th proximo, for executing the works of warming and venti-lating the church of Northfleet, with plan and specification; by 31st inst, for the erection of a stone bridge of one arch, of 80 feet span, at Ottery St. Mary, Devon, and for approaches to same; by 15th proximo, for the execution of the whole works connected with the erection of three passenger station houses on the Glasgow, Dumfries, and Carlisle Railway; by 12th, gow, Dumfries, and Cariste Railway; Dy Ezul, for laying down water pipes at Southampton; by 31st inst., for the masons' and joiners' work in erecting a coal shed at Sherburn House colliery (Gateshead); and by 12th proximo, for the erection of two four-story warehouses at Leicester.

ARCHITECTURE OF BIRMINGHAM. - At the ARCHITECTURE OF BIRMINGHAM.—At the St. George's Instruction Society, Birmingham, a lecture was delivered on Tuesday evening, by Mr. P. Hollins, "On the Architecture of Birmingham, with suggestions for its improvement." In the course of it the lecture urged ment." In the course of it the lecturer urged that so much advantage would follow the unprovement of the town, that it could scarcely be paid for too dearly. He said:—"If we take a prospective view of the subject for a hundred years, I venture to assert that half the amount of money that would be expended in that period upon public and private buildings on the present disjointed and irregular plan, might be made amply sufficient to produce order and harmony in our street architecture and splendour in our public edifices, and achieve for the town a high fame for its architectural character. The first thing to be done is, the authorities must obtain powers to control the designs of houses in the streets. This would enable us to obtain some of those beautrof the designs of houses in the streets. This would enable us to obtain some of those beautiful vistas of architecture which charm us so much in the improvements at the west end of London. Continuity of line, with uniformity of plan, in certain parts of a composition, give beauty and harmony, and, if on a sufficiently large scale, sublimity. Should any one ask what will become of the picturesque in the event of my plan being adopted, I reply, I am not considering a plan of a new town, but proposing to arrange and harmonize an old one, which is full of oddities, and where a few simple lines are absolutely necessary to soften down the conflicting and abrupt contrasts which every where meet and bewilder the be-holder."

PROVINCIAL.—A new county court house ROYNGIAL.—A new county court noise is in course of erection at Bow. —A native of Wolverhampton proposes to give 1,000% towards the building of an orphan asylum for South Staffordshire in that town, and an additional 1,000% towards the endowment, if the trusteer of the Blue Cent Saled on invested the Blue Cent Saled o trustees of the Blue Coat School can increase and remove their boarders to the new site, and leave their day-school to parochial tuition. leave their day-school to parochial tuition.

A new window, representing the crucifixion, has heen painted by Mr. M. O'Connor, of London, and placed in the eastern lancet of the chancel of Snenton Church, as an offering by Miss K. E. Wyatt, sister to the incumbent.

—Mr. Cobden and others have resolved to erect a very large public room at Leeds,—The foundation-stone of a new building for the Carlisle City and District Bank was laid on Wednesday week in that city. It is to be the Carisie City and District Dank was laid on Wednesday week in that city. It is to be of white stone, from Lanerton quarry, on the Earl of Carlisle's estate, the barony of Gilsland. The site is that of the old "White Lion" inn, The site is that of the old "White Lion" inn, English-street,—one of the oldest houses in the city, just removed. A fingaged thorough-fare will be provided from English-street to Lowther-street. The architect is Mr. T. J. Cox, and the contractor, Mr. R. Wright.—The works for building Flag-lane schools, Sunderland, were let on the 17th inst., to Messrs. Millar and Lax of that town, and it is intended to begin operations immediately. Mr. T. Oliver is the architect.

intended to begin operations immediately. Mr. T. Oliver is the architect.

The Marrles of Paros.—The Government of Greece have, by contract, made S. Cléanthes the sole possessor, for the period of thirty years, of all the quarries of marbles in the commune of Naoussa, at Paros. The proprietor has commenced extracting the marble, and has sent several blocks of large size to Rome and Florence. size to Rome and Florence.

New Hospital for King's College.—
New Hospital for King's College.—
The munificent offer of 5,000l. has been anonymously made and accepted by the council towards the extension of the hospital accommodation for King's College, Somerset House.

ARCHITECTURAL SOCIETY .-OXFORD At a meeting on the 5th instant, it was stated that the committee bave it in contemplation to establish a special fund, to be called the Church Building and Restoration Fund, the object of which will be to make small donations to such churches as submit their plans to the society for its approval, by which means it the society for its approval, by which means it is hoped that much practical good may be done throughout the country. Mr. Freeman delivered a lecture on the "Constructive Systems of the Entablature and of the Arch." Some remarks were then read by Mr. O. Jewitt on the proposed restorations of the pinnacle of St. Mary's Church. In the alterations of the seventeenth century, the pinnacles of the small spires which terminate each buttress seem to have been taken away, being probably much decayed, and in order to obviate the nakedness which their removal would occasion, the small pinnacles at the angles were added, having evidently nothing to do with the original deevidently norming to do with the original design. The large pinnacles, too, were most probably much decayed, and at the same period either rebuilt or cased as nearly in imitation of the originals as the ideas of beauty of the times would allow. The general form of the mass was originally much the same as at present and the one was resided up without intersent, and the eye was raised up without inter-ruption, from the parapet to the pinnacle, first roption, from the parapet to the pinnaces, mast by the canopies, then the spires, then the set off, and lastly by the crowning pinnacle. The only alterations necessary in the present pinnacles, according to Mr. Jewitt, are the restoration of the pinnacles to the spires of the canopies, the removal of the small pinnacles at the angles, and the restoration to the large pinnacles of their proper decorative character: little more would be required than a new facing to the pinnacles; and the whole, while it would retain to the spire that beauty of form and composition which is so admi-rable, would be executed at a comparatively trifling expense.

Supply of Pure Water.—A correspondent states, that a patent right for bringing water on the respective lines of railway into London and other cities, from high elevations and pure sources, in metallic and porcelain tubes, to supply the wants of the public at one-half the present price, and in a much purer state than hitherto obtained, bas been granted to Mr. Lamplough, and that arrangements are now being made for the laying down of pipes on the respective lines of railway into London, on a fixed rental on the income derived, thus adding permanently to the railway return, and preventing a needless outlay of capital in the purchase of property for a canal or aqueduct, or both conjoined, securing also the water from injurious impregnations and the absorption of gases. The principle of syphonic action is put into requisition, and by means of a hydraulic pump, a vacuum is caused and a continuous and uninterrupted flow of this necessary of life is obtained so long as the fountain maintains its supply.—What we want is pure water,—how, we care not. It is a fact undeniable, that the inhabitants of Lambeth and Southwark have little better than sewage water to drink, and that in proportion to the impurity and scanty supply, ceteris paribus, so they suffered in the late epidemic.

PICTORIAL MAPS.—On reading an article in a late number of The Builder, on pictorial maps, it occurs to me that, in the fine café Pedrocchi, at Padua, there are maps of the world painted on the walls, so that you may sip your coffee and study geography at the same time. I should mention also, that contrary to the usual practice, north is placed at the bottom. I do not know of any similar instance, and therefore imagined that this note might interest some of your readers.—C. F., jun.

The Facilities given for Forming Baths and Washinouses, under the Act 9 & 10 Vic., capt. 74, are not so generally known as they ought to be, and at the request of Mr. Woolcott, acting secretary to the committee for promoting the establishment of these most useful, and, indeed, most urgently called for conveniences to the working-classes, we are happy to reiterate what we have long and often pointed out, that this Act provides, that in the event of a request from ten rate-payers, the churchwardens of the parish shall convene a vestry for the special purpose of determining whether baths and washhouses shall be erected, and if a resolution affirming the proposition be agreed to by two-thirds of the vestry, an election by the parishioners of commissioners shall take place, who will be empowered to carry out the works. The council of any borough may, without any requisition, determine that this Act shall be adopted. The necessary funds for carrying the Act into execution may, from time to time, be borrowed at interest, on the security of a mortgage of the rates for the relief of the poor of such parish, or of the borough fund, as the case may be. In conclusion, we may add that the central committee at Exeter-hall will readily afford every information in their power to aid in promoting an object so highly important and beneficial to the community expensible.

community generally.

RAILWAY JOTINGS.—Mr. P. W. Barlow, C.E., of Blackheath, has registered a patent for improved permanent way, by which he proposes to dispense with the ordinary longitudinal sleepers, whilst the rails will be more efficiently secured than heretofore. The invention consists of two or more chairs in one piece, with a metal plate or bearer instead of the usual sleeper. The apparatus may, however, be cast in longitudinal halves, and secured by bolts and nuts, with bars crossing the way. The casting of chairs in two longitudinal halves for ordinary sleepers is also included in the specification. He claims the use of two or more chairs, or parts of chairs, combined with one plate or bearer, and the making of chairs in two parts for ordinary sleepers.—Mr. P. Macpherson, in a pampblet just published, states that the return to the House of Lords of law and Parliamentary expenses of 127 railway companies gives for law charges, 1,234,9481; Parliamentaryexpenses, 3,303,4614. Total, 4,538,4094. But this sum of upwards of 4½ millions does not include the law of some of the principal companies. The Great Western, the South-Eastern, Great Northern, Midland, York and North Midland, Berwick, Brighton, and others have not yet made a return.

Our Statues.—There are two very prominent objects in the centre of our renowned city (London) which seem to be little cared for. I mean the statues of our beloved Queen and the Duke of Wellington. I have been taught that statuary marble is a suitable emblem of purity; but the marble statue of the Queen in the Royal Exchange denotes any thing but that; the dingy, grimy appearance of the features, drapery, &c., almost forbids persons of correct taste from taking a lingering look bebind. Oh, Sir, what sort of opinion will our country cousins and foreigners form, who may visit our metropolis during the Christmas holidays, when they see Majesty in a condition so pitiable, and the noble Duke close by, the greatest general of the age, and a man of metal, exhibiting almost the appearance of a sweep with a soot bag wrapped around him? Really, Sir, I think soap, soda-water, and other requisites may be obtained at something less than war prices. I do, therefore, most sincerely hope that these few hints will be sufficient to stimulate our worthy city authorities, without any delay, to pay those necessary little attentions to royalty and merit, and prevent any further reference to the subject.—One

GREENWICH HOSPITAL.—I was at Greenwich a few days since, where I saw great preparations for building, and I was informed that considerable additions were in contemplation at the hospital to accommodate 1,000 additional pensioners, &c. Let us hope that the new building will be a prototype of the great master who has formed so magnificent a pile, and that it will be equally creditable to the present architect and so good a cause,—A. S.

ELECTRO-TELEGRAPHIC PROGRESS.—Some experiments have been made at Norwich, with a new apparatus, which seems by the description to be either that of Mr. Baker's ingenious autographic telegraph, or some modification of the same principle. Sixty letters were by this means legibly written in what we may fairly call long hand, stretching from London to Norwich, and it is expected that when the invention is fixed and ready to work without interruption, at least 200 letters a-minute will be worked off at once, thus doing away with all transcription, and insuring secrecy of correspondence.—The Americans are still going ahead with their lightning news-conductors, Between New York, Washington, and Baltimore, the charges are to be reduced for long messages; between 500 words and 1,000 to half rates, (4s., being the charge for the first 500), above 1,000 words to one-third only. Mr. Bain is said to have much improved his printing telegraph, and can not only transmit 1,000 letters a-minute, dispensing altogether with the perforated paper, but can give to any number of the 500 machines scattered over the union a simultaneous movement, which enables him to multiply intelligence at one and the same moment throughout the whole circuit of termini. Mr. Green, of New Jersey, also, as the Mining Journal notices, has invented a mode of coating the wires by rotating and stationary brushes, with portable paint, or other coating receptacle. A Mr. Pratt, of New York, has patented a plan for stretching wires over great distances, such as rivers, &c., by suspending strong gum elastic band, cord, or tube, to the posts, which, drawn out in the first instance, valves as the stretched. Mr. Curtis, of Ohio, has patented an improved mode of constructing indicating telegraphs.

indicating telegraphs.

RESPONSIBILITY OF PATENTEES.—In the Common Plea case, Dakin, administratrix, v. Brown and another, the parties have agreed to a verdict of 800% for the plaintiff, as damages or compensation for the death of Mr. Dakin. coffee merchant, by an explosion, in consequence of an alleged defect in the casting of a cylinder connected with an oven constructed by the defendants, who are straw bonnet makers in Cheapside, but also patentees of "Brown's Cellular Steam Plate,"—an oven said to be capable of generating a heat of 500 degrees, and which Mr. Dakin had ordered for heating a silver cylinder for roasting coffee. The only witness examined was Mr. Nasmyth, of Mancbester, who declared the casting defective.

COVENT GARDEN CHURCHYARD.—As your remarks upon intramural interment, and the state of our graveyards, have been so pertinent and seasonable as to cause universal attention, allow me to relate what occurred in Bedfordstreet, Covent Garden, on the 19th and 20th of this month. Eight double loads of the consecrated ground, full of human remains (as might he expected) were wheeled from Covent Garden Churchyard, where a brick grave had been dug, to the bottom of Church-place, and there remained till removed by carts, to the horror of the inbabitants and persons passing in that street,—the various bones of the human body being played with by boys, and jaw-bones, with the teeth perfect, taken up by various individuals. On inquiry, you will find the facts worse than my representation. The waterman for the coach stand, who was on the spot the whole time, was horrified at the desceration he wasobliged to witness.—J. G. G., Tavistock-row.

GEORGE JENNINGS.

29, GREAT CHARLOTTE STREET, BLACKFRIARS ROAD,

Begs to call the attention of those interested to the following articles, which he has invented and patented :-

THE SHOP SHUTTER FASTENER.

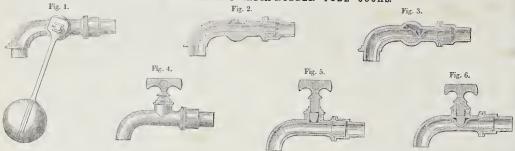

The trouble and disfigurement caused by the unsightly shutter bar is so well known, that it is only necessary to say, a shop front, handsomely decorated receives more injury from the application of the Shutter Bar than it does from any other cause.

The above invention not only protects the corners of the shutters, but effectually secures them, and its cost is much less than the destructive and troublesome Bar, as the patent fastenings can be had in malleable iron, at 5s, per shutter, or in brass, at 5s.

The following shops are selected as being in the principal thoroughfares, and the proprietors can bear testimony to the simplicity and efficiency of the invention:

Old Bond-street, 5, 34, 46; New Oxford-street, 468, 470, 471, 472, 473, 474; Strand, 140, 141, 166; Fleet-street, 74; Ludgate-hill, 31; Cheapside, 49; Westminster-road, 28, 29, 31, 41, 42, 43, 44, 65, 70, 71, 72, 73, 74, 75; Waterloo-road, 57; Blackfriars-road, 43, 46, 47, 57, 68, 71; High-street, Borough, 101, 156; Whitechapel, 99, 100, 101; Charing Cross, 55; St. Martin's-lane, 50; Aldgate, 12; Blackman-street, 15.

JENNINGS'S PATENT INDIA-RUBBER TUBE COCKS.

The principle on which these Cocks are made is so simple, that the following short description must at once make their superiority over the old Plug Cock apparent to all practical men.

Into the barrel and shauk of the Cock is placed a tube of Vulcanized India Rubber. Figures 2 and 5 represent the Cocks open, with an uninterrupted passage for the flow of liquids or gas. Figures 3 and 6 represent the water-way closed by the india rubber tube being compressed. By turning the handle, or The following are a few of its practical advantages:—

It will resist any pressure when closed, and when open the water flows as freely as through the pipe.

The water-way being entirely independent of the working part, it is not liable to damage by frost, and all leakage is avoided.

The facility of repairs by simply renewing the tube.

In the Ball-cock, its allowing a full stream of water to flow into the cistern till nearly full, and the impossibility of its "sticking up or down" cocks on this principle have now been fixed for some time in the Royal Mint, the House of Detention, Clerkenwell, the House of Correction, Cold establishments.

G. LENNINGS, has ween beloves in callegt the attention of the text and related and private establishments.

G. JENNINGS has much pleasure in calling the attention of the trade and public to the following

TESTIMONIALS.

I beg to certify that the greater part of the water-pipes of this building are fitted with Mr. Jenning's Patent India Rubber Tube Cocks. They have been in continue to give great satisfaction.

F. W. IH LL, Governor.

Sir,—Your Patent Joints and Cocks fixed in this establishment twelve months since as sound now, and answer every purpose at this time, quite as well as when Library and Joint Jonnings.

I am, Sir, your obedient servant, GEORGE PULMAN.

House of Correction, Coal Bath-fields, December 12th, 1848.

Sir,—In reply to your letter, I beg to say, the India Rubber Tube Cocks fixed in this prison are quite sound, and answering the purpose intended—I sup, Sir, yours obediently, To Mr. Jennings.

THOMAS FILLARY, Engueer.

Mr. Jennings,—Sir, I fed great pleasure in certifying, that—since your Patent Cocks and Water-closets have been fixed in this Union House—the several words are entirely very much to the counfort of the house,—I am, Sir, your obedient several, were the counfort of the house,—I am, Sir, your obedient several, Sir, Your obedient several, B. BONSER, Master.

2, Finsbury-circus, City, December, 1848.
Sir,—I have heard no complaints of any of your India Rubber Tube Cocks, though I
have had some fixed under great pressures.—I am, Sir, your obelient servant,
Alr. Jennings.
THOMAS CLARK, Engineer.

We hereby certify, that we have had Mr. Jennings's India Rubber Tube Cocks in this establishment for the last twelve months; they are auswering so well, that in future we shall use no other.

BROWNING AND SON. Distillery, Smithfield Bars, December, 1848.

12, Square, Winchester.

Sir.—I received the India Rubber Tube Cooks safely, and have had them fixed under the superintendence of Mr. Frampton, who is the manager of the water-works. I am delighted to be able to bear testimony to their efficiency, and feel certain their introduction into this city will be attended with great comfort with abbitants, from the following Greumstance—The city is in a valley, and is supplied with abbitants, from the following chromatomers, the highest eminence in its neighbourhood; consequently, the pressure of that elements of the cooks of th

I am glad I saw your advertisement in "The Builder," and I will do all I can to make your invention known in this city.—I am, Sir, yours respectfully,

W. SAVAGE.

The cost of these Cocks in brass is the same as the charge hitherto made for the old roundway plug-cock. As they can be made in iron, a great saving is effected, and they are warranted to answer as well as those manufactured in brass. Water Companies, Distillers, Brewers, and all large consumers, will save money, and relieve themselves from the annoyance of leaky cocks by their adoption.

JENNINGS'S WATER-CLOSET.

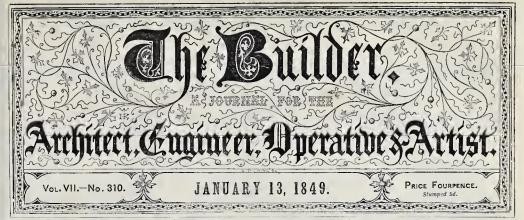

To this Closet the Patentee particularly invites the attention of all practical men—it is so constructed, it cannot be offensive, or get out of order—it has reither pan or valve—the raising of the handle allows the contents of the bason to fall with great force through a 4-incb India rubber pipe direct into the regulates the proper quantity to be retained in the bason. The cost of these closets are, brass-mounted, sunk plate blue bason, &c., 3l. 3s.; plain, with flat

CHEAP WATER-CLOSET PANS, WITH SYPHON TRAPS, IN GLAZED STONE WARE, PRICE 7s. 6d. EACH, MANUFACTURED BY

DOULTON AND WATTS, LAMBETH POTTERY, HIGH-STREET, LAMBETH, LONDON.

The importance of a system of thorough cleansing and drainage, and the application of Water-Closets with Traps, to every house, is so fully established by the late Parliamentary inquiries, and by public opinion, as to need no enforcement.

The annexed Pans are of the most simple yet perfect construc-tion; they are cleanly and imperishable; require no metal fans; and the price at which they are offered is so low, as to admit of their universal adoption.

Testimony in favour of the first three of these Closet Pana, and their suitability for general adaptation may be found in the recent evidence sixen before the Parlamentary Sanitary Commission, the HEAWIX AUSTIN, 28st, Consulting Engineer, and JOHN HEAWIX AUSTIN, 28st, Consulting Engineer, and JOHN sioners of Sewers. No. 4 is aggroved by Major JEBB, and has been extensively applied in Prisons and Asylums throughout the

PATENT TORRENT WATER-CLOSET, AUSTIN'S PATENT.

This much approved and admired Closet is strongly recommended to those Architects and Builders who have not yet tried it: it is SELF-ACTING, THOROUGHLY CLEANSES the basin, is always TRAPPED, and requires no CISTERN if it can be connected with the water-main.

THE STOVES AND WATER-CLOSETS ARE MANUFACTURED ONLY BY MESSRS. DOWSON (LATE OF 69, WELBECK-STREET), STINGO IRON WORKS, STINGO LANE, LONDON.

IMPORTANT TO THE SANITARY MOVEMENT.

PATENT FLUSHING SYPHON BASIN, AND SELF-ACTING CLOSET CONNECTIONS.

STEPHEN GREEN, PATENTEE, IMPERIAL POTTERIES, LAMBETH.

E M N В

A.—Basin, shewing the water flushing down the sides perpendicularly from the hollow rim or lip-all round when in action.

B.—Syphon, shewing the water trap as it always is, whether it use or out of use.

C.—Hollow rim or lip all round the basin, with the water flushing from it with great force perpendicularly.

DD.—Openings into the hollow rim of basin C, one leading to the right, the other to the left.

EE.—Two pipes leading from the measure lox to the hollow rim O.

F.—Valve box on the bottom of measure connected to pipes EE.

G.—Gleter measure with valve in the bottom.

H.—Valve on the hottom.

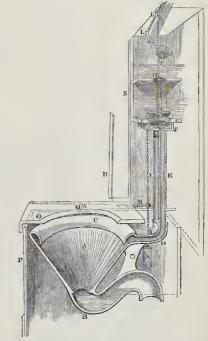

H.—Strong chain to left of the valve and attached to lever M.

J.—Ball valve, taking off all pressure on the cisteru

J.—Ball valve, taking off all pressure on the cistern

J.—Ball valve, taking off all pressure on the claters from the water supply.
K.—Union joint to attach the apparatus to the water supply, by means of a half-inch lead pipe, to any distance required.
LL.—Two pulleys for chain I to run ever.
M.—Lever with ohain attached.
M.—Counter weight at the end of chain I.
O.—Moveable seat connected to lever M.

P.-Woodfcase complete.

The absolute necessity for the adoption of trapped Water Closels to the health and comfort of every house is admitted by all; and the Meteopolitan Commissioners are about to cutore the filling cheen, effectual, and that cannot get out of order, is indispensable. The fartners of the SY HIGN FLOWARIAN MASHA and CLOSET CONNECTIONS flatters himself that his invention will be found to combine the above requirements. It is complete in telli, and require in a half-tick control of the state of the SY HIGN FLOWARIAN MASHA and CLOSET CONNECTIONS flatters himself that his invention will be considered to the state of the

force on the soiled parts, while the Syphon Flushing Basin directs the whole of the water with great force perpendicularly whom the sides of the basin, clearing all before it, and is thus effective will the and the sides of the basin, clearing all before it, and is thus effective will the and trustles. HIGH-STREET, LAMBETH, LONDON.

The annexed Pans are of the most simple yet perfect construction; they are cleanly and imperishable; require no metal fans, and the price at which they are offered as so low, as to admit of their universal adoption.

JAMES STIFF, MANUFACTURER of GLAZED STONE WARE DRAIN PIPES, BENDS, JUNCTIONS, THADS, de., 39, HIGH STREET, LAMBETH, LONDON. Established 1751.

STRAIGHT TUBES, with Socket Joints, in 9 fort lengths.

No. 4 in three pieces.

15 in. 3s. 4d. per Foot 4 in. 6d 12 in. 1s. 10d. May be had also a tMessra. GLADDISH'S LIME WHARFS.—Pedlar's Acre. Westminister Bridge; Gity-son Wharf, City, Baci Dycklead, Bermonder 2. Danyer's Wharf, toot of Batterea Bridge; Chelsea; Pratt Wharf, King's road, Camden New Town.

JENNINGS'S COCKS.

THE construction of these cocks is MOST NATURAL, consequently MOST SIMPLE. The circulation of BLOOD in the HUMAN BODY can be impeded, or allogether stopped, by more or less presures, so by these cocks the viru or tube of India rubber, as shown in fig. 13 of IFN AND FREE; in fig. 2 circulation is allocather stopped by the compression of the table. It is the only cock thors in the fig. 2 circulation is allocather stopped by the compression of the table. It is the only cock thors in the nection with the interior. The leafle cock, from the certainty of its action and the impossibility of its sticking up or down, is well worthy the attention of all who wish for a regular supply of water. As these cocks can be made in 100, a creat a suring is effected, and they are warranted to move a finite structure of the construction of the construction

INVENTOR AND PATENTEE, G. JENNINGS, 29, GREAT CHARLOTTE-STREET, BLACKFRIARS-ROAD, LONDON; OR OF JOHN WARNER AND SONS, JEWIN-CRESCENT, LONDON.

PIERCE'S NEWLY-INVENTED

PATENT PYRO-PNEUMATIC PURE WARM AIR SELF-ACTING AND VENTILATING STOVE-GRATE.

SPECIALLY ADAPTED FOR

CHURCHES, CHAPELS, INFANT AND OTHER SCHOOLS, PUBLIC BUILDINGS OR PRIVATE DWELLINGS, BANKING HOUSES, RAILWAY OFFICES, PICTURE GALLERIES, ENTRANCE HALLS, LECTURE ROOMS, INVALIDS' APARTMENTS, &c. &c.

ENTRANCE HALLS, LECTURE ROOMS, INVALID. PIERCE, after the most mature study and careful consideration, based on numerous experiments, during his practical experience as a manufacturer for upwards of thirty years, upon the nature and properties of fleat and Ventilation, has at length succeeded in producing that long-sought desiderature—a healthful and saster day, and, which such as former of the state of t

grate, yet producing a larger quantity of lutie warm at than could possibly be credited, until universally proved and experience. SPERO_PNEUMATIC_STOVE is the most powerful and economical grate that has yet been submitted to public notice, constantly burning with the clear, OPEN, CHERRUL, RADIATING FIRE (not being at any time an enclosed store), requires no attention or management, and eannot be put out of repair, as its principle of construction is wholly self-acting, and distributing to the production of the control of the

same time; and being constructed upon the most simple and uncring principle, requires no more attention than the ordinary Grate; and although the most powerful in producing warms in the same time equal to this PATENT PYRO-PNEUMATIC STOVE-GRATE, warms at the same time equal to this PATENT PYRO-PNEUMATIC STOVE-GRATE, being the only portion that is formed of Metal (with the exception of the hars and bottom), is so arranged, that in no case does the metal certain of any degree of warmsh that can possibly affect the purity of the air, whilst in error other description of Hot-Lar Stove the purity of the air is wholly destroyed and of the purity of the air is wholly destroyed and the large of the purity of the air is wholly destroyed and

NOTICES OF THE PUBLIC PRESS

UPON PIERCE'S PATENT PYRO-PNEUMATIC STOVE-GRATE.

From Herepath's Railway Journ'd, Feb 10, 1849.

"The object of this invention is to ware buildings or apartiments, and at the same time to rentilate them, by a constant supply of fresh warm air. This is effected by means of an open Stove Grate, to whole of the heating sarriese of which are formed for masses of the pured, allabraciae Fire sides and back of this stove are fermed in arrived to the same set of the pured, allabraciae Fire sides and back of this stove are fermed in arrived passages and tubes, which are heated by the fire in the second of the stove. The fresh air from the victorial part of the building is admitted into an are chamber formed at the descends of the stove. The fresh air from the stories are constant supply of fresh air, which is warmed in its passage into the room, while the foul air is constantly entried off by the dratical of the freshee. The grate is the stories of the story of the st

that in o case does the metal partake of any degree of warmth that can possibly affect the purity of the air.

From The Literary Graetis and Journal of the Bellet Litter, February 3, 1808.

"We have this week impected Mr. Pierce's Pyro-Pranuanic Stores-rate, which for Harming and "We have this week impected Mr. Pierce's Pyro-Pranuanic Stores-rate, which for the surrounce of the intraild second to us admirably adapted. From The Morning Post, February 16, 1849.

From The Morning Past, Pebruary 15, 1840.

"Waguing and Vernitarius—The elaborite attention directed by men of selence to the all-important consideration of readering the vital food of the respiratory organs, atmospheric air, pure and wholesome, has led to beneficial results which have from time to time found honourable mention. Amongst them the name of Mr. Heren, of Jernay-street, has more than ones occurred, and it is a state of the selection of the selection of the selection of the selection. When it is stated that the parity of the warm air evolved is of a gould summer disc character, and that, by the air character, and that, by the air character is no perfectly free from sulphurous exhaliation what the most pathiancie feel an immediate relief within its influence, and, moreover, that these health isporting attributes are secreted as a consomical raw, which of deprivation of the compact of our open Morse of the propagation of the confidence of the propagation of the confidence of the confidence of the propagation of the confidence of the propagation of the

From The Weekly News and Pinancial Economist.

"We have been favoured with a rise of a store grate, constructed and patented by Mr. Pierce, of Jermy affect, which effects that desirable combination which has hitherto been so difficult of accomplished by this apparaints at one and the same time; and this by an arrangement as simple a it is effective. One great improvement effected by this intention is, that the store itself, though containing a five which may be made of any regarded power, never becomes (the other hot-arrangement as time) as a distant part of any well-constructed aportiment."

From The Art-Journal, of March, 1849,

intensely hot. There are searchy five decrees more liest at the sides or back of this stove grate that at a distant part of any well-constructed apartment."

From The Art-Journal, of March, 1820.

CHUBB'S PATENT INVENTIONS

SECURITY OF PROPERTY FROM DEPREDATION OR FIRE.

THE QUADRUPLE LOCK.

C. CHUBB and SON, of 57, Sr. Paul's Churchyard, London, having recently secured Patents for several most important improvements in the construction of Locks, respectfully request the attention of Bankers, Mcrehants, and the public generally, to the subject. The first invention is peculiarly adapted for the security of Bankers' and Merchants' strong-rooms, and other analogous uses. It consists of a combination of four separate and distinct Defector Locks in one, all being acted upon at the same time by a single Key with four bits. The main botts are attached to an occentric wheel throwing them each way, and to these twenty or thirty bolt-heads may be fitted so as to secure an iron door on every side. The principle of the eccentric wheel has been used some years by C. CHUBB and SON, but by means of the rew quadruple arrangement the wheel and holts are nuch more effectually secured than hitherto. The QUADRUME LOCK, having six tumblers in each set, twenty-four in all, the four stumps in the tumblers being fixed in one circular plate acting on the bolt which fastens the eccentric wheel; and all being acted upon simultaneously by the motion of the four-bitted key, it is utterly impossible, from the extensive combinations, by any false key or instrument, to succeed in opening it. There is also a small Detector Lock adapted, which throws a strong shield over the key-hole, so that, in a Banking establishment, a confidential clerk may carry the quadruple key,—and the principal, having the smaller key, can at all times prevent the fire-proof safe or strong-room heing opened unless he is himself present. Notwithstanding the apparent complexity of this Lock, it is really very simple; and all the parts are so well fitted and strongly made, that there exists no chance of disarrangement.

CHUBB'S DETECTOR LOCKS.

A recent modification in the structure of these locks greatly increases their security. The Detector, which was formerly exposed near the key-hole, is now, by a simple but ingenious transposition, placed at the back of the tumblers and on the bottom plate of the lock, so that no instrument inserted in the key-hole can reach it. The locks have all six tumblers, and are made for every purpose to which locks are applied.

CHUBB'S PATENT LATCH.

The object of this improvement is to give greater security to Latches for Street Doors, and to Spring Locks in general. It is well known that, in all kinds of Latches hitherto made, however secure by ingenious construction from false keys, the bolts may he pushed back or lifted by a knife or thin piece of steel inserted between the door and door-post, and the house be thus easily robbed. C. CHUBB and SON's new Patent completely obviates this evil. The Latch has a bevilled bolt, which, striking against the staple when the door is pushed to, releases a spring to shoot forward the bolt and lock itself, so that it cannot by any means be forced back, and can only be opened by the knob inside or the key outside. The simplicity of action, and its consequent durability, with the security of five tumhlers, render this the most complete Latch ever made.

Spring Detector Locks for Drawers, Cupboards, &c., &c., made on the same principle.

CHUBB'S PATENT FIRE-PROOF STRONG ROOMS AND SAFES,

POSSESSING THE FOLLOWING QUALITIES.

Moverbility.—A Strong Room, as generally constructed, cannot be removed; so that, in case of a change of residence, a considerable expense is incurred in again building one; but this loss and inconvenience may be obviated, and perfect security obtained, by an Iron Room constructed on the principle of this Patent, which can be taken down, removed, and put together again with little trouble.

Fire-Proof.—These Patent Rooms and Safes have the power of resisting most intense heat, so as to be Fire-proof, in consequence of the use of certain non-conductors, as has heen proved by enclosing papers and parebments in a Patent Box, made on the same principle, and exposed in the furnace of a steamengine, where it hecame red hot, and remained in that state a considerable time, without any injury to the contents.

Strength.—The Rooms and Safes are made entirely of wrought iron, most securely fastened together on the inside; of thickness and strength sufficient to resist any violence; and lined with bard steel plates, which render ineffectional the application of any drill, spring-saw, or file.

Security.—The Doors of the Rooms and Safes are fitted with large Patent Detector Locks, which throw ten bolts round each door. A strong case-hardened Patent Scutcheon Lock, with a small key, is fixed over, and protects the key-bole of the large Lock.

Safes or Rooms constructed on this Patent can be made of any size, so as to suit any recess or apartment; and their interior may be fitted up with shelves and partitions according to any plan. Several Strong Rooms have been recently made for Bankers in London, other parts of England, Australia, the East Indies, and America.

Indies, and America.

Wrought Iron Doors and Frames, for stone or brick rooms, made very strong, with Locks to throw bolts all round, and Fire-proof Chests and Deed Boxes, for securing valuable papers, in great variety.

CAUTION

TO LOCK MANUFACTURERS AND DEALERS, AND THE PUBLIC GENERALLY.

CHUBB v. COOPER AND ANOTHER.

The COURT of CHANCERY having made an order in this cause, restraining the above Defendants, Francis Cooper, of Wolverhampton, Factor, and Joseph Taylor, of the same place, Lock Makers, their Agents, Servants, and Workmen, from Manufacturing or Selling any Locks or Keys, Stamped or Engraved with the name of Chubb, or with any other of the Plaintiff's distinctive Trade-marks, or with any other name or marks imitating or resembling the name or marks used by the Plaintiff's; and likewise from Manufacturing or Selling and Locks or Keys, as and for Locks and Keys made by the Plaintiff's or in order or so that Locks or Keys made by the Defeudants may be re-sold as and for Locks or Keys, made by the Plaintiff's; and likewise for copying or imitating in any manner the Plaintiff's Name and Trade-marks, and, Whereas, upon the trial of the cause

CHUBB v. DAVIS.

In the SHERIFF'S COURT, BIRMINGHAM, on the 17th April, 1844, the Jury found a verdict for the Plaintiffs, with FIFTY POUNDS DAMAGES, for the illegal use of the Plaintiffs' Name and Trade-marks upon Locks not of their manufacture. Now all persons are bereby cautioned against in any manner stamping the Name or Trade-marks of Messieurs Chubb and Son, or either of them, upon any Locks or Keys not of their Manufacture, or selling Locks so Stamped, as immediate proceedings of a similar nature will be commenced against such persons so doing, and full damages will be enforced against them.

UNSUCCESSFUL ATTEMPT TO OPEN A CHUBB'S FIRE-PROOF SAFE.

FROM THE "STAMFORD MERCURY," 19TH JANUARY, 1849.

"BURGLARY.—On Friday night last, the offices of Mr. Wilkinson, solicitor, in Peterborough, were entered by thieves, who picked the lock of the door, and so obtained an entrance. They appeared to have first forced open a draw of the table in Mr. W.'s office, whence they abstracted a few halfpence, and several keys belonging to the clerks' desks, with which they opened various hoxes and cupboards. From one clerk's desk about 5s. in silver was taken, and a quantity of receipts belonging to the Pbenix Fire-office, most likely mistaken for other paper. Returning to Mr. W.'s office, the thieves ransacked the drawers, cupboards, tin hoxes, and two portable desks, the contents of which they strewed over the floor. The chief point seems to have been a large iron chest in Mr. W.'s office: this at the time contained a considerable amount in cash, notes, gold and silver, which had been omitted to be paid into the bank during the day. The chest was one of Chubh's celebrated make; in this the burglars broke their picklocks, which were abstracted by means of a magnet the following morning. Having failed with the lock, they next tried to foge open the lid; but bore again they were foiled: the metal was too tough to break, and too solid to be wrenched or cut, and the thieves were haulked of their expected prize."

C. CHUBB and SON have received a letter from Mr. Wilkinson confirming the above statement, and expressing his gratification at the result.

CHEAP WATER-CLOSET PANS, WITH SYPHON TRAPS,

IN GLAZED STONE WARE, PRICE 7s. 6D. EACH.

MANUFACTURED BY

DOULTON AND WATTS, LAMBETH POTTERY, HIGH-STREET, LAMBETH, LONDON.

No. 2,

No. 3.

No. 4.

The importance of a system of thorough cleansing and drainage, and the application of Water Closets with Traps, to every house, is so fully established by the late Parliamentary riquiries, and by public opinion, as to need no enforcement.

The above Pans are of the most simple yet perfect construction; they are cleanly and imperivable; require no metal fans; and the price at which they are offered is so low, as to admit of their universal adoption.

Testimony in favour of the first three of these Closet Pans, and their suitability for general adaptation, may be found in the recent evidence given before the Parliamentary Sanitary Commission, by HENRY AUSTIN, Esq., Consulting Engineer, and JOHN PHILLIPS, Esq., Surveyor to the New Metropolitan Commissioners of Sewers. No. 4 is approved by Major LEBB, and has been extensively supplied in Prisons and Asylums throughout the Kingdom.

The absolute necessity for the adoption of trapped. Water Closets to the health and comfort of every house is admitted by all; and he McLupolitan Commissioners are about to enforce the filling chem, officially, and the admitted the commissioners are about to enforce the filling chem, officially, and that cannot get out of order, is independently. The Patternets of the 8Y PHON FLUSHING BASIN and CLOSET CONNECTIONS flatters humself that his invention will be found to evaluate the above requirements. It is complete in itself, and ready for use, wherever a satisfied place can be found to the water cupply. It is as simple in its constructions, that it cannot get out of order, mr is it likely to water upply. It is as simple in its constructions, that it cannot get not officers. It has no metal spreader, which is always out of order, and constantly destroys the place of the basin, and only directs the force of the water round the top of the pan, leaving it to full without

S. G. iuvites Architects, Surveyors, Builders, and the public, to inspect bis inventions at his Manufactory, Princes street, Lamboth. Where also may be seen the NOTED TERRA COTTA STONE

force on the soiled parts, while the Syphon Flushing Basin directs the whole of the water with great force perpendicularly down the sides of the basin, detarm all before it, and is thus effective with the great set of the property of water possible. It has no crubar on apply clearn, the only extra cost, which is the property of the

GLASS LINED DRAIN PIPES, so highly approved and exten sively used by her Majesty's Commissioners of Woods and Forests and the Metropolitan Commissioners of Sewers.

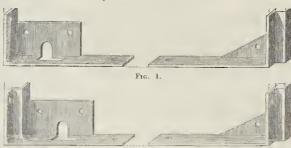

GEORGE JENNINGS,

29, GREAT CHARLOTTE STREET, BLACKFRIARS ROAD,

Begs to call the attention of those interested to the following articles, which he has invented and patented :-

JENNINGS'S PATENT SHOP SHUTTER SHOE AND FASTENER.

The trouble and disfigurement caused by the unsightly shutter bar is so well known to all persons, that it is only necessary to say a shop front receives more injury from the application of the shutter bar than it does from any other cause.

Figs. 1 and 2 represent two pairs of Jennings's Shutter Shoes and Fasteners, which not only protect the corners of the sbutters, but effectually secure them; and the cost of the patent fastenings is less than the destructive and troublesome bar. They can be bad in malleable iron at 3s. per shutter, or in brass at 5s. per shutter.

JENNINGS'S PATENT INDIA-RUBBER TUBE COCKS.

Fig. 2.

Frg. 3.

Fig. 4.

The principle on which these cocks are made is so simple, that the following short description must at once make their superiority over the old plug cock

The principle on which these cocks are made is so simple, that the following short description must at once make their superiority over the bar apparent to all practical men.

Into the barrel and shank of the cock is placed a tube of Vulcanized India Rubber. Figure 3 represents the section of a common bib cock open, with an uninterrupted passage. Figure 4 represents the water-way closed by the india-rubber tube being compressed. By turning the bandle, or key, the tube assumes its original circular shape, forming a full round water-way.

The following are a few of its practical advantages:—

It will resist any pressure when closed, and when open the water flows freely as through the pipe.

The water-way being eutirely independent of the working part, it is not liable to damage by frost, and all leakage is avoided.

All chance of setting fast from being out of use (an evil much complained of in cocks on the old ground-in principle) is entirely avoided.

The facility of repairs by simply renewing the tube.

In the ball-cock, its allowing a full stream of water to flow into the cistern till nearly full, and the impossibility of its "sticking up or down"—the cause of much loss and complaint with Water Companies.

Cocks on this principle have now been fixed for some time in the Royal Miut, the House of Detention, Clerkenwell, the House of Correction, Cold Bath Fields, Lambeth Water Works, Kent Water Works, Berelay and Perkins's Brewery, Brick-lane Gas Works, and many other public and private establishments. The limits of an advertisement preclude the possibility of giving one-balf of the testimonials received, but the Patentee has much pleasure in calling attention to the following:—

TESTIMONIALS.

House of Detention, December, 1818.

Mr. Jenning's Patent India Rubber Tube Cocks. They have been in constant use for some months, and continue to give great satisfaction.

F. W. HILL, Governor.

Sir,—Your Patent Joints and Cocks fixed in this establishment twelve months since
are as sound now, and answer every purpose at this time, quite as well as when fixed.

Mr. Jennings.

I am, Sir, your obedient servant, GEORGE PULMAN.

House of Correction, Cold Bath fields, December 12th, 1818.

Sir,—In reply to your letter, I beg to say, the India Rubber Tube Cocks fixed in this on are quite sound, and answering the purpose intended—lam. Sir, yours obediently, To Mr. Jennings.

Mr. Jennings.—Sir. I fed great pleasure in certifying, that—since your Patent Cocks and Water-closets have been fixed in this Union House—the several wards are entirely free from any bud smells, and an overflow of basons from leaky cocks, and they have added very much to the comfort of the house.—I am, Sir, your obelient servant. B. BONSER, Master.

2, Finsbury-circus, City, December, 1348.

Sir,—I have heard no complaints of any of your India Rubber Tube Cocks, though I ave had some fixed under great pressures.—I am, Sir, your obedient servant,

Mr. Jennings.

THOMAS CLARK, Engineer.

Distillery, Smithfield Bars, December, 1848.

We hereby certify, that we have had Mr. Jenning's India Rubber Tube Cocks in this stablishment for the last twelve mouths; they are answering so well, that in future we hall use no other.

BROWNING AND SON.

Sir,—I received the India Rubber Tube Cocks safely, and he had them fixed under the superintendence of Mr. Frampton, who is the manager of the had them fixed under delighted to be able to bear testimony to their efficiency, and feel certain their intendiation into this city will be attended with great comfort to the inhabitants, from the following circumstance:—The city is in a valley, and is supplied with water pumped into a reservoir on nearly the highest eminence in its neighbourhood; consequently, the pressure of that element is so great, that all the cocks I tried, provious to yours, have Leaked when fixed, or shortly afterwards.

I am glad I saw your advertisement in "The Builder," and I will do all I can so make your invention known in this city.—I am, Sir, yours respectfully,

W. SAVAGE.

The cost of these Cocks in brass is the same as the charge hitherto made for the old roundaway plug-cock. As they can be made in iron, a great saving is effected, and they are warranted to answer as well as those manufactured in brass. Water Companies, Distillers, Brewers, and all large consumers, will save money, and relieve themselves from the annoyance of leaky cocks by their adoption. They are admirably adapted for exportation, as the introduction of a fresh piece of tube will, at any time, make the cock equal to new.

JENNINGS'S INDIA-RUBBER TUBE WATER-CLOSETS, WITHOUT PAN OR VALVE, ARE SUITED ALIKE FOR A PALACE OR A COTTAGE: THEY CAN BE HAD AT TWO AND THREE GUINEAS EACH.

About sixty have been fixed, and they are giving the greatest satisfaction. The attention of Architects is particularly invited to this Closet. It is so constructed, it cannot be offensive or get out of order; it has neither pan or valve; the raising of the handle allows the contents of the bason to fall with great surplus water passes off through an overflow pipe, which regulates the proper quantity to be retained in the bason.

THE COCKS, CLOSETS, PATENT JOINTS, AND JENNINGS'S IMPROVED CISTERN VALVES, can be bad from the Patentee, or of John Warner and Sons, Jewin-street, London; or of Mr. J. R. Wood, Handver Chambers, Handver-street, Liverpool.

THE PATENT SHOP SHUTTER FASTENERS
can be had of the PATENTEE, or of any respectable Ironmonger, by sending the finished thickness of the Shutters, and which way they are put up, to the right or left.

DESCRIPTIVE DRAWINGS CAN BE HAD ON APPLICATION.

MOOD PAVING.—The Directors of the Metropolitan Patent Wood Paving Company are prepared to EXPCUTE 60 OBDERS, on the shortest notice, for yaving Railway Statious, Shols, Wharfs, Yards, Porticos, School-rooms, Gutways, Fonce, Workshops, Herwelten, Ele sa Admirally adapted for the above purposes and is much in use—Office, Beigrare Works, Thances-Bank, Planico.

REDUCTION IN THE PRICE

OF THE

PATENT TORRENT WATER CLOSET.

THE MOST EFFICIENT AND ECONOMICAL

APPARATUS FOR GENERAL PURPOSES,

AND WHICH IS UNIVERSALLY ADOPTED IN LIEU OF CESSPOOLS.

MODE OF ACTION.

When a person takes the seat, the front is pressed down, moving on the centre, and elevating the end of a lever, whereby a cock is opened, which fills the measure, and, as the water rises, it stops the supply, and therefore the water can never overflow.

On leaving the seat, the front rises by the weight of the lever, and shuts the admission of water,—at the same time opening it at the hottom, for letting it out into the torrent-pipe, from which it is discharged by the spreader, which directs the water to cleanse the hasin, and carry off everything through the scybing.

The syphon.

The syphon remaining full of water to the height of the point or elbow, forms a trap to prevent air rising from the soil-pipe through the basin.

THE TORRENT WATER CLOSET possesses the following decided advantages:—SIMPLICITY OF CONSTRUCTION: the TORRENT OF MOMENTARY RUSH OF WATER; THOROUGH CLEANSING OF THE PAN OR BASIN; A CISTERN IS NOT ESSENTIAL; IT IS SELFACTING; GREAT ECONOMY IN FIXING.

THE TORRENT WATER CLOSET is admirably adapted for Railway Stations, Schools, Barbacks, Workhouses, Lunaric Asylums, Prisons, and in fact for every situation.

THE TORRENT WATER CLOSET can be encased in wood, and rendered as handsome in appearance as any other.

REDUCTION IN THE PRICE

OF THE

PATENT TORRENT WATER CLOSET.

THE MOST EFFICIENT AND ECONOMICAL

APPARATUS FOR GENERAL PURPOSES,

AND WHICH IS UNIVERSALLY ADOPTED IN LIEU OF CESSPOOLS.

MODE OF ACTION.

When a person takes the seat, the front is pressed down, moving on the centre, and elevating the end of a lever, whereby a cock is opened, which fills the measure, and, as the water rises, it stops the supply, and therefore the water can never overflow.

On leaving the seat, the front rises by the weight of the lever, and shuts the admission of water,—at the same time opening it at the hottom, for letting it out into the torrent-pipe, from which it is discharged by the spreader, which directs the water to cleanse the basin, and carry off everything through the synbon.

The syphon.

The syphon remaining full of water to the beight of the point or elbow, forms a trap to prevent air rising from the soil-pipe through the basin.

THE TORRENT WATER CLOSET possesses the following decided advantages: —SIMPLICITY OF CONSTRUCTION; the TORRENT OF MOMENTARY RUSH OF WATER; THOROUGH CLEANSING OF THE PAN OR BASIN; A CISTERN IS NOT ESSENTIAL; IT IS SELF-ACTING; GREAT ECONOMY IN FIXING.

THE TORRENT WATER CLOSET is admirably adapted for Railway Stations, Schools, Barracks, Workhouses, Lunaric Asylums, Prisons, and in fact for every situation.

THE TORRENT WATER CLOSET can be encased in wood, and rendered as handsome in appearance as any other.

ance as any other.
