365, 366).—Abstracts of the following papers presented before the meeting held at Ithaca, N. Y., June 26-29, 1940, are noted: The Vitamins, by R. M. Bethke (Ohio Expt. Sta.); Influence of the Rations of the Hens Upon the Vitamin A and Riboflavin Content of the Eggs and Tissues, by B. Bisbey, A. Weis, and H. L. Kempster (Univ. Mo.); Composition and Quantity of Feed Consumed by Laying Hens Versus Composition and Quantity of Body Fat and Eggs Produced, by G. D. Buckner, W. M. Insko, Jr., and A. Harms (Ky. Sta.); Premature Expulsion of Eggs by Hens Injected With Posterior Pituitary Substances, by W. H. Burrows and T. C. Byerly (U. S. D. A. and Univ. Md.); The Physical Character of Poultry Droppings as Affected by Various Feed Ingredients, by L. E. Card and B. R. Burmester (Ill. Sta.); The Body Weights and Measurements of Purebred and Crossbred Turkeys, by T. B. Clark, T. D. Runnels, and E. A. Livesay (W. Va. Sta.); The Effect of Some Riboflavin Supplements on Chick Growth and Curled-Toe Paralysis, by T. G. Culton and H. R. Bird (Univ. Md.); Physical Measurements of Carcass Quality in Roasters, by R. L. Dolecek, W. O. Wilson, and W. E. Poley (S. Dak. State Col.); The Effect of Pregnant Mare Serum on Rate of Yolk Production in Domestic Fowl, by R. M. Fraps (U. S. D. A.); The Vitamin D Requirements of Ducklings, by J. C. Fritz, W. Archer, and D. Barker; Congenital Goiter in Chicks, and The Relationship of the Thyroid to the Thymus in the Chick, both by F. X. Gassner and H. S. Wilgus, Jr. (Colo. Sta.); Flowers of Sulphur and Charcoal in the Control of Experimentally Produced Coccidiosis, by O. E. Goff and C. W. Upp (La. Sta.); Breed Differences in Thick Albumen Content of Fresh-Laid Eggs, by C. D. Gordon, A Comparative Cost Study of Egg Prices Under Various Systems of Procurement and Sale, by H. G. F. Hamann, and The Composition of Turkeys as Affected by Age and Sex, by H. M. Harshaw and R. R. Rector (all U. S. D. A.); Transmitting Ability in Males of Genes for Egg Size, by F. A. Hays (Mass. Sta.); The Supplementary Effect of Cystine and Methionine Upon the Protein of Raw and Cooked Soybeans as Determined With Chicks and Rats, by J. W. Hayward and F. H. Hafner; The Efficiency of Feed Utilization by Barred Plymouth Rock and Crossbred Broilers, by C. W. Hess, T. G. Byerly, and M. A. Jull (Univ. Md.); The Proteins, by G. [F.] Heuser (Cornell Univ.); Vitamin B₁ and Chick Nutrition, by A. G. Hogan, L. R. Richardson, H. Patrick, B. L. O'Dell, and H. L. Kempster (Univ. Mo.); Do Turkey Eggs Need To Be Turned During the Latter Stages of Incubation? by W. M. Insko, Jr., and A. T. Ringrose (Ky. Sta.); Autosexing Accuracy—Effect of Barring Gene in Red to Black Down-Color Phenotypes, by R. G. Jaap (Okla. Sta.); Effect of Date of Hatch on Egg Weight, by F. P. Jeffrey (N. J. Stas.); Vitamin A Requirements of Growing Chicks as Determined by Nasal Histology, by E. Jungherr and K. C. Seeger (Univ. Conn.); A New Lethal Mutation in Fowl and Its Theoretical Significance, and The Effect of Estrogen Administration on Blood Calcium, Bone Formation, and Blood Fat in Cocks and Drakes, both by W. Landauer ([Conn.] Storrs Sta.); Factors Affecting the Duration of the First Annual Rest, by I. M. Lerner and L. W. Taylor (Univ. Calif.); The Effect of Lights on the Fecundity of Turkeys, by P. H. Margolf (Pa. State Col.); The Effect of Anterior Pituitary Extract Upon Vitamin A and Fat Metabolism in the Growing Chick,—II, The Influence of Dehydrated Grass in the Rations, by W. A. Maw, N. Nickolaiczuk, T. M. MacIntyre, W. E. Parker, F. P. Griffin, W. D. MacFarlane, and J. B. Collip; Poultry and Egg Marketing Research in the North Central States, by C. G. McBride (Ohio State Univ.); Heart Rate of the Adult Domestic Fowl, by E. H. McNally (U. S. D. A.); The Relation Between Specific Gravity of the Egg and Its Hatching Power, by

S. S. Munro; Viability and Weight of Chicks as Affected by Shipping and Time of Feeding, by M. W. Olsen and B. Winton (U. S. D. A.); Factors Affecting the Canded and Broken-Out Appearance of Fresh White-Shellled Eggs, by N. G. Paulhus and J. M. Gwin (Univ. Md.); Results of a 10 Year Study of the Influence of Artificial Light on Egg Production, by R. Penquite and R. B. Thompson (Okla. A. and M. Col.); Progeny Testing in the Breeding of Pigeons, by C. S. Platt (N. J. Stas.); The Effect of Selenized Grains on the Rate of Growth of Chicks, by W. E. Poley, W. O. Wilson, and A. L. Moxon (S. Dak. State Col.); Factors That Determine Earnings on Connecticut Poultry Farms, by P. L. Putnam (Univ. Conn.); Relationships Between Certain Physical Measurements Upon Fresh and Stored Eggs and Their Behavior in the Preparation and Baking of Cake, by W. E. Pyke and G. Johnson (Colo. Sta.); Inheritance and Variation of Blood Spots in Chicken Eggs, by J. P. Quinn and A. B. Godfrey, and Diurnal Variations in Spermatogenic Activity in the Domestic Fowl, by G. M. Riley (both U. S. D. A.); Oxygen Consumption as a Diagnostic Symptom of Functional Disturbances of the Embryo, by A. L. Romanoff ([N. Y.] Cornell Sta.); Comparison of Animal and Vegetable Protein Concentrates, Singly and Combined, in Chick Rations, by T. D. Rannels, T. B. Clark, and A. H. VanLandingham (W. Va. Sta.); Viability of Spermatozoa of the Chicken Under Various Environmental Conditions, by C. S. Shaffner, E. W. Henderson, and C. G. Card (Mich. State Col.); The Minerals, by P. J. Schaible, and The Effect of Mineral Supplements on the Availability of Manganese, by P. J. Schaible and S. L. Bandemer (both Mich. Sta.); The Use of Distillers By-Products in Poultry Rations, by H. J. Sloan (Univ. Minn.); Growth Factors Required by Chicks, by R. A. Sullivan; Marketing Problems in Deficit Production Areas, by J. L. Tennant (R. I. State Col.); The Economic and Statistical Significance of Longevity Egg-Yield Performance Records, by W. C. Thompson (N. J. Stas.); The Use of Artificial Insemination in Progeny Testing, by D. C. Warren and C. L. Gish (Kans. Sta.); The Proposed Breeding Program of the Regional Poultry Research Laboratory, by N. F. Waters and J. H. Bywaters (U. S. D. A.); and The Goitrogenicity of Soybeans, by H. S. Wilgus, Jr., F. X. Gassner, A. R. Patton, and R. G. Gustavson (Colo. Sta. et al.).

Poultry breeding, M. A. JULL (*New York: John Wiley & Sons; London: Chapman & Hall, 1940, 2. ed., pp. XIV+484, figs. 76*).—A revised edition of the book previously noted (E. S. R., 69, p. 411).

Methods for determining the relative value of proteins for chickens, A. H. VANLANDINGHAM and T. B. CLARK. (W. Va. Univ.). (*W. Va. Univ. Bul., 40. ser., No. 5-1 (1939), p. 89*).—A brief report of nitrogen balance trials with chickens receiving single protein supplements as the primary source of protein in the diet. The percentage nitrogen retention was approximately the same on a normal mixed ration and when dried whole egg was included in the basal diet. Fish meal and casein in the basal diet gave nitrogen retention values from about 10 to 15 percent less and meat scrap approximately 50 percent less than that obtained from the normal mixed ration.

Chicken and egg yolk fat, G. A. BUCKNER, W. M. INSKO, JR., J. H. MARTIN, and A. HARMS. (Ky. Expt. Sta.). (*Amer. Egg and Poultry Rev., 1 (1940), No. 7, p. 270*).—When hens of the Rhode Island Red breed were fed rations varying from 5.9 to 38 percent starch, the quantity of body reserve fat decreased with the percentage of starch in the ration but the percentage of yolk fat and the hatchability of the eggs were not influenced materially (E. S. R., 83, p. 388).

The tolerance of growing chicks for soybean oil in their ration, E. W. HENDERSON and W. E. IRWIN. (Iowa Expt. Sta.). (*Poultry Sci., 19 (1940),*

No. 6, pp. 389-395, figs. 5).—Varying amounts of soybean oil added to the basal ration of chicks up to 8 weeks of age were found to have no significant effects on growth rate until the rations contained over 10 percent of oil. There were proportionate decreases in weight as larger amounts of oil were present. No significant differences in the weights of the livers, volume of gall bladder, or histological sections of the livers were noted. The iodine numbers of the fat from birds on the higher oil rations ranged from 74 ± 0.64 for those having no oil to 120 ± 0.64 for those on rations with 22 percent of soybean oil. Excessive moisture and higher ether extract contents of the feces with abnormal molting were noted in the groups receiving more than 14 percent oil rations.

The effect of feeding wheat germ oil, I, II, C. E. HOLMES and W. W. CRAVENS. (Univ. Wis.). (*Poultry Sci.*, 19 (1940), No. 5, pp. 303-310, 311-314).—Two reports are noted.

I. Egg production and hatchability.—In trials involving both White Leghorn and Barred Plymouth Rock hens, the addition of cold-pressed wheat-germ oil at the rate of 0.5 cc. per bird daily to a well-balanced basal ration had no beneficial effect on egg production or fertility and hatchability of the eggs. It did not reduce embryonic mortality or improve the viability of the chicks hatched.

II. Growth, age to sexual maturity, and egg production.—In trials with growing White Leghorn chicks the addition of 0.1 percent of wheat-germ oil to the ration did not significantly affect growth, mortality, age to sexual maturity, or subsequent egg production.

Influence of wheat germ oil on semen production of cockerels, H. W. TITUS and W. H. BURROWS. (U. S. D. A.). (*Poultry Sci.*, 19 (1940), No. 5, pp. 295-298, fig. 1).—Four groups of 10 cockerels each were fed the same basal ration. Two groups received in addition 0.5 percent of wheat-germ oil, while the diet of the other two was treated with ferric chloride in ether. One group on each of the two modified diets received 100 mg. of desiccated thyroid, three times per week for the first 5 weeks of the 12-week experimental period. The feeding of the desiccated thyroid caused semen production to decrease steadily and at a fairly uniform rate, with this trend continuing for several days after this treatment was discontinued. The addition of wheat-germ oil to the diet caused a marked decrease in semen production. Treatment of the diet with ferric chloride had little, if any, effect on semen production.

Correlation of egg production with vitamin A, ascorbic acid, mineral reserves, and body weight of laying hens, A. D. HOLMES, F. TRIPP, and G. H. SATTERFIELD. (Univ. N. C. et al.). (*Poultry Sci.*, 19 (1940), No. 6, pp. 435-442).—Study was made of the body weights, vitamin A, ascorbic acid, and mineral reserves of Rhode Island Red pullets fed individually in batteries for 1 yr., with reference to groups producing from 230 to 315, 163 to 197, and 66 to 153 eggs each. Although variations between the composition of the livers and bones of the birds in the different groups were apparent, the high nutritive value of the ration did not permit wide differences in the vitamin A, ascorbic acid, and mineral reserves associated with egg production.

The effect of vitamin A deficiency on malposition of the chick embryo, H. D. POLK and G. R. SIPE. (Miss. Expt. Sta.). (*Poultry Sci.*, 19 (1940), No. 6, pp. 396-400).—During a 3-yr. period, Rhode Island Red yearling hens on an all-mash ration of yellow and white corn, wheat shorts, and bran laid a total of 6,099 eggs. Hatching results with the fertile eggs showed that 8.4 percent produced embryonic malpositions. A corresponding group on the same ration to which 0.33 percent of cod-liver oil was added produced 8,366 eggs, and only 4.9 percent of their fertile eggs developed embryonic malformations. All

of the six types of malpositions but one were produced in greater numbers by those hens receiving the vitamin A-deficient rations than by hens fed adequate amounts of vitamin A. However, the incidence of chicks in the abnormal positions was not related to the quantity of vitamin A in the ration.

Vitamin deficiency and abnormal bone growth of the chick, A. G. HOGAN. (Univ. Mo.). (*Sci. Mo.*, 51 (1940), No. 4, pp. 389, 390).—A brief report, indicating the requirements of the chick for an antiperosis vitamin contained in an alcohol extract of liver and tentatively designated as vitamin B_p.

Correlation of avian diseases and the ascorbic acid content of chicken blood, G. H. SATTERFIELD, M. A. MOSELEY, H. C. GAUGER, A. D. HOLMES, and F. TRIPP. (Univ. N. C. et al.). (*Poultry Sci.*, 19 (1940), No. 5, pp. 337-344).—Determination of the ascorbic acid content of groups of diseased chicks, divided with reference to the incidence of specific types of diseases, gave the following mean values: Coccidiosis (cecal) 0.695 mg. percent, coccidiosis (small intestine) 0.825, fowl typhoid 0.714, parasites (internal) 0.689, pullorum disease 0.584, coryza 0.971, fowl pox 0.725, epidemic tremor 0.54, leucosis (lymphoid) 0.912, leucosis (myloid) 0.746, leucosis (iritis) 1.005, tumors 0.806, enteritis 0.919, gizzard injury 1.178, cyst (cloaca) 0.699, a crop-bound bird 1.446, avitaminosis A 1.202, poisoning 0.808, and undiagnosed conditions 0.663 mg. percent ascorbic acid. A mean value of 1.768 mg. percent ascorbic acid was found in normal birds as compared with 1.713 mg. percent in birds afflicted with neurolymphomatosis gallinarum (nerve type). From these findings it appeared impossible to correlate any specific avian disease with an abnormal amount of ascorbic acid in the blood plasma.

Studies on a growth factor present in polished rice and required by chicks on a simplified diet, E. L. R. STOKSTAD, P. D. V. MANNING, and R. E. ROGERS (*Poultry Sci.*, 19 (1940), No. 6, pp. 412-417).—The existence of a growth-promoting substance in the liver, kidney, and cereal products and not identical with *α*-tocopherol, arginine, or linoleic acid was demonstrated in three series of experiments with White Leghorn chicks. The dissimilarity of this substance and riboflavin was evident in that both were strongly linked with protein, but riboflavin was separated at boiling temperatures. The factor concerned was stable after autoclaving in an acid medium but only partially stable in a neutral or alkaline medium.

The effect of minerals and vitamin D on the percentage bone ash of young chicks, J. W. COOK and E. I. ROBERTSON. (Wash. Expt. Sta.). (*Poultry Sci.*, 19 (1940), No. 6, pp. 385-388, fig. 1).—Chicks on a normal diet were found to show increases in the bone ash of their tibias from 36.10 to 44.37 percent for their first 9 days, while during the same age period the bone ash of the tibias from chicks on a diet deficient in vitamin D and minerals decreased from 36.92 to 28.36 percent. Continuing these chicks until 15 days of age decreased the bone ash to 22.69, but an adequate diet during this period on previously depleted chicks increased the bone ash to 32.92 percent. The daily changes in the bone ash were based on an average analysis of the tibias of five chicks.

Effect of parathyroid preparation on the blood calcium of the fowl, T. B. AVERY, H. M. SCOTT, and R. M. CONRAD. (Kans. Expt. Sta.). (*Poultry Sci.*, 19 (1940), No. 5, pp. 321-323).—Both intramuscular and subcutaneous injections of parathyroid extract in amounts ranging up to 1.5 cc. per kilogram of body weight into chickens of different ages, sexes, and physical conditions failed to elevate the blood calcium of the birds.

Effect of parathyroid preparation on the calcium metabolism of the fowl, T. B. AVERY, H. M. SCOTT, and R. M. CONRAD. (Kans. Expt. Sta.).

(*Poultry Sci.*, 19 (1940), No. 5, pp. 324, 325).—Calcium balance experiments with molting hens, part of which received parathormone in initial injections of 1.5 cc. and 0.5 cc. per kilogram of body weight daily for 6 successive days, showed no significant difference in the calcium retention of the control and injected birds. Apparently injection of this preparation did not cause the molting hens to deplete the body of its calcium repositories.

Some properties of the alcohol-precipitate factor with further results of its effect on chicks and hens, A. E. SCHUMACHER and G. F. HEUSER. (Cornell Univ.). (*Poultry Sci.*, 19 (1940), No. 5, pp. 315–320).—Continuing the investigations of Bauernfeind and Norris (E. S. R., 82, p. 667), an alcohol-precipitate factor concentrate prepared from dried brewers' yeast was tested on growing chicks and laying hens. When added to the ration of chicks at a rate equivalent to 5 percent of dried yeast, either alone or in combination with riboflavin, it exerted a marked growth-stimulating effect. The effect of this factor in the absence of riboflavin was greater than that of riboflavin (400 γ per 100 gm. of ration) in the absence of the alcohol-precipitate factor. When included in the diet of laying hens this factor appeared to have a relatively greater effect than riboflavin upon the maintenance of body weight. Also, in comparison with riboflavin, it had a relatively greater effect upon egg production than upon hatchability. The factor which is water-soluble proved to be dialyzable, stable to boiling, and precipitated by 90 percent alcohol.

Is riboflavin synthesized in the feces of fowl? W. F. LAMOREUX and A. E. SCHUMACHER. (Cornell Univ.). (*Poultry Sci.*, 19 (1940), No. 6, pp. 418–423, fig. 1).—Observation indicated that more riboflavin was recovered from the feces than was included in a ration fed to growing chicks. It was further shown that the removal of the ceca from fowls did not lessen the riboflavin present. Further studies seemed to indicate rather definitely that the rapid synthesis of the riboflavin in the feces following defecation, makes it essential that coprophagy be prevented if study of the riboflavin synthesis in the digestive tract is concerned.

The effect of some riboflavin supplements on chick growth and curled-toe paralysis, T. G. CULTON and H. R. BIRD. (Md. Expt. Sta.). (*Poultry Sci.*, 19 (1940), No. 6, pp. 424–430, figs. 2).—Crossbred Barred Plymouth Rock \times New Hampshire chicks raised on a basal ration containing 175 μ g. of riboflavin per 100 gm. developed curled-toe paralysis in about 75 percent of the birds, with little retardation in growth up to 5 weeks. The growth rate was increased and the occurrence of curled-toe paralysis was reduced by supplying additional amounts of crystalline riboflavin, dried skim milk, or even by less completely extracted casein (using alcohol instead of water), but the curled-toe paralysis was not prevented by the addition of 300 μ g. of crystalline riboflavin per 100 gm. to the basal ration nor entirely by 400 μ g. of riboflavin in dried skim milk or whey. Attention is called to the possibility of destruction of riboflavin in natural feeds and the use of less rich sources of the substance in order to cheapen the ration and to the higher requirements of larger birds for this vitamin.

Effect of level of dietary riboflavin upon quantity stored in eggs and rates of storage, L. C. NORRIS and J. C. BAUERNFEIND. (Cornell Univ.). (*Food Res.*, 5 (1940), No. 5, pp. 521–532, figs. 4).—By methods previously noted (E. S. R., 83, p. 151) studies were made of the riboflavin content of the yolks and whites of eggs of hens receiving from 100 to 2,000 μ g. of the vitamin per 100 gm. of ration. The riboflavin content of eggs of hens on low vitamin rations was less than 1.4 μ g. per gram. Increases up to about 1,000 μ g. of riboflavin per 100 gm. of ration produced progressive increases in the riboflavin content of the whole egg for periods of from 2 to 4 weeks. Regardless of the additional amount of

riboflavin supplied in the diet, the riboflavin contents of the egg white and yoke, respectively, were not increased above 2.89 and 3.98 $\mu\text{g.}$ per gram. The riboflavin content of the egg white changed more rapidly than that of the egg yoke. Similar results were obtained in assaying by the chemical, bacteriological (Snell and Strong) (E. S. R., 82, p. 587), and chick (E. S. R., 74, p. 682) methods.

Effect of thyroidectomy on production, quality, and composition of chicken eggs, L. W. TAYLOR and B. R. BURMESTER. (Univ. Calif.). (*Poultry Sci.*, 19 (1940), No. 5, pp. 326-331, figs. 2).—Using six pairs of White Leghorn pullets, carefully matched with reference to egg-producing ability, one of each pair was completely thyroidectomized. Average egg production during the subsequent year was only 27.1 percent as great in the thyroidectomized birds as in the controls. The rate of increase in egg weight was significantly greater in the controls, while rate of decrease in percentage shell during the same period was significantly greater in the treated birds. Other changes due to thyroidectomy were decreases in percentage of total white, percentage of firm white, and percentage of solids in the white, and increases in the percentage of outer liquid white and percentage of yolk.

With crossbred pullets, 4 birds incompletely thyroidectomized and 5 completely thyroidectomized produced on the average 66.7 and 35.8 percent, respectively, as much as the average of 10 normal controls. Either the complete or partial removal of the thyroid gland resulted in the accumulation of large amounts of fat, which in 2 cases was associated with degeneration of the liver.

The rate of plumping of uterine eggs immersed in an artificial uterine solution, B. R. BURMESTER, H. M. SCOTT, and L. E. CARD. (Univ. Ill.). (*Poultry Sci.*, 19 (1940), No. 5, pp. 299-302, figs. 2).—Eggs removed from the hen after they had been in the uterus for periods of time ranging from 0 to 12 hr. were weighed before and after immersion for 20 min. in artificial uterine solution (E. S. R., 80, p. 671). The rate of increase in weight due to uptake of the solution was maximal just after the eggs entered the uterus, the increase in weight of eggs removed at this stage amounting to about 4 percent in 20 min. The rate then declined, amounting to about 1.2 percent in 20 min. for eggs retained in the uterus 6 hr., and reached a minimum level after eggs had been in the uterus for 8 hr. It appeared that the amount of calcium carbonate in the shell was not the sole factor governing the rate of uptake of uterine fluid.

The relation of specific gravity to hatching power in eggs of the domestic fowl, S. S. MUNRO (*Sci. Agr.*, 21 (1940), No. 2, pp. 53-62, figs. 2).—Statistical analysis was made of the specific gravity of 2,957 Barred Plymouth Rock and 2,687 White Leghorn eggs with reference to the fertility and hatchability of the eggs after incubation. Contrary to the findings of Mussehl and Halbersleben (E. S. R., 49, p. 373), Plymouth Rock eggs below a specific gravity of 1.078 and Leghorns below 1.086 decreased rapidly in hatching power. The eggs below these points in specific gravity averaged 7.8 percent lower in fertility, 32.4 in fertile eggs hatching, and 29.7 percent lower in total eggs hatching. By discarding the low-specific gravity eggs it was possible to improve hatchability of the eggs set by 8.3 percent. The eggs laid by each hen showed a characteristic specific gravity, and when paired for those showing high and low values in this manner and χ^2 values determined, the odds were greater than 99:1 for separation of fertile and hatchable eggs on this basis. Chicks from hens laying eggs with low specific gravity had a higher death rate during brooding than chicks from hens laying eggs with a high specific gravity.

Checking market grades with meat measurements, H. M. SCOTT. (Kans. State Col.). (*U. S. Egg and Poultry Mag.*, 46 (1940), No. 12, pp. 717-719, figs. 2).—The factors influencing fleshing in poultry, as judged by the eye, are

grouped under three main headings, (1) development of musculature, (2) amount and distribution of fat, and (3) shape of body.

The composition of turkeys as affected by age and sex, H. M. HARSHAW and R. R. RECTOR. (U. S. D. A.). (*Poultry Sci.*, 19 (1940), No. 6, pp. 404-411).—Chemical and physical analyses of ♂ and ♀ crossbred turkeys at 16, 20, 24, 28, and 32 weeks of age showed that the percentage of dressed and drawn weights and total edible portions increased with age. The percentages of internal and external fat and skin made the greatest gains during the ages of from 28 to 32 weeks. The proportion of breast muscle and total edible portions of turkeys was higher than in chickens (E. S. R., 79, p. 525). Turkeys were similar to chickens in composition, but a considerably larger amount of fat was present in the 32-week-old turkeys than was found in the fattest roasting chickens. Unless especially fat birds are desired, turkeys should be marketed by 28 weeks of age.

Feeding grasshoppers to turkeys, T. T. MILBY and R. PENQUITE. (Okla. A. and M. Col.). (*Poultry Sci.*, 19 (1940), No. 5, pp. 332-336).—Grasshopper meal was prepared from the live insects, either by pressure cooking for 45 min. or quick freezing, followed in either case by drying and grinding. Substitution of the grasshopper meal in place of the ordinary protein concentrate in all-mash rations for growing poults did not significantly affect the rate of growth, although the feed required per unit of gain was somewhat higher on the grasshopper meal rations. Supplementing the normal ration with whole grasshoppers which had been quick-frozen and then thawed just prior to feeding (feed consumption 79 percent mash and 21 percent grasshoppers on dry basis) resulted in more rapid growth of poults than when the control ration was fed. No undesirable flavors or odors were imparted to the birds as a result of the grasshopper feeding.

Concentrate feeding of broad breasted Bronze turkeys, E. I. ROBERTSON and L. A. WILHELM. (Wash. Expt. Sta.). (*U. S. Egg and Poultry Mag.*, 46 (1940), No. 10, pp. 597-600, 639, 640).—In a study of the rate of growth and efficiency of feed utilization by toms and hen turkeys, poults 8 weeks of age on alfalfa range were fed free choice with a high-protein concentrate and corn, wheat, oats, and barley. Other groups received a developing mash with mixtures of whole grains in hoppers. The third and fourth groups received an all-mash ration, one on the range and the other in confinement on a sun porch without green feed. Part of the turkeys received limestone with granite grit only. At 28 weeks of age, the toms receiving the protein concentrate with the grains on range averaged 28.1 lb. in live weight, as compared with 26.0 for those on mash and grain, 25.2 for those on the all-mash ration, and 22.7 lb. for the toms in confinement. The toms on concentrate and whole-grain rations consumed 3.84 lb. of feed per pound of gain, as compared with 4.61, 4.83, and 5.05 lb. of feed per pound of gain for those fed on mash and range, mash and grain, and all mash in confinement, respectively. The hens showed smaller differences between the lots, but there was more efficient utilization of the concentrate and free choice of grains than was found for the other rations. On the whole, the hens also used feed as efficiently as the toms.

Where does the broad-breasted Bronze fit into the poultry picture? E. Y. SMITH. (Cornell Univ.). (*U. S. Egg and Poultry Mag.*, 46 (1940), No. 12, pp. 744-746, figs. 3).—A brief description of the broad-breasted Bronze turkey, which is said to be superior to other breeds for shape and quality of the carcass.

Interrelation of temperature, humidity, and air movement in the incubation of pheasant and quail eggs, A. L. ROMANOFF. (N. Y. [Cornell] Expt. Sta.). (*Game Breeder & Sportsman*, 43 (1939), No. 5, pp. 66-68, 71, 76, 77).—In studies pertaining to the interrelation of these conditions on the incubation

of pheasant and quail eggs and the development of the young after hatching, the author found that when uniform conditions were provided through 20 days of incubation, low temperature and low humidity had more pronounced deleterious effects than did high temperature and high humidity, both on hatchability and the occurrence of cripples. Slow air movement was less harmful, and was often beneficial, as contrasted with rapid air movement. Some differences in the optimum combinations of these factors in the incubators for the hatchability of pheasant and quail eggs were noted. For example, pheasant eggs hatched best with a low temperature, high humidity, and slow air movement, whereas quail eggs hatched best with low temperature, medium humidity, and slow air movement. The brooding mortality was invariably higher among chicks hatched under the extremely high or low conditions. The specific type of incubator was important as regards the best hatching temperature and humidity on account of the differences in the rate of air circulation.

DAIRY FARMING—DAIRYING

[Experiments with dairy cattle and dairy products in Pennsylvania] (*Pennsylvania Sta. Bul. 399 (1940), pp. 5-11, 12-14, figs. 2*).—Investigations for which results are noted include the economy of full-feeding dairy cows, by A. A. Borland (coop. U. S. D. A.); the value of green hay as a source of vitamin A for calves, and the relative values of molasses-alfalfa and molasses-soybean silages, both by S. I. Bechdel; the type of fermentation occurring in alfalfa silage preserved with molasses or phosphoric acid, by R. W. Stone; and factors affecting milk production costs, by W. L. Barr.

From studies with dairy products results are reported on the value of pasteurization in improving the keeping quality of frozen cream, and factors responsible for cooked flavor in milk and cream, both by C. D. Dahle; the stability of vitamin C to heat, by D. V. Josephson; the effect of homogenization on various dairy products, and the reliability of the phosphatase test, both by F. J. Doan; the influence of starters on cheese flavor, by Dahle and T. G. Anderson; the value of antioxidants for treating paper milk containers, by Dahle and Josephson; the control of lactic acid production in milk, by Stone; and the bacterial content of various levels of milk stored in cans, and the use of the photoelectric colorimeter in determining the bacterial population of milk, both by Anderson.

[Progress in dairy chemistry], S. J. ROWLAND and G. W. SCOTT BLAIR (*Jour. Dairy Res. [London], 11 (1940), No. 1, pp. 84-111*).—This review deals with the progress in dairy chemistry from the middle of 1937 to the middle of 1939. The bibliography contains 233 references (E. S. R., 79, p. 384).

A study of persistency in a herd of Ayrshire cows, G. PONTECORVO (*Jour. Dairy Res. [London], 11 (1940), No. 2, pp. 113-120, fig. 1*).—In this analysis of the production records of an inbred Ayrshire herd, only normal lactations falling between the second and seventh were used, with particular attention directed to that portion of the lactation curve between the peak of production and the rapid decline near the end of the period. Month of calving accounted for about one-third of the variation in persistency in this herd, while of the remaining variance approximately one-half is attributed to differences among cows. When a correction for month of calving was applied, persistency was found to be quite constant for different lactations of the same cow. The relationship between maximum yield and persistency is discussed.

The protein requirements for milk production, S. BARTLETT, A. S. FOOT, S. L. HUTHNANCE, and J. MACKINTOSH (*Jour. Dairy Res. [London], 11 (1940),*

No. 2, pp. 121-135, fig. 1).—In three large-scale experiments, involving about 1,400 cows in all, one-half of the animals in each herd received approximately a 16-percent concentrate ration, while the remaining cows were fed a ration containing approximately 21 percent protein. In addition to roughage all cows received 3.5 lb. of concentrate daily per gallon of milk produced. No significant difference in the milk production, live weight gains, or general condition of the animals was noted which could be ascribed to differences in the level of protein feeding. It appeared that the generally accepted feeding standard provided for an unduly high level of protein feeding.

The effect of concentrate feed on the milk production of native carabaos, T. V. RIGOR (*Philippine Jour. Anim. Indus.*, 7 (1940), No. 2, pp. 195-200).—Three feeding trials comparing soiling crops alone v. soiling crops and concentrates with animals having access to pasture in each case gave evidence that milk production was increased an average of 17.68 percent by the feeding of concentrates. At prevailing prices, concentrate feeding was an economical practice.

The dairying possibilities of native carabaos, L. J. PALICTE and P. S. MANALO (*Philippine Jour. Anim. Indus.*, 7 (1940), No. 4, pp. 379-389).—A preliminary report of the performance of foundation animals being used in a systematic breeding experiment to improve the dairy qualities of carabao in the Philippines.

The partition of serum calcium about the time of parturition in the dairy cow, J. DUCKWORTH and W. GODDEN (*Jour. Dairy Res. [London]*, 11 (1940), No. 1, pp. 9-14).—Data are presented on the serum calcium, partition of 10 individuals immediately preceding and following parturition. Included are values for total calcium, the calcium ion, ultrafiltrable calcium complex, non-ultrafiltrable calcium complex, and protein-bound calcium, also inorganic phosphorous and serum phosphatase. The significance of the variations in concentration of the bound calcium fractions is discussed.

A long-term study of the partition of serum calcium in Ayrshire cows, W. GODDEN and J. DUCKWORTH (*Jour. Dairy Res. [London]*, 11 (1940), No. 1, pp. 15-21, fig. 1).—Based on analyses of a series of blood samples collected from 14 individuals, the following average fractionation of serum calcium in the dairy cow was determined: Calcium ion, 10-12 percent; ultrafiltrable calcium complex, 40-45; nonultrafiltrable calcium complex, about 20; protein-bound calcium, about 25; and ultrafiltrable calcium 50-53 percent.

The nutritional value of milk and milk products, S. K. KON (*Jour. Dairy Res. [London]*, 11 (1940), No. 2, pp. 196-224).—A biennial review covering progress in this field during 1938 and 1939. The bibliography contains 411 references.

The problem of variations in the growth-promoting value of milk for rats, S. BARTLETT, K. M. HENRY, and S. K. KON (*Jour. Dairy Res. [London]*, 11 (1940), No. 1, pp. 22-36, figs. 4).—Three cows having access to good pasture and three similar cows continuously stall-fed on dry feed supplied the milk used in these experiments. Both raw and pasteurized mineralized milk from each group was fed to young rats. No significant difference either in appetite or gain in weight occurred under the different feeding regimes. In similar tests in which sugar was added to the milks to double their caloric value the appetite and growth of rats were the same on the raw summer (pasture) and winter (dry feed) milks. However, the summer milk, whether raw or pasturized, was superior to the pasteurized winter milk. Guinea pigs fed raw mineralized milk with or without sugar died in a short time, but there was no difference in growth rate or time of survival between the summer and winter milk groups.

The vitamin A and carotene content of Shorthorn colostrum, K. M. HENRY, J. HOUSTON, and S. K. KON (*Jour. Dairy Res. [London], 11 (1940), No. 1, pp. 1-8*).—Determinations were made on samples of colostrum from 13 cows. The concentration of vitamin A in the first colostrum ranged from 8,160 to 820 Moore blue units per 100 gm. and that of carotene from 2,026 to 411 Moore yellow units per 100 gm. The daily yield of vitamin A was higher in the colostrum than in later milk. Access to pasture prior to calving had no apparent effect on the secretion of vitamin A in colostrum but increased the output of carotene.

The vitamin B₁ and riboflavin of milk, I-IV (*Jour. Dairy Res. [London], 11 (1940), No. 2, pp. 145-183, figs. 5*).—Four reports are noted.

I. *The application of Jansen's thiochrome test to the estimation of vitamin B₁ in milk*, J. Houston, S. K. Kon, and S. Y. Thompson (pp. 146-150).—A method for the estimation of vitamin B₁ in milk by a modified Jansen test, involving takaphosphatase treatment, is fully described.

II. *The different forms of vitamin B₁ in milk*, J. Houston, S. K. Kon, and S. Y. Thompson (pp. 151-155).—Based on the results of a number of experiments, it is shown that vitamin B₁ is present in milk both unesterified and phosphorylated. Both forms may be freely diffusible or combined with protein either loosely or by firmer bonds.

III. *Effect of stage of lactation and of season on the vitamin B₁ and riboflavin content of milk*, J. Houston, S. K. Kon, and S. Y. Thompson (pp. 155-167).—The total vitamin B₁ content of colostrum ranged from 60 to 100 μ g. per 100 cc., that of early milk up to 60 μ g., and that of milk in mid- or late lactation from 30 to 40 μ g. per 100 cc. Feeding and season had little or no effect on the vitamin B₁ content of milk. Other findings indicated that vitamin B₁ of milk is mostly derived from the secretory cells of the mammary gland and not directly from the blood. The riboflavin content of colostrum was three to four times higher than that of later milk. Mean values for normal milk were about 110 and 150 μ g. per 100 cc. in winter and summer, respectively.

IV. *Comparison of chemical and biological methods of estimation of vitamin B₁*, K. M. Henry, J. Houston, S. K. Kon, and P. White (pp. 167-181).—By use of a fluorimetric test which measured the total vitamin B₁ in milk, values were obtained which were in satisfactory agreement with biological assays in all cases except when evaporated milk was fed. Since the apparent potency of all milks as measured biologically was higher when milk was fed at a high level than at a low level, and since evaporated milk had to be fed in relatively large quantities, the discrepancy between fluorimetric and biological assay values may be explained on this basis.

The effect of commercial pasteurization and sterilization on the vitamin B₁ and riboflavin content of milk as measured by chemical methods, J. Houston, S. K. Kon, and S. Y. Thompson (*Jour. Dairy Res. [London], 11 (1940), No. 1, pp. 67-70*).—The riboflavin content of milk was unaffected either by commercial pasteurization or commercial sterilization of the milk. The former process destroyed up to 10 percent and the latter up to 50 percent of the vitamin B₁ in the milk.

[Abstracts of papers on dairy bacteriology] (*Jour. Bact., 40 (1940), No. 1, pp. 157, 159, 160*).—The following papers were presented at the joint meeting of the north central and Indiana branches of the Society of American Bacteriologists and the Society of Illinois Bacteriologists, held at Chicago, Ill., May 3-4, 1940: Non-Spore-Forming Thermophilic Bacteria in Milk, by H. Wainess and E. H. Parfitt (Purdue Univ.); Heat-Resisting Bacteria in Milk, by M. J. Prucha and A. C. Maack (Univ. Ill.); Bacteriology of Brick Cheese, by

E. M. Foster, J. C. Garey, and W. C. Frazier (Univ. Wis.); and Some Milk Plant Control Problems of a Bacterial Nature, by P. H. Tracy (Univ. Ill.).

The value of certain tests in the differentiation of *Lactobacillus bulgaricus* from *Lactobacillus acidophilus*, J. M. SHERMAN and H. M. HODGE (Cornell Univ.). (*Jour. Bact.*, 40 (1940), No. 1, pp. 11-22).—To further determine the response of cultures of *L. bulgaricus* and *L. acidophilus* to various conditions, 152 cultures of the former and 43 cultures of the latter were included in the experiments described. *L. bulgaricus* was unable to make repeated growth in lactose-peptone-yeast extract broth, or to grow in media containing 2.5 percent sodium chloride, or in alkaline broth (pH 7.8). *L. acidophilus* was not inhibited by the mildly alkaline or saline media and grew well through 10 successive transfers in the simple media. *L. bulgaricus* rarely grew at 15° C., whereas *L. acidophilus* usually grew at this temperature. *L. acidophilus* never grew at 50°, while freshly isolated strains of *L. bulgaricus* nearly always grew at this temperature although old laboratory cultures frequently failed. These tests were found to correlate with other differential methods.

The influence of various factors on the fermentation end-products of the heterofermentative streptococci, C. C. THIEL (*Jour. Dairy Res. [London]*, 11 (1940), No. 1, pp. 51-61, fig. 1).—In this study of the influence of temperature, pH, oxygen tension, and yeast autolysate, on the activity of heterofermentative lactic acid streptococci, anaerobic conditions and relatively low temperature increased total lactic acid production, while anaerobic conditions and the presence of chalk increased the ratio of lactic acid formed to sugar utilized. Acetic acid production was higher in the presence of chalk and yeast at low temperatures but was decreased by anaerobic conditions. The ratio of acetic acid, both to sugar used and to lactic acid formed, was smaller at lower temperatures in the presence of yeast and chalk and under anaerobic conditions. Total alcohol production and also the ratio of alcohol formed to sugar used was higher when chalk or yeast was added under anaerobic conditions at low temperatures.

The influence of various factors on the fermentation end-products of the heterofermentative lactobacilli, C. C. THIEL (*Jour. Dairy Res. [London]*, 11 (1940), No. 2, pp. 136-144).—Following the same experimental procedures as in the above experiment, it was found that with the lactobacilli the total production of lactic acid was increased by the presence of chalk and yeast but was little affected by temperature or oxygen tension. The ratio of lactic acid produced to sugar used was decreased by the low temperatures and increased by the addition of chalk. The presence of chalk and yeast and anaerobic conditions tended to increase the total production of acetic acid but to decrease the ratio of acetic acid formed to sugar used and lactic acid formed. Total alcohol production and its ratio to sugar used was increased by anaerobiosis and by the presence of chalk. Yeast and temperature had little effect in this regard.

The action of chemical disinfectants on bacteriophages for the lactic streptococci, G. J. E. HUNTER and H. R. WHITEHEAD (*Jour. Dairy Res. [London]*, 11 (1940), No. 1, pp. 62-66).—Of several disinfectants tested, active chlorine and permanganate were by far the most effective in inactivating bacteriophage for the lactic streptococci, suggesting that such inactivation is brought about by oxidation.

The bacterial content of goat milk, C. S. BRYAN (Mich. Expt. Sta.). (*Vet. Med.*, 35 (1940), No. 10, p. 583; *Jour. Amer. Vet. Med. Assoc.*, 97 (1940), No. 764, pp. 551, 552).—Of 380 goats examined, 95.9 percent had neither in-

fections nor noninfectious mastitis, the remainder showing various degrees of udder infection. Milk from the noninfected animals was generally of high quality, but that of milk produced with mastitis was greatly reduced. The influence of various types of infection on milk characteristics is briefly discussed.

An agar slice method for the detection of mold and yeast on utensils, J. D. WILDMAN. (U. S. D. A.). (*Jour. Milk Technol.*, 3 (1940), No. 3, pp. 162, 163).—This contribution briefly describes the operation and practical application of the method.

The elimination of mastitis, G. J. HUCKER. (N. Y. State Expt. Sta.). (*Jour. Milk Technol.*, 3 (1940), No. 3, pp. 159-161).—Preliminary results reported gave evidence that definite progress is being made in the reduction of mastitis through the segregation and elimination program as now practiced in well-organized control areas.

Preliminary report on the deaeration of market milk, P. F. SHARP, D. B. HAND, and E. S. GUTHRIE. (Cornell Univ.). (*Jour. Milk Technol.*, 3 (1940), No. 3, pp. 137-143, fig. 1).—A continuous deaerating unit of 3,000 lb. per hour capacity is described. With this equipment deaeration may be carried out either before or after pasteurization. Data are presented on the oxygen content and also the resistance to oxidized flavor development during storage of milk samples collected at various stages in the processing of milk, both by the conventional holder-pasteurization method and when deaeration was employed. Typical values for bottled milk following conventional holder pasteurization, deaeration plus holder pasteurization, and deaeration plus flash pasteurization were 5.45, 1.86, and 0.8 mg. of oxygen per liter, respectively. Deaeration greatly increased the resistance of milk to the development of oxidized flavor and rendered the ascorbic acid stable. Airtight connections in a few critical places in the milk line and changes in bottler design, which prevent reaeration, were essential to best results.

Additional information is contained in the discussion of this paper.

A study of concentration and freezing as a means of preserving fluid whole milk, R. T. CORLEY and F. J. DOAN. (Pa. Expt. Sta.). (*Food Res.*, 5 (1940), No. 4, pp. 369-378, fig. 1).—Batches of fresh fluid milk were pasteurized at 145° F. for 30 min. and at 180° for 15 min. Subbatches of each were then (1) condensed 3 to 1, frozen, and stored at 0° F., (2) condensed 3 to 1, homogenized at 2,500 lb., frozen, and stored, or (3) homogenized at 2,500 lb., condensed 3 to 1, frozen, and stored. The higher pasteurization temperature was preferable, since it retarded the development of tallowy flavor and lessened the tendency for the formation of irreversibly coagulated protein during storage, but the lower temperature was more effective in retarding the rate of thickening. Homogenization retarded the development of tallowy flavor, lessened the rate of thickening, postponed the appearance of irreversible coagulation, and aided in maintaining the fat in an emulsified condition. Homogenization following condensation was more effective than when it preceded condensation. Copper contamination resulted in tallowy flavor regardless of treatment when the storage period exceeded 5 weeks. The protein stability toward alcohol was not affected in those milks in which coagulated protein was capable of being redispersed by heating the thawed product. In the high-temperature milks homogenized after condensation irreversible coagulation occurred only after 15 weeks of frozen storage. Reconstituted milk prepared from the concentrated product after frozen storage exhibited in vitro digestion characteristics superior to boiled milk and similar to evaporated or acidified milk.

Haemolytic organism isolated from pasteurized cream, L. O'DROMA (*Jour. Dairy Res.* [London], 11 (1940), No. 1, pp. 37-42).—A weekly hemolytic organism

isolated from partially churned pasteurized cream is described. It appeared to be a resistant strain of *Streptococcus thermophilus* which had adapted itself as a churn contaminant.

"Vacreating" cream for buttermaking, G. H. WILSTER. (Oreg. State Col.). (*Canad. Dairy and Ice Cream Jour.*, 19 (1940), No. 5, pp. 44, 50).—A summary of research noted previously (E. S. R., 84, p. 387).

Studies on the preparation of hard cheese.—I, American Cheddar cheese, M. R. PASCUA (*Philippine Jour. Anim. Indus.*, 7 (1940), No. 4, pp. 335-342).—Manufacturing procedures are described by which the finished product compared favorably with imported cheese, both in flavor and aroma. Control of temperature and humidity during curing proved absolutely necessary under Philippine conditions. It is concluded that with existing prices for fluid milk the manufacture of hard cheese in the Philippines is not profitable.

Studies on the manufacture of Cheddar cheese, A. VALENZUELA (*Philippine Jour. Anim. Indus.*, 7 (1940), No. 2, pp. 187-194).—Employing manufacturing and curing methods, as described, 1-year-old Cheddar cheese of local origin compared favorably with imported Dutch cheese in physical and chemical composition. It is suggested that hard cheese manufacture may offer an outlet for excess fresh milk produced locally if facilities for its manufacture are available.

An objective measure of the consistency of cheese curd at the pitching point, G. W. SCOTT BLAIR and F. M. V. COPPEN (*Jour. Dairy Res. [London]*, 11 (1940), No. 2, pp. 187-195, figs. 6).—A simple method and the necessary apparatus is described for measuring the consistency of cheese curd during the cooking process. A simple weight-height (W/h) ratio is determined which was found to be highly correlated with moisture content. The test has been satisfactorily applied to Cheddar and several other varieties of cheese. It is believed that W/h will serve as an effective single-value criterion of consistency, suitable for judging pitching time if the acidity is also known.

Bacteriology of cheese.—V, Defects of blue (Roquefort-type) cheese, H. W. BRYANT and B. W. HAMMER (*Iowa Sta. Res. Bul.* 283 (1940), pp. 109-147, figs. 10).—Continuing the reports of this series (E. S. R., 82, p. 815), this study includes a description of the methods used in the manufacture of blue cheese and Cheddar cheese and presents results of investigations on five defects encountered in blue cheese. A black discoloration, accompanied by a musty flavor, encountered in certain commercial cheeses was attributed to an organism identified as *Hormodendrum olivaceum*. Infection occurred through surface cracks and punch holes. Studies on gas formation in blue cheese through inoculation of the cheese milk with a culture of *Aerobacter aerogenes* isolated from gassy Cheddar cheese gave evidence that this problem is of relatively little importance in blue cheese manufacture. A defect characterized by a softening of the edges of blue cheese proved to be due to excessive moisture in the softened portions. Humidity control in the curing room seemed essential in preventing this condition. Another defect characterized by lack of mold growth in cheese inoculated in the usual manner proved to be due to the use of a mold powder in which an atypical strain of *Penicillium roqueforti* predominated. The necessity of using a mold powder of established effectiveness is emphasized. The fifth phase concerned a defect in which a gray discoloration and a mousy, ammoniacal flavor that later became soapy developed in blue cheese, accompanied by an increase in pH. The contaminating organism capable of reproducing the defect was not isolated. Excessive development of *P. roqueforti* or growth of a contaminating organism which might bring about certain lower disintegration products of protein are suggested as probable causes.

Minimum pasteurization requirements for ice cream, T. V. ARMSTRONG. (Ohio State Univ.). (*Canad. Dairy and Ice Cream Jour.*, 19 (1940), No. 11, pp. 38, 40).—A brief review, with 18 references.

The status of ice cream stabilizers, W. C. COLE. (Univ. Calif.). (*Internat. Assoc. Ice Cream Mfrs. Ann. Conv., San Francisco, Rpt. Proc.*, 39 (1939), vol. 2, pp. 35-44).—A summary, with 27 references.

A method for the accurate sampling of ice cream, A. C. MAACK and P. H. TRACY. (Univ. Ill.). (*Jour. Milk Technol.*, 3 (1940), No. 3, pp. 123-125).—A report previously noted (E. S. R., 83, p. 241).

Suggested standards for chocolate milk drinks, W. [S.] MUELLER. (Mass. State Col.). (*Milk Plant Mo.*, 29 (1940), No. 3, pp. 25-28, figs. 3).—A discussion of factors to be considered in evaluating chocolate milk, based on research previously noted (E. S. R., 82, p. 245).

VETERINARY MEDICINE

Medical mycology, C. W. EMMONS (*Bot. Rev.*, 6 (1940), No. 9, pp. 474-514).—This contribution includes a bibliography of 315 titles.

Index-catalogue of medical and veterinary zoology.—Part 4, Authors: D to Dzunkovski, A. HASSALL, M. A. DOSS, R. M. TAYLOR, G. B. CARSON, and D. BERO (*U. S. Dept. Agr.*, 1940, pp. [1]+963-1176).—A continuation of this index catalog (E. S. R., 82, p. 101).

Introduction to parasitology, with special reference to the parasites of man, A. C. CHANDLER (*New York: John Wiley & Sons; London: Chapman & Hall*, 1940, 6. ed., rewritten and enl., pp. XIII+698, figs. 309).—A rewritten and enlarged edition of this work (E. S. R., 76, p. 213).

The mechanism of acquired immunity in infections with parasitic worms, W. H. TALIAFERRO (*Physiol. Rev.*, 20 (1940), No. 4, pp. 469-492).—This contribution includes a list of references to the literature cited.

[Contributions on animal pathology and parasitology] (*Onderstepoort Jour. Vet. Sci. and Anim. Indus.*, 13 (1939), No. 1-2, pp. 9-197, 229-233, 245-317, 347-358, 369-398, figs. 27).—Contributions presented (E. S. R., 82, p. 817) include the following: Ovine Anaplasmosis—The Transmission of *Anaplasma ovis* and *Eperythrozoon ovis* to the Blesbuck (*Damaliscus albifrons*) (pp. 9-16), and The Immunity in Heartwater (pp. 245-283), both by W. O. Neitz; Studies of the Rickettsias of the Typhus-Rocky-Mountain-Spotted-Fever Group in South Africa—I, Isolation of Strains, by R. A. Alexander, J. H. Mason, and W. O. Neitz (pp. 19-23), II, Morphology and Cultivation (pp. 25-39), III, The Disease in the Experimental Animal—Cross-Immunity Tests (pp. 41-65), and IV, Discussion and Classification (pp. 67-76), all by R. A. Alexander and J. H. Mason; The Antigenic Structure of Salmonellas Obtained From Domestic Animals and Birds in South Africa, by M. W. Henning (pp. 79-189); A Tetrachlorethylene Emulsion as an Anthelmintic, by H. O. Mönnig and R. J. Ortlepp (pp. 193-197); Chemical Investigations Upon *Lotononis laxa* E. and Z. I.—The Isolation of Pinitol, a Fatty Ester and Benzaldehyde, by H. L. de Waal (pp. 229-233); A Rickettsiosis [of Sheep] New to South Africa, by K. Schulz (pp. 287-289); Serological Variants of *Salmonella typhimurium* Isolated From South African Animals, by M. W. Henning and D. Haig (pp. 293-306); The Use of Anthrax Vaccines Prepared From Avirulent (Uncapsulated) Variants of *Bacillus anthracis* (pp. 307-312), and The Immunization of Laboratory Animals Against Anthrax (pp. 313-317), both by M. Sterne; Alkali Poisoning, by D. G. Steyn (pp. 347-358); Quantitative Studies Upon Porphyrin Excretion in Bovine Congenital Porphyrinuria (Pink Tooth) No. 2, by P. J. J. Fourie and

G. C. S. Roets (pp. 369-382); and Bovine Congenital Porphyria (Pink Tooth) Inherited as a Recessive Character, by P. J. J. Fourie (pp. 383-398).

History of animal plagues of North America, B. [W.] BIERER (*Baltimore, 1939, pp. [141]*).—This further contribution by the author (*E. S. R., 84, p. 100*), presented in chronological form, includes 267 titles and an index.

The effect of glutathione on selenium toxicity, K. P. DuBois, M. Rhan, and A. L. Moxon. (*S. Dak. State Col.*). (*S. Dak. Acad. Sci. Proc., 19 (1939), pp. 71-74*).

A comparative study of liver glycogen values of control selenium and selenium-arsenic rats, R. L. Potter, K. P. DuBois, and A. L. Moxon. (*S. Dak. State Col.*). (*S. Dak. Acad. Sci. Proc., 19 (1939), pp. 99-106*).

Nature of Eimeria nieschulzi-growth-promoting potency of feeding stuffs.—I, Positive effect of gray shorts, E. R. Becker (*Iowa State Col. Jour. Sci., 14 (1940), No. 3, pp. 317-321*).—The disparity between the number of oocysts of *E. nieschulzi* eliminated by rats on a basal ration supplemented with soybean meal and on a basal ration supplemented with wheat shorts of comparable protein content may be attributed to the positive coccidium-growth-promoting potency of the middlings rather than to positive suppressive action of the soybean meal. Ether, alcohol, and petroleum ether extracts of gray shorts did not promote the development of the protozoan. Autoclaved mixtures of shorts and water yielded an extract that exhibited coccidium-growth-promoting potency. The substance (or substances) favoring the development of the parasite when added to the particular reference ration (R₂) used is water soluble and heat stable.

The bacteriostatic and the bactericidal action of certain organic sulphur compounds, E. L. Everitt and M. X. Sullivan (*Jour. Wash. Acad. Sci., 30 (1940), No. 11, pp. 457-463*).—Among the 50 compounds tested against streptococci, the most promising were phenothioxine and mercaptobenzothiazole.

Individual isolation of infected animals in a single room, F. L. Horsfall, Jr., and J. H. Bauer (*Jour. Bact., 40 (1940), No. 4, pp. 569-580, figs. 5*).—Description is given of equipment for the individual isolation of infected animals in a single room that has been designed and constructed by the authors. Animals ranging in size from the mouse to the dog and monkey have been successfully isolated in the unit.

Ammonium bicarbonate secreted by surgical maggots stimulates healing in purulent wounds, W. Robinson. (*U. S. D. A.*). (*Amer. Jour. Surg., n. ser., 47 (1940), No. 1, pp. 111-115*).—In continuing the work on secretions of surgical maggots (*E. S. R., 76, p. 690; 77, p. 68; 81, p. 573*), ammonium bicarbonate has been shown to be present in comparatively large quantities. With the aid of a number of physicians and surgeons this product has been tested clinically and found to possess marked healing properties similar to the two maggot products allantoin and urea. Ammonium bicarbonate is inexpensive and is easily prepared for use in solution form. It was applied to purulent wounds as a 1- or 2-percent sterile solution on gauze packs. The occurrence of this compound in maggot secretions is associated with the presence of the enzyme urease in maggot tissues. The blowfly *Phormia regina* was used in the investigation.

The soil as a source of microorganisms antagonistic to disease-producing bacteria, S. A. Waksman and H. B. Woodruff. (*N. J. Expt. Stas.*). (*Jour. Bact., 40 (1940), No. 4, pp. 581-600, figs. 5*).—Report is made of certain preliminary results of a study of the nature and abundance of some soil microorganisms, with special reference to their action against various bacteria, comprising both Gram-positive and Gram-negative forms. "Of a number of antag-

onistic organisms isolated from the soil, two were studied in greater detail, one a bacterium belonging to the *Pseudomonas aeruginosa* group and the other an *Actinomyces*. These organisms were found to inhibit the growth of several Gram-negative bacteria, as well and, even to a greater extent, of numerous Gram-positive bacteria. The active substance produced by the two antagonists was found to be largely thermostable. It passed through a Seitz filter, it was removed by charcoal, and was, partly at least, ether-soluble. Highly active preparations were obtained which inhibited, in very dilute solutions, the growth of *Escherichia coli*, *Brucella abortus*, and of many other bacteria. The active substance had also a strong bactericidal effect upon *E. coli* and *B. abortus*; 1 ml. of the preparations containing 0.4 mg. of the crude active substance killed aqueous suspensions of *E. coli* (215,000,000 viable cells) and of *B. abortus* (68,000,000 viable cells)." This substance of the two antagonists was found to reduce, in very low concentrations, the bacterial population of natural substrates, such as milk. When added to agar it prevented the development of the great majority of soil bacteria and actinomycetes but not of fungi.

A list is given of 19 references to the literature.

Anaplasmosis transmitted by tipping the horns of cattle, L. H. MOE, G. W. STILES, and D. E. HOWELL. (Okla. Expt. Sta. and U. S. D. A.). (*Jour. Amer. Vet. Med. Assoc.*, 97 (1940), No. 764, pp. 450, 451).—Sixteen in a herd of 747 3-year-old grade Brahman steers, the horns of which were tipped before shipment from Lake Charles, La., to Osage County, Okla., developed anaplasmosis, the first appearing 42 days after the last date of tipping. Three of the animals succumbed to the affection.

Tick-borne human encephalitis in the European part of USSR and Siberia, M. P. CHUMAKOV and N. A. SEITLENOK (*Science*, 92 (1940), No. 2386, pp. 263, 264).

John's disease infection of laboratory animals, L. SAHAI (*Vet. Jour.*, 96 (1940), No. 10, pp. 407-414, pls. 2).

Psittacosis: Possible response to sulfapyridine, H. C. HINSHAW (*Mayo Found. Med. Ed. and Res., Proc. Staff Mtgs. Mayo Clinic*, 15 (1940), No. 42, pp. 657-662, figs. 4).

The squirrel as a new host to a ringworm fungus, E. D. DELAMATER (*Mycologia*, 31 (1939), No. 5, pp. 519-526, figs. 3).—A study of a serious skin infection of a gray squirrel living at Homewood, Baltimore, Md., has for the first time revealed this squirrel to be a host to the ringworm fungus *Trichophyton mentagrophytes (gypseum)* (Robin-Sabouraud).

A ringworm disease of muskrats transferable to man, V. K. CHARLES. (U. S. D. A.). (*Jour. Wash. Acad. Sci.*, 30 (1940), No. 8, pp. 338-344).—Description is given of a fungus of the genus *Trichophyton*, identified as *T. mentagrophytes* (Robin), an infection with which was acquired by an investigator of the Iowa Experiment Station while working with muskrats (*Ondatra zibethica*) near Ruthven, Iowa. The identity of the organisms, one of which was isolated from man and the other from muskrats, was proved by comparative cultural studies. Reference is made to the above noted report of this fungus as affecting the common gray squirrel.

Highly virulent strains of Rocky Mountain spotted fever virus isolated from ticks (*D[ermacentor] variabilis*) in Georgia, G. D. BRIGHAM and J. WATT (*Pub. Health Rpts. [U. S.]*, 55 (1940), No. 46, pp. 2125, 2126).—Report is made of the isolation of two strains of Rocky Mountain spotted fever virus from the American dog tick in Georgia.

A method of preparation of antigen for surra complement-fixation test, R. A. ACEVEDO (*Philippine Jour. Anim. Indus.*, 7 (1940), No. 3, pp. 219-224).—

Description is given of an improved method of preparing antigen of pure trypanosomes from rats for the complement-fixation test for surra. The method is considered to solve the difficulties in the preparation of the antigen in small laboratories which lack apparatus.

Relationship of sex factors to resistance against *Cysticercus crassicolis* in rats, D. H. CAMPBELL and L. R. MELCHER (*Jour. Infect. Diseases*, 66 (1940), No. 2, pp. 184-188).—The experiments reported give additional evidence of a correlation between sex factors and resistance to infection of rats with the larvae of *Taenia taeniaeformis* (*C. crassicolis*).

A method of culturing large numbers of *Haemonchus contortus* larvae from eggs in cattle feces, G. E. CAUTHEN. (U. S. D. A.). (*Helminthol. Soc. Wash. Proc.*, 7 (1940), No. 2, pp. 82, 83).—Description is given of a method in which sphagnum moss was used to absorb water and assure better aeration.

Investigations on possible intermediate hosts, other than oribatid mites, for *Moniezia expansa*, W. H. KRULL. (U. S. D. A.). (*Helminthol. Soc. Wash. Proc.*, 7 (1940), No. 2, pp. 68-71).—Evidence is presented indicating that oribatid mites are the only organisms which serve as intermediate hosts of the sheep tapeworm *M. expansa*. Field observations suggest that certain invertebrates, including ants, centipedes, and earthworms, may carry the eggs of *Moniezia* into the soil and deposit them in locations favorable for their survival, thus making the eggs available to the intermediate hosts over a longer period than would otherwise be possible.

A note on resistance studies with the nematode, *Nippostrongylus muris* (Yokogawa, 1920) in laboratory piebald rats, L. M. YUTUC (*Philippine Jour. Anim. Indus.*, 7 (1940), No. 2, pp. 147-152).—Experiments on natural and acquired resistance of rats to *N. muris* have shown age to be a factor in natural resistance, but not necessarily an entity in itself. It was established that a sufficiently high degree of acquired immunity to the extent of preventing death of rats can be induced by a single subcutaneous injection of 50 living larvae per gram of body live weight. Twenty references to the literature cited are listed.

Studies on staphylococci of animal origin, W. B. BELL. (Cornell Univ.). (*Cornell Vet.*, 30 (1940), No. 4, pp. 514-525, figs. 9).—In the work reported 61 strains of staphylococci were isolated from disease processes in horses, cattle, sheep, goats, pigs, dogs, cats, and guinea pigs. Fifty-four strains were of the *Staphylococcus aureus* type, 7 of the *S. albus*. Only 1 of the *S. albus* strains proved to be hemolytic, the other 6 were inert. Of the *S. aureus* strains about half exhibited the hemolytic zones characteristic of the alpha toxin, and about one-third of these showed the beta toxin as well. No strains were found which formed the beta toxins alone. Thirty-seven of the strains were studied as to their ability to coagulate blood plasma and to ferment mannitol, and of these 8 showed on cow-blood plates the zones characteristic of both alpha and beta toxins, 2 showed the alpha toxin only, and 17 were inert. In the coagulase tests the plasma of human, horse, and rabbit blood gave identical results in all cases except two, in which the rabbit plasma was coagulated and the others were not. Bovine plasma, with two exceptions, was not coagulated when the others were. Coagulation of human and equine plasma correlated perfectly with the presence of the alpha toxin. In one case when coagulation only of the rabbit plasma occurred, no toxins were demonstrated on blood plates.

Mannitol fermentation did not correlate well with the coagulase tests and toxin formation. All coagulase-positive and toxin-forming strains fermented mannitol (with one exception), but as many more strains which were coagulase

and toxin-negative proved capable of fermenting it also. This agrees with the finding of Cowan (E. S. R., 79, p. 391), who reports greater correlation among strains of human than among those of animal origin.

Eight strains producing hemolytic zones on blood plates, and one which did not, were cultivated on a fluid medium and filtrates were prepared in order to determine whether or not they were hemolytic. The strains which were hemolytic on plates produced filtrates which were hemolytic; the inert strain produced a nonhemolytic filtrate.

Observations on the pathogenicity of avian staphylococci, W. N. PLASTRIDGE and E. JUNGHERR. ([Conn.] Storrs Expt. Sta.). (*Jour. Bact.*, 40 (1940), No. 3, pp. 464, 465).—Report is made of the biochemic and pathogenic properties of avian staphylococci obtained from joint, skin, and navel-ill lesions of barnyard fowl. The ability of avian staphylococci to coagulate rabbit plasma is considered a reliable means of detecting definitely pathogenic cultures of the avian staphylococci.

A gas-forming and proteolytic variant of *Str[eptococcus] agalactiae*, J. G. DAVIS and H. J. ROGERS (*Vet. Rec.*, 52 (1940), No. 38, p. 692).

Organisms described as avian *Toxoplasma*, F. WOLFSON (*Amer. Jour. Hyg.*, 32 (1940), No. 3, Sect. C, pp. 88-99, figs. 4).—A review of the literature dealing with avian *Toxoplasma*, presented in chronological order, is accompanied by 49 references to the literature.

***Corynebacterium equi* in bovine pyometra**, J. F. CRAIG and G. O. DAVIES (*Vet. Jour.*, 96 (1940), No. 10, pp. 417-419).

Streptococci other than *Streptococcus agalactiae* found in the cow's udder, R. B. LITTLE (*Cornell Vet.*, 30 (1940), No. 4, pp. 482-494).—The cultural characteristics and clinical manifestations in the udder of streptococci other than *S. agalactiae*, cultured from the milk of cows in three of the four herds studied, are described. It was shown that these other kinds of streptococci possess cultural characteristics quite different from those distinctive for *S. agalactiae*. Possibly one kind of mastitis caused by *S. dysgalactiae* is not commonly encountered except in an occasional herd, for in two herds no infections occurred during a period of 4 to 9 yr., respectively. *S. uberis* and the atypical streptococci which ferment mannite and split aesculin may cause either transient, mild, or severe infections. Of the atypical strains, certain ones were definitely regarded as *S. faecalis*. It is suggested that further study may reveal that the natural habitat of streptococci which attack mannite and aesculin may be the cow or the environmental conditions under which she is maintained.

Bang's disease (infectious abortion of cattle), H. WELCH (*Montana Sta. Vir.* 158 (1940), pp. 11, figs. 3).—A revision of Circular 152 (E. S. R., 79, p. 538).

The effect of variations in technic on the rapid or plate agglutination test for Bang's disease, M. H. ROEPKE and W. D. MURDOCK. (Minn. Expt. Sta. and U. S. D. A.). (*Cornell Vet.*, 30 (1940), No. 4, pp. 449-464).—Report is made of studies undertaken to determine whether or not the variations in technic employed in the rapid agglutination test affect the average titer readings and, if so, to what extent. The details are given in nine tables. The results have led the authors to conclude that a more rigid standard technic for conducting the plate test would be effective in reducing the percentage of tests by different operators which differ by from one to two dilutions.

The significance of the "ceased" reactor to Bang's disease, B. A. BEACH, M. R. IRWIN, and L. C. FERGUSON. (Wis. Expt. Sta. and U. S. D. A.). (*Jour. Agr. Res.* [U. S.], 61 (1940), No. 1, pp. 75-80).—Report is made of an investigation of the importance in the Bang's disease control program of cattle that following infection have lost their agglutination titer to *Brucella abortus* and are known as ceased reactors. In the experimental work 21 ceased reactors in two herds,

14 in one and 7 in the other, were allowed to commingle with a total of 54 cows from Bang-negative herds through either one or two gestation periods for each of the normal cows. "With the exception of a transitory infection in one-quarter of the udder of 1 of the ceased reactors, *B. abortus* was not demonstrated in any of these cows by culture or guinea pig injection at the time of calving. Moreover, none of the 54 normal cows showed evidence of having been infected by any of the ceased reactors, as evidenced by the lack of agglutinins in their serums for *B. abortus*, except 1 individual whose serum showed a low titer (1 : 100) for the organism. This one reactor was in the same herd as the cow showing the transitory infection cited." The authors were unable to demonstrate the organism in this cow either at the time of calving or after slaughter. The results indicate that it is relatively safe to allow ceased reactors to Bang's disease to mingle with noninfected stock.

Sporadic bovine encephalomyelitis (Buss disease), S. H. McNUTT and E. F. WALLER. (Iowa State Col.). (*Cornell Vet.*, 30 (1940), No. 4, pp. 437-448, figs. 6).—Report is made of a disease, a preliminary account of which has been noted (E. S. R., 83, p. 396). This affection, a sporadic bovine encephalomyelitis, was recognized in cattle under 3 yr. of age in five herds in an area in the eastern part of Iowa extending 200 miles diagonally across the State. The incubation period ranges from 4 to 27 days, and the course of the disease is from about 1 to 3 weeks. Death results in from 40 to 70 percent of the cases. There are usually no untoward aftereffects, and recovered animals are not carriers.

Sulfapyridine in the treatment of calf diphtheria, J. FARQUHARSON. (Colo. State Col.). (*Jour. Amer. Vet. Med. Assoc.*, 97 (1940), No. 764, pp. 431-435, 436).—Report is made of nine cases of clinical *Actinomyces necrophorus* infections in cattle (one 3 weeks old, seven from 6 to 18 mo. old, and one 2.5 yr. old) treated with sulfapyridine, eight having been calf diphtheria and one vaginitis. "The initial treatment by intravenous inoculation of 0.06 gm. per kilogram (2.2 lb.) of body weight resulted in a blood concentration of 6.7 to 8 mg. percent of sulfapyridine. For continued therapeutic effectiveness this was followed by the oral administration of 1 gr. per pound of body weight. Twenty-four hr. after treatment was initiated, a marked improvement was noted in all cases. After an average duration of treatment for 6 days, all animals were apparently normal. In only one case was there a relapse. In this instance the recommended administration of the drug was not followed. The meager data suggest the use of sulfapyridine in the treatment of calf diphtheria and perhaps in other infections due to or associated with *A. necrophorus*." At the time the report was prepared, 4 mo. following the last treatment of the animals, recovery was complete and there was every reason to believe that it would be permanent.

The helminth parasites and parasitic diseases of sheep in Canada.—II, Notes on the effect of winter upon the free-living stages of nematode parasites of sheep on the pastures in eastern Canada, W. E. SWALES (*Canad. Jour. Compar. Med. and Vet. Sci.*, 4 (1940), No. 6, pp. 155-161).—A continuation of the work previously noted (E. S. R., 83, p. 248).

Human infection with ecthyma contagiosum, a virus disorder of sheep, R. NOMLAND (*Arch. Dermatol. and Syphilol.*, 42 (1940), No. 5, pp. 878-883, figs. 2).—Report is made of two cases of local inoculation in men of ecthyma contagiosum, a virus disease of sheep characterized by vesicular and, later, crusted lesions of the mouth. This virus can attack human beings exposed to it, giving rise to a highly inflammatory, purulent, or crusted lesion at the points of inoculation.

Vibronic abortion in Michigan sheep, J. F. RYFF. (Mich. State Col.). (*Jour. Amer. Vet. Med. Assoc.*, 97 (1940), No. 764, pp. 452, 453).—*Vibrio fetus*

is recorded as the causative agent of abortion in three flocks of sheep in Michigan within the past year.

A note on phenothiazine therapy in sheep, J. H. WHITLOCK and R. COX. (Kans. State Col.). (*Jour. Amer. Vet. Med. Assoc.*, 97 (1940), No. 764, pp. 436, 437).—Report is made of the treatment of a few lambs heavily infected with strongyline nemas (chiefly stomach and nodule worms) in which a single dose (0.5 gm. per pound of body weight) of phenothiazine solution, consisting of phenothiazine 10 gm., powdered acacia 0.5 gm., and water to make 30 cc., reduced the E. P. G. (eggs per gram of feces) count to a harmless level in all cases. Under the same conditions a solution consisting of 1.7 percent copper sulfate and 1.7 percent nicotine sulfate solution (40 percent) failed to reduce the count in one animal to a nonsignificant level.

Tests of phenothiazine, a highly efficient anthelmintic, on a means of administration and the indicated uses for the control of parasitic diseases of sheep, W. E. SWALES (*Canad. Jour. Compar. Med.*, 3 (1939), No. 7, pp. 188-194).—The preliminary series of 10 experiments reported has confirmed the finding of Harwood and his associates (*E. S. R.*, 81, pp. 105, 715) that phenothiazine is of exceptional value for the control of nematode parasites of sheep. By administration of this chemical in the form of compressed tablets, developed by the author and which disintegrate rapidly in the stomach, its anthelmintic efficiency has been increased. It can be employed without prior fasting of the animals.

Further experiments on the use of phenothiazine as an anthelmintic for sheep, W. E. SWALES (*Canad. Jour. Res.*, 18 (1940), No. 7, Sect. D, pp. 266-271).—A further account (see above) is given of the development and production of a disintegrating tablet as a practical means of employing phenothiazine as an anthelmintic for sheep. Continued critical tests have shown high efficiencies against species of *Oesophagostomum*, *Haemonchus*, *Ostertagia*, *Monodontus*, *Nematodirus*, *Cooperia*, *Trichostrongylus*, and *Chabertia*. Tests against single infections with *Ostertagia* continued to show the complete efficiency of this form of treatment against this parasite. The periods of excretion of destroyed parasites with the feces are noted. It was found that single doses of phenothiazine did not anematize animals under treatment.

The fate of phenothiazine in the sheep, H. B. COLLIER (*Canad. Jour. Res.*, 18 (1940), No. 7, Sect. D, pp. 272-278).—Report is made of methods devised for the detection and estimation of phenothiazine and its derivatives in the feces, urine, blood, and milk of sheep following oral administration of the drug. Only unchanged phenothiazine was detected in the feces. In the urine was found a conjugate which was hydrolyzed by strong acid in the cold and tentatively identified as potassium leucophenothiazone sulfate. It was also present in the blood serum and the milk. Catalase is inhibited by leucophenothiazone, leucothionol, and thionol, but not by phenothiazone.

Studies on effects and excretion of phenothiazine when used as an anthelmintic for sheep, W. E. SWALES and H. B. COLLIER (*Canad. Jour. Res.*, 18 (1940), No. 7, Sect. D, pp. 279-287).—Tests were made on young sheep, barren ewes, pregnant ewes, and lactating ewes to determine the effects and excretion of phenothiazine and derivatives. Following the development of adequate technical methods, over 80 percent of the total dose was recovered from the feces and urine in roughly equal amounts. Observations were made upon the occurrence of the maximum concentrations of total leucophenothiazone in the blood, urine, and milk. No definite toxic effect was noted. Further evidence of anthelmintic efficiency of phenothiazine is presented. The bacteriostatic effect of the derivatives in the milk is noted.

The effect of food intake upon the dimensions of *Balantidium* from swine in culture, N. D. LEVINE. (Univ. Ill.). (*Amer. Jour. Hyg.*, 32 (1940), No. 3, Sect. C, pp. 81-87).

The incidence of *Salmonella* in normal hogs, H. L. RUBIN. (Univ. Ky.). (*Jour. Bact.*, 40 (1940), No. 3, p. 463).—An examination of the mesenteric lymph glands of apparently normal hogs (from 40 lots consisting of 25 animals each) for *Salmonella* resulted in detection of such organisms in 19, or 47.5 percent, of the lots. An examination of 100 of 224 cultures of *Salmonella* resulted in the identification of *S. cholerae-suis kuzendorf*, *Salmonella* sp. (Derby type), *S. anatis*, *S. enteritidis*, *S. typhimurium*, *Salmonella* sp. (Bredeney type), (Muenchen type), (St. Paul type), (New Brunswick type), and a hitherto undescribed type which has been named "*S. lexington*". More than one type of *Salmonella* has been found present in several of the large lots and in one of the single lots thus far examined.

The prevalence of larvae of *Trichinella spiralis* in the hearts, livers, stomachs, and kidneys of experimentally infected swine, C. H. HILL. (U. S. D. A.). (*Helminthol. Soc. Wash. Proc.*, 7 (1940), No. 2, pp. 83, 84).

The effect of human strains of *Hemophilus influenzae* on influenza virus infections of swine, J. R. MOTE and L. D. FOTHERGILL (*Jour. Bact.*, 40 (1940), No. 4, pp. 505-516, figs. 3).—An investigation of the possible existence of a concerted or synergistic action between known human strains of *H. influenzae* and two influenza virus strains in swine is reported upon. In no instance has a significant symbiotic action been demonstrated between the bacterial and the virus strains studied. The inability of human strains of *H. influenzae* to establish themselves in the respiratory tract of swine suggests a possible biologic difference between human and swine strains of *H. influenzae*. A list is given of 18 references to the literature.

The rôle of the veterinarian in effective immunization against hog cholera with tissue vaccine, W. H. BOYNTON and G. M. and F. W. WOODS. (Univ. Calif. et al.). (*Jour. Amer. Vet. Med. Assoc.*, 97 (1940), No. 764, pp. 427-430).

Corynebacterium equi as a possible cause of tuberculous-like lesions of swine, W. H. FELDMAN, H. E. MOSES, and A. G. KARLSON (*Cornell Vet.*, 30 (1940), No. 4, pp. 465-481, figs. 3).—The finding in Denmark that *C. equi* was responsible for tuberculouslike lesions of the lymph nodes of the region of the head and neck of swine led to an investigation of similar material from swine slaughtered in Minnesota. A submaxillary lymph node was obtained from the carcass of each of 89 swine, the opposite lymph node of which was considered in all instances to be tuberculous. A histological study of the lymph nodes and a study of cultures of emulsified tissue, together with guinea pig and rabbit inoculations, resulted in the finding of viable tubercle bacilli of the avian type to be present in 55 of the 89 specimens. In 13 instances *C. equi* was associated with tubercle bacilli, while in 7 instances *C. equi* alone was found. Neither viable tubercle bacilli nor *C. equi* was found in 34 of the specimens, although gross or microscopic lesions were noted in 28. In addition, *C. equi* was isolated from 6 of 25 apparently normal submaxillary lymph nodes of presumably non-tuberculous swine.

The findings have led to the conclusion that in Minnesota, in the great majority of instances, tubercle bacilli are the responsible etiologic agents in localized nodular or diffuse necrotizing granulomatous lesions of the submaxillary lymph nodes of swine, that *C. equi* occurs in approximately from 20 to 25 percent of diseased submaxillary lymph nodes of swine in association with tubercle bacilli, that the organism also occurs in approximately the same percentage of apparently normal submaxillary lymph nodes of nontuberculous swine, and

that there is no evidence to indicate *C. equi* is etiologically related to tuberculous adenitis of swine nor that a specific tissue reaction occurs by which invasion of the tissues with *C. equi* can be distinguished from that of tubercle bacilli. The part *C. equi* and other nonacidfast bacteria associated with tuberculous adenitis may contribute to the tissue reaction is obscure.

Properties of the isolated equine encephalomyelitis virus (eastern strain), D. G. SHARP, A. R. TAYLOR, D. BEARD, H. FINKELSTEIN, and J. W. BEARD (*Science*, 92 (1940), No. 2390, pp. 359-361).—Report is made of the investigation of a specific material obtained by ultracentrifugal fractionation of extracts of chick embryos diseased with virus of equine encephalomyelitis (eastern strain). The findings indicate that the material (with which is associated the infectivity of the extracts from which it is derived) is identical with the virus. A description by Taylor and associates of the process consistently yielding the purified virus has been noted (E. S. R., 83, p. 399). The purified material studied is specific to the virus-diseased chick embryos. No trace of a similar or related component has been found in repeated studies of normal embryo tissue. The homogeneity of the product is clearly evident in the findings with the analytical ultracentrifuge and in the uniformity of its biological and chemical behavior. It would thus appear that the virus of equine encephalomyelitis (eastern strain) is a complex of high molecular weight consisting of phospholipids, cholesterol, fatty acid, and ribonucleoprotein.

pH stability of the virus of equine encephalomyelitis (eastern strain) under various conditions, H. FINKELSTEIN, W. MARX, and D. and J. W. BEARD (*Jour. Infect. Diseases*, 66 (1940), No. 2, pp. 117-126, figs. 6).—Report is made on the pH stability of equine encephalomyelitis virus (eastern strain), which was studied by means of infectivity titrations in mice.

Endoparasites of aged horses and mules at the Beltsville Research Center of the U. S. Department of Agriculture, A. O. FOSTER and R. T. HABERMANN. (U. S. D. A.). (*Helminthol. Soc. Wash. Proc.*, 7 (1940), No. 2, pp. 85-87).

A field trial with phenothiazine as an equine anthelmintic, C. E. HOWELL and J. W. BRITTON. (Univ. Calif.). (*Cornell Vet.*, 30 (1940), No. 4, pp. 526-532).—Powdered phenothiazine fed mixed with the grain ration proved to be 100 percent effective in removing strongyles from 37 horses and from 78 to 95 percent effective in 8 horses. This treatment was 100 percent effective in removing *Trichostrongylus axei* from 4 colts but was ineffective against *Ascaris equorum* and *Gastrophilus* spp. Numerous *Oxyuris equi* were found in the feces of treated horses from 2 to 4 days following treatment. Dosage of the drug used was 45 gm. for weanlings and 2 yearlings and 70 or 80 gm. for the remaining horses. The efficiency of the drug was based on fecal examination before and after treatment and similar examinations of 28 control horses. No toxic effects were noted in any horses or foals following treatment.

A sporadic case of brucellosis in the dog, A. F. NOLAN. (Ky. Expt. Sta.). (*Cornell Vet.*, 30 (1940), No. 4, pp. 542-545).—Report is made of brucellosis in a dog which 3 mo. prior to the development of symptoms had ingested an unknown amount of meat from horses that had been inoculated with large doses of *Brucella abortus suis*.

Brucellosis in a dog, A. G. KARLSON and L. B. CLAUSEN. (Minn. Expt. Sta. and U. S. D. A.). (*Cornell Vet.*, 30 (1940), No. 4, pp. 546, 547).—Report is made of a case of brucellosis due to *Brucella abortus* in a dog which had been fed daily a quart of raw milk from a herd of 14 cows, 9 of which were suffering from Bang's disease.

Preliminary observations on the efficacy of diphenylamine for the removal of intestinal nematodes from dogs, J. E. GUTHRIE. (U. S. D. A.). (*Helminthol. Soc. Wash. Proc.*, 7 (1940), No. 2, pp. 84, 85).—In these experiments diphenylamine in doses of from 3 to 10 gm. per dog removed 64.2 percent of 291 hookworms from 6 dogs, 61.9 percent of 21 ascarids from 3 dogs, and 83.6 percent of 537 whipworms from 5 dogs. At no time were any symptoms of intoxication observed which could be attributed to the treatment.

[Contributions on animal pathology and parasitology] (*Poultry Sci.*, 19 (1940), No. 5, pp. 345-366).—Contributions presented at the annual meeting of the Poultry Science Association held in June 1940, abstracts of which are given, include the following: Egg Propagation of Turkey Pox Virus, by F. R. Beaudette and C. B. Hudson (p. 345) (N. J. Expt. Stas.); The Effect of Intra-peritoneal Injection of Lymphomatous Nerve Tissue Into Chickens From Strains Selected for Resistance and Susceptibility to Spontaneous Lymphomatosis, by K. B. DeOme, J. R. Beach, I. M. Lerner, and L. W. Taylor (pp. 347, 348) (Univ. Calif.); Flowers of Sulphur and Charcoal in the Control of Experimentally Produced Coccidiosis, by O. E. Goff and C. W. Upp (p. 349) (La. Sta.); The Pathologic Concept of So-Called "Pullet Disease," by E. Jungherr and J. M. Levine (p. 354) (Univ. Conn.); The Initiation of Avian Coccidial Infection with Merozoites, by P. P. Levine (p. 355); The Importance of Pathological Study in Poultry Disease, by E. L. Stubbs (pp. 362, 363); Studies on Gizzard Ulceration, by A. E. Tepper and H. R. Bird (p. 364) (Univ. Md.); The Outlook for Pullorum Disease Control and Eradication, by H. Van Roekel (p. 365) (Mass. Sta.); and Observations on Fowl Cholera Diagnosis, by J. F. Witter (p. 366) (Univ. Maine).

Viability in poultry flocks, D. R. MARBLE. (Pa. Expt. Sta.). (*Amer. Egg and Poultry Rev.*, 1 (1940), No. 10, pp. 340, 342).—Adult mortality in the station poultry flocks for the 6-yr. period (1927-32) preceding the commencement of selection for viability was extremely high. This was due to various forms of fowl paralysis complex and included iritis, paralysis, and tumors. Data on the adult mortality for the 5 yr. (1933-37) following the change in the method of selection of breeding stock revealed a highly significant decrease in such losses, that in the Single-Comb White Leghorn and Barred Plymouth Rocks in 1937 having been approximately half that for the 6-yr. period. The laying-flock mortality during these 5 yr. of selection decreased from 39.8 percent in the Single-Comb White Leghorns for the 6-yr. average for 1927-32 to 20.1 percent in 1937. The decrease in the Barred Plymouth Rocks was from 48.7 percent for the 6-yr. average to 24.6 percent in 1937. Cases of paralysis, tumors, and leucosis still constitute a large proportion of the mortality, but the percentage of families showing high viability has increased from year to year. The data indicate that losses from fowl paralysis can be decreased gradually by the use of breeders from families that show resistance to the disease and by the use of hen in preference to pullet breeders.

A direct method of determining the erythrocyte, leucocyte, and thrombocyte count of fowl blood, P. W. WETMORE. (Science, 92 (1940), No. 2391, p. 386).

Normal bactericidins in sera of the domestic fowl, E. E. SCHNETZLER and S. E. HARTSELL. (Ind. Expt. Sta.). (*Poultry Sci.*, 19 (1940), No. 6, pp. 431-434, figs. 2).—In the preliminary study here reported, serums of the domestic fowl were found to possess normal bactericidins against eight strains of *Salmonella pullorum*. The strains employed possessed varying degrees of susceptibility to the action of fowl bactericidins. The bactericidal action of the serums was less when tested with those strains of *S. pullorum* most recently isolated. The individual variation among hens in percentage of organisms killed was wide, ranging

from 9.6 to 85.9 percent. Against the strains of *S. pullorum* used, the serums of White Leghorns were found to possess greater bactericidal action than the serums of Rhode Island Reds. The mean percentage of organisms killed by bactericidins in the serums of White Leghorns was 63.8 percent, while in the Rhode Island Reds it was 45.3 percent.

Anthelmintic value of tobacco midrib powder mixed with the daily feed mash of infected chickens, Z. DE JESUS and D. J. CABRERA (*Philippine Jour. Anim. Indus.*, 7 (1940), No. 3, pp. 251-261, pl. 1).—A description is given of a practical and economical method of expelling tapeworms and roundworms of poultry. Mixed with the daily feed mash of mature fowls, tobacco midrib powder, in doses of from 4 to 5 gm. (1 heaping tablespoonful) in combination with from 5 to 7 gm. (1 heaping teaspoonful) of sodium sulfate and given for from 3 to 7 days, was found efficacious in expelling not only the common intestinal roundworms but also the tapeworms. As an anthelmintic, tobacco midrib powder is not as good a taeniafuge as when given in combination with a saline purgative, and it is more effective against roundworms than against tapeworms. The observations have shown that this method does not reduce the egg production and thus can be used for laying hens.

Arthropod intermediate hosts of *Acuaria hamulosa* in the Philippines, I, P. G. REFUERZO (*Univ. Philippines, Nat. and Appl. Sci. Bul.*, 7 (1940), No. 4, pp. 407-414, figs. 3).—Search was made for intermediate hosts of the gizzard worm *A. hamulosa*, a parasite of poultry in various parts of the world which was found to infect as high as 20 percent of the chickens examined. Two grasshoppers, *Aeolopus tamulus* (F.) and *Oxya sinensis* Walk., were discovered to act as such, *A. tamulus* for the first time and *O. sinensis* previously recorded from Hawaii. Larvae from 18 to 20 days old parasitized birds that were fed infected grasshoppers. Eggs were recovered from the droppings in from 85 to 96 days.

Coccidiosis in the laying flock, E. M. DICKINSON. (Oreg. Expt. Sta.). (*Nulaid News*, 18 (1940), No. 7, pp. 8, 9).

A study of aqueous colloidal sulphur in the control of *Eimeria tenella* in the fowl, C. D. CARPENTER. (Univ. Ky.). (*Poultry Sci.*, 19 (1940), No. 6, pp. 371-379).—Report is made of experiments conducted with aqueous colloidal sulfur solution with the following composition of solids, to determine its value in preventing and curing coccidiosis: Colloidal sulfur 3.85, yellow sulfur 2.28, and milk of sulfur 0.10 percent. It was found that a "1 percent aqueous colloidal sulfur solution in the drinking water did not protect chicks against mass doses of 100,000 sporulated *E. tenella* oocysts when given simultaneously nor after chicks had received this amount of sulfur for 1 week prior to inoculation. One percent aqueous colloidal sulfur solution administered in the drinking water for 10 days prior to inoculation failed to protect against graded mass doses of from 7,500 to 50,000 oocysts. Thirty percent aqueous colloidal sulfur in the mash protected chicks against mass doses of from 1,500 to 15,000 oocysts but interfered with growth and produced fatal nephritis. Ten percent aqueous colloidal sulfur solution in the mash provided protection against these same doses, with little evidence of kidney involvement, and did not adversely affect growth during the 24-day period. Fifteen thousand sporulated *E. tenella* oocysts failed to produce any appreciable hemorrhage or lesions of coccidiosis when the mash contained 3 parts of an aqueous colloidal sulfur which analyzed 10 percent total sulfurs and was fed for 5 days previous to inoculation, and 7 parts protected against 25,000. Exposure to natural infection for 29 days in the brooder house failed to produce lesions of coccidiosis in chicks when the mash contained 10 parts of a 10 percent aqueous colloidal sulfur."

Quantitative studies on size, variability, and growth rates of oöcysts of different strains of avian malaria, C. G. HUFF (*Amer. Jour. Hyg.*, 32 (1940), No. 3, Sect. C, pp. 71-80, figs. 2).

Active and passive immunity in chickens against Plasmodium lophurae, W. H. and L. G. TALIAFERRO (*Jour. Infect. Diseases*, 66 (1940), No. 2, pp. 153-165, figs. 3).—The authors have found that "infections begun with large numbers of *P. lophurae* in young chickens are characterized by an acute rise in numbers of parasites which is terminated by a sharp crisis and followed within a few days by latency. Ordinarily, latency is not interrupted by relapses, but parasites can be demonstrated for 4 mo. (the longest period tested) by the subinoculation of large quantities of blood into normal chickens. Asexual reproduction lacks synchronicity. Infections started with small numbers of *P. lophurae* in young chickens are slow in developing, are usually low in intensity, and do not generally exhibit a sharp crisis. There is a well-defined age immunity to the infection. During latency there is a marked immunity to superinfection as evidenced by the fact that when large numbers of parasites are introduced they are removed within 2 to 4 days. Acquired immunity can be passively transferred to normal chickens provided sufficient doses of immune serum (from latently infected chickens) are used and continued over a sufficient period. In successful experiments serum was given for 9 days, which included the period of the acute rise of the infection. Incubating immune serum with parasites at 37° C. for 2 hr. and injecting the mixture into chickens greatly enhances the protective action of the immune serum as compared to injecting serum and parasites without incubation."

Observations on the biology of Plasmodium gallinaceum Brumpt, 1935, in the domestic fowl, with special reference to the production of gametocytes and their development in Aedes aegypti (L.), W. H. R. LUMSDEN and D. S. BERTRAM (*Ann. Trop. Med. and Parasitol.*, 34 (1940), No. 2, pp. 135-160, figs. 6).

Immunization against pox in domestic fowl, R. GRAHAM and C. A. BRANDLY (*Illinois Sta. Bul.* 470 (1940), pp. 76, figs. 11).—This contribution is presented in two parts, the first (pp. 4-34) consisting of a review of the literature, of which five pages of references are listed (pp. 72-76), and the second (pp. 34-69) dealing with experiments conducted in the State. Included are experiments on fowl pox immunization with pigeon pox virus, antidiphtherin vaccination against fowl pox, use of the vaccine virus in immunizing against fowl pox by the feather-follicle method, value of chemically treated pigeon and fowl viruses in vaccination against fowl pox, fowl pox immunization of day-old chicks with fowl pox virus, pigeon pox immunization with fowl pox virus, and fowl pox and pigeon pox viruses in vaccination of pullorum-exposed chicks. The practical application of the findings are summarized as follows: "Potent fowl and pigeon pox vaccines properly administered to healthy fowls produce a measurable immunity against fowl pox. The immunity induced by the application of fowl pox vaccine, stick method, is of longer duration and better defined than the immunity induced by the application of pigeon pox vaccine by the feather-follicle method. Pigeon pox vaccine can be used with less risk than fowl pox vaccine, but it provides only a modified protection against the disease. In fact, fowls vaccinated with pigeon pox vaccine may, upon subsequent exposure, develop lesions, but the systemic disturbance accompanying the unaltered virus infection is appreciably modified and often avoided. It seems inadvisable to vaccinate laying flocks not exposed to fowl pox with fowl pox vaccine, though pigeon pox vaccine can be employed (feather-follicle method) without exciting harmful effects. On contaminated premises vaccination of fowls 4 to 8 weeks

old is recommended. In some cases it may be desirable to precede fowl pox vaccination by the application of pigeon pox vaccine. Under many conditions pigeon pox vaccine may provide a practical degree of protection against natural exposure to fowl pox. The method of application, together with the age of the birds and the general health of the flock at the time of vaccination and immediately thereafter, may largely influence the results."

Roup vaccine, T. TOPACIO and E. S. SALAFRANCA (*Philippine Jour. Anim. Indus.*, 7 (1940), No. 3, pp. 225-234).—Recent advance in the knowledge of the etiology of roup is reviewed, and the method of preparation of roup vaccine and its value are discussed. Field experiences with extensive use of roup vaccine for the prevention and control of roup infection have proved satisfactory.

Sarcocystis in birds, A. B. ERICKSON. (Minn. Expt. Sta. et al.). (*Auk*, 57 (1940), No. 4, pp. 514-519, pl. 1).—This contribution includes a list of avian hosts of the genus *Sarcocystis* arranged by orders and families, together with a list of 28 references to the literature cited.

A redescription of *Trichomonas gallinarum* Martin and Robertson, 1911, from the chicken and turkey, E. A. ALLEN (*Helminthol. Soc. Wash. Proc.*, 7 (1940), No. 2, pp. 65-68, fig. 1).

Further observations on blood protozoan infection in turkeys, J. L. WEST and L. E. STARR. (Ala. Polytech. Inst.). (*Vet. Med.*, 35 (1940), No. 11, pp. 649-653).—Report is made of an affection of turkeys that occurred during the summer of 1938 in a large flock in Alabama and was found to be due to *Leucocytozoon smithii*. Outbreaks of the disease are said to have been reported from nearly all sections of the State during the 2 yr. preceding.

Pullorum disease in turkeys, W. R. HINSHAW. (Univ. Calif.). (*Calif. Turkey News*, 1939, Sept., pp. 5-7).

A new *Salmonella* type isolated from turkeys: *Salmonella californica*, P. R. EDWARDS, D. W. BRUNER, and W. R. HINSHAW. (Ky. and Calif. Expt. Stas.). (*Jour. Infect. Diseases*, 66 (1940), No. 2, pp. 127-129).—Description is given of a new serologic *Salmonella* type designated as *S. californica*, which possesses the antigenic formula IV XII:gmt. It is represented by seven cultures isolated from two distinct outbreaks of paratyphoid infection fatal to poults in California.

The Acanthocephala of wild ducks in central Illinois, with descriptions of two new species, H. J. VAN CLEAVE and W. C. STARRETT. (Univ. Ill.). (*Amer. Micros. Soc. Trans.*, 59 (1940), No. 3, pp. 348-353, pl. 1).—A report is made of the systematic results of a field collection of the worm parasites of wild ducks in central Illinois from October 21 to November 21, 1935. The digestive tracts of 56 ducks representing 8 species were examined in the laboratory. Twenty-one of the birds representing 5 species were found parasitized by Acanthocephala, five species of which are represented in this material, and 2 described as new, namely, *Polymorphus cucullatus* and *P. acutis*. *P. minutus*, a species widely distributed in Europe, is here recorded for the first time from a North American host. *Corynosoma constrictum* and *P. marilis*, characteristic species of American ducks, are recorded from new hosts and a new locality.

Two apparently fatal grouse diseases, I. M. COWAN (*Jour. Wildlife Mangt.*, 4 (1940), No. 3, pp. 311, 312, pl. 1).—Reference is made to two apparently fatal diseases of grouse in British Columbia, namely, scabies, due to scaly leg mite in the ruffed grouse (*Bonasa umbellus sabinii*) and California quail, and avian cancer in the sooty grouse (*Dendragapus fuliginosus fuliginosus*).

The parasites of the sage grouse (*Centrocercus urophasianus*), F. SIMON. (Wyo. Expt. Sta.). (*Wyo. Univ. Pubs.*, 7 (1940), No. 5, pp. 77-100, figs. 16).—

A descriptive list of the known parasites of the sage grouse, including the essentials of the original descriptions and supplementary descriptive materials, comments, measurements, and reproductions of photographs, etc. Seventeen references to the literature are listed.

Causes of juvenile mortality of the ringneck pheasant [*Phasianus colchicus torquatus*], P. E. RANDALL. (*Pa. Expt. Sta. et al.*). (*Pa. Game News*, 11 (1940), No. 3, pp. 10, 11, 28, figs. 3).

AGRICULTURAL ENGINEERING

[**Agricultural engineering investigations by the Pennsylvania Station**] (*Pennsylvania Sta. Bul.* 399 (1940), pp. 3-5, fig. 1).—Data designed to clarify the principles of hitches for tillage machinery have been obtained by A. W. Clyde, who also reports means for reducing plow damage. The advantages and dangers of electric fencing are briefly discussed by J. E. Nicholas and F. L. Bentley, and observations of variations in the capacity of feed mills are noted by Nicholas.

A laboratory study of the drainage requirements of sweet clover, P. W. MANSON (*Minnesota Sta. Tech. Bul.* 144 (1940), pp. 28, figs. 17).—Experiments here described showed that biennial white sweetclover can be satisfactorily grown in the laboratory under artificial light if the heat developed by the lamps is intercepted by a water filter placed between the lamps and the plants. The drainage experiments were carried out in this way.

The growth of sweetclover was definitely stimulated by good drainage, but the plant was grown successfully on soils known to be drained too poorly for satisfactory results with many farm crops. The growth of young sweetclover from 5 to 7 in. high was not retarded by a water table only 3 in. below the surface for periods up to 2 weeks if afterward the ground water was lowered. If continuously grown on a 3-in. water table, the matured crop required a growing period to produce a given yield 50 percent longer than that required when the water table was lowered sufficiently to permit a normal rooting depth for this plant. A stand of young sweetclover from 8 to 9 in. high was not killed when the water was raised to within 1 in. of the surface but continued to grow at a much reduced rate. Water brought above the surface caused the plant tissue to break down within 2 weeks. Sweetclover was found so water tolerant that no great difference in growth and yield between drainage depths of 18 and 27 in. could be detected. Sweetclover flooded for 1 day after cutting and then drained at the rates of 0.25, 0.5, and 1 in. per day showed marked increases in rate of growth and yields with the increase in rate of drainage through 30 days.

Dynamometer tests of draft horses, R. W. PHILLIPS, M. A. MADSEN, and H. H. SMITH (*Utah Sta. Cir.* 114 (1940), pp. 14, figs. 5).—The study reported in this circular is based on records of 2,485 entries in pulling contests in Utah and southern Idaho during the years 1931-39. The average body weight of all teams entered was 2,872 lb. The average tractive pull recorded was 2,385 lb. The correlation between body weight and tractive pull for the entire group was 0.6, ranging in individual years from 0.56 to 0.65. The regression, indicating the increase in tractive pull for every 100 lb. increase in body weight was 64.8 for the entire group and varied from 55.8 to 84.4. The usefulness of dynamometer records is discussed, and the need for studies of the relationship between these records and ability to do farm work is emphasized.

AGRICULTURAL ECONOMICS

[**Investigations in agricultural economics by the North Dakota Station**], W. L. ETTEVOLD (*North Dakota Sta. Bimo. Bul.*, 3 (1940), No. 2, pp. 15-18, 23,

24, figs. 4).—An article, *Livestock Cycles in North Dakota, 1883-1940*, includes and discusses charts by years showing indexes of purchasing power (1910-14) = 100) of beef cattle, dairy cows, sheep, hogs, horses, and mules. The usual comparisons of prices received by North Dakota farmers are made for September and October 1940 and October 1939.

[*Investigations in agricultural economics by the Pennsylvania Station, 1940*] (*Pennsylvania Sta. Bul.* 399 (1940), pp. 56-59, 60, 61, fig. 1).—Included are (1) a chart, by J. E. McCord, showing the average labor income by years 1931-39 on farms in Centre County, from which a total of over 1,600 individual yearly farm management records were obtained; (2) a table, by D. H. Walter, showing the labor incomes in 1934 and 1938 on 102 farms grouped by type of farm (small dairy, large dairy, poultry, and general) and by whether there was co-operation or not with the Soil Conservation Service at its Crooked Creek project in Indiana and Armstrong Counties; (3) tables, by C. W. Pierce, showing estimated total sales by months, 1938 and 1939, of pasteurized milk for fluid use in Allegheny County, and the use of fresh and evaporated milk per person per week for different purposes in 99 families in Johnstown, Pa., in June 1939; and (4) brief statements, by W. R. Whitacre, showing an increase from 7 to 32 in the cold-storage locker plants from 1938 to 1940, an average rental for lockers of approximately 6 cu. ft. of \$8 to \$10 per month, and a percentage of patrons that are farmers of 70.

Land classification to aid the appraiser, C. H. HAMMAR. (Univ. Mo.). (*Jour. Land and Pub. Util. Econ.*, 15 (1939), No. 3, pp. 277-286).—"The purposes of this article will be (1) to describe very briefly the types of land-classification information now available to the appraiser, (2) to attempt a critical estimate of the usefulness of certain of these, (3) to point out particular developments in the technics and methodology of land classification which have some promise from an appraisal point of view, and (4) to suggest the information that a land-classification system should provide in order to be of maximum usefulness to appraisers."

Public land acquisition in a national land-use program.—I, Rural lands (*Washington: Govt.*, 1940, pp. V+25).—In this report to the President, the land committee of the National Resources Planning Board "has indicated the role of land acquisition among other instruments of land use adjustment, has set up criteria and objectives to guide land acquisition activities, and has recommended methods of integrating the land acquisition activities of Federal agencies and different levels of government."

Rural land holdings in South Carolina, G. H. AULL (*South Carolina Sta. Bul.* 331 (1940), pp. 23, figs. 10).—This study was made to ascertain facts regarding the ownership of rural land holdings in South Carolina as to type of owner, size of separate holdings, and assessed value distribution. The data, which were for the year 1938, were obtained from the tax rolls in 43 of the 46 counties of the State and included 141,355 rural properties. The data are analyzed by counties and by type-of-farming areas. The findings are presented in tables, charts, and maps and discussed. Of the 141,355 properties classified, 95.9 percent were reported to have been held by individuals. These properties represented 87.7 percent of the total acreage of 15,760,639 acres and 88.7 percent of total assessed valuation of \$87,513,402.

Seventh annual report of the Farm Credit Administration (*Farm Credit Admin.* [U. S.], *Ann. Rpt.*, 7 (1939), pp. VI+260, figs. 19).—This report covers the operations of the Federal land banks, national farm loan associations, production credit corporations and associations, Federal intermediate credit banks, banks for cooperatives, the Federal Farm Mortgage Corporation, Land Bank

Commissioner loans, emergency crop and feed loans, the organizations in liquidation, regional agricultural credit corporations, agricultural credit corporation stock purchase loans, the Agricultural Marketing Act revolving fund, joint-stock land banks, and the several divisions of the Washington office of the Administration.

Montana farm real estate mortgage indebtedness, R. R. RENNE (*Montana Sta. Bul. 383 (1940), pp. 40, figs. 21*).—"The purpose of this bulletin is to indicate the extent to which Montana farms and ranches are in debt, the types of lenders who have loaned most of these borrowed funds, the trend in the amount and character of the loans made during the last two decades, and related information which will furnish the basis for determining the scope and character of farm credit problems in Montana in the years ahead." It is based on data as to real estate mortgages compiled from the clerk and recorders' office in each of the counties of the State, and from records of selected lending agencies. A detailed analysis was made of all mortgages outstanding as of July 1, 1936, and an estimate was made of the total farm and real estate indebtedness outstanding July 1, 1940, based on the records of selected lending agencies. The factors affecting credit maladjustments in the State are discussed, and some suggestions made for improving farm credit practices.

On July 1, 1940, Montana farmers owed approximately \$60,000,000. Of the farms in the State, 41.1 percent were mortgaged, the average loan being \$6.02 per acre, or more than 75 percent of the average per acre census value. Nearly half (45.1 percent) of the farm real estate indebtedness is made up of Federal land bank and land bank commissioner loans; 16.9 percent by loans of resident individuals; 9 percent by loans of resident commercial banks; 8.1 percent by loans of individuals in other States; and 20.9 percent by loans of nonresident mortgage companies, insurance companies, and other agencies. Approximately half of the loans were for less than 10 yr. The interest rate on 52.8 percent of the loans was 6 percent or more, and that on 26 percent, 8 percent or more. Of the loans, 37.1 percent were of the straight-term type and 51.6 percent provided for amortized repayment. Straight-term loans running less than 10 yr. and bearing interest in excess of 6 percent had comparatively unsatisfactory repayment records. The average amount of the loans was about 87 percent of the average productivity value of the land mortgaged. Of the 11 principal types of lending agencies, 8 have loaned in excess of 100 percent of the true productivity value and 2 in excess of 150 percent. Methods suggested for the lessening of farm credit problems in the State are the making of loans on the basis of the long-time earning capacity or productivity value of the land, as measured by average yields and prices, together with a scientific soil survey; loaning on a long-term basis with annual payments adjusted to current income; incorporating improved land use and farm management practices in the mortgage contract; and effecting a strong credit educational program to familiarize borrowers and lenders of the consequences of unwise credit practices.

Measuring inequalities in farm property assessments in Maryland, W. P. WALKER and E. E. MILLER (*Maryland Sta. Bul. 435 (1940), pp. 40*).—This is the first of a series of bulletins dealing with farm property tax problems in the State. The major purpose of the bulletin, which deals with conditions prior to the reassessment of 1937-39, is "to point out differences resulting from a variation in the statistical treatment of the same data, as well as the possibility of using several criteria to describe the assessment levels and inequalities." Some consideration is also given the problem of adequate and representative sampling in determining assessment inequality among individuals

and between governmental units. Particular attention is given to assessments of real estate and livestock. Value of property is the major basis used in comparing assessments on real estate. Yields of crops, money income, cost of building construction, extent of rate classification for land, and composite factors of soils, roads, and yields were also used to measure inequalities of real estate assessment. For livestock, the variations in percentages of livestock assessed and ranges in assessed values were used as the basis for comparisons. Assessments for each type of land, buildings, and livestock, farm real estate sales data, and estimated costs of constructing farm buildings (one county) were obtained from county records. Data for farm values, number of farms, crop yields, and number of livestock were obtained from the 1935 United States Census of Agriculture. Individual farm yields of wheat were secured from the U. S. D. A. Agricultural Adjustment Administration, and individual farm crop yields and financial returns from the farm management records of the university. The analyses and discussions as to real estate assessment cover kind of sale, sampling, method of analysis, influence of size of sale and of value per acre, and census values as compared with assessed values. The influence on assessed values of wheat yields, composite yields, composite economic productivity, the relation of estimated cost of constructing farm buildings, the interrelation between acre yields, road facilities, and assessment, and land assessment practices in relation to equality of assessments are discussed. The number of livestock assessed is compared with the number of farms and the number of livestock shown by the 1935 census, and the range in assessment rates per head and the reasons for livestock being removed from the assessment rolls are described.

The ratio of assessed to sales value (7 counties) for the period 1933-35 ranged from 81 to 132 percent, averaging 99 percent, for bona fide voluntary sales; from 98 to 179 percent, averaging 137 percent, for administrators, executors, and assignors sales; and from 105 to 172 percent, averaging 142 percent, for foreclosures and other distressed sales. "Summary data for sales to assessed ratios show that the coefficients of dispersion and variability range among the counties from 30 to 48 and from 43 to 61, respectively." Individual ratios for the 807 bona fide voluntary sales varied from 15 to 603 percent, and generally there was a wider range for properties of small value than for the higher valued properties. Farms with a sale value of less than \$20 per acre were assessed about twice as high a ratio as farms with a sale value of \$80 or more. Inequality of assessment was greatest when measured on the sale value basis than when measured by other bases. The best degree of equality was obtained when a single factor, such as yield, kind of road, or cost of construction of buildings was used as a guide for assessing. It was found that there was no continuity of policy or uniform basis for assessing between election districts within a county or between counties; that different statistical methods may be advisable in determining ratios of assessments among political units in contrast to ratios among individual properties; and that inequalities increase between reassessment because of inadequate or improper adjustment to changes in condition of real estate and failure to completely list and hold personal property accounts for livestock.

Forest land taxation in Michigan, A. Z. NELSON (*U. S. Dept. Agr., Forest Serv., 1940, pp. [6]+46, pl. 1*).—This study, covering the period 1929-38, was made for the purpose of appraising the rural land tax situation in the State, with special reference to forest land. Particular attention is given to the effects (1) of the constitutional amendment of 1932 limiting the total combined tax rate in any township to 15 mills and (2) of the special forest tax laws

on tax burden and on the practice of forestry. The trends in tax burden on rural land, the local forest tax situation, the effects of special forest tax legislation, chiefly the wood-lot law of 1917 and the Commercial Forest Reserve Act of 1925 and its amendments, are discussed.

Farm outlook: Illinois 1941 (*Ill. Agr. Col. Ext. Cir. 511 (1940)*, pp. 8).—Forecasts are made as to the supply, demand, prices, etc., of different farm crops, kinds of livestock, livestock products, and forest products; prices for equipment, supplies, and labor; net cash income; etc. The basis of the different forecasts are briefly discussed.

Italian agriculture under Fascism and war, N. W. HAZEN (*U. S. Dept. Agr., Off. Foreign Agr. Relat., Foreign Agr.*, 4 (1940), No. 11, pp. 627-702, figs. 13).—The physical background, importance, organization, and Government control of agriculture in Italy, the production of different crops and livestock, the foreign trade in agricultural products, the Fascist agricultural policy, and Italian agriculture and the war are described and discussed.

"Agriculture is Italy's most important enterprise, engaging about 48 percent of the country's gainfully employed population. When the Fascists came to power in 1922, they had no definite agricultural policy; yet after 18 yr. of experimentation they have developed, as a means of attaining economic self-sufficiency, one of the world's most rigid systems of control over farm production and trade. Italy, however, still must depend on the outside world for many vital agricultural products. For this reason, the British blockade has more severely disorganized the Italian economic structure than has any other measure taken during the war.

"One result of Italy's participation in the present conflict has been to cut off almost completely its trade with the United States and to reduce substantially American trade with all countries of the Mediterranean Basin. Unless war conditions in that region are eased, there is danger that all United States trade with the Mediterranean countries may be further curtailed."

Types of farming in Mississippi, M. A. CROSBY. (*Coop. Miss. Expt. Sta.*). (*U. S. Dept. Agr., Bur. Agr. Econ.*, 1940, pp. [2]+126, figs. 42).—This study was made "(1) to delimit the different type-of-farming areas in the State and portray the character of farm types within these areas in terms of source of income, selection of enterprises, and farm practice; (2) to trace insofar as possible past changes in character of farming and indicate recent trends in crop and livestock production; and (3) to identify and evaluate the relative importance of physical, social, and economic forces which have and are now shaping the type of farming in the various areas." The basic data were obtained largely from the 1930 United States Census, various bureaus of the Department of Agriculture, the Mississippi State Tax Commission, the Mississippi Experiment Station, county agents, farmers, businessmen, etc. The early agriculture in the State and the recent trends and the physical, biological, and economic forces affecting agriculture in the State are discussed. Maps show the utilization of land, distribution of crops and livestock, distribution of different types of farms, etc. The State is divided into 10 type-of-farming areas, with subareas in the case of some areas, and the physical condition, land utilization, crops, livestock, types and size of farms, and farm tenure are described for each area.

Effects of strip mining on agricultural areas in Illinois and suggested remedial measures, H. W. HANNAH and B. VANDERVLJET. (*Univ. Ill. et al.*). (*Jour. Land and Pub. Util. Econ.*, 15 (1939), No. 3, pp. 296-311, figs. 5).—The development, extent, and efficiency of strip mining, the effect on agricultural values, the complaints on such mining, and the legal basis for control in Illinois are described. Remedial measures, Government ownership, compulsory leveling

or replacement of soil, delineation of areas for stripping, severance taxes, and equitable relief are discussed.

Strategy in protecting the public's interest in land, with special reference to strip mining, C. L. STEWART. (Univ. Ill.). (*Jour. Land and Pub. Util. Econ.*, 15 (1939), No. 3, pp. 312-316).—The problem is examined from the long- and short-range angles, with a view to ascertaining how the question of present v. future incomes impinges on public welfare and what suggestions it offers for formulation of public policy.

Cooperative grain marketing by local warehouses and elevators in the Pacific Northwest, H. E. RATCLIFFE (*U. S. Dept. Agr., Farm Credit Admin., Coop. Res. and Serv. Div., Bul. 40 (1940), pp. IV+44, figs. 12*).—Sixty of the 98 farmers' cooperative elevators and warehouses were studied during the 3 crop years 1934-35 to 1936-37. Analysis is made of the membership, volume of grain handled, control and management, the characteristics of handling and marketing grain, the corporate and cooperative features, financial status, income, expenses, and the unit costs of operation of the cooperative elevators and warehouses.

The Pacific Northwest associations are distinct from those in other regions (1) in that they were established to provide adequate and economical storage at local shipping points in a section where farm storage has been impracticable and consequently they have a substantial and steady income from fixed storage charges; and (2) they cover wider territories and 41 of the 60 associations studied operated more than one shipping point. The prevailing storage charge was 10 ct. per ton per month after 30 days' free storage. The charges for handling varied from 75 ct. to \$1.25 per ton including 1 month's free storage. The chances were that 42 out of 100 associations handling less than 150,000 bu. per year would operate at a loss. Income from side line sales apparently reduced the chances of losses but did not increase the chances for greater return on investment. Direct warehouse expenses per bushel did not vary greatly among the associations handling over 100,000 bu. per station and tended to approach 2 ct. for all associations handling 150,000 or more bushels per station. The associations warehousing less than 50,000 bu. per man-year of warehouse labor had direct warehouse expenses of more than 4 ct. per bushel as compared with 2 ct. where more than 100,000 bu. were handled per man. Utilization of warehouse capacity had a considerable effect on warehouse expenses per ton.

Financial operations of Ohio farmer owned elevators during the fiscal year 1939-40, B. A. WALLACE (*Ohio State Univ., Dept. Rural Econ. Mimeog. Bul. 133 (1940), pp. [1]+21*).—This bulletin, which continues the series (*E. S. R.*, 83, p. 407), is based on the main balance sheet and income and expense items from 146 companies operating 186 plants, detailed analysis of expense items from 53 companies, commodity sales and margins from 48 companies, and accounts receivable data from 19 companies.

Potato marketing investigations, F. L. PARSONS. (*Kans. Expt. Sta.*). (*Kans. State Hort. Soc. Bien. Rpt.*, 45 (1938-39), pp. 155-157).—Some of the important reasons for the decline of the potato industry in Kansas are discussed, and some of the findings in a study in 1939 as to local markets, cold-storage holdings, and disposition of cull potatoes are presented.

Problems in the marketing of Kaw Valley potatoes, S. W. DECKER. (*Kans. Expt. Sta.*). (*Kans. State Hort. Soc. Bien. Rpt.*, 45 (1938-39), pp. 55-65, fig. 1).—The competition with Kaw Valley potatoes and the purchasing practices of purchasers are described briefly, and the results are given of some investigations of precooling and washing shipments.

Marketing Kaw Valley potatoes, S. W. DECKER. (*Kans. Expt. Sta.*). (*Kans. State Hort. Soc. Bien. Rpt.*, 45 (1938-39), pp. 145-153, figs. 4).—The shipment

of Kansas and Missouri potatoes to the Chicago market in 1939 and the sources of potatoes in the Chicago Produce Terminal, July 1939, are discussed. Comments of the author and others on the condition of Kansas potatoes handled on the Chicago market in different ways are included.

Cooperative marketing of dairy products, H. C. TRELOGAN and F. M. HYRE (*Farm Credit Admin. [U. S.], Coop. Res. and Serv. Div., Cir. C-116 (1939), pp. [2]+47, figs. 22*).—The types and organizational structure of dairy cooperatives are discussed.

Economic analysis of the food stamp plan.—A special report, N. L. GOLD, A. C. HOFFMAN, and F. V. WAUGH (*U. S. Dept. Agr., 1940, pp. VI+98, figs. 8*).—“This report is based on a study conducted jointly by the Bureau of Agricultural Economics and the Surplus Marketing Administration.” The report is composed of sections on surpluses, nutrition, and the food stamp plan; theory and principles of the plan; scope of the plan—relation to total food sales and consumer participation: commodities purchased with blue stamps—comparison with consumption under the direct distribution program and other low-income consumption; the problem of substitution and the orange-stamp requirement; factors to be considered in selecting commodities for surplus list; costs under the food stamp plan; effect of the plan on retailers, retail margins, and employment; effect of the plan upon diets of low-income families, Dayton, Ohio, 1939; attitudes toward the plan; and national potentialities of the plan. Appendixes giving further details as to some of the analyses are also included.

Food and cotton stamp plans, M. I. HERB (*U. S. Dept. Agr., Bur. Agr. Econ., Econ. Libr. List 18 (1940), pp. 26*).—Included are 168 selected references on the food stamp and cotton stamp plans for distribution of surplus farm commodities.

World wheat survey and outlook, [May and September] 1940 (*Wheat Studies, Food Res. Inst. [Stanford Univ.], 16 (1940), No. 8, pp. [2]+365-402, figs. 7; 17 (1940), No. 1, pp. [2]+37, figs. 7*).—These numbers continue the series (*E. S. R., 84, p. 117*), data for May being reported by V. P. Timoshenko and H. Working, and for September by H. C. Farnsworth and Timoshenko.

“Official statistics of exports indicate that international trade in wheat has been larger than expected, apparently owing principally to large Italian and German takings. . . . Wheat prices in Canada were extraordinarily stable from January to mid-May, apparently owing largely to the circumstances under which sales were made to the United Kingdom.

“War developments and governmental wheat measures overshadowed all other factors in their influence upon wheat futures markets during May-September. Germany's successful invasion of Belgium and Holland in May was associated with spectacular price declines which were met by government-sponsored minimum price regulations. . . . Striking improvement in the outlook for the new North American wheat crop had little market influence after early May. Current estimates suggest that the wheat surplus for export and carry-over will be unprecedentedly large in North America, and perhaps in the four major exporting countries combined. In contrast, European wheat supplies are somewhat short and, in effect, shorter than their gross size would imply. The major deficit area is, as usual, in northwestern Europe. . . . World wheat exports in 1939-40 totaled well over 600 million bushels, despite contraction of the continental European market following extension of German control over the Low Countries and France.”

Wheat subsidization and exports: The experience of 1938-39, V. P. TIMOSHENKO (*Wheat Studies, Food Res. Inst. [Stanford Univ.], 17 (1940), No. 2, pp. [2]+39-99, figs. 11*).—“Competitive subsidization of exports threatened to continue at great losses in 1939-40. This was prevented by the onset of the

European war. The war soon led to concentration of wheat buying in many of the important countries, and the problem of coping with wartime conditions made government interventions in wheat markets indispensable for all countries involved in the war."

Price relations of Liverpool wheat futures, with special reference to the December-March spread. S. HOOS and H. WORKING (*Wheat Studies, Food Res. Inst. [Stanford Univ.], 17 (1940), No. 3, pp. [2]+101+142+[1], pl. 1, figs. 14*).—At Liverpool, as at Chicago, price influences which might seem significant principally for deferred futures are found in fact to have nearly or quite as much effect on the near future. Expectations of subsequent developments are reflected in prices of all futures about equally. Price differences between futures arise mainly from conditions and expectations that have greater price significance for the near future than for the deferred future. The price spread between the December and the March futures at Liverpool appears to have depended mainly on conditions that tend to determine the level of European stocks of imported wheat at about the end of December. The December-March spread as early as September implies a forecast of shipments during the autumn. As such, it has been reasonably trustworthy, but it has tended to underestimate the force of extreme conditions, with the result that unusually wide spreads have tended to widen as the season progressed. The influences affecting the December-March spread tend in August-October to bear principally on the price of the December future, but to affect the March future in the same direction. In November and December they tend to affect only the price of the December future.

World fresh pear production and trade. S. I. KATZ (*U. S. Dept. Agr., Off. Foreign Agr. Relat., F. S. 84 (1940), pp. [2]+51, figs. 7*).—The developments in the world pear situation for the two decades between the World War and through 1939 are covered. The world production, the international trade, and the production, exports, imports, and consumption of different European, South American, North American, Near East, and Oriental countries are discussed.

Cotton linters: Selected references in English, 1900-July 1940. E. L. DAY (*U. S. Dept. Agr., Bur. Agr. Econ., Agr. Econ. Bibliog. 88 (1940), pp. VI+39*).—Included are 205 selected references, 1900-July 1940, "describing methods of recovering linters, the place of linters in commerce, quality, and uses for linters. References to methods of delinting cottonseed for planting purposes are omitted."

Wholesale prices of fats and oils in the United States: Index numbers, 1910-39. R. M. WALSH (*U. S. Dept. Agr., Tech. Bul. 737 (1940), pp. 28, figs. 6*).—The index numbers of monthly and annual wholesale prices of fats and oils in the United States include three principal groups: (1) A series for eight domestic fats and oils (lard, butter, cottonseed oil, inedible tallow, linseed oil, A white grease, oleo oil, and edible tallow); (2) a series for all fats and oils (27 items), grouped according to the similarity of their physical origin; and (3) a series for all fats and oils, grouped according to similarity of use. The series for the eight domestic fats and oils begins with 1910, and the two for all fats and oils with 1922. Two base periods, 1910-14 and 1924-29, are used for the domestic series. Only the 1924-29 base period is used for all fats and oils. The prices for the domestic fats and oils are weighted by the relative production of the items during the period 1924-29. Relative consumption during 1924-29, taking into account foreign as well as domestic fats and oils, is used as the basis of weighting for all the fats and oils series. The group index numbers are described, and the dispersion among prices of the different items, the seasonal variations in the index numbers, etc., are commented on.

Prices received by North Carolina farmers, T. L. STUART and G. R. SMITH (*North Carolina Sta., AE-RS Inform. Ser. No. 6 (1940), pp. [1]+86, figs. 3*).—This bulletin, prepared in cooperation with the North Carolina Department of Agriculture, includes monthly index numbers 1909–39 of prices received by North Carolina farmers for all commodities (31) and for grains, cotton and cottonseed, tobacco, meat animals, poultry products, dairy products, and miscellaneous products; monthly price relations, 1909–38, for the 26 leading commodities of the 31 included in the group index numbers; and monthly prices, 1909–39, for the commodities included in the indexes. The method used in constructing the index numbers is described. The index numbers for several groups of commodities are discussed and compared. Comparisons are also made with index numbers for the United States for prices received by farmers, prices paid by farmers, wholesale prices of nonagricultural commodities, etc.

Crops and Markets, [October 1940] (*U. S. Dept. Agr., Crops and Markets, 17 (1940), No. 10, pp. 209–232, fig. 1*).—The usual reports are included.

RURAL SOCIOLOGY

Anthropology and agriculture: Selected references on agriculture in primitive cultures, K. MACLEISH and H. E. HENNEFRUND (*U. S. Dept. Agr., Bur. Agr. Econ., Agr. Econ. Bibliog. 89 (1940), pp. XI+134*).—Following an introduction by J. H. Provinse, "this bibliography is a selected list of references to general books and articles in the field of anthropology and to work on the culture of individual peoples and communities, particularly those in which their agriculture is discussed and the man-land relationship is brought out. Its purpose is to lead research workers to sources dealing with the total culture of these peoples so that they may see the part that agriculture and food-getting activities play in it."

A memorandum on research in income and levels of living in the South, W. H. SEWELL (*Okla. Agr. Col., Social Sci. Res. Council Pub. 3 (1940), pp. [1]+30*).—The author concludes that the most apparent need in the whole field of family living is for basic research on the sociological aspects of family life in the South, and particularly on the relationship between both income levels and consumption patterns and (1) the structural and functional aspects of family organization, (2) the attitudes of family members toward each other, the community, and social institutions, (3) community organization, (4) social mobility, and (5) the various social processes. There are, of course, studies dealing directly with certain of these relationships, but in general there has been very little intensive study of them in relation to income or consumption levels either in the South or elsewhere.

Houseboat and river-bottoms people, E. T. HILLER (*Ill. Univ. Studies Social Sci., 24 (1939), No. 1, pp. 146*).—The study is based on a sample of 683 households living on or near the Ohio and Mississippi Rivers in six counties of Illinois. The sample household schedules pertain to, first, the houseboat and land squatter residents who were actually living on or by the rivers in the selected areas during February and March 1935; second, households that derived some or all of their living from the river; and third, control cases from other shelter and occupational groups.

The free squatting and floating privileges and the pursuit of the self-help opportunities supplied by the stream are survivals of the frontier traditions rather than unique adjustments induced by the depression. The self-help extractive pursuits connected with the river are continuations of frontier occupations adapted to current technologies. The continuity of traditions and behavior patterns is indicated by the high ratio of the descendants of southerners who followed the

frontier methods of self-help in improvising shelter, using the river resources, and retaining the squatter customs in the use of land. From such observations the conclusion follows that, in order to change or improve any phase of living, there is need to improve not only the environment but also the attitudes of the population concerned. Any problem as complex as the reviewed information has shown the person-environment relation to be, even in these supposedly out-of-the-way places, cannot be remedied by fiat nor in a brief span of years. Such a change requires rather the slow processes of reintegrating the same or substitute attitudes, skills, resources, and potential opportunities.

Social insurance and agriculture: A memorandum presenting suggestions for research and bibliography, W. S. HOPKINS (*Social Sci. Res. Council, Pam. Ser. No. 5 (1940), pp. [2]+V+93*).—The author discusses factors contributing toward the social insecurity of agriculture, the capacity of agriculture to support a social insurance program, and the probable consequences of programs for social insurance coverage. The text is followed by an elaborate bibliography.

AGRICULTURAL AND HOME ECONOMICS EDUCATION

[Investigations in agricultural education by the Pennsylvania Station, 1940] (*Pennsylvania Sta. Bul. 399 (1940), pp. 59, 60*).—Brief statements are included (1) by W. A. Broyles, showing great consistency of well-trained students in livestock-judging contests, and (2) by H. S. Brunner, showing that 68 percent of 20,725 boys with one or more years of vocational agricultural instruction were farming, and 2,111 attended organized classes for instruction during the year.

Canadian farm problems (*Canad. Farm Prob., Econ. Ser. Nos. 2 (1940), pp. [2]+10; 3, pp. [2]+12; 4, pp. [2]+19; 6, pp. [2]+13*).—These publications are part of a series of 16 pamphlets prepared by the Agricultural Publications Committee of the Canadian Association for Adult Education. The purpose and nature of the pamphlets are described by the editor as follows: "This series, designed for the use of discussion club leaders, also constitutes the basis for a broadcast series over a Canadian hook-up to be initiated on January 21, 1941. It is to be used in connection with 'Listening Groups' now being organized in several provinces. The pamphlets represent a novel arrangement of material that has been used successfully with experimental groups in connection with the adult education program of Macdonald College. The title of each pamphlet is in the form of a question, and each starts out with a short introduction briefly outlining the subject and clarifying the issue involved. This is followed by a set of 'local questions,' which attempt to elicit from the group the practices currently followed in their community with respect to the problem at issue. Next, the main theme is resolved into a series of sub-questions which are briefly but not exhaustively discussed 'pro' and 'con,' with the idea of getting the discussion under way. A valuable feature is the list of annotated references at the end of each pamphlet containing factual material, points of view, etc."

No. 2 is entitled *Should Canada Restrict Farming of Submarginal Lands*; No. 3, *Will Increased Production Benefit the Farmer*; No. 4, *Should Canada Encourage Land Settlement of Immigrants*; and No. 6, *How Far Will Improved Farm Management Methods Help*.

The judging of livestock, dairy, poultry, and crops, H. O. WEST (*Mississippi Sta. Bul. 344 (1940), pp. [3]+143, figs. 131*).—This bulletin includes information for use in training Future Farmers of America judging teams.

Laboratory manual of household equipment, D. DAVIS and R. M. BEARD (*New York: John Wiley & Sons; London: Chapman & Hall, 1940, pp. VII+247, figs. 12*).—This manual, devised as a guide for students in their study of home appliances and as a basis for class discussion of the important factors in selection, use, and care of household equipment, gives working outlines for the study of various pieces of equipment. The statement of purpose, the list of materials, and the outline of procedure are given in printed form for each experiment, together with record forms provided with blanks for filling in the observations specified in the side heads. With the preliminary details of the experiment already recorded, the student's time may be devoted to the more important matter of making and recording pertinent observations concerning the structure and operation of equipment.

Exhibits, A. M. HANNAY (*U. S. Dept. Agr., Bur. Agr. Econ., Econ. Libr. List 17 (1940), pp. 12*).—This selected list of 59 references "is composed, for the most part, of periodical articles which describe exhibits of various kinds and which attempt to evaluate their success in terms of interest evoked and sales effected."

FOODS—HUMAN NUTRITION

The state of water in colloidal gels: Free and bound water in bread doughs, G. E. VAIL and C. H. BAILEY. (Minn. Expt. Sta.). (*Cereal Chem., 17 (1940), No. 4, pp. 397-417, figs. 9*).—This study, directed toward explaining changes in viscosity of flour-water systems, was concerned with the state of water in doughs as evidenced by changes in dielectric properties in progressing from the frozen to the melted state. The freezing or melting point of the doughs was determined by a modification of the Beckmann technic, involving determinations of the dielectric constant by measurement of the capacitance of a condenser under certain conditions in which the nature of the dielectric was the factor which varied. Accordingly, the change noted in the capacity of the cell with change in temperature was due solely to the change in the physical state of the dielectric (in this case, the dough).

Freezing points were determined for doughs mixed for 1-, 3-, and 10-min. periods. No significant differences were found, indicating that no change had occurred in the state of water in the dough due to variations in the degree of mixing. "Average bound-water values for the dough mixed for 3 min. were calculated. Calculations were based upon the depression of the freezing point of the doughs containing no sucrose and 0.125, 0.25, and 0.5 molal sucrose solutions. The calculated percentages of bound water at the three levels were 34.95, 36.46, and 35.06, respectively. The average calculated bound water was 35.5 percent, and the hydration capacity was 28.6 percent when calculated as bound water held per unit weight of dry matter."

The water and dry matter content in edible curd [trans. title], A. SCHLOEMER (*Milchw. Forsch., 20 (1940), No. 4, pp. 139-152*).—This study summarizes for the sake of establishing regulatory standards the results of analyses in a 10-yr. period of over 500 (German) samples of commercial products of the cottage cheese type. For curds up to 9.9 percent fat (i. e., made from skim milk), solids varied from 15.0 to 25.9 percent; curds with from 20.0 to 29.0 percent fat (made from partially skimmed milk) varied from 17.0 to 28.9 percent solids, while those having from 40.0 to 49.9 percent fat (made from whole milk) varied from 22.0 to 53.9 percent solids. It is apparent that the solids varied with the fat content.

The dietary value of fruits and fruit products, W. V. CRUESS. (Univ. Calif.). (*Fruit Prod. Jour. and Amer. Vinegar Indus., 19 (1940), No. 8, pp. 230-*

233, 245, 247, 251).—This paper, presented before the American Public Health Association at its 1939 meeting, consists largely of a review of the research during the past few years at the University of California on the value of fruits and fruit products in maintaining the natural acid-base balance of the blood and tissues, promoting hemoglobin regeneration, and contributing to the content of vitamins in the diet. Other topics discussed include the public health aspects of fruits with relation to spray residue and the SO_2 content of dried fruits and the laxative principle of California prunes. An extensive list of literature citations is appended.

The use of high conversion corn sirup in making jellies, jams, and fruit butters, D. K. TRESSLER. (N. Y. State Expt. Sta.). (*Fruit Prod. Jour. and Amer. Vinegar Indus.*, 19 (1940), No. 8, pp. 228, 229, 251).—Sweetose, a new high-conversion corn sirup, has been used alone or in combination with sucrose in making strawberry, red and black raspberry, cherry, blackberry, currant, grape, apple, and crab apple jellies; strawberry, red and black raspberry, currant, grape, and plum jam; and plum, peach, pear, and apple butters. The methods used are described, the composition of Sweetose is compared with that of ordinary corn sirup, and tabulated data are reported on the effect of varying sucrose: Sweetose ratios on the quality of certain jellies and on formulas and properties of some strawberry jellies made with sucrose and Sweetose alone and combined. The use of Sweetose is recommended for the following reasons:

"The nonsugar solids of this high-conversion corn sirup are as effective as sucrose in effecting jelling. Crystallization of dextrose does not occur during storage of fruit products prepared with either straight Sweetose or mixtures of Sweetose and sucrose. Fruit products prepared with Sweetose have a remarkably smooth texture and excellent spreading qualities. The fruity flavors of jellies, jams, preserves, fruit butters, and marmalades made with Sweetose are somewhat more pronounced than those of sucrose jellies. Preserves and jams made with straight Sweetose and Sweetose and sucrose blends possess a very pleasing appearance because of their high gloss."

Apple and cherry juice: Promising new outlets for Utah's fruit crops, off-grade apples and sour cherries now without a market may be used in this way, F. M. COE. (Utah Expt. Sta.). (*Fruit Prod. Jour. and Amer. Vinegar Indus.*, 20 (1940), No. 3, pp. 78, 79, figs. 2).—Essentially noted from another source (E. S. R., 84, p. 123).

Research on the utilization of agricultural products in California, W. V. CRUESS. (Univ. Calif.). (*Fruit Prod. Jour. and Amer. Vinegar Indus.*, 19 (1940), No. 5, pp. 132-137, 153, figs. 2).—An address.

Quality control of quick frozen foods, D. K. TRESSLER. (N. Y. State Expt. Sta.). (*Canner*, 91 (1940), No. 13, pp. 13, 16, fig. 1).—Precautions which must be taken by the producer to insure good quality in frozen foods are discussed, with the reasons for each point.

Nutrition studies [by the New Haven Station] (Connecticut [New Haven] Sta. Bul. 438 (1940), p. 500).—Progress is reported in the study of reproduction in rats on diets of purified foods, in the critical study to determine the best method of measuring the utilization of calcium from various food mixtures, and in experiments to determine the extent of healing in rickets without the aid of vitamin D.

[Nutrition studies of the Pennsylvania Station] (Pennsylvania Sta. Bul. 399 (1940), pp. 12, 60).—Progress reports are given by F. J. Doan on the development of a new artificial digestibility method for testing the suitability of various types of modified milks for infant feeding, and by P. B. Mack and

J. Smith on an extension to rural families of the earlier-noted investigation (E. S. R., 81, p. 141) of the dietary habits and nutritional status of urban families in the State.

Bibliography of nutrition in India, N. GANGULEE (*London: Oxford Univ. Press, 1940, pp. VIII+79*).—This bibliography contains most of the available material on nutrition in India, including diet surveys, food analyses, and deficiency diseases; a selection of material illustrating the sources of food supply; all available budget analyses, showing amount spent on food and consumed by city and rural communities; and an indication of sources of social prejudices regarding the eating of food. A list of Indian foodstuffs is given.

The diet of some Australian schoolboys, H. S. HALCRO WARDLAW and C. J. WHITE (*Austral. Jour. Expt. Biol. and Med. Sci., 18 (1940), No. 1, pp. 9-20, fig. 1*).—Data were obtained, (1) in the warmer and (2) in the cooler part of the year, on the daily intake of a large number of normal Australian schoolboys. From consumption records and analyses of representative food samples, the average caloric intake was calculated as 1,691 calories at 11 yr. This intake increased with age at a rate similar to the rate of increase of surface area, the average intake at 18 yr. being 2,707 calories. The corresponding range of protein intake was from 55.8 to 105.4 gm. and of ash from 10.1 to 20.9 gm. For these building materials the intake with age increased more rapidly than surface area and at a rate similar to the rate of increase of body weight. The mean value for calories was 1,588 per square meter and for protein 1.60 gm. per kilogram. "The mean composition of the food was protein 16.7 percent, fat 17.5, carbohydrate 62.7, and ash 3.1 percent. The proportion of fat was greater during the colder months of the year but the caloric value of the diet did not increase."

The authors had the assistance of R. Fisher and N. L. Wake.

Normal variation in the gastrointestinal response of healthy children, I. G. MACY, L. REYNOLDS, H. J. SOUDERS, and M. B. OLSON (*Amer. Jour. Roentgenol. and Radium Ther., 43 (1940), No. 3, pp. 394-403, figs. 2*).—The seven children used in previously noted studies of gastrointestinal response and motility (E. S. R., 82, p. 276; 83, p. 128) served as subjects in serial roentgenographic studies of the gastrointestinal response to test meals composed of 2 oz. of barium sulfate in 4 oz. of water and in 4 oz. of milk ingested at body temperature. A second series of observations following the milk meal was made 1½ yr. after the first. The roentgenograms taken 12, 40, and 80 min. and 24 hr. after the ingestion of the test meals are reproduced for comparisons of the same subject at different time intervals and of different subjects at the same time. The gastric and jejunal emptying times, estimated from complete series of reproductions, are presented in a table, together with pertinent data from measurements on the children.

Mean values for the seven subjects were gastric emptying time water 1.9 and milk 3.1 hr., and jejunal 2.4 and 3.4 hr., respectively. Individual differences were marked but consistent for both types of meals. There were no consistent significant differences in the emptying time of the colon as shown in the 24-, 48-, and 72-hr. roentgenograms, indicating that adjustments to the emptying times of the stomach had taken place in the small intestine within 24 hr. The values obtained for the milk meal after an 18-mo. interval were not consistent for the individual subjects with the earlier values. The average of the gastric emptying time was increased and of the jejunum decreased, the values being 3.6 and 3.2 hr., respectively. It is suggested that the individual variations may have been due to physiological changes coincident with growth or possibly to less complete preliminary standardization of the subjects.

Health and development of a group of nursery school children, J. B. MCCAY, E. B. WARING, and H. D. BULL. (*Cornell Univ.*). (*Child Develpmt.*,

11 (1940), No. 2, pp. 127-141).—This paper reports an extensive study of 66 children (12-15 a year) enrolled in the junior nursery school of the New York State College of Home Economics during the 5-yr. period of 1932-37. Physical and medical examinations and mental-development tests were given the children on enrollment and at the end of the year, and during the entire enrollment frequent growth measurements were made and almost daily records were kept of eating and sleeping behavior, outdoor play, elimination, and sickness. Wherever possible the data obtained were classified in terms of median scores representing average performance, interquartile range to describe variations of the middle levels, and total range to mark the outer boundaries of the group. There were 31 girls and 35 boys in the group, with ages at enrollment ranging from 1 yr. 11 mo. to 3 yr. 3 mo. and averaging 2 yr. 7 mo. The middle 50 percent (interquartile range) were between 2 yr. 4 mo. and 2 yr. 10 mo., and the median ages for the girls and boys were the same. The findings are discussed in sections dealing with infant development, status at beginning nursery school, and development during the school year. In summary, a description is given of the composite or average child of the group with respect to all of the items studied, and the three classes of numerical data are tabulated, thus furnishing convenient standards for comparison.

Ten "good" eaters and ten "poor" eaters, J. B. McCAY and H. D. BULL. (Cornell Univ.). (*Jour. Ped.*, 17 (1940), No. 2, pp. 230-240).—From the records obtained in the extensive study of health and development of the group of nursery school children referred to above, those of 10 children classified as good eaters and 10 as poor eaters were selected for a comparison of early infant histories, physical examination on beginning school, and behavior relevant to nutrition and health during the school year. The group of good eaters was comprised of 5 boys and 5 girls and the poor eaters of 7 boys and 3 girls. The average age of the children in the first group was 30.1 and in the second 30.2 mo. at the beginning of school.

The two groups were similar in the age of their mothers at the birth of the children; infant schedules and feeding practices; arrival of teeth; beginning of walking and talking; bony structures and posture, with the exception of more "winged" shoulders in the group of poor eaters; evidence of infected tonsils; amount of absence for sickness, although the group of good eaters lost more days because of colds and of poor eaters more because of digestive difficulties; and amount of sleep in 24 hr., although the poor eaters had fewer and shorter naps and equal gains in weight. Among the differences noted were smaller birth weights and weights on entering school of the poor eaters, inferior tone and musculature, a tendency toward anemia, poorer coordination of the eyes, occasional appearance of sugar in the urine, lower ratings in mental tests, more digestive difficulties, and more restless activities at meals. The good eaters showed more skin patches diagnosed as eczema and more roughened skin, more prominent abdomens, and a greater tendency to enuresis. Certain of the findings suggest the influence of unfavorable home environment in the group of poor eaters.

The mystery of alimentation, I, II, E. P. CATHCART (*Lancet* [London], 1940, I, Nos. 12, pp. 533-537; 13, pp. 586-590).—In these Oliver-Sharpey lectures delivered before the Royal College of Physicians of London, March 12 and 14, 1940, the author discusses the inadequacy of present knowledge concerning many of the fundamental processes governing the utilization of food in the body, selecting for particular consideration protein and calcium-protein "because it holds an unique position in alimentation as almost the only source of the requisite nitrogen" and calcium "because most attention has been, in modern times, devoted to a study of this mineral because it is so intimately associated with the apparently static skeletal structure and because so much

weight has been laid on it as a kind of gage of the adequacy of a diet." Assumptions unwarranted in the light of existing knowledge, controversial views, and unexplored problems, particularly those concerned with interrelationships among the various food constituents, are discussed, and new lines of inquiry are suggested through numerous questions.

"The problems are endless. We indeed see through a glass darkly; yet every day pronouncements are brazenly made about the adequacy of this and the inadequacy of that diet or the degree of malnutrition which is due to the absence of this or that essential constituent from the diet. Mendel was right when he wrote: "There is no field of practical importance related to human well-being in which there is greater opportunity for dogmatism and quackery, for pseudoscience and unwarranted presumptions and proscriptions, than in the domain of our daily diet."

Some modifications of the paired-eating method in meat cookery research, S. COVER. (Tex. Expt. Sta.). (*Food Res.*, 5 (1940), No. 4, pp. 379-394).—A paired-eating method, the essential features of which are that paired samples be provided and that these be judged by comparison with each other, is presented. A description is given of the method as used in testing tenderness of meat; and the setups of the sampling sheet, which is really a code followed in placing the samples on the plates of the individual judges, of the judging sheet for tenderness, and of the summary sheet are shown. As an illustration of the method, one complete set of actual data is recorded on the forms, and the process is discussed. Statistical treatment, which may be done simply in a short period of time either by the binomial method or the method of chi square, is presented for the data reported, using the chi-square method. The method is considered generally applicable "to those studies in which the major interest is concentrated on observing the effect of the extremes of one independent variable on one factor of palatability as the dependent variable." The method as originally given has been noted (E. S. R., 76, p. 126).

The nutritive value of the proteins of rice and its by-products.—II, Effect of amino acid additions on growth, M. C. KIK. (Univ. Ark.). (*Cereal Chem.*, 17 (1940), No. 4, pp. 473-476).—In continuation of studies noted previously (E. S. R., 81, p. 867), the supplemental effect of various amino acids with regard to the nutritive quality of rice proteins was studied. The various rations, adequate as to minerals and vitamins, employed whole rice, polished rice, rice polishings, or rice bran at levels sufficient to supply 6.0 percent, 5.5, 8.0, and 8.0 percent of protein, respectively. Paired feeding experiments showed that cystine, methionine, and lysine supplemented the proteins of whole or polished rice to a slight but statistically significant extent. Tryptophan had no beneficial effect, and a "leucine fraction" used with the polished rice was without effect. Cystine, as a supplement to the proteins of rice bran and rice polishings, failed to promote growth.

Effect of changes in food intakes upon the lignin, cellulose, and hemicellulose contents of diets, F. C. HUMMEL, M. L. SHEPHERD, and I. G. MACY (*Jour. Amer. Dietet. Assoc.*, 16 (1940), No. 3, pp. 199-207).—Data are reported for the total fiber, cellulose, hemicellulose, and lignite content, as determined by methods noted, of 14 common foods used in the experimental diets. In the dietary studies reported in detail the effect of altering the proportion of cellulose, hemicellulose, and lignin in the diet was observed in 9 normal children by the addition or substitution for cereal of 100 gm. of banana per day. Differences in the quantities of apple included in the diets of the different groups permitted comparison of the effects produced by similar quantities of

total fiber whose proportional composition varied. The apples contained a higher proportion of cellulose and hemicellulose but a lower proportion of lignin than the bananas.

Each child was given quantities of food suitable to meet his own dietary needs, and each subject served as his own control during preexperimental periods of from 30 to 55 consecutive days, immediately followed by experimental periods of from 20 to 45 days. From the data presented on intake and retention of nitrogen and on intake of total fiber, lignin, cellulose, and hemicellulose in the preexperimental and experimental periods, it appears that "there are other motivating factors besides quantity intake of nitrogen which produce increases in nitrogen retention and growth of soft tissue when conservative amounts of banana (from 100 to 200 gm. per day) are added to the diet. This study indicates that the unavailable carbohydrates may have a protein-sparing action, and that the character of the fiber (i. e. the proportion of lignin to cellulose and hemicellulose) may have physiological importance in the diet."

Influence of raw banana and apple upon disappearance of complex carbohydrates from the alimentary tracts of normal children, M. L. SHEPHERD, F. C. HUMMEL, I. G. MACY, ET AL. (*Amer. Jour. Digest. Diseases*, 7 (1940), No. 6, pp. 248-252).—The dietary studies reported in this paper are essentially noted in the above study.

Hematologic values for normal children three, four, and five years of age living in Hawaii, C. J. HAMBE and K. K. L. WONG. (Hawaii Expt. Sta.). (*Amer. Jour. Diseases Children*, 60 (1940), No. 1, pp. 22-35, fig. 1).—Hematologic values were determined for 179 healthy children (89 girls and 90 boys) from 3 yr. 6 days to 5 yr. 338 days in age and resident in the Hawaiian Islands for at least 1½ yr. before the examinations. The children were of several races (Caucasian, Chinese, Japanese, Korean, Hawaiian, and mixed) and came from families of average means. The determinations, made on peripheral blood by methods noted, included red cell, platelet, and differential white cell counts and determinations of hemoglobin, packed red cell volume, corpuscular volume, and corpuscular hemoglobin concentration.

The data, reported by races and again according to age and sex, indicated, upon statistical analysis, that no differences occur in respect to these factors. The mean values (reported, together with statistical constants and the range of observed values) compare closely with values summarized from the literature and pertaining to children in various parts of the world. "It is concluded that the blood levels for the children of the Hawaiian Islands do not differ significantly from those for children of other parts of the world."

Minerals in nutrition (*Massachusetts Sta. Bul. 374* (1940), pp. 40, figs. 2).—The studies reported in this bulletin were undertaken to gain some factual evidence of the degree and nature of certain mineral deficiencies, and include the following: Total Nutrients and Minerals in Human and Cattle Foods, by W. S. Ritchie and E. B. Holland; The Absorption by Food Plants of Certain Chemical Elements Important in Human Physiology and Nutrition, by W. S. Eisenmenger and K. J. Kucinski; Possible Relationship of Vitamin C and Arthritis, by W. B. Esselen, Jr., and C. R. Fellers; The Effect of Kelp and Mineral Supplements on Atherosclerosis in Rabbits Induced by Feeding Cholesterol, by H. S. Mitchell, M. F. Goldfaden, and G. J. Hadro; Effect of Added Iodine on the Enzymes of Milk and on Other Enzymes, by M. Glickstein, W. S. Mueller, and J. H. Frandsen; Added Iodine in Milk and Fecal Bacteria, by J. E. Fuller and W. B. Esselen, Jr.; and Iodine and Bacterial Counts in Milk, by J. E. Fuller, G. S. Congdon, and M. Glickstein. The introduction is by J. E. Fuller.

Growth and chemical composition of the human skeleton, W. W. SWANSON and V. IOB (*Amer. Jour. Diseases Children*, 59 (1940), No. 1, pp. 107-111, fig. 1).—The proportion of bone and cartilage is reported for five fetal skeletons varying in weight from 530 to 4,070 gm. and representing fetal ages from 4.1 to 10.0 lunar mo. In this time the skeletal weight changed from 12 to 9.8 percent of the weight of the body; the cartilage decreased from 42.5 to 36.1 percent of the total skeletal weight, while the bony skeleton increased from 57.5 to 63.9 percent of this weight. Three of the skeletons, at fetal ages of 4.1, 9.1, and 10.0 lunar mo., respectively, were analyzed for moisture, fat (except at 4.1 mo.), sodium, potassium, chlorine, phosphorus, calcium, and magnesium, the value being reported separately for bones and cartilage; at 4.1 mo., the spine was analyzed separately. The molecular equivalent of sodium in both bone and cartilage was from 2 to 6 times the molecular equivalent of chlorine, indicating that the greater part of the sodium, particularly in bone, was in the inorganic salts of the matrix.

The retention of calcium and phosphorus by pre-school children, H. B. PIERCE, R. G. DAGGS, A. B. MESERVEY, and W. J. SIMCOX. (Univ. Vt.). (*Jour. Nutr.*, 19 (1940), No. 4, pp. 401-414, fig. 1).—This study was planned to compare milk and a wheat farina fortified with an alkaline salt mixture (apparently disodium and tricalcium phosphates) as sources of calcium and phosphorus for preschool children. The subjects, four girls and six boys from 3 to 6 yr. of age, were divided into two groups of three boys and two girls each and matched as evenly as possible with regard to weight and age. An adequate basal diet was used, the diet being so planned that approximately 50 mg. of calcium per kilogram of body weight per day, or 80 percent of the total ingested calcium, was supplied by milk. To eliminate the effects of any previous calcium depletion, the basal diet supplemented with calcium lactate in the one group and with calcium phosphate in the other was fed for a preliminary period of 6 weeks. The experimental periods (5 weeks) were then begun; during this time the one group received the basal diet only, while the other group received the basal diet modified so that 200 mg. of milk calcium were replaced by 200 mg. of calcium in the fortified cereal. After an intermediary period of 2 weeks in which the calcium was reduced to approximately two-thirds that of the basal diet, the experiment was repeated with reversal of the groups in regard to dietary treatment. The data on calcium and phosphorus metabolism during the five periods are presented and discussed.

The results showed that retentions in the first two periods were higher than in the other three, probably because of previous depletion. During the test period the utilization of calcium and phosphorus, as measured by retention, was equally good from milk or from the cereal fortified with tricalcium phosphate. The children were in positive calcium, phosphorus, and nitrogen balance throughout the study, and more phosphorus was stored than was required to convert retained calcium to bone. The averages of calcium and of phosphorus retention over the 6-mo. period were in close agreement for the two groups, 11-12 mg. of calcium and 7-8 mg. of phosphorus per kilogram of body weight being stored daily. About 19 percent of the calcium and 11 percent of the phosphorus were retained. For maximal retention of calcium it was necessary with the basal diet used to have a daily intake of over 700 mg. of calcium. It is pointed out that this is greater than the amount suggested by Outhouse et al. (*E. S. R.*, 82, p. 132), but that the severity and length of winter with the limitation of sunshine might have necessitated more calcium than would be required for the same retentions in more moderate climates. The growth rates of the children were very satisfactory.

Studies in calcium metabolism with the aid of its induced radioactive isotope, I, W. W. CAMPBELL and D. M. GREENBERG. (Univ. Calif.). (*Natl. Acad. Sci. Proc.*, 26 (1940), No. 3, pp. 176-180, fig. 1).—Radioactive Ca^{45} with a half

life of 180 days was shown to be suitable for use as a "tracer" element when radioactivity is measured with a screen-wall counter tube. This element prepared, by a procedure noted briefly, as the lactate in 5 percent solution, was administered by stomach tube in a 5-cc. portion to a fasting rat weighing 259 gm. The animal, then placed within a metabolism cage, was given food after 18 hr. and was sacrificed after 69 hr. The blood was withdrawn by cardiac puncture, the organs were dissected out, and the tissues separated. Each of these, as well as the urine and the feces, was ashed preliminary to separation of calcium as the oxalate. Radioactivity measurements on each of these precipitates and the precipitate from the standard (0.0976 cc. of the original calcium lactate solution) were made on the screen-wall counter.

The sum of the measured activities of the excreta and all of the tissues showed a recovery of 103 percent of the Ca^{45} given. Data (corrected by the factor 100/103), presented to show the distribution of the radioactive calcium, indicate that 89.2 percent of the Ca^{45} administered by stomach tube was absorbed and that 65.6 percent of the amount given was excreted in the urine, 57.9 percent appearing during the first 9 hr. after administration. The unexcreted Ca^{45} (23.6 percent) was distributed in various tissues, the largest amount occurring in bone, with significant amounts in skin and teeth. Specific retentions (percentage of total dose per gram of fresh weight) "fell off in the following order: Highest in bone and teeth, which were about equal; intermediate in small intestine, large intestine, heart, lung, and skin; and least in the remaining tissues."

Iron metabolism.—I, The role of calcium in iron assimilation, S. W. KLETZIEN (*Jour. Nutr.*, 19 (1940), No. 2, pp. 187-197).—Young rats were fed a milk diet productive of severe anemia and a number of the animals were sacrificed as anemic controls at this stage. Others were transferred to a basic control ration providing a daily intake of 0.5 mg. of iron and 0.02 mg. of copper per animal or to the basic ration variously supplemented with calcium salts. After 5-6 weeks of controlled feeding, the animals were sacrificed and analyzed to determine the iron content of liver, spleen, blood, and carcass in order to follow the effect of variation in the supply of calcium on the amount of iron accumulated in organs and body. It was found that the addition of 1 percent of CaCO_3 to the basic ration reduced the iron content of all tissues except the spleen, the average liver, blood, and carcass values being 57, 86, and 90 percent of the respective values for the control group on the basic ration; at a 3 percent level of CaCO_3 these values were reduced to 28, 72, and 61 percent of the values for the control group; with calcium lactate in an amount equivalent to a 2.5 percent level of CaCO_3 the reduction was still greater, the liver, blood, and carcass values being only 25, 42, and 45 percent of the respective control values. CaCl_2 , $\text{Ca}_3(\text{PO}_4)_2$, and CaSO_4 in amounts equivalent to 3 percent of CaCO_3 had, with the exception of the sulfate, a similar adverse effect on the iron retention.

The addition of 1 and 3 percent CaCO_3 to a basal diet containing 90 percent of ground whole wheat likewise resulted in lower tissue iron values. It is suggested that these disturbances, caused by the introduction of the readily ionizable or metabolizable calcium salts into the intestinal tract, may be referable to the ionic imbalance produced; "that adsorption is a factor in making iron unavailable is not disproved; neither are changes in intestinal pH or the removal of iron by precipitation." The possible bearing of these findings on the metabolism of other minor elements is discussed.

Iron utilization in dogs on milk diets, D. V. FROST, C. A. ELVEHJEM, and E. B. HART. (*Wis. Expt. Sta.*). (*Jour. Nutr.*, 19 (1940), No. 4, pp. 311-320, fig. 1).—Young dogs made anemic (hemoglobin 3.5-6.0 gm. per 100 cc. of blood)

on whole milk were then given daily either 10 mg. of iron as ferric chloride alone or 10 mg. of iron plus 2 mg. of copper as copper sulfate. In the former group the animals responded by increases of hemoglobin to a level of 8-10 gm. per 100 cc. of blood during the first week or two of therapy, during which time about 80-90 percent of the ingested iron was utilized for hemoglobin formation. At the end of this period the hemoglobin level ceased to increase rapidly, and practically none of the ingested iron was returned as blood hemoglobin. Administration at this point of 2 mg. of copper per day along with the iron, produced another rapid resumption of hemoglobin formation until normal levels were reached again. The first plateau in the hemoglobin curve was considered as evidence that a copper deficiency had developed.

Dogs receiving the copper supplement, together with the iron, from the beginning of the experiment showed more rapid increases in the blood hemoglobin levels during the first weeks of the experiment and more rapid weight gains than the first set of experimental animals. Although calculated iron utilization approximated 100 percent during the first weeks of therapy with iron and copper, the percentage of utilization decreased rapidly thereafter, and after 6-8 weeks only 60-70 percent of the total iron ingested could be accounted for.

Some of the iron was apparently "stored" as demonstrated in succeeding experiments in which the animals, after a period of iron therapy with resulting hemoglobin formation, had their hemoglobin stores reduced by bleeding and the iron supplement withdrawn at the same time. During this latter period there was some hemoglobin formation, apparently drawing upon iron stored during the period of therapy. When the preliminary period of iron administration did not include simultaneous administration of copper, the copper stores were depleted and the hemoglobin regeneration in the succeeding period was slight; this is interpreted to indicate that stored iron becomes available for hemoglobin formation only in the presence of adequate copper. Experiments with one dog on a milk diet indicated that cobalt acted as an adjunct to copper and iron for maximal hematopoiesis.

Studies in mineral metabolism with the aid of induced radioactive isotopes.—IV, Manganese, D. M. GREENBERG and W. W. CAMPBELL. (Univ. Calif.). (*Natl. Acad. Sci. Proc.*, 26 (1940), No. 7, pp. 448-452).—Continuing this series (*E. S. R.*, 84, p. 137), radioactive manganese (Mn^{54}) with a half life of 310 days was prepared by the bombardment of Fe^{56} with deuterons, and separated by a procedure outlined, being then administered in metabolic tests on each of two rats weighing about 160 gm. and maintained on a normal diet; 1-cc. doses of the labeled $MnCl_2$ (1 mg. Mn) were given, by stomach tube in one case and by intraperitoneal injection in the other. The animals were sacrificed 75.5 hr. after administration of the doses. The various tissues separated at this time, as well as feces and urine obtained separately at desired intervals, were dried and ashed, 1 mg. of inactive Mn as the sulfate being added to each ashed sample as a carrier for the radioactive Mn. Data presented on the distribution of the labeled Mn (which was recovered to the extent of 96 and 78 percent in the two cases, respectively) showed that over 90 percent is excreted within 75 hr. when administered either by stomach tube or by intraperitoneal injection, that very little, if any, of the absorbed Mn is excreted in the urine, and that liver, bone, and muscle take up appreciable quantities of the absorbed Mn, although other organs may take up varying amounts due to storage or to processes of excretion.

Dietary and metabolic studies of Eskimo children with and without dental caries, including studies of the metabolic balances of calcium, phosphorus, and nitrogen, E. H. SIEGEL, L. M. WAUGH, and M. KARSHAN (*Amer.*

Jour. Diseases Children, 59 (1940), No. 1, pp. 19-38).—Calcium, phosphorus, and nitrogen balance studies over 2- to 4-day experimental periods were carried out on a total of 23 Eskimo children in 3 isolated native communities, Kepnuk, Hooper Bay, and the Moravian orphanage, in the Kuskokwim region of Alaska. Twelve of the children, ranging in age from 8.5 to 15 yr., were caries-free, while the other 11, from 7 to 15 yr. of age, had active (3 cases) or inactive caries. The results indicated that the 3 children with active caries had retentions that fell within the ranges of the caries-free group or those with inactive caries. Retentions were fairly uniform for the children in any one community but differed markedly between communities. There were high positive balances of both calcium and phosphorus at Hooper Bay, where the diet was high in these elements and potentially acid; there were large negative balances of both calcium and phosphorus at Kepnuk, where the diet was very high in both elements but potentially basic; and low positive to slight negative balances of the two elements at the orphanage, where the diet was low in calcium, moderately high in phosphorus, and potentially acid. Despite these differences in diets and in the retentions of the subjects studied over the brief periods, most of the natives in the areas studied were found to be caries-free. It is considered that the data reported give no basis for the view that the freedom from dental caries enjoyed by a primitive people is due to a nutritional superiority of "natural" as compared with "civilized" diets.

Biochemical studies of the saliva of Eskimos correlated with dental caries and the occurrence of salivary calculus, M. KARSHAN, E. H. SIEGEL, and L. M. WAUGH (*Amer. Jour. Diseases Children*, 59 (1940), No. 1, pp. 39-44).—In a study of stimulated and unstimulated saliva of Kuskokwim Eskimos (19 and 12 caries-free subjects, and 10 and 11 with caries, in the 2 groups, respectively) the mean values for total calcium, inorganic phosphate, and carbon dioxide capacity were found higher for the caries-free group than for the group with caries (including only 3 with active decay); similarly the mean values were somewhat lower in a calculus-free group than in a group with varying amounts of calculus. It is considered that there was no correlation between the carbon dioxide capacity of the saliva and the acid-base balance of the diet.

The diet of adolescent girls, with special reference to nutritional state and dental caries, L. M. BAYER. (Univ. Calif.). (*Jour. Ped.*, 16 (1940), No. 1, pp. 56-68, figs. 6).—This report is based on data collected in a group of 80 normal urban (Oakland, Calif.) public school girls of the "middle" socioeconomic class during 1932, 1934, and 1933. Analysis of the dietary showed the diets to be generally poor, with the greatest deficiency in vegetables, fruits, milk, and whole cereals, and with a corresponding excess of starches and sweets. Clinical investigation showed that about one-half of the girls were of optimum weight, the other half being about equally divided between underweight and overweight. The girls with optimum weight showed diets slightly superior to those of the other group. Dental caries was evaluated by making counts of decayed, missing, and filled permanent teeth as they appeared at semiannual medical inspection. The count of diseased teeth rose from an average of two at 11.5 yr. of age to an average of nine at 17.5 yr. of age. No statistical relationships between poor teeth and poor diet could be demonstrated, however, probably because no diets were good enough to exert a consistent protective influence.

Inhibition of experimental dental caries by fluorine in the absence of saliva, V. D. CHEYNE (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 1, pp. 58-61).—Beginning at 31 days of age, 76 rats received a caries-producing diet;

of these animals, 32 had had the salivary glands removed at 22 days of age; of the desalivated animals, 12 received daily an oral aqueous dosage of 3 mg. of fluorine as potassium fluoride. At the end of 200 days the animals were sacrificed, the jaws were separated, and all molar teeth were examined under magnification (30X) for simple fractures and carious cavities. On the caries-producing diet the normal animals were found to have an average of 9.1 cuspal involvements and 3.5 carious teeth per animal; those with the salivary glands extirpated had 40.0 and 10.5, respectively; while the desalivated rats receiving the 3 mg. of fluorine per day averaged only 6.0 cuspal involvements and 2.3 carious teeth per animal. These results indicate that the beneficial effect of the fluorine is greater than that of the saliva acting independently; that fluorine has an inhibiting effect even when oral secretions are at a minimum; and that fluorine does not prevent initial fracture of the teeth but does prevent subsequent progressive destruction, apparently by action on the tooth or in the region where food and bacteria come in contact with the tooth surface.

Oslo meals for school children (*Med. Off.*, 63 (1940), No. 11, pp. 95, 96).—The greater beneficial effects to school children of cold lunches of the Oslo type, consisting practically entirely of protective foods, than of a hot meal of meat and pudding is brought out through brief reports of comparisons of the gains in weight of groups of children in Oslo following 6 weeks' supplementary feeding of the two types of meal and of the percentage gains of height and weight of similar groups of children in London during a 10-week period. The Oslo breakfast as practiced in Norway consists of $\frac{1}{3}$ l. of unskimmed milk, crackers, and bread prepared with whole meal flour, with margarine and goat-milk cheese, and half an orange, half an apple, or 1 raw carrot. In the modified Oslo meal, as served in the London experiment, whole meal bread was substituted for the crackers, New Zealand butter for the margarine, and bland cheese for the goat-milk cheese. In both studies the gains were much greater for the children receiving the Oslo type meal.

Vitamins—their respective sources, their physiological values, C. A. ELVEHJEM. (*Univ. Wis.*). (*Bakers Digest*, 14 (1940), No. 10, pp. 183–186).—An address.

Vitamin A: Methods of assay and occurrence in foods, B. W. FAIRBANKS. (*Univ. Ill.*). (*North Amer. Vet.*, 21 (1940), No. 3, pp. 165–167).—A review considering very briefly the chemistry of vitamin A and carotene, methods of assay, units of vitamin A, occurrence in foods, and stability of the vitamin.

Dark adaptation and vitamin A deficiency: A new technic, A. G. SHEFTEL. (*Amer. Jour. Clin. Pathol.*, 10 (1940), No. 2, pp. 168–175, figs. 3).—The apparatus illustrated consists of a standard size X-ray viewing box (16 by 19 in.) of frosted white glass fitted into a white cardboard or wooden box and equipped with a 250-w. bulb. As a means of control of the bleaching process of the visual purple, the subject is required to read aloud the letters stenciled on thin white paper pasted in the center of the frosted glass, thus assuring direct gaze at the bright light. The degree of dark adaptation is measured by the intensity of light passing through a solution of prussian blue in a colorimeter cup so arranged, with syringe attachment, as to permit of decrease or increase in depth of the liquid column, thus modifying the intensity of light. The colorimeter is placed in the middle of the box about $\frac{1}{2}$ in. from the border. The subject is seated close to the apparatus with the forehead touching the upper part of the box two fingerbreadths above the eyebrows. After a 2-min. period of bleaching, the colorimeter light is turned on and the bright light extinguished. The rapidity of regeneration of the visual purple is first measured at the periphery of the eye by requiring the subject to signal upon perception of the colorimeter light coming through

a 10-mm. column of the liquid, while looking at a notch in the left side of the box 7 in. from the base and in which the thumb rests. This gives a rating at an angle of about 35°. The gaze is then transferred to the colorimeter and the subject signals when the light again appears, thus giving a separate measurement of foveal regeneration time. Two min. after disappearance of the bright light and at 2-min. intervals for a period of 8 min. the subject finds his light threshold by adjusting the depth of the liquid, thus modifying the light intensity. This adjustment by the subject rather than the operator permits of more exact readings. For 8 normal controls peripheral and foveal regeneration times averaged 15–25 and 40–70 sec., respectively. The light threshold, expressed as millimeters of the column of prussian blue after 2, 4, 6, and 8 min. was 11–12.5 mm., 12–14, 15–17, and 16.5–18.5 mm., respectively.

Some basic principles of dark adaptation, R. McDONALD (*Arch. Ophthalmol.*, 23 (1940), No. 4, pp. 841–851, figs. 6).—The problem of dark adaptation and its clinical significance is discussed with reference to the contributions of the past few years to the physiology of rod and cone vision and the chemical basis of vision. Commenting on the use of dark adaptation as a test for vitamin A deficiency, the author states that "many suggestions have been devised to simplify and hasten the procedure. It must be remembered, however, that dark adaptation is a physiologic phenomenon that requires time and that there are probably other factors concerned with dark adaptation besides the regeneration of visual purple. Apart from the subjective difficulties of the test, the exact metabolism of vitamin A in the body or the individual daily requirements are not yet known for certain. Theories do not always fit the facts, and the value of dark adaptation as a routine test of vitamin A deficiency can be established only by a critical analysis of the results obtained. Unfortunately, in one's enthusiasm the basic physiology is sometimes neglected, and a true appreciation of the significant changes is missed."

Effect of fertilizing treatment on vitamin A content of sweet-potatoes, P. SWANSON, G. STEVENSON, E. S. HABER, and P. M. NELSON. (Iowa Expt. Sta.). (*Food Res.*, 5 (1940), No. 4, pp. 431–438).—The vitamin A content of sweet-potatoes of the Prolific variety was determined as 25.3 International Units or 56 Sherman-Munsell units per gram. Five lots were used, grown, respectively, in Buckner sand (deficient in N, P, K, and organic matter) without fertilizer, and with fertilizing treatments supplying muriate of potash, manure, nitrate of soda, or superphosphate. The concentration of vitamin A in the five lots ranged from 22 to 28 I. U. on the basis of an 8-week test (from 20 to 26 I. U. in a 5-week test), and apparently was not significantly affected by the fertilizer.

The vitamin was estimated by the method of Swanson et al. (*E. S. R.*, 80, p. 277), the carotene used as standard being that supplied as a provisional standard material by the League of Nations. The average weight gains made by the lots of rats fed the sweetpotatoes are reported, together with standard deviations.

Effect of storage on vitamin A content of canned tomatoes, P. P. SWANSON, G. STEVENSON, and P. M. NELSON. (Iowa Expt. Sta.). (*Jour. Home Econ.*, 32 (1940), No. 4, pp. 246–251).—Tomatoes of the Marglobe variety, grown during the summers of 1930–34, inclusive, in the same garden and canned in tin containers for use in this experiment by a commercial canning company, were stored upon delivery at the laboratory for periods of 6, 18, 30, or 42 mo. Samples representing the different periods of storage, as well as fresh tomatoes grown under similar conditions, were assayed by a method previously outlined (*E. S. R.*, 80, p. 277). The tomatoes, preparatory to feeding, were sieved to give assay samples in which the vitamin A was uniformly distributed, diluted to volume, and fed as appropriate supplements. Except for the samples 42 mo. old, the

supplements were fed at more than one level. From 1933 to the termination of the experiment, carotene was fed at different levels to groups of rats carefully matched against those receiving the tomato supplements, and the response of the carotene-fed animals was used in establishing curves of reference from which to evaluate the results with the uncontrolled test animals. The carotene used was from samples supplied as provisional standard material by the League of Nations. The equations used for interpreting the bio-assays in terms of International Units are given; in addition the assays were interpreted to express the concentration of the vitamin A in the fruit in terms of Sherman-Munsell units.

The results, discussed in some detail with particular reference to methodology, indicated that the average concentration of vitamin A in canned Marglobe tomatoes was 5.7 I. U. (12.0 Sherman units) per gram. Fresh tomatoes of the same variety and grown under similar conditions averaged only 3.3 I. U. per gram. Storage of the canned tomatoes at room temperature for as long as 42 mo. did not change the vitamin A value of the tomatoes.

Histological demonstration of vitamin A in rats by means of fluorescence microscopy, H. POPPER (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 1, pp. 133-136, fig. 1).—Earlier observations by Peacock (E. S. R., 56, p. 110), Von Querner (E. S. R., 76, p. 276), and others that vitamin A shows a green fluorescence in ultraviolet light which disappears rapidly during irradiation were confirmed by observations under the fluorescence microscope of thin pieces of rat tissue fixed in excess of 10 percent formalin and frozen and by staining sections with fluorescent dyes. The tissues tested were obtained from 23 rats, including 8 positive controls, 7 deficient in vitamin A, and 8 treated with different quantities of vitamin A after preliminary depletion. The vitamin A content was determined biologically by the U. S. P. XI method and checked chemically. In the positive controls and in the deficient animals after repletion, green fluorescence fading to blue was noted in droplets in the parenchyma of the liver, in the cytoplasm, in the Kupffer cells, and in the adrenals. In the deficient rats and in those which had been given vitamin A therapy only a few hours before killing, the green fluorescence was absent. In 6 newborn rats there was no green fluorescence in the cytoplasm of the liver and only a few fluorescent droplets in epithelial and Kupffer cells, and there was likewise no green fluorescence in the adrenals. In a limited number of rats deficient in vitamins B₁, B₂, and D, normal amounts of fluorescent materials were found in the liver and adrenal. The livers of several other species gave essentially the same findings as the liver of normal rats.

Histological demonstration of vitamin A in the human liver by means of fluorescence microscopy, H. POPPER (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 2, pp. 234-236).—Using the same technic as in the rat study noted above, the author has examined on autopsy 113 human livers. In agreement with chemical determinations of the vitamin A content of human livers by Moore (E. S. R., 81, p. 451) and others, a great variation was found in the amount and distribution of the green fluorescing bodies. The Kupffer cells usually showed small fluorescing droplets which gave a silver-gray fluorescence after staining with phosphine 3 R but not after acetone treatment. In cases of infectious diseases there was usually a great increase in the number of green fluorescing Kupffer cells and in starvation and acute hepatitis a decrease. Green fading fluorescence was also shown in epithelial cells and varied in distribution under different conditions. The livers of newborn or premature infants showed little of this fluorescence. "The histological picture suggests that vitamin A is transmitted from the Kupffer cells to the epithelial cells and disappears from the latter only after reduced nutrition. Sometimes the trans-

mission to the epithelial cells is impaired with consequent retention in the Kupffer cells."

In addition the characteristic green fluorescence was found in the epithelial cells of the fascicular and glomerular layer of the adrenals, with amounts running parallel with that of the liver, in the cells of the corpus luteum of the ovary and the tubular and Leydig cells of the testes, and in small but varying amounts in the fat cells in different organs and in fat tissue. No fluorescence was shown by the normal kidney, but it was found in two cases of nephritis.

The relationship between biophotometer tests and the vitamin A content of the blood of children. W. S. BAUM and A. B. McCOORD (*Jour. Ped.*, 16 (1940), No. 4, pp. 409-418, fig. 1).—Ninety-eight children were tested once with the biophotometer, all readings being performed by the same operator on a Frober-Faybor instrument in a completely darkened room. Readings were taken (1) upon entering the darkroom, (2) after a 10-min. period in the dark, (3) 20 sec. after a 3-min. exposure to bright light, and (4, 5, 6, and 7) after 2½, 5, 7½, and 10 min. in the dark. The vitamin A, carotene, and xanthophyll contents of the blood were determined in all subjects.

As judged by the Frober-Faybor standards in which the (3) reading is considered the most significant, 33 of the subjects showed normal dark adaptation, 64 were intermediate, and 1 showed subnormal adaptation. When regrouped by the standards of Jeans (E. S. R., 77, p. 886), who used the same type of instrument and based his standards on the postbleaching reading (3) and the final reading (7), 32 subjects were in the normal group, 47 in the intermediate, and 19 subnormal, a distribution which corresponded with that obtained by Jeans. Dietary history, obtained from 70 of the subjects, showed no correlation with the biophotometer readings, nor was a history of symptoms of vitamin A deficiency elicited in any case. Correlation was absent between all readings of the biophotometer and the vitamin A, carotene, and xanthophyll content of the blood.

In a second series of 19 patients, each subject was tested repeatedly with the biophotometer until no further improvement in readings was evident. From 8 to 10 testings were necessary to accomplish this. The vitamin A content of the blood was then determined. The improvement in biophotometer readings after repeated testing resulted in a decrease in the number of subnormal readings in the trained subjects so that only about 10 percent came in the subnormal group. This decrease indicated the importance of the training factor, and it is considered, therefore, that a single reading of the biophotometer is of no importance in estimating vitamin A deficiency. Even in this trained group no statistically significant correlation was found between the blood vitamin A values and the postbleaching biophotometer readings (3) used for the grouping by the Frober-Faybor standards; neither was there any correlation when the subjects were regrouped according to the Jeans standards. In the latter grouping the normal subjects (9) averaged 17.2 vitamin A units per 100 cc. of blood, the intermediate group (8) averaged 12.6, and the subnormal group (2) 16.7 units per 100 cc. Vitamin A absorption tests were performed on 10 subjects, but the results were too few to permit conclusions.

Cutaneous manifestations of vitamin A deficiency in children. E. LEHMAN and H. G. RAPAPORT (*Jour. Amer. Med. Assoc.*, 114 (1940), No. 5, pp. 386-393, figs. 7).—A general discussion under the headings of clinical manifestations, photometric studies, treatment and course, occurrence in childhood, etiology, etiology of keratosis pilaris (lichen pilaris, ichthyosis follicularis), human requirements for vitamin A, and incidence of vitamin A deficiency in America, with numerous references to the literature, serves as a background for the

authors' observations over a period of 8 mo. on nine children, almost all of families on relief, attending an outpatient department of a New York City hospital. The clinical diagnosis of cutaneous lesions of vitamin A deficiency in these children was confirmed by biophotometer readings, all of which were definitely within the subnormal zone. The test was repeated several times before vitamin A therapy was begun, and as an additional corroboration in some cases the response after 1 or 2 hr. to 200,000 International Units of vitamin A by mouth was tested, with results indicating for the most part a rise from the deficient to the borderline or normal zone. Subsequent treatment with from 100,000 to 300,000 I. U. of vitamin A daily in the form of percomorph oil in addition to the vitamin A of the diet, estimated to furnish from 1,500 to 5,000 I. U. of vitamin A, resulted in improvement in the visual tests and in clinical symptoms. In some cases the response was rapid, and in others prolonged intensified treatment was required. Maximal improvement of the skin was reached in from 2 to 4 mo.

The authors conclude that "the typical follicular papules described by Frazier and Hu [E. S. R., 67, p. 482] and others are not an infrequent cutaneous manifestation of vitamin A deficiency during childhood. So far our investigations indicate that keratosis pilaris, lichen pilaris, lichen spinulosus, ichthyosis follicularis, and other synonyms are merely descriptive terms for the cutaneous manifestations of vitamin A deficiency."

Stomach lesions in rats kept on diets deficient in vitamin A, L. S. FREDERICIA, S. GUDJONSSON, B. VIMTRUP, and S. and J. CLEMMESSEN (*Amer. Jour. Cancer*, 39 (1940), No. 1, pp. 61-69).—The possible relation of lack of vitamin A as a causative factor for stomach lesions in the rat was considered in four series of experiments in which 114 rats were given for varying periods of time up to 52 weeks a diet deficient in vitamin A either intermittently or continuously and 74 rats were kept on a normal diet as a control. Proliferative changes in the mucosal lining of the stomach were found in 80 percent of all the experimental rats and in only 18 percent of the controls. Histological changes suggestive of malignancy were observed in the stomach of 1 experimental and 1 control rat. The length of time during which the rats were kept on the deficient diet was the most important factor in determining the development of changes in the stomach. The incidence of papillomatosis was by far the greatest in the animals particularly resistant to vitamin A deficiency.

In a fifth experiment 41 young rats were put on alternating A-deficient and normal diets for 18 days and then subjected to laparotomy for inspection of the outside of the stomach. In 27 cases thickening of the stomach wall was visible, and in 11 tumors were found projecting from the surface. When the animals in this group were put back on a normal diet, only 2 of 21 surviving at the end of a year showed lesions on autopsy.

It is concluded that vitamin A deficiency must have been a determining factor in the production of the stomach changes, although other factors as yet unknown may have played an important part.

White flour and vitamins, C. H. BAILEY. (Univ. Minn.). (*Northwest Miller*, 202 (1940), No. 5, pp. 23-25).—This paper, delivered as an address, is concerned particularly with vitamin B₁. Reference is made to its functions, the matter of units and requirements, and the distribution in foods—in wheat and wheat milling products particularly. It is pointed out that straight flours (71 percent yield) contain about one-seventh and wheat germ about one-sixth of the vitamin in the whole grain, leaving about 70 percent of the vitamin B₁ in other streams of flour.

If the vitamin B₁ content of bread is to be increased there are several methods possible: (1) The use of a low-grade flour, or of a patent flour reinforced with

wheat germ, (2) the addition of crystalline thiamin, (3) addition of vitamin concentrates, and (4) use of high vitamin yeasts. The first of these methods would most likely be managed at the mill. There are a number of difficulties, however, one being the poor storage quality of such flours, another the high ash content and resulting lower acceptability to the baker, and third, the limitation to the amount of available germ. It would require, for example, about $13\frac{1}{2}$ parts of germ (10 International Units per gram) and $86\frac{1}{2}$ parts of patent flour (0.3 I. U. per gram) to result in a mixture assaying 1.6 I. U. per gram (the average for the whole wheat grain). This amount of germ is about 15 times the amount commercially recoverable in milling the given amount of flour.

The other three methods of fortification would probably be handled at the bakery. They would involve an added direct cost for materials which would not include the cost of mechanical operations, wastage, or assaying. Because of these difficulties the millers and bakers are cautioned not to embark upon any extensive "reinforcing" programs until consumer reactions and preferences in the matters of price increase and change in bread type have been carefully tested.

Vitamin B₁ and vitamin B₂ (G) content of vegetables as influenced by quick-freezing and canning, C. R. FELLERS, W. B. ESSELEN, JR., and G. A. FITZGERALD. (Mass. Expt. Sta. et al.). (*Food Res.*, 5 (1940), No. 5, pp. 495-502).—Asparagus (Martha Washington variety), lima beans (Henderson Bush), and spinach (Virginia Savoy) grown at Bridgeton, N. Y., and peas (Thomas Laxton) grown at Corinna, Me., were harvested at 10-day intervals, portions of each lot being quick-frozen by the Birds Eye method or canned by commercial process. The fresh, frozen, and canned vegetables, shipped to Amherst, Mass., were assayed biologically for their content of vitamins B₁ and B₂, the samples during the period of shipment and use being held under suitable storage conditions.

For the canned vegetables separate assays were made for the solid portion and the juice. "Fresh asparagus, peas, lima beans, and spinach were found to contain 65, 133, 67, and 36 International Units of vitamin B₁ and 53, 70, 122, and 145 Bourquin-Sherman units of vitamin B₂ (G) per 100 gm., respectively. Asparagus, peas, lima beans, and spinach retained 78, 97, 46, and 94 percent of their vitamin B₁ and 95, 100, 84, and 91 percent of their vitamin B₂ (G), respectively, when quick-frozen; and 72, 60, 28, and 71 percent of their vitamin B₁ and 98, 100, 70, and 45 percent of their vitamin B₂ (G) content, respectively, when canned." It is pointed out that the order of loss of the vitamin B₁ and B₂ content of quick-frozen and canned vegetables appears to vary with the length of the blanching period. "Because of the solubility of these vitamins in water, minimum blanching periods consistent with the requirements are recommended."

Properties of the filtrate factor of the vitamin B₂ complex, with evidence for its multiple nature, A. MOHAMMAD, O. H. and G. A. EMERSON, and H. M. EVANS. (Univ. Calif.). (*Jour. Biol. Chem.*, 133 (1940), No. 1, pp. 17-28).—In this study, noted earlier from a preliminary report (E. S. R., 82, p. 280), procedures are described for the concentration of the rat filtrate factor complex obtained as preparations from cane molasses, an aqueous rice bran extract, and an alcohol-soluble liver preparation. Filtrate factor activity was judged by the growth of female rats maintained on a filtrate factor-deficient basic diet and supplied with thiamin, riboflavin, and vitamin B₆. The complex was found to be extractable with isoamyl alcohol, soluble in methanol, ethanol, and acetone, and adsorbable on norite from acid solution. The complex lost only part of its activity on heating with 1 N NaOH at 100° C., could be distilled at high vacuum (10^{-5} mm. Hg) at 100°, the resulting compound failing to form a benzylthiuronium salt. The complex also failed to form a Cu salt and was

not precipitated by semicarbazide hydrochloride or benzoyl chloride. "Two factors at least appear to be a part of the filtrate complex; one is essential for normal growth, the other preserves normal color in the pelage. While both factors are extractable with diethyl ether from acid solutions, the residue, while promoting growth, does not contain the antigraying factor. Cane molasses, an aqueous rice bran extract, and an alcohol-soluble liver preparation appear to be good sources of both factors, but brewers' yeast, while a rich source of the growth factor, is low in the antigraying factor; whole milk powder is low in its content of both factors."

Identity of natural and synthetic crystalline vitamin B₆, E. J. REEDMAN, W. L. SAMPSON, and K. UNNA (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 1, pp. 112-115, fig. 1).—A single dose curative method and a prophylactic method, both of which are described in detail, were used in this comparison of the biological activity for rats of natural and synthetic vitamin B₆. In both tests the natural and synthetic vitamins proved to be identical in their activity. A single dose of 100 γ cured 100 percent, of 50 γ 70-80 percent, and of 25 γ only 3 out of 25 of the test animals within 14 days. Gains in weight were proportional to the dosage. In the prophylactic tests 10 γ per rat per day was sufficient to promote growth at a practically normal rate. No increase in rate of growth was secured with 12.5 γ and 25 γ a day.

Urinary excretion of vitamin B₆ in the rat, J. V. SCUDI, H. F. KOONES, and J. C. KERESZTESY (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 1, pp. 118-122).—A colorimetric procedure for the determination of vitamin B₆, based upon a modification of the Gibbs reaction, is described briefly, and the results are reported of its use in studying the urinary excretion of vitamin B₆ in rats.

In comparable tests in which the vitamin was administered intravenously, intraperitoneally, and orally, the quantities of the vitamin recovered were essentially the same, suggesting complete absorption of the vitamin. The percentage output was approximately the same on low as on high doses, and the same in 5 hr. as in 24 hr., thus showing rapid excretion. At high dose levels (10 mg. per kilogram and above) deficient and normal rats excreted essentially the same percentages of the administered vitamin. At low levels (2 mg. per kilogram) normal rats appeared to excrete a higher percentage of the ingested vitamin than B₆-deficient rats. It is suggested that at this low level a differentiation of normal and deficient urinary output should be possible in larger animals.

Antidermatitic effect of vitamin B₆ analogues, K. UNNA (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 1, pp. 122-124).—With the use of the single dose curative method, data were obtained on the vitamin B₆ activity of 10 synthetic derivatives of 2-methyl pyridine closely related to the vitamin and summarized as follows:

"Acetylation does not diminish the antidermatitic effect of vitamin B₆. Methylation or ethylation of one of the hydroxymethyl groups diminishes the vitamin activity considerably but less than the methylation of the phenolic hydroxyl group. Replacement of one or more hydroxymethyl groups by methyl or amino groups destroys the vitamin activity."

Negative effect of synthetic vitamin B₆ hydrochloride in nutritional deficiency in man, K. KARK, E. L. LOZNER, and A. P. MEIKLEJOHN (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 1, pp. 97-99).—Contrary to the curative effects of vitamin B₆, reported by Spies et al. (*E. S. R.*, 83, p. 281) for certain symptoms continuing in pellagra patients after treatment with nicotinic acid, riboflavin, and thiamin chloride and by Fouts et al. (*E. S. R.*, 80, p. 711) for microcytic anemia developing in puppies on a synthetic diet deficient in vitamin B₆,

observations are reported showing the ineffectiveness of synthetic vitamin B₃ hydrochloride in the treatment of six patients with clinical diagnoses of alcoholic pellagra (2), endemic pellagra (2), idiopathic hypochromic anemia, and nutritional macrocytic anemia. Four of the patients received ferrous sulfate, nicotinic acid, thiamin chloride, riboflavin, and ascorbic acid previous to and during vitamin B₃ therapy. In none of the cases was there any improvement either in hematological findings or subjective symptoms and objective signs following vitamin B₃ administration.

Toxicity of vitamin B₃, K. UNNA and W. ANTOPOL (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 1, pp. 116-118).—In experiments with rats, dogs, and monkeys synthetic vitamin B₃ was shown to have very low toxicity, resembling in this respect thiamin, riboflavin, and nicotinic acid. In rats, doses up to 1 gm. per kilogram were well tolerated and only excessively large doses, 3.1 gm. per kilogram for the free base and 3.7 gm. per kilogram for the hydrochloride, were lethal. Differences were small between the toxicity by subcutaneous and oral administration, showing that the vitamin is absorbed rapidly and completely from the intestinal tract. There was no cumulative effect on prolonged feeding of sublethal doses.

Nicotinic acid potency of food materials and certain chemical compounds, H. A. WAISMAN, O. MICKELSEN, J. M. MCKIBBIN, and C. A. ELVEHJEM. (*Wis. Expt. Sta. et al.*). (*Jour. Nutr.*, 19 (1940), No. 5, pp. 483-492, fig. 1).—The blacktongue-preventive method of Goldberger et al. and Sebrell et al. (*E. S. R.*, 74, p. 286) was followed with certain modifications, including supplying other vitamins of the B group in which the basal diet was deficient, in this study of the nicotinic acid potency of the various meats and meat products previously investigated for their content of thiamin (*E. S. R.*, 81, p. 741), riboflavin (*E. S. R.*, 82, p. 853), and the chick antidermatitis factor (*E. S. R.*, 82, p. 231). Mongrel dogs were kept on the basal diet until the first distinct drop in weight was observed, and were then given a single standardizing dose of 20 mg. of nicotinic acid and observed during the period of gain in weight and subsequent loss to about the original weight. The food to be analyzed was then fed at a level estimated to furnish approximately the same amount of nicotinic acid as the original standardizing dose. By comparing the gains on the standardizing dose and the food to be tested, the content of nicotinic acid per gram of food was calculated. It is noted that the same animals can be used more than once, but that to minimize errors each animal should be restandardized after two successive assays. Generally the food was tested on more than one dog or retested on the same dog.

As thus determined, the highest content of nicotinic acid was found in liver, the values ranging from 72 to 135 mg. per 100 gm. of dried tissue (8 samples). Kidney ranked with the lower values for liver, 3 samples ranging from 72 to 89 mg. per 100 gm. Heart, spleen, lung, and brain tissues were still lower, all values falling in the range of from 23 to 52 mg. per 100 gm. Muscle tissue of pork ham and loin, beef, and veal ranged from 15 mg. per 100 gm. of dry tissue for ham (boiled) and beef muscle to 70 and 72 mg. per 100 gm. for 2 samples of veal hindquarter. A third sample of veal hindquarter, however, gave a value of only 24 mg. per 100 gm.

A series of foodstuffs other than meat was tested by the same method. Among the values reported are skim milk powder from 4.3 to 6.2 mg. per 100 gm., bakers' yeast 50, brewers' yeast (6 samples) from 34 to 93, alcohol-soluble liver extract 450, liver extract powder 270, rice bran extract (commercial) 165, whey concentrate (commercial) less than 15, raw peanut meal 13, hard-boiled egg yolk less than 4 and white less than 2.5, wheat germ less than 4, and extracted wheat germ (commercial) less than 6 mg. per 100 gm.

A biological assay of riboflavin in the liver of the cow, calf, sheep, lamb, and hog. O. B. SAFFRY, H. S. COX, B. L. KUNERTH, and M. M. KRAMER. (Kans. State Col.). (*Jour. Nutr.*, 20 (1940), No. 2, pp. 169-174, figs. 2).—Livers of beef, calf, lamb, and pork were purchased in the early fall and again in the winter and of mutton in the winter at local retail markets supplied from Kansas City packing plants. Each of the samples represented from two to six animals. The edible portions of the raw livers were run twice through a meat chopper (fine blade) and stored in glass containers at a temperature below 0° C. until used for riboflavin determinations by the Bourquin-Sherman method. The livers were fed in 200-mg. portions twice a week and riboflavin for comparison at levels of 2 and 2.5 mg. daily. A control from each litter received no supplement. From 8 to 15 rats were used for each sample of liver tested.

The riboflavin values, as estimated from the growth records, were lamb liver 4,950 and 5,400 $\mu\text{g.}$ per 100 gm., mutton (winter sample) 4,350, calf 3,450 and 4,350, beef 2,850 and 3,450, and pork 2,700 and 2,700 $\mu\text{g.}$ per 100 gm. At the end of the experiment the positive controls and the test animals fed the livers with the higher riboflavin content were in excellent condition, with glossy fur and a normal appetite. Those fed pork liver were restless and in poor condition, with shaggy fur, and the negative controls were in extremely poor condition, with rough fur and poor muscular tone.

The bacterial assay of riboflavin in the urine and tissues of normal and depleted dogs and rats, H. F. FRASER, N. H. TOPPING, and H. ISBELL (*Pub. Health Rpts. [U. S.]*, 55 (1940), No. 7, pp. 280-289).—The nutritive status of normal and riboflavin-deficient dogs and rats was followed by the microbiological technic of Snell and Strong (*E. S. R.*, 82, p. 587), preliminary experiments having indicated that the method was sensitive to $\pm 0.01\gamma$ - 0.02γ of riboflavin and that it was possible to repeat assays on the same material within ± 10 percent. The experimental methods used are discussed in some detail as to selection of the animals (dogs and rats), diets and supplements served to these two groups and the assay value of these diets, method of assaying the tissues, and the clinical course of the animals.

Riboflavin assay values of dog and rat urines indicated that in some depleted animals there were substances in the urine inhibitory to the growth of *Lactobacillus casei*. Quantitative interpretation as to absolute quantities of riboflavin present were not justified, although the results permitted comparison of the relative excretion in the urine of normal and depleted animals. In the latter group there was a definite reduction in the urinary excretion of riboflavin, this effect being observed before the animals manifested significant symptoms of riboflavin deficiency. Various tissues assayed showed marked reduction of riboflavin in deficient animals as compared with the controls on stock diets or basal diets appropriately supplied with riboflavin. In dogs the variations within each group were so marked that these differences were not statistically significant; in rats, however, the differences were significant.

This bacterial method of Snell and Strong is considered a useful adjunct in determining the nutritional status of dogs and rats with respect to riboflavin.

Investigation of the vitamin C content of Florida fruits and vegetables.—I, Effects of maturation and of cold storage on the vitamin C potency of oranges and grapefruit, R. B. FRENCH and O. D. ABBOTT. (Fla. Expt. Sta.). (*Jour. Nutr.*, 19 (1940), No. 3, pp. 223-232, figs. 5).—For each phase of this study 4 doz. or more fruit were picked and taken to the laboratory for analysis within a day. The fruit was graded according to size and color and, with the exception of a few off-color fruit, a sample of 24 fruits was weighed and peeled with a glass knife, and the juice expressed through cheesecloth in a

porcelain-block press. Total acidity in the juice was determined with phenolphthalein as indicator and vitamin C by indophenol titration.

For the maturity tests the fruits used came from individual trees of three varieties—Parson Brown (early ripening), Pineapple (midseason), and Valencia (late ripening)—and were picked at intervals of 2 weeks from the green to mature stage. The advance of maturity was accompanied by a decrease of acidity in all of the oranges tested, the rate being about the same for Parson Brown and Pineapple, and a little greater for Valencia, and continued without apparent change in rate as long as the oranges remained on the trees. The content of vitamin C remained surprisingly constant during the 6-mo. period, any tendency to change being masked by individual variations. Unripe green oranges taken from different parts of the tree—top, bottom, inside, and outside branches—showed little variation in acid and vitamin C content, but after crop yellowing the fruit of the Parson Brown and Pineapple varieties that did not color gave juice of inferior quality and usually lower vitamin C content. The variability in vitamin C concentration among oranges of the same variety from different sources was much greater than among like-appearing oranges from the same tree. Oranges from different trees but in the same grove, tested by Beacham and Bonner (*E. S. R.*, 78, p. 728), had a comparable vitamin C content. The juice of samples of green very young Valencia weighing less than 10 gm. apiece gave an average vitamin C content of 347 mg. per 100 gm. for the outer rind and 335 mg. per 100 gm. for the inner portion, the high values indicating almost as great a total quantity of vitamin C as in the small mature fruit. With this exception, no association could be detected between the concentration of vitamin C and the weight, amount of peel, or volume of juice in the oranges tested.

Oranges of the Pineapple variety grown in the north, central, and east coast sections of the State, Valencias grown in the north and central sections, and Florida seedling grapefruit grown in the central and east coast sections showed no sectional differences, a conclusion supported by the data of Beacham and Bonner.

Pineapple oranges from six different sources and Florida seedling grapefruit from four different sources were put in storage at 42° F., and samples tested at frequent intervals for 5 mo. Seven of the ten samples showed variable increases in vitamin C content after storage for 1 mo., the average extent of the increase amounting to 26 percent. The other 3 samples showed decreases amounting to 20 percent, but it was found later that these samples had been processed before being shipped. There was some correlation evident between acidity and vitamin C content. In the 6 samples of Pineapple oranges studied throughout the whole storage period, 4 showed slightly higher acidity values accompanying considerably higher vitamin C values and 2 showed no such correlation. With the grapefruit, an association between the two was found in only one instance. The causes of increases noted was investigated but without positive conclusions. Hydrolysis of the juice of fresh fruit in 10 percent CO₂ produced no change in titration value to suggest an ester combination, nor could the presence of reversibly oxidized ascorbic acid be determined by the method of McHenry and Graham (*E. S. R.*, 75, p. 572).

The ascorbic acid (vitamin C) content of six varieties of cantaloupes, M. A. MOSELEY, JR., and G. H. SATTERFIELD. (*Univ. N. C.*). (*Jour. Home Econ.*, 32 (1940), No. 2, pp. 104-107).—From 13 to 20 cantaloups of each of 6 varieties, purchased in the ripe and very ripe state on the Raleigh, N. C., market soon after removal from the vines, were analyzed for ascorbic acid by the same methods as in the earlier study of watermelons (*E. S. R.*, 84, p. 283), using

15-gm. samples obtained from the edible portion by cutting from stem to bloom end. The varieties, with their average ascorbic acid content for all samples, were Rocky Ford 31.23 mg. per 100 gm., Perfecto 30.56, Baltimore 28.14, Wood Perfection 28.92, Hale Best 25.47, and Banana 20.91 mg. per 100 gm. For all varieties the ascorbic acid content was higher in the ripe than in the very ripe samples, but the differences were not uniform. The average values for all varieties were 29.54 mg. per 100 gm. for ripe and 20.66 mg. for very ripe samples. Large variations in ascorbic acid content occurred with the same variety, but there appeared to be no relationship between size of the cantaloup and its content of ascorbic acid. Good flavor was generally associated with high vitamin C content.

Storage of frozen vegetables: Vitamin C requirements [Vitamin C in vegetables, XI], R. R. JENKINS, D. K. TRESSLER, J. MOYER, and J. MCINTOSH. (N. Y. State Expt. Sta.). (*Refrig. Engin.*, 39 (1940), No. 6, pp. 381, 382, figs. 5).—In continuation of the series (E. S. R., 83, p. 135; 84, p. 135), the vitamin C contents of frozen vegetables stored at -40° , -29° , -18° , -12° , and -9° C. were determined from time to time during the storage period of from 6 to 10 mo. The vegetables stored were commercial packs of frozen asparagus, cauliflower, brussels sprouts, yellow wax beans, and Kentucky Wonder beans. All frozen samples were weighed at -18° and placed in cold acid before removal to the laboratory, where vitamin C was determined by the Bessey and King titration method as modified by Mack and Tressler (E. S. R., 78, p. 154). The results, presented graphically, indicate that a definite loss in vitamin C occurred in the frozen asparagus and brussels sprouts held at -18° for 6 mo. and that no appreciable loss of the vitamin occurred in the beans. This latter finding is noted as contrary to earlier results with Refugee green beans, which showed marked loss of vitamin C when stored for 6 mo. under similar conditions.

Influence of catharsis and diarrhea on gastrointestinal absorption of ascorbic acid in infants, A. F. ABT, C. J. FARMER, and Y. J. TOPPER (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 1, pp. 24-26).—Blood plasma, urinary, and fecal ascorbic acid values are reported for a normal 10-month-old infant on a mixed diet containing approximately 50 mg. ascorbic acid daily and supplemented with 300 mg. of ascorbic acid daily for 3-5 days in three series of tests with an interval of 5 days between the first two and 2 days between the second and third series. In a fourth period catharsis was induced by the administration of 4 gm. of $MgSO_4$ dissolved in water.

During the first three periods the range in plasma ascorbic acid was between 0.67 and 2.37 mg. per 100 cc., the highest value occurring on the date of the eleventh administration of supplementary ascorbic acid. On this date the urinary excretion rose from 61.26 mg. for the preceding day to 247.76 mg. and the fecal excretion amounted to only 3.92 mg. On the day following the catharsis, plasma, urinary, and fecal ascorbic acid values were 1.33 and 70 mg. per 100 cc., and 22.27 mg., respectively. A similar effect of diarrhea in increasing markedly the ascorbic acid content of the feces was evident in values obtained on a number of infants suffering from acute nonspecific diarrhea. One case is reported in which the administration of 200 mg. of ascorbic acid daily for 3 days was followed by little change in the ascorbic acid content of the blood plasma and excretion in the urine, but an increase in the feces value from 1.64 mg. on the first day of ascorbic acid administration to 52.4 mg. on the third.

"The increased fecal excretion of orally administered ascorbic acid during acute diarrhea in the infant points to its failure of absorption in the intestinal tract, and explains the low blood plasma values and low urinary excretion."

Food preferences of rachitic and normal rats, P. T. YOUNG and J. R. WITTENBORN. (Univ. Ill.). (*Jour. Compar. Psychol.*, 30 (1940), No. 2, pp. 261-276, pl. 1).—Rats maintained on rachitic and normal diets, respectively, were offered, by a preference technic described, a choice between cottonseed oil and this oil combined with viosterol as a source of vitamin D; in other tests they were offered a choice between ground whole wheat and sugar. In the former test neither rachitic nor normal rats showed a preference for the oil containing the vitamin, even though some of the animals apparently had the sensory capacity to discriminate between the oils being tested. An attempt to train rats to select vitamin D, by leaving the vitamin-containing oil in the cage for 4 days, was unsuccessful as judged by the response to the two oils then offered in the preference apparatus. No generalizations are drawn from these results, since it is considered possible that rachitic rats might have shown a demand for the vitamin D had it been combined with some food other than fat. Fat was not much liked by the rachitic animals, and these, as judged by their running activity, had a lower demand than normal animals for fat. Rachitic rats were found very similar to normal animals in their increasingly frequent preference of sugar to wheat.

Treatment of rickets and tetany by parenteral administration of one massive dose of vitamin D, H. VOLLMER (*Jour. Ped.*, 16 (1940), No. 4, pp. 419-432, figs. 9).—Theoretical considerations are presented in support of the view previously expressed (E. S. R., 81, p. 745) that a single dose of 600,000 units of vitamin D is harmless. The correctness of this view is considered to have been demonstrated practically in that no toxic manifestations occurred upon administration of this dosage to 158 children.

Parenteral administration of this massive dose as shock therapy is recommended for rickets and tetany. Absorption of parenteral vitamin D depots can be accelerated by using a mixture of oil and ether (0.6 cc. of peanut oil and 0.4 cc. of ether) instead of oil alone as solvent. A number of case histories are noted briefly, and curves for blood calcium and phosphorus and roentgenograms are presented to demonstrate the efficacy of this treatment. The curves show that serum calcium and phosphorus become normal usually after 3-7 days, while roentgenographic evidence of calcification shows within 1 week, and recalcification is usually complete 30 days after the beginning of treatment. Tetanic convulsions cease within 24 hr. after the parenteral administration of the one massive dose of vitamin D.

Comparative activity of vitamin H curative of egg-white injury administered orally and parenterally to rats, P. GYÖRGY and C. S. ROSE (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 1, pp. 73, 74).—Quantitative data secured from experiments in which various preparations from yeast and liver of the factor curative of egg-white injury were administered simultaneously to two matched groups of rats, one orally and the other parenterally, showed that the factor is from 3 to 5 times as effective by parenteral as by oral administration.

Oral and parenteral toxicity of vitamin K₁, phthiocol, and 2 methyl 1, 4, naphthoquinone, H. MOLITOR and H. J. ROBINSON (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 1, pp. 125-128).—In the studies on acute toxicity the dosages were suspended in peanut or sesame oil and administered orally or intraperitoneally (using 0.25 cc. of oil per 20 gm. animal body weight) to white mice and to chicks. The oral lethal dose 50 in mice was found to be approximately 0.2 gm. per kilogram for phthiocol and 0.5 gm. per kilogram for 2-methyl-1,4-naphthoquinone; no lethal effect could be produced by doses up to 25 gm. per kilogram of vitamin K₁. In the intraperitoneal injection of vitamin K₁, much of the oily suspension was still present after 10 days, indicating an extremely slow rate of absorption of vitamin K₁.

In the experiments on chronic toxicity conducted on rats, daily feeding of 0.35 gm. per kilogram of phthiocol or 0.5 gm. per kilogram of 2-methyl-1,4-naphthoquinone was found to cause the death of most of the animals on various days over a 30-day feeding period. Doses of 0.1 gm. per kilogram of phthiocol and 0.35 gm. per kilogram of 2-methyl-1,4-naphthoquinone produced a marked fall in erythrocyte count and hemoglobin. No such effects were observed following vitamin K₁ administration.

Prothrombin levels and synthetic vitamin K in obstructive jaundice of rats, J. E. FLYNN and E. D. WARNER (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 1, pp. 190-194).—Using the method of Greaves (*E. S. R.*, 81, p. 746), young adult rats or rats selected at weaning were placed on a diet low in vitamin K, and after 7-8 weeks when the vitamin K reserves had been depleted the common bile duct was ligated. Under these conditions the prothrombin level dropped within 72 hr. to a level typically 10-25 percent of normal. At this stage the animals were given doses of phthiocol or 2-methyl-1,4-naphthoquinone administered in isotonic phosphate buffer solution by intravenous or intraperitoneal injection. Phthiocol in two daily doses of 1 mg. each brought the prothrombin level first from 16 to 47 percent and then to 91 percent; daily doses of 0.5 mg. did not always produce a rise in the prothrombin level, indicating that this dosage may represent approximately the daily maintenance requirement.

A single 20 γ -dose of 2-methyl-1,4-naphthoquinone caused a rise in the prothrombin level to 81 percent of normal within 24 hr.; this level fell to 20 percent of normal within 3 days. A larger dosage on 2 consecutive days permitted the increased prothrombin level to be maintained for several days. These results indicate that the depleted animal can build up normal stores only when the vitamin is assimilated in larger amounts, or perhaps in smaller amounts over a long period of time. This observation has a clinical counterpart, in that cases of biliary tract disease must be given repeated doses of vitamin K₁ before and after operation in order to maintain the increased prothrombin level.

Micro-prothrombin test with capillary whole blood: A modification of Quick's quantitative method, K. KATO (*Amer. Jour. Clin. Pathol.*, 10 (1940), No. 2, pp. 147-153, figs. 2).—The test described uses small quantities of oxalated whole capillary blood instead of larger amounts of venous plasma, and measures the concentration of prothrombin in the oxalated blood in terms of its coagulation time upon recalcification in the presence of excess thromboplastin. Specifically, 0.20 cc. of capillary blood obtained by deep puncture is introduced into the hollow of a hanging-drop slide and mixed with an oxalate mixture previously deposited there by evaporation of 20 mm.³ of a 2 percent double oxalate solution (0.75 gm. K₂C₂O₄ and 1.25 gm. (NH₄)₂C₂O₄ per 100 cc.). The slide is placed in a moist chamber until the test is performed, which should be as soon as possible after withdrawal of the blood from the host, since prothrombin undergoes relatively rapid deterioration. For the test, 10 mm.³ each of a freshly made thromboplastin suspension (0.2 gm. dried, acetone-extracted rabbit brain in 5 cc. of π saline) and 0.025 M CaCl₂ solution are measured out into combination microhemopipettes and introduced into the well of a clean slide or spot plate. To this mixture 10 mm.³ of the oxalated blood are quickly added simultaneously with the clicking of a stop watch and agitated for 5 or 6 sec. with a fine glass rod. The formation of a gelatinous clot is the end point of the reaction and can be noted with the stop watch. Dilution curves obtained by plotting the coagulation times against the percentages of dilution show close agreement between capillary whole blood and venous plasma curves, the latter showing slightly lower coagulation times because of the relatively higher prothrombin content of cell-free plasma per unit volume.

The prothrombin in the blood of newborn mature and immature infants as determined by the micro prothrombin test, K. KATO and H. G. PONCHER (*Jour. Amer. Med. Assoc.*, 114 (1940), No. 9, pp. 749-753, figs. 6).—Using the microprothrombin test developed by Kato as noted above, the prothrombin time of the blood was determined in 100 mature and 73 immature infants during the neonatal period extending over 4 weeks of postnatal life. The prothrombin times, as determined at different periods and representing 894 tests in the former group and 701 in the latter, are presented by scattergrams; curves showing the averages for mature, immature, and all infants are given, the normal adult time (20 sec.) being indicated as a base line. For the mature infants the average prothrombin time on the first day of life was found to be 43.2 sec.; there was a gradual shortening as the infants grew older, and by the tenth day of life the average time was 25 sec. For the immature infants the average time on the first day was 46.5 sec.; on subsequent days there was much greater fluctuation than was the case with mature babies. Some of the immature infants even evidenced an increase in prothrombin time after birth. In one case this was associated with strangulated hernia. No correlation was found to exist between the degree of the infant's maturity and the prothrombin clotting time of the blood, at least on the day of birth.

Factors influencing plasma prothrombin in the newborn infant.—II, Antepartum and neonatal ingestion of vitamin K concentrate, L. B. SHETLES, E. DELFS, and L. M. HELLMAN (*Bul. Johns Hopkins Hosp.*, 65 (1939), No. 5, pp. 419-426, figs. 2).—A control study of mothers and infants receiving no vitamin K concentrate considerably augmented the one reported earlier (E. S. R., 83, p. 424) and showed average plasma prothrombin levels of 131.4 and 28.6 dilution units in 31 mothers and 32 full-term infants, respectively. In 15 mothers and 17 premature infants the averages were 142.2 and 10.9 units, respectively.

Five mothers who received daily 4,500 units of vitamin K by mouth for varying lengths of time (14-35 days) during the last month of pregnancy averaged 214.3 units at delivery as compared with 130.9 units prior to treatment. The prothrombin levels of the 5 infants averaged 89.3 units. In 9 mothers receiving orally 9,000 units of vitamin K concentrate less than 24 hr. prior to delivery the prothrombin level averaged 233.7 units. In the 9 infants the average was 78.7 units. One twin in each of 4 sets of double ovum twins received 1,000 units of vitamin K daily for a varying number of days after birth, while the other twin remained untreated. All infants receiving vitamin K showed a steady rise in plasma prothrombin, the levels tending to remain high even after cessation of therapy. The levels of the untreated twins remained fairly constant.

Plasma prothrombin curves for 14 normal untreated infants indicated that the prothrombin level of the newborn infant rises extremely slowly during early life. Curves for 13 infants receiving 1,000 units of vitamin K concentrate during the first 4 days of life indicated a rapid rise in plasma prothrombin during treatment, the high levels produced being maintained fairly well after cessation of therapy.

The treatment of hypoprothrombinemia with synthetic vitamin K: Report of two cases, H. A. FRANK, A. HURWITZ, and A. M. SELIGMAN (*New England Jour. Med.*, 221 (1939), No. 25, pp. 975-977, figs. 2).—The compound 2-methyl-3-phytyl-1,4-naphthoquinone synthesized by Fieser and previously established as vitamin K (E. S. R., 83, pp. 586, 587) was tested in clinical cases of obstructive jaundice. The synthetic vitamin (supplied by Fieser) was prepared for intravenous use by dissolving 10 mg. of the oil in 2 or 3 cc. of absolute ethanol and slowly introducing this solution by means of a pipette into 1,000 cc. of 10 per-

cent glucose in distilled water. Sterilization was effected by autoclaving the mixture or by boiling the component solutions separately. No ill effects having been observed upon administration of the compound in preliminary tests with animals, three normal human subjects were given intravenously 1,000 cc. of the freshly prepared colloidal suspension containing 10 mg. of the vitamin. No untoward reaction was noted in these cases, and there was no significant change in the prothrombin level or in the clotting and bleeding times. The vitamin was administered then to two individuals with obstructive jaundice and having elevated prothrombin times. Oral administration with bile or intravenous injection of the vitamin in 10-mg. doses in these cases produced a distinct drop in clotting time, the drop being optimal in 24 hr. for doses administered orally. Intravenous injection, however, produced a fall to normal levels within 4 hr., the level staying within normal limits for several days in spite of operation within this time.

TEXTILES AND CLOTHING

Textile fiber atlas, I-VII, W. VON BERGEN and W. KRAUSS (*Rayon Textile Mo.*, 21 (1940), Nos. 1, pp. 57-60, pls. 2; 2, pp. 47-50, pls. 2; 3, pp. 53-57, pls. 2; 5, pp. 53-57, pls. 2; 6, pp. 49-53, pls. 2; 7, pp. 49-52, pls. 2; 8, pp. 49-52, pls. 2).—This series of articles, with bibliographic annotations, presents information as to the source of the various textile fibers and detailed descriptions of their microscopic structures. The descriptions are supplemented with photomicrographs of longitudinal views and cross sections of the fibers.

I. *Wool*.—A classification according to fineness, an approximate comparison of wool grades used in the United States, and a characterization of natural colored, raw, lamb's, shorn, and pulled wool are included in this section.

II. *Speciality hair fibers*.—Mohair and cashmere, camel, alpaca, llama, vicuna, and guanaco hair fibers are considered. A grade classification of mohair and fineness analyses (frequency distribution according to degree of fineness) of samples of commercial cashmere, camel, and llama hairs are given.

III. *Fur fibers*.—Angora rabbit, rabbit, hare, muskrat, beaver, raccoon, squirrel, and fox fur hairs are described, and the results of fineness analyses of a large number (100-1,000) of fibers of each are tabulated.

IV. *Minor hair fibers*.—Hog bristles and horse, human, goat, and cow hairs are considered, with certain indications as to their uses and with the tabulation of their diameter measurements.

V. *Silks*.—Cultivated and wild (tussah and Kuriwata) silks, both raw and degummed, are described, and cross sectional and width measurements are tabulated.

VI. *Cotton and minor seed hairs*.—The vegetable hairs, cotton (raw and mercerized), kapok, and pulu are considered, with tests for fiber maturity in cotton and with quoted data on width and cross sectional measurements of different types of cotton.

VII. *Bast fibers*.—Bast fibers of dicotyledonous plants, flax, hemp, jute, and ramie, are described. Width and cross sectional measurements and certain differential tests are given.

The relationship between price and certain properties of percale, D. SAVILLE (*Okla. Agr. Col., Household Arts Dept., Res. Pub. 1* (1940), pp. [1]+35. regular prices were 25, 19, 15, and 10 ct., although three groups were bought at two cities and one town in Oklahoma and from two mail-order houses. The regular prices were 25, 19, 15, and 10 ct., although three groups were bought at sale prices of 8, 13½, and 19 ct. Sampling for tests was made in accordance with the procedures prescribed by the American Society for Testing Materials.

Percales with the greater number of yarns per inch had the greater weight per square yard, a higher breaking strength in both directions, and greater elongation in the filling direction. The filling yarn was finer and more highly twisted than the warp, although there was little variation in size and twist in either of these yarns. In number of yarns per inch, an 80-square percale was found to have as a finished fabric not 80 yarns warpwise and fillingwise but more than 80 yarns in the warp and less than 80 in the filling. The total yarn per square inch was near 160, however.

All of the percales withstood the test for ordinary laundry and domestic washing, and 24 were fast to washing with a bleach. As to fastness to light, however, only 11 pieces faded no more than the tentative standard dyeing of the American Association of Textile Chemists and Colorists after 40 hr. of exposure to the Fade-Ometer (equivalent to about 53 hr. of direct midday June sun), and only 1 piece was satisfactory after 80 hr. of exposure (106 hr. of June sun). Since the same color faded more readily in some pieces than in others, it appeared that the kind of dye used and not the hue was the important factor in color permanency. The amount of sizing in the percales varied from about 1 to 18 percent. On the whole, the lower priced percales had a much greater amount of sizing, although wide differences were found within a price group. By the test used the percentage of shrinkage in the warp ranged from 2.78 to 5.55 percent or about 1-2 in. per yard, and in the filling from 0.00 to 5.21 percent, or 0.00-1.88 in. per yard. Only 1 percale met all the requirements set up in the Federal specifications. Two others were satisfactory in every requirement except fastness of color to light.

Little information could be obtained at the time of purchase except as to number of yarns per inch and fastness of color to washing. Statements as to the yarn count sometimes underestimated and sometimes overestimated that found in the actual tests, and guaranties as to fastness of color to washing were not qualified or explained. The number of yarns per inch, breaking strength, weight per square yard, and sizing were found to be related to price, but there appeared to be no relationship between price and shrinkage, thickness, and fastness of color. The 25- and 19-ct. percales were similar in all features analyzed and the 15- and 10-ct. grades were alike; the wide differences came between the 15- and 19-ct. fabrics. Sale price percales compared favorably with others bought at the same price, but a percale at sale price might be a good buy, whereas at regular price it would not have been. From this study in general it is concluded that the consumer may expect to find a wide range in grade of percale at the same price and to receive little sale information that will help her to make a wise selection.

Recent developments in rayon and some of the newer manufactured textile fibers, F. BONNET (*Rayon Textile Mo.*, 21 (1940), Nos. 2, pp. 42, 43, 70, figs. 2; 3, pp. 41, 42).—Rayon, a cellulosic product, is characterized today by fine multifilament yarns of high tensile strength in contrast to the earlier rayon with its coarse fibers and low strength. The increase in strength has been accomplished by stretching the filaments during their plastic formation and fixation. This process is capable of varying the tenacity and extensibility of the resulting yarns over a wide range, thus permitting the production of yarns of different characteristics for different purposes. It is pointed out that certain modern high strength yarns are even being employed for heavy duty tire fabrics such as are used in buses and trucks. Commercial acetate yarns are not as strong as the viscose type of yarns, although by special "stretch" spinning processes (not yet in operation in the commercial stage) yarns of much greater strength and finer filament size have been produced. Certain specialty yarns such as "T and T"

(thick and thin) and abraded rayon yarn are now in demand. The former, with irregularly spaced thick and thin places, is obtained by transmitting a pulsating effect to the spinning solution or the filaments as they leave the spinnerette; the latter is obtained by deliberately abrading the outer filaments of a good continuous filament yarn so as to produce a "woolly" effect. Much of such abraded yarn is made of acetate rayon. Within recent years rayon staple has developed rapidly; the fiber is the same as in continuous filament yarn which has been cut to suitable lengths to be handled on cotton, woolen, and worsted machinery. This rayon staple is gradually entering the field of spun rayon yarns, giving additional strength and interesting effects, especially as blended with natural fibers such as cotton, linen, wool, etc.

Casein staple fiber with wool-like properties is prepared from washed fat-free curds of milk by dissolving them in caustic and spinning through regular spinnerettes and into an acid bath. The filaments, hardened by a treatment with formaldehyde, are washed and cut to the desired staple length. Casein staple fibers have been produced commercially in England, Italy (as "Lanital," "Cisalfa"), and German, but they leave much to be desired. Protein staple fibers from soybean and corn proteins have been produced experimentally.

Aside from cellulose and casein fibers, purely synthetic fibers such as Nylon and more recently Vinyon have been produced. Vinyon, of high tensile strength and true elasticity, is resistant to mineral acids and alkalies and is unaffected by alcohols, glycols, and aliphatic hydrocarbons; it is affected by ketones, halogenated hydrocarbons, ethers, and certain amines. Fiber glass, an inorganic material, has certain potential uses, primarily in industry; the use is limited by the fact that the fibers are brittle, have an elongation at break of only about 1-2 percent, and lose strength when fixed or abraded.

Some new textile fibers, F. BONNET (*Rayon Textile Mo.*, 21 (1940), No. 6, pp. 53, 54, fig. 1).—Essentially noted above.

"Vinyon"—the new textile fiber and yarn (*Rayon Textile Mo.*, 21 (1940), No. 2, pp. 34, 35, figs. 2).—Vinyon, a synthetic fiber, is made from vinylite resin, which, chemically, is a copolymer of vinyl chloride and vinyl acetate, compounds derived from natural gas (or coal), salt, water, and air. In the production of vinyon fibers and yarns the vinylite resin in the form of a fine white powder is dissolved in acetone, the process being carried out at 50° C. The clear sirupy solution, known as "Vinyon dope," is converted at controlled temperatures and pressures into textile filaments at the spinning machine. After spinning, the yarns are stretched, this being a very special operation at elevated and strictly controlled temperatures (150° F. or higher), to increase tensile strength and reduce extensibility. Following this, the yarns are oiled, twisted, and redrawn on cones and spools.

Progress in the dyeing of Vinyon yarn and fabric has progressed and reds, blues, and browns have been dyed. The new textile is in use in industrial fabrics such as filter cloth and pressed felts, and an experimental program is being followed in the establishment of further uses. Bathing suits, glass curtains, upholstery, electrical insulation, chemical-resistant clothing, shower curtains, and fusible shape-retaining fabrics are some of the possibilities. "Laboratory work toward development of a Vinyon yarn for full-fashioned hosiery is now proceeding."

Finishing treatments applied to cotton hose, M. S. FURRY and L. E. WEIDENHAMMER. (U. S. D. A. et al.). (*Amer. Dyestuff Rptr.*, 29 (1940), Nos. 8, pp. 203-205; 9, pp. 229-234, figs. 3).—Full-fashioned cotton hose, some bought on the open market and others knit to specification from high-quality commercially combed yarns of regular twist, were subjected by methods noted to 10 different finishing treatments of 4 general types. Finish 1 was a chemical

compound reacting chemically with cellulose; finishes 2, 3, 4, and 5 were of the class of water-repelling agents that deposit waxy materials on the fibers, being emulsions of wax and either aluminum acetate or formate; finishes, 6, 7, and 8 were insoluble soaps of chromium, aluminum, and cadmium; and finishes 9 and 10 were synthetic resins, urea-formaldehyde and acrylic, respectively, of a type commonly used to make fibers crease-resistant. To determine the effectiveness of these finishing treatments in improving the properties of cotton hose, a study was made of the elastic properties, the weight per unit area, and the bursting strength of untreated and treated hose before and after laundering 1, 5, and 10 times. Elastic properties were measured by the stretch load required to stretch the top circumference from 19.2 to 20.2 in., by the maximum load to stretch the circumference to 21.3 in., and by the recovery load at a circumference at 19.2 in. after the stocking recovers from maximum distention. The testing procedures are described, and the hosiery testing machine which was used to subject the stockings to 200 cycles of distention in the test for elasticity is illustrated.

The tabulated data, analyzed statistically in order to evaluate the differences in properties between hose treated with various finishes, indicate that in hose treated with finish 1, even after repeated launderings, the stretch load, maximum load, and stretch recovery ratio are consistently smaller and the recovery load greater than in unfinished hose. In other words, the treated hose stretch more easily and fit more snugly than similar untreated hose. The wax emulsions are similar to each other in their effect on elastic properties, causing the hose to stretch easily and fit snugly, and finish 2 in addition increasing the bursting strength; however, the effectiveness of these finishes is practically gone after five launderings. In hose treated with the three insoluble soaps the effects on elastic properties were rather difficult to interpret, but the chrome alum soap was the only one that did not wash out completely, the bursting strength of hose treated with the cadmium soap was significantly less after 10 launderings than that of the untreated hose similarly laundered, and the other two soaps did not cause much loss of strength on laundering. The two synthetic resins behaved very differently; the urea-formaldehyde resin increased the elasticity of the treated hose but made them very much weaker, while the methyl acrylate resin had no appreciable effect on the properties of the hose studied.

Water repellency of cotton hose, M. S. FURRY and L. E. WEIDENHAMMER. (U. S. D. A.). (*Rayon Textile, Mo.*, 21 (1940), Nos. 6, pp. 72, 73; 7, pp. 73, 74, figs. 2).—Hose treated with water-repellent finishes and used in the above study of elastic properties were tested in the present experiments, in which results were obtained for both treated and untreated hose that were laundered 1, 5, and 10 times. All samples were conditioned overnight and tested by two methods, an immersion test and a spot test. The former, a method for measuring resistance to absorption and devised by the authors especially for the testing of cotton hose, was based on the principle of rotation during immersion. In this test a 2-in. band from the ankle section of the hose was fitted snugly but without stretching on a smooth metal cylinder, the whole then being immersed in a beaker of water and rotated at 100 r. p. m. for 15 sec. The test piece was quickly removed and placed between two sheets of blotting paper over which a 1-kg. roller was then drawn. The sample was weighed before and after immersion, and the percentage of water absorbed was calculated from these weights. The spot test, especially suitable for testing the water repellency of hosiery, consisted in measuring by stop watch the time in seconds required for the absorption of 0.1 cc. of water placed on the hose drawn taut, but not stretched, over the open top of a beaker. Absorption was considered

complete when the little water films visible in the meshes of the hose broke and disappeared. For the most part the results obtained by the spot test bore out the conclusions indicated by the immersion test.

The results by this latter test, reported with notations as to the significance (as determined statistically) of differences between the unfinished and the finished hose, indicated that the finish furnished by the compound octadecyl-oxyethylpyridinium chloride, which reacted chemically with the cellulose, was the most highly water repellent of the finishes investigated. It did not wash out even after 10 launderings. Of the four wax emulsion finishes, only two were water repellent. One of these washed out, but the other was still effective after 5 launderings. Hose treated with the insoluble soaps were water repellent to some extent, and the chrome alum soap did not wash out completely. The methyl acrylate resin had little or no effect on the water repellency of cotton hose, but the urea-formaldehyde resin was effective, although it did not withstand repeated washings nor was it as water repellent as the compound which reacted with the cellulose.

HOME MANAGEMENT AND EQUIPMENT

Consumer expenditures in the United States: Estimates for 1935-36, H. KNEELAND ET AL. (*Washington: Govt., 1939, pp. IX+195, [figs. 23]*).—This report forms the second part of a larger study of consumption demands in relation to productive resources. The first report³ from this study showed the amount of consumer income and how the total income was divided among the various groups of the population in 1935-36. The present report, showing how incomes were used, is based primarily on data obtained in the Study of Consumer Purchases, a nation-wide W. P. A. project conducted by the U. S. D. A. Bureau of Home Economics and the U. S. Bureau of Labor Statistics, with the cooperation of the National Resources Committee and the Central Statistical Board.

Detailed information on expenditures and savings during a 12-mo. period in 1935-36 was secured from a sample of more than 60,000 families living in cities and villages and on farms in 30 different States. These data, classified by income level according to occupation, color group, family composition, type of community, and region, served as the basis for average patterns of consumer spending for 99 major groups of families. Similar patterns from data for a smaller sample were built up for single men and single women. The spending patterns of all consumers are summarized to show how much was spent for food, clothing, housing, and other major classes of consumer goods and services; how much was spent for gifts and for certain personal taxes; and how much was saved. Consideration is also given to national consumption in 1935-36, with particular reference to the American consumer market, the savings of American consumers, income transfers through gifts and personal taxes, the consumption of institutional residents, and consumer services supplied by public and private agencies. Comparisons with other consumption studies are made. The appendixes give statistical tables for reference use, state the sources and methods used in the study, and indicate the effect of size and distribution of income on national consumption.

Performance of electric roasters, F. MADDEN and L. J. PEET (*Iowa Sta. Res. Bul. 282 (1940), pp. 69-107, figs. 15*).—Six electric roasters, the characteristics of which are noted, were checked for empty performance, using standard electric oven tests, and for operating performance by a series of cooking tests.

³ Consumer incomes in the United States: Their distribution in 1935-36, H. Kneeland et al. (*Washington: Govt., 1938, pp. VII+104, [figs. 19]*).

Power input was controlled, and interior temperatures were indicated by thermocouples and by a "thermosheet," connected to an indicating potentiometer. Methods used and data obtained in the various tests are given in some detail.

When the capacity of the various roasters was the same, their performance in preheating to various temperatures was similar in regard to time and kilowatt-hour consumption. Maximum temperatures reached for each thermostat setting were slightly lower with the thermosheet than with the thermocouple. Measurements of electric energy necessary to maintain certain interior temperatures showed that the roasters gained and lost heat at approximately the same rate after steady temperatures had been reached. In several cases less energy was required to maintain a roaster at a given temperature than to preheat it to that temperature. The thermostats were not highly accurate. Temperature changes indicated that roasters of equal capacity and power rating required approximately the same time to reach 500° F. and cooled at very nearly the same rate. Relative evenness of temperature was observed in measurements taken at either end and at the midpoint of each roaster. Surface temperatures, highest when the interior was the hottest, gave evidence of considerable heat loss through rim and lid. Determinations of temperature drop upon raising the lid were made under several conditions. Enamelware pans were found to absorb heat most rapidly, aluminum least rapidly, and glass and china utensils were intermediate. Aluminum pans did not retain the heat as well as those of other materials. To test the roaster for evenness of heat distribution for baking, foods of small mass (cookies, tarts, biscuits), medium mass (layer or angel cake), and large mass (cherry pies) were used. These could be baked satisfactorily in all roasters tested, but not always at the temperatures recommended by the manufacturer. Results indicated that the roaster may be used for baking operations without excessive kilowatt-hour consumption.

Training children for self-reliance. L. H. STOTT (*Nebraska Sta. Cir. 66* (1940), pp. 11, figs. 2).—This circular discusses in a nontechnical manner the implications of the findings in the investigation of personality development in children noted from the more technical reports (E. S. R., 82, p. 857). The complex nature of self-reliance is explained, and practical illustrations are given of the more important types of self-reliance, with suggestions to parents and teachers for ways of helping children to achieve a satisfactory measure of each type. Two factors considered of special importance are an atmosphere of geniality, confidence, and affection in the home and opportunity and encouragement for actual participation by the children in group discussions and activities in the home.

MISCELLANEOUS

Annual Report [of New Haven Station] for the year ending October 31, 1939. W. L. SLATE (*Connecticut [New Haven] Sta. Bul. 438* (1940), pp. 487-551).—The experimental work not previously referred to is for the most part noted elsewhere in this issue. A tribute to the late W. E. Britton (E. S. R., 80, p. 573) is included.

Science for the farmer: Fifty-third Annual Report of the Pennsylvania Agricultural Experiment Station, [1940], [S. W. FLETCHER] (*Pennsylvania Sta. Bul. 399* (1940), pp. [4]+76, figs. 17).—The experimental work not previously referred to is for the most part noted elsewhere in this issue. A climatological summary for State College, Pa., for 1939 by C. O. Cromer and C. A. Kern is also included (pp. 73, 74).

Report of Puerto Rico Experiment Station, 1937 [trans. title], [A. LEE] (*Puerto Rico Sta. Rpt. 1937, Span. ed., pp. [2]+128, figs. 28*).—A Spanish edition of this report (E. S. R., 80, p. 572).

NOTES

Arkansas University and Station.—Dr. E. L. Nielsen, assistant professor of agronomy and assistant agronomist, resigned January 31 and was succeeded on March 1 by M. Alan Sprague as instructor in agronomy and assistant agronomist.

Colorado College and Station.—Dr. C. P. Gillette, since 1932 emeritus professor of entomology and zoology and emeritus director of the station, died January 4 at the age of 82 years. He was a native of Michigan, graduating from the Michigan College in 1886 and receiving the M. S. degree in 1887 and the honorary D. Sc. degree in 1916, and served there as assistant zoologist from 1886 to 1888. Dr. Gillette came to Colorado in 1891 after 3 years' service as entomologist in the Iowa Station. He organized the new department of zoology, entomology, and physiology, and became the first Colorado State entomologist in 1907 and director of the station in 1910. A recent tribute in *Science* notes in part that he "was known best for his work in entomology, although he maintained a deep interest in genetics and eugenics and taught classes in these subjects until his retirement. He was an entomologist of the old school, doing work in many parts of the field. Probably few men were better posted on the western economic insect problems."

Ramey C. Whitney, associate professor of economics, resigned February 28 to become associate agricultural economist with the U. S. D. A. Bureau of Agricultural Economics, with headquarters at Lincoln, Nebr.

Connecticut University and Storrs Station.—William F. Kirkpatrick, head of the poultry department, retired February 1. His service to the institution began in 1912 and was preceded by 5 years in the Rhode Island Station and 2 years in the Mississippi College and Station. He has been succeeded by Dr. H. M. Scott, associate professor of poultry husbandry and poultry production investigator in the Kansas College and Station.

Kentucky Station.—Dr. J. Allan Smith has been appointed bulletin editor.

Montana Station.—Margaret Dewey Ekeberg has resigned as station librarian and has been succeeded by Alice Vandenhook. Ray R. Woodward has been appointed assistant in animal husbandry in the North Montana Substation.

North Carolina College and Station.—Gertrude M. Cox, research assistant professor of the section of statistics of the Iowa Station, has become director of a newly organized laboratory of experimental statistics. Dr. J. A. Pinckard, Jr., assistant plant pathologist in the Virginia Station and since 1935 in charge of the research program on tobacco diseases at its Tobacco Substation, has been appointed associate plant pathologist. In this capacity he will have charge of the research program on apple diseases and assist in the program on root diseases of tobacco.

Ohio Station.—Dr. Robert E. Yoder has been appointed chief in the department of agronomy, effective January 15.

Wyoming Station.—A W. P. A. project to construct a nursery packing and storage building at the Goshen County Experiment Farm at an estimated cost of \$3,500 has been authorized.

EXPERIMENT STATION RECORD

Vol. 84

May 1941

No. 5

EXPERIMENT STATION RESEARCH FOR 1941 CONDITIONS

The increasing realization of the radical changes in the conditions under which agriculture is carried on in this country is leading to serious study as to the extent to which these changes should influence existing and prospective research programs. That the experiment stations are alert to this situation is brought out rather clearly by their latest annual reports and similar publications. While many of the reports for the past fiscal year are not yet available, those which are at hand contain a number of interesting discussions which probably constitute a fairly representative cross section of current opinion.

One of the most comprehensive statements thus far issued is from the California Station. In this report Director C. B. Hutchison points out that "the farmer's thinking has undergone a reorientation during the past two decades. No longer is the emphasis in agriculture laid on producing more, on making two blades of grass grow where only one grew before. The battle for production quantity has largely been won. Unfortunately, the victory has come at a time when mere quantity of production is no longer enough to bring success to the farmer's enterprise. . . . To achieve success he must strive toward low unit costs of production, high quality of product, constructive management of his resources, and efficient marketing. To attain these goals he needs the aid of those whose knowledge goes far beyond that of most men actively engaged in agriculture. He must make use of the results of research performed by scientists familiar with problems of engineering, sociology, economics, nutrition, chemistry, and the life sciences."

Director W. C. Coffey of Minnesota also is of the opinion that "under existing conditions it would be folly to advocate a program of research designed solely to increase the total output of American farms." Nevertheless he maintains that the problems surrounding production should continue to receive the attention of the station. Climatic conditions, plant and animal diseases, insect pests, political and social changes, and still other factors create problems affecting production which call for research. Although an adequate research program must include more than projects on problems of production and there is need for a comprehensive attack on the use of agricultural commodities

which involves both new uses and better adaptation of existing uses to consumers' desires and demands, he concludes that it is unwise "to attempt to meet this need by turning away from those problems of production which, if left unsolved, will tend to disrupt the structure of agriculture and in many cases impose complete failure on individual farmers."

A similar view is expressed by Director A. B. Conner of the Texas Station. "The work of the agricultural experiment station," he states, "is concerned with the development of the State's agricultural resources and opportunities. The fact that agriculture is faced with changing conditions, particularly at this time, requires an ever increasing knowledge of the resources about us and of means of augmenting, developing, and conserving these resources so that they may yield the greatest returns and opportunities for the people. Money spent for agricultural research must be regarded as an investment which in the end will open up new opportunities, new enterprises, and enable adjustments which affect not only those engaged in agriculture but as well the opportunities for industrial development. . . ."

"Agriculture at the present time is encountering revolutionary changes which require a full measure of facts and information so that its reorganization can be based upon sound principles. For this reason there is great need for stimulating and developing agricultural research work that it may serve in the fullest way the reorganization of agriculture on a sound and substantial basis. Such a condition of agriculture is vital to our national welfare and to national defense, as well as imperative to the welfare of the people engaged in it. A well-developed and well-organized agriculture can provide the best means of meeting strenuous competition which we are likely to face both within and outside the borders of the Nation. Agriculture supplies raw materials and products for feeding and clothing the people of the Nation, and a well-organized agriculture can consistently expect to share in furnishing feed and clothing to the people of other parts of the world. These things can be accomplished in no other way than through basing our organization and development upon sound facts and information, much of which can be established only through research."

The continuing responsibility of the stations is referred to by Director C. Dorman of Mississippi as follows: "It should be emphasized that agriculture is Mississippi's chief industry, providing livelihood to approximately 85 percent of our people. It must continue to develop new and better practices and put them into general use; like other industries, it must improve or stagnate. The farmer, like the lawyer or doctor or businessman, is faced with new problems every year, and the solution of those problems can come only through increasing knowledge. Progress achieved in agricultural knowledge thus

far—extensive though it is by comparison—is, in reality, only the beginning. New things must be and will be learned in agriculture as in manufacturing processes, in medicine, and in invention. The experiment stations, farm fact finders, have a field of usefulness and a responsibility that increases from year to year.”

The fundamental nature of adequate research programs is attested by Director P. J. Parrott of the New York State Station as follows: “A distinguishing characteristic of present work of the experiment station is its emphasis on the necessity of precise knowledge of the principles relating to farm practices, which knowledge in turn should serve as the foundation for a sound and profitable agriculture. More than any other thing, research extends the horizon of economic insight and imparts a forward thrust.”

A tendency sometimes encountered to advocate the postponement or curtailment of research as an economy measure is mentioned in several discussions. On this point, Director R. H. Walker of Utah declares that “the foundation of progress in agriculture, as in any other industry, is research. . . . Research undertaken by the Utah Agricultural Experiment Station has been outlined to solve specific problems facing Utah agriculture, among them the problems of irrigation, dry farming, range management, and animal production. The prosperity of the State is dependent upon the success of these agricultural enterprises. Agricultural research should not, therefore, be considered a luxury marked for elimination, or materially decreased support, every time the State or Nation is faced with an emergency.”

Along much the same line, Director W. L. Blizzard of Oklahoma points out that “during times such as these, with the United States entering upon a major defense program, there is a strong temptation to reduce support for research, since research does not produce the immediate results that are shown by a service activity. It is to be noted, however, that services are the product of research activity. The continued effectiveness of such an organization as the Oklahoma Crop Improvement Association, to take but one example, rests upon the improved varieties of crops developed by research men and upon the continual testing of Oklahoma-grown seed to assure that the improvement bred into the varieties is being maintained.”

Director Blizzard’s further contention is that “with a national defense program under way, the scientific arm of the agricultural industry must be kept intact and ready to cope with any problem demanding the services of trained scientists. Research must be continued to guarantee for the future the adequate supply of clothing, food, and agricultural raw materials essential to defense. It may be needed at any time to combat disease or insect pests. Despite present surpluses, it may be needed in the future to step up production to meet an emergency. And it is needed now to assist in the development of more

equitable means of distributing present production, to the end that our entire population shall be adequately clothed and fed; for a population well clothed and well fed will contribute materially to defense in an era when warfare is directed as much against the morale of the civilian population as it is against the soldier in uniform. Furthermore, research will continue to be needed after the present crisis is over, for it is certain that new and perplexing problems demanding adjustments of all sorts will face farmers then, just as they did following the last World War."

According to Director J. A. Hill of the Wyoming Station, "the world crisis which came with the war in Europe in September 1939 is having a profound effect upon the agricultural economy of the United States. The rearmament program makes it necessary for the whole agricultural plant of the Nation to achieve the highest possible efficiency so as to release millions of men from the production of food and fiber in order that they may build and man a fighting machine which will insure the Western Hemisphere against war and aggression. Scientific research in agriculture is an important means by which this can be accomplished."

Director W. H. Martin of New Jersey is another who discusses the field of the stations as an essential part of the national defense. He suggests as among the research activities which might be inaugurated or expanded by the experiment station in time of emergency, "the development of economical substitutes for use in human and animal nutrition, especially substitutes for imported materials; investigation of new methods of storing and preserving food and feedstuffs; increased production, testing and certification of seeds, especially those which are now imported; increased testing of soils coupled with recommendations for the most effective soil treatments."

"Seldom have world events," he maintains, "taken on such immediate significance to New Jersey farmers as they have today. That fundamental changes are about to take place in the lives of all of us seems to be inescapable. As citizens and as farmers, the agriculturists of New Jersey will participate in these changes. Their scope and direction is as yet not altogether clear, but it would appear to be evident that a maximum of flexibility in thought and action will be essential for adjustment and survival."

The flexibility of program to which Director Martin refers is surely of much importance under present conditions. In this connection a news note recently supplied by Director S. W. Fletcher of Pennsylvania is of significance. According to this note, "on March 14 a conference was held to consider the need for redirection of the research program of the Pennsylvania Experiment Station in the interest of national defense. Representatives of farm organizations of the State and of all the State and Federal agencies that serve Pennsylvania

agriculture participated. Since the demands of national defense on agricultural research are still undefined, continuation of the present program was recommended. It was recommended to the experiment station that it hold some funds in reserve to meet emergencies as they may arise. Farm groups were requested to report difficult local situations to the State Agricultural Defense Council, which will enlist the cooperation of the experiment station when research is needed. More research on the problems of low-income farms was requested. The experiment station was requested to study the interrelationships of agriculture with other industries and with labor."

Under emergency conditions many new problems will arise, and for these the stations should, as far as possible, be ready. The following suggestions, made in these columns in January 1918, may still be pertinent: "The world conflict will not alter the content of science but will serve to increase dependence upon it. The best the stations can do in the main is, while relating their work and the results secured in the past to the special needs of the present, to preserve their organization and aims, to maintain their attitude toward experimental inquiry, and to continue to serve in the capacity of experts in agricultural science and in its interpretation in practice. But in this they will need to be governed by existing conditions to an unusual degree. In the past they have wisely been engaged to a large extent in developing the basis for permanent agriculture, and this has led them into lines of study which have become increasingly technical and fundamental. . . . The needs of the Nation in time of emergency are abundant justification for such temporary change and adjustment as necessary, for they are paramount considerations. The subjects worthy of our best thought and highest endeavors are those which deal with utilizing our science and directing it to questions and procedure which are just now vital."

There is much reason to believe that on the whole the stations are already attempting to meet their full responsibilities in these directions.

RECENT WORK IN AGRICULTURAL SCIENCE

AGRICULTURAL AND BIOLOGICAL CHEMISTRY

[Chemical investigations at the New York State Station] (*New York State Sta. Rpt. 1940, pp. 18, 19, 44*).—These have included work on the structure and denaturation of proteins, the effects of ultraviolet light on amino acids, proteins, and synthetic peptides, and the use of plant tissue tests for soil deficiencies.

[Chemical investigations by the Puerto Rico Station] (*Puerto Rico Sta. Rpt. 1939, pp. 2-22, 28-40, 120, 121, figs. 6*).—These included vanilla investigations, particularly as to curing and processing, extract preparation, and the toxicity of vanilla latex; essential-oil investigations with *Lippia helleri*, *Eugenia buxifolia*, lemon grass (*Cymbopogon citratus*), ilang-ilang (*Cananga odorata*), and *Eucalyptus citriodora*; and work on the improvement of orange wines.

[Investigations in bacteriological chemistry at the Wisconsin Station] (*Wisconsin Sta. Bul. 450 (1940), pp. 15, 16, fig. 1*).—The growth factor biotin has been shown, by P. W. and J. B. Wilson, to stimulate the growth of legume bacteria. *Clostridium madisonii*, isolated by E. McCoy, has been found especially effective in the butyl alcohol fermentation of molasses and to be resistant to the virus attacking butyl alcohol bacteria. Work by I. L. Baldwin, A. M. Hanson, C. B. Holden, W. H. Lohr, and R. S. Hutton on yeast-growth stimulation by minute quantities of copper is also reported.

[Reports on methods of analysis] (*Jour. Assoc. Off. Agr. Chem., 23 (1940), No. 2, pp. 183-189, 201-234, 242-282, 341-351*).—The following reports were among those presented at the 1939 meeting of the association: Volatile acids in wine, M. A. Joslyn (Univ. Calif.); soils and liming materials, W. H. MacIntire (Tenn. Expt. Sta.); H-ion concentration of soils of arid and semi-arid regions, W. T. McGeorge, and pH determination of alkali soils, W. T. McGeorge and W. P. Martin (both Ariz. Sta.); hydrogen-ion concentration of soils of humid regions, E. R. Purvis (Va. Truck Sta.); liming materials—determination of exchange bases and exchange capacity of soils, W. M. Shaw (Tenn. Sta.); fertilizers, G. S. Fraps (Tex. Sta.); nitrogen, A. L. Prince (N. J. Stas.); magnesium and manganese, J. B. Smith and E. J. Deszyck (R. I. Sta.); potash, O. W. Ford (Ind. Sta.); calcium, copper, zinc, and sulfur, G. Hart and W. Y. Gary; vitamin D—feeding of non-vitamin D skim or whole milk with the reference cod-liver oil, W. C. Russell (N. J. Stas.); and riboflavin, A. R. Kemmerer (Tex. Sta.).

A semimicro-Kjeldahl method for the determination of total nitrogen in milk, S. G. MENESEE and O. R. OVERMAN. (Univ. Ill.). (*Jour. Dairy Sci., 23 (1940), No. 12, pp. 1177-1185, fig. 1*).—The method and apparatus is described. Mercuric oxide is recommended as a catalyst with boric acid as the ammonia-receiving agent and methyl red-methylene blue as the indicator. The data presented showed close agreement between the semimicro and the Official methods. This method is considered well adapted to routine analysis and is particularly useful for detecting small amounts of nitrogen.

Comparative studies upon the methylene blue and resazurin tests, L. LITTLE (*Jour. Milk Technol.*, 3 (1940), No. 5, pp. 274-279).—Findings reported are based on the application of the methylene blue reduction test, the resazurin test, and direct microscopic counts to 304 samples of milk. The average reduction time of resazurin to purple pink averaged 0.452 that of methylene blue. Agreement between the two color tests was best on very low quality milks. Resazurin was relatively more sensitive to pathological and physiologically abnormal milks than methylene blue and also offered a more distinctive reaction to aid in their detection. The resazurin test checked slightly closer with the microscopic count than the methylene blue test. However, the two color tests checked more closely with each other than with the microscopic count.

Improved method for rapid estimation of lead in maple products, C. O. WILLITS, L. B. NORTON, and C. J. TRESSLER, JR. (N. Y. State Expt. Sta.). (*Jour. Assoc. Off. Agr. Chem.*, 23 (1940), No. 2, pp. 411-416).—A rapid and accurate method for determining minute quantities of lead was necessitated by work directed toward the detection of sources of lead contamination of maple sap, sirup, and sirup products. The electrolytic and sulfide methods were shown to be unsuitable. The authors developed a form of the "dithizone" (diphenylthiocarbazon) method. Their procedure employs a photoelectric photometer in place of the neutral wedge photometer. The Wratten light filter No. 65A, having a transmission maximum near that of the unchanged dithizone but a high absorption in the wave length range transmitted by the lead compound of this reagent, was used in a "mixed-color" method.

A comparison of the Petering-Wolman-Hibbard procedure for determining carotene, and two modifications thereof with the Peterson-Hughes-Freeman technic, E. J. BENNE, W. WOLMAN, R. P. HIBBARD, and E. J. MILLER. (Mich. Expt. Sta.). (*Jour. Assoc. Off. Agr. Chem.*, 23 (1940), No. 3, pp. 709-716, fig. 1; *abs. in Michigan Sta. Quart. Bul.*, 23 (1940), No. 2, pp. 115, 116).—The authors have developed a method which permits the determination of both chlorophyll and carotene in the same sample of plant tissue. The finely ground tissue is extracted with an aqueous-acetone solution, which is made to volume, and both pigments are determined in this extract by means of a photometric colorimeter. Chlorophyll is determined directly in the extract by use of proper light filters in the instrument. Carotene is determined, likewise by photoelectric means, in a petroleum ether extract of an aliquot of the same solution after chlorophyll is removed by barium hydroxide and the xanthophyll and flavones are separated from carotene by the usual methods.

The estimation of riboflavin, I-III (*Biochem. Jour.*, 34 (1940), No. 4, pp. 601-612, figs. 2).—This paper is presented in three parts.

I. **A new biological method, M. M. El Sadr, T. F. Macrae, and C. E. Work** (pp. 601-607).—The method depends upon the fact that treatment of extracts of liver or yeast with the norite charcoal yields a filtrate containing all of the known constituents of the vitamin B₂ complex except riboflavin. When young rats are fed this filtrate with graded doses of riboflavin as supplements to a vitamin B complex basal ration there is a graded growth response. Consequently, the riboflavin content of foodstuffs may be determined by employing this filtrate as the riboflavin-free supplement to the diet.

II. **The estimation of riboflavin in milk: Comparison of fluorimetric and biological tests, K. M. Henry, J. Houston, and S. K. Kon** (pp. 607-609).—The biological method of assay of riboflavin described in part I has been compared with the fluorimetric method following the procedure described by Henry et al.

(E. S. R., 82, p. 385), using full cream spray-dried milk and evaporated milk. Good agreement was found when the milks were fed at levels supplying up to 10 μg . daily, but the agreement was not so satisfactory with higher levels. For the three materials tested, the values obtained by the biological and fluorimetric methods, respectively, were spray-dried milk fed at levels of 0.9 and 1.8 gm. daily, 15.2 and 10 μg .; a sample of the same dried milk fed at levels of 0.5 and 1.0 gm., 9.3 and 10.3 μg .; and a sample of evaporated milk fed at levels of 2 and 4 gm., 2.6 and 2.9 μg . per gram.

III. *Statistical analysis of the data*, J. O. IRWIN (pp. 610, 611).—The significant point brought out in the statistical examination of the data is that the slope of the standard curve obtained from the data of El Sadr et al. is significantly steeper than the slopes for standard from the data of Henry et al. "The fact that significantly different slopes for the standard curve may occur in different laboratories emphasizes the necessity of using at least two doses of standard and two doses of the unknown preparation in routine testing."

The determination of vitamin E (the tocopherols) [trans. title], F. GRANDEL and H. NEUMANN (*Ztschr. Untersuch. Lebensmitl.*, 79 (1940), No. 1-2, pp. 57-65).—A review of methods, both biological and physicochemical.

Farm products and byproducts for industrial use (*U. S. Dept. Agr., Bur. Agr. Chem. and Engin.*, 1940, ACE-55, pp. [3]+69).—The present statement is in part a condensation and revision of basic data contained in a report¹ of a survey made by the Department relative to the establishment of four regional research laboratories (E. S. R., 80, p. 289). It is intended to provide "a brief summary of background facts that will be useful to those who wish information on the utilization of farm products and byproducts in industry."

Utilization of fruits in food products, II-VI, W. V. CRUESS. (Univ. Calif.). (*Fruit Prod. Jour. and Amer. Vinegar Indus.*, 19 (1940), Nos. 6, pp. 164-166, 174, figs. 2; 7, pp. 198-201, 203, 219, figs. 4; 9, pp. 260-262, 281, figs. 2; 10, pp. 297-299; 11, pp. 325, 326, 330, 343, figs. 2).—This series of articles, dealing primarily with commercial utilization, gives practical suggestions for various ways of using fruits (and in some cases fruit juices) (2) in the candy industry, (3) in carbonated and canned beverages, (4) ice cream and ices, (5) canned and glass-packed specialties, and (6) in cereal products, including baked goods.

Salting of green tomatoes, F. W. FABIAN and F. J. ERICKSON. (Mich. Expt. Sta.). (*Fruit Prod. Jour. and Amer. Vinegar Indus.*, 19 (1940), No. 12, pp. 363-367, 377, 379, figs. 2; *abs. in Michigan Sta. Quart. Bul.*, 23 (1940), No. 2, pp. 116, 117).—Cabbage, cucumbers, and green tomatoes have average sugar contents of 3.4, 2.57, and 0.99 percent, respectively, and sugar sufficient to bring the concentration up to that of the cucumbers should be added in salting green tomatoes in order to bring about a satisfactory fermentation and acid production. The best results were obtained when dextrose was added to a brine of 30° salometer strength in the proportion of 2.5 percent of the weight of the green tomatoes. A salt concentration sufficient to exclude spoilage bacteria (from 40° to 50° salometer) nearly or quite prevented fermentation by acid-producing bacteria, and satisfactory tomato color and texture were not obtainable.

Effect of CO₂ on growth of meat spoilage organisms at low temperatures, W. L. MALMANN and L. ZAIKOWSKI. (Mich. Expt. Sta.). (*Natl. Provisioner*, 103 (1940), No. 7, pp. 16, 17).—The authors isolated from beef 74 cultures of micro-organisms representing the genera *Micrococcus*, *Flavobacter*, *Bacillus*, *Achromobacter*, *Diplococcus*, *Gaffkya*, *Staphylococcus*, *Bacterium*, and *Sarcina*. These organisms were all found to multiply at temperatures of from

¹ U. S. Senate, 76. Cong., 1. Sess., Doc. 65 (1939), pp. VII+429, figs. 40.

3.5° to 5° C. in the absence of carbon dioxide, but in the presence of 10 percent of carbon dioxide the numbers of bacteria decreased. In an atmosphere of 2.5 percent carbon dioxide some bacteria grew very slowly. The data indicate that the use of 2.5 percent carbon dioxide atmospheres in meat storage boxes would prolong the keeping quality of the meat.

AGRICULTURAL METEOROLOGY

Discussion on plant diseases and the weather (*Brit. Mycol. Soc. Trans.*, 24 (1940), pt. 2, pp. 264-266).—Abstracts of the following papers are given: Weather in Relation to Plant Disease Survey Records, by W. C. Moore; Apple Canker and the Weather, by R. W. Marsh; A Functional Disorder of Cultivated Varieties of *Rubus*, by R. V. Harris; Climate and Disease in Australia, by T. H. Harrison; The Strawberry Yellow-Edge Disease in Relation to Weather Conditions, by M. E. King and R. V. Harris; The Effect of Weather on Some Diseases of Apple and Morello Cherry, by M. H. Moore; and Potato Blight and the Weather, by A. Beaumont.

Weather forecasting terms, H. LANDSBERG. (Pa. State Col.). (*Amer. Met. Soc. Bul.*, 21 (1940), No. 8, pp. 317-320).—A consideration of terminology based on discussions by the Central Pennsylvania Seminar of the American Meteorological Society.

Suggestions for improved presentation of weather information to the public, G. EMMONS (*Amer. Met. Soc. Bul.*, 21 (1940), No. 8, pp. 311-316).

Proposal for frequent and dependable weather reports from off the Pacific coast, W. H. WENSTROM (*Amer. Met. Soc. Bul.*, 21 (1940), No. 8, pp. 321-323, fig. 1).—Semipermanent offshore weather stations are suggested in the interest of more dependable forecasting for California coastal areas.

Occlusions on the Alaskan coast, A. B. CARPENTER (*Amer. Met. Soc. Bul.*, 21 (1940), No. 8, pp. 327-332, figs. 4).—The use of frontal analysis in recent years has helped to explain some of the peculiarities of storms crossing the Alaskan coast into western Canada. In view of the practical importance of the subject, the author here summarizes certain results from analysis of maps during the past few years, especially from a series of twice-daily charts for the winter season of 1938-39 covering the entire North Pacific area and including parts of Siberia, China, Japan, and the Philippines. The structure and behavior of two typical situations, one in fall and one in late winter, are discussed.

The use of isentropic layer data to determine stability, P. J. HARNEY (*Amer. Met. Soc. Bul.*, 21 (1940), No. 7, pp. 279-281, fig. 1).—Knowledge of stability is to be desired when shower activity is likely, but it is also important in studying mixing processes in the atmosphere. This note calls attention to a convenient quantitative measure of the stability of a layer, useful because it can be rapidly noted from data now transmitted to stations.

The coupling between tropospheric and stratospheric pressure and temperature variations, C. M. PENNER (*Amer. Met. Soc. Bul.*, 21 (1940), No. 7, pp. 283, 284).—An abstract.

Calculation of the incident light from sun and sky [trans. title], E. ELVEGÅRD and G. SJÖSTEDT (*Gerlands Beitr. Geophysik*, 56 (1940), No. 1, pp. 41-48, fig. 1; *abs. in Sci. Abs., Sect. A—Phys.*, 43 (1940), No. 512, p. 610).—It is stated that the average illumination of a horizontal plane for different solar altitudes can be approximated by the formulas $S=1.6 \sin h \times 10^{-0.1M}$ for solar illumination, $H=0.211 \sqrt{\sin h}$ for the clear sky, and $W=xS+yH$ for the cloudy sky, in which x and y are the rates of radiation penetrating the clouds from the sun and sky, respectively, M is the air mass through which the sunlight

has passed, and h the altitude of the sun. The total illumination of a horizontal plane at a solar altitude of 45° is taken as unity.

An improved design of cup anemometer, P. A. SHEPPARD (*Jour. Sci. Instruments*, 17 (1940), No. 9, pp. 218-221, figs. 5).—In the new type of 3-cup anemometer described, the minimum wind velocity in which it will function satisfactorily, about 40 ft. per minute, is appreciably lower than usual with this type of instrument, and compares favorably with other sensitive but more troublesome types involving movable parts. The rate of rotation of the cups is related linearly with the wind velocity, and consequently the indicated mean value of the velocity in a gusty wind is true, apart from the effects of inertia. The inertia of the moving parts is small, so that the anemometer is very responsive to changes in wind velocity and overestimation in a gusty wind is negligibly small. The apparatus is portable and of relatively small dimensions.

A new electronic anemometer, E. F. CORWIN (*Amer. Met. Soc. Bul.*, 21 (1940), No. 8, pp. 337-340, figs. 5).

A design for a geostrophic wind scale, C. V. BROWN. (U. S. D. A.). (*Amer. Met. Soc. Bul.*, 21 (1940), No. 5, pp. 178-181, fig. 1).—A scale may be constructed for any degree of latitude and for any distance between isobars by plotting the ordinates on a scale of log sine of latitude and the abscissa on a scale of map distance in miles. The resultant wind movement may then be plotted as sloping lines by connecting points for each 5° or 10° of latitude along the resultant map distance for each distance between isobars. Its use, with examples, is discussed.

An improved electrical hygrometer and its applications, F. W. DUNMORE (*Amer. Met. Soc. Bul.*, 21 (1940), No. 6, pp. 249-256, figs. 7).—This is a more detailed account (E. S. R., 83, p. 18), including construction details, operating characteristics in D. C. current radiosonde circuits, and in A. C. measuring circuits, designs for special uses, and radio soundings using the electric hygrometer. "Flight tests with two radiosondes carried by the same balloon, one using the electric hygrometer and the other the hair type hygrometer, showed marked changes in humidity recorded by the electric hygrometer which the hair unit failed to register."

Meteorological observations, [1940], C. I. GUNNESS ET AL. (*Massachusetts Sta. Met. Ser. Buls.* 613-624 (1940), pp. 4 each).—These are the usual summaries of observations for each month at Amherst, Mass., with brief notes on the more significant features.

The December number contains an annual summary for 1940, which shows that the mean pressure for the year was 30 in.; the mean temperature 46.1° F., as compared with the normal of 47.4° , highest 94° July 26, lowest -10° December 4; total precipitation 43.37 in., as compared with the normal of 43.7 in.; snowfall 54.75 in., as compared with the normal of 47.78 in.; mean cloudiness 54 percent, bright sunshine 52.8 percent; last frost in spring May 13, first in fall September 27; last snow April 22, first November 16.

Hurricane floods of September 1938 (U. S. Geol. Survey, *Water-Supply Paper* 867 (1940), pp. IX+562, pls. 20, figs. 61).—This report presents records of stage and discharge for the period including the flood at about 240 stream-gaging stations, records of storage in many reservoirs, a summary of peak discharges with comparative data for other floods at about 530 measurement points, and tables showing crest stages along an aggregate length of stream channel of 1,450 miles; and records of daily observations of precipitation during the period September 12-21 at about 745 places, of more frequent observations of precipitation at about 110 places of measurement, of ocean-wave

height at about 230 locations along the coast, and of water level in 31 observation wells on Long Island. The report also includes basic information in regard to the hurricane and general weather conditions associated with floods, analyses of rainfall and run-off, discussions of storage and ground-water recharge, and many other data pertinent to the floods.

The climate of Juan Viñas [trans. title], J. LEÓN (*Rev. Agr. [Costa Rica]*, 12 (1940), No. 11, pp. 487, 489-491, 493, 494, figs. 3).—Data on the temperature, humidity, wind, and rainfall of this Costa Rican region are presented, with special reference to agricultural and soil relations.

SOILS—FERTILIZERS

Reading for soil scientists, together with a library, C. E. KELLOG. (U. S. D. A.). (*Jour. Amer. Soc. Agron.*, 32 (1940), No. 11, pp. 867-876).—The author suggests 19 references on soil science, 19 works on related sciences, 13 sources on early agriculture, 19 references on general science, 40 contributions of philosophy and history, 53 novels, 14 bibliographies, and 48 works on drama and poetry as satisfactory reading material for soil scientists.

[Soil investigations by the Montana Station]. (Partly coop. U. S. D. A.). (*Montana Sta. [Bien.] Rpt. 1939-40*, pp. 23, 24, 51, 52).—This report notes work on the effect of phosphate fertilizers on the yield and phosphorus content of forage crops, the location of phosphorus-deficient soils in Montana, and factors inhibiting the productivity of Montana soils, all by A. R. Patton. Soil-moisture investigations in relation to agricultural practices and studies on the maintenance of soil productivity are reported upon by A. E. Seamans.

Soil surveying fundamental to efficient land-use planning, D. S. JENNINGS and L. WILSON (*Farm and Home Sci. [Utah Sta.]*, 1 (1940), No. 4, pp. 1, 8, 10, fig. 1).—The value of soil-survey information for land-use planning agencies and for the farmer is discussed. Reports from farmers throughout the State indicate that soil productivity has declined, on the average, about 25 percent since the soil was first cultivated, this decline being attributed to the lack of sufficient information as to the physical, chemical, and biological properties of the soil to determine the most satisfactory system of land management.

Preservation of soil profiles by Voigt's [Voigt's] method, W. H. LYFORD, JR. (*Soil Sci. Soc. Amer. Proc.*, 4 (1939), pp. 355-357; also *New Hampshire Sta. Sci. Contrib.* 78 [1939], pp. 355-357+2).—The author slightly modified the method of E. Voigt² and showed it to be very satisfactory for the preservation of sandy and stony soil profiles collected in New Hampshire.

According to the author's form of this method a profile section about 8 in. wide is cut vertically and brushed free from the looser particles. Stones larger than a hen's egg are to be avoided since they are not easily supported by the film. Small, deep holes left by small stones are filled up, and roots are cut off about 0.5 in. from the face of the profile, wire cutters being used to avoid disturbance of the surrounding soil. More satisfactory profiles were obtained when the soil was sprayed with the binder while at normal moisture content than when the soil surface was first allowed to become nearly or quite dry. As binder a clear cellulose nitrate airplane "dope" was used. About 0.5 pt. of a 2:1 dilution of the cellulose nitrate preparation with acetone was first spread on the profile surface, and, after from 10 to 20 min., a further coating of the undiluted cellulose nitrate solution was brushed on. A second brushing coat, applied 0.5 hr. or more after the first, was usually

² Ztschr. Pflanzenernähr., Düngung u. Bodenkn., 45 (1936), No. 1-2, pp. 111-115, figs. 4.

necessary to provide a film of sufficient strength. The film was detached before becoming completely dry because it was more flexible and more easily detached in this condition. The films were loosened from the bottom upward, with the use of a knife to free from the soil any stones adhering to the film. Heavy profile films were laid on strips of plywood to allow them to be carried with less danger of cracking or dropping. Curling of the profile films was best avoided by adding from 0.5 to 1 oz. of castor oil to the stock cellulose nitrate solution.

The cost per profile, mounted on a plywood backing, was from 75 ct. to \$1, and the total time, for taking a single profile, from 2 to 3 hr. Several profiles could be collected at neighboring points with much saving of time, and on the collecting trip the films could be left to dry and removed on the way back.

Notes made in 1940 of modifications of the method are appended to the station's publication.

The electro-chemistry of soil formation.—IV, The salt effect on amphoteric colloids and phosphate fixation, N. KARLSSON and S. MATTSON (*Lantbr. Högsk. Ann. [Uppsala]*, 8 (1940), pp. 405-424, figs. 4; *Swed. abs.*, p. 423).

The pH and the amphoteric behavior of soils in relation to the Donnan equilibrium, S. MATTSON and L. WIKLANDER (*Lantbr. Högsk. Ann. [Uppsala]*, 8 (1940), pp. 1-54, figs. 24).—Studies of the property of amphoteric soils to exchange H and OH ions for the cations and anions of a neutral salt solution, at or near the equi-ionic point of the soil, and the valence effect in the mass law have given significant results.

A study of the base exchange capacity of typical native sods and cultivated soil profiles of Colorado, together with the effects of saline irrigation waters upon adsorptive soil complex (*Colorado Sta. Rpt. 1940*, p. 21).—Data on base-exchange capacity of some 40 native sods and cultivated soil profiles of Colorado and the effect of saline irrigation waters upon the adsorptive soil complex are briefly referred to.

Some factors which influence infiltration and its measurement in Houston black clay, C. W. LAURITZEN and N. L. STOLTENBERG. (U. S. D. A.). (*Jour. Amer. Soc. Agron.*, 32 (1940), No. 11, pp. 853-866, fig. 1).—Two areas of Houston black clay, one of which had virgin prairie cover and the other cultivated and cropped to cotton, were investigated to determine a usable index of infiltration by using the method of Musgrave (*E. S. R.*, 73, p. 446). The infiltration rate as determined for individual soil cylinders varies within wide limits. This variation can be attributed to differences in the permeability of the soil. Earthworm activity was also found to affect infiltration greatly. There is a difference in the rate and the change in rate of infiltration with time directly attributable to soil and experimental conditions. Mechanical analyses, moisture equivalents, volume weights, soil moisture content, and pore space were investigated to obtain information on differences in infiltration, and correlations between several other factors were established.

The influence of temperature on the permeability of soils to water, Y. GUSTAFSSON (*Lantbr. Högsk. Ann. [Uppsala]*, 8 (1940), pp. 425-456, figs. 15; *Swed. abs.*, pp. 455, 456).—Determinations of the permeability of a soil, whether by field or laboratory studies, should be reduced to a fixed temperature in order to become commensurable.

Publications containing information on soil moisture and soil erosion, issued as a result of cooperative investigations by the Division of Dry Land Agriculture of the Bureau of Plant Industry and State agricultural experiment stations, J. S. COLE (*U. S. Dept. Agr., Bur. Plant Indus.*, [1940],

pp. 14).—The annotated bibliography on soil moisture lists 39 titles and that on soil erosion and its control 34 titles.

Soil and water conservation investigations, 1936–1939.—Progress report, C. E. SEITZ. (Coop. U. S. D. A. et al.). (*Virginia Sta. Multig. Rpt. 1 (1940)*, pp. [7]+54, figs. 39).—The report is of a preliminary nature, dealing with a description of the problem and the studies in operation with the methods being used. The results will be applicable to the limestone valleys and upland region of Virginia, and with adaptations should be of some value to the entire limestone valley extending from Pennsylvania to Alabama.

The effect of climatic factors and physical and chemical soil properties on erosion are under investigation with rotation control plats, watersheds, and through the use of artificial rainfall. Equations are presented for determining the relationship between soil and water losses and the degree of slope for corn and for wheat. Equations are also developed for relation of density of flow and degree of slope. Artificial rainfall studies indicated that 5-min. applications of rainfall at an intensity of 6.6 in. per hour after fertilization cause twice the phosphorus loss of an application of 3.3 in. of rainfall over a 20-min. period. Superphosphate applications increased plant growth and soil organic matter and brought about a better degree of aggregation in the 0- to 2-in. depth. Pasture contour furrows gave a higher soil moisture content in the A and B horizons than was found under check areas.

Details on the physical instillation are illustrated by photographs. Rainfall records, including intensity and frequency as well as data from the individual studies, are presented in appended tables.

Soil conservation (*New York State Sta. Rpt. 1940, p. 31*).—Four years' records from cooperative studies with the U. S. D. A. Soil Conservation Service on soil- and water-loss measurements in vineyards at Hammondsport are considered in relation to total annual precipitation.

Physico-chemical behavior of soil bacteria in relation to the soil colloid, T. M. McCALLA. (Kans. Expt. Sta.). (*Jour. Bact., 40 (1940), No. 1, pp. 33–43, figs. 2*).—The importance of colloidal clay in the mineral nutrition of plants is reviewed. The relationship of adsorbed ions to the nature of the clay is considered. A comparison is made between bacteria and colloidal clay to bring out the fact that bacteria adsorb cations. Colloidal clay was found to stimulate the growth of bacteria. The order of cation adsorption is as follows: $\text{Na} < \text{NH}_4 < \text{K} < \text{Mg} < \text{Ca} < \text{Ba} < \text{Mn} < \text{Al} < \text{Fe} < \text{H}$. It is suggested that soil bacteria obtain their mineral needs by contact exchange of adsorbed ions between the bacterium and clay particles.

The microflora in the soil and in the run-off from the soil, J. K. WILSON and H. J. SCHUBERT. (Cornell Univ.). (*Jour. Amer. Soc. Agron., 32 (1940), No. 11, pp. 833–841*).—Samples of soil and run-off material were collected at the U. S. D. A. Soil Conservation Experiment Station at the Arnot Forest near Ithaca, N. Y., to determine the extent to which certain physiological groups of the micro-organism population of the soil are carried away in run-off. From agar plate counts of the run-off and from a determination of the organisms in the soil in situ it was found that there were in several instances 180 to 400 times as many organisms in the run-off for each gram of solid material as there were in the soil from which the run-off came. Fertilizers did not affect the number of organisms in the sample of the original soil or in the run-off obtained from the soil.

Studies on Azotobacter (*Colorado Sta. Rpt. 1940, p. 39*).—The finding for the first time in Colorado soils of *A. vinelandii* in a soil incubated with sodium benzoate is noted.

The decomposition of the organic compounds in barnyard manure, N. BENGTSSON and C. BARTHEL (*Lantbr. Högsk. Ann. [Uppsala]*, 8 (1940), pp. 55-69, figs. 4; *Swed. abs.*, p. 68).—A study of the decomposition of cow manure at pH values of 6 and 8 revealed that after 4 yr. 100 percent of the cellulose, 92 of the pentosans, 61 of the lignin, and 45 percent of the proteins were decomposed in the alkaline samples. For the acid samples the figures were 85, 71, 28, and 22 percent, respectively.

Soil organic matter and nitrogen as influenced by green manure crop management on Norfolk coarse sand, N. McKAIG, JR., W. A. CARNS, and A. B. BOWEN. (U. S. D. A. and S. C. Expt. Sta.). (*Jour. Amer. Soc. Agron.*, 32 (1940), No. 11, pp. 842-852, figs. 5).—Results are reported from field and lysimeter studies on the effect of different crop management practices on the carbon and nitrogen content of Norfolk coarse sand. Soybeans and velvetbeans used as green manures in a 3-yr. rotation of legumes, corn, and cotton were similar in their effects. Soil from cowpea plats was a little lower in nitrogen and had a higher carbon:nitrogen ratio. A summer green manure crop followed by a winter cover crop of rye maintained the soil carbon and nitrogen at a higher level than a summer cover crop with winter fallow management. Maximum benefits from green manuring are obtained by storing organic legume matter with its contained nutrients during the soil improvement period and then releasing the nutrients by decomposition of the organic matter at the time when the nutrients will be of most benefit to the following crop.

Plant tissue tests may be valuable aid to farmers, C. B. SAYRE (*Farm Res. [New York State Sta.]*, 7 (1941), No. 1, pp. 11, 14).—Tissue tests of growing plants have been found useful for supplying accurate information on soil deficiencies and thus make it possible to diagnose the difficulty and assist the farmer in applying the proper fertilizer. Tissue tests are more valuable than soil analysis, since the latter gives no information on the availability of nutrients for plant use. The tissue test is referred to as a "trouble shooter" because it enables one to determine what is wrong with the soil and to determine the effectiveness of a particular fertilizer treatment.

A general deficiency of phosphorus was found through plant-tissue tests of tomato fields made during 1940. The method of application of the fertilizer is very important in determining phosphorus availability because phosphorus that is applied to the surface becomes fixed in the upper 2 or 3 in. of soil. The importance of a physiological balance of nutrients in the plant was brought out in field tests on tomatoes receiving heavy applications of phosphorus and potash. The plants under these heavy fertilizer treatments showed nitrogen starvation, and yields were not increased until nitrogen was supplied. Reasonably accurate tests for nitrogen, phosphorus, and potash can be made with a small kit in the field. However, tests for calcium, magnesium, manganese, iron, and aluminum must be made in the laboratory. While tissue tests are very helpful, it is pointed out that skill is required in the analysis and interpretation of the results.

Organic carbon, pH, and aggregation of the soil of the Morrow plats as affected by type of cropping and manurial addition, R. S. STAUFFER, R. J. MUCKENHIRN, and R. T. ODELL. (Ill. Expt. Sta.). (*Jour. Amer. Soc. Agron.*, 32 (1940), No. 11, pp. 819-832, figs. 3).—The effect of cropping systems under way since 1904 on the Morrow plats is reported from a study of pH, aggregate analysis, volume weight, mechanical analysis, and total carbon. The cropping systems included continuous corn, a corn-oats rotation, and a corn-oats-clover rotation, with and without manure, lime, and rock phosphate. Plats in continuous corn were poorly aggregated at the surface, but showed an increased aggregation with depth which is explained as being due to erosion and not to the corn, since the

B horizon is 6 to 9 in. nearer the surface under the corn plats. It was thus estimated that erosion had removed about 6 in. of soil, or about 0.1 in. annually since the plats were originally established. Taking into consideration soil losses of this magnitude under continuous corn it is difficult to make comparisons with other treatments. The limed plats were higher in pH than unlimed plats from 0 to 9 in. but were not greatly affected below 9 in. The unfertilized continuous corn plat was lowest in total carbon to a depth of 13 in., while the fertilized corn-oats-clover plat was highest to 9 in. A corn-oats rotation receiving fertilizer was not materially better in maintaining soil organic matter than was continuous corn with fertilizer. A bluegrass sod border under continuous cover for 34 yr. was no higher in total carbon than the fertilized corn-oats-clover plat.

Effects of rotational and manurial treatments for twenty years on the organic matter, nitrogen, and phosphorus contents of Clarion and Webster soils, W. J. PEEVY, F. B. SMITH, and P. E. BROWN. (Iowa Expt. Sta.). (*Jour. Amer. Soc. Agron.*, 32 (1940), No. 10, pp. 739-753, fig. 1).—Changes in organic matter, nitrogen, and total phosphorus content of Clarion and Webster soils from 1917 to 1937 from 2-, 3-, and 5-yr. rotation experiments are reported. Losses in total phosphorus were, in general, insignificant. Soils treated with rock phosphate showed significant increases in phosphorus content. The greatest losses of organic matter and nitrogen occurred with the 2-yr. rotation. The loss of organic matter and nitrogen was much less where manure was applied than where crop residues were returned to the soil. The authors report a significant correlation between the original soil organic matter and nitrogen and their losses, that is, the higher the original contents the greater the loss.

Proceedings of the fifteenth annual meeting of the National Joint Committee on Fertilizer Application, held at New Orleans, Louisiana, November 21, 1939 (Natl. Joint Com. Fert. Appl. Proc., 15 (1939), pp. [3]+153, figs. 3).—Reports of progress from 16 States on methods of fertilizer application for various crops are presented.

The influence of placement upon the movement of fertilizer salts in the soil, J. M. BLUME, M. M. PARKER, and E. R. PURVIS. (Va. Truck Expt. Sta.). (*Amer. Fert.*, 93 (1940), No. 13, pp. 8, 9, 24, 26, fig. 1).—The movement of fertilizer salts was followed by conductivity tests of soluble salts obtained from water extracts of soil taken at various intervals from unfertilized plats, plats fertilized by hand in a 12-in. strip in the row and worked into the soil immediately before planting, and from areas fertilized in bands 2 in. to each side and 2 in. below seed level at time of planting. The band treatment was made with a revolving cylinder top delivery fertilizer distributor attached to the planter. Soluble salts in the soil were determined 5, 19, 35, and 53 days after planting in the plant row 0, 2, 7, and 14 in. away from the plants. Salt concentration for the "in row" fertilizer placement remained high throughout the period of study. No germination or plant injury was evident, but this treatment produced only 80 percent as many snap beans as the band method of fertilizer application. Under the band treatment the high concentration of soluble salts remained in the band during the germination and early growth period and thus was not harmful to germination or early growth. Unfertilized areas showed a general low level of fertility and produced only 60 percent as many beans as the band fertilizer treatment.

The effect of soil characteristics and winter legumes on the leaching of potassium below the 8-inch depth in some Alabama soils, N. J. VOLK. (Ala. Expt. Sta.). (*Jour. Amer. Soc. Agron.*, 32 (1940), No. 11, pp. 888-890).—Representing 8 different soil types, 210 plats were sampled at from 0- to 8-, 8- to 16-, and 16- to 24-in. depths and analyzed for soluble and replaceable potash.

Soil texture and the type of plants grown were found to have a large effect on the potassium leached downward. Winter legumes were effective in reducing the leaching of potassium, the saving amounting to 17 percent of the total potassium applied, and thus, in addition to preventing erosion and supplying nitrogen for the succeeding crops, being valuable from the standpoint of conserving soil potassium.

"Milorganite" as a source of minor nutrient elements for plants, C. J. REHLING and E. TRUOG. (Wis. Expt. Sta.). (*Jour. Amer. Soc. Agron.*, 32 (1940), No. 11, pp. 894-906, figs. 2).—Dried activated sludge sold under the trade name of milorganite was shown in earlier work (E. S. R., 82, p. 451) to contain 0.0115 percent B_2O_3 , 0.0431 percent CuO, 0.0250 percent MnO, and 0.030 percent ZnO. In order to test the availability of these nutrients, culture solutions were set up to some of which were added a carbonic acid extract of milorganite to serve as the only source of these minor elements. Corn, sunflower, and tomato plants were grown and analyzed for each of the various elements. It is concluded that milorganite when used as a fertilizer or as a part of mixed fertilizer may serve as a source of minor nutrient elements required for plant growth.

Production and agricultural use of ammonium sulfate, C. C. FLETCHER, A. R. MERZ, and B. E. BROWN (*U. S. Dept. Agr. Cir. 578* (1940), pp. 15).—This is a more or less popular summary of sources, production figures, fertilizer properties, and uses of ammonium sulfate, together with home-mixing formulas and composting procedures.

Commercial fertilizers report for 1940, E. M. BAILEY (*Connecticut [New Haven] Sta. Bul. 441* (1940), pp. 60).—An explanation of the fertilizer law and regulations concerning fertilizers in Connecticut is presented, together with the usual analyses. The registrations for inspection for 1940 amounted to 64 firms and individuals, including 344 brands of fertilizer registered for sale in the State.

Inspection and analysis of commercial fertilizers, B. D. CLOANINGER (*South Carolina Sta. Bul. 330* (1940), pp. 163, figs. 6).—The provisions of a new fertilizer law which became effective August 1, 1939, are outlined. The new law is on the same basis as in adjoining States and has been helpful in avoiding confusion by farmers near the State's borders.

Recommended fertilizer analyses and rates of application are given for various crops grown in South Carolina. Analyses of 5,026 samples are tabulated.

AGRICULTURAL BOTANY

Abstracts of the papers presented before the Pacific section of the Botanical Society of America, Seattle, Washington, June 17 to 22, 1940 (*Amer. Jour. Bot.*, 27 (1940), No. 8, pp. 705-709).—The following are included: Vascular Differentiation in the Shoot Apex of *Sequoia*, by A. S. Crafts (p. 705), and The Structure of the Shoot Apex of *Opuntia cylindrica* and *Trichocereus spachianus*, by N. Boke (pp. 705, 706) (both Univ. Calif.); The Development of the Seed of *Lycopersicon esculentum* Mill., with Special Reference to the Differentiation of the Seed Coat, by A. J. Brown (p. 706) (Oreg. State Col.); Are Genera Natural Units? by C. L. Hitchcock (p. 706); Some Factors Influencing Speciation in the Genus *Calochortus*, by M. Ownbey (p. 706) (Wash. State Col.); Major Plant Communities on a Transect Through Western Oregon, by L. E. Detling (p. 706); A One-Year Record of Soil and Air Temperature in a Salt Marsh, by G. B. Rigg and L. D. Phifer (pp. 706, 707); Cell Size in Developing *Iris* Ovaries, by H. P. Riley and D. Morrow (p. 707); Origin and Development of the Carpel in *Lathyrus odoratus*, by A. R. Spurr (p. 707)

(Univ. Calif.); The Caryophyllaceous Flower—A Study in Floral Morphology, by F. G. Meyer (p. 707) (Wash. State Col.); A Chaparral Association of Northern Baja California, by C. Epling and H. Lewis (p. 707), Phytogeography of American Scirpi, by A. A. Beetle (pp. 707, 708), and The Taxonomy and Geographical Distribution of the Genus *Leptotaenia*, by M. E. Mathias and L. Constance (p. 708) (all Univ. Calif.); and Sexual Hormones in the Thallophytes, by J. Raper (p. 708).

[Abstracts of papers presented at National Academy of Sciences meeting] (*Science*, 92 (1940), No. 2393, pp. 415, 416).—The following are of interest to botany: Physiological Differentiation of *Astragalus* in Response to Selenium, by S. F. Trelease; Sensitivity of *Gladiolus* Corms During an Artificially Prolonged Rest Period, by F. E. Denny; Growth of Excised Roots and Heterosis in Tomato, by W. J. Robbins; Theoretical and Experimental Studies on Protoplasmic Streaming, by W. Seifriz and N. Kamiya; and Formation of Crystalline Cellulose in Plastids of Living Cells, by W. K. Farr.

Indices, The Botanical Review, Volumes I–V, 1935–1939 (*Bot. Rev. Indices*, 1–5 (1935–39), pp. 124).—Indexes to articles, subject matter, and authors are included.

John and William Bartram: Botanists and explorers, 1699–1777, 1739–1823, E. EARNEST (*Philadelphia: Univ. Pa. Press*, 1940, pp. VII+187, pls. 2).—This book is not only of biographical interest, but presents much of historical value for early botany and explorations in America.

A method for determining and specifying locality by collectors, C. F. REED (*Science*, 93 (1941), No. 2403, p. 68).—A system for plant collectors, using the quadrangle topographical maps published by the U. S. Geological Survey (or similar maps) and numbering the nine primary divisions of each quadrangle with the decimal figures 0.1 to 0.9. A transparent celluloid overlay is cut the size of an average primary division for the area to be studied and divided into nine secondary divisions numbered 0.01 to 0.09. In the same way, each secondary and tertiary division is further subdivided and numbered, respectively, 0.001 to 0.009, and 0.0001 to 0.0009. By placing the overlay on any one of the primary rectangular divisions of the map, any point on the division can be estimated as a 4-point decimal, and a fifth can be estimated. Since each quadrangle bears a name, this name precedes the code in specifying locations, as, e. g., "Ellicott 0.99887." For field use each map is cut into its nine primary divisions, which are pasted into a loose-leaf notebook.

Additions to the mycological flora of Venezuela [trans. title], C. E. CHARDON (*Bot. Soc. Venez. Cien. Nat.*, No. 40 (1939), pp. [1]+34, pls. 3).—This contribution supplements one previously referred to (E. S. R., 72, p. 460), presenting pertinent data on various fungi of the Phycomyces, Discomycetes, and Pyrenomycetes and including many new species.

List of Pyrenomycetes recorded for Britain, G. R. BISBY and E. W. MASON (*Brit. Mycol. Soc. Trans.*, 24 (1940), pt. 2, pp. 127–243).—An annotated list, with 117 references and an index to genera and species.

New data on the life histories of Ascomycetes [trans. title], E. GÄUMANN (*Ztschr. Bot.*, 35 (1940), No. 11–12, pp. 433–513, figs. 34).—A comprehensive analytical review (7-page bibliography).

Genera of cultivated plants represented in the indigenous flora of Argentina [trans. title], L. R. PARODI and A. I. PASTORE (*Physis*, 18 (1939), No. 50, pp. 255–268).—A copiously annotated conspectus.

Botany of the Canadian Eastern Arctic.—I, Pteridophyta and Spermatophyta, N. POLUNIN (*Canada Dept. Mines and Resources, Natl. Mus. Canada*

Bul. 92 (1940), pp. VI+408, figs. 9, map 1).—This monographic manual briefly considers the history and exploration of the region and discusses the general factors in the vascular plant flora before presenting the detailed data for individual species and varieties. New taxonomy is included, and an index to Latin binomials and a general bibliography of over 11 pages are provided.

Illustrated flora of the Pacific States—Washington, Oregon, and California.—I, Ophioglossaceae to Aristolochiaceae—ferns to birthworts, L. ABRAMS (*Stanford University, Calif.: Stanford Univ. Press; London: Oxford Univ. Press, 1940, vol. 1, pp. IX+538, figs. 1299*).

Alien plants growing without cultivation in California, W. W. ROBBINS (*California Sta. Bul. 637 (1940), pp. 128*).—The introduction and migration of species, the agencies concerned, the behavior of the migrants in their new environment and their influence upon it, the interaction between them and the native species, and their effect on agriculture are considered in this contribution. Lists of important species established in California by 1860 and those introduced between 1860 and 1900 and since 1900 are included, and the detailed data on individual species—the bulk of the text—are arranged by plant families. A 7½-page bibliography and an index of common and scientific plant names are provided.

Vegetation type maps of California and western Nevada, H. A. JENSEN. (U. S. D. A. coop. Univ. Calif.). (*Science, 92 (1940), No. 2389, p. 333*).—A description is given of these maps, prepared by the California Forest and Range Experiment Station. Of these 21 units were already available, showing the vegetational resources of the areas covered, superimposed in color and symbol on standard U. S. Geological Survey topographic quadrangle maps. Included on the wide margins are brief descriptions of the basic vegetational type classifications, summaries of type areas, and a profile illustrating the relationship of types to elevation and slope exposure. Plant associations, based upon dominant species composition, comprise the primary vegetational elements mapped. These are shown in their actual relation to the topography, with symbols identifying the species involved. These maps can be utilized in many projects dealing with protection, management, and utilization of vegetational resources and are valuable for instructional purposes.

Relic prairie areas in central Wisconsin, J. W. THOMSON, JR. (*Ecol. Monog., 10 (1940), No. 4, pp. 685-717, figs. 25*).—Observations on the geology, physiography, soils, climate, and prairie relics of the area are presented, with a page of references. The historical evidence and the presence of relic communities of prairie plants indicate that the prairie in Wisconsin once had a much wider range. Portions of these relic communities have been destroyed by cultivation, but portions of others remain and are still being invaded by the forest. Some of the prairie plants are spreading from the relic communities to the sandy soils of central Wisconsin, this spread all being on areas disturbed by human activities, such as abandoned fields and railroad rights-of-way. The succession on such places is from weed flora to prairie plants, which reach a maximum in about 15 yr. and finally decline. Then the forest, represented by jack pine and aspen and later also oak, supersedes the prairie plants.

The grassland biome, J. R. CARPENTER (*Ecol. Monog., 10 (1940), No. 4, pp. 617-684, figs. 7*).—Climax grassland communities occur on all the world's major land masses and are said to possess marked resemblance and consistency in climates, floral and faunal types, growth form, physiognomy, and in more characteristics of the component biota. The purpose of this monographic account (over 11 pages of references) was to bring together the results of research and reports on the condition, fauna, flora, and interrelationships as they existed in the North

American grassland before settlement by the European races, in the hope that a better understanding may be had of the best ways in which the region surveyed may be utilized. The text considers the climate of the grassland, the tall-grass prairie, mixed-grass prairie-plains, short-grass plains, edaphic woodland inclusions in the grassland, and the ecology of the grassland biome.

Plant sociological methods [trans. title], M. SCHWICKERATH (*Ber. Deut. Bot. Gesell.*, 58 (1940), No. 5, pp. 237-249).—A general discussion and review (12 references) of the subject.

The development of sphagnum bogs in North America, G. B. RIGG (*Bot. Rev.*, 6 (1940), No. 12, pp. 666-693).—A comprehensive review (89 references).

Problems of lake biology, edited by F. R. MOULTON (*Lancaster, Pa.: Science Press, 1939, pp. 142, figs. [43]*).—Following the foreword, by F. R. Moulton, this symposium includes the following papers: Some Physical and Chemical Factors in the Metabolism of Lakes, by D. S. Rawson (pp. 9-26); The Utilization of Solar Energy by Aquatic Organisms, by G. L. Clarke (pp. 27-38); The Distribution of Bacteria in Lakes, by A. T. Henrici (pp. 39-64) (Univ. Minn.); Some Relationships of Phytoplankton to Limnology and Aquatic Biology, by G. W. Prescott (pp. 65-78); The Zooplankton in Relation to the Metabolism of Lakes, by W. L. Tressler (pp. 79-93); The Microscopic Fauna of the Sandy Beaches, by R. W. Pennak (pp. 94-106); Rooted Aquatic Plants and Their Relation to the Limnology of Fresh-Water Lakes, by L. R. Wilson (pp. 107-122); Role of the Bottom Fauna in the Productivity of Lakes, by F. E. Eggleton (pp. 123-131); and The Position of Fish and Other Higher Animals in the Economy of Lakes, by F. E. J. Fry (pp. 132-142).

Investigations as to the absorption and accumulation of inorganic ions, H. LUNDEGÅRDH (*Lantbr. Högsk. Ann. [Uppsala]*, 8 (1940), pp. 233-404, figs. 37).—A comprehensive review with 219 references and results of experimental work on the interaction of aerobic respiration of roots and the electrochemical behavior of the surface of the protoplasm.

The absorption of bicarbonate ion by barley plants as indicated by studies with radioactive carbon, R. OVERSTREET, S. RUBEN, and T. C. BROYER. (Calif. Expt. Sta. and Univ.). (*Natl. Acad. Sci. Proc.*, 26 (1940), No. 12, pp. 688-695).—In the experiments detailed, radioactive carbon, present in the culture solution largely as HC^*O_3^- ion, was definitely assimilated by the plant roots. Under the conditions imposed, 4-5 percent of the originally available radiocarbon was retained by the tissue, and chemical examination revealed that the absorbed C^* was present chiefly as reduced carbon. The results obtained speak for the independent retention of cations by plant roots, a fact lending support to the exchange absorption theory. It is emphasized, however, that this conclusion applies to the net result of the accumulation reaction which presumably takes place in the cell protoplasm, and the experimental results in no way preclude the possibility that K^+ and HCO_3^- may penetrate the root cell as far as the protoplasmic surface in chemically equivalent amounts.

The significance of trace elements for Chlorella [trans. title], G. STEGMANN (*Ztschr. Bot.*, 35 (1940), No. 10, pp. 385-422, figs. 13).—This study concerned the growth of *C. vulgaris pyrenoidosa* in highly purified nutrient solutions in quartz flasks under deficiencies in N, P, S, K, Na, Ca, Mg, Mn, and Fe.

Electro-foliar diagnosis, C. H. SPURWAY. (Mich. State Col.). (*Science*, 92 (1940), No. 2395, pp. 489, 490, fig. 1).—A preliminary report on the use of a suitable form of the well-known electrolysis apparatus for qualitative or semi-quantitative spot tests for mineral elements (e. g., Fe and Mn, as studied in relation to their role in chlorosis) by electrolyzing the leaf tissue and catching the removable ions in chemically treated filter papers.

Studies on the nutrition of fungi.—V. Factors affecting zygosporo formation in *Phycomyces blakesleeanus*, L. H. LEONIAN and V. G. LILLY. (W. Va. Expt. Sta.). (*Amer. Jour. Bot.*, 27 (1940), No. 8, pp. 670-675, figs. 4).—Continuing the series (E. S. R., 83, p. 38), filter paper was substituted for agar to facilitate transferring the cultures, and a synthetic medium containing only well-known and highly purified substances was used to saturate it. When inoculated with plus and minus strains of *P. blakesleeanus*, a large number of zygo-spores developed. High concentrations of thiamin, dextrose, and aspartic acid proved unnecessary for zygosporo production. A vigorously growing colony of plus and minus strains, when washed and transferred to solutions of any one of the food constituents, failed to produce very many zygo-spores; thiamin was no more effective than distilled water. The constant presence of complete food is thus necessary for maximum zygosporo production. No single substance tested proved to be a sexuality-promoting substance for this fungus.

The chemistry of the fungi, A. E. OXFORD. (Univ. Wis.). (*Chron. Bot.*, 6 (1941), No. 8, pp. 177, 178).—A review and general discussion.

Solar rays and vitamin C, E. F. KOHMAN and D. R. PORTER (*Science*, 92 (1940), No. 2398, p. 561, fig. 1).—Since there was a rapid loss of ascorbic acid in growing tomato plants when kept in the laboratory overnight and a rapid recovery when exposed to direct sunlight, and since there was evidence of a positive correlation between ascorbic acid and sugar in the ripe fruit, the question is posed as to whether it is not possible that ascorbic acid may be a step in the formation of carbohydrates.

Coleoptile growth after preliminary soaking of oat grains in various solutions, H. G. ALBAUM, S. KAISER, and B. EICHEL (*Amer. Jour. Bot.*, 27 (1940), No. 8, pp. 619-623, figs. 5).—In coleoptiles of oats grains soaked 24 hr. at room temperature in solutions of glucose and 3-indoleacetic acid, early growth was retarded and the final length increased. Regardless of treatment, final length was always a function of K , a velocity index in the growth equation, the two being inversely related. The respiration rate of grains immediately after soaking was inversely related to the final length of coleoptiles and hence directly to the growth rate. Growth was also related to the O_2 content of the soaking medium. It is concluded that the coleoptile growth thus treated depends largely on the O_2 content of the soaking medium, which determines in part early respiratory activity. This in turn affects the early growth rate, and thus the final length attained. Under the conditions imposed, the lower the O_2 content of the soaking fluid the slower is the growth rate, the longer the growth period, and the larger the final length of the coleoptile. The relationships described were found to hold when gas mixtures containing 2.5-20 percent O_2 were used.

Growth substances in a hybrid corn and its parents, W. J. ROBBINS (*Bul. Torrey Bot. Club*, 67 (1940), No. 7, pp. 565-574, figs. 4).—The effects of extracts of partially germinated seed of a hybrid corn and its inbred parents was determined on the growth of *Phycomyces* with and without thiamin and on that of *Ashbya gossypii* without biotin. Extracts from the hybrid had a greater effect on early growth of *Phycomyces* in the presence of thiamin than had those of either parent, but extracts of the hybrid did not have a greater effect on *Phycomyces* in the absence of thiamin or on *Ashbya* in the absence of biotin. The possible relation of these findings to heterosis is briefly discussed.

The growth effects of thiamin chloride, ascorbic acid, and phytohormones on belladonna and Ricinus, L. C. ZOPF (*Jour. Amer. Pharm. Assoc.*, 29 (1940), No. 11, pp. 487-497, figs. 10).—Dust treatments of seed with hormone and hormone plus vitamins B_1 and C influenced both germination and growth of *Atropa belladonna* and *R. communis*, varying with the concentration and with

the species and age of plant. α -Naphthaleneacetic acid applied in solution in toxic doses induced varying responses in different plants, the toxic threshold varying with type of plant. Simultaneous use of vitamins B₁ and C exhibited an antitoxic or antidoting property toward plants previously subjected to toxic doses of the hormones used. This reaction was not ascribable to a neutralizing effect or chemical combination between the α -naphthaleneacetic acid and the vitamins. The antitoxic quality of concurrent administration of the water-soluble vitamins B₁ and C was also of value in delaying and reducing the degree of epinastic responses of belladonnas about to bloom. Photosensitizer in aqueous solution added directly to the soil of plants containing both vitamins B₁ and C increased their top growth.

On the growth factor requirements of isolated roots, J. BONNER (*Amer. Jour. Bot.*, 27 (1940), No. 8, pp. 692-701, fig. 1).—Culture of isolated roots in synthetic media is described with particular reference to organic growth substance requirements. Alfalfa, clover, and cotton were found to require additions of vitamin B₁ and nicotinic acid for luxuriant growth in vitro, but vitamin B₆ was without further growth-promotive effect. Isolated roots of *Datura stramonium* and sunflower required additions of vitamin B₁, B₆, and nicotinic acid for luxuriant in vitro growth, whereas carrot required vitamins B₁ and B₆, but nicotinic acid gave no further growth-promotive effect. Five strains of isolated tomato roots from three widely separated sources were successfully cultured in media containing vitamins B₁ and B₆, but nicotinic acid further increased their growth rates. Isolated roots of flax and clover, which can grow slowly in the absence of external supplies of vitamin B₁, were shown to synthesize small amounts of it during in vitro culture. Isolated roots may synthesize biotin during in vitro culture.

The cause of decreased germination of bean seeds soaked in water, H. C. EYSTER (*Amer. Jour. Bot.*, 27 (1940), No. 8, pp. 652-659).—Bean seeds soaked in water for several hours showed a decrease in germination that was significantly influenced by the temperature of the water in which they had been soaked. The germination of stringless green pod bush bean seeds soaked in water at about 25° C. was much less seriously reduced than in those soaked at either higher or lower temperatures. Bacterial activity is an important factor but not the sole cause for these decreases in germinability, as shown by the facts that (1) the soaking process is more deleterious at 10° than at 25°, at which temperature the bacteria are more active, (2) bean seeds placed in running water at 13° for 3 days did not differ in germinability from those soaked in stagnant water at 13° for 3 days, and (3) sterilized seeds soaked in sterile water exhibited a reduction in germinability. That bacteria do, however, reduce germinability was shown by the results with bean seeds soaked without regard to sterilization of both seeds and water. Chemical analyses of the water in which the seeds had been soaked indicated that there is a loss of proteins, digestive enzymes, and growth substances, and that the resulting germinability of the seeds is approximately inversely proportional to this loss. It is believed that alterations in the normal differential permeability of cell membranes in the seeds are the basic cause of the decrease in germinability here reported.

Preliminary observations on physiological and cytological effects of certain hydrocarbons on plant tissues, R. L. PATTON and B. R. NEBEL. (N. Y. State Expt. Sta.). (*Amer. Jour. Bot.*, 27 (1940), No. 8, pp. 609-613, figs. 2).—Treated roots of a purebred strain of corn grown in vitro showed a general lowering of rates of elongation, respiration, and dipeptidase activity of tissue extracts as compared to untreated controls. Methylcholanthrene proved more

active than 1,2,5,6-dibenzanthracene which was more active than acenaphthene, and anthracene appeared to have no effect. Colchicine was not strictly comparable with the other substances used on account of its high water solubility. Methylcholanthrene crystals inserted into stems of *Tradescantia reflexa* tended to increase the volume of the chromosomes in the first division of the pollen grain. Methylcholanthrene added to the water over which onion roots were sprouted increased the diameter of nuclei as observed in sectioned material. If root tips were removed during treatment, methylcholanthrene enhanced the formation but not the growth of lateral root initials. In excised corn roots, methylcholanthrene and dibenzanthracene increased the diameter of prophase nuclei. Acenaphthene increased the diameter of resting diploid nuclei. Colchicine increased the diameter of nuclei only in concentrations high enough to cause polyploidy.

Experimental studies on the cultivation of excised anthers in nutrient solution, W. C. GREGORY (*Amer. Jour. Bot.*, 27 (1940), No. 8, pp. 687-692, figs. 16).—Anthers of Easter lily, tomato, and *Datura stramonium* were excised aseptically and grown in vitro to determine the effects of such isolation on meiosis when they were excised at different stages of development. The young lily anthers grew in nutrient solution except early in meiosis, where the sporogenous cells failed in several ways, depending on the developmental stage of the anthers when excised. Similar reactions were obtained in entire excised buds containing young anthers. Lily anthers excised as late as diplotene continued their meiotic divisions to the formation of quartets. Anthers of tomato and *Datura* failed to grow in nutrient solution. Cutting the flower stems of tomato before meiosis in the buds had an effect on anther development similar to excision of the anther for in vitro culture. Cutting such stems after meiosis in buds only slightly larger than the preceding had no effect on anther or flower development. Furthermore, in a single grafted cutting of tomato on an uninjured stock normal flowering occurred, whereas it failed on similar nongrafted cuttings. The results suggest that control of the chromosomes at meiosis is not vested entirely in the cells actually undergoing the divisions, but results from interactions involving one or more necessary materials which are transported into the anthers from another part of the plant.

A division of the alfalfa cross-inoculation group correlating efficiency in nitrogen fixation with source of *Rhizobium meliloti*, J. C. BURTON and L. W. ERDMAN (*Jour. Amer. Soc. Agron.*, 32 (1940), No. 6, pp. 439-450, figs. 11).—Nitrogen-fixation studies of strains of *R. meliloti* on alfalfa, bur-clover, sweet-clover, and fenugreek indicated that those isolated from alfalfa or sweetclover caused no significant fixation in bur-clover or fenugreek, whereas those from bur-clover or fenugreek gave an average percentage effective in all four hosts. It is concluded that the Rhizobia associated with alfalfa and sweetclover lose some component not necessary for high nitrogen fixation on these legumes but which is very essential for it in bur-clover and fenugreek. The nodule-forming capacity of the bacteria is not altered by association with any of the legumes studied.

Studies on photosynthesis: Some effects of light of high intensity on *Chlorella*, J. MYERS and G. O. BURR. (Univ. Minn. et al.). (*Jour. Gen. Physiol.*, 24 (1940), No. 1, pp. 45-67, figs. 15).—Using the Warburg technic, the effect on oxygen evolution of *C. vulgaris* produced by light intensities up to about 40,000 footcandles was studied. Above a certain critical intensity, determined by the previous history of the cells, the rate of O₂ evolution decreased from the maximum to another constant rate, this depression at first being completely reversible. With a sufficiently high intensity this constant

rate represents an O_2 uptake greater than the rate of dark respiration, and during this constant rate a progressive injury to the photosynthetic mechanism occurs. After a given O_2 consumption the rate falls off, approaching zero, and the cells are irreversibly injured. The constant rate of O_2 evolution decreases in a continuous manner with increasing light intensities, approaching a value approximately constant for all lots of cells regardless of previous history. Theoretical explanations are presented. In *C. vulgaris*, solarization is influenced by the previous history of the cells.

The control of protoplasmic streaming, N. KAMIYA (*Science*, 92 (1940), No. 2394, pp. 462, 463, fig. 1).—Description of a method successfully used with slime-mold plasmodia and said to be adapted to analyses of protoplasmic rhythm and to such problems as that of the relative influences of motive force and viscosity in protoplasmic flow. It also suggests a new method for measuring protoplasmic viscosity.

Influence of daily variation of temperature on development of plants, J. I. POTAPENKO and E. I. ZAKHAROVA (*Compt. Rend. (Dok.) Acad. Sci. U. R. S. S., n. ser.*, 26 (1940), No. 3, pp. 278–282, figs. 2).—Investigating the photoperiodic and temperature relations of certain plants (*Malus baccata*, *Pyrus ussuriensis*, *Cerasus* (= *Prunus*) *besscyi*, and tomato), it was noted that their photoperiodic requirement varied during the course of their development and that light was not always an inhibitor of growth. Some plants may have developed adaptations making it possible for them to grow more intensively on long or continuous illumination, whereas others, adapted to short days, make a stronger growth on continuous illumination because the nightly reduction of temperature favors it. When the temperature is kept at a high level by night, the plants grow very slowly whether on long or short day lengths. It is thus due to a decrease in temperature that growth is stronger by night than by day in certain plants.

Rôle of the temperature gradient in the ontogenesis of higher plants, S. I. RADCHENKO (*Compt. Rend. (Dok.) Acad. Sci. U. R. S. S., n. ser.*, 26 (1940), No. 3, pp. 275–277).—Data presented led to the conclusion that during the period of embryonic development (at the expense of seed supplies) the plant depends exclusively on the temperature of the soil. Later on, when it has passed to an independent mode of nutrition, the plant requires a temperature gradient.

Effect of soil and air humidity and of the temperature of the air upon the formation of spikelets in the ear of wheat, E. G. MININA, E. V. IGRIZKAJA, and P. P. MAZKEVICH (*Compt. Rend. (Dok.) Acad. Sci. U. R. S. S., n. ser.*, 26 (1940), No. 3, pp. 271–274, fig. 1).—The authors conclude from their studies that a high moisture content of the soil and corresponding hydrothermal conditions of the air, as produced by spraying, are necessary conditions for increase in the number of spikelets per ear, this being the first step toward increases in yields. Comparisons of the reactions of the growing cone of summer wheat to external hydrothermal air conditions indicated that the phase of spikelet protuberance is more sensitive than earlier phases. Plants grown in soil at 80 percent moisture content are regarded as younger than those grown at 40 percent. Increased soil moisture, and consequently the lower air temperature, are regarded as factors which rejuvenate the organism.

Oxygen respiration in wheat grain in relation to freezable water, H. G. SHIRK and C. O. APPLEMAN. (Md. Expt. Sta.). (*Amer. Jour. Bot.*, 27 (1940), No. 8, pp. 613–619, figs. 7).—Using the Warburg manometer and mature wheat grain of different varieties, the respiration rate paralleled very closely the freezable water content in grains containing different amounts of imbibed

water in equilibrium with the tissues and colloids of the kernels. As the total water was increased, the unfreezable water calculated as percentage of total solids increased gradually until the grain had imbibed about 21 percent total water, beyond which the percentage of unfreezable water remained practically constant. Thus the ratio of freezable to unfreezable water increased as the grain continued to imbibe total water. The respiration rate correlated closely with the value of this ratio. It is concluded that the sharp acceleration of respiration rate in wheat grains when the total water is increased above a certain minimum is due to a rather sudden increase in the freezable water relative to the other constituents of the cell system. Studying the time rate of respiration in relation to freezable water during the period when a bound- and free-water equilibrium was being established after imbibition of different amounts of total water, the respiration rate decreased very rapidly during the first 5-7 hr. and then more slowly until a fairly constant rate was attained after 25-30 hr. This decline in respiration rate closely paralleled the decrease in freezable water. The total water of the grain remained practically constant throughout the experimental periods. The initial respiration rate and the rate of equilibrium was higher with each increase in total water. As the total water in the grain was increased, the downward drift, with time, of the respiration rate was more gradual but always attained a constant value within 25 hr. The greater the initial total water of the grain, the longer was the time required for establishing a free- and bound-water equilibrium.

Water content and osmotic pressure of certain prairie plants in relation to environment, F. L. MARSH (*Nebr. Univ. Studies*, 40 (1940), No. 3, pp. [3]+44, figs. 23).—In this thesis, water content and osmotic pressure of shoots of prairie plants were studied in both lowland and upland to discover the range of these quantities in plants of true prairie under normal environmental conditions. Relationships between these and the more important environmental factors were also determined and are discussed in detail.

Investigations of insecticidal plants: Physiological studies (*Puerto Rico Sta. Rpt.* 1939, pp. 71-85, figs. 14).—Progress reports are included covering a survey of resin- and starch-cell tissues in rotenone-bearing roots; studies of the effects of exhausting food reserves from rotenone-producing plants, particularly *Tephrosia* and *Derris*; and iron-deficiency chlorosis in sand cultures of *Derris* and fields of *Lonchocarpus*.

Double-staining of starch grains and plastids for permanent preparations, W. N. JONES (*Chron. Bot.*, 6 (1940), No. 7, p. 152).—A brief review of data on the use of methyl violet and Nile blue.

Structure and composition of plant cell membranes, W. K. FARR (*Nature* [London], 146 (1940), No. 3692, pp. 153-155, figs. 2).—A review discussing the historical and modern conceptions and current observations of membrane composition.

The problem of plasmodesmata and inclusion in guard cells of virus-diseased plants, K. ESAU. (Univ. Calif.). (*Amer. Jour. Bot.*, 27 (1940), No. 8, p. 705).—An abstract.

The floral anatomy of the Kalanchoideae, A. H. TILLSON. (U. S. D. A.). (*Amer. Jour. Bot.*, 27 (1940), No. 8, pp. 595-600, figs. 20).—From this study of the floral anatomy of 33 species of the 3 genera comprising the subfamily Kalanchoideae, family Crassulaceae, the validity of the genera *Bryophyllum* and *Kitchingia* is said to be supported by the evidence obtained, but it was indicated that *Kalanchoe fedtschenkoi*, *K. gastonis-bonnieri*, and *K. waldheimi* are species of *Bryophyllum*.

Morphological studies of the pollen grains of common weeds of the Valley of Mexico [trans. title], M. AGUSTINA BATALLA (*Am. Inst. Biol. [Univ. Nac. Mex.]*, 11 (1940), No. 1, pp. 129-161, figs. 87; *Eng. abs.*, pp. 160, 161).—Plants in 24 families whose pollen is wind-disseminated, including also their systematic characters and flowering periods, are considered.

Double fertilization and development of the seed in angiosperms, R. A. BRINK and D. C. COOPER. (Wis. Expt. Sta.). (*Bot. Gaz.*, 102 (1940), No. 1, pp. 1-25, figs. 9).—Following self-pollination in alfalfa 34.4 percent of the fertile ovules collapsed during the first 144 hr., as compared with only 7.1 percent after cross-pollination. Fertile ovule collapse was associated with excessive growth of the inner integument, and this type of seed failure is attributed to inability of the endosperm to keep pace with the growth of surrounding tissues. Up to 6 days after pollination the number of cells in the embryo increased in arithmetical progression, and there was little difference in growth rate after self- and cross-pollination. In the endosperm the number of nuclei increased exponentially during this period, and its growth rate after hybridization was significantly higher than after self-fertilization. The number of endosperm nuclei associated with an embryo at a given developmental stage was regularly higher after cross-fertilization. A survey of 36 other species indicated that the angiosperm ovule is characteristically low in food reserves at fertilization, and early development of the seed thus depends on translocated foods. The endosperm is considered to play an essential role in the partition of these nutrients. The evidence on differential survival of seeds after self- v. cross-fertilization, growth of endosperm and embryo, histological changes associated with collapse, and comparative lack of ovule food reserves are discussed in relation to the role of double fertilization in seed formation. Conjugation of a male nucleus with the polar-fusion nucleus to form the primary endosperm nucleus is believed to be a mechanism by which the physiological advantages of hybridity become available to the endosperm. Continued seed development demands a rate of endosperm development attained more frequently after cross-fertilization by reason of heterosis than following self-fertilization. This view is believed to be confirmed by the behavior of alfalfa seeds following the two types of matings. There are 22 literature citations.

Polyembryony, J. M. WEBBER. (U. S. D. A.). (*Bot. Rev.*, 6 (1940), No. 11, pp. 575-598).—A comprehensive review (116 references) on the various types of polyembryony, frequency of polyembryony and developmental competition of plural embryos, causes of polyembryony, and its relations to phylogeny and to agriculture.

The aerial root primordia in the olive tree and their relation to vegetative propagation [trans. title], J. VIEIRA NATIVIDADE (*Agron. Lusitana*, 2 (1940), No. 1, pp. 25-73, figs. 15; *Fr., Eng. abs.*, pp. 64-70).—The excrescences ("ovuli") formed on the trunk or at the base of olive trees, used for centuries in propagation work, have hitherto been considered as formed of parenchymatous tissue, rich in nutrients and possessing dormant buds. The present study of several varieties indicated that these trunk tumors contain not only dormant buds but also a number of root initials arising in the immediate vicinity of the vascular cambium, whereas the buds originate in the inner layers of the phelloderm, close to the phloem. Contrary to literature statements, it is now demonstrated that the ovuli show a marked positive geotropism. At whatever level formed they grow toward the ground, forming cordlike growths down the trunk and burying themselves in the soil, where they root. Physiologically, these cords represent aerial roots. Accumulations of these cords, forming the

swollen bole typical of adult trees, gradually replace the parts destroyed by rotting processes, and it is to them that this species owes its longevity. It is shown that in grafted trees the appearance of these root-bearing swellings inevitably causes the scions to root, and that this root system insures the nutrition and fixation to the ground of trees of fruit-bearing age, the rootstocks acting merely as nurses until the scions have properly rooted. In place of the current use of rootstocks of slower growth than that of the cultivated varieties, it is deemed desirable to hasten the growth of the trees during their early years by selecting rootstocks of vigorous types and raising them vegetatively.

Contributions to the knowledge of the histology and cytology of the centuryplant, [I-III] [trans. title], F. VILLAGRAN PRADO (*An. Inst. Biol. [Univ. Nac. Mex.]*, 10 (1939), No. 1-2, pp. 1-18, figs. 12, Eng. abs. p. 13; 11 (1940), No. 1, pp. 91-102, figs. 7, Eng. abs., pp. 101, 102).—These contributions are as follows: In part 1 the author presents a study of the cytology of the chondriome and vacuome in cells of the connective tissue. Waxy droplets observed in the epidermal cells are described, and they are believed to serve a defensive function. In part 2 the route followed by the vascular elements supplying the central bud of *Agave* spp. is discussed, showing how they are destroyed when the bud is removed. It is also indicated that all the substances in the plant juice ("aguamiel") come from materials stored in the leaves and not directly from the soil. In part 3 the calcium phosphate and calcium oxalate crystals found in the leaf tissues are identified and described, and hypotheses are presented as to their physiological functions.

Cellophane cover slips and a method for mounting, I. BUCHOLTZ (*Science*, 92 (1940), No. 2393, p. 436).

A simple duplicator for labeling slides, P. H. RALPH (*Science*, 93 (1941), No. 2402, p. 46, fig. 1).

An apparatus for measuring microscopic objects, J. C. LOTZE and M. J. YIENGST. (U. S. D. A.). (*Science*, 93 (1941), No. 2402, pp. 45, 46, fig. 1).—The apparatus described and illustrated was designed for measuring minute objects, such as anaplasms, etc., in tenths of a micron.

Fluorescence microscopy in biology, P. ELLINGER (*Biol. Rev. Cambridge Phil. Soc.*, 15 (1940), No. 3, pp. 323-350).—A comprehensive review (about 6 pages of references) considering the history, technic, and results of fluorescence microscopy, including the examination of spontaneous fluorescence of animal and plant tissues, fluorescence microscopy in bacteriology, and the results of intravital microscopic studies.

A dry-ice freezing unit for cutting frozen sections, K. U. SMITH (*Science*, 92 (1940), No. 2390, p. 364, fig. 1).

An inexpensive apparatus for drying from the frozen state, A. R. TAYLOR and J. W. BEARD (*Science*, 92 (1940), No. 2400, pp. 611, 612, fig. 1).—A simple and inexpensive apparatus is described for use of a specially prepared calcium sulfate ("Drierite") as a desiccant for drying in vacuo such biological materials as viruses and serum proteins.

Experiments on the dry preservation of twigs and buds in their natural form and color [trans. title], J. KISSER (*Ber. Deut. Bot. Gessell.*, 58 (1940), No. 5, pp. 256-268).

Warburg respirometers in plant physiology, J. W. BROWN (*Chron. Bot.*, 6 (1940), No. 6, pp. 126, 127, fig. 1).—An abstract of an article previously noted (*E. S. R.*, 81, p. 620).

An electronic relay for heat control, A. C. HALL and L. J. HEIDT (*Science*, 92 (1940), No. 2400, p. 612).—An improvement in the relay previously noted (*E. S. R.*, 84, p. 18).

An automatic zero pipette for dispensing sterile culture media, N. E. RIGLER and G. A. GREATHOUSE. (Tex. Expt. Sta. and U. S. D. A.). (*Science*, 92 (1940), No. 2390, pp. 363, 364, fig. 1).—The apparatus described and illustrated is made of Pyrex glass throughout. The measuring device resembles the automatic zero pipettes commercially available but is adapted for aseptic use and has proved convenient in sterilizing and aseptically dispensing measured amounts of liquid culture media into sterile flasks. It has been especially useful when large numbers of flasks were to be filled.

An A-C powered pH set, C. W. GOODWIN (*Science*, 92 (1940), No. 2399, pp. 587, 588, figs. 2).—An A-C amplifier for use with glass electrode devices for pH determination is described and diagramed. It has high input impedance and does not fluctuate spontaneously. The resulting elimination of batteries without loss of stability will be especially convenient for recording pH over relatively long periods of time.

The pH requirements of some heterofermentative species of Lactobacillus, J. C. M. FORNACHON, H. C. DOUGLAS, and R. H. VAUGHN. (Univ. Calif.). (*Jour. Bact.*, 40 (1940), No. 5, pp. 649-655, fig. 1).—*L. brevis*, *L. hilgardii*, *L. fructovorans*, *L. gracilis*, and *L. pentoaceticus* were used in this study.

Enzymes concerned in the primary utilization of amino acids by bacteria, E. F. GALE (*Bact. Revs.*, 4 (1940), No. 3, pp. 135-176, figs. 3).—A comprehensive review (107 references).

Attenuation of cell stimulating bacteria by specific amino acids, J. M. VAN LANEN, I. L. BALDWIN, and A. J. RIKER. (Wis. Expt. Sta. et al.). (*Science*, 92 (1940), No. 2396, pp. 512, 513, fig. 1).—As a part of a larger program aimed at clarifying the mechanism whereby *Phytomonas tumefaciens* incites diseased overgrowths in plants, attenuation was accomplished by 20-30 transfers in a mannitol nitrate mineral salts medium containing 0.1-0.3 percent glycine adjusted to pH 6.8. A large number of other amino acids gave similar results. Only racemic mixtures of optically active amino acids were studied except for leucine, in which case both the *l*- and *dl*-compounds proved active. Although glycine was active, its ethyl ester, its anhydride, and sarcosine were not, thus indicating that the free amino and carboxyl groups might be required for attenuation. Also since diglycine was less effective than glycine and triglycine was inactive, the length of the peptide chain appears influential. Over 1,000 attenuated cultures were produced during these studies.

Onion juice and bacterial growth, J. E. FULLER and E. R. HIGGINS. (Mass. Expt. Sta.). (*Food Res.*, 5 (1940), No. 5, pp. 503-507).—Onion juice filtered through a Seitz filter had lost all of its bactericidal vapor, but still retained some power to inhibit bacterial growth when incorporated in a fluid medium. Growth of bacteria from human sources was not inhibited sufficiently to suggest any practical value, but the juice was more effective in preventing growth of bacteria of the *Bacillus subtilis* group. Live steam greatly weakened the potency of the juice, and autoclave sterilization practically destroyed it. Neither a pH range of 5.8-8 nor cold storage for 4 mo. had any effect on the bacteriostatic property.

Radioactive carbon as a tracer in the synthesis of propionic acid from CO₂ by the propionic acid bacteria, S. F. CARSON, J. W. FOSTER, S. RUBEN, and M. D. KAMEN. (Univ. Calif. et al.). (*Science*, 92 (1940), No. 2393, pp. 433, 434).

The microbiology of cellulose decomposition and some economic problems involved, S. A. WAKSMAN. (N. J. Expt. Stas.). (*Bot. Revs.*, 6 (1940), No. 12, pp. 637-665).—This comprehensive review (130 references) covers the classification of cellulose-decomposing micro-organisms, types of cellulose decomposition, the industrial utilization of cellulose decomposition, aerobic and anaero-

bic cellulose-decomposing bacteria, cellulose-decomposing fungi and actinomycetes, chemistry of cellulose decomposition, environmental relations, and problems of cellulose decomposition still remaining unsolved.

Antagonistic interrelationships among microorganisms, S. A. WAKSMAN. (N. J. Expt. Stas.). (*Chron. Bot.*, 6 (1940), No. 7, pp. 145-148).—A general review of the subject, with bibliography.

Studies on the Spirillaceae: Methods of isolation and identification, J. MYERS. (Univ. Minn.). (*Jour. Bact.*, 40 (1940), No. 5, pp. 705-721, pl. 1).

GENETICS

The masquerade of Lamarckism, R. K. NABOURS. (Kans. State Col.). (*Amer. Nat.*, 74 (1940), No. 755, pp. 562-566).—Although there is practically no scientific evidence in support of Lamarckism, the survival of biological forms specially adapted to various complexes of environmental conditions contributes to evolution in such a subtle manner as to appear to have the environment consciously direct their somatic responses.

Dominance an incidental manifestation of general gene interaction, R. A. SILOW (*Chron. Bot.*, 6 (1941), No. 8, pp. 174, 175).—A review of recent work.

Lysenko and genetics, J. B. S. HALDANE (*Sci. and Soc.*, 4 (1940), No. 4, pp. 433-437).—This is in contradiction of and in answer to some of Lysenko's theories (E. S. R., 83, p. 324), such as the belief that breeds of livestock can be altered by feeding.

The chromosome complement and its relationship to cold resistance in the higher plants, W. M. BOWDEN (*Chron. Bot.*, 6 (1940), No. 6, pp. 123-125).—A critical discussion of recent contributions.

Effect of the method of combining two early and two late inbred lines of corn upon the yield and variability of the resulting double crosses, R. C. ECKHARDT and A. A. BRYAN. (Iowa Expt. Sta. coop. U. S. D. A.). (*Jour. Amer. Soc. Agron.*, 32 (1940), No. 9, pp. 645-656).—In experiments designed to test the best method for combining two early (*E*) and two late (*L*) inbred lines of corn, no consistent differences in yield were found between the (*E*×*E*)×(*L*×*L*) and the (*E*×*L*)×(*E*×*L*) double crosses. Variances for silking date, ear height, ear weight, ear diameter, and ear length were significantly less for the (*E*×*E*)×(*L*×*L*) double crosses.

Study of the "siamensis" character in corn (*Zea mays*) [trans. title], M. E. SANGUINETI (*An. Inst. Fitotec. Santa Catalina*, 1 (1939), pp. 17-134, figs. 13; *Eng. abs.*, pp. 133, 134).—Siamensis (*sn*), the gene involved in the twinning of embryos in local corn varieties in Argentina, appeared to be a recessive, and, from linkage data, seemed to be located in chromosome 6. Segregations after selfing suggested that *sn* may be modified by other factors. The twin plants studied were always diploid and had the same number of chromosomes. The material is described and illustrated, and other cases of polyembryony are discussed.

Studies in sterility in regional forms of corn in Argentina [trans. title], E. GINI (*An. Inst. Fitotec. Santa Catalina*, 1 (1939), pp. 135-158, figs. 3; *Eng. abs.*, p. 157).—Male sterility in 9 of 19 families of Argentina corn was due to heritable genes, in 6 to cytoplasmic disturbance, and in 4 to undetermined factors. The genetic and cytological behavior of the several forms are described. A new recessive (*as_{31a}*) producing asynapsis proved different from those reported by Beadle (E. S. R., 63, p. 624; 67, p. 514). Several recessive male steriles (*ms_{33a}*, *ms_{33b}*, *ms_{34a}*, *ms_{34b}*, *ms_{35a}*, *ms_{35b}*, and *ms_{33f}*) seemed normal in

melosis and distinct from North American male steriles tested with them to date. The *ms_{35f}* was linked with *Y y*, with about 8 per cent of crossing over. Cytoplasmic sterility was found only in Mais Amargo from Entre Rios, whereas that due to genetic factors had a wider varietal and geographic distribution.

Inheritance of resistance to *Cercospora oryzae* in rice, T. C. RYKER and N. E. JOBON. (La. Expt. Sta. and U. S. D. A.). (*Phytopathology*, 30 (1940), No. 12, pp. 1041-1047, figs. 2).—On studying plants of the progenies of six crosses between resistant and susceptible varieties, inoculated and also exposed to field infection, resistance was found to be dominant in F_1 , and a 3-to-1 segregation of resistant and susceptible plants was secured in the F_2 . It is thus assumed that a single dominant gene was responsible for resistance. Studies of F_3 were confirmatory.

Genetics, cytogenetics, and breeding in the potato: Review of literature, F. J. STEVENSON. (U. S. D. A.). (*Amer. Potato Jour.*, 17 (1940), No. 11, pp. 299-314).—The review covers 36 titles published 1937-39.

Colchicine induced tetraploids in dioecious and monoecious species of the Amaranthaceae, M. J. MURRAY. (Cornell Univ.). (*Jour. Hered.*, 31 (1940), No. 11, pp. 477-485, figs. 5).—"Colchicine-induced tetraploids have larger cotyledons, leaves, stomata, pollen grains, ovules, stamens, flowers, and seeds than the diploids. In *Acnida tamariscina*, the cross of an XXXX female to an XXYY male gave a sex ratio of 131 ♀♀ : 1,633 ♂♂. This excess of second generation males has been explained on the basis of a high percentage of X-X and Y-Y synapsis of the XXYY males. The high proportion (85 percent) of XY gametes, so produced, results in many XXXY plants which are males. All plants are fertile and without sex abnormalities. Intersexuality is not a barrier in this dioecious species to the production of a tetraploid race, as the cross of an XXXX ♀ to an XXXY ♂ results in a pure-breeding race, with a normal 1:1 sex ratio. Triploid males and females have also been obtained in *A. tamariscina*. The tetraploids of two monoecious species are fertile and exhibit no changes in sex. Comparisons are made between an amphidiploid and a 4n race of one of its parental species."

Heredity and environment in animal production [trans. title], G. BONNIER (*K. Lantbr. Akad. Tidskr.*, 79 (1940), No. 4, pp. 301-314; *Eng. abs.*, p. 314).—A discussion is presented of the possible modifications of heritable differences in production characters resulting from changes in the environment. Suggestion is made that such effects be studied in monozygous twins.

Genetics of farm livestock, R. T. CLARK (*Montana Sta. [Bicn.] Rpt.*, 1939-40, pp. 16, 17).—Studies are noted on the differences in the rate of gain of progeny of specific Hereford sires and on the establishment of families of Rambouillet and Columbia sheep distinct for wool characters.

Are they identical? R. C[OOK] (*Jour. Hered.*, 31 (1940), No. 10, pp. 454, 455, fig. 1).—Triplet calves alike in color markings but consisting of 2 ♂♂ and 1 ♀ are noted.

Genetics of horns in sheep, W. E. CASTLE (Univ. Calif.). (*Jour. Hered.*, 31 (1940), No. 11, pp. 486, 487).—Referring to the papers on the inheritance of horns in sheep by Warwick and Dunkle (*E. S. R.*, 82, p. 320) and Ibsen and Cox (*E. S. R.*, 83, p. 756), the author proposes a simple hypothesis that the horn character is controlled by three allelic genes, (1) *H'*, producing horns in both sexes and whose effect is increased by the ♂ sex hormone, (2) *h*, producing horns only in the presence of the ♂ sex hormone (♂♂ having horns), and (3) *H*, hornless in both sexes. Intermediate phenotypes, such as scurs and knobs, are suggested as resulting from gene interaction and heterozygosis.

Evolutionary allometry in the skeleton of the domesticated dog, H. LUMER (*Amer. Nat.*, 74 (1940), No. 754, pp. 439-467, figs. 9).—Further analysis of the findings of K. Wagner³ on measurements of the skull and limb bones in 28 modern breeds of dogs showed that relationships between them permit the designation of 6 allometric tribes. All members of each tribe fell on the same curve for the relation between the same measures. This classification served for ancient and prehistoric types, as well as modern breeds. Therefore, breeds within a tribe are considered indicative of relative homogeneity with respect to ontogenetic relations in growth. Selection has operated on general size factors differently in different breeds.

The Soviet rabbit "Marder" [trans. title], A. V. KLETCHENKO (*Yarovizatsiya*, No. 4 (1939), pp. 128-134, figs. 2; *abs. in Biol. Abs.*, 14 (1940), No. 9, p. 1374).—A dark-brown ♂ was produced among other progeny from a mating of a chinchilla ♀ with a Russian ermine ♂. This individual was lighter below, with darker extremities and back stripe. Half the progeny from this ♂ and Vienna Blue chinchilla and mongrel ♀s resembled the father. By continued inbreeding the Marder variety was established.

Linkage studies of the rat (*Rattus norvegicus*), III, W. E. CASTLE and H. D. KING. (Univ. Calif. et al.). (*Natl. Acad. Sci. Proc.*, 26 (1940), No. 9, pp. 578-580).—Continuing this series (*E. S. R.*, 77, p. 468), linkage tests between the character producing the jaundice syndrome designated as *j* by C. H. Gunn⁴ showed jaundice to be a marker for the tenth chromosome group in the rat. In suitable backcrosses to double recessives and F₂ populations, jaundice was shown to be independent of the genes for agouti, albinism, curly, curly₂, dilute, hooded, hairless, kinky, and wobbly. Other mutant genes for which no tests have been made because they are known to be linked with one or another of the genes already enumerated are those for brown, anemia, Grüneberg lethal, pink eye, red eye, and waltzing.

Abnormal growth in a strain of rats characterized by low fertility and a high incidence of benign mammary tumors, J. M. WOLFE, E. BURACK, and A. W. WRIGHT (*Endocrinology*, 27 (1940), No. 6, pp. 883-887, figs. 2).—A strain of rats which exhibited approximately 40 percent of mammary tumors at 14 mo. of age and a high degree of low fertility was found to show a growth rate inferior to that of the control strain with a low incidence of mammary tumors. Possible hormones of the pituitary are thought to be responsible.

Report of the committee on mouse genetics nomenclature, L. C. DUNN, H. GRÜNEBERG, and G. D. SNELL (*Jour. Hered.*, 31 (1940), No. 12, pp. 505, 506).—The report of the committee on mouse genetics nomenclature is presented with indications for the list of mutant genes and recommended symbols. The symbols selected for each and their linkage groups are indicated.

"Rhino," an allele of hairless in the house mouse, A. HOWARD (*Jour. Hered.*, 31 (1940), No. 11, pp. 466-470, figs. 2).—A condition in mice designated as rhino, in which the hair began to fall out at from 13 to 14 days of age and was accompanied by wrinkling of the skin, was found to be due to a recessive gene. The skin folds caused certain abnormalities in walking. Crosses of rhino with hairless mice produced mice that were hairless, but they remained smooth skinned. Since no normals were produced, rhino was concluded to be another allele in a series with *hr*, and the individuals were indicated as *hr_{rh}*. Rhino mice were found fertile in both sexes but unable to produce milk. In the F₂, hairless mice are three times as numerous as rhinos; thus *hr* is dominant to *hr_{rh}*.

³ Norske Vidensk. Akad. Oslo, Mat. Naturv. Kl. Skr., 3 (1929), No. 9, pp. 157, pis. 12, figs. 36.

⁴ *Jour. Hered.*, 29 (1938), No. 4, pp. 137-139, fig. 1.

The effects of the injection of Antuitrin G upon a strain of harelip mice, L. C. GLASS. (Univ. Idaho). (*Amer. Nat.*, 74 (1940), No. 755, pp. 566-568).—The influence of Antuitrin-G, the growth hormone, on the development of harelip in strains of mice afflicted with this condition and injected with 10 daily doses at mating was studied. Some reduction in litter size but no change in the occurrence of harelip was found in the 17 young whose dams were injected with $\frac{1}{2}$ unit. Injection with $\frac{1}{10}$ unit increased the average litter size from 4.25 to 6, and the percentage of harelip in 14 young increased to 46.7 as contrasted with 30.2 in the untreated controls.

Genetic studies in poultry.—XI, The Legbar, R. C. PUNNETT (*Jour. Genet.*, 41 (1940), No. 1, pp. 1-8, pl. 1, figs. 2).—Continuing this series (E. S. R., 83, p. 181), the author reports that study of the down color of the progeny of light and dark Legbar parents showed that there was a definite factor leading to darkening of the down feathers brought in by the dark Danish Brown Leghorn strain used in the origin of the breed. This factor was dominant to the ordinary lighter brown-striped type. There seemed to be modifying factors tending to make the heterozygous birds grade into lighter or darker classes, but the darker type is dominant to the lighter type. Mating F_1 δ s from a Legbar $\delta \times$ Brown Sussex q to Brown Sussex hens produced barred and unbarred chicks of both sexes. In this group the q s all showed a tingeing of the shanks at hatching, but it disappeared at maturity. Further analysis of the shank color showed that the two sex-linked factors for mesodermal shank pigmentation, *Id* (shank pigmentation inhibitor) and *B* (barring), suppress mesodermal pigmentation before maturity. They were so closely linked that mating double heterozygotes with barred q s produced four types of offspring, i. e., homozygous and heterozygous barred δ s, barred q s, and unbarred q s, in approximately equal numbers. Since homozygous δ s lacked *Id*, they showed tinged shanks, while heterozygous barred δ s hatched with light shanks. Of 69 progeny so produced there were 4 that were cross-overs. The Legbar has the mesodermal shank pigment derived from the Plymouth Rock, but it is inhibited at maturity by the barring factor.

The developmental anatomy of the Brown Leghorn breast feather, and its reactions to oestrone, P. G. ESPINASSE (*Zool. Soc. London Proc.*, 1939, Ser. A, IV, pp. 247-288, pls. 5, figs. 12).—The growth of marked feathers appearing in the breasts of three Brown Leghorn capons following plucking and injection of doses of from 0.025 to 0.15 mg. of oestrone is described in comparison with feather development noted by Fraps and Juhn (E. S. R., 77, p. 610). It was evident that this hormone spread over the whole area if administered in sufficient quantities and caused a salmon streak on all feathers at the same time. Those nearest the site of injection reacted longest and with the greatest intensity. Injections gave most pronounced effects in the feathers on the side of the injection. Suggestion of the capture and storage of oestrone by the feather germs is given some support. The method may also offer possibilities for testing the oestrone potency of hormones.

Auto-sex linkage in the domestic fowl: Modifiers of the gene for barred feathers, R. G. JAAP (*Okla. Acad. Sci. Proc.*, 20 (1940), pp. 21, 22).—Utilizing the knowledge that two sex-linked genes for white barring tend to make a lighter head spot on δ s than one gene in the sex chromosome in q s, the author studied the modifications of the down color at hatching by sex-linked genes of this kind. In the development of a sexing strain at hatching there were utilized Barred Plymouth Rocks, Partridge Plymouth Rocks, and Rhode Island Reds. Of the chicks produced there were 109 basically striped, of which the δ s (having two barring genes) were much lighter in color at hatching than q s (one barring gene). There was not the clear sex distinction of the red and mahogany progeny.

Four methods of chick sexing, J. J. MACILRAITH and J. H. PETTIT (*Ontario Dept. Agr. Bul.* 413 (1940), pp. 9, figs. 7).—Four methods of chick sexing based on the down color and plumage pigmentation of Barred Plymouth Rocks, feather growth in purebreds and hybrids, and sex-linked and color characters in crossbreds are presented.

Correlation in egg weight between mothers and daughters, F. A. HAYS. [Mass. Expt. Sta.]. (*Jour. Hered.*, 31 (1940), No. 11, p. 476).—Study of the size of eggs produced by mothers and daughters in three lines of Rhode Island Reds selected for small, medium, and large egg size for nine generations showed that regression was nonlinear in all lines. Presumably, this was due to the heterozygous nature of the mothers for genes affecting egg size, since all sires were full brothers. The similarity of correlations between dams and daughters for egg size in all lines is taken to support the hypothesis that genes affecting egg size are autosomal.

The problem of the moult in the castrated Brown Leghorn fowl, A. W. GREENWOOD and M. BURNS (*Quart. Jour. Expt. Physiol. and Cog. Med. Sci.*, 30 (1940), No. 2, pp. 163-171, fig. 1).—The shedding of feathers by three capons was compared with two ♂s and classified as to feather type and location for each month of the year. The capons exhibited a tendency to cast feathers in the winter, with intensification of the process in the spring and reaching a maximum in May or June. The ♀s molted much later, in the fall or early winter. The molting of ♂s was intermediate. It appears that reproductive activity inhibits the onset of molting. Distinct and characteristic evidence of rhythms of feather casting in various regions of the plumage was observed.

Spermatozoal antibodies and infertility in the fowl, W. F. LAMOREUX. (Cornell Univ.). (*Jour. Expt. Zool.*, 85 (1940), No. 3, pp. 419-430).—Study was made in three series of experiments of the influence of semen injections by subcutaneous and intravenous methods, with the resulting formation of antibodies on the fertility of eggs laid during the period of treatment. Injection of as much as 60 cc. of semen during a 10-week period did not show an appreciable increase in the titer of agglutinins against spermatozoa. Even when titers as high as from 1 to 2,000 were induced there was no demonstrable effect on the fertility of the eggs. No evidence of increased infertility induced in frequently copulating hens was noted, nor was it brought about as a result of intramuscular or percutaneous administration of testosterone propionate.

[**Physiology of reproduction in horses**], J. R. QUESENBERRY. (Coop. U. S. D. A. and Mo. Expt. Sta.). (*Montana Sta. [Bien.] Rpt.* 1939-40, pp. 62, 63).—Studies were made of the oestrous cycle and improved methods of artificial insemination of mares.

The reproductive cycle of the male weasel (*Mustela nivalis*), M. HILL (*Zool. Soc. London Proc.*, 1939, Ser. B, III-IV, pp. 481-512, pls. 3, figs. 16).—Based on a study of 327 ♂ weasels, a description is given of the seasonal changes in the reproductive development and histology of the gonadal tissues.

Effects of hypophysectomy in the chick embryo, N. W. FUGO (*Jour. Expt. Zool.*, 85 (1940), No. 2, pp. 271-297, pls. 3, figs. 6).—The removal of the pituitary preprimordium from 33- to 38-hr. chick embryos was found to have no effect on the primary morphological differentiation of organs, but its deficiency was noted in the second half of incubation. The removal of the pituitaries seemed to cause a reduction in growth and the lack of the thyrotropic and gonadotropic hormones affecting normal development of body size, thyroids, plumage, and gonads.

Effects of anterior pituitary extract on spermatogenesis in rat, H. S. RUBINSTEIN and A. R. ABARBANEL (*Jour. Urol.*, 41 (1939), No. 5, pp. 773-779, figs. 2).—Injection of 10 rat units of an extract of sheep anterior pituitary

for 4 days, followed by 20 rat units for 6 days, was studied as to the effect of these doses on body and testis development of rats over and under 45 days of age. There was proliferation of the germinal epithelium in both mature and immature animals. However, maturation was not hastened in immature rats. The testis weight of mature animals was increased, but there was no significant change in the testis size in immature animals, although testicular descent was hastened.

Proposed names for the follicle-stimulating and interstitial cell-stimulating hormones of the anterior lobe of the pituitary body, H. C. COFFIN and H. B. VAN DYKE (*Science*, 93 (1941), No. 2403, p. 61).—The names "thylakentrin" and "metakentrin" are suggested for these hormones.

The action of various steroid hormones on the ovary, H. SELYE and S. M. FRIEDMAN (*Endocrinology*, 27 (1940), No. 6, pp. 857-866, figs. 15).—Various steroids, desoxycorticosterone acetate, progesterone, testosterone, and oestradiol, were found to exert a gonad-inhibitory action on the rat ovary resulting from a depression in the gonadotropic hormone production of the pituitary. Atrophy of the ovarian stroma development, inhibition of follicle development, and the development and formation of the corpora lutea seem common.

Hyperfunction of anterior pituitary in rats.—II, Estrus cycles, B. K. HARNED and V. V. COLE (*Science*, 92 (1940), No. 2390, pp. 361, 362).—Continuing these papers (*E. S. R.*, 82, p. 322), the authors report that oestrous cycles averaged 4.5 and 5.5 days in two strains, respectively. These results were interpreted as an indication of the genetic difference in the strains involving hyperfunction of the anterior pituitary of the strain with the longer cycles.

Induction of fertility by the injection of gonadotrophic preparations, A. S. PARKES and J. HAMMOND (*Vet. Rec.*, 52 (1940), No. 30, pp. 540-543, figs. 2).—By the injection of horse pituitary extract it was possible to induce ovulation of from one to three ova in out-of-season ewes. Injection of the extract during the last 3 or 4 days of a normal cycle caused superovulation at the next oestrus. When injections were made a few days before the onset of oestrus, the corpora lutea inhibited ovulation, and the ripening follicles apparently banked up. If 50 mg. of horse pituitary extract were then administered, from seven to nine ova were shed. In some cases, seven fertilized ova were recovered. Five embryos were removed from the uterus at half term. This dose of extract produced practically 100 percent ovulation in April in barren ewes or in ewes that had lost their lambs. A second injection from 15 to 17 days after the first was needed to induce mating, especially to obtain a second lamb during the same year.

A study of the mechanism whereby copper acetate and certain drugs produce ovulation in the rabbit, C. M. BROOKS, W. G. BEADENKOPF, and S. BOJAR (*Endocrinology*, 27 (1940), No. 6, pp. 878-882).—Ovulation was induced in normal unanesthetized and anesthetized rabbits by intravenous injections of copper acetate. Transection of the hypophyseal stalk 30 days or more prior to the administration of the copper salts prevented ovulation, suggesting that copper salts caused ovulation by acting through the central nervous system.

The production of ovulation and functional corpora lutea in rabbits before and after transection of the hypophysial stalk, C. M. BROOKS, S. BOJAR, and W. G. BEADENKOPF (*Endocrinology*, 27 (1940), No. 6, pp. 873-877, fig. 1).—Although abnormally large quantities of pregnancy urine extract were required in some cases to induce ovulation in rabbits having the hypophysial stalk transected, only the normal amounts were needed in general, and the corpora lutea formed remained functionally active for from 10 to 12 days following injection. Decidual changes did not occur, but progestational changes were observed in these animals.

Artificial insemination [trans. title], B. RIVERIN (*Bonne Terre*, 21 (1940), No. 3-4, pp. 111-122).—A brief account is given of the technic and methods employed in the practice of artificial insemination with livestock.

Artificial insemination of cattle, L. A. GENDREAU (*Canad. Jour. Compar. Med. and Vet. Sci.*, 4 (1940), No. 8, pp. 230-233, figs. 5).—Current views on methods of collection of sperm and the practice of artificial insemination of cattle are discussed.

The effect of storage temperatures upon certain characteristics of bovine semen, H. P. DAVIS, G. K. L. UNDERBJERG, and N. K. WILLIAMS. (Nebr. Expt. Sta.). (*Jour. Dairy Sci.*, 23 (1940), No. 11, pp. 1057-1068).—Semen samples from 11 bulls of different breeds were stored up to 99 hr. at temperatures ranging from 35° to 50° F. and studied as to their comparative motility, pH, concentration of sperm per cubic millimeter, and viability in fertility experiments. Motility within the range studied had no effect on the keeping quality of the sperm. The lower pH was associated with a higher progressive motility and higher concentration of sperm. The storage temperature of 35° was most advantageous, since at that temperature the least change in viability and composition of the semen occurred.

The buffering capacity of bull semen, S. E. SMITH and S. A. ASDELL. (Cornell Univ.). (*Cornell Vet.*, 30 (1940), No. 4, pp. 499-506, figs. 4).—Neutralization curves and buffer coefficients calculated for fresh bull semen showed it to be well buffered in the regions of pH 4.0 to 5.5 and 9.0 to 10.0 but poorly buffered at other degrees of acidity. The buffering action of one sample of seminal vesicle fluid was similar to the semen, but the buffering action of aged semen was reduced.

Preservation of bovine spermatozoa in yolk-phosphate diluent and field results from its use, E. L. WILLETT, H. K. FULLER, and G. W. SALISBURY. (Cornell Univ. et al.). (*Cornell Vet.*, 30 (1940), No. 4, pp. 507-513).—By storage at 5° C. in dilution with the yolk-buffer pabulum described by Phillips and Lardy (*E. S. R.*, 83, p. 615), motility was maintained in some samples examined after 8 days. Conceptions were obtained from samples stored in this diluent as long as from 4 to 5 days. The results were based on over 1,500 inseminations in artificial breeding associations.

The effect of a non-androgenic testis extract on the estrous cycle in rats, D. R. McCULLAGH and I. SCHNEIDER (*Endocrinology*, 27 (1940), No. 6, pp. 899-902, figs. 4).—Studies on ♀ rats showed that injections of inhibin, a fat-free extract of bull testes, over periods of from 3 to 9 days caused cessation or interruption of the oestrous cycles.

The estrin content of the follicular fluid and urine of the mare and its relation to phenomena of the estrual cycle, D. T. MAYER, F. N. ANDREWS, and F. P. MCKENZIE. (Mo. Expt. Sta., Mont. State Col., and U. S. D. A.). (*Endocrinology*, 27 (1940), No. 6, pp. 867-872).—Specimens of urine and follicular fluid from Percheron, Belgian, and Shire mares at different stages of the oestrous cycle were quantitatively analyzed colorimetrically for the presence of oestrogens expressed as crystalline oestrone. The volume of follicular fluid that could be collected from the follicles varied with their age and size. The largest quantities were collected during oestrus. The oestrogen concentration of the follicular fluid was approximately identical at all stages. Therefore, the production of oestrogens was associated with the amount of fluid and the size of the follicle. There were two peaks in oestrogen production in the urine occurring during oestrus and between the tenth and fifteenth days of the cycle. During pregnancy there was a marked increase in oestrogen production as early as 30 days after conception.

Some effects of corpus luteum extracts and of synthetic progesterone on young male albino rats, J. K. LAMAR (*Physiol. Zool.*, 13 (1940), No. 3.

pp. 251-266, pl. 1).—Studies of the influence of administering corpus-luteum extracts from sows and synthetic progesterone to albino rats, mice, and rabbits suggested a weak androgenic action from these preparations. A significant weight increase was induced in the secondary sexual glands in castrated immature rats except that there was no decided weight change in the seminal vesicles. There was a significant weight decrease in the body weight. Sufficient differences were noted in the androgenic effects of progesterone and testosterone to suggest the action of different factors. The action of injections of oestrone was very dissimilar. These results thus show a bisexual effect of progesterone on the immature rat.

Modification of the intrauterine assay method for progesterone, A. L. HASKINS, JR. (*Endocrinology*, 27 (1940), No. 6, pp. 983-988, figs. 13).—A quantitative bio-assay of progesterone is suggested which is based on the epithelial and muscle mitotic counts when the doses were applied to the uteri of oestrogen-primed immature rabbits. Amounts of progesterone within the range of from 0.06 γ to 1.7 γ only could be tested quantitatively.

A new estrogenic substance present in the neutral fraction of human pregnancy urine, R. I. DORFMAN (*Science*, 92 (1940), No. 2399, pp. 585, 586).—In addition to oestrone, oestradiol, and oestriol, a fourth oestrogenic compound was found in the alkali-insoluble substance left after extracting human pregnancy urine with alkali, acid butanol, and ether.

The embryology and postnatal development of the prostate gland in the female rat, J. J. MAHONEY (*Anat. Rec.*, 77 (1940), No. 3, pp. 375-395, pls. 2, figs. 3).—The histological development of the ♀ prostate is described from two strains of rats. In one strain there was a 93-percent incidence of the gland in ♀s, whereas there were neither rudiments nor vestiges of prostate glands in ♀s of 13 days of age in the other strain. Development in the ♀s up to 30 days of age was much like development of the ventral lobe of the prostate in normal ♂s. Following 30 days, involution comparable to that following castration was noted.

The specificity of the lactogenic hormone in the initiation of lactation, A. J. BERGMAN and C. W. TURNER. (Mo. Expt. Sta.). (*Jour. Dairy Sci.*, 23 (1940), No. 12, pp. 1229-1237).—Studies in which graded doses of the lactogenic and thyrotropic hormones were administered singly and in combination to pseudopregnant rabbits showed that the primary function of the lactogenic hormone was to initiate and maintain established lactation. Thyrotropic hormone in large amounts, even in rabbits thyroidectomized to prevent metabolic disturbances, was not able to initiate lactation in a significant proportion of the animals. However, thyrotropic hormones had a beneficial supplementing effect on established lactation.

Evidence for the presence of a second mammogenic (lobule alveolar) factor in the anterior pituitary, J. P. MIXNER, A. A. LEWIS, and C. W. TURNER. (Mo. Expt. Sta.). (*Endocrinology*, 27 (1940), No. 6, pp. 888-892, figs. 3).—Groups of castrated mice given daily doses of from 50 to 200 mg. of fresh anterior pituitary from pregnant cows were found to respond in the development of a lobule alveolar system comparable to that found in ♀s 4 to 10 days pregnant. There is thus a second anterior pituitary mammogenic factor relating to the growth of the lobule alveolar system.

FIELD CROPS

The response to fertilizers of soils of the Blackland prairie section of Texas as determined by the triangle system, J. E. ADAMS, H. V. JORDAN, and P. M. JENKINS. (U. S. D. A.). (*Jour. Amer. Soc. Agron.*, 32 (1940), No. 9,

pp. 657-663, figs. 5).—Cotton grown in fertilizer tests (E. S. R., 80, p. 762) on Houston black clay soil (20 tests), Hunt clay (9), and Wilson clay loam (6 tests) averaged 604, 493, and 360 lb. of seed cotton on unfertilized plats. The average analysis of the three best fertilizers was 10-3-2 for the Houston, 7-4-4 for the Hunt, and 5-6-4 for the Wilson soil, and they produced respective maximum increases in yield of 115 lb. for the Houston, 129 for the Hunt, and 244 for the Wilson soil. Gradients in fertility and response to fertilizers were noted with changes from Houston to Hunt to Wilson soils. The triangle system was particularly effective in obtaining orienting information on the fertilizer needs of soils of the section. The Latin square and other approved field experimental designs, used since 1935 to test fertilizers indicated by the triangle experiments as of greatest importance, confirmed data secured by the triangle system.

[**Crop improvement in Arkansas**]. (Partly coop. U. S. D. A.). (*Arkansas Sta. Bul.* 405 (1940), pp. 29-36).—Outstanding new strains, the result of breeding work and subsequent performance tests, included Rowden 41A, 41B, 42A, and 42C cottons; a number of yellow corn lines and white lines outyielding leading open-pollinated varieties; Arkansas Fortuna and Zenith rice (E. S. R., 84, p. 40); and promising strains of oats derived from Lee × Victoria oats. Variety tests showing the superiority of winter oats over spring oats as an Arkansas crop are reviewed, with results of planting and fertilizer experiments with the crop.

[**Field crops and range investigations in Colorado**]. (Partly coop. U. S. D. A. et al.). (*Colorado Sta. Rpt.* 1940, pp. 9-12, 20, 21, 31, 33, 34, 42-46).—Agronomic research (E. S. R., 82, p. 762) reported on briefly included breeding work with corn (and hybrids) (E. S. R., 83, p. 186), alfalfa, barley, and sorghums; studies of factors responsible for hydrocyanic acid content of Sudan grass; potato research, including breeding work, yield, starch, and mineral content of potatoes grown in the principal potato-growing sections of Colorado as affected by the available soil nutrients and by moisture conditions, fertilizer tests, and seed certification; and research on natural revegetation of native range, involving different grazing methods, a study of nutritive values of range forage, artificial revegetation with native and introduced grasses of depleted range and abandoned croplands and measurement of their grazing capacities, irrigation and management practices to maintain and improve native hay meadows, and range resource surveys.

[**Field crops research in Montana**], A. H. POST, W. O. WHITCOMB, F. M. HARRINGTON, W. E. POLLINGER, D. HANSEN, A. E. SEAMANS, R. M. WILLIAMS, and F. S. WILLSON. (Partly coop. U. S. D. A.). (*Montana Sta. [Bien.] Rpt.* 1939-40, pp. 11-15, 28-31, 34, 35, 47, 48-50, 51, 52, 54, 55, 58, 59).—Current and completed agronomic research (E. S. R., 80, p. 757) reported on briefly included breeding work with wheat, barley, oats, corn, field beans, and grasses; variety tests with wheat, oats, barley, sugar beets, and miscellaneous forage grasses; a test with Ladak alfalfa; fertilizer trials with potatoes, including tests with boron, and with sugar beets; cultural (including planting) tests with crested wheatgrass and other forage grasses, alfalfa, wheat, oats, barley, rye, and corn; crop rotations on dry land and under irrigation and variously fertilized; crop-producing capacity of soils; soil fertility studies; the value of corn in a dry farming program where the corn can be used in the locality; effect of severe weathering on grade, milling, and baking qualities of wheat, and study of oven spring of dough; regrassing abandoned cropland and other uses of crested wheatgrass; studies of hard seeds in legumes, of seed value of light-weight wheat, and characters of strains of crested wheatgrass (E. S. R., 82, p. 39); and control of dandelions in lawns with kerosene.

[Crops research in Puerto Rico in 1939] (*Puerto Rico Sta. Rpt. 1939*, pp. 46-49, 50, 69-71, 98-100, figs. 5).—Variety tests with soybeans, corn, and sugarcane; breeding work with corn and soybeans; an adaptation test of annual teosinte; and work with the Abyssinian cowpea (*Dolichos hosei*), superior as a legume ground cover on steep banks and preferred to para grass by cattle, are reported on briefly.

[Crops research notes] (*Farm and Home Sci. [Utah Sta.]*, 1 (1940), No. 4, pp. 7, 10).—Weed control by chemicals, clean cultivation, and cropping-cultivation combinations; adaptation of strawberry clover for wet locations, even with some alkali; and reduction of cover, seed yield, and depth and weight of roots on range lands by too early and too heavy grazing (E. S. R., 83, p. 763) are described briefly.

Some problems in breeding barley for industrial uses, G. A. WIEBE. (U. S. D. A.). (*Brewers Digest*, 15 (1940), No. 11, pp. 43-45, fig. 1).—A practical discussion of aims and methods of barley improvement.

Bulbous bluegrass, valuable for reseeding intermountain ranges, A. C. HULL, JR. (U. S. D. A.). (*Natl. Wool Grower*, 30 (1940), No. 8, pp. 32, 33, 41-44, figs. 2).—The distribution, habitat, and life history of *Poa bulbosa* (E. S. R., 69, p. 645), its aggressiveness, germination, rate, and depth of planting the bulbils, establishing stands, forage yields, and its possibilities are described from experiments and observations in the intermountain region.

Winter clover pastures for peninsular Florida, R. E. BLASER and F. T. BOYD (*Florida Sta. Bul. 351* (1940), pp. 29, figs. 12).—Further experiments with clovers for pasture (E. S. R., 80, p. 186), largely in cooperation with livestock owners, were concerned with fertilizer needs on acid flatwoods sands and acid mucks and on slightly acid or alkaline soils, influence of fertilizer treatment and soil type on chemical composition of clovers, seeding and management practices, varietal behavior, and advantages of clover in pasture mixtures. Fertilizer treatments, seeds mixtures, and establishment and management practices are indicated for the several soil types and conditions.

To establish clover successfully in Florida, test results show that the soil must be properly fertilized and suitable varieties planted under adapted ecological conditions during a rainy period in October or November on closely grazed sods or well-packed seedbeds. Clover made good growth on acid soils, such as low-lying phases of Leon, Plummer, Portsmouth, Johnson, Scranton, Bladen fine sands, and acid mucks. Slightly acid or alkaline soils, with calcareous substrata, such as mucks and sandy mucks and low marl hammocks, also have proved satisfactory. Moisture requirements for different varieties varied, but none of the winter clovers tested in Florida furnished much feed under dry soil conditions. Unsatisfactory growth was noted on high ridge soils, as Norfolk sand, and high phases of Leon sandy soil. A mixture of Louisiana white Dutch and California bur-clovers appeared to be the most promising clover combination. Black medic, crimson, Persian, hop, little hop, red clovers, and Hubam sweetclover also have been productive under certain conditions.

Corn production in Colorado, W. H. LEONARD, J. F. BRANDON, and J. J. CURTIS. (Coop. U. S. D. A.). (*Colorado Sta. Bul. 463* (1940), pp. 38, figs. 7).—Corn varieties and hybrids and their adaptations, seed and its care, corn improvement, rotations, cultural and field methods, and irrigation and harvesting practices are described from prolonged experiments mainly on dry land at Akron and at the station, and largely noted earlier.

Good varieties comprised locally adapted strains of Minnesota 13, with average frost-free season 110-130 days, Reid Yellow Dent 120 days or longer, and Logan

County White and locally adapted corns for dry land in eastern Colorado. Hybrids have not been as promising at Akron as under irrigation (E. S. R., 82, p. 39). Productive practices included growing corn after a legume or a cultivated crop under irrigation or after fallow or corn on dry land; fall or early spring listing on dry land; four or five plants per hill or drilling from 6 to 9 in. apart under irrigation and plants from 24 to 30 in. apart in 44-in. rows for grain or from 12 to 18 in. apart for silage on dry land; planting May 1-10 in northern Colorado under irrigation and May 15-25 at Akron; cultivation enough to control weeds; and irrigating two or three times, especially at tasseling.

Spacing experiments with corn, A. A. BRYAN, R. C. ECKHARDT, and G. F. SPBAGUE. (Iowa Expt. Sta. coop. U. S. D. A.) (*Jour. Amer. Soc. Agron.*, 32 (1940), No. 9, pp. 707-714).—Comparison, 1936-39, of yields and other agronomic data from corn hybrids, double crosses, and varieties grown at five spacings ranging from 42 by 42 in. to 21 by 14.7 in. revealed that no consistent and material advantage would result from spacings closer than currently used, i. e., about 42 by 42 in. Within comparisons involving the same number of plants per acre, minor variations in spacing had little effect on acre yield.

Cotton variety experiments at seven locations in Georgia, 1937-1940, R. P. BLEDSOE and U. R. GORE (*Georgia Sta. Cir.* 124 (1940), pp. 4).—Variety tests with cotton supplementing earlier work (E. S. R., 83, p. 187) revealed that Stoneville 2B led north Georgia tests in highest average lint yield and money value per acre and was approached by D. and P. L. 11A and 12. Coker 100 also had a good record but is very susceptible to wilt. The high-ranking varieties in south Georgia tests on wilt soil were Coker 4-in-1, Coker Clewewilt 7, and W. W. Wannamaker Clewewilt Resistant, all highly wilt-resistant, stapling 1 in. or longer and with a fair ginning percentage and good-sized boll. Early Wilt, a new variety deemed promising for south Georgia, came from a cross of Cleveland Wilt Resistant and Stoneville 5 and is both resistant to wilt and to root knot nematode and is early. Rhyne Cook has made the best showing of the $\frac{7}{8}$ -in. cottons.

The influence of a 3-year rotation and fertilizer treatments on the organic carbon of soils, W. H. COATES. (N. H. Expt. Sta.). (*Amer. Potato Jour.*, 18 (1941), No. 1, pp. 19-26, fig. 1).—Experiments showing that losses of organic carbon are to be expected when potatoes are grown in a 3-yr. rotation, as potatoes, oats, and clover, with the removal of all crops, and that additions of lime and formulas high in phosphorus were the most effective treatments in reducing organic carbon losses, have been noted from another source (E. S. R., 84, p. 326).

Variations in cooking quality of potatoes as influenced by fertilizers, P. T. BLOOD and J. L. HADDOCK (*Amer. Potato Jour.*, 16 (1939), No. 12, pp. 329-335; also *New Hampshire Sta. Sci. Contrib.* 75 [1939], pp. 329-335).—Experiments with potatoes (E. S. R., 84, p. 326) demonstrated that the fertilizer ratio has had a pronounced influence on the cooking quality (mealiness) of potatoes but could be varied to maintain high quality and high yields. Fertilizers relatively high in potash have lowered cooking quality, whereas extra phosphoric acid increased quality and yields slightly. The general external appearance of the tubers seemed to be improved, but cooking quality was not enhanced, by application of a small amount of boron in the fertilizer.

Effect of time of seeding on yield, milling quality, and other characters in rice, C. R. ADAIR. (U. S. D. A. and Ark. Expt. Sta.). (*Jour. Amer. Soc. Agron.*, 32 (1940), No. 9, pp. 697-706).—Date-of-seeding tests, 1932-39, at Stuttgart, Ark., included 15 kinds of rice planted on four or five dates at 15- to

20-day intervals. Varieties were grouped as sensitive or indifferent in response to date of planting. The sensitive varieties showed a gradual but marked decrease, ranging from 18 to 26 percent, in number of days required to reach maturity when planted on successively later dates, and the indifferent varieties showed a small but less consistent shortening of the growth period, ranging from 9 to 15 percent, with delay in planting. The sensitive rices showed a gradual reduction in height from the first to the last date of seeding, whereas the indifferent were variable and usually showed no consistent reduction in height due to delay in seeding. Most varieties produced more straw in proportion to grain when sown in April than when sown in May or June. The highest yield of grain generally was obtained from late May seeding, although Nira and Arkansas Fortuna produced best from early May seeding. All varieties were highest in milling quality when they ripened during the cooler weather in late September and early October.

Nitrogen-potash-sunlight relationships, R. J. BORDEN (*Hawaii. Planters' Rec. [Hawaii. Sugar Planters' Sta.]*, 44 (1940), No. 4, pp. 237-241).—Fertilizer experiments with sugarcane revealed that when sunlight conditions were such as to limit complete assimilation of applied nitrogen and potassium fertilizers sugar yields would be affected adversely.

Further studies in nitrogen nutrition: Amounts-of-nitrogen test, A. H. CORNELISON and H. F. COOPER (*Hawaii. Planters' Rec. [Hawaii. Sugar Planters' Sta.]*, 44 (1940), No. 4, pp. 273-308, figs. 26).—Field experiments with sugarcane were made to study further (E. S. R., 75, p. 623) effects of nitrogen fertilization on the growth and yields of sugarcane, to study physicochemical and biochemical changes within the plant, and to establish a clearer theory of sugar metabolism and storage and its use in the plant as affected by age and season, irrigation, and varieties. This paper discusses the findings on the effect of nitrogen when supplied at rates of 0, 100, 200, and 400 lb. per acre, in one application, with uniform amounts of phosphorus and potassium.

Effects of nitrogen fertilization on the plant appeared to be controlled largely by weather during the period of most active utilization of nitrogen by the plant. Of effective factors making up the weather complex, temperature, above a certain minimum, seemed to be most important through acceleration of vegetative activity and respiration rates. The genetic age of the plant influences the magnitude of temperature effects and the sucrose storage at any time. Physical and chemical properties of the cell structures are influenced greatly by variable rates of vegetative activity, and, in some cases, changes induced appear more or less permanent. The difference between sugars elaborated by photosynthesis and fractions used in tissue formation and respiration determines at any time the amount of stored sucrose. Nitrogen applications appeared to produce increases in rates of all these functions up to a certain limit, beyond which optimum there was a disproportionate increase in the tissue formation and respiration rates and a resultant lowering in sucrose storage per volume of stalk. The optimum application thus becomes dependent upon temperature or age conditions as to magnitude.

Colchicine in relation to sugar cane breeding, D. M. WELER (*Hawaii. Planters' Rec. [Hawaii. Sugar Planters' Sta.]*, 44 (1940), No. 4, pp. 251-261, figs. 11).—Effects of colchicine on sugarcane are described and illustrated. Numerous seedlings developing from treated seeds of some 50 hybrids within the genus *Saccharum* showed various effects. Below the lethal treatment, which differed for varieties, stimulation or depression of growth resulted according to concentration of solution and duration of treatment. Shoots developing after treatment with high concentrations were short, broad, globose, or sometimes

differed little in external appearance from normal. Cytological study of such seedlings showed the cells of their coleoptiles and growing points to contain lobed nuclei or multinuclei. Division figures exhibited abnormal spindles and an increased number of chromosomes staining more deeply than normally. Seed treated with aqueous solutions of colchicine showed an increase in germination percentage and also stimulation of seedling growth. Very young buds near the growing points of mature cane developed into shoots differing little vegetatively from the parent plant, but flowers of such shoots produced pollen grains several times as large as normal. Often effects of colchicine, either stimulation or depression of growth, appeared in stalks developing from eyes (on the same seed piece) other than those treated.

Wheat varieties for North Carolina, G. K. MIDDLETON, W. H. CHAPMAN, J. W. HENDRICKS, and D. W. COLVARD (*North Carolina Sta. Bul. 328 (1940)*, pp. 11, fig. 1).—Carala, an early stiff-strawed wheat indicated for pastry purposes, originally designated as Alabama Blue Stem 89 and resembling Purple-straw in a number of agronomic characters, made the highest average acre yields, 27.6 bu., 1933-40, at Statesville, and led all named wheats, with an average of 32.7 bu., in 1939-40 at three locations in the Coastal Plain. Carala is recommended in the central and southern Piedmont and throughout the Coastal Plain. In the upper Piedmont, where Carala had not been thoroughly tried and where freezing may be important, Leap, Forward, and Greeson are suggested, and for the Mountain region, where winter injury is still more of a factor, Fulcaster is recommended.

Variation in protein percentage of wheat the result of environment: Moisture, temperature, and soil are important factors in determining quality in wheat, A. F. BRACKEN (*Farm and Home Sci. [Utah Sta.], 1 (1940)*, No. 4, p. 9).—Factors indicated and discussed as conducive to higher protein content in wheat include minimum water and high temperatures during ripening, available nitrogen especially during heading and ripening, inclusion of alfalfa or 5 tons or more of manure in the rotation, and the variety. See also earlier notes (E. S. R., 83, p. 770; 84, p. 183).

[Seed and inoculant research] (*Farm Res. [New York State Sta.], 7 (1941)*, No. 1, pp. 3, 6).—Legume Culture Tests for 1940, by A. W. Hofer (p. 3), tabulates and discusses results of tests of 61 cultures and lists brands of inoculants for sale in New York State. The Cereal Grains, by L. E. Everson (p. 6), reports wide variations in trueness to variety and in productiveness among 106 commercial stocks of barley and of oats tested in control fields.

Results of seed tests for 1940, B. G. SANBORN (*New Hampshire Sta. Bul. 328 (1940)*, pp. [1]+35).—Purity and germination percentages are tabulated for 408 official samples of field and forage crop seed collected from dealers in New Hampshire during the year ended June 30, 1940.

Agricultural seed, A. S. LUTMAN (*Vermont Sta. Bul. [465] (1940)*, pp. 14).—The germination and purity guaranties and variations therefrom are tabulated and discussed from tests of 543 samples of field crop seed and forage mixtures collected from local dealers in Vermont during 1940.

[Seed and weed investigations] (*New York State Sta. Rpt. 1940*, pp. 37-39).—Brief reports are made on the trueness to variety, germination, and other characteristics of official samples of field crop, vegetable, flower, and tree seed and special seeds mixtures; the progress of control field plantings of seed stocks; and weed seed studies.

Some important Michigan weeds, H. T. DARLINGTON, E. A. BESSEY, and C. R. MEGEE (*Michigan Sta. Spec. Bul. 304 (1940)*, pp. 216, figs. 94).—Descriptions, including remarks on habitat, distribution, injurious characteristics, and

illustrations are presented for 94 Michigan weeds, together with a list of species by families, a practical determinative key based on most obvious characteristics, a glossary, a bibliography, and an index. Information is also included on how weeds spread and their control by cultural practice, smothering, and chemicals.

A study of weeds [trans. title], I. RIVERA M. and R. BRETON M. (*An. Inst. Biol. [Univ. Nac. Mex.]*, 11 (1940), No. 1, pp. 103-127, figs. 50; *Eng. abs.*, p. 127).—From soil analyses of vacant lots in the outskirts of Mexico City, it was found that large amounts of calcium and potassium rendered them unfit for cultivation. All these soils were moderately rich in total nitrogen but were low in nitrates. The weeds normally most abundant belonged to the Gramineae, Amaranthaceae, Chenopodiaceae, Cruciferae, and Compositae. From this study, these plants are considered as especially adapted to unfavorable conditions.

A devastating weed, E. L. CAUM (*Hawaii. Planters' Rec. [Hawaii. Sugar Planters' Sta.]*, 44 (1940), No. 4, pp. 243-249, pl. 1, figs. 6).—*Mikania micrantha*, a large rank-growing herbaceous vine, abundant in thickets, along roadsides, in uncared-for clearings, and in more open places in forests, recently introduced into Fiji and Samoa, is indicated as a potential pest of major importance if brought to Hawaii. The plant, a native of Central America, is almost pantropic in range.

HORTICULTURE

Progress report on induced parthenocarpy in some horticultural crops, C. Y. WONG (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 158-160, fig. 1).—Seedless fruits from a number of varieties of watermelon, squash, cucumber, and eggplant were obtained by treating stigmatic surfaces or cut styles of the flowers with certain hormones, such as naphthalene acetic acid or acenaphthene. In certain varieties embryoless seeds developed in the fruits resulting from the treatments. In many instances better development was obtained by using a mixture of two or more growth-promoting substances than by using only one.

Extend use of colchicine as plant breeding tool, M. L. RUTTLE and B. R. NEBEL (*Farm Res. [New York State Sta.]*, 7 (1941), No. 1, pp. 10, 15, fig. 1).—The use of colchicine treatment in obtaining polyploid forms of plants is discussed with special reference to new tetraploid snapdragons and marigolds and the use of the chemical in restoring fertility in tetraploids.

[Horticultural studies by the Arkansas Station] (*Arkansas Sta. Bul.* 405 (1940), pp. 23-28).—Reports are presented upon studies by H. Reynolds and J. E. Vaile of the effect of rootstocks on grapes, by Vaile on factors causing the uneven ripening of grapes, by J. R. Cooper on fertilizers for peach trees, by Vaile and Cooper on varieties of peaches, and by V. M. Watts on irrigation of vegetables.

[Horticultural studies by the Colorado Station]. (Partly coop. U. S. D. A.). (*Colorado Sta. Rpt. 1940*, pp. 31, 32).—Brief statements are given on the progress of various investigations including the breeding of onions, orchard fertilizers, rootstocks, and mulches, and factors concerned with winter injury to raspberries.

[Horticultural studies by the Montana Station], F. M. HARRINGTON and W. E. POLLINGER (*Montana Sta. [Bien.] Rpt. 1939-40*, pp. 33, 35, 36, 45-47).—Included are brief reports on studies relating to the use of transplanting and fertilizer treatments to obtain earlier maturity in vegetables; cultural treatment of sweet cherry orchards; effect of boron on the apple, turnip, rutabaga, and potato; testing of strawberry varieties; culture of the strawberry; and varieties of tree and small fruits.

[Horticultural studies by the New York State Station]. (Partly coop. U. S. D. A., Cornell Univ., et al.). (*New York State Sta. Rpt. 1940, pp. 29-31, 31-37, 41*).—There are presented brief reports of progress on the following studies: Variety testing of fruits, the development of new fruits by breeding, cultural management of orchard soils, nutritional requirements of fruit trees, fertilizers for the strawberry, cultural requirements of the blueberry, propagation and introduction of clonal rootstocks, soil and peat mixtures for roses, sources of peach pits for growing seedlings, effect of growth substances on the development of inserted buds, effect of vitamin B₁ on transplanted fruit plants, embryo and fruit development of the peach, interaction of hydrocarbons and plant tissue, interaction of X-rays and plant nucleuses, genetical analyses of synthetic species, fertilizer requirements of orchard trees in the Hudson River Valley, grape culture, pruning and breeding at the Fredonia Vineyard Laboratory, varieties of hops, effects of vitamin B₁ and phytohormones on the germination of seed, and viability of tree and shrub seeds.

[Horticultural studies by the Puerto Rico Station] (*Puerto Rico Sta. Rpt. 1939, pp. 22-25, 26, 27, 40-45, 46, 62-68, 85-90, 93-98, 99, 100-102, figs. 9*).—Among studies, the progress of which is discussed, are the effect on germination of immersing vanilla cuttings in dilute nutrient solutions; the use of *Gliricidia sepium*, *Erythrina berteroana*, and *Bauhinia reticulata* as vanilla-supporting trees; comparison of Columnaris and West Indian coffee varieties; culture of cinchona, *Strychnos nuxvomica*, *Cinnamomum burmanni*, nutmegs, cloves, etc.; bamboo propagation and utilization; winter muskmelon production; nutrient requirements of the pineapple; smoking pineapples to induce blooming; propagation, culture, and root development of *Derris elliptica*; selection of *Lonchocarpus*; propagation of the mangosteen; treatment of *Aleurites fordii* with vitamin B₁; effect of yeast extract on the germination and growth of mangosteen seedlings; handling of mangosteen seeds in shipment; the value of *Aloe vera* leaves in the treatment of burns; seed production of chia and perilla; use of treefern fiber for orchid baskets; and the testing of miscellaneous plant materials.

[Vegetable crop studies by the New York State Station] (*New York State Sta. Rpt. 1940, pp. 41-44, 44-48*).—Among studies the progress of which is discussed are the weights of large crop seeds, the occurrence of split seeds in canning beans, fertilizer placement, application of fertilizer solutions at the time of transplanting, boron requirements of canning beets, effect of fertilizers on the anatomical structure of beets and on the firmness of canned tomatoes, comparison of northern- and southern-grown tomato plants, testing of vegetable varieties for canning, factors affecting the acidity of canning tomatoes, breeding of squashes and melons, spacing of sweet corn, and the use of corn plants for supporting pole bean vines.

The vegetable seeds, B. E. CLARK (*Farm Res. [New York State Sta.], 7 (1941), No. 1, p. 6, fig. 1*).—In tests of 49 stocks of Golden Cross Bantam, 56 of red kidney beans, 192 of beets, and 160 of carrots, great variability was observed in the viability of the seed and the uniformity and quality of the plants. In general, the stocks from any single source were comparable in quality irrespective of variety.

Searching for "ideal" snap bean, W. D. ENZIE (*Farm Res. [New York State Sta.], 7 (1941), No. 1, p. 13*).—An examination of experimental packs of new strains of snap beans revealed considerable improvement over existing varieties with respect to form and color of the pod and the color of the seeds.

How seed condition affects stand, W. F. CROSIER (*Farm Res.* [*New York State Sta.*], 7 (1941), No. 1, p. 13).—Stating that the field stand of canning beans may be influenced by the size of seeds and the percentage of separated and split cotyledons, the author reports an average of 9 and 11 percent of splitting in lots of Refugee and Kidney Wax, respectively, examined in the 1940 season. The number of seeds per pound for three lots of Improved Kidney Wax was 1,243, 1,450, and 1,570, respectively. A 1-lb. sample of Idaho Resistant Refugee beans had 1,810 seeds.

Some recent yellow sweet corn hybrids, W. D. ENZIE (*Farm Res.* [*New York State Sta.*], 7 (1941), No. 1, pp. 1, 7).—Seneca Golden, Sachem, Hybrid 92×28, Golden Cross, and Mohawk are discussed and compared as to yield, maturity, and plant and ear characters. The yields of cut corn per acre were 2,646, 2,723, 2,744, 3,035, and 3,202 lb., and the days from planting to maturity were 82, 90, 95, 96, and 99, respectively.

Effects of heavy applications of dusting sulfur on soil acidity and cover crop in an orchard, W. H. THIES. (Mass. State Col.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 76, 77).—Soil samples collected at a depth of from 1 to 2 in. from beneath apple trees which had been dusted heavily with sulfur were found to range from pH 3.5 to 4.1 as compared with a range of 4.0 to 4.75 in areas distant from the trees. Where samples were collected beneath the tree at 1-, 2-, 4-, 12-, and 24-in. depths, the pH readings were, respectively, 3.5, 3.92, 4.0, 4.2, and 4.22. At some distance from the trees under grass cover the readings at the same depths were 4.1, 4.6, 5.02, 5.0, and 5.3, respectively. Despite the acid conditions the trees were vigorous and produced abundantly, but liming is deemed necessary to promote the heavy development of cover crops.

The effect of root temperature on growth and nitrogen intake of apple trees, L. P. BATJER, J. R. MAGNESS, and L. O. REGEIMBAL. (U. S. D. A.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 11-18, figs. 2).—The subsection of the root systems of 1-yr. York Imperial apple trees on French seedling piece roots and growing in sand supplied with nutrient solutions of different N levels to a temperature of 45° F. resulted in the formation of terminal buds. Even where a high N solution was supplied, the foliage showed no increase in N content until after a period of about 4 weeks. Later, translocation of N proceeded rapidly with the greening of the leaves and the renewal of terminal elongation. Trees with roots at low temperature made less growth than comparable trees exposed to greenhouse temperatures.

In another experiment in which the cold chamber was held at 42° there was a greater difference in growth between the two temperature conditions and a definite constriction in diameter below the point where the trunk entered the cold chamber. Low root temperature caused a decrease in transpiration and earlier closing of stomata, making it likely that water shortage may have been partially responsible for the lesser growth in the root-chilled trees. Dormant trees with severely pruned roots made little if any growth when their roots were subjected to 40°. Apparently 40° interfered with translocation of N to the top, since control trees showed significantly more N in their bark.

A preliminary report of experiments designed to limit the amount of fertilization in the apple, F. S. HOWLETT. (Ohio Expt. Sta.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 150, 151).—In greenhouse tests the application of 1 to 4 wax emulsion to apple blossoms when they had reached anthesis and before they were pollinated was effective in preventing subsequent pollination. In greater dilutions the wax materials were not effective. The addition of bordeaux mixture to the wax emulsion was helpful in preventing set, except in weak dilutions where the bordeaux broke the emulsion. In the orchard none of the

wax treatments used alone or combined with copper compounds reduced the set significantly, but the author points out that heavy dropping of flowers following bloom may have masked the effects of the treatments.

Growth increment in apple trees, R. L. McMUNN. (Univ. Ill.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 106-109, fig. 1).—While removing trees from the apple variety orchard at Urbana, Ill., opportunity was offered to measure growth on the basis of annual ring increments. Great variations were found between varieties and also between trees within a single variety. There was no indication that any one year was more or less favorable for growth than other years. Averaging all the trees, there was a fairly uniform rate of enlargement after the trees had become well established. In the dry years of 1932, 1934, and 1936 trees laid down more wood than in the preceding year, suggesting that at no time had moisture deficiency been great enough to retard growth. Even where trees were in heavy sod there was no evidence of lesser growth. The trees made somewhat greater growth on their north and east exposures, suggesting more favorable growing conditions. Growth records failed to show any appreciable effect of heavy crops on trunk development.

A comparison of pruned and unpruned apple trees, T. J. TALBERT. (Mo. Expt. Sta.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 113-115).—Comparing three types of pruning, (1) none, (2) modified leader, and (3) open-center, it was found that the severer the pruning the greater were the dwarfing effects. This was particularly evident in the open-center trees, which required severe cutting. After some years no pruning resulted in much shading and killing of small and medium branches due to the lack of sunlight. In 1939, 16 yr. after planting, the yields averaged 7.51, 12.59, and 6.43 bu. per tree, respectively, with definite indications that the modified leader trees would continue to lead.

What the drouths of the '30s did to apple orchards in the Arkansas River Valley in Kansas, R. J. BARNETT and W. G. AMSTEIN. (Kans. Expt. Sta.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 116-118, fig. 1).—With an annual rainfall in 1933, 1934, and 1936 of 19.39, 20.33, and 17.56 in., respectively, Kansas orchards suffered disastrously. A survey in 1939 showed the surviving orchards to be composed largely of young trees and to be comparatively small one-man enterprises. Insects, such as clover mites, common red spiders, grasshoppers, and flatheaded apple-tree borers, were major factors in the death of trees. Irrigation would have saved many of the orchards.

The pollen value of 134 apple varieties as determined by germination tests and field trials, L. F. HOUGH. (Cornell Univ.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 133-136).—Data presented on the germinability of the pollen and on the set of fruit obtained following the application of the various pollens on Delicious and Rhode Island Greening flowers showed, in general, a correlation between the viability of the pollen and its value in pollination. Poor germination was observed in the pollen of Turley and Stayman Winesap and other triploids, yet in some cases triploid pollens gave fair sets of fruits. In general, bud sports gave similar results to those secured with the varieties from which they originated.

New fruits for Utah gardens, F. M. COE (*Farm and Home Sci.* [Utah Sta.], 1 (1940), No. 4, pp. 3, 5, fig. 1).—A number of promising new summer, fall, and early winter apples are briefly described and discussed, particularly with respect to their potential value in Utah.

Response of peach trees to potassium under field conditions, F. P. CULLINAN and J. G. WAUGH. (U. S. D. A.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 87-94, figs. 2).—In an orchard at Beltsville, Md., located on well-drained Sassafras gravelly loam to sandy loam, K deficiency symptoms were

noted on all plats receiving N alone. The production of a heavy crop accentuated the symptoms. Analysis of the leaves showed 2.5 times as much K in those of potash-fertilized trees as in the nitrogen group. K deficiency symptoms were most noticeable in late summer. Analysis of the leaves showing marked K deficiency showed a K content of less than 1 percent on a dry-weight basis. Although it was possible by K treatments to increase the K content of leaves showing from 1.5 to 2 percent K, it is questioned whether the added K would produce beneficial results. Foliar analysis is believed to be a valuable index to the K needs of peach trees, but it is pointed out that there may be only limited areas in an orchard in need of this element. Tabulated data are presented on the K content of peach leaves collected from orchards in Delaware, Maryland, Michigan, and Virginia.

Response of young peach trees in sand culture to varying amounts of nitrogen, potassium, and phosphorus, J. G. WAUGH, F. P. CULLINAN, and D. H. SCOTT. (U. S. D. A.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 95, 96).—In the spring of 1939 an experiment was conducted involving all possible combinations of three levels of N and K and two of P. The most outstanding differences in growth were associated with N at the various levels, irrespective of the amounts of the other nutrients supplied. An increase in N level resulted in significantly increased growth, even with P and K at their lowest levels, but N effects were greater at the higher P and K levels. The reduction in growth due to inadequate P became greater as the N content of the nutrient was increased. K at the levels used had less direct effect on growth than did N or P. Chemical analysis of the N, P, and K contents of the leaves on a dry-weight basis reflected very consistently the observations on foliar appearance.

Peach tree fertilizer demonstration results, E. H. RAWL (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 85, 86).—Under South Carolina conditions in order to obtain proper development of cover crops, foliage, fruit buds, twigs, and fruit, it was found necessary to supply (in addition to N) P, K, and limestone. Potash appeared to have the least significance, yet abnormal trees were not restored to satisfactory condition without this element.

The Redhaven peach, S. JOHNSTON (*Michigan Sta. Quart. Bul.*, 23 (1940), No. 2, pp. 93-95, fig. 1).—A description is presented of a promising new peach, developed at the South Haven Horticultural Substation, from a cross of Halehaven by Kalhaven. The fruit ripens about 1 mo. ahead of Elberta, the flesh is yellow, and the stone is free. The exterior color is a bright yellow, usually almost completely covered with brilliant red.

High-bush blueberry culture in Rhode Island, A. E. STENE (*Rhode Island Sta. Misc. Pub.* 8 (1940), pp. [14], pls. 3, figs. 3).—This is a presentation of general information relating to the selection of sites, varieties, pruning, culture, etc.

Late holding of water on cranberry bogs, C. S. BECKWITH (*New Jersey Stas. Cir.* 402 (1940), pp. 4).—Stating that the occasional late holding of water, to July 5-10, has been found an effective and economical means of insect control and for invigorating run-down plants, the author discusses the effects of such treatment on various insects, fruit rot organisms, and weeds. The practice is recommended only for bogs that have become partly exhausted and not for those in a thrifty condition.

The trailing raspberry—*Rubus parvifolius* L.: Characteristics and breeding, C. F. WILLIAMS and G. M. DARROW. (Coop. U. S. D. A. et al.). (*North Carolina Sta. Tech. Bul.* 65 (1940), pp. 13, figs. 4).—This includes a brief description of the species and an account of efforts to improve the fruit by selection and by crossing with the cultivated red raspberry. In plant characters

the hybrids were generally intermediate between the parents. The hybrids varied in resistance to leaf spot from very susceptible to resistant, none equaling the original *R. parvifolius* selections in this respect. The fruit of the hybrids ranged from light to very dark red in color and was usually very acid. The worst features of the hybrid fruits were the small number of drupelets and their crumbling structure. About 40 percent of the hybrids with Taylor, Newburgh, and Latham were self-fertile. Since many of the *R. parvifolius* seedlings are self-sterile, it is suggested that self-sterility in the hybrids may be an inherited character.

Effect of leaf removal and crown covering on the strawberry plant, G. F. WALDO. (U. S. D. A.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 548-552).—Covering strawberry plants with soil from June to September with a view to protection from egg-laying by adult strawberry crown moths reduced yields the following season when drought conditions obtained during the period of covering but not when ample moisture was available. Topping the plants prior to covering did not decrease yields when ample moisture was present. Topping alone increased yields under abundant moisture conditions and had no adverse effects under drought conditions. Covering or topping plus covering is recommended provided soil moisture is adequate.

The use of certain nutrient elements at the time of flower formation in the strawberry, J. H. LONG (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 553-556, figs. 2).—In Aroma plants that had been grown in loam or controlled nutrient cultures the first evidence of change from vegetative to flower cells was noted on October 2 when there was a slight corrugation of the parenchyma tissue of the crown. In Aroma plants grown in white sand supplied with solutions lacking in certain elements, it was evident that N may be withheld as late as 3 weeks prior to the date of approximate flower-bud formation without decreasing the number of flower buds as compared with the full-nutrient lot. Ample P must be added from 4 to 6 weeks prior to the expected date of flower-bud formation. The results with K were not as conclusive, but in general if any of the three elements was omitted there were fewer flower buds formed.

The Massey strawberry, G. M. DARROW and E. B. MORROW. (Coop. U. S. D. A. et al.). (*North Carolina Sta. Bul.* 327 (1940), pp. [3], fig. 1).—A description is offered of a new variety originated as a cross between U. S. D. A. No. 634 (Royal Sovereign × Howard 17) and Blakemore. In eastern North Carolina the fruit ripens a week or 10 days later than Blakemore and because of its beauty, size, firmness, and high dessert quality is considered superior for the fancy trade.

Search for maturity and quality tests for grapes continues (*Farm Res. [New York State Sta.]*, 7 (1941), No. 1, p. 16).—In search of a simple and effective criterion of maturity, the station collected samples of fruit of several varieties of grapes in four producing regions and tested them throughout the ripening season with respect to sugar and total solids contents. Total solids were some 2 or 3 percent higher than true sugar content, but fortunately the difference between the two constituents was nearly constant for any given variety. In the Concord the juice was found to contain, on an average, 2.2 percent more solids than sugars. Total solids determined by the hand refractometer agreed well with those determined by the hydrometer. The locality where grown exerted a profound influence on sugar content, necessitating standards for the different producing areas.

Cambial activity in the Hachiya persimmon, C. J. ARCHER and S. H. CAMERON. (Univ. Calif.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 127-129).—Observations on samples of wood taken at weekly intervals from 9-year-old trees showed swelling of cambial cells by the last week in February in the preceding season's growth, from 1 to 2 weeks later in second-year, and from 3 to 4 weeks

later in third-year growth. No unligified xylem elements were found in sections taken from normal trees after the third week of August, indicating a cessation of cambial activity. The initiation of cambial activity was dependent on bud growth and proceeded basipetally therefrom. Cambial activity ceased more abruptly and more uniformly than it was initiated, and fruiting had little effect on duration but did influence the rate toward the end of the season.

The influence of pollination on seed development in certain varieties of citrus, C. Y. WONG (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 161-164).—The absence of seed in Valencia, Hamlin, Pineapple, and Parson Brown oranges, the pollination of which was prevented by cutting off the filaments and styles before anthesis, suggested that apogamic embryonic seeds required the stimulation of fertilization and pollination or that of synthetic or natural auxins. Especially in naturally seedy types, such as Parson Brown and Pineapple oranges, the number of seed was increased by cross-pollination as compared with self-pollination. The lesser effect of cross-pollination on seed production by Valencia is attributed to hereditary factors for seedlessness in this variety, and the relative seedlessness of Valencia and Hamlin oranges and Marsh grapefruit in solid blocks to the insufficient amount of functional pollen for fertilization. It is believed that the seedlessness of a given variety is governed largely by its hereditary and evolutionary characters.

A preliminary note on nitrogen assimilation by citrus trees, R. H. HILGEMAN, J. G. SMITH, and G. E. DRAPER. (Univ. Ariz.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 58-61, figs. 2).—In the case of Marsh grapefruit trees growing on different soil types in the Salt River Valley, it was found that the application of N was reflected by an increased N content of the leaves within 15 days in some instances. The maximum percentage of N found in mature leaves was approximately 2.35 percent. The rate of assimilation of N was more rapid in early fall and spring than during winter. There was a greater assimilation of N during the winter from calcium nitrate than from ammonium sulfate. The percentage N content of the old mature leaves declined in late winter and early spring just prior to and during new growth and blooming. The N content of leaves on new spring growth was essentially the same regardless of the form of N used or whether applied in September, December, or early March.

Nitrogen nutrition in relation to yield and quality of grapefruit, W. E. MARTIN. (Univ. Ariz.). (*Plant Physiol.*, 14 (1939), No. 3, pp. 606, 607).—The experiments reported indicate that a relatively high nitrogen content of the tissue at blossoming time is followed by a relatively large set of fruit, while present evidence suggests that high quality fruit at harvest follows a relatively low N content of the tree during summer and fall and may be materially affected by cultural practices carried out during the growing season. "If present evidence is borne out by further studies, orchard management programs in Arizona could then be planned by considering the seasonal needs of the tree, and nitrogen could be applied when it would do the most good in maintaining production but be withheld or diverted by cover crops during the season of the year when its presence might impair the commercial quality of the fruit."

Some effects of cultural practices upon tree composition, yield, and quality of Marsh grapefruit in Arizona, W. E. MARTIN. (Univ. Ariz.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 68-75, figs. 2).—Supplementing the above article, further evidence is offered to show that the degree of vegetativeness of the tree and the N content of the leaves and twigs of the Marsh grapefruit at different times of the year may be altered by appropriate com-

binations of N fertilization and the use of competing cover crops such as Sudan grass and winter barley. N fertilization in winter together with clean cultivation promoted a high N content in the trees prior to bloom and satisfactory yields. On the other hand, N fertilization in summer plus clean cultivation caused a vegetative condition with coarse-textured fruits of low market quality. Competing cover crops in the summer decreased vegetative growth and increased the proportion of smooth-textured fruits. The most satisfactory system of management from the standpoint of quality and quantity of fruit was winter nitrogen treatment in conjunction with competing cover crops the balance of the year. Data are presented on the N and carbohydrate composition of twigs and leaves of the trees in the several treatments.

The influence of relative humidity on the respiration of papaya at high temperatures, W. W. JONES. (Hawaii Expt. Sta.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 119-124, figs. 3).—Papaya fruits were injured severely when subjected to a temperature of 43.3° C. under saturated conditions for a period of 16 hr. or more, but with a relative humidity of 60 percent and a 43.3° temperature visible injury did not occur. The factors causing the differential behavior are not fully clear, but it is suggested that the lower water content of the fruits at 60 percent relative humidity, brought about by increased transpiration, may have been an important factor in preventing injury. Anaerobic conditions are likely more intense in the saturated atmosphere due to decreased gaseous exchange.

Papaya culture in Florida, H. S. WOLFE and S. J. LYNCH (*Florida Sta. Bul.* 350 (1940), pp. 35, figs. 15).—General information is offered relating to the history, botany, uses, flower structure and sex variation, climate and soil requirements, propagation, planting, fertilization, culture, fruit thinning, harvesting and handling, yields, development of new varieties, and the control of insect pests and diseases.

The flower seeds, M. T. MUNN (*Farm Res.* [New York State Sta.], 7 (1941), No. 1, p. 6).—In 148 samples representing asters, calendulas, marigolds, and zinnias tested in the field there was a wide diversity in germination, varietal purity, vigor of growth, etc. In a few instances the seed was practically worthless, indicating the need of such field tests.

Propagation of ornamental plants, J. V. WATKINS (*Florida Sta. Bul.* 347 (1940), pp. 54, figs. 21).—Propagation is discussed from the standpoint of frames and their management, shading requirements, rooting media, root-promoting substances, water requirements, preparation of cuttings, types of cuttings, division of root clumps, layering, budding, grafting, growth from seeds, and the management of the new plants. In addition, recommendations are presented in tabular form for the propagation of a large number of ornamentals, together with a list of common and botanical names.

FORESTRY

Factors controlling the early development and survival of eastern white pine (*Pinus strobus* L.) in central New England, L. F. SMITH. (Kans. Expt. Sta.). (*Ecol. Monog.*, 10 (1940), No. 3, pp. 373-420, figs. 8).—In studies conducted in the Yale Forest near Keene, N. H., it was observed that overhead canopies of pine stands improved conditions for seedling germination by reducing evaporation from the surface soil. Germination was delayed a few days by the lower soil temperature under shade, but not to a harmful degree. Pine litter was an unfavorable medium for white pine seed germination, especially in direct sunlight. High surface temperature was a major cause of seedling mortality in full sunlight. Under full canopy, soil moisture

was a critical factor for 1-year-old seedlings, as the full canopy and heavy surface litter intercepted a considerable portion of the precipitation. With respect to light, approximately 20 percent of full sunlight was necessary for satisfactory first-year seedling growth, and plants in full light were larger and more vigorous than those in partial shade. Rodents were the major biotic factor in mortality, destroying 13.3 percent of the plants in full shade, 3.1 in part shade, and 1.8 percent in full sun. Insects were not a major factor in seedling mortality. Fungi caused 4 percent loss of seedlings in full shade but were of no significance in the open.

The natural establishment of pine in abandoned fields in the Piedmont Plateau region, W. E. McQUILKIN. (U. S. D. A.). (*Ecology*, 21 (1940), No. 2, pp. 135-147, figs. 7).—Stating that practically all of the abandoned agricultural land in the Piedmont area sooner or later reverts to pine, the author found that the paramount factor affecting the reestablishment of loblolly and shortleaf pines is the presence of an adequate source of seed in the form of nearby parental trees. Site factors, by their influence on available soil moisture, may account for variations in densities of established seedlings or influence the time required to establish stands. With adequate seed sources and fair to good site conditions, reproduction in densities equivalent to 1,000 or more seedlings per acre was recorded to distances averaging about 330 ft. away from the parental trees. Beyond 462 ft. seedling production rarely approached satisfactory densities.

Site factor variations and responses in temporary forest types in northern Idaho, J. A. LARSEN. (Iowa State Col.). (*Ecol. Monog.*, 10 (1940), No. 1, pp. 1-54, figs. 15).—Equipped with weather stations, established on a level area in a larch-Douglas fir forest, on a southwest western yellow pine slope, and on a northeast aspect within the western white pine type, a study was made of various site factors governing the reestablishment of forests following fire, logging, or other denudation. The southwest aspect had the higher daily and seasonal air temperature maxima and the longer duration of temperatures favorable for growth. The minima of the air temperatures were lowest on the flat both winter and summer and highest on the northeast slope.

Soil temperatures reflected and followed the trend of air temperatures, with absolute maxima at the surface of 125°, 100°, and 95° F., respectively, on the southwest, the flat, and the northeast aspects. On the southwest slope, soil moisture reached more critical minima and remained at dangerously low points for extended periods in summer. The soils on the northeast slope contained a greater clay and silt fraction and had higher capillary and other moisture-retaining qualities than those of the southwest slope. The soils of the larch-Douglas fir site were intermediate. Plantings on the several sites as measured by germination, survival, and growth responded in the same manner as existing trees, that is, western yellow pine was practically the only species of six tested to survive on the exposed southwest slope. There was demonstrated an early selectivity of the native species for their more suitable environment.

Watering germinating seedbeds, Y. LI (*Jour. Forestry*, 38 (1940), No. 11, pp. 897-898).—In studies conducted at the Cloquet [Minn.] Forest Experiment Station in which jack and red pine seeds were sown in watertight boxes supplied with different amounts of water, it was noted that the red pine required the more water for germination. Jack pine germinated more rapidly and completed germination sooner than did red pine. A moderate water supply was better than an excessive or scanty amount. Beneficial moisture conditions favored a low top : root ratio by weight and a high top : root ratio on the basis of length.

Soil temperatures during forest fires and their effect on the survival of vegetation, N. C. W. BEADLE (*Jour. Ecol.*, 28 (1940), No. 1, pp. 180-192, pl. 1, figs. 6).—Following the burial at different depths of small glass tubes containing organic materials of known melting point, fires were built on the surface and burned for different intervals. The results indicated that the probable maximal temperature during a severe fire is 111°-114° C. at 1 in. and 59°-67° at 3 in. Under extreme conditions the temperature at 1 in. may exceed 250° and attain 43°-50° at 1 ft. A high percentage of water in the soil retarded the conduction of heat. Fires had no appreciable effect on the physical properties of the soils under study. Seeds were apparently able when dry to resist a temperature of 110° for 4 hr. Seeds with hard coats could withstand immersion in boiling water for as long as 70 min. without complete loss of viability. Plants with lignotubers were rarely killed but put forth new shoots from these organs.

Snow damage to conifer plantations, M. W. DAY (*Michigan Sta. Quart. Bul.*, 23 (1940), No. 2, pp. 97, 98).—At the Dunbar Forestry Experiment Substation, 10- to 13-year-old blocks of coniferous species were examined following a winter of exceedingly heavy snowfall, totaling 128 in. The damage consisted almost entirely of the breaking away of lower lateral branches below the snow level. In order of decreasing injury were red pine 17.9 percent, white pine 7.3, white spruce 2, Norway spruce 1.2, and Scots pine 0.9 percent. Generally the more severely injured trees were the smaller ones, especially when surrounded by several larger trees.

Some effects of artificial defoliation in pine and larch, F. C. CRAIGHEAD. (U. S. D. A.). (*Jour. Forestry*, 38 (1940), No. 11, pp. 885-888).—An investigation with young Asiatic larch, jack pine, and Scotch pine, in which the trees were defoliated in different degrees of severity to simulate insect damage, showed that the complete removal of all the leaves at any time during the growing season or early in the dormant period resulted in death of the trees. The removal of the current year's growth on pines was relatively more injurious than the removal of old foliage, especially after the new growth had developed.

Retarding needle fall on black spruce Christmas trees, R. K. LEBARRON and A. P. SWAYNE. (U. S. D. A. and Univ. Minn.). (*Jour. Forestry*, 38 (1940), No. 12, pp. 941-943, fig. 1).—Comparing three treatments, (1) nothing, (2) bases in water, and (3) bases in a solution of malic and citric acids and calcium carbonate, for the preservation of cut Christmas trees placed in a warm dry room, after a preliminary storage period under damp cold conditions, it was found that plain water was the most effective method for retarding needle abscission. The chemical treatment was intermediate between the other two in effectiveness. In a second experiment in which some of the trees were sprayed with wax emulsion, this treatment caused a pronounced yellowing of the needles within a few days. As a practical deduction it is suggested that the placement of the tree base in a container of water is the simplest and most effective way of preserving Christmas trees.

Lumber from old-growth versus lumber from second-growth in *Pinus strobus*, E. M. DAVIS. (U. S. D. A. and Univ. Wis.). (*Jour. Forestry*, 38 (1940), No. 11, pp. 877-880).—Comparing second-growth white pine in New England with data taken in the 1922-26 period on old-growth pine cut in Minnesota, the author shows that the second-growth was far inferior in quality. The second-growth material under study produced only about one-fourth as much select and about one-half as much high-common lumber as did the old-growth in Minnesota. However, shake and decay, often the determining defects in old-growth low-common, were almost negligible in the second-growth. Knots were noticeably sounder in the second-growth.

DISEASES OF PLANTS

Abstracts of papers accepted for presentation at the thirty-second annual meeting of the [American Phytopathological] Society, Philadelphia, Pennsylvania, December 27 to 31, 1940 (*Phytopathology*, 31 (1941), No. 1, pp. 1-26).—Abstracts begun on the pages indicated are included: Page 1, The Problem of Controlling Certain Diseases of Forage Grasses by Selection and Hybridization, by O. S. Aamodt., C. L. Lefebvre, and H. W. Johnson; Temperature as a Precision Factor in Chemically Distinguishing *Cronartium ribicola* and *C. occidentale*, by R. J. Acree; Yellowing in Everbearing Progressive Strawberries, by M. M. Afanasiev and H. E. Morris; Some *Fusarium* Wilt Organisms, by G. M. Armstrong, L. Shanor, C. C. Bennett, and B. S. Hawkins (S. C. The Plant Disease Reporter, [December 1 and 15, 1940] (*U. S. Dept. Agr., Bur. Plant Indus., Plant Disease Rptr.*, 24 (1940), Nos. 22, pp. 451-468; 23, pp. 469-505, figs. 3).—The following items of interest to phytopathology are included:

No. 22.—Incidence of potato late blight in 1940; peanut diseases in certain Texas counties in 1940, by G. KenKnight; fall infections of cereal rusts in

Kansas, by C. O. Johnston; and host-parasite check-list revision (*Caryota* to *Castanopsis*), by F. Weiss.

No. 23.—Status of yellow-red virosis (X-disease) of peach and chokecherry in 1940, by E. M. Hildebrand and D. H. Palmiter; X-disease of peaches spreading in Utah, by B. L. Richards; apple tree anthracnose in Illinois, by H. W. Anderson; tomato defoliation diseases, by C. F. Andrus; potato late blight situation in Virginia in 1940, by H. T. Cook; *Phytophthora* bleeding canker and basal canker diseases of maple in New Jersey, by P. P. Pirone; relative susceptibility of rose varieties to black spot (*Diplocarpon rosae*), by E. A. Piester; host index of grass disease in the Pacific Northwest in 1940, by G. W. Fischer; and host-parasite check-list revision (*Castilla* to *Celtis*), by F. Weiss.

[Phytopathological work] (*Arkansas Sta. Bul.* 405 (1940), pp. 37-40, fig. 1).—Brief summaries are included on the present status of studies on the control of cotton wilt and "rust" conducted by V. H. Young and W. H. Tharp (coop. U. S. D. A.); the origin of oats crown rust epidemics, by H. R. Rosen and L. M. Weetman; promising results with spraying of strawberries, by S. B. Locke and Young; and controlling rice diseases, by E. M. Cralley.

[Phytopathological studies by the Colorado Station]. (Partly coop. U. S. D. A.). (*Colorado Sta. Rpt.* 1940, pp. 26, 31, 32).—Brief reports are given on studies of peach mosaic; bacterial ring rot of potato; onion breeding, including the development of resistance to purple blotch and thrips; and the relations of calcium and potassium to chlorosis in stone fruits.

Department of botany and bacteriology, H. E. MORRIS (*Montana Sta. [Bien.] Rpt.* 1939-40, pp. 20-22, 34).—Studies are briefly reported relative to seedling diseases ("black-root"), phosphate deficiency, and *Fusarium* yellows of sugar beets; and to a potato disease (bacterial ring rot) new to Montana—its identification and control, including a method of tuber selection developed by V. E. Iverson and H. C. Kelley.

Division of plant pathology (*New York State Sta. Rpt.* 1940, pp. 23-28, 39, 40).—Reports of disease investigations include brief notes on copper injury tests on apple, spray stickers, brown rot of peach, peach leaf curl, yellow-red virus or "X" disease of peach, bacterial canker of cherry, diseases of small fruits (raspberries, gooseberries, and currants), bean mosaic severity and control by resistant varieties, tomato leaf blight incidence and control by spraying, pea seed treatment, cabbage yellows control by resistant varieties, *Fusarium* foot rots of peas, diseases (downy and powdery mildews) of hops and the hop-vine borer and their control, lima bean seed treatment, cauliflower black rot studies (coop. Cornell Univ.), and studies of seed-borne fungi and bacteria of various crop plants and their control by chemical means.

Plant-disease investigations (*Puerto Rico Sta. Rpt.* 1939, pp. 68, 69, 117-119, figs. 2).—Brief reports are included on zinc sulfate sprays for minimizing mottle leaf in grapefruit, *Cercospora* leaf spot (Sigatoka disease) of bananas in Puerto Rico, and a serious infectious disease of vanilla of as yet unknown cause.

Descriptions of new fungi causing economic diseases in Scotland, C. E. FOISTER (*Bot. Soc. Edinb., Trans. and Proc.*, 33 (1939-40), pt. 1, pp. 65-68, figs. 14).—Descriptions are given of *Phytophthora verrucosa* n. sp., causing top rot of tomato; and *Phoma foveata* n. sp., causing gangrene disease of potato.

Some problems in handling and interpreting plant disease data in complex factorial designs, W. H. THARP, C. H. WADLEIGH, and H. D. BARKER. (*Ark. Expt. Sta. coop. U. S. D. A.*). (*Phytopathology*, 31 (1941), No. 1, pp. 26-48, figs. 2).—Plant-disease data are frequently expressed as percentages, or on some relative scale of an index system. However, when percentage data are from tests where large differences are secured for certain disease-control treatments,

or where known checks are included, the resultant heterogeneity makes the problem of a reliable error term or of selecting the proper transformation more difficult. This is especially true where the data are derived from experiments of factorial design because the interactions are of considerable interest, yet they are not always to be interpreted with confidence on the transformed scale. This paper, based on experimentation with mineral nutrition of cotton in relation to its susceptibility to *Fusarium* wilt, presents some of these problems in the hope that it may aid others under similar difficulties.

Handbook of virus investigation.—II, Specific viruses as infectious agents, immunity against virus infections, the technic of experimental investigation of phytopathogenic viruses, edited by J. CRAIGIE, R. DOERR, G. M. FINDLAY, C. HALLAUER, K. M. SMITH, and O. THOMSEN (*Handbuch der Virusforschung*, edited by R. DOERR and C. HALLAUER. 2. Hülft, *Die Virusarten als Infektiöse Agenzien, die Immunität gegen Virusinfektionen, die Technik der Experimentellen Erforschung Phytopathogener Virusarten*. Wien (Vienna): Julius Springer, 1939, pt. 2, pp. XVI+547-1384, figs. 19).—This is the second contribution in this monograph series, previously noted (E. S. R., 81, p. 523), and concerns both animal and plant viruses.

The identification of certain viruses found infecting leguminous plants in Great Britain, G. C. AINSWORTH (*Ann. Appl. Biol.*, 27 (1940), No. 2, pp. 218-226, pls. 2).—"A survey of the virus diseases affecting leguminous plants in Great Britain was made in order to ascertain whether the virus of lettuce mosaic, to which pea and sweet pea are susceptible, could be related to any other virus able to infect legumes. In the course of the work the viruses, which are briefly described and discussed in this paper, were recognized, but lettuce mosaic virus could not be equated with any one of them. Sweet pea streak disease was found to be invariably associated with virus infection and is, it is thought, a complex of virus diseases. The susceptibility of a range of host plants to the viruses of bean mosaic, mild pea mosaic, yellow pea mosaic, enation mosaic of pea, lettuce mosaic and tomato spotted wilt, a virus able to cause sweet pea streak, and a strain of cucumber virus 1 from sweet pea [is] indicated."

A comparison of the viruses of streak of tobacco and yellow dwarf of potato, W. D. VALLEAU. (Ky. Expt. Sta.). (*Jour. Bact.*, 40 (1940), No. 6, p. 869).—An abstract.

Infection with pure cultures of *Clitocybe tabescens*, A. G. PLAKIDAS. (La. Expt. Sta.). (*Phytopathology*, 31 (1941), No. 1, pp. 93-95, fig. 1).—Early attempts at inoculation with this root-rot fungus of pear and tung trees, using cultures on agar or autoclaved bean pods, failed, possibly due to the rapid disintegration of the media in the soil before the pathogen could invade the roots. Later attempts proved successful, using autoclaved, thick pieces of tung or pear wood, with corn meal and water added before sterilization. This is believed to be the first record of infection from pure-culture inoculations of *C. tabescens*.

Notes on *Cyphella villosa* [trans. title], A. P. VIÉGAS (*Inst. Agron. Estado [São Paulo], Campinas, Bol. Téc.* 80 (1940), pp. 7, pls. 5).—The systematic position, morphology, and cytology of this telephoracean fungus are considered.

The growth of *Fusarium oxysporum cubense* in the soil, C. H. MEREDITH (*Phytopathology*, 31 (1941), No. 1, pp. 91-93).—The organism spread on greenhouse compost an average of 0.47 cm. per day and on clay subsoil 0.3 cm. per day. It penetrated the loam, silt loam, and silty clay loam soils 0.3-0.37 cm. per day. The penetration in fine sandy loam and coarse sandy loam was 0.5-0.52 cm. per day. Over short periods the daily average surface spread was 0.24-0.6 cm. and the penetration 0.3-0.52 cm.

The British species of *Puccinia* included under "*P. syngenesiarum*" with notes upon the British rust fungi occurring on thistles, M. WILSON (*Brit. Mycol. Soc. Trans.*, 24 (1940), pt. 2, pp. 244-250).—Of 18 specimens of *P. syngenesiarum* examined, 15 proved to be *P. le monnieriana* on *Cnicus palustris*. Mistaken early identification of *C. palustris* for *C. lanceolatus* as host for *P. syngenesiarum* is believed to have led to the erroneous citations of *C. lanceolatus* as a host of *P. cardui* and of *P. cnici-oleracei*. Although type specimens of *P. cardui* have not been examined, this species is believed almost certainly identical to *P. le monnieriana*. Notes on the nomenclature and distribution of 7 other species of *Puccinia* are given, and *P. cirsiipalustris* is given as a new combination for *P. le monnieriana*.

Observations on the cultural and pathogenic habits of *Thielaviopsis basicola* (Berk. & Br.) Ferraris, R. E. RAWLINGS (*Ann. Missouri Bot. Gard.*, 27 (1940), No. 4, pp. 561-598, pls. 3, figs. 10).—Detailed studies here presented of three isolants (one from tobacco in Tennessee, one from *Primula obconica* in the Netherlands, and one from cotton in Texas) indicated them to be distinct physiologic races.

Two little known Argentinian Uredineae: *Bitzea ingae* and *Uredo ingae* [trans. title], J. C. LINDQUIST (*Darwiniana*, 4 (1940), No. 1, pp. 129-132, fig. 1).—*B. ingae* on *Inga* spp., and *U. ingae* on *I. uruguensis*.

Two diseases of grasses caused by species of *Helminthosporium* not previously recorded in Britain, K. SAMPSON and J. H. WESTERN (*Brit. Mycol. Soc. Trans.*, 24 (1940), pt. 2, pp. 255-263, figs. 2).—Two species of *Helminthosporium* recorded for the first time in Britain are *H. siccaus* on *Lolium perenne*, *L. multiflorum*, and *Festuca pratensis*, and *H. vagans* on *Poa pratensis*. Single-spore cultures of both were studied, and certain isolations of *H. siccaus* showed slight but consistent variations in cultural characters and in size and shape of conidia.

Physiologic forms of *Ustilago zeae* in various Argentinian localities: Their geographic characterization [trans. title], E. and J. HIRSCHHORN (*Physis*, 18 (1939), No. 50, pp. 181-222, pls. 7, figs. 7).—From the study presented it is concluded that *U. zeae* is to be considered a collective species made up of integrating physiological forms possessing the apparently inexhaustible capacity to vary by mutation. The phenomena concerned and the implications are discussed in detail.

The effects of pH on the cultural characters of corn smut (*Ustilago zeae*) [trans. title], E. and J. HIRSCHHORN (*Physis*, 18 (1939), No. 50, pp. 223-251, pls. 11, figs. 11).

The reaction of oats to different strains of *Ophiobolus graminis*, E. M. TURNER (*Brit. Mycol. Soc. Trans.*, 24 (1940), pt. 2, p. 267).—An abstract.

Tillering and flowering in rice.—III, Some remarks on the susceptibility of the Oentoeng variety (when cultivated on nutrient solutions) for *Piricularia oryzae* Cav. [trans. title], L. W. KUILMAN (*Landbouw [Buiten-zorg]*, 16 (1940), No. 8, pp. 465-470, fig. 1; *Eng. abs.*, p. 470).—Under the experimental conditions, the fungus prevented the elongation of the stems and finally killed the plants.

Physiologic specialization of *Puccinia graminis tritici* in Argentina, Chile, and Uruguay [trans. title], J. VALLEGA (*Rev. Argentina Agron.*, 7 (1940), No. 3, pp. 196-220; *Univ. Nac. La Plata, Inst. Fitotec, Santa Catalina, Pub. 12* (1940), pp. [1]+196-220; *Eng. abs.*, pp. 218, 219).—Seven races were identified, viz, Nos. 11, 14, 15, 17, 21, 36, and 42. Nos. 17 and 42 were most widely distributed and prevalent in Argentina and Uruguay, whereas in Chile No. 15 was generally distributed, 14 was found chiefly in the northern, 17 in the central, and 11 in the southern areas. The prevalence of races attacking durum

wheats is noteworthy. In a collection of 160 wheats, especially Argentinian, Chilean, and North American varieties, tested against 7 races isolated in South America, almost all proved susceptible in Argentina and Chile, but several exceptions noted were resistant to certain of these physiologic races. Several hybrids of Heines Kolben \times 38 M. A., from the Instituto Fitotécnico, Santa Catalina, Argentina, are said to be very resistant to the more prevalent races of stem rust in Argentina, viz, Nos. 42, 17, and 11.

Preliminary investigations on dwarf bunt of wheat, C. S. HOLTON. (Wash. Expt. Sta. coop. U. S. D. A.). (*Phytopathology*, 31 (1941), No. 1, pp. 74-82, figs. 5).—The reticulate chlamydospores of the dwarf race of *Tilletia tritici* failed to germinate under all laboratory treatments tried, but the smooth, hyaline, haploid resting spores occurring with them often germinated. Monosporidial lines of the dwarf race were obtained by isolating sickle-shape, secondary sporidia produced by the hyaline spores. Some of the single sporidia produced a haploid growth type, whereas others produced an apparently dikaryotic mycelial type, but the former type predominated. The unisexual nature of the monosporidial lines was indicated by the infection obtained from combinations of monosporidial lines and the lack of it from individual lines. Infection resulted in host symptoms and chlamydospore characteristics typical of dwarf bunt. Hybrids between the dwarf race and race 12 of *T. tritici* and race 9 of *T. levis* were obtained by inoculating with combinations of monosporidial lines. There was evidence of segregation for chlamydospore morphology and for dwarfing of the host.

Bacterial wilt of alfalfa and its control, F. R. JONES. (Coop. Wis. Expt. Sta.). (*U. S. Dept. Agr. Cir.* 573 (1940), pp. 8, figs. 3).—This disease appears to be permanently established in alfalfa regions of the country with abundant rainfall or where irrigation is practiced, except in some southern and extreme northern areas. The productive period and life of alfalfa stands are shortened and, though the disease may be somewhat retarded in certain localities by field management, usually stands of long life are possible only by the use of resistant varieties. Several of these are already available, and others are being developed.

Boron deficiency symptoms in some plants of the cabbage family, F. B. CHANDLER (*Maine Sta. Bul.* 402 (1940), pp. [3]+155-187, figs. 35).—In general, boron deficiency causes dwarfing and curled, rolled leaves, often with chlorotic margins. The more specific symptoms are described and illustrated for 11 members of the cabbage family and more briefly for 12 other plant species. This deficiency has been observed in a large number of towns in southern and eastern Maine. It may be corrected by use of 10 lb. of borax per acre, added in the row for row crops. It may be used with the fertilizer, as a side dressing, or as a spray. In setting out plants, boric acid solutions may be used, being poured into the holes in which plants are to be set.

The chemistry of resistance of plants to Phymatotrichum root rot.—VI, **Fungicidal properties of fatty acids**, N. E. RIGLER and G. A. GREATHOUSE. (Tex. Expt. Sta. coop. U. S. D. A.). (*Amer. Jour. Bot.*, 27 (1940), No. 8, pp. 701-704, fig. 1).—In these further studies (E. S. R., 83, p. 502), the fungicidal properties of 18 saturated and 4 unsaturated aliphatic monocarboxylic acids and the amide of pelargonic acid were tested against *P. omnivorum* in a well-buffered culture medium under controlled conditions. The fungicidal power of the saturated fatty acids increased progressively with increase in the number of C atoms from C₁ to C₁₁ and then diminished. None of the saturated acids with 14 or more C atoms was inhibitory at the concentrations used. There was no perceptible difference in toxicity as a result of odd v. even numbers of C atoms. Isobutyric acid was less inhibitory than *n*-butyric and undecylic less so than

undecylenic. Adding the acids to the nutrient solution lowered the pH only slightly. When the medium was made slightly more alkaline by the sodium salts of the acids, the fungicidal power was decreased. It seems apparent that the molecular form is more toxic, and that pH is important only as it affects the ratio between molecules and ions. This work suggests that the possible role of fatty acids in resistance of plants to *P. omnivorum* should be further studied.

Effectiveness and cost of a hop disease control program, R. O. MAGIE (*Farm Res. [New York State Sta.]*, 7 (1941), No. 1, p. 9).—A note summarizing the results of the station's research on hops through which spray and dust programs, at costs not excessive in view of the added returns, have been developed for controlling downy and powdery mildews and sooty mold.

Lightning injury to potato tubers, G. SAMUEL (*Ann. Appl. Biol.*, 27 (1940), No. 2, pp. 196-198, pl. 1).

Pathogenicity studies with isolates of *Rhizoctonia solani* obtained from potato and sugar beet, E. L. LECLEGG. (Minn. Expt. Sta. coop. U. S. D. A.). (*Phytopathology*, 31 (1941), No. 1, pp. 49-61, figs. 2).—In tests of 89 isolates of *R. solani* from underground-stem lesions on older potato plants or from sclerotia on potato tubers, none proved pathogenic to sugar beet roots. Although these isolates were from a very wide geographical range and the results parallel earlier observations, it is possible that by further sampling isolates pathogenic to sugar beets may be found. This view is substantiated by the results of inoculating potatoes with sugar beet isolates, which, in general, were more aggressive on potatoes than the potato isolates used for comparison. Furthermore, isolates have been obtained from potato stolons affected by *R. solani* which in a relatively high percentage rotted sugar beet roots. From potato plants grown in a field with a previous history of sugar beet cropping and severe root rot, two isolates were obtained from potato stems which were strongly virulent to sugar beet roots. A three-season field survey of sugar beet and potato fields showed that sugar beets following potatoes were, in general, relatively free from *Rhizoctonia* root rot, in strong contrast to the situation when sugar beets followed sugar beets. Observational evidence is presented bearing on the desirability of a potato-sugar beet sequence rather than the reverse rotation.

Leaf foot disease of sisal [trans. title], R. DRUMMOND-GONCALVES (*Biologico*, 6 (1940), No. 7, pp. 201, 202).—A note on this disease in the State of São Paulo, Brazil, thought by some to be virus-induced and by others to be due to potash deficiency.

University of Kentucky breeds two new disease-resistant types (*South. Tobacco Jour.*, 54 (1940), No. 9, p. 5).—Tobacco variety No. 16 is said to be an excellent stand-up type and to be extremely resistant to black root rot. No. 48 is probably as good a tobacco but is still in the experimental stage.

Recent research in Ceylon on the frog-eye disease of cigarette tobacco, M. PARK and M. FERNANDO (*Trop. Agr. [Ceylon]*, 95 (1940), No. 3, pp. 131-135).—A review (6 references) of work on the disease due to *Cercospora nicotianae*.

Conidial production in culture by *Cercospora nicotianae*, S. DIACHUN and W. D. VALLEAU. (Ky. Expt. Sta.). (*Phytopathology*, 31 (1941), No. 1, pp. 97, 98).—On plain tobacco agar prepared from the filtrate of chopped and steamed yellow and green leaves of Burley tobacco plants, conidia were produced by 88 of 91 isolates of the fungus. They were normal in shape and size, but the conidiophores differed from those on the leaves in being longer and straighter, with geniculations farther apart, and not clustered. Typical frog-eye spots developed on leaves atomized with conidia produced on tobacco agar.

Varieties of tobacco which localize the virus of common tobacco mosaic (*Nicotiana virus 1*) [trans. title], A. S. COSTA and A. R. LIMA (*Rev. Agr. [Brazil]*, 15 (1940), No. 5-6, pp. 209-213).

Size stability of tobacco mosaic under different conditions, J. W. GOWEN. (Iowa State Col.). (*Genetics*, 26 (1941), No. 1, pp. 153, 154).—An abstract.

Interrelations between mosaic virus and ascorbic acid in tobacco plant, M. I. GOLDIN (*Compt. Rend. (Dok.) Acad. Sci. U. R. S. S., n. ser.*, 26 (1940), No. 3, pp. 300-303).—Reduced amounts of ascorbic acid were found in regions of virus activity, but the accumulation of virus showed no correlation with the destruction or delay in development of the chloroplasts and there was no direct connection between the activity of the latter and the vitamin C balance in the plant cells.

Leaf blight of tomato, C. SAIYANANDA and M. S. CELINO (*Philippine Agr.*, 29 (1940), No. 4, pp. 365-377, figs. 4).—The history and symptoms are given of a disease in the Philippines shown to be due to a *Helminthosporium* provisionally identified as *H. lycopersici*. The various stages of the fungus are described, and its incidence in 1939 is outlined. All tomato varieties observed showed about the same degree of susceptibility. Pepper and eggplant were only slightly affected, and potato and tobacco not at all.

The angular leaf spot of apple trees, H. WORMALD (*East Malling [Kent] Res. Sta. Ann. Rpt.*, 27 (1939), pp. 63-66, fig. 1).—This disease, first seen in Britain in 1937, was found during 1939 in six localities. The fungi (*Phyllosticta* sp. and *Cladosporium* sp.) that were found on the spots are briefly described.

Virus disease of peaches spreading in Utah, B. L. RICHARDS (*Farm and Home Sci. [Utah Sta.]*, 1 (1940), No. 4, pp. 1, 11, figs. 2).—This discusses the symptoms, severity, and present distribution in the State of the X-disease first observed in Utah in 1937.

Cranberry fruit rots in New Jersey, R. B. WILCOX. (Coop. U. S. D. A.). (*New Jersey Stas. Cir.* 403 (1940), pp. 4).—An informational leaflet on these diseases and their control.

Review of research on strawberry virus diseases, 1932-1939, R. V. HARRIS and M. E. KING (*East Malling [Kent], Res. Sta. Ann. Rpt.*, 27 (1939), pp. 66-68).

Suggestions on plant virus nomenclature as exemplified by names for citrus viruses, H. S. FAWCETT. (Calif. Citrus Expt. Sta.). (*Science*, 92 (1940), No. 2398, pp. 559-561).—The author presents a system of nomenclature which he believes would combine the best features of Johnson's (*E. S. R.*, 57, p. 344), Smith's (*E. S. R.*, 78, p. 791), and Holmes' (*E. S. R.*, 82, p. 632) proposals, without the chief objections and difficulties in their use. The proposal is to use binomials as suggested by Bennett (*E. S. R.*, 81, p. 222), but to derive the "genus" from the host as do Johnson and Smith and to use specific names as does Holmes instead of numbers. The rule for the names of "genera" is to add the stem "vir" for virus to the Latin genitive of the genus of the host in which the virus was first discovered and recognized, dropping any final consonants that occur in the genitive.

Symptoms of diseases affecting citrus in Jamaica and suggestions on their control, Z. A. DANIELS (*Jour. Jamaica Agr. Soc.*, 44 (1940), No. 6-7, pp. 274-276, 278).

Observations on citrus diseases in Uruguay [trans. title], H. S. FAWCETT and A. A. BITANCOURT. (Univ. Calif. et al.). (*Rev. Asoc. Ingen. Agrón. [Montevideo]*, 12 (1940), No. 3, pp. 3-8, figs. 7; *Eng. abs.*, p. 8).—The most serious diseases found in the Salto region were foot rot and sweet orange scab. The for-

mer was especially serious, due probably in part to repeated plowing near the trunks which caused many injuries to the large roots. Less important diseases were sour orange scab, crotch disease of tangerine, bacterial leaf spot of sour orange, anthracnose rot, mesophyll collapse decortiosis of lemon bark, endoxerosis of lemon fruit, melanose, *Sclerotinia* twig blight, tear stain, anthracnose, green mold, and brown stain of fruit. Three important diseases present in Argentina but not seen in Uruguay are cankerosis B, leprosis, and psorosis.

Notes on *Septobasidium pseudopedicellatum*, cause of the felt disease of citrus in São Paulo [trans. title], A. P. VIÉGAS (*Inst. Agron. Estado [São Paulo], Campinas, Bol. Téc. 79 (1940), pp. 7, pls. 4*).—The author briefly considers the economic importance and symptoms of the disease and describes the fungus, including the germination of the probasidia and its dissemination.

Citrus leprosis [trans. title], A. A. BITANCOURT (*Biologico, 6 (1940), No. 2, pp. 39-45, fig. 1*).—A discussion of the occurrence, symptoms, etiology, varietal susceptibility, and control of this disease in the State of São Paulo, Brazil.

Septoria spot of citrus fruits, H. S. FAWCETT and L. J. KLOTZ. (Calif. Citrus Expt. Sta.). (*Calif. Citrog., 26 (1940), No. 1, p. 2, fig. 1*).—Toxicity tests of various fungicides on the spore germination of the *Septoria* spp. (apparently *S. citri* and *S. limonum* in California) responsible for this spot disease have suggested that thorough covering with bordeaux mixture, zinc-lime, and zinc-copper-lime sprays, and whitewash to which the zinc or copper sulfate materials are added may protect the fruit. Recommended procedures are given.

A case of dodder (*Cuscuta subinclusa* Durand and Hilgard) on valencia orange (*Citrus sinensis* Osbeck) in southern California, G. L. STOUT (*Calif. Dept. Agr. Bul., 29 (1940), No. 3, pp. 121-124, figs. 2*).

Record of dodder (*Cuscuta subinclusa* Durand and Hilgard) on citrus in Orange County, M. K. BELLUE (*Calif. Dept. Agr. Bul., 29 (1940), No. 3, p. 145*).

Algal leaf and fruit spot of guava, G. D. RUEHLE. (Fla. Expt. Sta.). (*Phytopathology, 31 (1941), No. 1, pp. 95, 96, fig. 1*).—The alga *Cephaleuros virescens* is now known to occur on 44 plants in southern Florida, and a complete list would probably exceed 50 species. In most cases its presence causes but little injury, but fruit blemishes on oranges and avocados have been reported. Its parasitism on guava, here briefly discussed, is therefore of special interest. Twig or bark infections on this host are of little concern, but the leaves and fruits are severely attacked and partial defoliation of a Peruvian variety was observed. Spraying with a copper fungicide every 3-4 weeks during the rainy season gave good control in tests of one season.

Anthracnose (*Elsinoe*) of the Annonaceae [trans. title], A. A. BITANCOURT (*Biologico, 6 (1940), No. 7, pp. 199, 200*).—Note on this disease of *Annona* spp.

A *Phytophthora* blight of bulbous iris, G. W. GIBSON and P. H. GREGORY (*Brit. Mycol. Soc. Trans., 24 (1940), pt. 2, pp. 251-254, figs. 5*).—The authors describe a foliage blight of Dutch iris varieties observed in the Isles of Scilly since 1928 and associated with an unidentified *Phytophthora* possibly related to *P. cypri-rotundati*. Suggestions for control are based on sanitary measures.

Experiments on the control of basal rot of narcissus bulbs caused by *Fusarium bulbigenum* Cke & Mass, with notes on *Botrytis narcissicola* Kleb. L. E. HAWKER (*Ann. Appl. Biol., 27 (1940), No. 2, pp. 205-217*).—Losses from basal rot in storage were greater at 27° C. (80.6° F.) than at lower temperatures, whereas stocks infected with *B. narcissicola* showed greater losses below 27°. Rapid drying of bulbs after lifting reduced the wastage by *Fusarium*, and partial cleaning soon after lifting accelerated drying and also reduced losses. Reduction of *Fusarium* rot by early planting are attributed to the fact that soil

temperatures in September may be lower than those in the bulb warehouses. The number of bulbs rotting after hot-water treatment for nematodes was reduced by adding formalin or Uspulun or by dipping in a cold solution of formalin following the hot water. Use of certain cold fungicidal steeps and dusts soon after lifting also reduced *Fusarium* wastage, and most of these treatments had no effect on growth or blooming.

Mosaic of roses [trans. title], M. KRAMER (*Rev. Agr. [Brazil]*, 15 (1940), No. 7-8, pp. 301-311, figs. 3; *Eng. abs.*, pp. 308, 309).—A virus disease found in rose plantations of the States of Rio de Janeiro and São Paulo, Brazil, is described and provisionally named "rose mosaic." From the symptoms and experimental results it is suspected that certain virus diseases of roses, and especially the "infectious chlorosis" of the United States, are due to the same virus or to closely related ones. Pale green or sometimes white stripes along the midrib and main veins are said to be characteristic, and ring spots also are present.

Probable virus disease of *Pittosporum daphniphyloides*, D. G. MILBATH. (U. S. D. A.). (*Calif. Dept. Agr. Bul.*, 29 (1940), No. 3, pp. 158, 159, fig. 1).—A note describing typical mosaic symptoms on *Pittosporum* plants in the U. S. Plant Introduction Garden, near Chico, Calif. A preliminary inoculation test gives strong evidence of the virus nature of the disease.

Black fungus (*Corynelia*) on leaves of *Podocarpus* [trans. title], S. C. ARBUDA (*Biologico*, 6 (1940), No. 7, p. 201).—A note on the disease due to *C. brasiliensis*.

Pests and diseases of trees and shrubs, E. L. CHAMBERS and N. F. THOMPSON (*Wis. State Dept. Agr. Bul.* 213 (1940), pp. 87, figs. 54).

[Leaflets on tree diseases] (*Mass. Forest and Park Assoc., Tree Pest Leaflets* 41 (1940), pp. [4], figs. 2; 44 (1940), pp. [4], fig. 1; 45 (1940), pp. [4], fig. 1; 48 (1940), pp. [4], figs. 5).—Of these leaflets, No. 41 deals with Black Spot Fungus of Elm (*Gnomonia ulmea* (Schw.) Thuem.), by R. P. Marshall (U. S. D. A. et al.); No. 44 with Needle Cast Disease of Pines (*Bifusella*, *Hypoderma*, *Hypodermella*, *Lophodermium*), by J. S. Boyce; and No. 45 with The Sweetfern Blister Rust of Pitch Pines (*Cronartium comptoniae* Arth.), by J. R. Hansbrough, and No. 48 with Sycamore and Oak Anthracnose—*Gnomonia veneta* (Sacc. & Speg.) Kleb. by A. M. Waterman (both U. S. D. A. et al.).

Successful tree inoculation, W. W. WILLIAMS, JR. (*Shade Tree*, 13 (1940), No. 7, pp. [2-4]).—A method of controlling diseases and insect pests by tree injection is proposed. An editorial notation is appended.

Association of *Stereum murrayi* with heart rot and cankers of living hardwoods, R. W. DAVIDSON, W. A. CAMPBELL, and R. C. LOBENZ. (U. S. D. A.). (*Phytopathology*, 31 (1941), No. 1, pp. 82-87, fig. 1).—Cultures from rots in living yellow and paper birch trees indicated *S. murrayi* to be one of the heart-rotting fungi occasionally present. It was also isolated once each from incipient decay in red maple and from cankers on sugar maple and yellow birch, and sporophores were found associated with trunk cankers and heart rot of ironwood, beech, and striped maple and on logs and dead limbs. Readily isolated from both incipient and advanced decay, it was identified by its characteristic odor and growth habit in culture. It apparently enters living trees through dead branch stubs or trunk injuries.

Chestnut breeding work in 1939, A. H. GRAVES (*Brooklyn Bot. Gard. Rec.*, 29 (1940), No. 2, pp. 58-63).—A further progress report (E. S. R., 81, p. 536), with special reference to chestnut blight.

Blight-resistant chestnuts, G. F. GRAVATT. (U. S. D. A.). (*Pa. Nut Growers Assoc. Rpt. Proc.*, 8 (1940), pp. 17-20).—An address briefly setting forth

the history and present status of the search for and breeding work directed toward the development of chestnuts with the timber and other good qualities of *Castanea dentata* but with the resistance to *Endothia* blight and *Phytophthora* exhibited by some of the Asiatic chestnuts. Of over 5,000 hybrids now under test by the U. S. D. A. Bureau of Plant Industry, some are said to give promise for orchard, forest, or game food purposes but need further trials to determine their full value.

The Dutch elm disease in Connecticut. (Conn. [New Haven] Expt. Sta. coop. U. S. D. A.). (*Science*, 92 (1940), No. 2395, pp. 472, 473).—A brief summary of eradication work and prospects.

Dutch elm disease: New treatment devised to save infected trees (*Florists Exch. and Hort. Trade World*, 94 (1940), No. 25, p. 9, fig. 1).—A note claiming the development of a method of chemically treating infected elms, with rubber playing a vital role in the technic.

A mahogany seedling blight in Puerto Rico, L. A. ALVAREZ GARCÍA. (P. R. Univ. Expt. Sta.). (*U. S. Dept. Agr., Forest Serv., Caribbean Forester*, 1 (1939), No. 1, pp. 23, 24; *Span. abs.*, p. 24).—A sudden epidemic of a foliage blight on 6-month-old trees of *Swietenia mahogani*, symptoms of which are described, was found to be due to *Phyllosticta swietenia* n. sp.

Brown-spot needle disease of pines, F. A. WOLF and W. J. BARBOUR (*Phytopathology*, 31 (1941), No. 1, pp. 61-74, figs. 4).—This study involves the developmental morphology of a fungus causing brown spot needle disease. This disease is seriously destructive to seedlings and young trees of pines, especially *Pinus palustris*, throughout the entire range of the latter. Brown necrotic areas girdle the needles, the portions distal to the lesions becoming dry, the needles dwarfed, and the seedlings stunted or killed. Genetic connection has been established between the conidial stage, properly identified as *Lecanosticta acicola*, and the perithecial stage, *Systemma acicola* n. comb. Viable conidia may be found throughout the year. The acervuli are innate and become erumpent, the conidia being extruded in a matrix, binding them in heaps. The conidia are adapted to distribution by rain splash to longleaf pines in the "grass stage." Perithecia are initiated within stromata bearing spermogonia and carpogonia concurrently. The perithecia mature 6-8 weeks later. Ascospores are disseminated by air currents. Presumably perithecial formation is not controlled by temperature alone. Since the fungus is dothidiaceous and is pigmented throughout, as established by these studies, it is placed in the phaeodidymous aparaphysate genus *Systemma* and is briefly described. It is indicated from studies of its life history and dissemination that the brown spot fungus may best be combated by use of controlled fires.

The function of tannin in host-parasite relationships, with special reference to *Ribes* and *Cronartium ribicola*, H. R. OFFORD (*U. S. Dept. Agr., Bur. Ent. and Plant Quar.*, 1940, E-518, pp. 27).—After a review on the chemical properties, function in plants, and influence of tannins on host-parasite relations and the physiologic nature of host-parasite relations in white pine blister rust, data on the tannin content of several western American species of *Ribes* are summarized along with qualitative tests on tannins, the histology of their distribution, and microchemical tests for tannins. Evidence is presented that their chemical properties and degradation products, their probable function, and their action on parasitic fungi lend themselves to an explanation of the specificity of host-parasite relationships. A theory is offered which postulates a toxic action of tannin initiated and conditioned by enzymes or hormones secreted by the fungi. The ultimate toxicity of the tannins appears to depend partly on the type of phenolics and other potentially toxic constituents formed by the host-parasite

reactions, and partly on the quantity and manner of distribution of the tannin mass. The seasonal tannin content was determined for leaves, current-season stems, roots, and old stems of *R. petiolare*, *R. inerme*, *R. viscosissimum*, *R. lacustre*, *R. nevadense*, and *R. roezli*. In general there was an increase up to the middle of the growing season, the amounts being largest in the leaves and decreasing in the other parts in the order named. The quantity of tannin per se could not be used alone to determine the susceptibility of *Ribes* to blister rust. A study of the decomposition products of the tannin mass of *R. petiolare* (highly susceptible) and *R. inerme* (moderately susceptible) showed the latter to contain more of the catechol tannins, which probably contributed to a higher specific toxicity to the fungus than those of *R. petiolare* which were predominantly of the gallotannin type. Differences were also noted in the ratio of alcohol to water-soluble tannins between *R. petiolare* and a group of less susceptible *Ribes* (*R. inerme*, *R. lacustre*, and *R. viscosissimum*). In leaves of *R. petiolare*, *R. inerme*, and *R. lacustre* the tannins were concentrated in epidermal layers and around vascular bundles. There are 59 references.

Last minute information on [Ceratostomella] plane tree disease, J. M. WALTER. (U. S. D. A.). (*Shade Tree*, 13 (1940), No. 11, pp. [4-6]).

The nematode parasites of plants catalogued under their hosts, T. GOODEY (*St. Albans, Eng.: Imp. Bur. Agr. Parasitol.*, 1940, pp. [3]+80).

On the stem and bulb eelworm (*Anguillulina dipsaci* Kühn) with special reference to its occurrence on weeds of arable land, L. R. JOHNSON (*Ann. Appl. Biol.*, 27 (1940), No. 2, pp. 248-251).—Field observations showed the widespread occurrence of *A. dipsaci* on *Galium aparine* and *Stellaria media* in nematode-infested oats and on the former in crops of infested field beans. The infestations persisted on these weeds under nonsusceptible rotations. Infection tests indicated that strains of *A. dipsaci* on oats and field beans are reciprocally infective, and that the weed hosts are capable of infesting the crop hosts and vice versa. Experiments proved that the rhubarb strain, which readily infests oats and chickweed, is capable also of transference to field beans.

Ethylene chloride for soil sterilization against nematodes, B. G. CHITWOOD. (U. S. D. A.). (*Florists Exch. and Hort. Trade World*, 95 (1940), No. 11, p. 9).—A note on recent experiments indicating that ethylene chloride promises to be a highly effective and less expensive chemical than chloropicrin for ridding soil of the bulb-and-stem nematode and the root knot nematode, having shown excellent results both alone and with chloropicrin.

ECONOMIC ZOOLOGY—ENTOMOLOGY

Nomenclator zoologicus: A list of the names of genera and subgenera in zoology from the tenth edition of Linnaeus, 1758, to the end of 1935, I-IV, edited by S. A. NEAVE (*London: Zool. Soc. London*, 1939, vols. 1, pp. XIV+957; 2, pp. [4]+1025; 1940, 3, pp. [4]+1065; 4, pp. [4]+758).—This work, which constitutes an attempt to give as complete a record as possible of the bibliographical origin of the name of every genus or subgenus in zoology that has been published, in works not excluded by the International Commission on Zoological Nomenclature, since 1758 up to the end of the year 1935, appears in four volumes, as follows: Volumes 1, A-C; 2, D-L; 3, M-P; and 4, Q-Z and supplement.

[Work in economic zoology and entomology by the Puerto Rico Station]. (Partly coop. U. S. D. A.). (*Puerto Rico. Sta. Rpt.* 1939, pp. 25, 45, 49-62, 90-93, 102-117, figs. 7).—The work of the year referred to (E. S. R., 82, p. 506) includes a study of the damage to vanilla by *Epantheria icasia* Cramer and *Erythrina*

spp. by *Terastia meticulosalis*; control of the scale insects *Asterolecanium bambusae* Bdv. and *A. miliaris* Bdv. on bamboo by introduced predators, particularly two coccinellid beetles (*Egias platycephalus* Muls. from Cuba and *Curinus* sp. from Martinique); an experiment with annual teosinte (*Euchlaena mexicana*) to determine its susceptibility to the lesser cornstalk borer; experiments with various methods and insecticides for the control of corn ear pests (the corn earworm, the fall armyworm, and the corn-silk fly *Euxesta stigmatias* Loew), the chief limiting factor in commercial sweet corn production; studies of the injury to lima beans by the leafhopper *Empoasca fabalis* DeLong; tests with acetone extracts of roots of *Lonchocarpus* plants to determine their toxicity to the housefly and with other insecticidal plants, i. e., *Derris* spp., *Piscidia piscipula*, and *Tephrosia toxicaria*; collection of new physiological races of three species of parasites (*Metagonistylum minense* Tns., *Theresia claripalpis* (V. d. W.), and *Bassus stigmaterus* (Cress.)) which attack the sugarcane borer in São Paulo, Brazil; parasitization of the sugarcane borer by *M. minense* in São Paulo and the hyperparasitization of the latter by *Trichopria* sp.; receipt of new strains of sugarcane borer parasites from Brazil; the rearing in the laboratory of the São Paulo strains of *M. minense* and *Theresia claripalpis* and liberations of the former at Guayama and of three adults of *B. stigmaterus* from Brazil at Santa Isabel; the rearing and liberation of the Amazon strain of *M. minense*, its establishment in the vicinity of Santa Isabel and in the Afiasco Valley district, and shipment to Trinidad and Louisiana; and the rearing and liberation of *T. claripalpis* from Trinidad; receipt of the European corn borer parasite *Macrocentrus gifuensis* Ash. for trial against the sugarcane borer; the rearing, liberation, and recovery of the ladybeetle *Coelophora inaequalis* (F.), a predator of the yellow sugarcane aphid *Sipha flava* Forbes; shipment of the fruitfly pupal parasite *Dirhinus giffardii* Silv. to the Dominican Republic; introduction from Trinidad and Brazil of new species of beetles predaceous on scale insects; liberations of bamboo scale predators at Bayamon and Mayaguez and of *Hyperaspis bellotti* at Rio Piedras; establishment of introduced species of scale predators (*Chilocorus cacti* L., *Curinus* sp., *Egias platycephalus*, *Pentilia castanea*, *Azya trinitatis* Marsh., and *Cryptognatha nodiceps* Marsh.) and their redistribution to new areas; shipments of predatory coccinellid beetles (*C. nodiceps*, *P. castanea*, *P. egena*, and *A. trinitatis*) to Florida and Hawaii for liberation against the coconut scale *Aspidiotus destructor*; the rearing and liberation of the pineapple mealybug parasite *Anagyrus coccidivorus* Doz. and its recovery at Lajas; recovery and redistribution of the pineapple mealybug parasite *Hambletonia pseudococcina* Comp.; establishment of *Pseudophycus utilis* Timb., a parasite of the coconut mealybug, from Hawaii; shipment of *Dasyscapus parvipennis* Gahan, a parasite of thrips, to Florida; tests with several species of bamboo to determine their susceptibility to the powder-post beetle *Dinoderus minutus* F.; a lepidopterous predator (*Kearfottia* n. sp.) found abundant and well distributed on old infestations of bamboo scales (*Asterolecanium bambusae* and *A. miliaris*); tests on the comparative effectiveness of two protective seed treatments, etc., against the coconut rhinoceros beetle *Strategus quadriveatus* Beauv., *Tephrosia* insecticidal plants found attacked by a new species of leaf miner *Phyllonorycter* n. sp. and the rearing of two species of parasites (*Zagrammosoma* n. sp. and *Elachertus* n. sp.) thereon; destruction of native red cherry by a chrysomelid beetle, *Leucocera laevicollis* Ws.; and the finding of a parasitic copepod, *Lernaea carassii* Tidd, first recorded from Puerto Rico, as the cause of the death of goldfish.

Shrubs for wildlife on farms in the Southeast, V. E. DAVISON (*U. S. Dept. Agr. Leaflet 200 (1940)*, pp. [8], figs. 5).—A discussion of the importance and use of shrubs as a means of protection and a source of food for wildlife where fields and woodlands meet, in hedges, and on steep slopes, rocky outcrops, stream banks, and drainageways.

Wild animal damage to seed and seedlings on cut-over Douglas fir lands of Oregon and Washington, A. W. MOORE (*U. S. Dept. Agr., Tech. Bul. 706 (1940)*, pp. 28, figs. 14).—This discussion applies to the Douglas fir region in Oregon and Washington where an enormous quantity of debris remains on the logged-over areas after removal of salable logs. The disposal of such slash by fire after logging operations destroys desirable replacement young growth, and recurring fires cause additional destruction. Such fires do not remove many of the small animals which depend partly upon forest-tree seeds for food. White-footed mice (*Peromyscus* spp.) are the commonest and heaviest of these seed consumers. In live-trap studies, occurrence of *Peromyscus* over the winter period on two burned slash sites, each 200 ft. square, was 34 and 35 individuals, respectively. The animals were numbered and their travel recorded. Shrews are numerous in the moist coastal area and are also seed consumers. Squirrels are of little importance from the forest regeneration angle. Douglas fir, hemlock, Sitka spruce, and western red cedar seeds are preferred in the order listed. Artificial reforestation by planting of nursery grown stock, mainly 2-year-old Douglas fir, is retarded by cropping by rabbits common to the area. Mountain beavers, pocket gophers, bears, grouse, and porcupines also contribute to retardation of plantations. The animal instrumental may at times be determined by the type of injury. Port Orford cedar, a valuable and desirable species, suffers but little and is apparently avoided. Efforts to develop indices of damage have thus far been unsuccessful.

A more effective method of orchard mouse control, H. J. SPENCER (*Ill. State Hort. Soc. News Letter 7 (1940)*, pp. [1, 2]).—A recently developed rodenticide employing zinc phosphide as the lethal agent has proved superior to past and present existing poisons or rodenticides in the orchard. Apple has proved to be the best food bait, with sweetpotato and carrot second and third in choice.

Some studies of *Peromyscus* and other rodents in the San Bernardino Mountains of California, 1937 to 1940, S. E. PIPER and E. JOHNSON (*Calif. Dept. Agr. Bul., 29 (1940)*, No. 3, pp. 131-145, figs. 2).—Report is made of studies directed toward development of dependable supplemental and alternate toxic baits and satisfactory procedures for their use in control of the several species of white-footed mice, of importance in the spread of sylvatic plague.

A collection of the ecto- and endo-parasites associated with domestic animals in Kedah during the past few years, R. S. NARAYANAN (*Indian Vet. Jour., 17 (1940)*, No. 2, pp. 77-83).

Two new species of trematodes (*Apharyngostrigea bilobata*: Strigidae, and *Cathaemasia nycitoracis*: Echinostomidae) from herons, with a note on the occurrence of *Clitostomum campanulatum* (Rud.), O. W. OLSEN. (Minn. Expt. Sta. et al.). (*Zoologica [New York]*, 25 (1940), No. 3, pp. 323-328, pl. 1).

Preliminary studies on parasites of upland game birds and fur-bearing mammals in Illinois, W. H. LEIGH (*Ill. Nat. Hist. Survey Bul., 21 (1940)*, Art. 5, pp. [4]+185-194, figs. 5).—Studies of parasites of the greater prairie chicken, bobwhite quail, ring-necked pheasant, opossum, red fox, raccoon, skunk, and muskrat in the upland of Illinois are reported.

[Notes on economic insects and their control] (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 942-952, figs. 3).—The contributions presented (E. S. R., 84, p. 357) are: Insecticidal Properties of the Fruit of *Phellodendron* spp., by H. L. Haller (p. 941) (U. S. D. A.); The European Pine Shoot Moth in British Columbia, by W. G. Mathers and H. F. Olds (p. 941); Three Additional Species of Aphids [the Rosy Apple Aphid, Black Cherry Aphid, and the Pea Aphid] Transmitting Narcissus Mosaic, by F. S. Blanton and F. A. Haasis (p. 942) (U. S. D. A. and Cornell Univ.); A Portable Dusting Tent, by C. H. Martin (pp. 942, 943) (Ohio Expt. Sta.); Establishment of the Codling Moth on Stone Fruits in California, by R. H. Smith (p. 944) (Univ. Calif.); Mosquito Collections at Brownsville, Texas, by F. W. Fisk and J. H. Le Van (pp. 944, 945); A Seed-Infesting Psocid [*Lepinotus patruelis* Pearman] New to North America, by E. O. Essig (p. 946) (Univ. Calif.); Chloropids Swarming in Houses, by C. W. Sabrosky (pp. 946, 947) (Mich. State Col.); Observations on the Biology of the Elm Leaf Beetle Parasite *Erynnia nitida* R.-Desv., by S. E. Flanders (pp. 947, 948) (Calif. Citrus Sta.); The Establishment in British Columbia of Parasites of the Holly Leaf Miner (*Phytomyza ilicis* Curtis), by W. Downes and H. Andison (pp. 948, 949); Infestation of a High School by *Oeciacus vicarius* Horv., by G. A. Mail (p. 949); Mediterranean Flour Moth Breeding in Comb of Honeybee, by E. O. Essig (pp. 949, 950) (Univ. Calif.); Plum Curculio Adults Survive Low Temperatures in the South, by O. I. Snapp (p. 950) (U. S. D. A.); The Use of Calcium Cyanamid in the Control of the Pear Thrips (*Taeniothrips inconsequens* Uzel) in Prune Orchards, by E. P. Breakey, G. A. Huber, and K. E. Baur (pp. 950, 951) (Western Wash. Sta.); A New Species of Leafmining Sawfly [*Fenusa* n. sp.] Attacking Violet, by F. R. Shaw (p. 951) (Mass. State Col.); and Corn Ear Worm Hibernates in Washington State, by R. B. Eichmann (pp. 951, 952) (Wash. Sta.).

[Work in economic entomology by the Colorado Station], J. L. HOERNER and L. B. DANIELS. (Partly coop. U. S. D. A.). (*Colorado Sta. Rpt. 1940*, pp. 23-26).—The work of the year (E. S. R., 82, p. 791) relates to the harlequin cabbage bug, tomato psyllid, tomato fruitworm, Say's stinkbug on potatoes, insecticide tests with cucurbit insects, and psyllid resistance in potatoes.

[Work in economic entomology by the Montana Station], H. B. MILLS (*Montana Sta. [Bien.] Rpt. 1939-40*, pp. 26-28).—Brief reference is made to the relation of tillage to grasshopper population, the sugar beet webworm, and insect transmission of bean diseases.

[Work in economic entomology by the New York State Station]. (Partly coop. U. S. D. A.). (*New York State Sta. Rpt. 1940*, pp. 19-23).—The work of the year (E. S. R., 82, p. 355) briefly reported upon includes early spring treatments, applications during the growing season, and biological control for the suppression of aphids, oystershell scale, scurfy scale, San Jose scale, bud moth, fruit tree leaf roller, European red mite, and codling moth, particularly on apple; colonization of *Tiphia vernalis*, *T. popillivora*, and the milky disease for control of the Japanese beetle; rotenone sprays for the cherry maggot; biological control of the oriental fruit moth on peaches and spraying with arsenicals for its control on quinces; the oil deposit from sprays; and experiments with insecticides for the control of insects attacking vegetables, particularly the European corn borer, pea aphid, pea weevil, Mexican bean beetle, and asparagus beetle, and for the control of insects affecting ornamental and nursery plants, including the spruce gall aphid, viburnum aphid, oystershell scale (lilac form), pine leaf scale, common red spider, and the elm leaf beetle.

Insects affecting greenhouse plants, A. GIBSON and W. A. ROSS (*Canada Dept. Agr. Pub. 695 (1940)*, pp. 88, figs. 53).—A practical work arranged according to the nature of the attack, namely, leaf eating, sucking, boring, and root destroying, and pests other than insects.

Curculionidae, Bruchidae, Lepidoptera, and their parasites infesting the seed pods of cowpea and various wild plants, T. L. BISSELL. (Ga. Expt. Sta.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 844-847, fig. 1).

How to know and control stored-grain insects, M. D. FARRAR, T. F. WINBURN, and W. P. FLINT (*Ill. Agr. Col. Ext. Cir. 512* (1941), pp. 16, figs. 18).—A practical account contributed by the Illinois Experiment Station in cooperation with the State Natural History Survey and the U. S. D. A. Bureau of Entomology and Plant Quarantine, replacing Circulars 489 (E. S. R., 80, p. 806) and 497 (E. S. R., 82, p. 509).

Livestock sprays: A rapid method for determining their toxicity, C. EAGLESON. (U. S. D. A.). (*Soap and Sanit. Chem.*, 16 (1940), No. 7, pp. 96-99, 117, figs. 6).—Description is given of a technic for assaying the insecticidal power of livestock fly sprays in which emphasis is placed on the provision of forced ventilation of the insects during spray application and the observation period. From 14 to 20 percent less mortality was observed among houseflies when well aerated after spraying than when protected from currents of air (as when placed in screen cages having solid bottoms). Examples of results of the method of assay are given. It is indicated that a chemical assay of a toxicant is not an entirely adequate or dependable index of toxicity for livestock sprays.

Insecticide dispersion: A new method of dispersing pyrethrum and rotenone in air, W. N. SULLIVAN, L. D. GOODHUE, and J. H. FALES. (U. S. D. A.). (*Soap and Sanit. Chem.*, 16 (1940), No. 6, pp. 121, 123, 125, figs. 2).—Housefly tests with an aerosol produced by spraying safrol solutions of rotenone and pyrethrum oleoresin, alone and in combination, on a hot plate at 375° C. were conducted. "The test flies were liberated in a 1,100-cu. ft. room and subjected to 1-hr. exposure. In no test was a mortality of less than 74 percent obtained after 72 hr., and with the rotenone-pyrethrum mixture a kill of 95 percent was obtained. However, similar tests with the American cockroach showed little or no toxic effect. A mortality of 99 percent was obtained when adult *Culex* mosquitoes were exposed for 10 min. to the aerosol produced in a similar way from an ethyl alcohol solution of the pyrethrum."

An improved method of applying insecticidal dusts, A. G. GALLOWAY and A. F. BURGESS. (U. S. D. A.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 912-915, fig. 1).—Description is given of a method of dispersing insecticidal or fungicidal dusts with liquid adhesives so that a uniform controlled dispersion rate may be maintained under varied conditions and adherence of the finely divided particles of insecticides to foliage may be obtained. The principle involved in this method is such that the process may be used in conjunction with aircraft in combating insects or plant diseases, or it may be adapted for use with relatively slow-moving ground equipment of the type generally used in the treatment of truck and orchard crops.

The ratio of lead to arsenic in spray residues from lead arsenate, II, G. W. PEARCE and A. W. AVENS. (N. Y. State Expt. Sta.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 918-920).—A reinvestigation of the weathering of spray deposits (E. S. R., 80, p. 369), made during the season of 1939, is reported upon. "No changes in the ratio of lead to arsenious oxide in spray residues from lead arsenate alone were observed. The addition of lime to lead arsenate sprays produces conditions which tend to result in an increase in the ratio of Pb to As₂O₃ after more or less prolonged periods of weathering. The presence of materials, such as bordeaux mixture, Coposil, and aluminum sulfate, which can act as arsenical injury correctives tends to suppress any changes in the lead arsenate spray deposits brought about by lime or other materials having an opposite effect. Oil sprays applied with or following lead arsenate sprays also tend to suppress any changes in the composition of the residues. As the num-

ber of lead arsenate cover sprays applied is increased, the ratio of Pb to As_2O_3 in the residues at harvest tends to approach that in di-lead arsenate."

A method for determination of oil-spray residue on citrus foliage, W. EBELING. (Calif. Citrus Expt. Sta.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 900-904, figs. 6).—Description is given of a method employed in the spraying of citrus leaves in the laboratory and the determination of oil spray residue according to a simple and rapid technic involving the absorption of the oil off the upper surfaces of the leaves with filter paper and the subsequent extraction of the oil from the paper.

A colorimetric method for the determination of oil deposit on citrus leaves, G. L. McCALL and J. F. KAGY. (Calif. Citrus Expt. Sta.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 905-908).—A rapid, simple, and accurate colorimetric method for the determination of oil deposited on citrus leaves by spray oil, which can be used over a wide range of oil concentrations, is described. It consists in the staining of the spray oil with Sudan III. "After the dyed oil has been sprayed as an emulsion the deposited oil is washed from the leaves with a highly refined light distillate oil or odorless kerosene found to be a satisfactory solvent for removing the spray oil from the upper surface of citrus leaves. The amount of oil deposited is determined by comparing the color intensity of the unknowns with a set of color standards prepared from the dyed spray oil in question. The recovery of oil from leaves by the use of the colorimetric method averages 98.41 percent, and the laboratory oil deposit determinations show an average coefficient of variation of 5.38 percent. The standard error, in percent of the mean, varies from 1.83 to 3.07 percent. An amount of oil as low as 19 mg. was determined from a sample of 25 leaves. Plant waxes and essential oils do not appear to affect the accuracy of the method."

Studies on foodstuffs fumigated with methyl bromide, H. C. DUDLEY, J. W. MILLER, P. A. NEAL, and R. R. SAYERS (*Pub. Health Rpts. [U. S.]*, 55 (1940), No. 49, pp. 2251-2275, figs. 4).—Description is given of a method of analyzing fruits and vegetables for total bromides following fumigation with methyl bromide for insect pests. The results indicate that the amount of methyl bromide (determined as bromide) absorbed by the produce during fumigation is several times the normal bromide content. In most cases the fumigated material showed a drop in bromides after aeration. Dried fruits, fresh fruits, and vegetables absorbed minor quantities of the fumigant, but greater amounts were absorbed by milled grains, cheese, nuts, and nut meats. The adsorptive capacity of milled grains is due primarily to their greater surface area, while the oily and fatty foods absorb large quantities of methyl bromide because of its solubility in fats. The lack of appreciable systemic pathological findings in animals fed foodstuffs fumigated with 3 lb. of methyl bromide per 1,000 cu. ft. is considered significant. Since the diets fed to the test animals (rabbit and rat) reported upon consisted entirely of fumigated foodstuffs, all of which contained more methyl bromide than if fumigated commercially, it is considered unlikely that the small amount of methyl bromide or bromide residues on commercially fumigated fresh vegetables and fruits, or dried fruits, is harmful to the consumer.

Barium compounds as poisons in firebrat baits, C. H. RICHARDSON and E. J. SEIFERLE. (Iowa Expt. Sta.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 857-861, fig. 1).—Of 26 barium compounds tested for mortality to the firebrat, the 5 found most toxic are placed in three groups on the basis of mortality in 96 hr., namely, barium fluosilicate and barium carbonate, followed by barium oxalate and then by barium peroxide and barium triphosphate. The difference

between the last two groups may not be significant. At concentrations of 4 and 8 percent, barium carbonate produced approximately the same mortality as sodium fluoride and it possessed little, if any, repellent effect, while sodium fluoride rendered the bait noticeably repellent. No significant sex differences in mortality were observed in these experiments. A practical bait containing barium carbonate as the toxic ingredient is described.

Some reactions of grasshoppers to castor bean plants, L. A. SPAIN. (Iowa Expt. Sta.). (*Iowa State Col. Jour. Sci.*, 14 (1940), No. 4, pp. 353-357, pl. 1).—The experiments reported have failed to show that castor beans have any direct value in grasshopper control or as a measure of preventing grasshopper damage to crops.

Preliminary studies on the use of dinitro-o-cresol dusts in grasshopper control, G. C. DECKER and C. J. DRAKE. (Iowa Expt. Sta.). (*Iowa State Col. Jour. Sci.*, 14 (1940), No. 4, pp. 345-351).—Experimental findings in Iowa suggest the possibility of obtaining good kills of grasshoppers in a comparatively short time with a 10 percent 3,5-dinitro-o-cresol dust applied at the rate of from 10 to 15 lb. per acre.

Taxonomic and biological studies on the Cyrtacanthacrinae of South China, E. R. TINKHAM (*Lingnan Sci. Jour.*, 19 (1940), No. 3, pp. 269-382, pls. 7).—Forms of the orthopteron family Cyrtacanthacrinae occurring in South China, 54 in number, are dealt with, part 1 relating to taxonomic studies and part 2 to biological studies. Six genera are erected and 15 species described as new.

The resistance of corn to the migratory grasshopper Schistocerca paranensis [trans. title], A. H. MARCHIONI (*An. Inst. Fitotec. Santa Catalina*, 1 (1939), pp. 159-166, figs. 2; *Eng. abs.*, p. 166).

Residual poison sprays against the onion thrips on carnations, R. D. EICHMANN. (Wash. Expt. Sta.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 926-932, figs. 2).—In control work with the onion thrips, a serious pest of greenhouse carnations in eastern Washington, tartar emetic 2 lb. with brown sugar 4 lb. in 100 gal. of water was found the best residual poison spray combination tested. Nicotine sulfate with molasses or karaya gum and paris green with brown sugar are of some value but inferior to tartar emetic.

Thrips attacking citrus fruits in Florida, W. L. THOMPSON. (Fla. Expt. Sta.). (*Citrus Indus.*, [21] (1940), [No. 10], pp. 5, 8, 9, 12, 13, 17, figs. 7).—A Florida flower thrips *Frankliniella cephalica bispinosa* (Morg.), *Chaetoanaphothrips orchidii* (Moult.), the greenhouse thrips, and citrus thrips are considered.

The thrips-transmitted bronze disease of the tomato [trans. title], L. BONNEMAISON (*Ann. Épiphyt. et Phytogénét.*, n. ser., 5 (1939), No. 3, pp. 267-308, figs. 22).—The onion thrips, vector of the virus of the so-called bronze disease of the tomato, is dealt with at some length in this report, which is presented with a four-page list of references to the literature.

Citrus thrips damage on Chinese photinia, J. B. STEINWEDEN (*Calif. Dept. Agr. Bul.*, 29 (1940), No. 3, p. 151).—Considerable injury to young, tender foliage of Chinese photinia (*Photinia serrulata nova*) observed in nurseries in Stanislaus, Merced, and Fresno Counties, Calif., by the citrus thrips is reported. Its attack on young foliage of Virginia creeper (*Ampelopsis quinquefolia*) near Fresno is recorded.

The longevity of the fasting bed-bug (C[imex] lectularius L.) under experimental conditions and particularly in relation to the saturation deficiency law of water-loss, C. G. JOHNSON (*Parasitology*, 32 (1940), No. 3, pp. 239-270, figs. 11).

The biology of *Anasa tristis* DeGeer, with particular reference to the tachinid parasite *Trichopoda pennipes* Fabr., R. L. BEARD (*Connecticut [New Haven] Sta. Bul.* 440 (1940), pp. 593-679, pls. 3, figs. 18).—The synonymy, morphology, and life history of the squash bug are discussed. High temperatures favor oviposition, the peak of which is reached in early July. Nymph mortality and winter mortality of hibernating adults are high. *T. pennipes* (Diptera: Tachinidae) is the most important natural enemy of the squash bug; its synonymy, morphology, and life history are discussed. This parasite deposits eggs on the surface of the host, principally on the abdomen. Larvae upon hatching bore through the body wall to spend their larval life attached to a tracheal branch from the metathoracic spiracle within the body cavity of the host. Mature larvae emerge through the posterior end of the bug and pupate in the soil. The host usually dies within 24 hr. after the emergence of the parasite. Superparasitism occurs commonly, but the supernumerary maggots are destroyed, leaving only one to mature in each host. The author suggests that cannibalism is probably responsible for this elimination. When older squash bug nymphs become parasitized the maggot remains in the first instar until the host matures. Death to the host is the result of larval emergence. Parasitic castration causes a reduction of oviposition by the female. The life histories of the squash bug (one generation) and the parasite (three generations) do not synchronize sufficiently for the parasite to maintain the squash bug at a low population density.

Plant bugs in citrus groves. (Fla. Expt. Sta.). (*Citrus Indus.* [21] (1940), [No. 10], pp. 16, 17, 18, 19).—Two contributions are presented, one by W. L. Thompson (pp. 16, 17) and the other by J. R. Watson (pp. 18, 19).

Three species of the genus *Lygus* and their relation to alfalfa seed production in southern Arizona and California, L. L. STITT (*U. S. Dept. Agr., Tech. Bul.* 741 (1940), pp. 19, figs. 2).—*L. hesperus* Knight, *L. elisus* Van Duzee, and *L. pratensis oblineatus* (Say) and their relation to alfalfa seed production in southern Arizona and California are discussed. Observations on seasonal activities, food plants, character of injury, economic importance, life history, natural enemies, and control are included. Both cage and field studies demonstrated that *Lygus* bugs seriously damage alfalfa flower parts and immature seed, and positive relationships between *Lygus* populations and percentage of flower fall were noted. Important host plants included alfalfa, cotton, sugar beets, winter mustard, and sowbane. Two species of spiders, several Hemiptera (*Geocoris* spp. and *Nabis ferus* (L.)), and the ant *Formica perpilosa* were observed attacking *Lygus* bugs. It was noted that *Lygus* populations varied with the stage of growth of the alfalfa and that lack of uniformity in alfalfa cutting in a locality resulted in heavy infestations while uniform cutting of all fields reduced the infestation and resulting damage.

Delphax striatella Fallen as vector of the virus disease zakuklivanie in grains, K. S. SUKHOV and P. T. PETLYUK (*Compt. Rend. (Dok.) Acad. Sci. U. R. S. S., n. ser.*, 26 (1940), No. 5, pp. 483-486).—The results of a study of the biology of *D. striatella*, vector of the virus of the zakuklivanie disease of grains, particularly in the vicinity of Omsk, are reported.

Species and variety differences in resistance to aphid injury in vetch, H. R. ALBRECHT. (Ala. Expt. Sta.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 833, 834).—The evaluation of vetch species and varieties within a species grown at Auburn, Ala., revealed a considerable difference in the reaction of their foliage to injury resulting from attack by the pea aphid. Field observations and tests with caged plants showed that the inflorescences and green pods of both the resistant and susceptible vetches could be severely damaged by

aphids. It is thought probable that this injury limited the seed production of the vetches studied.

"Snowball" bushes are sometimes deformed by aphids, F. L. GAMBRELL (*Farm Res. [New York State Sta.]*, 7 (1941), No. 1, p. 15, fig. 1).—A practical account, including data on methods of control.

Females of the San Jose scale rendered unproductive by lime-sulfur, M. A. YOTHERS. (U. S. D. A.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 890-892).—The experiments reported indicate that the unproductivity of female San Jose scales sprayed with lime-sulfur may be due to the action of the spray on the generative organs or to lack of fertilization on account of death of the males by the spray.

Fumigation of walnut trees in Ventura County, D. L. LINDGREN and R. C. DICKSON. (Calif. Citrus Expt. Sta.). (*Calif. Dept. Agr. Bul.*, 29 (1940), No. 3, pp. 146-151, figs. 3).—The fumigation of walnut trees in Ventura County, Calif., for the control of the California red scale is reported upon.

The citrus red scale problem in New South Wales, with special reference to fumigation, P. C. HELY (*Jour. Austral. Inst. Agr. Sci.*, 6 (1940), No. 3, pp. 140-146).—Hydrocyanic acid gas is considered to be the most satisfactory fumigant available at the present time for the California red scale, since if properly applied it can quite generally be relied upon to give a highly satisfactory kill of the scale.

Hydrocyanic acid dosages in relation to control by fumigation of [California] red scale (*Aonidiella aurantii* (Mask.)) on citrus, A. F. SWAIN and R. P. BUCKNER (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 895-900, figs. 3).

Asterolecanium variolosum Ratzeburg, a gall-forming coccid, and its effect upon the host trees, T. PARR (*Yale Univ. School Forestry Bul.* 46 (1940), pp. [5]+49, pls. 15).—A study of the taxonomic position, anatomy, biology, and economic importance of the golden oak scale *A. variolosum*, including its effect upon the trees and upon the host tissues, salivary gland enzymes, and the chemical changes in the plant tissue, is reported upon. This scale, recognized as a pest of oak in Europe, has spread throughout the entire world wherever its hosts occur, several species of the white oak group being attacked. Eighty-three references to the literature cited are listed.

On coccids found on roots of plants in Egypt, M. HOSNY (*Egypt Min. Agr., Tech. and Sci. Serv. Bul.* 237 (1939), pp. [3]+21, pls. 3).

Effects of defoliation by the pine butterfly upon ponderosa pine, J. C. EVENDEN. (U. S. D. A.). (*Jour. Forestry*, 38 (1940), No. 12, pp. 949-955, figs. 5).—Report is made of a severe defoliation of ponderosa pine by the pine butterfly over thousands of acres in the Payette Lakes area of central Idaho in 1922 and its effect upon the defoliated mature pine. By 1935, 13 yr. later, 26 percent of the trees had died, and the growth of those that survived was adversely affected by the defoliation. The severity of the defoliation is believed to be the most important factor contributing to the ultimate death or survival of the defoliated trees.

Investigations on the biology and control of the alfalfa caterpillar (*Colias eurytheme* Boisduval), E. H. FLOYD (*La. State Univ. Bul.*, n. ser., 32 (1940), No. 1, pp. 86, 87).—An abstract of a thesis.

Studies on the biology and control of sod webworms in California, R. M. BOHART. (Univ. Calif.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 886-890, fig. 1).—The larvae of the two webworms known to damage lawns in California, namely, *Crambus bonifatellus* (Hulst) and *C. sperryellus* Klots, are said to be the most serious annually recurring pests of bluegrass and bentgrass lawns in that State. The first mentioned occurs especially along the coast and the

latter predominates in the drier inland valleys. These species were found to complete their life cycle in 6 weeks or less in warm weather, and four generations are normally completed in a year. "Temporary control was obtained by the use of sprays containing pyrethrum extract, derris extract, and dichloroethyl ether, but none of these treatments prevented reinfestation in 3 weeks to a month's time. Therefore, it was necessary to repeat the treatment from one to three times during the summer. Lead arsenate used at the rate of 5 lb. to 1,000 sq. ft. in 50 gal. of water with 2 lb. of white flour added as an adhesive gave excellent temporary control and retained its effectiveness throughout the season under most conditions. Where watering is done every day it may be necessary in some cases to make two applications a month apart, using 10 lb. of lead arsenate and 4 lb. of flour to 1,000 sq. ft."

Melissopus latiferreanus as a pest of filberts in the Northwest, S. M. DOHANIAN. (U. S. D. A.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 852-856).—Studies of the so-called filbert worm *M. latiferreanus*, which has caused the filbert growers of the Pacific Northwest great concern on account of its direct damage to the nuts and the expense involved in sorting the infested nuts from sound ones, are reported. It is widely distributed and has a diverse number of host plants, although the most damage is caused by the larvae feeding in the kernel of the filbert nuts. Eggs hatch from 8 to 11 days after deposition, and in about 3 weeks the larvae are fully fed and ready for hibernation. They overwinter in cocoons until from 2 to 5 weeks before emergence as adults, at which time they go into the pupal stage. In Washington and Oregon the insect has one full generation a year and a partial second. Natural control agencies discovered during 2 yr. of study include more than six hymenopterous parasites of the larvae and one dipterous pupal parasite.

A progress report on the use of rotenone dusts for the control of the pickleworm and the melonworm in Alabama, F. S. ARANT. (Ala. Expt. Sta.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 840-843, figs. 3).—In experiments with the pickleworm and the melonworm at Auburn, derris-talc dusts containing 1 percent rotenone were effective in controlling both insects on small field plots. The control in cantaloups varied from 83 to 100 percent and in squash from 89 to 100 percent. "A derris dust containing 25 percent sulfur was effective against the insects but caused such severe burning to cantaloup foliage that an average of only 2.2 ripe edible fruits per 10 hills was produced, as compared with 3.1 on the checks and approximately 31 edible melons per 10 hills on plants dusted with derris and talc. Derris mixtures containing 0.5 percent rotenone were less effective than dusts containing 1 percent rotenone. Cube appeared to be inferior to timbo and derris. Heavy applications of dusts were made, approximately 15 to 30 lb. per acre, and no attempt was made to determine the minimum effective rate of application."

Experiments to control the grape-berry moth (*Polychrosis viteana* Clemens), Erie County, 1939.—Progress report, H. N. WORTHLEY and B. D. GLEISSNER (*Pennsylvania Sta., Jour. Ser. Paper 959* (1940), pp. [8]).

Will a dormant spray protect the apple crop against bud moth? F. Z. HARTZELL (*Farm Res. [New York State Sta.]*, 7 (1941), No. 1, pp. 1, 14).—The importance of dormant and summer sprays for control of the bud moth is emphasized.

Codling moth problem intensified (Arkansas Sta. Bul. 405 (1940), pp. 41, 42).—A report on migration studies and some other factors influencing percentage of codling moth infestation.

Attractiveness to codling moth of substances related to those elaborated by heterofermentative bacteria in baits, J. R. EYER and J. T. MEDLER. (N. Mex. Expt. Sta.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 933-940).—In this contribution (E. S. R., 78, p. 368) the results of additional comprehensive field tests during 1937 and 1938 are reported. Cane sirup bait consisting of Brer Rabbit sirup 1 part to 9 parts of water fermented by species of *Aerobacter* and *Aerobacillus* was found to be more attractive to the codling moth in the State than the same bait allowed to ferment through contamination by the yeast, mold, and bacterial flora of the air. Analyses of this bait revealed that ethyl alcohol, acetic and lactic acids, and acetylmethylcarbinol are the most prevalent of the compounds in these respective classes during the first 10 days of fermentation. A review of the literature relating to the chemical products elaborated by these bacteria in the fermentation of sucrose, glucose, and fructose suggested that homologous series of alcohols, acids, and esters related to the above-mentioned be exhaustively compared in a number of different ways. A design of an olfactometer somewhat similar to that used by earlier investigators in determining the response of the codling moth to colored lights proved useful in making preliminary comparison of these organic chemicals in the laboratory. Also a mixture of tragacanth, glycerine, and water was found instrumental as a medium for the emulsification of these chemicals for comparison.

"In tests in the olfactometer more of the hydroxy, dibasic, and aromatic acids proved attractive than the aliphatic acids and simple alcohols. Of the simple alcohols and acids, the three carbon groups (propyl or propionyl) proved consistently attractive. Of the esters of the same, the methyl series exhibited the most consistent degree of attractiveness when the alcohol radicle is considered, and the propionyl series when the acid radicle is considered. Of the hydroxy and dibasic acid esters, those of malonic, malic, lactic, and oxalic were attractive. Of the more complex alcohols and esters, those possessing a phenyl radicle were consistently attractive both in olfactometer and field comparisons. Since a wide variety of alcohols, acids, esters, and gases related to those elaborated by heterofermentative bacteria in the fermentation of sirup bait were found to be attractive, it is concluded that no one chemical is to be considered the most important or key factor in the chemotropic response of the codling moth."

Calcium arsenate and lead arsenate sprays with soybean flour for codling moth control, L. T. GRAHAM and C. H. RICHARDSON. (Iowa Expt. Sta.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 862-865, fig. 1).—It was found in work in Iowa during the season of 1939 that ordinary commercial calcium arsenate sprays with ferrous sulfate "safener" control the first-brood codling moth about as well as lead arsenate sprays and cause no injury to apple foliage. For heavy first-brood infestations and for moderate or heavy second-brood infestations lead arsenate was more reliable than the calcium arsenate-ferrous sulfate mixture. The addition of soybean flour to calcium arsenate or to lead arsenate sprays in the proportion of 12 oz. to 100 gal. of spray neither increases nor lessens the efficiency of the arsenical for codling moth control.

The present status of organic insecticides for codling moth control, R. L. WEBSTER, J. MARSHALL, and H. FALLSCHEER. (Wash. Expt. Sta.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 909-912).

The cotton leaf worm in the Western Hemisphere, L. PYENSON (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 830-833, fig. 1).

Seasonal abundance of eggs of the corn ear worm moth in Virginia, W. J. PHILLIPS and G. W. BARBER. (U. S. D. A.). (*Jour. N. Y. Ent. Soc.*, 48 (1940), No. 4, pp. 305-317, figs. 2).—The daily examination of selected corn plants of

successive plantings in two localities and four environments during a period of 6 yr. gave data on 16 seasonal records of egg occurrence, which are reported in tables and charts. A considerable difference in the seasonal occurrence of eggs was found to be dependent in part on earliness or lateness of the spring or fall. Precipitation seemed to be a principal factor in determining the abundance of the eggs.

Notes on the biology of the corn ear worm (*Heliothis obsoleta* Fabricius), E. R. LETT, JR. (*La. State Univ. Bul., n. ser., 32 (1940), No. 1, p. 209*).—An abstract of a thesis.

Tentative method of test for resistance of textile fabrics and yarns to moths (In *A. S. T. M. Standards, 1940 Sup., III. Philadelphia: Amer. Soc. Testing Mater., [1940], pt. 3, pp. 422, 423*).—A description is given of a method of test which covers the procedure for determining the resistance to clothes moths and carpet beetles of treated textile fabrics or yarns containing wool or other hair fibers.

Some factors influencing feeding activity of simuliids in the field, G. W. UNDERHILL. (Va. Expt. Sta.). (*Jour. Econ. Ent., 33 (1940), No. 6, pp. 915-917, figs. 5*).—In a study of the feeding activity of blackflies on turkeys, there was found to be a "definite relationship between the feeding of the insects and temperature, maximum feeding taking place at temperatures of 75° to 85° F. The flies were observed feeding at humidities as low as 42 percent and as high as 89 percent. Apparently humidity was not an important factor in the feeding activity of the insect. The flies were mostly active in feeding at a low atmospheric pressure or following a rapid fall in the barometer. Maximum feeding took place at barometric pressures of 27.85 and 28.05 in. (at 2,000 ft. elevation). Strong wind prevented feeding of the flies. They fed most actively when there was a calm or, at most, only a light breeze."

Introduction of dry area race of *Metagonistylum minense* into Barbados, R. W. E. TUCKER (*Agr. Jour. [Barbados], 8 (1939), No. 4, pp. 113-127*).—A report on the work attending the introduction of the melanic dry area variety of the Amazon fly *M. minense* from São Paulo, Brazil, in April and May 1939 into Barbados by airplane, its breeding in the laboratory and liberation in the sugarcane field.

The feather-legged fly, H. E. BRATLEY. (Fla. Expt. Sta.). (*Citrus Indus., [21] (1940), [No. 10], pp. 6, 11*).—The importance of the dipterous parasite known as the feather-legged fly as an enemy of the southern green plant bug is noted.

The nutritional requirements of screwworm larvae, R. MELVIN and R. C. BUSHLAND. (U. S. D. A.). (*Jour. Econ. Ent., 33 (1940), No. 6, pp. 850-852*).—In rearing larvae for experimental purposes an artificial medium consisting of 1 l. of water, 6 cc. of formalin (39 percent formaldehyde), 1 kg. of finely ground lean beef, and 500 cc. of citrated beef blood (3 gm. of sodium citrate per liter of blood) has been successfully used. Variations of this formula are possible, but the proportion of formalin should not be changed.

Lateral migration and depth of pupation of the larvae of the primary screwworm *Cochliomyia americana* C. and P., B. V. TRAVIS, E. F. KNIPLING, and A. J. BRODY. (U. S. D. A.). (*Jour. Econ. Ent., 33 (1940), No. 6, pp. 847-850*).—The investigations reported indicate that 90 percent of the larvae pupate within a radius of 18 in. from where they drop, and that under field conditions practically all larvae pupate in the soil within ½ in. of the surface.

The insecticidal effects of organic compounds.—I, Toxicity of sulfur and nitrogen compounds to fleshfly larvae, W. M. HOSKINS, H. P. BLOXHAM, and M. W. VAN ESS. (Univ. Calif.). (*Jour. Econ. Ent., 33 (1940), No. 6, pp. 875-881*).—In the studies reported, the details of which are given in tables, the

toxicity to larvae of the flesh fly *Lucilia sericata* of representatives from several series of organic compounds containing amino nitrogen or sulfur, or both, was determined through the addition of the substances at various concentrations to a synthetic diet. "Di- and tri-aliphatic amines are more toxic than the monoamines, but the reverse relation holds with the aromatic amines. Mercaptans and monosulfides are relatively nontoxic. Disulfides are more toxic than monosulfides. The group $-C(=S)N=$ gives rise to highly toxic compounds, especially thiourea, certain of its derivatives, and certain thioamides. Introduction of a phenyl group upon the nitrogen reduces toxicity. Substitution upon the sulfur atom reduces the toxic effect. Since thiourea has little toxicity to leaf-eating insects but is very effective against flesh fly larvae and clothes moth larvae, it may be that the mechanism of its poisonous action is to be sought in the behavior of the enzymes concerned in the metabolism of a highly proteinaceous diet."

Experimental studies on the influence of low temperatures upon the development of fruit-flies.—XI, Are the eggs, larvae, and pupae of Formosan fruit-flies possible to develop in the temperatures of the autumn, winter, and spring of the main-land of Japan? XII, On the acclimation to low temperatures in the pupae of *Chaetodacus ferrugineus dorsalis* Hendel, K. KOIDSUMI (*Jour. Soc. Trop. Agr. (Nettai Nôgaku Kwaisi)*, 11 (1939), No. 2, pp. 130-151; 12 (1940), No. 1, pp. 48-53).—A continuation of the series (E. S. R., 81, p. 549).

New elm pest invades Utah, G. F. KNOWLTON (*Farm and Home Sci. [Utah Sta.]*, 1 (1940), No. 4, p. 2, fig. 1).—A practical discussion of the biology and control of the elm leaf beetle, which is well established as an elm pest at Smithfield.

Parasites of the elm leaf beetle, S. E. FLANDERS. (Calif. Citrus Expt. Sta.). (*Trees Mag.*, 3 (1940), No. 2, p. 14).

Notes on the species of white grubs present in the Saratoga Forest Tree Nursery, C. E. HEIT and H. K. HENRY (*Jour. Forestry*, 38 (1940), No. 12, pp. 944-948, figs. 3).—Observations of white grubs at the New York State Saratoga Forest Tree Nursery have shown six species, namely, *Polyphylla variolosa*, *Phyllophaga tristis*, *P. fusca*, *P. anxia*, *Diplotaxis sordida*, and *Pachystethus lucicola*, to have caused severe injury to the roots of coniferous trees during 1 yr. of the 6-yr. period under study and five species to be of questionable importance. Description is given of the easily recognized characteristics which seem to differentiate the various beetle larvae. It is pointed out that certain species which have received little or no attention in this field may be even more serious in their effect than those of the well-known genus *Phyllophaga*.

A promising fungous pathogen of adult Japanese beetles (*Popillia japonica*), E. G. REX (*Journal N. Y. Ent. Soc.*, 48 (1940), No. 4, pp. 401-403).—It has been found that the spores of *Beauveria bassiana* may be produced cheaply and in large quantities upon a variety of culture media. Preliminary tests of infection in adult beetles indicate that this fungus may be a promising new natural control agency for the Japanese beetle.

The bronze birch borer and its relation to the dying of birch in New Brunswick forests, R. E. BALCH and J. S. PREBBLE (*Forestry Chron.*, 16 (1940), No. 3, pp. 179-201, figs. 9).—This account of the bronzed birch borer, native to North America, which during the past 5 yr. has caused the death of large numbers of yellow, white, and gray birch in New Brunswick, is presented with a list of 27 references to the literature. In 1939 the typical mature yellow birch stand showed about 20 percent of the trees dead and 35 percent with over half the crown dead.

Life history and control of the imported willow leaf beetle, C. E. HOOD (*U. S. Dept. Agr. Cir.* 572 (1940), pp. 10, figs. 3).—During the past few years

Plagioder a versicolora (Laich.), the imported willow leaf beetle, has become prevalent in many sections of New England. It is a small, robust beetle, metallic blue in color and sometimes tinged with red or bronze. In eastern New England the adult, which hibernates under willow bark or in grass, debris, etc., appears the latter part of April or early in May, feeds briefly, and begins oviposition. Black willow and golden willow are the preferred food plants, but the insect also feeds on Babylon weeping willow and the shiny willow. It has three full generations and a partial fourth annually. Extremely cold winters are fatal to adults not well protected, and the parasite *Schizonotus sieboldi* (Ratz.) often kills pupae. If care is exercised in treating the under surface of the foliage, efficient control results from the application between May 25 and June 25 of 4 lb. of lead arsenate per 100 gal. of water plus fish oil or linseed oil to act as an adhesive.

Tests with benzene, paradichlorobenzene, and other insecticides against the tobacco flea beetle (*Epitrix parvula* (F.)) in plant beds, N. ALLEN and W. A. SHANDS. (U. S. D. A., S. C. Expt. Sta., et al.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 834-840, figs. 3).—The use of benzene and paradichlorobenzene as control measures for downy mildew in tobacco plant beds led the authors to investigate their toxicity to the tobacco flea beetle in the plant beds being treated experimentally for blue mold. Concentrations of benzene vapor considered adequate for effective control of blue mold were not toxic to the tobacco flea beetle. In experiments with paradichlorobenzene, applied daily at rates of 0.25, 0.5, 1, and 2 oz. per square yard of plant bed, it was not toxic and apparently had little if any repellency to the flea beetle where ordinary plant-bed cover was used. Where covers having from 38 by 38 to 64 by 64 threads per square inch were used, probably resulting in greater concentrations of the vapor, a few beetles were killed, some were made sluggish but continued to feed to some extent on the plants, and the material had some repellent action, but at rates and by methods known to control blue mold it cannot be considered a satisfactory control for flea beetles in plant beds.

A maize and strawberry pest, *Clivina rugithorax* Putz., J. MUGGERIDGE (*New Zeal. Jour. Sci. and Technol.*, 21 (1939), No. 3A, pp. 184A-186A, figs. 2).—The native carabid *C. rugithorax* here considered caused considerable injury to recently planted corn by eating into the kernel of the seed, and was also found attacking ripe strawberries.

Effect of ether on the toxicity of certain fumigants to the confused flour beetle (*Tribolium confusum* Duval), H. GUNDERSON. (Iowa Expt. Sta.). (*Iowa State Col. Jour. Sci.*, 14 (1940), No. 4, pp. 405-417, figs. 7).—Under experimental conditions carbon disulfide, carbon tetrachloride, and ethyl acetate were more than seven times as toxic to the confused flour beetle as was ether.

The scolytid beetles of the genus *Renocis* Casey, with descriptions of nine new species, M. W. BLACKMAN (*U. S. Natl. Mus. Proc.*, 88 (1940), No. 3084, pp. 373-401, figs. 2).

Fumigation of sweetpotatoes with methyl bromide for control of the sweetpotato weevil, S. S. EASTER. (U. S. D. A. et al.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 921-926).—In the fumigation work reported upon a complete kill of all stages of embedded sweetpotato weevils was obtained at both reduced and atmospheric pressures. The gas exerts a variable deleterious physiological effect on the sweetpotatoes which may result in a considerable loss. This loss may be avoided partially by careful handling, partial curing, and postfumigation heating. Small-scale fumigations run on seed sweetpotatoes from a number of farms gave results satisfactory to the farmers. The loss was not prohibitive, and the production of plants was equal to or better than

that in the checks. The requirement of an airtight fumigation chamber and provision for postfumigation heating may restrict the use of this fumigant to those areas where the sweetpotatoes are raised on a commercial scale.

Experiments with derris and cubé dusts for pea weevil control, T. A. BRINDLEY, F. G. HINMAN, and R. A. FISHER. (U. S. D. A.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 881-886, figs. 3).—The results of laboratory and field work with derris and cube dusts, which have been effective in the control of the pea weevil in the Northwest, are reported. It was found that this enemy of the pea can be controlled in both green and dry peas by the application of derris dust mixtures with a rotenone content ranging from 0.5 to 1 percent. "Large-scale field tests demonstrated that the application of dust mixtures containing either 0.75 or 1 percent of rotenone derived from derris, cube, or timbo, at rates ranging from 25 to 40 lb. per acre, gave satisfactory control. No significant difference could be detected between the performance of the two dilutions of the mixture. It was found that the use of a hood or of a short trailing canvas on the dusting machine increased the efficiency of the treatment by preventing excessive wind drift. When the pea weevils continued to migrate from hibernation quarters to pea fields after the first dust application two and sometimes three dustings were necessary. Satisfactory control of the pea weevil was achieved only when all infested parts of pea fields were treated."

The lesser pepper weevil *Lophobaris piperis* Marsh. [trans. title], J. VAN DER VECHT (*Landbouw [Buitenzorg]*, 16 (1940), No. 6, pp. 323-366, figs. 7; *Eng. abs.*, pp. 364-366).—An account of the biology, importance, and control of *L. piperis* as it occurs in Java, Sumatra, and Borneo. Observations of four natural enemies, including three chalcidoids and a braconid, are presented.

Further notes on *Bathyplectes curculionis* and the alfalfa weevil in lowland middle California, A. E. MICHELbacher. (Univ. Calif.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 892-895, fig. 1).—Report is made of further observations of the larval parasite *B. curculionis* of the alfalfa weevil (E. S. R., 83, p. 664). This parasite has been most effective in the cooler coastal regions, where it has played an important part in reducing the alfalfa weevil populations.

The distribution of California buckeye in the Sierra Nevada in relation to honey production, G. H. VANSSELL, W. G. WATKINS, and L. F. HOSBROOK. (Coop. U. S. D. A.). (*California Sta.*, 1940, pp. 4, pls. 18).—California buckeye (*Aesculus californica*) has been an important factor in the failure of many attempts by deciduous fruit growers to keep bees in foothill orchards in California. When a high percentage of buckeye products is received in the food of the bees, a condition soon arises in which only eggs, day-old larvae, and sealed brood are present, the absence of unsealed brood being a typical symptom of "buckeyed" colonies. Later eggs alone are found in the cells. The distributional maps included in this publication show the upward limit of buckeye in the Sierra Nevada from the point where it crosses the Sacramento River in Shasta County southward into Tulare County, except for small sections in Nevada and Placer Counties between Grass Valley and the Rubicon River, which because of limited funds could not be surveyed.

Relative humidity and nectar concentration in fireweed, H. A. SCULLEN. (Oreg. Expt. Sta.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 870, 871, fig. 1).—Studies conducted throughout Oregon have shown a decided preference of bees for the more concentrated nectars when working in the field. The data presented in table and chart form clearly show that the relation of relative

humidity to nectar concentration in fireweed is "highly significant in a negative manner."

Trapping honeybee-gathered pollen and factors affecting yields, F. E. TODD and R. K. BISHOP. (U. S. D. A., Univ. Calif., et al.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 866-870, fig. 1).—In a study made of the seasonal distribution of pollen brought into the hive by honeybees use was made of pollen traps prepared by placing two parallel strips of hardware cloth over the hive entrance in such a way as to permit the ready passage of field bees but to relieve them of their pollen loads. The full year's trappings ranged from about 13.5 to 18 kg. per colony for the various areas. Pollen yields were found to be influenced by weather factors and by colony strength. Seasonal trends were in rhythm with the flowering of good sources. Peaks in the cycles occurred not during population peaks but during the blooming of good sources, while lows occurred during dearth of blossoms.

The toxicity of tartar emetic to the honeybee, J. E. ECKERT. (Univ. Calif.). (*Jour. Econ. Ent.*, 33 (1940), No. 6, pp. 872-875, fig. 1).—In work conducted in California it was found that, while the minimum lethal dose of tartar emetic for the honeybee is between 3 and 6 μ g per individual, the tartar emetic-sugar spray applied in greater concentrations in the control of the citrus thrips did not cause noticeable loss during the year to colonies in the vicinity of treated fields.

The Argentine ant in Victoria: A report on survey and control measures adopted following its discovery in Melbourne, T. W. HOGAN (*Jour. Dept. Agr. Victoria*, 38 (1940), No. 10, pp. 486-493, figs. 9).—Report is made of a survey of the metropolitan area of Melbourne following the appearance of the Argentine ant in Australia, as reported in September 1939, and a description given of the methods used. A system of suburban inspections resulted in the discovery of 13 minor areas of infestation.

Notes on the life history of some beneficial Javanese *Campsomeris* species [trans. title], C. J. H. FRANSSSEN (*Landbouw [Buitenzorg]*, 16 (1940), No. 5, pp. 292-315, figs. 22; *Eng. abs.*, pp. 312, 313).—Studies of the dagger wasps of the genus *Campsomeris*, well known natural enemies of white grubs in Java, including the technic employed in rearing the wasps in the laboratory, are reported.

Revision of the chalcid-flies of the tribe Chalcidini in America north of Mexico, B. D. BURKS (*U. S. Natl. Mus. Proc.*, 88 (1940), No. 3082, pp. 237-354, figs. 9).—This revision of the tribe Chalcidini includes descriptions of 14 species new to science. It is pointed out that the species of the genus *Chalcis* are larval parasites and that all the other species that have been reared are pupal parasites. A host catalog is included.

Larval disease prevalent in heavy infestations of the European spruce sawfly in southern New Hampshire and Vermont, P. B. DOWDEN. (U. S. D. A.). (*Jour. Forestry*, 38 (1940), No. 12, pp. 970-972, fig. 1).—During 1939 a disease, the causative organism of which has not been identified, destroyed tremendous numbers of larvae of the European spruce sawfly in heavily infested areas in southern New Hampshire and Vermont. The disease, which affects the first five larval stadiums, is similar in effect to the wilt diseases of other insect larvae.

Establishment in the United States of *Microplectron fuscipennis* Zett., a parasite of the European spruce sawfly, P. B. DOWDEN, W. F. SELLERS, and F. E. MILLER, JR. (U. S. D. A.). (*Jour. Forestry*, 38 (1940), No. 12, pp. 972-974).

Review and summary of studies of insects associated with *Lemna minor*, M. B. SCOTLAND. (Cornell Univ.). (*Jour. N. Y. Ent. Soc.*, 48 (1940), No. 4, pp. 319-333, figs. 21).

Eriophyid studies, IX, X, H. H. KEIFER (*Calif. Dept. Agr. Bul.*, 29 (1940), Nos. 2, pp. 112-117, figs. 4; 3, pp. 160-179, figs. 16).—In continuation of this series of studies (E. S. R., 83, p. 528), 4 new species are described in part 9. In part 10, 4 genera are erected and 16 species described as new. One of these, *Phyllocoptes destructor* Keifer n. sp., is of particular importance because of its serious damage on two occasions to tomatoes in California. *Calacarus adornatus* K. is listed as a camelia pest of some importance.

Rotenone in low concentration as a tickicide and insecticide for house pets, Z. DE JESUS and R. B. GAPUZ (*Philippine Jour. Anim. Indus.*, 7 (1940), No. 4, pp. 391-395).—A mixture of rotenone and cassava starch as a vehicle in concentrations of 1 and 2 percent rotenone has been found to be an economical, very convenient, nontoxic, and effective tickicide and insecticide for use on dogs and cats. The brown dog tick and a species of *Dermacentor* were killed in from 24 to 72 hr., these ticks having remained attached to the skin of the host, where they died and dried up.

The biology and economic importance of a nematode parasitic in insects, R. W. GLASER, E. E. MCCOY, and H. B. GIRTH. (U. S. D. A. et al.). (*Jour. Parasitol.*, 26 (1940), No. 6, pp. 479-495, figs. 8).—In work with the nematode parasite of the Japanese beetle, *Neoplectana glaseri* Steiner, its life history on culture media was found to be similar to that in nature (E. S. R., 74, p. 238).

ANIMAL PRODUCTION

[Animal husbandry studies by the Arkansas Station] (*Arkansas Sta. Bul.* 405 (1940), pp. 17-22).—These studies dealt with feeding trials with cottonseed meal v. soybean meal as a supplement to corn and pasture for fattening pigs, carried on by S. R. Johnson; cross-breeding for broiler production, by W. R. Horlacher, R. M. Smith, and W. H. Wiley; and the use of mash developed by the station for starting and growing broilers, by Johnson and Smith.

[Livestock production investigations by the Colorado Station] (*Colorado Sta. Rpt.* 1940, pp. 15, 16, 17, 40-42).—The results are briefly reported of the following investigations in progress: Yellow and white corn, barley, wheat, and milo when fed to lambs with alfalfa, cane fodder, and beet tops; comparison of cut milo and corn fodder for fattening lambs; depletion of birds for assay of riboflavin; the utilization by poultry of minerals from various sources; the riboflavin requirements of turkeys for breeding; and the iodine requirements of poultry.

[Experiments with livestock by the Montana Station], R. T. CLARK, D. HANSEN, A. E. SEAMANS, R. M. WILLIAMS, F. S. WILLSON, and J. R. QUESENBERRY. (Partly coop. U. S. D. A.). (*Montana Sta. [Bien.] Rpt.* 1939-40, pp. 16, 17-19, 50, 52, 53, 55-57, 59-62).—Included are brief reports of progress on the following investigations: Survey of marketing and feeding costs in lamb production; management and utilization of forage by sheep on summer range; lamb feeding on rations consisting of 50 percent molasses beet pulp and 50 percent oats in comparison with rations of one-third of each of these substances and one-third of alfalfa hay; fattening calves on barley and molasses beet pulp; the superiority for market lamb production of Suffolk as compared with Hampshire, Columbia, Romney, and Corriedale lambs for mating with grade Rambouillet ewes; the use of cottonseed-molasses beet pulp pellets as a supplement to crested wheat-

grass range and hay for wintering beef cattle; lamb feeding experiments with home-grown feeds; comparison of forage crops for swine; beef production on crested wheatgrass, bromegrass, and native range; seasonal changes in the high value of crested wheatgrass for beef production; and the effect of plane of nutrition of beef cows on the calf crop. From cooperative investigations with the U. S. Range Livestock Experiment Station at Miles City results are presented on the quality of meat produced by calves and record-of-performance studies of beef sires; rate of grazing cattle and sheep and its influence on the progeny; and the development of superior strains of swine.

Some recent observations on the feeding values of some local animal foodstuffs, M. H. FRENCH (*East African Agr. Jour.*, 6 (1940), No. 2, pp. 87-90).—Observations were reported on the feeding of canna tops and tubers, velvetbeans, wheat bran, kapok seed cake, leaves of *Ficus sycamorus*, and banana plants to livestock, especially cattle.

The nutritional basis of the artificial drying of home-grown fodders [trans. title], H. EDIN (*K. Lantbr. Akad. Tidskr.*, 79 (1940), No. 3, pp. 211-230, fig. 1; *Eng. abs.*, pp. 227-230).—Different methods of drying were compared for conserving the net energy and digestible protein in grasses and legumes cut at different seasons of the year. In hay cured on wire racks, about 75 percent of the feed units and digestible protein was conserved. In silage there was from 65 to 80 percent saved. On the other hand, it was possible to conserve from 97 to 100 percent of the feed units and from 92 to 100 percent of the protein by artificial drying. The loss of protein was greatest in rapid driers in which a temperature above 500° C. was attained.

A silage investigation with marrow stem kale [trans. title], A. HELMBERG (*K. Lantbr. Akad. Tidskr.*, 79 (1940), No. 3, pp. 261-269, fig. 1; *Eng. abs.*, p. 269).—A comparison of the quality of silage of marrow stem kale cut in 1, 2.5, 5, and 10 cm. lengths showed little benefit from the finer cutting. The quality of all silage was good, and the pH, ammonia, and organic acids varied little except that there was no butyric acid in the finest-cut lot. There was less loss in dry matter in the finer-cut group.

The effect of replacing solvent-extracted soybean oil meal with soybeans in a low fat ration, A. R. SCHUBERT and J. G. WELLS (*Michigan Sta. Quart. Bul.*, 23 (1940), No. 2, pp. 72, 73).—The basal concentrate ration used in this experiment consisted of ground barley and solvent-extracted soybean meal and contained 1.3 percent ether extract. Alfalfa hay and grass silage constituted the roughage ration. The high fat concentrate ration consisted of ground barley and ground soybeans and contained 4.75 percent ether extract. Changing one group of cows from the basal to the high fat ration for 30 days failed to influence significantly the production of milk or butterfat as compared with the check group continued on the basal ration.

Inspection of commercial feeding stuffs, 1940, T. O. SMITH and H. A. DAVIS (*New Hampshire Sta. Bul.* 327 (1940), pp. 106).—This is the usual report of the guaranteed and found analyses of 495 brands of feeding stuffs collected for official inspection during the year ended June 1940 (E. S. R., 82, p. 521).

Analyses of commercial feeding stuffs and registrations for 1940, C. S. CATHCART (*New Jersey Stas. Bul.* 680 (1940), pp. 64).—A summary of the results of the 1939 feed inspection and a tabulation of the guaranteed and found analyses of 1,517 samples of feeds are presented (E. S. R., 82, p. 372).

Commercial feeding stuffs from September 1, 1939, to August 31, 1940, F. D. FULLER and J. SULLIVAN (*Texas Sta. Bul.* 594 (1940), pp. 221).—Included in this annual report (E. S. R., 82, p. 662) are tabulations of the guarantees and analyses of 3,592 samples of feeding stuffs submitted to chemical

analysis and microscopic examination, the results of bio-assay of 28 fish-liver oils, carotene determinations of 30 feeds, hardness tests for 27 samples of cottonseed cake, and determinations of salt and calcium carbonate in 385 and 363 samples, respectively. The average composition, digestible protein, and productive energy of many feeding stuffs analyzed and the average protein content of cottonseed products from each oil mill in the State are tabulated separately. Information is included on the chemical standards for various byproducts and special-purpose feeds and definitions of and standards for commercial unmixed feeds.

[Feeding experiments in Utah] (*Farm and Home Sci. [Utah Sta.]*, 1 (1940), No. 4, pp. 10, 12).—A progress report on feeds for turkeys and a summary, by A. C. Esplin, M. A. Madsen, and R. W. Phillips, of research on feeding ewe lambs previously noted (E. S. R., 84, p. 374).

Vitamin A.—II, Occurrence in hay and silage—deficiency symptoms—requirements of horse, B. W. FAIRBANKS. (Univ. Ill.). (*North Amer. Vet.*, 21 (1940), No. 5, pp. 281–283).—A general discussion (E. S. R., 84, p. 556).

Availability to white rats of phosphorus in Lespedeza sericea and alfalfa hays, D. E. WILLIAMS, F. L. MACLEOD, and E. MORRELL. (Tenn. Expt. Sta. et al.). (*Jour. Nutr.*, 19 (1940), No. 3, pp. 251–262).—The present experiments were designed to compare the availability to the rat of the P of low-P and of high-P hays. Triplicate feeding tests were conducted in which the experimental diets contained P at a minimum level of adequacy (0.16 percent) and all other nutrients at optimum levels, the same for all diets. The variable in these diets was the source of P, this element being furnished entirely by a salt mixture in the control diet, but in the test diets only half by the salt mixture, the balance (0.08 percent) being supplied by the hay. Leaves and stems of low-P lespedeza hay containing, respectively, 0.18 and 0.13 percent of P were compared with leaves and stems of high-P lespedeza hay containing, respectively, 0.26 and 0.27 percent of P. Low- and high-P alfalfa hays containing, respectively, 0.21 and 0.35 percent of P were also compared. Tests with the control diet where P was supplied by a readily assimilable salt mixture showed that a diet containing 0.16 percent of P and having a Ca:P ratio of 3:1 is just about minimal for normal growth and P retention when the diet is fed ad libitum or in slightly restricted amounts (as in the triplicate feeding tests).

As judged by growth of the animals and by P retention, the P of the low-P *L. sericea* or alfalfa hay was less available to the rat for growth and bone development than the P of the high-P hay of the same type. This difference in availability was apparently due to lack of absorption from the low-P hays, which were fed in relatively large amounts to supply the minimum amount of P. With these large amounts of hay there was increased elimination, as evidenced by increased fecal weight, with a loss of nutrients including P. Hays of higher P content were fed in smaller amounts and were apparently retained in the intestines long enough for sufficient digestion to make the P available to the rat.

Availability to white rats of phosphorus in soybean and red clover hays, D. E. WILLIAMS, F. L. MACLEOD, and E. MORRELL. (Tenn. Expt. Sta. et al.). (*Jour. Nutr.*, 20 (1940), No. 4, pp. 391–398).—Continuing the investigations noted above, soybean hay of low-phosphorus (0.12 percent) and high-phosphorus (0.21 percent) content and red clover hays containing 0.12 and 0.31 percent phosphorus were used as the principal ingredients in rat rations. The mineral supplement was varied to provide 0.16 percent phosphorus and an equal amount of calcium in each experimental diet. In each instance the retention of food phosphorus was materially higher from the high-phosphorus hay ration than from the low-phosphorus hay ration, while phosphorus elimination in the feces was much

higher on the low-phosphorus hay rations. With phosphorus at a minimal level, an increase in the calcium:phosphorus ratio resulted in a decrease in food consumption and in the amount of phosphorus stored in the animal body.

The identification of live stock by tattooing, C. E. ALLEN (*Sci. Agr.*, 21 (1940), No. 4, pp. 180-197, figs. 6).—Tattooing is suggested as a practical method of animal identification for swine, horses, sheep, cattle, and dogs. The procedure for carrying out the tattooing with the necessary dye is described.

The influence of climatological factors on cattle: Observations on cattle in tropical regions, J. C. BONSMAN (*Farming in So. Africa*, 15 (1940), No. 175, pp. 373-385, figs. 17).—Climatic conditions in South Africa are depicted in a series of maps. From experiments conducted at the Messina Experiment Station, where a mean temperature of about 70° prevails, data are graphically presented on the grazing habits, respiration counts, body temperature, saliva secretion, and pulse rate of Africander and purebred Hereford, Shorthorn, and Aberdeen Angus cattle. The superiority of the Africander over the exotic breeds in withstanding the effects of high temperature is strikingly demonstrated. It is concluded that the selection of breeding stock according to a European standard of excellence is not desirable in South Africa, and that a type must be evolved that will suit the ranching conditions of that country.

The length of time required for depletion of vitamin A reserves in range cattle, J. K. RIGGS. (Tex. Expt. Sta. and U. S. D. A.). (*Jour. Nutr.*, 20 (1940), No. 5, pp. 491-500).—The time required for 260 Hereford steers from 3 to 16 mo. of age and ranging from 225 to 559 lb. in weight to develop night blindness as the first symptom of vitamin A deficiency in eight lots on rations containing practically no carotene was ascertained. The younger animals had smaller reserves than older animals and therefore developed deficiencies in a shorter interval. The youngest group (from 3 to 6 mo. of age) required an average of but 56 ± 6 days for depletion as compared with 178 ± 37 days for depletion of the 16-month-old group. The amount of green vegetation as influenced by rainfall from season to season was an important factor in the amount of carotene present in the grass and the time required by the steers for depletion.

The birth weights of Red Scindi cattle at Alabang Stock Farm, M. MUÑOZ and T. V. RIGOR (*Philippine Jour. Anim. Indus.*, 7 (1940), No. 3, pp. 263-267).—The mean birth weight of bull calves was 19.19 and of heifer calves 18.32 kg., averaging for bull calves 7.05 percent that of their dams and for heifer calves 6.38 percent. There was a significant positive correlation of the birth weight of bull calves and of the combined sexes to weight of dams, but a significant negative correlation between birth weight of heifers and weight of dams.

The influence of breeding on the performance of beef calves produced in Mississippi, A. E. CULLISON (*Mississippi Sta. Bul.* 347 (1940), pp. 14, figs. 6).—In continuation of this study (*E. S. R.*, 82, p. 232), comparative tests are reported on the grades and gains of calves of native cows sired by native and by purebred bulls fed during the suckling and fattening periods in 1938-39 and 1939-40. Average daily gains during the suckling period for the 2 years' results combined showed that the native calves excelled with 1.86 lb., as compared with 1.80 lb. for the calves sired by Polled Shorthorns and Polled Devons and 1.67 and 1.64 lb. for the calves sired by Herefords and Aberdeen Angus, respectively. The native calves, however, graded Medium as compared with Good for the crosses. Weaning was at approximately 200 days of age. During a subsequent fattening period of the same duration the Polled Devon-sired calves excelled the others in rate of gain, 1.70 lb. per day, with Aberdeen Angus-sired second at 1.62 lb. and the Polled Shorthorn-sired and Polled Hereford-sired at 1.59 and 1.51 lb., respectively. During this period native calves made

average daily gains of 1.46 lb. and graded only Medium as contrasted with Good for the other groups. The native calves were less efficient utilizers of feed per unit gain than the crossbreds.

Legume silage vs. corn silage vs. legume hay for fattening heifer calves, G. A. BRANAMAN and G. K. DAVIS (*Michigan Sta. Quart. Bul.*, 23 (1940), No. 2, pp. 106-110).—A second comparison of these feeds for fattening heifer calves produced equal gains in the 202-day feeding period. These results were somewhat less favorable for alfalfa silage than in the first trial (E. S. R., 82, p. 89). It was not necessary to add a protein-rich feed to the alfalfa hay ration to produce a satisfactory gain.

Finishing two-year-old steers with grass and grain, E. A. LIVESAY (*West Virginia Sta. Bul.* 296 (1940), pp. 12).—The general plan of the three experiments reported was to winter yearling steers on roughage and cottonseed meal (126 days), graze them from April to September (140 days), and follow with a 56-day finishing period. The three lots of steers in each trial were handled alike during the wintering period. Lot 1 received supplementary feed during the last 84 days and lot 2 for the last 56 days of the grazing period, while lot 3 received no supplement on grass. Lots 1 and 2 were finished on grass with heavy grain feeding but no roughage, while lot 3 was finished in dry lot on hay and grain. The amount of grain required to finish the 2-year-old steers by the three methods did not differ widely. Average dressing percentages for three groups were similar, as were the carcass grades. The animals in lots 1 and 2 each received some grain during the grazing season and consistently showed slightly better finish than the steers in lot 3. However, the margins of sale value over total costs consistently favored the lot 3 steers.

Finishing lambs on different proportions of corn and alfalfa, L. H. BLAKESLEE and G. A. BROWN (*Michigan Sta. Quart. Bul.*, 23 (1940), No. 2, pp. 66-69).—Lambs hand fed on 70-percent hay and 30-percent corn rations gained about 3 lb. less during a feeding period of 103 days than lambs self-fed on similar rations supplying equal amounts of corn and alfalfa. Although the feed cost of the 70-percent alfalfa ration was less, the increased finish from the 50-percent corn ration more than offset the greater cost.

The feeding of camels, I. LEITCH (*Imp. Bur. Anim. Nutr. [Aberdeen], Tech. Commun.* 13 (1940), pp. 35).—The general requirements and methods followed in feeding camels are described. Notation is made of the importance of and daily need for about 5 oz. of salt for hand-fed camels unless saltwort pastures are available.

Swine management, W. C. SKELLEY (*New Jersey Stas. Cir.* 401 (1940), pp. 31, figs. 10).—This supersedes Circular 259 (E. S. R., 68, p. 77).

A plan of economical swine production for the Coastal Plain area, B. L. SOUTHWELL (*Georgia Coastal Plain Sta. Cir.* 7 (1940), pp. [13], figs. 11).—A plan for the production, management, and breeding of pigs under Coastal Plain conditions is presented.

Market classes and grades of swine, D. J. SLATER (*U. S. Dept. Agr. Cir.* 569 (1940), pp. 36, figs. 14).—Terms and classifications for swine under the present system of market classes and grades are defined, and the various classes of slaughter swine and feeder and stocker animals are described and illustrated.

Feeding soybeans to pigs: The effect on gains and a method of producing firm carcasses, E. H. HOSTETLER and J. O. HALVERSON (*North Carolina Sta. Tech. Bul.* 63 (1940), pp. 23).—The results of this investigation point toward the development of a method of producing firm carcasses from pigs fed soybeans. Rations containing 30, 40, and 50 percent of mature soybeans with corn and tankage until an average weight of 100 lb. was reached, followed by

corn and tankage containing 13 percent of cottonseed meal, were successfully fed to the attainment of an average weight of 230 lb. The carcasses graded firm, and these data were correlated with chemical determinations on the hardness of fat.

The influence of prolonged starvation on the composition of pig depot fats, T. P. HILDITCH and W. H. PEDELTZ (*Biochem. Jour.*, 34 (1940), No. 1, pp. 40-47).—Two pigs fattened to 330 lb. live weight were fasted for 51 and 135 days, respectively, and showed weight losses of 65 and 143 lb. during these fasting periods. Data are presented on the total amounts of the various fatty acids in the fat depots and the percentage proportions of the fatty acids remaining after inanition. After 51 days' fast 59, 64, and 75 percent and after 135 days' 47, 35, and 38 percent of the respective outer, inner, and perinephric total fatty acids remained. The most striking feature of the results was the relatively small change in composition of the fats in corresponding depots during the course of the prolonged fast (*E. S. R.*, 84, p. 379).

[The nutritive value of dried foods for dogs], J. R. WAGNER and C. A. ELVEHJEM (*Wisconsin Sta. Bul.* 450 (1940), p. 34).—A progress report.

The digestibility of animal products and cereals by minks, J. K. LOOSLI, S. E. SMITH, and L. A. MAYNARD. (U. S. D. A., Cornell Univ., et al.). (*Amer. Fur Breeder*, 13 (1940), No. 6, pp. 32-34).—Digestion trials with minks on 13 different diets showed that fresh beef and horse meat were more digestible than dried or cooked meat or canned fish. Although carbohydrates and fats are good sources of energy, the carbohydrates were less digestible than proteins.

Egg shells are good poultry feed, H. L. WILCKE. (Iowa State Col.). (*U. S. Egg and Poultry Mag.*, 46 (1940), No. 10, pp. 617, 618).—In trials with both laying hens and growing chicks eggshell was found equal to oystershell as a calcium supplement in the rations, leading to the conclusion that price should be the determining factor in choosing between these supplements.

A study of the physical and chemical changes of the egg during its passage through the isthmus and uterus of the hen's oviduct, B. R. BURMESTER. (Univ. Ill.). (*Jour. Expt. Zool.*, 84 (1940), No. 3, pp. 445-500, figs. 7).—Data are presented on the changes in the weight, percentage of solids, and percentage of ash of the egg yolk during its passage through the isthmus portion of the uterus and oviduct. Measurements based on 47 yolks of eggs removed from the isthmus and uterus and 58 eggs manually expelled from the uterus are presented as ratios to the yolks of laid eggs. In general, the weight of the yolk and its ash and solids contents do not change while the egg passes through the isthmus and anterior uterus. The total weight of the white was only slightly if at all increased, but an appreciable amount of water was added, thus reducing the percentage of solids and ash. The volume of outer and inner thin white in the egg increased with curvilinear relation to the time the egg remained in the uterus, and the percentage of thick white decreased as a result of the increased amount of water added to the egg as it passed through the posterior portion. Active deposition of the shell membrane began in the isthmus and continued with the movement of the egg through it. Deposition of shell calcium apparently began in the anterior uterus. Changes in the composition of the white are thought largely responsible for the later changes in the composition of the yolk.

The preservation of eggs, R. B. HAINES (*Chem. and Indus.*, 59 (1940), No. 23, pp. 391-396, figs. 4).—This contribution from the Cambridge Low Temperature Research Station discusses the chief types of change which are liable to occur when eggs are stored and methods for controlling them.

Effect of high humidity on egg quality during short holding periods, F. P. JEFFREY and V. DABAGO (*New Jersey Stat. Bul.* 682 (1940), pp. 16, figs. 5).—Three tests were conducted in which fresh eggs were held at temperatures typical of fall (around 60° F.), winter (around 43°), and summer (around 80°) conditions. Two levels of relative humidity, the prevailing rate and a high rate (above 90 percent), were employed in each series. Eggs were examined for loss in albumin height, loss of weight, and degree of shell mottling at 2-day intervals up to 14 days. Interior egg quality as measured by height of the thick albumin was little affected by the relative humidity, whereas temperature markedly affected the rate of quality decline. High relative humidity tended to reduce the rate of evaporation of the egg content and reduced the incidence of severely mottled shells. Degree of shell mottling was not related to height of the thick albumin. Both degree of shell mottling and size of the air cell were measures of the rate of evaporation. The latter is recommended as a measure for this factor in the candling and grading of eggs. Attempts to maintain relative humidity of 90 percent or more in the egg storage room were not practical under the conditions of these experiments.

The development of mold on cold storage eggs and methods of control, W. L. MALLMANN and C. E. MICHAEL (*Michigan Sta. Tech. Bul.* 174 (1940), pp. 34, fig. 1).—A detailed report of research previously noted (*E. S. R.*, 83, p. 237).

Frozen storage of poultry.—IV, Further observations on surface drying and peroxide oxygen formation, W. H. COOK and W. H. WHITE (*Canad. Jour. Res.*, 18 (1940), No. 10, Sect. D, pp. 363-370, fig. 1).—Continuing these studies (*E. S. R.*, 82, p. 809), a package for frozen poultry capable of being ventilated during chilled storage but sealed to prevent surface drying during frozen storage is described which satisfactorily maintained the desired humidity of the pack. Experiments with a jacketed room in which the cooling coils were separated from the storage space indicated that this procedure does not prevent surface drying of boxed goods. Delay between slaughter and freezing accelerated the development of rancidity in the fat of poultry during subsequent frozen storage, but the free fatty acid content was seldom affected unless extensive microbial development occurred prior to freezing.

Concentrate feeding of broad breasted Bronze turkeys, E. I. ROBERTSON and L. A. WILHELM. (*Wash. Expt. Sta.*). (*U. S. Egg and Poultry Mag.*, 46 (1940), No. 10, pp. 597-600, 639, 640).—Feeding practices for growing turkeys compared in this experiment were (1) all-mash ration with birds confined, (2) all-mash ration on range, (3) a high-protein concentrate plus free choice of corn, wheat, oats, and barley on range, and (4) developing mash plus free access to a mixture of whole grains. Pens of both toms and hens were carried from 8 to 28 weeks of age. The feed required per pound of gain over the entire period was for toms 5.05 lb. 4.61, 3.84, and 4.83 and for hens 5.22, 5.28, 4.39, and 4.86 lb. for groups 1 to 4, respectively. The hens utilized feed as efficiently as the toms to 16 weeks of age. The toms receiving the protein concentrate plus free choice of grains showed highest final weight, most efficient feed utilization, and lowest feed cost per pound of gain. The results with hens were similar except that the final weight of this group was slightly below that of the birds receiving the all-mash ration. Grain consumption under the free-choice plan was wheat 64 percent, corn 25, oats 10, and barley 1 percent.

Feeding and confinement rearing experiment with turkeys during 1939, F. N. BARRETT, C. G. CARD, and A. BERRIDGE (*Michigan Sta. Quart. Bul.*, 23 (1940), No. 2, pp. 85-92).—Studies of free-choice feeding of crossbred small-type and standard Bronze turkeys on corn, wheat, oats, and barley with mash

showed that oats was preferred to the other grains during a 24-week feeding period in confinement. Barley was eaten in rather large amounts during the first 4 weeks, but consumption of this grain later decreased. Wheat was preferred to corn. A mash containing fish meal in place of wheat flour middlings gave highly satisfactory results. The ♂ turkeys made more rapid gains and more efficient feed utilization than ♀s.

DAIRY FARMING—DAIRYING

[Investigations with dairy cattle and dairy products in Montana], J. A. NELSON and D. V. KOPLAND (*Montana Sta. [Bien.] Rpt. 1939-40, pp. 25, 26, 53, 54*).—Studies, for which results are briefly noted, include the effect of pasteurization on the flavor of market milk, methods of improving cultured butter-milk, the influence of certain weeds consumed by the cow on milk flavor, raising dairy calves on skim milk powder, and the effect on the dairy herd of the continuous use of sires which transmit a high level of productive inheritance.

[Dairy feeding investigations in Wisconsin], I. W. RUPEL, G. BOHSTEDT, M. I. WEGNER, E. B. HART, A. N. BOOTH, W. H. PETERSON, F. W. DUFFEE, B. C. JOHNSON, and W. A. KING (*Wisconsin Sta. Bul. 450 (1940), pp. 20-23, figs. 2*).—Results are reported on the utilization of urea by lactating cows, in vitro conversion of nitrogen to protein, and the use of corn meal, molasses, and phosphoric acid as preservatives for grass silage.

The length of the intestine of calves and its bearing on the absorption of the nutrients from the chyme, D. ESPE and C. Y. CANNON. (Iowa Expt. Sta.). (*Jour. Dairy Sci., 23 (1940), No. 12, pp. 1211-1214*).—Data are presented on the length of the intestines of five calves ranging in age from 5 to 12 mo. Average in vivo and post-mortem lengths were, respectively, 21 ft. 5 in. and 69 ft. 10 in. for the small intestine and 7 ft. 2 in. and 15 ft. 9 in. for the large intestine. It appeared that variations in the ratio between body length and length of intestines depended more on individuality than upon the age of the calf. Based on a review of available information, it is concluded that while the progress of the chyme through the calf intestine is comparatively rapid the relatively greater length of this organ in ruminants allows for proper absorption of the nutrient if it is thoroughly comminuted in the rumen.

Report of the Chief of the Bureau of Dairy Industry, 1940, O. E. REED (*U. S. Dept. Agr., Bur. Dairy Indus. Rpt., 1940, pp. 53*).—Dairy cattle investigations at the Beltsville, Md., Research Center and field experiment stations for which results are reported include breeding experiments with purebred dairy cattle, methods of preserving bull semen, the prevention of calf scours, various anatomical relationships in dairy cattle, the suspensory apparatus and circulatory system of the cow's udder, methods of ensiling forages and the feeding value of the silages, the grazing value of numerous types of permanent and temporary pastures, the man-labor requirement for handling dairy herds, costs of artificially dehydrating hay, all-roughage v. roughage and limited grain feeding of dairy cows and growing heifers, the use of liquid manure on pasture, the use of short-wave diathermy in the treatment of mastitis, numerous phases of the physiology of reproduction and lactation, and the gonadotropic activity of certain plant materials.

Nutrition investigations include the relation of vitamin E to nutritional muscular dystrophy, the hydroxyamino acids in proteins, carotene requirements for normal reproduction in cattle, the vitamin A requirements of young calves, the carotene content of corn silage and of alfalfa, nutritional deficiencies in poor-quality hay, and nutrition and lactation studies with rabbits.

From investigations with dairy products results are noted on various phases of the chemistry and bacteriology of milk, particularly the vitamin requirements of bacteria and the fat acid composition of milk fat; methods of utilizing dairy byproducts in ice cream and the whipping properties of ice cream mixes; new industrial and food uses for dairy byproducts; cheese quality improvement; methods of detecting mastitis infection; the effect of pasteurization on goat's milk; factors affecting the activation of milk phosphatase; the effects of homogenization on curd tension of milk; the relation of curd tension to digestion; and relation of curd size to curd tension and digestibility.

Station dairy research is widely diversified in nature (*Farm Res. [New York State Sta.]*, 7 (1941), No. 1, pp. 4, 12, figs. 2).—A brief description of the dairy research activities of this station, with particular reference to cheese production, ice cream manufacture, and dairy herd improvement.

The "in vitro" conversion of inorganic nitrogen to protein by microorganisms from the cow's rumen, M. I. WEGNER, A. N. BOOTH, G. BOHSTEDT, and E. B. HART. (Wis. Expt. Sta.). (*Jour. Dairy Sci.*, 23 (1940), No. 11, pp. 1123-1129).—Through in vitro experiments in which synthetic media were inoculated with juice expressed from bovine rumen contents it was demonstrated that inorganic nitrogen is converted to protein through action of bacteria from the cow's rumen. It was necessary to maintain a relatively high pH of the media through use of a calcium carbonate buffer to permit this reaction. The optimum pH range was from 5.5 to 7. Ammonium carbonate and urea were utilized by the rumen organisms with equal efficiency. Corn molasses, glucose, and starch were equally efficient in influencing nitrogen conversion, but cellulose was not an acceptable carbohydrate for this purpose. The decrease in ammonia could be accounted for by an increase in protein nitrogen. The level of protein in the media had a negative influence on the decrease in ammonia nitrogen. Rumen fluid exceeded the saliva in amylolytic activity, and saliva showed no proteolytic activity.

The fat metabolism of the mammary gland, J. C. SHAW and W. E. PETERSEN. (Minn. Expt. Sta.). (*Jour. Dairy Sci.*, 23 (1940), No. 11, pp. 1045-1056, figs. 2).—Findings reported are based on arteriovenous blood fat differences in over 200 simultaneously drawn arterial and venous blood samples, mainly from Holstein cows. Very little blood fat was taken up by the mammary gland immediately after milking. The amount used by the gland increased steadily up to 4 hr. after milking and then remained rather constant for a few hours. Blood fat absorption ceased after 15 hr. Calcium absorption followed similar trends. It appeared that passage into the lactating gland of blood fat and also calcium and acid-soluble phosphorus is associated with distension of the alveoli and the filling of the secretory cells with milk. Blood glucose and amino acids were not similarly affected but continued to be used in fairly constant amounts. Intravenous injection of oxytocin prevented the passage of blood fat into the gland. The quantity of blood fat used by the gland was sufficient to account for all milk fat, absorption of plasma fat being limited to neutral fat and/or cholesterol fractions.

[Experiments with dairy products in Wisconsin] (*Wisconsin Sta. Bul.* 450 (1940), pp. 1-14, 24, 25, figs. 7).—Studies for which results are briefly reported include methods of packaging natural cheese, including canning, and a new method of hooping and draining brick cheese, by W. V. Price; the effect of washing the curd in the manufacture of brick cheese, by J. C. Garey, E. M. Foster, and W. C. Frazier; methods of handling Swiss cheese starters, by R. M. Stern and Frazier; the relative vitamin D potency imparted by irradiation to the surface and submerged parts of a flowing film of milk, by H. H. Beck, K. G.

Weckel, and H. C. Jackson; tests for measuring milk losses during the evaporation process, by H. H. Sommer, T. L. Forster, and J. W. Knechtges; methods of preventing coagulation of homogenized milk used for cooking, by H. Hollender and Weckel; the protective properties of various types of containers against sunshine flavor in milk, by J. C. Flake, Weckel, and Jackson; methods of determining the viscosity of cream, by F. M. Skelton and Sommer; the comparative nutritive value of whole milk and filled milk, by E. G. Schantz, R. R. Boutwell, C. A. Elvehjem, and E. B. Hart; and the stability of vitamin A and riboflavin in irradiated milk, by W. H. Peterson and A. C. Dornbush.

Composition of goat milk of known purity, H. C. LYTCHGEE (*Jour. Dairy Sci.*, 23 (1940), No. 11, pp. 1097-1108).—Based on the chemical analyses of milk samples from 335 individual goats, data are presented on the average composition and range in composition of milk collected during 7 separate periods. The February and August samples, respectively, contained an average percentage of total solids of 14.56 and 11.44, fat 5.13 and 3.37, lactose 4.87 and 4.32, protein 3.97 and 2.99, and ash 0.85 and 0.78. Included are data on freezing point depression, copper serum reaction, and acetic serum ash. Due to greater variance in serum constants and freezing point, watering and skimming could be less certainly detected in goat's milk than in cow's milk. Summer-produced goat's milk was relatively very low in total solids. The phosphatase test proved of little value in detecting inadequate pasteurization of goat's milk, since the enzyme was inactivated at pasteurization temperature considerably before expiration of the legal holding time.

The composition of dog's milk, H. D. ANDERSON, B. C. JOHNSON, and A. ARNOLD. (Wis. Expt. Sta.). (*Amer. Jour. Physiol.*, 129 (1940), No. 3, pp. 631-634, fig. 1).—Samples of dog's milk obtained between the eighteenth and thirtieth days of lactation were chemically analyzed. These samples contained an average of fat 8.3 percent, crude protein 7.5, sugar 3.7, ash 1.2, and total solids 22.6 percent. No carotene was detected in any of the milks, but they contained an average of 2.6 γ and 6.9 γ per cubic centimeter of vitamin A and flavin, respectively. Trends in composition with advance in lactation are discussed.

Evaluation of methods for grading milk, E. H. PARFITT (*Ind. State Dairy Assoc. Ann. Rpt.* 50 (1940), pp. 56-60).—The relative efficiency of the plate count, the direct microscopic count, and the methylene blue reduction test for determining the sanitary properties of milk and especially the adaptations of each are discussed.

Effect of pasteurization upon the properties of milk, R. F. HOLLAND (*Farm Res. [New York State Sta.]*, 7 (1941), No. 1, pp. 8, 9, fig. 1).—A comparison of pasteurization temperatures ranging from 140° to 175° F., with a range of holding time at each temperature, gave evidence that 170° for 1 sec. was most desirable with reference to the destruction of bacteria, inactivation of phosphatase, and the effect on creaming ability of milk.

Thermoduric bacteria in pasteurized milk: A review of the literature, J. L. HILEMAN (*Jour. Dairy Sci.*, 23 (1940), No. 11, pp. 1143-1160).—This comprehensive review cites 74 references.

A comparison of the results obtained from incubating bacteriological plates at 32° C. and 37° C. on the bacterial counts of milk, A. C. FAY and A. W. HOWARD (*Jour. Dairy Sci.*, 23 (1940), No. 11, pp. 1069-1072).—Comparative counts were made on 253 samples of raw milk from grade A dairies, 777 samples of laboratory-pasteurized milk, 140 samples of raw milk from tank car shipments, and 142 samples taken from tank cars and pasteurized in the laboratory. Comparative results are tabulated to show the number of samples falling in the different ranges of counts at the two incubation temperatures.

While counts of all milks tended to be somewhat higher at 32° incubation temperature, it is concluded that producers of grade A milk were not sufficiently penalized by the use of the lower temperature to warrant readjustment of the premium base.

Relation of surface tension of rancid milk to its inhibitory effect on the growth and acid fermentation of *Streptococcus lactis*, N. P. TABASSUK and F. R. SMITH. (Univ. Calif.). (*Jour. Dairy Sci.*, 23 (1940), No. 12, pp. 1163-1170, figs. 4).—Following the demonstration that rancidity lowered the surface tension of milk and that rancid milk exerted an inhibitory effect on the activity of lactic acid starters (E. S. R., 83, p. 240), experiments reported here confirmed the inhibitory effect of rancid milk on the growth and acid formation of *S. lactis* and established a causal relationship between the low surface tension of rancid milk and this effect. Under optimum conditions, appreciable growth of *S. lactis* occurred in rancid milk which increased the surface tension to a value approaching that of normal milk. This increase in surface tension apparently resulted from the utilization of surface-tension-lowering fat acids by *S. lactis* in the process of growth.

A study of the causes of periodic abnormalities of a high grade pasteurized milk supply, B. A. RUBIN and F. S. ORCUTT. (Va. A. and M. Col.). (*Va. Acad. Sci. Proc.*, 1938, pp. 42, 43).—An abnormality of whole milk, characterized by rapid acid liquefaction, was attributed to contamination with *Bacillus albolactis*. This organism proved to be very heat resistant and was not eliminated from milk by comparatively high pasteurization temperatures.

Control of flavor in milk heated to high temperature, I. A. GOULD. (Mich. Expt. Sta.). (*Milk Dealer*, 29 (1940), No. 8, pp. 70, 72, 74-76; *abs. in Michigan Sta. Quart. Bul.*, 23 (1940), No. 2, p. 116).—As an outgrowth of earlier findings (E. S. R., 80, p. 99; 81, p. 565), the possibility of using in combination added copper and homogenization of high-temperature treated milk to control cooked and oxidized flavors was investigated. Milk heated to 180° F. and then treated with small amounts of copper salts invariably lost its cooked flavor and became oxidized. However, when from 1.5 to 2 p. p. m. of copper were added to the heated milk and the milk then homogenized, the cooked flavor disappeared within 24 hr. and an excellent flavor with no evidence of oxidized flavor development was maintained during 120 hr. of subsequent storage. When less copper was added the cooked flavor disappeared less rapidly. Similar results were obtained when homogenization preceded the addition of copper. The practical applications of these findings are discussed.

Studies on the source-origin of activated flavor in milk, J. C. FLAKE, H. C. JACKSON, and K. G. WECKEL. (Wis. Expt. Sta.). (*Jour. Dairy Sci.*, 23 (1940), No. 11, pp. 1079-1086).—Continuing this line of investigation (E. S. R., 81, p. 413), various constituents of milk including a series of protein hydrolyzates prepared from casein were subjected to ultraviolet irradiation. Riboflavin and other dialyzable substances when irradiated failed to produce any semblance of the typical activated flavor. Inconclusive results were obtained on the protein hydrolyzates although tryptone developed a flavor somewhat similar to the typical activated flavor. Irradiation of the amino acids indicated that cystine, methionine, tryptophan, and histidine may be important contributors to the activated flavor of milk.

Isolation of substances responsible for the activated flavor of milk, J. C. FLAKE, H. C. JACKSON, and K. G. WECKEL. (Wis. Expt. Sta.). (*Jour. Dairy Sci.*, 23 (1940), No. 11, pp. 1087-1095, figs. 3).—A highly volatile flavor and odor material believed responsible for the typical activated flavor produced in milk by irradiation was obtained by steam distillation of an intensely

irradiated casein preparation. The flavor and odor materials recovered in the distillate were adsorbed on activated charcoal and eluted with ether, but the quantities thus secured were too small to permit analysis. Evidence pointed to the possible role of sulfur compounds in formation of the activated flavors.

Effect of the properties of the fat and of the fat globule surface on lipolytic activity in milk, V. N. KRUKOVSKY and P. F. SHARP. (Cornell Univ.). (*Jour. Dairy Sci.*, 23 (1940), No. 11, pp. 1109-1118, figs. 6).—Lipolytic activity as measured by the increase in acid degree of the fat was determined on combinations of skim milk and cream covering a wide range in fat content, on milk containing various fat fractions obtained by stepwise cooling of milk oil, and on milk containing resurfaced fat globules. Cooling, warming, and recooling proved effective in increasing lipolysis in raw cream as well as in raw milk. While total lipolytic action increased with fat content up to 45 percent, the acidity per unit of fat and per unit of plasma increased with fat content only up to 8-10 percent and then remained constant or decreased. The lower the temperature required for crystallization of the fat fraction, the greater was the increase in acidity when used as a substrate for milk lipase, indicating that the rate of lipolysis is dependent on the melting point of the fat or the degree of solidification of the fat at a given temperature. Resurfacing the fat globules accelerated the lipolysis of milk fat, but cooling, warming, and cooling such material failed to further increase lipolysis. The pronounced influence of the conditions at the fat-plasma interface on lipolytic action in milk and cream was clearly demonstrated.

Inactivation of milk lipase by dissolved oxygen, V. N. KRUKOVSKY and P. F. SHARP. (Cornell Univ.). (*Jour. Dairy Sci.*, 23 (1940), No. 11, pp. 1119-1122, figs. 2).—Comparing the lipolytic activity of normal and deaerated milk in the presence of varying amounts of copper, it was found that dissolved copper caused no inactivation of lipase in whole milk in the absence of oxygen. Lipase was susceptible to inactivation by dissolved oxygen, and this reaction was accelerated by dissolved copper and by heat.

The effect of commercial practices on ascorbic acid and dehydroascorbic acid (vitamin C) in milk, W. W. WOESSNER, K. G. WECKEL, and H. A. SCHUETTE. (Wis. Expt. Sta.). (*Jour. Dairy Sci.*, 23 (1940), No. 11, pp. 1131-1141).—The total ascorbic acid and dehydroascorbic acid contents of mixed herd milk were determined at various stages in the processing and delivery of the milk. Pasteurization by the holder method was found to cause a 20-percent loss in total ascorbic acid. The dehydroascorbic acid proved to be highly heat labile, so that the rate of destruction of total ascorbic acid depended on the rate at which ascorbic acid was transformed to the reversibly oxidized form. Ascorbic acid in the absence of copper was highly heat stable. Contamination with the copper and exposure to light markedly accelerated the rate of loss of total ascorbic acid. Tubular preheating, clarification, homogenization, cooling, and light-protected delivery, individually or collectively, caused no loss in vitamin C potency. The production of a vitamin C-fortified milk through addition of ascorbic acid proved practical only when rigid exclusion of copper and protection from light were practiced. The addition of sodium metaphosphate or pancreatic enzyme to milk had neither a protective nor detrimental effect on vitamin C, although the latter prevented the development of copper-induced oxidized flavor.

Canning of evaporated and sterilized natural milk, with special emphasis on the most common problems and difficulties encountered, D. B. GAPUZ (*Philippine Jour. Anim. Indus.*, 7 (1940), No. 3, pp. 269-285, pls. 2).—Methods which have proved applicable to Philippine conditions are described.

Effect of salt on the keeping quality of cream, W. J. CAULFIELD, F. E. NELSON, and W. H. MARTIN. (Kans. Expt. Sta.). (*Jour. Dairy Sci.*, 23 (1940), No. 12, pp. 1215-1227, figs. 4).—Samples of fresh cream to which were added 0, 7, 10, 13, and 16 percent of salt were held for 10 days at temperatures of 60°, 70°, 82°, and 90° F. Tests including organoleptic grading, acid titration, formal titration, and direct microscopic bacterial counts were made at frequent intervals on all samples. The effectiveness of salt in preventing deterioration varied with time and temperature. At least 10 percent of salt was required to prevent cream from becoming second grade when held for 10 days at 60° or 70° or for 5 days at 82° and 90°. When cream was held for 0, 3, 4, 5, and 6 days at 70° before 13 percent of salt was added, the delayed addition of salt failed to prevent further deterioration of the cream. Butter churned from cream to which 13 percent of salt was added at the beginning of the 10-day storage period scored 2 to 5 points higher than did butter produced from control lots of the same cream without salt. In no case did butter from the salted cream contain more than 2.5 percent salt. A modification of the Babcock test applicable to salted cream is described.

The neutralization of cream for buttermaking.—I, The accuracy of acid reduction by various neutralizers. II, The speed of acid reduction and the influence of pasteurization temperature, R. C. TOWNLEY and I. A. GOULD. (Mich. Expt. Sta.). (*Canad. Dairy and Ice Cream Jour.*, 19 (1940), Nos. 5, pp. 54, 56, 58, 60, figs. 3; 6, pp. 50, 52, 54, 56; abs. in *Michigan Sta. Quart. Bul.*, 23 (1940), No. 2, pp. 114, 115).—This contribution is a more detailed report of research previously noted (E. S. R., 82, p. 530). It is further noted that at higher acidity ranges the acid reduction was often somewhat greater than expected on the basis of calculation, whereas at the lower ranges the acid reduction was less than expected. The reaction between the neutralizers and cream was practically complete after 5 min. Pasteurization had no appreciable effect on the acid reduction of cream treated with either sodium hydroxide or calcium lime. However, with carbonates or magnesium lime the acid reduction due to pasteurization became progressively greater as the amount of neutralizer added to cream increased.

pH values of cream, butter, and buttermilk as affected by different neutralizers, R. C. TOWNLEY and I. A. GOULD (*Michigan Sta. Quart. Bul.*, 23 (1940), No. 2, pp. 69-72, fig. 1).—In connection with the above-described studies, data were gathered on the pH of the corresponding buttermilks. The pH of butter sera and buttermilk maintained a rather uniform relationship to the pH of the corresponding cream, averaging 0.15 and 0.10 pH unit, respectively, lower than that of the corresponding cream.

Method for determining losses of butter fat in the creamery, M. MORTENSEN. (Iowa Expt. Sta.). (*Jour. Dairy Sci.*, 23 (1940), No. 11, pp. 1073-1077).—A series of mathematical formulas, based on predetermined volume and composition data, are presented for computing butterfat losses at various steps in the handling of cream and churning of butter.

A study of fresh and frozen plain, superheated, and sweetened condensed skimmilk for ice cream, L. K. CROWE and H. H. WINN. (Nebr. Expt. Sta.). (*Jour. Dairy Sci.*, 23 (1940), No. 12, pp. 1187-1199).—Plain and superheated condensed skim milks, each containing 30 percent of total solids, and sweetened condensed skim milk containing approximately 60 percent of total solids were prepared as described. Samples of each were frozen and removed after 1, 2, and 3 months' frozen storage for examination. The plain and sweetened condensed products underwent little change during storage except that the solubility of the former slowly decreased as the storage period progressed. The

superheated product declined rapidly in solubility and showed marked protein precipitation after 3 months' storage. Each of the three products were used when fresh and after 1, 2, and 3 months' storage as sources of serum solids in ice cream mixes. Data are presented on the chemical and physical characteristics, pH, viscosity, and whipping ability of the mixes as affected by the condensed products used. In general, there was no appreciable difference in the flavor scores of the ice cream which could be attributed to the type of condensed skim milk used and whether fresh or frozen. The three fresh condensed products also gave ice creams of similar body and texture. In all cases, body and texture scores of ice cream were slightly lowered as a result of 1 month's frozen storage of the condensed product. Melting time and characteristics of the melted products are discussed.

New York State Limburger cheese has reputation for quality, M. W. YALE (*Farm Res. [New York State Sta.]*, 7 (1941), No. 1, pp. 2, 3, figs. 2).—A brief account of the Limburger cheese industry in New York with reference to research on the pasteurization of milk used in the manufacture of such cheese (E. S. R., 84, p. 99).

VETERINARY MEDICINE

[**Work in animal pathology and parasitology by the Colorado Station**] (*Colorado Sta. Rpt. 1940*, pp. 17, 19, 22, 23, 34-39, 40).—The work of the year reported (E. S. R., 82, p. 818) relates to the nutritional control of mastitis; poisonous plants, including *Oxytenia acerosa*, large buttercup and small buttercup, gum weed, blue-green algae (*Anabaena flos-aquae*), and *Suckleya suckleyana*; nitrate content of oats hay and beet tops; vaccination for sore mouth of lambs; coccidiosis of lambs and dogs; parasites of lambs and cattle; effect of the H-ion concentration on over-eating and diseases of the digestive tract; effect of lack of iodine in the ration upon the thyroid gland in lambs; urinary calculi; Bang's disease; pullorum disease and paratyphoid infections in poultry; and histological studies on thyroid tissues from rats and fowls.

[**Abstracts of theses on animal pathology and parasitology**] (*La. State Univ. Bul., n. ser.*, 32 (1940), No. 1, pp. 28, 85-88).—These include Inherent Resistance of S[ingle] C[omb] White Leghorns to Iritis as a Manifestation of Fowl Paralysis, by W. Guidry (p. 28); Studies on the Bovine Blood Picture in Health and Under Parasitism, by E. Delaune (pp. 85, 86); and Trematode Parasites From Birds in Louisiana, by A. G. Humes (pp. 87, 88).

[**Work in animal pathology by the Montana Station**], H. MARSH and J. R. QUESENBERY. (Coop. U. S. D. A. et al.). (*Montana Sta. [Bien.] Rpt. 1939-40*, pp. 38, 39, 63, 64).—Reference is made to work with Bang's disease in range cattle, black disease and mastitis (bluebag) in sheep, and equine encephalomyelitis.

[**Contributions on animal pathology and parasitology**] (*N. Y. State Vet. Col. Rpt., 1938-39*, pp. 67-183, figs. 8).—Included in the contributions presented and not previously noted are: Some Diseases of the Genito-Urinary Systems, by H. J. Milks (pp. 67-75); Disease Problems of Duck Raisers, by K. F. Hilbert (pp. 161-164); The Value of Chemically-Killed Cultures for the Control of Cholera in Ducks (Second report), by K. F. Hilbert and H. Tax (pp. 165-167) (E. S. R., 81, p. 114); and Some Common Parasitism of Bovines Encountered in the Northeastern States, by D. W. Baker (pp. 175-183).

[**Work in animal pathology by the Wisconsin Station**]. (Coop. U. S. D. A. et al.). (*Wisconsin Sta. Bul. 450 (1940)*, pp. 23, 24, 29, 30, 34, 35, 42-45).—The work of the year (E. S. R., 83, p. 105) includes the identification of the toxic compound which causes "sweet clover disease" of cattle, by H. A. Campbell,

K. P. Link, M. Stahmann, C. Huebner, and R. Overman; ichthyosis of chicks caused by lack of a vitamin, by D. M. Hegsted, J. J. Oleson, C. A. Elvehjem, and E. B. Hart; vitamin C deficiency in cattle lacking vitamin A, by W. A. King, P. Phillips, M. E. Nesbit, I. W. Rupel, and G. Bohstedt; prevention of "Chastek paralysis" of foxes, by A. I. Coombes, W. Wisnicky, and E. B. Hart; and tests proving the worthlessness of "Bowman's" and "3-V Tonic" as remedies for Bang's disease, by W. E. Cotton, J. M. Buck, A. B. Crawford, J. S. Healy, E. G. Hastings, B. A. Beach, and N. Clark.

[Viruses and the virus diseases of animals] (In *Handbuch der Virusforschung*, I, II, edited by R. DOERR and C. HALLAUER Wien (Vienna): Julius Springer, 1938, pt. 1, pp. 126-446, figs. 34; 1939, pt. 2, pp. 547-1357, figs. 4).—Among the subjects dealt with in this work of particular interest to the animal pathologist are: The Sizes of Viruses and Bacteriophages and Methods for Their Determination, by W. J. Elford (pp. 126-231); Inclusion Bodies and Their Relationship to Viruses, by G. M. Findlay (pp. 292-368); The Growth of Viruses on the Chorioallantois of the Chick Embryo, by F. M. Burnet (pp. 419-446); Natural and Experimental Transmission of Viruses [trans. title] (pp. 547-574) and The Propagation of Viruses in the Host [trans. title] (pp. 690-825), both by R. Doerr; Variation in Animal Viruses, by G. M. Findlay (pp. 862-947); The Viruses of Tumor-Producing Agents [trans. title], by O. Thomsen (pp. 994-1105); and Virus Species as Antigens and the Acquired Immunity to Virus Infections [trans. title] (pp. 1106-1291). A tabulated list of the known animal viruses is appended (pp. 1343-1357).

Rat virus enquiry report, including a note on the raticidal value of certain commercial and other chemical poisons, J. T. PARANJOTHY (*Inst. Med. Res., Fed. Malay States, Bul. 1 (1939), pp. [3]+23*).

Demonstration of a capsule on *Brucella* cells, I. F. HUDDLESON. (Mich. State Col.). (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 4, p. 773).—This more detailed account (*E. S. R.*, 84, p. 245) includes a description of the technic employed in demonstrating the presence of a capsule on all smooth strains of species of *Brucella*. No success was met with in the attempt to stain the capsule on *Brucella* cells. The capsule may be removed from the cell by digestion with hot chloroform-ether mixture acidified with HCl. This treatment also destroys that part of the organism which is made visible by the usual staining methods. Preliminary studies in progress show that the capsular material is composed of lipids in close combination with a polysaccharide. Capsular swelling has not been demonstrated when organisms are incubated with specific serum. It is said that the rough form of *Brucella* also shows a capsule.

The behavior of *Brucella abortus* vaccine in various excipients, A. EICHHORN, C. K. MINGLE, and F. M. MURDOCK. (U. S. D. A.). (*Amer. Jour. Vet. Res.*, 1 (1940), No. 1, pp. 3-17).—Investigations having as their ultimate object the determination of the relative merits of *B. abortus* vaccines suspended in various excipients, particularly from the standpoint of induced immunological response, are reported, with the details given in 10 tables. The studies included the in vitro as well as the in vivo behavior of viable *Brucella* organisms in such excipients as liquid petrolatum, oil of sweet almond, lanolin, saponin, cholesterol, and physiological saline. Anticipated correlation between the action of various excipients on *B. abortus* in vitro and their effect in animal tissues was not possible. "While 50 percent lanolin in liquid petrolatum suspensions were sterilized within 96 hr. at 37.5° C., it was possible to isolate viable *Brucella* from vaccinal sites 85 days following inoculation of identical suspensions. No variations in general reactions, following animal

inoculation, can be associated with the use of various excipients studied. Furthermore, the transient character of these reactions is similar to that observed in saline suspended injections. Marked differences were noted in the persistence of local reactions following inoculation of *B. abortus* suspended in various excipients. These reactions may persist for a period of at least 5 mo. in the case of 50 percent lanolin-liquid petrolatum mixtures, in contrast to the rapid absorption which commonly occurs within 3 to 4 weeks following the administration of comparable bacterial suspensions prepared in physiological saline. *B. abortus* strain 19 may remain viable at the site of inoculation for at least 85 days following subcutaneous injection of saline suspended vaccine. This persistence of viability may be increased to at least 150 days by the use of 2 percent cholesterol in liquid petrolatum as an excipient. No significant differences were noted in the agglutinin response induced in cattle and rabbits as the result of *B. abortus* inoculations in which various excipients were employed. In no instance was any evidence of enhanced virulence observed in 10 cultures recovered at intervals of 59 to 97 days from vaccinal sites in cattle inoculated with *B. abortus* strain 19. Based on the theory that increased immunological response may be induced by retarded antigen absorption, 2 percent cholesterol in liquid petrolatum has shown sufficient promise to justify further study."

Prevention of goiter in farm animals, H. WELCH (*Montana Sta. Cir.* 160 (1940), pp. 5, figs. 4).—A revision of Circular 145 (E. S. R., 72, p. 825).

The resazurin test for detecting mastitis, R. R. RUSSELL, T. PALMER-JONES, and G. M. MOIR (*New Zeal. Jour. Sci. and Technol.*, 21 (1939), No. 3A, pp. 161A-167A).—Account is given of the resazurin test, hitherto used mainly for milk grading, which has been found of value in the diagnosis of mastitis. An analysis of results obtained from 814 individual quarter samples demonstrates good agreement between the resazurin test and cultural and microscopic methods of diagnosing mastitis. The test is sensitive to the presence of streptococci, staphylococci, or leucocytes, but comparatively insensitive to the presence of micrococci in milk drawn aseptically from the udder. It is comparatively simple, rapid, and economical.

The efficiency of soaps and other disinfectants in destroying mastitis streptococci, E. C. McCULLOCH. (Wash. Expt. Sta.). (*Amer. Jour. Vet. Res.*, 1 (1940), No. 1, pp. 18-22, figs. 2).—Solutions of commercial soaps and soap powders at 40° C. and in the presence of 5 percent each of skim milk and broth culture of the organisms were found to be between two and three times as effective in killing mastitis streptococci in 1 min. as was phenol, and were as effective as 100 p. p. m. of the most active germicidal of several hypochlorites tested. "A soap containing cresols was no more germicidal than were the nonmedicated soaps, and the soaps containing mercury compounds were only slightly more effective. A soft soap usually called 'green soap,' tincture of green soap, and a coconut oil base liquid soap were found to be inferior germicides against mastitis streptococci. No correlation was observed between the germicidal efficiency of the mixture of soap solution, milk, and broth and the degree of alkalinity. Drene, said to consist largely of triethanolammoniumlauryl sulfate, which gave a final dilution near the neutral point, was effective in dilutions comparable with the solid soaps. High-test household lye, which probably kills by the hydroxyl-ion concentration produced, was found to be effective in dilutions of 1:300 and 1:500, which gave a final alkalinity of pH 11.22 to 11.18, but was much slower than the soaps in exerting germicidal action. Soap solutions in the concentrations usually obtained in lathering the hands with soap in warm water are effective disinfectants against mastitis streptococci

and may satisfactorily replace other disinfectants for the hands of the milkers and the teats of the cows. Household lye is the disinfectant of choice for dairy barns where it is especially necessary to destroy mastitis streptococci on the floors."

Acid agglutination in Salmonella group, H. Ogonuki (*Kitasato Arch. Expt. Med. [Tokyo]*, 17 (1940), No. 2, pp. 80-87).—Report is made of an investigation of the acid agglutination of the *Salmonella* group on the basis of the newer knowledge of their antigenic structures.

Studies on Thysanosoma actinioides, II, F. X. GASSNER and F. THORP, JR. (Colo. Expt. Sta.). (*Amer. Jour. Vet. Res.*, 1 (1940), No. 1, pp. 36-43, figs. 13).—Report is made in this further contribution (E. S. R., 83, p. 249) of the discovery of an early embryonal stage in the life of the fringed tapeworm *T. actinioides*, in which embryonated ova are encased in heavy fibrous capsules.

Differentiation of the human and bovine types of tubercle bacilli and its significance, Y. WATANABE (*Kitasato Arch. Expt. Med. [Tokyo]*, 17 (1940), No. 2, pp. 65-73).

A note concerning the influence of zinc on the growth of tubercle bacilli on malate media, R. R. HENLEY. (U. S. D. A.). (*Amer. Jour. Vet. Res.*, 1 (1940), No. 1, pp. 25, 26).

Man's greatest victory over tuberculosis, J. A. MYERS (*Springfield, Ill.: Charles C. Thomas*, [1940], pp. IX+419, figs. 31; rev. in *Jour. Amer. Vet. Med. Assoc.*, 97 (1940), No. 765, pp. 613-619, fig. 1).—This work relates to achievements in the conquering of animal plagues, particularly bovine tuberculosis and its eradication in the United States, claimed to have been successfully concluded in November 1940. A foreword by J. R. Mohler and a bibliography of nine pages are included. The review is by L. A. Merillat.

Two cases of undulant fever treated with sulphanilamide, R. J. G. MORRISON (*Jour. Roy. Army Med. Corps*, 75 (1940), No. 1, pp. 45-47).—A brief account is given of two cases of undulant fever successfully treated with sulfanilamide. In observations of agglutination reactions following administration of the drug a slow steady fall in the titer was noted.

A convenient field test for albuminuria, M. H. ROEPKE. (Minn. Expt. Sta.). (*Jour. Amer. Vet. Med. Assoc.*, 97 (1940), No. 765, pp. 602, 603).—Description is given of a simple field test for albuminuria in dairy cows, which is a slight modification of the usual sulfosalicylic acid tests.

The standardisation and interpretation of the agglutination test for Brucella infection in cattle, W. L. HINDMARSH (*Vet. Rec.*, 52 (1940), No. 48, pp. 832-835).

Calfhood vaccination as an aid in cooperative Bang's disease (=bovine brucellosis) control, J. R. MOHLER, A. E. WIGHT, and H. M. O'REAR. (U. S. D. A.). (*Jour. Amer. Vet. Med. Assoc.*, 98 (1941), No. 766, pp. 1-9).—This is a discussion of the progress of work in Bang's disease control and eradication and the presentation of a proposed policy involving official recognition of calfhood vaccination as an adjunct to the test-and-slaughter method employed during the 6 yr. that the cooperative campaign has been under way.

Preliminary observations on the duration of immunity in cattle vaccinated in calfhood with strain 19 of Brucella abortus, A. L. DELEZ. (Ind. Expt. Sta.). (*Jour. Amer. Vet. Med. Assoc.*, 97 (1940), No. 765, pp. 581-583, 584).—In the work reported 15 heifer calves negative to the agglutination test for *B. abortus* were used in a study of the duration of the immunity in the second gestation that results from vaccination with *B. abortus* strain 19. Thirteen of the animals were carried through two gestation periods. Nine were vaccinated when from 4 to 6 mo. of age, and 4 were kept as controls.

"One mo. following vaccination the blood agglutinin titers of the vaccinated heifers varied from 1-100 to 1-500. During the first 5 mo. the titers dropped to 1-25 and 1-50. At the end of the first pregnancy the 9 principals delivered full-term living calves. The 4 controls also carried full-term calves, but 2 were born dead. Following exposures in the fifth and sixth month of the second pregnancy, 6 principals gave birth to full-term living calves. Two of the other principals delivered living calves in the middle of the eighth month and 1 early in the ninth month of gestation. *B. abortus* was demonstrated in the 3 animals that calved prematurely. At the termination of the second pregnancy 2 controls dropped dead calves and 1 a live calf in the eighth month of gestation. The fourth control aborted in the seventh month of pregnancy. *B. abortus* was demonstrated in the colostrum and fetal tissues of 3 controls, while material for bacteriological examinations was not obtained in the fourth control animal."

Acaprin in the treatment of piroplasmosis (=Texas fever), G. A. ROBERTS (*Jour. Amer. Vet. Med. Assoc.*, 97 (1940), No. 765, pp. 599, 600, figs. 2).—Cases are reported which call attention to the rapid action of acaprin in the treatment of bovine piroplasmosis.

Bovine type of tuberculosis in sheep, G. T. CREECH. (U. S. D. A.). (*Amer. Jour. Vet. Res.*, 1 (1940), No. 1, pp. 23-25).—The apparent extreme rarity of the bovine type of tuberculosis in sheep led to the reporting of a case.

Studies on organisms of the genus *Listerella*.—IV, **An outbreak of abortion associated with the recovery of *Listerella* from the aborted fetuses,** J. S. PATERSON (*Vet. Jour.*, 96 (1940), No. 8, pp. 327-332).—An outbreak of abortion in sheep is described in which *Listeria* (*Listerella*) (E. S. R., 83, p. 541) was recovered from the fourth stomachs of the aborted fetuses. No trace of infection was detected in the ewes. Intravenous injection of the organism into pregnant sheep was found to be followed by the localization of the bacteria in the uterus, fetal membranes, and fetus, finally causing expulsion of the fetus. The oral administration of cultures to similar sheep failed to provoke abortion. The possibility of certain cases of this affection of human infants being due to intra-uterine infection is discussed.

Treatment of trichostrongylosis (black scour) with copper sulphate and nicotine sulphate, H. M. GORDON (*Jour. Council Sci. and Indus. Res. [Austral.]*, 13 (1940), No. 3, pp. 169-172).

Intestinal worms in sheep (*Montana Sta. Cir.* 159 (1940), pp. 6, figs. 5).—A brief practical account of the roundworms and tapeworms in Montana sheep, symptoms characteristic of their infestation, diagnosis, and treatment.

Preliminary examination of the anthelmintic efficiency of certain compounds related to phenothiazine, H. M. GORDON and M. LIPSON (*Jour. Council Sci. and Indus. Res. [Austral.]*, 13 (1940), No. 3, pp. 173-177).—A preliminary study was made of compounds related to phenothiazine, including phenothiazine, diphenylamine, phenoxthine, phenarsazine chloridé, and thionol, with the view to detecting anthelmintic properties, toxicity for sheep, and effect on larval development in fecal cultures from treated sheep. "Phenarsazine in doses of 0.04 to 0.12 gm. per kilogram body weight (1, 2, and 3 gm. for sheep of 25 kg. body weight) showed a high degree of efficiency against *Oe[sophagostomum] columbianum* but was very toxic for sheep, causing severe inflammation of the rumen and abomasum. Smaller doses were ineffective against *O. columbianum* and *H[aemonchus] contortus*. Phenoxthine in doses of 0.25 gm. per kilogram body weight (10 gm. for sheep of 40 kg.) showed a slight degree of anthelmintic efficiency against *H. contortus* and prevented development of larvae in fecal cultures from treated sheep. A dose of 0.5 gm. per kilogram (20 gm. for sheep of

40 kg.) was fatal. Doses of 0.15 gm. per kilogram were ineffective against *H. contortus*. Phenothiazone (doses of 0.017 and 0.024 gm. in water injected into the abomasum of sheep of 25 kg. body weight and doses by mouth of 0.07 to 0.12 gm. per kilogram body weight) and thionol (doses of 0.13 gm. per kilogram body weight) showed no evidence of anthelmintic efficiency against *H. contortus*. Diphenylamine in doses of 0.03 to 0.12 gm. per kilogram body weight showed no anthelmintic efficiency against *H. contortus*. Doses of 0.4 gm. per kilogram body weight produced temporary reduction in the number of eggs of this parasite in fecal egg counts, development of larvae in fecal cultures was prevented on the day following treatment, and only a few larvae developed in cultures prepared on the next 2 days. None of the compounds tested showed the combination of high efficiency and low toxicity characteristic of phenothiazine, which in doses of 0.15 gm. per kilogram body weight shows a high degree of efficiency against *H. contortus*."

An effective treatment for the control of the sheep head grub *Oestrus ovis* in areas where the winters are cold, N. G. COBBETT. (U. S. D. A.). (*Jour. Amer. Vet. Med. Assoc.*, 97 (1940), No. 765, pp. 565-570, figs. 3).—Experimental treatment of sheep for this parasite with saponified cresol (lysol), the details of which are tabulated, has shown a 3-percent solution to destroy the first-stage larvae while in the nasal passages and before they migrate to the frontal sinuses in the spring. The treatment applied during late fall and winter months consists in forcing a small stream of the solution, backed by from 35 to 45 lb. of air pressure, into the nasal passages while the head of the animal is held on the dorsal surface with the muzzle slightly elevated. By thus injecting about 1 fluid oz. of the medicament into each nostril of infested sheep approximately 90 percent of the existing infestation was eliminated by one treatment, and two such treatments, administered 5 days apart, eliminated 98 percent of the existing infestation.

A method of large-scale treatment of sheep for the destruction of head grubs (= *Oestrus ovis*), N. G. COBBETT. (U. S. D. A.). (*Jour. Amer. Vet. Med. Assoc.*, 97 (1940), No. 765, pp. 571-575, figs. 6).—Description is given of equipment through the use of which as many as 700 sheep were satisfactorily treated per hour for head grubs by the method above noted.

The source and availability of infective oöcysts in an outbreak of coccidiosis in lambs in Nebraska feedlots, J. F. CHRISTENSEN. (U. S. D. A.). (*Amer. Jour. Vet. Res.*, 1 (1940), No. 1, pp. 27-35).—Observations made during an outbreak of coccidiosis among 16,000 feeder lambs in central Nebraska with a mortality of 3.4 percent are reported. An effort was made to determine the source of infective oöcysts and to evaluate drinking water and various feed materials as mediums for the sporulation and preservation of oöcysts and as contributors to the outbreak. Effective sterilization of old feed lots had taken place during the previous summer, and fresh fecal pellets from lambs that had just arrived were found to constitute the source of the clinical infection. Fecal contamination of the drinking water was considered to be negligible.

Mycotic stomatitis of goats, Z. DE JESUS (*Philippine Jour. Anim. Indus.*, 7 (1940), No. 4, pp. 373-375, pls. 2).—An acute stomatitis of the goat was found to be due to the so-called thrush fungus *Monilia albicans* (Robin) Zopf (= *Oidium albicans* Robin).

Contagious pleuro-pneumonia of goats, E. O. LONGLEY (*Indian Jour. Vet. Sci. and Anim. Husb.*, 10 (1940), No. 2, pp. 127-197, pls. 11, figs. 2).—Description is given of the symptoms, course, pathology, and histopathology of contagious pleuropneumonia of goats which occurs as a specific epizootic in the Madras

Presidency and is transmissible experimentally. The designation *Borrelomyces peripneumoniae capri* is proposed for the etiological agent.

Swine erysipelas in South Australia, N. ATKINSON and F. V. COLLINS (*Austral. Vet. Jour.*, 16 (1940), No. 5, pp. 193-199).—Swine erysipelas in its chronic, septicemic, and urticarial forms is described for the first time in South Australia.

Necrotic enteritis, V. R. GARDNER (*Michigan Sta. Quart. Bul.*, 23 (1940), No. 2, pp. 63-66).—A practical summary of the results of work with a disease of swine sometimes confused with hog cholera and thought to rank first in importance as the cause of death losses in the herds of Michigan. A report of this disease by Davis, Freeman, and Madsen has been noted (*E. S. R.*, 83, p. 97). Experiments conducted with the affection, now known as infectious necrotic enteritis, have suggested that it is a secondary complication caused by the intestinal invasion of *Salmonella choleraesuis* and probably other organisms after the symptoms of a deficiency of nicotinic acid have developed.

Brucellosis in horses: A study of five cases without clinical symptoms, A. G. KARLSON and W. L. BOYD. (Minn. Expt. Sta.). (*Jour. Amer. Vet. Med. Assoc.*, 97 (1940), No. 765, pp. 576-580, figs. 2).—A bacteriological examination was made of the blood, urine, and feces of five horses that reacted to the agglutination test for *Brucella abortus* infection. Complete necropsies were performed on each animal, and various tissues were examined for the presence of the organism. *B. abortus* was isolated from the feces of two horses, another developed an abscess of the withers from which *B. abortus* was isolated, and the organism was isolated from a lesion in the sternum of a fourth horse and from lesions in the ribs of a fifth. It could not be demonstrated in the blood stream or urine of any of the horses. The observation that *B. abortus* may be eliminated with the feces in infected horses leads to the conclusion that such animals may be a source of infection for cattle.

The relation of brucellosis to periodic ophthalmia in Equidae, T. C. JONES (*Amer. Jour. Vet. Res.*, 1 (1940), No. 1, pp. 54-57).—Agglutination tests with the serums from 187 normal horses and 95 horses with periodic ophthalmia are reported. Although the series of cases studied is still relatively small, cultural and serological tests indicate that *Brucella* organisms are not constantly present in periodic ophthalmia. Organisms of the genus *Listeria* (*Listerella*) have been isolated from various organs in 14 out of 27 periodic ophthalmia cases studied culturally, but their significance has not been established.

Report on the relationship of thyroid activity to periodic ophthalmia, H. R. SEIBOLD. (U. S. D. A.). (*Amer. Jour. Vet. Res.*, 1 (1940), No. 1, pp. 52-53).

Equine encephalomyelitis virus isolated from naturally infected *Triatoma sanguisuga* LeConte, C. H. KITSELMAN and A. W. GRUNDMANN (*Kansas Sta. Tech. Bul.* 50 (1940), pp. 15, fig. 1).—Report is made of the isolation of the virus of equine encephalomyelitis from a collection of the bloodsucking conenose made near Garrison, Kans., in June 1940 from a pasture in which two horses had died from the disease in 1939. This bug is reported as occurring commonly throughout that State and over much of the region where the disease has appeared. The work reported is considered to present the first known evidence of the finding of this virus in a bloodsucking insect in nature that is known to feed upon horses and also evidence that the virus is that of equine encephalomyelitis. Following collection, the insects were ground, centrifuged, and a bacteria-free filtrate obtained. The intracranial inoculation of guinea pigs with this filtrate resulted in the appearance of symptoms characteristic of a neurotropic virus and a 50 percent mortality in 6 days. The intracranial injection

of a second series of guinea pigs with a candle filtrate from the brains of the guinea pigs that had succumbed resulted again in a 50 percent mortality. Following the second passage, the virus remained fixed to cause 100 percent mortality in guinea pigs in 4 days. When first isolated, the virus appeared to be of low virulence but built up rapidly by serial passage. It also killed consistently following intranasal instillation and foot pad inoculation. Typing studies revealed the virus to be of the western form. The live insects from each group that were not used for direct isolation of virus were placed in separate cages and fresh susceptible guinea pigs were placed in contact with them to see if the insects could transmit the virus through biting and feeding. In one instance the guinea pig succumbed 28 days after entering the cage, and the virus was isolated from the brain. This virus is now in the third serial passage. The details of virus typing studies and the cross immunity work are given in appended tables. A brief history of equine encephalomyelitis, accompanied by a list of 15 references to the literature, is included, as is a note on the biology of the bloodsucking conenose, the latter by R. C. Smith (p. 14).

Immunization with non-infectious formalin derivative of purified equine encephalomyelitis virus protein, D. G. SHARP, A. R. TAYLOR, H. FINKELSTEIN, and D. and J. W. BEARD (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 4, pp. 650-652).

A note on immunologic reactions associated with equine infectious anemia, C. C. TORRANCE (*Amer. Jour. Vet. Res.*, 1 (1940), No. 1, pp. 63-65).—It was observed in horses affected with infectious anemia that elevations of temperature followed the subcutaneous injection of a preparation of globulins obtained from the serum of an infected horse but did not follow the injection of a similar material from a normal horse.

Some observations on nephritis in horses, R. F. LANGHAM and E. T. HALLMAN. (Mich. Expt. Sta.). (*Amer. Jour. Vet. Res.*, 1 (1940), No. 1, pp. 49-52, figs. 14).

Sulphanilamide treatment of streptococcal infections in horses, P. L. BAZELEY (*Austral. Vet. Jour.*, 16 (1940), No. 5, pp. 187-193).—Of 13 animals suffering from severe hemolytic streptococcal infections that were treated with sulfanilamide, 12 reacted to its administration, indicating a high value for the drug in the treatment of such infections. No benefit resulted from its administration in a case of strangles.

Preliminary studies on the effects of diet upon internal parasites in horses, C. E. HOWELL and M. A. STEWART. (Univ. Calif.). (*Amer. Jour. Vet. Res.*, 1 (1940), No. 1, pp. 58-62).—Horses that were kept on a vitamin A-deficient diet seemed to possess a greater susceptibility to *Parascaris equorum*. It is pointed out that the vitamin A-deficient experiment was incidental and not set up in such a way as to permit definite statements concerning the effects upon strongyle and *P. equorum* infections.

A review of the life history of Spirocerca lupi (=S. sanguinolenta), the esophageal worm of the dog, A. C. JERSTAD. (U. S. D. A.). (*Amer. Jour. Vet. Res.*, 1 (1940), No. 1, pp. 73-75, fig. 1).

Pentobarbital sodium as an anesthetic for minks, F. A. FUHRMAN and E. T. STUHR. (Oreg. Expt. Sta. et al.). (*Jour. Amer. Vet. Med. Assoc.*, 98 (1941), No. 766, pp. 43, 44).—The subcutaneous administration of pentobarbital sodium was found to produce hypnosis satisfactory for the examination of minks after its administration intravenously had proved to be impractical. The minimum hypnotic dose administered subcutaneously as a 2-percent solution was determined as 22 mg. per kilogram of body weight.

A nonspecific lesion of the esophagus and oral cavity of the chicken, W. T. S. THORP, W. J. RUDY, and R. V. BOUCHER. (Pa. Expt. Sta.). (*Amer. Jour. Vet. Res.*, 1 (1940), No. 1, pp. 78-81, figs. 4).—Report is made of 25 cases of nonspecific lesions of the esophagus and oral cavity of the chicken, gross and microscopical studies of which were made to determine the relationship, if any, of this condition to the nutritive status of the fowl. A limited bacteriological study of 15 cases of esophagitis indicated that the organisms found in the lesions were not the etiological agent.

[**Check list of bacterial diseases of poultry**] (*Jour. Amer. Vet. Med. Assoc.*, 97 (1940), No. 764, pp. 510-526).—This is a second check list prepared by the committee of the American Veterinary Medical Association on poultry diseases. It follows that on virus diseases (E. S. R., 82, p. 392) and is based upon published reports of bacterial diseases, a list of 189 references to which is included.

The toxicity of various copper compounds and mixtures for domesticated birds, II, E. M. PULLAR (*Austral. Vet. Jour.*, 16 (1940), No. 5, pp. 203-213, figs. 2).—In further work (E. S. R., 84, p. 252) the author has determined the maximum daily intake of copper carbonate tolerated by birds as "0.06 gm. per kilogram live body weight for fowls and 0.029 gm. per kilogram live body weight for domestic mallards. It was not possible to produce copper poisoning in fowls supplied with a 1 in 4,000 dilution of copper sulfate in place of drinking water. Domestic mallards were fed a 1 in 4,000 dilution of copper sulfate, and fowls were given a 1 in 1,000 solution. The results were somewhat indefinite, but no obvious copper poisoning was produced. Wheat dry pickled with copper carbonate at the rate of 2 oz. per bushel is definitely unpalatable for fowls. Owing to the fact that it is unpalatable, fowls do not consume enough treated grain to provide a toxic dose." The question of the use of treated grains for food for birds is discussed.

Cultivation of avian pest virus in the embryos of chickens, ducks, and turkeys.—Preliminary report, J. D. GENEROSO, R. A. ACEVEDO, and I. L. MENDOZA (*Philippine Jour. Anim. Indus.*, 7 (1940), No. 4, pp. 357-363).—Avian pest virus was cultivated and made more highly concentrated in the embryos of the chicken, duck, and turkey. Whether this virus can be converted into vaccine remains to be determined.

Avian staphylococcosis, E. JUNGHERR and W. N. PLASTRIDGE. ([Conn.] Storrs Expt. Sta.). (*Jour. Amer. Vet. Med. Assoc.*, 98 (1941), No. 766, pp. 27-32, figs. 2).—Report is made of a study conducted during the course of several epornithic outbreaks of staphylococcal arthritis in chickens. A comparative study was made of 39 strains of staphylococci isolated from these outbreaks, also from fowl pox lesions and navel ill. A group of strains derived from joint and skin lesions and natural fowl pox lesions was characterized primarily by ability to produce alpha toxin and to coagulate rabbit plasma. Such cultures were lethal to 6-week-old chickens on intravenous injection and caused severe intradermal reaction in chickens and rabbits. Other cultures obtained from similar sources and from induced fowl pox lesions failed to produce alpha toxin and to coagulate rabbit plasma, but induced mild intradermal reaction in chickens and rabbits. The navel ill strains studied were comparatively inactive biochemically and failed to produce distinct reactions in chickens. In the determination of pathogenicity and etiologic significance of avian staphylococci, a positive rabbit plasma coagulase test definitely detects pathogenic strains. The wattle test in young chickens permits the recognition of mildly pathogenic strains among coagulase-negative organisms.

On avian tuberculosis, its frequency and role as a source of infection [trans. title], K. HILLERMARK (*Skand. Vet. Tidsskr.*, 30 (1940), No. 9, pp. 918-931; *Eng. abs.*, p. 931).—The occurrence of tuberculosis in fowl, both in Sweden and

its different provinces and in other lands, is considered, together with its occurrence in man and domestic animals.

A new disease in fowls (infectious laryngo-tracheitis) [trans. title], H. MAGNUSSON (*Skand. Vet. Tidskr.*, 30 (1940), No. 6, pp. 629-637, figs. 3; *Eng. abs.*, pp. 636, 637).—The occurrence of infectious laryngotracheitis in a flock of fowls near Lund, Sweden, is reported. The mortality was nearly 50 percent.

Studies on fowl leukosis: Transfer with fractions obtained by ultracentrifugation of leukemic plasma and bone-marrow extracts, A. KIRSCHBAUM, K. G. STERN, and C. W. HOOKER (*Yale Jour. Biol. and Med.*, 13 (1940), No. 1, pp. 1-14).—Work with the filtrable agent of fowl leukosis is reported. The sedimented material did not appear to possess a greater total activity than the material from which it was derived (crude marrow extract or plasma). None of the agent was sedimented at 6,000 r. p. m. ($\frac{1}{2}$ hr.). Sedimentation was incomplete at 30,000 r. p. m. ($\frac{1}{2}$ to 1 hr.). The material responsible for the induction of leukosis was not completely sedimented at a single speed, indicating a variation in size of the particles associated with activity of the agent. As sedimented from crude marrow extracts, the agent was not filtrable. The resistance to both cells and agent appeared to increase with age. Susceptibility to filtrable agent plus leukemic cells (blood) or washed cells was greater than to the agent alone. Although activity of the agent manifested itself first in the bone marrow, intra-amniotic inoculation of 7-day embryos, before the appearance of bone marrow, resulted in the development of leukemia after hatching.

Identification of Salmonella pullorum colonies with immune serum by means of a macroscopic plate test, H. J. STAFSETH and A. C. CORBUTT. (Mich. Expt. Sta.). (*Amer. Jour. Vet. Res.*, 1 (1940), No. 1, pp. 76, 77).—It is concluded that the macroscopic plate test will differentiate *S. pullorum* colonies from those of *Salmonella* and other organisms except *Shigella gallinarum*. The fact that these two organisms give identical reactions with this test is no disadvantage from a practical standpoint. Such cross reactions occur in the accepted agglutination tests now employed in the control of pullorum disease, and some investigators consider *S. gallinarum* merely a variant of *Salmonella pullorum*, thus making pullorum disease and fowl typhoid one problem. The practical importance of shortening the time required for diagnostic procedures is considered too obvious to warrant comment. If there are no colonies of sufficient size to make this procedure possible, agar slant cultures must be made from the available colonies, and the antigen can then be taken from them after from 15 to 24 hr. By so doing, sufficient time and materials can be saved to make this method of practical value.

Salmonella suispestifer infection in canaries, I. E. ALTMAN (*Jour. Amer. Vet. Med. Assoc.*, 97 (1940), No. 765, p. 601).—Report is made of what is thought to be the first recorded case of *S. suispestifer* infection in canaries.

AGRICULTURAL ENGINEERING

[Agricultural engineering investigations by the Arkansas Station] (*Arkansas Sta. Bul.* 405 (1940), pp. 13-16, figs. 2).—An experimental low-cost four-room frame house (E. S. R., 82, p. 574) is described by D. G. Carter; also a home-made walk-in type refrigerator of 220 cu. ft. net inside volume built at a cost of \$1.66 per cubic foot. A study of other sources of water for rice irrigation to replace or supplement the gradually declining well supply is by K. Engler.

[Agricultural engineering investigations by the Colorado Station]. (Partly coop. U. S. D. A.). (*Colorado Sta. Rpt.* 1940, pp. 51, 52-55).—Data on high-strength wire for concrete reinforcement has been obtained by A. R. Legault;

on a photographic method of making snow surveys by M. Parshall et al.; and on single seed ball planting and storage losses in beet piles.

[**Agricultural engineering investigations by the Montana Station**], O. W. MONSON (*Montana Sta. [Bien.] Rpt. 1939-40, pp. 36, 37*).—Work on home-made water-lifting devices and water-power utilization, water-supply studies based on snow surveys, and return flow and duty of water investigations is briefly reported.

[**Agricultural engineering investigations at the Wisconsin Station**] (*Wisconsin Sta. Bul. 450 (1940), pp. 64-68, figs. 3*).—Notes are given on forage harvesters which speed up grass silage making, as tested by F. W. Duffee, a home-made electric brooder as improved by H. D. Bruhn, and windrowing before combining as studied by Duffee.

Surface water supply of the United States, 1938.—Part 3, Ohio River Basin (*U. S. Geol. Survey, Water-Supply Paper 853 (1940), pp. VII+418, pl. 1*).—This paper records measurements of stream flow in this basin for the year ended September 30, 1938.

Ponds for farm water supply, J. B. DAVIDSON and C. H. VAN VLACK (*Iowa Sta. Bul. P17, n. ser., (1940), pp. 493-508, figs. 11*).—This bulletin is a review of the problems involved in the establishment and use of farm ponds and offers suggestions for their location, construction, and maintenance.

As a basis for estimating required pond capacity, the daily consumption per head of various livestock and per person in the use of a domestic water supply is stated. Capacities of round ponds having depths at the spillway of from 8 to 20 ft. and a bank slope of 3:1 are tabulated, together with water available for use, calculated on the basis of 54 percent loss by evaporation and seepage, and the drainage area needed to maintain a pond of each of the sizes tabulated. It is pointed out that run-off in drought years should be the basis for determining the watershed area required, and it is considered safe to accept an annual run-off figure of 2 in. as such a basis. The tabulated drainage-area requirements are, therefore, based upon an annual 54,000 gal. per acre, of which 25,000 gal. (46 percent) is estimated available for use. Surveying to determine high-water line and size of dam, earth-dam construction, sod and masonry spillways, outlet pipes, fences, etc., are also taken up.

Small irrigation pumping plants, C. ROHWER and M. R. LEWIS. (Coop. Colo. and Oreg. Expt. Stas.). (*U. S. Dept. Agr., Farmers' Bul. 1857 (1940), pp. [2]+30, figs. 10*).—This publication supersedes Farmers' Bulletin 1404 (E. S. R., 51, p. 483), which dealt only with wells as sources of irrigation water. The present publication deals also with the pumping of irrigation water from ponds, reservoirs, and streams, giving information designed to provide owners and operators of such farms as can practicably be irrigated with some indications of initial and operating costs, legal requirements, suitability of the available soil and water supply, and the sort of plant and equipment likely to be most satisfactory.

Tile drainage not advocated for land overlaying an artesian basin, W. GARDNER (*Farm and Home Sci. [Utah Sta.], 1 (1940), No. 4, p. 5, fig. 1*).—This is a popular summary of model experiments showing that land overlying an artesian basin can be adequately drained by tile only if the tile lines are laid so deep and so close together as to make the cost prohibitive. Pump wells, making the excess water available for irrigation, are considered to offer a practicable solution of the problem of the drainage of such lands.

Power alcohol from farm products: Its chemistry, engineering, and economics, G. SHEPHERD, W. K. McPIERSON, L. T. BROWN, and R. M. HIXON (*Contrib. Iowa Corn Res. Inst. [Iowa Sta.], 1 (1940), No. 3, pp. [1]+283-375, figs. 17*).—In nontechnical terms this bulletin summarizes the chemistry of

gasoline as obtained by direct distillation and by cracking and polymerization processes; the engineering aspects of gasoline motor fuels; manufacturing processes for ethyl alcohol as made from various agricultural surpluses and wastes, including denaturation of the product for motor-fuel mixtures; economic considerations affecting the manufacture of fuel mixtures of alcohol with gasoline, with and without the further addition of tetraethyl lead; present and future problems, with which is included some discussion of petroleum conservation; and corn as an important raw material for alcohol manufacture. Four appendixes supplement the text discussion of some of these topics.

With corn at 50 ct. per bushel, alcohol may be made profitably for fuel blending purposes at approximately 25 ct. per gallon and can be used in proportions of from 5 to 12 percent with an increase in the price per gallon of between 0.7 and 1.2 ct. over gasoline given an equal antiknock value or "octane" rate by other antiknock agents. It somewhat increases the mileage per gallon and lowers the operating temperature of engines. It may be brought into future use by lowered cost of manufacture or by a necessity for petroleum conservation.

Tractor costs in Michigan, 1939, F. M. ATCHLEY (*Michigan Sta. Quart. Bul.*, 23 (1940), No. 2, pp. 99-105, figs. 2).—Records kept by 56 Michigan farmers, operating 25 one-plow, 30 two-plow, and 5 three-plow tractors in 1939, included those of cash operating expenses, as well as the fixed charges for depreciation, interest, and shelter on the individual tractors, together with a record of the hours of use for all operations, including belt, drawbar, and custom work. Information on the acreage and production of the various crops, the number and production of the various kinds of livestock, and the receipts and expenses of operating each cooperator's farm was also obtained. Costs by size groups, sorts and quantities of fuel, hours of use by operations, hours of tractor use and tractor costs, and influence of size of farm are tabulated or shown in graphic form and are discussed.

Details of construction for a truck excavator, D. A. ISLER (*U. S. Dept. Agr., Soil Conserv. Serv.*, 1939, SCS-TP-28, pp. [2]+8+[6], pls. 8).—This publication gives constructional detail, working drawings, and bill of materials for an attachment to be mounted on a truck 1.5-ton or larger. This type of excavator eliminates hand dumping and hand return of the scrapers, the machine is easily moved from one job to another, and the construction is neither costly nor complicated. The machine is designed primarily for maintenance work and works to best advantage where the bottom width does not exceed 3 ft., the depth 6 ft., nor the quantity excavated from 40 to 45 cu. yd. per 100 ft. of length.

A small practical vinegar generator: A vinegar generator suitable for the farm or small manufacturer, F. W. FABIAN (*Michigan Sta. Cir.* 174 (1940), pp. 13, figs. 3).—The generator described consists essentially of (1) a base made from a glazed T-tile filled with cement-sand concrete (1:2) to 0.5 in. below the central opening and with paraffin over the concrete flush with the opening and (2) the generator tower proper made from three lengths of plain glazed tile jointed first with paraffin sufficient to prevent attack of the vinegar upon the concrete and above the paraffin with concrete to strengthen the joints. The outlet is fitted with a paraffined wooden disk having an outlet opening for the vinegar at the bottom and two air inlets above. The tower filling used in the experiments here described was of beech shavings, sifted to remove the finer pieces and loosely packed to allow abundant air space. A distributing trough of two compartments dumping alternately was made from tin plate and covered with paraffin to prevent corrosion, and is considered necessary to provide for even distribution of the cider over the shavings.

A paraffin-coated funnel set over the top of the generator reduced loss by evaporation. The shavings were kept in place by top and bottom plates of paraffined wood provided with numerous 0.25-in. holes. A bill of materials for generators made from 6- and 8-in. tile is given, together with a tabulation of estimated costs of construction, indicating that the 6-in. generator can be made for less than \$7 and the 8-in. generator for between \$8 and \$9. It is pointed out that these generators are adapted for from 5 to 50 bbl. of cider and are not practical for either larger or smaller quantities.

The processes of charging the filling material (shavings or corncobs, the former being preferred if suitable shavings are available) with *Acetobacter aceti* and operating the generator are described, and comparative observations on the performances of the two sizes of the generator are reported upon. In all experiments the 8-in. generator produced a much more rapid conversion, the vinegar reaching the same strength in several trials in one-third of the time required by the 6-in. generator. The 8-in. generator made 4 percent or standard vinegar in 2 days from cider cut back 50 percent with finished vinegar. It also produced a vinegar of 5.8 percent strength in a little more than 3 weeks from unmodified cider stock. The method of cutting back with finished vinegar is recommended because of the much shorter time required for complete conversion.

Operation of orchard heaters, R. A. KEPNER (*California Sta. Bul. 643 (1940), pp. 32, figs. 15*).—Observations and experiences in the operation of heaters are reported.

The smoke nuisance was minimized by keeping burning rates within the proper range for the type of heater used, by cleaning stacks and covers regularly and after each 20 to 30 hr. of burning at the least, by the use of tight-fitting covers kept tight by careful handling, and by regulating the heaters as soon as possible after lighting, with frequent inspection to keep them properly regulated. Difficulties due to residues in the bowl-type heaters were reduced by emptying the bowls after each 50 to 75 hr. of burning either by dumping the residual oil or burning it out, by preventing soot from falling into the bowls during the cleaning of stacks and covers, and by keeping residual oil separate from fresh oil. Automatic draft regulators were found superior to the ordinary regulator in control of the burning rate. A heater especially designed for burning residual or pour-back oil was devised, together with a heater so designed as to return part of the hot stack gases to the bowl and thereby to improve completeness of combustion. Coke heaters are considered advantageous where temperatures are relatively steady when firing is necessary, but impractical under conditions of large and frequent temperature fluctuations. A combined installation, the oil heaters for small heat demands and the coke heaters, or both oil and coke, for more severe conditions, is suggested. The chief advantages of coke heaters are lower investment costs and the elimination of the smoke nuisance.

Range, pasture, and field fencing: Recommended procedure, T. B. CHAMBERS (*U. S. Dept. Agr., Soil Conserv. Serv., 1939, SCS-EP-17, pp. 10, pls. 5*).—This condensed guide was prepared to aid in securing uniformity of practice, economy, effectiveness in the construction of the hundreds of miles of fencing required by the soil conservation program on purchased land and in the carrying out of conservation practice on numerous farms. Emphasis is placed especially on the selection of suitable types of fence, the materials required, and the more important methods of construction. Gates and cattle guards are also considered, and some working drawings for their construction are appended.

AGRICULTURAL ECONOMICS

Economics with applications to agriculture, E. F. DUMMEIER and R. B. HEFLEBOWER (*New York and London: McGraw-Hill Book Co., 1940, 2. ed., pp. XII+752, figs. 63*).—In this second edition (E. S. R., 72, p. 401) the changes in economic institutions and economic thought since 1934 have been incorporated; a number of chapters have been rewritten, and the statistical tables and charts are revised to include the latest available data. "The chapters describing such institutions as the money and banking system and agricultural credit and the relations of government to agriculture and to business have been largely recast in order not only to bring them up to date but also to integrate effectively recent and earlier developments. . . . Among the recent contributions to economic theory which have been included are those relating to the individual firm approach in price analysis and to monopolistic competition, money, and the business cycle."

[**Papers on agricultural economics**] (*Jour. Farm Econ., 22 (1940), No. 4, pp. 673-761*).—Included are the following papers: Price Analyses, Wars, and Depressions, by M. Ezekiel (pp. 673-679) and War-Time Price Control in the United Kingdom, by J. H. Richter-Altschaffer (pp. 680-690) (both U. S. D. A.); Democratic Telesis and County Agricultural Planning, by B. Ryan (pp. 691-700) (Iowa State Col.); Crop-Yield Index Numbers, by E. J. Working (pp. 701-713) (Univ. Ill.); The British Program for Farm Labor—as a Contribution to American Thinking on the Subject, by M. R. Benedict (pp. 714-728) (Univ. Calif.); Contributions of Soil Science and Agronomy to Rural Land Classification, by C. E. Kellogg (pp. 729-739) (U. S. D. A.); Contribution of Cooperation to the Problem of Distribution, by W. E. Paulson (pp. 740-752) (Tex. Expt. Sta.); and Procedures which Increase the Usefulness of Farm Management Research, by W. D. Goodsell, R. J. Jessen, and W. W. Wilcox (pp. 753-761) (Iowa Sta. coop. U. S. D. A.).

[**Investigations in agricultural economics by the Arkansas Station, 1939-40**] (*Arkansas Sta. Bul. 405 (1940), pp. 10-12*).—Included are (1) brief findings by J. L. Charlton in a study of seasonal employment of nonresident labor as to number of migratory workers, earnings, income per family, and educational attainment of children, and (2) a discussion of the possibilities of adjustments through land use based on facts obtained in Hempstead County in cooperation with the U. S. Department of Agriculture

[**Investigations in agricultural economics by the Colorado Station, 1939-40**] (*Colorado Sta. Rpt. 1940, pp. 46-48*).—Brief statements are included as to the net returns per head for lambs fed in northern Colorado in 1938-39 as compared with 1937-38 and the average for 17 yr., and as to the average cash farm receipts on 155 rehabilitation units of the Farm Security Administration in 1937 as compared with those on 294 units in 1938.

Current Farm Economics, [December 1940] (*Oklahoma Sta., Cur. Farm Econ., 13 (1940), No. 6, pp. 139-170, fig. 1*).—Included, in addition to a discussion of the agricultural outlook for 1941, by the staff of the department of agricultural economics, extension economists, and commodity specialists of the station and extension division and the usual tables of indexes of prices, purchasing power of Oklahoma farm products, etc., are articles on (1) Agricultural Conservation in Okfuskee County, by D. L. W. Anker (pp. 156-161) (coop. U. S. D. A.), including tables showing for 1939 the size of farm and participation in soil building practices, tenure of operators and participation and relationship between soil building practices and size of farm and tenure of operators, and (2) Is Storage of Wheat Profitable to the Oklahoma Farmer, by A. L. Larson (pp. 162-166). This article includes tables by years for 1921-39 showing

the gains and losses to the following September, December, March, June, and July from storing wheat in June and July. It did not appear profitable to hold wheat regularly after storage price was 1 ct. per bushel per month. Possibilities for loss were greater for wheat stored in June than that stored in July. The possibilities of loss in both cases were greater where the storage period averaged 1 yr. in length.

[Investigations in agricultural economics by the Wisconsin Station, 1939-40]. (Partly coop. U. S. D. A.). (*Wisconsin Sta. Bul.* 450 (1940), pp. 49-63, figs. 5).—Included are brief general statements regarding (1) the possibility of higher incomes from the adoption of a soil conserving cropping system as shown by a study made by H. O. Anderson, D. M. Keyes, and P. E. McNall; (2) the effect of efficient feeding on dairy incomes on 100 farms in Emmet Township studied by D. R. Mitchell; (3) the effect of size of down payment on the success of farm purchasers as shown by a study by McNall in a township in the northern part of the State; (4) the assets of tenants available for purchasing farms as shown by a study by McNall of 28 tenants who have operated the same farm for one year or more; (5) relation of size and condition of buildings to quality of soil of farm as shown by a study made by McNall, Mitchell, and E. J. Graul; (6) the proportion of farm families in rural areas of northern Wisconsin that can be classed as real farmers and the social and economic problems of different groups as shown by a study by G. W. Hill, R. A. Smith, and J. H. Kolb; (7) data as to prices of clover seed and the factors affecting such prices, by F. V. Beck and W. H. Ebling; (8) the returns from canning peas and the factors affecting such returns, by H. H. Bakken and M. Beal; (9) the preference of consumers for natural American cheese packed in small packages v. bulk cheese as shown by data obtained from 959 Madison housewives in a study by M. A. Schaars, A. Hobson, and collaborators; (10) data as to the number of food locker plants in the State, the location, size, rental, other charges, etc., obtained in a survey by Schaars in cooperation with the U. S. D. A. Farm Credit Administration; and (11) the effects of city expenditures on taxes of farmers in the rural-urban fringe area as shown by a study of Blooming Grove Township adjacent to Madison, by G. S. Wehrwein, S. Keyes, and assistants.

State summary of "annual farm success factor reports" on 1,346 Michigan farms, 1939, H. A. BERG, C. O. MAY, and J. C. DONETH (*Michigan Sta. Quart. Bul.*, 23 (1940), No. 2, pp. 74-84, figs. 6).—Tables and charts are included and discussed showing (1) for 1939 the average farm earnings, the distribution of individual labor incomes by groups and by items, the average farm investments, farm receipts, and farm expenditures, and (2) by years 1929-39, the financial returns on farm-account farms, the percentage distribution by income groups of labor incomes, and the relationship between the ratio of Michigan farm prices to farm costs and labor incomes. Other tables show for the 1,346 farms studied in 1939 for the State and the 17 type-of-farming areas the average financial summary and crop and livestock figures, the percentages of land in different crops and crop yields, the kinds, amounts, and returns from livestock, and labor, machinery, improvement, and other costs.

Summary of returns on 17 identical farms in the Coastal Plain area of North Carolina 1928, 1930, 1934, and 1937, R. E. L. GREENE (*North Carolina Sta., AE-RS Inform. Ser. No. 7* (1940), pp. [1]+10, figs. 2).—Tables and charts show by years the average investment, utilization of land, acreages of different crops, numbers of livestock, receipts, and expenditures.

Some costs and results of a soil and moisture conservation program in western Pennsylvania, D. H. WALTER. (Coop. U. S. D. A.). (*Pennsylvania Sta., Jour. Ser. Paper 992* (1940), pp. [2]+38, figs. 3).—This paper is based on

survey data for the years 1934, 1936, and 1938 regarding the farms of 48 cooperating and 58 noncooperating farmers in the Crooked Creek watershed of Indiana and Armstrong Counties, which area was designated as a Federal erosion control project by the U. S. D. A. Soil Conservation Service in 1934. The area and farms studied are described. The soil conservation program; its implications as to land use, fertility practices, yields, and utilization of crops; food, livestock, and milk production; receipts, expenses, and labor income, etc.; and the attitude of farmers toward the program are discussed.

Farm management aspects of soil conservation on flue-cured tobacco farms in Virginia, W. L. GIBSON, JR. (Coop. U. S. D. A.). (*Virginia Sta. Bul.* 327 (1940), pp. 24, fig. 1).—This is a summary of the findings applicable to soil conservation reported in greater detail in Technical Bulletin 66 (E. S. R., 84, p. 258). It is based chiefly on studies made in 1933 and 1936 in Pittsylvania County in which the Banister River Watershed is a demonstration area of the U. S. D. A. Soil Conservation Service. Included are a description of the area, a general business analysis of the farms, and discussions of changes in farm practices related to soil conservation, the effects of erosion on the tobacco enterprise, and the effects of the Soil Conservation Service program on the operation of the farm business.

Rural assessment, with special reference to forests, A. Z. NELSON (*U. S. Dept. Agr., Forest Serv., 1940*, pp. [1]+29).—This bibliography includes general items on forest land taxation and valuation, the theory of land and property appraisals, and general assessment practices and technics, and references by States including assessment manuals and other published instructions, studies of property tax administration, and State tax law compilations.

American cooperation, 1940 (*Washington, D. C.: Amer. Inst. Coop., [1940]*, pp. XXII+785, figs. 7).—Included are the papers presented at the 1940 summer session of the American Institute of Cooperation, at East Lansing, Mich., on cooperation at work in America, cooperation in democracy today, war's effect on American life and agriculture, Government functions as they affect agriculture and cooperation, operating principles and practices of cooperatives, membership relations of cooperatives, education in cooperation, cooperative purchasing of farm supplies, cooperative marketing of fluid milk and of manufactured dairy products, cooperative marketing of poultry and eggs, cooperative marketing of livestock and wool, problems of farmers' elevators, cooperative marketing of potatoes, cooperation among sugar beet growers, and cooperative marketing and canning of fruits and vegetables.

Cooperative purchasing of farm supplies in West Virginia, M. A. ABRAHAMSEN (*West Virginia Sta. Bul.* 297 (1940), pp. 76, figs. 9).—Data were obtained regarding "(1) the historical development of purchasing associations; (2) agricultural and general economic conditions influencing the development of and the possibilities in cooperative purchasing; (3) organization features giving special consideration to problems of membership, management and control, and financial structure; (4) operating set-up paying particular attention to facilities, personnel, purchasing policy and methods, sales policy, side line activities, and accounting and auditing procedure; and (5) operating efficiency as indicated by available balance sheets and operating statements." The influence of agricultural development on cooperative purchasing in the State and the historical development of such cooperation are described. The analysis deals chiefly with Cooperative Farm Services, which name was assumed by the West Virginia Farm Bureau Service Company upon its reorganization in 1928. The organization features of Cooperative Farm Services are discussed in sections on membership relations, management and control, and financial structure. Its

operating set-up is discussed in sections on method of operation, purchasing policy, sales policy, and side line activities and accounting procedure, and its operating and financial condition in sections on sales and commissions, operating efficiency, and financial condition. Local warehouse operations are discussed in sections on operating practices, financial condition, service store operations of the Southern States Cooperative, Inc., and observations on local warehouse operations. The changes contemplated in the proposed reorganization of Cooperative Farm Services are discussed in the different sections and in the conclusions based on the study. Suggestions and recommendations for improvement in its organization are discussed in sections on historical, social, and economic background, the advisability of separating business control of Cooperative Farm Services from the West Virginia Farm Bureau, operating set-up, operating practices, and financial policies.

North Carolina cotton prices and local marketing practices, G. R. SMITH (*North Carolina Sta. Tech. Bul. 64 (1940), pp. 75, figs. 12*).—Data were obtained from 36 local buyers in the Piedmont area of the State, 99 buyers in the Coastal Plain area, and 14 buyers in the Flatwoods area. Information as to marketing practices was obtained from 252, 321, and 50 cotton growers in the respective areas. Production v. consumption of cotton in North Carolina, trend in average length of staple and price relationships, premiums and discounts for individual bale sales, relationship between average price and average quality, variations in price between local markets, monthly variations in price, size of lots and prices received, and types of local markets and marketing practices of growers are analyzed and discussed. Some of the findings were: The number of bales of North Carolina cotton spun by spinners of the State exceeds production in the State by more than two to one. The cost of transporting cotton from surplus States to North Carolina mill points is generally 0.75 ct. or more per pound and the price paid growers for a given class of cotton is usually higher in North Carolina than in States farther from the southeastern textile center. The average price is somewhat higher in the local markets where the cotton is better than the average grade and longer in staple. Lots of more than one bale generally sell at slightly higher prices for a given grade and staple than do individual bale lots. The major portions of the cotton in the Piedmont and Flatwoods areas are sold to the ginner. In the Coastal Plain area local cotton merchants and representatives of central cotton merchants purchase about one-third of the cotton sold in the local markets. In the Coastal Plain and Flatwoods areas a majority of the local buyers grant production credit to some farmers. In the Piedmont area only one-sixth of the local buyers grant such credit. The percentages of cotton sold in single bale lots were less than 8 in the Coastal Plain area, 39 in the Piedmont area, and 27 in the Flatwoods area. Factors found to influence the time of selling were the necessity of meeting immediate obligations and the belief that the price had reached the most favorable level. Approximately 25 percent of the growers in the Piedmont area, 29 percent in the Flatwoods area, and 65 percent in the Coastal Plain area interviewed more than one buyer before selling. The number of bales of cotton purchased by local buyers varied from less than 50 to over 6,000 bales. Approximately 86 percent of the local buyers in the Flatwoods area, 40 percent in the Coastal Plain area, and 42 percent in the Piedmont area purchased less than 500 bales. Approximately 70 percent of the cotton is sold on standard description, with 34 percent classed by the take-up man of the firm purchasing and 36 percent classified after the cotton is received by the second buyers. Approximately 61 percent of the cotton purchased by local buyers is resold within 3 days. Local buyers deliver the major portion of their cotton to the second buyers by truck. Over 41 percent of the cotton purchased by local buyers is sold direct to the mills.

South Brazil: New land of cotton, O. W. HERRMANN (*U. S. Dept. Agr., Farm Credit Admin. Cir. C-117 (1940)*, pp. [4]+47, figs. 47).—The geographic and population pattern and the trends in production and exports of cotton in south Brazil are described. The cotton improvement program and the cotton marketing practices in the State of São Paulo are discussed. Attention is called to some things United States cotton growers can learn from Brazil.

The world wheat situation, 1939-40: A review of the crop year, J. S. DAVIS (*Wheat Studies, Food Res. Inst. [Stanford Univ.], 17 (1940), No. 4*, pp. [2]+145-220, figs. 19).—In 1939-40, with carry-over and crop each the second largest in history, wheat supplies for the world ex-Russia surpassed the high record set in 1938-39, with stocks heavily concentrated in North America, Australia, and Europe. The war which broke out in September 1939 profoundly influenced the season's wheat developments. The volume of international trade in wheat and flour surprisingly exceeded 600 million bushels. European countries, eager to maintain consumption and build up reserves, imported heavily despite marked advances in ocean freights, insurance rates, and c. i. f. prices. From very low levels in August 1939, wheat prices rose sharply in early September and advanced further in December on bullish crop news. In mid-May, responding to startling changes in war prospects, prices collapsed. Favorable crop progress further weakened United States prices thereafter, while price controls checked declines in Canada and Australia. Wheat consumption was generally well maintained in spite of wartime regulations and destruction.

World wheat survey and outlook, January 1941, H. C. FARNSWORTH and B. M. JENSEN (*Wheat Studies, Food Res. Inst. [Stanford Univ.], 17 (1941), No. 5*, pp. [2]+221-260, fig. 7).—Continuing the series (*E. S. R.*, 84, p. 542), world wheat supplies for 1940-41 are of record size and concentrated heavily in overseas exporting countries. In Canada and Argentina, embarrassing surpluses present serious problems of storage in the face of wartime barriers to exports. In continental Europe ex-Russia, wheat supplies are moderately light, unevenly distributed, and partly withheld from consumption by governmental agencies and by farmers. World wheat exports in August-December were lower than in any preceding year of the present century, with the possible exception of 1917-18. Australian and Argentine exports were well maintained; but clearances from North America were strikingly small, especially as compared with the record heavy supplies there. Continental European imports, particularly into the Axis-dominated area, were notably low.

Charts and tables relating to the small fruit industry in New Hampshire, L. A. DOUGHERTY (*New Hampshire Sta. Bul. 321 (1940), Ref. Sup.*, pp. [39], figs. 13).—Charts and tables supplementary to Bulletin 321 (*E. S. R.*, 84, p. 263) are included covering varieties, yields, production, sales, prices, returns, etc., of strawberries, red raspberries, blackberries, grapes, and the berry industry as a whole in the State.

A preliminary report of the cost of milk production on 53 dairy farms in four areas of Pennsylvania, 1939, W. L. BARR (*Pennsylvania Sta., Jour. Ser. Paper 987 (1940)*, pp. [1]+7, figs. 2).—This report is based on data from 53 farms, with 861 dairy cows, continuing previous work (*E. S. R.*, 82, p. 406).

Report of the Chief of the Agricultural Marketing Service, 1940, C. W. KITCHEN (*U. S. Dept. Agr., Agr. Market. Serv. Rpt., 1940*, pp. 45).—The work of the Service during the year ended June 30, 1940, is discussed in sections on agricultural statistics; market news; standards for farm products; inspection, classification, and grading; regulatory work; and marketing research. The marketing research (pp. 41-45) is briefly described, and some findings are

given under the headings of cotton-marketing studies, toward better cotton ginning, spinning tests to determine quality, wool-shrinkage research, and the New York market study.

Report of the Chief of the Commodity Exchange Administration, 1940, J. M. MEHL (*U. S. Dept. Agr., Commod. Exch. Admin. Rpt., 1940, pp. 48*).—This report for the fiscal year ended June 30, 1940, summarizes the year's trading in commodities supervised by the Administration and discusses the future trading—volume, visible supply of the commodity, prices, deliveries, special accounts, etc.—in grain, cotton, wool tops, butter, eggs, potatoes, and millfeeds. The regulatory activities of the Administration are also discussed.

Report of the Director of the Office of Foreign Agricultural Relations, L. A. WHEELER (*U. S. Dept. Agr., Off. Foreign Agr. Relat. Rpt., 1940, pp. 14, fig. 1*).—This report for the fiscal year ended June 30, 1940, discusses the European war and American agriculture and inter-American relations in agriculture, and describes the organization and work of the major divisions of the office.

Wartime agricultural surpluses of the Danube Basin, F. STRAUSS (*U. S. Dept. Agr., Off. Foreign Agr. Relat., Foreign Agr., 4 (1940), No. 12, pp. 705-778*).—The role of the Danube Basin before and during the present war, the European needs for farm products, and the Danube Basin surpluses are described. The agricultural structure, pattern of agricultural production, agricultural export trade, and potential farm surpluses during and after 1940-41 of Rumania, Hungary, Yugoslavia, and Bulgaria are discussed.

Crops and Markets, [November 1940] (*U. S. Dept. Agr., Crops and Markets, 17 (1940), No. 11, pp. 233-256, figs. 3*).—Included are crop and market reports of the usual types. Those on crops include reports on the cattle feeding situation, November 1; cotton report, November 1; employment on farms, November 1; lamb feeding situation, November 1; prices received by farmers; stocks of wheat in interior mills, elevators, and warehouses, October 1; wage rates for picking seed cotton; and yield and production estimates as of November 1 for different crops, with comparisons with 1939 and the averages for 1929-38.

Agricultural statistics, 1940 (*U. S. Dept. Agr., 1940, pp. [1]+737*).—This volume continues the series (E. S. R., 82, p. 412) and includes statistics prepared under the direction of the Yearbook Statistical Committee on grains, cotton, sugar, tobacco, fruits, vegetables, tree nuts, beef cattle, hogs, sheep, horses, mules, miscellaneous crops, dairy cattle, dairy products, poultry, poultry products, foreign trade in agricultural products, farm business and related subjects, and miscellaneous subjects—forestry, weather, roads, etc.

RURAL SOCIOLOGY

Farmers in a changing world: Yearbook of Agriculture, 1940 (*U. S. Dept. Agr. Yearbook 1940, pp. XII+1215, figs. 100*).—The 54 articles included in the Yearbook of the Department are grouped into 7 parts, as follows:

Part 1, *The Farmer's Changing World*—*The Farmer's Changing World*, by F. F. Elliott (pp. 103-110); *Old Ideals Versus New Ideas in Farm Life*, by P. H. Johnstone (pp. 111-170); *American Agriculture—The First 300 Years*, by E. E. Edwards (pp. 171-276); *Agriculture in the World War Period*, by A. B. Genung (pp. 277-296); and *The Development of Agricultural Policy Since the End of the World War*, by C. C. Davis (pp. 297-326). Part 2, *Agriculture and the National Welfare—Agricultural Surpluses and Nutritional Deficits*, by J. P. Cavin, H. K. Stiebeling, and M. Farioletti (pp. 329-341); *The Farmer's Stake in Greater Industrial Production*, by L. H. Bean (pp. 342-365); and *The City Man's*

Stake in the Land, by A. P. Chew (pp. 366-382). Part 3, The Farmer's Problems Today and the Efforts to Solve Them—Agriculture Today, an Appraisal of the Agricultural Problem, by O. V. Wells (pp. 385-397); Our Major Land Use Problems and Suggested Lines of Action, by L. C. Gray (pp. 398-415); The Challenge of Conservation, by B. W. Allin and E. A. Foster (pp. 416-428); Our Soil Can Be Saved, by H. H. Bennett (pp. 429-440); The New Range Outlook, by W. R. Chapline, F. G. Renner, and R. Price (pp. 441-457); Forest-Resource Conservation, by R. E. Marsh and W. H. Gibbons (pp. 458-488); Farm-Management Problems in an Era of Change, by S. E. Johnson (pp. 489-508); The Influence of Technical Progress on Agricultural Production, by R. S. Kifer, B. H. Hurt, and A. A. Thornbrough (pp. 509-532); The Place of Forests in the Farm Economy, by B. P. Kirkland (pp. 533-550); Acreage Allotments, Marketing Quotas, and Commodity Loans as Means of Agricultural Adjustment, by J. B. Hutson (pp. 551-565); The Meaning of Foreign Trade for Agriculture, by A. P. Chew (pp. 566-584); Reciprocal Trade Agreements—A New Method of Tariff Making, by L. A. Wheeler (pp. 585-595); Methods of Increasing Agricultural Exports, by H. B. Boyd (pp. 596-605); The Industrial Market for Farm Products, by W. B. Van Arsdel (pp. 606-626); Reducing the Costs of Food Distribution, by A. C. Hoffman and F. V. Waugh (pp. 627-637); Marketing-Agreement Programs as a Means of Agricultural Adjustment, by B. A. Holt and D. M. Rubel (pp. 638-649); Thirty Million Customers for the Surplus, by M. Perkins (pp. 650-655); Barriers to Internal Trade in Farm Products, by E. L. Burtis and F. V. Waugh (pp. 656-666); Standardization and Inspection of Farm Products, by C. W. Kitchen (pp. 667-683); Cooperative Marketing by Farmers, by E. A. Stokdyk (pp. 684-705); The Growth of Farm-City Cooperative Associations, by S. N. Gubin (pp. 706-719); The Transportation Problem of Agriculture, by R. L. Dewey and J. C. Nelson (pp. 720-739); Agricultural Credit, by E. C. Johnson (pp. 740-754); Crop Insurance, by W. H. Rowe and L. K. Smith (pp. 755-770); Rural Taxation, by E. Englund (pp. 771-789); Rural Electrification, by R. T. Beall (pp. 790-809); New Conditions Demand New Opportunities, by R. C. Smith (pp. 810-826); The Rural People, by O. E. Baker and C. Taeuber (pp. 827-847); Patterns of Living of Farm Families, by D. Monroe (pp. 848-869); Overcrowded Farms, by W. W. Alexander (pp. 870-886); Farm Tenancy, by P. V. Maris (pp. 887-906); Farm Labor in an Era of Change, by W. T. Ham (pp. 907-921); and Beyond Economics, by M. L. Wilson (pp. 922-937). Part 4, Farm Organizations—Trends in National Farm Organizations, by D. C. Wing (pp. 941-979). Part 5, What Some Social Scientists Have to Say—Cultural Anthropology and Modern Agriculture, by R. Redfield and W. L. Warner (pp. 983-993); Democracy in Agriculture—Why and How? by R. Likert (pp. 994-1002); The Cultural Setting of American Agricultural Problems, by R. Turner (pp. 1003-1032); Education for Rural Life, by E. R. Embree (pp. 1033-1041); The Contribution of Sociology to Agriculture, by C. C. Taylor (pp. 1042-1055); and A Philosophy of Life for the American Farmer (and Others), by W. E. Hocking (pp. 1056-1071). Part 6, Democracy and Agricultural Policy—Public Information and the Preservation of Democracy, by A. D. Stedman (pp. 1075-1080); Science and Agricultural Policy, by T. S. Harding (pp. 1081-1110); Schools of Philosophy for Farmers, by C. F. Taeusch (pp. 1111-1124); Old and New in Agricultural Organization, by M. S. Eisenhower and R. I. Kimmel (pp. 1125-1137); and Cooperative Land Use Planning—A New Development in Democracy, by E. A. Foster and H. A. Vogel (pp. 1138-1156). Part 7, Essentials of Agricultural Policy—Some Essentials of a Good Agricultural Policy, by H. R. Tolley (pp. 1159-1183). The articles are summarized by G. Hambidge (pp. 1-100), and an appendix includes A Brief Chronology of American Agricultural History, compiled by D. C. Goodwin and P. H. Johnstone (pp. 1184-1196).

[Investigations in rural sociology by the Arkansas Station, 1940]. (Partly coop. U. S. D. A.). (*Arkansas Sta. Bul.* 405 (1940), pp. 4, 5, 8-10).—Data are presented showing displacement of families on cotton farms and on farmers moving to towns and cities, the latter by W. H. Metzler, and on factors affecting medical care in rural areas, by I. C. Wilson.

Proceedings of southern conference-seminar on teaching and research in rural sociology, Blue Ridge, N. C., August 26-30, 1940 (*South. Conf. Seminar, Teaching and Res. Rural Sociol., Blue Ridge, N. C., 1940, Proc.*, pp. [X]+196).—Included are the following papers (with discussions) on research: An Inventory and Critique of Rural Sociological Research Projects in the South During the Past Five Years, Including Current Projects in Progress, by B. O. Williams (pp. 79-119) (Clemson Agr. Col.); A Review of Some Recent Studies of Southern Culture, by C. P. Loomis (pp. 121-143), Charting Needed Areas of Rural Sociological Research in the South, by C. H. Hamilton (pp. 145-162), and Cooperation in Rural Sociological Research on an Interstate and Regional Basis, by C. C. Taylor (pp. 163-179) (all U. S. D. A.); and Selection and Recruitment of Personnel in Rural Sociology, by W. E. Gettys (pp. 181-196).

A survey in the social sciences: Men, groups, and the community, T. H. ROBINSON ET AL. (*New York and London: Harper & Bros.*, [1940], pp. XIX+965, [figs. 83]).—The perspective, some of the features of communities, social change, and problem situations are discussed, and ways and means of solving them are suggested.

Proposals for reorganization of the American Sociological Society, D. SANDERSON. (Cornell Univ.). (*Rural Sociol.*, 5 (1940), No. 3, pp. 345, 346).—The author reports on the proposals of the Organization Committee of the American Sociological Society, one of which is to the effect that the Rural Sociological Society, along with "other specialized societies," should have the privilege of affiliation. Affiliated societies are to be autonomous as to membership, finances, etc., but restricted to meeting at the same time and place as the American Sociological Society, and with coordination of programs.

Leadership for rural life, D. SANDERSON (*New York: Assoc. Press*, 1940, pp. 127).—This is an analysis of rural leadership from the viewpoints of the demand for leadership, manner of leadership, types of leaders, the group and the leader, the evolution of the leader in the group, developing and training leaders, the professional leader, and the meaning and values of leadership to the leader. Also included are a bibliography and an index and a foreword by M. L. Wilson.

Rural life in process, P. H. LANDIS (*New York and London: McGraw-Hill Book Co.*, 1940, pp. [XX]+599, [pls. 8, figs. 94]).—This book presents a view of rural life in a state of rapid transition. It is divided into five parts—the structure and organization of rural life in the United States, social experience and personality formation, interaction processes of a dynamic society, social institutions in a changing culture, and emerging problems of a dynamic society—comprising 29 chapters, an appendix, and author and subject indexes. In the appendix material is presented concerning the development of rural sociology in the United States.

A long-time experiment in local social planning, W. D. NICHOLLS. (Univ. Ky.). (*Rural Sociol.*, 5 (1940), No. 4, pp. 449-453).—The author reports a successful experiment in community improvement begun about 20 yr. ago in Fayette County, Ky. It is concluded that the project has culminated in the attainment of all the major goals of community improvement sought by its sponsors.

Cultural factors and land-use planning in Cuba Valley, New Mexico, K. OBERG. (U. S. D. A.). (*Rural Sociol.*, 5 (1940), No. 4, pp. 438-448, fig. 1).—"Cuba Valley is today inhabited by two distinct cultural groups, each with its

characteristic form of settlement and method of land use. The Spanish-American villages along the irrigable lands of the Rio Puerco represent a relatively long period of adjustment of people to a semiarid environment; the Anglo-American homesteads on the surrounding dry lands have some 20 yr. of recent history and represent a process of economic and cultural adjustment which is still in progress. Economic distress, especially among the Spanish-Americans, arises from the decrease in the physical resources of range and farm land, the contraction of the market for agricultural labor, and the natural increase in the population dependent upon these resources. The essential need of both cultural groups is for more land resources; the existing land resources are insufficient. A lessening of the intensity of their use is even desirable.

"In the light of these needs the Federal Government has initiated a land-use adjustment program in the area, placing its land-managing agencies in a position to determine the long-term trends in the use of resources. Some choice may have to be made as between the Spanish-American villages and the homesteaders. Before any choice can be made, however, it will be necessary to evaluate the possibilities of the development of a relatively stable community organization in the homestead area."

World wheat planning and economic planning in general, P. DE HEVESY (*London and New York: Oxford Univ. Press, 1940, pp. XIV+912, [figs. 8]*).—The author calls attention to the mutual interest of all countries in the solution of the wheat problem, and discusses both a proposal for an international wheat agreement and the economic, political, and social problems raised. Appended are more than 200 pages of tabular material and useful information pertaining to wheat.

Report of the Administrator of the Farm Security Administration, 1940, C. B. BALDWIN (*U. S. Dept. Agr., Farm Security Admin. Rpt., 1940, pp. V+24*).—The Administrator reports that the farm population is growing and that the rate of increase is highest in the poorest counties, mostly in the Appalachians, the Cotton Belt, the Lake States Cut-Over, the Great Plains States, and the Southwest, where, within 30 yr., assuming no migration and the present rate of population increase, the population of these poorer counties would double in number. Other problems confronting needy farmers are loss of soil, mechanization, and farm tenancy. More than 1,690,000 farm families had average incomes of less than \$500 a year, and nearly half of these had incomes of less than \$250 a year, including products raised for home use. In other words, about 4,000,000 people were subsisting on an average income of about \$1 a week. The rural standard of living was also shown to be very low by rural housing and health surveys. During the past 5 yr. the Administration has carried out a program of rehabilitation for needy farmers, has helped plan for a better standard of living, and has helped finance the farm and home plan. It is estimated that at least 80 percent of all the money loaned will be repaid. The Administration has made loans for special purposes, such as water facilities and adjustment of farm debts, and endeavored to improve the tenure of farm tenants. It is also making land owners out of some farm tenants. It reports managing 164 homestead projects which were started by the Resettlement Administration, the Subsistence Homesteads Division of the U. S. Department of the Interior, and other prior agencies, and conducts migratory labor camps in Idaho, Oregon, Washington, California, Arizona, Texas, and Florida, where migratory problems are serious. In addition, the Administration is carrying on activities for the development of better rural housing, the encouragement of cooperatives, and the development of plans for medical care for low-income farm people.

Some characteristics of farmers on the Stillwater Creek watershed, O. D. DUNCAN and P. B. BOYER. (Okla. Expt. Sta. and U. S. D. A.). (*Southwest. Social Sci. Quart.*, 21 (1940), No. 3, pp. 234-245).—The data show that there is very little difference between cooperators and noncooperators with the soil conservation program in the Stillwater Creek watershed area of Oklahoma on the basis of the characteristics chosen. It may even be true that the soil conservation program itself may not operate selectively because of its conscious effort to appeal to all types of farm people. Education and plane of living seemed to be positively correlated with cooperation and to a significant degree.

They live on the land: Life in an open-country southern community, P. W. TERRY and V. M. SIMS (*University, Ala.: Univ. Ala., Bur. Ed. Res.*, [1940], pp. [XIV]+313, [figs. 20]).—This is a study of Upland Bend, an Alabama community. The origins, people, economic and civic life, health and medical services, homes, churches, schools, social and recreational activities, and leadership are discussed.

The South in progress, K. D. LUMPKIN (*New York: Internatl. Publishers*, [1940], pp. 256).—The author endeavors to diagnose the South and its social questions.

Comerio: A study of a Puerto Rican town, C. C. ROGLER (*Lawrence: Univ. Kans.*, 1940, pp. VI+198, [pls. 2]).—This is a presentation of information gathered by the author of the culture of the people of a Puerto Rican town.

Social aspects of land use in Delaware, R. O. BAUSMAN. (Univ. Del.). (*Jour. Farm Econ.*, 22 (1940), No. 3, pp. 637-640).—The author reports on the sociological aspects of land use in Delaware, including the influence of land use on the standard of living of farm families, on the age of farmers and the age at which they retire, and on the education of farm children.

Transmission of farming as an occupation, II, W. A. ANDERSON. (Cornell Univ.). (*Rural Sociol.*, 5 (1940), No. 3, pp. 349-351).—In a previous article (*E. S. R.*, 82, p. 844) the author presented a series of generalizations about the transmission of farming over three generations. "The present article supplements and tests whether these generalizations are true. It is based upon information obtained from 664 farm operators in Cortland County, N. Y., who furnished data about the occupations followed by their fathers, their brothers, and their sons. . . . These data show clearly that there is a decrease in the transfer of farming from fathers to sons in succeeding generations. In the previous study, 50 percent of the sons of the grandfathers and only 31 percent of the sons of the fathers became farmers." It is also shown that farming is an occupation that perpetuates itself and has little influx from other occupations. In the grandfather generation there were 148 families and in the father generation, 25, in which there were 2 or more sons, only one of whom followed the father's occupation of farming. The oldest son follows the father most frequently and then the youngest son. Both in the grandfather and the father generations, each major class of occupation was represented by sons.

Population trends in Colorado, R. W. ROSKELLEY (*Colorado Sta. Bul.* 462 (1940), pp. 81, figs. 52).—This bulletin analyzes broad trends in Colorado's population make-up from the vantage point of historical perspective. It presents in pictorial and graphic form certain basic trends which occurred between 1860 and 1930, the statistical data being based almost entirely upon the Federal census.

The evidence indicates that the State is approaching a population saturation point under its present economic and social structure. Under present conditions of agriculture it is carrying about as many people as it can under

the standard of living. Additional people may have to be supported by mining or industry, or future increases in population may add to the relief burden already in existence or reduce the average numbers of hours of employment per person—reduce the standard of living.

Concepts of marginality in rural population studies, R. M. WILLIAMS. (Univ. Ky.). (*Rural Sociol.*, 5 (1940), No. 3, pp. 292-302).—"Current use of the concept of marginality with reference to farm populations raises certain problems of interpretation. Three types of marginality may be distinguished: Social welfare, cultural, and economic. Welfare marginality refers to a level of 'decent living' and therefore constitutes a value judgment defining a social problem. Cultural marginality arises at those points at which a population is confronted with instable, ambiguous, or conflicting norms for conduct. The economic margin may refer either to grades or to units of population and is conditioned upon social definitions of standards of living. The distinction between margin returns and average per capita returns is essential for clarity.

"The nature of the distribution of resources, rates of population growth, skills, and abilities affects per capita returns. Inequalities which raise returns in the short run may have unanticipated long-time results. Social structures and their supporting sentiments exert a significant influence upon mobility in response to economic conditions. Because of this, a social equilibrium is of a different order from, and does not necessarily correspond to, an economic equilibrium. Studies in rural sociology have made important contributions to the analysis of this problem; the outlook for further analytical research is promising."

Migration and rural population adjustment, C. TAEUBER. (U. S. D. A.). (*Rural Sociol.*, 5 (1940), No. 4, pp. 399-410).—"A mobile population is essential to the maintenance of an effective balance between population and resources in a nation characterized by marked differentials in rates of reproduction and in employment opportunities. Although migration from rural to urban areas was at a high rate during the 1920's, the unguided migration of that period did not evacuate rural problem areas on the scale which would be necessary to bring about desirable adjustments of resources and population. If this did not occur during a period when urban industry was calling for large numbers of rural workers, it was virtually impossible after 1930. Between 1930 and 1935 the increase in farm population was greatest in the poorest land areas—those in which considerations of a sound land use would call for a reduction rather than an increase in numbers."

Jewish agricultural colonization in Palestine: A sociological experiment in collectivism, J. W. EATON. (Cornell Univ.). (*Rural Sociol.*, 5 (1940), No. 3, pp. 327-344).—"From every corner of the globe Jews are coming to Palestine to find liberty and security in their ancient homeland. Inspired by the ideals of Zionism, they have founded about 250 villages on lands that for hundreds of years had been barren deserts or malaria-ridden swamps. This Jewish agricultural colonization by city-bred traders and professionals constitutes a large-scale social experiment in collectivism. About a third of these Jewish colonies are collectives, with a communal household and without private property. Another third are cooperatives, with individual management of farms but cooperative buying and selling of goods. The rest are settlements of fully independent farmers. Together they offer an opportunity to study the possibility and problems of a collective society created by voluntary action without any governmental compulsion. They are an experiment in the establishment of a new democratic social system which attempts to more adequately adjust our society to its complex technology."

Men on the move, N. ANDERSON (*Chicago: Univ. Chicago Press*, [1940], pp. XIII+357, [figs. 74]).—In chapter 1 the passing of the "hobo" is noted. In the last chapter the author discusses work and welfare for migrants. The intervening chapters show the evolution of a class of migrant laborers. The author calls it journalistic sociology.

Part-time farming research, L. A. SALTER, JR., and L. F. DIEHL (U. S. D. A.). (*Jour. Farm Econ.*, 22 (1940), No. 3, pp. 581-600).—The authors analyze 24 part-time farming research reports for the purposes of summarizing what has been learned about certain aspects of part-time farming and of aiding in the orientation of future research efforts in the field.

A sociological approach to farm tenancy research, O. D. DUNCAN. (Okla. A. and M. Col.). (*Rural Sociol.*, 5 (1940), No. 3, pp. 285-291).—"The thesis of this paper is that farm tenancy is an attempted adaptation of land and other resources to human needs through definite socially sanctioned institutional channels. Thus far, however, sociological research in farm tenancy has been incidental for the most part. Hence, there is a need for more specific research on tenancy as a purely sociological phenomenon or as a pattern of social adjustment. The principal task of the paper is, therefore, to set up definite general propositions or hypotheses to be tested by research. In all, 15 propositions are posited which purport to cover, if not the entire sociology of farm tenancy, at least its major aspects."

Rural electrification: A field for social research, J. K. ROSE. (U. S. D. A.). (*Rural Sociol.*, 5 (1940), No. 4, pp. 411-426, fig. 1).—The author presents rural electrification as a dividing field for economic and social research. Nine questions are suggested for study, some economic, some sociological.

Some contrasts in white women employees in garment plants located in three types of communities of Mississippi, D. DICKINS. (Miss. Expt. Sta.). (*Rural Sociol.*, 5 (1940), No. 4, pp. 427-437).—"Data concerning the women employed in garment plants of three communities, a village, a town, and a small city of Mississippi, are examined for the purpose of studying the feasibility of decentralization of industry in situations such as described. From the data presented, it would seem that decentralization of industries is feasible. The areas around the village plant had not yielded the maximum number of women anxious for work and with characteristics acceptable to industry. These included young women either single, widowed, divorced, or, if married, with no children or not more than one or two children, and women with some high school training. Women desiring to live at home reside within a reasonable distance of the plant on good roads and in a location where they could come with others or furnish transportation for others."

Dependent children in South Dakota, R. L. WOOLBERT and R. L. MCNAMARA (*South Dakota Sta. Mimeog. Cir. Ia* (1940), pp. [43]).—A statistical supplement presenting the tables upon which Bulletin 332 was based (E. S. R., 83, p. 410).

FOODS—HUMAN NUTRITION

[Studies on food preparation and utilization at the Colorado Station] (*Colorado Sta. Rpt.* 1940, pp. 27-30).—Noted in this progress report is a continuation of the project on the cooking quality of eggs which dealt with the differences in eggs from individual hens, as shown by differences in deterioration rates, physical measurements, and performance when used in whole-egg sponge cakes and in custard. Progress is reported in a number of studies on the culinary quality of potatoes, including those dealing with cause and control of sloughing in pared boiled potatoes (E. S. R., 82, p. 847), the effect of fertilizer treatments on culinary

characteristics of Russet Burbank potatoes, and deep-fat frying tests with potatoes of several varieties. In a new project on pome and stone fruits, canning qualities of a number of freestone varieties of peaches were investigated and a number of cherry juice preparations and blends suitable for beverages and for jelly making were prepared.

[**Foods and nutrition studies at the New York State Station**] (*New York State Sta. Rpt. 1940, pp. 12-15*).—In addition to studies previously noted are discussions of the relation of yeasts to problems of food preservation and food quality, including investigations on kinds of containers suitable for packaging various types of food products. Vitamin A losses from freezing vegetables, the preparation of fruit flavors, and the production of superior wines from Concord and Niagara grapes are also discussed.

[**Studies in foods and nutrition of the Montana Station**], J. E. RICHARDSON (*Montana Sta. [Bien.] Rpt. 1939-40, pp. 31, 32*).—Brief summaries are given of a series of studies on methods of conserving the quality and food value of vegetables (E. S. R., 84, p. 122), and a progress report on the nutritional status of Montana college women with respect to vitamin C.

[**Research in food and nutrition by the Wisconsin Station**] (*Wisconsin Sta. Bul. 450 (1940), pp. 17-19, 26-29, 31-33*).—Progress reports, some of which represent an extension of earlier work (E. S. R., 83, p. 126), are given of studies by H. Parsons and J. Wayne on paraffin sealing of kitchenette sauerkraut as an aid to preserving vitamin C and preventing brown discoloration (p. 17); by G. Everson and D. Hussemann in an attempt to find means of preventing progressive vitamin C destruction in canned tomatoes (p. 18); by Parsons and C. Walliker on the effectiveness of soaking prior to deep-fat frying in improving the quality of the protein in salted soybeans (pp. 18, 19); by S. B. Randle, H. A. Sober, C. A. Elvehjem, and E. B. Hart on the vitamin, found present in milk, that prevents stomach ulcers in guinea pigs and, in cooperation with J. Shaw and P. Phillips, on the precise nature of the symptoms involved (p. 26); by J. M. McKibbin and Elvehjem on the vitamins of the B complex needed for dogs (pp. 26, 27); by H. A. Waisman, L. M. Henderson, and Elvehjem on the destruction of vitamin B₆ in meats (p. 27); by T. W. Conger and Elvehjem on a method for assaying materials for vitamin B₆ (pp. 27, 28); by E. Nielson, J. J. Oleson, and Elvehjem on isolating the anti-gray hair vitamin in pure crystalline form (p. 28); by Waisman and Elvehjem on the multiple deficiencies of the Goldberger pellagra-producing diet (pp. 28, 29); by Waisman, Henderson, and Elvehjem in developing a chemical method for assaying foods for nicotinic acid (p. 29); by Oleson, R. Mills, and Elvehjem on the need of pantothenic acid to keep the adrenal glands of rats in good condition and to prevent development of the chick disease formerly called "chick pellagra" (p. 31); by F. M. Strong, R. E. Feeney, and A. Earle in working out a bacterial assay method for pantothenic acid (pp. 31, 32); by F. Quackenbush, F. Kummerow, and H. Steenbock in finding that white rats need linoleic acid (p. 32); by Steenbock, Parsons, and P. Glindeman in determining the conditions under which low-phosphorus diets produce kidney stones in animals (p. 33); and by E. Hove, Elvehjem, and Hart on the unfavorable effect of boron deficiency on reproduction and lactation (p. 33).

[**The effect of quick freezing on the nutritive values of foods**, M. S. Rose (*Jour. Amer. Med. Assoc., 114 (1940), No. 14, pp. 1356-1361*).—This review, authorized for publication by the Council on Foods of the American Medical Association, deals with available evidence on the nutritive value of quick-frozen foods under the headings—types of process used in quick freezing, special problems in selection and preparation of foods for quick freezing, quick freezing reduces cooking time, nutritive values of quick-frozen foods, and effect on vitamin

A, vitamin B₁ (thiamin), vitamin G (riboflavin), and vitamin C (ascorbic acid) values.

Review of progress in research in bread staling, W. H. CATHCART (*Cereal Chem.*, 17 (1940), No. 1, pp. 100-121, figs. 4).—This review summarizes the explanations that have been offered concerning what happens in the staling of bread, and discusses methods of measuring staleness and of preventing it. Present knowledge as to the nature of the staling process is inadequate, and further strictly controlled scientific researches are necessary to determine the nature of this process before looking for substances that will prevent it.

Some of the methods recommended for delaying crust staling increase crumb staling and vice versa. Crumb staling is most effectively delayed by heat or cold, although application of these processes is not entirely practical at the present time. On the basis of present data pertaining to staling of crust and crumb, it is suggested that a palatable loaf of good keeping qualities can probably be produced by observing the following precautions: "Using flour with high-quality gluten; using liberal amounts of milk, shortening, and sugar (preferably sirup); using normal amounts of salt and yeast; using some malt extract and some moisture-retaining agent such as gelatinized starch; making a medium slack dough by high-speed mixing; proper fermentation, handling, and baking; rapid cooling and wrapping after adequate cooling."

Foods and drugs, E. R. TOBEX (*Maine Sta. Off. Insp.* 175 (1940), pp. 135-254).—In this annual report (E. S. R., 82, p. 274) analyses are given for 3,662 samples of milk, 415 of cream, 20 of ice cream, 13 of maple sirup, and 71 and 5 of opened (shucked) clams and oysters, respectively. Results of examinations of various drugs, 89 samples of hamburg steak as to sulfite content, and 113 samples of canned sardines as to the nature of the packing oil are also reported.

To market, to market, M. T. GAMBLE and M. C. PORTER (*Indianapolis: Bobbs-Merrill Co.*, [1940], pp. 279, [figs. 72]).—This book, concerned not with food values but with the buying of foods, is nontechnical in character. It gives very general information, based upon the practical experience of the writers, concerning the various foods on the market shelves, the nature of these products being noted in some cases. Opinions concerning quality and buying guides are presented, chiefly through illustrative incidents involving the cast of characters rather than by factual information.

Feeding the family, M. S. ROSE (*New York: Macmillan Co.*, 1940, 4. ed., pp. XV+421, [pls. 17]).—This book, noted in earlier editions (E. S. R., 62, p. 686), has not been extensively changed in the present revision, the main purpose still being "to show how the use of suitable proportions of common foods—milk, cereals and breadstuffs, fruits and vegetables, fats, sugars, and meats—will provide all the healthy members of the family group with food for optimum nutrition." In the light of more recent knowledge as to the importance of diet for the mother during the periods in which the child is directly dependent upon her for its nourishment, increased emphasis has been placed upon the daily use of rich sources of vitamins and mineral elements at all times when growth is involved. More liberal use of milk and green vegetables in the diet of the adult is also emphasized. Progress in the recognition of allergy as a dietary problem has led to the inclusion of a section on allergy in the chapter on feeding the sick. The table on nutritive values of serving portions of individual foods (presented in the appendix) has been remade to include data on minerals and vitamins.

The composition of optimal and marginal diets, A. L. BACHARACH and J. C. DRUMMOND (*Chem. and Indus.*, 59 (1940), No. 3, pp. 37-40).—In this paper an optimal diet is defined as "one whose effect on health cannot be improved by any change in quantity or quality of the elements and compounds present," and

a marginal diet as "a diet that, if consumed for a considerable time—say 6 mo. or even a year—would not result in the appearance of any obvious conditions of deficiency and would not even bring about any untoward changes that could not be reversed by substitution of a diet nearer the optimal." Estimated requirements for the two types of diets are given for a man of 60–70 kg. body weight, with recognition of the necessity of making allowances for certain conditions in adapting the figures to other individuals. In order to avoid the difficulty of individual variations in requirements, the two dietary standards devised have been calculated to provide the upper and lower safety limits. The tabulated data on requirements indicate gaps in knowledge or uncertainty in requirements by interrogation points. The definite values given for "fuel, bricks, and mortar" for marginal and optimal diets, respectively, are animal fat 30 and 100 gm., vegetable fat 20 and 20, animal protein 30 and 50, vegetable protein 20 and 50, carbohydrate 570 and 485, and total weight 670 and 705 gm., furnishing 3,000 and 3,500 calories, respectively. Estimates given without question for mineral elements and vitamins are phosphorus 1.0 and 1.5 gm. for the marginal and optimal diets, respectively; calcium 0.75 and 1.5 gm.; iron 10 and 20 mg.; vitamin A or β -carotene 1 or 2 mg., totaling 3,000 International Units for the marginal and 3 and 5 mg., totaling 7,000 I. U. for the optimal diet; vitamin D (calciferol) 200 and 400 I. U.; aneurin or vitamin B₁ 1 mg.=350 I. U. and 3 mg.=1,000 I. U.; and ascorbic acid 25 mg.=500 I. U. and 75 mg.=1,500 I. U., respectively.

Adequate nutrition for the industrial worker, L. E. BOOHER. (U. S. D. A.). (*Jour. Amer. Med. Assoc.*, 114 (1940), No. 7, pp. 548–553).—This article, based, according to the citations, as to diet plans and food selections upon material presented in the U. S. D. A. Yearbook for 1939 (E. S. R., 82, p. 553), gives a general view of what constitutes sound nutritional policy and cites certain studies bearing particularly on the needs of the industrial worker; these latter are concerned primarily with the relation of diet to the relief of industrial fatigue.

Diet during lactation and pregnancy, E. C. HUGHES (*Med. Woman's Jour.*, 47 (1940), No. 1, pp. 19–24).—The metabolic changes occurring in each of the trimesters of pregnancy and in lactation are discussed as the basis for the diet recommendations given. A bibliography of 30 references is appended.

The estimation of the nutritional state in children, M. M. GLAZIER (*New England Jour. Med.*, 222 (1940), No. 5, pp. 180–184, figs. 5).—The subjects of this investigation consisted of 556 children from 2 to 12 yr. of age, including 287 attending the first four grades of a primary school and for the most part from families whose yearly income was from \$1,000 to \$2,000, and 269 representing consecutive cases from the outpatient department of the Boston Dispensary which gives medical services to a comparatively low-income section of the population. Observations on these children over a 5-yr. period were of two types classified as A, physiological aspects or functional symptoms, including appetite, activity, character of stools, sleep, and frequency of infection; and B, physical aspects, including family tendency or inheritance and physical development as shown by interval gains in weight and height and physical examination. Special emphasis was placed in this examination on the state of the soft tissues and skeletal structure and the presence of foci of infection. Analysis and coordination of the data obtained in A and B resulted in placing the subjects in three groups classified as good, fair, and poor nutrition. In the first group were included children ranked as good in both A and B, in the second those ranked as good in only A or B, and in the third those rating low in both A and B. At the beginning there were 332 cases in group 1, 151 in group 2, and 73 in group 3.

In a special study of 30 children whose state of nutrition changed during the years of observation, the first sign of improvement in children with mal-

nutrition was in their physiological state as shown by better appetite, more restful sleep, regular bowel movements, and a lessening or disappearance of fatigue. From several days to several weeks were required for reclassification as fair nutrition, and from 4 weeks to 8 mo. further for the development of physical signs denoting good nutrition. The reverse change from good to fair nutritional state required varying periods of time, depending on the degree of infection or the dietary deficiency. The first signs of regression were in the functional symptoms, followed by poor posture, poor tissue turgor, and other signs of malnutrition. The relationships between certain factors in A and B with reference to the three stages of nutrition are discussed and presented in graphs.

Individual growth records of two healthy girls from birth to maturity. H. GRAY and H. K. FABER (*Amer. Jour. Diseases Children*, 59 (1940), No. 2, pp. 255-280, figs. 4).—Two healthy girls of known racial-economic background, health, and age of puberty were observed at frequent intervals from birth to 17.3 and 18.2 yr. of age, respectively, as to height and weight (reported in this study) and anthropometric measurements. The weight series for each girl beyond the age of 13 yr. illustrated that a girl's weight may diverge markedly from the most suitable standard despite absence of disease, and may fluctuate markedly from month to month despite absence of dieting.

The food habits and physical condition of children in selected communities in Maine. M. M. CLAYTON (*Maine Sta. Bul.* 401 (1940), pp. [4]+154, figs. 17).—This is a detailed report of an examination of 677 grade school children in three towns in sections of the State where potato growing, fishing, and general farming predominated. The children in all three towns were studied in the fall of 1934 and spring of 1935 and in the potato-growing section in the fall of 1935 and spring of 1936 after educational work in health and home gardens had been carried on in the interim. The tests included physical examinations (by physicians), dental examinations (by a dentist or the State director of dental hygiene), physical measurements, and tests for vitamin C deficiency by the Dalldorf capillary resistance method and for vitamin A deficiency by the Jeans and Zentmire method.

The most outstanding nutrition and health problem was considered to be the need for improving the condition of the bones and teeth by providing more calcium and vitamin D. Another important problem appeared to be the need for more vitamin C, the lack of which was evident in the extent of inflamed gums and to some extent in the capillary resistance tests. Anemia was also quite common during the winter months. There was some evidence of improvement as a result of the educational work, particularly in the smaller differences between fall and spring readings in the second year.

"Efforts toward improving the nutritive condition of Maine people should be directed toward increasing food production and preservation by families and toward educating them to choose more adequate diets. Special attention should be given to the regular provision of vitamin D and calcium throughout the year, especially to women during pregnancy and lactation and to infants and children."

Protein requirement in adolescence and in middle age. I. HARRIS, J. T. IRELAND, and G. V. JAMES (*Lancet [London]*, 1940, I, No. 5, pp. 220, 221).—Data are reported briefly on nitrogen balance studies on two normal young men and one middle-aged man normal except for a moderate rise in blood pressure often typical of this age. These cases and the findings are offered as illustrative of many such cases observed. The young men on a daily intake of approximately 23 gm. of nitrogen showed a negative or only a slightly positive balance, but the older man on a similar intake retained a large part of this nitrogen, some of which was accounted for in the increase in total blood nitrogen and some of which must have been stored in the tissues. Whereas the adolescent was capable

of metabolizing a large quantity of protein, the requirement of the middle-aged man was small. It is urged that these differences be taken into account under the rationing scheme.

Symposium on carbohydrate metabolism (*Endocrinology*, 26 (1940), No. 2, pp. 285-351, figs. 6).—In this symposium, sponsored by the American Physiological Society at Toronto, Canada, April 29, 1939, the following papers were presented: Glycogen Breakdown and Synthesis in Animal Tissues, by C. F. Cori (pp. 285-296); The Liver and Carbohydrate Metabolism, by S. Soskin (pp. 297-308); The Adrenal Cortex and Carbohydrate Metabolism, by C. N. H. Long, B. Katzin, and E. G. Fry (pp. 309-344); and The Pituitary Gland and Carbohydrate Metabolism, by F. C. Young (pp. 345-351).

Sucrose taste thresholds of rats and humans, C. P. RICHTER and K. H. CAMPBELL (*Amer. Jour. Physiol.*, 128 (1940), No. 2, pp. 291-297, figs. 2).—The technic employed with rats involved a preliminary adjustment of the animals which were kept at room temperature (75°-78°F.) in individual cages equipped with two graduated inverted drinking fountains filled with distilled water. After 10-15 days, when the intake from each bottle reached a fairly constant level, the sugar solution, increased in concentration daily in small steps from 0.01 to 1.60 percent, was substituted for water, always in the same bottle. The point at which the rats began to drink more sucrose solution and less distilled water was taken as the concentration at which they distinguished between the two. For the 13 rats studied, the difference was recognized at a sucrose concentration of 0.5 percent on an average, with a variation from 0.3 to 0.8 percent. This concentration apparently represented the sweet taste threshold of the rats.

In the experiments with human subjects the "choice" method used in an earlier study with salt solutions (E. S. R., 83, p. 129) was used. Forty-five young adults first recognized the difference between distilled water and sucrose solution in average concentrations of 0.17 percent and first recognized the sweet taste in average concentrations of 0.41 percent. Nineteen adults from the laboratory staff and clinic patients showed similar results. In 58 children the sugar taste threshold averaged 0.68 percent and in 52 elderly individuals 1.23 percent. From these studies it is concluded that rats and humans have nearly the same sucrose taste thresholds.

Effects of natural and refined sugars on oral lactobacilli and caries among primitive Eskimos, D. B. and L. M. WAUGH (*Amer. Jour. Diseases Children*, 59 (1940), No. 3, pp. 483-489).—After a preliminary survey of Eskimos in three native settlements of the lower Kuskokwim River area of Alaska, the mouths and teeth of the cooperating subjects were examined. All caries and "catches" were recorded. Paraffin-stimulated saliva was cultured, and the findings concerning the presence of lactobacilli were recorded. Twenty-four of the subjects were observed over subsequent periods varying from 5½ to 10½ weeks, during which time they received refined sugar in the form of lump sugar, sugar solutions, candy, and very sweet preserved figs. Twenty subjects observed for 5½-13 weeks received sugar as it occurred naturally in such foods as raisins, dried figs, dates, maple sirup, and honey. At the end of the observation periods another check was made as to the occurrence of caries and the presence of lactobacilli in the saliva.

The results showed that practically 100 percent of those free from caries in the group fed the naturally occurring sugars remained free from caries and had a decrease in the percentage of lactobacilli. Of those with carious mouths in this group, 57.2 percent showed an increase in cavities, with an average increase of 1.57 cavities. Of those free from dental caries in the group fed refined sugars, 72.7 percent showed inception of caries, with an average of 3.6 cavities.

Of those with carious mouths in the group fed refined sugars, 100 percent showed an increase in cavities, with an average increase of 4.9 cavities. Of the subjects receiving refined sugar, 81.9 percent showed initiation of the growth of oral lactobacilli, and these organisms were present in 100 percent of the mouths at the end of the feeding period. It is considered from these results that refined sugars initiate and cause an increase in dental caries and in the growth of oral lactobacilli in the Eskimo.

Failure of galactose given subcutaneously to produce cataract in rats, R. M. SELLE (*Arch. Ophthalmol.*, 23 (1940), No. 2, pp. 369, 370).—In an effort to determine the exact manner by which galactose induces the formation of cataracts in rats, as first demonstrated by Mitchell and Dodge (*E. S. R.*, 74, p. 418) and confirmed by Yudkin and Arnold (*E. S. R.*, 74, p. 419) and by Day (*E. S. R.*, 77, p. 429), 10 young adult female rats averaging 160 gm. in weight were given daily for 120 days subcutaneous injections of 2 cc. of a 50 percent solution of galactose in an 0.85 percent solution of sodium chloride and an equal number 2 cc. of the same salt solution without galactose. None of the rats in either group developed cataract, but among the 124 young in 19 litters born to the 10 controls and 106 young in 17 litters born to the 10 animals receiving galactose, 1 litter of 2 in each group had defective eyes. In 3 of these 4 animals (all females) the defect was in the form of large bilateral cataracts. When sexually mature, these rats were bred to the 1 male in the same group. In the 3 litters produced all of the animals (2, 3, and 6) had normal lenses. In the second experiment 17 rats at the age of 21 days were given daily subcutaneous doses of 1 cc. of a 50 percent solution of galactose, again with negative results.

Diurnal variations in the acid-base balance, A. B. HASTINGS and C. W. EISELE (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 2, pp. 308-312, fig. 1).—This study involved determinations of percentage of cells, pH, and total CO_2 in samples of cutaneous blood collected at 2-hr. intervals (in two 24-hr. experiments) from a normal individual recovering from a minor surgical operation and at rest in bed. Bicarbonate concentration of the serum and CO_2 tension of the blood were calculated. Any trends toward net base excess or net acid excess were determined by estimating what the serum bicarbonate concentrations would have been at pH 7.40 (calculated as bicarbonate concentration of serum +30 (pH -7.40)). For this normal adult it was found that the acid-base balance of the blood varied in a regular, not a random, manner during the 24-hr. period due to (1) a rise in plasma HCO_3 associated with the ingestion of food and (2) an increase in the CO_2 tension of the blood associated with sleep.

Influence of organic acids, sugars, and sodium chloride upon strains of food poisoning staphylococci, T. D. NUNHEIMER and F. W. FABIAN. (*Mich. Expt. Sta.*). (*Amer. Jour. Pub. Health*, 30 (1940), No. 9, pp. 1040-1049, figs. 2; *abs. in Michigan Sta. Quart. Bul.*, 23 (1940), No. 2, pp. 111, 112).—Five viable pathogenic strains of staphylococci isolated from food poisoning outbreaks and the nonpathogenic strain of *Staphylococcus albus* were used in these tests in which growth-inhibiting and germicidal effects of the various chemical agents were determined by methods noted briefly. The antiseptic and germicidal effects of the highly dissociated mineral acid (HCl) appeared to be due mainly to the H-ion concentration, but with the organic acids studied these effects were apparently associated with the unionized molecule or the anion or both. "The decreasing order of germicidal action of the acids was found to be acetic, citric, lactic, malic, tartaric, hydrochloric. The decreasing order of antiseptic action was found to be acetic, lactic, citric, malic, tartaric, hydrochloric. . . . Dextrose

exerted an inhibitive effect in concentrations of 30 to 40 percent and a germicidal effect at 40 to 60 percent. Sucrose is less active than either dextrose or sodium chloride, since a concentration of 50 to 60 percent was required for inhibition and 60 to 70 percent for germicidal action." With mixtures of sugars and acid, dextrose was found to be more effective than sucrose in lower concentrations of acids. Neither of the sugars, however, was as efficient as sodium chloride in acid.

Mineral metabolism of rats on an extremely sodium-deficient diet, E. ORENT-KEILES and E. V. MCCOLLUM (*Jour. Biol. Chem.*, 133 (1940), No. 1, pp. 75-81).—The symptomatology of extreme sodium deficiency and its effect on reproduction in the rat were reported earlier.⁵ The present study continues with a report of the effect of such deficiency on the excretion of nitrogenous compounds, K, Ca, Mg, P, Na, and Cl. Balance determinations of these elements were made at 7-day intervals throughout the experimental period of over 19 weeks in which the behavior of three young rats placed at weaning on a diet containing 0.002 percent of Na was compared with that of three litter mate controls on a diet containing 0.66 percent of Na.

On an average the experimental and control animals, respectively, gained 57.7 and 97.5 gm. in weight over this period, consumed 435 and 452 gm. of food, and 1,074 and 1,720 cc. of water, and retained 760 and 2,095 mg. of N. Thus the Na-deficient animals failed to utilize protein as effectively as the controls and this, together with the lesser water retention and fat deposition, accounted for their smaller weight gains. There was a continuous negative Na balance totaling -41 mg. in the Na-deficient animals (+636 mg. in the controls). At the same time there was a slightly increased Mg retention (85 mg. as compared with 65 mg. in the controls) and a greatly increased K retention (310 mg. compared with 78 mg. in the controls). The Ca, P, and Cl metabolism, however, was similar in the two groups of animals.

The increase in Mg and K retention apparently compensated for the low Na retention, thereby maintaining the alkaline reserve of the body. The lowered water retention associated with a negative Na balance but a normal Cl retention indicated that Na rather than Cl is associated with water metabolism, and that the tissues do not retain water unless supplied with Na. Extreme pathological changes in the eye and the onset of rapid loss of weight occurred simultaneously with the change in the fourteenth week from a positive, although progressively decreasing, N balance to a negative N balance which remained negative to the end of the experiment.

The biochemical behavior of lead.—I, Influence of calcium, phosphorus, and vitamin D on lead in blood and bone, A. E. SOBEL, H. YUSKA, D. D. PETERS, and B. KRAMER (*Jour. Biol. Chem.*, 132 (1940), No. 1, pp. 239-265).—These experiments were designed to clarify the type of relationship existing between the deposition of Ca and Pb in young rats fed diets varying in Ca, P, and vitamin D but constant in Pb. The experimental diets were of three types, all with Pb at 0.8 percent but one being low in Ca (0.025 percent) and low in P (0.262 percent), another high in Ca (1.02 percent) and low in P (0.262 percent), and the third high in P (0.857 percent) and low in Ca (0.025 percent). Each diet was fed to two groups of animals, one of which received vitamin D (100 International Units by mouth per rat per day), while the other did not.

The influence of vitamin D and of dietary Ca and P on Pb deposition was followed through quantitative data obtained on Ca, P, and Pb of the serum, Pb of whole blood, and ash and Pb in the dried fat-free femurs. The results,

⁵ Amer. Jour. Physiol., 119 (1937), No. 3, pp. 651-661, figs. 6.

which are tabulated and discussed at length, show that Ca, P, and vitamin D all influence the biochemical behavior of Pb. Apparently Pb, P, and vitamin D form a system of Pb deposition analogous to the system of calcification; the addition of Ca tends to remove P from the system for Pb deposition. It is shown that Pb can be deposited in the bones simultaneously with the removal of Ca, and that increased calcification does not necessarily mean increased Pb deposition. This is taken as evidence that Pb deposition is not a coprecipitation with Ca phosphate, but is directed by a system of its own apparently governed by the same laws as for Ca deposition. The influence of Ca is competitive, since the Ca tends to remove P available for Pb deposition. As the dietary ratio of Pb:P is increased, the blood Pb increases, these relationships being similar to the ones in the Ca system; the effect of vitamin D additions on the Pb system is similar to the influence on the blood Ca.

Lead content of human blood, J. N. M. CHALMERS (*Lancet [London]*, 1940, *I*, No. 10, pp. 447-450).—The content of lead in blood, determined by the dithizone method of Tompsett (*E. S. R.*, 84, p. 8), was studied in 70 people with no known industrial exposure to lead and in 44 lead workers who presented no clinical symptoms of lead poisoning, but 34 of whom showed a slight degree of stippling of the erythrocytes in blood films stained with methylene blue. In the former group the blood lead values varied from 30 to 89 μg . and averaged 57 μg . per 100 cc.; in the latter group the values ranged from 60 to 192 μg . and averaged 104 μg . per 100 cc. The raised concentrations of lead in the blood, like the presence of stippled cells in the blood films, indicated an increased absorption of lead. They were indicative of the degree of exposure, but bore no correlation to the length of exposure. It is considered that the diagnosis of lead poisoning is essentially clinical, but that the biochemical and hematological tests furnish useful information, particularly in the diagnosis of doubtful cases or as negative evidence.

Preliminary feeding experiments with thiourea (thiocarbamide), A. HARTZELL (*Contrib. Boyce Thompson Inst.*, 11 (1940), No. 4, pp. 249-260, figs. 2).—The use of thiourea to prevent browning of cut surfaces of fruits and some vegetables, in preparing fresh fruit salads and in the canning of various fruits or in their use in pie baking, prompted the present study, which appears to indicate its nontoxicity to guinea pigs, rats, and man. The results of feeding tests with dogs and mice by H. Molitor, incorporated in this paper, led to similar conclusions.

Feeding tests with thiourea (thiocarbamide), F. B. FLINN and J. M. GEARY (*Contrib. Boyce Thompson Inst.*, 11 (1940), No. 4, pp. 241-247).—The authors made tests on rabbits and rats, finding the toxic dose to be ± 10 gm. per kilogram of body weight of these animals, which would be ± 700 gm. of thiourea for a man weighing 70 kg. This is more than 100,000 times the amount that would be ingested in eating 200 gm. of fruit treated with thiourea.

Observations on the multiple nature of the "rat filtrate factor," D. W. WOOLLEY (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 2, pp. 352-354, fig. 1).—In a further study of the question of the identity of pantothenic acid with the rat filtrate factor (*E. S. R.*, 83, p. 567), evidence is reported briefly, indicating that there are other unknown growth factors. Pantothenic acid was found to promote growth in filtrate factor-deficient rats for only a relatively short period, after which there was a dramatic response in growth to certain liver concentrates. Several sources of the unknown growth factor were compared, of which the fraction of aqueous liver extract soluble in 95 percent alcohol proved to be the richest source. One percent of this fraction added to the ration of rats which had ceased to grow after the addition of 100 γ per day

of pantothenic acid caused a weekly gain of 15 gm. A method is described for concentrating the unknown factor or factors in this extract.

Negative results are reported in attempts to substitute for this liver extract or the concentrate prepared from it a highly potent concentrate of biotin prepared by the method of Woolley, McDaniel, and Peterson (E. S. R., 82, p. 463).

Margarine, J. C. DRUMMOND (*Nature [London]*, 145 (1940), No. 3663, pp. 53-55).—The development of margarine manufacture is traced from its earliest production by *in vitro* digestion of beef fat to the present production of vitaminized margarine. The place of margarine in the nation's diet in time of war is discussed, with emphasis on the desirability of enriching all margarines with vitamins A and D. It is estimated that a weekly supplement to the butter ration of Great Britain at the time of this writing (slightly less than 4.5 oz. weekly), of 6 oz. of reinforced margarine would add about 2,700 units of vitamin A and 180 units of vitamin D to the weekly diet.

The vitamin A content of the livers of Chinese infants, children, and adults, T. T. WOO and F. T. CHU (*Chin. Jour. Physiol.*, 15 (1940), No. 1, pp. 83-99).—Specimens of human liver obtained as autopsy material from 77 still-born Chinese infants, 95 Chinese children under 12 yr. of age, 50 Chinese adults, and 10 adult westerners were analyzed for vitamin A. The tissue was digested with dilute alkali, the digest extracted with ether, the ether evaporated from this extract, and the residue taken up in chloroform, the vitamin A being determined on this solution by the antimony trichloride method. The vitamin A reserves of the livers, expressed as International Units per gram of tissue, are tabulated, the data being grouped with reference to the above classes of subjects and with respect to the anatomical diagnoses which, with other pertinent information, are noted in the tables.

The average vitamin A content of the livers of Chinese newborn infants was lower than values reported for western infants, probably due to differences in the vitamin A supplies of the pregnant mothers. The results with the 95 Chinese children indicated that vitamin A reserves in the liver increased with age only during early infancy. Very low reserves were found in the group suffering from diarrhea and dysentery, and an infant with biliary cirrhosis had no vitamin A in the liver, although 924,000 I. U. of the vitamin had been administered over a period of 84 days. In a group of young children who had received very large doses of vitamin A concentrate for a prolonged period, the maximum storage of the vitamin in the liver was usually less than 10 percent of the amount administered. In tuberculosis the children showed higher vitamin A reserves than the adults, presumably due to more liberal use of cod-liver oil therapy in the children. In 12 cases of accidental death in Chinese adults the median value was 54 I. U. per gram of wet liver; 60 percent of the 50 Chinese adults and 54 percent of the 95 Chinese infants and children had vitamin A reserves of less than 50 I. U. per gram of wet liver tissue.

The state of vitamin A in the liver of the rat after feeding various forms of the vitamin, E. L. GRAY, K. C. D. HICKMAN, and E. F. BROWN (*Jour. Nutr.*, 19 (1940), No. 1, pp. 39-46, figs. 2).—Vitamin A in 20,000-unit doses was fed over a period of 48 hr. to 53-day-old rats in groups of 15. The animals were killed and the livers of each group pooled, weighed, frozen, and kept at -55° C. until used for vitamin A determinations by molecular distillation. Only traces of unchanged carotene were recovered from the livers, together with a small but definite quantity of free vitamin A alcohol. The greater part was recovered as esters, the percentage recovery being in decreasing order of U. S. P. reference oil 55.7 percent, vitamin A caproate 46.6, vitamin A stearate 44.3, distilled

ester concentrate 44.2, vitamin A alcohol 39.3, and β -carotene 9.7 percent. The type of ester was similar in all cases, suggesting a selective utilization of fatty acids by the rat for the purpose of esterifying the vitamin. The poor utilization of carotene in the large doses fed is also shown by the appearance of large amounts of the unchanged provitamin in the feces.

Mobilization of vitamin A from its stores in the tissues by ethyl alcohol, S. W. CLAUSEN, W. S. BAUM, A. B. MCCOORD, J. O. RYDEEN, and B. B. BREESE (*Science*, 91 (1940), No. 2361, pp. 318, 319).—Evidence is presented briefly from experiments on dogs indicating that ethyl alcohol has the power of increasing the vitamin A content of blood serum by mobilizing it from the liver.

Mobilization of vitamin A by alcohol, L. B. PETT (*Science*, 92 (1940), No. 2377, p. 63).—In routine comparisons of the author's visual test for vitamin A deficiency (E. S. R., 84, p. 129) with blood analyses unaccountably short recovery times, indicating higher blood vitamin A levels, were observed the day following the taking of alcohol. A few of these observations are recorded as confirming the above noted observations of Clausen et al.

Vitamin A deficiency.—III, Blood analysis correlated with a visual test, L. B. PETT and G. A. LEPAGE (*Jour. Biol. Chem.*, 132 (1940), No. 2, pp. 585–593, fig. 1).—In this investigation of the relationship between the regeneration of visual purple and the vitamin A content of the blood the visual regeneration time was determined by the method of Pett noted previously (E. S. R., 84, p. 129), and immediately after this measurement a sample of blood obtained by venipuncture was analyzed for vitamin A by a colorimetric method developed as a modification of existing procedures. In one subject receiving 20,000 International Units of vitamin A orally, the vitamin A value of the blood increased from 76 to 133 I. U. per 100 cc. within 4 hr., this increase (accounting for about 10 percent of the vitamin administered) being associated with a decrease in recovery time from 9 to 5.7 sec. In another individual the recovery time increased from 6 to 17 sec. and the vitamin A blood values decreased from 87.8 to 66.4 I. U. per 100 cc. during 12 days on a vitamin A-free diet. Oral administration of 8,500 I. U. of the vitamin on the twelfth day was followed by a decrease in recovery time to 9 sec. within 2 hr. and an increase in the blood plasma value to 117.0 I. U. per 100 cc. Following this, recovery time increased again and plasma vitamin A decreased.

In another study involving 26 people with different adaptation times, blood vitamin A values were determined and a curve (a rectangular hyperbola) was obtained, showing good correlation between the adaptation test and the blood level of vitamin A. The fact that the points showed considerable dispersion about the curve was interpreted to mean that the adaptation test is not sensitive enough to detect changes in the blood level of vitamin A due to absorption or to transference of vitamin A into the tissues. Additional interpretations of the curve are presented.

The vitamin B complex and its constituents in functional digestive disturbances, F. F. CHESLEY, J. DUNBAR, and L. A. CRANDALL (*Amer. Jour. Digest. Diseases*, 7 (1940), No. 1, pp. 24–27).—A vitamin B concentrate, representing an extract of brewers' yeast and containing 125 International Units of thiamin and 35 Sherman-Bourquin units of riboflavin per gram, was given to 44 patients for periods from 3 mo. to 1 yr.; 8 gm. daily were given as the therapeutic dose. Patients with organic disorders and those with abnormality of the duodenal bulb or of the function of the gall bladder were excluded from these tests. In 11 cases the concentrate was alternated with crystalline thiamin (1,500–2,000 I. U. per day) and in 9 cases with a riboflavin concentrate that contained no other member of the B complex (600 Sherman-Bourquin units daily). Nicotinic

acid (100–200 mg. per day) was given to 42 patients, 22 of whom previously or somewhat later received the vitamin B complex.

The specific symptoms exhibited by the patients and the responses of each symptom to treatment with the vitamin B complex are listed. Likewise, results from use of the whole B complex and nicotinic acid are tabulated for comparison. Urinary output of thiamin, determined for some patients and normal subjects by the method of Helmer (E. S. R., 78, p. 283), is also reported.

A high percentage of the patients with functional digestive disturbances were improved by the administration of the vitamin B complex. That there had been a deficiency of this complex was indicated by the therapeutic results and by the demonstration of an abnormally low excretion of thiamin. Neither the thiamin nor the riboflavin alone appeared to be as effective as the whole complex, due apparently to the beneficial effect also produced by the nicotinic acid present in the complex. The use of a vitamin B complex rather than nicotinic acid alone is recommended in the treatment of functional digestive disorders, since these seem to be associated with deficiencies of the several B factors.

Studies on rat bradycardia, D. G. H. MACDONALD and E. W. MCHENRY (*Amer. Jour. Physiol.*, 128 (1940), No. 3, pp. 608–614, figs. 3).—The effect of various B vitamins, differences in food intake, and dietary fat on the development of bradycardia in rats on a diet deficient in the constituents of the vitamin B complex and choline was tested, with results indicating that thiamin alone of the members of the B complex is effective in reducing the bradycardia, but that the quantity of food consumed is also a factor. A sparing action of dietary fat upon thiamin requirement for the prevention of bradycardia was also demonstrated, and it is emphasized that this should be considered in the assay of the thiamin potency of foods by the bradycardia method.

Vitamins in economy of food utilization (*Arkansas Sta. Bul.* 405 (1940), pp. 5–7).—This progress report deals with studies on vitamin B₁ and riboflavin in the economy of food utilization.

Vitamin B₁ content of Chinese plant beriberi remedies, E. F. YANG and B. E. READ (*Chin. Jour. Physiol.*, 15 (1940), No. 1, pp. 9–17).—Fifty-nine plant materials long used by the Chinese as beriberi remedies were analyzed for vitamin B₁. The samples included seeds and fruits, leaves, herbs, roots and rhizomes, and stems and barks. For the most part they had been sun-dried and stored and were purchased at a local (Shanghai) drug store, but in addition several of the fresh materials collected in the vicinity of the laboratory were also analyzed. The determinations, all of which were controlled by recovery experiments with added vitamin B₁, were made by the method of Yang and Platt (E. S. R., 83, p. 279). The data, reported as gamma of vitamin B₁ per 100 gm., indicate that the seeds contained significant quantities of the vitamin, plantain (*Plantago major*) seeds in particular containing 1,540 γ per 100 gm. Among the leaves, high values were obtained for leaves of mulberry (*Morus alba*), loquat (*Eriobotrya japonica*), and carpenter weed (*Brunella vulgaris*), for which values of 460 γ , 280 γ , and 320 γ per 100 gm., respectively, are reported. Barks and stems were low in vitamin B₁ and the roots contained moderate amounts.

The use of vitamin B₁ for the relief of pain in varicose ulcers, A. OCHSNER and M. C. SMITH (*Jour. Amer. Med. Assoc.*, 114 (1940), No. 11, pp. 947, 948).—Among 10 hospital patients with painful varicose ulcers treated with vitamin B₁ in doses of from 3 to 30 mg. daily, all but 1 experienced definite relief from pain in from 3 to 11, with an average of 5 days, and in a few of these cases there was also definite improvement in the healing of the ulcers. A dosage of 5 mg. 3 times a day is recommended, with doubling of the dose within 3 or 4 days if the symptoms have not subsided.

Saturation studies with vitamin B₁ [trans. title], S. MOLNÁR and M. HORÁNYI (*Klin. Wchnschr.*, 19 (1940), No. 9, pp. 204-206).—Intravenous injections of 1,000 γ of vitamin B₁ were given to 9 normal subjects and 23 with various diseases. The total vitamin B₁ content (including cocarboxylase) of the blood was determined in each case immediately preceding injection and at 5-, 10-, 15-, 20-, and 60-min. intervals after injection. Vitamin B₁ was also determined in the urine collected during the 3 hr. following the injection.

In the 9 normal subjects the vitamin B₁ content of the blood varied from 17 γ to 26 γ and averaged 19.5 γ percent. The maximum increases, which occurred from 5 to 30 min. after the injection, varied from 7 γ to 13 γ and averaged 10 γ percent. In cases including ulcer patients who had been on an ulcer diet deficient in vitamin B₁, patients with febrile conditions, a number of cancer patients, and several with Basedow's disease, the vitamin B₁ content of the blood averaged 17 γ percent (range 8 γ -24 γ), but the maximum increases, likewise occurring 5-30 min. after injection, amounted to only 1 γ -5 γ , with an average of 2.8 γ percent. In 2 patients with pernicious anemia, 1 with fever-free pannyelophthisis, and 3 with gastric or duodenal ulcer who had not been on a vitamin B₁-deficient ulcer diet, the average B₁ content of the blood was 15 γ percent, and the maximum increases after the injection were like those of the normal subjects, varying from 7 γ to 12 γ and averaging 10 γ percent. One patient with Addison's disease showed no increase in the vitamin B₁ content of the blood, most of the injected vitamin being eliminated by way of the urine; in another case, however, there was a maximum increase of 18 γ percent 15 min. after the injection.

Deficiency of vitamin B₁ in man as determined by the blood cocarboxylase, R. GOODHART and H. M. SINCLAIR (*Jour. Biol. Chem.*, 132 (1940), No. 1, pp. 11-21, fig. 1).—Simultaneous analyses of the blood plasma of groups of individuals with various diseases were made for cocarboxylase by the authors' modification of the method of Ochoa and Peters (*E. S. R.*, 83, p. 420) and total vitamin B₁ by a slight modification of the Meiklejohn method, as described by Sinclair (*E. S. R.*, 82, p. 298). In 80 samples of blood the cocarboxylase values ranged from 0.0 to 13.0 μ g. per 100 cc., with a mean of 4.14, and the B₁ values from 1.5 to 13.0 μ g. per 100 cc., with a mean of 5.11. The correlation coefficient was 0.76 ± 0.05 , $t=5.2$. In 7 of 8 cases the values for both cocarboxylase and total vitamin B₁ were increased following vitamin B₁ injections. In the other case the total vitamin B₁ value was increased markedly after daily injection of 10 mg. of crystalline vitamin B₁ for a week, while the cocarboxylase value remained unchanged. Further evidence was also obtained in support of the statement in the earlier paper that variations in the blood cell count within certain limits do not appreciably affect the blood level of cocarboxylase. It is concluded, therefore, that the cocarboxylase content of the blood is a reasonably accurate index of saturation of the body with cocarboxylase and vitamin B₁.

In the application of the method to 111 untreated patients with various diseases, the cocarboxylase values for 40 were significantly low and 66 below the lowest normal value of 4.5 μ g. reported in the earlier paper for 26 normal subjects. Low values were definitely related etiologically to alcoholic neuritis, nutritional neuritis, and some cardiovascular disturbances, and were found to be associated, although not necessarily etiologically, with cases of anemia, subacute combined degeneration of the cord, and certain psychiatric disorders and with diminished gastric acidity. It is emphasized, however, that "vitamin deficiencies in man are almost always multiple and are, therefore, usually inadequately treated by administration of a single pure vitamin."

The pathology of the nervous system in vitamin deficiencies, H. M. ZIMMERMAN (*Yale Jour. Biol. and Med.*, 12 (1939), No. 1, pp. 23-28, pls. 7).—The noninflammatory degenerative lesions of the peripheral nerves occurring in

human beriberi, chronic alcoholism, vomiting of pregnancy, diabetes mellitus, and other organic diseases are compared with the lesions of the nervous system produced experimentally in pigeons, rats, and dogs fed vitamin B₁-deficient diets.

The pathological changes in the nervous system in human pellagra (considered as a multiple deficiency disease) are compared with the changes produced in experimental animals. In pellagra there is not only peripheral nerve degeneration but also degeneration in the posterior column and sometimes in the lateral spinal sensory and pyramidal tracts; in man there are also pathological changes in the Betz cells in the motor cortex. The Wernicke type of hemorrhagic pseudo-encephalitis occurring in the brain is frequently found in cases of vitamin B₁ avitaminosis. This same type of lesion has been produced experimentally in pigeons, dogs, and rats on vitamin B₁-deficient diets.

Photomicrographs are presented of a number of the lesions observed in the nervous system in these avitaminoses.

Prevention of hyperplasia in the forestomach epithelium of rats fed white flour, G. R. SHARPLESS (*Jour. Nutr.*, 19 (1940), No. 1, pp. 31-37).—Further study of the cause and prevention of the lesions of the squamous epithelium of rats first noted by Pappenheimer and Larimore (*E. S. R.*, 53, p. 165) as occurring on a diet of white flour is reported, with the conclusion that the preventive factors are nonspecific. In connection with a low protein diet cystine may be the preventive factor, while with a diet of white flour the principal factors for prevention appear to be all of at least three components of the vitamin B complex—lactoflavin, nicotinic acid, and at least one factor other than vitamin B₁. In discussing these findings the author explains the localization of the lesions in the forestomach, rather than in other organs in which the epithelium is of the squamous type, as probably due to local conditions which change the epithelium so that less stimulus is required to produce proliferation, and the nonspecificity of the factors preventing the lesion as each contributing in some phase of metabolism to the lowering of the sensitivity of the cell to proliferative stimuli. It is suggested that some factors may do this by increasing the sulfhydryl content of the cell.

Bisulfite binding substances (B. B. S.) in the blood and cerebrospinal fluid, H. WORTIS, E. BUEING, and W. E. WILSON (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 2, pp. 279-282).—A comparison of B. B. S. values in the blood and cerebrospinal fluid, as determined by a modification of the method of Clift and Cook, the technic of which is similar to that employed by Wilkins et al. (*E. S. R.*, 77, p. 424), is reported for 126 patients with various neuropsychiatric disorders. Values for 50 normal controls fell within the range previously found by Wilkins et al. for normal subjects, and the highest value, 5.75 percent, was used as the upper limit of normal. Of the entire number of patients tested, 105 gave values below this upper limit and ranging from 2.00 to 5.72 mg. percent. The spinal fluid figures for these subjects ranged from 0.42 to 3.07, with an average of 1.64 mg. percent. Among 8 cases of peripheral neuropathy in inebriates, considered to be due to vitamin B₁ deficiency, 4 showed an elevated B. B. S. in the blood or cerebrospinal fluid or both, and 4 had normal figures from which the author concludes that the B. B. S. cannot be used as an indication of vitamin B₁ deficiency. In the group of psychiatric disorders represented among the subjects no constant deviation from normal in B. B. S. was found. Paraldehyde caused an elevation of B. B. S. in the blood and cerebrospinal fluid in 24 hr. Unpublished observations indicate that the B. B. S. is not an accurate measure of pyruvic acid in the blood or cerebrospinal fluid.

Bisulfite binding substances (B. B. S.) and thiamin deficiency, M. SHILS, H. G. DAY, and E. V. MCCOLLUM (*Science*, 91 (1940), No. 2362, p. 341).—Attention is called to certain precautions which must be taken in adapting the Clift and Cook method for determining B. B. S. (*E. S. R.*, 71, p. 157) to studies of thiamin nutrition. As the food intake is an important factor in the results obtained with this method, the amount of food should be limited to an arbitrary level during the urine collection periods. The addition of considerable common salt to the diet is also recommended for the purpose of securing sufficient urine for individual study. In young adult rats on a thiamin-deficient diet there is a rapid and progressive rise in urinary B. B. S., amounting in a few days to an increase of from 200 to 400 percent and in advanced deficiencies to as much as from 600 to 900 percent. When adequate thiamin is given, the B. B. S. of deficient rats drops to normal within 24 hr. and continues within a narrow range of 3–8 cc. (expressed as cubic centimeters of 0.005 N iodine) after the diet is restricted, but when food is given ad libitum the resulting stimulation of appetite tends to mask the effect to some degree. When fat as autoclaved lard is substituted isocalorically for sucrose in the thiamin-deficient diet, there is some immediate decrease in B. B. S., but the values remain from 300 to 400 percent above normal even after feeding the fat for 2 weeks, although during this interval the growth rate and appearance markedly improve. Thiamin administration causes a drop in B. B. S. to normal values within 24 hr.

Effect of cooking upon the thiamin content of foods, E. AUGHEY and E. P. DANIEL. (U. S. D. A.). (*Jour. Nutr.*, 19 (1940), No. 3, pp. 285–296).—The thiamin content of the foods tested in the raw and cooked state and in the liquids drained from the cooked products was determined by the method of Booher and Hartzler (*E. S. R.*, 83, p. 131), which employs crystalline thiamin as the standard and estimates the thiamin value by interpolation from growth on two quantities of the test food selected on the basis of exploratory tests as presumably giving growth rates just over and under that on 3 μ g. of thiamin. Tabulated data are presented on the foods tested, the method and time of cooking, average cooked weight of 100 gm. of raw food, and thiamin content in International Units per 100 gm. of cooked food, 100 gm. of raw food and cooked food per 100 gm. raw weight, and on the percentages of thiamin retained by the cooked food, dissolved in the cooking water, and destroyed on cooking.

The materials tested included Texas and California carrots cooked by boiling and pressure-cooker methods; Maine-grown Irish Cobbler potatoes baked and boiled; Bloomsdale Savoy spinach boiled; Washington State-grown Laxton Progress peas simmered alone or with a small amount of soda; Maryland-grown Bountiful string beans boiled alone or with a small amount of soda; dried navy beans boiled alone and with soda; rolled oats and whole wheat cooked in a double boiler; whole wheat ground and baked as bread; and pork loin (lean portion) braised as chops and roasted. Among the practical conclusions drawn are that on a serving basis baked potatoes, including the skin, furnished more thiamin, and boiled potatoes, spinach, and carrots as much thiamin as cooked whole wheat or oats, or about one-tenth of a liberal daily allowance. Navy beans, because they take up less water during cooking, furnished proportionately more thiamin than cereals. Snap beans as usually eaten are not a rich source of thiamin, but a serving of green peas supplies about one-fourth to one-third of a liberal daily allowance. One serving of the lean portion of pork loin cooked either as chops or roast furnishes a plentiful daily allowance of thiamin for the adult.

Ocular manifestations of ariboflavinosis, H. D. KRUSE, V. P. SYDENSTRICKER, W. H. SEBRELL, and H. M. CLECKLEY (*Pub. Health Rpts. [U. S.]*, 55 (1940), No. 4, pp. 157-169).—Nine patients known to be receiving insufficient amounts of riboflavin and showing cheilosis and seborrheic dermatitis, already described as characteristic of ariboflavinosis (*E. S. R.*, 83, p. 134), were found to present ocular lesions. The case histories are presented, and the observations are given in detail. Slit-lamp examinations and ocular signs revealed that the principal ocular manifestation was a keratitis, but a special type of glossitis was also observed. The occurrence in persons on a riboflavin deficiency diet of this keratitis, its similarity to the analog produced experimentally in animals in ariboflavinosis, its association in humans with other signs of ariboflavinosis, its failure to be cured by thiamin chloride, nicotinic acid, ascorbic acid, crystalline vitamin A, or fish-liver oils, but its cure (together with that of the associated conditions) by riboflavin and relapse upon withdrawal of the riboflavin therapy—all point to this ocular lesion as a specific manifestation of ariboflavinosis. Two patients with severe interstitial keratitis associated with syphilis showed marked improvement upon therapy with riboflavin, suggesting the possibility of a riboflavin involvement in these syphilitic cases.

The relationship of the dietary intake of nicotinic acid to the coenzyme I content of blood, A. E. AXELROD, E. S. GORDON, and C. A. ELVEHJEM. (*Wis. Expt. Sta.*). (*Amer. Jour. Med. Sci.*, 199 (1940), No. 5, pp. 697-705, figs. 2).—This study demonstrated that the coenzyme I level of blood can be increased by the ingestion of large amounts of nicotinic acid. Five normal subjects, each receiving orally 100 mg. of nicotinic acid daily, showed an average increase of 85 percent in the coenzyme I content of the blood over a 10-day period. This rather slow response was followed by a slow drop to the normal level after the nicotinic acid administration was stopped. Two normal subjects fed 1,800 mg. of nicotinic acid within 16 hr. showed very rapid increases in the blood coenzyme I content, the levels being increased within 48 hr. by 152 and 310 percent, respectively. In the one case studied completely, a fairly rapid fall was noted soon after the maximum peak was reached. In the one pellagrin studied, an increase of 144 percent was obtained after the administration of 2 gm. of nicotinic acid over a 4-day period; this level of coenzyme I was maintained for 1 mo. by the feeding of 750 mg. of nicotinic acid daily. The blood of this pellagrin was normal with respect to the coenzyme I level before the therapy was begun, indicating that analyses of the blood for this component cannot be used as a diagnostic test for pellagra.

The synthesis of nicotinic acid by rats, K. L. SHOURIE and M. SWAMINATHAN (*Indian Jour. Med. Res.*, 27 (1940), No. 3, pp. 679-683).—From nicotinic acid balance experiments on rats on diets with and without additional nicotinic acid and from analyses of the organs and tissues from these animals on autopsy, it is concluded that the rat can synthesize nicotinic acid and does not require it in the diet.

The urinary excretion of nicotinic acid, M. SWAMINATHAN (*Indian Jour. Med. Res.*, 27 (1939), No. 2, pp. 417-428, fig. 1).—The author's cyanogen-bromide-aniline method (*E. S. R.*, 80, p. 131) was used with certain modifications in this study of the excretion of nicotinic acid by various groups in Coonoor, India. Hydrolysis of the 24-hr. urine samples with sodium hydroxide was employed to convert into nicotinic acid the derivatives which might be present in the urine, and for the final colorimetric measurement a phosphate buffer was added to stabilize the reaction. With the modified method, which is described in detail, recoveries of added nicotinic acid ranged from 95 to 110 percent.

The subjects included 10 laboratory workers of whom 4 were on diets in which wheat and 6 in which rice predominated, and 24 hospitalized patients of whom 8 had clinical conditions ascribed to dietary deficiencies (5 peripheral neuritis and 3 stomatitis) and 16 had no outward signs of dietary deficiency. Minimum, maximum, and average values for the four groups in the above order were 4.76, 8.88, and 6.77 mg.; 2.06, 4.21, and 3.15; 0.42, 2.20, and 1.15; and 0.58, 2.91, and 1.33 mg., respectively. Corresponding values following a single test dose of 100 mg. of nicotinic acid were 20.03, 37.85, and 27.87 mg.; 14.06, 26.15, and 19.69; 1.86, 13.61, and 5.10; and 1.70, 24.70, and 9.84 mg., respectively. With allowance for the estimated nicotinic acid content of the diet, the responses of the normal subjects to the test dose ranged from 12 to 29 percent of the intake.

Attempts to saturate one of the normal subjects on the rice-predominating diet by increasing test doses up to 500 mg. resulted in nicotinic acid excretion averaging only about 13 percent of the intake. "What happens to the larger fraction which is not excreted and how much is converted into trigonelline are problems of further study." In similar saturation tests conducted on one of the patients with stomatitis, the nicotinic acid excretion represented a much lower percentage of the intake. Clinically, the patient showed rapid improvement, and the mouth lesions disappeared within 4 days.

The nicotinic-acid content of cereals and pellagra, W. R. LYKROYD and M. SWAMINATHAN (*Indian Jour. Med. Res.*, 27 (1940), No. 3, pp. 667-677, figs. 2).—Average values for the content of nicotinic acid, determined by the cyanogenbromide method of Swaminathan referred to above are reported as follows for various Indian-grown cereals: Corn, whole, white (mean of nine samples), 1.3 mg. per 100 gm.; corn, whole, yellow (nine), 1.4; rice, raw, home-pounded (four) and milled (nine), 2.4 and 1.6, respectively; rice, parboiled, home-pounded (four), and milled (nine), 4.0 and 3.8, respectively; wheat, whole (two), 5.0; refined white flour (two), 1.0; wheat germ (one), 9.1; barley (two), 2.8; oats (two), 1.0; sorghum (two), 1.4; *Eleusine coracana* (five), 1.4; and *Pennisetum typhoid-eum* (mean of two samples), 2.0 mg. per 100 gm. For comparison two samples of corn meal, one a whole and the other a degerminated white meal, were obtained from the United States; these two samples from regions where pellagra is endemic were found to contain 1.6 and 0.9 mg. of nicotinic acid per 100 gm., respectively. Ten samples of yellow corn grown in regions of endemic pellagra in Rumania were also analyzed and found to average 1.4 mg. per 100 gm., with a range from 1.2 to 1.6 mg.

Raw and parboiled rices, home-pounded and milled, were analyzed before and after cooking, the results indicating that washing and cooking may remove some 50 percent of the nicotinic acid present in rice. From the above analyses it is also concluded that the nicotinic acid in rice is concentrated in the germ and pericarp, and that the parboiling of rice causes the nicotinic acid to diffuse through the grain so that it cannot be removed upon subsequent milling. Poor rice (India) and poor corn (Rumania) diets were estimated to furnish, respectively, 12 and 15 mg. of nicotinic acid per adult male per day. It appears, therefore, that the low nicotinic acid content of the corn diets fails to explain the association of pellagra and corn.

Nicotinic acid deficiency encephalopathy, N. JOLLIFFE, K. M. BOWMAN, L. A. ROSENBLUM, and H. D. FEIN (*Jour. Amer. Med. Assoc.*, 114 (1940), No. 4, pp. 307-312).—Observations are reported on the treatment of 22 consecutive cases of an encephalopathic syndrome characterized by clouding of consciousness, cogwheel rigidities, and uncontrollable grasping and sucking reflexes. Patients with these symptoms treated by hydration or hydration plus thiamin chloride al-

most invariably died, others treated with hydration plus substances rich in the vitamin B complex showed a moderate drop in mortality, and others treated by hydration plus nicotinic acid a marked drop in mortality. It is thought that the condition described represents a complete deficiency of nicotinic acid, whereas the classic symptoms of pellagra represent a partial deficiency. The term nicotinic acid deficiency encephalopathy has been given to the syndrome. Five detailed case reports are included as representative of the series.

Pellagra, H. S. STANNUS (*Lancet [London]*, 1940, I, No. 8, pp. 352-355).—The view is presented that pellagra results from a disturbance in the coenzyme-oxidase system, and evidence bearing on the problem is brought together. The catalyses of this system are outlined as follows: (1) Dehydrogenases activate the specific substrates. (2) A coenzyme, or codehydrogenase which may be common to several dehydrogenase systems, is needed to activate the dehydrogenase. Coenzymes I and II contain nicotinic acid and are, respectively, di- and triphosphopyridine nucleotides; they function in the dehydrogenase systems for lactic, citric, and hexosephosphoric acids, glucose, and alcohol; when reduced they cannot react with oxygen, oxygen carriers, or hydrogen acceptors except in the presence of another enzyme, (3) the "coenzyme factor" or "diaphorase". This latter is a riboflavin nucleotide, which itself becomes reduced in catalyzing the oxidation of the coenzyme. The coenzyme factor is oxidized, however, under the influence of (4) cytochrome, which is thus reduced, but which becomes oxidized by molecular oxygen under the catalytic action of (5) cytochrome oxidase, an enzyme that is cyanide sensitive. The cytochrome thus acts as a carrier between the two types of cell respiratory enzymes, the dehydrogenases and the oxidases. The coenzymes, the coenzyme factor, and cytochrome are widely distributed in animal tissues and in yeast.

In view of these relationships, it is thought that pellagra is due to a disturbance of the second link in the chain in which nicotinic acid plays a part; that riboflavin plays a part due to its place in the third link; that liver extract and yeast are of therapeutic value because of their enzyme content; and that the action of various factors in initiating a train of processes leading to pellagra may be explained as an attack on some link in the chain. Thus, in alcoholic pellagra, the large consumption of alcohol calls for the action of its dehydrogenase, which becomes an overwhelming competitor for coenzyme and the other enzymes in the chain. The role of sugar, work, infections, snake venom, and cyanogenetic substances as possible etiologic factors is explained as an attack on some link of the chain. Angular stomatitis and related symptoms are considered as signs of the pellagrous state, a state supervening on a fault in one or more links of the catalytic chain.

Observations on the factor curative of nutritional achromotrichia, P. GYÖRGY, C. E. POLING, and Y. SUBBAROW (*Jour. Biol. Chem.*, 132 (1940), No. 2, pp. 789, 790).—A basal vitamin B-free diet supplemented with vitamin B₁, riboflavin, and vitamin B₆ produced cutaneous lesions and achromotrichia ("graying") in rats. The addition of pantothenic acid concentrates of 40-50 percent purification in doses of 75 γ -200 γ in terms of pantothenic acid caused a regression of the skin lesions and a blackening of the fur. The blackening appeared first as a bluing of the skin and did not progress to completion, and depigmented areas often persisted. These concentrates, it is concluded, appear to contain one but not the only factor concerned in the cure of nutritional achromotrichia in rats.

The B vitamins and fat metabolism.—III, The effects of vitamin B₆ upon liver and body fat, G. GAVIN and E. W. MCHENRY (*Jour. Biol. Chem.*, 132 (1940), No. 1, pp. 41-46).—In continuation of this series (E. S. R., 81, p. 877), evidence is

presented showing that the administration of crystalline vitamin B₆ in conjunction with thiamin, riboflavin, and choline to rats on a fat-free diet causes a slight increase in body fat and an increase in body weight; that nicotinic acid increases slightly the effect of vitamin B₆ on body fat but not on body weight; that neither vitamin B₆, nicotinic acid, nor riboflavin prevents the deposition of fat in the liver following the administration of thiamin; but that the amount of liver fat remains normal if choline is administered, either alone or with any combination of the above factors.

The evaluation of the intradermal dye test for vitamin C in health and disease, I. BAKSHI, B. D. KOCHHAR, and A. Q. MALIK (*Indian Jour. Med. Res.*, 27 (1940), No. 3, pp. 695-703, figs. 2).—The Rotter intradermal vitamin C test (E. S. R., 78, p. 571) was given to 140 apparently healthy students of a medical college and 200 patients suffering from various diseases in a hospital in Lahore, India, and the results were compared with blood plasma ascorbic acid values for the same subjects. Statistical analysis by the chi-square method of the relation between the blood values classified in three groups of less than 0.8, 0.8-1.5, and 1.5 mg. per 100 cc. or more and the decolorization times in groups of less than 5, 5-10, 10-15, and 15 or more min. gave values of $X^2=59.5$ for the students and 8.34 for the patients. These values, when referred to Fisher's tables for 6 degrees of freedom, establish a significant degree of association between the two variables in the case of the students but not of the patients. However, the scatter diagrams for the students show that the degree of correlation was not sufficiently high to make the test of any use in clinical practice.

Of the students 20 gave blood plasma ascorbic acid values of less than 0.8, 81 of 0.8-1.5, and 39 of 1.5 mg. or more per 100 cc., while of the patients 60 gave values in the first group, 138 in the second, and 2 in the third. Classified by clinical diagnosis, the lowest blood values were for 79 subjects classed as miscellaneous, with values of 0.72 ± 0.23 mg. per 100 cc., followed by 14 cases of pneumonia with an average of 0.76 ± 0.17 mg. per 100 cc., and the highest for 9 cases of gastric and intestinal disease (1.03 ± 0.19) and tuberculosis (1.05 ± 0.25 mg. per 100 cc.).

The bound ascorbic acid of animal tissues [trans. title], P. HOLTZ (*Hoppe-Seyler's Ztschr. Physiol. Chem.*, 263 (1940), No. 3-5, pp. 187-205).—The author advances the hypothesis, supported by experimental evidence obtained with the cooperation of H. Walter, that ascorbic acid in animal tissues exists partly in the free form and partly bound to protein. The customary method of determining ascorbic acid in animal tissues and fluids by deproteinization and titration of the protein-free filtrate measures only the free form. To determine the bound form it is necessary to free it from protein by hydrolysis of the tissues with hydrochloric acid or by the action of proteolytic enzymes such as pepsin and papain, or by prolonged autolysis (which however sets free only a part of the ascorbic acid). The best method for the quantitative freeing of the bound ascorbic acid consists in treating the sulfosalicylic acid or trichloric acid precipitated protein for 10 min. at 100° C. with $N/2$ HCl in an atmosphere of CO₂. Cell-free organ extracts, body fluids such as blood, and human and cow's milk have also been shown to contain some bound ascorbic acid. In milk this can be set free in part by simple heating.

The bound ascorbic acid is thought to be the reserve or depot form of the vitamin. In contrast to the free form it withstands oxidation and decomposition, and does not decrease appreciably for several days on the deficient diet. The working hypothesis is advanced that the biological synthesis of ascorbic acid in the organism involves binding with protein.

The protein bound form of vitamin C [trans. title], P. HOLTZ and H. WALTER (*Klin. Wchnschr.*, 19 (1940), No. 6, pp. 136, 137).—This summary of the study

noted above contains a few figures showing the proportion of free and bound ascorbic acid in certain biological tissues and fluids. Among these are the following: The kidneys of guinea pigs on a normal diet, free ascorbic acid 5.83 and bound 7.14 mg. percent, and on a vitamin C-deficient diet 3.68 and 7.05 mg. percent, respectively: intestinal tract of guinea pigs on a normal diet, free ascorbic acid 16.69 and bound 6.39 mg., and on a deficient diet, free 3.20 and bound 5.20 mg. per 100 cc.; cow's milk, free 0.98 and bound 0.60 mg.; cow's milk heated in an atmosphere of CO₂, free ascorbic acid 1.41, and heated with HCl in an atmosphere of CO₂, free ascorbic acid 1.62 mg. per 100 cc.

A comparison of the utilization by guinea pigs of equivalent amounts of ascorbic acid (vitamin C) in lemon juice and in the crystalline form, E. N. TODHUNTER, R. C. ROBBINS, G. IVEY, and W. BREWER. (Wash. Expt. Sta.). (*Jour. Nutr.*, 19 (1940), No. 2, pp. 113-120).—The comparison was made on the basis of weight gains, scurvy scores, and the ascorbic acid content of the blood and adrenals of two matched groups of 9 guinea pigs each, placed on a basal vitamin C-free diet at the age of 6-8 weeks and weight of approximately 300 gm. and after 13 days given supplementary feeding of 1 cc. of lemon juice daily for one group and for the other group the same quantity of ascorbic acid as 1 cc. of ascorbic acid solution. Feeding of the supplements was continued for 20 days, and on the following day, immediately after the removal of 1 cc. of blood from the heart, the anesthetized animals were killed, the adrenals and blood samples analyzed for ascorbic acid, and scurvy scores determined. No group differences were noted in the average adrenal weights, total ascorbic acid content of the adrenals, and the ascorbic acid content of the blood plasma, and although there were wide individual differences in the scurvy scores, more low scores were recorded in the lemon juice than in the ascorbic acid group.

In a repetition of the work with only 6 animals in each group and a larger dose of ascorbic acid (4 cc. of lemon juice or its equivalent), the ascorbic acid content of the blood and adrenals was again similar for the two groups and considerably higher than in the first series. The scurvy scores were all negative on the lemon juice diet but were noted as "traces" in four of five animals on the ascorbic acid diet.

These data, although not conclusive, are thought to indicate the possibility that lemon juice may contain another factor than ascorbic acid concerned in the prevention of the hemorrhages which are characteristic of scurvy.

Vitamin-C (ascorbic acid) nutrition of Utah State Agricultural College students found low, A. P. BROWN (*Farm and Home Sci. [Utah Sta.]*, 1 (1940), No. 4, pp. 2, 11).—Of 127 college students on whom blood plasma ascorbic acid tests were made, 7.1 percent had values of 1 mg. or more per 100 cc. of plasma, 15 between 0.8 and 1 mg., 47.2 between 0.4 and 0.8 mg., and 30.7 percent values of 0.4 mg. or less per 100 cc. In terms of commonly accepted standards, somewhat less than one-fourth of the total number of students were in a satisfactory state of vitamin C nutrition. The health significance of low blood plasma vitamin C levels is discussed and summarized as "the chance of lowered efficiency through constant fatigue, a threat of impaired bodily function in the resistance to infection, and the probability of impaired mental health through a continued feeling of irritability and of apprehension."

The effect of vitamin C on the calcium, phosphorus, and nitrogen metabolism in scurvy and osteomalacia, H. I. CHU, S. H. LIU, K. C. CH'EN, T. F. YÜ, H. C. HSU, and T. Y. CHENG (*Chin. Jour. Physiol.*, 15 (1940), No. 1, pp. 101-117, figs. 3).—Details are reported for balance studies conducted on two patients with mild scurvy and one with osteomalacia. The diets were very low in vitamin C, but furnished adequate protein and calories and an adequate cal-

cium intake administered as calcium lactate. Vitamin C, administered after three or four preliminary control periods, was given by mouth in the form of Cebion in 100-mg. doses three times daily for four or five periods. The vitamin D deficiencies found developing were corrected by the administration of Vigantol.

Serum Ca and inorganic P were found to be essentially normal in both cases of scurvy, the Ca retention was low in one case and normal in the other, and neither Ca nor P retention nor that of N was influenced by the administration of saturating doses of ascorbic acid. P and N retentions were, however, increased by an increase in protein and calorie intake. In the case of osteomalacia the serum Ca and inorganic P were low and Ca retention was minimal in spite of high Ca intake. This abnormal Ca and P metabolism was not affected by doses of vitamin C and was only corrected by administration of vitamin D. The results are interpreted as evidence that there is no disturbance in the Ca and P metabolism in scurvy, and that vitamin C has no effect on the metabolism of these elements.

The occurrence of C avitaminosis upon an exclusive meat diet [trans. title], W. RUDOLPH (*Klin. Wchnschr.*, 19 (1940), No. 4, p. 84).—The case is cited of a man obliged to live for more than a year on an exclusive meat diet (muscle, liver, heart, kidneys, and bone marrow of antelope), except for the first 3-4 mo. when raw onions were available. About 1 kg. of meat and when available 200-250 gm. of onion were eaten daily. After 3-4 mo., as the supply of onions was exhausted, increasing weakness developed and bleeding and shrinking of the gums was evident. These symptoms increased in intensity, and after about a year extreme looseness of the teeth was observed as in typical scurvy. When a more normal diet, with a few fresh vegetables and a rich supply of fresh fruit, was finally available, improvement was noted within a few days, a feeling of well-being was regained, and within 3 weeks all symptoms of vitamin C deficiency had disappeared. This case, indicating the complete ineffectiveness of animal tissues in meeting the body's need for vitamin C is cited in refutation of the claims of Rietschel and Schick (*E. S. R.*, 83, p. 715).

Vitamin C in tuberculosis, C. E. CHANG and T. H. LAN (*Amer. Rev. Tuberc.*, 41 (1940), No. 4, pp. 494-506, figs. 4).—In determinations made on 100 tuberculous patients, vitamin C in the blood plasma was found to vary from 0.03 to 0.60 mg. per 100 cc.; in the 24-hr. urine the range was from 1.30 to 69.54 mg. These values are appreciably lower than those obtained in the 10 normal persons studied, for whom blood plasma values for vitamin C varied from 0.64 to 1.14 mg. per 100 cc., and urinary values varied from 24.40 to 72.60 mg. per 24 hr.

Classification of the tuberculous cases indicated that the more severe the tuberculous infection the lower the vitamin C level in the blood and urine; cases complicated with idiopathic pleural effusion showed the lowest blood concentration. Saturation tests performed on a few subjects indicated that the degree of unsaturation of vitamin C in the body is proportional to the severity of the tuberculous infection.

A study of two hundred and forty breast-fed and artificially fed infants in the St. Louis area.—I, A comparison of prophylactic antirachitic effects of 135 and 200 unit irradiated evaporated milks, 200 unit irradiated fresh milk and human and nonirradiated evaporated milk fortified with 800 to 1,000 units of vitamin D as viosterol, E. C. ROBINSON (*Amer. Jour. Diseases Children*, 59 (1940), No. 4, pp. 816-827, figs. 3).—The healthy infants selected were grouped according to the type of feeding and source of vitamin

D and placed on the group formulas before the tenth day of life. Physical examinations, including measurements of weight, height, head, and chest, were made at 5 or 6 weeks of age and every 4 weeks thereafter, and roentgenograms were made routinely every 8 weeks; if these indicated questionable or active rickets, roentgenograms were made every 4 weeks until healing was observed. The majority of the infants were studied for at least a year.

"The findings on the incidence of rickets are presented by table and by graph. Positive evidence of rickets was found in the roentgenograms in 33 percent of the cases. In 24.9 percent of these the appearances were those of moderate or marked rickets; in 8.2 percent, of slight rickets." Viosterol in a daily dose of 5 drops (800-1,000 U. S. P. units of vitamin D) was sufficient to protect breast-fed infants against rickets, but did not suffice to protect infants fed nonirradiated milk. "Irradiated milk containing 135 and 200 U. S. P. units of vitamin D to the quart did not protect against rickets. Two hundred-unit whole milk was more protective than 200-unit evaporated milk. In most of the cases rickets healed spontaneously without increase of vitamin D during the summer months."

Do α -tocopherol additions to the normal diet influence lactation? [trans. title] C. BENNHOLDT-THOMSEN (*Klin. Wchnschr.*, 19 (1940), No. 5, pp. 102-104).—Four professional wet nurses served as subjects of this study. During the period of investigation they received essentially the same basal diet, and each mother nursed only her own child. A record was kept of the total milk production, the amount consumed by the infant in each case (determined by weighing before and after nursing) being added to the amount obtained by manual expression.

Two of the subjects in the thirtieth and the ninth weeks of lactation, respectively, were maintained on the normal diet for 21 days, after which for 35 days the first subject was given daily doses of 10 mg. of synthetic α -tocopherol dissolved in sesame oil, while the second was given only the sesame oil. After an intermediate 14-day period on the basal diet alone, the dosages were resumed with reversal of the subjects, twice the initial doses being given for the first 14 days and 3 times the initial amounts for a succeeding 14-day period. Both subjects were then given only the basal diet for a period of 28 days. These experiments, with the omission of the 21-day preliminary period, were repeated with two other subjects in the thirty-fourth and the ninety-fifth weeks of lactation.

The findings on milk production and milk fat content indicated that the quantity of milk was dependent on the stage of lactation, that the fat content was related to the quantity of milk, and that both of these factors were independent of the dietary management employed in this study. It is concluded, therefore, that the addition of α -tocopherol to a normal diet does not further lactation either with regard to the quality (fat content) or the quantity of the milk produced.

The prevention and cure of nutritional muscular dystrophy in the rabbit by alpha-tocopherol in the absence of a water-soluble factor, C. G. MACKENZIE, M. D. LEVINE, and E. V. MCCOLLUM (*Jour. Nutr.*, 20 (1940), No. 4, pp. 399-412).—Continuing this line of investigation (E. S. R., 83, p. 382), attempts were made to confirm the report of Morgulis et al. (E. S. R., 81, p. 89) that two or more nutritive factors are required in the prevention and cure of muscular dystrophy in the rabbit. Employing a previously described dystrophic diet, muscular dystrophy was prevented or cured by adding α -tocopherol to the diet without the addition of a water-soluble factor. No quantitative relationship between α -tocopherol and a water-soluble factor could be demonstrated. The

average daily antidystrophy requirement of the rabbit was found to lie between 0.6 and 1.0 mg. of α -tocopherol per kilogram of body weight. Symptoms of the disorder are further discussed with reference to the action of vitamin E.

Vitamin E in the treatment of muscular dystrophies and nervous diseases, F. BICKNELL (*Lancet [London]*, 1940, I, No. 1, pp. 10-13).—The work of L. Einarson and A. Ringsted,⁶ suggesting that the muscular dystrophies, amyotrophic lateral sclerosis, and tabes dorsalis are due to a deficiency of vitamin E, is discussed briefly. Case histories are presented of 26 subjects, chiefly children, given fresh wheat germ ($\frac{1}{2}$ oz. twice daily) in treatment of such muscular and neuromuscular disorders. Wheat germ rather than α -tocopherol was administered, since it was considered that the myotrophic and neurotrophic factors might not be identical with the antisterility vitamin itself, but only associated with it in the wheat-germ oil.

Except in advanced cases, the treatment gave promising results, thus supporting the contention that these muscular dystrophies and nervous diseases are deficiency diseases and curable. It is recognized that the dietary deficiency itself may not be the cause of the muscular and nervous degeneration, but it is argued that an abundant supply of the vitamin necessary for the nourishment of the cell would make it more resistant to the causative factor.

Vitamin E and neuromuscular diseases, V. DEMOLE (*Lancet [London]*, 1940, I, No. 9, p. 431).—Apropos of the paper of Bicknell noted above, a number of studies, including that of Goettsch and Ritzmann (*E. S. R.*, 83, p. 382), are cited as evidence bearing on the therapeutic equivalence of pure tocopherol and its acetate with natural vitamin E. A parallel is drawn between the late onset of neuromuscular disturbances observed during trials with young rats and the relatively late appearance of myopathies in children. It is suggested that attention should be directed in such cases toward ascertaining the history of the children, and if possible the mother, "in the hope of finding the missing link between the antisterility and neuromuscular effects."

Comparison of the antihemorrhagic activity of natural and synthetic vitamin K₁ with the proposed standard 2-methyl-1,4-naphthoquinone, A. D. EMMETT, R. A. BROWN, and O. KAMM (*Jour. Biol. Chem.*, 132 (1940), No. 1, pp. 467, 468).—In accordance with a previous suggestion of Thayer et al. (*E. S. R.*, 83, p. 857) that the stable and exceptionally potent 2-methyl-1,4-naphthoquinone be used as a standard of reference in comparing the potency values of vitamin K preparations from different laboratories, the biological activity of 1 γ of this quinone was defined as 1 standard unit of vitamin K₁. In a series of experiments with about 260 chicks, using the Thayer-Doisy method (*E. S. R.*, 81, p. 406), it was found through running the standard concurrently and using the master curve that the standard unit was equivalent to 1.98 chick units. The conversion factor, therefore, was 0.5.

The potencies of several samples of natural and synthetic vitamin K₁, furnished by Doisy and by Merck & Co., were determined and expressed in chick units and standard units. The preparations, natural and synthetic, had about the same potency values, the average being about 450 units per milligram, based on 2-methyl-1,4-naphthoquinone. It is pointed out that this is a somewhat higher value for natural vitamin K₁ than the 262 units reported by Almqvist and Klose (*E. S. R.*, 83, p. 736).

⁶Effect of chronic vitamin E deficiency on the nervous system and the skeletal musculature in adult rats: A neurotropic factor in wheat germ oil. Copenhagen: Levin & Munksgaard; London: Oxford Univ. Press, 1938, pp. 163, pls. 2, figs. 95.

The vitamin K activity of 4-amino-2-methyl-1-naphthol and 4-amino-3-methyl-1-naphthol, A. D. EMMETT, O. KAMM, and E. A. SHARP (*Jour. Biol. Chem.*, 133 (1940), No. 1, pp. 285, 286).—Data showing the potency of these two preparations are reported. In terms of chick units the two compounds averaged 2,415 and 1,567 units per milligram, respectively; based on 2-methyl-1,4-naphthoquinone, the averages were 1,208 and 784 units per milligram. Clinically the 4-amino-2-methyl-1-naphthol gave excellent results. "Daily doses ranging from 3,600 to 7,200 curative chick units given intravenously restored to normal severe prothrombin deficiency of obstructive jaundice within 2 to 3 days. Infants have responded within 12 hr. to a dosage of 1,800 units, as have dogs with severe prothrombin depletion induced by biliary fistula."

The prothrombin changes in banked blood, E. R. ZIEGLER, A. E. OSTERBERG, and M. HOVIG (*Jour. Amer. Med. Assoc.*, 114 (1940), No. 14, pp. 1341, 1342, figs. 3).—A study of the prothrombin content of blood drawn in sterile tubes and stored in the refrigerator from 1 to 37 days showed that a decrease occurred over a period of time to a level of 40 percent of the original content. It is concluded, therefore, that in cases in which it is desired to raise the prothrombin content of the blood by transfusion, old banked blood is not a suitable agent.

The prothrombin in preserved blood, A. J. QUICK (*Jour. Amer. Med. Assoc.*, 114 (1940), No. 14, pp. 1342, 1343).—Determinations of prothrombin concentrations and clotting times of plasma at increasing time intervals indicated that the prothrombin of decalcified blood diminishes on standing, and support the conclusion that stored blood is inferior to fresh blood for controlling bleeding in jaundice.

The use of 2-methyl-1,4-naphthoquinone (a synthetic vitamin K substitute) in the treatment of prothrombin deficiency in patients, J. E. RHOADS and M. T. FLIEGELMAN (*Jour. Amer. Med. Assoc.*, 114 (1940), No. 5, pp. 400, 401).—All but 1 of 10 patients tested responded satisfactorily to daily oral doses of 1-4 mg. "In 3 cases hemorrhagic phenomena occurred before the first dose was given. In all these the hemorrhage was controlled. 2-Methyl-1,4-naphthoquinone appears to be the most potent agent for the treatment of prothrombin deficiency so far employed clinically. No toxic effects were observed."

Correction of prothrombin deficiencies by means of 2-methyl-1,4-naphthoquinone injected intramuscularly, W. D. ANDRUS and J. W. LORD, JR. (*Jour. Amer. Med. Assoc.*, 114 (1940), No. 14, pp. 1336, 1337).—The injection therapy (using the compound dissolved in corn oil) administered to a total of 28 cases with various diagnoses was found effective in restoring the plasma prothrombin level in the absence of severe liver damage. "Single injections of as little as 2 mg. of this substance restore the level of plasma prothrombin by as much as 48 percent, and the effect is evident as early as 8 hr. after injection. The effect of a single injection may be prolonged for as long as a week, unless adverse factors such as operations on the biliary tract or other liver damage supervene. No toxic effects have been noted resulting from doses of as much as 4 mg. in patients or in animals."

Production of "prothrombin deficiency" and response to vitamins A, D, and K, M. C. ELLIOTT, B. ISAACS, and A. C. IVY (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 2, pp. 240-245).—As determined by a modification of the Quick method, which is outlined, the mean prothrombin time in 120 rats weighing 200-370 gm. and maintained from weaning on an adequate stock diet was 69.8 ± 0.9 (S. E.) sec. The standard deviation of the distribution was 9.8 sec. In a series of 30 animals it was found that the prothrombin time for any given rat was reliable from week to week within normal limits, and that weekly bleeding (by cardiac puncture) did not affect the prothrombin time significantly.

Of a group of 66 normal rats placed on the control diet, 7 parts, mixed with Petrolagar, 3 parts, and containing 20 percent by weight of mineral oil, 56 developed a prolongation of the prothrombin time within 36 days. The median prothrombin time for these animals was 199 sec. (range 118-1,800+ sec.) as compared with an average control time of 70 sec. (46-90 sec.) for the group of 66. Two of the rats failed to develop a prolonged prothrombin time even after 77 days on the diet. The other animals of the group either died of heart puncture (4) or were discontinued at an early stage. That the effect of the Petrolagar was due to the mineral oil component was shown by the results obtained in a repetition of the experiment, using plain mineral oil (20 percent) in place of the Petrolagar. It is noted that this method of producing prothrombin deficiency is very convenient and that it has potentialities for being developed into an assay method for vitamin K. In another experiment, using 33 rats whose prothrombin times had been increased by the Petrolagar diet, 10 were given 50,000 International Units of vitamin A in oil, 11 were given 500 I. U. of viosterol in oil, and 8 received 2,000 Almquist units of vitamin K, the administrations in all cases being by subcutaneous injection. The vitamin A had no effect, the viosterol caused a significant improvement, and the vitamin K returned the prothrombin time to normal.

Diseases of metabolism and nutrition: Review of certain recent contributions, I, II, (*Arch. Int. Med.*, 65 (1940), No. 2, pp. 390-460, fig. 1).—This annual review (*E. S. R.*, 83, p. 425), which contains 319 references to recent literature, is given in two parts.

I. *Diseases of metabolism*, R. M. Wilder and H. C. Browne (pp. 390-416).—The greater part of this review is devoted to diabetes mellitus. Other conditions discussed briefly are diabetes insipidus, gout, obesity, and xanthomatosis (lipoid disease).

II. *Nutrition*, H. R. Butt (pp. 417-460).—In the introduction to this review, which is devoted almost entirely to vitamins, the author states that "of the many interesting advances in the work on nutrition during the past year, the isolation and the synthesis of vitamins B₆ and K and the therapeutic application of vitamins B₆, K, and riboflavin have been perhaps the most outstanding."

Dietary deficiencies and iron salts in hookworm infections, G. F. Otto and J. W. LANDSBERG (*Amer. Jour. Hyg.*, 31 (1940), No. 2, Sect. D, pp. 37-47, fig. 1).—Seventeen young dogs in two litters were used in these experiments. One dog from each litter was maintained on the standard stock diet, while the other 15 were placed on a generally deficient diet; 8 of the latter group were each given daily doses of 3,000-6,000 mg. of iron-ammonium citrate. After 42 days on these diets the dogs were experimentally infected with hookworm larvae and observed under the same dietary regimes until death. Hemoglobin concentration, red blood cell and reticulocyte counts, and packed cell volume were determined weekly or oftener. At death the worms recovered from the intestinal tract were counted, and paraffin sections of the bone marrow and internal organs were prepared and stained. It was found that "the additional iron stimulated a marked but apparently transient erythropoiesis; it had no effect upon the development or persistence of the worms. Likewise it did not in any way prevent or delay the development of fatal anemia." The 2 well-nourished animals, on the other hand, were able successfully to combat the infections which were fatal to the other dogs. It is concluded, therefore, that a balanced and adequate diet is of more fundamental importance than iron therapy in the development of immunity to hookworm infection, although iron therapy may well supplement general dietary improvements and removal of the worms with an anthelmintic.

TEXTILES AND CLOTHING

Identification of the textile fibers, J. H. SKINKLE (*Rayon Textile Mo.*, 21 (1940), No. 8, pp. 37-39).—A scheme is presented for the chemical identification of fibers of glass, asbestos, weighted silk, silks, hairs, casein, acetate rayon, vinyl resin, Nylon, viscose and cupra rayons, casein-viscose mixtures of the Cisalfa type, jute and hemp, and cotton, flax, and ramie. The flame and chemical tests used are described.

Wool shrinkage research, R. T. CLARK. (Coop. U. S. D. A.). (*Montana Sta. [Bien.] Rpt. 1939-40*, pp. 15, 16).—The most accurate and cheapest sampling method for determining the shrinkage of the wool producer's own clip was the aim of comparisons of sampling technics.

Proper evaluation of special finishes for textiles, E. FREEDMAN (*Rayon Textile Mo.*, 21 (1940), No. 8, pp. 55-57, fig. 1).—This rather general survey without reference to specific substances or trade names points out that the evaluation of antiseptic finishes is based upon (1) their ability to remain germ-free, (2) their destructive action on germs, and (3) the permanence of the finish; that crease resistance may be evaluated by the size of the crease angle measured at a definite humidity and crush resistance by the ratio of the pressure to compress the pile to the energy of recovery; that water-resistant finishes that also resist dry-cleaning and washing are now on the market; that finishes to render textiles more resistant to abrasion vary considerably in value, those to reduce the incidence of runs and snags having proven without worth; that acetate rayons dyed with certain blue dyestuffs are subject to reddening in spite of applied finishes; that mothproofing finishes may be evaluated by various tests involving the use of the larvae; and that flame-retardant finishes should not affect adversely the hand and appearance of the fabric and should be harmless and permanent. It is stressed that to retain the goodwill of consumers the textile industry should (1) engage in research to determine whether the finish is capable of producing the effect claimed, (2) restrict each finish to the type of textile fiber to which it imparts a substantial effect, (3) subject each finish to biological tests to make certain that it will not prove injurious, and (4) study the degree of permanence under conditions incidental to use and see that this information is affixed by tag or label to the merchandise. In the matter of terminology, water-resistant, fire-retardant, and reodorize are offered as more accurate than water-repellent, flameproof, and deodorize, respectively, and the term antiseptic, it is noted, should be qualified.

HOME MANAGEMENT AND EQUIPMENT

Family income and expenditures: Middle Atlantic, North Central, and New England regions.—I, Family income. Farm series, D. S. MARTIN, D. MONROE, D. S. BRADY, and E. PHELPS (*U. S. Dept. Agr., Misc. Pub. 383 (1940)*, pp. IV+258, figs. 5).—This report, the sixth in the series on family income and expenditures, is the second in the farm series, and presents information similar to that previously reported for farm (E. S. R., 83, p. 286) and for urban and village (E. S. R., 84, p. 429) families.

New soap substitutes unsatisfactory for general home laundering, J. E. RICHARDSON (*Montana Sta. [Bien.] Rpt. 1939-40*, pp. 32, 33).—This is a brief summary of the results of a comparison of soap and certain of the new detergents in laundering.

MISCELLANEOUS

Bibliography of tropical agriculture, 1939 (*Roma: Internatl. Inst. Agr., 1940, pp. VII+497*).—A continuation of this bibliography (E. S. R., 82, p. 431).

Elements of statistical reasoning, A. E. TRELOAR (*New York: John Wiley & Sons; London: Chapman & Hall, 1939, pp. XI+261, figs. [47]*).—Explanations are given of the frequency distributions of the normal curve and their relation to sampling. The basis for the derivation of the more common statistical constants are presented and the formulas given for them.

Science works for the farmer: Fifty-second Annual Report [of Arkansas Station, 1940], [W. R. HORLACHER] (*Arkansas Sta. Bul. 405 (1940), pp. 45, figs. 9*).—The experimental work not previously referred to is for the most part noted elsewhere in this issue.

Fifty-third Annual Report, Colorado Experiment Station, [1940], I. E. NEWSOM (*Colorado Sta. Rpt. 1940, pp. 62*).—The experimental work not previously referred to is for the most part noted elsewhere in this issue.

Serving Montana agriculture through research: Forty-sixth and Forty-seventh Annual Reports of the Montana Agricultural Experiment Station, July 1, 1938, to June 30, 1940, C. MCKEE ET AL. (*Montana Sta. [Bien.], Rpt. 1939-40, pp. 68, fig. 1*).—The experimental work not previously referred to is for the most part noted elsewhere in this issue.

Fifty-ninth Annual Report of the New York State Agricultural Experiment Station, [1940], P. J. PARROTT (*New York State Sta. Rpt. 1940, pp. 58*).—The experimental work not previously referred to is for the most part noted elsewhere in this issue.

Report of the Puerto Rico Experiment Station, 1939, [A. LEE] (*Puerto Rico Sta. Rpt. 1939, pp. II+126, pl. 1, figs. 43*).—The experimental work not previously referred to is for the most part noted elsewhere in this issue.

What's new in farm science: Annual report of the director. [Wisconsin Station, 1940], I, compiled by N. CLARK and N. HOVELAND (*Wisconsin Sta. Bul. 450 (1940), pp. [2]+80, figs. 19*).—The experimental work not previously referred to is for the most part noted elsewhere in this issue.

NOTES

Alaska College and Station.—Dr. Earl Graves has been appointed veterinarian in charge of research and extension. It is expected that special attention will be given to diseases of poultry.

Colorado College and Station.—A wool laboratory has been equipped, including a scouring room and classroom and a room for technological studies. Additional courses are to be offered, and increased facilities will be available for the wool research program.

Idaho University and Station.—Godfrey L. A. Ruehle, professor of bacteriology and bacteriologist from 1926 to 1929 and subsequently senior bacteriologist in the Insecticide Control Laboratory of the U. S. Food and Drug Administration, died in Washington, D. C., on January 31 at the age of 56 years. He was a native of Minnesota, but was educated in pharmacy and bacteriology in the University of Washington. He had also served as an assistant bacteriologist in the New York State Station from 1911 to 1918 and as research assistant and associate in the Michigan College and Station from 1918 to 1926.

Minnesota University and Station.—Dean and Director W. C. Coffey has been appointed acting president to take office on the retirement July 1 of President Guy S. Ford.

To facilitate research on foreign-type cheese the dairy division of the station has added a series of six storage rooms equipped with temperature and humidity controls. Each room has a storage capacity of about 200 lb. of cheese. The cheese manufacturing department has also been enlarged and rearranged and new equipment added, including a pasteurizer and a new hydraulic cheese press with a capacity of 1,000 lb. Since 1933, when research on foreign-type cheeses was undertaken, the station has developed and perfected methods for producing blue or Roquefort-type cheese and Gorgonzola- and Trappist-type cheeses. With the new equipment, efforts will be made for shortening the ripening time of these cheeses and also for investigating the manufacturing of other foreign-type cheeses. The dairy division is also completing a \$25,000 enlarging and remodeling of its market milk department to include a complete set-up for receiving, pasteurizing, bottling, and storing fluid milk.

The latest field crop introduction to be announced in the station is Marmin, a new winter wheat. This variety was developed in cooperation with the U. S. Department of Agriculture as a selection from a cross of Marquis with Minturki and is said to combine the desirable qualities of both.

Eight new field corn hybrids are being released by the station and with the six that were released in 1940 will supply for the first time adapted hybrid varieties for all the important corn-growing regions in Minnesota, although these adaptation zones vary from 85 to 115 days in time of maturity.

Horticulturists of the station have recently introduced several new vegetables, vine crops, and flowers. Among these introductions are Green Gold squash, a winter-type variety of 3-4 lb.; Zenith bean, a brown-eyed, dry shell bean of good baking quality; Golden Gopher, a new muskmelon, chiefly important because of its resistance to *Fusarium* wilt; Midget cucumber, a new bush or dwarf variety

for home garden and pickling purposes; and the *Daisy*, *Sioux*, and *Winona*, greenhouse chrysanthemums for cut-flower production.

Montana College and Station.—Layton S. Thompson has resigned as instructor and assistant in agricultural economics as of April 1 to accept a research position with the Federal Land Bank at Wichita, Kans.

New York State Station.—Thais A. Merrill, specialist in pomology in the Michigan Station, has been appointed associate in research (horticulture) and given charge of the Vineyard Laboratory at Fredonia, effective April 1.

North Dakota College and Station.—During the past year the station has given special attention to means of securing public appreciation of its work. There is an increasing demand on the part of farmers for first-hand discussions and demonstrations by those actually doing research work. This is due in part to the fact that many research fields are not represented in extension organizations and in part to a growing alertness on the part of the abler farm managers and operators, many of whom are interested in progress reports and particularly desire opportunity to see researches in progress. During January the staff presented the results of investigations to 36 employees of cooperative grain elevators who attended a 4 weeks' special training school at the college, to about 150 employees of the U. S. D. A. Farm Security Administration who attended a 1-week training conference, and to a group of 50 real estate owners and managers at a 2-day conference on real estate problems. In February about 450 farm men and women attended a 3-day farm and home conference at which station workers presented their results on such diverse projects as frozen foods, the blights on durum wheat in 1940, hybrid corn tests, yield and milling and baking tests on new hard red spring wheats, wheat storage, sheep diseases, native and introduced grasses, the trends in the livestock market, etc. Special tours were made of the research laboratories. Director H. L. Walster also addressed a group of about 200 producers of potatoes at one of their monthly potato clinics, in which he reviewed the history of potato research at the station and discussed the need for ample financial support of a broad-scale attack upon the problems of marketing table stock.

A new division of animal industry has been organized in the station to include the departments of animal and human nutrition, animal husbandry, dairy husbandry, poultry husbandry, and veterinary science and with J. H. Longwell of the Illinois University and Station as chief beginning July 1. E. J. Thompson, chairman of the department of animal husbandry, has resigned to engage in commercial work.

Leave of absence from February 25 until May has been granted Director Walster, who will be one of a party of scientists and journalists who are making a good will tour of South America under the auspices of the Carnegie Endowment for International Peace. J. R. Dice is serving as acting director.

Clemson College.—Dr. E. W. Sikes, president from 1925 to 1940, died January 8, aged 72 years. A native of North Carolina, he received the M. A. degree from Wake Forest College in 1891 and the Ph. D. degree from Johns Hopkins University in 1897. His early career was as a teacher, as dean of Wake Forest College, and as president of Coker College. He was also a member of the North Carolina State Senate in 1911 and the author of numerous books on southern history.

South Dakota College and Station.—J. E. Graphius has been appointed associate professor of agronomy and associate agronomist. Walter P. Cotton has been appointed assistant economist in charge of marketing research as of April 1 vice L. M. Brown, who has been given indefinite leave for army duty from March 22.

EXPERIMENT STATION RECORD

VOL. 84

JUNE 1941

No. 6

EUGENE DAVENPORT, MIDWESTERN PIONEER AND PROPHET

The rapidly dwindling roll of agricultural college and experiment station leaders in service a half century ago was further curtailed on March 31, 1941, by the death of Dr. Eugene Davenport, of Illinois and Michigan. Dr. Davenport died at his boyhood home in the latter State, to which he had returned in 1922 upon retirement as dean and director emeritus of the Illinois University and Station. He was nearing his eighty-fifth birthday, having been born at Woodland, Mich., on June 20, 1856.

Dean Davenport's death not only removes one of the oldest survivors of the pioneer era but a leader of outstanding accomplishments and national reputation. Although his active service to the land-grant institutions was not unusual as measured by length of days, few men have been more prominently identified with the advancement of agricultural education, research, and extension in this country.

One secret of Dean Davenport's popularity and influence with country people was his intimate knowledge of their life and problems. He was born in a log cabin which his pioneering father had built on 260 acres of Michigan boulder clay and timber land bought from the Government in 1853. He helped to clear this farm of timber and bring it into cultivation, and, after graduating in 1878 from the Michigan Agricultural College, where he shared in the labor system of its college farm, he returned to Woodland to spend the following 10 years. In 1888, however, he resumed further study at the college, served as assistant in botany under Dr. William J. Beal, and in 1889 was made professor of agriculture and farm superintendent. Here he functioned effectively as, to quote his own words, "the only college professor of agriculture in captivity who had spent 10 years after graduation in the actual, everyday work of the farm."

In 1891 he was selected by Senor Louis Quieroz, a wealthy citizen of Brazil desirous of establishing in the State of Minas Geraes what he called a "leettle Lansing," as the head of a projected agricultural college. After about a year of pioneer development, however, revolution broke out and Dr. Davenport returned to his Michigan farm.

Three years later he was appointed dean of the College of Agriculture of the University of Illinois and agriculturist of the station, and the following year was also made professor of thremmatology and director of the station. His major life work was carried on in these capacities during the ensuing 27 years. In 1921 he was also made for his remaining year vice president of the university.

When Dean Davenport began his work in Illinois there were but five students in agriculture and three members of the agricultural faculty. The experiment station was functioning somewhat more extensively, but its work was mainly confined to field experiments and its income was limited to farm receipts of about \$2,500 and the Hatch Act grant of \$15,000 per year. When he retired the undergraduate attendance in the College of Agriculture had grown to 1,200 students and the faculty comprised 175 members. The station income had reached \$435,353, of which \$310,394 was from State appropriations, and its staff numbered over 100. Comparable extension forces and facilities had also been obtained.

This phase of his work has been fittingly characterized by the present dean and director, Dr. H. P. Rusk, as follows: "He cast his lot with Illinois in 1895, when much of the richest farm land of the State was still covered with wild prairie grass, and by sheer weight of ability almost immediately assumed the agricultural leadership of this State. More than any other man, Dean Emeritus Davenport contributed to clear thinking and sound practice during the years when Illinois agriculture was passing from raw pioneer beginnings to procedures based on scientific information. To him is due the major credit for the closely knit and effective organization of the College of Agriculture, the experiment station, and the extension service in agriculture and home economics at the University of Illinois. As the administrative head of all agricultural activities at the university for more than a quarter of a century, he exercised rare judgment in the selection of men and women for positions on the staff, and then with unusual insight and patience gave every member of the staff his fullest confidence and untiring support. His broad knowledge of agriculture, his sound judgment, his unquestioned sincerity, and his fine human qualities made him a great leader who was admired and loved by all who knew him."

Outstanding as were the services of Dean Davenport to Illinois, his influence was not long, if ever, confined within the borders of a single State. He became early recognized as a representative and champion of the Middle West, and his views on such matters as the extension movement, agricultural cooperation, nature study, the development of secondary education in agriculture, and the preservation of institutional integrity soon commanded national attention. He became widely known as a writer on current agricultural topics and was the

author of numerous books, including *Principles of Breeding*, 1907; *Education for Efficiency*, 1909; *Domesticated Animals and Plants*, 1910; and *The Farm*, 1927. He was long a favorite speaker at other institutions in dedicatory exercises, commencements, and similar gatherings.

Notwithstanding his marked independence of thought and viewpoint, Dean Davenport was a man of wide contacts and a believer in the effectiveness of group action. Much of his success in Illinois came through his cordial relations with the farmers' institutes, the farm organizations of the State, and the system of advisory committees of breeders and other specialized interests which was developed. Nationally, he was a participant in the initial programs of the American Country Life Association, the National Research Council, and of Section O of the American Association for the Advancement of Science, becoming chairman of that section in 1916. Nor was his interest and enthusiasm restricted to new or popular undertakings, as is indicated by his loyal adherence to the Society for the Promotion of Agricultural Science and his acceptance of its presidency for two terms in 1911 and 1912.

Special mention should be made of his work in the organization now known as the Association of Land-Grant Colleges and Universities. This connection began with the Washington meeting of 1889 and continued unofficially far beyond his retirement as an ever-welcome visitor and participant in its programs. In the intervening years he had served as secretary of the college section and as a member of the committees on graduate study and the indexing of agricultural literature, the latter throughout its existence. Upon the formation of the committee of experiment station organization and policy in 1905 he became its chairman, serving continuously in this capacity until 1920 and thereafter as a member until his retirement. He was elected vice president of the association in 1904 and again in 1912, and in 1917 became one of the relatively few members not chief executives to be elected president.

Because of the World War, his presidential address was deferred until the Baltimore meeting of January 1919. Speaking less than 2 months after the armistice, Dean Davenport took for his title *Wanted: A National Policy*, and announced his purpose as "to invite attention to the very great need at the present time of a more definite policy regarding agriculture, a policy that shall be national in its scope, universal in its interests, and comprehensive in its procedures." Following a comprehensive discussion of the existing situation, he set forth as fundamentals of a national policy "fourteen points for agriculture." In brief these provided for subsidization of country schools to an extent sufficient to educate every child born on the farm to a stage admitting to college; recognition of the farmer as "a man-

aging operator of a small business of which the home and the family are integral parts" and entitled to "an income comparable with his labor, his investment, and his skill"; requirement by law of minimum housing conditions on rented farms; "the obligation not only to maintain but to increase the fertility of land, this obligation to be equally binding upon landlord and tenant and enforced by public license"; "elimination from the public mind of the idea that tenantry is to be regarded in America as typical land occupancy or as the ideal road to ownership"; public funds for financing young men in prospective ownership; interest rates on loans on land for home building based upon those of the most favorable bond issues; discouragement of speculation in land; "recognition of agriculture in all its phases as a matter of deep public concern, whether regarded as the machinery for the production of the food of the people or as the means of providing ideal conditions for the rearing of children"; and "finally, the determination to maintain upon the land the same class of people as are those who constitute the prevailing type among the mass of American citizens."

Much history has been made since these policies were proposed, including the advent of the "agricultural situation" of the twenties, the financial depression, and the renewal of hostilities abroad. Nevertheless, not a little which he advocated has come to pass in whole or in part, and other policies have received sympathetic consideration sufficient to justify for their author the appellation of a prophet. He was not, however, one of those prophets traditionally without honor in his own country. Michigan, Kentucky, Iowa, and Illinois in turn gave him advanced academic recognition in his lifetime. Many other States will join with these to pay tribute to his substantial accomplishments for agricultural education and research and the advancement of American country life.

RECENT WORK IN AGRICULTURAL SCIENCE

AGRICULTURAL AND BIOLOGICAL CHEMISTRY

[Chemical investigations of the Bureau of Agricultural Chemistry and Engineering] (*U. S. Dept. Agr., Bur. Agr. Chem. and Engin. Rpt., 1940, pp. 2-63*).—The food research of this Bureau included work on vegetables and vegetable products; citrus-fruit and apple products; miscellaneous fruits and fruit products; cereals and seed products; eggs and egg products; enzyme, phytochemical, pharmacological, and microbiological investigations; plant viruses; animal viruses; and preserving biological specimens. Carbohydrate research covered sugarcane and cane sugar, beet sugar, farm-made sirups, honey, starches, and miscellaneous carbohydrates. Oil, fat, and wax investigations included determination of the number of tung-oil nuts necessary for estimating variations in quantity and quality of the oil due to variation in cultural conditions, improvements in the method for determining tung-oil content, studies on the solvent extraction of tung oil from press cake, work on the effects of cultural and environmental factors on content and quality of linseed oil, and work on South American palm kernel oil, Florida rubber-seed oil, and on the compositions of oils. Protein investigations included work on digestibility of soybean proteins, amino acids in oats, effects of storage on proteins of grains and seeds, and selenium in toxic plants. Allergen investigations dealt with cottonseed allergens and wheat allergens. Industrial farm-products research covered the subjects of hides and skins; tanning materials; leather; farm wastes; lignin; hemicelluloses; fermentation products; motor fuels; chemical products from oils, fats, and waxes; plastics; chemical weed killers; and soybeans and soybean products. Naval-stores research was concerned with the chemistry and technology of naval stores (turpentine and rosin) and production and processing of naval stores.

[Chemical work by the Texas Station] (*Texas Sta. Rpt. 1939, pp. 17, 161-163*).—Work by S. H. Wender on the isolation of the toxic principles of the locoweed, fig-products by H. M. Reed, and grape juice-blending by Reed and U. A. Randolph is noted briefly.

Influence of variety and treatment on phytin content of wheat, S. M. YOUNG and J. E. GREAVES. (*Utah Expt. Sta.*). (*Food Res., 5 (1940), No. 1, pp. 103-108*).—Thirty-two samples of wheat from the Nephi Dry-land Substation were analyzed for their phytin content by a method involving precipitation of the phytin from an acid extract of the grain by titration with ferric chloride in the presence of a suitable indicator. One group of samples represented 21 different varieties, all grown, harvested, threshed, and handled alike. Total phosphorus, as determined in these wheats at an earlier date (*E. S. R., 63, p. 108*), varied from 0.233 to 0.378 percent, while phytin phosphorus, as determined in the present study, varied from 0.152 to 0.328 percent. There was no particular relationship between total and phytin phosphorus, and calculations based on these two sets of figures indicated that phytin phosphorus represented from 52.3 to 94.3 percent of the total phosphorus in the various samples. Eleven samples of Kanred wheat grown under different conditions showed the phytin content to vary from 0.222 to 0.292 percent. On the basis of earlier determined values for

total phosphorus (0.278-0.366 percent), phytin phosphorus in these several samples represented from 70.0 to 93.0 percent of the total phosphorus.

A comparative study of the chemical composition of five varieties of soybeans, R. C. BURRELL and A. C. WOLFE. (Ohio State Univ.). (*Food Res.*, 5 (1940), No. 1, pp. 109-113).—Jogun, Bansei, and Kura, representative of better edible varieties of soybeans, and Illini and Peking, representative of varieties of inferior quality, were analyzed as mature beans by methods noted. The data for ash, fat, protein, crude fiber, reducing sugars, sucrose, raffinose, dextrins, starch, pentosan, galactans, calcium, magnesium, and phosphorus are presented by varieties. The three edible varieties were found to contain less fiber than the two field varieties, but no other important differences were indicated by the data reported.

The cystine content of eleven varieties of soybeans, T. S. HAMILTON and F. I. NAKAMURA. (Ill. Expt. Sta.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 3, pp. 207-214).—On the basis of the cystine determined in fat-free and carbohydrate-free extracts, averaging 96.2 percent of the total nitrogen, and expressed as a percentage of the whole soybean seed, the cystine content varied from 0.213 for Virginia beans to 0.553 for Mansoy beans. Expressed in milligrams of cystine per gram of nitrogen, a variation from 33.1 for the Virginia beans to 89.4 for the Mansoy variety was found.

Effect of protein concentration and cysteine on growth of halophilic bacteria, L. S. STUART. (U. S. D. A.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 4, pp. 267-275, fig. 1).—The author shows that growth of halophilic bacteria at 3, 3.2, 3.5, and 3.8 M concentrations of sodium chloride is stimulated by increasing the concentration of protein. At a concentration of 4 M growth is not appreciably affected, but at 4.4, 4.5, 4.8, and 5 M, growth is inhibited as the concentration of protein increases. Increasing the concentration of protein in the substrate appears to offset the influence of unfavorably low pH when the sodium chloride concentration is not greater than 3.8 M.

The addition of small quantities of cysteine to agars and broths stimulates the growth of halophilic bacteria. There is a marked stimulation in media containing concentrations from 3 to 3.8 M sodium chloride at pH values ranging from about 6.6 to 7.2. With higher concentrations of sodium chloride the stimulating effect of cysteine is not so noticeable. The addition of cysteine to media also appears to offset the influence of unfavorably low pH.

The effects of protein concentration, sodium chloride concentration, and pH on the growth of halophilic organisms are markedly interdependent. At 3.2 and 3.8 M sodium chloride concentrations, increasing the protein concentration causes marked stimulation of growth when the pH is low, but only slight stimulation when it is high. However, when the concentration of sodium chloride is above 3.8 M, increasing the protein concentration tends to inhibit more strongly at the low pH than at the high.

The growth of halophilic bacteria in concentrations of sodium chloride above three molar, L. S. STUART. (U. S. D. A.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 4, pp. 259-265).—Although pure sodium chloride yielded solutions of constant pH at all concentrations at which the measurement was made, commercial grades were found capable of becoming more acid or more alkaline with increase in concentration from 3 to 5 M. In contact with air the salt media for bacteria showed Eh values decreasing with increase in salt concentration in the range above mentioned, but when air was excluded the Eh values did not change with change in salt concentration. A stimulation of the growth of halophytic bacteria by salt concentrations above 3 M under aerobic conditions is considered attributable to the decrease in dissolved oxygen content, and the concomitant slight decrease in oxygen tension, thus indicated. Growth of

halophiles under atmospheres partially deprived of oxygen supported the indication that such bacteria may require a relatively low oxygen tension for optimum growth.

Studies on the mold mycelia count of butter, R. L. VANDAVEER and J. D. WILDMAN. (U. S. D. A.). (*Jour. Assoc. Off. Agr. Chem.*, 23 (1940), No. 3, pp. 693-709, figs. 10).—The presence and growth of molds in cream are associated with the development of decomposition flavor characteristics. There is a correlation between the mold mycelium content of butter and the acidity of cream churned, sweet cream or good sour cream producing a butter of a zero or a very low mycelium count, while butter made from high acid cream almost invariably has a high mold mycelium count. Such a count shows conclusively that decomposed or unfit cream was used.

[Selenium content of plants and soils] (*South Dakota Sta. Rpt. 1940*, p. 15).—Work by A. L. Moxon and O. E. Olson has shown the selenium content of grasses and most forage plants to decrease with growth of the plants, western wheatgrass (*Agropyron smithii*) absorbing more than do other common grasses, while gumplant (*Grindelia squarrosa*) often contains relatively large quantities of selenium and increases in selenium content with advancing growth. The same authors report on the forms of chemical combination in which selenium is held in converter plants, of which combination in proteins appeared one of the more important; and on the occurrence of arsenic, which acts to some degree as antidote to selenium poisoning, in seleniferous plants, the indications of this study being that, although more arsenic than selenium occurs in most of the rocks and soils examined, the plants contain much less of arsenic than of selenium.

Iodine in drinking waters, vegetables, cottonseed meal, and roughages, G. S. FRAPS and J. F. FUDGE (*Texas Sta. Bul. 595 (1940)*, pp. 25, fig. 1).—Iodine was determined in nearly 500 samples of city and rural drinking waters, feeds (E. S. R., 83, p. 275), and feeding stuffs. The range in 103 samples of city waters was from 4 to 312 parts per billion, with an average of 56; in 37 samples of vegetables from 62 to 3,502 parts; in 235 samples of cottonseed meal from 23 to 1,420 parts; and in 56 samples of roughages and grasses from 17 to 1,125 parts per billion.

The use of iodized table salt for human consumption in Texas is considered not advisable, except under the supervision of a competent physician. Nor is the use of iodized mineral mixtures for livestock in Texas recommended.

The composition of certain nutshells, M. PHILLIPS and M. J. Goss. (U. S. D. A.). (*Jour. Assoc. Off. Agr. Chem.*, 23 (1940), No. 3, pp. 662-665).—The percentage compositions of the following nutshells were determined: Almond (*Amygdalus communis*), Brazil nut (*Bertholletia excelsa*), candlenut (*Aleurites moluccana*), coconut (*Cocos nucifera*), English walnut (*Juglans regia*), filbert (*Corylus avellana*), and pecan (*Hicoria pecan*). The shells were ground to pass through a 60-mesh sieve, were dried at 105° C., and the following determinations were made: Ash; nitrogen; methoxyl; alcohol-benzene extractives, hot-water extractives, 1 percent hydrochloric acid extractives, and total extractives; uronic acid anhydrides; total furfural; pentosans; crude cellulose; furfural in crude cellulose; cellulose; and lignin, nitrogen in lignin, ash in lignin, and methoxyl in ash-free and in "pure" lignin. In general, the percentages of methoxyl in the lignin were higher than those usually found in lignified plant material. In the shells of the Brazil, candle, and pecan nuts, however, the percentages of lignin were unusually high, exceeding those of such highly lignified materials as woods, and in these instances of very high lignin content the percentage of methoxyl in the lignin was relatively low. High pentosan percentages usually accompanied low lignin contents, and high lignin contents were usually associated with low pentosan contents.

Thermal decomposition of undercured alfalfa hay in its relation to spontaneous ignition, E. J. HOFFMAN. (U. S. D. A.). (*Jour. Agr. Res.* [U. S.], 61 (1940), No. 4, pp. 241-257).—It is shown conclusively that heating undercured alfalfa in an atmosphere of nitrogen at approximately from 76° to 78° C. causes an increase in oxygen absorption, and that the oxygen consumed in the oxidation of the preheated alfalfa is far in excess of the carbon dioxide produced. Under the influence of heat supplied from external sources, with the exclusion of bacterial action, changes take place in alfalfa that render it more susceptible to oxidation, and the results give further indirect evidence of the formation of unsaturated substances in alfalfa hay by heat and chemical action without the intervention of micro-organisms.

“The conclusion appears to be fully warranted that in a haymow in which temperatures approximating those of the laboratory experiments have been reached as the result of respiratory and micro-organic processes, together with the more limited chemical reactions, the hay will undergo fundamental changes that will render it more susceptible to oxidation, and if this heat is sufficiently prolonged under favorable conditions the hay will reach a condition that may appropriately be called pyrophoric.” The significance of the great increase in oxygen absorption caused by the presence of small quantities of ammonia is considered. The production of ammonia in the heating haymow, resulting in a weakly alkaline condition of the hay, is considered likely to facilitate the conversion of monosaccharides of the hay into unsaturated easily oxidizable compounds and thereby to promote spontaneous ignition.

The constitution of the so-called isocarotene [trans. title], P. KARRER and G. SCHWAB (*Helvetica Chim. Acta*, 23 (1940), No. 4, pp. 578-581).—Based on elementary analyses, the empirical formula for isocarotene is either $C_{40}H_{66}$ or $C_{40}H_{54}$. Structural formulas in accordance with known properties and reactions of the compound are formulated to correspond to these two empirical formulas. Evidence cited in favor of each of these structures is finally summarized as favoring the structure representing dehydro- β -carotene and associated with the formula $C_{40}H_{54}$.

Synthesis of 2-phytyl-1,4-naphthoquinone [trans. title], P. KARRER, A. GEIGER, A. RUEGGER, and G. SCHWAB (*Helvetica Chim. Acta*, 23 (1940), No. 4, pp. 585-590).—This paper presents the details of the experimental procedures involved in the synthesis of 2-phytyl-1,4-naphthoquinone. The scheme of the reactions employed and certain properties of the compound were noted in a preliminary report (E. S. R., 83, p. 735).

Another lower homolog of α -tocopherol [trans. title], P. KARRER and K. S. YAP (*Helvetica Chim. Acta*, 23 (1940), No. 4, pp. 581-584).—The synthesis is described of 2,5,7,8-tetramethyl-2-[12¹-metho-pentyl]-6-oxy-chroman. This compound differs from α -tocopherol in having the long aliphatic side chain shortened by two isoprene residues. In 40-mg. doses this newly synthesized compound was completely devoid of vitamin E activity. The compound 2,5,7,8-tetramethyl-2-[4',8'-dimethyl-nonyl]-6-oxy-chroman, previously synthesized and differing from α -tocopherol by one less isoprene group in the long side chain, showed no vitamin E activity in 20-mg. doses.

[Reports of referees and associate referees on analytical methods] (*Jour. Assoc. Off. Agr. Chem.*, 23 (1940), No. 3, pp. 445-658).—The following reports were contributed from the State and Federal institutions respectively noted: Carbohydrates in plants, by J. T. Sullivan (pp. 445-446), enzymes, by A. K. Balls (pp. 446-447), waters, brine, and salt, by A. E. Mix (pp. 447-451), butter, by J. A. Mathews (pp. 458-463), fat in malted milk, by E. W. Coulter (pp. 465-467), lactic acid in dried skim milk, by F. Hillig (p. 467), mold in butter, by J. D. Wildman (p. 468), neutralizers in dairy products, by F. Hillig (pp. 468-469), cereals, by V. E.

Munsey (pp. 477-480), ash in flour, macaroni products, and baked products, by L. H. Bailey (pp. 480-482), fat acidity in grain, by L. Zeleny (pp. 492-496), flour-bleaching chemicals, by D. B. Scott (pp. 497-502), ergot in flour, by L. C. Miller (pp. 504-505), standard solutions, by R. L. Vandaveer (pp. 540-542), standardization of sulfuric acid, by W. H. King (pp. 542-543), standardization of potassium permanganate solutions, by G. M. Johnson (pp. 543-546), pyrethrum, derris, and cube, by J. J. T. Graham (pp. 551-556); naphthalene in poultry lice products, by R. Jinkins (pp. 556-557), disinfectants, by C. M. Brewer (pp. 557-558), ash in molasses, by R. A. Osborn (pp. 567-572), flavors and nonalcoholic beverages, by J. B. Wilson (pp. 572-576), organic solvents in flavors, by R. D. Stanley (pp. 576-577), meat and meat products, by R. H. Kerr (pp. 577-578), spices and other condiments, by S. Alfend (pp. 578-586), vinegars, by A. M. Henry (pp. 586-588), fish and other marine products, by H. D. Grigsby (pp. 589-593), cacao products, by W. O. Winkler (p. 593-596), gums in foods, by F. L. Hart (pp. 597-603), oils, fats, and waxes, by G. S. Jamieson (pp. 603-604), nuts and nut products, by S. C. Rowe (p. 605), microbiological methods, by A. C. Hunter (pp. 606-607), frozen egg products, by R. Schneiter (pp. 613-617), biological methods for determination of vitamin D carriers, by C. D. Tolle (pp. 648-652), and biological methods for components of the vitamin B complex, by O. L. Kline (pp. 653-654) (all U. S. D. A.); dairy products, by G. G. Frary (pp. 451-453); total solids and ash in milk and evaporated milk, by G. G. Frary and B. Jordan (pp. 453-457); tests for pasteurization of butter, by E. H. Parfitt (pp. 469-470) (Purdue Univ.); sugar in flour, by R. M. Sandstedt (pp. 496-497) (Univ. Nebr.); whole wheat flour, by C. S. Ladd (pp. 508-512); sugars and sugar products, by R. F. Jackson (pp. 558-560); maple products, by J. L. Perlman (pp. 560-562); salad dressings, by L. T. Ryan (p. 589); coffee and tea, by H. J. Fisher (pp. 605-606) (Conn. [New Haven] Expt. Sta.); feeding stuffs (p. 617) and need of a method for determination of castorseed in feeding stuffs (pp. 618-619), both by L. S. Walker (Vt. Sta.); sampling feeding stuffs, by L. M. Jeffers (pp. 619-620); ash in feeding stuffs, by J. L. St. John (pp. 620-636) (Wash. Sta.); mineral mixed feeds, by A. T. Perkins and B. W. Beadle (pp. 637-640) (Kans. Sta.); manganese in stock feeds, by J. B. Smith and E. J. Deszyck (pp. 654-656) (R. I. Sta.); and adulteration of condensed milk products and cod-liver oil, by P. B. Curtis (pp. 656-658) (Purdue Univ.).

The Shaffer-Somogyi reagent for the determination of sugars in plant materials, T. A. PICKETT. (Ga. Expt. Sta.). (*Jour. Assoc. Off. Agr. Chem.*, 23 (1940), No. 2, pp. 431-437, fig. 1).—Results obtained with the copper iodometric method for fermentable sugars agreed fairly closely with reducing sugar values obtained by the Official method of Quisumbing and Thomas. In determinations of sucrose the two methods agreed closely. The copper iodometric reagent was found to be economical, rapid, and applicable to materials of low sugar content, all these characteristics being of value in the determination of sugars in plant material.

Thorium nitrate titration of micro quantities of fluorine in aqueous and alcoholic systems, J. W. HAMMOND and W. H. MACINTIRE. (Tenn. Expt. Sta. et al.). (*Jour. Assoc. Off. Agr. Chem.*, 23 (1940), No. 2, pp. 398-404, figs. 2).—The authors present results indicating that microquantities of fluorine cannot be determined accurately in aqueous systems by application of the normality value of a thorium nitrate solution. Were normality value applied for the 2-50- μ g. range in the aqueous systems adjusted with hydrochloric acid, the mean apparent incidence would be 1.5 times the true value. Similar application of normality value for microgram range in the buffered aqueous systems would give a medial apparent indication 2.05 times the true medial. For such microgram range, titration value of a thorium nitrate solution must be de-

terminated empirically against corresponding quantities of fluorine from a material of known assay and for the specific solvent, definite volume, and identical quantity of indicator. When titrations are made in alcoholic solution, however, application of the stoichiometrical value of the standard thorium nitrate will give accurate values in a solution of adjusted pH and without inclusion of a buffer solution.

Quantitative spectroscopic analyses of important trace elements in mixed fertilizers, E. H. MELVIN, R. T. O'CONNOR, O. R. WULF, and C. H. KUNSMAN. (U. S. D. A.). (*Jour. Assoc. Off. Agr. Chem.*, 23 (1940), No. 2, pp. 282, 283).—The authors determined boron, copper, and manganese simultaneously by a spectroscopic method in which standards and samples were prepared for analysis by the addition of 0.05 percent of beryllium which served as an internal reference element. The importance, for direct current arc excitation, of burning the sample completely is among the points brought out.

Estimation of decomposition of fish muscle, H. C. BRADLEY and B. E. BAILEY. (Univ. Wis.). (*Food Res.*, 5 (1940), No. 5, pp. 487-493, fig. 1).—The phosphomolybdate color test for tyrosine was found sufficiently sensitive to permit detection of the beginning of spoilage before taste or odor or spoilage could be noted. A sample consisting of 20 gm. of the fish product was extracted for 30 min. or more with 50 cc. of water. Of the resulting suspension 10 cc. were diluted with 10 cc. of water and treated with 20 cc. of 10 percent trichloroacetic acid. After 3 hr. the precipitated protein was filtered out and the filtrate (from 1 to 10 cc.) was treated with 15 percent sodium carbonate (20 cc.) and 5 cc. of the tyrosine reagent, the volume being completed to 50 cc. Comparison was made in a colorimeter with standards containing known quantities of tyrosine.

On the use of various sera for the determination of the soluble calcium and phosphorus in milk, G. T. PAYNE (*Jour. Dairy Res.* [London], 11 (1940), No. 3, pp. 292-297).—The sera examined in this study included milk dialysate in the static form, rennet whey, papain whey, and mercuric chloride borax serum. Rennet whey was the most satisfactory and yielded fairly accurate values for calcium, but slightly low values for phosphate in fresh milk. With increasing acidity of the milk both sets of values tended to rise somewhat in comparison to those of the dialysate. Mercuric chloride borax serum gave higher results for soluble phosphate in fresh milk, while with increasing acidity the results dropped steadily. Papain whey gave somewhat low results for both the phosphate and calcium of raw and pasteurized milk, and exhibited the same tendency as rennet whey to yield higher results as the acidity of the milk increased.

A comparator for the resazurin test, J. G. DAVIS and S. B. THOMAS (*Dairy Indus.*, 5 (1940), No. 9, pp. 244-246, figs. 2).—Two types of Lovibond color comparators are described and illustrated. The data presented indicate that finer color distinction is possible through use of the comparator than by simple color grading. Good agreement of results were obtained by two or more observers.

Ash determinations in foods with an alkaline balance, [1], H. J. WICHMANN. (U. S. D. A.). (*Jour. Assoc. Off. Agr. Chem.*, 23 (1940), No. 3, pp. 680-687, fig. 1).—The author studied various sources of discrepancy in the results of ash determinations. Turned covers of duralumin were made to fit platinum dishes and were shown to prevent absorption of moisture by the ash even in a very moist atmosphere. Heating a sulfated ash to constant weight required as much time as obtaining consistent results in the determination of true ash, and the author also considers that a sulfated ash differs too much from a normal ash. In the determination of ash as carbonated ash, the temperature for the reheating after adding ammonium carbonate was reduced to 260° C. ($\pm 10^\circ$) because higher temperatures appeared to bring about a slow decomposition of the carbonates. Variations in temperature in various parts of the crucible

space of the muffle furnace are held responsible for some discrepancies. Such differences in temperature may be lessened by placing the ashing dishes on a silica plate supported above the floor of the muffle.

Interpretation of a new method for the detection of bleaching of flour with chlorine, D. B. SCOTT. (U. S. D. A.). (*Jour. Assoc. Off. Agr. Chem.*, 23 (1940), No. 3, pp. 675-678).—The author made some minor modifications in the procedure in accordance with the observations of collaborators, determined the chlorine content of a number of bleached and unbleached flours, compared these results with those of some other analysts, and concluded that a chlorine content in the extracted fat amounting to more than 0.25 mg. per gram definitely indicates treatment with chlorine bleaching compounds. The average chlorine content of the 28 authentic samples was 0.11 mg. per gram of fat.

Copper in tomatoes, W. J. SHANNON and D. T. ENGLIS. (Univ. Ill.). (*Jour. Assoc. Off. Agr. Chem.*, 23 (1940), No. 3, pp. 678-680).—To obtain a basis for the detection of copper from processing equipment or from other sources exclusive of the natural copper content of the unprocessed material, four varieties of tomatoes were subjected to oxidation with nitric and perchloric acids, the copper content being estimated by means of the diethyldithiocarbamate color reaction with the use of a photoelectric colorimeter. The copper content of the material analyzed varied from 15 to 25 p. p. m., approximately.

Determination of chlorides in feeding stuffs, G. E. GRATTAN and A. POTVIN (*Jour. Assoc. Off. Agr. Chem.*, 23 (1940), No. 2, pp. 425-428).—The authors found ordinary ashing to cause a loss of chlorides both by direct volatilization and by formation of hydrochloric acid through the action of nonvolatile acid oxides on the chlorides. Adding oxides of alkaline-earth metals necessitated making blank determinations. These difficulties were overcome by ashing at 550° C. in the presence of sodium carbonate. This method gave satisfactory results but was time consuming and tedious. A second method was then developed, the organic matter being destroyed by oxidation with potassium permanganate solution. Such oxidation could be completed by boiling for about 10 min. The excess permanganate was decomposed by hydrogen peroxide. The chloride content was finally determined, in either method, by titration with silver nitrate solution.

Determination of carotene in presence of lycopene, G. S. FRAPS, A. R. KEMMERER, and S. M. GREENBERG. (Tex. Expt. Sta.). (*Jour. Assoc. Off. Agr. Chem.*, 23 (1940), No. 2, pp. 422-425).—Magnesium carbonate, prepared by heating for 1 hr. at 200° C. and, when necessary, adjusted with respect to its moisture content after cooling, was found to adsorb lycopene without adsorbing carotene. This reagent, tested in the process of adjusting its moisture content by means of a lycopene solution prepared from canned tomato pulp, was found to remove much more lycopene from carotene solutions than did a similar magnesium carbonate reagent standardized for adsorption of crude xanthophyll prepared from alfalfa-leaf meal.

An adsorption method for the determination of pure carotene, G. S. FRAPS, A. R. KEMMERER, and S. M. GREENBERG. (Tex. Expt. Sta.). (*Jour. Assoc. Off. Agr. Chem.*, 23 (1940), No. 3, pp. 659-662).—The modified A. O. A. C. method, in which the carotene in petroleum ether solution is purified by shaking with an adsorbent to remove impurities, is shortened by adsorbing the xanthophyll and impurities directly, instead of first washing with methyl alcohol and then using the adsorbent. Comparisons of the results obtained in determinations on 19 samples indicated that the shorter adsorption method gives the same results for pure carotene as does the longer modified A. O. A. C. method.

Chromatographic identification and biological evaluation of carotene from mature soybeans, W. C. SHERMAN. (Ala. Polytech. Inst.). (*Food Res.*, 5 (1940), No. 1, pp. 13-22).—Pigments were removed from the ground soybeans

by successive extraction with methanol, ethanol, and skellysolve. Following saponification of the combined extracts, the method of Sherman and Salmon (E. S. R., 83, p. 130) was employed for removal of the xanthophyll and purification of the carotene solution. The purified extract, concentrated to small volume under reduced pressure and taken up in skellysolve, was subjected to chromatographic analysis applied on a microscale. The solution was poured through a small Tswett column packed with an intimate mixture of magnesium oxide and heated siliceous earth. The bands of pigment, usually three in number, were separated, and the pigment was completely removed from each adsorbent layer by appropriate washing. The final solutions were made up to suitable volumes in which the pigment content was determined by calculation based on spectrophotometer readings at 475 m μ . Identification of the pigment obtained from each band was established by chromatographic analyses of a mixture of the unknown with a known pigment, α - and β -carotene and cryptoxanthin being used as the pigments for identification. Results obtained with five varieties (F. P. I. Nos. 85384, 93057, and 94168, Matthews, and Kura) of soybeans showed that the total pigment content ranged from 92 γ to 174 γ per 100 gm. and that from 80 to 88.8 percent of it was β -carotene, while from 2.5 to 11.8 percent was α -carotene. Cryptoxanthin was not found. These results were confirmed by biological assays in which the soybeans, fed on an equivalent carotene basis (2 γ daily) to vitamin A-deficient rats, gave growth responses similar to those obtained from 2 γ of β -carotene. Yellow corn fed as a control at a level to supply 2 γ of pigment produced a smaller weight gain than did the soybeans, since 66 percent of the corn pigment, as shown by chromatographic analysis, was cryptoxanthin.

A chemical study of juice from Concord grapes, C. F. POE (*Fruit Prod. Jour. and Amer. Vinegar Indus.*, 19 (1940), No. 6, pp. 175-178).—Data on total and sugar-free solids; ash; total, volatile, and fixed acids; and reducing sugars, together with values for specific gravity, alkalinity of the ash, and ratios of sugar to acid and of sugar-free solids to ash are reported for 54 samples of Concord grape juices from grapes of the seasons of 1933, 1934, 1935, and 1937, respectively. The grapes, purchased on the open market, represented fruit grown in Nebraska, Missouri, Arkansas, Michigan, Colorado, and Kansas. The juices, expressed hot from washed (adhering water removed) crushed grapes, were filtered and sterilized and stored under refrigeration until analyzed. Similar data are given for a few samples each of juices from Niagara, Delaware, and white grapes. Not only were there seasonal variations in average composition, but within any given season different samples varied widely in composition. It is considered, therefore, that the determination of most of the constituents would be of little value for the purpose of judging the purity in cases of minor adulterations.

Chemical and physical characteristics of the petroleum ether soluble material of fresh and canned Florida Valencia orange juice, A. J. NOLTE and H. W. VON LOESECKE. (U. S. D. A.). (*Food Res.*, 5 (1940), No. 5, pp. 457-467, fig. 1).—From fresh juice the authors obtained unidentified waxy bodies insoluble in petroleum ether; oleic, linoleic, cerotic, palmitic, and stearic acids; unidentified aliphatic alcohols and resins; phytosterols; sterols; and carotenoid pigments. The characteristics of the petroleum ether extract of aged canned orange juice indicated that the fatty material had undergone oxidative changes, with the formation of hydroxy acids and other decomposition products, and had become rancid. It is believed that off-flavors subsequently developing in canned orange juice are, to some extent, due to the oxidation of the fat in the juice.

Citrus fruit products, E. M. CHACE, H. W. VON LOESECKE, and J. L. HEID (*U. S. Dept. Agr. Cir.* 577 (1940), pp. 47, figs. 14).—This circular, which supersedes Department Circular 232 (E. S. R., 48, p. 13), describes present commercial

manufacturing methods for products from cull and surplus citrus fruit. Processes for the production of canned and frozen juices, canned segments, vinegar, beverage bases, alcoholic beverages, citric acid, pectin, essential oils, candied peel, marmalade, and jellies are described. Home-use recipes for the last three products are included. The final section takes up disposal of the wastes from citrus canneries and other byproduct plants.

Some factors in the spoilage of an acid canned fruit, C. H. SPIEGELBERG. (Hawaii. Pineapple Prod. Expt. Sta.). (*Food Res.*, 5 (1940), No. 5, pp. 439-455, figs. 3).—Factors involved in the spoilage of an acid canned fruit caused by both spore-forming (*Clostridium pasteurianum*) and non-spore-forming (*Lactobacillus plantarum*, *Leuconostoc mesenteroides*) and three unnamed types of bacteria are discussed. Commercial processes were found effective when fruit of average pH was packed with commercial pineapple-juice sirups. Swells developed only when the time or temperature of processing was greatly reduced from the standard. When the pH of the can contents was increased either by adjusting the pH of the sirup or by selecting high pH fruits and packing them with unadjusted commercial sirups, however, pH was found a factor of considerable importance in sterilization. A low pH juice sirup was more effective in producing sterility than a high pH juice sirup. Unbuffered water sirup was more effective than naturally buffered juice sirup. At a pH of from 4.4 to 4.5 and below, a temperature of 87.8° C. (190°F.) in the fruit leaving the cooker was adequate to insure sterility, but at pH 4.5 and above a temperature of 93.3° C. was required to eliminate the non-spore-forming types of swells, while butyric swells persisted with even much higher temperatures. It is considered that spoilage may be avoided by maintaining the final pH of cans at or below 4.4 and processing to give a temperature of 190° F. or above in the fruit from the cooker.

200 tell what they prefer in pickle sweeteners, R. G. SWITZER and F. W. FABIAN. (Mich. Expt. Sta.). (*Food Indus.*, 12 (1940), No. 11, pp. 38-40, fig. 1).—Four series of pickles were prepared, in which sugar at 37° and at 33° Brix (20.3° and 18.2° Baumé, respectively) and acid, as acetic, at 2.0 and 2.28 percent (20 and 22.8 gr., respectively) were the variables. In all experiments three combinations of sugar were used, namely, 100 percent sucrose, 75 percent sucrose plus 25 percent dextrose, and 50 percent sucrose plus 50 percent dextrose. Samples of the 12 products resulting were sent to 40 different pickle companies and food laboratories where about 200 people scored the products, according to definite instructions, for flavor and general palatability. Analysis of the scores indicated that the tasters were more sensitive to slight increases in acidity than to slight reductions in sweetness, and that within practical limits there should be for every grain increase or decrease in acetic acid a corresponding increase or decrease of 1° Baumé. The best combination of sucrose and dextrose in a 20° sirup at 20 gr. acidity was 75 percent sucrose and 25 percent dextrose. Increasing the acidity to 22.8 gr. in either the 18° or the 20° sirup or reducing the sugar concentration to 18° at 20 gr. acidity decreased the number of first choices in the sucrose-dextrose combination as compared with sucrose alone.

[Jerusalem artichoke as raw material for fermentation lactic acid] (*Utah Sta. Bul.* 294 (1940), pp. 12, 41).—This report notes briefly the possibility of producing a fermentable material at a cost less than that of corn or blackstrap molasses, the development of a fermentation method utilizing a *Bacillus* species, and the elaboration of an hydrolysis process satisfactory for breaking down the inulin content of the tubers into fermentable units.

Turpentine still buildings and equipment (*U. S. Dept. Agr., Misc. Pub.* 387 (1940), pp. [2]+44, figs. 35).—This publication contains specifications, working drawings, and bills of materials for still buildings including ramp, for a copper

fire still for turpentine, and for a still worm to be attached to this still. Directions for setting the fire still are given in addition to the drawings. Condenser tub, separators, dehydrators, rosin vats, and a cooper's winch are also taken up. Working drawings for these accessories are included.

AGRICULTURAL METEOROLOGY

Report of the Chief of the Weather Bureau, 1940, F. W. REICHELDERFER (*U. S. Dept. Agr., Weather Bur. Rpt., 1940, pp. 16*).—This report discusses the reorganization of the Central Office; outlines the work of the weather service for civil airways, the forecasting and warning services, the river and flood service, and climate and crop service; briefly summarizes the weather of 1940; describes the instrument equipment of the Bureau; briefly reviews the progress in meteorological research and education; and notes the Bankhead-Jones projects conducted by the Bureau during 1940.

Climatological data for the United States by sections, [January–June 1940] (*U. S. Dept. Agr., Weather Bur. Climat. Data, 27 (1940), Nos. 1–6, [about 220 pp., 2 pls., 8 figs. each]*).—These numbers contain the usual brief summaries and detailed tabular statements of climatological data for each State.

Climates, climax, and vegetational strata [trans. title], H. GAUSSEN (*Bol. Soc. Broteriana, 2. ser., 13 (1938–39), pp. 29–40*).—A discussion of the relations of climate and climax to plant associations at different elevations.

In how far does the farmer consider the climatic factor? [trans. title], P. LEHMANN (*Bioklim. Beibl. Met. Ztschr., 7 (1940), No. 3, pp. 77–85*).—A general discussion and review (27 references).

Fog: Its causes and forecasting with special reference to eastern and southern United States, I–III, J. J. GEORGE (*Amer. Met. Soc. Bul., 21 (1940), Nos. 4, pp. 135–148, figs. 5; 6, pp. 261–269, figs. 5; 7, pp. 285–291, figs. 5*).—In part 1 the author discusses the conditions necessary for fog, and presents a new classification of fogs and a procedure for forecasting them. In part 2 he presents the results of quantitative studies of fog causes and forecasting at Atlanta, Ga., Camden, N. J., Richmond, Va., and Louisville, Ky., and in part 3, at Jacksonville, Fla., San Antonio, Tex., and New Orleans, La.

Temperature in the hothouse [trans. title], K. WEGENER (*Bioklim. Beibl. Met. Ztschr., 7 (1940), No. 3, pp. 109–112, figs. 3*).—A general discussion of temperature relations and control in greenhouses.

SOILS—FERTILIZERS

[Soil and fertilizer investigations of the Bureau of Plant Industry] (*U. S. Dept. Agr., Bur. Plant Indus. Rpt., 1940, pp. 12–13, 27–35*).—Fertilizer researches given in this report include investigations on the domestic source of magnesium in fertilizers, production of dicalcium phosphate from phosphate rock, granulation of superphosphate, and methods of decreasing the caking tendency of hygroscopic fertilizer materials.

Soil chemistry and physics investigations included characteristics of various soil groups, minor elements in soils and vegetation, a study of rapid soil tests in comparison with laboratory methods, and the relation of thermal conductivity and moisture content of soils.

Soil-fertility investigations are reported on the use of leaf symptoms to show soil deficiencies, improvement of soil fertility in relation to pecan yield, fertilizers for strawberry growing, fertilizer studies on southern truck crops and cotton soils, relation of fertilizer and plant composition to cotton root rot, the effect of nitrogen fertilizers on sugar beet yields, domestic in comparison with foreign potash for potatoes, and fertilizer studies on certified seed potatoes.

Soil-microbiology investigations included data from a study of bacteriophages found in soils, a test of legume inoculants, and soil micropopulation in relation to control of root diseases.

Soil survey progress includes improvement of methods and a list of surveys made and published.

[Soil investigations by the New Jersey Stations] (*New Jersey Stas. Rpt. 1940, pp. 80-85, fig. 1*).—Lysimeter studies, quick soil tests, soil-profile investigations, land use in relation to soil fertility, soil-nitrogen relations, action of green manure, phosphorus fixation, dolomitic v. high-calcium lime, use of lime, the effect of boron on plant growth, the need of New Jersey soils for boron, oxygen tension in relation to root growth, organic matter and surface mulch for erosion control, the role of soil microbes in erosion control, nitrogen fixation, commercial use of soil microbes, microbial antagonism, and the role of actinomycetes in the soil are briefly reported.

[Soil investigations by the Cornell Station] (*[New York] Cornell Sta. Rpt. 1940, pp. 92-94, 95-96*).—Progress is reported on investigations of the oxidation-reduction phenomena in soils in relation to the availability of certain minor elements by R. W. Cummings and R. Bradfield; phosphorus fixation for three New York soils by E. V. Staker and Bradfield; the effect of soil type upon the growth of black locust plantations and the relation of soil character to forest growth in the Adirondack region by R. F. Chandler, Jr.; and zinc toxicity in peat soils by B. D. Wilson and Cummings.

[Soil investigations by the Oklahoma Station] (*Oklahoma Sta. Bien. Rpt. 1939-40, pp. 38-45, 46-48, 52, figs. 4*).—Reports are made of progress on cooperative experiments with individual farmers of the State to serve as a basis for recommending various agronomic practices, the average plant nutrient content and soil reaction of 13 soil areas, the effect of soil pore space on plant growth, the loss of sulfur from Oklahoma soils, and cotton burs as a fertilizer for cotton.

[Soil investigations by the South Dakota Station] (*South Dakota Sta. Rpt. 1940, pp. 5, 6, fig. 1*).—Research by L. F. Puhr on the effect of cropping practices on soil organic matter and nitrogen and the difference in rate of decomposition of crop residues in the soil is reported.

[Soil investigations by the Texas Station]. (Partly coop. U. S. D. A.). (*Texas Sta. Rpt. 1939, pp. 16, 95-98, 211-212, 264-266*).—Investigations include a greenhouse study of factors of soil fertility, by G. S. Fraps, J. F. Fudge, and P. F. Macy, and nitrification in soils under different conditions, by A. J. Sterges. The status of a soil survey for Brown County is reported by E. H. Templin et al.; for Cherokee County, by H. M. Smith et al.; for McLennan County, by Templin et al.; and for Uvalde County, by W. I. Watkins and W. T. Carter. Soil investigations reported from the Nacogdoches Substation include results of preliminary studies of artificial plats for field experiments, and green-manure investigations, both by H. F. Morris. Soil investigations at the Weslaco Substation include progress on the acid sulfur composts, comparisons between sulfur and sulfur compost in the rate of acid development in soils, the effects of various acidifying chemicals and fertilizers on soil pH, and diffusion of acidity outward from spot and trench applications of sulfur, all by G. H. Godfrey and H. Rich.

[Soil investigations by the Utah Station] (*Utah Sta. Bul. 294 (1940), pp. 45-51, figs. 2*).—Progress is reported on the studies of the loss of nitrogen and organic matter from dry lands, physical and chemical studies of soil types, factors affecting the activities of bacteria in soils, the effect of various fertilizers on crop yields, and the effect of different fertilizer treatments on the quantity and distribution of different elements in beets.

[Soil investigations by the West Virginia Station]. (Partly coop. U. S. D. A.). (*West Virginia Sta. Bul. 298 (1940), pp. 4, 7*).—F. W. Schaller and

G. G. Pohlman report the effect of soil management on pasture returns. Root growth of deep-rooted plants in limestone soils is reported on by Pohlman, T. C. McIlvaine, and W. M. Broadfoot.

Report of the Chief of the Soil Conservation Service, 1940, H. H. BENNETT (*U. S. Dept. Agr., Soil Conserv. Serv. Rpt., 1940, pp. 64*).—The cost and extent of erosion in the United States, and the accomplishments for better protection and use of the land under soil conservation practices are reported. Action research, the economic aspects of soil conservation for the various regions, development of soil conservation districts, land-use capabilities, and outstanding findings at the soil conservation experiment stations are briefly reported. Engineering phases of this report are noted on page 823.

Soil conservation achieved by the AAA program, F. L. MORISON (*Ohio Sta. Bimo. Bul. 208 (1941), pp. 11-12*).—Percentages of increase in soil-conserving crops and of decrease in soil-depleting crops and related information for the period from 1937 to 1940 are summarized and briefly discussed.

Erosion and related land use conditions (*U. S. Dept. Agr., Soil Conserv. Serv., Erosion Survey 12 (1940), pp. [1]+25, pls. 3, figs. 2, maps 2; 13, pp. [1]+31, pls. 5, fig. 1, maps 2; 14, pp. [1]+23, pls. 3, fig. 1, maps 2; 16, pp. [1]+35, figs. 13, maps 2*).—Conservation surveys are reported as follows: Hell and Mud Creeks Demonstration Project, Mississippi, by D. T. Webb; Mad River Watershed, Vermont, by C. H. Atkinson; Lake Crook Watershed, Lamar County, Texas, by H. Oakes; and Crooked Creek Project, Near Indiana, Pa., by J. G. Steele and R. G. Mowrey.

The story of soil conservation in the South Carolina Piedmont, 1800-1860, A. R. HALL (*U. S. Dept. Agr., Misc. Pub. 407 (1940), pp. [1]+36, figs. 9*).—This publication is a historical review dealing with some early efforts to stop the depletion and destruction of land by continuous cotton growing and by alternating corn and cotton crops.

[**Soil erosion investigations by the West Virginia Station**] (*West Virginia Sta. Bul. 298 (1940), pp. 5-7*).—A study of the slipping of soils is briefly reported upon by S. L. Galpin, and the rebuilding of eroded soils by G. G. Pohlman, W. M. Broadfoot, W. C. Percival, T. Holsoe, and G. M. Browning.

Factors affecting aggregation of Cecil soils and effect of aggregation on run-off and erosion, J. ELSON and J. F. LUTZ. (N. C. Expt. Sta. coop. U. S. D. A.). (*Soil Sci., 50 (1940), No. 4, pp. 265-275*).—Soils from several plats of the U. S. D. A. Soil Conservation Field Station and from the Piedmont Substation, both at Statesville, were studied in an attempt to find the relationship between chemical and physical soil properties and erosion. Results are reported on aggregate analysis, organic carbon, changeable hydrogen, total exchange capacity, percentage of sesquioxides, and pH. Aggregation was highest and erosion less on plats where a 4-yr. rotation, including lespedeza, was grown. An area in continuous grass for 7 yr., but which was declining toward the end of the period, was almost as effective as the 4-yr. rotation in aggregating the topsoil but was less effective in the subsurface soil due to the shallow-rooted character of the grass cover. Continuous cotton had the lowest percentage of aggregation in both the topsoil and subsurface soil, and decrease in aggregation with a reduction in the free iron oxide content of the soil due to superphosphate fertilization is discussed. Aggregation of Cecil clay was decreased by liming. The condition of the humus was found to be more important than the total organic matter present in bringing about aggregation.

Field tests on the effectiveness of trashy fallow and contour seeding in controlling erosion, J. H. PARKINS (*Northwest Sci., 14 (1940), No. 4, pp. 88-89*).—Field tests by the U. S. D. A. Soil Conservation Service in Oregon demonstrated the effectiveness of trashy fallow and contour fallow in controlling erosion

in connection with wheat production. Comparisons are reported for four fields of approximately 10 percent slope on Walla Walla silt loam. Different tillage was used in each field, and varying amounts of straw were left on the surface. Soil loss was estimated by measuring the length and cross section of the rills formed. These field trials indicate that contour seeding and trashy fallow appear to be of nearly equal effectiveness.

The base binding capacities of hydrogen clays as determined by different methods, I. R. P. and A. K. MITRA (*Indian Jour. Agr. Sci.*, 10 (1940), No. 3, pp. 344-351).—Total acidities of colloidal solutions of hydrogen clays calculated from their electrometric titration curves have been compared with their base-binding capacities obtained by other methods.

Relationship between organic matter content and moisture constants of soils, J. T. STONE and C. S. GARRISON. (Mich. Expt. Sta.). (*Soil Sci.*, 50 (1940), No. 4, pp. 253-256).—Soil samples from Michigan fence lines, which have been in sod cover perhaps since the land was cleared, were compared with samples obtained from adjoining cultivated fields. Hygroscopic-moisture, moisture-equivalent, wilting-coefficient, and organic-matter-content determinations were made for several different soil types to establish any relationship between organic-matter content and moisture condition. In all but one case the organic-matter content of the soil collected from the sod areas was higher than that from the adjoining field. A direct correlation was obtained between organic-matter content of the soils and their available moisture.

The use of soil moisture characteristics in soil studies, E. C. CHILDS (*Soil Sci.*, 50 (1940), No. 4, pp. 239-252, figs. 6).—The use of "soil-moisture characteristic curve" is demonstrated by applying it to the study of soil tilth and soil stability. Soil-moisture characteristics are assumed to indicate pore size distribution in certain cases. The author brings out, in a discussion of pore space in a clay fraction and in a sand fraction, that the use of the terms "capillary or noncapillary pore space" is misleading, since they imply a knowledge of the physical properties of the pores which is not known. A numerical value as a definition of soil stability is developed.

Effect of exchange sodium on the moisture equivalent and the wilting coefficient of soils, F. M. EATON and C. R. HORTON. (U. S. D. A.). (*Jour. Agr. Res.* [U. S.], 61 (1940), No. 6, pp. 401-425, figs. 3).—The average moisture equivalents of 12 well-leached Ca, Mg, K, and Na soils were Ca 17.9, Mg 18.1, K 18.8, and Na 33.8. The average moisture uptake by these soils when exposed (after oven drying) in an atmosphere with a relative humidity of 84 percent at 20.3° C. was K 2.66, Na 3.09, Ca 3.26, and Mg 3.38 percent. A close parallelism was found for 10 soils between the effect of sodium on the moisture equivalent and the percentage of clay, the exchange capacity, and the quantity of adsorbed sodium.

Adsorbed sodium decreased the moisture equivalent of a soil high in silica and that of an Aiken (lateritic) clay. Both of these soils had low cation exchange capacities. The moisture in centrifuged Ca soil samples increased from the inner toward the outer surfaces. An opposite gradient was found in Na soils. Some migration and segregation of sand, silt, and clay particles occurred when the finer-textured Na soils were centrifuged, a higher proportion of large particles being observed in the outer portions with well-defined clay layers on the inner surface. In certain of the soils water was also displaced toward the axis of rotation and remained on the surface after centrifuging.

Wetting Na soils with normal calcium or sodium chloride solutions gave moisture equivalent values that were nearly the same as those of Ca soils. The moisture equivalent may, therefore, provide a measure of sodium-induced dispersion of field soils if comparisons are made between leached and unleached

soils and soils wetted with a strong electrolyte. The moisture equivalent of mixtures of Ca and Na soils in successive proportions gave sigmoid graphs. The moisture equivalent was not significantly affected by less than 2 milliequivalents of adsorbed sodium per 100 gm. of soil, and values approaching maximum were found when there were 12 m. e. or more of adsorbed sodium. Adsorbed sodium caused soil moisture to be less available to plants.

The calcium and sodium averages of 9 soils were at the moisture equivalent 17.5 and 29.5, at the wilting coefficient 8.4 and 11.3, and at the ultimate wilting point 7.8 and 9.2, respectively. Plotted as moisture content against a pF scale, the Ca and Na soil graphs intersected at moisture percentages below the ultimate wilting point.

Studies on soil temperatures in relation to other factors controlling the disposal of solar radiation, R. K. DRAVID (*Indian Jour. Agr. Sci.*, 10 (1940), No. 3, pp. 352-387, figs. 5).—Experiments showed the sensitivity of soil temperatures to changes of color or surface wetness, and the thermal diffusivity is not influenced by the surface treatments but increases when the moisture content of the interior of the soil is increased during the wet season.

A comparison of the organic matter of uncultivated and cultivated Appalachian upland Podsol soils, H. F. SALISBURY and W. A. DELONG (*Sci. Agr.*, 21 (1940), No. 3, pp. 121-132).—Appalachian upland Podzol soils from forested, cultivated, and pastured areas have been studied to determine the amount and nature of the organic matter in the plow-depth layer. After about 75 yr. of deforestation the cultivated and pastured soils were found to be somewhat lower in organic matter than the forested soils. The hemicellulose and lignin content for the forested soils is higher than that for the cultivated or pastured soils.

The pedography of hydrologic Podzol series, I, II (*Lantbr. Högsk. Ann. [Uppsala]*, 7 (1939), pp. 185-227, figs. 11, *Swed. abs.* pp. 226-227; 8 (1940), pp. 183-207, figs. 7, *Swed. abs.* p. 207).—These papers cover mainly a description of a new hydrologic soil series and a report of some chemical and physical properties. In I, Loss on ignition, pH, and amphoteric reactions, by Mattson and H. Lönnemark, results are presented, in the form of charts, for 190 samples from a hydrologic series of 15 Podzol profiles, giving loss on ignition, pH, and amphoteric reactions. In II, The loss on ignition and the reaction of the Annerstad series, by H. Lönnemark, L. Wiklander, and S. Mattson, Annerstad soil, a new hydrologic soil series, located near the south end of Lake Bolmen in the province of Småland in southern Sweden, is described in detail.

Chemical and physical properties of soils and of their colloids developed from granitic materials in the Mojave Desert, I. C. BROWN and M. DROSDOFF. (U. S. D. A.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 5, pp. 335-352).—Of the six Mojave Desert profiles studied, three were residual soils derived from granite, the others from alluvial fan material. Well-developed clay pan horizons were found in five of these soils, none in the remaining one. All were found near Mojave, Calif., at from 2,700 to 3,000 ft., and have developed under about 5 in. annual rainfall and at an annual mean temperature of about 65° F. The observed chemical alteration of clay pan soils was greater than the moisture supplied by the rainfall of the desert is expected to produce. Neither the chemical nor the mineralogical composition of the colloids appeared to be influenced by the formation of a clay pan in these desert soils. The colloids were found saturated with bases, chiefly calcium and magnesium. Of the total iron, 25 percent was present as free iron oxide. X-ray data indicated that about 75 percent of the colloids consists of a mixed-layer mineral of hydrous mica and montmorillonite similar to the coarse weathered mica in the soil. About 25 percent was kaolinite (halloysite).

Soils of Michigan, C. E. MILLAR. (Coop. U. S. D. A.). (*Michigan Sta. Cir.* 176 (1940), pp. 20, figs. 9).—Michigan soils are considered from the standpoint of formation, soil-forming processes, productivity, and recommended management practices. On a state-wide productivity basis, Michigan contains from 9 to 10 million acres of land classed as excellent to good soils well suited for farming; and 10 to 11 million acres of good to fair soils which are mainly suited for farming with occasional areas which require special farming methods or should be retired from agricultural use under present conditions; 7 million acres of fair to poor soil, part of which should be retired from agricultural use due to stoniness, poor drainage, unfavorable topography, or droughtiness; and from 9 to 10 million acres of soil which is submarginal for ordinary crop production. Proper use and maintenance of soils to protect fertility is a national problem.

Survey of the most important tobacco soils of the Union of South Africa, J. L. STEENKAMP (*Union So. Africa Dept. Agr. and Forestry Bul.* 213 (1940), pp. 74).—Tobacco produced in South Africa is used almost entirely for cigarettes, pipes, rolls, or snuff. Water control is one of the factors limiting production. The relation of other soil properties to tobacco production is discussed, and detailed soil descriptions and properties for 10 areas are presented. Recommendations for the growing of tobacco on the various areas are also given.

Toxicity of sodium chlorate in three Yakima Valley soils, W. A. HARVEY. (Wash. State Col.). (*Northwest Sci.*, 14 (1940), No. 4, p. 91).—Sodium chlorate effectiveness in laboratory trials as a weed killer was found to be related to soil fertility, more of the chemical being required to kill weeds on fertile soils. Applications of sodium chlorate on soils with a high alkali content may cause them to become tough, to tend to cake when drying out, and to become difficult to cultivate.

Microbial activities in soil.—VI, Microbial numbers and nature of organic matter in various genetic soil types, S. C. VANDECAVEYE and H. KATZNELSON. (Wash. Expt. Sta.). (*Soil Sci.*, 50 (1940), No. 4, pp. 295-311, figs. 3).—This sixth paper of this series (E. S. R., 80, p. 308) reports analyses of soil samples from different horizons of 15 profiles representing a number of different genetic soil types, and gives a general description of the place of origin of each of the soils studied. The samples were placed in gallon glazed pots with moisture adjusted to the normal field-moisture percentage. The pots were covered loosely and incubated at 28° C. Soil-moisture content within narrow limits was maintained by additions of water throughout the experiment. The numbers of bacteria, actinomyces, fungi, aerobic cellulose-decomposing bacteria, and *Azotobacter* were determined at 4-week intervals. Analyses for ammonia and nitrate nitrogen were made at the beginning and end of the experiment.

Different soil properties were found to have a marked effect on the kind and number of organisms present. Certain genetic soil types supported 19 times as many bacteria, 200 times as many fungi, and 800 times as many actinomyces as certain other types. The numbers of aerobic cellulose-decomposing bacteria were small in all soils, and only 4 soils contained active *Azotobacter*. No significant relationship was found between the total content of humified organic matter in the soils and their microbial numbers.

The relation of algae to the nitrogen economy of the soil, J. L. STOKES (*Chron. Bot.*, 6 (1941), No. 9, pp. 202-203).—A brief review, including the author's work.

The influence of two *Juniperus* species on soil reaction, S. H. SPURR (*Soil Sci.*, 50 (1940), No. 4, pp. 289-294 figs., 2).—The influence of vegetation on soil reaction was studied in the vicinity of New Haven, Conn., during the fall and winter of 1939-40. Red cedar (*J. virginiana*) and ground juniper (*J. com-*

munis) growing on old field soils were compared in a series of random samples in previously laid-out blocks, and both were found to alter the pH of the soil in which they were grown. *J. virginiana* raises the pH of the upper part of the mineral soil and lowers it at a depth of 6 in., while *J. communis* lowers the pH at both depths. The addition of litter is a very important factor influencing the pH of the upper part of mineral soils. Withdrawal of soluble substances by the roots appears to be equal at a 6-in. depth.

Rate of penetration of lime in soils under permanent grass, T. C. LONGNECKER and H. B. SPRAGUE. (N. J. Expt. Stas.). (*Soil Sci.*, 50 (1940), No. 4, pp. 277-288, figs. 2).—Samples of 12 soil types common to New Jersey were taken to a depth of 4 in., transported to experimental areas 10 ft. square, and planted to Kentucky bluegrass and red fescue. From 1929 forward, each plat received two applications yearly of 8-6-4 fertilizer, each at the rate of 10 lb. per 1,000 sq. ft. In May 1935 half of each plat was treated with hydrated lime at the rate of 1 ton per acre. In November 1938 an application of finely ground limestone, at the rate of 1 ton per acre, was made to a portion of each plat. One-fourth of each plat received no lime. Soil samples were taken at various months during 1935, 1936, 1937, and 1939 from the various areas. pH and available calcium were determined from different depths under the various soil types. Soil moisture determinations were used as an index of permeability.

The moisture content of the upper 4 in. was greatly increased as a result of liming, and the vigor and density of sod were also improved. The pH rose sharply in the upper inch of all soil types by the end of 6 mo., but substantial changes at 2-, 3-, and 4-in. depths did not occur until after 30 mo. had elapsed. The second lime application, made 42 mo. after the first, produced a sharp increase in pH of the 2-, 3-, and 4-in. layer, within a 12-mo. period.

One ton of finely ground limestone, applied in November 1938, had produced as great an effect on the pH below the upper inch, by the end of 12 mo., as 1 ton of hydrated lime applied in May 1935 after an 18-mo. period. The hydrated lime became caked and dissolved more slowly than the limestone, which remained in a finely divided condition irrespective of moisture conditions. Changes in available calcium varied with the soil type.

Commercial fertilizers, 1940, E. R. TOBEY (*Maine Sta. Off. Insp.* 177 (1940), pp. 51-98).—Reports of the analyses of 408 samples of fertilizers collected and submitted during the year 1940 are reported, according to the requirements of the Maine fertilizer law (E. S. R., 82, p. 452).

Inspection of commercial fertilizers, P. H. SMITH and J. W. KUZMESKI (*Massachusetts Sta. Control Ser. Bul.* 105 (1940), pp. 49).—Detailed analyses and statistical data pertaining to the work of the Massachusetts Fertilizer Control Service for the season of 1940 (E. S. R., 83, p. 168)

Inspection of agricultural lime products, P. H. SMITH and J. W. KUZMESKI (*Massachusetts Sta. Control Ser. Bul.* 106 (1940), pp. 11).—Analyses (E. S. R., 83, p. 168) of hydrated lime, pulverized and ground limestone, and gypsum or land plaster, are reported for the 1940 inspection.

AGRICULTURAL BOTANY

New pronouncing dictionary of plant names, E. R. ROBINSON (*Chicago: Florists' Pub. Co.*, [1939], pp. 64).—This dictionary of plant names and botanical terms, with brief definitions, is intended as a handy reference booklet on pronunciation and spelling.

Georgia medicinal and poisonous plants, R. S. JUSTICE (*Ga. Univ. Bul.*, 39 (1939), No. 8, pp. 27-32, fig. 1).—This includes annotated lists of commercially

important drug and poisonous plants of Georgia, a medicinal plant map, and notes on collecting, markets, and culture.

The flora of Roaring Plains, West Virginia, E. L. CORE (*W. Va. Univ. Bul.*, 40. ser., No. 5-I (1939), pp. 33-35).

Legumes of the Brazilian Amazon, A. DUCKE (*As Leguminosas da Amazônia Brasileira. Rio de Janeiro: Min. Agr., Serv. Florestal*, 1939, pp. 171, [pls. 5]).—A manual with keys and index to common and scientific names.

A key to the common Leguminosae of the Hawaiian Islands, based upon characters of fruit and leaf, F. E. EGLER (*Syracuse, N. Y.: N. Y. State Col. Forestry*, 1940, pp. [2]+IV+42).

Studies in the Patellariaceae, E. T. BUTLER (*Mycologia*, 32 (1940), No. 6, pp. 791-823, figs. 10).—A monographic study of this ascomycete family of the Pezizales, with keys and 50 references.

The genus *Armillaria* in western Washington, H. H. HOTSON (*Mycologia*, 32 (1940), No. 6, pp. 776-790, figs. 3).—A monographic study of this fungus genus from the area noted, including a key to the 15 species found and 29 references.

The carbohydrate requirements of *Diplodia macrospora*, A. S. MARGOLIN. (*W. Va. Expt. Sta.*). (*W. Va. Univ. Bul.*, 41. ser., No. 4-II (1940), pp. 56-59).—This study indicated that *D. macrospora* grows equally well on dextrose, sucrose, and maltose if supplied with the necessary auxithal-biotin or a biotinlike substance. If this auxithal is not present, practically no growth occurs on any of these sugars. The excellent growth on brown sugar is believed due to auxithal as an impurity.

Movement of organic solutes in the sausage tree, *Kigelia africana*, H. F. CLEMENTS. (Hawaii Expt. Sta.). (*Plant Physiol.*, 15 (1940), No. 4, pp. 689-700, fig. 1).—The growth of fruits of *K. africana* was followed from pollination to maturity to determine the required rate of sugar movement into them. An unsuccessful attempt was made to explain this movement on the assumption of the mass flow hypothesis, and the reasons for its inadequacy are given. The observed movement into the fruit was so great that it seemed necessary to describe it as a function of the living protoplasm of the sieve tubes, which through their respiratory activity performed work in this movement.

Some effects of stannous sulphate and stannic chloride on several herbaceous plants, B. B. COHEN (*Plant Physiol.*, 15 (1940), No. 4, pp. 755-760, figs. 3).—"A method for the detection of bivalent tin in plant tissues has been devised. In the sunflower, 0.01 and 0.05 p. p. m. of tin as tin chloride stimulates root growth. Concentrations of tin, either as chloride or sulfate, in concentrations of 5 or more p. p. m. have toxic effects upon corn, pea, and sunflower."

Investigations on the influence of the electrolyte content of the soil water on the transpiration rate in grapevines [trans. title], L. WIENKE (*Planta, Arch. Wiss. Bot.*, 31 (1940), No. 1, pp. 22-31, figs. 13).—In potted vines of different grape varieties the transpiration rate was measured daily at ½-hr. intervals and curves were drawn, the rate being determined by the Huber technic. These curves exhibited characteristic fluctuations, with maxima at the time of strongest sunlight. When these vines were treated to 0.5 percent solutions of KCl or potassium phthalate or to 0.025 percent solutions of boric acid or ZnSO₄, a strong increase in the transpiration rate followed. The form of the curves remained the same, only their values becoming higher.

A simple method of diagnosing plant deficiencies, G. M. SHEAR. (Va. Expt. Sta.). (*Va. Acad. Sci. Proc.*, 1940, p. 213).—Note.

The regulation of plant growth, F. W. WENT (In *Science in Progress*, edited by G. A. BAITSELL. *New Haven: Yale Univ. Press; London: Oxford Univ. Press*, 1940, [vol. 2], pp. 33-54, figs. 3).—In this review of recent develop-

ments in the field of growth hormones (growth substances) in plants, the author has aimed "to present a synthetic picture of a plant in its growth and development as far as our present knowledge allows."

Experimental studies of the relation between vitamin requirements and loss of the synthesizing capacity in some mixotrophic algae [trans. title], K. ONDRATSCHKE (*Arch. Mikrobiol.*, 11 (1940), No. 3, pp. 228-238).

Effects of environmental factors on oxidizing enzymes of rose mallow seeds, K. STALEY (*Plant Physiol.*, 15 (1940), No. 4, pp. 625-644, figs. 8).—In the earliest germination stages of these seeds the catalase activity was depressed, but soon increased rapidly as germination progressed. The oxidase showed some fluctuation at first, then increased according to the germination rate. At 8° C. germination and catalase and oxidase activity were slowed up, but 20°-27° favored both germination and enzyme activity. Above 40° germination was inhibited, and correspondingly the enzymes decreased very rapidly. Excess or adequate supplies of O₂ favored germination and also an increase in enzyme activity. With limited or inadequate O₂ there was a tendency toward retardation of both germination and enzyme activity. There is thus a close relationship between the environmental factors and oxidizing enzyme activity in rose mallow seeds.

The growth rate of some fungi in the presence of cocarboxylase, and the moieties of thiamin, V. G. LILLY and L. H. LEONIAN. (W. Va. Expt. Sta.). (*W. Va. Univ. Bul.*, 41. ser., No. 4-II (1940), pp. 44-49).—Of the four heterotrophic fungi tested (*Rhizopus suinus*, *Mucor ramannianus*, *Pythiomorpha gonapodioides*, and *Phycomyces blaksleeanus*) cocarboxylase, a pyrophosphoric ester of thiamin, induced slower initial growth than thiamin in three species and greater in one. With three of them autolysis occurred later in the presence of cocarboxylase than in that of thiamin. This was true whether the cocarboxylase induced a more or less rapid initial growth rate than thiamin. Under the test conditions, thiamin produced only an initial depression in the growth rate of *R. suinus*.

Biotin as a growth stimulant for the root nodule bacteria, P. M. WEST and P. W. WILSON. (Univ. Wis.). (*Enzymologia*, 8 (1940), No. 2-3, pp. 152-162, figs. 7; *Fr. abs.*, p. 161).—The nature of the heat-stable factor which markedly accelerates the growth of *Rhizobium trifolii* was studied with the following results: "The active substance is not replaceable by crystalline thiamin, cocarboxylase, riboflavin, nicotinic acid and amide, adenine, cozymase, vitamin B₆, β -alanine, uracil, inositol, ascorbic acid, ergosterol, β -idole-3-acetic acid, 18 amino acids, or concentrates of 'sporogenes vitamin' or pantothenic acid. Treatment of yeast extract by hydrolysis with acid or alkali, oxidation, adsorption, or extraction with various solvents affected its power to stimulate either *R. trifolii* or *Saccharomyces cerevisiae* to the same extent, indicating that the two organisms may have a factor in common. Concentrates of biotin, prepared by the procedure of Kögl and Tönnes,¹ are highly stimulative to the growth of *R. trifolii*. At each step in the fractionation of egg yolk, the increase in purification of the heat-stable *Rhizobium* factor and biotin was found to be nearly identical. No qualitative differences could be found between the physiological effects of 'coenzyme R' preparations and biotin concentrates on either yeast or Rhizobia. Both active fractions stimulated yeast growth only in the presence of pantothenic acid or β -alanine; either promoted growth of Rhizobia without any supplement, although their effects were enhanced by the addition of the other factors. The presence of biotin in coenzyme R preparations was demonstrated, using *Nematospora gossypii* as a test organism. The amount of biotin found accounted for the quantitative

¹ Hoppe-Seyler's Ztschr. Physiol. Chem., 242 (1936), No. 1-2, pp. 43-73, figs. 3.

differences in activity between coenzyme R and biotin concentrate for Rhizobia and yeast."

Further studies on the action of aneurin and biotin on the growth of mycorrhiza [trans. title], E. MELIN and B. NYMAN (*Arch. Mikrobiol.*, 11 (1940), No. 3, pp. 318-328, figs. 3).—In this and the previous investigation,² aneurin (vitamin B₁) exerted a strong stimulating action on various mycorrhizal fungi, whereas biotin stimulated some but not all species tested. In addition, two species of *Boletus* and *Cenococcum grandiforme* were apparently able to synthesize aneurin. It is considered of great interest that the micorhizas of trees are not physiologically equivalent with regard to their growth substance requirements.

Effects of thiamin, its components, and heteroauxin on the growth of three parasites of wheat [trans. title], G. DÉFAGO (*Phytopathol. Ztschr.*, 13 (1940), No. 3, pp. 293-315, figs. 5).—The fungi concerned were those causing bunt (*Tilletia tritici*), foot rot (*Cercospora herpotrichoides*), and take-all (*Ophiobolus herpotrichus*).

Influence of auxins on reproduction of Lemna major, N. A. CLARK and E. E. FRAHM. (Iowa State Col.). (*Plant Physiol.*, 15 (1940), No. 4, pp. 735-741, fig. 1).—Indole-3-acetic, phenylacetic, and phenylpropionic acids in various concentrations were tested on *L. major* grown in inorganic solutions under controlled light and temperature and free from micro-organisms. Added to the media twice weekly, the auxins failed to increase the reproduction markedly at 0.01 mg. per liter or lower, and higher concentrations were more or less toxic, 10 mg. per liter or slightly above killing the plants. Intermittent applications produced increased reproduction, the last two acids proving more effective than the first. Following subjection to the influence of the auxins, the plants returned to the normal reproduction rate when placed in standard inorganic medium.

Some root-forming substances, in relation to one another, to plant metabolism, and to growth, M. A. H. TINCKER (*Ann. Appl. Biol.*, 27 (1940), No. 2, pp. 184-195, fig. 1).—"Tested on cuttings, indolylacetic acid and indolylbutyric acid are active growth substances. Several derivatives of tyrosine and histidine proved inactive, and from phenylalanine substances like phenylacetic and β -phenylpropionic acids possess low activity. Tetrahydronaphthylideneacetic acid, m. p. 92° C., is highly active, its isomeride less so. By dehydration of tetralolacetic acid a useful active mixture is obtained. 2-Phenanthryl and 3-phenanthrylacetic acid proved inactive, as did also cyclopentylideneacetic and fluorenylideneacetic. Growth substances when applied to seeds by soaking caused the resulting seedlings to be no heavier than those untreated. When applied to annuals at a wide range of concentration these substances produced no stimulus but only toxic effects at higher concentrations. Applied to bulbs the growth substances checked stem elongation. In unusual circumstances the growth substances may cause accelerated development of roots from bulbs. The relationship between certain amino acids and some active growth substances is briefly discussed. Cell division is a prominent feature of the response shown by cuttings.

The presence of an inhibitor in plant extracts and its relation to the growth substance content and output in plants and plant parts [trans. title], H. LINSER (*Planta, Arch. Wiss. Bot.*, 31 (1940), No. 1, pp. 32-59, figs. 18).

A study of the pigments produced in darkness by certain green algae, J. MYERS. (Univ. Minn.). (*Plant Physiol.*, 15 (1940), No. 4, pp. 575-588, figs. 5).—The pigments produced by *Protococcus* sp. and *Chlorella vulgaris* in darkness were studied with a photoelectric spectrophotometer and compared with those produced in the light, by a method not previously used in pigment work. No significant qualitative differences were found. For the *C. vulgaris* strain

² Bot. Notiser, 1939, No. 1, pp. 241-245.

used, the pigments produced in darkness were adequate for photosynthesis. From a comparison of the results obtained with data in the literature, it is suggested that there is a dissimilarity between the induction in O₂ evolution and the induction in CO₂ uptake.

Respiration of cereal grains and flaxseed, C. H. BAILEY. (Univ. Minn.). (*Plant Physiol.*, 15 (1940), No. 2, pp. 257-274, figs. 5).—Curves showing the relationship between moisture content and respiratory rate in stored cereals are expressed by an exponential formula approaching a linear form when the logarithm of the respiratory rate is recorded against the arithmetical progression of moisture content. Formulas are given. Wheat, rice, and barley behaved much alike in these particulars. Oats displayed less respiratory acceleration per unit increase in moisture than did rice, barley, and wheat, whereas rye deviated still more in this respect. No significant correlation between market grade of barley and oats and their respiratory rates at unit moisture levels appeared in these studies. Shriveled or small barley kernels gave a higher respiratory level than plump or large kernels, a situation previously noted for wheat. At all moisture levels tried, flaxseed respired much more vigorously than cereals. The difference may result from the fact that the actual moisture content of the hydrophylic substances in flaxseed may be substantially higher than suggested by the percentage of moisture in the entire seed. Relative capacitance of cereal grains may be more highly correlated with respiratory rate than any other single chemical or physical determination hitherto used as a basis of prediction.

An estimation of the volume of water made available by root extension, P. J. KRAMER and T. S. COILE (*Plant Physiol.*, 15 (1940), No. 4, pp. 743-747).—Using the data of Dittmer (*E. S. R.*, 78, p. 609), the volume of water made available daily by root growth was calculated for winter rye. It was assumed that the roots contacted all soil particles in a cylinder 2 mm. in diameter and that 3.1 miles of roots were added daily. This amount of root extension would make available about 1.6 l. of water daily in a sandy loam at field capacity and about 2.9 l. in a heavy clay soil. It is apparent that at least under some conditions root extension might supply all the water required by a plant.

Studies on the protoplasmic nature of stimulation and anesthesia, II, H. T. NORTEN. (Univ. Wyo.). (*Plant Physiol.*, 15 (1940), No. 4, pp. 645-660, figs. 5).—In a recent paper³ the author discussed the protoplasmic nature of stimulation and anesthesia. Since then the effects of other stimulating agents on protoplasm in cells of *Spirogyra* have been studied, and the data here presented are believed to demonstrate that electricity, disease, CO₂, cold, and mechanical impacts cause a decrease in the structural viscosity of protoplasm.

Atypical growth, abnormal mitosis, and polyploidy induced by ethylmercury-chloride, D. KOSTOFF (*Phytopathol. Ztschr.*, 13 (1940), No. 1, pp. 91-96, figs. 2).—The experimental plants used were *Secale cereale* and *Triticum* spp.

Colchicine polyploidy and technique, H. DERMEN. (U. S. D. A.). (*Bot. Rev.*, 6 (1940), No. 11, pp. 599-635).—A comprehensive review (87 references) covering the history of the subject, comparative cytological effects of temperature and of colchicine, reactions of animal and of plant cells to colchicine, technic of application, detection and determination of polyploidy, and the nature of some of the changes following induced polyploidy.

Use of photomicrography in mycological research, T. BENEDEK (*Chron. Bot.*, 6 (1941), No. 9, pp. 201-202, fig. 1).

Recent advances in microtechnique.—II, The paraffin method in plant cytology, P. MAHESHWARI (*Cytologia*, 10 (1939), No. 1-2, pp. 257-281).—This

³ *Cytologia*, 10 (1939), No. 1-2. pp. 105-112.

contribution to the series (E. S. R., 77, p. 596) contains over three pages of literature references.

Cytophysiologic studies of the petiolar nectaries of the leaf of *Ricinus communis* [trans. title], A. GONÇALVES DA CUNHA (*Bol. Soc. Broteriana*, 2. ser., 13 (1938-39), pp. 1-28, pls. 2).

The growth and anatomical structure of the carrot (*Daucus carota*) as affected by boron deficiency, K. WARINGTON (*Ann. Appl. Biol.*, 27 (1940), No. 2, pp. 176-183, pls. 2, figs. 7).—Carrots grown in nutrient solution minus B were unable to complete normal development and exhibited both external and internal deficiency systems, which are described in detail. Recovery of both shoot and root took place when B was added, even after prolonged growth in its absence. When the culture solutions were renewed regularly, 1 part boric acid in 2,000,000 proved sufficient to maintain healthy growth.

Observations on the microflora of ageing cigarette leaf tobacco, W. E. GRUNDY and J. J. REID. (Pa. State Col.). (*Jour. Bact.*, 40 (1940), No. 3, p. 462).—An abstract.

The utilization of hydrocarbons by bacteria, R. J. STRAWINSKI and R. W. STONE. (Pa. State Col.). (*Jour. Bact.*, 40 (1940), No. 3, p. 461).—An abstract.

Coliform bacteria and streptococci in swimming pool water, R. L. FRANCE and J. E. FULLER. (Mass. Expt. Sta.). (*Amer. Jour. Pub. Health*, 30 (1940), No. 9, pp. 1059-1062).—Comparing the streptococcus and coliform tests in a college swimming pool, it was the exception rather than the rule to find coliform bacteria, whereas streptococci were always present when bathers were in the pool. These streptococci proved resistant to chlorine. It is believed that these organisms come from the mouths of the bathers, though it is possible that they may come from both the oral cavity and the body surface.

GENETICS

Nucleoli and sat-chromosomes, F. RESENDE (*Bol. Soc. Broteriana*, 2. ser., 13 (1938-39), pp. 391-424, figs. 5).—This address considers the behavior of nucleoli during mitosis in the higher plants, relations between the satellited chromosomes and the nucleoli in the higher plants, satellited and nonsatellited constrictions, nuclear asymmetry, satellites and the systematics of higher plants, the value of nucleoli in exhaustive studies of the set of chromosomes, nucleoli in lower plants, and the satellited chromosomes and nucleoli in animals. There are about two and a half pages of references.

Hybrid vigor and its utilization in sweet corn breeding, W. R. SINGLETON. (Conn. [New Haven] Expt. Sta.). (*Amer. Nat.*, 75 1941), No. 756, pp. 48-60).—In this review of the research underlying the utilization of hybrid vigor in plant breeding, particularly that of corn, the author points out that the utilization of hybrid vigor in corn improvement has far exceeded the knowledge of the phenomenon itself. At present the only way to determine the merit of an inbred line is to test it by crossing, although such analysis is now made at a much earlier generation than formerly. Since there is small positive correlation between good growth in inbreds and hybrids, the author suggests that the genes responsible for hybrid vigor must be different from the normal growth-promoting genes. Possibly the genes responsible for heterosis act more in the nature of complementary factors similar to the color genes A, C, and R that give a colored aleurone when all are present and a colorless aleurone when any one is lacking.

Chromosome number and behaviour in a plant breeder's sample of pentaploid wheat hybrid derivatives, R. M. LOVE (*Canad. Jour. Res.*, 18 (1940), No. 9, Sect. C, pp. 415-434, pl. 1).—Meiosis was studied in Marquis, Marquillo, Hope, and R. L. 729, all *Triticum vulgare*, in Iumillo durum, and in 336 rust-

resistant selections from their pentaploid hybrids. In the F_5 to F_7 material in 50 lines subjected to rigorous selection, plants were found with 28, 38, 39, 40, 41, 42, and 43 chromosomes, while less than 42 percent of the plants had 42 chromosomes—the vulgare number. Half of the plants were heterozygous for arrangement of one or more chromosome segments. Chromosome aberrations detected were, in order of frequency, inversions, translocations, deficiencies, and duplications. All types of aberration were transmitted from F_7 to F_5 in some cases. Incidence of natural crossing in the aberrant plants was much higher than in normal wheats. One suggestion is that plant breeders use as parents only those plants known to be stable cytologically.

Genetic relations of sparse lint, naked seeds, and some other characters in upland cotton, J. O. WARE (*Arkansas Sta. Bul. 406 (1941), pp. 32, fig. 1*).—Selfed lines from upland (*Gossypium hirsutum*) cotton varieties were involved in the study of lint level with respect to seed cover in the crosses No Lint \times Sproull and No Lint \times Hastings Upright, and in the study of seed cover and leaf shape (also including lint level) in No Lint \times Okra Leaf. No Lint was characterized by sparse lint, naked seeds, and normal shaped leaves; Sproull and Hastings Upright by abundant lint, covered seeds, and also normal shaped leaves; and Okra Leaf by abundant lint, covered seeds, and okra-like leaves. One progeny generation from each parental plant was grown for comparison with their respective hybrid generations carried through F_1 and F_2 . F_1 progenies from backcrosses to both parents were also grown.

Seeds in the F_1 were free of fuzz but had abundant lint which was at a level somewhat lower than in the high-lint parents. In the normal and okra leaf crosses, the F_1 had leaves of an intergrade shape. In the F_2 the seed cover segregated according to the 1:2:1 ratio into fuzzy, intermediate or naked-adherent, and naked classes. In the naked-adherent class the seed coat condition was free of fuzz but with scattered broken-off lint base segments which caused the seeds to have a certain downy-like appearance. When the F_1 was backcrossed to the fuzzy seeded parent, the progenies segregated into fuzzy and naked-adherent classes, while with the backcross to the naked seeded parent segregation was into naked-adherent and naked classes. The backcross ratio was 1:1. In the F_2 as well as in backcross progenies, fuzzy classes had lint at the normal level and resembled production in the original fuzzy seeded parents. The naked-adherent classes in these groups had abundant lint but at a definitely lower level than in the fuzzy class. In all naked classes the lint was as sparse as in the naked seeded parents but at a level somewhat higher than in these parents.

Leaf shape segregated in the same manner as seed cover in F_2 and backcrosses from the No Lint \times Okra Leaf, i. e., into nine classes according to the 1:2:1:2:4:2:1:2:1 ratio in F_2 and into four classes in backcross progenies, indicating that leaf shape is independent of seed cover as well as of lint level. Seed cover and high lint appeared to be controlled by the same gene or by two very closely linked genes. One or more minor modifying factors appeared to affect lint development without altering the fuzz covering to any extent. Inheritance of seed index evidently was more complex than that of seed cover, lint level, or leaf shape. The seed indexes in the F_2 leveled out practically among the seed cover classes, whether or not the parental contrast was large or small. The fuzzy class usually was the heavier, but possibly no more than was represented by the extra weight of attached fuzz. In the progeny from the backcross on Sproull, which had much heavier seed, the fuzzy class of the progeny approached the original parent in seed index. The naked-adherent class was also higher than in other combinations.

Chromosomal deficiencies in *Datura stramonium* induced by colchicine treatment. A. D. BERGNER, A. G. AVERY, and A. F. BLAKESLEE (*Amer. Jour. Bot.*, 27 (1940), No. 8, pp. 676-683, figs. 3).—Among 2,000 *D. stramonium* plants from colchicine-treated seed, 88 exhibited deficiencies. In them a total of 173 chromosomes had been lost. There were 7 diploid ($2n-1$) deficiencies, this frequency being about 70 times the rate for untreated plants. Among the 81 plants with tetraploid deficiencies, the chromosome count ranged from 42 to 47 ($n=12$). The 46 and less than 46 chromosome plants exhibited 2 types of deficiency, viz, loss of 1 chromosome of a kind and loss of 2 of a kind. The largest chromosome was missing more often than any other. No deficient plants were found among the offspring of selfed $2n$ deficiencies. Presumably $n-1$ microspores and megaspores are unable to produce viable gametophytes. Fewer viable seeds were obtained by selfing $4n$ deficiencies lacking 2 chromosomes of the same kind. Apparently $2n-1$ microspores usually do not produce viable male gametophytes. Both diploid and tetraploid types with extra chromosomes were also found among plants grown from treated seeds, the rate being about 3 times the normal rate at which $2n+1$ plants are produced by $2n$ parents. It is suggested that chromosome losses result from lagging and nondisjunction during mitosis. These losses may or may not be associated with doubling of the total number. Acquisition of extra chromosomes could result from nondisjunction.

[Experiments in animal genetics and physiology of reproduction by the Bureau of Animal Industry]. (Partly coop. Mont., Mo., Idaho, W. Va., Fla., and S. Dak. Expt. Stas. et al.). (*U. S. Dept. Agr., Bur. Anim. Indus. Rpt.*, 1940, pp. 10, 11, 12, 18-20, 26-29, 30-31, 31-34, 37-38, 39-41).—There are included progress reports on the following investigations: Artificial insemination and semen storage for cattle, inheritance of intelligence and temperament in dogs, reproductive cycle in fur-bearing animals, synthesis of compounds related to sex hormones, breeding and crossing beef and dual-purpose cattle and record-of-performance study, crossing sheep and goat breeds for fleece and meat production, crossing and selecting swine, artificial insemination of horses, development of a small-type white turkey, blood spots in eggs, relation of railroad shipment to viability of chickens, and status of the national poultry improvement plan.

[Investigations in animal genetics and physiology of reproduction by the Cornell Station] (*[New York] Cornell Sta. Rpt.* 1940, pp. 103-104, 105-106, 165-169).—Reports are given of progress on studies by S. A. Asdell, S. E. Smith, F. I. Elliott, M. G. Fincher, G. W. Salisbury, E. L. Willett, E. S. Harrison, E. S. Savage, J. P. Willman, I. C. Gunsalus, F. B. Hutt, J. H. Bruckner, R. K. Cole, G. O. Hall, A. L. Romanoff, and W. F. Lamoreux in the following subjects: Failure of gonadotropic hormones to increase fertility of sterile cows; reaction of vaginal mucus of sterile and normal cows; technic of artificial insemination and measuring quality of semen; genetic resistance to mortality and poultry diseases—fowl cholera and neoplasms; variation of eggshell color between white- and brown-egg breeds; location of genes in six chromosomes in fowls; early detection of infertile eggs; genetics of the pheasant; strains of poultry differing in egg production and relation of δ and q hormones to reproduction in the fowl; and infertility in the fowl.

[Investigations in animal genetics by the Oklahoma Station] (*Oklahoma Sta. Bien. Rpt.* 1939-40, pp. 61-62, 63-65, 143-144, 144-146, 156, figs. 2).—Brief results are presented on the following projects, carried on by H. M. Briggs, R. G. Jaap, and T. T. Milby: Twinning in a strain of Hampshire sheep increased by selection, dam-daughter comparisons which indicate the inheritance of wool production, desirable types of Duroc-Jersey sows, differences in individuals as regards feed utilization, swine records indicate difficulties of making selections.

selection from small litter may prove misleading, measurement tables give guide for use in selecting breeders among poultry, heritable differences in body conformation of poultry, value of crossbred poultry for meat production, inheritance of baldness in chicks, and breeder selection program improves hatchability of turkey eggs.

[**Studies in animal breeding by the West Virginia Station.** (Partly coop. U. S. D. A.). (*West Virginia Sta. Bul.* 298 (1940), pp. 18-19, 22-23).—The results of projects carried on by C. V. Wilson, D. A. Spencer, E. T. Wightman, E. N. Moore, T. B. Clark, and E. A. Livesay included the following: Backcrossing Corriedale and Hampshire ewes with Corriedale rams for wool and mutton, selecting White Leghorn breeders for long life in progeny, and cross-breeding turkeys for better market quality.

[**Papers on sex control presented at the American Society of Animal Production symposium, November 30, 1940**] (*Jour. Hered.*, 31 (1940), No. 12, pp. 498-505, fig. 1).—Three papers on sex control by methods recommended by Warren (E. S. R., 83, p. 615) were presented, as follows:

The effect of lactic acid and sodium bicarbonate on the sex ratio, E. Roberts (pp. 499, 500) (Univ. Ill.).—In these tests there were produced 32 litters by ♀s douched with 2 percent lactic acid in which the progeny were 111 ♂s and 163 ♀s. Seventy-one litters were produced after douches with 3 percent lactic acid of which the young were 169 ♂s and 304 ♀s. Following douches with 3 and 5 percent sodium bicarbonate the young produced were 154 ♂s and 123 ♀s and 366 ♂s and 177 ♀s, respectively. Considering the litters of the same ♀s treated alternately with both solutions, bicarbonate solution produced an excess of ♂s, and lactic acid an excess of ♀s in the progeny.

A test of sex control by modification of the acid-alkaline balance (preliminary report), L. J. Cole, E. Waletzky, and M. Shackelford (pp. 501, 502) (Univ. Wis.).—Douching the dams of 271 litters of rats for sex control showed deviations of little more than the probable errors from the mean, with the highest percentage of ♂s in the controls. Similar results were obtained from douching rabbits with 2-percent solutions. To test the theory more critically, the pH of rabbit semen was altered by KH_2PO_4 and NaHCO_3 solutions. The semen was then used for artificial insemination. Fertilization with sperm of pH 5.6 to 6.2 produced 29 ♂s and 35 ♀s, and semen with pH 7.9 and 9.2 produced 20 ♂s to 23 ♀s. There were no young resulting from sperm of pH 3.8 to 5.1. Thus the effectiveness of sex control by acid and alkaline douches and by modification of the pH of semen for artificial insemination in rabbits was entirely negative.

An experimental attempt to modify the sex ratio in rats and rabbits, J. H. Quisenberry and S. V. Chandiramani (pp. 503-505) (Tex. A. and M. Col.).—In two strains of rats the young produced by alkali- and acid-douched ♀s did not give support to the methods of controlling sex by douching. However, copulation in rabbits took place immediately after the treatment and gave a sex ratio with sufficient departure from equality to offer promise for further testing, although the numbers were small.

The inheritance of an albumen quality characteristic of chicken eggs, F. W. LORENZ and L. W. TAYLOR. (Calif. Expt. Sta.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 4, pp. 293-301).—Continuing the studies of the inheritance of high and low firm egg albumen (E. S. R., 72, p. 172), 5 years' data on selection in two litters showed a continuous highly significant difference of 11.37 ± 0.46 percent in firm albumen between the two lines over the entire period, with some increase in this difference in the later years. This was similar to the findings of Knox and Godfrey (E. S. R., 84, p. 314). A variance analysis within and between dams gave further support to the inheritance of the condition by the significance of differences between families. The percentage of firm albumen in eggs pro-

duced by crossbreds was intermediate between the high and low lines, and backcrosses were also intermediate between the parents. However, the percentage of firm albumen resulting from any cross approached the phenotype of the dam's line more closely than that of the sire's line. Forty-five percent of the variance of the albumen thickness of the daughters' egg quality was explained by the quality of the eggs produced by the dams, dams' sisters, and sires' sisters. Multiple-gene inheritance of the character and the substantial importance of the sire seemed indicated.

Some physiological effects in animals of a plant hormone "auxiphyle" from peas, H. C. CAMERON. (W. Va. Expt. Sta.). (*W. Va. Univ. Bul.*, 40, ser., No. 5-1 (1939), p. 50).—A substance isolated from peas and giving a positive chemical test for oestrogenic substances was found to induce oestrus in spayed rats and mice. When injected twice daily for 10 days it caused a decrease of from 25 to 75 percent in the weight of the testes in rats.

The influence of X-rays on pigment production in the bird feather [trans. title], W. GREITE (*Biol. Zentbl.*, 60 (1940), No. 5-6, pp. 258-267, figs. 6).—Treatment of pigeons and Brown Leghorns with X-rays was found, as in the case of studies by DeBoer (*E. S. R.*, 84, p. 462), to cause bleaching of the newly developed feathers, the degree depending upon the strength of the dose administered. Bleaching or speckling effects were apparent in the third feather generation after treatment with 1,250 r. (roentgen rays).

Qualitative changes in the gonadotropic complex of the rat pituitary following removal of the testes, A. A. HELLBAUM and R. O. GREEP (*Amer. Jour. Anat.*, 67 (1940), No. 2, pp. 287-304).—Study was given to the gonadotropic effects of fresh or powdered suspensions of pituitaries of 482 ♂ rats, part of which were castrated at different ages. A total of 334 normal or hypophysectomized immature ♀s served for carrying out the assays. The results showed the pituitaries of normal ♂s to possess relatively little ability to stimulate development of corpora lutea in immature ♀s. The pituitaries of castrated ♂s produced primarily follicle development until from 15 to 20 days after castration, when corpus luteum formation was induced. It is suggested that the luteinizing factor of the pituitary is not released in the absence of the testicular hormone but is stored in the gland. Other studies indicated that in the normal ♂ the testicular secretion continually inhibits the release of the follicle-stimulating hormone. Implanted pituitaries failed to release their stored luteinizing hormone in immature recipients because of the absence of the releasing stimulus. The pituitaries of adult ♂s castrated 20 days to 9 mo. invariably induced corpus luteum formation, but later follicle stimulation only was retained. The luteinizing effect of pituitaries from ♂s castrated at 25 days on normal ♀s was retained about 17 mo. However, in hypophysectomized ♀s this property lasted only 13 mo. Implants of pituitaries from castrated donors stimulated only follicle development, but when the graft was recovered and was readministered as a suspension corpus luteum development was induced. The similarity between the pituitary hormone producing luteinization and interstitial cell stimulation in the ♀ and in the ♂ is suggested.

Masculinization of female rats treated with testosterone propionate, K. E. PASCHKIS, H. SHAY, J. GERSHON-COHEN, and S. S. FELS (*Amer. Jour. Physiol.*, 129 (1940), No. 1, pp. 191-194, figs. 4).—Female rats treated for from 3.5 to 13 mo. of age with total doses of from 45 to 150 mg. of testosterone propionate showed the formation of two masculine features, including the development of scrotal layers containing tubuli and coarse masculine hair.

A technic suppressing development of reproductive function and sensitivity to estrogen in the female rat, J. G. WILSON, W. C. YOUNG, and J. B. HAMILTON (*Yale Jour. Biol. and Med.*, 13 (1940), No. 2, pp. 189-202, pls. 3).—

Female rats subjected to treatment with testosterone propionate during early postnatal development failed to display spontaneous cyclic changes and ovulation. Normal mating behavior and normal growth of uterine tissues did not follow injections of oestradiol benzoate followed by progesterone. A few animals responded when the androgen was prenatally administered or when excessive doses of oestrogen were given.

There were three groups of ♀s employed in the tests. Testosterone was injected daily for 3 days after the sixteenth day of gestation, so that the total amount varied from 1.5 to 6 mg. per animal. The ♀ young received a total of 12 mg. postnatally over a 4-week period. A second group of pregnant ♀s received total doses of from 6 to 50 mg., and the young received no androgen after birth. The third group of young was given from 3 to 36 mg. in graded doses after birth. Administration of 3 mg. or more of androgen during 28 days of postnatal life rendered the ♀ insensitive to injections of oestradiol benzoate followed by progesterone in amounts 10 times greater than that required to produce oestrous response in spayed control animals. Thus, androgens after birth were mainly effective, whereas those prior to birth had little effect.

Site of action of oestrogens, J. M. ROBSON and J. ADLER (*Nature [London]*, 146 (1940), No. 3689, p. 60).—Natural and synthetic oestrogens were shown to induce cornification in the vaginas of mice by local action. They were not dependent on absorption by the circulatory system. The conclusion was derived from study of the effect of small doses of oestradiol, stilboestrol, and oestriol glucuronide injected into a portion of the upper part of the vagina severed from the rest of the organ and implanted in the abdominal wall. Vaginal responses were less in the other portions of the vagina, although both received blood circulation.

The effect of combinations of amniotin and progesterone on the uterine weights of rats and mice, L. J. ZELDIS (*Amer. Jour. Physiol.*, 129 (1940), No. 3, pp. 546-552).—The administration of from 25 γ to 800 γ of progesterone with 2 International Units of amniotin to mature and immature mice daily for 5 days caused less response in the uterine weight than when amniotin alone was administered. However, with rats there was no such effect of progesterone in preventing uterine growth from amniotin.

Experimental intersexuality: The effects of estrogens on the antenatal sexual development of the rat, R. R. GREENE, M. W. BURRELL, and A. C. IVY (*Amer. Jour. Anat.*, 67 (1940), No. 2, pp. 305-345, pls. 5).— α -Oestradiol, oestradiol dipropionate, or stilboestrol was used in the treatment of 232 pregnant rats for about the last third of the gestation period in studying the effects on the intersexuality of the progeny. The young were carried to term by 118 ♀s. Among the progeny there were 134 ♀s and 116 ♂s, of which 22 ♀s and 11 ♂s were raised to adult age. Enough young and dams were killed at term for dissection purposes. The results showed that young ♂s had external genitalia of the ♀ type, and the primary and secondary sex organs were modified to a greater or lesser extent toward the ♀. Certain minimal doses of oestrogen were necessary for effects on specific organs. The effect on prenatal development in the rat, mouse, and opossum is shown to differ in that any change in the rat which modifies the internal genitalia also produces abnormalities in the external genitalia. However, in the mouse the effect is less likely to show on the external organs. The influence of androgens on rat, mouse, guinea pig, opossum, and freemartin embryos is tabulated.

FIELD CROPS

[Field crops research in the Bureau of Plant Industry]. (Partly coop. State expt. stas. et al.). (*U. S. Dept. Agr., Bur. Plant Indus. Rpt.*, 1940, pp. 3-6, 6-8, 10-11, 13-15, 22, 23-24, 31, 35-36, 37-40).—Accomplishments and im-

portant progress results are reported from breeding work with corn, wheat, oats, barley, rice, grain sorghum, cotton, white clover, soybeans, Napier grass, potatoes, tobacco, sugarcane, and sugar beets; the development of corn hybrids resistant to insects, flax resistant to freezing injury, alfalfa resistant to bacterial wilt, improved soybeans for the South, Southwest, and the North Central States, improved strains of Napier grass for the South, a sugar beet variety for early planting with resistance to diseases, cold-tolerant sugarcane, and tobacco immune to blue mold disease; effects of colchicine treatments on chromosome numbers in wheat and related genera, cotton, and sugar beets, and its utilization in plant breeding; cotton improvement in one-variety communities; expansion of production and use of corn hybrids, improved wheats, and high-quality rice varieties; relation of soil moisture at seeding time to yield of spring wheat; comparison of diversified cropping with winter wheat alone; use of crotalaria for soil improvement in the South; growing annual lespedeza in combination with bluegrass; improvement of buffalo grass seed production; dependence of irrigation agriculture on crop rotation and livestock; reduction of sugar beet losses by rotation and manure; increase of sugar beet yields by nitrogen fertilization; domestic v. foreign potash for potatoes and fertilizer studies on certified seed potatoes; expansion of domestic sugar beet seed industry and its dependence upon superior varieties; use of ground peanut hulls in promoting growth of tobacco seedlings; and the growing of high-nicotine tobacco for insecticidal purposes.

[Crop plant research of the U. S. Department of Agriculture, 1940] (*U. S. Dept. Agr., Sec. Agr. Rpt., 1940, pp. 148, 149, 152*).—Examples of the application of science in crop production, discussed briefly, include the development and widespread use of Thatcher wheat and hybrid corn, domestic sugar beet seed production as an outgrowth of breeding for disease resistance, and the use of soil moisture content as a criterion of potential wheat yields.

[Research with farm crops in New Jersey]. (Partly coop. U. S. D. A.). (*New Jersey Stas. Rpt. 1940, pp. 59, 65-67, 67-71, 72, 73, 96-98, figs. 3*).—Experimentation with field crops (*E. S. R., 83, p. 617*) reported on briefly comprised breeding studies with corn, barley, oats, alfalfa, and lawnglass; value of colchicine in potato improvement; variety tests with corn (and hybrids), oats, barley, potatoes, soybeans, alfalfa, lespedeza, and red clover strains; variety-date of planting tests with soybeans; planting corn on contours v. up and down slopes; sowing cover crops in standing corn; merits of winter barley as a grain crop; fertilizer tests with potatoes, sweetpotatoes, and alfalfa (with potash); nitrogen needs of Green Mountain potatoes; markets for New Jersey potatoes; place of Korean lespedeza and *Lespedeza sericea* in New Jersey farming; and experiments with fine turf, including the value of Raritan velvet bent for lawn and other turfs, needs of lawns for lime, and merits of chemicals for control of weeds in lawns and similar turf.

[Field crops and plant improvement research in New York. (Partly coop. U. S. D. A. et al.).] (*[New York] Cornell Sta. Rpt. 1940, pp. 94, 96, 97, 117, 118, 143, 144, 145, 178, 179, 183-185*).—Progress results are reported from breeding work by H. B. Hartwig, J. K. Wilson, R. Bradfield, D. B. Johnstone-Wallace, R. B. Musgrave, J. A. Bizzell, L. F. Randolph, D. B. Hand, H. H. Love, W. T. Craig, F. P. Bussell, R. G. Wiggans, C. H. Myers, J. R. Livermore, E. V. Hardenburg, O. Smith, E. N. McCubbin, G. E. Davis, P. H. Wessels, and R. H. White-Stevens with corn, wheat, oats, barley, timothy, soybeans, and potatoes; studies on tetraploid corn and of chromosome number and behavior in fertile and sterile lines of tetraploid corn; an investigation of methods for improving the quality and the economy of production of feed crops in the principal soil and climatic regions of New York; the accretion of nitrogen under several crop-

ping systems, including legumes; methods of hay production and preservation; and potato investigations, including fertilizer, rotation, and irrigation experiments, and studies of ecological factors affecting growth, yield, and seed value of potatoes and of the factors affecting chemical composition and culinary quality of tubers.

[**Field crops research in Oklahoma, 1938-40**]. (Partly coop. U. S. D. A. et al.). (*Oklahoma Sta. Bien. Rpt. 1939-40*, pp. 26-38, 45, 46, 48-51, 102-104, 105-107, 114, figs. 6).—Brief reports are made on field crops work (E. S. R., 81, p. 35) during the above period by F. T. Dines, C. B. Cross, H. F. Murphy, F. A. Fenton, K. S. Chester, J. C. Ireland, H. E. Dunlavy, I. M. Parrott, H. W. Staten, L. L. Ligon, W. B. Gernert, H. J. Harper, E. F. Burk, H. B. Cordner, and F. A. Romshe, including variety tests with cotton, corn and hybrids, wheat, barley, oats, potatoes, alfalfa, and miscellaneous grasses and legumes; breeding work with cotton, wheat, corn, and barley; winter barley as a substitute for corn; seedbed preparation for fall-sown grains; chemical fertilization of the cotton flowers; an increase of cotton bolls set caused by naphthalene acetic acid sprays; cultural (including planting) experiments with barley, corn, oats, and fall potatoes; merits of fertilizer in a rotation of cotton, oats, cowpeas, and darso, and in a rotation of alfalfa 4 yr. and wheat 4 yr.; effects of fertilizers on yield and milling and baking quality of wheat; fertilizer tests with alfalfa and potatoes; response of crops in rotation and in continuous culture to green manure; draft of corn on soil nitrogen and its replacement; pasture fertilization; and effects of weather on chemical composition of grass.

[**Agronomic research in South Dakota**]. (Partly coop. U. S. D. A.). (*South Dakota Sta. Rpt. 1940*, pp. 6-14, fig. 1).—Continued experimentation by C. S. Franze, E. L. Erickson, S. P. Swenson, and A. N. Hume with field crops (E. S. R., 82, p. 615) for which progress results are reported included breeding work with corn and hybrids, hard red spring and winter wheat, oats, barley, alfalfa, sweetclover, and sorghum for low HCN content; development of a high-protein strain of corn; cultural tests with crested wheatgrass and corn; corn and sorghum in alternate rows; effect of a nurse crop on grass seedlings; variety tests with soybeans, corn, and forage grasses; and control of bindweed with cultural practices and chemicals.

[**Field crops research in Texas**]. (Partly coop. U. S. D. A. et al.). (*Texas Sta. Rpt. 1939*, pp. 28, 36-37, 62-79, 81-84, 140-145, 147-148, 155-160, 163-166, 167-169, 170, 180-187, 189-197, 200, 203-204, 205-208, 209, 212-214, 221-223, 226-227, 227-230, 230-233, 234-235, 242-243, 257-258, 259-261, 261-262, 267-271, 274, 279).—Agronomic and plant breeding investigations (E. S. R., 82, p. 472) at the station and substations are briefly reported on work by W. H. Friend, J. F. Wood, R. E. Wright, E. B. Reynolds, P. R. Johnson, D. T. Killough, T. R. Richmond, R. E. Harper, J. O. Beasley, R. H. Wyche, H. M. Beachell, H. P. Smith, D. L. Jones, R. H. Stansel, R. A. Hall, P. B. Dunkle, V. L. Cory, W. H. Dameron, R. E. Karper, G. S. Fraps, R. L. Hensel, J. H. Jones, G. C. Warner, E. S. McFadden, P. C. Mangelsdorf, H. E. Rea, R. G. Reeves, J. E. Roberts, E. C. Tullis, A. L. Martin, C. E. Minarik, C. H. Rogers, I. M. Atkins, P. A. Young, J. R. Quinby, J. C. Stephens, L. E. Brooks, E. Mortensen, R. E. Dickson, B. G. Langley, and C. E. Fisher. This included varietal tests with cotton, corn (and corn hybrids), wheat, oats, barley, rice, grain sorghum, sorgho, sugarcane for sirup, flax, soybeans, alfalfa, clover, bur-clover, sweetclover, crotalaria, potatoes, sweetpotatoes, castor-beans, sugar beets, and miscellaneous winter and summer legumes and grasses; production tests with fenugreek, perilla, chia, sunn hemp, and pigeonpeas; flax as a new cash crop for south Texas; sugar beet seed production trials; breeding work with cotton, wheat, oats, barley, corn, sweet corn, rice,

flax, grain sorghum, Sudan grass, sorgo, broomcorn, cowpeas, buffalo and Angleton grasses, and peanuts; development of cotton varieties adapted to mechanical harvesting; composition of seed of different cotton varieties; cytogenetics of cotton; inheritance studies with cotton, corn, broomcorn, and different sorghums; studies of the genetic and cytological relationships of corn, *Euchlaena*, and *Trip-sacum*; hybrid vigor in sorghum; cultural (including planting) tests with cotton, corn, wheat, rice, grain sorghum, buffalo grass, flax, soybeans, alfalfa, sweetclover, and sweetpotatoes; a variety-spacing test with corn; size of seed, height of bed, spacing, rooted v. cut slips, cover crop, and harvesting tests with sweetpotatoes; effects of different plant spacings upon cotton yield and fiber length; cotton topping studies; root initiation of cotton plant material by the use of growth-promoting substances; seedbed preparation studies; a study of the influence of awns on wheat yields; comparisons of corn and sorghums and their effects on succeeding small grain crops; double cropping experiments with sorghum to determine the feasibility of growing two crops of grain from early varieties having favorable characteristics of side branching and tillering; forage yields of corn, sunflower, and sorghum varieties; irrigation tests with cotton and grain sorghum, corn, alfalfa, castor-beans, sugar beets, and potatoes; rotation and sequence experiments with different field crops; fertilizer tests with crops in rotation, corn, oats, rice, potatoes, sweetpotatoes, grain sorghum, alfalfa, pasture, and cotton; a minor element spray test with potatoes; methods of applying fertilizers, and carriers of nitrogen and phosphorus for rice; tolerance of rice to different soil reactions; polyhalite as a source of potassium for cotton fertilizers; nitrogen and potash carriers for cotton and corn, cotton burs v. manure as cotton fertilizers; hairy vetch and other green manures for cotton and other crops; inoculation studies with soybeans; soil fertility and improvement studies; germination and longevity of seed and control of bitterweed; control of tabosa grass (*Hilaria mutica*) and pasture weeds; production and germination of buffalo grass seed, composition of buffalo grass strains, and establishment of buffalo grass pasture; and other pasture improvement and management investigations concerned with plants and seeds mixtures for different types of pasture, effects of fertilizer treatments on yield and chemical and botanical composition of herbage, introduction of new grasses and legumes and sods for observation, planting tests with Angleton grass, grazing tests with Sudan grass strains and new grasses, comparison of Sudan grass broadcast and in rows with buffalo grass turf on dry land and under irrigation, combination woodland and pasture studies, effects of fertilizers on production of carpet grass pastures and on establishment and survival of clovers on native pasture, and carrying capacity of improved pastures.

[Field crops research in Utah] (*Utah Sta. Bul. 294 (1940)*, pp. 9-10, 10, 15, 26-31, 35-39, 40-41, 43-45, 82-85, figs. 12).—Accomplishments and progress results are reported from experimentation (E. S. R., 80, p. 332) at the station and substations for the biennium ended June 30, 1940, and longer periods, including variety tests with spring and winter wheat, corn and hybrids, alfalfa, soybeans, potatoes, sugar beets, and miscellaneous forage grasses; breeding work with wheat, alfalfa, and grasses; experiments with strawberry clover; seeding tests with soybeans for hay; wheat experiments on dry land concerned with varieties, tillage, harvesting and cultural practices, type of plowing, manuring, green manuring, stubble disposal, cropping systems, and effects of these factors on quality and protein content of grain; studies of the mineral content of wheat (E. S. R., 78, p. 189; 83, p. 770) and on the nutritive value of high v. low calcium and phosphorus-carrying wheats; seeding of pasture mixtures in alfalfa stubble and pasture fertilizer tests; tillage, chemicals, and other weed control measures,

especially with whitetop, morning-glory, Canada thistle, and perennial sow-thistle; and range research, dealing with effects of grazing methods on range plants and their root reserves (E. S. R., 83, p. 763), phosphorus content of summer range plants, range revegetation, effect of spring and fall grazing upon forage production and seeding habits of grass, and germination studies on native species.

[**Field crops experiments in West Virginia, 1938-40**]. (Partly coop. U. S. D. A. et al.). (*West Virginia Sta. Bul.* 298 (1940), pp. 4, 8-11, 15-16).—Crop production and related agronomic research (E. S. R., 80, p. 757), done by F. W. Schaller, G. G. Pohlman, T. C. McIlvaine, W. M. Broadfoot, R. O. Weibel, E. J. Wellhausen, J. L. Cartledge, K. C. Westover, and E. P. Brasher at the station and substations during the biennium ended June 30, 1940, included breeding work with barley, corn, and hybrids; variety tests with corn, wheat, oats, barley, and soybeans; planting tests with barley and oats; fertilizer experiments with wheat and potatoes; fertilizer and liming tests with several field crops in rotation; short-fertilized rotations for early-crop potatoes; response of alfalfa to fertilizers and lime, and its phosphorus deficiency on certain soils; responses of corn to sweetclover as a green manure; and relation of soil fertility to botanical composition of pastures.

Hybrid corn in Ohio—historical notes, G. H. STRINGFIELD. (Coop. U. S. D. A.). (*Ohio Sta. Bimo. Bul.* 208 (1941), pp. 3-5).—A brief historical account of the development of hybrid corn in the United States and its extension in Ohio through efforts of the station, extension service, U. S. Department of Agriculture, other agencies, and growers is presented, with comments on the current status of the industry in the State and on the merits of hybrid seed.

Lespedeza culture and utilization, R. MCKEE (*U. S. Dept. Agr., Farmers' Bul.* 1852 (1940), pp. [2]+14, figs. 4).—Information on varieties of lespedeza and their adaptation, cultural methods, and field practices involved in growing the crop for hay, pasturage, soil conservation, and soil improvement; the place of lespedeza in cropping systems; and other practices superseded that given in Leaflet 100 (E. S. R., 70, p. 611) and in Farmers' Bulletin 1724 (E. S. R., 71, p. 469).

Experiments with lespedeza, A. L. GRIZZARD and T. B. HUTCHESON (*Virginia Sta. Bul.* 328 (1940), pp. 20, figs. 3).—Experiments, 1932-40, to determine the best dates of seeding, varietal adaptation, lime requirements, and fertilizer needs of lespedeza on several soil types and under different climatic conditions in Virginia are reported. Korean (*Lespedeza stipulacea*) appeared to be adapted to all sections of the State, while common, Tennessee No. 76, and Kobe (all *L. striata*) were not well adapted for elevations above 1,500 ft. Annual lespedezas have done best when seeded from 40 to 60 days before the last average killing frost date of the section, at rates of from 10 to 30 lb. of viable seed per acre broadcast on small grains, pastures, or specially prepared fields, and covered lightly. Yields of all varieties were increased markedly by fertilizers, and all varieties responded favorably to lime yet varied widely in degree of response. Korean showed a decidedly greater response to lime than any variety of *L. striata*. Sericea (*L. sericea*), the perennial, has produced heavy yields of hay on relatively poor and acid soil without lime, and yields could be increased decidedly by fertilizers. Although sericea may be seeded on small grains in late winter or early spring, best results followed the planting of scarified seed on specially prepared soil from March 15 to April 15. Practical information is included on the uses of the crop, harvesting the seed, and control of dodder.

Management of Korean lespedeza, C. A. HELM (*Missouri Sta. Cir.* 210 (1940), pp. 8, figs. 7).—Management practices for Korean lespedeza (E. S. R., 75, p. 42) grown continuously are suggested, with directions for the preparation of the seed-

bed for spring-sown oats or for winter wheat, rye, or barley to be sown on the land after the lespedeza has matured seed.

Oats in Mississippi. R. KUYKENDALL, J. PITNER, J. F. O'KELLY, J. L. ANTHONY, and C. D. HOOVER (*Mississippi Sta. Bul.* 348 (1940), pp. 22, figs. 10).—Variety, seeding, fertilizer, and rotation experiments with oats, made at the station and substations and with farmers in the hill sections of the State and at the Delta Substation, are summarized with measures for control of oat smut and armyworm. The main conclusions from work in the Delta were noted earlier (E. S. R., 82, p. 475). For the hill sections the Rustproof strains, including Terruf, New Nortex, Appler, Ferguson 922, and Hastings appeared most dependable, and the Fulgrains, Victorgrain, and Fulghum were among the best of the earlier oats. Fall-sown oats have outyielded spring oats. An indicated fertilizer practice was application of 100 lb. of sodium nitrate about March 15. Sodium nitrate produced higher yields than ammonium sulfate or cyanamide.

Studies of oats.—II, Portuguese oats of the section *Euavena* Griseb. [trans. title], A. TABORDA DE MORAIS (*Bol. Soc. Broteriana*, 2. ser., 13 (1938-39), pp. 573-709+[1], pls. 20).—This second contribution⁴ presents a monographic systematic study of this group of the genus *Avena*, including a key to the species and subspecies described.

A study of seedlings and varieties of the Irish potato in Cuba. M. A. TAMARGO (*Amer. Potato Jour.*, 17 (1940), No. 12, pp. 323-327).—The performance of a number of American, German, and wild varieties of potatoes and Cuban seedlings is described from tests during 3 yr. at the experiment station at Santiago de las Vegas.

[Proceedings of the eighteenth and nineteenth annual meetings of the American Soybean Association] (*Amer. Soybean Assoc. Proc.*, 18 (1938), pp. [1]+58; 19 (1939), pp. 72, fig. 1).—Technical papers presented at the eighteenth annual meeting held in Wooster and Columbus, Ohio, September 12-14, 1938, included Progress of the U. S. Regional Soybean Industrial Products Laboratory, by R. T. Milner (pp. 3-5), and Edible Varieties of Soybeans, by W. J. Moore (pp. 30-33) (both U. S. D. A.); Soybeans and Soybean Products as Feed for Dairy Cattle and Sheep, by C. F. Monroe (pp. 9-16) (43 refs.), Soybean Oilmeal for Beef Cattle and Sheep, by P. Gerlaugh (pp. 17, 18), and Soybeans and Soybean Oilmeal for Pigs, by W. L. Robison (pp. 18-22) (all Ohio Expt. Sta.); Soybean Products as a Feed for Poultry, by A. R. Winter (pp. 22-24), The Soybean as Food for Man, by J. F. Lyman (pp. 25-30), The Effect of Soybeans on Soil Productivity, by J. A. Slipper (pp. 42-44), and Inter-relations of the Soybean Enterprise in a Farming System, by J. H. Sitterley (pp. 48-55) (all Ohio State Univ.); and Soybeans in the Northeast, by R. G. Wiggans (pp. 33-37).

Papers presented at the nineteenth association meeting held in Madison, Wis., September 11 and 12, 1939, included Soybeans in Central Wisconsin on Light Sandy Soils, by A. R. Albert (pp. 10-12); Soybeans Need Inoculation With Good Strains of Bacteria, by W. W. Umbreit (pp. 13, 14), The Preparation and Feeding Value of Soybean Silage, by G. Bohstedt (pp. 29-34), The Effect of Solvents and Heat on the Nutritive Value of the Proteins of Soybeans, by M. Johnson, H. T. Parsons, and H. Steenbock (pp. 44-46), Putting Up Grass or Legume Silage, by F. W. Duffee (pp. 47, 48), and The Effect of Cooking on the Proteins of Edible Soybeans, by H. T. Parsons, A. L. Marlatt, and G. M. Briggs (pp. 51-53) (all Univ. Wis.); Soybean Meal for Growing Chicks, by J. G. Halpin (pp. 18-21); Extending the Soybean Belt Northward, by E. J. Delwiche (pp. 22-26); Soybeans—The World Around, by W. J. Morse (pp. 39-44), and Recent Progress of the U. S. Regional Soybean Industrial Products Laboratory, by R. T. Milner (pp. 56-60)

⁴ *Bol. Soc. Broteriana*, 2. ser., 11 (1936), pp. 49-86, pls. 7.

(both U. S. D. A.); and *The Merits and Possibilities of Green Vegetable Soy Beans as Food*, by T. A. Rogers (pp. 65-69).

Sugar beets in Michigan (*Michigan Sta. Cir. 175 (1940), pp. 53+[2], figs. 29*).—Current information on effective sugar beet production practices, based extensively on station research and experience, deals with the status of the crop, its soil and fertility needs, cultural and harvesting requirements and machinery, sugar beets and byproducts as stock feed, diseases of the crop, and production costs.

Sweetpotato plant production in Mississippi, W. S. ANDERSON (*Mississippi Sta. Bul. 349 (1940), pp. 20, figs. 15*).—A revision and enlargement of Bulletin 325 (E. S. R., 80, p. 479).

The influence of the awns upon the rate of transpiration from the heads of wheat, H. G. GAUCH and E. C. MILLER. (Kans. Expt. Sta.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 6, pp. 445-458, figs. 5).—Effects of removal of awns upon the transpiration rate of heads of Pusa 52 × Federation wheat were studied, 1935-37, with a modification of the Freeman method (E. S. R., 20, p. 733) in greenhouse cultures. The average ratio of amount of water transpired from seven sets of intact heads that later were de-awned to seven sets of heads serving as controls was 0.976. In 108 experiments made as early as 2 min. after de-awning and as late as 34 days after and from early flowering to complete ripeness of grain, the ratio of amount of water transpired from de-awned to awned heads averaged 0.61. De-awned heads transpired 38.9 percent less than did awned heads. Curves of transpiration of awned and de-awned heads paralleled each other throughout the experiments, showing a maximum transpiration rate at flowering and another as maturity approached. The rate of transpiration from heads of wheat evidently is decreased by de-awning, but the significance of such transpiration in the metabolism of the plant seemed unknown.

HORTICULTURE

[**Horticultural studies by the U. S. Department of Agriculture**] (*U. S. Dept. Agr., Sec. Agr. Rpt., 1940, pp. 149-150, 152*).—Brief mention is made of studies relating to crop plant improvement by breeding, the use of growth-promoting substances in delaying the dropping of apples and hastening the rooting of pecan transplants, the icing of refrigerator cars used in transporting citrus fruits, the treatment of southern-grown tomato plants for the control of diseases and for stimulating better growth, effect of nutrient deficiencies on the vitamin C content of citrus fruits, the effect of N on the color of apples, the effect of B in preventing corky brown spots in the apple, and the improvement of the Easter lily.

[**Horticultural studies by the Bureau of Plant Industry**] (*U. S. Dept. Agr., Bur. Plant Indus. Rpt., 1940, pp. 9, 10, 18, 19, 20, 21, 22, 23, 26, 27*).—Brief progress statements are made on the following studies: Testing of fish-poison plants and devil's shoestring for insecticidal value (coop. P. R. Expt. Sta.). native canaigre and sumac as sources of tannin, improvement of hop varieties, effect of N fertilizers on the color of apples, effect of growth-promoting substances in retarding apple drop, effect of CO₂ on the ripening of stored apples, introduction of new peach varieties, refrigeration of oranges in transit, value of time elapsed after full bloom as an index to the maturity of highly colored apples, pruning of vinifera grapes, ethylene as a stimulus to early fruiting of the pineapple, breeding of strawberries resistant to red stele disease, introduction of new raspberries and blackberries, relation of dormancy to hardiness in the tung tree, treatment of pecan transplants with indole-3-butyric acid to stimulate

renewed root development, handling of tomato plants for long transit, breeding of wilt-resistant tomatoes and cabbages (partly coop. Wis. Sta.), testing of vegetables for the Great Plains area, breeding of Easter lilies, selection of double-flowered stocks, effect of gaseous emanations from fruit on the life of cut flowers, introduction of new plants, and the testing of rubber-yielding plants.

[**Horticultural studies by the Oklahoma Station**] (*Oklahoma Sta. Bien. Rpt. 1939-40*, pp. 101, 102, 104, 105, 106-113, 114-127, figs. 9).—Brief reports of progress are presented on the following investigations by F. B. Cross, E. L. Hartman, H. B. Cordner, F. A. Romshe, G. E. Gray, J. E. Webster, V. G. Heller, M. Afanasiev, and L. G. McLean: Effect of growth-promoting substances on the rooting of cuttings, testing of early-flowering chrysanthemums, improvement of the lima bean, use of aster cloth houses for the protection of tomato plants, selection of pea varieties for freezing storage, testing of watermelon varieties for wilt resistance, testing of vegetables, tree fruit, and small fruit varieties, irrigation of sweet corn and tomatoes, comparison of overhead and furrow methods of irrigation, improvement of overhead irrigation equipment, fertilizer requirements of vegetables, comparison of modified leader and open-center types of pruning, soil management of orchards, methods of transplanting peach trees, factors involved in the uneven ripening of the Concord grape, effect of high soil temperature on strawberry roots, comparative ease of cracking of pecan varieties, culture of pecan groves, testing of the gravel-nutrient culture system of growing flower plants, spacing of greenhouse tomato plants, effect of different concentrations of salts and alkalis in water applied to greenhouse crops, improved methods of handling seed of native trees and shrubs, and methods of establishing stands of red cedar.

[**Horticultural studies by the South Dakota Station**] (*South Dakota Sta. Rpt. 1940*, pp. 16, 55-60, fig. 1).—Included are brief reports on investigations by L. D. Hiner in the improvement and culture of *Ephedra sinica*; fruit breeding, breeding of hardy double and hardy thornless roses, and development of triploid apples by crossing tetraploid with diploid forms, by N. E. Hansen; breeding of high vitamin C-content tomatoes, testing of Manchurian walnut, and effect of ground covers on the development of shelterbelt trees, by L. L. Davis; and the development of sweet corn hybrids and the testing of vegetable varieties, by S. A. McCrory.

[**Horticultural studies by the Texas Station**]. (Partly coop. U. S. D. A., Univ. Wis., Ill. Expt. Sta., et al.). (*Texas Sta. Rpt. 1939*, pp. 21-28, 28-36, 120, 121-122, 148-149, 160-161, 166, 167, 209-210, 214-216, 225, 233-234, 247-250, 251-254, 255-256, 263, 272-274, 274-275, 276-279, 279-282).—In the usual manner (E. S. R., 82, p. 481) there are presented brief progress reports on horticultural investigations at the main and branch stations of work by S. H. Yarnell, J. F. Rosborough, J. C. Ratsek, B. S. Pickett, H. F. Morris, W. H. Friend, E. Mortensen, J. F. Wood, H. M. Reed, U. A. Randolph, W. S. Flory, J. C. Walker, L. R. Hawthorn, H. B. Parks, A. H. Alex, R. H. Stansel, J. J. Bayles, W. H. Dameron, J. P. McCollum, S. S. Ivanoff, R. H. Wyche, and P. A. Young. Among studies discussed are varietal, cultural, and breeding tests of various fruits, vegetables, and ornamentals; oak breeding and propagation; effect of environment on head shape of cabbage; effect of colchicine in doubling the chromosomes in Copenhagen cabbage; treatment of seeds with chemicals in dust form; chromosomal determinations of species of *Cooperia*, *Hymenocallis*, *Habranthus*, and *Zephyranthes* and rose hybrids; propagation and utilization of grapes; testing of canaigre tubers as sources of tannin; propagation and storage of rose plants; reforestation of slash pine; citrus orchard reclamation; effect of a growth-promoting substance containing fluorescein dye on the ripening of grape-

fruit; propagation and progeny tests with citrus; effect of girdling on the development of citrus fruit; wound protectants for citrus trees; propagation of date palms; papaya utilization; pruning of tomatoes; methods of breaking dormancy in the onion; and irrigation of spinach.

[**Horticultural studies by the Utah Station**] (*Utah Sta. Bul. 294 (1940)*, pp. 13, 14, 60, 62-68, figs. 11).—Information is presented on the progress of studies relating to methods of planting tomatoes; new varieties and selections of tomatoes; cultural and harvesting practices for canning peas; variety testing of tree and berry fruits; breeding of apricots, peaches, cherries, and plums; soil management of orchards; and rootstocks for the cherry.

[**Horticultural studies by the West Virginia Station**]. (Partly coop. U. S. D. A.). (*West Virginia Sta. Bul. 298 (1940)*, pp. 11-15, 16-17).—Information is presented on the progress of studies by R. S. Marsh, W. H. Duis, W. H. Childs, R. H. Sudds, D. S. Brown, R. B. Dustman, I. J. Duncan, K. C. Westover, and E. P. Brasher on the relation of soil management to winter injury in the peach; raspberry varieties; value of mulch for raspberries; improvement of the blueberry; soil management of orchards; rootstocks for apples; removal of soot deposits from apples; pruning of the cherry; sodium thiocyanate sprays as a factor in increasing the color of apples; variety tests of vegetables; starter nutrient solutions for tomatoes; training of tomato plants; the deleterious effect of wax coatings on transplanted cabbage; effects of hardening treatments on tomatoes, peppers, and other vegetables; and the value of rye and vetch green manure crops for cabbage and tomato culture.

Soil as a rooting medium for cuttings, W. L. DORAN. (Mass. Expt. Sta.). (*Amer. Nurseryman, 72 (1940)*, No. 5, pp. 7-8).—Softwood cuttings of most deciduous species tested rooted in larger percentages in sandy soil than in sand. Among the few which rooted better in sand were *Magnolia soulangeana*, *Corylopsis pauciflora*, and *Buddleia alternifolia*. August cuttings of American holly rooted better in sand-peat than in sandy soil. *Viburnum carlesi* rooted well in sand if treated with indolebutyric acid. In general, the best rooting was obtained with treated cuttings placed in sandy soil, although treatment had no more effect than did the proper selection of the rooting medium.

Tree wound dressings, P. E. TILFORD. (Ohio Expt. Sta.). (*Natl. Shade Tree Conf. Proc., 16 (1940)*, pp. 41-51, figs. 4).—Of various materials tested, asphaltum dissolved in a light volatile hydrocarbon solvent was most satisfactory as a wound dressing, consistently stimulating callus formation during the first year following treatment. Water-asphaltum emulsion also stimulated callusing, but not as greatly as did liquid asphaltum. Asphaltum dissolved in creosote was distinctly injurious to elm, maple, and hickory. Bordeaux-linseed oil paint retarded callus formation. Waterglass was neither injurious nor beneficial and weathered off rapidly. Avenaceous carbolineum caused severe injury to maple, elm, and oak, even when applied 1 mo. after wounding. Lanolin containing indole butyric acid did not stimulate callusing, and lead paint and varnish were both neutral with respect to healing.

Grafting-wax melter, B. G. SITTON and E. P. AKIN (*U. S. Dept. Agr. Leaflet 202 [1940]*, pp. 5, figs. 2).—The construction and operation is discussed of a new apparatus developed at the U. S. Pecan Field Laboratory.

[**Vegetable crop studies by the New Jersey Stations**] (*New Jersey Stas. Rpt. 1940*, pp. 16-17, 56-58, 59-60, 62-64, fig. 1).—Among studies the progress of which is discussed are the superiority of liquid fertilizer, tomato breeding, the relation of phosphorus concentrations in the nutrient supply to the growth of the tomato, the fertilization of the tomato, mulching of the tomato, value of cover crops in tomato rotations, effect of deep soil treatment upon asparagus root development, pepper breeding, effect of nitrogen fertilizers in correcting over-

liming injury, and effect of cover crops and farm manure in conserving soil and water.

[**Vegetable crop studies by the Cornell Station**] ([*New York*] *Cornell Sta. Rpt. 1940*, pp. 144, 177-178, 179-183).—Included are progress reports on studies by R. A. Emerson, H. C. Thompson, R. H. White-Stevens, W. J. Jacob, P. H. Wessels, J. E. Knott, R. D. Sweet, G. J. Raleigh, R. L. Carolus, O. A. Lorenz, H. Platenius, and E. M. Anderson in celery breeding, asparagus spacing, cultivation requirements of vegetables, fertilizer needs of Long Island vegetables, adaptation and soil management of crops on muck soils, effect of manganese sulfate on muck-land onions, fertilizer for cauliflower in Delaware County, use of dolomitic limestone for the control of chlorosis due to magnesium deficiency, effect of boron in preventing internal break-down of beets, relation of soil moisture to availability of boron, lettuce handling and storage, effect of variety and ecological conditions on pungency of various species of *Allium* and *Brassica*, breeding of lettuce, relation of the temperature of the air to that within lettuce heads, and relation of soil moisture to lettuce growth.

Disease-resistant varieties of vegetables for the home garden, R. J. HASKELL and V. R. BOSWELL (*U. S. Dept. Agr. Leaflet 203* [1940], pp. 8).—This leaflet describes briefly some of the diseases that have caused heavy losses to vegetable growers and discusses resistant varieties.

The phosphorus fertilization of vegetables [trans. title], S. GERICKE (*Gartenbauwissenschaft*, 15 (1940), No. 2, pp. 159-183, figs. 7).—In a total of 161 experiments with phosphorus fertilizers applied to different vegetables there was recorded a definite response, despite the fact that most of the tests were conducted on soils of high phosphoric acid content and in many cases large amounts of stable manure were used. The larger the applications of phosphates, in general the larger were the resulting yields.

Vegetable crops affected by boron deficiency in eastern Virginia, E. R. PURVIS and W. J. HANNA (*Virginia Truck Sta. Bul. 105* (1940), pp. 1719-1742, figs. 9).—Stating that B deficiency, as evidenced by growth response to borax or by malnutrition symptoms, has been observed in at least 16 vegetable crops in eastern Virginia, the authors present data showing that applications of borax have in several areas resulted in increased yields or better quality with a majority of vegetables under test. Although certain of the light Norfolk soils were found extremely deficient in B, the condition is not general with the majority of eastern Virginia truck crop soils. Vegetable crops are classified according to their tolerance to applied borax. In general, assuming normal rates of fertilizer application, the addition of 10 lb. of borax per ton of fertilizer is deemed a safe practice for all vegetable crops in this region. Borax should never be applied alone as it is practically impossible to secure uniform distribution, and with any system care should be taken to avoid concentrating borax in the soil adjacent to the seeds or roots. On soils where any one crop is affected by B deficiency it is suggested that borax be applied at the rate of not more than 10 lb. per acre for the following crops: Beets, carrots, cauliflower, celery, corn (field and sweet), eggplant, kale, lettuce, mustard, pepper (sweet), potatoes, radish, sweetpotatoes, tomatoes, and turnips.

The quantity of pericarp in several hybrid and inbred strains of sweet corn, W. G. GAESSLER, R. M. HIXON, and E. S. HABER. (Iowa Expt. Sta.). (*Iowa State Col. Jour. Sci.*, 14 (1940), No. 4, pp. 379-383).—Utilizing a method, described in some detail, for separating the pericarp of sweet corn from other tissues of the kernel at the edible stage, it was found that inbred and hybrid strains differ in the quantity of pericarp at the canning stage. Strains classed as very tough on chewing contained 50 to 100 percent more pericarp than tender strains. The

kernels of tender, medium tender, tough, and very tough strains contained, respectively, 4 to 5, 5 to 6, 6 to 7, and over 7 percent pericarp on a dry weight basis.

A developmental analysis of kohlrabi and cabbage stems, A. L. HAVIS. (Ohio Expt. Sta.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 6, pp. 459-470, figs. 4).—In developing kohlrabi and cabbage stems cell diameter in the pith and cortex was compared with pith and also with stem diameters. The greater size of the kohlrabi stem was due largely to a greater number of cells, although some of the difference was evidently due to cell size. The pith, of which the edible kohlrabi is largely composed, grew at the same rate, relative to the entire stem, throughout its development and at the same relative rate as that of the cabbage pith to its stem. There was no sharp point of demarcation between the cell division stage and the cell enlargement stage in the growth of the pith and cortex of these stems. The innermost cells of the pith increased most rapidly in size, and in the kohlrabi were the first to become very meristematic again after a definite size was reached. By use of grafting tests with kohlrabi and cabbage stems, it was found that the cells of each plant retained their own morphogenetic nature even though they developed in direct contact with each other.

Effect of roasting and scalding pimienta fruits in preparation for canning on the subsequent germination of the seeds, H. L. COCHRAN. (Ga. Expt. Sta.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 3, pp. 223-229, figs. 2).—Over a 2-yr. period the average germination for seeds from untreated, roasted, or oil-scalded pimienta fruits were 90.7, 14, and 14.5 percent, respectively. The two treatments are said to be used for removing the outer skins of the fruits in preparation for canning. Seeds of the fruits passing through the roasters were exposed to an average internal temperature of 71° C., and those from the scalding vats had an average internal temperature of 60° but were 12 sec. longer in the oil. In addition to low germination a considerable percentage of the seedlings arising from the seed from the treated fruits showed abnormalities such as adhering seed coats, baldheads, and single cotyledons.

Tomato hybridization [trans. title], J. HACKBARTH (*Gartenbauwissenschaft*, 15 (1940), No. 1, pp. 36-47, figs. 6).—The yield of tomato hybrids resulting from crosses of *Solanum racemigerum* with cultivated tomatoes showed that fruit size is the most difficult goal to attain, since the small size of the species parent appeared to dominate the crosses. However, by careful selection in the later generations some crosses were found with fruits about two-thirds of the size of the cultivated parents. Some of the hybrids outyielded Bonny Best and ripened earlier. Certain of the strains bore fruit of good quality with definite commercial possibilities.

Minnesota fruit breeding farm report for 1940, W. H. ALDERMAN and F. E. HARALSON. [Minn. Expt. Sta.], (*Minn. Hort.*, 69 (1941), No. 1, pp. 5, 18).—A record is presented of progress in the improvement of the apricot, plum, peach, cherry, apple, grape, strawberry, and other fruits, with comments on some of the outstanding seedlings.

Home orchards in Mississippi, T. E. ASHLEY (*Mississippi Sta. Bul.* 350 (1940), pp. 38, figs. [29]).—General information is presented on the establishment of orchards, training and pruning, soil management, fruit thinning, insect and disease control, and varieties.

[**Pomological studies by the New Jersey Stations**] (*New Jersey Stas. Rpt.* 1940, pp. 15-16, 44-DE, 47, 48-51, 52-53, 54, 54-55, fig. 1).—Included in this general progress report is information relating to studies of apple breeding, apple rootstocks, effects of liming apple orchard soils, timing and selection of sprays to reduce the arsenical residue on fruits and vegetables, role of lime in spray mixtures in relation to arsenical and copper injury, control of biennial bearing in apples by blossom thinning or spraying with oils, varietal differences in resist-

ance to early fall frosts of apple foliage, date of bloom in the Elberta peach and Stayman apple in 1940, peach varieties and breeding, classification of peach varieties on the basis of leaf characters, catechol tannin content of peach fruits, chromosomal variations in the peach, rootstocks for peaches, methods of applying potassium to peach trees, fertilization and soils for blueberries, varieties of blueberries, productive life of blueberry canes, methods of harvesting cranberries, mulching of red raspberries, and the breeding of strawberries.

[**Pomological studies by the Cornell Station**]. (Partly coop. U. S. D. A.). ([*New York*] *Cornell Sta. Rpt. 1940*, pp. 157-162).—Among studies discussed are those by R. M. Smock, A. Van Doren, A. J. Heinicke, D. Boynton, W. Reuther, E. F. Savage, L. J. Edgerton, M. B. Hoffman, L. H. MacDaniels, E. M. Hildebrand, and W. H. Childs on the effects of controlled atmospheres on the keeping quality of apples and other fruits; the cause and control of bitter pit in apples; the relation of climatic, soil, and cultural factors and maturity to the behavior of apples in storage; effect of low but nonfreezing temperatures on the keeping quality of apples; methods of preventing shriveling of apples in storage; influence of soil type on the oxygen and carbon dioxide content of the soil; effect of prolonged flooding on top growth and nutrient absorption by the Northern Spy apple tree; influence of soil type on the potassium supply of the fruit tree; seasonal fluctuations of soil moisture in orchards; influence of soil acidity on growth of budded apple trees and seedlings; effect of mulch on growth and fruiting of the apple; effect of various bactericides and fungicides on the set of apple blossoms; duration of pruning effects in bearing trees; effect of heavy applications of barnyard manure in stimulating unproductive fruit trees; soil management in the Champlain and Hudson River Valleys with special reference to color and fruit drop of the apple; effect of hormone sprays on set of fruit and on preharvest drop; and the photosynthetic activity of apple foliage under natural conditions.

Juvenile and old growth in the apricot and other fruits [trans. title], F. PASSECKER (*Gartenbauwissenschaft*, 14 (1940), No. 5, pp. 614-625, figs. 11).—Stating that old and young types of growth may be found in various species of fruit, the author reports that in the apricot the leaves of the juvenile form are smaller, shorter petioled, and rougher due to short stiff hairs. Constant age forms of apricot were obtained by vegetative propagation. Juvenile wood cuttings rooted more freely than did those taken from the older wood.

Winter growth in the vegetative buds of the Wagener apple, H. P. BELL (*Canad. Jour. Res.*, 18 (1940), No. 12, Sect. C, pp. 585-590, fig. 1).—Measurements of vegetative buds collected at Kentville, N. S., twice a month from September 1938 to March 1939 showed a slow and continuous growth in length within the bud throughout the winter months. The data were analyzed statistically and found significant.

Spraying apples for blossom removal, J. R. MAGNESS, L. P. BATJER, and C. P. HARLEY. (U. S. D. A. et al.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 141-146, fig. 1).—At Kearneysville, W. Va., the application of tar distillate oils or DNO spray at three stages of flower development, (1) buds in delayed dormant condition, (2) early-cluster bud, and (3) early-pink stage, all reduced the set of fruit, but the first treatment was much less effective than the others. There was no clear-cut difference in effectiveness of the DNO and the tar oil distillate sprays. Varieties appeared to differ in their response to a given treatment. Although the sprays tended to injure the young leaves, there was a rapid recovery and, in addition, there was abundant fruit-bud formation where the spraying was effective in reducing markedly the current set of fruit. In Golden Delicious there was increased russetting of the fruit.

In similar studies at Wenatchee, Wash., in which only tar oil distillate was used there was again noted much varietal difference in response to sprays.

Delicious, Winesap, and King David were effectively prevented from setting fruit by a spray at the late-cluster bud stage, and there was a definite indication of increased fruit-bud formation for the next season.

Respiration and maturity in peaches and plums, E. R. ROUX (*Ann. Bot. [London]*, n. ser., 4 (1940), No. 14, pp. 317-327, figs. 6).—In the case of Peregrine peaches and Kelsey plums, collected at different stages from the small green to the fully mature, it was found that in both varieties the very young fruits have an early and pronounced climacteric. Fruits of intermediate age had a very delayed climacteric and kept longest in storage. The stage of maximum length of storage life coincided with the beginning of the period of most rapid increase in size of fruits. There was an inverse relation between longevity and the rate of respiration.

The response of the plum grown under hillculture conditions to modifications in cultural treatment, J. M. AIKMAN and H. E. BREWER. (Iowa Expt. Sta. and U. S. D. A.). *Iowa State Col. Jour. Sci.*, 14 (1940), No. 4, pp. 385-391, pl. 1, figs. 3).—At the Hillculture Experimental Farm in Davis County, Iowa, five varieties of commercial plums were planted in 1938 on contour furrows on steep eroded Lindley and Clinton soils. There was noted a well defined variety difference in survival and growth, with Superior doing best and Tonka the poorest. Responses to type of culture were greater in the second than in the first year, due apparently to reserves in the trees when planted. The three treatments, chisel furrow, two furrows kept tilled above, and cultivation with mulch appeared to result in adequate growth response and at the same time provide soil protection and improvement. Complete cultivation gave the greatest growth but soil losses rendered this system impracticable. Fertility, degree of erosion, aspect and degree of slope, and competition with original vegetation were all important factors in the choice of the best cultural method to use.

Blueberries, G. M. DARROW (*U. S. Dept. Agr. Leaflet 201* (1940), pp. 8, fig. 1).—Six types or species of blueberries that are marketed extensively in different sections of the United States are discussed briefly as to location and importance. Information is presented on cultivated blueberries, their development, principal varieties, cultural management, propagation, etc.

A preliminary report on the training of boysenberries, T. E. ASHLEY. (Miss. Expt. Sta.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 597-598).—Observations on plants grown on (1) a 2-wire vertical trellis, (2) a 2-wire horizontal trellis, (3) stakes, and (4) no support, showed the highest average total yield per plant for the vertical trellis and the lowest for the untrained plants. The plants on the horizontal trellis also gave satisfactory though somewhat smaller yields.

Correlations between leaf area and leaf weight and between leaf weight and fruit production of red raspberries, M. A. KHANMAI and W. S. BROWN. (Oreg. State Col.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 589-592).—In the Chief and Newburgh varieties correlations of 0.9821 ± 0.0027 , 0.8498 ± 0.0189 , and 0.9329 ± 0.0087 were established between the size and weight of leaves of fruiting laterals in three respective positions, (1) from the top of canes above 6 ft. from the ground, (2) from the lower part of canes up to 6 ft. where leaves were only partially exposed to sunlight and were not very uniform in texture, and (3) from the lower 6 ft., with full exposure to the sun and with uniform texture. Using leaf weight as a measure of the amount of foliage, high positive correlations were established between leaf area on laterals and weight of fruit produced by such laterals. No definite correlation was established between the number of fruits produced on a lateral and the size of leaves borne on the same lateral. There was some evidence that Newburgh leaves are from 17 to 18

percent more efficient than those of Chief as measured by weight of fruit produced.

Variety comparisons of raspberries with respect to yield, hardiness, and fruiting period, I. C. HAUT. (Md. Expt. Sta.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 599-603).—Observations on six black and four red varieties of raspberries planted in 1936 and grown under good cultural care at Rohrsersville, Md., showed no significant difference in yield in 1937 between the four blacks, Bristol, Black Beauty, Cumberland, and Quillen. Naples yielded significantly lower than all other blacks, and Logan significantly lower than Bristol or Black Beauty. In 1938 Bristol yielded significantly higher than other blacks, without significance between other varieties except that Naples yielded significantly less fruit than all others except Quillen. There was no significant difference in the 1938 yields of four red varieties, but in 1939 injury from a premature freeze the preceding November affected the several reds differently, Newburgh and possibly Taylor showing more damage than Latham or Chief. As to fruiting period, Naples, Logan, and Bristol ripened at a slightly faster rate than Cumberland, Black Beauty, and Quillen. Despite the fact that the harvest of Naples in 1937 and 1938 was approximately 4 days later than the other blacks, it was completed at the same time. Among reds, Chief ripened at a slightly faster rate than the other three, but the difference was only about 2 days. Apparently the difference in ripening periods recorded in localities farther north tends to disappear under Maryland environment.

Strawberry culture: South Atlantic and Gulf Coast regions, G. M. DARROW (*U. S. Dept. Agr., Farmers' Bul. 1026, rev. (1940), pp. [2]+40, figs. 26*).—This is a revision of the edition of 1919 (*E. S. R.*, 40, p. 838). Among new facts discussed are the effects of length of day and temperature on flower bud formation and varietal adaptation, new varieties, and new developments in the control of various pests.

Strawberry growing in Kansas, R. J. BARNETT (*Kansas Sta. Cir. 203 (1941), pp. 20, figs. 10*).—General information is given with regard to varieties, soils, culture, propagation, planting, fertilizers, renovation, control of pests, harvesting, marketing, and processing.

Seed size in strawberries, G. M. DARROW. (U. S. D. A.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 564-566).—Based on the weights of 100 seed samples, those of the diploid species *Fragaria vesca* were found the smallest and those of *F. chiloensis*, *F. cuneifolia*, and *F. virginiana*, all octoploids, were the largest, averaging about twice the weight of the diploid seeds. Although the seed size of cultivated varieties varied greatly, only one, Marshall, had seed larger than that of the octoploid *F. cuneifolia*. Klondike was notable for its very small seeds. Selfed seedlings of Dorsett averaged about the same in seed size as Dorsett itself. Blakemore berries averaged about 1.3 percent of seed of the total weight of the fruit.

A quantitative spectrographic determination of eight elements in young leaves of the Delaware grape, A. T. MYERS, B. C. BRUNSTETTER, I. W. DIX, and C. A. MAGOON. (U. S. D. A.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 645-649).—Where Delaware vines were grown under four cultural treatments (1) mulch plus nitrate, (2) mulch plus NPK, (3) clean cultivation plus nitrate, and (4) clean cultivation plus NPK, a statistically significant higher content of Mg and Ca in vines was found under treatment 2. There was a significantly higher content of Ca, Cu, and K in Delaware leaves than in Concord leaves receiving the same treatment, but no marked difference in Mg, Mn, Al, Fe, and P. Delaware leaves were higher than Ontario in Mg, Ca, and Al and significantly lower in Mn and P. It is pointed out that the observed differences may not

have any biological significance, but do show differences between varieties in their capacity to absorb certain nutrient elements through their roots.

Studies on the adaptability of some American grape varieties to southern conditions when grown on their own roots and on certain stocks, N. H. LOOMIS, J. R. MAGNESS, and C. A. MAGOON. (U. S. D. A.). (*Amer. Soc. Hort. Sci. Proc.*, 36 (1939), pp. 639-644).—Of 10 grape rootstocks tested with 10 scion varieties at Meridian, Miss., Dog Ridge and Aramon \times [*Vitis*] *rupestris* Ganzin 2 were rated as very good and Solonis \times Othello 1613 as good. The others rated only poor to fair. Only 21 of 58 varieties tested on their own roots showed 51 percent or more survival after the 6-yr. test, and of these 21 only 8, namely, Champanel, Champion, Delaware, Extra, Herbeumont, Lenoir, Marguerite, and R. W. Munson, had an average yield of 5 lb. of fruit per living vine in the sixth year.

Forty varieties of American grapes tested for resistance or susceptibility to chlorosis, G. A. BEACH and L. R. BRYANT (*Colo. Farm. Bul.* [*Colorado Sta.*], 3 (1941), No. 1, p. 11).—In a study extending over a period of more than 5 yr. and involving more than 40 varieties of grapes it was found that 20, including such well-known varieties as Brighton, Delaware, Agawam, and Vergennes, were resistant or relatively chlorosis free. Only a small number were so severely affected as to be of no value.

Studies in tropical fruits.—IX, The respiration of bananas during ripening at tropical temperatures, C. W. WARDLAW and E. R. LEONARD (*Ann. Bot.* [*London*], n. ser., 4 (1940), No. 14, pp. 269-315, figs. 23).—There was recorded during ripening and senescence a succession of well-defined phases, designated as the preclimacteric, climacteric, postclimacteric, eating ripe, and overripe or senescent stage, all characterized by well-defined respiration activities. For example, the climacteric phase, in which the curve of respiration rises steeply to a peak, was characterized by a rise in pulp temperature, by a sharp decline in the internal concentration of oxygen, and a corresponding rise in the internal content and concentration of carbon dioxide. This was a stage of rapid change from a lower to a higher level of metabolic activity. Ripening was initiated in the central placental region and proceeded outward toward the skin.

Preliminary note on the use of β -indoleacetic acid for rooting sour orange cuttings [trans. title]. C. R. MARQUES DE ALMEIDA (*Bol. Soc. Broteriana*, 2. ser., 13 (1938-39), pp. 117-121, pl. 1; *Eng. abs.*, p. 120).—Rooting was induced on hard cuttings with a 1:10,000 concentration of the growth substance.

Studies of the root system of *Coffea arabica* L.—II, Growth and distribution in Catalina clay soil, J. GUISCAFRÉ-ARRILLAGA and L. A. GÓMEZ (*Jour. Agr. Univ. Puerto Rico* [*Univ. Sta.*], 24 (1940), No. 3, pp. 109-117, figs. 3; *Span. abs.*, pp. 115-117).—Continuing this investigation (*E. S. R.*, 79, p. 631) and using a soil very deficient in N, P, and K, 95 percent of the roots were found in the upper 12 in. of soil. A fixed ratio, approximately 3:1, of tops to roots was indicated, and a heavy and vigorous top was correlated with an extensive root system. The diameter of the trunk was found a more accurate index of the size of the root system than was the lateral spread of the branches or the height of the tree.

Stimulation of growth in juvenile mangosteen plants, C. L. HORN. (P. R. Expt. Sta.). (*Jour. Agr. Res.* [*U. S.*], 61 (1940), No. 5, pp. 397-400, fig. 1).—Stating that normal growth in young mangosteen plants is so unthrifty that few develop past the juvenile stage but that the survivors attain a satisfactory degree of vigor, the author reports that the irrigation of young plants with nutrient solution containing yeast extract stimulated greatly their development. In the case of plants growing in sphagnum moss, those supplied with yeast made 75.8 percent more leaf area in the first 10 mo. than did plants without yeast. Stimulation became less as time advanced beyond the 10 mo., suggesting that the

larger plants are able to produce a sufficient quantity of growth-promoting substance, possibly vitamin B₁, to meet their current needs. Growth of all plants in the nutrient cultures, whether or not supplied with yeast extract, was much better than in soils.

[**Floricultural studies by the Cornell Station**] ([*New York*] *Cornell Sta. Rpt. 1940*, pp. 117, 137-139).—Included are progress reports of studies by L. Knudson, K. Post, E. P. Hume, C. Weddle, C. Keyes, H. T. Skinner, A. M. S. Pridham, R. C. Allen, and K. E. Wheeler in orchid germination, effect of increasing the daily photoperiod on the growth and flowering of greenhouse plants, cultural requirements of the gardenia, propagation of rhododendrons and other ericaceous plants, factors affecting shoot growth and flower-bud set in azaleas and rhododendrons, methods of watering greenhouse plants, cultural requirements of the rose, and the use of organic materials in preparing soil for flowering plants.

Dahlia variety test—1940, H. L. COCHRAN, D. D. LONG, M. LAMOTTE, and T. L. BISSELL (*Georgia Sta. Cir. 125 (1940)*, pp. 11, figs. 7).—Brief information is presented on promising new varieties and seedlings included in the 1940 trials and on the control of the stalk borer.

Nutritional studies with orchids, O. R. EVERS and A. LAURIE (*Ohio Sta. Bimo. Bul. 207 (1940)*, pp. 166-173, figs. 3).—Young, unflowered *Cattleya* orchid plants potted in three materials—osmunda fiber, haydite, and silica gravel—and supplied periodically with chemical solutions grew exceptionally well, making better leaf and root development than the control plants. The majority of plants in osmunda fiber grew better than those in haydite or gravel. Haydite gave somewhat better results than silica gravel. No outstanding results could be noted from the application of vitamin B₁ solutions to young, unflowered *Cattleya* plants. In the case of mature, flowering *Laeliocattleya* plants, response to cultural solutions was not as striking as with the younger plants, partly because of a more severe check in transplanting. Those plants which remained healthy and vigorous made strong root and shoot growth. Attempts to transfer seedlings directly from the flasks to sand with periodic applications of chemical solutions met with only limited success due to moisture control difficulties and damping-off disease. The seedlings which survived were larger and darker green than those on osmunda fiber. The addition of vitamin B₁ to the cultural solution again gave no evidence of value. Good results secured with *Cypripedium*, *Dendrobium*, and *Oncidium* plants grown in inert media with chemical solutions further indicated the possibilities of this form of culture.

[**Ornamental horticultural studies by the New Jersey Stations**] (*New Jersey Stas. Rpt. 1940*, pp. 17, 98-99, 100-101).—Among studies discussed are the causes of poor growth of greenhouse crops, advantages of soilless culture in the production of greenhouse crops, effect of root temperatures on the flowering of gardenias, calcium and phosphorus nutrition of roses, and the effect of winter droughts on the rhododendron and other broad-leaf evergreens.

Growing ornamental greenhouse crops in gravel culture, A. LAURIE and D. C. KIPLINGER (*Ohio Sta. Bul. 616 (1940)*, pp. [1]+49, figs. 24).—Outlining briefly the history of the development of growing plants with nutrient solutions, the authors discuss the equipment and operation of greenhouses devoted to the soilless culture of ornamental plants. Among points covered are the pumping apparatus, piping, media, preparation and handling of the nutrient solutions, and requirements of various crops such as roses, carnations, chrysanthemums, gardenias, sweet peas, lilies, etc. Dormant-budded roses were found best for gravel culture and should preferably be planted in January or February. Frequent syringing of roses was safer in gravel than in soil, since there was no danger of creating too moist a medium. Stocks, snapdragons, pansies, feverfew, asters, Boston yellow daises, sweet peas, and chrysanthemums produced more and better

flowers in gravel than in soil. Carnations required less frequent applications of solutions per day than many of the other plants.

FORESTRY

Report of the Chief of the Forest Service, 1940, E. H. CLAPP (*U. S. Dept. Agr., Forest Serv. Rpt., 1940, pp. IV+42*).—Included in this general administrative report is information pertaining to the relation of forests to national defense and general welfare, forest problems, the significance of private ownership, the status of the national forests, planting activities, protection from fire and insect and fungus pests, progress of research activities, etc.

[**Forestry studies by the U. S. Department of Agriculture**] (*U. S. Dept. Agr., Sec. Agr. Rpt., 1940, pp. 177-181*).—Information is given on forest production necessary to the defense program, importance of forests in the national life, the place of forestry in agriculture, aims of the forest program, need of increased public ownership of forest lands, and forest fire control.

[**Forestry studies by the New Jersey Stations**] (*New Jersey Stas. Rpt. 1940, pp. 76-77*).—Progress reports are given on studies in woodland management, possibilities in production of timber on farm lands, and the marketing of farm-grown timber.

[**Forestry studies by the Cornell Station**] (*[New York] Cornell Sta. Rpt. 1940, pp. 141-142*).—Reports are presented on the studies by E. F. Wallihan, L. G. Cox, and A. B. Recknagel on germination of forest tree seeds and the establishment, culture, and development of forest plantations.

[**Forestry studies by the West Virginia Station**] (*West Virginia Sta. Bul. 298 (1940), pp. 33-35*).—Included are brief reports of progress of studies by W. C. Percival, E. A. Marten, and L. Besley in forest management and utilization, rate of decay of different types of forest leaves, and rates of growth in different forest types.

Soil-fertility standards for growing northern hardwoods in forest nurseries, S. A. WILDE and W. E. PATZER. (Wis. Expt. Sta.). (*Jour. Agr. Res. [U. S.], 61 (1940), No. 3, pp. 215-221, fig. 1*).—A large number of samples of soils collected under productive stands of representative hardwood species such as yellow birch, sugar maple, basswood, American elm, and white ash were analyzed for pH value, base-exchange capacity, total and available nitrogen, available phosphorus, available potassium, and replaceable bases. The average values obtained by means of statistical treatment of the results are suggested as standards for the maintenance of fertility in hardwood nursery soils. The analysis showed that the nitrogen:phosphoric acid:potash ratio lies in the proximity of 1:2:5 for yellow birch and 1:3:5 for the rest of the hardwood species studied.

Plantation survival as related to soil type, aspect, and growing season, L. S. MINCKLER (*Jour. Forestry, 39 (1941), No. 1, pp. 26-29*).—An analysis of first year survival on 180 one-fourth acre plats distributed over a radius of about 25 miles on T. V. A. land in eastern Tennessee showed that shortleaf pine thrived best on dolomite north or south and limestone south aspects. Dense weedy growth characterized the limestone and shale north slopes, making such sites unfavorable for shortleaf pine. In a very dry year, white pine and yellow poplar gave only fair survival on limestone south slopes and failed on shale south slopes. White pine was less able to endure heavy vegetative competition than was yellow poplar. Black walnut showed relatively poor survival only on dolomite south slopes. White ash was equally good on all soils and aspects. The two direct seeded species, black walnut and northern red oak, withstood drought particularly well, due apparently to their more extensive root systems.

When all soil types and aspects were considered, ash and walnut constituted the highest survival group, yellow poplar the second, and white and shortleaf pine the third.

Vegetative propagation of conifers, C. G. DEUBER (*Conn. Acad. Arts and Sci. Trans.*, 34 (1940), pp. 1-83, pls. 7).—Factors found of greatest significance in the successful asexual propagation of conifers were the season of the year at which cuttings were collected, the age of the parent tree, and the genetic variations in rooting capacity. The use of indolebutyric acid gave significant results only in the case of the hemlock. Cuttings taken from juvenile trees rooted more readily than those from older trees, and the time of taking the cuttings was less important in the case of young trees. Large scale propagation of Norway spruce from parental trees covering a wide age range appeared practicable, but in the case of white pine, propagation from trees older than 4 yr. was difficult with present technics. In hemlock, cuttings from trees 4 yr. old rooted more freely than cuttings from 20-yr. trees. Dust treatments with indolebutyric acid increased rooting in both age classes, and vitamin B₁ improved the growth of stems and roots of hemlock but not of Norway spruce cuttings.

Note on the propagation by cuttings of white pine and white spruce, J. L. FARRAR and N. H. GRACE (*Canad. Jour. Res.*, 18 (1940), No. 12, Sect. C, p. 612).—In the case of cuttings taken from 10- to 15-year-old trees and planted in outside frames protected by lath and cotton shades, the propagation medium proved to be the most important single factor affecting rooting. A mixture of peat and sand was greatly superior to sand alone, and a well-decomposed native peat of sedge origin gave better results than did European peat moss. The time of taking cuttings was important, but indoleacetic acid mixed with talc and applied to the base of cuttings had no well-marked effect on rooting. On an average, white spruce and white pine rooted 80-90 and 50-60 percent, respectively.

The effect of position within the bole upon fiber length of loblolly pine (*Pinus taeda* L.), J. S. BETHEL (*Jour. Forestry*, 39 (1941), No. 1, pp. 30-33, figs. 3).—Selecting three trees on a dry upland site and three on wet bottomland, the author found that the maximum fiber length occurred progressively higher up the tree with an increase in age. The height at which the maximum fiber length occurs in any particular annual ring is apparently a function of the height of the tree at the time the ring was formed. It was evident that the factor governing the length of fibers is the age of the tree at the particular level being investigated rather than the absolute age of the tree itself.

Forest resources of the Douglas-fir region, H. J. ANDREWS and R. W. COWLIN (*U. S. Dept. Agr., Misc. Pub.* 389 (1940), pp. IV+169, pls. 4, figs. 41).—A comprehensive analysis of the economic and physical aspects of the forest resources of the Douglas fir region of Oregon and Washington showed this region to include 29 million acres of forest land of which 26 million acres are classed as commercial conifer land. There is a total saw-timber stand of 546 billion board feet, all but 4 billion feet of which is conifers. Only about half the timber volume is considered economically available under current conditions. Annual depletion of the region's forests totals 8.3 billion board feet, 7.9 billion feet the result of cutting. Current annual growth amounts to 2.4 billion board feet. Under intensive forestry, a potential annual growth of 8.2 billion board feet would be possible. The region is singularly dependent upon the forest resources, more than half the population being supported directly or indirectly by forest enterprises.

Past timber cutting has been concentrated in favored localities, resulting in a shortage of raw material around many industrial centers and costly industry

migration. Conversion of the region's forests to sustained yield management is deemed imperative to the maintenance of a satisfactory regional economy.

DISEASES OF PLANTS

[Phytopathological research by the Bureau of Plant Industry] (*U. S. Dept. Agr., Bur. Plant Indus. Rpt., 1940, pp. 6, 9, 11, 15-18, 19, 20, 22, 24-26, 36-37, 38, 40*).—Brief reports of progress are presented on some of the outstanding recent accomplishments by the Bureau, including a laboratory test for the rapid detection of the two loose smuts of barley in mixtures; the control of cotton wilt through resistant varieties and potash; control of chlorosis of grapes, trees, and shrubs by iron sulfate; demonstration that clover and Sudan grass seed may carry many disease fungi, the latter, particularly, a virulent *Helminthosporium*; increases in the stands of Sudan grass and forage legumes by seed treatment; studies of sap stain fungi in lumber; prediction of decay following fires in oaks; proof that the *Ceratostomella* disease of sycamores is spread by pruning; *Fusarium* wilt of mimosa; the susceptibility of whitebark pine to blister rust; a fungus parasite (probably *Fusarium*) of dwarf mistletoe (*Arceuthobium* spp.); fusiform rust of southern pines; protection of peach seedlings from crown gall; control of bacterial blight of filberts by spraying; potato ring rot; notes on important additions to the fungus collections, the work of the Plant Disease Survey, and on a new system of composting for mushrooms; chloropicrin as a promising nematocide; the spread of root knot nematodes by man; acquired immunity to curly top virus in tobacco plants; spread of chlorotic streak of sugarcane; reductions in *Aphanomyces* root rot by heavy applications of phosphate; control of diseases by crop rotations; and the use of tear gas (chloropicrin) for sterilization of tobacco seedbeds.

[Plant disease work of the Bureau of Entomology and Plant Quarantine] (*U. S. Dept. Agr., Bur. Ent. and Plant Quar. Rpt., 1940, pp. 39-50, 61-66*).—Progress reports are given on Dutch elm disease eradication; white pine blister rust control; and barberry eradication for wheat stem rust control, together with data on the incidence of stem rust in 1939, population trends in parasitic strains of the wheat stem rust fungus, and susceptibility tests, nursery inspection, and identification.

The Plant Disease Reporter, [January 15 and February 1 and 15, 1941] (*U. S. Dept. Agr., Bur. Plant Indus., Plant Disease Rptr., 25 (1941), Nos. 1, pp. 34, figs. 2; 2, pp. 35-74; 3, pp. 75-104, figs. 3*).—In addition to the host-parasite check-list revision, by F. Weiss (No. 1, *Cephalanthus* to *Cissus*, and errata for *Castanea*; No. 2, *Citrus*; and No. 3, *Cladrastris* to *Cornus*), the following items are noted:

No. 1.—The weather and disease situation in Massachusetts in 1940, by O. C. Boyd; Burley tobacco diseases in central Kentucky in 1940, by W. D. Valleau and S. Diachun; tobacco diseases in western Kentucky in 1940, by E. M. Johnson; stem rust now migrating to the South to spend the winter months, by E. S. McFadden; *Physalospora obtusa* on peach nursery stock in Arkansas, by J. C. Dunegan; rusty spot of peach, by E. C. Blodgett; studies of *Botryosphaeria ribis* on *Cercis* and *Benzoin*, by A. J. Watson; and brief notes on additional hosts and locations for the bleeding canker disease of trees, late blight in Minnesota in 1940, bacterial ring rot in Rhode Island, tobacco survey notes from Puerto Rico, and molds increase in apple orchards infested with mealybug.

No. 2.—The eelgrass situation, fall 1940, by C. Cottam; spread of white pine blister rust during the calendar year 1940; *Ceratostomella ulmi* isolated from elm wood of dish crates imported from England, by R. P. True; freezing injury to trees and nursery stock in Nebraska and Kansas during November 1940, by

E. Wright; additions to the host index of fungi of Mount Shasta, Calif., by W. B. Cooke; notes on fruit diseases (apple, peach, plum, cherry) in the Ozark section of Arkansas in 1940, by J. C. Dunegan; diseases of fruits and vegetables on the New York market during the months of April to September 1940, inclusive, by C. O. Bratley and J. S. Wiant; a case of the crown gall organism persistent in grain land, by L. C. Cochran; and a unique case of powdery mildew (*Erysiphe cichoracearum*) on lettuce in the field, by D. E. Pryor.

No. 3.—A new black raspberry disease in western Pennsylvania, by G. L. Zundel; origin of cabbage black rot epidemics, by J. C. Walker; fungus diseases of truck crops near Colma, Calif., by J. T. Middleton and M. W. Gardner; canker of red bud in New Jersey, by P. P. Pirone; field tests on the susceptibility of the southern gooseberry, *Ribes curvatum*, to *Cronartium ribicola*, H. E. Yost; brief notes on tobacco downy mildew, alfalfa, sugar beet, and tomato diseases observed in Mexico; *Pythium* foot rot of small grains reported in Virginia, and *Vermicularia trichella* on *Hedera helix* in an Oregon greenhouse; and a hardiness map for the United States.

[Studies in disease control] (*U. S. Dept. Agr., Sec. Agr. Rpt., 1940, pp. 150-151*).—A brief note on potash as an aid to control of cotton wilt and of phosphate applications for a serious root disease of sugar beet.

Plant pathology notes, G. E. THOMPSON and J. H. MILLER (*Ga. Univ. Bul., 39 (1939), No. 8, p. 35*).—Brief notes on tomato seed tests, cottonseed tests for disease organisms, and plant disease survey for Georgia.

[Phytopathological findings by the New Jersey Stations] (*New Jersey Stas. Rpt. 1940, pp. 48, 51, 52, 54, 59, 60-61, 61-62, 72, 74-75*).—Brief reports are given on the best fungicides and schedules to use for the Brooks fruit spot control; adhesiveness of copper fungicides in relation to safety; the present status of the "X" disease and *Valsa* canker of peach in New Jersey; the most effective fungicides for controlling cherry leaf spot; sanitary measures in control of spur blight of raspberry; sweetpotato pox control through pH adjustment of the soil by sulfur; control of wilt in eggplants by rotations, soil management, and similar methods; recent advances in chemical control of root knot on vegetable crops; the best bordeaux formulas for potatoes in central New Jersey; and safeguarding the street and shade trees of the State against old and new diseases, such, e. g., as the *Phytophthora* disease of Norway maple and the chlorosis of pin oak.

Plant pathology. (Partly coop. U. S. D. A.). ([*New York*] *Cornell Sta. Rpt. 1940, pp. 144, 145, 146-153*).—Brief progress reports on the following work by various members of the station staff (C. H. Myers, R. A. Emerson, H. M. Munger, F. M. Blodgett, P. Decker, E. D. Hansing, S. G. Younkin, W. H. Burkholder, A. B. Burrell, F. H. Lewis, L. A. Brinkerhoff, C. Chupp, A. W. Dimock, F. A. Haasis, C. E. Williamson, L. M. Massey, K. Longrée, W. D. McClellan, A. G. Newhall, D. Reddick, W. R. Mills, D. S. Welch, K. G. Parker, and L. J. Tyler) are included: Breeding cucumbers and muskmelons for disease resistance; potato seedling tests for scab resistance; potato rotations for disease control; potato yellow dwarf; bacterial diseases of gardenia, carnation, onion, tomato, and pepper; boron deficiency of apple; field fungicidal tests for apple scab control; monograph of the genus *Cercospora*; control of club root of crucifers; control of diseases of miscellaneous ornamentals under glass; *Verticillium* disease of chrysanthemums and other greenhouse ornamentals; diseases of narcissus and tulips; rose diseases; damping-off of ornamental seedlings and its control; permanent crop improvement by disease control through development of immune or resistant stocks; Dutch elm disease studies; bulb nematode of onions; celery root and storage rots; and control of onion smut and mildew.

Plant disease studies (*Oklahoma Sta. Bien. Rpt. 1939-40, pp. 128-138, figs. 8*).—Brief reports are given on the progress of investigations involving a new machine for treating seed to control loose smut of cereal crops; resistant varieties as the only means of controlling leaf rust of wheat; the cost of cottonseed treatment found more than repaid by higher yields; studies of seedling disease in cotton as an aid to better stands; cotton wilt checked by introduction of resistant varieties; the virus mosaics of cowpea and their control; "charcoal rot" of sorghum, corn, and other crops (coop. U. S. D. A.); and sorghum root and stalk rots.

[**Phytopathological studies by the Texas Station**] (Partly coop. U. S. D. A.). (*Texas Sta. Rpt. 1939, pp. 16, 79-80, 84-95, 149-151, 169-170, 170-177, 186, 187, 205, 224, 225, 226, 250, 254, 256, 258-259, 262-263, 263-264, 275-276, 282-284*).—Progress reports by various station workers (E. S. McFadden, P. C. Mangelsdorf, J. J. Taubenhause, W. N. Ezekiel, H. E. Rea, S. H. Wender, L. M. Blank, P. J. Talley, G. A. Greathouse, N. E. Rigler, G. E. Altstatt, D. T. Killough, J. E. Roberts, A. A. Dunlap, A. L. Harrison, S. S. Ivanoff, G. H. Godfrey, H. Rich, E. W. Lyle, A. L. Martin, C. E. Minarik, C. H. McDowell, C. H. Rogers, T. B. Randolph, P. A. Young, and L. E. Brooks) are included on breeding wheat and oats for resistance to rusts; various investigations on *Phymatotrichum omnivorum* root rot, including sclerotial longevity, spore stage, variations, resistance of cotton, girdling and topping of cotton plants as influencing survival of the fungus, age of cotton plants as affecting susceptibility to field inoculation, greenhouse and field studies on root rot and its control, causes of immunity and resistance, growth response of the fungus to certain inorganic nitrogen compounds, zinc, and sulfur, effects of continuous grass, rotations, and clean fallow on the fungus, residual effects of oil and ash treatment on cotton, crude oil treatments, including effects of depth of application on cottonseed germination, root rot fungus, and cotton yield, effects of soil treatments on root rot of various plants, cottonseed treatments, germination of cottonseed from plants killed by root rot at different dates, fertilizer-rotation test on cotton yield and root rot infestation, yields and resistance of cowpea varieties to root rot, resistance of grape rootstocks to root rot, and sorghum as a root rot remover; cotton varieties resistant to root rot; regional studies of *Fusarium* wilt of cotton; water economy of cotton in relation to excessive shedding of squares and immature bolls; tomato diseases, including injuries from soil drenches, spray-material tests, factors affecting inoculations of tomatoes with *F. lycopersici*, varietal resistance to *Fusarium* wilt (including breeding), perfect stage of *Sclerotium rolfsii*, dodder (*Cuscuta indecora*) attacking tomatoes in coldframes, chloropicrin to control soil pathogens, damping-off control, dusting tests for early blight, and fruit pox etiology; selection and disinfection of garlic cloves for planting; control of crapemyrtle mildew; fungicides for rose black spot, isolation of roses to avoid black spot, and artificial inoculations with conidia of the fungus; crown gall control on rose cuttings; sulfur dioxide for defoliation of roses; varietal resistance of watermelon to *Fusarium* wilt; physiology and diseases of rice, including the effects of magnesium and calcium on "white tip," rice straighthead, black kernel disease due to *Curvularia lunata*, fungi recovered from the dust of strawstacks, and the effects of fertilizers and seed treatments on black kernels and yield; important diseases of miscellaneous plants in 1939; charcoal disease (*S. bataticola*) of sorghum; citrus diseases and their control, including chlorosis and *Diplodia* stem-end rot of lemons; cabbage seed treatments for black rot; spray tests for potato early and late blights; potato scab control by band applications of sulfur; flax pasmo (*Phlyctaea linicola*); resistance of Sudan grass to rust, *Helminthosporium* blight, and bacterial stripe; chrysanthemum

root failure due to meadow nematode; chlorosis of roses and other plants; effects of various soil fumigants on seed germination of snap beans and teosinte; virus-induced eggplant yellows and its insect transmission; cantaloup breeding for downy mildew resistance; control of downy mildews of cantaloup and spinach by dusting; and breeding onions for pink root resistance.

[Plant disease work by the Utah Station] (*Utah Sta. Bul.* 294 (1940), pp. 10, 11, 12, 31, 32, 39, 40, 51-57, 61, 68-71, 72, figs. 10).—Brief reports of progress are included on physiological experiments; development and testing of tomatoes for resistance to curly top; selection and propagation of alfalfa strains resistant to bacterial wilt; the relations of *Pseudomonas* (= *Phytomonas*) *medicaginis* and *Ascochyta* sp. to alfalfa stem blight; soil-borne diseases of potato, including bacterial ring rot; tomato diseases in Utah, including wilt diseases, bacterial canker, curly top, and mosaic; survey for western celery mosaic; heartburn v. boron deficiency in celery; chlorosis and related mineral deficiency diseases of horticultural crops in Utah, including grape chlorosis and little leaf of sweet cherries; and viruslike diseases of stone fruits, including cherry leaf mottle and lace leaf, leaf spot of Italian Prune plums, and "X" disease of peach and chokecherry.

Plant diseases (*West Virginia Sta. Bul.* 298, pp. 26, 26-27).—Brief notes are presented on progress with studies of orchard fruit and leaf injuries from spraying, by C. F. Taylor; a rust-resistant red cedar, by A. Berg; and insect transmission of potato bluestem, by J. G. Leach and J. R. Mullin.

Nineteenth annual report of the Canadian Plant Disease Survey, 1939, I. L. CONNERS (*Canada Dept. Agr., Sci. Serv., Plant Disease Survey Ann. Rpt.*, 19 (1939), pp. [I]+XI+112).—This report follows the same general procedure as previous ones of the series (*E. S. R.*, 81, p. 796).

Some data concerning the history of phytopathology in Brazil and the first notices of diseases of plants in the country, A. PUTTEMANS, trans. by A. E. JENKINS and A. D. MARCHANT. (Coop. U. S. D. A.). (*Jour. Agr. Univ. Puerto Rico [Univ. Sta.]*, 24 (1940), No. 3, pp. [3]+77-107, pls. 9).—As stated in the foreword, by Jenkins, "the history of the development of phytopathology in Brazil, covering nearly three quarters of a century, forms a valuable contribution to the subject in general, containing as it does much information of international interest not otherwise available. A pioneer phytopathologist in Brazil, Dr. Arsène Puttemans was uniquely qualified by reason of his 40 yr. of service there to present at the 'Primeira Reunião de Phytopathologistas do Brasil' this account of the growth of the science in that country." Addenda present notes and a bibliography of 104 entries.

On the systematics of gram negative bacterial plant pathogens, W. J. DOWSON (*Chron. Bot.*, 6 (1941), No. 9, pp. 198-199).—A further discussion and clarification of the subject previously noted (*E. S. R.*, 81, p. 796).

Quantitative comparison of methods for sterilizing solutions of organic compounds used in culture media, G. A. GREATHOUSE and N. E. RIGLER. (Tex. Expt. Sta. coop. U. S. D. A.). (*Phytopathology*, 31 (1941), No. 2, pp. 149-158).—The losses from a number of typical organic compounds at 0.01 M concentration were compared by (1) autoclaving in presence of water, medium No. 70, and Czapek's solution, (2) intermittent steaming in presence of water, and (3) alcohol. With the series of fatty acids the losses from heat treatment increased progressively from formic to pelargonic and thereafter decreased. For acids with less than 10 C atoms the losses were greater in the salt-solution media than in water, but for most of the other compounds tested the differences were slight. The more water-soluble and strongly polar compounds (alcohols, phenols, acids, amides, and amines) were vaporized to a smaller extent than the more volatile, less soluble, and less strongly polar compounds.

(esters, ethers, aldehydes, and hydrocarbons). Of the 33 compounds tested, only formic, acetic, and propionic acids suffered greater losses by sterilization with the original alcohol evaporation technique than by heat treatment. Recommendations are given for sterilizing organic compounds for culture studies without loss and minimum alteration. The data indicate that when a great degree of accuracy is required the contemplated sterilization method should be tested to determine whether it is applicable to the types of compounds under consideration.

Survival of fungi in the digestive tract of cattle, B. STEIEMENS (*So. African Jour. Sci.*, 36 (1939), pp. 220-224).—The importance of the possible survival of spores of *Diplodia zaeae* and *Gibberella saubinetii* after passage through the digestive tract of cattle in the spreading of the disease to the maize crop led to the work here reported. *Diplodia* spores were not found viable after such passage, they did not germinate on fresh manure, nor could *Gibberella* spores be recovered from the feces.

A new Ascochyta on Pentstemon from California, A. E. JENKINS. (U. S. D. A.). (*Phytopathology*, 31 (1941), No. 2, pp. 194-197, fig. 1).—*A. pentstemonii* n. sp. is described on wild *P. spectabilis* from San Antonio Canyon, near Claremont, Calif., where the fungus was collected (1939) by C. L. Shear and H. C. Fawcett. The fungus, which was isolated, occurred both on small raised stem cankers and on larger cankered areas reaching 10 cm. in length.

Supplement to "The species of Cintractia in the flora of Argentina" [trans. title], E. HIRSCHHORN (*Rev. Argentina Agron.*, 7 (1940), No. 2, pp. 128-132, pls. 2, figs. 2).—Additional species of this rust genus from Argentina.⁵

Gymnosporangium rusts in Maine and their host relationships, A. E. PRINCE and F. H. STEINMETZ (*Maine Univ. Studies*, 2. ser., No. 50 (1940), pp. VII+46, fig. 1).

Factors influencing the carbon metabolism of the crown gall organism, F. C. MCINTIRE, W. H. PETERSON, and A. J. RIKER. (Wis. Expt. Sta. et al.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 4, pp. 313-319).—Under conditions whereby *Phytoplasma tumefaciens* was grown rapidly in a synthetic medium with only small variation in the products from carbon metabolism, the growth rate and sugar fermentation were considerably increased by aeration and the fermentation was further stimulated by adding plant extracts. The size of inoculum, amount of aeration, and, where cultures were aerated with a stream of air, the amount of sugar in the medium influenced the amount of sugar fermented. The uniformity among replicate cultures with respect to sugar fermented and to distribution of metabolic products was influenced by the size of inoculum, fermentation time, and type of aeration, the last seeming to be the most important. Consistently reproducible fermentations were obtained in cultures receiving a 5 percent inoculum of 24-hr. liquid culture and aerated by shaking. The ratio of metabolic products was related to the concentration of unfermented sugar in the medium. When its concentration was high the ratio of CO₂ to unidentified products was low, and vice versa. This ratio increased with age of culture.

Germination experiments with uredio- and teliospores of Tranzschelia pruni-spinosae discolor, J. C. DUNEGAN and C. O. SMITH. (U. S. D. A. and Ark. and Calif. Citrus Expt. Stas.). (*Phytopathology*, 31 (1941), No. 2, pp. 189-191, fig. 1).—Urediospores were sown on water agar and incubated for 3 hr. at various temperatures, vigorous germ-tube growth being obtained at 10°-25° C., but little germination at 30°, and none at 35.5°. With leaves of cultivated *Prunus* species bearing uredia and kept outdoors on the ground and in cheese-

⁵ Rev. Argentina Agron., 6 (1939), No. 3, pp. 179-202, pls. 4, figs. 2.

cloth packets, indoors at room temperature, and in a refrigerator at 5°, the effects were variable, but urediospores from leaves held at 5° were still viable after 537 days. Overwintered teliospores from *P. (=Amygdalus) communis* leaves were germinated on water agar. The promycelium may develop from either cell of the spore, emerging near the septum between the two cells. The basidiospores were almost globose in shape, measuring 8–8.5 μ by 6–6.5 μ .

Descriptions of tropical rusts, III, G. B. CUMMINS. (Ind. Expt. Sta.). (*Bul. Torrey Bot. Club*, 67 (1940), No. 7, pp. 607–613, figs. 2).—In this paper of the series (E. S. R., 83, p. 204), aside from the nine new species described some other collections of unusual interest are cited.

Longevity of teliospores of *Puccinia graminis* under laboratory conditions, T. JOHNSON (*Phytopathology*, 31 (1941), No. 2, pp. 197–198).—Teliospores germinated and infected barberry after continuous freezing up to 2½ yr., and those previously rendered germinable were found to retain their viability and infectivity in dry storage at 8°–10° C. for over 6 yr.

Effect of X-radiation on the germination of chlamydospores of *Ustilago hordei*, H. A. RODENHISER and L. R. MAXWELL. (U. S. D. A.). (*Phytopathology*, 31 (1941), No. 2, pp. 175–181, figs. 2).—Studying the effect of X-rays on chlamydospore germination, promycelial and sporidial development, and sectoring, it was found that chlamydospore germination was not materially affected by dosages up to 100 kr. (kiloroentgen). At higher dosages the number of nonviable spores and the germination time of the viable ones increased in varying amounts with increasing dosages up to 1,000 kr., at which point all the spores were killed. There was some evidence that the degree of X-ray sensitivity depends on some unknown physiological condition of the chlamydospore. Irradiation of chlamydospores at certain dosages resulted in elongation of the promycelium. It was noticeable at 30 kr. and became progressively more marked at 60, 100, and 150 kr. For the last dosage, promycelial lengths were approximately three times the normal. The normal number of sporidia was formed on promycelia from chlamydospores irradiated up to 60 kr., on only about 10 percent of the promycelia at 100 kr., and above this point only occasionally. X-irradiation of chlamydospores at 50 and 100 kr. did not affect the rate of mutation in cultures of monosporidial lines.

A new cause of foot disease in wheat, barley, rye, and oats (*Colletotrichum graminicolum* (Ces.) Wilson?) [trans. title], A. G. WINTER (*Phytopathol. Ztschr.*, 13 (1940), No. 3, pp. 282–292, figs. 9).—The author describes a mycosis of the roots, culms, and leaf sheaths of these cereals. A definite determination of the fungus was impossible, due to lack of fructifications, but it appears to be identical to the *C. graminicolum* reported from Canada as causing a similar disease of oats.

Two additional factors for resistance to mildew in barley, E. H. STANFORD and F. N. BRIGGS. (Calif. Expt. Sta.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 3, pp. 231–236).—The authors report two new genetic factors for resistance to race 3 of powdery mildew (*Erysiphe graminis hordei*). The Psaknon (M_p) factor, in the Psaknon variety, is dominant in effect and identical to one of the two factors previously reported in Arlington Awless, Nigrate, and Chinermé. Hereafter M_p will replace the M_z factor designation tentatively assigned to these varieties. A new factor found in Duplex combined with two previously identified factors, M_h and M_p , is recessive in effect and designated as the Duplex (m_d) factor. The full factorial composition is given. In all there are seven factors for resistance—six dominant and one recessive—and the number in a single variety varies from one to three. Of the seven identified, two are definitely linked.

Modification of diurnal transpiration in wheat by infections of *Puccinia triticina*, C. O. JOHNSTON and E. C. MILLER. (U. S. D. A. coop. Kans. Expt. Sta.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 6, pp. 427-444, figs. 5).—The effects of leaf rust on the transpiration of a resistant and a susceptible variety of spring wheat grown to maturity in sealed stone jars was studied in the greenhouse during 3 yr., plants in the flowering stage proving superior to younger plants or seedlings for this work. Normal transpiration rose very rapidly during the morning, reached a maximum about noon, and declined rapidly in late afternoon, remaining extremely low during darkness. Observations at 2-hr. intervals for 48-hr. periods (1935-36) indicated that rusted plants of the susceptible variety transpired 13.17 percent and 32.7 percent, respectively, more than nonrusted controls for the entire 2-yr. period. The diurnal rhythm of transpiration was seriously disturbed in rusted plants of the susceptible variety, such plants transpiring much more than controls during the night. In 1935 the increase in nocturnal transpiration of rusted plants over the controls was 83.41 percent, while in 1936 it was 89.62. The higher transpiration rate of rusted plants at night was apparently due in part to transpiration through ruptures in the cuticle caused by the uredia and partly to the transpiration of the fungus itself.

The use of chlorine gas as a seed disinfectant, R. W. LEUKEL and O. A. NELSON (U. S. Dept. Agr. Cir. 576 (1940), pp. 16, fig. 1).—As tested in field and laboratory, surface-borne spores of certain cereal smuts were not all killed by 5-min. exposure to undiluted chlorine gas, but under certain conditions 2-hr. exposure to 1 percent gas by volume inhibited spore germination without seed injury. Spores carried beneath the glumes were not killed. To kill surface-borne smut spores without seed injury, the Cl concentration should be 3-9 percent by volume, the period of exposure 1-2 hr., and the volume of gas not less than 20 percent or greater than 40 percent of the net volume of seed. A considerable percentage of adult grain weevils survived exposure to 10 percent gas for 1 hr. and to 50 percent for 10 min. Using the commercial outfit employing chlorine gas for custom seed treatment, tests indicated that the seed was being exposed to a concentration of less than 0.5 percent Cl gas for about 3 min. When smutty seed of wheat, oats, and barley, treated once and twice in this outfit, was sown in field plats along with untreated seed, emergence was in no case improved, nor was satisfactory smut control obtained.

Soil mold, *Phytophthora capsici*, attacks important truck crop plants of Colorado, W. A. KREUTZER and E. W. BODINE (*Colo. Farm Bul. [Colorado Sta.]*, 3 (1941), No. 1, pp. 3-5, fig. 1).—This pathogen is believed to infest most of the arable soil in the Arkansas River Valley, where pepper blight, tomato rot, and diseases of other truck crops due to this fungus are becoming a serious menace. Discussions of the factors favoring infection, the existence of strains of the pathogen, and recommended control measures are briefly presented.

Fungi associated with diseases of cotton seedlings and bolls, with special consideration of *Glomerella gossypii*, R. WEINDLING, P. R. MILLER, and A. J. ULLSTRUP. (U. S. D. A. and S. C. Expt. Sta.). (*Phytopathology*, 31 (1941), No. 2, pp. 158-167, figs. 3).—Random samples of diseased specimens were secured from most sections of the Cotton Belt (1938-39). *G. gossypii* was widely distributed on bolls and was predominant in cultures from seedlings. *Rhizoctonia solani* was widely spread but occurred on few seedlings. *Fusarium moniliforme*, other *Fusaria*, and *Alternaria* spp. were frequent on seedlings and bolls. Most boll spots harboring *G. gossypii* were indistinguishable from those yielding other fungi. This change in type from symptoms described in the early literature is attributed to unfavorable conditions for boll rot due to the adop-

tion of early maturing cotton varieties of open type. Mixing of seed with infested trash during ginning will spread the fungus on seed sufficiently to cause damping-off. This may explain the abundance of *G. gossypii* on seedlings in spite of its infrequency on bolls. The scarcity of *G. gossypii* in Texas and Oklahoma seems attributable to dry conditions which check summer survival on dead tissues of cotton stems and leaves.

Wilt resistance of the new cottons, D. C. NEAL and H. B. BROWN. (La. Expt. Sta.). (*Better Crops With Plant Food*, 24 (1940), No. 10, pp. 16, 46, fig. 1).—During 1939, eight new strains and three F₂ hybrid lines were studied for *Fusarium* wilt resistance on uniformly infested soil, along with the extremely susceptible Half and Half. Six proved outstanding in resistance, the infection ranging from 0.4 percent for the best one (Delfos) to 87 percent for the susceptible control. Seed stocks of some of these strains have been increased and are available for planting in wilt-infested districts.

The infection capabilities of hop downy mildew, G. R. HOERNER. (U. S. D. A. coop. Oreg. Expt. Sta.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 5, pp. 331-334, fig. 1).—The host range of *Pseudoperonospora humuli* was considerably extended by this study, but all hosts were members of the nettle family. Of the hop species inoculated, *Humulus japonicus* and *H. japonicus variegatus* showed some resistance, but evidence of resistance in horticultural varieties or strains of hops developed by selection or hybridization was inconclusive. In view of the successful inoculation of *P. humuli* into species of *Cannabis*, *Celtis*, and *Urtica*, hosts, respectively, of *P. cannabina*, *P. celtidis*, and *P. urticae*, it is suggested that the forms of *Pseudoperonospora* described under these names, along with *P. humuli*, may eventually prove to be physiological races of one species.

Eye spot of lemon grass, B. A. BOURNE (*Phytopathology*, 31 (1941), No. 2, pp. 186-189, fig. 1).—The author describes the disease fully and establishes its etiology. By cross-inoculation and other studies it was demonstrated that this disease of both lemon grass and sugarcane is caused by *Helminthosporium ocellum* (*H. sacchari*).

The shape and development of potato tubers and their significance in the diagnosis of spindle tuber, J. G. BALD, B. T. DICKSON, and D. O. NORRIS (*Phytopathology*, 31 (1941), No. 2, pp. 181-186, fig. 1).—Three stages were recognized in the development of tubers from normal potato plants of the Factor (Up-to-Date) variety and from plants with a disease diagnosed in Australia as spindle tuber. These stages comprise a radial swelling of the stolon to form a tuber rudiment, swelling of this rudiment without change of shape, and elongation at a greater rate than radial expansion. The shape of normal and diseased tubers in the second stage is similar. The greater elongation of the mature tubers (third stage) from diseased plants depends on the earlier initiation of that stage.

Soybean mosaic and its insect transmission [trans. title], K. HEINZE and E. KÖHLER (*Phytopathol. Ztschr.*, 13 (1940), No. 3, pp. 207-242, figs. 16).—The symptoms are described, including a strongly necrotic variant. Using carborundum powder and juices from infected plants, 100 percent infection was obtained. By the rubbing method the disease was transferred from soybean to common bean and common vetch (*Vicia sativa*), but not to garden pea, hairy vetch (*V. villosa*), or *Pisum arvense*. The following aphids were found capable of transmitting the virus: *Doralis frangulae*, *D. rhamni*, *D. fabae*, *Macrosiphum solanifolii*, *Aulacorthum pseudosolani*, *Myzus ornatus*, *Myzodes persicae*, and *Neomyzus circumflexus*. No incubation period in the vector was necessary.

Development of secondary tumors and tumor strands in the crown gall of sunflowers, A. C. BRAUN (*Phytopathology*, 31 (1941), No. 2, pp. 135-149,

figs. 7).—This study indicated that secondary tumors and tumor strands can be produced by introducing the *Phytomonas tumefaciens* at a distance of 4-6 in. from the apical bud into internodes that had elongated to, or almost to, their full length, thus proving that these structures are truly secondary and do not depend for their development on the rapid elongation of immature tissue. The ridgelike overgrowths, which sometimes extend from the primary tumor to within a short distance of the soil line, are also secondary. Tumor strands and secondary tumors occurred invariably in association with the xylem region of sunflower plants. The strands are not direct outgrowths of the primary tumor, as suggested by E. F. Smith, but develop laterally from the xylem region into the pith. Two distinct types of secondary tumors are described, differing both from the standpoint of their relative positions on the host and in their internal structure. Secondary tumors and tumor strands may be produced by an attenuated strain of *P. tumefaciens* even though no primary tumor be formed. This suggests that the pathogenesis of these secondary structures may not be identical with that in the primary tumor.

The bronzed disease of the tomato [trans. title], L. BONNEMAISON (*Ann. Épiphyt. et Phytogénét.*, n. ser., 5 (1939), No. 3, pp. 267-308, figs. 22).—This is a monographic study of the virus disease usually known under the name of tomato spotted wilt. It comprises the history and geographical distribution of the disease (over three pages of references); the virus and its properties; the vector (*Thrips tabaci*), including studies of its general morphology, the buccal apparatus, mode of nutrition, biology, and the behavior of the virus within the vector; the host symptoms, factors influencing them, and overwintering of the virus; the techniques used in preparing the virus, mechanical inoculations, and rearing the vector; an account of the successful inoculations by mechanical means and by the vector; and suggested methods of control by destroying the thrips, suppression of the plant host, and obtaining resistant viruses.

The refractory diffusion method of Lamm and a modified Ostwald viscometer, as used in a study of the tobacco mosaic virus protein, V. L. FRAMPTON. (Cornell Univ.). (*Phytopathol. Ztschr.*, 13 (1940), No. 3, pp. 272-281, figs. 10).—The refractory method of Lamm, carrying out diffusion studies, and a viscosimetry method are discussed. Anomalies in the diffusion and viscosity of this virus protein are pointed out, and data obtained with it are compared with those using glycerine. An indication of the rate of sol-gel transformation in the virus protein-water system is obtained from observing a sphere falling through a sol under polarized light.

Morphological and anatomical features of phylloidy in varieties of tomatoes and beans, B. F. DANA. (Oreg. Expt. Sta. coop. U. S. D. A.) (*Phytopathology*, 31 (1941), No. 2, pp. 168-175, figs. 4).—“In phylloid tomato blossoms carpels often were represented by simple leaflets adhering by their margins or fully separated. In bean transformations, the phylloid ovary varied from an inflated, saclike structure, through a marginal-veined leaf with marginal leaflets representing the ovules, to normal-appearing leaves. There was an extension of the axis between whorls of the phylloid flower where there was not a close relationship (adhesion or union) of vascular traces supplying these adjacent whorls. In common bean there were found secondary or accessory phylloid flowers, inflorescences with phylloid flowers, and shoots produced by axis extension beyond the carpel of the primary flower. Vegetative modifications of the perianth occurred in both tomato and beans. In extreme cases, members of the perianth whorls were represented by leaflike structures. Stamens failed to mature normally but persisted, and were separate in the phylloid tomato blossom.”

Pathogenic and cultural variation among single-spore isolates from strains of the tomato-wilt *Fusarium*, F. L. WELLMAN and D. J. BLAISDELL. (U. S. D. A.). (*Phytopathology*, 31 (1941), No. 2, pp. 103-120, figs. 2).—Studies of more than 2,000 single-spore isolates from 18 parent strains of *F. bulbigenum lycopersici* indicated that the tendency to variation is from cultures with abundant aerial mycelium (highly pathogenic) through intermediate types to cultures of appressed slimy character with little or no aerial growth (very mildly pathogenic), and the cultural type obtained was independent of choice of macrospores, microspores, or chlamydo-spores. Of the total isolates, 3 varied towards a more raised growth type. The complete range of cultural variants was secured only from strains of the unstable yet fully raised types of culture. By selection from successive generations of single-spore reisolations out of sectors, strains with little or no aerial mycelium (low pathogenicity) were obtained from parent cultures that originally had developed abundant mycelium in culture (highly pathogenic).

Chemical investigations relating to magnesium deficiency of fruit trees. T. WALLACE (*Jour. Pomol. and Hort. Sci.*, 18 (1940), No. 2, pp. 145-160, pl. 1).—Data from soil and foliage samples (apple, black currant, gooseberry, and plum) from 10 centers where symptoms of magnesium deficiency had occurred showed a low Mg content in the leaves and it was indicated that when either CaO or K₂O dominated the other was deficient. At one center the MgO in the leaves did not vary appreciably under wide levels of K₂O. Two groups of MgO deficiency were distinguished, viz, with CaO also low and with this base high. A time lag may be expected after applying lime and MgSO₄ before the levels of CaO and MgO become satisfactory in the apple foliage. The possible inaportance of Mg deficiency in abnormal susceptibility to spray injury is discussed.

Magnesium deficiency of apples in the Nelson district of New Zealand, E. B. KIDSON, H. O. ASKEW, and E. CHITTENDEN (*Jour. Pomol. and Hort. Sci.*, 18 (1940), No. 2, pp. 119-134, pls. 2, fig. 1).—Premature defoliation of apple trees in this region was identified as a magnesium deficiency, and injection of MgSO₄ into the branches prevented the leaf blotching and defoliation. A large number of analyses indicated a close correlation between leaf blotching and a low Mg and high K content in the leaves, and premature defoliation was found most severe under liberal potassic fertilization. It is believed that the unfavorable ratio between these two elements in the soil has reduced the Mg intake by the trees.

Bitter pit of apple.—I, In orchard and in storage, M. B. CUMMINGS and R. G. DUNNING (*Vermont Sta. Bul.* 467 (1940), pp. 30, pls. 4).—This bulletin sets forth the history of this functional disease of most apple regions where susceptible varieties are grown, presents data secured in the station orchard, and discusses its development in storage at different temperatures. Of the 40 varieties under observation, only Arctic, Baldwin, Northern Spy, and Shiawassee have proved susceptible. The disease is very erratic, occurring all over a tree, on any quadrant, high up or low down, in shade or sun, on a tree's periphery or its interior. It may be rife one year and absent the next, and all over one tree when its neighbor is free. Furthermore, an apparently normal crop may be harvested only to go bad in storage, where it develops usually during the first 2-3 mo. It is stated that if pit develops at harvest or in storage the apples may be sorted and sold at midwinter with assurances that little or no more will be seen, since all pits appear a few weeks before decay sets in.

Boron in relation to bitter pit in apples, T. WALLACE and J. O. JONES (*Jour. Pomol. and Hort. Sci.*, 18 (1940), No. 2, pp. 161-176).—In storage tests

(1935-36) on fruits and chemical studies on fruits and leaves it was shown that the pitting troubles were not concerned with boron. The major ash constituents (Ca, Mg, K, and P) were present in normal amounts in both fruits and leaves, and the status of Ca in these was not affected by boric acid injections.

The red core root disease of the strawberry caused by *Phytophthora fragariae* n. sp., C. J. HICKMAN (*Jour. Pomol. and Hort. Sci.*, 18 (1940), No. 2, pp. 89-118, pls. 2, figs. 4).—An account is given of the first authenticated outbreaks of this disease in England, and it is stated that a similar if not identical disease has recently been recognized in the United States. The symptoms and studies of the fungus are described. The roots become invaded at the tips, the fungus passing backwards in the central vascular cylinder and occasionally reaching the rootstock. High soil moisture favors development of the disease, and it appears to be inhibited by soil alkalinity. Some varieties proved resistant, and four new seedlings are said to be immune. The disease is undoubtedly spread from one locality to another by infected runners, and it is said to be the most menacing one attacking strawberries. There are 27 references.

The use of wraps containing o-phenylphenol for citrus fruits, J. E. VAN DER PLANK, J. M. RATRAY, and G. F. VAN WYK (*Jour. Pomol. and Hort. Sci.*, 18 (1940), No. 2, pp. 135-144).—These wraps significantly reduced fruit infection by *Penicillium digitatum*, *P. italicum*, and *Trichoderma lignorum* in standard commercial packs, but tended strongly to injure the rind when too much of the preservative was used. Lemons were less readily injured than oranges. When glyceride oils were added to these wraps, more of the preservative could be used without causing injury and the oil did not significantly affect its potency.

Investigations of mal secco or "kurutan" of lemon trees [trans. title], G. GASSNER (*Phytopathol. Ztschr.*, 13 (1940), No. 1, pp. 1-90, figs. 50).—This is a review (52 references) and monographic study of the destructive disease due to *Deuterophoma tracheiphila*.

Root rot of orange trees [trans. title], J. P. DA COSTA NETO (*Rev. Agron. [Brazil]*, 4 (1940), No. 44, pp. 643-646, figs. 4).—A note on the disease due to *Deuterophoma tracheiphila*, usually known as mal secco, which occurs in southern Brazil and neighboring regions of Argentina.

The scab (*Elsinoë australis*) of sweet orange in Uruguay [trans. title], J. C. BERTELLI (*Rev. Assoc. Ingen. Agrón. [Montevideo]*, 12 (1940), No. 4, pp. 17-20+[1], figs. 29; *Eng. abs.*, p. [1]).—The author describes the symptoms of this disease at different stages, as observed in the citrus zone of northern Uruguay, and the technic used in microscopical preparation and staining of the fungus, and outlines recommended control measures. In spring conidial infection was found to occur through the cuticle or via the stomata. It was also noted that wounds may become infected by conidia through the agency of thrips.

Necrosis of the coffee tree [trans. title], V. WELLBORN (*Café el Salvador*, 10 (1940), No. 115, pp. 484-500).—The author discusses the gross and microscopic symptoms, cause, affinities, and control of the coffee tree phloem necrosis in Liberia and Surinam, recent studies of the disease in Surinam, and the present status of investigations on insect transmission.

Further evidence for multiplication of the aster-yellows virus in the aster leaf hopper, L. M. BLACK (*Phytopathology*, 31 (1941), No. 2, pp. 120-135).—The aster yellows virus (*Chlorogenus callistephi vulgaris*) was mechanically transmitted from insect (*Macrostelus divisus*) to insect. Juice from viruliferous insects was infectious at dilutions as high as 1:1,000 in 0.85 percent NaCl solution. The virus in insects inoculated mechanically underwent a minimum incubation period of 11-45 days. Once these insects began to transmit the virus, they usually did so throughout life. Mechanical transmission proved

more efficient at 0° C. than at 25°. Most of the virus was inactivated by freezing viruliferous insects for 20 min. at -10°, and by 24 hours' storage at 0° of insect juice diluted 10^{-1.5} with 0.85 percent NaCl solution. Direct experimental evidence indicated that the virus multiplied at least one-hundred-fold during the first 12 days of a 17-day incubation period, and it reached a high concentration in the insects 6 days before the end of the incubation period.

A study of chlorosis affecting the Japanese azalea, T. H. McHATTON and R. A. BOWDEN (*Ga. Univ. Bul.*, 39 (1939), No. 8, pp. 36-39, figs. 2).—In the tests reported, iron sulfate sprayed or applied to the soil partially controlled the chlorosis, the response being more rapid in an acid than in a neutral soil.

Bacterial wilt of carnation, L. K. JONES. (Wash. State Col.). (*Phytopathology*, 31 (1941), No. 2, p. 199).—Wilting and death of carnation plants due to an undescribed bacterial species is reported.

Bacterial leaf spot of gardenia, W. H. BURKHOLDER and P. P. PIRONE. (Cornell Univ. and N. J. Expt. Stas.). (*Phytopathology*, 31 (1941), No. 2, pp. 192-194, fig. 1).—In the fall of 1938, a severe spotting of gardenia foliage was observed in a greenhouse at New Brunswick, N. J., the Belmont, Hadley, Pierson, and Veitchii varieties and the botanical species *Gardenia radicans* being infected. The cause was proved to be *Phytonomonas gardeniae* n. sp.

Effect of magnesium on Primulas, R. A. BOWDEN (*Ga. Univ. Bul.*, 39 (1939), No. 8, pp. 33-35, figs. 2).—A chlorotic condition in two species of primrose, resulting in dwarfing of the leaves, failure to bloom, and gradual and continuous loss of plants throughout the summer, responded to addition of Mg to the soil.

Fertilizer in relation to disease in roses, H. R. ROSEN. (Ark. Expt. Sta.). (*Better Crops With Plant Food*, 24 (1940), No. 10, pp. 21, 22, 43, 44, fig. 1).—In 4 years' field tests no correlation was found between fertilizers or their absence and the amount of black spot, but there was a very obvious correlation of late spring frost injury and dieback with the fertilizers and mulches. As a whole, the experiments indicated that barnyard manure, peat moss, and presumably other organic materials as mulches are very unsafe for roses, predisposing them to frost injury. The possible value of soluble potash in this connection is noted.

Some outstanding needs for research in tree husbandry—pathology, D. S. WELCH. (Cornell Univ.). (*Natl. Shade Tree Conf. Proc.*, 15 (1939), pp. 77-81).—An address.

Diseases of trees: Latest findings on various infections of trade importance reported in recent research studies, L. R. TEHON (*Amer. Nurseryman*, 72 (1940), Nos. 3, p. 28; 4, p. 28; 5, p. 26; 6, pp. 22, 23; 7, p. 28; 8, pp. 24-26; 9, pp. 24, 25; 10, pp. 22, 23).—Data on the following are included: Italian prune leaf spot, peach shot hole, apple and pear scab, soft rot of apple fruit, trunk sampling for Dutch elm disease, crown gall tests on decorative evergreens, persimmon wilt, needle blight on fir, plane-tree disease spread, Berckman blight, a rare rust of cypress, survival of Dutch elm fungus at low temperature, butt rot in eastern oak, Swiss needle cast of fir, and Japanese cherry twig disease.

Some new species of Ascomycetes on coniferous hosts, E. K. CASH and R. W. DAVIDSON. (U. S. D. A.). (*Mycologia*, 32 (1940), No. 6, pp. 728-735, figs. 2).—The fungi described include one pyrenomycete and four discomycetes from conifers in various parts of the United States.

Damping-off of tree seedlings, E. WRIGHT. (U. S. D. A.) (*Amer. Nurseryman*, 72 (1940), No. 6, pp. 5, 6, 32-34).—This is a general discussion and summary of "control measures of damping-off on conifers and broad-leaved trees developed in investigations of the Federal Division of Forest Pathology."

New England mistletoe, R. J. EATON and R. DOW (*New England Nat.*, No. 9, (1940), pp. 1-5, figs. 15).—A semipopular general account on dwarf mistletoe (*Arceuthobium pusillum*) in New England, including its distribution and hosts.

A new host for *Taphrina bacteriosperma*, W. W. RAY. (Okla. A. and M. Col.). (*Mycologia*, 32 (1940), No. 6, pp. 752-755, figs. 2).—The fungus was found parasitizing leaves of yellow birch (*Betula lutea*).

Breeding work toward the development of a timber type of blight-resistant chestnut.—Report for 1939, A. H. GRAVES (*Bul. Torrey Bot. Club*, 67 (1940), No. 9, pp. 773-777).—A further progress report (E. S. R., 81, p. 536).

Chlorosis of pin oaks and its control, P. P. PIRONE (*Shade Tree*, 13 (1940), No. 12, pp. [2-6], fig. 1).—The symptoms of iron-deficiency chlorosis and methods of correction are described, and the results of successful control tests on shade trees are summarized. Because most New Jersey soils are acid, chlorosis is only a major problem there under certain local conditions where spraying or injection of iron salts and soil acidification are needed to correct the trouble.

Studies in *Ceratostomella montium*, M. TAYLOR-VINJE. (Univ. Wis.). (*Mycologia*, 32 (1940), No. 6, pp. 760-775, figs. 30).—The author reports on a study of ascus development in *C. montium* isolated from beetle galleries in lodgepole pine (*Pinus contorta* (=murrayana)).

Studies in forest pathology.—III, Hypoxylon canker of poplar, J. E. BIER (*Canada Dept. Agr. Pub.* 691 (1940), pp. 40, pls. 9, fig. 1).—The history and symptoms of this disease, due to *H. pruinaum*, are given. In Ontario it was found prevalent on *Populus tremuloides* and *P. grandidentata*. It possibly occurs on other species. Incipient cankers are always associated with wounds, in the Toronto region insect punctures usually serving as entrance courts. Infected bark of older cankers is heavily infested with the larvae of secondary bark-boring beetles. The fungus has been isolated from ascospores, conidia, and from diseased bark, and cultural studies were made. Inoculations on wounded tissue developed into cankers like those spontaneously produced. Trees 4-7 in. in diameter were girdled and killed 3½ yr. after inoculation.

Decay and other volume losses in wind-thrown timber on the Olympic Peninsula, Wash., T. S. BUCHANAN and G. H. ENGLERTH (*U. S. Dept. Agr., Tech. Bul.* 733 (1940), pp. 30, figs. 10).—Losses in timber blown down on this area by the storm of January 29, 1921, were found due to breakage, high stumps, and invasion by insects and fungi. Periodic examinations for 15 yr. thereafter indicated progressively increasing losses from insects and fungi. Breakage and high stump losses were greater than under normal logging conditions, but it was the deterioration through decay that finally resulted in the tremendous reduction in merchantable volume. Wind-thrown silver fir (*Abies amabilis*) and western hemlock (*Tsuga heterophylla*), irrespective of size, were rendered completely unmerchantable within 8 yr. Sitka spruces (*Picea sitchensis*) up to 118 in. in diameter were worthless after 15 yr. The heartwood of the larger trees (over 30 in. in diameter) of Douglas fir (*Pseudotsuga taxifolia* (=douglasi)) still contained considerable merchantable volume after 15 yr. on the ground. At the end of the study heartwood of wind-thrown western red cedar (*Thuja plicata*) was as sound as when the trees fell, only the sapwood zone having become decayed. The results show, however, that if deterioration is to be entirely avoided, trees of all the species studied must be salvaged within 1-2 yr. after falling.

Nitrogen content of sound and decayed coniferous woods and its relation to loss in weight during decay, R. E. HUNGATE (*Bot. Gaz.*, 102 (1940), No. 2, pp. 382-392).—Using methods described, determinations of the specific gravity and nitrogen content for sound and decayed woods of several coniferous species indicated but little change in total N during decay. Comparisons of the amount of wood disappearing during decay with the amount of available N

indicated that the amount of wood was 500-700 times as great as the total N available. As to the effects of added N, it appeared that the N present was utilized more effectively during decay than was that added. The efficiency of certain fungi in utilizing N may explain in part their great success in destroying wood.

Sap-stain, mould, and decay in relation to export shipments of British Columbia softwoods. H. W. EADES (*Canada Dept. Mines and Resources, Lands, Parks, and Forests Branch, Forest Serv. Cir. 57 (1940)*, pp. [2]+12).—Sap stain and mold, and sometimes the surface mycelium of wood-rotting fungi, were found to grow on British Columbia softwoods during transit overseas, particularly on sapwood, when shipped in unseasoned condition. In some cases actual rot developed. Seasoning to a moisture content of 25 percent or less is recommended as a preventive method, and even 30 percent in the case of larger timbers aids in retarding attack. Chemical sprays and dips were found useful, but to insure their efficiency lumber should be at least partially seasoned following treatment.

ECONOMIC ZOOLOGY—ENTOMOLOGY

[**Work in economic zoology by the Cornell Station**] (*[New York] Cornell Sta. Rpt. 1940*, pp. 104-105, 187-188).—The work of the year (E. S. R., 82, p. 792) reported upon relates to the nutritional requirements of trout, by C. M. McCay, A. V. Tunison, and A. Phillips; the nutritive requirements for growth, fur production, and reproduction in foxes and minks, by S. E. Smith, J. K. Loosli, and R. Bernard; economics and biology of rodent pests in New York, with special reference to orchard mice, by W. J. Hamilton, Jr.; and life history, behavior, economic status, relation to land use, and management of the birds of New York, by A. A. Allen, P. P. Kellogg, G. M. Sutton, et al.

[**Work in economic zoology by the Oklahoma Station**] (*Oklahoma Sta. Bien. Rpt. 1939-40*, pp. 95, 97-100, figs. 2).—Brief reference is made to the effects of management practices with bobwhite quail, decline in number of quail due to lack of food, tests of feed plats, studies of the enemies of quail, quail production on the Lake Carl Blackwell game farm, and a study of fish in Lake Carl Blackwell.

[**Contributions on economic zoology and entomology**] (*Va. Acad. Sci. Proc., 1940*, pp. 206-222).—For these contributions abstracts are given as follows: Notes on the Control of the Fuller's Rose Weevil (*Pantomorus godmani* (Crotch)) on Kale, by H. G. Walker and L. D. Anderson (p. 206) (Va. Truck Expt. Sta.); The Effect of Attractants on Mosquitoes, by K. B. M. Crooks (p. 207); The Etiology of the *Beauveria* Disease of *Dendroctonus frontalis*, by J. G. Harrar and J. G. Martland (p. 211), The Biology of a Species of *Beauveria* From the Southern Pine Bark Beetle, by J. G. Harrar and R. P. Ellis (p. 211), and Morphology and Histogenesis of the Blood of the [Yellow] Mealworm (*Tenebrio molitor* L.), by H. W. Jackson (pp. 221-222) (all Va. A. and M. Col.); and Miscellaneous Studies of Codling Moth Bands, by A. M. Woodside (p. 212) and The Relative Importance of the Host Plants of the Tobacco Flea Beetle (*Epitrix parvula* F.), by E. H. Glass (pp. 213-214) (both Va. Sta.).

[**Wildlife research by the Texas Station**] (*Texas Sta. Rpt. 1939*, pp. 125-130).—The work of the year reported upon (E. S. R., 82, p. 507) includes wildlife resources surveys in Harris, La Salle, and Culberson Counties, by T. F. Smith, B. E. Ludeman, W. P. Taylor, and W. B. Davis; winter food of bobwhite, scaled, and Gambel quail and quail management in the coastal plains and prairie regions of Texas, both by V. W. Lehmann; the influence of cover control on food and

shelter for quail, by H. C. Hahn; genetic experiments with bobwhites, by E. H. Roesner and D. H. Reid; ecological wildlife relationships, by T. P. Chenault; present status of Texas bighorn sheep, by Davis and Taylor; wildlife and farming practices in eastern Texas, by W. H. Kellogg; beaver restoration, by A. H. Cook; pocket gophers of Texas, by Davis; summer food habits of gars, by K. Bonham; and habits of the armadillo, by F. W. Taber.

The digestive capacities of the white-tailed deer, E. B. FORBES, L. F. MARCY, A. L. VORIS, and C. E. FRENCH. (Pa. Expt. Sta. et al.). (*Jour. Wildlife Mangt.*, 5 (1941), No. 1, pp. 108-114, pl. 1).

Methods of increasing deer browse, L. W. KREFTING. (Minn. Expt. Sta.). (*Jour. Wildlife Mangt.*, 5 (1941), No. 1, pp. 95-102, pl. 1. fig. 1).

A respiration apparatus for serial work with small animals, particularly rats, M. KLEIBER. (Calif. Expt. Sta.). (*Calif. Univ. Pubs. Physiol.*, 8 (1940), No. 15, pp. [2]+207-220, figs. 3).

A trap-removal census study of small mammals, V. H. CAHALANE (*Jour. Wildlife Mangt.*, 5 (1941), No. 1, pp. 42-67, pls. 2, figs. 11).—A study made of the mammals of the Chiricahua Mountains of southeastern Arizona during the field seasons of 1932 and 1933 with a view to determining the population of various species in the major habitats and evolving a method that would be useful elsewhere under similar conditions is reported. Considerable ecological data were gathered as a basis for possible conclusions.

Food habits of chipmunks, S. E. ALDOUS (*Jour. Mammal.*, 22 (1941), No. 1, pp. 18-24).—The high frequency of animal food, especially such forms as lepidopterous larvae and grasshopper eggs which were found in large quantities in the stomachs, indicates a beneficial influence on the part of chipmunks. It is very probable that during June and July, when insects are even more numerous in the forest than in August and September, they may be consumed in still greater quantities. The part chipmunks and other small rodents play in controlling forest insects is not known, but normal rodent populations often exceed in numbers the bird life in an area.

Identification of mice in genus *Peromyscus* by a red blood cell agglutination test, P. A. MOODY. (Univ. Vt.). (*Jour. Mammal.*, 22 (1941), No. 1, pp. 40-47, fig. 1).

Versatility in feeding and population maintenance of the muskrat, P. L. ERRINGTON. (Iowa Expt. Sta. et al.). (*Jour. Wildlife Mangt.*, 5 (1941), No. 1, pp. 68-89).—It was found that the muskrat may be selective or highly indiscriminate in its feeding, depending upon opportunities and necessity, individual tastes and habits, and what may be termed local custom. Certain foods, as ear corn and rootstocks of cattails and bulrushes, may be both preferred and of superior quality. Most green vegetation is more or less adequate as food in warm weather, and populations may winter on dry grass and weeds and cold-blooded prey, such as frogs, fishes, and mussels. Very harsh and innutritious fare, including corncobs, rotting vegetation, and wood, may also be the principal diet of some animals for varying lengths of time in winter and spring. Because of this versatility in food utilization, muskrats of the agricultural north-central region are not often subject to rapid or outright starvation. Shortage or unavailability of food in combination with winter vicissitudes may on occasion result in decimation over wide areas, but the check that food deficiencies impose upon muskrat populations appears to be mainly indirect and, to at least some extent, psychological. Twenty-eight references to the literature cited are included.

Notes on the winter feeding of the muskrat in Delaware, L. A. STEARNS and M. W. GOODWIN. (Del. Expt. Sta.). (*Jour. Wildlife Mangt.*, 5 (1941), No. 1, pp. 1-12, fig. 1).

Severe parasitism in a raccoon (*Procyon lotor lotor* Linnaeus), B. B. MORGAN and E. F. WALLER. (Univ. Wis., Iowa State Col., et al.). (*Amer. Micros. Soc. Trans.*, 59 (1940), No. 4, pp. 523-527).—A sick female raccoon captured in Clayton County, Iowa, was found heavily infested by parasites. They included three ectoparasites (*Trichodectes crassus* Nitz., *Trichopsylla lotoris* Stewart, and *Ixodes cookei* Pack.), two nematodes (*Ascaris columnaris* Leidy and *Physaloptera* sp.), a coccidium resembling *Eimeria nuttalli* Yakim. and Matikasch., and a cestode resembling *Mesocestoides lineatus* Goeze. The raccoon is recorded as a new host for the trematode *Fibricola cratera* Barker and Noll, notes on the life cycle of which are included.

Winter and spring habits of weasels in central Iowa, E. B. POLDERBOER, L. W. KUHN, and G. O. HENDRICKSON. (Iowa Expt. Sta. et al.). (*Jour. Wildlife Mangt.*, 5 (1941), No. 1, pp. 115-119, pl. 1).

[**Reports of quail studies**], H. L. STODDARD (*Coop. Quail Study Assoc. Ann. Rpts.*, 6 (1937), pp. 27; 7 (1938), pp. 31; 8 (1939), pp. 27).—Annual reports (E. S. R., 78, p. 508) of work with quail, their life and habits, food, enemies, diseases, protection, etc., under way in the Southeastern States.

[**Oyster investigations by the New Jersey Stations**] (*New Jersey Stas. Rpt. 1940*, pp. 102-104, fig. 1).—The work of the year (E. S. R., 83, p. 651) reported upon relates to the production of oyster seed, studies of the filtration of water by oysters, effect of a severe drought upon the oyster farmer, and pest control.

Studies on some early developmental stages of nematode worms, R. O. CHRISTENSON. (Ala. Polytech. Inst.). (*Jour. Tenn. Acad. Sci.*, 15 (1940), No. 4, p. 415).

A new cestode, *Cladotaenia oklahomensis*, from a hawk [*Buteo jamaicensis*], F. L. SCHMIDT. (Okla. A. and M. Col.). (*Amer. Micros. Soc. Trans.*, 59 (1940), No. 4, pp. 519-522, figs. 3).

Report of the Chief of the Bureau of Entomology and Plant Quarantine, 1940, L. A. STRONG (*U. S. Dept. Agr., Bur. Ent. and Plant Quar. Rpt.*, 1940, pp. 1-128).—The work of the year (E. S. R., 83, p. 83) on apple and pear insects included biological control studies on Comstock's mealybug and search for a substitute for lead arsenate for codling moth control, as well as investigations on the benefits from tree scraping and banding, biological-mechanical control and methods of determining the periods when spring-brood codling moths emerge and lay eggs, and insecticides in the Hudson River Valley on apple maggot control; peach insect investigations dealt with the value of mass liberations of *Macrocentrus ancylivorus* Roh. for oriental fruit moth control, the use of ethylene dichloride for peach borer, the use of dichloroethyl ether against the plum curculio larvae in the soil, continuation of peach mosaic work, and tests for vectors of phony peach disease; work with grape insects included the practical use of cultivation and insecticides for grape berry moth; investigations on nut insects included field experiments for control and parasites of the hickory shuckworm on pecan, insecticide tests for control of pecan nut casebearer, observations on pecan leaf casebearer, and additional observations on distribution and parasites of filbert worm; dried-fruit insect investigations included information on the saw-toothed grain beetle as a pest of dried fruits and protection against crawling insects for stored raisins by trough barriers containing oil, studies on cold storage for control of dried-fruit insects, and a field study for causes of spoilage of mature vineyard grapes and relation to raisin moth; and subtropical fruit insect investigations included factors influencing results of red scale fumigation with cyanide and toxicants in oil, insecticide studies on citrus thrips, effect of sulfur on black scale and citrus rust mite, and influence of temperature on Florida red scale. Japanese beetle control by milky disease, nematodes, traps, insecticides, fumigants, and para-

flax, grain sorghum, Sudan grass, sorgo, broomcorn, cowpeas, buffalo and Angle-included.

Forest and shade tree insects mentioned are the Black Hills beetle, western pine beetle, elm bark beetle, ambrosia beetles, European spruce sawfly, Douglas fir twig weevil *Cylindrocopturus longulus* (Lec.), cedro shoot borer *Hypsipyla grandella* (Zell.), aceitillo seed weevil *Apion martinezi* Marshall, and the gypsy and brown-tail moths.

Work with cereal and forage insects dealt with grasshoppers, the Mormon cricket, white-fringed beetle, chinch bugs, corn earworm, corn flea beetle as a vector of Stewart's disease of corn, European corn borer, hessian fly, pale western cutworm, armyworm and fall armyworm, control of stored grain pests, alfalfa weevil, the weevil *Hypera brunneipennis* (Boh.), pea aphid, *Lygus* sp. on alfalfa, vetch bruchid, and sugarcane borer.

Truck crop and garden insect investigations reported included work on tomato fruitworm, pea weevil, cabbage caterpillar, tobacco flea beetle, cigarette beetle, tobacco moth, sweetpotato weevil, wireworm, raspberry fruitworm, red berry mite, gladiolus thrips, red spider, orchid thrips, flower thrips, beet leafhopper, *Lygus* spp. on seed beets, Say's plant bug and another plant bug, *Thyanta custator* (F.), and false chinch bug.

Studies with cotton insects dealt with the bollweevil, leaf and root aphids, cotton flea hopper and other hemipterous pests, bollworm, pink bollworm, and the thurberia weevil.

Bee investigations included pollen studies, nectar secretion, American foul-brood, abnormal death losses in Utah, spotted brood, tests of commercial stock, biochemical differentiation of female castes, effect of feeding on weight of queens, artificial insemination, and notes on mating.

Investigations on insects affecting man and animals included work with screwworms and blowflies, horn flies, cattle grub, external parasites of sheep, goats, and cattle, fly sprays, mosquitoes, Clear Lake gnat, insect secretion, ticks, and the clothes moth and black carpet beetle.

Work with insecticides included testing of materials, fumigation investigations, physiology of insects, application of insecticides, insecticidal plants (tobacco, derris, pyrethrum, etc.), synthetic organic insecticide development, spray residues and removal, development of inorganic insecticides, fumigants, accessory materials for use with insecticides, toxicity of new insecticidal compounds to goldfish, and analytical investigations.

Inspection and quarantine work is also summarized. Plant disease studies (pp. 39-50, 61-66) are noted on page 768.

[**Insect pest control**] (*U. S. Dept. Agr., Sec. Agr. Rpt., 1940, pp. 166-171*).—A progress report on control work with insect pests (*E. S. R., 82, p. 646*), including the Japanese beetle, white-fringed beetle, fruitflies, corn rootworm, oriental fruit moth, gypsy moth, Mormon cricket, grasshoppers, stored-grain insects, western pine beetle, Mexican bean beetle, cabbageworms, turnip aphid, gladiolus thrips, mites, European corn borer, hessian fly, alfalfa aphid, chinch bugs, and woolly apple aphid, as well as recent work on bees resistant to disease.

[**Contributions on economic insects**] (*U. S. Dept. Agr., Bur. Ent. and Plant Quar., Insect Pest Survey Bul., 17 (1937), Nos. 1, Sup., pp. 29-42; 3, Sups., pp. 111-116, pl. 1, pp. 117-150; 6, Sup., pp. 331-333; 7, Sup., pp. 381-383, pl. 1; 8, Sup., pp. 431-433, pl. 1; 9, Sups., pp. 473-482, pls. 3, pp. 483-590; 18 (1938), Nos. 1, Sup., pp. 33-50; 3, Sup., pp. 141-146; 4, Sup., pp. 225-240; 6, Sup., pp. 385-443; 7, Sup., pp. 515-517, pl. 1; 9, Sups., pp. 639-642, pp. 643-647, pl. 1, pp. 649-656, pls. 2; 19 (1939), Nos. 1, Sup., pp. 25-28, pls. 2; 3, Sup., pp. 103-109, pls. 4; 4, Sup., pp. 179-270, pl. 1; 7, Sup., pp. 483, 484, pl. 1; 8, Sups., pp. 527-534, pls. 3, pp. 535-538, pp. 539-543; 9, Sups., pp. 589-602, pp. 603-618, pls. 2, pp. 621-626;*

10, *Sup.*, pp. 649, 650; 20 (1940), *Nos. 1, Sups.*, pp. 35, 36, *pl. 1*, pp. 37-39; 4, *Sup.*, pp. 209-211, *pls. 2*; 7, *Sup.*, pp. 429-431; 8, *Sup.*, pp. 483, 484, *pl. 1*; 9, *Sups.*, pp. 525-532, *pls. 2*, pp. 533-538).—These further contributions (E. S. R., 78, p. 216) are as follows:

Vol. 17.—(1) Alfalfa Weevil Survey, Fall of 1936, by W. C. McDuffie; (3) The Two Broods of Periodical Cicada Scheduled to Appear in 1937; and The Species and Distribution of Grasshoppers in the 1936 Outbreak, by R. L. Shotwell; (6) Spread of Alfalfa Weevil in 1937, by J. C. Hamlin; (7) Hessian Fly Survey, Harvest-Time 1937 (E. S. R., 78, p. 224); (8) Liberations of Parasites of the European Corn Borer in the United States in 1937, by C. A. Clark; and (9) Liberations of Japanese Beetle Parasites in the Eastern States in 1937, by J. L. King; and Insect Notes From Costa Rica in 1936, by C. H. Ballou (E. S. R., 78, p. 220).

Vol. 18.—(1) Alfalfa Weevil Survey, Fall of 1937, by W. C. McDuffie, F. V. Lieberman, and R. W. Bunn; (3) Notes on Tobacco Insects in 1937, by W. C. Nettles; (4) Population and Host Preferences of June Beetles in Southern Wisconsin in 1935, 1936, and 1937, by T. R. Chamberlin, C. L. Fluke, L. Seaton, J. A. Callenbach, and P. O. Ritcher; (6) The Species and Distribution of Grasshoppers in the 1937 Outbreak, by R. L. Shotwell; (7) Hessian Fly Survey at Harvest-Time, 1938; and (9) Spread of Alfalfa Weevil in 1938, by J. C. Hamlin; Relative Abundance of the European Corn Borer in 1938, by W. A. Baker and A. M. Vance; and The Field Status of Parasites of the European Corn Borer in the Fall of 1937, by W. G. Bradley and C. A. Clark.

Vol. 19.—(1) Colonization of Japanese Beetle Parasites in the Eastern States in 1938, by J. L. King; (3) Populations and Host Preferences of June Beetles in Southern Wisconsin in 1938, by T. R. Chamberlin, C. L. Fluke, L. Seaton, and J. A. Callenbach; (4) The Species and Distribution of Grasshoppers in the 1938 Outbreak, by R. L. Shotwell; (7) Hessian Fly Survey at Harvest Time, 1939, summarized by W. B. Cartwright; (8) The Field Status of Parasites of the European Corn Borer in the Fall of 1938, by W. G. Bradley and C. A. Clark; Estimates of Damage by the European Corn Borer in 1938 and a Comparison With 1937 Estimates, by A. M. Vance; and Spread of Alfalfa Weevil in 1939, by J. C. Hamlin; (9) Distribution and Food Plant Records of *Paratetranychus citri* McG., *P. ilicis* McG., *P. pilosus* C. & F., *Tetranychus pacificus* McG., and *T. telarius* L., by J. E. Mabry and M. M. Walton; Status of the European Corn Borer in 1939, by A. M. Vance; and Colonization of European Corn Borer Parasites in 1939, by C. A. Clark and W. G. Bradley; and (10) European Corn Borer.

Vol. 20.—(1) Populations of Chinch Bugs in Hibernation, November-December 1939; and Estimates of Damage by the European Corn Borer in 1939, by A. M. Vance; (4) Colonization of Japanese Beetle Parasites in 1939, by J. L. King and L. B. Parker; (7) Alfalfa Weevil Scouting, 1940, by J. C. Hamlin; (8) Hessian Fly Survey at Harvest Time 1940, summarized by W. B. Cartwright; and (9) The Field Status of Parasites of the European Corn Borer at the Close of the 1939 Season, by W. G. Bradley and C. A. Clark; and Colonization of European Corn Borer Parasites in 1940, by C. A. Clark and W. G. Bradley.

Montana insect pests, 1939 and 1940, H. B. MILLS (*Montana Sta. Bul. 387* (1941), pp. 28, *figs.* 8).—This biennial report (E. S. R., 80, p. 796) contains a review of the Montana grasshopper and Mormon cricket control programs in 1939 and 1940, includes notes on clover insects for the years, namely, the clover seed midge, clover root borer, and clover aphid, and discusses the following grain insects: The granary weevil, saw-toothed grain beetle, flat grain beetle, broad-horned flour beetle *Gnathocercus cornutus* (F.), confused flour beetle, foreign grain beetle *Ahasverus advena* (Walfl.), yellow mealworm, dark mealworm,

cadelle, meal moth, Mediterranean flour moth, Indian-meal moth, Say's stinkbug, and grass plant bugs. Notes are also included on the following miscellaneous insects: The potato and tomato psyllid, pear psylla, lettuce root aphid *Pemphigus bursarius* (L.), spruce gall lice, striped cucumber beetle, strawberry rootworm *Paria canella* (F.), red turnip beetle, soft-winged flower beetle *Malachius aeneus* (L.), alfalfa weevil, sugar beet webworm, alfalfa looper, armyworm, pale western cutworm, codling moth, termites, Alpine rock crawler *Grylloblatta campodeiformis* Walk., and earwigs.

[Entomological work of New Jersey Stations] (*New Jersey Stas. Rpt. 1940*, pp. 46-47, 51, 53-54, 60, 61, 67, 75-76, 92-95, 99, fig. 1).—Brief progress report (E. S. R., 83, p. 651) on codling moth, peach tree borer, cranberry weevil, blunt-nosed leafhopper *Euscelis striatulus* Fall., six-spotted leafhopper in relation to lettuce yellows, carrot weevil, corn earworm, wireworms, European corn borer, red spiders, mosquitoes, honey production, nonpoisonous sprays for control of leaf-eating insects on shade trees and shrubs, climate and insect control, devil's shoestring as an insecticide, and arsenical substitutes.

[Work in entomology by the Cornell Station]. (Partly coop. U. S. D. A. et al.). ([*New York*] *Cornell Sta. Rpt. 1940*, pp. 126-135).—The work of the year (E. S. R., 82, p. 792) reported upon includes the following: The alfalfa snout beetle, by H. H. Schwardt and C. G. Lincoln; white grubs and other forage crop pests, by Schwardt and T. W. Kerr, Jr.; Mexican bean beetle, by Schwardt and M. Ramsay; biology and control of cutworms, by C. E. Palm and W. D. Wylie; nonpoisonous sprays, by T. R. Hansberry and L. B. Norton; onion thrips, by T. C. Watkins and W. H. Ewart; potato insect investigations on Long Island, by W. A. Rawlins, Lincoln, Watkins, and J. O. Nottingham; efficiency of spraying and dusting practices in protecting potatoes grown on muck soils, by Rawlins, Watkins, and J. N. Roney; wireworms and potato injury, by Rawlins and R. E. Olson; potato rotation studies, by Rawlins and K. B. Nash; varietal resistance of plants to insect attacks, by Rawlins, Watkins, Ewart, and Roney; Dutch elm disease work, by D. L. Collins, H. Dietrich, D. Connola, and L. E. Hagmann; sulfur and sulfur compounds in relation to insect control, by Hansberry, Palm, G. E. Carman, and E. Stafford; and fumigation for control of two common clothes moths and dermestids injurious in dwelling houses, and the economic aphids of New York, all by G. H. Griswold.

[Insect investigations by the Oklahoma Station] (*Oklahoma Sta. Bien. Rpt. 1939-40*, pp. 77-95, figs. 11).—Brief notes on progress (E. S. R., 81, p. 68) include studies of grasshopper baits, by F. E. Whitehead; location of green bug infestations by aerial survey, by Whitehead and F. A. Fenton; cotton flea hopper, by E. Hixson; control of melon louse, by Fenton and Whitehead, sand crickets (*Daihinia brevipennis* Hald.), by Whitehead, and the white grub *Phyllophaga lanceolata* (Say), by R. Dahms, Fenton, and Whitehead; varietal resistance to corn earworm, by Fenton; stored wheat pests, by Fenton and F. T. Dines; resistance of sorghum hybrids to chinch bugs, by Dahms, Fenton, J. E. Webster, and C. B. Cross; flies and mosquitoes as related to anaplasmosis, by D. E. Howell, L. E. Rozeboom, and L. H. Moe (coop. U. S. D. A.); conservation activities in relation to mosquitoes, by Rozeboom; materials for killing flies in manure, by Howell; bee studies, by G. A. Bieberdorf; and orchard and shade tree pests by Fenton.

[Entomology work by the South Dakota Station] (*South Dakota Sta. Rpt. 1940*, pp. 61-62, fig. 1).—A brief progress report of work by H. C. Severin, N. P. Larson, and G. B. Spahn (E. S. R., 82, p. 647) on electrocutor traps for grasshopper control, the life history of the confused grasshopper *Melanoplus confusus* (Say), and blister beetle control.

[Work in entomology by the Texas Station]. [Partly coop. U. S. D. A., Iowa and Wyo. Expt. Stas., et al.). (*Texas Sta. Rpt. 1939*, pp. 51-62, 118-120,

121, 230, 232, 244-246, 251, 254-255, 256-257, 259, 261, 284-286).—The work of the year reported upon (E. S. R., 82, p. 507) relates to the biology, control, and taxonomy of white grubs, by H. J. Reinhard; the bollweevil, its migration, hibernation, and control, by F. L. Thomas, J. C. Gaines, and Reinhard; the cotton flea hopper, including migration and dispersal, abundance, host plants, varietal resistance, influence of strip planting, other planting practices, and rotations and fertilizers upon infestations, hibernation, and control, by Gaines, R. K. Fletcher, S. E. Jones, W. L. Owen, Jr., Thomas, Reinhard, J. R. Quinby, and J. C. Stephens; the pink bollworm, by Thomas and A. J. Chapman; the biology and natural control of the cotton bollworm, by Fletcher; cotton thrips, by Gaines and Fletcher; pecan insect studies, by S. W. Bilsing; devil's shoestring as an insecticide, by V. A. Little and G. A. Russell; investigations of truck crop insects, including the control of the turnip aphid, harlequin bug, cabbage looper, and common red spider, by M. J. Janes and H. Menusan; injury to range grasses by desert termites, by W. S. McGregor and Thomas; damage to flax by the stinkbug *Chlorochroa ligata* Say, by Menusan and Thomas; the leaf crumpler (*Mineola indigenella*) injurious to ornamentals, by Fletcher; the flatheaded apple tree borer as a rose pest, by Owen; apiary inspection, by C. E. Heard and W. C. O'Neal; activities of bees, by H. B. Parks; adaptability of native plants for bees, queen rearing, bee resistance studies, and horsemint for honey and oil production, all by Parks and A. H. Alex; at the Sonora Substation, external parasites of sheep and goats, by O. G. Babcock, J. O. Stovall, S. W. Clark, and I. B. Boughton; at the Weslaco Substation, citrus insect (rust mite and scale insect) studies and control of cabbageworms, tomato fruitworm, garden flea hopper, potato psyllid, and of the cotton bollweevil and thrips on cotton, all by T. B. Randolph, and control of white grubs and the beet webworm, by Randolph and P. T. Riherd; and at the Winter Haven Substation, studies for vectors of eggplant yellows and control of tomato fruitworm and beet leafhopper, by Jones, onion thrips control tests by Jones and Menusan, and notes on the lesser cornstalk borer, potato leafhopper on beans, cabbage webworms, desert termites, and the stinkbug *C. ligata* Say, by Jones.

[Entomological investigations by the Utah Station] (*Utah Sta. Bul.* 294 (1940), pp. 12-13, 32-35, 41-43, 57-60, 61, 71-72, 73, 92-93, figs. 9).—A brief progress report (E. S. R., 80, p. 367), including notes on alfalfa insects (pale western cutworm and *Lygus* sp.), Mormon crickets, grasshoppers (coop. U. S. D. A.), the beet leafhopper, tomato fruitworm, pea aphid, peach twig borer, stinkbugs, strawberry root weevils (*Brachyrhinus ovatus* (L.) and *B. rugosostriatus* Goeze), and bee investigations.

[Contributions in entomology]. (Utah Expt. Sta.). (*Utah Acad. Sci., Arts, and Letters, Proc.*, 16 (1938-39), pp. 43-73, figs. 2).—Contributions presented include Grasshopper Control in Utah, 1938, by G. F. Knowlton (pp. 43-47) (coop. U. S. D. A. et al.); A New *Myopa* From Utah (Diptera), by G. S. Stains and G. F. Knowlton (p. 51); Some Entomophagous Utah Hymenoptera, by G. F. Knowlton and F. C. Harmston (pp. 59-63); Studies of Western Aphids, by G. F. Knowlton and D. L. Bischoff (p. 69); and A New *Scellus* (Dolichopodidae: Diptera) With Key to Males, by F. C. Harmston (pp. 71-73).

[Entomological investigations by the West Virginia Station] (*West Virginia Sta. Bul.* 298 (1940), pp. 28-29).—Brief notes on progress (E. S. R., 80, p. 796) of studies relating to weather records and insect control, ants v. codling moths, and spray investigations.

[Contributions on economic entomology] (*Ztschr. Angew. Ent.*, 26 (1939), Nos. 1, pp. 1-183, figs. 74; 2, pp. 185-367, figs. 82; 3, pp. 387-544, figs. 85; 26 (1940), No. 4, pp. 545-663, figs. 56).—Contributions presented (E. S. R., 82, p. 353) are as follows:

No. 1.—Penetration of the Tracheae by Different Fluids and the Results, by H. Gäbler (pp. 1–62); The Parasitization of the Nun Moth by Insects—I, Investigations of the Life History and Habits of the Tachinid Parasite *Parasetigena segregata* Rond. (= *Phorocera agilis* R.-D.) in the Rominten Heath District in 1935, With Observations on Hymenopterous Parasites, by E. von Finck (pp. 104–142), and II, The Variation in Abundance of the Tachinid Parasite *Parasetigena segregata* Rond. in the Rominten Heath District, by O. F. Niklas (pp. 63–103); Investigations of the Action of the Sex Scent in the Grape Moths *Clysia ambiguella* and *Polychrosis botrana*, by B. Götz (pp. 143–164); Further Tests of Naaki Against the Granary Weevil in 1938, by A. Claus (pp. 165–170); The Rearing of *Phlugiola dahlemica* Wd. Eichl. (Orthopt.: Tettigoniid.), by W. Eichler (pp. 171–179); and The Control of Spider Mites by Use of Adhesives, by P. Steiner (pp. 180–183).

No. 2.—The Biology of the Pine Geometrid (*Bupalus piniarius* L.) Parasite *Ichneumon nigritarius* Grav., by W. Thalenhorst (pp. 185–208); *Ceutorhynchus suturalis* F., a Little-Known Pest of Onions, by O. Jancke and G. Nietzke (pp. 209–214); Investigations of the Movements of the Larvae of May Beetles (*Melolontha melolontha* L. and *M. hippocastani* F.), by F. Schwerdtfeger (pp. 215–252); Contributions to the Biology and Anatomy of Mites Infesting Houses, by H. Oboussier (pp. 253–296); The Biology of *Pemphigus spirothecae* Pass., by L. Tóth (pp. 297–311); The Alfalfa Weevil, by O. Kaufmann (pp. 312–358); and Mortality and Growth of Larvae of the Pine Geometrid Fed on Pine Needles from Pure Stands and From Mixed Forests, by F. P. Müller (pp. 359–367).

No. 3.—The Alfalfa Weevil, by O. Kaufmann (pp. 387–488); Contributions to the Forest Entomology of Turkey—II, Some Pests of Hazelnut Culture, by E. Schimitschek (pp. 449–461) (E. S. R., 82, p. 354); Investigations of the Beet Leaf Sawfly *Athalia colibri* Christ. (*A. spinarum* F.), by E. Riggert (pp. 462–516); Studies of the Entomophthoraceae, V, VI, by G. Lakon (pp. 517–521) (E. S. R., 73, p. 644); Observations of the Effect of *Empusa weberi* Lakon on the Larvae of *Raphidia ophiopsis* L., by H. Weber (pp. 522–535); and Investigations of the Coleopterous and Dipterous Fauna of Pastures, by B. Schaerffenberg (pp. 536–544).

No. 4.—The Outbreak of *Ips scaberrimus* Börner in the *Picea orientalis* Districts, by E. Schimitschek (pp. 545–588); the H-ion Concentration and Buffering Power of the Contents of the Intestines of *Clysia ambiguella*, *Polychrosis botrana*, and Some Other Insects and Their Foods, by T. Staudenmayer and F. Stellwaag (pp. 589–607); Exact Mimicry Investigation and Applied Entomology, by F. Heikertinger (pp. 608–623); and Descriptions of New Genera and Species of the Family Trichogrammidae (Hym.: Chalcidoidea) From the Palearctic Region, With Notes—Supplement, by S. Nowicki (pp. 624–663) (in English).

Insect outbreaks in Europe, J. R. CARPENTER (*Jour. Anim. Ecol.*, 9 (1940), No. 1, pp. 108–147, figs. 11).

[Contributions on economic insects] (*Indian Jour. Ent.*, 1 (1939), No. 1–2, pp. 17–105, figs. 20).—Contributions presented include the following: Ecological Studies on the Spotted Bollworms of Cotton and Their Parasites—I, The Pre-imaginal Development and Viability of *Earias fabia* and *Microbracon lefroyi* Under Different Conditions of Temperature and Humidity, by T. Ahmad and G. Ullah (pp. 17–47); The Influence of Dust-Storms on the Migrations of the Desert Locust, by D. Bhatia (pp. 49–51); A Note on the Change in the Status of Mango-Hopper (*Idiocerus clypealis*: Jassidae) in North Sind, by H. Khan (pp. 53–54); A Note on Phase Transformation in *Locusta migratoria*, by R. L. Gupta (pp. 55–56); Observations on the Reactions of the Dermestid Beetle *Trogoderma khapra* Arr. to Light, by K. A. Rahman and G. Singh Sohi (pp. 57–63); Descriptions of New and Records of Some Known Chalcidoid and Other Hymen-

opterous Parasites From India, by M. S. Mani (pp. 69-99); and The Fruit Fly *Dacus ferrugineus* Fabr. and Its Variety *dorsalis* Hendel in North West India, by H. K. Munro (pp. 101-105).

The bionomics of entomophagous insects, II, W. V. BALDUF (*St. Louis, Mo.: John S. Swift Co., [1939], pt. 2, pp. [3]+384, figs. 228*).—This is the second (E. S. R., 78, p. 515) of a series planned to treat the general subject bionomics of entomophagous insects. It embraces the orders Lepidoptera, Trichoptera, Mecoptera, and Neuroptera.

An illustrated laboratory manual of parasitology, R. M. CABLE (*Minneapolis, Minn.: Burgess Pub. Co., [1940], pp. V+108, figs. 104*).

A comparison of the transmission of four cucurbit viruses by cucumber beetles [the western striped cucumber beetle and the western spotted cucumber beetle] and by aphids, J. H. FREITAG (*Phytopathology, 31 (1941), No. 1, p. 8*).

Pea aphid and pea weevil control, H. GLASGOW. (N. Y. State Expt. Sta.). (*Canner, 91 (1940), No. 4, pp. 12, 20*).

Principal potato insects of Iowa and their control, H. C. MANIS and H. GUNDERSON (*Iowa Sta. Bul. P18, n. ser. (1941), pp. 509-516, figs. 5*).—A practical account.

The role of insects in the pit scab of potatoes, A. A. GRANOVSKY and A. G. PETERSON (*Phytopathology, 31 (1941), No. 1, pp. 9-10*).

Insect transmission, host range, and properties of squash-mosaic virus, J. H. FREITAG (*Phytopathology, 31 (1941), No. 1, p. 8*).

Insects injurious to wheat [trans. title], A. F. DE SEABRA (*Arg. Secç. Biol. e Parasitol., Mus. Zool. Univ. Coimbra, 3 (1939), pp. XIV+[1]+699+13*).—This work, presented in four parts and an appendix, lists by orders and families and briefly considers the insect forms injurious to wheat, their natural enemies, etc. A list of the principal wheat insects, as reported by leading authorities of the more important wheat-producing countries of the world, and a bibliography of 42 pages are included.

Control of aphids and scale in Virginia apple orchards in 1940, W. S. HOUGH. (Va. Expt. Sta.). (*Va. State Hort. Soc. Rpt., 45 (1940), pp. 120-123*).—Report is made of the progress of control work with the rosy apple aphid and scurfy scale in apple orchards in 1940, details of which are given in tables.

The status of citrus pests following the recent cold (*Fla. State Hort. Soc. Proc., 53 (1940), pp. 64-72, fig. 1*).—Two contributions are presented, the first by R. L. Miller (pp. 64-67) and the second from the Florida Experiment Station by W. L. Thompson (pp. 67-72). They relate to the effect upon the insect and mite enemies of citrus of the cold wave that visited Florida from January 26 to 29, 1940, with a temperature at Lake Alfred as low as 17.3° for 2 hr.

Life history and control of destructive nursery insects in Oklahoma, F. A. FENTON. (Okla. A. and M. Col.). (*South. Florist and Nurseryman, 49 (1940), No. 26, pp. 5, 28-29*).

Some outstanding needs for research in tree husbandry—entomology, J. S. HOUSER. (Ohio Expt. Sta.). (*Natl. Shade Tree Conf. Proc., 15 (1939), pp. 81-85*).

Second survey of the wood-destroying insects in public buildings in Sweden, I. TRÄGÅRDH (*Bul. Ent. Res., 31 (1940), No. 3, pp. 287-294, figs. 4*).—This further contribution (E. S. R., 80, p. 227) consists of a short summary of the results of the survey that has been continued in Svealand in the middle part of Sweden.

Studies on the thermal death points and heat tolerance of eggs of *Heterakis gallinae* and *Ascaridia lineata*, H. H. EARL, JR., H. HOWELL, and R. O. CHRISTENSON. (Ala. Expt. Sta.). (*Jour. Tenn. Acad. Sci., 15 (1940),*

No. 4, p. 416).—The thermal death points of eggs of *H. gallinae* and *A. galli* were found to be between 134° to 136° and 138° to 140° F., respectively. "Preliminary studies on heat tolerance have proved the ability of eggs of *H. gallinae* to withstand lengthy exposures to temperatures below the coagulation point of protoplasm. At relatively low temperatures, i. e., between 34° and 44° C. (93° and 111° F.), no appreciable mortality occurred over an extended period of time. At median temperatures of 47° and 50°, however, there was a decrease in percentage viability in proportion to the time element. Total mortality occurred at both temperatures when cultures were incubated beyond 4 hr. and 45 min. At 55° total mortality was obtained after 3 hr. of incubation. At 57.8° death was instantaneous. The viability of controls ranged from 50 to 81 percent."

The parasitism of economic insects by fungi, J. G. HARRAR, J. J. MCKELVEY, and J. W. SHOWALTER (*Phytopathology*, 31 (1941), No. 1, p. 10).

Work on the control of insect pests, T. J. NAUDE (*Farming in So. Africa*, 15 (1940), No. 177, pp. 513-516, fig. 1).—This is the annual report of the division of entomology of the department of agriculture of the Union of South Africa.

New facts about oil sprays, P. J. CHAPMAN. (N. Y. State Expt. Sta.). (*Amer. Fruit Grower*, 61 (1941), No. 2, pp. 9, 30-31, 34-35, figs. 2).

Time interval in double fumigation, H. J. QUAYLE. (Calif. Citrus Expt. Sta.). (*Calif. Citrog.*, 26 (1940), No. 1, p. 4).

Physiological characteristics of the diapause grasshopper egg.—I, **The stability of the diapause condition**, J. H. BODINE and W. A. ROBBIE (*Physiol. Zool.*, 13 (1940), No. 4, pp. 391-397, figs. 3).—The stability of the diapause state in the egg of the differential grasshopper was studied by subjecting eggs to various experimental conditions and determining the number of individuals starting active development after the treatment. The stability of the diapause state varies with the age of the eggs, the younger ones being relatively resistant to all the treatments used, while the older ones are more easily induced to resume growth. Treatments which were most effective in breaking diapause in old eggs are drying and wetting, centrifugation, exposure to nitrogen, and temperatures of 10° and 36° C. Exposure to oxygen, carbon dioxide, and hypertonic sodium chloride solutions resulted in a smaller number of eggs breaking diapause than in the control groups. A discussion is given of the possible correlation of the egg behavior with water balance, level of metabolism, or cellular structure.

The distribution and migrations of *Locusta* in Europe, Z. V. WALOFF (*Bul. Ent. Res.*, 31 (1940), No. 3, pp. 211-246, figs. 4).—This review is presented with a list of 103 references to the literature.

The life history of the American cockroach (*Periplaneta americana* Linn.) (Orthop.: Blattidae), P. RAU (*Ent. News*, 51 (1940), Nos. 5, pp. 121-124; 6, pp. 151-155; 7, pp. 186-189; 8, pp. 223-227; 10, pp. 273-278).

A review of the genus *Ankothrips* D. L. Crawford (Thysanoptera), S. F. BAILEY. (Univ. Calif.). (*Pan-Pacific Ent.*, 16 (1940), No. 3, pp. 97-106, figs. 24).—Included in this review is a key to the species of *Ankothrips*, a description of *A. notabilis* n. sp., from laurel, manzanita, and plum blossoms in Mix Canyon, Solano County, Calif., and a catalog of the 10 species recognized.

Thrips attacking citrus fruits in Florida, W. L. THOMPSON. (Fla. Expt. Sta.). (*Fla. State Hort. Soc. Proc.*, 53 (1940), pp. 56-61, pls. 2).—Noted from another source (E. S. R., 84, p. 645).

Development, hatching, and mortality of the eggs of *Cimex lectularius* L. (Hemiptera) in relation to climate, with observations on the effects of preconditioning to temperature, C. G. JOHNSON (*Parasitology*, 32 (1940), No. 2, pp. 127-173, figs. 13).

Immature nutfall of coconuts in the Solomon Islands, J. S. PHILLIPS (*Bul. Ent. Res.*, 31 (1940), No. 3, pp. 295-316, pl. 1, figs. 4).—It is concluded from the experiments and observations summarized that the coreid *Amblypelta cocophaga* is the main agent responsible for the immature nut fall of coconuts in the Solomon Islands. The bug is thought to have come from the bush, and the area of invaded plantations is said to be slowly spreading.

A preliminary report on the control of Comstock's mealybug on apple, J. A. COX. (Va. Expt. Sta.). (*Va. State Hort. Soc. Rpt.*, 45 (1940), pp. 84-88).—In 1940 two applications of Loro, consisting of aliphatic thiocyanates (1:800), for each of the first and second broods applied when the mealybugs were in the first and second instars gave satisfactory control. Three applications of 40 percent nicotine sulfate (1:400) were fairly effective in controlling the young crawlers. Two applications of summer oil for the second-brood crawlers, used at the rate of 1 gal. to 100 gal. of spray, did not give satisfactory control but when combined with rotenone-bearing insecticides showed promising results. It is concluded from these findings that in a heavily infested orchard there may be a sufficient number of the mealybugs left on the tree to cause considerable damage to the fruit at harvesttime, even if an insecticide has killed from 90 to 95 percent of the individuals of the first and second broods.

A fungous parasite of the mealy bug, V. K. CHARLES, J. N. COUCH, J. G. HARRAR, and J. J. MCKELVEY, JR. (*Phytopathology*, 31 (1941), No. 1, p. 5).—Report is made of finding an undescribed fungus in August 1940 to kill nearly all the adult Comstock's mealybugs in orchards near Roanoke and to occur at Winchester, Va. In infection experiments mealybugs have been readily killed in the laboratory and greenhouse.

Notes on dictyospermum scale infesting citrus, W. L. THOMPSON. (Fla. Expt. Sta.). (*Citrus Indus.*, 21 (1940), No. 11, pp. 5, 9).—These notes relate to the dictyospermum scale, known in Florida for a number of years as a major pest of avocado and some other plants, which has appeared on citrus in Lake, Orange, and southwest Seminole Counties.

Parasites of the black scale (*Saissetia oleae*) in Africa, H. COMPERE. (Calif. Citrus Expt. Sta.). (*Hilgardia [California Sta.]*, 13 (1940), No. 7, pp. 387-425, figs. 7).—This paper records notes on the black scale in Africa and the search for parasites, including methods of packing parasitized black scales, shipping, and propagation and colonization of black scale parasites. A key (pp. 396-397) is presented which separates the females of the genus *Coccophagus* that are parasitic in the black scale, namely, *C. bivittatus* Comp., *C. basalis* Comp., *C. ochraceus* How., *C. flavidus* n. sp., *C. rusti* Comp., *C. specialis* Comp., *C. cowperi* Girault, *C. eleaphilus* Silv., *C. pulvinariae* Comp., *C. critreaensis* Comp., *C. baldassarii* Comp., *C. anthracinus* Comp., *C. trifasciatus* Comp., *C. fallax* Comp., *C. saintebeauvei* Girault, *C. nigrinus* Comp., *C. heteropneusticus* Comp., *C. yoshidae* Nakayama, *C. nubes* Comp., *C. spectabilis* Comp., *C. coracinus* n. sp., and *C. capensis* Comp. Species treated other than those belonging to the genus *Coccophagus* were *Coccidoxenus niloticus* n. sp., *Diversinervus masakaensis* n. sp., *D. smithi* n. sp., *Encyrtus fuliginosus* n. sp., *Euranthellus* sp., *Mesopeltis* sp., *Metaphycus helvolus* (Comp.), *M. lounsburyi* (How.), *M. natalensis* Comp., *M. stanleyi* Comp., *Microterys kenyaensis* Comp., *M. suissetiae* Comp., and *Scutellista cyanea* Motschulsky. Two hyperparasites are mentioned, *Bacoonusia minor* (Silv.) and *Tetrastichus injuriosus* Comp.

There are two strains of red scale, D. L. LINDGREN. (Calif. Citrus Expt. Sta.). (*Calif. Citrog.*, 26 (1941), No. 3, p. 72).

The control of Coccidae on coconuts in Seychelles, D. VESEY-FITZGERALD (*Bul. Ent. Res.*, 31 (1940), No. 3, pp. 253-283, pls. 2).

Status of biological control of scale pests, H. S. SMITH. (Calif. Citrus Expt. Sta.). (*Calif. Citrog.*, 26 (1941), No. 3, pp. 58, 76-77, figs. 3).

The biology of the small white butterfly *Pieris rapae*, with special reference to the factors controlling its abundance, O. W. RICHARDS (*Jour. Anim. Ecol.*, 9 (1940), No. 2, pp. 243-288).—In this contribution the author deals with the general biology, methods of estimating population density, and factors affecting population density of the imported cabbageworm.

Chemical factors determining the choice of food plants by *Papilio* larvae, V. G. DETHIER (*Amer. Nat.*, 75 (1941), No. 756, pp. 61-73).

Control of the oriental fruit moth by mechanical means, G. E. MARSHALL. (Ind. Expt. Sta.). (*Amer. Fruit Grower*, 61 (1941), No. 2, pp. 15, 36-37, figs. 2).

Investigations of caterpillars attacking tomatoes in northern California during 1939, A. E. MICHELbacher, G. F. MACLEOD, and W. M. HOSKINS (*California Sta. Bul.* 644 (1940), pp. 20, figs. 6).—An account of the tomato pinworm, potato tuber worm, tomato and tobacco worms, armyworms (the beet armyworm and *Prodenia praefica* Grote), alfalfa looper, and corn earworm as tomato pests, with notes on the flight habits and control measures (including information on residue removal) for the corn earworm.

Effects of some ingested insecticides on the midgut wall of the southern armyworm larva, P. A. Woke. (U. S. D. A.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 5, pp. 321-329, pls. 5).—Larvae of the sixth-instar southern armyworm were fed certain insecticides by the sandwich method, then killed, and tissues of the midgut wall prepared by histological methods for examination and comparison with larvae that had not ingested poison. The effects of the following insecticides were studied in this way: Acid lead arsenate, paris green, calcium arsenate, calcium arsenite, arsenic trioxide, barium fluosilicate (20 percent silica), sodium fluoride, sodium fluoaluminate, rotenone, and phenothiazine.

Disintegration of the midgut epithelial cells and damage to the midgut muscle fiber followed the ingestion of arsenicals. The substance of the cytoplasm and nuclei of the epithelial cells decomposed following the ingestion of NaF. In larvae that had ingested sodium fluoaluminate, the epithelial cells were disintegrated and the cross striations of the muscle fibers were faint or obliterated. No obvious changes in the epithelial cells or muscle fibers could be noted in the larvae that had ingested barium fluosilicate, phenothiazine, and rotenone.

Control of tomato fruit worm and corn ear worm, S. MARCOVITCH and W. W. STANLEY (*Tennessee Sta. Cir.* 72 (1940), pp. 4, figs. 4).—A practical account.

Oviposition in gall midges (Cecidomyiidae) affecting seed production in grasses, D. P. JONES (*Jour. Anim. Ecol.*, 9 (1940), No. 2, pp. 328-335, fig. 1).—It has been found that in certain species of gall midges affecting seed production in grasses, particularly *Contarinia merceri* on *Alopecurus pratensis*, oviposition exhibits a diurnal periodicity. In favorable weather, oviposition occurs mainly between 5 p. m. and 8 a. m. (G. M. T.), with a crest shortly before sunset and another sometime after sunrise. Oviposition is very much influenced by the intensity of the light and the velocity of the wind. Contrary to expectations, the time of flowering of the host grass appears to have no relation to the time of oviposition.

Two new California Dolichopodidae (Diptera), F. C. HARMSTON and G. F. KNOWLTON. (Utah Expt. Sta.). (*Pan-Pacific Ent.*, 16 (1940), No. 3, pp. 108-110, figs. 4).

Bembix wasps as enemies of sheep blow-flies, G. C. ULLYETT and A. H. DE VRIES (*Farming in So. Africa*, 16 (1941), No. 178, pp. 19-20).—The present knowledge of the habits of wasps of the genus *Bembix*, particularly *B. olivata*,

which capture and carry away adult blowflies, thus being of value as a factor in controlling the blowfly complex, is reviewed.

Flight records of Phyllophaga (Coleoptera: Scarabaeidae), H. K. HENRY and C. E. HEIT (*Ent. News*, 51 (1940), No. 10, pp. 279-282).

Experimental studies on the duration of life.—XVI, Life tables for the [confused] flour beetle (Tribolium confusum Duval), R. PEARL, T. PARK, and J. R. MINER (*Amer. Nat.*, 75 (1941), No. 756, pp. 5-19, figs. 2).

The prevention of outbreaks of the pine beetles under war-time conditions, S. HANSON (*Bul. Ent. Res.*, 31 (1940), No. 3, pp. 247-251).

Relation of proteolytic enzymes to phase of life cycle of Bacillus larvae and two new culture media for this organism, E. C. HOLST and A. P. STURTEVANT. (U. S. D. A. and Univ. Wyo.). (*Jour. Bact.*, 40 (1940), No. 5, pp. 723-731).—The findings presented indicate that the proteolytic enzymes found in honeybee larvae infected with *B. larvae*, or in scales of larvae dead from such infection, are not elaborated by the honeybee larval organism. "Larvae in the presealed stage, at which time they are consuming pollen and honey, do contain enzymes which liquefy gelatin and peptonize milk, but in healthy larvae, after being sealed and in the prepupal stage, the enzymes can no longer be demonstrated. That these enzymes are released by the bacterial organism as it sporulates is evidenced by the fact that the amount of enzyme in diseased larvae is in direct proportion to the percentage of spores, and, although in vegetative cultures of *B. larvae* no such proteolytic enzymes are found, they appear concomitantly with sporulation, increasing with further sporulation. Production of these enzymes by dormant spores could not be demonstrated." A list is given of 17 references to the literature.

The genus Centris in California (Hymenoptera: Apoidea), P. H. TIMBERLAKE. (Calif. Citrus Expt. Sta.). (*Pan-Pacific Ent.*, 16 (1940), No. 3, pp. 138-141).—The species *C. californica* and *C. rhodomelas* are described as new.

Two new species of Lomachaeta, with a key to described species (Hymenoptera: Mutillidae), C. E. MICKEL. (Minn. Expt. Sta.). (*Pan-Pacific Ent.*, 16 (1940), No. 3, pp. 127-131).

The identification of the female of the myrmosid subgenus Myrmosula (Hymenoptera: Tiphiidae), C. E. MICKEL. (Minn. Expt. Sta.). (*Pan-Pacific Ent.*, 16 (1940), No. 3, pp. 132-134).

The oviposition habits of the Eucharidae (Hymenoptera), C. P. CLAUSEN. (U. S. D. A.). (*Jour. Wash. Acad. Sci.*, 30 (1940), No. 12, pp. 504-516, figs. 6).—This contribution relates to the oviposition habits of a family of small wasps that are parasitic upon the mature larvae and the pupae of ants.

Toxicity of selenium-containing plants as a means of control for red spiders, V. H. MORRIS, C. R. NEISWANDER, and J. D. SAYRE. (U. S. D. A. and Ohio Expt. Sta.). (*Plant Physiol.*, 16 (1941), No. 1, pp. 197-202).—Report is made of the results of an investigation aimed at determination of the concentrations of sodium selenate that are not toxic to the plants but which would allow the accumulation in plant tissues of levels of selenium sufficient to be toxic to the common red spider. In this work corn plants were grown by "tank culture" technic in cement tanks 10 ft. long, 2½ ft. wide, and 8 in. deep, with a capacity of 470 l. of nutrient solution. "Under the conditions of these experiments, with additions of 0.5, 1, 2, and 3 p. p. m. of selenium to the nutrient solution in which corn was grown, leaf tissues contained approximately 25, 50, 100, and 150 p. p. m. of selenium, respectively. The leaf tissues containing approximately 25 p. p. m. of selenium were sublethal to red spiders, although the infestations did not cause much injury; at 50 p. p. m. red spider infestations were inhibited, although occasional sluggish individuals were found. At concentrations approximately 100 p. p. m. or above red spiders were unable either to multiply or persist. The

experiment in which a natural infestation of aphids occurred on plants which did not receive selenium but did not occur on plants receiving selenium indicates that aphids are unable to persist on plants which have an available supply of selenium."

Ornithodoros turicata in California (Arachnida: Acarina), T. F. KELLEY. (Univ. Calif.). (*Pan-Pacific Ent.*, 16 (1940), No. 3, pp. 106-107).

Ticks and relapsing fever in the United States, G. E. DAVIS (*Pub. Health Rpts. [U. S.]*, 55 (1940), No. 51, pp. 2347-2351).—Six species of *Ornithodoros*, to which genus the relapsing-fever-transmitting ticks belong, have been reported from the United States (*O. turicata* (Duges), *O. hermsi* Wheeler, *O. parkeri* Cooley, *O. talaje* (Guerin Menneville), *O. coprophilus* McIntosh, and *O. coriaceus* Koch). One or more of these ticks have been reported from 17 States. Tick-borne relapsing fever is present in 11 States. The known vectors are *O. turicata* in Texas and Kansas and *O. hermsi* in California, Colorado, and northern Idaho. *O. parkeri* is the only known species in a large area from which 17 cases have been reported. Spirochetes have been recovered from *O. talaje* collected in Arizona and from *O. parkeri* collected in Wyoming, Montana, and Utah.

ANIMAL PRODUCTION

Farm animals: Their breeding, growth, and inheritance, J. HAMMOND (*New York: Longmans, Green & Co.; London: Edward Arnold & Co.*, 1940, pp. VIII+199, figs. 114).—This book presents the facts on growth, fertility, reproduction, and artificial insemination of farm animals, including poultry.

[**Advances in livestock breeding and feeding**] (*U. S. Dept. Agr., Sec. Agr. Rpt.*, 1940, pp. 152-155).—Included are conclusions from sire performance studies with beef cattle; a comparison of large-, medium-, and small-type Poland China hogs; studies in the use of waste hair from livestock; the development of a small-type turkey; the use of additional vitamin A for improved feeding; and the grazing efficiency of livestock.

[**Experiments in livestock production by the Bureau of Animal Industry**]. (Partly coop. Cornell Univ.; Mich., Va., S. C., N. C., Wyo., W. Va., Tex., Ga. Coastal Plain, Mo., Mont., Calif., S. Dak., Idaho, Miss., and Tenn. Expt. Stas.; et al.). (*U. S. Dept. Agr., Bur. Anim. Indus. Rpt.*, 1940, pp. 2, 3, 4, 10-11, 11-12, 12-18, 20-26, 29-30, 34-35, 36-37, 38-39, 41-42).—The results include progress on the following investigations: Nutritive values of different forages measured with laboratory animals; metabolism studies with silver foxes and minks; vitamin requirements of fur animals; studies on the nutrition and feeding of quail; feeding, breeding, refrigeration, and cooking factors affecting quality of beef, pork, and lamb; feeding of beef and dual-purpose cattle; pasture and range utilization; sheep feeding, grazing, and management; swine feeding; breeding, feeding, care, management, and utilization of horses and mules; and poultry feeding.

[**Investigations on poultry and swine production by the New Jersey Stations**] (*New Jersey Stas. Rpt.* 1940, pp. 35-40, 79).—Included are reports on the following investigations: Individual matings with poultry where separate breeding pens are not available, the position of eggs in the clutch as related to shape, rate of growth in early life not related to egg-producing ability of pullets, necessity for fat in the poultry ration, comparison of the effect of differing roofing materials with and without insulation on the temperature of poultry houses, relation of humidity of storage to egg albumen quality, laying house mortality in a line of Leghorns selected for freedom from paralysis, an inexpensive ration for pigeons, and reduced mortality of pigs by the use of posterior pituitary solution during parturition.

[Experiments on nutrition, feeding, and management of livestock by the Cornell Station] ([*New York*] *Cornell Sta. Rpt. 1940*, pp. 100-102, 105, 107-110, 110-112).—Reports are given of the results on studies by C. M. McCay, L. A. Maynard, S. A. Asdell, G. H. Ellis, L. L. Barnes, G. Sperling, G. Kimball, J. A. Saxton, P. Johnson, H. R. Guilbert, J. I. Miller, F. B. Morrison, J. P. Willman, L. E. Hanson, M. C. Babcock, K. Mills, E. L. Worthen, R. W. Pease, N. F. Smith, R. B. Hinman, and C. S. Hobbs of the prolongation of productive life of rats; the requirements of calves, goats, and lambs for the B group of vitamins; soybeans and other proteins for growing lambs; a comparison of various protein supplements and supplemental mixtures and the effect of vitamin supplements for growing and fattening pigs; value of incubated eggs and methods of feeding them to growing and fattening pigs; large-scale sheep and wool production in New York; distillers' corn dried grains and brewers' dried grains in comparison with corn for fattening lambs; and a comparison of protein-rich supplements for fattening steers.

[Investigations in livestock production by the Oklahoma Station] (*Oklahoma Sta. Bien. Rpt. 1939-40*, pp. 1, 2-6, 53-61, 62, 66-69, 166, figs. 3).—Brief results are given of the following investigations by R. Wall, V. G. Heller, R. Penquite, C. P. Thompson, W. D. Gallup, A. H. Kuhlman, R. Reder, W. L. Blizzard, B. R. Taylor, H. M. Briggs, J. C. Hillier, and J. A. Beall: Effect of extremely fine grinding of feed; value of fiber in feedstuffs; quick-cured hay; carotene loss in carefully stored baled hay; a blood analysis which revealed vitamin A deficiency; egg oil as a fair source of vitamin A; oats and cottonseed cake in beef cattle-fattening rations; grain and silage winter ration for choice yearling feeder steers; cottonseed cake and corn compared for use with oats for fattening beef calves; barley v. No. 2 corn in calf-fattening ration; the free-choice feeding plan for fattening calves; absence of abortions among ewes on cottonseed meal rations; barley compared with oats for creep-feeding lambs; corn, oats, and barley tested for use in lamb-fattening ration; corn and cottonseed meal and alfalfa and prairie hay compared for fattening lambs; digestibility of cottonseed meal for lambs; no advantage in "flushing" ewes; reduction by molasses of digestibility of other components in rations for lambs; carotene in dry-lot ration for swine cuts cost one-fourth; grinding barley for fattening swine; protein supplements to corn for fattening swine; effect on pigs of protein in sow's ration; best lamb-curing method requires thorough chilling; and grazing work with Angora goats.

[Investigations in livestock production by the South Dakota Station] (Partly coop. U. S. D. A.). (*South Dakota Sta. Rpt. 1940*, pp. 17-29, figs. 3).—The results of investigations are included on the following studies by T. Wright, F. U. Fenn, I. B. Johnson, J. Watson, J. W. Wilson, and M. Myers: Sooner milo v. corn, v. low prussic acid cane, and v. Dakota Amber cane for fattening pigs, rations for pigs in dry lot and on pasture after weaning, good-quality pork production on pasture, creep feeding and purebred bulls for baby beef production, comparison of sorghum grains and corn for fattening steers, feeding gummer ewes and lambs, improved rations for the pregnant ewe, sheep v. hogs on irrigated pastures, and livestock research by the Newell Field Station which involves lamb feeding and early breeding.

[Experiments in livestock production by the Texas Station] (Partly coop. U. S. D. A.). (*Texas Sta. Rpt. 1939*, pp. 15, 44-49, 108-109, 112-113, 145-146, 202-203, 208-209, 217, 218, 221, 235, 236).—In addition to investigations previously noted there are included brief reports on the following projects, carried on by P. B. Pearson; H. Schmidt, A. C. Mackey, I. B. Boughton, W. T. Hardy, J. H. Jones, R. E. Dickson, J. K. Riggs, J. M. Jones, F. E. Keating, W. H. Black, P. E. Howe, J. J. Bayles, R. A. Hall, E. M. Neal, L. H. Tash, E. K.

Crouch, L. E. Brooks, F. Hale, G. S. Fraps, R. M. Sherwood, F. D. Fuller, J. R. Couch, and L. E. James: Limited and deferred feeding of ground milo heads with cottonseed meal and silage and ground hegari fodder compared with hegari silage for fattening steers, replacing part of the corn by dried citrus peel and pulp in cattle fattening rations, green oat grazing and sorghum silage compared for winter feeding of steer calves, mineral and protein deficiencies in range beef cattle rations including calcium and phosphorus supplements, alfalfa v. Sudan hay and ground v. chopped Quadroon heads for fattening lambs, quantitative requirements of vitamin A for pigs, oat pasture for fattening hogs, calcium requirements of pigs on rations with cottonseed meal, concrete wallows for fattening hogs, carotene requirements of hens, protein requirements of chicks, effect of sulfur flour on intestinal cell development of fowls, vitamin D requirements for chicks, corn supplements with oat grazing compared with silage for wintering steer calves, rotation and control grazing of beef cattle, Angora goats, and the role of nicotinic acid in the nutrition of sheep.

[Investigations in livestock production by the Utah Station] (*Utah Sta. Bul.* 294 (1940), pp. 14, 15, 79-82, 88-91, figs. 3).—Included are brief reports on the following investigations: The effect of feeding and breeding on lamb and fleece production, comparison of molasses and grain rations for pork production, breeding and feeding practices for egg and meat production in chickens and turkeys, and studies in bone deformities in growing turkeys.

[Studies on livestock production by the West Virginia Station] (Partly coop. U. S. D. A.). (*West Virginia Sta. Bul.* 298 (1940), pp. 17-18, 19-22).—Investigations by C. V. Wilson, W. H. Black, E. A. Livesay, A. H. VanLandingham, C. E. Weakley, Jr., R. B. Dustman, T. B. Clark, T. D. Runnels, E. T. Wightman, and J. H. Rietz as briefly reported include pastures for finishing yearling steers and heifers, feeding value for beef cows of corn silage with the ears left on, composition of bones from left and right sides of pigs and chickens, proteins for battery chick rations, effect of rations and methods of feeding grain on egg production, and high and low protein rations for White Leghorns.

The accuracy of digestion experiments [trans. title], J. RINGEN (*Meld. Norges Landbr. Høgskole*, 20 (1940), No. 1, pp. 51-81, fig. 1; *Eng. abs.*, pp. 78-80).—Various factors which enter into the accuracy of digestion experiments are discussed, based on the analysis of data acquired from numerous digestion trials. Dry matter determinations made by drying small samples at 100° C. or large samples either at 50°-55° or 65°-70° were of about equal accuracy. The preservation of feces with formalin and holding samples at low temperature prevented loss of nitrogen up to 12 days storage. Chloroform was not a satisfactory preservative. In simple experiments a preliminary period of 7-10 days and an experimental period of 7 days are considered satisfactory. When parallel experiments were conducted with two animals, significant differences in digestion coefficients for the two animals seldom occurred. Greatest differences occurred in the case of crude fiber. When digestion coefficients are determined by difference the importance is stressed of employing a basal ration containing little of the group of nutrients in which the experimental feed is lacking.

The value of grassland products in animal nutrition [trans. title], J. AXELSSON (*K. Lantbr. Akad. Tidskr.*, 79 (1940), No. 5, pp. 399-425, figs. 5; *Eng. abs.*, p. 424).—A comparison of various methods of forage crop preservation indicated dry matter losses of 3-4, 12, 15, and 21 percent in artificial drying, A. I. V. silage, drying on frames, and drying on the ground, respectively. The crude protein, ether extract, and ash contents of the plant material steadily declined as the percentage of crude fiber increased. The coefficient

of digestibility of the organic matter declined about 0.9 unit for each percentage increase in crude fiber content, either in the fresh or preserved material. The feeding value of A. I. V. silage, frame-dried hay, and hay dried on the ground was 85-86, 79-80, and 72-73 percent, respectively, that of the green forage, while the protein value of the conserved products was slightly below these respective levels.

The chemical composition and apparent digestibility of nutrients in crested wheatgrass harvested in three stages of maturity, J. SOTOLA. (Wash. Expt. Sta.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 4, pp. 303-311, fig. 1).—Study of the crude protein, fiber, nitrogen-free extract, and mineral content of fresh and dried samples of crested wheatgrass cut at different stages of maturity up to 36 in. in height showed the ash, fiber, and nitrogen-free extract to increase as the season progressed, but the percentage of protein in the dry matter decreased. A summary of 30 digestion trials on sheep with fresh and dried samples of the grass cut at 4 and 10 in. in height and dried grass cut in the anther-falling stage showed that the nutrients in the fresh and 4-in. grass clippings were generally better digested than those in the dry and 10-in. clippings, respectively. In the immature stages crested wheatgrass is considered an excellent forage, but it loses much of its nutritive value as it matures.

The apparent digestibility and nutritive value of beardless wheatgrass at three stages of maturity, W. H. BURKITT. (Wash. Expt. Sta.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 6, pp. 471-479).—According to methods employed by Sotola, noted above, study was made of the crude protein, fat, fiber, nitrogen-free extract, calcium, and phosphorus composition of early-, medium-, and late-cut samples of beardless wheatgrass from practically pure stands. The average apparent digestibility when fed to sheep showed that as the grass matured the digestibility of all the nutrients decreased from over 70 to about 63 percent for the total digestible material and 64 percent for the protein. The nutritive ratio widened from 1:3.39 to 1:10.10 in the late-cut samples.

Dry matter content of crops in relation to hay and silage making, A. E. PERKINS (*Ohio Sta. Bimo. Bul.* 208 (1941), pp. 6-10, figs. 2).—Methods are suggested for producing and testing crops that may be used and stored as silage and hay and methods for bringing them within the optimum dry matter content of from 25 to 40 percent for silage.

The microbiology of silage made by the addition of mineral acids to crops rich in protein.—I, Quantitative chemical and bacteriological data, A. CUNNINGHAM and A. M. SMITH (*Zentbl. Bakt. [etc.]*, 2. Abt., 100 (1939), No. 18-23, pp. 394-408, figs. 4).—This contribution from the College of Agriculture, Edinburgh, describes the experimental ensiling of unchopped ryegrass-clover and bean-pea-vetch mixtures, with the addition of sufficient amounts of mineral acids to reduce the pH of the mixture to approximately 3.5. Acidifying the material to this extent did not completely inhibit the growth of microorganisms, and lactic acid bacteria isolated from the silage were capable of growing in artificial media within a pH range of 3.0-4.0. The predominant fermentative change which occurred in silage of this type was the formation of lactic acid. Fodder crops containing about 20 percent of crude protein were successfully preserved by this treatment.

The microbiology of silage made by the addition of mineral acids to crops rich in protein.—II, The microflora, A. CUNNINGHAM and A. M. SMITH (*Jour. Dairy Res. [London]*, 11 (1940), No. 3, pp. 243-265).—Through application of differential tests, it was found that the microflora of A. I. V. silage consisted mainly of lactic acid bacteria—lactobacilli, streptococci, micrococci, and sarcinae. Both homo- and heterofermentative types of lactobacilli were

represented. A new type of motile homofermentative lactobacilli was isolated and is described. Unidentified homofermentative lactobacilli, micrococci, and sarcinae were also isolated. Streptococci, micrococci, and motile lactobacilli were found mainly in freshly ensiled material, while the majority of lactobacilli and sarcinae were associated with the older samples. Ability to produce carbon dioxide, percentage of lactic acid formed, and lactic-acetic acid ratio were valuable tests for differentiating the organisms.

Kitchen waste for feeding farm stock, J. BEHARRELL (*Nature [London]*, 146 (1940), No. 3689, pp. 47-48).—An account of the provisions being taken by Great Britain for saving and drying kitchen waste for poultry and swine feeding. The dried and ground product is a good source of protein and minerals.

Commercial feeding stuffs, 1939-40, E. R. TOBEX (*Maine Sta. Off. Insp.* 176 (1940), pp. 49).—Guaranties and analyses for protein, fat, and fiber of commercial feed samples examined in connection with the feed law in Maine are tabulated. The text of the statute is included.

Inspection of commercial feedstuffs, P. H. SMITH (*Massachusetts Sta. Control Ser. Bul.* 104 (1940), pp. 72).—Guaranties and analyses are reported for 1,628 samples of feedstuffs intended for livestock and poultry consumption. An assay of oil products for units of vitamin D and a discussion of Federal standards for corn and oats are included.

Commercial feeding stuffs, L. S. WALKER, E. F. BOYCE, and H. J. CANNON (*Vermont Sta. Bul.* 468 (1940), pp. 59).—The usual report of the guaranties and analyses of 2,273 samples of feeds officially examined in Vermont during 1940 (*E. S. R.*, 82, p. 805).

The biological value of white fishmeal as determined by growing sheep and rats, D. B. SMUTS and J. S. C. MARAIS (*Onderstepoort Jour. Vet. Sci. and Anim. Indus.*, 13 (1939), No. 2, pp. 361-366).—The determined apparent and true digestibility of white fish meal were, respectively, 79 and 97 percent with rats and 63 and 87 percent with sheep. The biological value when fed to rats at a 9-percent level was 90 and for sheep at a 14-percent level 74.

Sterility and depression of growth in relation to age of male rats fed a vitamin E-deficient diet, C. A. CABELL and N. R. ELLIS. (U. S. D. A.). (*North Amer. Vet.*, 21 (1940), No. 9, pp. 539-542, fig. 1).—The critical period for the effects of vitamin E-deficient rations on fertility and growth of ♂ rats started on the deficient ration at 4 weeks of age was found between the fourteenth and sixteenth weeks. When the deficient diet was not started until 8 weeks of age there was evidently sufficient storage of the growth factor to continue growth and fertility for more than 14 weeks, and rats not started on the deficient ration until 12 weeks of age attained normal maximum growth. Return of these animals to a complete stock ration did not result in further increase in weight. The study was conducted with three groups of ♂ rats having their mating ability tested with three fertile ♀s each. The testes were later weighed and examined for motile sperm. The results largely confirmed other growth and fertility findings.

Some factors affecting the quality and composition of meat, J. HAMMOND (*Chem. and Indus.*, 59 (1940), No. 29, pp. 521-525, figs. 4).—The quality, composition, tenderness, color, and flavor of meat are considered to be mainly modified by the age of the animal, plane and quality of nutrition, and part of the carcass from which the cut is taken.

Factors influencing length of gestation and birth weight in cattle, B. KNAPP, JR., W. V. LAMBERT, and W. H. BLACK. (U. S. D. A.). (*Jour. Agr. Res.* [U. S.], 61 (1940), No. 4, pp. 277-285).—The length of the gestation period of

beef and Milking Shorthorn cattle averaged 280.8 and 281.7 days, respectively, with the birth weights of the calves averaging 69.2 and 79.2 lb., respectively. The results on 164 parturitions of 65 beef Shorthorn cows and 133 parturitions from 68 Milking Shorthorn cows analyzed by variance showed that there is a tendency for individual cows to have a characteristic length of gestation period, and the birth weights of calves produced by any one cow tend to be less variable than those of calves from different cows. Differences in the length of gestation period account for from 25 to 35 percent of the variation in birth weight between sexes. The highest simple correlation of birth weight with other factors was 0.55 with length of the gestation period. This was increased to 0.58 by holding calving sequence and weight of dam constant and to 0.62 for the multiple correlation between all of these factors. Other variables taken into consideration were breed, season of calving, and sex of calves.

Studies on riboflavin and thiamin in the rumen content of cattle, C. H. HUNT, C. H. KICK, E. W. BURROUGHS, R. M. BETHKE, A. F. SCHALK, and P. GERLAUGH. (Ohio Expt. Sta.). (*Jour. Nutr.*, 21 (1941), No. 1, pp. 85-92).—Biological assays of the dried rumen contents of steers gave evidence that when a ration of yellow corn, protein supplement, and alfalfa hay was fed riboflavin was synthesized in the rumen. Ingesta removed 4, 12, and 16 hr. after feeding each were found to be richer in riboflavin than the original feed. However, when the ration consisted entirely of alfalfa hay, the rumen content contained less riboflavin than the hay. On either type of ration the ingesta removed 4 hr. after feeding contained more thiamin than the feed, while that removed from 12 to 16 hr. after feeding contained less thiamin than the feed.

On the feeding of a phosphorus supplement to mother-reared calves, prior to weaning, under open range conditions in Bechuanaland, J. H. R. BISSCHOP, A. I. MALAN, H. P. STEYN, and G. B. LAURENCE (*Onderstepoort Jour. Vet. Sci. and Anim. Indus.*, 13 (1939), No. 2, pp. 321-343, fig. 1).—Results are presented for an experiment comparing the growth rate and blood picture of groups of range calves with and without a supplement of bonemeal up to weaning age. The dams of each group received supplementary bonemeal during the nursing period. The growth rates of the two groups were similar, but the inorganic phosphorus of the blood was subnormal for the unsupplemented group. It is concluded that such a supplement prior to weaning is not necessary if the calves receive the necessary phosphates from weaning onward.

The endogenous nitrogen metabolism of young sheep, with reference to the estimation of the maintenance requirement of sheep, D. B. SMUTS and J. S. C. MARAIS (*Onderstepoort Jour. Vet. Sci. and Anim. Indus.*, 13 (1939), No. 1, pp. 219-225, figs. 2).—Employing essentially the same basal diet as previously used for mature sheep (*E. S. R.*, 82, p. 373), the nitrogen excretion of 4-month-old lambs was determined. Endogenous nitrogen excretion for this age group averaged about 0.051 gm. per kilogram of body weight daily, or 0.01 gm. more than mature sheep. It appeared that the basal metabolism of sheep could be predicted from the endogenous nitrogen. Values obtained in this manner were in close agreement with those reported in the literature. A formula for estimating the maintenance requirement of sheep is presented and its application discussed.

Studies on the metabolism of nicotinic acid in the sheep, P. B. PEARSON, A. H. WINEGAR, and H. SCHMIDT. (*Tex. Expt. Sta.*). (*Jour. Nutr.*, 20 (1940), No. 6, pp. 551-563, figs. 2).—Lambs restricted to a diet deficient in nicotinic acid continued to excrete in the urine essentially as much nicotinic acid as lambs on a well-balanced growing ration, leading to the conclusion that nicotinic acid is synthesized in the alimentary tract or body of sheep. Further, there

was no essential difference in the nicotinic acid level of the blood. The presence of nicotinic acid in the tissues was determined photometrically by methods of Winegar, Pearson, and Schmidt (E. S. R., 83, p. 532).

The effect of breeding on feedlot performance and carcass characteristics of lambs as determined by feeding trials and carcass tests: A comparison of Ryeland × Rambouillet, Romney × Rambouillet, Canadian Corriedale, and Rambouillet feeder lambs, K. RASMUSSEN and J. A. WEIR (*Sci. Agr.*, 21 (1940), No. 4, pp. 153-166).—Comparisons of the rate and economy of gain in 1937-38 and 1938-39 of four groups of 40 lambs each of Ryeland × Rambouillet, Romney × Rambouillet, grade Rambouillet, and Corriedale breeding showed only slight differences. In the first trial an attempt was made to keep all lambs on about the same amount of grain mixture of barley and oats with alfalfa hay. In the second trial the amount of barley was increased to 3 parts. The average initial weights of the lambs in the groups ranged about 70 lb., with the Corriedales averaging 65 lb., the lightest in weight. The first year's average daily gains were about 0.3 lb., with the largest average gains being made by the Ryeland-cross lambs. In the second year this group made the poorest gains, averaging 0.23 lb. per day as compared with 0.27, 0.28, and 0.27 lb. for the other groups. The lambs were slaughtered, and the carcasses were cut, measured, and graded. A statistical analysis by the methods of variance revealed differences, but in most cases such differences were not statistically significant.

Prenatal growth in the Merino sheep, J. H. L. CLOETE (*Onderstepoort Jour. Vet. Sci. and Anim. Indus.*, 13 (1939), No. 2, pp. 417-558, figs. 46).—This comprehensive report is based on data obtained by post mortem studies on 49 ewes, including 11 nonpregnant individuals and 12, 8, 6, 7, and 5 animals sacrificed after 1, 2, 3, 4, and 5 mo. of pregnancy, respectively. The observations and discussion extended to the genital tract and placenta, fetal membranes and fluids, fetus, mammary glands, and endocrine glands, and in general. An extensive bibliography is included.

The cystine content of Merino wool in relation to its physical attributes, S. D. ROSSOUW and V. BOSMAN (*Onderstepoort Jour. Vet. Sci. and Anim. Indus.*, 13 (1939), No. 1, pp. 237-242).—From cystine determinations on a series of selected Merino wool samples, which differed widely in physical attributes, no significant correlation could be established between the cystine content and textile strength, fiber fineness, crimping, scaliness, percentage extension, or whiteness. It is concluded that the role of cystine in wool production is not an important one.

Gestation period in the pig [trans. title], S. BERGE (*Meld. Norges Landbr. Høgskole.*, 20 (1940), No. 1, pp. 82-119, figs. 3; *Eng. abs.*, pp. 117-118).—The following average gestation periods are reported: Large White 112.7 ± 1.71 days, Norwegian Landrace 114.2 ± 1.52 , and cross-breeds involving these two breeds 114.6 ± 1.67 . A negative correlation was found between the number of pigs per litter and length of the gestation period, the regression coefficient being -0.14 days per pig. Neither age of the sow nor the season of the year were found to have any significant influence on length of the gestation period. The average length of farrowing was 3.5 hr., ranging from 2.68 for the Large White to 4.07 for the Landrace. Only a slight correlation was found between the number of pigs and duration of farrowing.

Studies on the thiamin requirement of young swine, C. VAN ETEN, N. R. ELLIS, and L. L. MADSEN. (U. S. D. A.) (*Jour. Nutr.*, 20 (1940), No. 6, pp. 607-625, pl. 1, fig. 1).—Pigs fed an autoclaved and sodium sulfite-treated diet developed convulsions, locomotor incoordination, paralysis, and other malnutrition symptoms, but thiamin as the sole supplement to the diet permitted

normal growth and alleviation of all deficiency symptoms. The total thiamin chloride hydrochloride requirement for pigs under the conditions was estimated as between 106 and 120 μg . per 100 gm. of carbohydrate and protein feed consumed. It appeared that the requirement of all species, based on the protein and carbohydrates consumed, was the same. The sulfite-sulfur treatments seemed to require 8 days for complete destruction of thiamin in the early work, but later studies seemed to give complete destruction in 5 days.

A comparison of the nutritive values of raw, pasteurized, and evaporated milks for the dog, H. D. ANDERSON, C. A. ELVEHJEM, and J. E. GONCE, JR. (Wis. Expt. Sta.). (*Jour. Nutr.*, 20 (1940), No. 5, pp. 433-443, pl. 1, figs. 3).—Normal reproduction and good growth in the pups in two litters were maintained on a ration of raw milk supplemented with iron, copper, manganese, and cod-liver oil. When similarly fed evaporated milk instead of raw milk, the pups showed muscular dystrophy and their growth was not as satisfactory. This condition was cured by α -tocopherol. A hemorrhagic condition of the pericardium, lungs, and brain occurring on the evaporated milk diet was not prevented by the vitamin E. Results on the pasteurized milk diet were midway between the raw and evaporated milk rations.

A study of the need for cobalt in dogs on milk diets, D. V. FROST, C. A. ELVEHJEM, and E. B. HART. (Wis. Expt. Sta.). (*Jour. Nutr.*, 21 (1941), No. 1, pp. 93-100, figs. 3).—Following earlier trials with rats (E. S. R., 80, p. 276), experiments were conducted with young dogs suffering from nutritional anemia in which milk fortified with iron and copper with and without the addition of cobalt was fed as the sole diet. In many cases the iron and copper supplements alone were adequate for normal hemoglobin building. Adding small amounts of cobalt stimulated hematopoiesis in certain dogs in which the rate of blood formation was unusually low. About half of the dogs showed a cobalt deficiency as evidenced by hematopoietic responses to cobalt at a minimum level of 0.1 mg. per day.

The heat production and blood and urine constituents after administration of l(—) histidine to the dog, A. G. EATON and J. R. DORY. (La. State Univ.). (*Jour. Nutr.*, 21 (1941), No. 1, pp. 25-34).—On this series of investigations (E. S. R., 81, p. 556), upon intravenous injection of l(—) histidine (free base) into the dog there was a prompt and sustained rise in the urea nitrogen of the blood, but in contrast to the results with glycine, lysine, and arginine there was but little excretion of unchanged histidine in the urine. Histidine was metabolized somewhat faster than arginine. The specific dynamic action of histidine was about 50 percent higher than that of arginine, while the total increase in heat production was about half as great as that produced by an equal weight of glycine. No toxic effects of the histidine were noted.

Economical rations for dogs, C. J. KOEHN. (Ala. Polytech. Inst.). (*Jour. Amer. Vet. Med. Assoc.*, 97 (1940), No. 765, pp. 592-595).—Tests of 13 rations for dogs showed that animal proteins were not necessary for growth and maintenance, but the Auburn ration consisting of yellow corn, wheat shorts, wheat bran, meat scrap and fish meal, alfalfa meal, bonemeal, and salt was unsatisfactory for reproduction without the inclusion of skim milk powder. Three other rations satisfactory for growth and maintenance were included in the comparison.

Deficiencies and fallacies in canine diet, A. F. MORGAN. (Univ. Calif.). (*North Amer. Vet.*, 21 (1940), No. 8, pp. 476-486).—A discussion of the general nutritive requirements of dogs and the specific purpose of using certain foods in dog rations.

[Experiments in poultry nutrition by the Cornell Station] (*New York Cornell Sta. Rpt. 1940, pp. 163-165*).—Results are reported on investigations by L. C. Norris and G. F. Heuser of the requirements of poultry for components of the vitamin G complex—pantothenic acid and riboflavin—and the role of manganese in the nutrition of poultry and its relation to perosis.

[Investigations with poultry by the Oklahoma Station] (*Oklahoma Sta. Bien. Rpt. 1939-40, pp. 2, 147-152, 156-159*).—Brief results are reported on the following investigations by V. G. Heller, R. Penquite, C. P. Thompson, T. T. Milby, C. A. Roberts, and R. G. Jaap: Kind of feed more important than methods of management used for egg production, use of 5 percent of cottonseed meal does not produce colored yolks, from 16 to 20 percent protein best for laying hens, protein requirement highest during the first 8 weeks, fiber requirement of chicks, oil-soluble green best dye for tracing color deposit in eggs, no profit in capon production on limited range, lights increase fall eggs but not hen's annual production, cottonseed and soybean meals show equal value for poults, bagasse dangerous as poult litter, minimum yard space for turkeys, and lights for poults show no advantages.

[Studies in poultry production by the South Dakota Station] (*South Dakota Sta. Rpt. 1940, pp. 47-54, figs. 2*).—Included are results of the following investigations by W. E. Poley, W. O. Wilson, A. L. Moxon, and R. L. Dolecek: Oats, millet, and wheat good poultry feeds, use of selenium by the chick, successful use of low-grade cereals for egg production, methods of measuring poultry meat quality, sorghums and millets for turkeys, need of vitamin A supplements for turkeys, and soybean meal improves turkey hatchability.

Viability in poultry flocks, D. R. MARBLE. (Pa. Expt. Sta.). (*Amer. Egg and Poultry Rev.*, 1 (1940), No. 10, pp. 340, 342).—Adult mortality in the Single-Comb White Leghorn and Barred Plymouth Rock flocks was decreased from 39.8 and 48.7 percent, respectively, in the period 1927-32 to 20.1 and 24.6 percent, respectively, for the period 1933-37. This was accomplished by selection based on family viability and the maintenance of egg production, egg size, body weight, and earliness of mortality.

Effect of corn, wheat, and barley in the diet on the physical and chemical composition of fryers and roasters, W. E. POLEY, A. L. MOXON, W. O. WILSON, and R. L. DOLECEK. (S. Dak. Expt. Sta.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 3, pp. 161-178, figs. 2).—Experiments were conducted in 1936 and 1937 on the effects of all-mash rations consisting of 64 percent corn, wheat, or barley with the same basal protein mixture of meat, buttermilk, dried milk, oats, alfalfa leaf meal, and cod-liver oil on the gains, grades, and chemical analyses of the meat of roasters. In the first trial involving White Plymouth Rock cockerels the growing rations were fed from 8 to 31 weeks of age. In the second trial Barred Plymouth Rock cockerels were fed to 24.5 weeks of age, with a 2-week finishing period. The birds in the first trial were fed on millet and rape range, whereas in 1937 comparative feeding was done both on range and duplicated in batteries except that the mash was fed dry in the range tests and as a thin paste to the battery-fed groups. Ten of the most representative birds from each group were graded and measured for the derivation of an index based on breast measurements. Physical separation of the edible portions of the meat and chemical analyses for fat and moisture were carried out. Similar methods were employed in the conduct of tests with fryers in 1937.

The combined results showed that the gains in weight on the barley were made less rapidly than on corn and wheat rations in 1936, but there was no significant difference between the groups in 1937. The corn-fed fryers and roasters showed a consistent tendency to deposit more fat in the light meat,

dark meat, skin and subcutaneous fat, and the abdominal fatty tissue than the other two groups. They graded better than the barley-fed and, to a lesser extent, the wheat-fed lots. Regardless of the cereal used, an increase was found in the percentage of fat in each of the four classes of edible meat in both fryers and roasters finished in the batteries as compared with range-fed birds. In general, the barley-fed groups showed the smallest fat deposits. A tendency was noted toward an inverse relationship between the fat and moisture content of edible meat. Consequently, the range groups generally had a slightly higher moisture content than the battery-fed groups. Corn-fed birds showed a lower moisture content than either barley-fed or wheat-fed birds.

Feathering, growth, feed consumption, and rachitogenesis in chicks as influenced by the kind of grain in the diet, H. L. WILCKE and J. C. HAMMOND. (U. S. D. A.). (*Jour. Agr. Res. [U. S.], 61 (1940), No. 5, pp. 369-380, figs. 2*).—In the stimulation of growth and feather development in chicks, single-grain all-mash rations supplemented with dried buttermilk and minerals ranked in the order of oats, barley, wheat, and corn. The inclusion of oat hulls, whole oats, and hulled oats with corn or wheat showed the beneficial effect of the oat products on growth and feathering. However, both oats and barley exerted a slightly depressing effect on the percentage of bone ash in the tibias. The results of the investigation were based on the biweekly weights of 12 lots of 50 chicks and the feather development, bone ash, and bone measurements at 8 and 12 weeks of age. The lowered ash contents of the tibias, as contrasted with those of the birds fed corn and wheat rations, were not considered due to the presence of a rachitogenic factor in oats and barley since all ash values were at a relatively high level. Feed intake on the different rations seemed directly responsible for the rate of growth.

Multiple deficiencies in the modified Goldberger diet as demonstrated with chicks, H. A. WAISMAN and C. A. ELVEHJEM. (Wis Expt. Sta.). (*Jour. Nutr., 20 (1940), No. 6, pp. 519-526, figs. 2*).—The effects on growth of day-old chicks are reported resulting from supplements, singly and in groups, of liver extract, thiamin, riboflavin, nicotinic acid, pantothenic acid, vitamin B₆, and the U factor added to the modified Goldberger diet of yellow corn, casein, salts, cottonseed oil, and cod-liver oil. Addition of 100 μ g. of thiamin to the basal diet gave a slight improvement in the response during the 5-week test period, but further addition of 200 μ g. of riboflavin produced a marked growth response. Although nicotinic acid in small amounts gave some favorable response, above 20-25 mg. per 100 gm. of ration it was definitely toxic. In favorable combinations, B₆, pantothenic acid, and the U factor with riboflavin and thiamin showed favorable results. As the addition of a yeast extract and animal tissues to the diet was favorable, it is concluded that there are other factors than the known members of the B complex concerned in growth of the chicks.

Studies on a dermatitis in chicks distinct from pantothenic acid deficiency, D. M. HEGSTED, J. J. OLESON, R. C. MILLS, C. A. ELVEHJEM, and E. B. HART. (Wis. Expt. Sta.). (*Jour. Nutr., 20 (1940), No. 6, pp. 599-606, fig. 1*).—Lesions in chicks from pantothenic acid deficiency are clearly differentiated from the typical dermatitis which develops on purified diets and responds favorably to vitamin H, biotin, and extracts of liver, spleen, kidney, and yeast. The dermatitis produced with an adequate pantothenic acid diet was much more severe.

Effect of choline and other supplements on perosis, T. H. JUKES. (Univ. Calif.). (*Jour. Nutr., 20 (1940), No. 5, pp. 445-458, figs. 2*).—A. T. Ringrose,

J. H. Martin, and W. M. Insko, Jr.,⁶ found manganese to lower the incidence of perosis in turkeys. In further testing of the effectiveness of certain supplements to a ration of corn meal, skim milk, casein, alfalfa meal, fish oil, and minerals. "the following five modifications of the diet were all found to be completely ineffective in preventing perosis: (1) Substitution of limestone and bonemeal for CaCO_3 and KH_2PO_4 , respectively; (2) replacement of 25 parts of yellow corn meal by wheat bran; (3) addition of 2 parts of wheat bran ash to 100 parts of diet; (4) addition of 0.5 part of mineral mixture (consisting of ZnO , 5; $\text{Al}_2(\text{SO}_4)_3$, 5; CoCl_2 , $2\text{H}_2\text{O}$, 1; ferric citrate, 89) to 100 parts of diet; (5) omission of KH_2PO_4 and halving the CaCO_3 content." It was previously noted (E. S. R., 83, p. 813) that choline was the only synthetic product tested to prevent perosis consistently. Soybean meal at a 25-percent level was also effective in this respect. Further tests showed choline in 0.1-percent amounts in the ration to be sufficient for growth, but 33 percent of the birds showed perosis at 15 days. With 0.2 percent of choline in the ration, perosis was entirely prevented in the turkey. Choline gave similar results in perosis prevention in chicks.

A comparison of S-4 Type sun lamps and cod-liver oil as a source of vitamin D for poultry, D. C. KENNARD and V. D. CHAMBERLIN (*Ohio Sta. Bimo. Bul.* 207 (1940), pp. 157-165, fig. 1).—Portions of six groups of from 200 to 250 chicks similarly treated during brooding but receiving radiation from an S-4 Type sun lamp thereafter as contrasted with cod-liver oil gave consistent evidence that the lamp provided adequate vitamin D for growth. Similar rates of growth and mortality were obtained in turkeys supplied vitamin D from a sun porch, sun lamp, or cod-liver oil. The sun lamp also proved favorable in comparison with cod-liver oil as a source of vitamin D for egg production, hatchability of White Leghorn and Rhode Island Red eggs, and growth of chicks after 4 weeks of age. The higher cost of vitamin D from the sun lamp than from the cod-liver oil was more than offset by the returns, but it is pointed out that precautions must be taken to ensure ample vitamin A.

Feeding for hatchability, H. J. DAVIS (*Louisiana Sta. Cir.* 27 (1941), pp. [4]).—A discussion of the nutrients needed for hatchability of eggs, with special consideration of proteins, vitamins, and minerals.

The influence of intensity of egg production upon infertility in the domestic fowl, W. F. LAMOREUX. (N. Y. [Cornell] Expt. Sta.). (*Jour. Agr. Res.* [U. S.], 61 (1940), No. 3, pp. 191-206, figs. 2).—An analysis of the infertility in the eggs of over 1,200 hens showed that during a single week period the highest percentage of infertility, 31.2, was in the eggs of hens laying at the rate of one egg per week, whereas the least infertility, 11.8 percent, was found among hens averaging seven eggs per week. Similar results were obtained in eggs laid over a 6-week period. With larger clutches, a smaller percentage of infertile eggs was found than in smaller clutches. The first two and last two eggs of clutches did not show consistent differences in fertility, disproving the theory that oestrogen present in the Graafian follicles at the beginning of a clutch was related to fertilizability of the ova. The duration of fertility following artificial insemination was not prolonged by the daily injection of 100 rat units of Progynon-B. Hens which laid at a rate of less than 55 percent laid fertile eggs for a shorter period than heavier layers. Evidence pointed toward less frequent copulation of low-producers, and the frequency was influenced only slightly, if at all, by 12 daily injections of from 100 to 1,000 rat units of Progynon-B.

⁶ Poultry Sci., 18 (1939), No. 5, pp. 409, 410.

Changes in ovomucin during egg storage, R. M. CONRAD and H. M. SCOTT. (Kans. Expt. Sta.). (*Amer. Egg and Poultry Rev.*, 1 (1940), No. 9, pp. 306, 308).—No change in the microscopic structure in the gel of eggs stored for 8 days at 35° C. could be detected, although the percentage of mucin decreased from 2.11 to 1.83. The pH increased from 8.22 to 9.45, but if the eggs were sealed before storage the pH was reduced to 7.35. The changes in quality associated with storage are attributed to supposed changes in the elasticity of the mucin fibers of eggs from 13 pullets histologically studied in the boiled egg white.

The Khaki-Campbell egg-type duck, W. C. THOMPSON (*New Jersey Stat. Bul.* 685 (1940), pp. 15, figs. 5).—This is a brief account of the characteristics and egg production of the Khaki-Campbell duck as observed in England and the United States.

DAIRY FARMING—DAIRYING

[Progress in dairy research] (*U. S. Dept. Agr., Sec. Agr. Rpt.*, 1940, pp. 128-130).—Brief reports are presented on progress in dairy herd improvement through testing and the use of proved sires, cheese quality improvement, and the utilization of whey and other dairy byproducts.

[Investigations with dairy cattle and dairy products in New Jersey] (*New Jersey Stat. Rpt.* 1940, pp. 21-26, 28-31, fig. 1).—Studies, for which results are briefly reported, include returns secured from the application of fertilizer and lime to pastures, including a comparison of various systems of fertilization; the influence of mid-June fertilization of timothy on its composition and nutritive value; the loss of nutrients in molasses-grass silage and the fate of molasses during the ensiling process; roughage as a sole ration for yearling dairy heifers; feeding methods to insure good flavor and color in winter milk; silo pressures developed by grass silage; the protection of silo walls against the corrosive action of silage juices; grass silage harvesting equipment; breeding for high color in milk; the relationship of endocrine activity to the decline in milk production after the peak is reached; the influence of various metals on milk flavor; the value of oat flour as an antioxidant in dairy products; chemical methods for determining the vitamin D content of milk and standards of comparison for use in assaying vitamin D in milk; the value of ultraviolet lamps for sterilizing dairy equipment; and milk marketing investigations.

[Investigations with dairy cattle and dairy products by the Cornell Station] ([*New York*] *Cornell Sta. Rpt.* 1940, pp. 98, 99, 102, 103, 112-115, 119-125).—Brief progress reports (E. S. R., 82, p. 810) are presented for the following investigations, by L. A. Maynard, C. M. McCay, J. K. Loosli, G. H. Ellis, M. J. Babcock, P. Johnson, K. E. Gardner, E. Pagé, W. L. Nelson, E. S. Savage, E. S. Harrison, J. S. Taylor, and L. K. Lu: The influence of fat intake and of fat components in the ration upon milk and fat secretion; factors in cod-liver oil which lower the percentage of fat in milk; the role of yeast vitamins in growth and lactation, and the value of yeast for dairy cattle; chemical changes occurring in phosphoric acid silage and the effects of such silage on acid-base relationships in the animal body; losses and changes accompanying the ensiling of legumes and nonlegumes with various amounts of phosphoric acid, and the feeding value of phosphoric acid silage and molasses silage; and a comparison of mangel beets v. dried beet pulp on a total-digestible-nutrient-replacement basis.

From investigations with dairy products, by P. F. Sharp, V. N. Krukovsky, D. B. Hand, E. S. Guthrie, H. Doob, A. W. Willmann, I. C. Gunsalus, B. L. Herrington, R. F. Holland, O. Rahn, G. Knaysi, C. N. Stark, M. L. Speck, W. A.

Seleen, W. R. Straughn, J. M. Sherman, C. F. Niven, Jr., K. L. Smiley, P. A. Smith, H. M. Hodge, F. J. Rudert, C. Lamanna, A. J. Wood, and D. J. O'Kane, results are briefly noted on the inactivation of milk lipase by dissolved oxygen; the effect of properties of the fat and of the fat-globule surface on lipolytic activity of milk; a method for determining oxygen in milk; the amount of flavoprotein on the surface of milk-fat globules; the browning of dried milk and dried whey; crystalline modifications in lactose; the reduction of dehydroascorbic acid by *Bacterium coli*; lactose-nuclei formation in ice cream; the taxonomy, physiology, and morphology of coliform and related bacteria, streptococci, lactobacilli, and aerobic spore-forming bacilli; and the riboflavin production of staphylococci.

[Investigations with dairy cattle and dairy products in Oklahoma] (*Oklahoma Sta. Bien. Rpt. 1939-40, pp. 70-76, fig. 1*).—Studies for which results are reported include work by A. H. Kuhlman, W. D. Gallup, E. L. Fouts, and W. A. Krienke on the amount of carotene required for normal reproduction in dairy cattle, the relation of color to carotene content of hay, prairie hay v. alfalfa for milking cows, the value of cottonseed meal as a source of carbohydrates in the dairy ration, prevention of rickets in calves by feeding sun-cured hay and by direct exposure to sunlight, methods of reducing deterioration in cream on the farm, a comparison of cream neutralizing agents, the influence of repeated washings and of various intensities of working on butter quality, a rapid incubation test for predicting the keeping quality of butter, and the influence of breed of cattle on the yield and quality of cottage cheese.

[Experiments with dairy cattle and dairy products in South Dakota] (*South Dakota Sta. Rpt. 1940, pp. 30-41, figs. 2*).—Investigations, for which results are reported by T. M. Olson, G. C. Wallis, and D. H. Jacobsen, include the comparative returns secured from sweetclover, alfalfa, and Sudan grass pastures; types and amounts of gases in the rumen of bloated cows; corn silage v. legume-sorghum silage for dairy cows; the effect of the fineness of grinding grain on its digestibility and value for milk production; the effect of green and dried peppergrass on milk flavor; the vitamin D requirements of dairy cows; the influence of the roughage ration on the vitamin D potency of milk, and the relative vitamin D potency in the milk of the different breeds; methods of reducing weedy cream flavor in butter; methods of holding cream for churning in the dairy plant; and the influence of storage temperature on butter flavor.

[Dairy investigations in Texas] (*Texas Sta. Rpt. 1939, pp. 109-112, 148*).—Brief progress reports (E. S. R., 82, p. 529) are presented for the following studies, made by O. C. Copeland, A. L. Darnell, G. S. Fraps, C. N. Shepardson, E. B. Reynolds, P. R. Johnson, F. E. Hanson, and T. R. Freeman: The quantitative requirements of vitamin A for dairy cattle, dried citrus peel and pulp in the ration of lactating dairy cows, the value of manure and fertilizers for improving Bermuda grass pasture, the effect of adding bonemeal and lime to the rations of growing heifers and milking cows, methods of manufacture and other factors affecting the quality of butter, the effect of various temperature exposures on the quality of southern short-cure Cheddar cheese, and variations in the normal composition of milk produced in the State.

[Dairying investigations in Utah] (*Utah Sta. Bul. 294 (1940), pp. 74-75, 85-86*).—Results are briefly reported on man-, horse-, and machine-hours required in the production of 100 lb. of digestible nutrients and the butterfat production per acre for various feed crops, and the utilization of frozen fruits in the manufacture of ice cream.

[Dairy investigations in West Virginia] (*West Virginia Sta. Bul. 298 (1940), pp. 23-25, figs. 3*).—Results of studies by H. O. Henderson, R. A. Acker-

man, G. G. Pohlman, G. A. Bowling, A. H. VanLandingham, E. N. Moore, C. E. Weakley, Jr., W. C. Brown, and R. B. Dustman are briefly noted on gains in dairy heifers on bluegrass, alfalfa, and lespedeza pastures; pasture improvement through the use of fertilizers; the use of alfalfa as the sole source of protein in dairy rations; the influence of rations on the incidence of mastitis; and the value of high-quality hay in the ration in preventing oxidized flavor development in milk.

Yield, chemical composition, and feeding value for milk production of alfalfa hay cut at three stages of maturity, J. R. DAWSON, D. V. KOPLAND, and R. R. GRAVES (U. S. Dept. Agr., Tech. Bul. 739 (1940), pp. 52, figs. 6).—Experiments were conducted at the U. S. Dairy Field Station, Huntley, Mont., for 3 yr., in which irrigated alfalfa cut at the initial-bloom, half-bloom, and full-bloom stages was compared. The stage of cutting had little effect on the stand as indicated by plant counts and vigor of the plants in the spring following the third year of the experiment. Average per acre yields of field-cured hay were 8,938, 8,888, and 6,940 lb.; average crude protein content of the hay was 18.24, 18.29, and 15.71 percent; the digestion coefficient of the crude protein was 77.7, 77.1, and 75.4 percent; and the average cost per pound of total digestible nutrient was 70, 77, and 91 ct. for the initial-bloom, half-bloom, and full-bloom alfalfa, respectively. First cuttings of all stages were inferior to later cuttings. The crude fiber content was lower for the initial- and half-bloom stages. When the alfalfa hay was fed as the sole ration to milking cows the average consumption per lactation period was 14,390, 14,442, and 14,060 lb. of hay, the average milk production was 11,099, 9,763, and 8,981 lb., and the average butterfat production 404, 345, and 331 lb. on the initial-, half-, and full-bloom stages, respectively. These values indicated that initial-bloom hay was somewhat more nutritious than hay cut at a later stage. The average production of 4-percent fat-corrected milk per acre was 6,330 lb. for the initial-bloom, 5,254 for the half-bloom, and 3,970 lb. for the full-bloom plots.

Effect of ensiling upon the composition of forage crops, M. W. TAYLOR, C. B. BENDER, and W. C. RUSSELL (New Jersey Stat. Bul. 683 (1940), pp. 19).—Complete feed analyses and carotene determinations were made on over 100 samples each of green crops and the corresponding silages, including a wide range of crops ensiled with and without preservatives. Most of the materials showed losses of from 10 to 15 percent in total dry matter during ensiling. The loss of protein was usually higher than that of dry matter and was most marked in samples high in protein. The use of larger amounts of preservative tended to reduce protein losses. Carotene values in the silages were highly variable, but in general good quality silage showed a high degree of preservation of carotene. Grasses and legumes ensiled with molasses or phosphoric acid contained from two to three times as much carotene as corn silage. The loss of carotene did not necessarily parallel losses of other constituents but seemed dependent on moisture content and degree of packing. Fat, phosphorus, and ash were other constituents showing great variability.

Rumen synthesis of the vitamin B complex, M. I. WEGNER, A. N. BOOTH, C. A. ELVEHJEM, and E. B. HART. (Wis. Expt. Sta.). (Soc. Expt. Biol. and Med. Proc., 45 (1940), No. 3, pp. 769-771).—A heifer calf with rumen fistula was fed a synthetic diet of washed casein, urea, corn molasses, cornstarch, bleached wood pulp, cod-liver oil, and salt mixture which was low in all members of the vitamin B complex. Assay of the rumen contents indicated the synthesis of significant amounts of thiamin, riboflavin, nicotinic acid, pantothenic acid, pyridoxin, and biotin. When thiamin was added to the basal diet and the rumen content removed and assayed 6 hr. later, a destruction of the thiamin was contraindicated, while there was an apparent stimulation of the synthesis of the other factors.

Age as a factor influencing breeding efficiency in a dairy herd, G. A. BOWLING, D. N. PUTNAM, and R. H. ROSS. (W. Va. Expt. Sta.). (*Jour. Dairy Sci.*, 23 (1940), No. 12, pp. 1171-1176, figs. 6).—A summary of the breeding records of 706 cows and 43 bulls by conceptions and age showed that the number of services required for first conceptions of cows by bulls of all ages averaged 2.79, as compared with about 1.8 for the second to the sixth conception. The breeding of heifers to bulls under 4 yr. of age gave somewhat better results than when older bulls were used. Bulls over 6 yr. of age began to be less certain breeders.

Secretion of radio-strontium in milk of two cows following intravenous administration, L. A. ERF and C. PECHER. (Univ. Calif.). (*Soc. Expt. Biol. and Med. Proc.*, 45 (1940), No. 3, pp. 762-764, fig. 1).—Each of two lactating Holstein cows received intravenous injections of 50 cc. of an isotonic solution containing radioactive strontium lactate which emitted 11.2 microcuries of beta radiation per cubic centimeter. Following injection, milk was collected hourly for 6 hr. and twice daily for 4 additional days. Over this period of 4.25 days 7.88 and 11 percent of the radio-strontium were secreted in the milk.

A preliminary report on the effect of metals on fresh milk, A. VALENZUELA (*Philippine Jour. Anim. Indus.*, 7 (1940), No. 5, pp. 453-457, fig. 1).—The effects of immersing strips of copper or brass in fresh milk from the cow or carabao on the methylene blue reduction time and the nutritive value of the milk are reported. Fresh milks thus treated decolorized methylene blue in from 7 to 8 hr., whereas untreated fresh milk from the same source reduced the dye in 5 hr. The growth-promoting properties of the untreated milk and the copper- or brass-treated milk were similar when each was fed as the sole diet to young albino rats over a period of 8 weeks. Metallic milk became flat, tasteless, and somewhat metallic in flavor, losing the natural flavor of fresh milk.

Subclinical staphylococcus mastitis in herds free from streptococcus mastitis, and its effect upon milk composition, P. M. F. SHATTOCK and E. C. V. MATTICK (*Jour. Dairy Res. [London]*, 11 (1940), No. 3, pp. 311-315).—In a herd of 428 cows free from streptococcus mastitis, 21 percent of the individuals were found to harbor staphylococcus infection in their udders, although no clinical cases of mastitis were observed. Data are presented to indicate that changes in the chemical composition of the milk accompany staphylococcus infection. Crystal violet blood agar, used in detecting *Streptococcus agalactiae* infection, failed to indicate the presence of staphylococci.

The effect of variations in the fat percentage and in the reaction (pH) of milk media on the heat resistance of certain milk bacteria, A. A. NICHOLS (*Jour. Dairy Res. [London]*, 11 (1940), No. 3, pp. 274-291, figs. 2).—The heat resistance of about 40 strains of aerobic sporeformers isolated from canned milk products and three strains of *B[acillus] subtilis* which caused bitterness and thinning in canned cream was determined with skim milk, whole milk, and 23 percent cream as substrates. Most of these strains showed extremely high heat resistance, and the variation in the butterfat content of the media had no pronounced effect on the resistance. In parallel experiments with certain nonspore-forming organisms of lower thermal death point, increasing the butterfat content of the substrate failed to increase heat resistance. The results of varying the pH of the medium from about 5.95 to 7.25 were inconsistent, but it appeared that increases or decreases on either side of pH 6.6 to 6.8 may tend to decrease the resistance of the spores to heat.

Possible errors in the phosphatase test resulting from bacterial growth in milk, H. W. LEAHY, L. A. SANDHOLZER, and M. R. WOODSIDE (*Jour. Milk Technol.*, 3 (1940), No. 4, pp. 183-188).—Twenty-eight cultures of bacteria, repre-

senting 8 different genera, were tested for their ability to produce phosphatase when grown in sterile milk. The phosphatase test of Kay and Graham was applied, using both the Folin-Ciocalteu reagent and the Gibbs phenol reagent. One strain of *Staphylococcus*, 5 of *Aerobacter*, and 3 of *Klebsiella* were found to produce a true phosphatase reaction. Seven additional strains produced a false phosphatase reaction to the Folin-Ciocalteu reagent, which gave as strong color reactions with oxygenated purine derivatives as with phenol. It is concluded that phosphatase tests on milk having standard plate counts higher than 2,000,000 per cubic centimeter or direct microscopic counts higher than 8,000,000 per cubic centimeter should be interpreted with caution.

Symposium on tryptone-glucose-extract-milk agar, H. E. LIND (*Jour. Milk Technol.*, 3 (1940), No. 4, pp. 208-214).—The survey results reported indicate a rather general favorable acceptance on the part of public health departments of the new standard medium in milk control. A discussion by D. Dixon follows (pp. 210-214).

Time required for destruction of bacteria at different temperatures of pasteurization, M. J. PRUCHA and W. J. CORBETT. (Univ. Ill.). (*Jour. Milk Technol.*, 3 (1940), No. 5, pp. 269-273, fig. 1).—Fresh raw milk samples of low initial bacterial content were inoculated with a pure culture of a selected, heat-tolerant strain of *Escherichia coli*. Subsamples were exposed to 10 pasteurization temperatures, ranging from 143° to 162° F., with a range of holding periods at each temperature. To attain the equivalent in killing property of 143° for 30 min., it required 150° for 8 min. 30 sec., 156° for 2 min. 24 sec., 160° for 47 sec., or 162° for 21 sec. The greatest intensities of cooked flavor were induced at the low-temperature, long-holding-time levels, while cream volume was most adversely affected at the highest temperatures. Complete inactivations of phosphatase in milk (readings under 0.8 p. p. m. of phenol) occurred at 143° for 30 min., 150° for 5 min., 156° for 25 sec., or instantaneous exposure at 160° or above.

High temperature-short-time pasteurization of milk, F. C. BUTTON. (N. J. Expt. Stas.). (*Jour. Milk Technol.*, 3 (1940), No. 4, pp. 198-203).—A review, with 21 references.

The effect of the time and temperature of pasteurization upon some of the properties and constituents of milk, R. F. HOLLAND and A. C. DAHLBERG (*New York State Sta. Tech. Bul.* 254 (1940), pp. 55, figs. 6).—In this more detailed report (E. S. R., 84, p. 664), it is further noted that within a temperature range from 140° to 175° F. a semilogarithmic relationship between the time and temperature of pasteurization was found in the case of cream volume, the inactivation of phosphatase, and the destruction of *Escherichia coli*. The rennet coagulation time of milk was slightly increased by pasteurization over the entire temperature range. No significant changes in the relative amounts of CaHPO_4 and $\text{Ca}_3(\text{PO}_4)_2$ or of casein and heat coagulable protein were found within time and temperature ranges useful for commercial pasteurization. Residual nitrogen was increased by heating in most instances. A pasteurization temperature of 170° appeared very promising on the basis of all criteria applied.

Browning of autoclaved milk: Chemical factors involved, J. P. KASS and L. S. PALMER. (Univ. Minn.). (*Indus. and Engin. Chem.*, 32 (1940), No. 10, pp. 1360-1366, figs. 5).—Chemical changes which characterize and accompany the caramelization of lactose were studied by following the development of color in relation to the reducing, optical, and acid-forming properties of lactose solutions heated in the presence of various buffers at extended ranges of pH, concentration, and time. The trend of the caramelization reaction was the same for all buffers used, and the coloration formed was a logarithmic function of the optically inactivated lactose. The parallelism between the reaction of caramel prepared by heat alone or heat in the presence of buffers and the

brown coloration present in heated milk led to the conclusion that the origin and behavior of this coloration may be satisfactorily accounted for on the basis of the caramelization of lactose by the casein and the adsorption of the lactocaramel by the colloidal caseinates.

Supplementary notes on the deaeration of milk, P. F. SHARP, D. B. HAND, and E. S. GUTHRIE. (Cornell Univ.). (*Jour. Milk Technol.*, 3 (1940), No. 4, pp. 228, 229).—A supplement to a previous report (E. S. R., 84, p. 521).

Nutritional aspects of milk, II, W. E. KRAUSS. (Ohio Expt. Sta.). (*Jour. Milk Technol.*, 3 (1940), No. 4 pp. 205-207).—A general discussion, with particular reference to the effect of rations on the vitamin content of milk.

Measuring the sanitary quality of market cream, W. J. CAULFIELD, F. E. NELSON, and W. H. MARTIN. (Kans. Expt. Sta.). (*Jour. Milk Technol.*, 3 (1940), No. 5, pp. 245-254).—The study reported covered the examination of 63 samples of cream collected from commercial plants and numerous laboratory samples processed under controlled conditions. Tests applied included the New York City field and the Gilcreas and Davis phosphatase tests, bacterial counts (both by the standard plate and direct microscopic methods), numbers of *Escherichia-Aerobacter* organisms, pH and titratable acidity. The enzyme phosphatase proved to be more heat-resistant than selected heat-resistant strains of *Escherichia-Aerobacter*. Pasteurization of cream at 143.5° F. for 30 min. failed to insure negative phosphatase tests, but 150° for 30 min. resulted in 100 percent negative phosphatase tests. A high percentage of commercial samples were phosphatase negative and had bacterial plate counts of under 60,000 per cubic centimeter. The bacterial counts of coffee cream averaged nearly double that of whipping creams. As compared with the milk from which cream was separated, cream samples showed an increase in number of phosphatase-positive samples and in plate count and a marked increase in numbers of coliform organisms. No single test proved adequate in evaluating the sanitary properties of cream, each test having its own particular significance.

Application of the resazurin test to pasteurized cream, H. JENKINS (*Milk Dealer*, 30 (1940), No. 3, pp. 58, 60).—Data secured on the relation of resazurin reduction time to the bacterial content of pasteurized cream gave evidence that a reduction time of from 6 to 7 hr. insured that cream would meet regulations requiring the maximum standard plate count of 40,000 bacteria per cubic centimeter. The average count of cream in this class was 17,000 per cubic centimeter, whereas in creams having a reduction time of less than 3 hr. 100 percent of the samples exceeded 40,000 per cubic centimeter.

The quality of butter made from vacuum-pasteurized and vat-pasteurized lots of the same creams, N. E. FABRICIUS and E. W. BIRD (*Iowa Sta. Res. Bul.* 284 (1940), pp. 149-172, figs. 3).—Duplicate batches of cream representing good-, slightly defective-, and poor-quality creams were vat pasteurized at 155° F. for 30 min. and vacuum pasteurized in a steam-injection system at 190°-204° (vacuum 11 to 4.5 in.), respectively. Churning and working procedures employed with the two lots of the same cream were as nearly identical as possible. The scores of butters from the vacuum-pasteurized cream of the various grades were consistently higher than those of butter from the duplicate batches of cream pasteurized by the vat method. This applied to fresh butter and to butter held for 6 weeks at 38° or 6 mo. at 0°. Vacuum pasteurization proved desirable even for highest grade cream, and improved both body and flavor scores at all seasons of the year. There was little difference in the bacterial count of cream pasteurized by the two methods, and both were equally effective in destroying yeasts and molds. On some occasions the vacuum-pasteurized cream was phosphatase positive.

A bacterial discoloration of print butter, A. H. WHITE (*Sci. Agr.*, 20 (1940), No. 11, pp. 638-645, pl. 1).—Studies of an unusual discoloration developing on the surface of mildly salted butter resulted in the isolation of the causal organism, for which the name *Pseudomonas nigrificiens* is suggested. The morphology and cultural characteristics of the organism are described. This defect of butter was reproduced by inoculating the cream used for churning or butter wash water with a pure culture of the organism providing about 0.5 percent salt was added to the butter. Unsalted butter or that containing over 1 percent salt failed to support growth of the organism.

Studies on the chemistry of Cheddar cheesemaking.—VII, The measurement of the acidity of cheese and the relation of acidity to grading score, R. M. DOLBY, F. H. McDOWALL, and W. RIDDET (*Jour. Dairy Res.* [London], 11 (1940), No. 3, pp. 305-310, figs. 5).—Continuing this series (E. S. R., 77, p. 536), data are graphically presented on the relationship of titratable acidity to pH in cheese and also the relation of acidity at 14 days to the grade of the cheese at 3 mo. The pH of cheese at 14 days appeared to be the most useful means of measuring the extent of acid development in the cheese. Such values showed a rather close agreement with the grade of mature cheese. Cheeses having a pH value close to 4.9 at 14 days gave the highest grade at maturity.

The influence of "mastitis" upon the yield and quality of Cheddar cheese, C. K. JOHNS, T. J. HICKS, and C. A. GIBSON (*Jour. Dairy Res.* [London], 11 (1940), No. 3, pp. 298-304).—This contribution from the Canadian Department of Agriculture describes tests of the cheese yield from normal milk, milk infected with *Streptococcus agalactiae*, and abnormal milk free from *S. agalactiae* infection. In all cases the normal milk gave higher cheese yields than the other two classes of milk, apparently due to the lower casein and solids-not-fat contents of the mastitis milk. In only one case was the quality of cheese from the mastitis milks inferior to those made from normal milk.

Cheese in consumer-size packages, H. L. WILSON. (U. S. D. A.). (*Natl. Butter and Cheese Jour.*, 32 (1941), No. 1, pp. 64-66).—A general discussion.

Whey solids in candy, B. H. WEBB and C. F. HUFNAGEL. (U. S. D. A.). (*Food Res.*, 5 (1940), No. 2, pp. 185-195).—The experiments reported demonstrated that excellent candy containing up to 40 percent whey solids could be made, the whey partially replacing sugar, skim milk, and corn sirup. Adjustments in formulas were necessary to allow for the effect of whey upon sucrose inversion and for the development of proper body through control of the physical state of the lactose. Sweetened, condensed, Cheddar-cheese or Swiss-cheese whey (E. S. R., 80, p. 100) proved the most desirable form for this purpose. Whey condensed without sugar was satisfactory, but its perishable nature was a serious disadvantage. Soluble, spray-dried, sweet-whey powder was also satisfactory. Condensed, acid, cottage cheese whey required neutralization and sometimes produced candy of inferior quality. Directions for preparing various types of whey candy are included.

Protein stability of ice cream mixes and its effect on certain properties, C. D. DAHLE and P. W. RIVERS. (Pa. State Col.). (*Ice Cream Trade Jour.*, 36 (1940), No. 10, pp. 58, 60, 114-121).—To determine the influence of reducing the acidity of ice cream mixes on protein stability, experimental mixes made from fresh ingredients and also those containing frozen cream received additions of sodium hydroxide, calcium hydroxide, or magnesium oxide to give a desired range of acidity in each case. Protein stability in the mix and in the melted ice cream as measured both by the acid number and the alcohol number was increased by the addition of these alkalis. The sodium ion was more effective in reducing acidity and had a greater stabilizing effect than the calcium or magnesium ions. The use of alkalis was particularly effective in

restoring the whipping ability of mixes containing frozen cream, although this condition was not always associated with increased viscosity of the mix. The addition of alkali after processing had about the same influence on protein stability as when added before processing. The method of freezing had little influence on protein stability. High acid mixes were not improved materially from the flavor standpoint when the acidity was reduced.

The relation of acidity, solids per gallon, and different sources of serum solids to the physical and chemical properties of high serum solids ice cream, W. H. E. REID, C. W. DECKER, and W. S. ARBUCKLE (*Missouri Sta. Res. Bul.* 322 (1940) pp. 48, figs. 18).—Four series of experimental ice creams were studied with reference to the chemical and physical properties of the mix and quality of the resulting ice cream. In series 1 and 2, containing 13.5 and 15 percent serum solids, respectively, mixes were standardized to acidities of 0.08, 0.12, 0.18, and 0.24 percent, respectively. Corresponding pH values were 7.65, 7.5, 6.9, and 6.8 in series 1, and 8.5, 7.65, 6.9, and 6.6 in series 2, indicating that serum solids content definitely influences pH values. Variable acidity had little effect on surface tension of the mix, but a marked effect on viscosity. Consumer preference indicated that those samples of neutral or slightly alkaline pH were most desirable. In series 3, in which total solids content per gallon ranged from 1.65 to 2.06 lb., ice cream containing 1.77 lb. was preferred by a majority of the consumers, while that containing 1.9 lb. ranked second. Macroscopic examination showed that ice cream having from 0.12 to 0.18 percent acidity and a total solids weight per gallon of 1.77 gave the most desirable texture, while microscopic examination indicated that that having an acidity of 0.12 percent and total solids weight of 1.77 to 1.9 lb. per gallon contained smaller and more uniform shaped ice crystals. Reducing the total solids per gallon and increasing overrun tended to increase stability of the ice cream due to the development of a minute air-cell structure. Ice cream in which the major proportion of the serum solids was made up with mineralized dry milk solids showed greater resistance to melting and gave a smaller average weight per disher but more dishes per gallon than when the major proportion of serum solids was derived from plain dry milk solids. A serving temperature of 8° F. was preferred by a majority of the consumers. The largest average weight per disher occurred at 12° and the smallest at 4°.

Dextrose and corn sirup for frozen desserts, A. C. DAHLBERG and E. S. PENCZEK (*New York State Sta. Bul.* 696 (1940), pp. 36, figs. 4).—Three different types of corn sweeteners, namely, enzyme-converted corn sirup, corn sirup solids from regular corn sirup, and hydrated dextrose were compared with sucrose. These products possessed relative sweetness of 67, 49, and 89, respectively, as compared with a value of 100 for sucrose. The freezing point depression in the water solutions increased in the following order—corn sirup solids, sucrose, the enzyme-converted corn sirup, and dextrose. The viscosity, acidity, and fat clumping in ice cream mixes were only slightly affected by the addition of corn sweeteners. Best results were secured by replacing 25 percent of the sucrose with amounts of the corn sweeteners necessary to give the same sweetening equivalent. Such additions of corn sweeteners resulted in slight but definite improvement in body and texture of ice cream but tended to lower its melting resistance. The corn sweeteners markedly improved the body and texture of sherbets and ices and delayed sucrose crystallization.

The application of wetter water to dairy and milk plant use, F. M. SCALES and M. KEMP (*Jour. Milk Technol.*, 3 (1940), No. 4, pp. 221-227).—Experiments comparing the action of a number of wetting agents in wash waters are described. Data are also presented on the detergent qualities of common alkali cleaners, which as a group were deficient in wetting and penetrating qualities.

It is concluded that the use of suitable wetting agents will yield better results with less time and labor than are generally attained with ordinary plant cleaning materials.

VETERINARY MEDICINE

Veterinary bacteriology, I. A. MERCHANT (*Amcs: Iowa State Col. Press, 1940, pp. VIII+628, figs. 135*).—This textbook is presented in four parts, as follows: General biology of micro-organisms (pp. 1-128); infection, resistance, and immunity (pp. 129-213); classification and characteristics of pathogenic bacteria (pp. 215-535); and the filtrable viruses (pp. 537-601).

[**Work in animal pathology and parasitology by the Bureau of Animal Industry**] (*U. S. Dept. Agr., Bur. Anim. Indus. Rpt., 1940, pp. 1, 2, 3, 5-9, 36, 43, 44, 45-61, 62-90*).—The work of the year reported (E. S. R., 82, p. 817) relates to Bang's disease; tuberculosis and its eradication; bovine mastitis; fowl leucosis (fowl paralysis); avian encephalomyelitis; vesicular stomatitis; hog cholera and its control; disinfectants; tuberculin and other diagnostic tests; eradication of scabies; inspection and quarantine of imported animals and products; infectious equine encephalomyelitis; periodic ophthalmia; swine erysipelas; anaplasmosis; infectious anemia; miscellaneous diseases; stock-poisoning plants; tick eradication; parasites of horses, ruminants, swine, and other animals and of poultry and treatment for their removal; and virus-serum control.

[**Control of diseases of livestock**] (*U. S. Dept. Agr., Sec. Agr. Rpt., 1940, pp. 155-158*).—Reference is made to the continued exclusion of foreign livestock diseases, the work of bovine tuberculosis eradication, suppression of Bang's disease, tick eradication 99 percent completed, and the trichinosis situation.

[**Work in animal pathology by the New Jersey Stations**] (*New Jersey Stas. Rpt. 1940, pp. 26-27, 40, 41-42, 42-43*).—The work of the year (E. S. R., 83, p. 677) reported upon relates to the protection of the udders of dairy heifers from Bang's disease, initiation of a program of herd hygiene, a study of infectious laryngotracheitis, use of the agglutination test for the detection of paratyphoid of pigeons, and equine encephalomyelitis in pheasants.

[**Work in parasitology by the Cornell Station**] (*[New York] Cornell Sta. Rpt. 1940, pp. 106-107, 110*).—The work of the year reported upon includes the control of strongyles in horses, by G. W. Salisbury, D. W. Baker, and J. W. Britton; and a comparison of tetrachloroethylene and the combined copper sulfate-nicotine sulfate solution as treatments for the control of the worm parasites of the digestive tract of sheep and lambs, by J. P. Willman and Baker.

[**Work with livestock diseases and parasites by the South Dakota Station**] (*South Dakota Sta. Rpt. 1940, pp. 42-46*).—The work of the year (E. S. R., 82, p. 678) reported upon includes studies on the selenium poisoning of livestock and oat hay poisoning, both by A. L. Moxon and O. E. Olson; tests with immunizing agents for hemorrhagic septicemia, by J. B. Taylor; and chenopodium for the eradication of worms in lambs, by F. J. LeBlanc, T. Wright, and J. Watson.

[**Work in animal pathology and parasitology by the Texas Station**] (*Texas Sta. Rpt. 1939, pp. 12-14, 37-38, 238-242*).—The work of the year (E. S. R., 82, p. 531) briefly reported upon includes infectious bovine abortion by H. Schmidt, R. D. Turk, O. C. Copeland, and C. N. Shepardson; anaplasmosis in cattle, by P. L. Piercy; disease resistance of sheep to stomach worms (*Haemonchus contortus*) by B. L. Warwick, Schmidt, Turk, and R. O. Berry; and at the Sonora Substation, stomach worms in sheep and goats, hard yellow livers of sheep and cattle, feeding trials of suspected plants, infectious enterotoxemia of lambs, limberleg of sheep, tests with screwworm larvae, and pregnancy

disease, all by I. B. Boughton and W. T. Hardy; and the calcium and phosphorus requirements in the Edwards Plateau by Boughton.

[Work in animal pathology by the Utah Station, 1939-40] (*Utah Sta. Bul.* 294 (1940), pp. 86-88, fig. 1).—The work (E. S. R., 80, p. 392) of the biennium referred to includes post-parturient hemoglobinemia in cows, control of mastitis in a dairy herd, and the relationship of soft-curd milk to subclinical mastitis.

[Reports of the veterinary director general for the years ended March 31, 1937, 1938, 1939, and 1940] (*Canada Dept. Agr., Rpts. Vet. Dir. Gen.*, 1937, pp. 46; 1938, pp. 45; 1939, pp. 41; 1940, pp. 45).—The annual reports (E. S. R., 78, p. 99) of work with infectious diseases for 1937 and 1938 are by G. Hilton et al. and for 1939 and 1940 by A. E. Cameron et al.

[Contributions on animal pathology and parasitology] (*Onderstepoort Jour. Vet. Sci. and Anim. Indus.*, 14 (1940), No. 1-2, pp. 9-119, 433-488, figs. 47).—Contributions presented (E. S. R., 84, p. 523) include the following: Eperythrozoonosis in Cattle, by W. O. Neitz (pp. 9-28); Swine Fever [Hog Cholera] in South Africa, by G. de Kock, E. M. Robinson, and J. J. G. Keppel (pp. 31-93); South African Helminths—VII, Miscellaneous Helminths, Chiefly Cestodes, by R. J. Ortlepp (pp. 97-110) (E. S. R., 82, p. 817); Treatment Against Lungworms (*Dictyocaulus filaria*) in Sheep (pp. 111-114) and *Marshallagia marshalli* (Ransom, 1907) Orloff, 1933 and a New Species of this Genus [*M. brevispiculum*] From Sheep in South Africa (pp. 115-119), both by H. O. Mönnig; The *Senecio* Alkaloids—II, Hydrogenation, Hydrolysis, and Structural Results of Isatidine, by H. L. de Waal (pp. 433-447) (E. S. R., 82, p. 817); Conjunctivitis of the Domestic Fowl and an Associated *Rickettsia*-like Organism in the Conjunctival Epithelium, by J. D. W. A. Coles (pp. 469-478); and Anatomical Studies No. 63—An Abnormal Bovine Heart, by J. H. L. Cloete and H. P. Steyn (pp. 481-488).

Buffered blood cultures, C. I. NELSON. (N. Dak. Expt. Sta.). (*Jour. Infect. Diseases*, 66 (1940), No. 2, pp. 113-116, fig. 1).—Description is given of a type of medium for use in culturing refractory organisms in circulating blood. The medium depends upon the added blood for its nutrients and avoids inhibiting influences usually found in culture media for this purpose. The time required for growth is much shorter than that required for other blood culture media.

Studies on the hemorrhagic sweet clover disease.—I, The preparation of hemorrhagic concentrates, H. A. CAMPBELL, W. L. ROBERTS, W. K. SMITH, and K. P. LINK. (Wis. Expt. Sta.). (*Jour. Biol. Chem.*, 136 (1940), No. 1, pp. 47-55).—Report is made of an extraction and fractionation scheme that has been developed for the concentration of the hemorrhagic substance in spoiled sweetclover hay. "When 0.6 gm. of this concentrate is fed to standardized susceptible rabbits, the plasma prothrombin is reduced to 10 percent of the normal in 40 to 48 hr. This is equivalent to a 200-fold concentration (minimum) of the hemorrhagic agent. The chemical nature of the hemorrhagic agent present in the concentrates is not known at this stage. However, it can be stated that the concentrate is essentially free from the following classes of substances: Fats, waxes, certain pigments, sugars, glycosides, water-soluble polysaccharides, water-soluble acids, amines, alkaloids, water-soluble proteins, and water-soluble decomposition products of chlorophyll."

White snakeroot poisoning in Arkansas, E. L. NIELSEN and D. F. EVELETH. (Ark. Expt. Sta.). (*Vet. Med.*, 36 (1941), No. 3, pp. 136-137, fig. 1).—Record is made of the instance of human milk-poisoning ("milk sickness") near Harrison and Jasper, Ark., during the last 40 yr. White snakeroot (*Eupatorium*

urticaefolium), grazed upon by cows, is said to be abundant throughout this region.

Culture media for *Brucella*, G. P. KERBY and R. M. CALDER (*Jour. Bact.*, 40 (1940), No. 5, pp. 637-643).—Only two of the numerous substances studied for their possible value as growth-promoting factors for *Brucella* were found worthy of further investigation. A milk medium described may prove useful if variation due to undefined differences in lots of milk can be controlled. Sodium caseinate medium seems to show promise in the isolation of certain strains of *Brucella*, but it probably cannot be relied upon to improve tryptose broth in all instances.

Capsule formation by members of the *Brucella* group, W. A. MICKLE (*Jour. Infect. Diseases*, 66 (1940), No. 3, pp. 271-277, figs. 5).—Of 27 strains of *Brucella* examined microscopically, culturally, and serologically for evidence of capsule formation, 5 produced demonstrable capsules either directly or after mouse passage and 5 others showed serological and cultural characteristics similar to the encapsulated strains but did not produce demonstrable capsules. The encapsulated strains were not agglutinable in ordinary antiserum but were highly agglutinable in serums prepared against homologous organisms, and vice versa. The encapsulated strains served as poor antigens in vivo. Encapsulated organisms can be denuded by cultivation in beef extract broth. These stripped variants are culturally indistinguishable from the encapsulated and nonencapsulated forms. They act as better antigens in vivo than encapsulated organisms and produce agglutinins for the encapsulated forms to high titer. Opsonic studies showed that injection of encapsulated organisms into rabbits was followed by low opsonocytophagic index increase, while the injection of nonencapsulated organisms produced a large increase in this index for homologous organisms.

Studies relating to *Brucella abortus* infection.—I, On the occurrence of the organism in the blood stream. II, On the occurrence of the organism in serous swellings or hygromata on cattle, F. A. HUMPHREYS and T. MOORE (*Canad. Jour. Compar. Med. and Vet Sci.*, 5 (1941), No. 1, pp. 5-20, figs. 4).—This contribution is presented in two parts.

In work reported in the first part (pp. 5-11) heart blood specimens from 3 groups of infected guinea pigs comprising 157 animals were cultured, and blood from 35 of these was passaged to other guinea pigs. *B. abortus* was isolated in pure culture from 21 guinea pigs, and its presence was indicated in 4 others by animal inoculation. Twelve cultures grew only under increased carbon dioxide tension, 5 grew only in ordinary atmosphere, and 4 grew in both. When 116 specimens of bovine blood collected from 40 different animals, both naturally and artificially infected, were cultured, not a single specimen yielded a culture of *B. abortus*.

In work reported in the second part (pp. 11-20) the contents of 45 serous swellings (hygromata) on 36 positive and 6 negative animals were examined. The presence of *B. abortus* was indicated by (1) successful isolation in pure culture in 15 of the 25 specimens cultured; (2) guinea pig inoculation, and the resulting serological reactions, in 25 of the swellings; and (3) both methods combined, in 27 of the swellings. In 1 animal whose blood serum was negative and whose hygromatous fluid did not agglutinate *B. abortus* above 1:50, the presence of *B. abortus* was indicated by guinea pig inoculation. In 2 animals in which both the blood serum and hygromatous fluid were negative, the presence of *B. abortus* in the hygromatous fluid was proven by direct isolation of the organism. Evidence of *B. abortus* infection was deduced in approximately 93 percent of the animals that developed hygromata.

Progress in the control of contagious abortion and mastitis in Illinois, R. GRAHAM and J. A. HENDERSON. (Univ. Ill.). (In *Dairy Manufactures Con-*

ference Manual, Department of Dairy Husbandry, University of Illinois, Urbana, Illinois, November 13-17, 1939. Urbana: Univ. Ill., 1939, pp. 9-17).

Agglutinability of mastitis streptococci, W. N. PLASTRIDGE, L. F. BANFIELD, and L. F. WILLIAMS. ([Conn.] Storrs Expt. Sta.). (*Jour. Infect. Diseases*, 66 (1940), No. 3, pp. 202-211).—The importance of accurate identification of *Streptococcus agalactiae*, *S. dysgalactiae*, and *S. uberis*, representing mastitis streptococci groups I, II, and III, respectively, as classified by Minett and Little, led to the work here reported. Its significance is indicated by the fact that *S. agalactiae* infection can be eradicated from herds by detection, segregation, and elimination of infected animals. When this is accomplished herds can be maintained free from infection, while a similar program has not been effective in attempting elimination of *S. dysgalactiae* and *S. uberis*.

"All ingredients, especially the kind of peptone, used in preparing nutrient broth were found to have a pronounced influence on the agglutination properties of bovine udder streptococci. Of the mediums studied, the one of the following composition proved to be best suited for the routine production of antigens for use in the slide agglutination test: Beef infusion plus 2 percent Difco-Proteose peptone, 0.4 percent dextrose, and 1 percent K_2HPO_4 and adjusted to pH 7.4. The presence of 1 percent normal sterile ox serum in the medium selected made possible the preparation of usable antigens from most spontaneously agglutinable strains but tended to make inagglutinable the cultures which were specially agglutinable when grown in the serum-free medium. Reduction of the dextrose content of the medium to 0.1 percent made possible the preparation of usable antigens from a majority of inagglutinable strains. Cells of a mucoid-rough variant which were unsatisfactory antigens because they occurred in stringy viscid masses were made specifically agglutinable by shaking in the presence of tenth-normal sodium hydroxide. The tendency of cultures to be specifically agglutinable, spontaneously agglutinable, or inagglutinable was found to vary in different herds. *S. dysgalactiae* cultures showed a marked tendency toward spontaneous agglutination which was more difficult to overcome than that of either *S. agalactiae* or *S. uberis*. A procedure which made possible the preparation of specifically agglutinable antigens from 99.2 percent of 240 strains of *S. agalactiae* is described."

The work supplements that previously noted (E. S. R., 81, p. 421).

Streptococcus acidominimus, F. R. SMITH and J. M. SHERMAN. (Univ. Calif. and Cornell Univ.). (*Jour. Infect. Diseases*, 65 (1939), No. 3, pp. 301-305).—It is shown that *S. acidominimus*, described by Ayers and Mudge from the udder of cows (E. S. R., 47, p. 682), commonly occurs in significant numbers in the vagina of cows. From a rather extensive physiological study of cultures isolated from this source, it is concluded that these organisms may be clearly differentiated from the other known species of the streptococci. Serologically, *S. acidominimus* does not belong to any of the established streptococcal groups.

The effects of environmental conditions on the accessibility of third stage trichostrongyle larvae to grazing animals, W. P. ROGERS (*Parasitology*, 32 (1940), No. 2, pp. 208-225, figs. 12).—In studies conducted in Western Australia it was found that the larvae of *Trichostrongylus*, *Haemonchus*, *Ostertagia*, and *Chabertia* migrated upwards on the blades of sedge (*Kyllinga* sp.) and of ryegrass (*Lolium perenne*) in greatest numbers when subjected to a light of an intensity about 62 footcandles. Moisture on the grass favored larval migration, but more than 0.12 cc. of water per square centimeter of soil surface retarded movement, and more than 0.2 cc. per square centimeter tended to prevent larval migration up the grass. Of the genera examined *Ostertagia* spp. were most favored by the presence of moisture on the grass; *H. contortus* was most hin-

dered by its presence. Increasing quantities of moisture in the soil up to 85-percent saturation assisted larvae to move on to the grass. Above this value larval migration was retarded. *Ostertagia* spp. were best able, and *H. contortus* least able, to migrate from wet soil. *H. contortus* was found to migrate on relatively dry grass at a faster rate than *Trichostrongylus* spp. and *Ostertagia* spp. In the temperature range examined larvae were found to move up the grass in largest numbers at 5° and 45° C. *H. contortus* was the most active species at higher temperatures.

Yeast as an adjunct to the anthelmintic treatment of advanced cases of trichostrongylosis in calves, D. W. BAKER (*Cornell Vet.*, 31 (1941), No. 1, pp. 13-16).—Emaciated calves heavily parasitized by trichostrongyles, representing the genera *Trichostrongylus*, *Ostertagia*, *Cooperia*, and *Nematodirus*, were reconditioned and the reconditioning maintained by administration of suspensions of dried yeast. Successful treatment consisted of the use of tetrachloroethylene and mineral oil immediately after oral swabbing with a 5 percent copper sulfate solution.

The standardisation of johnin.—I, The suitability of the guinea-pig as a test animal, R. E. GLOVER (*Vet. Jour.*, 97 (1941), No. 1, pp. 3-15, figs. 2).

The use of phenothiazine in veterinary parasitology, W. E. SWALES (*Canad. Jour. Compar. Med. and Vet. Sci.*, 4 (1940), No. 12, pp. 333-341).—This review of the subject is presented with a list of 31 references to the literature.

The materia medica of phenothiazine, J. W. BRITTON (*Cornell Vet.*, 31 (1941), No. 1, pp. 1-12).—This summary of the chemistry, pharmacology, methods of administration, action on parasites affecting domestic animals, and the toxicology of phenothiazine is presented with a bibliography of 50 titles.

Some experiences with phenothiazine, A. FOGGIE (*Vet. Rec.*, 52 (1940), No. 45, pp. 783-785).—The administration of from 40 to 60 gm. of phenothiazine to calves suffering from parasitic gastritis gave very encouraging results. Dosing sheep suffering from stomach worm disease with from 13 to 20 gm. of phenothiazine was much less satisfactory.

An examination of the urine of sheep dosed with phenothiazine, M. LIPSON (*Austral. Jour. Expt. Biol. and Med. Sci.*, 18 (1940), No. 3, pp. 269-272, fig. 1).—In the work conducted about 10 percent of the original dose of phenothiazine administered to sheep was recovered in the urine passed within 26 hr. following. "The red color developing in the urine of sheep dosed with phenothiazine is due in part to thionol, but does not consist entirely of this compound as the results of previous workers on other animals have indicated. Phenothiazone is also formed from phenothiazine, and the present study has shown that the color developed in sheep's urine is due as much to phenothiazone as to thionol. The two oxidation products can be conveniently separated by chromatographic adsorption. The three compounds occur in combination with other constituents of the urine. The thionol and phenothiazone are excreted mainly in the form of leuco bases which are oxidized to the parent dyestuffs on allowing the urine to stand in the air."

A preliminary note on the efficiency of phenothiazine against some poultry helminths, F. H. S. ROBERTS (*Vet. Rec.*, 52 (1940), No. 47, pp. 819, 820).—The administration of phenothiazine in the commercial form, Thiox, at dose rates of 0.4 gm. per pound body weight, 1 gm. per pound body weight in a single dose, and 1 gm. per pound body weight divided into three equal portions and administered on 3 successive days, was ineffective against *Cheilosporura hamulosa*, *Raillietina tetragona*, and *Hymenolepis carioca*. The dose rate of 1 gm. per pound body weight in a single dose gave a moderate effi-

ciency against *Ascaridia galli* (56.2 percent) and indicates that better results may be secured with a higher dose rate.

The diseases of dairy cattle, P. S. WATTS (*Jour. Dairy Res.* [London], 11 (1940), No. 3, pp. 316-350).—Reviews are given of the progress of work with mastitis, Bang's disease, and bovine tuberculosis, together with a list of 320 references to the literature.

A modified Whiteside test for the detection of chronic bovine mastitis, J. M. MURPHY and J. J. HANSON. (N. J. Expt. Stas.). (*Cornell Vet.*, 31 (1941), No. 1, pp. 47-55, fig. 1).—A description is given of a modification of the Whiteside test for mastitis. It is performed by mixing five drops of foremilk and one drop of N NaOH solution on a flat glass plate, using a dull green blotter as a background. After mixing for 20 sec. with a glass rod the test is examined by reflected light for the presence of a precipitate. The amount and character of the precipitate can be graded. The modified Whiteside test was found to parallel closely the leucocyte count in ability to detect the presence of udder infection. It embodies simplicity of operation and ability to show in a rough quantitative manner the degree of irritation existing in the mammary gland and should be of great value in field use as a simple, accurate, presumptive test for the presence of chronic bovine mastitis.

Hemolytic streptococci associated with the bovine udder, F. R. SMITH and H. S. CAMERON. (Univ. Calif.). (*Cornell Vet.*, 31 (1941), No. 1, pp. 24-29).—A study was made of four groups of hemolytic streptococci isolated from the bovine udder. One appears to be associated with well-recognized species in the enterococcus group. The other three did not show characteristics usually associated with recognized species, and no attempt was made to name them.

Trichomonads in the heart blood of an aborted fetus, D. E. MADSEN. (Utah Expt. Sta.). (*Cornell Vet.*, 31 (1941), No. 1, pp. 18-20).—The etiological significance of the author's findings led to the presentation of this report of the detection of trichomonads (*Trichomonas fetus*) in the mucus of the mouth, stomach contents, heart blood, and lungs of aborted bovine fetuses. None of the trichomonads were observed in the liver. They were most numerous and active in the heart blood and stomach, those in the lungs being sluggish and scattered. The findings are considered to add support to the possibility of congenital transmission, although in this instance the possibility of invasion of the blood stream from the digestive tract after death cannot be discounted.

The parasitic hazards encountered in southern and western raised calves and lambs in New York, D. W. BAKER (*Cornell Vet.*, 31 (1941), No. 1, pp. 42-44).

A report on the prevalence of helminth parasites in sheep in southwestern Virginia, together with observations on certain anthelmintics employed, W. L. THRELKELD. (Va. Expt. Sta.). (*Va. Acad. Sci. Proc.*, 1940, pp. 209-210).—Report is made of parasites found on autopsy of 28 sheep raised in southwestern Virginia. Nine of the 15 parasites observed were present in more than 10 of the animals, namely, *Cooperia curticei* 20, *Oesophagostomum columbianum* 18, *Haemonchus contortus* 17, *Nematodirus* sp. 17, *Moniezia* sp. 16, *Ostertagia circumcincta* 13, *Trichostrongylus vitrinus* 11, *Bunostomum trigonocephalum* 11, and *Trichuris ovis* 11. The use of from 2.5 to 3 cc. of a 10 percent copper sulfate solution for stimulating closure of the oesophageal valve for directing anthelmintics in capsules not larger than 20 mm. × 16 mm. to the abomasum was 68.4 percent effective, and has a percentage value of 46.2 advantage over capsules administered without preliminary treatment with the copper sulfate. Anthelmintics employed to date are copper sulfate, copper tartrate, copper arsenate, nemural, and phenothiazine. Comparative results based on autopsy of treated and untreated animals are reported.

Enteritis in sheep and swine: Reaction to johnin, D. F. EVELETH and J. L. REINECCIUS. (Ark. Expt. Sta. and U. S. D. A.). (*Vet. Med.*, 35 (1940), No. 9, p. 500, fig. 1).—Typical lesions of Johne's disease and the presence of acidfast organisms thought to be *Mycobacterium paratuberculosis* are reported as found in cattle, sheep, and swine examined in northwest Arkansas.

Studies on genetic resistance in swine to Brucella infection.—II, A bacteriological examination of resistant stock, H. W. CAMERON, P. W. GREGORY, and E. H. HUGHES. (Univ. Calif.). (*Cornell Vet.*, 31 (1941), No. 1, pp. 21-24).—Further studies (E. S. R., 83, p. 542) led to the conclusion that the genetic constitution of the resistant stock in the investigations was an ability to resist infection by *Brucella suis* rather than an inability to produce agglutinins against it.

On an Entamoeba occurring in English goats, C. A. HOARE (*Parasitology*, 32 (1940), No. 2, pp. 226-237, figs. 16).—Description is given of an apparently nonpathogenic amoeba, found in the feces of 10 of 14 English goats in three different localities, that is morphologically identical with *E. deblickei* of the pig.

The toxicity of Sartwellia flaveriae to goats, F. P. MATHEWS. (Tex. Expt. Sta.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 4, pp. 287-292, pl. 1, fig. 1).—In investigations commenced in Pecos County, Tex., in 1933 the force feeding of the range plant *S. flaveriae* to goats was found to cause loss of appetite and with the continued feeding of the plant regardless of this symptom fatal results were produced as early as the twenty-second day. Extensive necrosis of the liver was associated with such cases. Long feeding periods were made possible by discontinuing the force feeding of the plant whenever inappetence appeared but resuming it when the appetite returned to normal. There appeared to be little or no permanent ill effects from the first feeding period conducted in this manner. However, two or more feeding periods of this nature produced pulmonary edema, hydrothorax, and death in four out of five goats which were thus fed. There was slight necrosis of the liver cells in such cases and a deposit of yellow pigment which was soluble in alcohol.

Further studies on moldy corn poisoning (leucoencephalomalacia) in horses, H. E. BIESTER, L. H. SCHWARTE, and C. H. REDDY. (Iowa State Col. et al.). (*Vet. Med.*, 35 (1940), No. 11, pp. 636-639, figs. 7).—This account supplements the earlier report (E. S. R., 76, p. 694) in which the pathology of fatal cases of moldy corn poisoning was described and the condition was differentiated from equine encephalomyelitis. Many species of organisms were present in the moldy corn. There was no clue as to the pathogen involved in the disease. Of these species, *Trichoderma lignorum* Harz was grown on sterilized corn and fed without ill effects. One horse, fed the corn on which a green mold growth appeared, died 40 days after the experiment was started. It was also determined that severe microscopic changes are associated with nonfatal cases in which no gross liquefaction necrosis exists. Another horse, killed after consuming the same material for 110 days, showed marked microscopic changes in the central nervous system. No gross liquefaction was found in the brain, but histologic studies revealed small foci of coagulation, perivascular edema, hemorrhages, evidence of thrombosis, and degenerative changes in the blood vessel walls. Similar variations in individual susceptibility were found in a previous feeding experiment. Three horses, fed corn showing a gray type of mold growth, were killed after a feeding period of 110 days. During this period the animals rolled frequently, gave indications of increased irritability, and at times appeared depressed. One horse presented slight incoordination. At autopsy no gross liquefaction was found in the brains. The microscopic changes consisted of perivascular edema, retrograde changes in the blood vessel walls, minute foci of coagulation, and

hemorrhages in the brain. The spinal cords were softened and presented some similar changes.

Studies on the bionomics and control of the bursate nematodes of horses and sheep.—VIII, Comparisons of the lethal effects of some chemicals containing sulphur on the free-living stages of sclerostomes, I. W. PARNELL (*Canad. Jour. Res.*, 18 (1940), No. 11, Sect. D, pp. 371-394, figs. 11).—In continuation of this series (*E. S. R.*, 82, p. 819), tests of 14 common chemicals containing sulfur on free-living stages of sclerostomes are reported. It was found that "potassium xanthogenate in weak solution will sterilize about 160 times its weight of fresh feces; in a strong solution, less than a quarter of the weight. Carbon disulfide will sterilize only about 32 times its weight under the conditions imposed by this technic. In solutions of medium strength the sulfates of zinc will sterilize 32 times and those of iron (ferrous), copper, and manganese, 13 times their weight. Lesser quantities, however, might be effective in practice because the larvae from cultures so treated die comparatively rapidly after reaching the third stage. Dry ferric sulfate will sterilize 20 times its weight. Sodium sulfide, sodium sulfite, and sodium sulfate are all so ineffective that only when applied dry or as strong solutions are they lethal. They sterilized from 8 to 5 times their weight. Magnesium sulfate will sterilize only 4 times and zinc sulfide twice its weight of fresh feces. Ferrous sulfide and flowers of sulfur do not appear to have any lethal value, but the latter may, by controlling antagonistic factors, increase the chances of survival of the larvae."

Effect of feeding repeated small doses of selenium as sodium selenite to equines, W. T. MILLER and K. T. WILLIAMS. (U. S. D. A.). (*Jour. Agr. Res.* [U. S.], 61 (1940), No. 5, pp. 353-368, figs. 8).—In the experimental work reported, selenium (the cause of alkali disease) in the form of sodium selenite when fed in small repeated doses over long periods of time was responsible for the death of all four animals used but failed to induce outstanding symptoms typical of chronic poisoning in any of them. Two horses received 24 parts of selenium per million of feed and a mule 17.3 parts for a period of 6 mo. At the end of this time the dose of selenium was doubled, and 2 weeks later the mule died. The horses were continued at this level for 9 mo., after which the dose was again doubled. Both horses died within 2½ mo. after the dosage was increased, or within 17½ mo. after the experiment began. A third horse fed a diet containing 115 parts of selenium per million parts of feed survived but 5 weeks. All the animals exhibited loosening of the hair in the mane and tail, slight changes in the horn of the hoofs, listlessness, and extreme emaciation in spite of a fairly good appetite. Shortly before death there was a sharp increase in the selenium content of the blood, a condition which suggested a break-down in elimination of selenium from the body. At autopsy the lesions observed in the heart, liver, spleen, and kidneys resembled those described in field cases.

Blood glucose, plasma inorganic phosphorus, plasma calcium, hematocrit, and bone ash values of normal minks (*Mustela vison*) and foxes (*Vulpes fulva*), S. E. SMITH. (U. S. D. A., Cornell Univ., et al.). (*Cornell Vet.*, 31 (1941), No. 1, pp. 56-62).

The composition of vesical calculi of fur animals, S. E. SMITH and A. Z. HOBSON. (U. S. D. A., Cornell Univ., et al.). (*Cornell Vet.*, 31 (1941), No. 1, pp. 30-34, figs. 2).

The cytology of fox encephalitis and the effects of centrifugation upon the intranuclear inclusions, A. M. LUCAS. (Iowa Expt. Sta. et al.). (*Amer. Jour. Pathol.*, 16 (1940), No. 6, pp. 739-760, pl. 1).—This contribution is presented with a list of 45 references to the literature.

The importance of pathological study in poultry diseases, E. L. STUBBS (*Poultry Sci.*, 20 (1941), No. 1, pp. 66-68).

A disease of chickens apparently identical with nutritional encephalomalacia, F. D. ASPLIN (*Vet. Jour.*, 96 (1940), No. 11-12, pp. 449-452, pl. 1).

Listeria (Listerella) infection in the fowl, R. K. COLE. (Cornell Univ.). (*Poultry Sci.*, 20 (1941), No. 1, pp. 28-32, figs. 2).—Report is made of 8 cases of *Listeria* infection in pullets of the New York (Cornell) Station flock observed in the fall of 1939. Massive necrotic foci of the myocardium appear to be rather reliable pathognomic lesions. The causative organism produced a marked relative monocytosis upon intraperitoneal injection of young chickens. In a footnote the author reports that no less than 18 additional cases of *Listeria* infection occurred between July 1 and August 20, 1940, among the young stock (4 or 5 mo. old) being raised on the same range.

A nervous disorder of young chickens, J. R. BEACH. (Univ. Calif.). (*Nulaid News*, 18 (1941), No. 10, p. 13, fig. 1).—A brief account is given of a type of nervous disorder that has appeared in some 50 flocks of growing chicks in California which does not conform to any of the known diseases of this nature of either infectious or dietary origin.

Fowl paralysis: Transmission of infective agent to young chickens, R. E. GLOVER (*Vet. Jour.*, 96 (1940), No. 11-12, pp. 427-437).—An infective agent that was isolated from the tissues of a turkey with typical lesions of neurolymphomatosis produced lymphocytic and necrotic lesions in the liver and heart of very young chicks of the Brown Leghorn and Plymouth Rock strains. The infection was passed through 16 generations without demonstrable modification. Transmission was secured by the intraperitoneal, subcutaneous, intravenous, intracerebral, and intranasal routes. Attempts to produce an immunity to the agent in chicks were unsuccessful, and no neutralizing antibodies were demonstrated. These failures may have been due to inability to control quantitative factors.

Studies on Plasmodium lophurae, a malarial parasite in fowls.—I, Biological characteristics, L. A. TERZIAN (*Amer. Jour. Hyg.*, 33 (1941), No. 1, Sect. C, pp. 1-22, figs. 2).—Report is made of the first of studies undertaken to determine (1) the characteristics of infections in chicks with *P. lophurae*, (2) some of the biological characteristics of the organism, (3) the pathological and blood changes taking place in infected chicks, and (4) the effects of various experimental factors in the course of the infection in chicks inoculated under laboratory conditions.

The occurrence of multiple types of paratyphoid bacilli in infections of fowls, with special reference to two new Salmonella species, P. R. EDWARDS and D. W. BRUNER. (Ky. Expt. Sta.). (*Jour. Infect. Diseases*, 66 (1940), No. 3, pp. 218-221).—A description is given of 15 outbreaks of paratyphoid infection in fowls in each of which more than one *Salmonella* type was found. In 2 instances two paratyphoid species were recognized in cultures from the internal organs of the same bird. In 1 case three *Salmonella* species were found in a culture taken from the liver of a single poult. Two new serological types of *Salmonella* are described. One of these, a member of the *S. paratyphi* B-S. *typhimurium* group, is designated as *S. saint paul*. Its antigenic formula is I IV V: eh: 1, 2, 3. The second type is named *S. litchfield*. It is a member of the *S. newport* group, and its antigens are represented by the formula VI VIII: lv: 1, 2, 3.

Further observations on an organism in turkeys whose blood serums agglutinate Salmonella pullorum, E. P. JOHNSON and M. POLLARD. (Va. Expt. Sta.). (*Jour. Infect. Diseases*, 66 (1940), No. 3, pp. 193-197).—A further report (E. S. R., 76, p. 109) is made of a Gram-positive organism isolated from turkeys, whose cultural and morphological characteristics resemble those of lactobacilli.

Rabbits and turkeys inoculated with this organism developed agglutinins for *S. pullorum*. A similar agglutinin response occurred in chickens inoculated with *Lactobacillus casei*. The exact chemical nature of the antigen which is responsible for this phenomenon has not been ascertained. Observations indicated that the pH of the antigen exerts considerable influence on the accuracy of the agglutination test. At pH 7.6, which approximates the pH of the host serum, the antigen is regarded as having a more accurate suspension stability than at pH 6.2 or pH 8.2. The name *L. meleagridis* is suggested for the organism. The significance of nonspecific antigenicities as complicating factors in the program for the eradication of pullorum disease of chickens and turkeys is emphasized.

Egg propagation of turkey pox virus, F. R. BEAUDETTE and C. B. HUDSON. (N. J. Expt. Stas.). (*Poultry Sci.*, 20 (1941), No. 1, pp. 79-82).—Report is made of the successful egg propagation of turkey pox virus, it appearing to be the first time that this type has been cultivated in eggs. A description of the technique employed is included. The authors failed to observe any difference in the macroscopical appearance of the serosa lesions provoked in the egg by this virus and that of fowl origin. Of the 10 eggs inoculated in the third and fourth generations, not an embryo died, despite extensive lesions. Cross-immunity tests made in a limited attempt to study the immunological relationships of canary, pigeon, turkey, and fowl viruses are reported, the details being given in table form.

"The strain of turkey pox studied seems to differ from that observed by Brunett [E. S. R., 71, p. 836] in that it produces in chickens a lesion of longer duration than that produced by fowl pox. This difference, however, may be quantitative rather than qualitative. The strain differs from that studied by Brandly and Dunlap [E. S. R., 80, p. 688] in that it produces a typical scab of considerable thickness. Whether the reaction will become decreasingly less severe with serial passage in chickens remains to be determined. If the lesions observed in egg passages are an indication, however, the reverse is to be expected. Compared with our strain of fowl pox the turkey strain produces far more severe local and systemic reactions and also provokes a high percentage of secondary head lesions. Immunologically, canary virus seems to protect chickens against pigeon virus but not against turkey virus. It also appears to produce very slight immunity against fowl virus. The pigeon virus protects chickens against canary virus and also confers a high degree of immunity against turkey and fowl viruses. Both turkey and fowl viruses protect chickens against the four viruses used."

Experimental transmission of *Trichomonas gallinae* from the chicken to other birds, N. D. LEVINE, L. E. BOLEY, and H. R. HESTER. (Univ. Ill.). (*Amer. Jour. Hyg.*, 33 (1941), No. 1, Sect. C, pp. 23-32, pl. 1).—The results of further feeding experiments (E. S. R., 84, p. 107) on the transmission of *T. gallinae* from the upper digestive tract of the chicken to the turkey, bobwhite quail, canary, and English sparrow are reported. Characteristic lesions were produced in these birds, and a light infection without lesions was similarly produced in 1 of 11 ducklings. "An unsuccessful attempt was made to infect 2 ring-neck pheasants and a starling by feeding cultures of the *Trichomonas*. In view of the similarity of morphology in a variety of natural hosts and ease of transmission from one natural host to any other and to many species of birds in which natural infections have not been found, it is apparent that all the trichomonads so far reported from the upper digestive tract of birds belong to a single species, *T. gallinae*." A list is given of 46 references to the literature.

AGRICULTURAL ENGINEERING

[Agricultural engineering investigations of the Bureau of Agricultural Chemistry and Engineering] (U. S. Dept. Agr., Bur. Agr. Chem. and Engin.)

Rpt., 1940, pp. 63-80).—Chemical engineering research covered agricultural fires and dust explosions. Farm-structures research dealt with farmhouses, potato storage, the farm-building plan service, silage-pressure studies, corn storage, wheat storage, and grain-sorghum storage. Farm mechanical equipment work was concerned with pest-control equipment and methods, fertilizer-distributing machinery, and crop-production machinery. Investigations on mechanical processing of farm products covered ginning and packing of cotton and fiber-flax processing. Rural electrification research on heating outdoor chick and pig brooders, warming drinking water, lighting dairy barns, and capturing moths of the European corn borer is also reported upon briefly.

[**Engineering investigations and operations of the Soil Conservation Service**] (*U. S. Dept. Agr., Soil Conserv. Serv. Rpt., 1940, pp. 37-38, 39-40, 52-54, 56-58*).—Demonstration and instruction in the use of farm equipment for conservation work, planning of more than 36,000 miles of terraces and diversions for the protection of approximately 500,000 acres, erosion-control work on highways, expansion of drainage work, technical assistance to farmers in improved irrigation methods, work on the Florida Everglades project, and the preparation and distribution of engineering handbooks to provide specifications and standardization for satisfactory field construction work on submarginal land are briefly reported, together with work on the development of small water facilities in the arid and semiarid sections of the country, hydrologic studies, sedimentation studies, drainage investigations, and irrigation investigations.

[**Agricultural engineering investigations by the South Dakota Station**] (*South Dakota Sta. Rpt. 1940, pp. 64-66, fig. 1*).—These have included work on rammed-earth construction, by R. L. Patty, H. M. Crothers, and H. H. DeLong; comparative tests of galvanized and painted steel fence posts, by Patty; hard-surfaced floors for poultry houses, by Patty and L. F. Larsen; and an investigation of the causes of mechanical injury to barley, by DeLong and Larsen (coop. N. Dak. and Minn. Expt. Stas. et al.).

[**Agricultural engineering at the Texas Station**]. (Partly coop. U. S. D. A.). (*Texas Sta. Rpt. 1939, pp. 122-125, 151-154, 177-180, 198-200*).—Brief notes are given on mechanical harvesting of cotton, as studied by H. P. Smith, D. T. Killough, D. L. Jones, and M. H. Byrom; efficiency in distribution and placement of cottonseed and fertilizer, treatment of cottonseed for planting purposes, and atmospheric exposure of wire and fencing, all by Smith and Byrom; and garlic drying, by Smith and G. E. Altstatt. Soil and water conservation work at the Tyler, Temple, and Spur Substations is also reported by J. B. Pope, O. C. Word, and J. C. Archer; H. O. Hill; and R. E. Dickson, B. C. Langley, and C. E. Fisher, respectively.

[**Irrigation, drainage, and ground-water investigations by the Utah Station**] (*Utah Sta. Bul. 294 (1940), pp. 9, 76-79, figs. 3*).—This report notes irrigation surveys covering more than 207,000 acres, water-application efficiencies in irrigation and their relation to irrigation methods, snow surveys, and the application of hydromechanics to the design of structures for controlling ground water, the last-named study dealing with pumping-wells as the most practical solution for the problem of the drainage of lands waterlogged from underlying artesian basins

[**Water supply and sewage investigations [at the New Jersey Stations]**] (*New Jersey Stas. Rpt. 1940, pp. 105-107, fig. 1*).—These are briefly summarized under the following captions: Can copper or brass piping always be used for household water supplies? Is there a standard chemical procedure for the treatment of sewage? What is the activated sludge process of sewage treatment? Is the sewage received from a given system always uniform in character? Is there any way of reducing the size of the sedimentation tanks which take up so much

space and represent so much of the capital outlay involved in building a sewage treatment plant? Cannot the industries of this State be compelled to cease polluting our waters? Are the results of investigations in water and sewage problems being applied for the benefit of other departments in the State?

Surface water supply of the United States, 1938.—Part 6, Missouri River Basin (*U. S. Geol. Survey, Water-Supply Paper 856 (1940), pp. VIII+419, pl. 1*).—This paper records measurements of stream flow in this basin for the year ended September 30, 1938.

Rapid increase in irrigation wells prompts survey by station: Purposes are explained, W. E. CODE (*Colo. Farm Bul. [Colorado Sta.], 3 (1941), No. 1, pp. 7-8*).—This brief article calls attention to the rapid increase in irrigation pumping brought about by drought demands and the presence of cheap electric power, and explains that the survey work of the station during the past 12 yr. has been undertaken for the purpose of developing efficient utilization of the water resources of the State and not to bring about any unnecessary restrictive legislation.

Supplemental irrigation, F. E. STAEBNER (*U. S. Dept. Agr., Farmers' Bul. 1846 (1940), pp. [2]+74, figs. 42*).—The most important of the numerous varieties of possible equipment are here discussed. Under the head of water supply are taken up quality, quantity, surface supplies, stream measurements, use of small and flash-type streams, underground and municipal water supplies, and legal requirements. The various available pumps and power outfits are dealt with in similar detail, as are also transportation, distribution, determination of the proper time for irrigation, choice of equipment, and plant-design information. The publication supersedes Farmers' Bulletins 1529 (*E. S. R., 58, p. 77*) and 1635 (*E. S. R., 64, p. 181*).

Natural water loss in selected drainage basins, G. R. WILLIAMS ET AL. (*Coop. U. S. D. A. et al.*). (*U. S. Geol. Survey, Water-Supply Paper 846 (1940), pp. IV+62, pls. 2, figs. 5*).—This report, prepared in cooperation with the U. S. D. A. Soil Conservation Service et al., is primarily a statistical study that presents the results of computations of annual water loss, or annual rainfall minus annual run-off, for river basins in the humid or semiarid regions east of the Rocky Mountains. Sample computations are given, and the various steps and probable accuracy of the results are discussed.

Infiltration of water into the soil: A list of references relative to the physical aspects of the principal factors affecting the rate and its measurement, J. M. DAVIDSON (*U. S. Dept. Agr., Soil Conserv. Serv. Bibliog. 3 (1940), pp. [4]+76*).—References arranged alphabetically by authors are concerned, with but few exceptions, with the capacity for and the rate and quantity of infiltration, papers not dealing with measurement or calculation of such data being, for the most part, omitted from the list. Each reference is accompanied by a brief indication of the nature of the cited material.

Designs for suspended-load samplers based upon an experimental investigation of the disturbances caused by the instruments and analysis of sediment-laden flow, J. P. O'NEILL (*U. S. Dept. Agr., Soil Conserv. Serv., 1940, SCS-TP-33, pp. [49], figs. 23*).—Testing numerous grab samplers, both of the horizontal tube and the cutter types, the author found the Eakin cutter-type sampler⁷ to cause the least disturbance of flow in the sampling space. They were able, however, to reduce the disturbance of flow still further by removing the support rod from the center of the sampling space, eliminating the trip cord and a 0.25-in. recess at the top of the sampling space, and using a thin-walled cutter tube. In the improved model here described and figured the mechanism

⁷Eakin, H. M. *Amer. Geophys. Union Trans.*, 16 (1935), pt. 2, pp. 467-472, figs. 7.

is supported from the rear and is enclosed in a streamlined housing. An additional improvement in flow pattern was secured on protecting the sampling space from the stream filaments diverted into it by the body sections by means of thin horizontal plats placed above and below the sampling space and extending to the sides and upstream.

Appendixes 1, 2, and 3 contain complete drawings and specifications for a multiple-unit sampler and for two forms of the single-unit sampler.

Alkali reclamation investigations, R. S. SNYDER, M. R. KULP, G. O. BAKER, and J. C. MARR. (Coop. U. S. D. A.). (*Idaho Sta. Bul. 233 (1940)*, pp. 34, figs. 9).—The experiments reported upon included irrigation and drainage, treatment with chemicals and other soil amendments, establishment of alkali- and water-resistant crops, and work with some forest and shade trees on the Helms farm near Caldwell.

It was concluded, in part, that drainage is the most important factor in economical alkali-land reclamation. Where the soil is porous or semipermeable and natural underground drainage can be secured, the recovery of such areas is only a question of time, dependent upon the kind and quantity of salts present and the degree of percolation. When the soils have become highly deflocculated because of the nature and concentration of the alkali salts present, however, the impervious condition of the soil overcomes the value of drainage as far as economical reclamation is concerned. Irrigation waters will not penetrate such soils to any great depth, and no economical artificial method of improving the vertical drainage has been developed. "The best method of reclamation for such alkali lands, at least from the standpoint of economical recovery, seems to lie in the practice of irrigation with as little disturbance of the surface soil as possible. The native vegetation should be left untouched so that it will serve as a cover or shade for the protection and establishment of crops. Perennial legumes and grasses appear to be best suited to these soils. When the crops have become established on the more permeable areas they will gradually encroach upon the impervious spots and, through the additions of organic matter and because of increased carbon dioxide activity, will gradually overcome the impervious nature of these areas and bring about their recovery."

Such chemical treatments as the use of gypsum, sulfur, sulfuric acid, etc., effected flocculation in varying degrees and correspondingly increased the permeability. Their cost was too high to permit economically feasible reclamation, however.

The coniferous trees could not be established. Deciduous trees could be grown successfully on alkali soils of the more pervious types. They could not be established with any degree of success on the more alkaline impervious soils.

The irrigation waters used contained some sodium carbonate, chloride, and sulfate. Their sodium and potassium content somewhat overbalanced their calcium and magnesium content. The waters used consisted mainly of seepage and waste from higher irrigated lands. Despite these characteristics, "it appears that all types of soils on the Helms tract, even the more impervious, were benefited rather than harmed by these waters. Irrigation waters of a similar character have been used on other tracts in Idaho without noticeable harm to the soil."

The slotted-templet method for controlling maps made from aerial photographs, H. T. KELSH (*U. S. Dept. Agr., Misc. Pub. 404 (1940)*, pp. 30, figs. 22).—Methods for the accurate mapping from aerial photographs of areas in which ground-control points are few and widely separated are here discussed. The earlier or hand-templet method consisted in transferring to a transparent templet (film of cellulose acetate or nitrate) the principal point of each photograph, together with lines radial to the principal point and passing through

the image points located on the photograph. These templets were so assembled that all the radials common to each identified position intersect, the intersection being the true location of the point. Distortion of the transparent templets by humidity and temperature changes was found considerable. Limitations in the possible accuracy of the drafting introduced further error. It is also pointed out that, if tilt is present, the radials will not intersect but will form triangles of error, and the elimination of these is a matter requiring considerable experience and, at the best, is largely a matter of personal judgment and compromise. In the slotted-templet method the radial line on the templet is replaced by a radial slot, in which a close-fitting round stud is inserted, free to slide along the longitudinal axis of the slot. The slot takes the place of the line: The templet material need not be transparent, therefore, and can be made of stiff material not subject to the distortion of the flexible cellulose ester sheets used for hand templets. The rigidity of templet material permits the laying of all of the templets having cuts to the same common point over the stud representing that point. The stud and the templets being of rigid material, motion is possible only along the longitudinal axes of the slots. The templets therefore tend to adjust themselves into theoretically perfect positions. A hand cutter for slotted templets and a more elaborate machine, capable of being set to change scale automatically so as to cut templets to any scale between one-half that of the photograph and twice that of the photograph, are briefly described.

Tests at Beltsville, Md., and elsewhere indicated that the limitations of the system would not prevent its use in making an aerial planimetric map of any portion of the United States, using only the existing control and the type of photographs at present available.

Farm electrification in Idaho, H. BERESFORD (*Idaho Sta. Bul.* 237 (1940), pp. 32, pl. 1, figs. 52).—This is an abundantly illustrated popular summary of the progress of rural electrification in Idaho, with a brief statement concerning current research projects. It is noted that 64.2 percent of all occupied Idaho farms have electric service, as compared with the national average of 27.8 percent, and that 87.44 percent of Idaho farms with dwellings valued at more than \$500 now have electricity. The kilowatt-hour use by the farms of Idaho is twice the national average for domestic service.

Electric motors for the farm, H. L. GARVER, O. A. BROWN, J. T. BOWEN, and R. B. GRAY (*U. S. Dept. Agr., Farmers' Bul.* 1858 (1940), pp. [2]+29, figs. 17).—Following a brief introduction dealing with advantages over other sources of stationary power, this publication defines, in a manner intended to be clear to readers without technical knowledge of electric power, some necessary electrical terms; and proceeds to brief, partial descriptions of the split-phase, repulsion-induction, capacitor, and universal types of the single-phase motor. Selection of the type of motor best suited to a given set of power requirements is taken up, together with the care of motors. A tabular discussion of motor troubles is included, as are also suggestions concerning mounting of motors, types of drive, pulleys and pulley ratios, and motor control and protection. A popular explanation of the fundamental principles of electric motors concludes the publication.

Farm power machinery ([*New York*] *Cornell Sta. Rpt.* 1940, p. 91).—Improvements in design are briefly discussed by B. A. Jennings and F. W. Barrett, for a grain-drill arrangement for planting peas and beans with side-band fertilizer placement and hoe openers for the seed so spaced as to avoid fouling, a corn planter having three seed hoppers on a grain-drill frame with provision for side-band fertilizer placement, and an improved tractor-potato digger hitch.

[Weatherproofing and fireproofing studies on wood by the West Virginia Station] (*West Virginia Sta. Bul.* 298 (1940), p. 35, fig. 1).—A brief note of work by H. D. Erickson on effects of fireproofing chemicals on the swelling and strength of woods.

AGRICULTURAL ECONOMICS

[Problems in agricultural economics and rural sociology]. (Partly coop. La. and Minn. Expt. Stas. et al.). (*U. S. Dept. Agr., Sec. Agr. Rpt.*, 1940, pp. 1-127, 130-137, 142-148, 171-173).—The economic and social implications of the war and of national defense as they relate to agriculture are discussed, together with such related topics as land use planning, social implications of science, and teamwork by research men and farmers.

[Investigation in agricultural economics by the Cornell Station 1939-40]. (Partly coop. U. S. D. A.). ([*New York*] *Cornell Sta. Rpt.* 1940, pp. 79-91).—Some general findings are included for the following studies: (1) The production and marketing of fruits, by G. P. Scoville; (2) farm-management study of Livingston County, and (3) farm tenancy in the State, both by S. W. Warren; (4) organization of up-State milk markets, by L. Spencer; (5) changes in demand for milk, cream, and evaporated milk in the New York metropolitan area, by Spencer; (6) costs of operating farm motortrucks in marketing fruits and vegetables, by M. P. Rasmussen and P. S. Williamson; (7) an analysis of methods and practices involved in the distribution of apples and competitive fruits in New York City by chain and independent retailers, by Rasmussen; (8) an analysis of the amount and grade of potatoes sold in retail stores offering choices in Buffalo, Rochester, and Syracuse, by P. J. Findlen and Rasmussen; (9) marketing procedures and prices of eggs, by A. Van Wagenen; (10) fruit marketing, by F. A. Harper, M. E. Cravens, and M. D. Woodin; (11) marketing New York livestock, by W. M. Curtiss and E. H. Matzen; (12) factors affecting the costs of cooperative farm fire insurance, by W. Powell and A. W. Peterson; and (13) rural health administration and financing in New York, by M. P. Catherwood and F. A. Coffey.

[Investigations in agricultural economics by the Ohio Station] (*Ohio Sta. Bimo. Buls.* 207 (1940), pp. 174-177, 178; 208 (1941), p. 13).—No. 207 includes an article on agricultural land use as affected by strip mining of coal in eastern Ohio, by H. R. Moore and R. C. Headington, based on a study in cooperation with the U. S. Department of Agriculture. It describes the extent, present and future of strip mining in the State, and discusses its effects on the tax system and community life in the area so mined, the possible use of strip-mined tracts, etc.

The tables of indexes of production, prices, and income, by J. L. Falconer, are brought down through August 1940 in No. 207 and through October 1940 in No. 208.

[Investigations in agricultural economics by the Oklahoma Station, 1938-40] (*Oklahoma Sta. Bien. Rpt.* 1939-40, pp. 10-24, figs. 6).—In addition to results previously noted, tables, charts, and short statements are included showing the relation between size of farm and farm income; the effects of the soil conservation program on yields, farm income, and time required for farm operations; marketing of dairy products; cooperative marketing in the State in 1937; cars of wheat of different grades shipped into and from Enid in the 1939 marketing year; cooperative marketing of wheat in 1937; operating costs and earnings of small elevators; real estate instruments recorded in Payne County, 1895-1939, for properties in or at the edge of mineral areas and outside such areas; and the percentages of tax collection by school districts by periods

1918-39 located entirely within oil areas, just outside such areas, and entirely removed from such areas.

[Investigations in agricultural economics by the South Dakota Station, 1939-40] (*South Dakota Sta. Rpt. 1940*, pp. 72, 75).—In addition to findings previously noted, brief statements are made as to (1) the relative changes in purchasing power of livestock and field crops, 1890 to 1939, and of the advisability of expanding the cash grain area based on a study of prices by W. H. Peterson; and (2) mortgages in 1939 as compared with 1894 and 1938 as shown by a study under the leadership of G. Lundy.

[Investigations in agricultural economics by the Texas Station, 1939]. (Partly coop. U. S. D. A.). (*Texas Sta. Rpt. 1939*, pp. 99-107).—The objectives and procedures being used in different projects on agricultural adjustment, operating costs and financial conditions of gins, marketing of turkeys, factors affecting the equitable assessment of rural and urban properties, factors affecting the collection and expenditure of taxation revenues, and the economic significance of different farm leasing systems are described. In addition to results previously noted, findings are reported (1) by C. A. Bonnen, A. C. Magee, and B. H. Thibodeaux as to farm earnings in 1939 on different soil types in the Rolling Plains area of the State and the effects of crop yields, size of farm, and acreage in cotton on the earnings; (2) equations, by W. E. Paulson and L. P. Gabbard, for estimating total costs and determining profits for different types of cotton gins in eastern and western Texas; (3) brief statement by Gabbard and H. C. Bradshaw as to trends of the tax-price ratio for farm and ranch lands 1913 to 1938; (4) brief general statement by Bradshaw and Gabbard as to available funds and expenditures for certain purposes by counties in 1935; and (5) brief general statement by C. H. Hamilton and Gabbard as to the effects of mechanization and government benefit payments on farm leasing arrangements and the percentages of noncash farm income accounted for by livestock products consumed at home.

[Investigations in agricultural economics by the Utah Station, 1938-40] (*Utah Sta. Bul. 294* (1940), pp. 16-26, fig. 1).—In addition to results previously noted, brief statements of some findings are included as to studies of types of farm organization in Sanpete and Sevier Counties; dairy farms in the Ogden milk-shed area; sheep production in Iron, Washington, and Beaver Counties; agricultural resources in western Box Elder County; type-of-farming areas; diversified, specialized, and part-time farming; the relation of income to production; trends in Utah's agriculture; and agricultural credit and farm mortgage indebtedness in the State.

[Investigations in agricultural economics by the West Virginia Station, 1938-40] (*West Virginia Sta. Bul. 298* (1940), pp. 29-32).—In addition to findings previously noted, brief statements are included as to increase in pasture improvement in Upshur County from 1937 to 1939 under the experimental program, and as to the percentages of apples of different grades packed in 1938 by 24 packing houses in the eastern Panhandle area and percentages of packing costs for different items.

The classification of land (*Missouri Sta. Bul. 421* (1940), pp. 334, figs. 9).—Included are a foreword by C. H. Hammar, an introduction by M. M. Kelso and C. E. Kellogg, and the following papers, with discussions thereon, presented at the First National Conference on Land Classification, held at the University of Missouri from October 10-12, 1940: Productivity Ratings of Soil Types, by J. K. Albeiter (pp. 13-24) (U. S. D. A.); Primary Soils Features Considered in Land Classification, by C. W. Conrey (pp. 33-36) (Ohio State Univ.); Land Classification in Relation to the Soil and its Development—I, Physical Aspects, by H. H. Krusekopf, and II, Chemical Aspects, by W. A.

Albrecht (pp. 39-53) (Univ. Mo.); Land Classification as an Appraisal and Credit Aid, by A. B. Lewis (pp. 58-71) (U. S. D. A.); Land Classification as an Aid in Real Estate Assessment, by R. R. Renne (pp. 77-92) (Mont. State Col.); Relationship of Soil Classification to Land Classification, by R. S. Smith (pp. 95-99) (Ill. Expt. Sta.); Materials and Techniques of Modern Land Classification, by J. J. Haggerty and A. M. Meyers, Jr. (pp. 100-123) (U. S. D. A.); Land Classification for Rural Zoning, by G. S. Wehrwein (pp. 135-143) (Univ. Wis.); Land Classification Along the Rural-Urban Fringe, by L. A. Salter, Jr. (pp. 147-156) (Univ. Wis.); The Theory of Land Classification—I, The Contributions of Soil Science and Agronomy to Rural Land Classification, by C. E. Kellogg (U. S. D. A.), II, The Contributions of Geography to Land Classification, by G. D. Hudson, and III, The Contributions of the Economist to Theory of Land Classification, by M. M. Kelso (pp. 164-200) (U. S. D. A.); The Classification of Lands for Forest Management, by J. R. Camp (pp. 203-211) (U. S. D. A.); The Classification of Grazing Land for its Future Use and Management, by R. H. Rutledge (pp. 219-227); Classifying Land to Facilitate Adjustment in the Great Plains Area, by E. A. Starch and W. W. Pate (pp. 233-239) (U. S. D. A.); Land Classification to Determine the Feasibility of Reclamation Projects, by J. C. Page (pp. 247-255); Land Classification in Relation to Recreational Land Use, by C. L. Wirth (pp. 261-269); Land Classification in the Public Domain, by J. B. Bennett and R. K. Coote (pp. 274-282); Land Classification for General Land Use Planning, by C. P. Barnes and H. A. Vogel (pp. 283-288) (U. S. D. A.); Land Classification as an Aid in Soil Conservation Operations, by E. A. Norton (pp. 293-304) (U. S. D. A.); and Land Classification and Farm Management, by R. R. Hudelson (pp. 313-326) (Univ. Ill.).

Planning the physical layout of farms, O. W. HOWE. (Coop. U. S. D. A.). (*Minnesota Sta. Bul. 350 (1940)*, pp. 20, figs. 12).—"The purpose of this bulletin is to present a systematic procedure and technic in planning a farm lay-out. The factors which must be considered are discussed, and methods of transition from the present practices to the new plan are suggested. This discussion closes with an example showing the application of such planning and transition to a given farm."

Operation of Webber demonstration farm, 1929-1938, C. LARSEN (*South Dakota Sta. Cir. 31 (1940)*, pp. 31, figs. 15).—The operation of a 480-acre farm in Hughes County is described. Tables show by years the income from different sources, expenses for feed and seed, labor, gas and oil, and miscellaneous items, and family labor income.

A study of land utilization in Providence County, Rhode Island, B. E. GILBERT (*Rhode Island Sta. Bul. 275 (1940)*, pp. 27, figs. 5).—This third bulletin in the series on land utilization in the State (E. S. R., 80, p. 548) is based on data obtained in land cover surveys made during the years 1936-38 and the soil resurvey being made by the station in cooperation with the U. S. Department of Agriculture. Tables, maps, and a chart are included and discussed showing by towns the acreages in different crops, kinds of timber, the soil types, the estimated acreages of cover types on different soil types, and the estimated acreages classified as suitable for commercial agriculture, adapted to livestock and dairy farming and to forestry uses, and land unadapted to agriculture and forestry.

An economic study of the dairy enterprise in northeastern Iowa, R. K. BUCK, J. A. HOPKINS, and C. C. MALONE (*Iowa Sta. Res. Bul. 278 (1940)*, pp. 853-875, figs. 4).—This bulletin dealing with factors affecting profits from dairying, amounts of dairy income per cow, capital investment, cash expenditures, feed, and other costs is the second bulletin (E. S. R., 84, p. 404) based on records

kept during 1935 and 1936 on farms in northeastern Iowa. The study is based on the records of 51 herds. In the analysis the herds are divided into 4 groups, 3 of dairy herds (producing less than 200 lb. of butterfat per cow, producing 200-250 lb., and producing over 250 lb.) and dual-purpose herds.

The average investment in the high-producing herds was \$66 per milk cow and \$120 for buildings and fences as compared with \$49 and \$90, respectively, in the low-producing herds. The investment per pound of butterfat produced was lower in the high-producing herds. The high-producing herds were fed more heavily and received better balanced rations. Total concentrates fed averaged 2,300 lb. per cow in the high-producing herds as compared with 1,200 lb. in the low-producing herds. The total values of all feeds plus pasture were \$72 and \$50, respectively, in the two groups. On the basis of pounds of butterfat there was but little difference in the cost of feed. Generally the cow receiving the most feed produced more butterfat but not necessarily in proportion to the difference in amount of feed. Herds fed the highest proportion of roughage had the lowest return per \$100 of feed fed and the lowest butterfat production. Herds fed the highest proportion of grain, however, were among the less profitable herds. On a butterfat production basis, amount and value of feed, cost of labor, and other factors rose with production, but costs rose less rapidly than production. "After credits were made for all products from the herds, including skim milk and manure, total income was sufficient to pay local market rates for feeds, cash expenses, and interest on investment, and to allow about 21 ct. per hour for labor in the high-producing herds under 1935-36 price levels, with butterfat at about 34 ct. per pound. The low-producing dairy herds, however, earned only 15 ct. per hour and the dual-purpose ones only 8 ct. per hour. Returns from beef produced in the dual-purpose herds were not sufficient to overcome the economic handicap from low butterfat production as compared to the herds of dairy-type cows." Detailed labor records on 10 farms showed an average of 131 hr. of labor per year for each milk cow and 143 hr. if young stock was included.

A farm management and cost study of strawberry farms in southeastern Louisiana, 1937-38, J. N. EFFERSON (*Louisiana Sta. Bul. 326 (1941), pp. 31*).—Detailed records of the farm business for the year ended June 30, 1938, were obtained for 144 farms in the Ponchatoula-Hammond and Independence areas of the Tangipahoa Parish strawberry area. Supplementary information on the costs and returns from the strawberry enterprise was obtained from 94 of the farmers interviewed. The most important factors affecting financial returns from farming on the 144 farms are discussed.

The average size of farm was 27 acres, of which 10.5 acres were in crops. Due to double cropping an average of 16.2 acres of crops were grown per farm. In the Ponchatoula-Hammond area an average of 3.6 acres of strawberries and 13.4 acres of all crops and in the Independence area 7 acres of strawberries and 19.4 acres of all crops were grown. The average labor income and labor earnings in the two areas were \$24 and \$285 and \$5 and \$319, respectively. The average cost of producing strawberries on the 94 farms was \$1.61 per crate, of which 9 percent was for growing the plants, 45 percent for growing the crop, and 46 percent for harvesting and marketing. The average total return, including receipts from shipments of packed berries, sales of stemmed berries, sales of strawberry plants, and the value of berries used by the farm families, was \$1.88 per crate. The average net return was 27 ct. per crate, or 7 ct. with single-row and 31 ct. with double-row production. In the Ponchatoula-Hammond area the average production of strawberries was 165 crates per acre and the average labor required to grow and harvest an acre was 131 10-hr. days, as compared with 82 crates and 81 10-hr. days

in the Independence area. The average net returns per crate were 32 and 10 ct., respectively, in the two areas.

Sugar beet costs and returns in Michigan, K. T. WRIGHT (*Michigan Sta. Spec. Bul. 305 (1940), pp. 45, figs. 12*).—This bulletin is based chiefly on from 45 to 95 records per year (total 279 records) on costs of production and returns from sugar beets kept by cooperating farmers from 1933 through 1936. General information is included on the history of the sugar beet industry; the production of beet sugar in the world, the United States, Michigan, and other States; the economic conditions during the study; and the farms included in the study. Tables are included and discussed showing usually for each year, with averages for the 4 yr., the costs by items in the production and delivery of sugar beets per farm, per acre, and per ton. Comparisons are made with yields and costs in other States in 1930 and 1931. The variations among the farms studied as to acres in beets, planting date, number of cultivations, yields, distance to sugar factory, and costs per ton are shown in charts and discussed. An analysis is made of the effects on costs and returns of yield per acre, soil type, drainage, date of planting, distance between rows, beet acreage per farm, machine work efficiency, hand labor costs, distance to factory, etc.

The farms studied averaged 150 acres, with 115 acres tillable and 15 in sugar beets. The average production of sugar beets for the 4-yr. period was about 10 tons per acre. The average cost of production was about \$39 and the cost of marketing approximately \$9 per acre. The income totaled about \$70 and the net income approximately \$22 per acre. Costs of production per ton averaged \$4.03 and marketing costs 89 ct. Receipts from beets averaged \$6.08 per ton, from Government benefit payments 69 ct., and from beet tops 35 ct. The average net return per ton was \$2.20. An average of approximately 85 hr. of man labor, 26 hr. of horse work, and 2½ hr. of tractor use was required per acre. Of the total cost of production and marketing, hand labor made up about 33 percent, grower's labor and use of power and machinery 18, land use 16, other production costs 15, and marketing costs 18 percent. Total production costs per ton during the 4 yr. varied from approximately \$3 to \$10 per ton and averaged about \$4. The costs for half of the growers were between \$3.20 and \$4.80 per ton and for two-thirds of the growers between \$2.80 and \$5.20 per ton. Growers with yields of approximately 6½ tons per acre had a production cost of \$5.74 per ton and the net returns per acre were \$3.21, as compared with \$3.21 and \$39.90, respectively, for those averaging approximately 13 tons per acre.

A survey of practices and costs of producing grass silage on 50 New Jersey farms, J. W. CARNCROSS, A. G. WALLER, and E. RAUCHENSTEIN. (Coop. U. S. D. A.). (*New Jersey Stat. Bul. 684 (1940), pp. 16, figs. 6*).—Data were gathered from 50 farms putting up grass silage in 1938. The kinds of farms using grass silage; reasons for ensiling legumes and grasses; stage at which alfalfa is cut for the silo and the time between cutting and ensiling; amount of molasses added; care of alfalfa silage; and time, labor, and power used in harvesting and ensiling different kinds of silage, etc., are analyzed and discussed and comparisons made.

The average production per acre and the cost of production and harvesting per ton were: Alfalfa 5.2 tons and \$3.09 for the first cutting; mixed grasses 4.2 tons and \$4.94; soybeans 5.5 tons and \$6.41; and corn 8 tons and \$4.98.

Cost of production of tobacco in Puerto Rico, 1937-38 [trans. title], R. HUYKE and R. C. TORRES (*Puerto Rico Univ. Sta. Bul. 56 (1940), Span. ed., pp. 28; Eng. abs., pp. 26-28*).—Tobacco, the second most important crop of the island, has come to disaster because of low prices in recent years. It was hoped that this study would help improve the situation. The total cost per cuerda (0.9712 acre) of seedbeds under shade averaged \$384.47, while costs of open-field

seedbeds averaged \$216.54. The cost of producing a cuerda of tobacco was \$116.05, or \$12.95 per quintal of barn-dried tobacco. The net cost per hundredweight was \$12.90. The authors also present data concerning other factors influencing the costs of producing tobacco.

Gross farm income and indices of farm production and prices in the United States, 1869-1937, F. STRAUSS and L. H. BEAN (*U. S. Dept. Agr., Tech. Bul. 703 (1940)*, pp. V+154, figs. 57).—"In this bulletin an attempt has been made (1) to assemble the best data on farm production, farm prices, and farm income for individual farm products; (2) to correct for inadequate data; and (3) to combine the estimates for individual products into measures of total farm production, an index of farm prices, and a measure of total gross income. These series are carried back, on an annual basis, to 1869."

The sources of data and the methods of estimating the production, price, and income from the individual farm products and determining the gross agricultural income and computing the indexes of production, price, and gross income are described. Tables and charts show by years the production, price, and gross income from individual products and groups of products, and the indices of farm production and prices and of gross agricultural income.

Operating methods of Challenge Cream & Butter Association, P. E. QUINTUS (*U. S. Dept. Agr., Farm Credit Admin. Cir. C-119 (1940)*, pp. II+45, figs. 12).—"The Challenge Cream & Butter Association of Los Angeles, Calif., is a regional sales agency owned and controlled by cooperative creameries. It is distinguished by the fact that it handles a complete line of dairy products. Its general scheme of operations, started in Los Angeles in 1911, is to market all member products under Challenge brands through a direct system of distribution. Local cooperative units scattered throughout the far western States which depend on the California markets for an outlet make up the membership under a federated plan."

The circular describes the special features of the structure and operation of the association in sections on the structure of the marketing system dealing with the affiliated locals, distributing plants, and the whole-milk business; the business operations; corporate and cooperative features; capital structure; and settlement methods.

The citrus industry and the California Fruit Growers Exchange system, N. FOGELBERG and A. W. MCKAY (*U. S. Dept. Agr., Farm Credit Admin. Cir. C-121 (1940)*, pp. [4]+109, figs. 21).—"The purpose of this publication is primarily descriptive. It aims to tell how the Exchange system functions in such detail as to afford other cooperative associations a means for checking their own operating policies. Sufficient detail on organization structure is presented to assist interested groups in forming cooperative marketing associations. A presentation of the principal factors influencing Exchange development and some of the problems and difficulties encountered during its existence may give courage to those to whom a successful example is a powerful help. Finally, as a prerequisite to a better understanding of the development and workings of the Exchange system, the citrus-fruit industry is briefly summarized." The organization structure and general policies of the association and how the exchange system functions at the grove and packing house, its selling procedures, advertising, transportation functions, surplus control, and cost of its service are described and discussed.

The banana industry in tropical America, with special reference to the Caribbean area, 1930-1940, A. M. HANNAY (*U. S. Dept. Agr., Bur. Agr. Econ., Econ. Libr. List 19 (1941)*, pp. 30).—"This is an annotated list of 93 selected references dealing primarily with the economic aspects of the industry.

Operation of small-lot country fruit and vegetable auctions, E. W. CAKE. (Coop. Cornell Univ.). (*U. S. Dept. Agr., Farm Credit Admin. Cir. C-118 (1940)*,

pp. IV+40, figs. 7).—"The aim of this study is to provide a general picture of fruit and vegetable marketing at country auctions by describing the development and present status of such markets, the environment in which these auctions operate, the results of their operations, and the reactions of growers and buyers toward them." It is based on a study of 9 auctions in New Jersey, 6 in Delaware, 10 on the Eastern Shore of Maryland, 18 on the Eastern Shore of Virginia, 13 in the southeastern truck-crop area of North Carolina, 1 each in Massachusetts and Florida and 2 each in Connecticut, New York, and South Carolina. The study includes only sales agencies at country shipping points or farmers' markets handling fruits and vegetables delivered by motortrucks, wagons, and automobiles, where physical facilities and an auctioneer were regularly provided. The data were obtained by personal visits with the operators of the auctions, and interviews with 114 buyers at the auctions and 431 fruit and vegetable growers located in their vicinity.

Cooperative purchasing of farm supplies in Georgia, G. M. FRANCIS (*U. S. Dept. Agr., Farm Credit Admin. Cir. C-120 (1940)*, pp. [2]+38, figs. 13).—The farm supply requirements of Georgia agriculture, the trends in cooperative purchasing in the State, and the factors and conditions retarding and favoring such purchasing are described. The circular discusses the organization methods, operation facilities, volume of business, etc., of the four principal types of purchasing cooperatives in the State—local cooperative associations, cooperatives set up by the Farm Security Administration, fertilizer associations, and marketing associations providing such service. In the study on which the circular is based, "basic information was obtained during the summer of 1939 from managers of the associations and county agricultural agents. Complete analysis was made of organization structure, operating practices, and financial and operating results for 22 associations for the year 1938-39. The remaining 38 associations surveyed were small informal groups of farmers which assembled and pooled small orders for seed. Sales data for these associations were recorded when found available." A cooperative purchasing program for the State is outlined, in which suggestions are made as to methods for advancing cooperative purchasing in the State.

The food supply of Puerto Rico, E. B. HILL and J. R. NOGUERA (*Puerto Rico Univ. Sta. Bul. 55 (1940)*, pp. 32, figs. 2; *Span. abs.*, pp. 31-32).—Tables and charts are included showing for the year 1937-38 the production of different foods for local consumption, the net imports of foods, the retail values of locally produced and imported foods, and the estimated per capita consumption of different foods, with comparisons with white families in North Atlantic and East South Central cities of the United States and Negro families in the Southern cities. Appendixes describe the methods used in obtaining and analyzing the data.

"Puerto Rico in 1937-38 was 65 percent self-sufficient in food production in terms of quantities. It produced practically all the sugar, coffee, and fruit and nuts consumed. Local production contributed with more than 80 percent of the eggs, starchy vegetables, and green and leafy vegetables. Sixty-six percent of the dairy products and half the meat consumed were locally produced. On the other hand, it depended entirely on outside sources for its consumption of fats and oils and cereals and preparations, and imported 89 percent of the fish and 60 percent of the legumes it consumed."

Of the Puerto Rican consumer's dollar spent for food, 20 percent was sent for cereals, 18 for meats and fish, 13 for starchy vegetables, 11 for dairy products, 9 for green leafy vegetables, 7 for legumes, 6 for sugar, 5 for fats, 5 for fruits, and 6 percent for other products. The comparison with the three United States areas showed Puerto Rico to be deficient in the consumption of dairy products,

fats, meats, eggs, and green and leafy vegetables. It surpassed the other areas only in the consumption of starchy vegetables.

RURAL SOCIOLOGY

The sampling method in social and economic research: A partial list of references, N. G. LARSON (*U. S. Dept. Agr., Bur. Agr. Econ., Agr. Econ. Bibliog.* 90 (1941), pp. VI+155).—An annotated list of 426 books, pamphlets, and periodical articles in the English language, published between January 1928 and June 1940, dealing with the theory, technic, and application of the sampling method in social and economic research, with particular reference to human populations.

Working relationships in governmental agricultural programs, J. A. VIEG. (Iowa Expt. Sta.). (*Pub. Admin. Rev.*, 1 (1941), No. 2, pp. 141-148).—This essay is based primarily upon Iowa data.

[Investigations in rural sociology by the Cornell Station] (*[New York] Cornell Sta. Rpt.* 1940, pp. 174-177).—Brief reports are presented on social attitudes of rural people, by L. S. Cottrell, Jr., L. S. Bee, and H. F. Kaufman; selective factors in rural urban migration, by D. Sanderson and A. A. Gessner; transmission of farming as an occupation, and population analysis, both by W. A. Anderson; and types of families residing on marginal and submarginal land, by Sanderson and Anderson.

[Studies in rural sociology by the Oklahoma Station]. (Partly coop. U. S. D. A.). (*Oklahoma Sta. Bien. Rpt.* 1939-40, pp. 160-164, figs. 4).—The station reports that rate of increase in tenancy is becoming slower, and that types of tenancy are closely associated with types of farming. Despite unfavorable economic conditions, the rural birth rate in Oklahoma has remained high. The conclusion is reached that the State's main problem is not one of finding people to exploit its resources but one of finding ways and means of supporting its existing population adequately. The studies were carried on by O. D. Duncan, P. Nelson, and W. H. Sewell.

The plantation South, 1934-1937, W. C. HOLLEY, E. WINSTON, and T. J. WOOFER, JR. (*Works Prog. Admin.* [U. S.], *Div. Res., Res. Monog.* 22 (1940), pp. XXII+124, pls. 13, figs. 11).—Topics discussed are changes in organization and operation and labor and power, credit, income, operator and tenant income, relief needs, and living conditions.

Rural migration in the United States, C. E. LIVELY and C. TAEUBER. (Univ. Mo. and U. S. D. A.). (*Works Prog. Admin.* [U. S.], *Div. Res., Res. Monog.* 19 (1939), pp. XXI+192, pls. 12, figs. 19).—Topics discussed are rural population movements before and since 1930, migration and rural reproduction, migration and selected socioeconomic factors, migration in selected areas, characteristics of migrants, and the social significance of rural migration.

Colorado people seeking 'greener pastures' set migration record between 1930 and 1940, R. W. ROSKELLE (Colorado Farm Bul. [*Colorado Sta.*], 3 (1941), No. 1, pp. 9-10, 15).—The author discusses intercounty migration in Colorado between 1930 and 1940.

State migration definitely slowed up. (Coop. U. S. D. A.). (*South Dakota Sta. Rpt.* 1940, p. 77).—Data are presented by W. F. Kumljen on migration in and out of the State.

Youth in agricultural villages, B. L. MELVIN and E. N. SMITH (*Works Prog. Admin.* [U. S.], *Div. Res., Res. Monog.* 21 (1940), pp. XXI+143, pls. 9, figs. 14).—The authors present the results of a study of a field survey of 45 villages located in better than average agricultural territory. Topics discussed are mobility, personal characteristics, economically independent youth away from villages,

school attendance and educational attainment, employment, occupations, financial status, and social and recreational activities.

AGRICULTURAL AND HOME ECONOMICS EDUCATION

Canadian farm problems (*Canad. Farm Prob., Econ. Ser. Nos. 10 (1941)*), pp. [2]+25; 11, pp. [2]+11; 12, pp. [2]+10; 13, pp. [2]+14; 14, pp. [2]+16; 15, pp. [2]+22; 16, pp. [2]+14).—These pamphlets continue the series (E. S. R., 84, p. 545). No. 10 is entitled Government Grading and Marketing—Do They Help the Farmer? No. 11, What Do We Need for Efficient Marketing? No. 12, What Can the Farmer Gain Through Organization? No. 13, Will Cooperation Solve the Farmer's Troubles? No. 14, Is Government Control of Marketing Desirable or Practicable? No. 15, If Regulation is Adopted, What Should It Be? and No. 16, What Should We Do About It?

FOODS—HUMAN NUTRITION

Public health in national defense, W. S. LEATHERS (*Amer. Jour. Pub. Health*, 30 (1940), No. 11, pp. 1269-1275).—In this 1940 presidential address before the American Public Health Association, the importance of nutrition in national defense is emphasized as follows:

"The new science of nutrition may profoundly affect the economic and social structure of future civilization. We know now that much ill health, physical disability, disease, and incapacity which have heretofore been poorly understood and regarded as inevitable are caused by faulty diet and are preventable. The knowledge gained in the laboratory and clinic must be applied as soon as possible to the general population. If our nutritional requirements are pushed to the background during a period of emergency, disastrous results are inescapable. The present war is a 'war of nerves,' and the issue may well depend upon whether or not the people are able to withstand the physical and mental strain to which they may be subjected. The nutritional status of the nation's population will certainly be a determining factor."

Food in a world at war, J. S. DAVIS (*Harvard Business Rev.*, 19 (1941), No. 2, pp. 133-142).—This article presents a picture of the present and prospective adequacy of supplies of foodstuffs as of October 1940 throughout the world and specifically in Russia and Asia, the British Isles, the European Continent, and in some individual European countries. The main conclusions are that world supplies of foodstuffs are abundant, but that war conditions prevent their effective distribution to consumers to a far greater extent than was true under the abnormal conditions preceding September 1939; that because of war conditions diets are undergoing more or less drastic modifications throughout Europe; that severe shortage of calories seems in prospect in some sections of Belgium, France, and Poland, and perhaps parts of Norway, Finland, and some other countries, and that serious deficiencies in nutritional essentials are increasing in these countries and elsewhere; and that malnutrition due especially to deficiencies in fats, vitamins (especially A and D), and minerals must be expected to increase in continental Europe, with resulting reduction in vitality and rise in death rates.

Britain's food supplies in peace and war, C. SMITH (*London: George Routledge & Sons*, [1940], pp. X+290).—This book, presenting a study of food supply and food policy, was completed during the early days of the war and was subsequently revised, according to the author's note, to include a survey of the effect of the first 6 mo. of the war on the food trades. An account is presented of Britain's principal food supplies (bread, milk and milk products, eggs, meat,

bacon, sea fish, vegetables and fruit, tea, and sugar), both home-produced and imported, and of the methods by which they are distributed to the people. The author also discusses the need for a food policy, particularly as it relates to improving the dietary status of the lower economic groups; the part which a revived British agriculture could play in improving the diet and health of the people; and the basic need in such a program of money to invest in land for development, and a more efficient and cheaper marketing of agricultural products. The final chapters consider food problems in wartime and the improvement in nutrition, in war or peace, through a comprehensive plan for the organization of food supply so that sufficient food to provide the home population with a satisfactory diet can be distributed at the lowest possible prices.

Foods that aided blitzkrieg (*Food Indus.*, 13' (1941), No. 1, pp. 43, 79, fig. 1).—This article, said to be based upon information published in Germany, describes some of the concentrated foods in the German Army ration. Among these are "Edelsoja," a soybean flour with a protein content of from 40 to 45 percent, and "Bratling" powder, a mixture of soybean, grain, and milk albumin spiced with herbs. Both of these may be added to other dishes. Another highly concentrated food is "Pemmikan" made from smoked meat, bacon, soybean flour, dried fruits, whey, tomato pulp, yeast, green peppers, cranberries, and lecithin. This is issued to tank, fortress, and mountain troops and also to air crews. Meat is made to go further and to have higher vitamin value by the addition of germinating grains. Many foods, including tomatoes, cheese, jam, and applesauce, are distributed in dried form. Various dehydrated vegetables are compressed into brick forms, and roasted meat is compressed in corrugated cardboard boxes and frozen gradually. It is stated that "American quick freezing methods are extensively used for meats, fruits, and vegetables, and the German military authorities are lavish in their praise of the system, especially as a means of preserving vitamins."

Foods and nutrition [at the Bureau of Home Economics] (*U. S. Dept. Agr., Bur. Home Econ. Rpt.*, 1940, pp. 7-12).—In this annual report (E. S. R., 82, p. 697) are summarized studies of the Foods and Nutrition Division bearing on nutritional requirements for vitamin A (E. S. R., 83, p. 707), and on the vitamin B₁ content (E. S. R., 83, p. 131) and the proximate (E. S. R., 83, p. 699) and mineral constituents of foods; and work pertaining to food utilization, including studies on food quality and palatability, food preservation, and the utilization of surplus foods.

[Foods and nutrition research of the Texas Station]. (Partly coop. U. S. D. A. et al.). (*Texas Sta. Rpt.* 1939, pp. 18, 114-117).—Progress reports, most of which represent an extension of earlier work (E. S. R., 82, p. 554), are given by W. W. Meinke and R. Treichler on variations in the vitamin content of human foods; by S. Cover on chemical and physical factors responsible for tenderness in meat during cooking; by Cover, A. K. Mackey, and C. E. Murphey on the effect of degree of fatness on tenderness of lamb; by J. Whitacre, S. H. Yarnell, G. S. Fraps, L. R. Hawthorn, and B. S. Pickett on the mineral composition of vegetables grown in representative regions of the State; and by Whitacre on the effect of tea upon energy metabolism of children and on regional relationships of body measurements of children.

[Food and nutrition studies by the Utah Station] (*Utah Sta. Bul.* 294 (1940), pp. 13, 14, 72-74, 75-76, 91).—In this progress report summaries are given on freezing preservation of Utah fruits and vegetables, on the appraisal of quality in frozen peas (E. S. R., 83, p. 412), on the ascorbic acid metabolism of college students (E. S. R., 84, p. 711), and on the effect of various factors on the vitamin C content of tomatoes.

Effect of corn, wheat, and barley in the diet on the flavor of fried and roasted chickens, W. E. POLEY, A. ROSENQUIST, and A. L. MOXON. (S. Dak. Expt. Sta.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 3, pp. 179-190, fig. 1).—The Barred Plymouth Rock cockerels used in this study were taken from three groups of chickens fed either corn, wheat, or barley as the principal constituents of the ration. The rations and the methods of finishing were the same as those used in the study of Poley et al. noted on page 802. The 10 fryers selected from each group at the age of 17 weeks and likewise the 10 roasters selected from each group at 26½ weeks represented birds whose weights were nearest the average for each ration. For birds on the corn, wheat, and barley rations the average dressed weights for fryers were 1,446, 1,457, and 1,359 gm., respectively; for the roasters the respective averages were 2,329, 2,249, and 2,166 gm.

"Records which were kept included the live weights, dressed and drawn weights, weights of head, shanks and feet, entrails, gizzard, heart, liver, neck, and abdominal fat. Each drawn carcass was split longitudinally through the vertebrae and breast into two halves of approximately equal weights. The amounts of light meat, dark meat, skin and subcutaneous fat, and bones were determined for one-half of each uncooked carcass for both fryers and roasters. With the fryers, the other half of each carcass was fried in hydrogenated lard and the weights of cooked light meat, dark meat, skin and subcutaneous fat, drippings, bones, and inedible were taken. Cooking losses were calculated for birds receiving each cereal grain. Half of each roaster carcass was placed on a rack and roasted in an uncovered pan in an electrically heated oven. The amounts of cooked meat and bones were determined in the same manner as with fryers. Nine judges who had been previously tested for taste sensitivity were each given samples of light and dark muscle from each of the fryers and roasters. No appreciable differences could be detected in the aroma, flavor, juiciness, or tenderness of either the light or dark meat from fryers and roasters receiving either corn, wheat, or barley in the growing and finishing rations. There were no significant differences between the dressing and cooking percentages of the fryers and roasters receiving either wheat or barley as the principal constituent of the ration and those receiving yellow corn."

Meat food products (*U. S. Dept. Agr., Bur. Anim. Indus. Rpt., 1940, pp. 44-45*).—A study is noted on the nutritive properties and digestibility of lard and hydrogenated cottonseed oil and of the effect on digestibility of adding stearic acid to olive oil.

Canned Atlantic crab meat: A new American food, C. R. FELLERS and S. G. HARRIS. (Mass. Expt. Sta.). (*Indus. and Engin. Chem.*, 32 (1940), No. 4, pp. 592-594, figs. 3).—A new process for the successful canning of the meat of the Atlantic blue crab (*Callinectes sapidus*) is described. The crucial step in the process is the application of a protective brine dip containing small amounts of aluminum and/or zinc salts, which stabilize the copper present in the crab's blood and flesh, thus protecting the meat against turning blue to black in color and developing a strong ammonia flavor after canning.

Data reported on the proximate and mineral (K, Ca, Mg, P, Fe, Cu, and I) constituents of the canned product indicate that it is a good source of protein (18 percent, shown by biological tests to be of high quality) and is rich in Ca (1,330 p. p. m.), Fe (20 p. p. m.), Cu (13 p. p. m.), and I (0.46 p. p. m.). Ascorbic acid, thiamin, and riboflavin are reported, respectively, at 0.012 mg. (24 International Units), 230 γ (70 I. U.), and 150 γ (60 Bourquin-Sherman units) per 100 gm.

Tenderometer readings as an index of quality of fresh asparagus.—A preliminary paper, R. R. JENKINS and F. A. LEE. (N. Y. State Expt. Sta.). (*Food Res.*, 5 (1940), No. 2, pp. 161-166, fig. 1).—Asparagus (Mary Washington variety), freshly cut in 20- to 30-lb. lots, was taken at three periods during the cutting season from three types of soil (upland sandy, upland light clay, and river bottom), graded as to size (tiny, medium, and jumbo), and cut into 4-in. lengths from the tip end of the spear. These lengths were used for filling the sample chamber of the tenderometer, which was filled full by alternating the spears. Tenderometer readings and the results of crude fiber and dry matter determinations on unblanched samples preserved by freezing and of organoleptic tests on cooked samples of washed, blanched, frozen lots are presented.

Analysis of the data indicated that the tenderometer gave a high correlation for tenderness and quality when compared with crude fiber and organoleptic tests; and that measurements of tenderness by the tenderometer may be made on graded or ungraded samples, depending upon whether or not quality of the asparagus as received, or quality of the individual sizes, is to be determined. Crude fiber content appeared to be an excellent index of maturity, but although crude fiber determinations are of use in control work, they are not practical as an objective method. For such a method the tenderometer would serve admirably. As a tentative maturity standard, based on the readings obtained in the present study, it is suggested that a fancy grade of asparagus should have a tenderometer reading of 150 or lower and a crude fiber content of 0.70 percent or less.

Comparison of organoleptic and physicochemical methods for determining quality in fresh, frozen, and canned lima beans, A. KRAMER and C. H. MAHONEY. (Md. Expt. Sta.). (*Food Res.*, 5 (1940), No. 6, pp. 583-592).—Thirteen varieties of lima beans were used in these tests, quality differences being induced in 2 of these varieties through brine separation and through varying both the time interval between harvest and blanching and the length of the blanching period. Preblanching intervals of 2, 6, 10, and 22 hr. and blanching periods of 45, 90, 180, and 300 sec. at 91° C. were selected. Of the frozen samples, some were dry-packed and some were brine-packed, a 20 percent salt brine being used for these and for the canned samples.

Organoleptic tests were made by four groups of men who graded on a score card basis for odor, color, texture, and flavor of the canned samples, and of the frozen samples after cooking. Qualitative determinations of catalase activity and semiquantitative determinations of peroxidase activity and pigment content proved to be unsuitable as quality indices for these samples. An iodine-threshold test correlated well with organoleptic tests, and appeared, therefore, to be a good measure of the quality of material subjected to various holding periods previous to blanching. The iodine test is a modification of the method suggested by Joslyn et al. for the measurement of vitamin C, but as described measures only the difference between treatments and not the total iodine reducing substances. The iodine test is recommended because of the good agreement between it and the organoleptic tests and because of the rapidity and simplicity of the test and its adaptability to field application. It is noted, however, that overblanching reduces the iodine value significantly more than the organoleptic value, and that there is an inverse relation between the two tests as affected by brine separation. Data presented to show the agreement between the organoleptic and the iodine-threshold tests show, further, that there is no detectable difference in quality between beans frozen in dry- and brine-packs, that bean varieties vary in quality, that of the factors affecting quality preblanching is the most important, and that there is apparently no

relationship between the iodine test on fresh material and either the iodine or organoleptic tests on the frozen samples.

Pectins and the texture of cooked potatoes, M. E. FREEMAN and W. S. RITCHIE. (Mass. Expt. Sta.). (*Food Res.*, 5 (1940), No. 2, pp. 167-175).—In the experiment reported various pectin fractions were extracted from raw and cooked potatoes to determine whether mealiness is related to cell separation as effected by solution of pectic materials. The extracts, obtained by methods noted in detail, included those obtained by extraction with water (1) at 37° C. and (2) at 85°, and by extraction with (3) citric acid and finally with (4) ammonium citrate. Various methods of preparation of the samples for analysis indicated that minimum changes in potato pectin fractions occurred when sliced tissue was rapidly dried in air. Heat treatment barely sufficient to inactivate the enzymes (such as treatment with boiling alcohol) rendered part of the pectin soluble in water. Steaming for 1 hr., as well as the hot alcohol treatment, preserved the largest amount of total pectin, while baking and rapid air drying caused small but significant losses. Fractionation of pectic material, applied to samples prepared by the various methods, indicated that potato pectin consists largely of two fractions, the one, which may be pectic acid or insoluble salts of the acid, being soluble in ammonium citrate (or oxalate) and insoluble in hot water, and the other a fraction easily dispersed by hot water but not by cold water. This latter fraction, so easily removed, is probably not a cellulose-pectin complex of protopectin but rather a lyophilic gel readily peptized by warm water. Analyses of raw and cooked potatoes for water-soluble pectin fractions indicated that the solution or degradation of pectic material does not determine mealiness in potatoes.

Soybean flour as an emulsifying agent in preparation of salad dressings, B. M. WATTS and L. MORSE. (Univ. Calif.). (*Food Res.*, 5 (1940), No. 2, pp. 197-203, figs. 2).—Salad dressings made from cooked and uncooked soybean flours, both whole and benzene-extracted, were compared with those made by the same method with egg yolk and egg white. The comparisons included camera lucida drawings of the oil droplets and quantitative measurements of the relative viscosity. The dressings were made with 105 gm. of cottonseed oil, 22.5 gm. of vinegar (4 percent acidity), 7.5 gm. of spice mix (sugar, salt, and spices), and 75 gm. of emulsifying agent. With each emulsifying agent a series of dressings was prepared in which the concentration of the agent was varied from 3 to 7.5 gm. of solid material, the remainder of the 75 gm. being made up with water.

Dressings made with the soybean flour, particularly those prepared from the benzene-extracted flour, showed higher viscosity than the egg dressings. The high viscosity was accompanied by greater resistance to drainage. The cooked soybean dressings were so viscous that it was necessary to reduce the concentration of emulsifying solids from 3.6 to 2.1 percent in order to incorporate the full amount of oil. From the flavor standpoint the uncooked whole soybean dressings were unacceptable, but all of the cooked dressings were excellent in flavor even after several months' storage. The emulsions employing soybean flour were less finely dispersed than those prepared from an equal proportion of yolk solids, but were practically identical in droplet size to the egg white emulsions. Cooking had no effect on droplet size. Fat-free soybean flour used in one series of dressings to replace egg white in combination with egg yolk had a definite thinning effect. The relatively high viscosity of the soybean dressings suggests the possibility of preparing inexpensive salad dressings containing a low amount of oil, with the soybean flour as the sole emulsifying and thickening agent.

A study of starch from different varieties and types of corn, L. P. TANNER and D. T. ENGLIS. (Univ. Ill.). (*Food Res.*, 5 (1940), No. 6, pp. 563-581, fig. 1).—Four varieties of Illinois corn, Pride of Saline, Sutton, Golden Beauty, and h. h., and one variety each from Argentina and Africa were used in this study. Part of the Sutton variety was frozen on the cob 1 week after harvesting. Starch, prepared from these samples by the method of Woodruff and Hayden (E. S. R., 75, p. 277), was analyzed for moisture, ash, nitrogen, fat (acid hydrolysis), and phosphorus; pH and acidity determinations were made; swelling power, viscosity, and alkali-labile property were determined; and the amyloses were separated and characterized.

Microscopic examination indicated that granules of similar size and shape were in all starches, the differences between the starches being in the ratios of large round granules to small, irregularly shaped granules. Photomicrographs showed that more small granules were to be found in the hard (Golden Beauty, Sutton, Pride of Saline, and Argentina) than in the soft (h. h. and African) varieties. The hard corn starches contained more noncarbohydrate material and formed more viscous pastes than the soft starches and were disintegrated by grinding the corn for 624 hr., whereas this treatment did not disrupt the soft starches. α -Amylose, separated by electro dialysis from the soft starches, was accordingly contaminated with whole granules. Grinding caused contamination of the ash of hard starches, but soft starches were not appreciably contaminated. Electro dialysis at 110 v. did not always separate 5 percent suspensions of ground starch into a clear solution above a gelatinous precipitate of α -amylose. Consequently β -amylose, obtained from alcoholic precipitation of the opalescent liquid, was contaminated with a trace of α -amylose. Results obtained in the present study are considered insufficient to prove that α - and β -amyloses exist as separate entities, but they do suggest that (1) different particle sizes rather than materials may be responsible for the soluble and insoluble fractions and (2) that the nonuniformity of results obtained from "identical" samples may be due to differences in unavoidable contamination and chemical and physical changes.

Licanic acid of oiticica fat and a study of its nutritive value and efficiency, C. F. KREWSON and C. A. ELVEHJEM. (Univ. Wis.). (*Oil & Soap*, 17 (1940), No. 2, pp. 30-33).—Licanic acid, 4-keto-octadecatrienoic acid, 9, 11, 13, isolated as the α -isomer from "oiticica fat" obtained by pressing or by solvent extraction of the kernels of nuts from the Northeast Brazilian tree *Licania rigida*, was tested for nutritive value in feeding trials with rats. The ability of the fat to promote growth in young rats was noted in tests employing animals on a basal ration of mineralized (Fe, Cu, Mn supplemented) skim milk, a 2 percent butterfat supplement being given to two of the rats while two others received 2 percent each of butterfat and licanic acid. In the former group the animals in a 26-day period made good growth at the rate of 2 gm. daily, consuming 2.45 gm. of total solids to produce 1 gm. of weight. In the latter group, however, the daily weight gains averaged but 1.1 gm., with 3.97 gm. of total solids required to produce a 1-gm. weight gain. These results were borne out in a second experiment in which rats restricted in total solid intake to the level consumed by the test group receiving the butterfat and licanic acid, as noted above, were given the ration plus 4 percent butterfat. The daily weight gain averaged 1.7 gm. on an intake of but 2.37 gm. of total solids, as compared with the lesser gain and the larger intake of the group receiving 2 percent butterfat and 2 percent licanic acid. These several results indicate that licanic acid possesses no apparent energy value, and under the conditions described may be slightly deleterious to the growth of young rats. Animals on the mineralized skim milk diet supplemented with 2 percent of butterfat lost some

sugar in the urine; with the supplement of 2 percent of butterfat plus 2 percent licanic acid this loss was not observed, indicating that the licanic acid "is capable, in the rat, of assisting in the utilization of lactose in milk." Fifty-nine references are given.

M. R. C. memorandum on bread (*Lancet [London], 1940, II, No. 5, p. 143*).—In this memorandum from the Accessory Food Factors Committee of the Lister Institute and the Medical Research Council concerning improvement in the nutritive value of bread to benefit the health of the people of Great Britain, it is recommended that (1) flour should be milled to 80-85 percent extraction instead of the existing 70 percent extraction, (2) the bleaching or improvement of flour by the use of oxidizing agents or by any other process which damages the nutritive value of the flour should be prohibited, (3) calcium salts should be added to flour and the bread made from flour thus supplemented should be specially designated, and (4) the use of baking powder which produces alkaline conditions should be strongly discouraged in making bread or biscuits. The reasons for these recommendations, together with possible disadvantages from increased extraction, are discussed.

Sugar tests on jams and preserves, D. K. TRESSLER. (N. Y. State Expt. Sta.). (*West. Canner and Packer, 32 (1940), No. 10, pp. 29, 31*).—Essentially noted from another source (E. S. R., 84, p. 547).

Essentials of nutrition, H. C. SHERMAN and C. S. LANFORD (*New York: Macmillan Co., 1940, pp. X+418, figs. 34*).—This text, offering a well-rounded and up-to-date view of the essentials of nutrition, is nontechnical in its presentation, assumes no prerequisite training in science, and is adaptable to various teaching needs. The subject matter considered, following an introductory chapter indicating the present position and the aims of the science of nutrition, deals with the energy aspects, the proteins and their amino acids, the mineral elements (Ca, P, Fe, and I), and the several vitamins. The final chapters discuss the relation of food to the teeth, nutritional characteristics of the chief types of foods, food costs and values, and the effective application of nutritional knowledge. Exercises and suggested readings accompany each chapter, and the appendix includes fairly extensive tables on the mineral, vitamin, and proximate constituents of foods, information on the fatty acids in foods, a list of the digestive enzymes and their origins and actions, a list of the principal acids of typical fruits, a glossary of terms, and brief summaries with regard to simple statistical treatment of nutritional data and the planning of diets in terms of 12 food groups.

Recent findings in nutrition, I-III, J. E. BECKER (*Med. Woman's Jour., 47 (1940), Nos. 3, pp. 80-84, XI; 4, pp. 115-122; [5], pp. 140-143*).—An address discussing progress in vitamin research, essentially noted (E. S. R., 83, p. 415), and in research on the physiological significance of the minerals and the needs of the body for these inorganic elements. Tables on vitamin requirements and vitamin values of various food groups by Munsell (E. S. R., 83, p. 130), used in discussion of the paper, are included.

The cost of the special diet, R. OKEY. (Univ. Calif.). (*Med. Woman's Jour., 47 (1940), No. 12, pp. 366-370*).—Practical suggestions to the dietitian, but also useful to all meal planners concerned with food costs, are given on the nutritive equivalents of foods showing seasonal or other price variations, and on the unlike contributions of certain foods commonly grouped together in dietary recommendations. Illustrative tables are given for both.

[**Nutrition studies by the West Virginia Station**] (*West Virginia Sta. Bul. 298 (1940), pp. 27-28*).—Progress reports are given on studies by H. Cameron of the nutritional status, particularly with respect to blood values, of university

students, and by Cameron and G. S. Dodds on the histology of bone growth in the healing of rickets in rats.

Phosphorus in human and animal health, T. S. HAMILTON. (Univ. Ill.). (*Amer. Fert.*, 94 (1941), Nos. 1, pp. 5-8, 26; 2, pp. 9-11, 20, 22, 24).—A discussion of the essentiality and sources of phosphorus for vital functions and parts of the animal body.

Medical evaluation of nutritional status.—I, Methods used in a survey of high school students, H. D. KRUSE, C. E. PALMER, W. SCHMIDT, and D. G. WIEHL. (Cornell Univ. et al.). (*Milbank Mem. Fund Quart.*, 18 (1940), No. 3, pp. 257-298, figs. 7).—This is the first of a series of papers reporting a cooperative investigation by the Cornell University Medical School, the Milbank Memorial Fund, The New York City Department of Health, and the U. S. Public Health Service of methods for appraising the nutritional status of apparently well persons for the purpose of selecting the most satisfactory tests and procedures for a system of examination adaptable to mass nutrition surveys. Certain limitations in the approach to the nutrition problem through dietary surveys as well as through anthropometric measurements and the estimates of physicians are discussed, and the advantages to be derived from the extensive operation of a satisfactory system of examination are listed preliminary to the description of the plan of the investigation.

The sample studied consisted of about 2,000 students of a senior high school in a predominantly low-income area on the lower east side of New York City and for purposes of comparison students of a private school in the city comprised of children from a relatively high-income group. The examination and specific tests applied to each individual are described in some detail. In addition to the customary medical, physical, and dental examinations and dietary histories, the tests included certain anthropometric measurements; roentgenograms; electrocardiogram; stethogram; adaptometer tests; Snellen test; bio-microscopic eye examination with the slit lamp; capillary resistance; neuromuscular response to galvanic stimuli; nerve accommodation; red blood cell count and volume; white blood cell count; differential count; sedimentation rate; Mantoux test; ascorbic acid in blood plasma; calcium, phosphatase, and phosphorus in blood serum; hemoglobin in whole blood; qualitative tests for albumin and sugar in urine and serological tests for syphilis. Numerous references to the literature and copies of various record forms used in the survey are appended.

Nutritional balance in pregnancy, S. J. COWELL (*Jour. Roy. Inst. Pub. Health and Hyg.*, 3 (1940), No. 4, pp. 102-110).—The term balance is used in this address in the sense of (1) equilibrium between intake and output, (2) interrelationships among different constituents, and (3) the balance between the maternal and fetal organism. The requirements during pregnancy of nitrogen, calcium, iron, and vitamins A, B₁, and C are discussed with reference to one or more of these types of balance.

Change in body-weight and food consumption of rats on repeated feeding of a deficiency diet, J. H. KELLERMANN (*Onderstepoort Jour. Vet. Sci. and Anim. Indus.*, 13 (1939), No. 1, pp. 201-216, figs. 6).—Rats placed on diets deficient in minerals and vitamins; minerals, vitamins, and bulk; and proteins until there was significant loss in weight followed by the restoration of the nutrient condition of the animals by a second diet did not lose weight more rapidly when again placed on deficient diets. In fact, there was slightly less weight lost during the second deficient feeding period than in the first, and the food intake did not differ appreciably. The findings thus differ from those of L. R. French and A. L. Bloomfield.⁸

⁸ *Jour. Nutr.*, 14 (1937), No. 2, pp. 117-129, figs. 8.

The diagnosis and treatment of nutritional deficiency, A. P. MEIKLEJOHN (*New England Jour. Med.*, 222 (1940), No. 18, pp. 760-765).—The purpose of this report, as stated by the author, "is to summarize the more valuable clinical criteria by which nutritional deficiency can be recognized, with the hope that it may help to define more clearly the various conditions in which adequate nutritional therapy can be expected to achieve results." The various predisposing conditions are first summarized as a restricted or unbalanced diet, defective absorption of food, increased dietary requirements, and defective utilization. It is also emphasized that a deficiency of a single dietary factor is very rarely encountered in clinical medicine, and that since most deficiencies are multiple adequate treatment requires the administration of a combination of dietary essentials.

Some of the outstanding features in the history, physical examination, laboratory tests, and treatments which may be of value in establishing a diagnosis of nutritional deficiency are then outlined. In conclusion it is noted that "in the absence of a definite diagnosis of deficiency, it is unwise to expect that the administration of concentrated preparations of vitamins will result in any benefit, except possibly some psychological improvement through suggestion."

Round table discussion on food allergy in children, B. RATNER ET AL. (*Jour. Ped.*, 16 (1940), No. 5, pp. 653-672).—Papers presented preliminary to general discussion at this round table, held at the 1939 meeting of the American Academy of Pediatrics, include the following: Modes of Acquisition, by B. Ratner; Diagnosis, by L. W. Hill; Prevention of Food Allergy, by H. H. Donnelly; Definition of Allergenicly Denatured Foods, by B. Ratner; Infant Feeding in the First Year in Relation to Allergy, by L. W. Hill; and Feeding After First Year in Relation to Allergy, by H. H. Donnelly.

Effect of gelatin on power of women to perform maximal anaerobic work, F. A. HELLEBRANDT, R. RORK, and E. BROGDON. (Univ. Wis.). (*Soc. Expt. Biol. and Med. Proc.* 43 (1940), No. 4, pp. 629-634, figs. 3).—Six young adult women accustomed to severe physical activity rode to exhaustion on an electrodynamic brake bicycle ergometer equipped with a graphic voltmeter to record the rate of working and the speed of pedaling; these two factors were kept constant so that duration of exercise was the independent variable. After a preliminary period of training varying in length in the different subjects, gelatin (60 gm. daily) was added to the diet. The results, presented graphically (work in watt-minutes plotted against time in days) for the training period and the gelatin and post-gelatin periods, showed that the gelatin had no effect on the capacity of the women to perform maximum anaerobic work nor any apparent effect upon the improvement in power due to training. The "staleness" which developed as the extremely severe work was repeated daily was not prevented by the gelatin. Comparison of the published data of Ray et al. (*E. S. R.*, 81, p. 306) with the present experiments suggests that the increase in work output attributed by the earlier workers to gelatin may have been a training effect.

Effects of naringin and hesperidin on albino rats, R. H. WILSON and F. DEEDS. (U. S. D. A. et al.). (*Food Res.*, 5 (1940), No. 1, pp. 89-92, fig. 1).—Naringin and hesperidin, glucosides present in grapefruit and oranges, respectively, were fed for a period of 200 days to male albino rats without apparent cumulative injurious effect or hypoglycemic action. The glucoside in pure crystalline form was mixed with the stock diet at levels from 0.0625 to 1.0 percent, and from 6 to 8 rats weighing 50 gm. at the start of the experiment were used for each dosage tested. The growth of all test animals was comparable to that of controls receiving no glucosides, blood sugar levels were normal, and all organs showed weights within the normal range as well as normal macroscopic and microscopic appearances.

Blood sugar levels in rats receiving the cataractogenic sugars galactose and xylose, W. J. DABBY and P. L. DAY. (Univ. Ark.). (*Jour. Biol. Chem.*, 133 (1940), No. 2, pp. 503-509, fig. 1).—In extension of the study in which xylose was found to be as effective as galactose in producing cataracts in rats (E. S. R., 83, p. 573), confirmative data are presented. The results are also reported of frequent sugar determinations by a modification of the Folin-Malmos method permitting the use of samples as small as 0.025 cc. The animals receiving xylose or galactose gave blood sugar values considerably higher than those receiving glucose, fructose, mannose, and arabinose, but there was no direct relation between the times of onset of cataract and the degree of hyperglycemia. It is noted that both xylose and galactose are derivatives of *d*-threose and the other sugars of *d*-erythrose.

Influence of fluid and of evaporated milk on mineral and nitrogen metabolism of growing children, H. J. SOUDERS, H. A. HUNSCHER, F. C. HUMMEL, and I. G. MACY (*Amer. Jour. Diseases Children*, 58 (1940), No. 3, pp. 529-539, fig. 1).—Three average healthy children 3½-6 yr. of age served as subjects of the metabolic study in which they were first adjusted to a rigidly controlled regime before initiation of the first experimental period. During the first period 400 gm. of plain fluid milk were ingested, in addition to the basal diet conforming with accepted nutritive standards, for 25-40 consecutive days. During the next 20-25 days 400 gm. of diluted (1:1) evaporated milk was substituted for the fluid milk in each child's diet. For the next 25 days irradiated evaporated milk replaced the plain evaporated milk, the daily vitamin D supplement thus furnished amounting to 90 U. S. P. units per day per child. The values for caloric intake and for the average daily intakes and retentions of fat, nitrogen, and the acid-base minerals (Ca, Mg, Na, K, P, S, and Cl) per kilogram of body weight are tabulated to show the results for each child in each period.

When evaporated milk was substituted for fluid milk there appeared to be added impetus to the formation of soft tissue as judged by parallel increases in retention of nitrogen, sulfur, and potassium, unaccompanied by increases in retention of other elements. The irradiated evaporated milk apparently effected a more rapid and stable rate of bone formation, as indicated by the increased Ca:P ratios of the retentions, the higher levels and more consistent trends of the acid-base balances, and the increase in rate of gain of recumbent length.

Factors influencing appearance of centers of ossification during early childhood.—II, **A comparative study of degree of epiphyseal ossification in infancy under varying conditions of diet and health,** C. C. FRANCIS (*Amer. Jour. Diseases Children*, 59 (1940), No. 5, pp. 1006-1012).—This paper, in continuation of previous work,⁹ presents the results of a study of epiphyseal ossification in four groups of infants. These include 50 breast-fed infants who received vitamin supplements, but no mineral supplement except in a few cases for a limited time; 50 infants who were nonbreast-fed and who received mineral supplements, together with vitamin additions; 50 infants, some breast-fed, others not, nearly all of whom received supplemental feedings, and all of whom showed evidence during the first year of some difficulty in intestinal adjustment; and a fourth group of 33 children on whom measurements and observations were made only after death. The children in the first three groups were examined at 3, 6, 9, and 12 mo. of age, at which time roentgenograms were taken of a number of epiphyseal ossification centers, length and weight were determined, and skeletal maturity and psychomotor progress in months were rated.

The results indicated that epiphyseal ossification was a more delicate indicator of constitutional health than progress in height or weight. Gastro-

⁹ *Amer. Jour. Diseases Children*, 57 (1939), No. 4, pp. 817-830, figs. 13.

intestinal sensitivity did not retard growth in length, but did tend to retard epiphyseal ossification. Among the healthy children, those receiving the mineral supplement showed more epiphyses ossified by the twelfth month than those in the other groups, while the children dead from severe illness showed the greatest retardation in epiphyseal ossification. The advance in precocity of the female child over the male child in epiphyseal ossification was observed in the healthy children but not in those who had suffered prolonged illness.

The influence of lactose on calcium retention in children, R. MILLS, H. BREITER, E. KEMPSTER, B. MCKEY, M. PICKENS, and J. OUTHOUSE. (Univ. Ill.). (*Jour. Nutr.*, 20 (1940), No. 5, pp. 467-476).—The ability of lactose to influence the retention of calcium was studied in five small boys from 5 to 7 yr. of age. Calcium balances were determined through two periods, in the first of which, the nonlactose period of 13-16 weeks, the children were fed a basal dietary supplemented with CaHPO_4 (supplying 126 and later, 176 mg. of Ca) sufficient to bring the total calcium intake to about 500 mg. daily. Vitamin D was also fed. For the individual children the retentions averaged 131, 137, 103, 83, and 69 mg. per day, these amounting to 26.6, 26.5, 20.1, 16.2, and 14.0 percent of the individual intakes, respectively; the average for the group was 20.7 percent. In the second or lactose period, lasting for 6-9 consecutive weeks, an additional supplement of lactose (36 gm. daily) was given. During this period the individual retentions for the children, noted in the same order as above, averaged 151, 146, 111, 160, and 109 mg. per day; these amounts represented, respectively, 29.3, 29.4, 21.5, 30.6, and 21.1 percent of the intakes, the average being 26.4 percent. These values for the lactose period, higher in every case than the corresponding values in the nonlactose period, constituted gains in retention (expressed as percentage increase of the percent of calcium retained) of 10.2, 10.9, 7.0, 88.9, and 50.7 percent, the average being 33.5 percent.

It was observed that the average losses in urinary calcium amounted to 16.9 and 12.0 percent of the intake during the control and lactose periods, respectively, a decrease of 29 percent during the latter period. These findings suggest that the increased retention due to the lactose ingestion was effected through a decrease in the calcium lost by way of the kidney.

The utilization of the calcium of dicalcium phosphate by children, E. KEMPSTER, H. BREITER, R. MILLS, B. MCKEY, M. BERND, and J. OUTHOUSE. (Univ. Ill.). (*Jour. Nutr.*, 20 (1940), No. 3, pp. 279-287, fig. 1).—Calcium metabolism experiments were conducted on six preschool boys $3\frac{1}{2}$ - $6\frac{1}{2}$ yr. of age. They received daily 500 mg. of calcium, 126 mg. of this total intake being fed as CaHPO_4 and the remainder being furnished by the basal diet. After 6 weeks, when the percentage utilization of calcium at this level had been established, the CaHPO_4 supplement was withdrawn, and the utilization of the calcium on the basal diet alone (furnishing 350 mg. of calcium daily) was observed. The difference between the calcium retentions at the two levels of intake calculated as percentage of the difference in intakes at the two levels gave thus a measure of the utilization of the calcium from the supplement of CaHPO_4 . Thus calculated, the utilization of calcium averaged 19.5 percent; individual values were 16.8, 17.9, 23.0, 19.5, 22.6, and 17.3 percent. These same children had previously served as subjects in a study of the availability of milk calcium and had been able to utilize only 19.8 percent of that calcium (E. S. R., 82, p. 133). It is concluded, therefore, that the dicalcium phosphate is not superior to milk as a source of calcium for children, and that except for the person who is allergic to milk there is little virtue in recommending the replacement of milk in the diet by dicalcium phosphate.

Retention of calcium in the diet by children, J. OUTHOUSE (In *Dairy Manufacturers Conference Manual, Department of Dairy Husbandry, University of*

Illinois, Urbana, Illinois, November 13-17, 1939. Urbana: Ill. Univ., 1939, pp. 143-146).—Studies on the calcium requirements of preschool girls (E. S. R., 82, p. 132) and boys (noted above) reported in detail elsewhere are here summarized briefly. It is concluded from these findings that within the age range of 2½-6½ yr. the well-nourished normally growing child can secure all the calcium he needs when 1 pt. of milk daily is added to an otherwise adequate dietary. It is pointed out that the older child, particularly during the period of rapid growth, should have a much larger quantity of milk, probably as much as 1½-2 qt. daily.

Calcium and phosphorus content of the blood of normal and mentally diseased men, G. H. SATTERFIELD, W. S. MCKIMMON, A. D. HOLMES, and F. TRIPP. (Univ. N. C. et al.). (*Jour. Amer. Dietet. Assoc.*, 16 (1940), No. 2, pp. 117-123).—Calcium in the blood of 20 college men who served as normal controls averaged 10.65 mg. per 100 cc. of serum, with a range from 9.50 to 12 mg.; phosphorus averaged 3.93 mg., with a range from 3.33 to 4.83 mg. per 100 cc. of serum. In 96 patients with various mental deficiencies, the serum calcium averaged 10.20 mg. and the phosphorus 3.68 mg. per 100 cc. Only 6 of the subjects had a blood calcium content outside the normal limits of from 9 to 12 mg. per 100 cc. and of these 3 were slightly above the maximum and 3 slightly below the minimum limit. In 6 other subjects phosphorus levels slightly exceeded the maximum normal limit. Since abnormal calcium values did not accompany abnormal phosphorus values, the Ca × P product was within the normal range in all cases. Hence, the calcium and phosphorus content of the blood of nearly all of the patients with various types of mental diseases was found to be within normal limits.

Calcium and phosphorus metabolism in rats and dogs as influenced by the ingestion of mineral oil, M. C. SMITH and H. SPECTOR. (Ariz. Expt. Sta.). (*Jour. Nutr.*, 20 (1940), No. 1, pp. 19-30).—In one series of experiments rachitic lesions were induced in young rats by feeding the Steenbock rachitogenic cereal ration No. 2965. The ability of vitamin D, fed separately as cod-liver oil, to calcify these lesions was then observed in the absence of mineral oil and in its presence as incorporated in the basal ration at 5- and 10-percent levels. The "line test" findings indicated that mineral oil ingestion interfered with the utilization of the vitamin D. Three times as much cod-liver oil was necessary to heal rachitic lesions where the basal ration contained 5 percent of mineral oil as was needed in the absence of mineral oil; from 5 to 10 times as much cod-liver oil was needed when 10 percent of mineral oil was incorporated in the basal ration.

In other experiments the retention of calcium and phosphorus in mineral oil- and nonmineral oil-fed puppies was observed in a series of weekly balance studies. These showed that the mineral oil ingestion seriously interfered with the retention of both calcium and phosphorus. Moreover, the dogs fed the mineral oil developed characteristics of severe rickets even though they received adequate amounts of calcium and phosphorus and a supposedly minimum protective dose of cod-liver oil. In the dog receiving the ration containing 10 percent of mineral oil, optimum retention of the mineral elements did not occur even though the amount of cod-liver oil was increased fivefold.

The nomenclature of the vitamins, G. ADAMS. [U. S. D. A.]. (*Jour. Home Econ.*, 32 (1940), No. 5, pp. 314, 315).—This is a very brief presentation of the developments in vitamin nomenclature, with indication as to the relationship between various terms.

Vitamins and their occurrence in foods, H. E. MUNSELL (*Milbank Mem. Fund Quart.*, 18 (1940), No. 4, pp. 311-344).—This report, available as a reprint, constitutes a practical handbook of up-to-date information on the properties,

food sources, and factors affecting the stability of vitamins A, B₁ (thiamin), C (ascorbic acid), D, G (riboflavin), nicotinic acid (pellagra-preventive factor), and E, and on the properties and food sources of vitamin K (the anti-hemorrhagic vitamin) and vitamin B₆ (pyridoxin); a few practical rules to remember in the selection and preparation of foods for a diet adequate in vitamin content; a discussion of methods of determining vitamin values, with definitions of the International Units already adopted and suggested inter-relationships between Sherman and International Units; a table of vitamin values arbitrarily selected as most representative of the foods considered; and the previously published (E. S. R., 83, p. 130) table of values suggested as expressive of the daily requirements of vitamins A, B₁, C, D, and riboflavin.

Vitamins for war (*Jour. Amer. Med. Assoc.*, 115 (1940), No. 14, pp. 1198, 1199).—In this editorial comment attention is called to the recent action of England in the compulsory fortification of margarine with vitamin A and of flour with calcium and vitamin B₁. As evidence of the need in this country of increased consumption of these factors, particularly vitamin B₁, the reports are cited of Stiebeling and Phipard (E. S. R., 81, p. 142) showing the inadequacy of a large proportion of diets in this factor and of Williams et al. on the effects of induced vitamin B₁ deficiency in man and the benefits of a liberal intake (E. S. R., 82, p. 852). These reports suggest that "efficiency for prosecution of a war can be increased by the simple expedient of providing a very little more vitamin B₁ than the public is receiving. This subject is also receiving consideration by those responsible for our national defense."

Whey as a source of vitamins and vitamin products, G. C. SUPPLEE (*Indus. and Engin. Chem.*, 32 (1940), No. 2, pp. 238-240).—This review, presented as an address, indicates that "eight successive generations of white rats have been maintained with a normal life cycle on a restricted experimental diet in which the whey vitamin fraction supplemented with rice polish served as the sole source of all vitamins except the fat-soluble factors carried by a small percentage of cod-liver oil."

Does quick freezing of meat affect its vitamins? (*South Dakota Sta. Rpt.* 1940, p. 68).—A progress report of work by L. M. Burrill and E. M. Pierson (E. S. R., 82, p. 707).

Determination of carotene in fresh and frozen vegetables.—I, Carotene content of green snap beans and sweet corn, W. I. ZIMMERMAN, D. K. TRESSLER, and L. A. MAYNARD. (N. Y. State Expt. Sta. coop. Cornell Univ.). (*Food Res.*, 5 (1940), No. 1, pp. 93-101).—The procedure described for the estimation of carotene in plant tissue is a modification of the method of W. C. Russell et al.¹⁰ The first modification consists in extraction of the pigment by heating the plant material in acetone. This permits rapid extraction without loss of carotene due to enzymic action, facilitates filtration, and decreases the tendency toward emulsion formation during subsequent analysis. A second modification, devised to remove noncarotenoid pigments, consists in successive extractions of the petroleum ether solution of the pigments with 89 percent methyl alcohol, 25 percent KOH in methyl alcohol, and large portions of diacetone. Xanthophyll, chlorophyll, and other noncarotenoids are removed by these treatments, permitting the carotene in the washed, dried petroleum ether solution of definite volume to be determined colorimetrically with pure β -carotene as a standard. Estimations by this method of the carotene in green beans and in Golden Bantam corn were confirmed in general by biological assays for vitamin A, the U. S. P. XI method being employed and the vege-

¹⁰ Plant Physiol., 10 (1935), No. 2, pp. 325-340, figs. 2.

tables being fed at levels sufficient to furnish, respectively, 0.6 and 1.2 $\mu\text{g.}$ of carotene.

Results indicated that from 50 to 60 percent of the pigment of Golden Bantam corn is not carotene. By analysis from 0.9 γ to 1.1 γ of carotene per gram of fresh material was found present in the frozen corn and from 2.1 γ to 2.2 γ in the frozen green beans. The amounts were not decreased upon storage of the frozen samples for 3-4 mo. at 0 and -40° F. It was observed in the biological analyses that increasing levels of cod-liver oil gave better growth response than correspondingly increasing levels of β -carotene, and that groups receiving quantities of vegetables sufficient to furnish 0.6 $\mu\text{g.}$ of carotene (1 International Unit) per day showed greater variation in average growth response than groups receiving vegetable supplements equivalent to 1.2 $\mu\text{g.}$ (2 I. U.) of carotene.

The carotene and vitamin A content of market milks, A. C. DORNBUSH, W. H. PETERSON, and F. R. OLSON. (Wis. Expt. Sta.). (*Jour. Amer. Med. Assoc.*, 114 (1940), No. 18, pp. 1748-1751, figs. 4; *abs. in Milk Plant Mo.*, 29 (1940) No. 6, pp. 66, 67).—Four types of commercial milks marketed by eight large distributors in the Madison and Milwaukee areas of Wisconsin were examined monthly for carotene and vitamin A content, these constituents being determined on the nonsaponifiable fraction of the butterfat by a photometric procedure. The value $E_{1\text{cm}}^{1\%} = 328 \text{ m}\mu = 1,600$ was used in the calculation of vitamin A. Monthly variations in vitamin A and carotene contents, expressed as micrograms per gram of butterfat, are shown by graph for the market (mainly Holstein), Guernsey, and certified milks. Vitamin D milks were similar to market milks, since the breeds and rations used for the production of the two types are usually the same. All milks showed marked seasonal changes in both carotene and vitamin A contents, the variations for carotene being greater than for vitamin A. The milks were fairly similar in vitamin potency per gram of butterfat, although certified milks were somewhat higher than the other milks during the late winter months (probably because feeds of better quality were used), and Guernsey, because of its higher fat content, had a higher potency on the fluid basis than the others. Per quart the winter milks (January to April) averaged 1,088, 1,241, and 1,334 U. S. P. units for market, Guernsey, and certified milks, respectively, while summer milks (June to October) gave corresponding averages of 1,906, 2,415, and 1,995 U. S. P. units.

Influence of liquid petrolatum on the blood content of carotene in human beings, A. C. CURTIS and E. M. KLINE (*Arch. Int. Med.*, 63 (1939), No. 1, pp. 54-63 figs. 7).—Observations of the effect in man of liquid petrolatum ingested in varying amounts and at different times of day on the absorption of carotene from the gastrointestinal tract as measured by blood carotene levels are reported. The conclusion is drawn that liquid petrolatum administered in amounts of 20 cc. twice or three times a day before meals or mixed with carotene dissolved in cottonseed oil prevents complete absorption of the carotene, but that there is little, if any, effect on the blood carotene if the liquid petrolatum is given in a single dose of 30 cc. at bedtime.

Further evidence of a new factor in the B complex, W. R. WYATT and V. E. NELSON. (Iowa State Col.). (*Iowa Acad. Sci. Proc.*, 46 (1939), pp. 203-206).—A further study of the SB factor of the vitamin B complex (E. S. R., 81, p. 311), is reported. The conclusions drawn in the earlier study are confirmed. In addition evidence is presented leading to the conclusion that the deficiency resulting from absence of this factor is also distinct from that of deficiency in unsaturated fatty acids, and that the factor is not identical with the spectacled eye factor, antihemorrhagic factor, and chondroitin sulfuric acid.

Reproduction in rats on synthetic B-complex supplement, T. H. JUKES. (Univ. Calif.). (*Soc. Expt. Biol. and Med. Proc.*, 45 (1940), No. 2, pp. 625-627).—

Reproduction, although not as successful as on a normal diet of natural foods, and rearing of healthy representatives of a second generation is reported for rats on a diet in which all of the water-soluble factors were in the synthetic form and were fed at levels thought to be more than sufficient in each case. Reproduction occurred when the females on the diet were mated to males from stock and also when mated to males which had been on the experimental diet from weaning. There were some resorptions and complete failure to suckle the young when pantothenic acid was removed from the diet.

Effects of a supplement of vitamin B (adsorbate) on the growth of infants, M. R. PRICE (*Brit. Med. Jour.*, No. 4150 (1940), pp. 80-82).—A daily supplement of 100 International Units (300 γ) of vitamin B₁ in the form of a tablet of kaolin adsorbate from a natural source was administered to 50 infants (30 boys and 20 girls) selected at random from those brought to the child welfare clinic of the Royal Free Hospital. Any beneficial effect of the vitamin B₁ supplement was judged by monthly increases in weight and height increases over 4 mo. as compared with these changes in a control group (26 boys and 25 girls likewise selected at random) not receiving the supplement. The results, analyzed for significance, indicate that for boys the figures may be regarded as significant, although they are merely suggestive for the girls. "Taking both sexes, together, however, it can be asserted that there is a 100 to 1 probability that the greater rate of growth of the treated group is significant. The figures for weight do not carry the same degree of certainty. . . . From these considerations and from the clinical results recorded, it, therefore, appears probable that supplements of vitamin B₁ derived from natural sources and providing not less than 100 units daily can usefully be given to infants whose progress is unsatisfactory."

The story of vitamin B₁ (thiamine hydrochloride U. S. P.), C. R. ADDINALL (*Rahway, N. J.: Merck & Co., 1940, rev. ed., pp. 72, figs. 18*).—In this revision (*E. S. R.*, 80, p. 710) the review of the literature has been brought up to date and new topics have been added on clinical manifestations and therapy of vitamin B₁ deficiency and vitamin B₁ in plant growth. Numerous references through 1939 are given at the end of each section.

The influence of exercise on the growing rat in the presence and absence of vitamin B₁, N. B. GUERRANT and R. A. DUTCHER. (Pa. Expt. Sta.). (*Jour. Nutr.*, 20 (1940), No. 6, pp. 589-598, figs. 5).—Employing methods used for studying the relation of exercise to vitamin A consumption (*E. S. R.*, 81, p. 557), the authors depleted two groups of rats on a vitamin B₁-deficient diet until paralytic symptoms developed. Following this, 6 μ g. of vitamin B₁ was fed to each rat per day. Controls received this supplement throughout the experiment. Those in the forced exercise group were unable to perform the 1,000 cage revolutions per day. It was noted that the activity of the depleted rats was greater than that of the controls during the first few weeks, but the depleted rats became progressively less active as the paralytic symptoms were more fully developed. Such animals became progressively less active for several days after supplementary feeding of 6 μ g. of thiamin per day was begun. The group with voluntary exercise gained less weight than those undergoing forced exercise or those in confinement. Likewise, those permitted voluntary exercise lost a greater percentage of their weight before developing paralytic symptoms than the other groups. The findings indicate that the vitamin B₁ requirements are increased with physical exercise. In rats receiving no vitamin B₁ there was less food consumption, less growth, early development of paralytic symptoms, and the elimination of a greater number of fecal particles with increased exercise than in the other groups.

The therapy of the Cook County Hospital: The therapy of subvitaminosis B₁. B. FANTUS, E. F. TRAUT, and R. S. GREENBAUM (*Jour. Amer. Med. Assoc.*, 115 (1940), No. 6, pp. 450-454).—Subvitaminosis B₁, defined as a peripheral neuropathy produced by vitamin B₁ deficiency, is used synonymously with beriberi and thiamin deficiency. The conditions in which it must be suspected are summarized as inadequate intake of foods containing vitamin B₁, inadequate absorption, disturbed utilization, and disturbed distribution. The symptoms and signs of early, moderately advanced, and advanced subvitaminosis B₁ are described, together with a brief listing of certain conditions sometimes attributed to, but less generally accepted as due to, subvitaminosis B₁. It is considered that at present the diagnosis of this condition must be based upon symptoms and physical signs until a satisfactory chemical method for determining thiamin absorption and utilization can be found for clinical use. Prophylactic and therapeutic measures are discussed, including treatment of associated conditions.

Vitamin B₁ requirements of the average adult are given as from 1 to 1.5 mg., or from 300 to 450 International Units of thiamin hydrochloride daily, depending upon the nonfat caloric intake, or from 10 to 15 I. U. per 100 calories consumed on the assumption that the average diet furnishes 3,000 calories; for the pre-school child, at least from 20 to 25 I. U. per 100 calories; and for pregnant or lactating women, about 50 I. U. per 100 calories or 1,500 I. U. (5 mg.) daily. "To obtain an adequate amount of thiamin an adult should have daily at least 1 pt. (500 cc.) of milk, one or two eggs, at least one serving of meat, two servings of fruit (one raw), two servings of vegetables (one a legume), nuts, and whole-grain bread and cereals."

Peripheral neuropathy due to vitamin B₁ deficiency in diabetes mellitus. H. D. FEIN, E. P. RALLI, and N. JOLLIFFE (*Jour. Amer. Med. Assoc.*, 115 (1940), No. 23, pp. 1973-1976).—Among 422 ambulant diabetic patients, 9 developed a symmetrical peripheral neuropathy characteristic of the peripheral neuropathy found in subjects with proved vitamin B₁ deficiency. Treatment by oral administration of 10 mg. of thiamin daily, with no other change, resulted in the cure of 8 subjects and improvement in the ninth. The development of this condition is attributed to a diet of borderline adequacy in vitamin B₁ through substitution of foods poor in vitamin B₁ for prescribed foods of equivalent carbohydrate and calcium values, but richer in vitamin B₁.

Treatment of multiple sclerosis with nicotinic acid and vitamin B₁.—**Preliminary report.** M. T. MOORE (*Arch. Int. Med.*, 65 (1940), No. 1, pp. 1-18, figs. 7).—Favorable results are reported, with detailed case histories, in the treatment of five cases of advanced multiple sclerosis parenterally with nicotinic acid and vitamin B₁. Doses of nicotine acid as large as 120 mg. and thiamin chloride, 32.2 mg., were given for prolonged periods without harmful effects. Although complete remissions were not secured in any of the cases reported, every patient noted improvement in bodily movements. Evidence is presented, both in the rise of cerebrospinal fluid pressure in the subjects during the period of flushing of the skin and in photographs showing visualization of dilated vessels and increased capillary filling in the brain and spinal cord of the cat under similar treatment, leading to the conclusion that nicotinic acid produces vaso-dilatation and increased blood flow in the brain and spinal cord.

Wernicke's disease: Identity of lesions produced experimentally by B₁ avitaminosis in pigeons with hemorrhagic polioencephalitis occurring in chronic alcoholism in man. L. ALEXANDER (*Amer. Jour. Pathol.*, 16 (1940), No. 1, pp. 61-70, pls. 13, fig. 1).—Evidence is presented establishing the identity in topographical distribution and in morphological and histological characteristics of the lesions of Wernicke's hemorrhagic polioencephalitis in man and lesions produced experimentally in pigeons by a diet deficiency in vitamin B₁, but

furnishing ample supplies of other vitamins (A, B₂, C, and D). It is noted that some of the lesions have been demonstrated by Prickett in rats (S. E. R., 72, p. 884) and that the earlier work of the author and associates on the production of Wernicke's disease in pigeons has been confirmed in the report of Zimmerman previously noted (E. S. R., 84, p. 704).

Relation of nicotinic acid to pellagra, C. A. ELVEHJEM. (Univ. Wis.). (*Physiol. Rev.*, 20 (1940), No. 2, pp. 249-271).—In this review the various steps leading up to the recognition of nicotinic acid as the antipellagra factor are traced chronologically, with an explanation in the light of later developments of some of the difficulties encountered in the earlier work. The relationship between respiratory enzymes and vitamins of the B group is emphasized, with the comment that studies on the constitution of pyridine coenzyme undoubtedly aided in the identification of nicotinic acid as the antipellagra factor. Discussion is included of the cozymase and nicotinic acid content of various tissues, of the nicotinic acid content of foods, and of studies on the urine during nicotinic acid deficiency. In conclusion, two important facts which apply not only to nicotinic acid but also to the vitamins in general are emphasized—(1) the importance of the experimental animal in extending knowledge of important nutritional factors and (2) the importance of recognizing the specificity of each of the individual vitamins. In discussing the first, attention is called to the fact that in the case of nicotinic acid the species of experimental animal used has been an important factor. The antipellagra factor was first distinguished from thiamin by rat experiments, then from riboflavin by the use of the chick, and finally from the chick antidermatitis factor by the use of the dog. In each case the identification of the factor has been followed by recognition of its indispensability for the human. Under the second point it is brought out that the full value of a single factor can be realized only when it is used with all of the other known essential factors. "Thus nicotinic acid will cure or prevent all conditions produced by a true nicotinic acid deficiency but can be of no value in the treatment of conditions produced by a deficiency of other factors, and its value in the treatment of pellagra is much more effective when all other factors are supplied in optimum amounts."

An extensive list of literature references is appended.

Relation of pantothenic acid to dermatitis of the rat, L. R. RICHARDSON and A. G. HOGAN. (Mo. Expt. Sta.). (*Soc. Expt. Biol. and Med. Proc.*, 44 (1940), No. 2, pp. 583-585).—In this preliminary note a comparison is reported of the effects of pantothenic acid or its sodium or calcium salt and vitamin B₆, alone or combined, on mild dermatitis produced in rats on a ration of casein 20, sucrose 71, cellulose 3, cod-liver oil 2, and salts 4 percent supplemented with 0.2 mg. of thiamin and 0.4 mg. of riboflavin per 100 gm. of food.

All of the 11 rats receiving vitamin B₆ without pantothenic acid improved, but 9 of them had a recurrence within an average of 15 days, the other 2 being continued for 12 and 30 days, respectively, without recurrence. The 2 animals becoming moribund on the vitamin B₆ supplement without pantothenic acid were cured in 15 and 16 days, respectively, by treatment with sodium pantothenate in doses of 70 μ g. daily. Of the 10 rats receiving either sodium or calcium pantothenate, 2 were cured although 1 showed mild recurrence later. Some of the others improved, but none made a complete recovery. The 5 rats receiving both vitamin B₆ and pantothenate recovered within a week and made considerable gains in weight.

The lesions produced by deficiency of the two vitamins separately were indistinguishable except for the eyes, which were said to be affected more severely in the pantothenic acid deficiency. "The lids adhere and are soon

covered by a large scab. If pantothenic acid is supplied in addition to vitamin B., at this stage the scab falls off, leaving a spectacled appearance which disappears without any additional treatment as the hair grows back in the denuded areas."

The vitamin C content of fruits and vegetables, R. C. BURRELL and V. R. EBRIGHT. (Ohio State Univ.). (*Jour. Chem. Ed.*, 17 (1940), No. 4, pp. 180-182).—The vitamin C content of a large number of fresh fruits and vegetables was determined by titration with 2,6-dichlorophenolindophenol. The details concerning reagents and method are noted, and the values for the various samples are reported together with notations as to variety and whether the samples were from the market or freshly picked. Results on a few vegetables analyzed immediately before cooking and immediately afterward, with determinations on the cooking water as well as the cooked vegetables, indicated that a very considerable part of the cooking loss of vitamin C is due to discarding the cooking water.

The effect of cooking and storage on the ascorbic acid content of potatoes, L. A. ROLF. (U. S. D. A.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 5, pp. 381-395, figs. 2).—This study has been summarized by the author as follows:

"The vitamin C value of potatoes was found to depend more upon the time and temperature of storage than upon the method of cooking. Maine-grown Green Mountain and Irish Cobbler potatoes stored at 15.5° C. decreased in ascorbic acid content very rapidly during the first few weeks after harvesting and much more gradually thereafter. The Green Mountain potatoes decreased nearly 50 percent in ascorbic acid content in 5 mo. of storage, about 30 percent being lost during the first month. The decrease in the vitamin was more rapid at 4.5° than at 15.5° storage for both varieties. The maximum loss of ascorbic acid due to cooking Irish Cobbler potatoes stored at 15.5° never exceeded 25 percent. Steaming and boiling unpared tubers caused smallest losses. Baking and pressure cooking caused somewhat greater losses, while boiling pared potatoes was least conserving of the vitamin. The distribution of ascorbic acid in the potato tuber was not uniform, differed in the two varieties, and was affected by the temperature and the length of storage."

Capillary fragility and ascorbic acid studies, H. G. RAPAPORT, S. H. MILLER, and A. SICULAR (*Jour. Ped.*, 16 (1940), No. 5, pp. 624-626).—In this comparison of the reliability of the capillary fragility and blood plasma ascorbic acid tests for vitamin C nutrition, the positive pressure technic, as described by Wright and Lilienfeld (*E. S. R.*, 77, p. 281), was used for measuring capillary fragility with the standard for normality as not more than 10 petechiae, and the method of Farmer and Abt for blood plasma with values from 0.7 to 2 mg. per 100 cc. as normal. The subjects comprised 150 children ranging in age from 5 to 13 yr., 41 of whom had signs of rheumatic disease. Of the entire number 60 gave values within the normal range in both tests; 32 normal blood plasma and positive or abnormal capillary fragility values; 41 subnormal blood plasma and normal capillary fragility values; and 17 subnormal blood plasma and positive capillary fragility values. The authors conclude that there appears to be no correlation between abnormal capillary fragility and avitaminosis C, but suggest the possibility that vitamin P may be the main factor responsible for the maintenance of the normal capillary wall.

Aspects of the function of vitamin E irrespective of its relation to the reproductive system, H. M. EVANS. (Univ. Calif.). (*Jour. Amer. Dietet. Assoc.*, 15 (1939), No. 10, pp. 869-874, fig. 1).—An address.

Effect of synthetic vitamin K compounds on prothrombin concentration in man, P. M. AGGELER, S. P. LUCIA, and L. GOLDMAN. (Univ. Calif.). (*Soc. Expt. Biol. and Med. Proc.*, 43 (1940), No. 4, pp. 689-694).—Twenty-six patients

with hypoprothrombinemia were variously treated with stated doses of phthiocol, 2-methyl-1,4-naphthoquinone, or 4-amino-2-methyl-naphthol-hydrochloride. The three compounds, of about the same relative effectiveness when considered in terms of the dosages employed, produced marked elevation in prothrombin concentration (from a range of 3-43 percent before treatment to 60-130 percent 24 hr. after treatment) in the 11 cases of obstructive jaundice; no elevation in 8 and only slight elevation in 3 patients with chronic diseases of the liver; no elevation in 1 patient and after initial delay slight elevation in another patient with acute liver disease; and moderate elevation in 2 patients with gastrointestinal diseases. No untoward reactions were observed except that injection of 4-amino-2-methyl-naphthol-hydrochloride produced a slight burning pain at the site of injection.

The effect of vitamin K on chicks with avitaminosis K due to diet or to experimental obstructive jaundice [trans. title], H. DAM and J. GLAVIND (*Ztschr. Vitaminforsch.*, 10 (1940), No. 1-2, pp. 71-79, figs. 4; *Fr., Eng. abs.*, pp. 78, 79).—For these experiments 330- to 400-gm. chicks were used, the control group receiving a synthetic basal diet devoid of vitamin K plus a supplement of alfalfa sufficient to furnish about 4 units of vitamin K per 100 gm. of feed. One test group of normal chicks received the basal diet without supplement, while another test group of chicks with bile-duct ligation received the basal diet and the supplement. Upon development of K avitaminosis, as judged by very low prothrombin activity of the blood (about 26-28 days after ligation in the one group), intravenous injections of vitamin K were administered. An emulsion of vitamin K concentrate from alfalfa or of synthetic vitamin K (E. S. R., 82, p. 441) was used, the amounts injected varying from 0.05 to 50 units per gram of body weight. Prothrombin activity, determined at intervals after injection, was practically the same for all doses from 0.5 to 50 units 24 hr. after injection; maximum activity was reached, as indicated by the graphs, within the first or second day, and thereafter declined. The vitamin K, however, was "equally effective in raising the prothrombin content of the blood in chickens with avitaminosis K whether due to dietary restriction or induced by ligation of the bile duct."

Vitamin M, P. L. DAY. (Univ. Ark.). (*Natl. Livestock and Meat Bd. Rpt.*, 17 (1940), pp. 35, 36, 37, fig. 1).—This is a progress report on the isolation of vitamin M (E. S. R., 81, p. 459) and the relation of a deficiency of this vitamin to susceptibility to bacillary dysentery.

Does citrin (vitamin P) occur in milk? [trans. title] W. NEUWEILER (*Ztschr. Vitaminforsch.*, 9 (1939), No. 4, pp. 338-342; *Fr., Eng. abs.*, p. 341).—The method employed for the detection of citrin involved treatment of the sample (2 cc. of milk or urine) with 5 cc. of silver acetate solution, followed by treatment of the supernatant fluid (remaining after centrifugation) with 5 cc. each of 5 percent sodium cyanide and 5 percent sodium carbonate solutions. The color development after 24 hr. was determined in the case of urine by direct reading in a step photometer (filter S 47), the concentration of citrin being read from a standard curve. With milk the color developed was compared with that obtained with standard milk samples containing known and graded amounts of citrin (eriodictyol).

Tests on many samples failed to detect citrin either in cow's milk or in breast milk even after intravenous administration of 50 mg. of citrin for 6 days. Injected citrin was found to be eliminated practically quantitatively in the urine. It is concluded, therefore, that citrin plays no important part as an activator of ascorbic acid.

The rôle of diet in the control of dental caries, J. D. BOYD (*Jour. Amer. Dent. Assoc.*, 27 (1940), No. 5, pp. 750-756, figs. 3).—This report, presented as an address, is based on a statistical study of the records of about 250 children

observed repeatedly through hospital attendance over periods of months or years. About 80 percent of these were living under quantitatively prescribed dietary regimens, which consistently afforded liberal allowances of milk, eggs, vegetables, and fruits and included cod-liver oil. The various dietaries differed widely, however, in consistency, in the amount and nature of the carbohydrate component, and in fat content.

In the children under dietary control there was a predominant tendency for the exposed dentin in carious areas to harden within a few weeks or months after the dietary regimen was established and to show no further progress of decay as long as the regimen was followed. This was in contrast to the conditions in the children not receiving controlled diets. In this latter group the caries of affected teeth tended to progress rather than retrogress, and there was a marked increase in the tendency toward progressive caries in the teen age. Although there was some increase in caries at this age in the group under dietary control, the increase was less marked than in the uncontrolled group. Since adequate content of the protective factors was the most consistent characteristic of the various prescribed diets, it is considered that their influence in protecting the teeth can be attributed to the furtherance of complete and optimum nutrition, thereby offering the teeth full opportunity to resist destructive agencies.

The diabetic child: An analytic study of his development, G. D. BROWN and W. H. THOMPSON. (Univ. Minn.). (*Amer. Jour. Diseases Children*, 59 (1940), No. 2, pp. 238-254).—Data obtained from case studies and through individual interviews are presented for 60 juvenile diabetic patients considered typical of this population group in Minnesota. In age the patients ranged from 22 mo. to 20 yr. and 1 mo., all of the older members having had the onset of diabetes before 15 yr. of age. The group on the whole was as healthy as the nondiabetic sibs (except for acidosis and insulin reactions). Limited measurements revealed no consistent or peculiar deviations from the average in height, weight was not significantly below average except during the first 6 mo. of the disease, and the intelligence of the group showed no deviation from the average and no significant deviation from that of their sibling controls or from the average of Minnesota children. No characteristic abnormalities in personalities were discovered.

Vitamin A deficiency in diabetes mellitus, J. G. BRAZER and A. C. CURTIS (*Arch. Int. Med.*, 65 (1940), No. 1, pp. 90-105, figs. 6).—A group of 20 ambulatory young and early middle-aged patients with juvenile diabetes mellitus and a control group of the same number of normal subjects were given dark adaptation tests with the biophotometer according to the Jeans technic except that the readings were recorded in millifoot candles instead of as direct readings. Determinations were also made of blood carotene and blood cholesterol.

The control group gave biophotometer readings comparable to the normal values reported by other observers. Blood carotene values were somewhat higher than previously reported values, and blood cholesterol, averaging 200 mg. per 100 cc., agreed fairly well with the upper normal limits. The biophotometer readings of the diabetic patients, 3 of whom were subjectively aware of night blindness and 9 showed skin changes such as have been noted in vitamin A deficiency, were in the range definitely suggestive of vitamin A deficiency, although the blood carotene in all but 2 cases was considerably higher than the average of the normal group. Blood cholesterol averaged 239 mg. per 100 cc.

The daily administration of 60,000 U. S. P. units of vitamin A in the form of crystalline carotene dissolved in vegetable oil for as long a period as 14 days had no effect on the light adaptation in these subjects, but increased the already high blood carotene levels. The same intake of vitamin A administered in the

form of concentrated fish-liver oils produced significant improvement in the biophotometer readings, with light adaptation returning to normal or nearly normal in from 3 to 21 days. Removal of the vitamin A supplements after the readings had become normal resulted in prompt relapse to subnormal values. The changes in cholesterol values throughout the experiment were insignificant.

"The cause of poor light adaptation in patients with juvenile diabetes mellitus appears to be an inability to convert carotene to vitamin A."

Diet and resistance to tuberculosis, K. A. TISSUE (*Jour. Amer. Dietet. Assoc.*, 16 (1940), No. 4, pp. 313-324).—This paper is chiefly a review of the literature, with particular emphasis on vitamin A and C deficiencies and therapy in tuberculosis. A report is included of a study of the dietary records of 1,000 cases of the childhood type of tuberculosis. A deficiency of vitamin A was indicated in 31 percent and of vitamin C in 84.6 percent of the cases. Correction of these and other dietary deficiencies resulted in an improvement in the physical condition of the children. An increase in vitamin C and milk intake alone was followed by marked improvement in symptoms. A list of 78 references to the literature is appended.

TEXTILES AND CLOTHING

Textiles and clothing [at the Bureau of Home Economics] (*U. S. Dept. Agr., Bur. Home Econ. Rpt.*, 1940, pp. 12-17).—This annual report (E. S. R., 82, p. 715) summarizes the work of the Division of Textiles and Clothing dealing with physical tests on women's full-fashioned hosiery knit from commercial cotton yarns; with finishing treatments and water repellency in the case of cotton hose (E. S. R., 84, p. 573); with fabric deterioration by micro-organisms (E. S. R., 83, p. 428); with wool substitutes; and with consumer buying guides.

Physical characteristics in cotton and their interrelationship (*Texas Sta. Rpt. 1939*, pp. 117-118).—This progress report summarizes findings by M. A. Grimes in extension of the study reported earlier (E. S. R., 82, p. 572) concerning the number of locks per boll, the quantity of fiber on the seed, and the length, uniformity, fineness, strength, and thickness of fibers of Lightning Express and Half and Half varieties of cotton and succeeding generations of hybrid lines resulting from a cross of these two varieties.

Surface characteristics of cotton fibers, as indicated by electrophoretic studies, A. M. SOOKNE and M. HARRIS (*Jour. Res. Natl. Bur. Standards [U. S.]*, 26 (1941), No. 1, pp. 65-69, fig. 1).—The pH mobility curve for cotton depectinized by treatment with a boiling 1-percent solution of sodium hydroxide for various periods showed a low order of acidity, that for pectic substance from cotton was characteristic of a highly acid substance, and the curve for dewaxed cotton appeared to be a composite of curves for cellulose and pectic substance. The purified cellulose exhibited a reversal of charge below pH 2.5 and accordingly was isoelectric at that pH. This reversal did not result from irreversible changes produced in the fiber during immersion in the dilute solutions of acid used.

Notes on the determination of the fibre fineness of a Merino wool sample, V. BOSMAN and C. M. VAN WYK (*Onderstepoort Jour. Vet. Sci. and Anim. Indus.*, 13 (1939), No. 2, pp. 401-413, fig. 1).—The described method consists in removing the grease from the wool sample with cold benzene, cutting the fibers into fragments, transferring to ether and then drying, and finally mounting on a slide in Euparal mounting medium. Close agreement was obtained in the mean fiber fineness of successive clumps of fiber fragments taken from the ether bath for mounting. Factors affecting the accuracy of the weight-length method for determining fiber fineness are discussed.

Addition of reworked wool decreases fabric strength (*South Dakota Sta. Rpt. 1940*, p. 67).—This progress report summarizes the results of laboratory phys-

ical and chemical tests by B. Bailey of fabrics of virgin and reworked wool before and after dry cleaning and pressing for 15, 30, and 45 times.

Accuracy of small wool samples for shrinkage tests (*Texas Sta. Rpt. 1939, p. 50*).—Results obtained in tests by S. P. Davis, J. M. Jones, and B. L. Warwick on fine short wools from 19 different flocks of sheep indicated that accurate shrinkage estimations of wool clips may be made by use of a correction factor in connection with shrinkage figures obtained on small samples taken from the wool clips at shearing.

HOME MANAGEMENT AND EQUIPMENT

Building national strength through home economics (*U. S. Dept. Agr., Sec. Agr. Rpt., 1940, pp. 162-166*).—This brief account of the work of the Bureau of Home Economics covers essentially the same points as noted elsewhere.

Economic studies [at the Bureau of Home Economics] (*U. S. Dept. Agr., Bur. Home Econ. Rpt., 1940, pp. 2-7*).—This report of the Division of Family Economics (E. S. R., 82, p. 717) considers the food consumption habits of families in small cities, villages, and farms, and points to many existing inadequacies as revealed by data from the consumer purchases study; the effect of the food stamp plan on the diets of low-income city families, as shown by a study in Dayton, Ohio, in 1939; and the status and needs of farm housing noted below.

Family housing and facilities: Five regions. Urban, village, farm, H. KYRK, D. MONROE, M. Y. PENNELL, and E. D. RAINBOTH (*U. S. Dept. Agr., Misc. Pub. 399 (1940), pp. VI+223, figs. 5*).—This report, one of a series from the consumer purchases study, presents a description of the housing (number of rooms) and housing facilities (running hot and cold water, electric lights, central furnace, etc.) of native-born families living in 20 small cities, 140 villages, and 64 counties of 12 farm sections. Expenditures of these families for housing are to be discussed in another report constituting one of the group presenting details of expenditures for specific commodities.

The relationship of housing and housing facilities to such factors as income level, degree of urbanization, region (and therefore climate, culture, and other environmental conditions), composition of families (number and age of members), occupation, and tenure are discussed. A summary describing the housing of families at three economic levels concludes the report.

Family income and expenditures: Five regions.—II, Family expenditures. Urban and village series, D. S. BRADY, D. MONROE, E. PHELPS, and E. D. RAINBOTH (*U. S. Dept. Agr., Misc. Pub. 396 (1940), pp. III+410, figs. 13*).—This is the seventh report (E. S. R., 84, p. 717) on family income and expenditures from the extensive study of consumer purchases. Dealing with expenditures, it constitutes part 2 of the urban and village report; part 1, dealing with income, was issued in four volumes covering the Southeast Region (E. S. R., 84, p. 429), the Middle Atlantic and North Central Region and the New England Region (E. S. R., 83, p. 861), the Plains and Mountain Region (E. S. R., 82, p. 287), and the Pacific Region (E. S. R., 81, p. 603). A similar series deals with income and expenditures of farm families.

The present report is concerned with the consumption patterns of families living in 140 villages and 20 small cities in different parts of the United States, the regions involved being the five dealt with in part 1 of the report. The distribution of total expenditures for farm family living in 15 major categories—food, clothing, housing, medical care, and the like—are analyzed, with special attention to variations associated with income, family composition, occupation, and region. The study is limited to families not on relief and in which both husband and wife are native-born. It is pointed out that the average income of

these families was higher than that of all the families in the communities and that this difference between the group studied and the total population must be recognized in the use of the expenditure data presented. The basic data used for the various analyses are presented in detail in the appendixes.

Housing and household equipment [at the Bureau of Home Economics] (*U. S. Dept. Agr., Bur. Home Econ. Rpt., 1940, pp. 17-19*).—This annual report (E. S. R., 82, p. 717) of the Division of Housing and Household Equipment summarizes the research pointed toward establishing minimum desirable standards for urban and rural homes for families of different sizes at different income levels; and the studies directed toward giving the homemaker facts to guide her in the extension of electric lines (E. S. R., 84, p. 140) and in the buying, use, and care of equipment, such as lighting appliances, electric roasters, irons, and refrigerators. It is noted that buying guides for various items of household equipment have been prepared.

The care and maintenance of wood floor finishes in the home, B. M. KUSCHKE (*Rhode Island Sta. Bul. 276 (1940), pp. 20, figs. 5*).—In this report of an investigation noted previously from progress reports (E. S. R., 84, p. 141) actual wear tests of a number of finishing materials applied to new oak and pine stair flooring and an old pine floor, both in institutional use, are summarized; an abrasion machine for accelerated wear tests, designed and constructed by E. I. Shock of the engineering school and further developed by other members of the school, is described and illustrated, with the technic for its use; and water-resistant tests for a number of finishes are given. A brief account of the early history of protective finishes and a description of modern protective finishes are included.

Finishes selected for the stairs were one spirit shellac, one short oil mop-on varnish, three short oil varnishes, and two penetrating seals. Observations for cleanliness, scratches, and chipping were made at stated intervals during a period of 2 yr. of constant use and regular care, including refinishing of the varnished and shellacked stairs at the end of 6 mo. and 1 yr. and recoating of the liquid seal finishes with liquid wax after each cleaning and a second application of the seal, followed by two coats of wax at the end of 1 yr. For the oak flooring the penetrating seal finishes proved to be by far the most satisfactory in all respects, followed by shellac, the short oil mop-on varnish, and last by the regular short oil varnishes, all of which were in very poor condition at the end of the period. For the pine flooring the penetrating seal finish proved satisfactory with respect to scratches and chipping, but gave no better results for cleanliness than the short oil varnishes. In this respect the shellac ranked first, followed by the short oil mop-on varnish.

Four penetrating seal finishes and one water emulsion wax were used in restoring sections of the old pine floor after cleaning and sanding. All of the penetrating seals proved much more satisfactory than the water emulsion waxes, although one did not clean as well as the others. It is thought that the penetrating seal finishes, if of good quality and well protected with a thin even layer of wax film, are satisfactory even for pine floors. This has been borne out by 18 months' experience in the use of such a finish, with frequent cleaning and rewaxing in a community hall subjected to very hard usage.

Although too few tests have been made with the accelerated wear machine to report definite results, the work to date has shown the desirability in finishing floors of preparing a very smooth surface and applying the finish as evenly as possible. "The additional expense involved may very likely be offset by the increased length of the satisfactory wear period."

Ten wood finishes, including four varnishes, one mop-on varnish, four mop-on seals, and one spirit varnish were tested for resistance to water by applying

each of the finishes evenly to all sides of small wooden blocks and recording the changes in weight under differing conditions of atmospheric humidity. In comparison with four unfinished blocks, all of the finished blocks showed marked decreases in change in weight over the unfinished, with some having better water-repellent qualities than others. One of the penetrating mop-on seal finishes showed the greatest water-repellent properties.

"The results of this study indicate that satisfactory standard laboratory equipment and test methods may be developed for measuring the essential qualities in floor or wood finishes. The use of such standard measurements would afford a means for maintaining reliable label information for consumer guidance in buying these products."

Sanitary and physiological aspects of flooring materials, J. M. DALLA VALLE (*Pub. Health Rpts. [U. S.], 55 (1940), No. 42, pp. 1884-1892*).—Certain physical measurements of flooring materials, such as wear, resiliency, heat transmission, and acoustical transmission are discussed in relation to certain sanitary and physical aspects, namely, dustiness, fatigue, coldness, and noise. The studies serving as a basis for this discussion are cited. It is concluded that "floors constructed in accordance with the best accepted technics possess only slight differences in physical properties. Complaints often made in regard to certain kinds of floors, with a few exceptions, can be attributed to poor design, materials, workmanship, or construction."

MISCELLANEOUS

History of the Kansas State College of Agriculture and Applied Science, J. T. WILLARD (*Manhattan: Kans. State Col. Press, 1940, pp. VIII+568, [pt. 1, figs. 128]*).—This is mainly a chronological history.

The American agricultural press, 1819-1860, A. L. DEMAREE (*New York: Columbia Univ. Press, 1941, pp. [XXI]+430, [pls. 12]*).—Following a brief discussion of early American agricultural literature, part 1 of this book deals with the American agricultural press, 1819-60, as a collective entity. Part 2 presents "28 selected articles which furnish the real flavor of these periodicals." Part 3 gives a more detailed study of 16 periodicals "chosen for special study."

Statistical procedures and their mathematical bases, C. C. PETERS and W. R. VAN VOORHIS (*New York and London: McGraw-Hill Book Co., 1940, pp. XIII+516, figs. 42*).—This book presents and explains the origin and uses of the more general statistical formulas pertaining to variability, probability, correlation, and variance.

Statistical methods, G. W. SNEDECOR (*Ames: Iowa State Col. Press, 1940, 3. ed., [rev.], pp. XIII+422, figs. [22]*).—A revision of the book previously noted (*E. S. R.*, 80, p. 324) with the addition of a chapter on design and analysis of samplings.

Statistical methods for medical and biological students, G. DAHLBERG (*London: George Allen & Unwin; New York: Interscience Pubs., Inc., [1940], pp. 232, figs. 13*).—The essentials of statistical analysis of medical and biological data are presented.

Practical difficulties met in the use of experimental designs, A. E. BRANDT. (*U. S. D. A.*). (*Jour. Amer. Statis. Assoc.*, 35 (1940), No. 209, pt. 1, pp. 101-106).—These difficulties are divided into the following classes: (1) Those met with in securing the adoption of modern designs, (2) those involving proper selection and execution of modern designs, and (3) those connected with the analysis of the results. The author's experiences with difficulties in each of these classes in agricultural field trials are discussed.

A solution of normal equations giving the standard errors of the constants, W. D. BATTEN. (Mich. Expt. Sta.). (*Jour. Agr. Res. [U. S.]*, 61 (1940), No. 3, pp. 237-240).—A method suitable for machine calculation for finding the c values of Fisher (E. S. R., 80, p. 604) and regression constants.

Report of the Secretary of Agriculture, 1940, H. A. WALLACE (*U. S. Dept. Agr., Sec. Agr. Rpt., 1940, pp. IV+184*).—The principal findings in this report are noted elsewhere in this issue.

Science and the land: Sixty-first Annual Report of the New Jersey State Agricultural Experiment Station and Fifty-third Annual Report of the New Jersey Agricultural College Experiment Station for the year ending June 30, 1940, W. H. MARTIN (*New Jersey Stas. Rpt. 1940, pp. [1]+151, figs. 16*).—The experimental work not previously referred to is for the most part noted elsewhere in this issue.

Fifty-third Annual Report [of Cornell Station], 1940, C. E. LADD ET AL. (*[New York] Cornell Sta. Rpt. 1940, pp. 79-195*).—The experimental work reported is for the most part noted elsewhere in this issue.

Science serving agriculture: Biennial Report [of Oklahoma Station, 1939-40], W. L. BLIZZARD ET AL. (*Oklahoma Sta. Bien. Rpt. 1939-40, pp. XV+190, figs. 61*).—The experimental work not previously referred to is for the most part noted elsewhere in this issue.

Farm research in South Dakota: Fifty-third Annual Report [of South Dakota Station, 1940], I. B. JOHNSON ET AL. (*South Dakota Sta. Rpt. 1940, pp. [2]+95, figs. 13*).—The experimental work not previously referred to is for the most part noted elsewhere in this issue.

Fifty-second Annual Report [of Texas Station], 1939, A. B. CONNER ET AL. (*Texas Sta. Rpt. 1939, pp. 304*).—The experimental work not previously reported is for the most part noted elsewhere in this issue.

Research aids Utah agriculture: Biennial Report, Utah Agricultural Experiment Station, 1938-1940, R. H. WALKER (*Utah Sta. Bul. 294 (1940), pp. 119, figs. 58*).—The experimental work reported is for the most part noted elsewhere in this issue.

Epistle to the farm: [Biennial Report of West Virginia Station, 1939-40], C. R. ORTON (*West Virginia Sta. Bul. 298 (1940), pp. 40, figs. 21*).—The experimental work not previously referred to is for the most part noted elsewhere in this issue.

NOTES

Colorado College and Station.—Homer J. Henney, chief of the program planning division of the U. S. D. A. Federal Crop Insurance Corporation, has been appointed dean of agriculture and director of the station beginning July 1.

Purdue University and Indiana Station.—Swine breeding projects in cooperation with the U. S. D. A. Regional Swine Breeding Laboratory have been initiated on the Pinney-Purdue Farm at Wanatah and the Herbert Davis Forestry Farm at Farmland. At the latter location an inbred strain of Chester White is being established and at the former an inbred strain from a foundation of Duroc-Landrace.

Gordon Fredine, biologist in charge of wildlife management and conservation in the Minnesota Department of Conservation, has been appointed associate in the department of forestry and conservation beginning April 1. Charles M. Kirkpatrick has been appointed instructor in wildlife management and conservation and assistant in the station vice J. C. Kase, who has accepted a position with the Indiana State Department of Conservation.

Kansas College and Station.—On March 15 a fire of unknown origin destroyed two frame buildings originally constructed by the Federal Government in 1918 to house enlisted men who were stationed at the college for training in vocational lines. One building was being used for teaching and investigational work in agricultural engineering, and the other had been converted into a small-animal laboratory building which provided space for the departments of animal husbandry, zoology, and bacteriology of the station. All records of the experimental work were stored in fireproof safes and were saved, and the greatest loss consisted of strains of guinea pigs developed through more than 20 years and used in animal genetics studies. Aside from the buildings the financial loss has been placed at \$16,840.

Dr. A. E. Schumacher has been appointed associate professor of poultry husbandry and associate poultry husbandman effective June 1.

Louisiana University and Station.—Dr. T. J. Arceneaux, assistant professor of agronomy, has resigned to become dean of agriculture in the Southern Louisiana Institute. Dr. Clara Tucker, professor and director of student teaching in home economics at the Texas State College for Women, has been appointed professor and head of the department of home economics.

Thomas H. Jones, station entomologist from 1920 to 1923, died at Morristown, N. J., on February 22 at the age of 55 years. A native of Rhode Island, he was graduated from the Massachusetts College in 1908. Aside from his work in Louisiana and 3 years as entomologist of the Puerto Rico Sugar Producers' Station from 1911 to 1914, he was associated with the entomological work of the U. S. Department of Agriculture, notably that with gypsy moth parasites. At the time of his death he was a senior entomologist in the Division of Forest Insect Investigations of the Bureau of Entomology and Plant Quarantine engaged in research on the Dutch elm disease.

Massachusetts College.—At the instance of the Associate Alumni, a bill has been introduced into the legislature to change the name of the institution to the University of Massachusetts. This bill has received a favorable report from the House Committee on Agriculture.

Following a clarification by the courts of the provisions of the Lotta Crabtree fund (E. S. R., 58, p. 601), increased aid to undergraduates expecting to engage in agriculture has been made available, 16 scholarships recently being awarded to members of the freshman class.

Michigan College and Station.—President R. S. Shaw is to retire on July 1 after 39 years' service and will be succeeded by John A. Hannah, secretary of the State Board of Agriculture.

Levi R. Taft, in charge of the horticultural work of the college and station from 1888 to 1909 and subsequently president of a commercial orcharding company, died in Petoskey, Mich., on February 12. Prof. Taft was born in Massachusetts on August 22, 1859, graduated from the Massachusetts College in 1882, and served as assistant professor of horticulture there for the following 3 years. In 1885 he accepted a similar position in the University of Missouri and received the M. S. degree there on leaving in 1888. In Michigan he was also appointed superintendent of farmers' institutes and State inspector of nurseries and orchards in 1902, continuing in the former capacity until 1917 and in the latter work until 1921, when he became chief horticulturist of the State Board of Agriculture for 5 years. As one of the pioneer station horticulturists he initiated much testing of varieties and similar work. Among his many writings may be mentioned Greenhouse Construction, 1891, and Greenhouse Management, 1895, both of which were standard college texts for many years.

Missouri University and Station.—W. S. Arbuckle, instructor in dairy husbandry and assistant dairy husbandman, has resigned to become assistant professor of dairy manufactures in the Texas College and Station.

New Hampshire University and Station.—Director John C. Kendall, prominently associated with the work of the institution since 1910, died March 16 at the age of 64 years. A native of New Hampshire, he was graduated from the college in 1902 and returned to it after 5 years as instructor and assistant professor of dairying and assistant in dairying in the North Carolina College and Station and 3 years as professor of dairy husbandry and dairy husbandman in the Kansas College and Station. His original appointment in 1910 was as director of the station, a position which he filled for nearly 30 years. In 1912 he also became director of extension. Much development of the agricultural work of the institution took place under his leadership. He was especially successful in bringing the institution in close touch with the people of the State, and this led logically in 1938 to his designation as director of the general extension service of the university.

Cornell University and Stations.—A luncheon illustrating the role of agricultural research in developing New York State food products was given at the university in honor of Governor Herbert H. Lehman during his visit to the Thirty-fourth Farm and Home Week. All foods served at this luncheon were associated with research conducted at the Cornell and New York State Stations. The occasion received much publicity from the newspapers of the State.

Utah College and Station.—D. W. Pittman, professor of soils and associate agronomist, has been granted leave of absence to become specialist in soils for the Department of Agriculture of Iran (Persia). His work will be taken over by Dr. H. B. Peterson.

George A. Carpenter, research associate professor of agricultural economics, has been appointed extension agricultural economist vice Dr. O. J. Wheatley, who has accepted a position with the U. S. D. A. Farm Security Administration.

Virginia College and Station.—Dr. Paul B. Barringer, president from 1907 to 1913, died at Charlottesville on January 9, aged 84 years. A native of North Carolina, he was educated largely at the University of Virginia and from 1896

to 1903 was a member of its medical faculty. He was the author of *The American Negro, His Past and Future*, and other articles on the race problem.

Recent appointments include A. M. Baisden as superintendent of the new sub-station in Orange County and Dr. Allen D. Edwards as associate rural sociologist.

Washington Station.—Floyd B. Wolberg has been appointed assistant dairy husbandman with headquarters at the Western Washington Station vice Ralph E. Hodgson, resigned.

Wisconsin University and Station.—Professor Emeritus Ransom A. Moore, from 1895 until his retirement in 1936 associated with the agronomic and extension work of the institution, died February 26, age 80 years. Prof. Moore was a native of Wisconsin, grew up under frontier conditions, and was largely self-educated. Coming to the university as an assistant to Dean W. A. Henry, he developed the short courses and boys' and girls' clubs, established the first grain-breeding nursery in the State, and in 1901 brought together the short-course students whom he had trained in the technics of producing superior grains and forages into an organization of purebred seed growers known as the Wisconsin Agricultural Experiment Association, a medium which has functioned successfully for 40 years, for the dissemination of foundation seed stocks of pedigreed grains and improved forages produced by the station. When the agronomy department of the College of Agriculture was organized in 1903 he was made its chairman. In the words of a recent memorial by his colleagues, "under his leadership for 32 years agronomic research, teaching, and extension were motivated by an idealism that was imbued with practicality and an understanding of the realities of the urgent needs of Wisconsin farmers and Wisconsin agriculture."

Cold Spring Harbor Symposium on Genes and Chromosomes.—The 1941 symposium of the Biological Laboratory at Cold Spring Harbor, Long Island, N. Y., is to be held from June 18 to July 2. The general subject will be genes and chromosomes, including the structure of chromosomes as revealed by optical methods, salivary gland chromosomes, spontaneous and induced changes in chromosome structure, mutations, physical aspects and tools, and properties of giant molecules as related to chromosome problems.

New Journals.—The establishment of *American Journal of Veterinary Research*, published quarterly by the American Veterinary Medical Association at 600 South Michigan Avenue, Chicago, has been noted editorially (E. S. R., 83, p. 434). The initial number contains 18 articles.

Quarterly Journal of Studies on Alcohol is being published by the Journal of Studies on Alcohol, Inc., 4 Hillhouse Avenue, New Haven, Conn. The initial number contains several articles reporting the results of research, among them *The Influence of Alcohol on the Adequacy of the B Vitamins in the American Diet*, by N. Joliffe.

The Indian Journal of Entomology is being published semi-annually at New Delhi by the Entomological Society of India. It will be devoted to all branches of entomology. The initial number contains several articles of economic interest, among them *Entomology in India—A Retrospect*, by T. V. R. Ayyar.

Agronomia, a monthly journal of scientific agriculture, is being published at Habana, Cuba, as the official organ of the Society of Agriculture and Chemistry. The initial number contains among other material several original articles and the text of the fertilizer law of 1936.

The Conservation Volunteer is being published monthly at St. Paul, Minn., as the official bulletin of the Minnesota Department of Conservation.

INDEX OF SUBJECTS

NOTE.—The abbreviations "Ala.," "Conn.[New Haven]," "Mass.," etc., after entries refer to the publications of the respective State experiment stations; "Hawaii" and "P.R." to those of the experiment stations in Hawaii and Puerto Rico; "Can." to those of the experiment stations in Canada; and "U.S.D.A." to those of this Department.

- Abacá**—
bacterial wilt, 60.
mosaic, studies, 60.
wilt disease, 204.
- Abortion**—see also Bang's disease and *Brucella abortus*.
in sheep associated with recovery of *Listeria* from aborted fetuses, 672.
vibriotic, in Michigan sheep, 528.
- Acanthoscelides obtectus*, see Bean weevil.
- Acanthocephala** of wild ducks, 535.
- Accounting**, farm, see Farm.
- Acetillo** seed weevil, U.S.D.A. 784.
- Acer saccharophorum*, history of nomenclature of, 159.
- Acetate** rayon fibers, chemical identification, 717.
- Acetonemia** in dairy cattle, 388.
- Acetylsalicylic acid**, effect on ascorbic acid excretion, 427.
- Achromotrichia**, nutritional, factor curative of, 709.
- Acid-base balance**, diurnal variations in, 698.
- Acids**—
amino, see Amino acids.
fatty, see Fatty acids.
- Acrasieae**, communal nature of fruiting process in, 160.
- Acriflavine**, studies, Idaho 389.
- Acrobasis caryae*, see Pecan nut casebearer.
- Acrobasis juglandis*, see Pecan leaf casebearer.
- Acrobelloides enoplus* n. sp., on potatoes, 70.
- Acro-dynia**, cure of in young rats, 422.
- Acrothecium lunatum*—
on *Pennisetum typhoideum*, 200.
spores, 200.
- Actinomyces**—
action against disease-producing bacteria, 525.
sp., wide-range H-ion indicator produced by, 455.
- Actinomycetes**—
morphology and physiology, 342.
role, in soil, N.J. 735.
- Actinomycosis**, treatment, use of sodium iodide injections in, Ariz. 101.
- Acuaría hamulosa*, arthropod intermediate hosts of, 533.
- Adelges abietis*, see Spruce gall aphid, eastern.
- Adelphocoris rapidus*, see Plant bug, rapid.
- Adonia variegata* pre-dating on aphids, bio-nomics, 223.
- Adrenal(s)**—
cortex and carbohydrate metabolism, 697.
glands, pantothenic acid requirement, Wis. 693.
ox, isolation of oestrone from, 29.
- Adrenalin** tablets, subcutaneous implantation, effect on blood sugar and milk composition in lactating ruminants, 238.
- Aedes aegypti*, see Yellow-fever mosquito.
- Aeolopus tamulus*, intermediate host of gizzard worm, 533.
- Aeolus dorsalis* in Florida Everglades, 223.
- Aeolus mellillus*, life history, 357.
- Aerobacter aerogenes*, cell-free juices, formation of acetylmethylcarbinol by, 455.
- Agar**, tryptone-glucose-extract-milk, symposium on, 809.
- Agrarian**—
jurisprudence of Italian Court of Cassation, 256.
law in Italy, 256.
legislation and new civil code in Rumania, 256.
- Agricultural**—
adjustment, 256.
adjustment, acreage allotments, marketing quotas, and commodity loans, U.S.D.A. 687.
adjustment projects, objectives and procedures, Tex. 828.
byproducts, utilization, Idaho 293.
census, sample, suggestions for, in West, 255.
colleges—see also specific colleges.
social science courses required by, Tenn. 268.
colonization, Jewish, in Palestine, 691.
conservation in Okfuskee County, Okla. 681.
conservation program, experimental, in Licking County, Ohio, 260.
control measures, wartime, U.S.D.A. 250.
credit, Ark. 111, U.S.D.A. 687.
credit and farm mortgage indebtedness in State, Utah 828.

Agricultural—Continued.

- economic personnel, training and recruitment, 255.
- education, Pa. 545.
- engineering, *see* Engineering.
- experiment stations, *see* Experiment station(s).
- experimental designs, practical difficulties met in use of, 858.
- exports, methods of increasing, U.S.D.A. 687.
- finance in United States, 262.
- fires and dust explosions, U.S.D.A. 823.
- history, American, chronology of, U.S.D.A. 687.
- journals, new, 862.
- labor—
 - and tenancy, 256.
 - British program for, 681.
 - households, professional migratory, 119.
 - in era of change, U.S.D.A. 687.
 - income on farms in Centre County, Pa. 537.
 - problems of unemployment and poverty, 110.
- laborers, renters, share croppers, and day hands, trends in social and economic conditions, 401.
- laborers, tenants, croppers, and day laborers, policies for raising status, 401.
- law, papers on, 256.
- leases, Dutch law on, 256.
- machinery—*see also* Combines.
 - costs of, Ind. 256.
 - for soybean growers, 183.
 - notes, U.S.D.A. 823.
 - repairing, treatise, 109.
- Marketing Service, report of chief, U.S.D.A. 685.
- organization, old and new in, U.S.D.A. 687.
- outlook for 1941, Okla. 681.
- planning, county, and democratic telesis, 681.
- policy and science, U.S.D.A. 687.
- policy, essentials of, U.S.D.A. 687.
- policy since end of World War, U.S.D.A. 686.
- policies and programs, immediate backgrounds, 401.
- press, American, 858.
- problem of today, U.S.D.A. 687.
- problems, American, cultural setting, U.S.D.A. 687.
- production—
 - and trade, U.S.D.A. 256.
 - effect of technical progress on, U.S.D.A. 687.
 - marketing, consumption and trade, and wartime prospects, U.S.D.A. 256.
- products—
 - and byproducts for industrial use, U.S.D.A. 584.
 - cost of production, *see specific crops*.

Agricultural—Continued.

- products—continued.
 - government grading and marketing, value, 835.
 - indexes of prices, purchasing power, etc., Okla. 681.
 - industrial market for, U.S.D.A. 687.
 - marketing, *see* Marketing.
 - production and prices, La. 409.
 - production, changes in methods affecting labor organization, 401.
 - quality, reliability of retail prices as guides to, 110.
 - standardization and inspection, U.S.D.A. 687.
 - transportation by commercial truckers, Ind. 263.
 - use in California, 269, 547.
 - programs, governmental, role of land-grant colleges in, 267.
 - programs, governmental, working relations in, 834.
 - research—*see also* Research.
 - and a North Dakota live-at-home program, N.Dak. 287.
 - resources in western Box Elder County, Utah 828.
 - situation, Okla. 402.
 - statistics, U.S.D.A. 686.
 - surpluses and nutritional deficits, U.S.D.A. 686.
 - surpluses, wartime, of Danube Basin, U.S.D.A. 686.
 - tenancy, *see* Farm tenancy, Farm tenure, Land tenancy, and Land tenure.
 - workers, accessions in working and ownership of land, 110.
 - workers, migratory, earnings, income per family, educational attainment of children, and possibilities of adjustments, Ark. 681.
- Agriculture—
- American, and European war, U.S.D.A. 686.
 - American, first 300 years, U.S.D.A. 686.
 - and social insurance, 545.
 - and the war in Netherlands, U.S.D.A. 256.
 - and the war in Sweden, U.S.D.A. 410.
 - at Philadelphia meetings of A.A.A.S., editorial, 289.
 - Belgian, rural cooperation in, treatise, 262.
 - Department of, *see* United States Department of Agriculture.
 - electricity in, *see* Electricity.
 - Federal-State relationships in, 268.
 - in countries of western Europe, 411.
 - in primitive cultures, bibliography, U.S.D.A. 544.
 - in Russia, financing, 256.
 - in World War period, U.S.D.A. 686.
 - inter-American relations in, U.S.D.A. 686.
 - Italian, under Fascism and war, U.S.D.A. 540.

Agriculture—Continued.

- meaning of foreign trade for, U.S.D.A. 687.
- metallic salts and alkaloids in, Mich. 215.
- of Netherlands Indies, U.S.D.A. 256.
- of Utah, trends in, Utah 828.
- of Worcestershire, history and rural evolution, 410.
- relation to war and national defense, U.S.D.A. 827.
- southern, human relations in changing conditions, 266.
- southern, suitable crop patterns for changing conditions in, 178.
- transportation problem of, U.S.D.A. 687.
- tropical, bibliography, 718.
- Agrius anxius*, see Birch borer, bronzed.
- Agriotes mancus*, see Wireworm, wheat.
- Agromyza*—
- caerulea*, infesting sweetpotato seed in Puerto Rico, 74.
- obtusata*, parasite, life history and morphology, 225.
- Agronomists and entomologists, cooperation in plant breeding studies, 358.
- Agropyron smithii*, germination studies, 470.
- Ahasverus advena*, notes, Mont. 785.
- Air—see also Atmosphere.
- and its mysteries, treatise, 153.
- Airplane—
- disinsectization of, 361.
- spore traps for study of wheat rust migration, 483.
- Alabama argillacea*, see Cotton leaf worm.
- Alabama Station, report, 141.
- Alaska College, notes, 719.
- Alaska Station, notes, 719.
- Albumin, egg—
- high and low percentage of thickness, breeding for, 314.
- inheritance of quality, 748.
- injury, relation to biotin deficiency in ducks, 233.
- injury, vitamin H as curative factor, 284.
- quality, relation to humidity of storage, N.J. 794.
- Albuminuria in dairy cows, field test for, 671.
- Alcohol—
- power, from farm products, Iowa 678.
- vitamin A, preparation from rich fish-liver oils, 438.
- Alewives jordi*, treatment with vitamin B₁, P.R. 618.
- Aleyrodidae genera and subgenera, list, 500.
- Alfalfa—
- aphid, U.S.D.A. 784.
- as aid in reducing wireworm populations, Idaho 357.
- as sole source of protein in dairy rations, Utah 807.
- bacterial wilt, control, U.S.D.A. 633.
- bacterial wilt resistant strains, selection and propagation, Utah 771.
- bacterial wilt-resistant varieties, development, U.S.D.A. 751.

Alfalfa—Continued.

- breeding, Ariz. 33, Colo. 612, N.J. 751, R.I. 34, S.Dak. 752, Utah 753.
- breeding in Sweden, 321.
- carotene content, U.S.D.A. 662.
- caterpillar, biology and control, 647, La. 357.
- culture experiments, Ariz. 33, Mont. 612, Tex. 753.
- diseases in Mexico, U.S.D.A. 769.
- effect of nurse crops with, Idaho 319.
- fertilizer experiments, Ariz. 33, Idaho 319, N.J. 751, Okla. 752, Tex. 753.
- hay, artificially dried, vitamin A potency, 235.
- hay cut at three stages of maturity, effect on milk production, U.S.D.A. 807.
- hay, digestibility by bovines, 383.
- hay, hemicelluloses of, 7.
- hay phosphorus, availability to white rats, 657.
- hay, undercured, thermal decomposition, relation to spontaneous ignition, 728.
- hay v. mixed hay and grass silage for dairy cattle, Wash. 383.
- hopper, three-cornered, biology and control, La. 358.
- Improvement Conferences, reports, 324.
- insects, Utah 787.
- irrigation tests, Tex. 753.
- Ladak, test, Mont. 612.
- leaf meal as substitute for wheat by-products in broiler rations, Ind. 227.
- leaf meal, effect of differing mash levels in enhancing hatchability, R.I. 95.
- looper, Mont. 786.
- measurement of winter growth for grazing value, Ariz. 33.
- mosaic virus, comparative host ranges, 344.
- red clover, and sweetclover as hay crops, comparison, Ind. 178.
- response to boron, effect of soil conditions, 180.
- response to fertilizers and lime, W.Va. 754.
- response to phosphorus deficiency on certain soils, W.Va. 754.
- rhizosphere of, microbial population in, 447.
- seed production, relation to *Lygus* spp., U.S.D.A. 646.
- seed setting, 465, Ariz. 33.
- seed viability in, farm demonstrations as measure, 470.
- silage, see Silage.
- snout beetle, studies, 86, 371, [N.Y.] Cornell 786.
- stem blight, relation to *Phytophthora medicaginis* and *Ascochyta* sp., Utah 771.
- stubble, seeding of pasture mixtures in, Utah 753.
- symbiotic nitrogen fixation by, relation to bacteriophage of *Rhizobium* in, 21.
- uses, U.S.D.A. 35.

- Alfalfa—Continued.
varieties varying in susceptibility to wilt, relative nodulation of, 204.
variety tests, Ariz. 33, Idaho 319, Mont. 612, N.J. 751, Okla. 752, Pa. 464, Tex. 752, Utah 753.
weevil, 788, Mont. 786, U.S.D.A. 784.
weevil, larval parasite of, 653.
weevil, spread, U.S.D.A. 785.
weevil survey, U.S.D.A. 785.
- Algae—
blue-green, poisonous to livestock, Colo. 668.
green, pigments produced in darkness by, 743.
mixotrophic, relation between vitamin requirements and loss of synthesizing capacity, 742.
of Oklahoma, additions to, 446.
relation to nitrogen economy of soil, 739.
sexual substances in, 453.
thermal, chlorophylls and photosynthesis of, 165.
- Alimentation, mystery of, 549.
- Alkali—
disease of horses, experimental studies, 820.
land reclamation, Idaho 298, 825.
poisoning, 523.
soils, pH determination, 582.
- Alkaline soils, acidification, 338.
- Allium—
species, pungency, effect of variety and ecological conditions, [N.Y.]Cornell 759.
vegetable species, smut resistance in, 627.
- Almond(s)—
bud shattering, 480.
composition of shell, 727.
leaf and flower buds, marked histogenic differences in, Calif. 454.
- Aloe vera* leaves in treatment of burns, P.R. 618.
- Alpine rock crawler, Mont. 786.
- Alsine media* seed germination, 469.
- Alternaria*—
spp. on cotton seedlings and bolls, 774.
stem canker of *Antirrhinum*, notes, U.S.D.A. 342.
- Alyceclover—
adaptation, cultural needs, and uses, U.S.D.A. 324.
in Florida, cultural and fertilizer requirements, composition, and disorders, 324.
- Alysia ridibunda*, parasite of blowfly, studies, 224.
- Amanita muscaria* in Uruguay, 160.
- Amazon fly—
dry area race, introduction into Barbados, 650.
parasite of sugarcane borer in Louisiana, 368.
promising parasite of sugarcane borer, 494.
- Amblypelta cocophaga* cause of immature nutfall of coconuts, 791.
- Ambrosia beetle(s)—
studies, U.S.D.A. 784.
transmits Dutch elm disease, 357.
- American—
Association of Economic Entomologists, Cotton States Branch, history, 494.
Sociological Society, proposals for reorganization, 688.
Soybean Association, proceedings, 182, 755.
- Amino acids—
effect of ultraviolet light on, N.Y.State 582.
in oats, U.S.D.A. 725.
use by bacteria, enzymes concerned, 603.
- 4-Amino-2-methyl-1-naphthol and 4-amino-3-methyl-1-naphthol, vitamin K activity, 715.
- Ammonia, atmospheric, as primary source of nitrogen to plants, 297.
- Ammonium—
bicarbonate secreted by surgical maggots, healing properties, 524.
sulfate, production and agricultural use, U.S.D.A. 592.
- Amniotin and progesterone combinations, effect on uterine weight of rats and mice, 750.
- Amsinckia intermedia* nutlets, toxic to swine, horses, and cattle, 101.
- Anabasin—
concentration-mortality curves for solutions toxic to eggs of *Lygaeus kalmii*, 360.
tests against apple aphids, 364.
- Anabrus simplex*, see Cricket, Mormon.
- Anaerobes, nonsporulating, growth in synthetic media and extracts from corn silk, 169.
- Anaerobic infections, experiments with sulfa-pyridine administered against, 102.
- Anagyris*—
coccidiovorans, rearing, liberation and recovery at Lajas, P.R. 640.
fusciventris, parasite of long-tailed mealybug, 365.
- Analytical methods, referees reports, A.O. A.C., 1940, 728.
- Anaplasma ovis*, transmission to blesbuck, 523.
- Anaplasmosis—
in Antigua, 246.
ovine, studies, 523.
relation to flies and mosquitoes, Okla. 786.
studies, Tex. 813, U.S.D.A. 813.
transmitted by tipping horns of cattle, 525.
- Anarhopus sydneyensis*, parasite of long-tailed mealybug, 365.
- Anarsia lineatella*, see Peach twig borer.
- Anasa tristis*, see Squash bug.
- Ancyliis fragariae*, see Strawberry leaf roller, American.

- Androgens—**
 endogenous, and liver, 174.
 ovarian, in mice, comparison with synthetic androgens, 30.
Androsterone, relation between volume of vehicle and chick comb response to, 318.
Anemia—
 equine infectious, immunologic reactions associated with, 675.
 hemorrhagic, in dogs, iron and copper v. liver in treatment, 276.
 infectious, U.S.D.A. 813.
 nutritional, studies, Miss. 427.
 of pigeons as a deficiency disease, 382.
Anemometer—
 cup, improved design, 586.
 new electronic, 586.
Anesthesia—
 and stimulation, protoplasmic nature of, 744.
 of fur-bearing animals, 213.
Aneurin, see Vitamin B.
Angiosperms, double fertilization and development of seed, 601.
Angitia cerophaga, notes, 225.
Angleton grass, breeding, Tex. 753.
Angleton grass, planting tests, Tex. 753.
Anguina australis n.sp., description, 70.
Animal(s) — see also Cattle, Livestock, Mammals, Sheep, etc.
 and products, imported, inspection and quarantine, U.S.D.A. 813.
 breeding and twins, research on, 456.
 chromosomes, see Chromosomes.
 diseases—see also *specific diseases*.
 foreign, continued exclusion, U.S. D.A. 813.
 in Canada, 814.
 laboratory diagnoses, Ind. 243.
 of genito-urinary systems, 668.
 progress in use of prontosils, sulfanilamide and sulfapyridine for, 243.
 studies, U.S.D.A. 813.
 domestic, from Formosa, parasites of, catalog, 214.
 experimental, methods of exposing to virus infection through mosquito vectors, 245.
 farm, breeding, growth, and inheritance, treatise, 794.
 farm, goiter in, prevention, Mont. 670.
 fats, see Fats.
 feed utilization, differences in individuals, Okla. 747.
 fur-bearing—
 anesthesia of, 213.
 reproductive cycle, U.S.D.A. 747.
 tomatoes and tomato products for, 93.
 identification by tattooing, 658.
 infected, individual isolation in single room, 524.
 licks, composition, 373.
Animal(s)—Continued.
 nutrition—
 function of manganese in, Pa. 507.
 papers on, 506.
 value of grassland products in, 796.
 parasites, see Parasites.
 plagues of North America, history, 524.
 production, heredity and environment in, 605.
 production of kidney stones on low-phosphorus diet, Wis. 693.
 reactions to environmental temperature, humidity, and air movement, 227.
 reproductive cycles in, 316.
 small, respiration apparatus for serial work with, 782.
 tissues, glycogen break-down and synthesis in, 697.
 tissues, protein bound ascorbic acid of, 710.
 wild, damage to seed and seedlings on cut-over Douglas fir lands, U.S.D.A. 641.
Anisandrus pyri in British Columbia, 505.
Ankothrips—
 genus, review, 790.
 notabilis n.sp., description, 790.
Annona anthracnose, 636.
Annulus zonatus, transmission from currant to tobacco, 628.
Anomala orientalis, see Oriental beetle.
Anopheles, see Malaria and Mosquitoes.
Ant(s)—
 Argentine, survey and control measures in Victoria, 654.
 bait containers, new type, 494.
 in golf greens and lawns, control, R.I. 75.
 v. codling moth, W.Va. 787.
 white, see Termites.
Antestia lineaticollis, two egg parasites of, 372.
Anthelmintic, equine, phenothiazine as, 531.
Anthelmintics, comparative tests, 396.
Anthers, excised, cultivation in nutrient solution, 598.
Anthonomus—
 grandis, see Bollweevil.
 grandis thurberiae, see Thurberia weevil.
 musculus, see Cranberry weevil.
Anthracnose, see *specific host plants*.
Anthrax—
 immunization of laboratory animals against, 523.
 inoculation against, saponin spore vaccine for, 101.
 symptomatic, see Blackleg.
 vaccines prepared from avirulent variants of *Bacillus anthracis*, use, 523.
Anthrenus—
 serophulariae, see Carpet beetle.
 voraæ, new parasite of, 372.

- Anthropology—
and agriculture, bibliography, U.S.D.A. 544.
cultural, and modern agriculture, U.S.D.A. 687.

 Arkansas Station, notes, 576.
 Arkansas Station, report, 718.
 Arkansas University, notes, 576.
 Armadillo, habits, Tex. 782.
Armillaria—
 in western Washington, 741.
 root rot, relation to soil temperature, 627.

Armyworm—

- beet, as tomato pest, Calif. 792.
 control, U.S.D.A. 366.
 fall, notes, U.S.D.A. 784.
 fall, on corn, control, P.R. 640.
 life history, in Mississippi, 366.
 southern, effect of ingested insecticides on midgut wall, 792.
 studies, Ind. 212, Mont. 786, U.S.D.A. 784.
Arotes amoenus, external morphology, 224.
 Arsenate-arsenite systems, in sand and soil mediums, oxidation-reduction potential, 302.
 Arsenic absorption by plants from soils under natural conditions, 22.
 Arsenic, distribution in soils and its presence in plants, U.S.D.A. 14.
 Arsenical substitutes, N.J. 786.
 Artesian basin, land overlaying, tile drainage not advocated for, Utah 678.
 Arthritis in swine, 388.
 Arthropoda, unexpected species, found in South Dakota, 499.
 Artichoke plume moth, predacious mite on eggs, 506.
Artona catowantha, parasites and hyperparasites of, 372.
 Asbestos fibers, chemical identification, 717
 Ascariid infestation in dogs, phenothiazine test in, 398.
Ascaridia—
 bonasae n.sp., description, 399.
 galli, efficiency of phenothiazine against, 252, 818.
 lineata eggs, thermal death points and heat tolerance, 789.
 lineata in ruffed grouse, 399.
 lineata, resistance of chickens to, following immunization, 252.
Ascaris—
 columnaris, parasite of raccoon, 783.
 equorum, test of phenothiazine against, 531.
 lumbricoides, anthelmintic activity of crystalline papain, 103.
 lumbricoides, anthelmintic activity of fresh pineapple juice against, 102, 103.
 suus eggs, effect of tropical sunlight on, 214.
Ascia rapae, see Cabbageworm, imported.
Ascochyta—
 bohemica on *Campanula*, 200.
 majalis on lily of the valley in United States, 628.
Ascochyta pentstemonii n.sp., on *Pentstemon* from California, 772.
 Ascomycetes—
 life histories, new data on, 593.
 new species on coniferous hosts, 779.
 Ascorbic acid—see also Vitamin C.
 and dehydroascorbic acid in milk, effect of commercial practices, 666.
 availability in food, method for study, 426.
 determination, 151.
 excreted at each urination during twenty-four hour periods, amount, 424.

- Ascorbic acid—Continued.
 excretion, effect of drugs on, 427.
 gastrointestinal absorption, in infants, effect of catharsis and diarrhea, 566.
 growth response of plants to, 20.
 in cabbage, effect of variety, season, and soil fertility, 422.
 in foods, Ga. 122.
 in goat's milk and blood, 236.
 in guinea pigs, excretion, absorption, and storage in, 283.
 in Indian gooseberries, 424.
 in lemon juice and in crystalline form. comparison of utilization by guinea pigs, 711.
 in parsnips, 423.
 in quick-frozen food, 694.
 in red raspberries and in crystalline form, comparison of utilization by college women, 425.
 in strawberries, varietal differences, 423.
 in turnip greens, changes during boiling under different conditions, 423.
 in urine, determination, 439.
 metabolism of college students, 424, Utah 711, 836.
 properties, food sources, and stability, 847.
 protein bound form, of animal tissues, 710.
 relation to tobacco mosaic virus, 635.
 requirement to maintain tissue saturation, 425.
 therapy of slow-breeding bulls, directions for, 508.
 values of blood and urine, effect of fever therapy, 137.
- Ash trees, response to soil fertility in station frames, Conn.[New Haven] 442.
- Asparagine and glutamine in beets and spinach, relative rates of production, R.I. 13.
- Asparagus—
 beetle, insecticides for control, N.Y.State 642.
 root development, effect of deep soil treatment, N.J. 758.
 spacing, [N.Y.]Cornell 759.
 tenderometer readings as index of quality, 833.
- Asparagus sprengeri*, macrosporogenesis and development of female gametophyte, 17.
- Aspergillus*—
flavus, bactericidal filtrates from, 23.
niger bombarded by low voltage cathode rays, variant strains induced by, 311.
niger, distribution in Germany, 342.
niger, yield, sporulation, and starch formation of, action of organic compounds on, 60.
 spp. in soils of Buenos Aires, 445.
 spp., isolated in Montevideo, identification, 160.
 spp., mutations and reversions in reproductivity with nitrite, colchicine and *d*-lysine, 21.
- Aspidiotus perniciosus*, see San Jose scale.

abortus, *see* *Brucella abortus*.
albolactis, contamination of high grade pasteurized milk with, 665.
anthracis, notes, 523.
genus, taxonomy, modes of spore germination, 169.
larvae, relation of proteolytic enzymes to phase of life cycle of, 793.
lentimorbus n.sp., description, 503.
mesentericus, variation in *Helminthosporium sativum* induced by toxic substance from, 490.
popilliae n.sp., description, 503.
species, phytopathogenic, redistribution, 59.
subtilis in milk, heat resistance, factors affecting, 808.
- Bacon—
Canadian Wiltshire, research on, 379.
curing, function of nitrate, nitrite, and bacteria in, 93.
prepared from carcasses of hogs fed different feed mixtures, quality, 509.
- Bacteria—
anaerobic, *see* Anaerobes.
and insects, biologic relations between, 74.
as colloids, 169.
cation adsorption by, 455.
cell stimulating, attenuation by specific amino acids, 603.
coliform and related, taxonomy, physiology, and morphology, [N.Y.]Cornell 806.
coliform, succinic acid formation by, relation to CO₂ utilization, 455.
disease-producing, soil as source of micro-organisms antagonistic to, 524.
- Bacteria—Continued.
distribution in lakes, 595.
growth, efficiency of energy utilization in, 311.
growth rate, photomicrographic study, 170.
growth, relation between food concentration and surface for, 312.
halophilic, growth, effect of protein concentration and cysteine, 726.
halophilic, growth in concentrations of sodium chloride above three molar, 726.
important to dairy industry, growth on new standard milk agar, 386.
in milk and soil, *see* Milk and Soil.
life and death of, 446.
luminous, physiology of luminescence and respiration of, 169.
marine, thermal sensitivity, 170.
photosynthetic purple, absorption spectra of water extracts, 16.
progress in study, 455.
recent electronmicroscope findings on, 430.
seed-borne, of crop plants, control, N.Y. State 630.
spore-forming, responsible for type A and type B milky diseases of Japanese beetle larvae, 503.
suspended in air, efficacy of ultraviolet light sources in killing, 22.
use of amino acids by, enzymes concerned in, 603.
use of hydrocarbons by, 745.
vitamin requirements, U.S.D.A. 663.
- Bacterial—
fungus antagonisms, 455.
growth, effect of onion juice, 603.
spores, germicidal activity of hydrogen peroxide on, 240.
- Bactericides in sera of fowl, 532.
- Bacteriologic culture media, *see* Culture media.
- Bacteriology—
dairy, papers, 239.
dairy, use of tributyrin agar in, 240.
elementary, textbook, 23.
implications of variability on species concept in, 455.
textbook, 23.
veterinary, textbook, 813.
- Bacteriolytins, natural, studies, 169.
- Bacteriophage(s)—
and legume bacteria, 168.
glycine an essential growth factor, 21.
in soil, U.S.D.A. 735.
sizes and methods for determination, 669.
- Bacterium*—
coli—*see also* *Escherichia coli*.
reduction of dehydroascorbic acid by, [N.Y.]Cornell 806.
malvacearum, relation to anthracnose boll rot of cotton, 629.
necrophorum strains, antigenic relations 390.

Bacterium—Continued.

- phaseoli* and bean mosaic virus, association, 628.
salicis, associated with willow water-mark disease, 489.
salmonicida, notes, 245.
tabacum invasion of tobacco leaves, mechanism, 627.
tabacum, notes, Pa. 480.
- Bactrocera cucurbitae**, see Melonfly.
- Badianus manuscript of Vatican library, an Aztec herbal of 1552, 445.
- Bacoanusia minor**, hyperparasite of black scale, Calif. 791.
- Bagasse dangerous as poulit litter, Okla. 802.
- Bahia grass, establishment, 36.
- Balanitidium** from swine, changes in dimensions upon cultivation, 249, 530.
- Balsamroot, arrowhead, composition, effect of stage of maturity, Idaho 372.
- Bamboo**—
 propagation and utilization, P.R. 618.
 scale predators, liberations, P.R. 640.
 scales, old infestations, *Kearfottia* n.sp. on, P.R. 640.
 species, susceptibility to powder-post beetle, tests, P.R. 640.
- Banana(s)—
 effect on disappearance of complex carbohydrates from alimentary tracts of children, 551.
 Gros Michel, fertilizer experiments, 476.
 industry in Caribbean area, U.S.D.A. 832.
 leaf spot due to *Cercospora*, P.R. 630. shade for, 486.
 leaf spot due to *Cercospora*, P.R. 630.
 plants, feeding value, 656.
 respiration during ripening at tropical temperatures, 764.
- Bang's disease—
 agglutination test for, Ind. 243.
 ceased reactor to, significance, 527.
 control, cooperative, calfhood vaccination as aid, 671.
 control in Illinois, 815.
 eradication and control, 246.
 eradication, benefits from, U.S.D.A. 104.
 in range cattle, Mont. 668.
 rapid or plate agglutination test for, effect of variations in technic, 527.
 relation to public health, 246.
 studies, 388, 818, Colo. 668, Ind. 243, Mont. 527, Tex. 813, U.S.D.A. 813.
 suppression, U.S.D.A. 813.
 vaccination for, 246, 388.
 worthlessness of Bowman's and 3-V tonic as remedies, Wis. 669.
- Barberry eradication for wheat stem rust control, U.S.D.A. 768.
- Bark beetles, trees killed by, salvage of timber in, 370.
- Barley**—
 breeding, Ariz. 33, Colo. 612, Mont. 612, N.J. 751, [N.Y.] Cornell 751, Okla. 752, S.Dak. 752, Tex. 752, U.S.D.A. 751, W.Va. 754.

Barley—Continued.

- corn and wheat, comparison in diet of chickens, 802.
 covered smut fungi, physiologic races, Idaho 342.
 covered smut, natural inoculation of seed with, 61.
 culture experiments, Mont. 612, Okla. 752.
 fall-sown, rough and smooth awned segregates in, winter survival and yield, 178.
 foot disease, new cause of, 773.
 grinding, for fattening swine, Okla. 795.
 improvement for industrial uses, aims and methods, 613.
 in greenhouse, growth and yield, effect of phytohormone dust seed treatment, 451.
 in lamb-fattening ration, Okla. 795.
 loose smuts, identification, and species integrity, 629.
 loose smuts in mixtures, detection, U.S.D.A. 768.
 mechanical injury to, causes, S.Dak. 823.
 mildew, new genetic factors for resistance to, 773.
 planting tests, W.Va. 754.
 plants, absorption of bicarbonate ion by, 595.
 respiration, formation of pyruvic acid in, 451.
 roots, excised, salt accumulation by, methods of sap expression for study, 307.
 seed, variations in trueness to variety and in productiveness, N.Y.State 616.
 variety tests, N.Dak. 180, N.J. 751, Okla. 752, Tex. 752, W.Va. 754.
 Velvon, new smooth-awned variety, Utah 466.
 winter, as corn substitute, Okla. 752.
 winter, merits as grain crop, N.J. 751.
 winter, rate of seeding, Ind. 179.
 yields in Delta area, Miss. 319.
- Barns, dairy, lighting, U.S.D.A. 823.
- Bartram, John and William, botanists and explorers, treatise, 593.
- Basisporium gallarum**, growth in corncocks, 629.
- Bassus stigmaterus**, new physiological races, P.R. 640.
- Bast fibers, classification and description, 570.
- Bathyplectes curculionis**, larval parasite of alfalfa weevil, 653.
- Batrissodes** new species, from South Carolina, 504.
- Bats, reproductive cycles in, 316.
- Bauhinia reticulata**, use as vanilla-supporting trees, P.R. 618.
- Bean(s)**—see also Mung bean Soybean(s), and Velvetbean(s).
Anguillulina dipsaci on, relation to weed hosts, 639.
 aphid, toxicities of optically active nicotine and nornicotines, 360.
 at different levels of nutrition, response to indoleacetic acid, 451.

Bean(s)—Continued.

- beetle control, R.I. 75.
- beetle, Mexican, insecticides for control, N.Y.State 642.
- beetle, Mexican, new pest in Louisiana, La. 357.
- beetle, Mexican, notes, Ind. 212, [N.Y.] Cornell 786, U.S.D.A. 784.
- Blue Lake pole, grown in Oregon, potentialities for New York State, N.Y.State 185.
- breeding, Mont. 612.
- breeding and selection for disease resistance, Ga. 60.
- broad, mineral deficiencies in, injection for diagnosis of, 449.
- canning, seed condition affecting stand, N.Y.State 619.
- canning, split seeds in, N.Y.State 618.
- curly top resistance in Great Northern U. I. 15 strain, 63.
- curly top, varietal resistance and susceptibility to, 58.
- disease-resistant, development, Idaho 342.
- diseases, insect transmission, Mont. 642.
- diseases, seed-borne, problems of, N.Y. State 202.
- embryos, isolated, effect of β -indoleacetic acid on, 452.
- fertilization, Ga. 44.
- grown in two localities of Michigan, vitamin B₁ in, 281.
- hard-shell seeds in, 469.
- leaf variegation in, inheritance, 629.
- leaves, starch hydrolysis following spraying with α naphthalene acetic acid emulsion, 452.
- lima—
 - bush, root-top ratio as index of adaptability to ecological conditions, 185.
 - fertilizer requirements for, 186.
 - fresh, frozen, and canned, methods for determining quality, 838.
 - germinating, chemical control of molds in, 469.
 - germination, abnormalities in, 470.
 - improvement, Okla. 757.
 - injury by *Empoasca fabalis*, P.R. 640.
 - seed treatment, N.Y.State 630.
- mosaic resistance in Great Northern U. I. 15 strain, 63.
- mosaic severity and control by resistant varieties, N.Y.State 630.
- new gray mold on, 60.
- phyllid flowers, morphological and anatomical features, 776.
- planting machinery, [N.Y.]Cornell 826.
- pod borer, lima, in Puerto Rico, P.R. 82.
- pod meal of broad beans, composition and nutritive value for ruminants, 229.
- pole, use of corn for supporting vines of, N.Y.State 618.
- pole, variety tests, Ala. 44.
- powdery mildew resistance, new factor for, 58.

Bean(s)—Continued.

- red kidney, variability in viability and uniformity of plants, N.Y.State 618.
- rust in Quebec, U.S.D.A. 199.
- rust, inheritance of resistance to, 58.
- rust resistance to physiologic races, 629.
- seedlings, effect of naphthalene acetic acid on mobile auxin in, 20.
- seeds soaked in water, decreased germination from, 16, 597.
- snap, carotene in, 847.
- snap, improved new strains, N.Y.State 618.
- snap, seed germination, effect of soil fumigants, Tex. 771.
- variety tests, Ga. 44, Pa. 472.
- weevil, longevity and egg production in, 505.
- wild, chromosome number, 28.
- Zenith, new variety, 719.
- Bear, damage to seed and seedlings on cut-over Douglas fir lands, U.S.D.A. 641.
- Beauveria*—
 - bassiana* spores for control of Japanese beetle, 651.
 - sp. from southern pine bark beetle, biology, 781.
- Beaver—
 - mountain, damage to seed and seedlings on cut-over Douglas fir lands, U.S.D.A. 641.
 - restoration, Tex. 782.
- Bedbug—
 - eggs, development, hatching, and mortality, relation to climate, 790.
 - experiments with liquid insecticides in houses infested with, 362.
 - fasting, longevity, 645.
- Beech—
 - bleeding canker, control, R.I. 60.
 - dying, near Philadelphia, associated with *Phomopsis* sp., U.S.D.A. 342.
- Beef—*see also* Cattle, beef.
 - buying by grade, U.S.D.A. 271.
 - Federal grading, U.S.D.A. 374.
 - grass-fed v. grain-fed, 226.
 - production, beginnings in, Miss. 372.
 - production on crested wheatgrass, brome-grass, and native range, Mont. 656.
 - quality, factors affecting, U.S.D.A. 794.
- Beehive covers, effect of color on temperature within, 87.
- Bee(s)—
 - adaptability of native plants for, Tex. 787.
 - changing pasture for, 224.
 - combs, moth pests of, 371.
 - female, biochemical aspects of differentiation, 505.
 - fly, immature stages, external morphology, 368.
 - foulbrood, *see* Foulbrood.
 - poison system of, 505.
 - queen, effect of feeding on weight, U.S.D.A. 784.
 - queen rearing, Tex. 787.
 - resistant to disease, U.S.D.A. 784.

- Bee(s)—Continued.
 serious losses of last few years, cause, Utah 86.
 studies, Okla. 786, Tex. 787, U.S.D.A. 784, Utah 787.
 toxicity of tartar emetic to, 654.
 wintering v. package, 371.
- Beet(s)—
 anatomical structure, effect of fertilizers on, N.Y.State 618.
 and spinach, relative rates of production of asparagine and glutamine, R.I. 13.
 boron deficiency in, 629.
 canning, boron requirements, N.Y.State 618.
 color and sugar content, environmental factors affecting, Conn.[New Haven] 471.
 field or fodder, *see* Mangel(s).
 harvesting machinery, Idaho 399.
 intensive production on sandy land, soil management for, Conn. [New Haven] 443.
 internal break-down. control with boron, 204, [N.Y.]Cornell 759.
 leaf sawfly, 788.
 leafhopper, control, Tex. 787, U.S.D.A. 784, Utah 787.
 leafhopper, mechanical protection of tomatoes from, Idaho 357.
 piles, storage losses in, Colo. 678.
 pulp, dried, v. mangel beets, comparison, on total-digestible-nutrient-replacement basis, [N.Y.]Cornell 805.
 quantity and distribution of different elements in, Utah 735.
 seed, selecting for germination testing, 469.
 seed, treated and untreated, germination, 470.
 single seed ball planting, Colo. 678.
 stocks, variability in viability and uniformity of plants, N.Y.State 618.
 sugar, *see* Sugar beet(s).
 top silage for fattening steers, N.Dak. 508.
 tops, nitrate content, Colo. 668.
- Beetle, fungus-eating, new to Puerto Rico, 357.
- Belladonna, growth effects of thiamin chloride, ascorbic acid, and phytohormones, 596.
- Bembix* wasps, enemies of sheep blowflies, 792.
- Bentgrass—
 breeding, R.I. 34.
 fertilization, comparison of nitrogen carriers for, 36.
 Raritan velvet, value for lawns, N.J. 751.
 varieties and strains, seed production, R.I. 34.
- Berberi remedies, Chinese plant, vitamin B₁ in, 703.
- Bermuda grass—
 introduced into Utah, Utah 43.
 lespedeza pasture production, fertilizers and limestone for, Ga. 34.
- Bermuda grass—Continued.
 pasture, value of manure and fertilizers for improving, Tex. 806.
- Berries, *see* Fruits, small, and Raspberries. Strawberries, *etc.*
- Beverages, sulfur in, 127.

 of world, check list, 213.
 of world, systematic classification, 492.
 ornamental woody plants attractive to, 213.
 trematode parasites from, in Louisiana, 668.
 Birth rate, rural, in Oklahoma, Okla. 834.
 Bison, American, in United States and Alaska, status, 213.
 Bisulfite binding substances—
 and thiamin deficiency, 706.
 in blood and cerebrospinal fluid, 705.
 Bitterweed—
 germination and longevity of seed and control, Tex. 753.
 western, control, 471.
Bitzea ingae on *Inga* spp., 632.
 Black disease and mastitis in sheep, Mont. 668.
 Black Hills beetle, U.S.D.A. 784.
 Black scale—
 control, 218.
 effect of sulfur on, U.S.D.A. 783.
 parasites, in Africa, Calif. 791.
 Blackberry (ies)—
 culture and disease control, Ill. 53.
 dwarf in boysenberries and youngberries, U.S.D.A. 342.
 new, introduction, U.S.D.A. 756.
 production, prices, returns, etc. N.H. 685.
 Blackfly (ies)—
 on turkeys, feeding activity, 650.
 Rocky Mountain, studies, 503.
 Blackleg aggrassin, serological studies, 104.
Blakeslea trispora, notes, 200.
 Blatchley, W. S., chronological account of work, and bibliography of his publications, 357.
Blattella germanica, see Cockroach, German.
 Blissus—
 hirtus, see Chinch bug, hairy.
 leucopterus, see Chinch bug.
 Blister beetle—
 black, effect of pyrethrum and derris, 369.
 control, S.Dak. 786.
 Blood—
 and cerebrospinal fluid, bisulfite binding substances in, 705.
 banked, prothrombin changes in, 715.
 capillary, micro-prothrombin test with, 568.
 carotene in man, effect of liquid petrolatum, 848.
 cell, red, as source of iron and bilirubin of blood plasma, 275.
 cells, red, in healthy young women, diameter, 415.
 coenzyme I level of, relation to dietary intake of nicotinic acid, 707.
 constituents of cattle, effect of atmospheric temperature, 229.
 cultures, buffered, 814.

- Blood—Continued.
 groups, studies, methods of securing blood from rats for, 456.
 human, lead in, 700.
 lead in, effect of calcium, phosphorus, and vitamin D, 699.
 of children, vitamin A in, relation to biophotometer tests, 559.
 of dogs, coagulation time, effect of hookworm infestation, 106.
 of fowl, erythrocyte, leucocyte, and thrombocyte count, determination, 532.
 of normal and mentally diseased men, calcium and phosphorus in, 846.
 picture, bovine, in health and under parasitism, 668.
 pyruvate in vitamin B₁ deficiency in man, effect of exercise on, 134.
 recent electronmicroscope findings on, 430.
 serum of fowls, bactericidins in, 532.
 sugar of fowls, effect of coccidiosis, 106.
 sugar values of rats receiving xylose or galactose, 844.
 vitamin B₁ in, estimation, 9.
- Blowfly (ies)—
 citronella oil for protection of lambs against strike, 248.
 destruction of larvae and pupae in carcasses and in soil, methods, 83.
 laboratory rearing for 200 generations, 83.
 of sheep, *Bombix* wasps as enemies, 792.
 parasite, indigenous, introduction into Uvalde County, Texas, 224.
 reared from struck sheep, analysis of results, 84.
 strike in sheep, prevention and treatment, 222.
- Blueberry (ies)—
 bud mite, a new pest, 74.
 canes, productive life of, N.J. 761.
 cultural requirements, N.Y. State 618.
 fertilization and soils for, N.J. 761.
 high-bush, culture in Rhode Island, R.I. 621.
 improvement, W.Va. 758.
 maggot, adaptability in respect to hosts, 222.
 protecting from damage by herring gulls, 212.
 types or species marketed in different sections, U.S.D.A. 762.
 varieties, N.J. 761.
- Bluegrass—
 bulbous, for reseeding intermountain ranges, 613.
 Canada, seed, sensitive to germinative conditions, 470.
 Kentucky, progeny test as measure of types of seed development in, 467.
 mineral composition, effect of soil type and treatment, 446.
- Boars, castration under chloroform anesthesia, 249.
- Bobwhite, *see* Quail.
- Body parts, differences in size, factors governing, 314.
- Bollweevil—
 and cotton leaf aphid control, combination of insecticides for, 494.
 control, La. 357, Tex. 787.
 control, effect of insecticides used for, on aphid and mirid infestations, 371.
 control, field test of timed poisoning schedules for, 494.
 control, insecticides tested for, 78, 371, 494.
 control, mixtures of calcium arsenate and sulfur for, 494
 control with calcium arsenates of different percentages of arsenic pentoxide, 86, 494.
 injury to cotton, alternative method of measuring, 494.
 migration, hibernation, and control, Tex. 787.
 studies, U.S.D.A. 784.
- Bollworm—
 biology and natural control, Tex. 787.
 insecticides for, tests, 78.
 oviposition, relation to flowering curves of food plants, 366.
 parasite, biology, 83.
 parasites in quantitative relation to bollworm populations in South Africa, 219.
 pink, diapause in, nature and origin, 81.
 pink, notes, Tex. 787, U.S.D.A. 784.
 spotted, and parasites, 788.
 studies, U.S.D.A. 784.
- Bombardia* n.sp. on dry twigs of *Thunbergia grandiflora*, 200.
- Bone—
 ash of chicks, effect of minerals and vitamin D on, 513.
 composition in extreme osteoporosis associated with hepatoma, 416.
 lead in, effect of calcium, phosphorus, and vitamin D, 699.
- Books on—
 agriculture, Belgian, rural cooperation in, 262.
 air and its mysteries, 153.
 animals, farm, breeding, growth, and inheritance, 794.
 bacteriology, 23.
 Bartram, John and William, 593.
 botany, 445.
 climate and acclimatization, 12.
 cooperation, Belgian rural, a study in social adjustment, 262.
 economics with applications to agriculture, 681.
 entomology, introduction to, 74.
 farm machinery, repairing, 109.
 food buying, 694
 food for the family, 694.
 food inspection, 270.
 histological and cytological technic, 100.
 home economics, functioning program, 268.
 insect transmission of plant diseases, 57.
 mammals, American, 70.
 marketing, elements of, 262.
 migrants, 692.
 milk distribution as public utility, 115.

Books on—Continued.

- mosquitoes, control, 219.
 nomenclature, zoological, 639.
 nutrition, essentials of, 841.
 parasitology, 100, 523.
 pigs, production in South, 231.
 plant diseases, 58.
 plant diseases, insect transmission, 57.
 plant protection, scientific principles, 341.
 plants, aquatic, 158.
 plants, culture in nutrient solutions, 25.
 poultry breeding, 511.
 poultry management, 231.
 rural life in process, 688.
 rural society, organization and changes, 411.
 statistical analysis, methods, 287, 858.
 statistical methods for medical and biological students, 287.
 statistical reasoning, 718.
 sugarcane, 183.
 synoptic meteorology, 441.
 veterinary bacteriology, 813.
 veterinary history, American, 100.
 virus studies, 631.
 weather analysis and forecasting, 441.
 wheat, world, planning and economic planning in general, 689.
- Borax on alfalfa and as herbicide, tests, Idaho 319.
- Bordeaux formulas for potatoes, N.J. 769.
- Boron—
 absorption by sunflower seedlings, 449.
 as plant nutrient, bibliography, 22.
 availability in soil and distribution in plants, 303.
 availability in soils, effect of liming, Ala. 13.
 availability, relation to soil moisture, [N.Y.]Cornell 759.
 copper, and manganese simultaneously determined in mixed fertilizers, 730.
 deficiency and internal cork of apples, 66.
 deficiency, effect on reproduction and lactation, Wis. 693.
 deficiency in apple, 210, [N.Y.]Cornell 769.
 deficiency in beets, 629.
 deficiency in crops, symptoms and diagnosis, 60.
 deficiency in plants of cabbage family, symptoms, Me. 633.
 deficiency in soils, Conn.[New Haven] 442.
 deficiency in soils, sunflowers as indicator, 468.
 effect on plant growth, N.J. 735.
 requirement of N.J. soils, N.J. 735.
 studies, R.I. 34.
- Botanical—
 explorations in Peru, historical résumé, 159.
 microtechnic, elements of, 169.
 Review, indexes, 593.
 Society of America, papers, 15.

Botany—

- during last hundred years, effect of microscope, 310.
 of Canadian Eastern Arctic, Pteridophyta and Spermatophyta, 593.
 of Oregon, bibliography with notes on botanical explorers of the State, 304.
 range and pasture, studies in, 159.
 textbook, 445.
- Botfly—
 horse, unpublished records of specimens, 221.
 sheep, larvae, control where winters are cold, 673.
 sheep, larvae, large-scale treatment for destruction, 673.
 throat, unpublished records of specimens, 221.
- Botryosphaeria ribis* on *Cercis* and *Benzoin*, U.S.D.A. 768.
- Botrytis cinerea* from pinewood soil, 202.
- Botulism studies, Mass. 124.
- Boxwood, varietal forms in, descriptive study, 159.
- Boysenberry (ies)—
 blackberry dwarf affecting, U.S.D.A. 342.
 canes, overwintered, canker and dieback disease, 58.
 training, 762.
- Brachyrhinus*—
ligustici, see Alfalfa snout beetle.
ocatus, see Strawberry root weevil.
rugosostriatus, notes, Utah 787.
- Bradycardia in rats, factors affecting, 703.
- Brambles, methods of protection and fertilization to reduce winter damage, Colo. 334.
- Brass, effect on milk flavor, 808.
- Brassica* species, pungency, effect of variety and ecological conditions, [N.Y.]Cornell 759.
- Brazil nut, composition of shell, 727.
- Bread—see also Flour.
 and bread ingredients, iron content, 293.
 doughs, free and bound water in, 546.
 improvement for Great Britain, 841.
 staling, progress in research in, 694.
 white and whole wheat, making with types of yeast and hard wheat flour, Wyo. 269.
- Breeding, see Animal breeding, Plant breeding, and specific animals and plants.
- Brevicoryne*—
brassicae, see Cabbage aphid.
 genus, table for separation of species, 501.
salizutis n.sp., notes, 501.
symphoricarpi, notes, 501.
- Bristle-grass, plains, seed germination, 43.
- Britton, W. E., tribute to, Conn. [New Haven] 575.
- Broccoli, vitamin C in, 135.
- Bromegrass, composition and growth habits, effect of environment, 36.
- Bromegrass, smooth, hay and seed yields, effect of ammonium sulfate on, Idaho 319.
- Bronchitis, infectious, studies, R.I. 101

- Brooder(s)—
 chick and pig, heating, U.S.D.A. 823.
 electric, design, Idaho 399.
- Brooks fruit spot control, fungicides and schedules for, N.J. 769.
- Broomcorn—
 breeding, Tex. 753.
 inheritance studies, Tex. 753.
 silage for dairy cattle, 384.
- Brown-tail moth, U.S.D.A. 784.
- Brucella*—
abortus—see also Bang's disease.
 bacterial dissociation in, 388.
 in blood stream and in serous swellings or hygromata, 815.
 infection, immunity to, 246.
 isolation from lymph nodes, 390.
 long-continued cultivation in chick embryos, results, 388.
 plate antigen, preparation, 390.
 soil micro-organisms antagonistic to, 525.
 strain 19, calfhood vaccination with, duration of immunity, 671.
 vaccine, behavior in various excipients, 669.
 culture media for, 815.
 group, capsule formation by, 245, 669, 815.
 group, protein-nucleate and components from, interaction with *Brucella* specific sera, 245.
 infection in cattle, agglutination test for, standardization and interpretation, 671.
 infection in swine, genetic resistance to, 388, 819.
melitensis, epidemic of brucellosis due to, 246.
- Brucellosis—
 epidemic, due to *Brucella melitensis*, 246.
 in cattle, vaccine to control, 388.
 in dog fed milk from Bang's disease infected cows, 531.
 in dog, sporadic case due to horse meat, 531.
 in horses and goats, 388.
 in horses, cases without clinical symptoms, 674.
 relation to periodic ophthalmia, 388, 674.
 twenty-five years' progress in study, 388.
- Bruchidae and parasites infesting seed pods of cowpea and wild plants, 643.
- Bruchus brachialis*, see Vetch bruchid.
- Bruchus pisorum*, see Pea weevil.
- Brumus suturalis* predated on aphids, biometrics, 223.
- Bryophyllum*, validity of genus, 600.
- Buckeye, California, distribution in Sierra Nevada, relation to honey production, Calif. 653.
- Buckwheat seedlings, effect of light, gravity, and centrifugal force, 448.
- Budmoth—
 control, N.Y.State 642.
 dormant and summer sprays for, importance, N.Y.State 648.
- Buds, dry preservation, in natural form and color, 602.
- Buffalo grass—
 and Sudan grass, comparison, Tex. 753.
 breeding, Tex. 753.
 culture experiments, Tex. 753.
 pasture, establishment, Tex. 753.
 seed, production and germination, Tex. 753.
 seed production, improvement, U.S.D.A. 751.
 seed, testing, 37.
 strains, composition, Tex. 753.
- Buffalo herd, albino, in Alaska, 172.
- Bulb scale mite, studies, U.S.D.A. 493.
- Bull(s)—see also Sires.
 associations, for providing service for high-quality bulls to small dairy herd, Idaho 383.
 physiology of reproduction, role of ascorbic acid in, 173.
 semen, preservation, methods, U.S.D.A. 662.
 slow-breeding, ascorbic acid therapy, directions for, 508.
- Bunostomum trigonocephalum* in sheep—
 and goats, life history, 101.
 anthelmintics against, 818.
- Bunt, see Wheat smut, stinking.
- Bupalus piniarius*, biology, 788.
- Burweed—
 control, Ariz. 33.
 life history, reproduction, and distribution on ranges, Ariz. 33.
- Butter—
 application of Burri smear technic to, Ind. 235.
 composition and deterioration, 240.
 Federal inspection, requires farm care, Miss. 141.
 flavor, effect of storage temperature, S. Dak. 806.
 graded, consumer reaction to, Ind. 235.
 Indiana, quality, factors affecting, Ind. 235.
 iron and copper in, determination, 151.
 keeping quality, incubation test as indication, [N.Y.]Cornell 99, Okla. 806.
 making, neutralization of cream for, Mich. 667.
 making, vacreating cream for, 522.
 mold mycelia count, 727, Ind. 235.
 mold mycelia in, significance, Ind. 235.
 pH value, effect of different neutralizers, Mich. 667.
 print, bacterial discoloration, 811.
 quality, effect of repeated washings and of intensities of working, Okla. 806.
 quality, factors affecting, Tex. 806.
 quality, from vacuum-pasteurized v. vat-pasteurized cream, Iowa 810.
 texture and flavor, effect of various feeds, Miss. 98.
 weedy cream flavor in, reducing, S.Dak. 806.
 yeast and mold counts, relation to bacterial count and phosphatase reaction, Ind. 235.
- Buttercup, large and small, poisonous to livestock, Colo. 668.

Butterfat—

- and vegetable oils, comparative nutritive value, 413.
- carotene added to, determination, Ind. 150.
- constants, effect of various feeds, Miss. 98.
- fat acid composition of, U.S.D.A. 663.
- globule, studies, 386, [N.Y.]Cornell 806.
- in milk, factors in cod-liver oil which lower percentage, [N.Y.]Cornell 805.
- melting time, relation to melting point, 98.
- neutralization value, determination, 151.
- of high vitamin A value, vitamin A requirements of dairy cows for production, 235.
- secretion, effect of fat intake and of fat components in ration, [N.Y.]Cornell 805.

Butterflies of Michigan, list, 82.

Buttermilk—

- cultured, effect of standardizing acidity in, Mo. 240.
- cultured, methods of improving, Mont. 662.
- pH value, effect of different neutralizers, Mich. 667.

Buying guides, consumer, U.S.D.A. 855.

Byturus unicolor, see Raspberry fruitworm.

Cabbage—

- aphid, notes, 501.
- ascorbic acid in, effect of variety, season, and soil fertility, 422.
- black rot epidemics, origin, U.S.D.A. 769.
- black rot, seed treatments for, Tex. 770.
- caterpillar, abundance of various species in Charleston, S. C., area, 494.
- caterpillar, notes, U.S.D.A. 784.
- Chinese varieties, classification, description, and culture, U.S.D.A. 331.
- classification according to extent of caterpillar injury, 494.
- clubroot, control with mercurials, 628.
- Copenhagen, effect of colchicine in doubling chromosomes, Tex. 757.
- diseases in Indiana, control, 347.
- family, boron deficiency symptoms in, Me. 633.
- fertilizer experiments, R.I. 34, Miss. 331.
- head shape, effect of environment, Tex. 757.
- leaves and aphids on, auxinic activity, 628.
- looper, control, Tex. 787.
- maggot in radishes and cabbage, control, Idaho 357.
- Marion Market, head shape in, effect of environment, 186.
- root maggots, control, R.I. 75.
- stems, developmental analysis, 760.
- tip burn, effects of potash, 628.
- transplanted, wax coatings on, deleterious effect, W.Va., 758.
- value of rye and vetch green manure crops for, W.Va. 758.
- variety tests, Miss. 331, Pa. 472.
- webworm, notes, Tex. 787.

Cabbage—Continued.

- wilt-resistant varieties, breeding, U.S.D.A. 757.
- yellows control by resistant varieties, N.Y.State 630.
- yellows resistant cauliflower varieties, N.Y.State 205.

Cabbageworm(s)—

- control, N.Y.State 365, Tex. 787, U.S.D.A. 784.
- green, control, R.I. 75.
- imported, biology, population density, etc., 792.

Cacao—

- diseases and pests, 200.
- pods in Grenada, maturation period, 335.
- transpiration and carbon assimilation in, 335.

Cacellus oecanthi, parasite of four-spotted tree cricket, 505.

Cacoecia argyrosplia, see Fruit tree leaf roller.

Cactus—

- giant, bacterial necrosis, 628.
- prickly-pear, biological control, 217, 329.

Cadelle, notes, Mont. 786.

Caesalpinia to *Carpinus*, host-parasite check list revision, U.S.D.A. 342.

Cajanus seed, catalase activity at different stages, 446.

Cake, high-sugar-ratio, relation of mixing methods and formula to quality and economy in, 414.

Calacarus adornatus on camelia, 655.

Calcium—

- and phosphorus metabolism in Indians on rice and on wheat diets, 416.
- and phosphorus requirements in Edwards Plateau, Tex. 814.
- arsenate and inert ingredients, compatibility, 627.
- assimilation, effect of orange juice on, 275.
- available, studies, Ga. 122.
- blood, of fowls, effect of parathyroid preparation on, 513.
- copper, zinc, and sulfur, studies, 582.
- cyanamide for pear thrips control in prune orchards, 642.
- effect on lead in blood and bone, 699.
- in blood of normal and mentally diseased men, 846.
- in diet, retention by children, 845.
- in gastric juice, 275.
- in relation to phosphorus utilization by crops, 179.
- ion, relation to sloughing of potatoes, 414.
- level of blood of fowls following theelin injections, 233.
- metabolic balance, in Eskimo children, 554.
- metabolism in rats and dogs, effect of mineral oil ingestion, 846.
- metabolism of fowls, effect of parathyroid preparation, 513.
- metabolism, studies with its induced radioactive isotope, 552.

- Calcium—Continued.
of dicalcium phosphate, utilization by children, 845.
retention by preschool children, 552.
retention in children, effect of lactose, 845.
role in iron assimilation, 553.
serum fractionation, in Ayrshire cows, 518.
serum, partition, at time of parturition in dairy cow, 518.
submicroquantities, estimation, 438.
sulfate, *see* Gypsum.
utilization, from various food mixtures, measuring, Conn.[New Haven] 547.
- Calendula seeds, tests, N.Y.State 624.
- California Station, notes, 288, 431.
- California University, notes, 288, 431.
- Calochortus*, factors affecting speciation in genus, 592.
- Calosoma* sp., feeding habits, 503.
- Calf(ves)—
beef, economy of a wintering, pasturing, and dry-lot finishing for, Idaho 372.
beef, fattening, cottonseed cake v. corn for use with oats, Okla. 795.
beef, production, Miss. 89.
brought in from ranges and placed on alfalfa pastures, control of death losses in, Ariz. 101.
effect of feeding vitamins A and D in concentrated cod-liver oil with hay, Vt. 235.
fattening—
comparison of feeds, Mich. 659.
free-choice feeding plan, Okla. 795.
hybrid v. open-pollinated corn for, Ohio 90.
on barley and molasses beet pulp, Mont. 655.
ration, barley v. No. 2 corn, Okla. 795.
value of mixed shelled corn and ground ear corn for, Ind. 226.
feeding of phosphorus supplement prior to weaning, 799.
from cows v. calves from heifers, Ohio 90.
Hereford, familial cerebellar hypoplasia and degeneration in, 247.
immunity to hookworm and nodular worm infection in, 394.
iron-treated cottonseed meal for, Ohio 90.
length of intestine, relation to absorption of nutrients from chyme, 662.
on pasture, adding supplement to corn for, Ohio 91.
performance, effect of breeding, Miss. 658.
quality of meat produced by, and record-of-performance studies of beef sires, Mont. 656.
raising on skim milk powder, Mont. 662.
scours, prevention, U.S.D.A. 662.
southern and western raised, parasitic hazards in New York, 818.
- Calf(ves)—Continued.
spring and fall, relative returns from fattening, 226.
triplet, are they identical?, 605.
vitamin A requirements, U.S.D.A. 662.
vitamin B group requirements, [N.Y.] Cornell 795.
winter feeding, green oat grazing v. sorghum silage, Tex. 796.
wintering, corn supplements with oat grazing v. silage for, Tex. 796.
- Camellia—
anthracnose, 627.
yellow spot, a virus disease, 58.
- Camels, feeding, 659.
- Campoplegidea* genus in America north of Mexico, revision, 371.
- Campsomeris* spp., beneficial Javanese, life history, 654.
- Canagire tubers as source of tannin, tests, Tex. 757.
- Canary(ies)—
apoplexy in, 253.
infected with *Plasmodium cathemerium*, development of acquired immunity in, 253.
Salmonella suispestifer infection in, 677.
- Canary grass, bulbous, hardy selection, Idaho 319.
- Candlenut, composition of shell, 727.
- Candy, whey solids in, 811.
- Canine distemper virus, infections produced in ferrets by, 243.
- Canna tops and tubers, feeding value, 656.
- Cannibalism among game birds in captivity, common salt as curative for, 213, 355.
- Cantaloup, *see* Muskmelon(s).
- Capillary fragility and ascorbic acid studies, 852.
- Capitophorus cefsmithi* n.sp., description, 363.
- Capons—
production and marketing, Iowa 382.
production on limited range, profit in, Okla. 802.
- Carabaos—
dairying possibilities, 518.
milk production, effect of concentrate feed, 518.
- Carabid beetles, feeding habits, 503.
- Carbohydrate(s)—
dynamic effects, Pa. 507.
enzymatic break-down and synthesis, 17.
metabolism during prolonged fasting in dogs, 124.
metabolism, symposium on, 697.
research, U.S.D.A. 725.
- Carbon dioxide, bacterial fixation, heavy carbon as tracer in, 170.
- Carex* genus, chromosome numbers and meiosis in, 313.
- Caribbean pod borer in Puerto Rico, P.R. 82.
- Carnation(s)—
bacterial disease, [N.Y.]Cornell 769.
bacterial wilt, 779.
basal blight, causal fungus, 61.
central bud rot, relations to *Pediculopsis graminum* and *Fusarium poae*, 352.

- Carnation(s)—Continued.
 control of onion thrips on, 645.
 culture in cinder and gravel for greenhouse flowering, 194.
 diseases, effect of cutting-bench treatments on, 628.
 flowering, and intermittent light, 337.
 in cold storage rooms, ethylene injury to, 339.
 potassium deficiency in plants, symptoms, 211.
 requirements for soilless culture, Ohio 765.
- Carneocephala flaviceps*, see Leafhopper, yellow-headed.
- Carotene—
 determination, adsorption method for, 731.
 determination, in presence of lycopene, 731.
 determinations of feeds, Tex. 657.
 in alfalfa hay, utilization by hens, Idaho 372.
 in artificially dried grass and hay, stability and estimation, 508.
 in colostrum from cows, 519.
 in fresh and frozen vegetables, determination, 847.
 in grasses and clovers, 89.
 in hay, relation to color, Okla. 806.
 in market milk, 848.
 loss in carefully stored baled hay, Okla. 795.
 requirement of poultry, Idaho 372.
 soybean, chromatographic identification and biological evaluation, 731.
 vitamin A activity in different vegetable fats, Ind. 227.
- Carotenoid(s)—
 in liver of man and animals, 279.
 pigments, Ind. 150.
- Carpet beetle(s)—
 black, effect of paradichlorobenzene on feeding, 357.
 black, studies, U.S.D.A. 784.
 lures and traps to control, 79.
 resistance of treated textile fabrics to, test for, 650.
- Carpet grass pastures, production, effect of fertilizers, Tex. 753.
- Carpocapsa pomonella*, see Codling moth.
- Carrot(s)—
 edible tap root, developmental anatomy of, Calif. 455.
 growth and anatomical structure, effect of boron deficiency, 745.
 intensive production on sandy land, soil management for, Conn.[New Haven], 443.
Macrosporium leaf blight, Ariz. 59.
 stocks variability in viability and uniformity of plants, N.Y.State 618.
 weevil, N.J. 786.
- Carya* genus, host-parasite check-list revision for, U.S.D.A. 342.
- Caryospora*—
minima n.sp. description, 61.
putaminum, life history, characters, and taxonomy, 61.
- Caryota* to *Castanopsis*, host-parasite check-list revision, U.S.D.A. 630.
- Casein fibers, chemical identification, 717.
- Casein, light white, vitamin A in, 280.
- Cassava(s) —
 diseases and pests, 200.
 testing, Ariz. 44.
 treatment with colchicine, 310.
- Castanea*, host-parasite check-list revision, errata for, U.S.D.A. 768.
- Castilla* to *Celtis*, host-parasite check-list revision, U.S.D.A. 630.
- Castor-bean(s)—
 growth effects of thiamin chloride, ascorbic acid, and phytohormones, 596.
 irrigation tests, Tex. 753.
 leaf, cytophysiologic studies of petiolar nectaries, 745.
 plants, reactions of grasshoppers to, 645.
 variety tests, Tex. 752.
 wilt in Brazil, 211.
- Cat(s)—
 flea, distribution and hosts, 74.
 preovulatory development and changes in follicles, including maturation of ova, 315.
 tickicide and insecticide for, 655.
- Catalase and respiration, relation between, 16.
- Catana clauseni* n.sp., description, 223.
- Catana* new genus, erection, 223.
- Cataract in rats—
 failure of galactose given subcutaneously to produce, 698.
 fed galactose, effect of exercise on development, 417.
 galactose and xylose produced, blood sugar levels in, 844.
- Catenophora pini* n.g. and n.sp., description, 68.
- Cathemasia nycticoracis* n.sp., from herons, 641.
- Catharinaca mulleri*, *Neotiella catharinaea* on, 200.
- Cattle—see also Calf(ves), Cow(s), Heifer(s), Livestock, and Steer(s).
 artificial insemination—
 and semen storage for, U.S.D.A. 747.
 for breeding, advantages, limitations, and uses, U.S.D.A. 316.
 results from, Idaho 316.
 attacked by starlings in Plains States, 356.
 baby beef, production, creep feeding and purebred bulls for, S.Dak. 795.
 baby beef, winter-finishing on corn in different forms, comparison, Tenn. 230.
 beef—
 and dual-purpose, breeding and crossing, U.S.D.A. 747.

Cattle—Continued.

- beef—continued.
 - and dual-purpose, feeding, U.S.D.A. 794.
 - breeding herd, winter feed requirements, Ga. 89.
 - fattening rations, oats and cottonseed cake in, Okla. 795.
 - feeding tests checked at packing house, Colo. 374.
 - kudzu as grazing crop, Ala. 88.
 - prices, Ind. 265.
 - rotation and control grazing, Tex. 796.
 - sire performance studies, U.S.D.A. 794.
 - wintering on pasture, Miss. 372.
 - wintering, rations, Mont. 656.
 - young, on summer pasture, value of supplementary concentrates for, Ga. 89.
- breeding in Tanganyika Territory, 313.
- breeds, in Canada, history, 508.
- calcium and phosphorus deficiencies in, treatment and prevention, 229.
- dairy—*see also* Cows.
 - anatomical relations in, U.S.D.A. 662.
 - and beef, index of purchasing power, N.Dak. 537.
 - broomcorn silage for, 384.
 - carotene requirement for reproduction, Okla. 806.
 - diseases, 818.
 - reproductive efficiency, effect of fertilized pastures, Ga. 89.
 - stables for, N.Dak. 235.
 - value of yeast for, [N.Y.]Cornell 805.
 - vitamin A requirements, Tex. 806.
 - winter feeding, Miss. 385.
- diseases, *see specific diseases*.
- fattening rations; dried citrus peel and pulp in, Tex. 796.
- fattening, sweetpotato meal for, Ga. 89.
- fattening value of peanuts and vines in rations, Ga. 89.
- grubs, control with derris and cube washes, Ariz. 101, U.S.D.A. 493.
- grubs, notes, U.S.D.A. 784.
- grubs, unpublished records of specimens, 221.
- Holstein and Jersey, improvement in milk and butterfat production by use of proved sires, Idaho 383.
- identification by tattooing, 658.
- in tropical regions, effect of climatological factors, 658.
- income from, possibilities, Colo. 257.
- indigenous and exogenous, in semiarid regions of Union of South Africa, bionomic studies, 229.
- lacking vitamin A, vitamin C deficiency in, Wis. 669.
- length of gestation and birth weight, factors affecting, 798.

Cattle—Continued.

- outbreak of *Listeria* in, 391.
- parasites, Colo. 668.
- parasites, external, U.S.D.A. 784
- parentage determination in, 388.
- poisoning, *see* Livestock poisoning, Plant(s), poisonous, and *specific plants*.
- purebred, breeding experiments, U.S.D.A. 662.
- range beef, mineral and protein deficiencies in, Tex. 796.
- rate of grazing and effect on progeny, Mont. 656.
- Red Scindi, birth weights, 658.
- reproduction in, carotene requirements, U.S.D.A. 662.
- riboflavin and thiamin in rumen content, 799.
- rumen digestion in, 383.
- ticks, *see* Tick(s).
- zebu and high-grade European, comparative digestive powers, 229.
- Cauliflower—
 - black rot studies, N.Y.State 630.
 - diseases in Indiana, control, 347.
 - fertilizer for, [N.Y.]Cornell 759.
 - magnesium deficiency in, 186.
 - root maggots, control, R.I. 75.
 - varieties resistant to cabbage yellows, N.Y.State 205.
 - vitamin C in, 135.
 - worm control, nonarsenical dusts for, N.Y.State 365.
- Cecropia moth, parasites and hyperparasites of, 506.
- Cedar—
 - red, establishing stands of, Okla. 757.
 - red, rust-resistant, 354, W.Va. 771.
 - red, scale, notes, 75.
 - red, seedlings, injury by seed-corn maggot, 222.
 - rust, *see* Apple rust.
- Cedro shoot borer, U.S.D.A. 784.
- Celastrus scandens* new host for *Glomerella cingulata*, U.S.D.A. 199.
- Celery—
 - breeding, [N.Y.]Cornell 759.
 - breeding for blight resistance, Conn.[New Haven] 471.
 - growth, effect of large applications of nitrogen, 186.
 - heartburn v. boron deficiency in, Utah 771.
 - mosaic, western, 480, Utah 771.
 - plant, structure, effect of nitrate level in solution, R.I. 44.
 - root and storage rots, [N.Y.]Cornell 769.
 - storage rot, undescribed, 628.
 - variety tests, Pa. 472.
- Cell—*see also* Plant cell.
 - elongation, physiology of, 448.
- Celloidin sections, method for stamping serial numbers on, 18.
- Cellophane cover slips and method for mounting, 602.

Cellulose—

- crystalline, formation in plastids of living cells, 593.
- decomposition by aerobic organisms, 455.
- decomposition, microbiology, 603.
- industry, chemical cotton, development, 325.

Centipede, garden, notes, Pa. 495.

Centris californica n.sp., description, 793.

Centris rhodomelas n.sp., description, 793.

Centuryplant, histology and cytology, 602.

Cephalanthus to *Cissus*, host-parasite checklist revision, U.S.D.A. 768.

Cephaluros virescens on plants in southern Florida, 636.

Cephalosporium cinnamomeum n.sp. leaf spot of foliage plants, 353.

Cephalothecium roseum spores, 200.

Cephus pygmaeus, see Sawfly, European wheat stem.

Ceratostomella—

disease of sycamores, spread by pruning, U.S.D.A. 768.

tips and *C. montium*, ascospores, 629.

montium from lodgepole pine, 780.

multiannulata, heterothallism in, 311.

of planetree, transmission in asphalt wound dressings, 629.

pini, notes, 354.

plane tree disease, 639.

sp., effect on specific gravity and strength of pine wood, 490.

ulmi, dissemination, 357.

ulmi, inoculation of elms with, apparent recovery, 488.

ulmi isolated from elm wood of dish crates imported from England, U.S. D.A. 768.

ulmi, isolation from *Scolytus multi-striatus* stored at different temperatures, 370.

ulmi spores, microagglutination, 628.

ulmi, uninfected elm wood as source of bark beetle carrying, [N.Y.]Cornell 504.

ulmi, vascular invasion of American elm by, 627.

Cercospora—

genus, monograph, [N.Y.]Cornell 769.

leaf spot of bananas in Puerto Rico, P.R. 630.

leaf spot of peanut, sulfur dust for control, 628.

musae leaf spot of banana, control by growing under shade, 486.

nicotianae, conidial production in culture by, 634.

nicotianae on tobacco, recent research in Ceylon, 634.

oryzae in rice, inheritance of resistance to, 605.

oryzae, resistant factors to, in rice, linkage of, 629.

pittospori n.sp., description, 354.

Cereal(s)—see also Grain and specific grains.

and forage insects, U.S.D.A. 784.

and seed products, U.S.D.A. 725.

diseases and pests, 200.

Cereals—Continued.

grains, respiration, 744.

loose smut control, new seed-treating machine for, Okla. 770.

mosaic in Voronezh district of U. S. S. R. 203.

plants, growth from dry and soaked irradiated grains, 16.

root-rotting fungi, pathogenicity, effect of crop debris, 61.

rusts—see also Rust(s) and specific hosts.

studies, U.S.D.A. 629.

smut(s)—see also, Smut(s) and specific hosts.

new culture medium for germination of spores, 345.

sulfur in, 127.

Cerebrospinal fluid and blood, bisulfite binding substances in, 705.

Cestode, new, from a hawk, 783.

Cetiocysta new genus, erection, 499.

Cetorhynchus suturalis, little-known pest of onions, 788.

Chabertia—

larvae, third stage, accessibility to grazing animals, 816.

ovina, tests of various drugs on, 248.

Chaetananaphothrips orchidii on citrus fruit in Florida, 79, 645, 790.

Chaetocnema pulicaria, see Corn flea beetle.

Chaetodacus ferrugineus dorsalis, pupae, acclimation to low temperatures, 651.

Chalaropsis thielavioides, cause of black mold of rose grafts, 353.

Chalcidini in America north of Mexico, descriptions of new species, 654.

Chalcidoidea, Indian parasitic, biological notes, 225.

Chalcodermus aeneus, see Cowpea curculio.

Chalepus dorsalis, see Locust leaf miner.

Chamaecypris, *Phytophthora* disease of, 58.

Chaoborus lacustris, see Gnat, clear lake.

Chaparral association of northern Baja California, 593.

Chastek paralysis of foxes, prevention, Wis. 669.

Cheese—

American, acidoproteolytic cocci in, 239.

American Cheddar, manufacture, 522.

American, packed in small packages v. bulk, consumers' preference, Wis. 682.

bacteriology, defects of blue cheese, Iowa 522.

brick, bacteriology, 519.

brick, effect of washing curd in manufacture, Wis. 663.

brick, hooping and draining, new method, Wis. 663.

Cheddar, made from pasteurized milk, effect of bacteria on flavor, 241.

Cheddar, making, acidity measurement and relation to grading score, 811.

Cheddar, southern short-cure, quality, effect of various temperature exposures, Tex. 806.

Cheddar, yield and quality, effect of mastitis on, 811.

Cheese—Continued.

- cottage, manufacturing, effect of standardizing acidity in, Mo. 240.
 cottage, yield and quality, effect of breed of cattle, Okla. 806.
 curd, consistency, measuring at pitching point, 522.
 flavor, effect of starters, Pa. 517.
 hard, ripening process, 239.
 in consumer-size packages, 811.
 Limburger, industry in New York, N.Y. State 668.
 Limburger, made from pasteurized milk, quality, N.Y.State 99.
 making, measurement and significance of pH values in, 294.
 making, value of salt in, 242.
 moisture determination in, use of coconut oil for, 10.
 packaging, Wis. 663.
 production, N.Y.State 663.
 quality improvement, U.S.D.A. 663, 805.
 research, bacteriological methods in, 239.
 soft, preservation, application of frozen pack method to, 242.
 Swiss, moisture in, relation to quality and yield, 241.
 Swiss, starters, methods of handling, Wis. 663.
 types, propionic acid bacteria in, 239.
 varieties, improved by research, N.Y. State 241.
 vitamin A in, 281.
Cheilosporira hamulosa, efficiency of phenothiazine against, 252, 817.
 Chemical compounds having antihemorrhagic activity, 440.
 Chemistry as background for most agricultural research, N.Y.State 150.
 Chenopodium for eradication of worms in lambs, S.Dak. 813.
 Cherry (ies)—
 aphid, black, vector of narcissus mosaic, 642.
 bacterial canker, N.Y.State 630.
 breeding, Utah 758.
 cracking, effect of calcium sprays in reducing, Idaho 329.
 crinkle disease, 480.
 diseases in Ozark section of Arkansas, U.S.D.A. 769.
 improvement and outstanding seedlings, 760.
 Japanese, undescribed fungus on, 68.
 juice, new outlet for Utah's fruit crops, 547, Utah 123.
 juice preparations and blends suitable for beverages, Colo. 693.
 leaf mottle and lace leaf, Utah 771.
 leaf spot control, new copper spray for, 210.
 leaf spot, copper fungicides for control, 629.
 leaf spot, effective fungicides for, N.J. 769.
 leaves, photosynthetic activity, effect of fungicides, 210.

Cherry (ies)—Continued.

- little leaf control demonstrations, 486.
 little leaf, notes, Utah 771.
 maggot, rotenone sprays for, N.Y.State 642.
 Montmorency, twig growth in mutants of, 192.
 native red, destruction by *Leucococca laevicollis*, P.R. 640.
 new varieties, Pa. 471.
 orchards, cultural treatment, Mont. 617.
 pruning, W.Va. 758.
 rootstocks, mazzard and mahaleb, tests, 52.
 rootstocks, studies, Utah 758.
 rusty-mottle, a new virosis, 58.
 sour, juice yields obtainable from, Colo. 295.
 sour, pollen, longevity, 47.
 sour, propagation by piece-root grafting, 352.
 sour, quality and yield, effect of fungicides, 628.
 sweet, maturity studies, 333.
 twig disease, Japanese, 779.
 Chestnut—
 blight eradication, 480.
 blight-resistant, timber type, breeding for development, 780.
 blight-resistant varieties, 637.
 breeding, 637.
 seedlings, testing, Ga. 56.
 Chia, production tests, Tex. 752.
 Chia, seed production, P.R. 618.
 Chickadee, black-capped, eating tent caterpillars, 366.
 Chick(s)—
 baby, oestrogenic compounds for, relative potency, 463.
 baldness in, inheritance, Okla. 748.
 battery, proteins for rations, W.Va. 796.
 calcium-phosphorus ratio for, Ind. 226.
 comb response to androsterone, improvement in, with alcohol as vehicle, 318.
 comb response to androsterone, relation to volume of vehicle, 318.
 complex nature of alcohol precipitate factor required by 94.
 congenital goiter in, 510.
 deficiency disease in, prevented by *dl*-alpha tocopherol, 506.
 egg white injury, relation to deficiency of biotin, 233.
 embryo, functional disturbances, oxygen consumption as diagnostic symptom, 511.
 embryo, growth of viruses on chorio-allantois, 669.
 embryo, malposition, effect of vitamin A deficiency, 512.
 embryo, technic for intravenous inoculation of, 251.
 fiber requirement, Okla. 802.
 from eggs treated with oestradiol benzoate, sexual development, 32.
 growth and bone ash, effect of elemental sulfur on, 95.

Chick(s)—Continued.

- growth and feather development, effect of kind of grain in diet, 803.
 growth, effect of riboflavin supplements, 510, 514.
 growth, effect of ultraviolet irradiation on, Ind. 227.
 growth factors required by, 511.
 growth rate, effect of selenized grain, 511.
 nervous disorder of, 821.
 nutrition and vitamin B₁, 510.
 pellagra, prevention, pantothenic acid for Wis. 693.
 protein feeds for, values, Tex. 232.
 protein requirements, Tex. 796.
 relation of thyroid to thymus, 510.
 Rhode Island Red, color markings in, relation to sex and adult color, 463.
 sexing, auto-, accuracy, effect of barring gene in red to black down-color phenotypes, 510.
 sexing, four methods, 608.
 tolerance for soybean oil, 511.
 use of food elements by, Nebr. 94.
 use of selenium by, S.Dak. 802.
 viability and weight, effect of shipping and time of feeding, 511.
 vitamin A requirements, Pa. 507.
 vitamin A requirements, determined by nasal histology, 510.
 vitamin D requirements, Tex. 796.
- Chicken(s)—*see also* Chick(s), Cock(s), Cockerel(s), Fowl(s), Hens, Poultry, and Pullet(s).
 body louse, effect of phenothiazine, 74.
 broiler(s)—
 efficiency of feed utilization by breeds, 510.
 production, cross-breeding for, Ark. 655.
 starting and growing, use of mash developed by station, Ark. 655.
 value of alfalfa leaf meal in rations, Ind. 227.
 carcass quality in roasters, physical measurements, 510.
 fried and roasted, flavor of, effect of corn, wheat, and barley in rations, 837.
 fryers and roasters, composition, effect of corn, wheat, and barley in diet, 802.
 head louse, effect of phenothiazine, 74.
 market grades, checking with meat measurements, 515.
 meat production in, Utah, 796.
 meat quality, methods of measuring, S.Dak. 802.
 viability, relation to railroad shipment, U.S.D.A. 747.
- Children—*see also* Girls and Infants.
 body measurements, regional relations, Tex. 836.
 calcium metabolism experiments, 845.
 calcium retention in, effect of lactose, 845.
 dependent, in South Dakota, S.Dak. 692.
 energy metabolism, effect of tea on, Tex. 836.
 food allergy in, 843.

Children—Continued.

- food habits and physical condition, Me. 696.
 gastrointestinal response, variation in, 548.
 in Hawaii, hematologic values for, 551.
 Mexican school, growth, Ariz. 122.
 mineral and nitrogen metabolism, effect of fluid and of evaporated milk, 844.
 nursery school, health and development, 548.
 nutritional state in, estimation, 695.
 obese, growth and development, 272.
 preschool, caloric balances, effect of nitrogen in diet, 271.
 preschool, retention of calcium and phosphorus, 552.
 retention of calcium in diet, 845.
 school, dark adaptation in, Ga. 122.
 school, Oslo type meals for, 556.
 training for self-reliance, Nebr. 575.
 vitamin A deficiency in, cutaneous manifestations, 559.
- Chili wet rot due to *Choanephora cucurbitarum*, 200.
Chilocorus cacti, establishment of introduced species, P.R. 640.
Chiloplacus trilineatus n.sp., from diseased snapdragon cuttings, 70.
 Chinch bug(s)—
 false, notes, U.S.D.A. 784.
 hairy, notes, Pa. 495.
 populations in hibernation, U.S.D.A. 785.
 resistance of sorghum hybrids to, Okla. 786.
 resistance of sorghums, effect of fertilizers, 79.
 studies, Ind. 212, U.S.D.A. 784.
- Chinchilla(s)—
 infectious disease of, 398.
 raising in captivity, 213.
- Chinese families in Sungpan, dietary study, 271.
Chionaspis furfura, *see* Scurfy scale.
 Chipmunks, food habits, 782.
Chlorella—
 cells, growth-inhibiting substance produced by, 162.
 effect of light of high intensity, 598.
 significance of trace elements for, 595.
 vulgaris, pigments produced in darkness by, 743.
- Chlorides in feeding stuffs, determination 731.
 Chlorine gas as seed disinfectant, U.S.D.A. 774.
Chlorochroa—
 ligata, notes, Tex. 787.
 sayi, *see* Stinkbug, Say's.
- Chlorophyll—
 effect on activity of gonadotropic extracts, 459.
 pigments and photosynthesis, Ind. 150.
 preparations, criteria for purity of, 19.
- Chloropicrin—
 as promising nematocide, U.S.D.A. 768.
 effect in overcoming influence of previous crops, R.I. 13.
 to control soil pathogens, Tex. 770.

- Chloropids swarming in houses, 642.
 Chloroplasts, isolated, reduction of ferric
 ovalate by, 165.
 Chlorosis—
 and related mineral deficiency diseases
 of crops, Utah 771.
 due to magnesium deficiency, dolomitic
 limestone for control, [N.Y.]Cornell
 759.
 effect of lime in soil, Idaho 298.
 in grape, resistant varieties, tests, Colo.
 764.
 in grapes, trees, and shrubs, control by
 iron sulfate, U.S.D.A. 768.
 in Japanese azalea, 779.
 in lemons, Tex. 770.
 in pin oak, control, 780, N.J. 769.
 in roses and other plants, Tex. 771.
 in stone fruits, relation to calcium and
 potassium, Colo. 630.
 iron-deficiency, in sand cultures of *Derris*
 and fields of *Lonchocarpus*, P.R. 600.
Choanephora cucurbitarum, notes, 200.
 Chocolate milk drinks, suggested standards
 for, 523.
 Chokecherry—
 wild host of X disease, eradicating, 66.
 X disease, studies, 66, U.S.D.A. 59, 630,
 Utah 771.
 X-virus disease, first appearance in the
 State, R.I. 60.
 Cholera in ducks, value of chemically killed
 cultures for, 668.
 Choline for lactation and growth of rats,
 essential nature, 421.
 Christmas trees, black spruce, retarding
 needle fall on, 626.
 Chromosome(s)—
 and gene theory and cytology, 456.
 and genes, Cold Spring Harbor sympo-
 sium on, 862.
 complement, relation to cold resistance
 in plants, 604.
 in fowls, location of genes in [N.Y.]
 Cornell 747.
 number, effect of colchicine treatments
 and use in plant breeding, U.S.D.A.
 751.
 number in *Desmodium* and *Lespedeza*, 28.
 number in *Solanum* species in Buenos
 Aires area, 313.
 number in wild beans, 28.
 satellited and nucleoli, 745.
 Chrysanthemum(s)—
 diseases, control, 353.
 early-flowering, testing, Okla. 757.
 flower bud formation in, relation to tem-
 perature, 194.
 foliar nematode on, Conn.[New Haven]
 480.
 greenhouse, new varieties for cut-flower
 production, 720.
 requirements for soilless culture, Ohio
 765.
 root failure due to meadow nematode,
 Tex. 771.
 Verticillium disease in greenhouse, [N.
 Y.]Cornell 769.
Chrysobothris femorata, see Apple tree borer,
 flatheaded.
Chrysomphalus—
 anidum, see Red scale, Florida.
 aurantii, see Red scale, California.
Chrysotus chlanoflava n.sp., description, 221.
 Cicada, periodical—
 broods scheduled to appear in 1937,
 U.S.D.A. 785.
 notes, 217, U.S.D.A. 493.
Cicadula divisa, see Leafhopper, six-spotted.
 Cigarette beetle, U.S.D.A. 784.
Cimex lectularius, see Bedbug(s).
 Cinchona, culture, P.R. 618.
Cinnamomum burmanni, culture, P.R. 618.
 Cintractia—
 leucoderma, germination of chlamydo-
 spores, 23.
 species in flora of Argentina, supplement,
 772.
Cirphis unipuncta, see Armyworm.
 Citric acid, endogenous production, effect of
 diet, 126.
 Citrin occurrence in milk, 853.
 Citronella oil for protection of lambs against
 blowfly strike, 248.
 Citrulline, ability to replace arginine in diet
 of chick, 94.
 Citrus—
 aphids on, 363.
 byproduct wastes, disposal, U.S.D.A. 733.
 cold resistance in, due to varieties and
 other factors, 336.
 cultural practices, quarter century
 changes in, 335.
 dictyospermum scale infesting, 791.
 disease involving death of fibrous roots,
 210.
 diseases, control, Tex. 770.
 diseases in Uruguay, 635.
 diseases, symptoms, in Jamaica, and con-
 trol, 635.
 dry root rot, Ariz. 59.
 felt disease in São Paulo, cause of, 636.
 fertilization, Ariz. 44.
 fertilizer requirements, Ariz. 13.
 fruit(s)—see also Lemon(s), Orange(s),
 etc.
 development, effect of girdling, Tex.
 758.
 development of color in, 476.
 products, U.S.D.A. 725.
 products, commercial manufactur-
 ing methods, U.S.D.A. 732.
 respiration and color development,
 effect of emanations from several
 species of fungi, 23.
 vitamin C in, effect of nutrient de-
 ficiencies, U.S.D.A. 756.
 volatile products of. identification
 of acetaldehyde among, 193.
 wraps containing *o*-phenylphenol
 for, 778.
 genus, host-parasite check-list revision,
 U.S.D.A. 768.
 groves, plant bugs in, 646.

Citrus—Continued.

- Cryptognatha nodiceps*—
 establishment as scale predator, P.R. 640.
 shipment to Florida and Hawaii for liberation against coconut scale, P.R. 640.
- Cryptolaemus montrouzieri* for mealybug control in greenhouses, Mass. 500.
- Ctenocephalides canis*, see Dog flea.
Ctenocephalides felis, see Cat flea.
- Cuckoos, North American, life history, 73.
- Cucumber beetle(s)—
 and aphids, transmission of cucurbit viruses by, comparison, 627.
 control studies, 358.
 striped, insecticide tests against, 494.
 striped, notes, Mont. 786.
 studies, Ind. 212.
 western spotted, transmission of cucurbit viruses by, 789.
 western striped, transmission of cucurbit viruses by, 789.
- Cucumber(s)—
 breeding for disease resistance, Conn. [New Haven] 471, [N.Y.]Cornell 769.
 diseases in Indiana, 347.
 downy mildew, new copper compounds for, Conn.[New Haven] 480.
 Midget, new dwarf variety for pickling, 719.
 mosaic virus, comparative host ranges, 344.
 seedless fruits from varieties, 617.
 variety tests, Pa. 472.

- Cucurbit—
 diseases, caused by *Phytophthora capsici*, 347.
 insects, insecticide tests with, Colo. 642.
 mosaic virus, comparative host ranges, 344.
 powdery and downy mildews, in New York, U.S.D.A. 342.
 viruses, transmission by cucumber beetles and by aphids, 627, 789.
- Culture media—
 sterile, automatic zero pipette for dispensing, 603.
 sterilizing solutions of organic compounds used in, methods, 771.
- Culture of people of a Puerto Rican town, 690.
- Culture, southern, recent studies of, 688.
- Cuprous oxide and inert ingredients, compatibility, 627.
- Curclic spray, special, comparison of adhesives for, Conn.[New Haven] 495.
- Curculionidae and parasites infesting seed pods of cowpea and wild plants, 643.
- Curd, edible, water and dry matter in, 546.
- Curinus* sp., predator of scale insects, P.R. 640.
- Curly top virus strains, 58, 627.
- Currant—
 black, flower midge, in Finland, 221.
 black, magnesium deficiency in, 777.
 diseases, N.Y.State 630.
 leaf spots, control, 66.
- Curcularia lunata*, notes, Tex. 770.
- Cuscuta* and its host, auxin in, 16.
- Cuterebra buccata*, notes, 221.
- Cuterebra cuniculi*, notes, 221.
- Cut-over land—
 cost of clearing, Idaho 319.
 recent settlement on, economic and sociological study, Idaho 402.
- Cutworm(s)—
 biology and control, N.J. 786.
 on velvet bentgrass, control, R.I. 75.
 pale western, Mont. 786, U.S.D.A. 784, Utah 787.
 studies, Ind. 212.
- Cycas revoluta* shoot apex, zonal structure and growth, 311.
- Cyclocephala immaculata* as test insect, 74.
- Cytas formicarius*, see Sweetpotato weevil.

 - on quinces, control with arsenicals, N.Y.State 642.
 - parasites, importation, rearing, and colonization, U.S.D.A. 88.
 - parasites in Japan and Chosen, introduction into United States, U.S.D.A. 502.
 - relation of parasites to control, 73.
 - studies, 359, Conn.[New Haven] 495, Ind. 212, U.S.D.A. 784.
- new, development by breeding, N.Y. State, 618.
- new varieties, for Utah gardens, Utah 620.
- plants, subtropical, distribution of auxin in, 17.
- plants, transplanted, effect of vitamin B₁ on, N.Y.State 618.
- preparation for freezer storage and how to use them, 415.
- production and marketing, [N.Y.]Cornell 827.
- retail demand for, 408.
- riboflavin content, 422.
- set and preharvest drop, effect of hormone sprays, [N.Y.]Cornell 761.
- small, industry in New Hampshire, charts and tables relating to, N.H. 685.
- small, of New Hampshire, markets and prices for, N.H. 263.
- small, production on toxic orchard soils, 185.
- small, varieties, Mont. 617.
- spraying and leaf injuries, W.Va. 771.
- spraying to reduce arsenical residue on, N.J. 760.
- stone, chlorosis, relation to calcium and potassium, Colo. 630.
- stone, viruslike diseases of, Utah 771.
- sulfur in, 127.
- sulfuring for drying, Calif. 440.
- testing, Okla. 757.
- tree(s)—
 - aftereffects of New England hurricane on, 297.

Fruit—Continued.

- tree(s)—continued.
 - bearing, duration of pruning effects, [N.Y.]Cornell 761.
 - diseases and pests, 200.
 - leaf roller, control, N.Y.State 642.
 - leaf roller, recent spread, and recommended controls, 359.
 - magnesium deficiency in, 777.
 - nutritional requirements, N.Y.State 618.
 - phosphate nutrition, 475.
 - root injury and recovery, 66.
 - unproductive, effect of heavy applications of manure, [N.Y.]Cornell 761.
 - viroses and California regulatory laws, 58.
 - viruses, graft transmission, persistence and migration of, 59.
 - young, widening crotch angles, effect of indoleacetic and indolebutyric acids in, Idaho 329.
- tropical, studies, 764.
- use in food products, 584.
- variety tests, N.Y.State 618, Tex. 757, Utah 758.
- vitamin C in, 852.
- waxing, tests, 191.
- Fruitfly (ies)—
 - control, U.S.D.A. 784.
 - development, effect of low temperatures, 651.
 - Formosan, effect of winter temperature of Japan, 651.
 - pupal parasite, shipment to Dominican Republic, P.R. 640.
- Fuels, motor, U.S.D.A. 725.
- Fumigation—
 - double, time interval in, 790.
 - principles for insects in stored products, 79.
 - research, U.S.D.A. 784.
- Fungus(i)—
 - associated with cotton diseases, 774.
 - associated with *Dendroctonus frontalis* in killing shortleaf pines and effect on conduction, 354.
 - associated with grass seed, 470, 480.
 - brown rot in Britain, host plants, 201.
 - chemistry of, 596.
 - collections, important additions to, U.S.D.A. 768.
 - destructive, on plantain and violet in District of Columbia area, unusual collections, U.S.D.A. 199.
 - different toxicity ratings of compounds by, 628.
 - diseases of truck crops, U.S.D.A. 769.
 - filamentous, auxithals synthesized by, 304.
 - for thiamin assay, 22.
 - growth rate in presence of cocarboxylase, and moieties of thiamin, 742.
 - growth substances for, survey of literature, 20.
 - latent infections caused by, 481.

Fungus (i)—Continued.

- nutrition, 596.
 of Mount Shasta, host index, U.S.D.A. 60.
 of Mount Shasta, host index, additions, U.S.D.A. 769.
 of Venezuela, additions to, 593.
 parasitic, germination of spores, effect of relative humidity, 16.
 parasitism of economic insects by, 628, 790.
 recovered from dust of rice strawstacks, Tex. 770.
 sclerotial, on rice, physiological studies, 346.
 seed-borne, of crop plants, control, N.Y. State 630.
 species of phytopathological interest, 481.
 spores, micrographic studies, 160.
 spores surviving irradiation, effect of monochromatic ultraviolet radiation on growth, 16.
 survival in digestive tract of cattle, 772.
 wood-rotting, on apple trees, 351.

Fungicides—see also Sprays and specific kinds.

- copper, see Copper.
 effect on fungi in culture, rapid method of testing, 482.
 predicting protective value, in laboratory, 628.
 spore-germination tests, 202, 628, 629, studies, 345.
 tenacity, laboratory biological assay of, 344.
 testing in laboratory before field use, value, 481.

Fur-bearing animals—

- composition of vesical calculi, 820.
 parasites, in Illinois, 641.
 vitamin requirements, U.S.D.A. 794.

Fur—

- fiber(s)—
 classification and description, 570.
 research, problems in, 139.
 type of, 139.
 graying and other disturbances due to vitamin deficiency, 419.
 laws, 1939-40, abstract of, 213.
 Furniture carpet beetle, new parasite of, 372.

Furunculosis in Oregon fish, 245.

Fusarium—

- bulbigenum*—
blasticola in Argentina, 488.
lycopersici, single-spore isolates from, pathogenic and cultural variation, 777.
 on narcissus bulbs, control, 636.
 cross-inoculations from tobacco and sweetpotato, 629.
 foot rots of peas, N.Y.State 630.
 genus in Argentina, 481.
 juice obtained with a wet crushing mill, alcoholic fermentation by, 23.
lini, variations in, 627.

Fusarium—Continued.

- moniliforme* damaged corn, effect on nutritive value, 507.
moniliforme on cotton seedlings and bolls, 774.
niveum, synthesis of biotin and thiamin by, 304.
orthoceras, notes, 211.
oxysporum cubense, growth in soil, 631.
oxysporum f. 3, cause of abacá wilt, 204.
scirpi acuminatum on carnation in Argentina, 61.
vasinfectum on pimiento peppers, 64.
 wilt of tomato, resistance of Riverside variety to, 65.
 wilt organisms, 627.
 yellows of sugar beet, Mont. 630.

Fusicladium dendriticum, see Apple scab.*Fusicoccum amygdali*, cause of peach canker, 628.

Galactose, failure to produce cataract in rats, 698.

Galerucella xanthomelaena, see Elm leaf beetle.*Galerucida bicolor* on yams, bionomics, 504.

Gall midges—

- attacking seed heads of cocksfoot, 221.
 oviposition in, affecting seed production in grasses, 792.
 separation of species, 225.

Galls, insect, and their producers, 497.

Game—

- animals, insects of forest floor available as food for, 70.
 big, inventory of United States, 212.
 preserve, national, Sullys Hill, North Dakota, 213.
 survey in northeastern Tennessee, 213.

Garbage disposal, municipal methods as related to spread of trichinosis, 393.

Garden beetle, Asiatic, parasites of, U.S.D.A. 503.

Gardenia(s)—

- bacterial disease, [N.Y.]Cornell 769.
 bacterial leaf spot, 779.
 bud formation, abscission, and flower production, effect of light and temperature, 195.
 cultural requirements, [N.Y.]Cornell 765.
 culture, U.S.D.A. 476.
 flowering, effect of root temperatures, N.J. 765.
 grown in nutrient solutions, mineral deficiency symptoms of, 211.
 new leaf spot and canker, 627.
 requirements for soilless culture, Ohio 765.

Gardening, solution, treatise. 25.

Garlic—

- cloves, selection and disinfection for planting, Tex. 770.
 drying, Tex. 823.

Garment plants in three types of communities of Mississippi, women employed in, 692.

Gars, summer food habits, Tex. 782.

- Gasoline, chemistry of, Iowa 678.
- Gastric juice, calcium in, 275.
- Gastritis, parasitic, effect of phenothiazine, 396, 817.
- Gastrophilus* —
- inermis*, unpublished records of specimens, 221.
 - intestinalis*, see Botfly, horse.
 - nasalis*, see Botfly, throat.
 - spp., test of phenothiazine against, 531.
- Gelatin, effect on power of women to perform maximal anaerobic work, 843.
- Gene(s) —
- and chromosome theory and cytology, 456.
 - and chromosomes, Cold Spring Harbor Symposium on, 862.
 - interaction, dominance an incidental manifestation of, 604.
- Genera as natural units, 592.
- Genetics and Lysenko, 604.
- Genetics, modes of research in, 288.
- Geography contributions to land classification, Mo. 829.
- Georgia Station, notes, 142, 431.
- Georgia Station, report, 141.
- Georgia University, notes, 142.
- Geraniol —
- and eugenol mixtures, attractiveness to Japanese beetle, 357.
 - distillation, standard method for, U.S.D.A. 493.
- Geranium aphid, new, 363.
- Geranium leaf curl and mosaic, Wash. 353.
- Giardia ondatrae*, from intestine of muskrat, strains in, 103.
- Giardomyia rhododendri*, notes, 216.
- Gibberella* —
- fujikuroi*, biological antagonism to *Trichoderma viride*, 346.
 - saubinetii*, development in corn pith following stalk inoculations, 629.
 - saubinetii* survival in digestive tract of cattle, 772.
 - zeae* damaged corn, effect on nutritive value, 507.
- Gins, operating costs and financial conditions, Tex. 828.
- Girls —
- adolescent, diet of, 555.
 - individual growth records from birth to maturity, 696.
- Gizzard worm, arthropod intermediate hosts of, 533.
- Gladiolus —
- bulbs, dormant, oxygen intake and carbon dioxide output, 16.
 - corms, formation of β -*o*-chlorophenyl-gentiobioside from absorbed *o*-chlorophenol, 20.
 - corms, induced formation of β -gentiobiosides in, 20.
 - corms, sensitivity during artificially prolonged rest period, 593.
 - flowering, and intermittent light, 337.
 - thrips, studies, Ind. 212, U.S.D.A. 784.
 - thrips, summer sprays for control, Mich. 216.
- Glass —
- fibers, chemical identification, 717.
 - wool, as substratum in seed testing, Conn.[New Haven] 464.
- Gleditsia* —
- spp., diseases due to *Thyronectria austro-americana*, 68.
 - triacanthos*, bacteria associated with, 168.
- Gliricidia sepium*, use as vanilla-supporting trees, P.R. 618.
- Glomerella* —
- cingulata* —
 - Celastrus scandens* new host for, U.S.D.A. 199.
 - control on mango, 487.
 - on black pepper, control, 485.
 - gossypii* control by seed treatment with sodium hypochlorite, 484.
 - gossypii* on cotton bolls and seedlings, 774.
- Glutamine and asparagine in beets and spinach, relative rates of production, R.I. 13.
- Glutathione —
- effect on selenium toxicity, 524.
 - protective effect, on copper-induced oxidation of ascorbic acid in milk, 386.
 - role in breaking of rest period of buds by ethylene chlorohydrin, 19.
- Glycine, essential factor for growth of bacteriophage, 21.
- Glycogen break-down and synthesis in animal tissues, 697.
- Glycoside formation in plants from absorbed substances, 16.
- Glyphonyx recticillis* in Florida Everglades, 223.
- Gnat, clear lake, U.S.D.A. 784
- Gnathocerus cornutus*, notes, Mont. 785.
- Gnomonia ulmea*, notes, 637.
- Gnomonia veneta*, notes, 637.
- Gnorimoschema lycopersicella*, see Tomato pinworm.
- Goat(s) —
- and sheep breeds, crossing for fleece and meat production, U.S.D.A. 747.
 - Angora, grazing studies, Okla. 795.
 - Angora, notes, Tex. 796.
 - breeding, applications of reproduction physiology to, 314.
 - breeding, milk flavor important in, N.Y. State 235.
 - English, nonpathogenic amoeba in, 819.
 - fasting metabolism of, 373.
 - gastrointestinal worm parasitism acquired during winter season, 247.
 - milk and blood, ascorbic acid in, 236.
 - parasites, external, Tex. 787, U.S.D.A. 784.
 - toxicity of *Sartwellia flaveriae* to, 819.

- Goiter, congenital, in chicks, 510.
- Goiter in farm animals, prevention, Mont. 670.

- Golden oak scale, anatomy, biology, and effect on host trees, 647.
- Goldfish—
 death, caused by *Lernaea carassii*, P.R. 640.
 toxicity of new insecticidal compounds to, U.S.D.A. 784.
- Golf greens, increase of potash losses from, by heavy ammonium sulfate applications, Ind. 179.
- Gonadotropic—
 extracts, effect of chlorophyll on activity, 459.
 extracts, effectiveness, modification of, 176.
 extracts, reaction of immature female guinea pigs to, 460.
 hormone(s)—
 destruction while exerting action on ovaries, 460.
 failure to increase fertility of sterile cows, [N.Y.]Cornell 747.
 of discharged rabbit pituitary, restitution, relation to diet, 29.
 production of rats, effect of age and nature of injected hormone preparation, 175.
 pituitary antagonist, effect of heat on, 30.
- Gonadotropin—
 from pregnancy urine, mechanism of action, 176.
 from pregnant mare serum, electrophoretic homogeneity of, 316.
 from pregnant mare serum, highly purified, biological properties, 459.
 standards, international, comparison, 29.
- Gonads of hypophysectomized pigeons, effects of oestrone, testosterone, and pituitary extracts, 176.
- Goniocotes hologaster*, see Fluff louse.
- Gooseberry (ies)—
 diseases, N.Y.State 630.
 Indian, ascorbic acid in, 424.
 leaf spots, control, 66.
 magnesium deficiency in, 777.
 powdery mildew control, 66.
 southern, susceptibility to *Cronartium ribicola*, U.S.D.A. 769.
- Gopher, pocket—
 damage to seed and seedlings on Douglas fir cut-over lands, U.S.D.A. 641.
 distribution and variation in southwestern United States, Tex. 355.
 of Texas, Tex. 782.
- Gossypium* genus, taxonomic relations, 446.
 Gourds, useful and ornamental, U.S.D.A. 331.

- Grafting-wax melter, construction and operation, U.S.D.A. 758.
- Grain beetle—
 flat, Mont. 785.
 foreign, Mont. 785.
 saw-toothed, as pest of dried fruits, U.S.D.A. 783.
 saw-toothed, notes, Mont. 785.
- Grain(s)—see also Cereal(s) and Oat(s), Rye, Wheat, etc.
 area, cash, advisability of expanding, S.Dak. 828.
 crops, green bug damage to, 80.
 digestibility, effect of fineness of grinding, S.Dak. 806.
 diseases, seed-borne, problems of, N.Y. State 202.
 fall-sown, seedbed preparation for, Okla. 752.
 fields, annual weeds in, control, N.Dak. 471.
 foot and root rots in the Dakotas, U.S.D.A. 59
 germination, effect of fumigants on, 358.
 insect infestations, survey, 361.
 land, crown gall organism persistent in, U.S.D.A. 769.
 marketing, cooperation in, Iowa 408.
 marketing, cooperative, by local warehouses and elevators in Northwest, U.S.D.A. 541.
 mosaic disease virus, new, and its carrier, interrelations, 203, 646.
Pythium foot rot of, in Virginia, U.S.D.A. 769.
 rusts in Oklahoma, U.S.D.A. 342.
 rusts, unusual development in Oklahoma, U.S.D.A. 199.
 seed treater, Oklahoma hot-water, custom operation, 627.
 seed, treatment with mercury dust as protection against weevil damage, Ind. 179.
 selenized, effect on growth rate of chicks, 511.
 stored, insects of, U.S.D.A. 784.
 stored, pest control, U.S.D.A. 784.
 stores, new records of insects in, 361.
 white, use in poultry rations, Idaho 732.
- Granary, ever-normal, as insect problem, 358.
 Granary weevil, studies, 788, Mont. 785.
- Grape(s)—
 American, forty varieties tested for resistance to chlorosis, Colo. 764.
 American, survey of eight mineral elements and nitrogen in young leaves, 475.
 berry moth—
 control, Pa. 648.
 cultivation and insecticides for, U.S.D.A. 783.
 spray schedule for, Pa. 495.
 black rot on muscadines, Ga. 59.
 Concord, uneven ripening of, Okla. 757.
 criterion of maturity, search for, N.Y. State 622.
 culture, pruning and breeding at Fredonia Vineyard Laboratory, N.Y. State 618.
 Delaware, eight elements in young leaves, spectrographic determination, 763.
 diseases, European, 480.
 effect of rootstocks, Ark. 617.

Grape(s)—Continued.

- grown in Minnesota, biochemical studies, Minn. 437.
improvement and outstanding seedlings, 760.
juice-blending, Tex. 725.
juice, Concord, chemical study, 732.
leafhopper control, 359.
mature vineyard, causes of spoilage, U.S.D.A. 783.
moth, action of sex scent in, 788.
muscadine, cold injury to, Ga. 44.
muscadine, rooting, use of hormones in, Ga. 44.
production, prices, returns, etc., N.H. 685.
propagation and utilization, Tex. 757.
rootstocks, testing, Ariz. 44.
seedless Emperor, 335.
Tokay, heat required to bring to maturity, 193.
uneven ripening, cause, Ark. 617.
varieties, American, adaptability to southern conditions, 764.
varieties, 5-year test, many casualties in, Miss. 334.
vinifera, pruning, U.S.D.A. 756.
vinifera, somatic mutation in, 335.

Grapefruit—

- Arizona, changes in invert sugar and sucrose during ripening, 193.
fertilization in Arizona, 55.
indexes of maturity in, Ariz. 44.
Marsh, in Arizona, tree composition, yield, and quality, 623.
mottle leaf, zinc sulfate sprays for, P.R. 630.
nitrogen nutrition, relation to yield and quality, 623.
quality and yield, factors affecting, Ariz. 44.
ripening, effect of growth-promoting substance containing fluorescein dye, Tex. 757.
storage requirements, Ariz. 44.
storage rot, apparently undescribed, 58.
vitamin C potency, effect of maturation and cold storage, 564.

Grapevines—

- Pierce's disease of, 480.
transpiration rate, effect of electrolyte content of soil water, 741.

Graphidium strigosum, parasite of rabbit, 72.

Graphiola leaf spot of date palms, Ariz. 59.

Graphium rigidum, effect on specific gravity and strength of pine wood, 490.

Grappolitha molesta, see Fruit moth, oriental.

Grass(es)—see also Grassland, Lawn(s), Meadow(s), Pasture(s), etc.

- artificially dried, carotene in, 508.
at different stages of maturity, riboflavin in, 227.
breeding, Mont. 612, Utah 753.
carotene content, 89.
composition at various stages of maturity, and changes occurring during haymaking, 89.
composition, effect of weather, Okla. 752.

Grass(es)—Continued.

- conservation of nutrients by ensiling, artificial drying, and natural curing, Vt. 235.
dehydrated, in rations, effect, 510.
disease in Pacific Northwest, host index, U.S.D.A. 630.
diseases caused by *Helminthosporium* spp. not previously recorded in Britain, 632.
diseases, notes, R.I. 60.
effect of spring and fall grazing on forage production and seeding habits, Utah 754.
fine turf, compost materials for maintenance, Pa. 464.
fine turf, variety tests, Pa. 464.
foot and root rots in the Dakotas, U.S.D.A. 59.
forage, breeding for adaptation to southern conditions, 178.
forage, culture experiments, Mont. 612.
forage, disease control, 627.
forage, variety tests, Idaho 319, Mont. 612, S.Dak. 752, Utah 753.
green, best for calves, Miss. 89.
head smut, host specialization in, 482.
immature, effect of clipping and drying on yield and composition, Del. 6.
in southern agriculture, 178.
introduced, 1939-40 winter survival, Ga. 34.
iodine in, Tex. 727.
lawn and turf, fertilizer experiments, R.I. 34.
lawn and turf, variety tests, R.I. 34.
native, germination studies, Utah 754.
new, grazing tests, Tex. 753.
new, introduction for observation, Tex. 753.
of Arizona, Ariz. 17.
of Utah, annotated list, 446.
pasture, root development and response to day lengths and soil moisture, R.I. 34.
range, injury by desert termites, Tex. 787.
range, introduced and native, germination requirements of seed, 469.
resistance to melting out disease, Pa. 464.
seed, fungi associated with, 470, 480.
seed, native, testing at Kansas State seed laboratory, 470.
seed production in, gall midges affecting, 792.
seedlings, effect of nurse crop, S.Dak. 752.
selenium in, S.Dak. 727.
silage, see Silage.
small-seeded, uniform technic for analysis, 470.
variety tests, Okla. 752, Tex. 752.
western, drought resistance, 16.

Grasshopper(s)—

- baits, Okla. 786.
confused, life history, S.Dak. 786.
control. U.S.D.A. 784.

- Grasshopper(s)—Continued.
 control, electrocutor traps for, S.Dak. 786.
 control in British Columbia, use of oil sprays in, 362.
 control in Utah, 787.
 control, tests of poisons in baits for, 362.
 differential, stability of diapause state in egg of, 790.
 dinitro-*o*-cresol dust for control, 645.
 egg pods, predator of, external morphology of immature stages, 368.
 feeding on seleniferous vegetation, selenium content, 499.
 feeding to turkeys, 516.
 injury to wheat, relation to stem rust, 497.
 migratory, resistance of corn to, 645.
 Montana, control programs, Mont. 785. notes, Utah 787.
 population, effect of idle land on, 74.
 population of typical pastures in Blue-stem region of Kansas, 498.
 population, relation to tillage, Mont. 642.
 reactions to castor-bean plants, 645.
 species and distribution, in outbreaks. U.S.D.A. 785.
- Grassland—*see also* Grass(es), Meadow(s), and Pasture(s).
 biome, 594.
 experimentation, in Scandinavia and Finland, technic, 421.
 products, value, in animal nutrition, 796.
 research, N.Dak. 465.
 research in Australia, 321.
 vegetation, factors changing, 447.
- Grazing—*see also* Range.
 land, classification for future use and management, Mo. 829.
- Green bug—
 infestations, location by aerial survey, Okla. 786.
 injury in Oklahoma, airplane survey, 363.
 outbreak in Oklahoma, 80.
- Green manure(s)—
 action, N.J. 735.
 crops, effect on nitrogen, organic carbon, and pH of Coastal Plain soils, 301.
 crops, management on Norfolk coarse sand, effect, 590.
 crops, variety tests, Ariz. 33.
 for cotton and other crops, Tex. 753.
 response of crops in rotation and in continuous culture to, Okla. 752.
 studies, 179, Tex. 735.
- Greenhouse(s)—
 pests, insecticides for, 494.
 problems, application of biological control methods to, 358.
 soil, sterilizing, formaldehyde and steam mixture for, 203.
- Greenhouse(s)—Continued.
 temperature relations and control in, 734.
 thrips on citrus fruits, 645, 790.
- Grocery stores of Burlington, price variations among, Vt. 429.
- Grouse—
 damage to seed and seedlings on cut-over Douglas fir lands, U.S.D.A. 641.
 diseases, apparently fatal, 535.
 ruffed, endoparasitism in, 399.
 ruffed, fall foods of, Pa. 495.
 ruffed, new intestinal roundworm from, 399.
 sage, parasites of, 535.
 sharp-tailed, food habits, 492.
- Growth substances, *see* Plant growth substances.
- Grubs, white, *see* White grubs.
- Grylloblatta campodeiformis*, notes, Mont. 786.
- Guaiacol, effect in presence of barium and calcium, 166.
- Guava algal leaf and fruit spot, 636.
- Guinea pigs—
 ascorbic acid excretion, absorption, and storage in, 283.
 genetic studies on a species cross, 172.
 relaxation of pelvic ligaments induced by progesterone, 173.
 spayed, with hypothalamic lesions, failure of ovarian hormones to cause mating, 173.
- Gulls, herring, protecting blueberries from damage by, 212.
- Gum weed, poisonous to livestock, Colo. 668.
- Gymnosperms, vegetative propagation with indole acetic acid, 17.
- Gymnosporangium*—
cupressi, notes, 211.
 geographical distribution of genus, 201. in Oklahoma, 212.
juniperi-virginianae, cedars resistant to, 354.
 rusts in Maine and host relations, 772.
- Gypsum in—
 irrigation water, Ariz. 13.
 superphosphate, value for cotton, Ga. 34.
- Gypsy moth, U.S.D.A. 784.
- Habranthus* species, chromosomal determinations, Tex. 757.
- Habrobracon females, stinging of eggs, 224.
- Haemaphysalis bispinosa*, *Rickettsia* sp. isolated from, 103.
- Haematobia irritans*, *see* Horn fly.
- Haemonchus contortus*, *see* Stomach worms.
- Haemoproteus* from wild birds of Mexico, 214.
- Hair fibers, classification and description, 570.
- Halticus citri*, *see* Flea hopper, garden.
- Ham(s)—
 cured, dry, warm storage for, Miss. 381.
 curing, function of nitrate, nitrite, and bacteria in, 93.

Ham(s)—Continued.

frozen, curing, pumping as aid in, Pa. 507.

pickle curing, pumping as aid in, Pa. 507.

prepared from carcasses of hogs fed different feed mixtures, quality, 509.

Hambletonia pseudococcina, parasite of pineapple mealybug, recovery and redistribution, P.R. 640.

Hamburg steak, analyses, Me. 694.

Hare(s)—

Belgian, complete unequal twin in a teratomatous tumor of, 315.

snowshoe, *Euparyphium melis* as parasite of, 214.

snowshoe, population cycle on Lake Alexander area, 491.

Harelip in mice, effect of injection of antitritin G, 607.

Harlequin bug, control, Colo. 642, Tex. 787.

Harpalus sp., feeding habits, 503.

Hawk(s)—

asymmetry in sex glands, germ cell migration in relation to, 315.

marsh, seasonal food habits in Pennsylvania, 492, 495.

Hay—

artificially dried, carotene in, 508.

artificially dried, costs, U.S.D.A. 662.

at different stages of maturity, riboflavin in, 227.

carefully stored baled, carotene loss in, Okla. 795.

color in, relation to carotene, Okla. 806.

crop, mixed seedings of legumes and timothy v. straight clover for, Ind. 178.

crops, comparison of alfalfa, red clover, and sweetclover as, Ind. 178.

green, as source of vitamin A for calves, Pa. 517.

making, problems in, 319.

mixed, fertilizer experiments, R.I. 34.

mixed, residual effects from different levels of fertilizer, R.I. 34.

mixed, yields, effect of lime, manure, and commercial fertilizers, Ind. 179.

poor quality, nutritional deficiencies in, U.S.D.A. 662.

problems, with emphasis on quality, 226.

production and preservation, methods, [N.Y.]Cornell 752.

quick-cured, Okla. 795.

yield increase from phosphate applications, Pa. 442.

Hazlenut culture, pests of, 788.

Health—

administration and financing in rural New York, [N.Y.]Cornell 827.

public, and Bang's disease, relation, 246.

public, and foods, Mass. 124.

public, in national defense, 835.

relation to diet, 128.

Heart, abnormal bovine, 814.

Heartwater, immunity in, 523.

Heat—see also Temperature.

control, electronic relay for, 18, 602.

production, relation to protein, Pa. 507.

Heaters, orchard, operation of, Calif. 680.

Heifers—see also Cow(s).

all-roughage v. roughage and limited grain feeding, U.S.D.A. 662.

dairy, on summer pasture, value of supplementary concentrates for, Ga. 89.

dairy, protection of udders from Bang's disease, N.J. 813.

dairy, roughage as sole ration, N.J. 805.

effect of adding bonemeal and lime to rations, Tex. 806.

gains on bluegrass, alfalfa, and lespedeza pastures, W.Va. 807.

pastures for finishing, W.Va. 796.

Heliothis—

obsoleta, see Bollworm, Corn earworm, and Tomato fruitworm.

virescens, see Tobacco budworm.

Heliothrips haemorrhoidalis, see Greenhouse thrips.

Hellula undalis, see Cabbage webworm.

Helminth(s)—

of South Africa, 814.

parasites in sheep and anthelmintics used, 818.

serological reactions and species specificity, 245.

Helminthosporium—

leaf spot of corn, importance, Ind. 200.

tycopersici on tomato in Philippines, 635.

sacchari on lemon grass, 775.

sativum, variation in, induced by toxic substance from *Bacillus mesentericus*, 490.

sativum virulence on wheat seedlings, variability in association effects of other soil fungi, 482.

siccans, first record in Britain, 632.

sigmoideum irregular, notes, 346.

sp. on grasses, and tests of fungicides for, Pa. 464.

virulent, from Sudan grass seed, U.S.D.A. 768.

Hemicelluloses, U.S.D.A. 725.

Hemiptera-Heteroptera, of America north of Mexico, synopsis, 79.

Hemlock, vegetative propagation, 767.

Hemoglobin in blood of cattle, effect of atmospheric temperature, 229.

Hemoglobinemia, post-parturient, in cows, Utah 814.

Hemoglobinuria, nonspecific, and acute pulmonary emphysema of cattle, essential enterotoxemias, 388.

Hemophilus influenzae, human strains, effect on influenza virus infections, 530.

Hemorrhagic septicemia, see Septicemia.

Hemp, manila, see Abacá.

Hemp, sunn, production tests, Tex. 752.

Hens—

carotene requirements, Tex. 796.

first annual rest, factors affecting duration, 510.

- Hens—Continued.
 flocks of, effect of thyroxine injections on social order in, 461.
 laying—*see also* Egg production.
 bioelectric potential as indicator of ovulation in, 316.
 composition and quantity of feed v. composition and quantity of body fat and eggs produced, 510.
 effect of feeding dyes to, 95.
 feeding, Okla. 382.
 lability of metabolic processes in, 94.
 manganese requirements, breed difference in, 95.
 mortality among, 251.
 protein requirement, Okla. 802.
 rations, dried skim milk and soybean products in, Ind. 227.
 rations for, Ariz. 89.
 on vitamin B-deficient diet, intestinal yeast flora of, 228.
- Herb vegetable seeds, classification and germination, 470.
- Herbage plants, breeding, in Scandinavia and Finland, 321.
- Herbage, yield and composition, effect of fertilizers, Tex. 753.
- Herbarium labels, use of outline maps on, 18.
- Herbicides, penetration, rate and mode, 43.
- Heredity—
 and environment in animal production, 605.
 of baldness in Chicks, Okla. 748.
 of egg shape, Pa. 507.
 of intelligence and temperament in dogs, U.S.D.A. 747.
 of leaf variegation in beans, 629.
 of pink eye in fowls, 29.
 of resistance in mice increased by 10 generations of selective breeding, 456.
 of resistance to *Cercospora oryzae* in rice, 605.
 of tail abnormality in mice, 457.
 of wheat rust resistance in H-44 and Hope wheats, 313.
 of yellow bill color in ducks, 457.
- Heron, eastern little green, new species of cestode from, 103.
- Herpetology of Florida, 213.
- Hesperidin, effect on albino rats, 843.
- Hessian fly—
 parasites, other hosts of, 505.
 resistance, transference from Marquillo spring wheat to winter wheat, Kans. 502.
 studies, Ind. 212, U.S.D.A. 784.
 survey, U.S.D.A. 785.
- Heterakis gallinae*—
 efficiency of phenothiazine against, 252.
 eggs, thermal death points and heat tolerance, 789.
 embryonation of eggs and infectivity of larvae, effect of freezing temperatures, 244.
- Heteroauxin and growth of meristems of *Brassica*, 453.
- Heterodera marioni*, *see* Root knot nematodes.
- Heteroderes laurentii*, *see* Wireworm, gulf.
- Heteroptera-Hemiptera of America north of Mexico, synopsis, 79.
- Heterosis and plant growth hormones, 17.
- Hexuronic acid, *see* Ascorbic acid.
- Hexylresorcinol, effect in presence of barium and calcium, 166.
- Hickory shuckworm on pecan, control and parasites of, U.S.D.A. 783.
- Hides and skins, U.S.D.A. 725.
- Highways, *see* Road(s).
- Hippelates*, *see* Eye gnats.

Hypera—*brunneipennis*—

- habits and characteristics, 86.
- notes, U.S.D.A. 784.
- on Yuma Reclamation Project, 86.

postica, see Alfalfa weevil.

Hyporaspis bellotti predators, liberations at Rio Piedras, P.R. 640.

Hyphomycetes, new, preying on free-living terricolous nematodes, 212.

Hypocrella fluminensis n.sp., description, 23.

Hypoderma lineatum, see Cattle grub.

Hypomyces—

ipomoeae, white perithecia and taxonomy, 343.

origin and inheritance of M types in, 58.

Hypophysectomy, effect on chick embryo, 608.

Hypophysis, see Pituitary.

Hypopteromalus tabacum, important enemy of *Apanteles congregatus* in tobacco fields, 506.

Hypotrichosis in rat, hereditary, 457.

Hypoxylon pruinautum, cause of poplar canker, 780.

Hypsipyla grandella, U.S.D.A. 784.

Hythergraph, application to distribution of natural vegetation types, 296.

Ice cream—

as it reaches the consumer, comparative evaluation, 100.

bacteria in, taxonomic study, 387.

body, texture, and quality, Ind. 235.

experimental properties of mix and quality of resulting product, Mo. 812.

lactose-nuclei formation in, [N.Y.] Cornell 806.

manufacture, N.Y.State 663.

manufacture of plain skim milk for, 242.

manufacture, use of frozen fruits in, Utah 806.

mixes, basic viscosity and procedure to obtain it, 243.

mixes, homogenization, homogenizers compared, 100.

mixes, pan condensed, composition and properties, relation to hydrometer readings, 243.

mixes, protein stability and effect on properties, 811.

mixes, whipping properties, U.S.D.A. 663.

pasteurization requirements for, minimum, 523.

samples, analyses, Me. 694.

sampling, accurate method for, 523.

skim milk of different treatment for, 667.

stabilizers, status, 523.

store, retail, modern trends in, Mo. 410.

technical literature, 243.

texture and structure, analysis, Mo. 387.

utilization of dairy byproducts in, U.S.D.A. 663.

Ice, melting in roof gutters and downspouts, soil heating cable for, Idaho 399.

Ichneumon nigrivarius, parasite of, 788.

Ichneumonidae of New England, studies, 224.

Ichthyosis of chicks due to vitamin deficiency, Wis. 669.

Idaho Station, notes, 719.

Idaho Station, report, 430.

Idaho University, notes, 719.

Idiocerus clypealis in North Sind, change in status, 788.

Ilang-ilang, essential oil studies, P.R. 582.

Illegitimacy in rural Utah, Utah 121.

Illinoia pisi, see Pea aphid.

Index numbers of—

prices and purchasing power of farm products, Okla. 402.

prices received by North Carolina farmers, N.C. 544.

production, price, and income, Ohio 110, 827.

Indian-meal moth, Mont. 786.

Indian men, basal metabolism of, 416.

Indiana Station, notes, 432.

Indiana Station, report, 287.

Industrial worker, adequate nutrition for, 695.

Infants—see also Children.

ascorbic acid absorption in, effect of catharsis and diarrhea, 566.

breast-fed and artificially fed, antirachitic effects of various milk treatments, 712.

epiphyseal ossification in, effect of conditions of diet and health, 844.

growth, effect of vitamin B₁ supplement, 849.

Influenza, human, virus, infections produced in ferrets by, 243.

Inheritance, see Heredity.

Inhibin, injections, effect on oestrous cycles in rats, 610.

Inositol—

crystalline, isolation from organic phosphorus compounds of soils, 158.

effect on yeast growth, 22.

Insect(s)—see also Entomology.

activity at light traps during various periods of night, 79.

affecting greenhouse plants, 642.

affecting man and animals, U.S.D.A. 784.

affecting ornamental and nursery plants, control, N.Y.State 642.

and control methods, discussion, 78.

as vectors of onion yellow dwarf, 364.

beneficial, introduction into Hawaii, 496.

biochemistry, 74.

common names approved by American Association of Economic Entomologists, supplementary list, 74.

common names in different countries, 493.

control and climate, N.J. 786.

control and weather records, W.Va. 787.

control in Union of South Africa, 790.

control measures, regional and community adaptations of, 358.

control, relation to sulfur and sulfur compounds, [N.Y.]Cornell 786.

cucurbit, insecticide tests with, Colo. 642.

destructive, losses due to, 215.

entomophagous, bionomics, 789.

entomophagous, notes, 496.

Insect(s)—Continued.

entomophagous, searching for, 357.
 forest, *see* Forest insect(s).
 gall-causing, parasites of, 361.
 immunity and serotherapy of, 215.
 injurious to crops, *see special crops*.
 intestine contents, pH and buffering power, 788.
 life, effect of abnormally cold winter on, Ga. 75.
 microbial flora of, 215.
 microbiology, 74.
 mimicry and applied entomology, 788.
 mount, Riker, history of, 75.
 mounting for student collections, new method, 494.
 notes for Costa Rica, U.S.D.A. 785.
 numbers, fluctuations in, 215.
 nursery, life history and control, 789.
 of cultivated plants in Guam, survey, 358.
 of forest floor available as food for game animals, 70.
 of Nigeria, food plants of, 358.
 of Puerto Rico and Virgin Islands—noctuid moths, synonymy and habitat, 219.
 orchard, *see* Orchard insect(s) and Fruit insect(s).
 outbreaks in Europe, 788.
 parasitism by fungi, 628, 790.
 pests in stored produce, fumigation principles, 79.
 population summary of Kansas, 495.
 reared from elm bark and wood, annotated lists, additions to, 78.
 rearing, glass tubes for, 358.
 resistance and tolerance to, cooperation of agronomists and entomologists in plant breeding studies on, 358.
 role in Indian agriculture, 215.
 role in potato pit scab, 789.
 scale, *see* Scale insects.
 secretion, U.S.D.A. 784.
 State collection, value, N.Dak. 493.
 stored-grain, recognition and control, 643.
 sucking, injurious to rose, 78.
 toxicology and control, contributions of insect physiology to, Calif. 496.
 transmission of plant diseases, 496.
 transmission of plant diseases, treatise, 57.
 wood-destroying, in public buildings in Sweden, 789.

Insecticidal—

dusts, improved method of applying, 643.
 plants, tests, P.R. 640.

Insecticide(s)—*see also* Spray(s) and specific forms.

abstracts of foreign and domestic patents relating to, U.S.D.A. 494.
 apparatus for applying, new or recently developed, 358.
 contact, penetration through pronotum of American cockroach, N.H. 360.

Insecticide(s)—Continued.

cryolite, titratable acidities and pH values, 74.
 detergents, wetting, dispersing, and emulsifying agents, U.S.D.A. 493.
 dispersion, new method for pyrethrum and rotenone in air, 643.
 liquid household, effect on oothecae of German cockroach, 498.
 materials of vegetable origin, survey, 215.
 new coal tar, description, 75.
 research, 345, U.S.D.A. 784.
 tests against apple aphids, 364.
 use on plants grown in nutrient solutions, 358.

Insemination, artificial—

and semen storage for cattle, U.S.D.A. 747.
 in livestock breeding, U.S.D.A. 316.
 of bees, U.S.D.A. 784.
 of cows, Vt. 235.
 of horses, U.S.D.A. 747.
 of mares, Mont. 608.
 technic, and measuring quality of semen, [N.Y.]Cornell 747.
 technic and methods, 610.
 use in progeny testing, 511.

Insurance, agricultural, one field of International Confederation of Agriculture, 110.
 International Confederation of Agriculture, annals, 110.

Intersexuality, experimental, effect of oestrogens on antenatal sexual development of rat, 750.

Iodine—

in salt and feeding stuffs, stabilization, 507.
 in water and feeding stuffs, Tex. 727.
 lack of in ration, effect on thyroid gland in lambs, Colo. 668.
 requirements of poultry, Colo. 655.

Iowa College, notes, 432.

Iowa Station, notes, 432.

Ips scedentatus, outbreak in spruce stands, 788.

Iris—

bulbous, *Phytophthora* blight of, 636.
 bulbous, principles of disease control applicable to, Ore. 211.
 ovaries, developing, cell size in, 592.
 variety tests, Pa. 471.

Iritis—

as manifestation of fowl paralysis, inherent resistance of White Leghorns to, 668.
 of fowls, transmission experiments with, 389.

Iron—

and copper in butter, determination, 151.
 and copper v. liver in treatment of hemorrhagic anemia in dogs, 276.
 for body needs, suitability of green leafy vegetables and legumes as sources, Miss. 127.
 in blood plasma, source of, 275.

- Iron—Continued.
 in bodies of rats under different conditions, total weight, Ariz. 121.
 in bread and bread ingredients, 293.
 metabolism, role of calcium in iron assimilation, 553.
 therapy and diet in hookworm control, 716.
 utilization by anemic rats, sex variation in, 276.
 utilization in dogs on milk diet, 553.
- Irrigation—
 agriculture, dependence on crop rotation and livestock, U.S.D.A. 751.
 canals, lining to save water, Utah 108.
 effect on movement of lime and salts, Idaho 298.
 experiments, *see special crops*.
 methods, improved, technical assistance to farmers in, U.S.D.A. 823.
 overhead and furrow methods, comparison, Okla. 757.
 overhead, improvement of equipment, Okla. 757.
 pumping and use, Idaho 399.
 pumping plants, small, U.S.D.A. 678.
 studies, U.S.D.A. 823.
 supplemental, U.S.D.A. 824.
 surveys, Utah 823.
 water, duty of, and return flow, Mont. 678.
 wells, rapid increase in, purpose of, survey by station, Colo. 824.
- Isobutyl methacrylate polymer as a mounting medium, evaluation, 18.
 Isocarotene, formula for, 728.
Isotaxis toddaliae on *Toddalia asiatica* transferred to *Elsinoë toddaliae*, 201.
Izodes cookei, parasite of raccoon, 783.
 Jack sperm, preservation of motility, 463.
 Jan(s)—
 making, use of sweetose in, 547.
 sugar tests on, 841.
- Japanese beetle—
 control, U.S.D.A. 783, 784.
 geraniol and eugenol mixtures, attractiveness to, 357.
 larva, growth of head capsule, 503.
 milky disease for control, N.Y.State 642.
 milky disease, new spore-forming bacteria causing, 503.
 milky diseases, status, 503.
 parasites and related Scarabaeidae in Far East, U.S.D.A. 503.
 parasites, colonization, in Eastern States, U.S.D.A. 785.
 parasites, liberations, in 1937, U.S.D.A. 785.
 promising fungus pathogen of, 651.
 retardation work in Maryland, new developments in, 74.
 studies, Conn.[New Haven] 494.
- Jaundice—
 character producing, linkage tests, 606.
 obstructive, treatment with synthetic vitamin K, 568, 569.
- Jelly making, use of sweetose in, 547.
- Jerusalem-artichoke as raw material for fermentation lactic acid, Utah 733.
 Jewish agricultural colonization in Palestine, 691.
 Johne's disease—
 infection of laboratory animals, 525.
 of cattle in Assam, 246.
- Johnin, standardization, suitability of guinea pig as test animal, 817.
 Johnson grass, variations in, 177.
 Journal of Hygiene, preparation of papers for publication in, 101.
 Judging of livestock, dairy, poultry, and crops, training for, Miss. 545.
 June beetles in southern Wisconsin, population and host preferences, U.S.D.A. 785.
 Juniper midge, pest of red cedars, 220.
Juniperus spp., effect on soil reaction, 739.
 Jute and hemp fibers, chemical identification, 717.
 Jute seeds, catalase activity, 446.
Kalanchoe spp. and *Bryophyllum*, synonymy, 600.
Kalanchoideae, floral anatomy, 600.
 Kale, marrow stem, cut in various lengths, quality of silage from, 656.
 Kale, vitamin C in, 135.
 Kansas College, notes, 288, 860.
 Kansas State College of Agriculture and Applied Science, history, 858.
 Kansas Station, notes, 288, 860.
 Kansas Station, publications available from, Kans. 430.
 Kapok seed cake, feeding value, 656.
Kearfottia n.sp. on old infestations of bamboo scales, P.R. 640.
 Kentucky Station, notes, 576.
 Keratitis in cattle and goats, bacteriological studies, Ariz. 101.
 Keratoconus experimentally produced in rats by vitamin A deficiency, 131.
 Ketone-body formation, physiology, 388.
 Kidney stones in animals, production on low-phosphorus diet, Wis. 693.
 Kitchen waste for feeding farm livestock, 798.
Kitchingia, validity of genus, 600.
 Kohlrabi stems, developmental analysis, 760.
 Kohlrabi, vitamin C in, 135.
 Kudzu as grazing crop for beef cattle, Ala. 88.
 Kudzu, value for poultry, Ala. 89.
 Kulitis, spineless, new gray mold on, 60.
 Labeling slides, simple duplicator for, 602.
 Labor, *see* Agricultural labor.
Lachnum, new species, 23.
 Lactation—
 and pregnancy, diet during, 695.
 bibliography, 385.
 dietary requirements for, 420.
 effect of *a*-tocopherol additions to normal diet, 713.
 initiation, specificity of lactogenic hormone, 611.
 physiology of, numerous phases of, U.S.D.A. 662.
- Lactic acid—
 fermentation, Jerusalem-artichoke as raw material for, Utah 733.
 in milk, determination, 294.

Lactobacilli—

oral, of Eskimos, effect of natural and refined sugars, 697.
taxonomy, physiology, and morphology, [N.Y.]Cornell 806.

Lactobacillus—

acidophilus and *L. bulgaricus*, differentiation, value of certain tests in, 520.
bulgaricus and *L. acidophilus*, differentiation, value of certain tests in, 520.
bulgaricus, respiration near its maximum growth temperature, 455.
heterofermentative species, fermentation end-products of, 520.
heterofermentative species, pH requirements, 603.
meleagridis, proposed name, 822.

Lactose, crystalline modifications in, [N.Y.] Cornell 806.

Ladybeetle(s)—

new genera and species related to *Seranium*, 223.

rearing, liberation, and recovery, P.R. 640.

Laelius voracis, new parasite of furniture carpet beetle, 372.

Laemophloeus minutus, see Grain beetle, flat.

Lake(s)—

biology, problems of, 595.
metabolism of, physical and chemical factors, 595.
metabolism, relation to Zooplankton, 595.
productivity, role of bottom fauna in, 595.

Lamarckism, masquerade of, 604.

Lamb(s)—

creep-fed, growth, relation to palatability of concentrate feeds, Idaho 372.
creep-feeding, barley v. oats for, Okla. 795.
curing requires thorough chilling, Okla. 795.
deleterious effect of iodine supplement in rations, Ind. 227.
digestibility of rations, reduction by molasses, Okla. 795.
endogenous nitrogen metabolism, 799.
ewe, effect of feeding during first winter, Utah 374.
ewe, feeding, Utah 657.
export, effect of delayed slaughter on, 375.

fattening—

comparative value of corn, oats, and barley in, 230.
comparison of rations, [N.Y.] Cornell 795, Okla. 795.
cut milo v. corn fodder for, Colo. 655.
long v. cut legume hay for, Ind. 227.
on cottonseed meal, hegari, and alfalfa hay, N.Mex. 92.
on Oregon feedstuffs, Oreg. 91.
rations compared, Tex. 796.
self-feeding v. hand-feeding, and rations for self-feeding, Mich. 92.

Lamb(s)—Continued.

fed in northern Colorado, net returns per head, Colo. 681.

feeding and early breeding, S.Dak. 795.

feeding, cost data, Colo. 405.

feeding experiments, Colo. 655, Mont. 655.

feeding with home-grown feeds, Mont. 656.

feedlot performance and carcass characteristics, effect of breeding, 800.

finishing on different proportions of corn and alfalfa, Mich. 659.

growing, soybeans and other proteins for, [N.Y.]Cornell 795.

growth and development, factors affecting, 375.

New Zealand Romney, Mendelian situation in birthcoat of, 28.

nutritional condition, effect on susceptibility to artificial infestation with parasitic nematodes, 396.

parasites, Colo. 668.

parasites of digestive tract, treatments for control, [N.Y.]Cornell 813.

phosphorus requirements and adequacy of home-grown feeds, Idaho 372.

production for market, breeds compared, Mont. 655.

production, marketing and feeding costs, Mont. 655.

quality, factors affecting, U.S.D.A. 794.

southern and western raised, parasitic hazards in New York, 818.

superior type, breeding for hothouse lamb production, Pa. 506.

tenderness, effect of degree of fatness, Tex. 836.

treatment with phenothiazine, copper sulfate, and nicotine sulfate, comparison, 396.

vitamin B group requirements, [N.Y.] Cornell 795.

worms in, chenopodium for eradication, S.Dak. 813.

Land—see also Farm land(s).

city man's stake in, U.S.D.A. 686.

classification—

rural, contributions of soil science and agronomy, 681.

studies, 256, Mo. 828.

to aid appraiser, 537.

colonization in Sicily, Italian act providing for, 257.

colonization in Spain, setting up bases for, abstracts of act, 256.

credit, see Agricultural credit.

cut-over, see Cut-over land.

divisions, natural, of Santa Cruz County, utilization and adaptation, Calif. 298.

dry, loss of nitrogen and organic matter from, Utah 735.

forest, see Forest land.

grant colleges, legislation regarding financial support, administration and work, 121.

grant colleges, responsibilities to cooperative movement, 402.

Land—Continued.

- grant colleges, role in governmental agricultural programs, 267.
 marginal and submarginal, types of families residing on, [N.Y.] Cornell 834.
 overindebtedness in Switzerland, speculation in, measures against, 257.
 ownership patterns, relation to land types in Dickinson County, Mich. 260.
 ownership right in Yugoslavia, evolution of, 256.
 public, acquisition in national land use program, 537.
 recreational use, relation to land classification, Mo. 829.
 resources in Beauregard Parish, economic use, La. 405.
 resources, inventory and characterization, relation to cotton production, 325.
 rough untillable, returns from in form of beef produced, Ala. 88.
 rural, holdings in South Carolina, S.C. 537.
 tax, graduated, principle of, Okla. 256.
 tenancy relations, improved, legal barriers, 401.
 tenure conditions, improving, programs for, 401.
 tenure improvement in South, anticipated goals, 401.
 tenure in Arkansas, Ark. 113.
 tenure problems, needed types of research on, 401.
 use in China, critic of methodology in previous study, 115.
 use in Delaware, social aspects, 256, 690.
 use in Kent County, economic study, Del. 114.
 use in Providence County, R.I. 829.
 use legislation in 1939, 405.
 use on different soils, Ind. 256.
 use planning—
 and cultural factors in Cuba Valley, New Mexico, 688.
 cooperative, U.S.D.A. 687.
 efficient, 412.
 efficient, soil surveying fundamental to, Utah 587.
 operation in Oklahoma, Okla. 256.
 studies, 256.
 use problems and suggested lines of action, U.S.D.A. 687.
 use problems of Ozarks, technics for solving, 115.
 use, relation to soil fertility, N.J. 735.
 waterlogged from underlying artesian basins, drainage, Utah 823.
 Landlord-tenant relations, Ind. 256.
 Lantana lace bug, synonymy and distribution, 499.
Laphygma frugiperda, see Armyworm, fall.
 Larch, effect of artificial defoliation, 626.
 Lard—
 hydrogenated, studies, Ind. 269.
 nutritive properties and digestibility, U.S.D.A. 837.
 physical and chemical characteristics, relation to value for frying, Iowa 413.

Laryngotracheitis—

- and fowl pox vaccination, 107.
 infectious, N.J. 813.
 infectious, of fowls in Sweden, 677.
Lasioderma serricornis, see Cigarette beetle.
Laspicyresia caryana, see Hickory shuckworm.
Lathyrus odoratus, origin and development of carpel in, 592.
 Lawn(s)—
 experiments, Ohio 323.
 increase of potash losses from by heavy ammonium sulfate applications, Ind. 179.
 lime requirements, N.J. 751.
 sod webworm pests of, 647.
 summer care of, 34.
 Lawngrass breeding, N.J. 751.
 Lead—
 absorption from alimentary tract, effect of diet, 277.
 arsenate—
 colloidal, studies, 216.
 in sprays, rosin residue emulsion as sticker for, Del. 359.
 spray residue health investigation, scope and method, 78.
 spray residue, ratio of lead to arsenic in, 643.
 substitute for codling moth control, search for, U.S.D.A. 783.
 wetting agents for, tests, 216.
 biochemical behavior, 699.
 determination in biological materials, 8.
 in human blood, 700.
 in maple products, improved method for estimation, 583.
 mobilization, studies, 277.
 Leaf(ves)—
 crumpler injurious to ornamentals, Tex. 787.
 detached, low-temperature injury in, 449.
 excised, assimilation and respiration at high CO₂ concentrations, 309.
 extracts, transmission spectograms of, 306.
 relation of internal surface to intercellular space in, 169.
 temperatures, regulating, significance of ethereal oils in, 450.
 Leafhopper(s)—
 blunt-nosed, N.J. 786.
 infesting Persian walnut, 363.
 on lettuce, light trap for counting or collecting, 74.
 six-spotted, relation to lettuce yellows, N.J. 786.
 yellow-headed, on rose, 78.
 Leather, research, U.S.D.A. 725.
Lecanosticta acicola, notes, 638.
 Lecithin in milk and its products, Ind. 235.
 Legume(s)—see also Green manure and Alfalfa, Clover, etc.
 adaptation in South, 178.
 and legume bacteria, 168.
 antianemic potency, Miss. 427.
 bacteria, growth, effect of biotin, Wis. 582.

Legume(s)—Continued.

- bacteria, selection of effective strains for leguminous plants, 178.
 conservation of nutrients by ensiling, artificial drying, and natural curing, Vt. 235.
 coverage studies in Alabama, 177.
 culture tests, N.Y.State 616.
 ensiling with various amounts of phosphoric acid, losses and changes from, [N.Y.]Cornell 805.
 for crop production, Miss. 320.
 forage, stands, increases in by seed treatment, U.S.D.A. 768.
 hard seeds in, Mont. 612.
 infesting weevils, host plants and parasites, 494.
 inoculants, tests, U.S.D.A. 735.
 new, introduction for observation, Tex. 753.
 nitrogen-fixation studies of *Rhizobium meliloti* strains on, 598.
 of Brazilian Amazon, keys and index, 741.
 root nodule bacteria of, 17.
 symbiosis and carbohydrate supply, 168.
 variety tests, Okla 752, Tex. 752.
 viruses in Great Britain, identification, 631.
 winter, absorption of phosphorus and nitrogen, effect of liming, 35, 178.
 winter, culture, La. 320.
 winter, time of turning for cotton and corn, Ala. 33.
 yield, effect of fertilization, Ga. 34.

Leguminosae—

- inoculation experiments, Ariz. 13.
 of Hawaii, key, 741.
 symbiotic promiscuity in, 168.
Lemna major, reproduction, effect of auxins, 743.
Lemna minor, insects associated with, 655.
 Lemon—
Diplodia stem-end rot, Tex. 770.
 mal secco or kurutan disease, 778.

Lemon grass—

- essential oil studies, P.R. 582.
 eye spot disease, 775.
 Lentin, anthelmintic efficiency against *Oesophagostomum columbianum*, 248.

Lenzites betulina, notes, 351.

Lepidoptera and parasites infesting seed pods of cowpea and wild plants, 643.

Lepidosaphes ulmi, see Oystershell scale.*Lepinotus patruelis*, infesting seed, new to North America, 642.*Leptosphaeria salvinii*, notes, 346.*Leptospira ictero-haemorrhagiae*, susceptible and resistant species of rodents to, 391.*Leptotaenia*, taxonomy and geographical distribution of genus, 593.*Leptoteleia oceanthi*, parasite of four-spotted tree cricket, 505.*Lernaea carassii*, cause of death of goldfish, P.R. 640.

Lespedeza—

- cover crop, effect of low-temperature injury, Ga. 44.

Lespedeza—Continued.

- culture and utilization, U.S.D.A. 754.
 cytological investigations in, 28.
 in combination with bluegrass, U.S.D.A. 751.
 in Maryland, 319.
 Korean, management, Mo. 754.
 place in New Jersey farming, N.J. 751.
 seeding dates, varieties, and fertilizer needs, Va. 754.
 variety tests, N.J. 751.

Lespedeza sericea—

- phosphorus, availability to white rats, 657.
 selections, tests, Ga. 34.

Lestodiplosis predaceous midges, notes, 221.

Lettuce —

- breeding, [N.Y.]Cornell 759.
 breeding and improvement, Ariz. 44.
 damping-off, 60.
 fall crop, growing, Miss. 46.
 fertilization, Ariz. 44.
 fertilizer placement in raised irrigated beds for, 187.
 growth, relation to soil moisture, [N.Y.] Cornell 759.
 handling and storage, [N.Y.]Cornell 759.
 head, variety tests, Idaho 329.
 heads, temperature within, relation to that of air, [N.Y.]Cornell 759.
 improvement, Pa. 471.
 intensive production on sandy land, soil management for, Conn.[New Haven] 443.
 on alkaline-calcareous soils, fertilization, Ariz. 45.
 powdery mildew, unique case, U.S.D.A. 769.
 root aphid, Mont. 786.
 sclerotinose, notes, Ariz. 59.
 seed, storage requirements, Ariz. 44.
 seedlings, growth, effect of growth regulating substances, 16.
 shot-hole or anthracnose fungus, host range and overwintering, 628.
 vitamin C in, 135.
 yellows, relation to six-spotted leafhopper, N.J. 786.

Leucocera laevicollis, destruction of native red cherry by, P.R. 640.*Leucocytozoon*—

- from wild birds of Mexico, 214.
smithii in turkeys, 535.

Leucosis—

- fowl, filtrable agent of, 677.
 fowl, notes, U.S.D.A. 813.
 fowl, transmission, 389, Ind. 243, Mass. 107.

virus, propagation on chick embryos by intravenous inoculation, 251.

Licanic acid of oiticica fat, nutritive value and efficiency, 840.

Life resources surveys, Tex. 781.

Light—see also Sunlight.

- incident, from sun and sky, calculation of, 585.

intensity in footcandles, apparatus for continuous recording, 164.

- Lightning injury to potato tubers, 634.
 Lignin, research, U.S.D.A. 725.
- Lilium*—
formosanum, culture, R.I. 44.
 generative cells, effect of colchicine on division, 310.
sulphureum hybrids from controlled pollination with *L. henryi* pollen, 338.
- Lily (ies)—
 culture in cinder and gravel for greenhouse flowering, 194.
 Easter, culture and forcing, Mass. 476.
 hybrids, new race, 338.
 mosaic, likely procedure for control, 487.
 of the valley, *Ascochyta majalis* on, 628.
 requirements for soilless culture, Ohio 765.
- Lima beans, *see* Beans, lima.
 Limberleg of sheep, Tex. 813.
- Lime—*see also* Calcium and Liming.
 dolomitic v. high-calcium, N.J. 735.
 movement, effect of irrigation, Idaho 298.
 products, inspection and analyses, Mass. 740.
 rate of penetration in soils under permanent grass, 740.
 use in balancing our southern agriculture, 178.
- Limes (fruit), Persian, seasonal variation in juice and acid content, 476.
- Lime-sulfur—
 effect on productivity in female San Jose scale, 647.
 fungicides, commercial and home-boiled, specific gravity, Pa. 480.
- Liming—
 effect on boron availability in soils, Ala. 13.
 in Kentucky, place and value, 177.
 materials and soil, 582.
 materials, determination of exchange bases and exchange capacity of soils, 582.
 materials, kinds, Ga. 34.
- Limnology and aquatic biology, relation to Phytoplankton, 595.
- Limpet, Hawaiian, mineral constituents and vitamin content, 412.

 auto-sex, in fowls, 607.
 studies of rat, 606.
- Linoleic acid requirement of white rats, Wis. 693.
- Linseed oil, content and quality, U.S.D.A. 725.
- Lipeurus heterographus*, *see* Chicken head louse.
- Liponyssus bacoti*, *see* Rat mite, tropical.
- Lippia helleri*, essential oil studies, P.R. 582.
- Lissonota inconstans* n.sp., description, 372.
- Listrella*, outbreak of abortion in sheep associated with, 672.
- Listeria*—
 cultures, living and dead, attempts at immunization with, 392.
- Listeria*—Continued.
 experimental transmission among domestic animals, 391.
 infection associated with spontaneous encephalitis in goats, 105.
 spp., notes, 674.
 strain, isolated from a premature bovine fetus, 391.
- Listroderes obliquus*, *see* Vegetable weevil.
- Liver(s)—
 and carbohydrate metabolism, 697.
 dietary essentials for pigeons, and their relation to vitamin B₆, 282.
 extract, riboflavin in, 293.
 filtrate factor of vitamin B₂ complex, 281.
 flukes of cattle in Hawaii, control, 388.
 flukes of cattle, losses from, 394.
 hard yellow, of sheep and cattle, Tex. 813.
 human, vitamin A in, histological demonstration, 558.
 of Chinese children and adults, vitamin A in, 701.
 of man and animals, vitamin A and carotenoids in, 279.
 of rat, vitamin A in after feeding various forms of the vitamin, 701.
 riboflavin in, biological assay, 564.
 v. iron and copper in treatment of hemorrhagic anemia in dogs, 276.
- Livestock—*see also* Animal(s), Mammals, Cattle, Sheep, *etc.*
 breeding, applications of reproduction physiology to, 314.
 cycles in North Dakota, N.Dak. 537.
 diseases, *see* Animal diseases and specific kinds.
 drinking water, warming, electric heat for, Ind. 254.
 effect of breeding on performance, Miss. 89.
 feeder, movements of, Ind. 256.
 feeding, directions, 507.
 genetics of, Mont. 605.
 grazing efficiency, U.S.D.A. 794.
 identification by tattooing, 658.
 in Ireland, economic history, 257.
 judging, training for, Miss. 545.
 mineral supplements for, 373.
 New York, marketing, [N.Y.]Cornell 827.
 poisoning—*see also* Plants, poisonous, and specific plants.
 by oat hay, and other plants containing nitrate, Wyo. 101.
 with selenium and oat hay, S.Dak. 813.
 production in Midwest, probable effects of agricultural conservation program, U.S.D.A. 406.
 relative changes in purchasing power, 1890 to 1939, S.Dak. 828.
 sprays, determining toxicity, 643.
 statistics, *see* Agricultural statistics.
 trend of motor transportation rates for, Ohio 263.

Livestock—Continued.

- trend on State farms, Miss. 430.
 use of waste hair from, U.S.D.A. 794.
 watering facilities, improvement, U.S. D.A. 108.
 wintering problems, 226.
- Living in the open country and farming, opinions on, R.I. 119.
- Living, standards of, see Standards.
- Lobelia*, *Septoria* leaf blotch of, 200.
- Locoweed, toxic principles, isolation, Tex. 725.
- Locust (insect)—
 desert, migrations, effect of duststorms, 788.
 lubberly, control, 217.
- Locust (tree)—
 black, growth, effect of soil type, [N.Y.] Cornell 735.
 black, newly set, effect of phosphate on, Ga. 56.
 leaf miner, pest of soybean, 369.
- Locusta*—
 in Europe, distribution and migrations, 790.
migratoria, phase transformation in, 788.
- Logs and stumpage prices for 1938, U.S.D.A. 341.
- Logs, grading, Ind. 196.
- Lomachaeta*, new species and key, 793.
- Lonchocarpus*—
 roots, acetone extracts, toxicity to house-fly, P.R. 640.
 selection, P.R. 618.
- Lonicera tartarica* cuttings, rooting, effect of indolylbutyric acid and oestrone, 339, 452.
- Lophobaris piperis*, biology, importance, and control, 653.
- Lotononis lara*, chemical studies, 523.
- Louisiana Station, notes, 860.
- Louisiana University, notes, 860.
- Loxostege sticticalis*, see Webworm, beet.
- Lucilia sericata*—
 laboratory rearing for 200 generations, 83.
 toxicity of sulfur and nitrogen compounds to, 650.
- Lumber—see also Timber and Wood.
 destroyed by hurricane in Rainbow Forest, salvaging, Conn.[New Haven] 478.
 sap stain fungi in, U.S.D.A. 768.
 white pine, cost of production in New England, U.S.D.A. 56.
- Lunches, school, using farm surpluses, U.S. D.A. 271.
- Lungworms in sheep, treatment, 814.
- Luperodes brunneus*, see Corn silk beetle.
- Lupine(s)—
 breeding and selection for disease resistance, Ga. 60.
 diseases, 59.
- Lyctus* powder-post beetles, tests of wood preservatives against, 504.
- Lygaeus kalmii* eggs, toxicity of nitrogenous bases to, 360.

Lygus—

- insects, tests with insecticides for, Idaho 357.
pratensis, see Tarnished plant bug.
 sp. on alfalfa, U.S.D.A. 784.
 spp. on seed beets, U.S.D.A. 784.
 spp., relation to alfalfa seed production, U.S.D.A. 646.
- Lymphomatous nerve tissue, effect of intraperitoneal injection into chickens from strains resistant and susceptible to spontaneous lymphomatosis, 532.
- Lysenko and genetics, 604.
- Lysimeter design, improvement in, 298.
- Lysimeter studies, 155, N.J. 735.
- Machinery, see Agricultural machinery.
- Macracanthorhynchus hirudinaceus*—
 anthelmintic activity of crystalline papain, 103.
 anthelmintic activity of fresh pineapple juice against, 102, 103.
- Macrocentrus*—
ancylicivorus, value of mass liberations for oriental fruit moth control, U.S. D.A. 783.
gifuensis, receipt for trial against sugarcane borer, P.R. 640.
- Macrorileya oceanthi*, parasite of four-spotted tree cricket, 505.
- Macrosiphum rubiellum*, variation of size within species, 217.
- Macrosporium* leaf blight of carrot, Ariz. 59.
- Macrosteles divisus*, notes, 485, 778.
- Macroteleia* n.sp., parasite of *Orchelimum*, 506.
- Maggots, surgical, ammonium bicarbonate secretion by, healing properties, 524.
- Magicalada septendecim*, see Cicada, periodical.
- Magnesium—
 and manganese, studies, 582.
 compounds, relative availability for plants, R.I. 13.
 deficiency in cauliflower, 186.
 deficiency in soils induced by high rates of potash fertilization, Ind. 179.
 deficiency of apples in Nelson district of New Zealand, 777.

deposit from sprays, N.Y.State 642.

distillates, undiluted low-boiling petroleum, phytotoxic properties, 76.

spray residue on citrus leaves, determination, 644.

sprays, new facts about, 790.

sprays, studies, Conn.[New Haven] 495. vegetable, and butterfat, comparative nutritive value, 413.

wholesale prices, in United States, index numbers, U.S.D.A. 543.

Oiticica—

fat, licanic acid of, nutritive value and efficiency, 840.

oil, production, in Brazil, U.S.D.A. 410.

Oklahoma Station, report, 859.

Olive oil, digestibility, effect of adding stearic acid to, U.S.D.A. 837.

Olive tree, aerial root primordia, relation to vegetative propagation, 601.

Onion(s)—

bacterial disease, [N.Y.]Cornell 769.

bloat, status, U.S.D.A. 59.

breaking dormancy in, methods, Tex. 758.

breeding, Colo. 617.

breeding for resistance to purple blotch and thrips, Colo. 630.

bulb nematode, [N.Y.]Cornell 769.

fall v. spring planting, Idaho 329.

fertilizer experiments, R.I. 34.

Onion(s)—Continued.

juice and bacterial growth, 603.

mildew, control, [N.Y.]Cornell 769.

muck-land, effect of manganese sulfate on, [N.Y.]Cornell 759.

pest, little-known, 788.

pink root disease on tomatoes, U.S.D.A. 199.

pink root resistance, breeding for, Tex. 771.

smut, control, 628, [N.Y.]Cornell 769.

thrips, breeding for resistance to, Colo. 630.

thrips control tests, Tex. 787.

thrips, notes, [N.Y.]Cornell 786.

thrips on carnations, residual poison sprays against, 645.

thrips, vector of tomato bronze disease, 645.

variety tests, Ga. 44.

wild, seasonal activity of bulbs related to eradication, Ala. 33.

yellow dwarf, in New Zealand, 205.

yellow dwarf, insects as vectors, 205, 364.

Ophiobolus graminis, different strains, reaction of oats to, 632.

Ophthalmia, periodic—

notes, U.S.D.A. 813.

relation to brucellosis, 388, 674.

relation to thyroid activity, 674.

Ophthalmology in equidae, 388.

Opihi, mineral constituents and vitamin content, 412.

Opossum(s)—

albinism in, 172.

parasites of, in Illinois, 641.

pouch young, as experimental material. 317.

susceptibility to equine encephalomyelitis, 249.

Opuntia cylindrica, structure of shoot apex. 592.

Orange(s)—

cuttings, rooting, β -indoleacetic acid for, 764.

juice, effect on calcium assimilation, 275.

juice, fresh and canned Florida Valencia, characteristics of petroleum ether extract, 732.

mal secco in Brazil and Argentina, 778.

refrigeration, in transit, U.S.D.A. 756.

rot in storage, 200.

scab, in Uruguay, 778.

trees, Valencia, relation between leaf, branch, and root systems, 54.

Valencia, granulation after picking, 337.

Valencia, dodder on, 636.

vitamin C potency, effect of maturation and cold storage, 564.

Washington Navel, density of stomate and oil glands and water spot in rind, 66.

Washington Navel, fertilizer experiments, 336.

wines, improvement, P.R. 582.

Orchard(s)—see also Fruit(s), Apple(s), Peach(es) etc.

care in summer and fall, Miss. 48.

 trees, crown injury in New York, U.S.D.A. 59.
 trees, dinitrophenol compounds to break rest period in, 475.
 trees, fertilizers for, Ark. 617.
 trees in nursery row, summer pruning, 475.
 trees, methods of applying potassium to, N.J. 761.
 trees, transplanting, methods, Okla. 757.
 trouble, new, resembling X disease, 480.
 twig borer, Utah, 787.
Valsa canker, status in New Jersey, N.J. 769.
 varieties, Ark. 617.
 varieties, classification, N.J. 761.
 varieties, new, introduction, U.S.D.A. 756.
 variety tests, Ga. 44.
 winter injury, relation to soil management, W.Va. 758.
 Winters disease, 480.
 X disease, (yellow-red virosis)—
 first appearance in the State, R.I. 60.
 in 1940, U.S.D.A. 630.
 spreading in Utah, U.S.D.A. 630, Utah 635.
 status in New Jersey, N.J. 769.
 studies, 66, 352, 486, Conn.[New Haven] 480, N.Y.State 630, Utah 771.

Peanut(s)—

and peanut meal for swine feeding, Ga. 89.
 breeding, Ga. 33, Tex. 753.
 breeding and selection, Ga. 59.
Cercospora leaf spot, sulfur dust for control, 628.
 diseases in Texas, U.S.D.A. 629.
 hay v. silage for fattening cattle, Ga. 89.
 hay, value for wintering breeding cows and for fattening steers, Ala. 88.
 hulls, ground, for promoting growth of tobacco seedlings, U.S.D.A. 751.
 hulls v. other organic materials for use in greenhouse soils, Ala. 44.
 large-seeded Virginia-type, effect of mass selection, 39.

Peanut(s)—Continued.

leaf spots, sulfur dust for control, Ga. 60.
 meal v. cottonseed meal for fattening cattle, Ga. 89.
 meal, value for pullets, 381.
 microscopical studies, Ga. 6.
 oil in derris dust mixtures against the pea aphid, 364.
 production, Miss. 39.
 response to inoculation with *Rhizobia*, 447.
 seed treatment, effect on germination and yields, Ga. 60.

Pear(s)—

Bartlett, effect of carbon dioxide in lengthening life, 191.
 fruit set, factors effecting, Vt. 185.
 pollen, longevity, 47.
 psylla, Mont. 786.
 scab, 779.
 situation, world, production and trade, U.S.D.A. 543.
 stony pit virus, 58.
 stony pit at Hood River, 486.
 thrips, control with dichloroethyl ether, 74.
 tree buds, breaking dormancy with glutathione, 16.

Peat—

and its uses, N.J. 157.
 native, effect in rose culture, Pa. 471.
 nicotine, sticker used with, 360.
 resources of Connecticut to replace imports no longer available, Conn.[New Haven] 442.
 soils, zinc toxicity in, [N.Y.]Cornell 735.

Pecan(s)—

composition of shell, 727.
 groves, culture, Okla. 757.
 groves, results of three years' treatment for root rot, 58.
 hickory shuckworm on, control and parasites of, U.S.D.A. 783.
 indicators of maturity, Ariz. 44.
 insects, Tex. 787.
 leaf casebearer, U.S.D.A. 783.
 leaf scorch studies, 211.
 nut casebearer, insecticide tests for control, U.S.D.A. 783.
 nut casebearer, pecan foliage as food for, 218.
 transplants, rooting, U.S.D.A. 756.
 transplants, treatment with indole-3-butyric acid, U.S.D.A. 756.
 varieties, comparative ease of cracking, Okla. 757.
 yield of varieties and filling of nuts, Ariz. 44.

Pectic substance in cotton fibers, relation to growth, 451.

Pectin(s)—

and texture of cooked potatoes, 839.
 in plant material, criticism of recent paper on, 309.

Pectinophora gossypiella, see Bollworm, pink.

- Pellagra—
 and nicotinic acid in cereals, 708.
 cause, 709.
 producing diet, Goldberger, multiple deficiencies of, Wis. 693.
 relation to nicotinic acid, 851.
- Pemphigus bursarius*, notes, Mont. 786.
- Pemphigus spirothecae*, biology, 788.
- Penicillium roqueforti*—
 growth, effect of various concentrations of carbon dioxide, 240.
 oxygen requirements in presence of nitrogen as diluent and absence of carbon dioxide, 240.
- Pentophora gigantea*, effect on strength of southern yellow pine sapwood, 489.
- Pennsylvania College, notes, 432.
- Pennsylvania Station, notes, 432.
- Pennsylvania Station, report, 575.
- Penttilia*—
castanea, establishment as scale predator, P.R. 640.
castanea, shipment to Florida and Hawaii for liberation against coconut scale, P.R. 640.
egena, shipment to Florida and Hawaii for liberation against coconut scale, P.R. 640.
- Pentobarbital sodium as anesthetic for minks, 675.
- Pentstemon, new *Ascochyta* on, 772.
- Peony blooms, grading and standardization, Ind. 185.
- Peony root knot, Ohio 68.
- Pepper(s)—
 anthracnose, due to *Glomerella cingulata*, 485.
 bacterial disease, [N.Y.]Cornell 769.
 blight due to soil mold, Colo. 774.
 breeding, N.J. 758.
 effect of hardening treatments, W.Va. 758.
 farms, types, cash returns, labor requirements, etc., Ga. 110.
 improvement, Pa. 471.
 intensive production on sandy land, soil management for, Conn.[New Haven] 443.
 mildew or blight due to *Phytophthora capsici* in Argentina, 485.
 pimlento—
 effect of roasting and scalding on planting value of seed, 187, 760, Ga. 44.
 fertilizers for, Ga. 44.
 wilt of, 64.
 yield, effect of date of planting, Ga. 44.
 southern blight, resistance to, Ga. 59.
 spotted wilt outbreak in Pennsylvania, U.S.D.A. 59.
 variety tests, Pa. 472.
 weevil, lesser, biology, importance, and control, 653.
- Peppermint—
 oil, variation in composition of different fractions, Ind. 150.
- Peppermint—Continued.
 production and marketing on muck, Ind. 185.
- Peptides, synthetic, effect of ultraviolet light on, N.Y.State 582.
- Percule, properties, relation to price, 570.
- Pergandeida cahwillae* n.sp., description, 501.
- Perilla, production tests, Tex. 752.
- Perilla, seed production, P.R. 618.
- Periplaneta*—
americana, see Cockroach, American.
fuliginosa, biology, Ind. 361.
- Peromyscus* spp., identification by red blood cell agglutination test, 782.
- Peronospora* genus in Argentina, 481.
- Perosis—
 effect of choline and other supplements on, 803.
 relation to manganese in poultry rations, [N.Y.]Cornell 802.
 relation to unrecognized vitamins, 506.
- Persimmon(s)—
 anthracnose, 211.
 Hachiya, cambial activity in, 622.
 mistletoe on, 352.
 Oriental, rootstocks for, 476.
 wilt, notes, 779, U.S.D.A. 59.
- Personnel administration and personnel training, bibliography, U.S.D.A. 268.
- Pest control—
 division, University of Florida, 494.
 equipment and methods, U.S.D.A. 823.
- Petrolatum, liquid, effect on carotene in blood of human beings, 848.
- Petsai heart rot caused by *Pythium aphanidermatum*, 60.
- Peziza sejournei*, systematic study, 311.
- Pezizales, studies, 741.
- Phaeangium*, new species, 23.
- Phacociboria*, systematic study, 311.
- Phacogenes ater*, parasite of peach borer, 218.
- Phalaris tuberosa*, breeding, Idaho 319.
- Phanerotoma grapholithae*, egg parasite of oriental fruit moth, U.S.D.A. 502.
- Pheasant(s)—
 crippled, losses, Pa. 495.
 egg incubation, effect of temperature, humidity, and air movement, 516.
 genetics of, [N.Y.]Cornell 747.
 nesting habits, Pa. 495.
 ring-necked—
 causes of juvenile mortality, 536.
 in southeastern Minnesota, winter observations, 492.
 mortality, Pa. 495.
 parasites of, in Illinois, 641.
- Phellodendron* spp., fruit, insecticidal properties, 642.
- Phenothiazine—
 as an anthelmintic, 248, 252, 389, 390, 397, 529, 531, 817.
 compounds related to, anthelmintic efficiency, 672.
 effect on ascarid infestation in dogs, 398.
 effect on calves suffering from parasitic gastritis, 817.
 fate, in sheep, 529.
 materia medica of, 817.

- Phlebotomus*, rearing, glass tubes for, 358.
 Phlox charcoal rot, U.S.D.A. 59.
Phlugiola dahlemica, rearing, 788.
Phlyctacna linicola, notes, Tex. 770.
Pholiota adiposa, notes, 351.
Phoma foveata n.sp., description, 630.
Phomopsis—
 fruit rot of tomato, 629.
 sp. fatal to beech near Philadelphia, U.S.D.A. 342.
Phormia regina, laboratory rearing for 200 generations, 83.
Phorocera agilis, life history, habits, and abundance, 788.
 Phosphatase test, reliability, Pa. 517.
 Phosphate—
 catalyst, spent, fertilizing value, 302.
 fixation, salt effect on, 588.
 monocalcium, Idaho 389.
 rock, dialcium phosphate from, U.S.D.A. 734.
 rock, quenched slag as byproduct from, nature and liming value, 303.
 solubility in Colorado soils, relation to pH, 157.
 Phosphorus—
 absorption by winter legumes, effect of liming, 178.
 and calcium metabolism in Indians on rice and on wheat diets, 416.
 availability, in hay, 506.
 compounds, organic, in soil, isolation of inositol, 158.
 deficient diet, mineral metabolism, growth, and symptomatology of rats on, 126.
 deficiency, effect on protein and mineral metabolism of sheep, 374.
 deficiency in livestock, symptoms, Mont. 373.
 effect on lead in blood and bone, 699.
 fixation, N.J. 735.
 fixation, by Prairie group soils, 301.
 fixation for New York soils, [N.Y.] Cornell 735.
 in blood of normal and mentally diseased men, 846.
 in human and animal health, essentiality and sources, 842.
 in Iowa soil profiles, 301.
 in *Lepidocya sericea* and alfalfa hay, availability to white rats, 657.
 in soybean and red clover hays, availability to white rats, 657.
 lateral movement in orchard soil, 50.
 metabolic balance, in Eskimo children, 554.
 metabolism in musculature of dystrophic vitamin E-deficient rats, 228.
 metabolism in rats and dogs, effect of mineral oil ingestion, 846.
 removed from Alabama soils, 178.
 retention by preschool children, 552.
 supplements for livestock, methods of feeding, 373.
 use by crops, importance of calcium in, 179.
 yellow, toxicity to cockroach, 498.
 Photinia, Chinese, citrus thrips damage to, 645.
 Photometer, photoelectric, Ind. 150.
 Photomicrography in mycological research, 744.
 Photoperiodic response of plants, U.S.D.A. 309.
 Photosynthesis—
 and chlorophyll pigments, Ind. 150.
 and fluorescence, course of, 25.
 and fluorescence, time course observed simultaneously, 25.
 and oxidation reactions in green plants, relation, 17.
 in horticultural plants, environment-control chamber for study, 164.
 studies, 598.
 studies with *Chlorella pyrenoidosa*, use of dropping mercury electrode in, 16.
 Phthiocol, oral and parenteral toxicity, 567.
Phycomyces—
 blakesleeanus—
 extracts, effect on its development, 305.
 synthesis of thiamin and biotin by, 305.
 zygospore formation in, 596.
 effect of potato extracts on growth, 305.
 Phycomycetous fungi from soil, quick method of isolating, 481.
Phyllocoptes—
 destructor n.sp., description, 655.
 oleivorus, see Citrus rust mite.
 Phyllody in varieties of tomatoes and beans, morphological and anatomical features, 776.
Phyllonorycter n.sp. on *Tephrosia*, P.R. 640.
Phyllophaga—
 flight records, 793.
 hirticula, notes, Ind. 212.
 lancoolata, notes, Okla. 786.
 spp. in newly set strawberries, arsenicals for control, 85.
Phyllosticta—
 sp. on apple angular leaf spot, 635.
 swietenia n.sp. causing mahogany seedling blight in Puerto Rico, U.S.D.A. 638.
Phymatotrichum omnivorum—
 resistance of plants to, chemistry of, 633.
 root rot in pecan groves, results of treatment, 58.
 root rot research, Ariz. 59, Tex. 770.
Physaloptera sp., parasite of raccoon, 783.
Physalospora obtusa on peach nursery stock, U.S.D.A. 768.
Phytalus smithi control, search for parasites of, 369.
 Phytohormones, effect on seed germination, N.Y.State 618.
Phytomonas—
 gardeniae n.sp., notes, 779.
 juglandis and filbert blight pathogen, comparison, 67.
 pruni, overwintering in peach buds, 628.
 sepedonica, bactericidal efficiency of chemicals against, 627.
 sepedonica, notes, 206.

Phytomonas—Continued.

- stewartii* strains, agglutination test applied to, 483.
- stewartii* strains, agglutinin absorption by, 484.
- tumefaciens*, carbon metabolism, factors affecting, 772.
- tumefaciens*, notes, 201.
- tumefaciens*, production of secondary tumors in sunflower by, 776.

Phytomyza—

- ilicicola*, see Holly leaf miner.
- ilicis*, parasites, establishment in British Columbia, 642.

Phytopathology, history of development in Brazil, P.R. 771.

Phytophaga destructor, see Hessian fly.

Phytophthora—

- cactorum* of hardwoods, tree injection for control, 628.
- cactorum* on maple and beech, R.I. 60.
- capsici*, hosts of, 347.
- capsici* isolates, sexual phenomenon exhibited by, 343.
- capsici* on important truck crops, Colo. 774.
- disease of Norway maple, N.J. 769.
- erythroscripta*, synthesis of biotin by, 305.
- fragariae* n.sp., cause of red core root disease, 778.
- infestans*—see also Potato blight, late.
 - on tomato leaves, 351.
 - pink rot and wilt of potato, U.S.D.A. 59.
 - unidentified sp. on Dutch iris, 636.
 - verrucosa* n.sp., description, 630.

Phytoplankton, relation to limnology and aquatic biology, 595.

2-phytyl-1,4-naphthoquinone, synthesis, 728.

Pickle sweeteners, comparison, 733.

Pickleworm, rotenone dusts for control, 494, 648.

Pteris—

- canidia*, destructive pest in Hong Kong market gardens, 78.
- rapae*, biology, population density, etc., 792.

Fig(s)—see also Sows and Swine.

- and dairy farming in northeastern Iowa, Iowa 404.
- bacon, form and composition, effect of plane of nutrition, 378.
- bacon, growth rate and carcass quality, statistical analysis, 509.
- bacon, restricted feeding experiment, 509.
- breeding and selection for commercial types, relation of environmental conditions, 231.
- brooders, electric, Ind. 253, Oreg. 109.
- calcium requirements, on rations with cottonseed meal, Tex. 796.
- carcass quality characters, 377.
- carotene in dry-lot ration cuts cost, Okla. 795.
- Chester White, litter size in, effect of inbreeding, U.S.D.A. 172.
- composition and synthesis of fat in, effect of planes of nutrition, 379.

Fig(s)—Continued.

- composition of bones from left and right sides, W.Va. 796.
- crossing and selecting, U.S.D.A. 747.
- depot fats, composition, effect of prolonged fast, 660.
- dried whey powder in rations for, 93.
- economical production, transmission of factors related to, Ala. 88.
- effect of kinds of fat in ration on character of fat formed, Ind. 227.
- effect of protein in sow's ration, Okla. 795.
- effect of type and finish on carcass and product grades, Ind. 227.
- fattening—
 - comparison of protein mixtures for, Ind. 227.
 - concrete wallows for, Tex. 796.
 - grinding barley for, Okla. 795.
 - oat pasture for, Tex. 796.
 - optimum protein levels for, Pa. 507.
 - protein supplements to corn for, Okla. 795.
 - rations, comparison, Ark. 655, S.Dak. 795.
- feeding, U.S.D.A. 794.
- feeding experiments with distillery slops, Ky. 376.
- feeding, inadequacy of concentrates commonly used, Mo. 376.
- feeding, saving and drying kitchen waste for in Great Britain, 798.
- feeding soybeans to, effect on gains and method of producing firm carcasses, N.C. 659.
- forage crops for, comparison, Mont. 656.
- gestation period in, 800.
- grain-fed and garbage-fed, carcass studies, 231.
- husbandry, coordinated experiments in, 231.
- identification by tattooing, 658.
- index of purchasing power, N.Dak. 537.
- industry in Argentina, U.S.D.A. 256.
- management, N.J. 659.
- market classes and grades, U.S.D.A. 659.
- newborn, death loss in, Ind. 243.
- parasites of, treatment for removal, U.S.D.A. 813.
- plan of economical production for Coastal Plain area, Ga.Coastal Plain 659.
- Poland China, comparison of large-, medium-, and small-type, U.S.D.A. 794.
- prices, guideposts for farmers' analysis, Okla. 256.
- production in South, textbook, 231.
- production in western Canada, 92.
- protein and vitamin supplements for, [N.Y.]Cornell 795.
- protein levels for, Pa. 508.
- rations, in dry lot and on pasture after weaning, S.Dak. 795.
- reduced mortality, by use of posterior pituitary solution during parturition, N.J. 794.

Fig(s)—Continued.

- selections, difficulties of making, Okla. 747.
 - superior strains, development, Mont. 656.
 - vitamin A requirements, 376, Tex. 796.
 - vitamin D requirements, 476.
 - vitamin deficiency symptoms in experimental herd, 231.
 - year-round grazing and hogging-off program for, 226.
 - young, thiamin requirement, 800.
- Pigeonpeas, production tests, Tex. 752.
- Pigeons—
- breeding, progeny testing, 511.
 - inexpensive ration for, N.J. 794.
 - maintenance nutrition in, 282.
 - on vitamin B-deficient diet, intestinal yeast flora of, 228.
 - vagrant domestic, control, 213.
- Pigment production in bird feathers, effect of X-rays, 749.
- Pimientos, *see* Pepper(s).
- Pimplini* of eastern North America, revision, 506.
- Pine beetle—
- outbreaks, prevention under war-time conditions, 793.
 - southern, attacking pine, infection by *Cerastostomella pini* following, 354.
 - southern, etiology of *Beauveria* disease, 781.
 - western, U.S.D.A. 784.
- Pine—*see also* White pine.
- blister rust, *see* White pine blister rust.
 - blue stain, effect on specific gravity and strength of wood, 490.
 - brown-spot needle disease, 638.
 - butterfly, effect of defoliation of ponderosa pine by, 647.
 - direct seeding in southeastern Piedmont region, 340.
 - dying, infected with blue-stain fungus, 354.
 - effect of artificial defoliation, 626.
 - geometrid, biology, 788.
 - geometrid larvae fed on pine needles from pure stands and from mixed forests, mortality and growth, 788.
 - grafting, tested methods of, 479.
 - leaf scale, control, N.Y.State 642.
 - loblolly, fiber length, effect of position within bole, 767.
 - longleaf, seed trees, increased growth after release cutting, 340.
 - multiple seedlings of, 478.
 - natural establishment, in abandoned fields, 625.
 - needle cast disease, 637.
 - nursery stock, effect of high rate fertilizer treatments on survival and growth in field, 479.
 - ponderosa, insect-killed, entomological considerations in salvaging, 370.
 - ponderosa, seedlings, to development and transpiration, effect of soil temperature, Vt. 197.
 - ponderosa, shade effects in, 480.

Pine—Continued.

- seed, extracting from fresh and stored cones, kiln schedule for, 198.
 - seed germination, water requirements, 625.
 - seed, large scale extraction, laboratory tests as applied to, 197.
 - seed, southern, successful storage for seven years, 198.
 - seed treatment, growth substances of doubtful benefit for, 340.
 - shoot moth, European, in British Columbia, 642.
 - slash, reforestation, Tex. 757.
 - slash, survival and growth from different grades of planting stock, Ala. 56.
 - southern, fusiform rust of, U.S.D.A. 768.
 - trunks, fungi in, and relative susceptibility of artificial and natural stands, 629.
- Pineapple(s)—
- caterpillar control, 501.
 - early fruiting, ethylene as stimulus to, U.S.D.A. 756.
 - juice, fresh, anthelmintic activity, 102, 103.
 - nutrient requirements, P.R. 618.
 - smoking to induce blooming, P.R. 618.
- Pinewood soil, fungi isolated from, 202.
- Pinitol, isolation, 523.
- Pinus strobus* cuttings, rooting, changes induced by indole acetic acid in, 17.
- Piperidine, concentration-mortality curves for solutions toxic to eggs of *Lygaeus kalmii*, 360.
- Pipette—
- automatic zero, for dispensing sterile culture media, 603.
 - spatulate, serving as section lifter, 18.
- Piroplasmosis—
- acaprin in treatment, 672.
 - canine, sulfanilamide in treatment, 398.
- Piscidia piscipula*, toxicity tests, P.R. 640.
- Pistillaria* n.sp., on rice straw, 311.
- Pistol casebearer—
- control, Pa. 495.
 - parasites of, 357.
- Pittosporum*—
- angular leaf spot, 354.
 - daphniphylloides*, probable virus disease of, 637.
 - tobira* disease, suggestive of virus etiology, 480.
- Pituitary (ies)—
- anterior—
 - effect on molting in birds, 462.
 - extract, effect on energy and protein metabolism, Pa. 507.
 - extract, effect on spermatogenesis in rat, 608.
 - extract, in growing chicks, effect, 510.
 - hormone, effect of picric and flavanic acids on potency, 318.
 - hyperfunction in rats, 609.
 - second mammogenic factor in, 611.

Pituitary (ies)—Continued.

anterior—continued.

species variation in thyrotropic, gonadotropic, and prolactin activities, 30.

cell types in rat, following administration of antagonotropic serum, 317.
extract injection, induction of fertility in ewes by, 609.

from pregnant cows, gonadotropic action, 458.

gland and carbohydrate metabolism, 697.

gonadotropic hormone in, restitution, relation to diet, 29.

of rat—

changes in gonadotropic complex following removal of testes, 749.
experimental transplantation, 461.
mamogenic factor in, evidence for, 176.

posterior, substances, effect on premature expulsion of eggs by hens injected with, 510.

Plagioidera versicolora in New England, 652.

Plague in United States, 392.

Planera, susceptibility to *Ceratostomella ulmi*, 629.

Planetree—

Ceratostomella disease, spread by pruning, U.S.D.A. 768.

Ceratostomella, transmission in asphalt wound dressings, 629.

disease due to *Ceratostomella*, 639.

disease, spread and seriousness, 212, 779.

Planning board activity, State, fields of, 259.

Plant(s)—*see also* Flora and Vegetation.
ability to absorb native potash from soil, Ind. 179.

aging, relation to fertilizers, Vt. 200.

alien, growing without cultivation in California, Calif. 594.

and soil micro-organisms, interaction, 447.

aquatic, manual, 158.

breeding, colchicine as tool, N.Y.State 617.

breeding for disease resistance, problems in, 485.

breeding for insect resistant crops, 358.

breeding programs, quick testing of nematode resistance in, U.S.D.A. 489.

bug, rapid, insecticides for, tests, 78.

bug, Say's, U.S.D.A. 784.

bug, southern green, feather-legged fly as parasite, 650.

bugs, grass, Mont. 786.

bugs in citrus groves, 646.

cell membranes, structure and composition, 600.

chromosomes, *see* Chromosome(s).

coccids on roots in Egypt, 647.

cold resistance in and chromosome complement, 604.

collectors, method for determining and specifying locality by, 593.

communities, major, on a transect through western Oregon, 592.

Plant(s)—Continued.

cultivated, in indigenous flora of Argentina, 593.

culture, effect of vitamins and other chemicals, 329.

culture in cinder and gravel for greenhouse flowering, 194.

culture in fluid media, test of availability of adsorbed ions to, 306.

culture in nutrient solutions, treatise, 25.

culture without soil, 25, R.I. 164.

cuttings—

response to treatment with naphthyl acids and their potassium salts in a talc carrier, 330.

rooting, effect of hormodin A on, Iowa 471.

rooting, effect of growth-promoting substances, U.S.D.A. 757.

soil as rooting medium for, 758.

stimulating root development in, with growth-promoting substances, Pa. 471.

cytology, paraffin method in, 744.

deep-rooted, root growth of, in limestone soils, W.Va. 736.

deficiencies, method of diagnosing, 741.
desert, *see* Desert.

disease(s)—*see also* Fungi and different host plants.

and breeding work, progress, Ind. 199.

and pests in Bermuda, 200.

and weather, 585.

control by crop rotations, U.S.D.A. 768.

data in complex factorial designs, problems in handling and interpreting, 630.

due to soil-borne pathogens, relation to microflora of rhizosphere, 202.

greenhouse, control, [N.Y.]Cornell 769.

host-parasite check list revision, U.S.D.A. 59, 199, 342, 630, 768.

important, in 1939, Tex. 770.

important, not previously known in Philippines, 60.

in Brazil, first notices of, P.R. 771.

in Espirito Santo, Brazil, preliminary list, 342.

in Massachusetts, U.S.D.A. 199.

in Santa Fe, Argentina, 200.

in Scotland, new fungi causing, 630.

insect transmission, 57, 496.

new and interesting, 200.

notes, R.I. 60.

plasmodesmata and inclusion in guard cells, problem, 600.

seed-borne, problems of, N.Y.State 202.

situation in Massachusetts in 1940, and weather, U.S.D.A. 768.

summary of causes, 480.

survey for Georgia, 769.

survey of Canada, 771.

Plant(s)—Continued.

disease(s)—continued.

- Survey, work of, U.S.D.A. 768.
 treatise, 58.
 virus, acquired immunity from, 481.
 virus, affecting legumes, identification, 631.
 virus, morphogenetic aspects, 481.
 virus, technics of study, 202.
 ecological array, calcium-potassium-phosphorus relation as factor, 301.
 effect of isotopic nitrogen, Conn.[New Haven] 437.
 embryo, nitrogen metabolism of, 450.
 ericaceous, propagation, [N.Y.]Cornell 765.
 extracts, inhibitor in, relation to growth substance content and output in plants, 743.
 fish-poison, testing for insecticidal value. U.S.D.A. 756.
 flower development, relation to mineral nutrients, 449.
 flowering—
 culture, gravel-nutrient system for, Okla. 757.
 diploidy, polyploidy, and winter hardiness relations in, 171.
 effect of vitamin B₁ on development, 451.
 use of organic materials in preparing soil for, [N.Y.]Cornell 765.
 galls and gall makers, 497.
 green, hydrogen assimilation in, 16.
 green, oxidation reactions and photosynthesis in, relation, 17.
 greenhouse, effect of daily photoperiod increase on growth, [N.Y.]Cornell 765.
 greenhouse, insects affecting, 642.
 greenhouse, methods of watering, [N.Y.]Cornell 765.
 growth—

- and soil reaction, 34.
 and tropisms, new research on, 448.
 as index of soil fertility, Pa. 442.
 effect of boron on, N.J. 735.
 effect of daily variation of temperature, 599.
 effect of light of different wave lengths, 16.
 effect of soil pore space, Okla. 735.
 effect on character of bacterial flora, 302.
 harmful effect of direct and alternating currents on, 161.
 regulation, 741.
 relation to vitamin B₁, 22.
 response to riboflavin and ascorbic acid, 20.
 growth substances—
 and heterosis, 17.
 effect on development of inserted buds, N.Y.State 618.
 effect of dust treatment of seeds with, 596.
 extraction from tissues, difficulties encountered in, 19.

Plum(s)—

breeding, Utah 758.

curculio—

control, new developments in, 359.

larvae in soil, dichloroethyl ether for, U.S.D.A. 783.

survive low temperatures in South, 642.

diseases in Ozark section of Arkansas, U.S.D.A. 769.

grown in Minnesota, biochemical studies, Minn. 437.

grown under hillculture conditions, response to modifications in cultural treatment, 762.

improvement and outstanding seedlings, 760.

Italian Prune, leaf spot, Idaho 342, Utah 771.

magnesium deficiency in, 777.

pollen, longevity, 47.

respiration and maturity in, 762.

varieties, Ind. 185.

varieties in station tests, Miss. 52.

Plutella maculipennis, see Diamondback moth.

Poa compressa seed germination, moistening and drying as pretreatment in, 469.

Poa spp., reproduction in, 467.

Poa spp., seed germination at different alternating temperatures, 16.

Podalonia of North and Central America, 371.

Podocarpus leaves, black fungus on, 637.

Poisonous plants, see Livestock poisoning.

Plants, poisonous, and specific plants.

Poisons—

chemical, raticidal value, 669.

in grasshopper baits, tests, 362.

soil, duration of efficacy, 359.

Pollen—

honeybee-gathered, trapping and yields, 654.

male gametes, small, functioning, effect of female stock on, 456.

studies, U.S.D.A. 784.

tubes in angiosperms, morphology, 454.

tubes, methods for growing for physiological and cytological studies, 454.

Polychrosis—

botrana—

action of sex scent in, 788.

intestine contents, pH and buffering power, 788.

viteana, see Grape berry moth.

Polyembryony, notes, 601.

Polygonatum generative cells, effect of colchicine on division, 310.

Polygonum utahense n.sp., description, 447.

Polyhalite as source of potassium for cotton, Tex. 753.

Polymorphus—

marilis, new hosts and new locality, 535. n.sp., description, 535.

Polynema bifasciatipenne, parasite of four-spotted tree cricket, 505.

Polyphylla spp., in Saratoga Forest Tree Nurserv. 651.

Polyploidy—

in cassava, shown by differences in size of stomata, 310.

induced by colchicine and technic of application, 744.

relation to chemical analysis, 171.

Polyporaceae in northern Brazil, 160.

Polyporus—

circinatus, morphology, cultural characters, and histopathology, 354.

frondosus, cause of oak heart rot, 488.

spp., notes, 351.

spp., of Rio Grande do Sul, Brazil, 160.

Polystictus—

sanguineus, abnormal sterile form, 200.

species and varieties in Rio Grande do Sul, Brazil, 161.

Ponds, farm, fish production in, Ala. 73.

Ponds for farm water supply, Iowa 678.

Popillia japonica, see Japanese beetle.

Poplar—

Hypoxylon canker of, 780.

ink-spot disease, 69.

yellow, germination and survival, effect of seedbed treatment, Ga. 56.

Population—

analysis, [N.Y.]Cornell 834.

changes in and in percentages in different age groups, R.I. 110.

growth, 1925, biology of, 288.

in Black River settlement, Louisiana, situation and prospects, La. 266.

migration—

and social welfare, 119.

in and out of State, decrease in, S.Dak. 834.

intercounty, in Colorado, Colo. 834.

rural, and adjustment, 691.

rural, in United States, 834.

rural urban, selective factors in, [N.Y.]Cornell 834.

natural history of, 288.

of New Mexico, composition and changes, N.Mex. 266.

rural, concepts of marginality in, 691.

trends in Colorado, Colo. 690.

Porcupine, damage to seed and seedlings on cut-over Douglas fir lands, U.S.D.A. 641.

Poria weirii, cause of Douglas fir root rot, 354.

Pork—

production, molasses v. grain rations for, Utah 796.

production on pasture, quality, S.Dak. 795.

products, utilization and effect of freezing storage, Ind. 268.

quality, effect of hominy feed on, Ind. 227.

quality, factors affecting, U.S.D.A. 794.

Porosagrotis orthogonia, see Cutworm, pale western.

Porphyrinuria, bovine congenital—

inherited as recessive character, 524.

porphyrin excretion in, 523.

Portheiria dispar, see Gypsy moth.

- Posthodiplostomum minimum*, morphology and development of stages in life cycle of, 399.
- Potash—
 deficiency, diagnostic value of leaf symptoms, Miss. 60.
 domestic v. foreign, for potatoes, U.S.D.A. 751.
 studies, 582.
- Potassium—
 availability in soils, effects of wetting, drying, and treatments, 178.
 content of orchard foliage, variations in, 50.
 deficiency in carnation plants, symptoms, 211.
 for cotton fertilizers, polyhalite as source, Tex. 753.
 in plants, role of, 449.
 isotopes in *Valonia* and *Nitella*, separation, 166.
 lateral movement in orchard soil, 50.
 leaching below 8-inch depth, effect of soil characteristics and winter legumes, 591.
 leaching below feeding zone of plants, Ala. 13.
 supply of fruit tree, effect of soil type [N.Y.]Cornell 761.
- Potato(es)—
 American, German, and wild varieties, in Cuba, 755.
 and tobacco rotations, Pa. 464.
 ascorbic acid in, effect of cooking and storage, 852.
 bacterial ring rot—
 in Rhode Island, U.S.D.A. 768.
 new to Montana, identification and control, Mont. 630.
 studies, 206, 326, 480, Colo. 630, Utah 771.
 bacterial soft rot in southern Florida, Fla. 485.
 bacterial wilt, studies, 64, 206.
 blight, late—
 breeding for resistance to, 485.
 control by resistant strains, 60.
 in 1940, U.S.D.A. 629.
 in Minnesota, U.S.D.A. 768.
 notes, U.S.D.A. 59.
 resistance of varieties and seedling progenies to, 64.
 situation in Virginia in 1940, U.S.D.A. 630.
 blights, early and late, spray tests for, Tex. 770.
 bluestem, insect transmission, W.Va. 771.
 bordeaux formulas for, N.J. 769.
 bought on a retail market, palatability and color, 270.
 breeding, Colo. 612, [N.Y.]Cornell 751, Pa. 464, U.S.D.A. 751.
 breeding, in South, technic and methods, 178.

riboflavin requirements, Pa. 507.
Science Association, meeting, papers, 509.
seasonal metabolic rhythms in, 94.
selecting breeders among, measurement tables as guide, Okla. 748.
strains different in size and egg weights, Ind. 173.
strains differing in egg production [N.Y.]Cornell 747.
summer green feeds for, 226.
utilization of minerals from various sources, Colo. 655.
vitamin D for, S-4 Type sun lamps v. cod-liver oil as source, Ohio 804.
vitamin G complex requirements, [N.Y.]Cornell 802.
White Leghorn breeders, selection for long life in progeny, W.Va. 748.
Power machinery for farm, [N.Y.]Cornell 826.
Prairie—
areas, relic, in central Wisconsin, 594.
chicken, greater, parasites of, in Illinois, 641.
mixed-grass, of Oklahoma, effect of overgrazing and erosion, 447.
plants, water content and osmotic pressure, relation to environment, 600.
section of Texas, Blackland, response to fertilizers, 611.
Pratylenchus pratensis, distribution and relation to *Fusarium* wilt of cotton, U.S.D.A. 489.
Precipitation—*see also* Rainfall, Snow, *etc.*
conservation by summer fallowed soil tanks in Saskatchewan, 11.
effect of altitude, Idaho 399.
tree rings as record, in western Nebraska, 296.
Pregnancy—
and lactation, diet during, 695.
delayed, in albino rat, experimental shortening, 318.
disease, Tex. 813.
in rats, effect of heterologous antigonadotropic sera on course of, 176.
maintenance in castrated rats by progesterone, 318.
nutritional balance in, 842.
urine, human, new oestrogenic substance in, 611.
vitamin C in blood during and after, 136.

- Pregnant mare serum, effect on blood and liver lipids of fowls, 32.
- Pregneninolone, effectiveness in inducing copulatory response in spayed guinea pigs after oestrogen conditioning, 460.
- Preserves, sugar tests on, 841.
- Price(s)—
analyses, wars, and depressions, 681.
control, Government, advantages and disadvantages, 262.
control, war-time, in United Kingdom, 681.
fixing by foreign governments, bibliography, U.S.D.A. 262.
received by North Carolina farmers, N.C. 544.
variations among retail grocery stores of Burlington, Vt. 429.
- Pricklypear, *see* Cactus.
- Primulas, effect of magnesium, 779.
- Printing, public ownership v. State purchasing, 141.
- Prodenia eridania*, *see* Armyworm, southern.
- Prodenia praefica* as tomato pest, Calif. 792.
- Progesterone—
activity in spayed females not pretreated with oestrin, 460.
administration, inducing relaxation of pelvic ligaments in guinea pigs, 173.
and amniotin combinations, effect on uterine weight of rats and mice, 750.
androgenicity of, 460.
assay method, 175, 611.
effectiveness in inducing copulatory response in spayed guinea pigs after oestrogen conditioning, 460.
restoration of ovulatory cycles and corpus luteum formation by, 460.
synthetic, effect on young male rats, 610.
- Program planning and building, standards of value for, U.S.D.A. 118.
- Prolactin—
assay, modification of Riddle's method, 463.
micro-assay, effect of volume used for injection in, 319.
- Prontosils, progress in use in animal diseases, 243.
- Propionic acid, synthesis, from CO₂ radioactive carbon as tracer in, 603.
- Prostate gland in female rat, embryology and postnatal development, 611.
- Protein(s)—
concentrates, animal and vegetable, in chick rations, comparison, 511.
conversion of inorganic nitrogen to, in vitro, 663, Wis. 662.
dynamic effects, Pa. 507.
effect of ultraviolet light on, N.Y.State 582.
hydroxyamino acids in, U.S.D.A. 662.
importance of quality in feeds, 227.
levels for pigs, Pa. 508.
metabolism during prolonged fasting in dogs, 124.
of grains and seeds, effects of storage, U.S.D.A. 725.
- Protein(s)—Continued.
relative value, for chickens, determining, 511.
requirement in adolescence and in middle age, 696.
requirements for milk production, 517.
structure and denaturation, N.Y.State 582.
studies, 510.
- Prothrombin—
changes in banked blood, 715.
concentration in man, effect of synthetic vitamin K compounds, 852.
deficiency production and response to vitamins A, D, and K, 715.
deficiency, treatment with 2-methyl-1, 4-naphthoquinone, 715.
in blood of newborn infants, 569.
levels and synthetic vitamin K in obstructive jaundice of rats, 568.
- Protococcus* sp., pigments produced in darkness by, 743.
- Protocoronospora phoradendri* n.sp. on mistletoe, 355.
- Protoparce quinque maculata*, *see* Tobacco worm.
- Protoparce sexta*, *see* Tomato worm.
- Protoplasm, sieve-tube, supposed permeability of, 16.
- Protoplasmic streaming—
control, 599.
in oat coleoptile, factors affecting, 162.
theoretical and experimental studies, 593.
- Prune(s)—
French, drying ratios, effect of yields, 52.
leaf spot of Italian variety, 779.
nutritive value, 269.
orchards, control of pear thrips in, 642.
varieties, Ind. 185.
- Pruning—*see also specific crops*.
modified leader v. open-center types, Okla. 757.
new method, 479.
- Prunus cerasus*, virus disease, 628.
- Prunus* species used as stocks, relative cold resistance, 192.
- Psallus seriatus*, *see* Cotton flea hopper.
- Pseudococcus*—
adonidum, *see* Mealybug, long-tailed.
brevipes, *see* Mealybug, pineapple.
citri, *see* Mealybug, citrus.
comstocki, *see* Mealybug, Comstock's.
nipae, *see* Mealybug, coconut.
- Pseudogonatopus magnus* n.sp., description, 224.
- Pseudomonas*—
aeruginosa group, action against disease-producing bacteria, 525.
citri, *see* Citrus canker.
fluorescens, notes, Pa. 480.
nigrifaciens, suggested name for causal organism of butter bacterial discoloration, 811.
radicicola, *see* Nodule bacteria.
- Pseudoperonospora humuli*, host range, 775.
- Pseudophycus utilis*, establishment, P.R. 640.

- Psittacosis**—
in importations of psittacine birds, 393.
possible response to sulfapyridine, 525.
- Psocid**, seed-infesting, new to North America, 642.
- Psychology**, comparative, plants and invertebrates, 492.
- Psyllia pyricola**, see Pear psylla.
- Psyllid(s)**—
in 1938 and outlook for 1939, 326.
resistance in potatoes, Colo. 642.
- Pterochlorus persicae**, life history, 217.
- Ptinidae** in dwellings and warehouses of Canada, key to species, 223.
- Puccinia**—
British species, included under *P. syn-gnesiarum*, 632.
graminis, flexuous hyphae, 627.
graminis in laboratory, longevity of teliospores, 773.
graminis tritici—see also Wheat stem rust.
in Argentina, Chile, and Uruguay, physiologic specialization, 632.
helianthi, aberrant strain, 343.
peridermiospora on ash trees, U.S.D.A. 199.
suaveolens, urediospores as origin of systemic mycelia in, 627.
- Pucciniastrum ericae** in America, hosts for, U.S.D.A. 199.
- Puerto Rico Station**, report, 575, 718.
- Pulex irritans**, see Flea, human.
- Pullet(s)**—see also Fowl(s) and Poultry.
disease or blue comb, pathology, 389.
disease, pathologic concept, 532.
egg-producing ability, relation to growth rate, N.J. 794.
laying, palm-kernel and peanut meals in rations for, 381.
laying, steamed potatoes for, 232.
summer management, Ohio 94.
- Pullorum disease**—See also *Salmonella pullorum*.
agglutination test for, Ind. 243.
and paratyphoid infections in poultry, Colo. 668.
control and eradication, outlook, 532.
eradication in Massachusetts, Mass. 107.
in poultry flocks, control and eradication, Idaho 389.
in turkeys, 535.
in two poultry breeds, 389.
testing with whole blood, causes for false reactions, 398.
- Pulpwood** on farm woodlands of Upper Connecticut Valley, cost of production, U.S.D.A. 199.
- Pumpkins**, canning quality, factors affecting, Ind. 150.
- Purdue University**, notes, 432.
- Pycnopeziza**, systematic study, 311.
- Pyometra**, bovine, *Corynebacterium equi* in, 527.
- Pyralis farinalis**, see Meal moth.
- Pyrausta nubilalis**, see Corn borer, European.
- Pyrenomyces** recorded for Britain, list, 593.
- Pyrenopeziza**, new species, 23.
- Pyrethrum**—
deterioration, 496.
emulsion and paris green as anopheline larvicides in Georgia, 220.
insect sprays, prolonging toxicity, 496.
oil spray for reduction of beet leafhopper on tomatoes, Idaho 357.
- Pyrgotidae** species, parasitic on Japanese beetles, U.S.D.A. 503.
- Pyridine**, concentration-mortality curves for solutions toxic to eggs of *Lygaeus kalmii*, 360.
- Pyridoxin**, see Vitamin B₆.
- Pyrilla perpusilla**, bionomics and control, 363.
- Pyruvate** injected in rabbit, fate of, 135.
- Pyruvic acid**—
in barley respiration, formation, 451.
metabolism in normal and vitamin B₁-deficient states, 133.
- Pythiomorpha gonapodioides**, synthesis of thiamin and biotin by, 305.
- Pythium**—
aphanidermatum, notes, 60.
foot rot of small grains in Virginia, U.S.D.A. 769.
root and bulb rots of tulip, 200.
spp., from soil, quick method of isolating, 481.
spp. on wheat, control, 347.
- Quail**—
bobwhite—
effect of management, Okla. 781.
food and cover plants in Brazos County, Texas, phenology, 492.
genetic experiments with, Tex. 782.
parasites of, in Illinois, 641.
populations, effect of woodland management, Tex. 355.
cannibalism among, salt as curative, 355.
eggs, incubation, effect of temperature, humidity, and air movement, 516.
food and enemies, Okla. 781.
food and shelter for, effect of cover control, Tex. 781.
habits, food, enemies, diseases, etc., in Southeastern States, 783.
management and winter food, Tex. 781.
nutrition and feeding, U.S.D.A. 794.
production on Lake Carl Blackwell game farm, Okla. 781.
- Quinoline**, concentration-mortality curves for solutions toxic to eggs of *Lygaeus kalmii*, 360.
- Quinones**, antihemorrhagic, comparative activities, 506.
- Rabbit(s)**—
and steers, relative ability to digest pasture herbage, 228.
appearance of hair and hair growth on shaved areas, effect of maturity, sex, and oestrinization, 317.
artificially infected with avian tubercle bacilli, effect of sulfapyridine, 244.
cestode parasites of, 73.
cottontail and jack, susceptibility to equine encephalomyelitis, 249.
cottontail, worst enemies, Pa. 495.

Rabbit(s)—Continued.

- damage to seed and seedlings on cut-over Douglas fir lands, U.S.D.A. 641.
- dwarf mutation in, 314.
- feeding for meat and fur, 509.
- food and parasites in lowland area of Oklahoma, 491.
- hematology of avitaminosis A in, 508.
- nematode parasites of, 72.
- nutrition and lactation studies, U.S.D.A. 662.
- on vitamin B-deficient diet, intestinal yeast flora of, 228.
- papilloma virus, purification and properties, 388.
- Soviet, Marder variety, 606.
- superovulation in, 174.

Rabies—

- canine, vaccination with phenol-treated vaccine, 250.
- control and prevention, 398.
- vaccination, efficacy of single intraperitoneal injection method with phenol-treated vaccine, 388.
- vaccines, potency of, 388.

Raccoon—

- food habits, in eastern Iowa, 492.
- parasites of, in Illinois, 641.
- severe parasitism in, 783.

Radiosonde, improved, and its performance, 152.

Railletina tetragona, efficiency of phenothiazine against, 252, 817.

Rainfall—see also Precipitation.

- and run-off from watersheds—
 - and terraces of Fort Hays Conservation Experiment Station, 442.
 - of Missouri Valley, compilation, U.S.D.A. 442.
 - of Texas Experiment Station, U.S.D.A. 154.
- and water planning in Minnesota, 442.
- effects on erosion-measurement plats, Miss. 300.
- frequency determinations, accuracy, 441.
- great, 11.

Raisin moth, role in spoilage of mature vine grapes, U.S.D.A. 783.

Raisins, stored, protection against crawling insects, U.S.D.A. 783.

Ramie fibers, chemical identification, 717.

Ranch—

- lands, tax-price ratio, 1913 to 1938, trends, Tex. 828.
- stability, effect of cultural practices, seeding methods, and livestock husbandry, Nev. 464.

Range(s)—

- and pasture botany, studies in, 159.
- and pasture utilization, U.S.D.A. 794.
- depleted, revegetation, Colo. 612.
- forage composition, effect of stage of maturity, Idaho 372.
- grasses, see Grass(es).
- improvement through conservation of flood waters, Mont. 254.
- land conservation, economic aspects, 114.

Range(s)—Continued.

- lands, effect of too early and too heavy grazing, Utah 613.
 - midwestern, deterioration, 180.
 - native, natural revegetation of, Colo. 612.
 - new and extended, for Utah plants, 446.
 - outlook, new, U.S.D.A. 687.
 - overgrazed, management as cure for, 323.
 - plants and their root reserves, effect of grazing methods, Utah 754.
 - plants, common, of Arizona and New Mexico, 24.
 - plants, fall and winter, phosphorus content, Idaho 372.
 - plants, nutritional value, Ariz. 89.
 - plants, poisonous, see Plant(s), poisonous, Livestock poisoning, and specific plants.
 - plants, summer, phosphorus in, Utah 754.
 - plants, water requirements and fertilizer tests of, Ariz. 33.
 - resource surveys, Colo. 612.
 - revegetation, Utah 754.
 - vegetation, composition and utilization, Tex. 89.
- Ranunculus* occurring in North America, monographing, Ariz. 17.
- Raphidia ophiopsis*, effect of *Empusa weberi* on larvae, 788.
- Raspberry(ies)—
- anthracnose control, 629.
 - ascorbic acid in, comparison with crystalline form, utilization by college women, 425.
 - autumn-fruiting, breeding, 193.
 - black, new disease in Pennsylvania, U.S.D.A. 769.
 - crown gall, control, 486.
 - culture and disease control, Ill. 53.
 - diseases, N.Y.State 630.
 - fruitworm, U.S.D.A. 784.
 - growth and production, effect of mulching, 192.
 - inbreeding experiments, Conn.[New Haven] 47.
 - inheritance and linkage in, 456.
 - leaf area and weight and leaf weight and fruit production, correlations between, 762.
 - methods of protection and fertilization to reduce winter damage, Colo. 334.
 - mosaic control, 66.
 - mulching, N.J. 761, W.Va. 758.
 - new, introduction, U.S.D.A. 756.
 - new variety, Tennessee Autumn, description, Tenn. 193.
 - production, prices, returns, etc., N.H. 685.
 - roots, phycomycete affecting 59.
 - selective fertilization 456.
 - spur blight, control, 66, N.J. 769.
 - streak disease, mild, in Maryland, U.S.D.A. 59.
 - trailing, characteristics and breeding, N.C. 621.
 - varieties, W.Va. 758.
 - winter injury to, Colo. 617.
 - yield, hardiness, and fruiting period, variety comparisons, 763.

- Rat(s)—*see also* Rodent(s).
 change of age of puberty by selective mating, 173.
 fed galactose, effect of exercise on growth and cataract development, 417.
 fed white flour, hyperplasia in forestomach epithelium, prevention, 705.
 female, a technic suppressing development of reproductive function and sensitivity to oestrogen in, 749.
 female, growth, effect of reproductive condition, 31.
 female, postnatal masculinization with testosterone propionate, 31.
 female, treated with testosterone propionate, masculinization, 749.
 filtrate factor, multiple nature of, 700.
 flea, oriental, distribution and hosts, 74.
 male and female, differences in vitamin E requirements, Idaho 372.
 male, reproductive organs in, effect of oestrogen and androgen injections, 174.
 mite, tropical, in Minnesota, 506.
 of low fertility and high incidence of mammary tumors, abnormal growth in, 606.
 on deficiency diet, change in body weight and food consumption, 842.
 on vitamin B-deficient diet, intestinal yeast flora of, 228.
 on vitamin E-deficient diet, sterility and depression of growth in relation to age, 798.
 prolongation of productive life, [N.Y.] Cornell 795.
 reproduction in, on diets of purified food, Conn.[New Haven] 547.
 reproductive efficiency under different breeding conditions, 31.
 respiration apparatus for serial work with, 782.
 virus inquiry report, 669.
 vitamin A in, histological demonstration, 558.
 white-throated wood, life history and ecology, relation to grazing, Ariz. 72.
- Rayon(s)—
 chemical identification, 717.
 recent developments in, 571.
- Real estate—
 instruments recorded in Payne County, 1895-1939, for properties in or near mineral areas, Okla. 827.
 mortgaged, deficiency judgment problem resulting from foreclosure, 112.
 rural and urban, equitable assessment of, Tex. 828.
- Red berry mite, U.S.D.A. 784.
- Red mitc—
 citrus, distribution and food plant records of, U.S.D.A. 785.
 European, control, Conn.[New Haven] 495, N.Y.State 642.
 European, distribution and food plant records of, U.S.D.A. 785.
- Red scale—
 California, control with hydrocyanic acid gas, 647.
- Red scale—Continued.
 Florida, effect of temperature, U.S.D.A. 783.
 fumigation with cyanide and toxicants in oil, U.S.D.A. 783.
 two strains, 791.
- Red spider—
 control, N.Y.State 642, Tex. 787.
 control with adhesives, 788.
 notes, N.J. 786, Pa. 495, U.S.D.A. 784.
 on hops, control, 88.
 on roses, control, 194.
 on strawberries, control, La. 357.
 on water hyacinth, entomogenous fungus on, 212.
 toxicity of selenium-containing plants for control, 793.
- Redbud canker in New Jersey, U.S.D.A. 769.
- Redbud insects, 75.
- Redwoods—
 coast, climatic chronology in, 296.
 of California coast, problems in dating rings, 296.
- Reed canary grass, hull-less seeds, germination, 470.
- Reforestation, role of soil organic matter in, 479.
- Refrigeration in farm household, Ind. 286.
- Refrigerator—
 cars, icing, for transporting citrus fruits, U.S.D.A. 756.
 home-made walk-in type, Ark. 677.
- Relapsing fever and ticks in United States, 794.
- Relationships, analyzing data for, [N.Y.] Cornell 287.
- Rennet test, viscosimetric form of, 295.
- Rennin in whey, inactivation, effect of heat and pH, 100.
- Renocis* n.spp., descriptions, 652.
- Reproduction—
 in rats on synthetic B-complex supplement, 848.
 physiology of, numerous phases, U.S.D.A. 662.
- Resazurin test—
 comparator for, 730.
 for milk, compared with other tests, 238.
- Rescue grass smut, different methods of combating, 203.
- Research—*see also* Agricultural research.
 work, improved and expanded facilities for, Miss. 430.
- Respiration—
 and catalase, relation between, 16.
 and oxygen requirements of *Nuphar adenatum* and other water plants, 16.
 apparatus for serial work with small animals, 782.
 in horticultural plants, environment-control chamber for study, 164.
 in wheat grain, relation to freezable water, 599.
 micro-, differential volumeter for measurements, 16.
 plant, mechanism of, 25.
 protoplasmic streaming, and auxin transport in *Avena coleoptile*, relation, 162.

Respiration—Continued.

- rate in relation to nitrogen metabolism of potato tuber, 17.
- Respirometers, Warburg, in plant physiology, 602.
- Rhabdophaga*, separation of species, 225.
- Rhabdospora* parasitizing bindweed, Idaho 342.
- Rhabdospora* sp., notes, 69.
- Rhagoletis cingulata*, see Cherry maggot.
- Rhagoletis pomonella*, see Apple maggot and Blueberry maggot.
- Rhaphium rossi* n.sp., description, 221.
- Rhinoceros beetle, coconut, protective seed treatments, etc., against, P.R. 640.
- Rhinotrichum depauperatum* n.sp. on spider mites on water hyacinth, 212.
- Rhipicephalus sanguineus*, see Dog tick, brown.
- Rhizobium*—
- growth metabolism, 21.
- leguminosarum* cultures for inoculation of peas, 187.
- meliloti*, nitrogen-fixation efficiency, effect of host plant, 35.
- meliloti*, resting cells, respiration studies, 169.
- meliloti* strains, nitrogen fixation on legumes, 598.
- respiration rates, estimation and significance, 168.
- sp. on soybeans, nodulation and nitrogen fixation, 448.
- spp., inoculation of peanut plants with, response, 447.
- strains, ineffective, structure of and effect on nitrogen fixation, 168.
- strains, inefficiency of, suggested explanation, 168.
- trifolii*, biotin as growth stimulant, 742.
- Rhizoctonia*—
- defoliation of holly cuttings by, 627.
- solani* from potato and sugar beet, pathogenicity studies, 634.
- solani* on cotton seedlings, 774.
- spp. on potatoes in Argentina, 206.
- Rhizopus* *suinus*, synthesis of biotin and thiamin by, 304.
- Rhode Island Station, report, 141.
- Rhodes grass, root reserves in, storage, 308.
- Rhododendron(s)—
- detrimental effect of walnut to, 211.
- effect of winter droughts, N.J. 765.
- midge, studies, 216.
- propagation, [N.Y.]Cornell 765.
- shoot growth and flower-bud set in, 196, [N.Y.]Cornell 765.
- Rhopalosiphum pseudobrassicæ*, see Turnip aphid.
- Rhubarb—
- improvement, Pa. 471.
- leaf, amide synthesis in, Conn.[New Haven] 437.
- variety tests, Ga. 44.
- Rhus* and allied genera, wood anatomy and pollen morphology, 24.
- Rhyacionia buoliana*, see Pine shoot moth, European.

Riboflavin—

- and vitamin B₁ in economy of food utilization, Ark. 703.
- and vitamin B₁ of milk, 519.
- assay, depletion of birds for, Colo. 655.
- deficiency, relation to ocular lesions, 707.
- dietary, level, effect on quantity stored in eggs and rates of storage, 514.
- effect on chick growth and curled-toe paralysis, 510, 514.
- estimation, new biological method, 583.
- growth response of plants to, 20.
- in distillers' residues, 507.
- in eggs and tissues, effect of rations of hen, 510.
- in hays and grasses at different stages of maturity, 227.
- in liver, biological assay, 564.
- in liver extract, 293.
- in quick-frozen food, 694.
- in rumen content of cattle, 799.
- in urine and tissues of dogs and rats, bacterial assay, 564.
- in vegetables and fruits, 422.
- in vegetables, effect of quick-freezing and canning, 561.
- in yeasts, 151.
- minimum requirement for growing pigs, 377.
- production of staphylococci, [N.Y.]Cornell 806.
- properties, food sources, and stability, 847.
- requirements of White Leghorn and Barred Plymouth Rock chickens, Pa. 507.
- stability in irradiated milk, Wis. 664.
- studies, 582.
- synthesis in feces of fowl, 514.
- Rice—
- arsenic compounds toxic to, 182.
- black kernels, effect of fertilizers and seed treatments, Tex. 770.
- breeding, Tex. 752, U.S.D.A. 751.
- cadang-cadang, probable cause, 60.
- carriers of nitrogen and phosphorus for, Tex. 753.
- Cercospora oryzae* in, inheritance of resistance to, 605.
- culture experiments, Tex. 753.
- diseases and physiology, Tex. 770.
- diseases, control, Ark. 630.
- fertilizer experiments, Tex. 753.
- high-quality, varieties, U.S.D.A. 751.
- insect pests in Guam, 358.
- irrigation, sources of water to supplement declining well supply, Ark. 677.
- linkage of two resistant factors to *Cercospora oryzae*, 629.
- new outstanding strains, Ark. 612.
- palay lalake, a fungus disease, 60.
- parboiled, v. unmilled raw, antineuritic value, 278.
- polished, growth factor in, and requirement by chicks, 513.
- proteins, nutritive value, effect of amino acid additions on growth, 550.

Rice—Continued.

- rough, farm storage and marketing in Arkansas, Ark. 118.
- Sclerotium* diseases, causal fungi, physiological studies, 346.
- straw, new species of *Pistillaria* on, 311.
- strawstacks, fungi recovered from dust of, Tex. 770.
- tillering and flowering in, 632.
- tolerance to different soil reactions, Tex. 753.
- variety tests, Ark. 40, Tex. 752.
- wild, ergot in Maine, U.S.D.A. 199.
- yield, milling quality, and other characters in, effect of time of seeding, 614.
- Ricketts—
- experimental, in rats, behavior and fate of cartilage remnants in rachitic metaphysis, 138.
- healing, histology of bone growth in, W.Va. 842.
- healing without aid of vitamin D, Conn. [New Haven] 547.
- in calves, prevention, Okla. 806.
- production, comparison of cereal and non-cereal diets in, 138.
- treatment, with one massive dose of vitamin D, 567.
- Rickettsia diaporica*, persistence in tissues of *Ornithodoros turicata*, 393.
- Rickettsias, of typhus-Rocky-Mountain-spotted-fever group in South Africa, 523.
- Rickettsiosis of sheep new to South Africa, 523.
- Ringworm fungus, squirrel as new host to, 525.
- River-bottoms and houseboat people, 544.
- River measurement, *see* Stream flow.
- Roasters, electric, studies, Va. 286.
- Rodent(s)—*see also* Mice and Rat(s).
- control, 73, 629, Ind. 212, Kans. 333.
- pests in New York, economics and biology, [N.Y.]Cornell 781.
- seasonal utilization and forage requirements of range vegetation by, Ariz. 73.
- wild, epizootics of plague infection in western United States, 392.

Roentgen rays, *see* X-ray.

Root(s)—

- aerobic respiration, interaction, and electrochemical behavior of surface of protoplasm, 595.
- cells, salt accumulation by, methods for recovery of tissue fluids, 307.
- cuttings, regeneration, role of growth substances in, 453.
- extension, estimation of volume of water made available by, 744.
- growth, oxygen tension in relation to, N.J. 735.
- inducing activity of individual substances and mixtures, comparison, 17.
- isolated, growth factor requirements, 597.
- knot, breeding for resistance to, inducing uniform soil infestations of nematodes as aid, U.S.D.A. 489.

Root(s)—Continued.

- knot in Florida cigar-wrapper tobacco fields, control, U.S.D.A. 489.
- knot injury to peach trees and other plants, U.S.D.A. 199.
- knot nematode(s)—
- and cotton wilt, 63.
- attacking stems and leaves of plants, U.S.D.A. 489.
- control, chemical treatment of soil for, U.S.D.A. 490.
- control in greenhouse tomatoes, R.I. 60.
- diseases in Virginia, U.S.D.A. 489.
- effect of crop rotation on, U.S.D.A. 489.
- in potatoes, control by irrigation, U.S.D.A. 489.
- infestation, plants resistant or tolerant to, U.S.D.A. 490.
- list of hosts, additions to, U.S.D.A. 489.
- spread by man, U.S.D.A. 768.
- nematode of tomatoes, Ind. 212.
- nodules, *see* Nodule bacteria.
- penetration, effect of compact subsoil horizon on, 479.
- pressure, effectiveness in ascent of sap, 450.
- studies, container for growing plants for, 454.
- worms, protection of strawberries from, 359.
- Rootstocks, clonal, propagation and introduction, N.Y.State 618.
- Rosa multiflora* and its progeny, 338.
- Rose(s)—
- beetle, Fuller's, control, 781.
- Better Times, effect of incorporating sand with soil, Pa. 471.
- black mold of grafts, causing death of scions, 353.
- black spot, relative susceptibility of varieties to, U.S.D.A. 630.
- black spot, studies, Tex. 770.
- blooms, fading, factors in, 477.
- breeding, 338.
- bushes, sprayed with nicotine sulfate combinations, persistence of nicotine on, 361.
- calcium and phosphorus nutrition, N.J. 765.
- cultural requirements, [N.Y.]Cornell 765.
- culture in cinder and gravel for greenhouse flowering, 194.
- culture in home garden, Tex. 196.
- different understocks for, value, 338.
- diseases, notes, [N.Y.]Cornell 769.
- diseases, relation to fertilizers, 779.
- effect of native peats in culture, Pa. 471.
- growth in alkaline soil, effect of sulfur, 195.
- growth, interrelation of calcium and phosphorus concentrations on, 195.
- hardy double and hardy thornless, breeding, S.Dak. 757.

Rose(s)—Continued.

- hybrids, chromosomal determinations, Tex. 757.
 in cold storage rooms, ethylene injury to, 339.
 in soil and soil-peat mixtures, root growth and flower production, 195.
 mosaic in Brazil, 637.
 plants, propagation and storage, Tex. 757.
 plants, storage, 338.
 powdery mildew, control in greenhouse, relation to wetting agents, 628
 powdery mildew in Connecticut, U.S.D.A. 59.
 requirements for soilless culture, Ohio 765.
 research at Cornell University, 338.
 roots, depth and lateral spread, 338.
 soil and peat mixtures for, N.Y.State 618.
 sulfur dioxide for defoliation, Tex. 770.
 thornless, progress in, 338.
 thrips, control, 499.
 use of fertilizers on, 338.
 virus diseases, spread, 211.
 watering problem, 338.

Rosin residue emulsion as sticker for lead arsenate in sprays, Del. 359.

Rostrella species causing coffee tree disease, 67.

Rotation of crops—

- and sequence experiments, Tex. 753.
 effect on organic matter in surface soils, Ga. 34.
 in Tennessee types of farming areas, Tenn. 260.
 merits of fertilizer in, Okla. 752.
 notes, R.I. 34.
 on dry land and under irrigation, Mont. 612.

Rotenone—

- bearing roots, effect of alkaline dust diluents on toxicity, 77.
 bearing roots, resin- and starch-cell tissues in, P.R. 600.
 in low concentration as tickicide and insecticide for house pets, 655.
 producing plants, effect of exhausting food reserves from, P.R. 600.
 tests against apple aphids, 364.

Rotylenchulus reniformis—

- as root parasite, U.S.D.A. 489.
 notes, Ga. 60.

Roughage(s)—

- iodine in, Tex. 727.
 problems, with emphasis on quality, 226.

Roundworm—

- larvae, development in feces, effect of phenothiazine on, 105.
 of poultry, anthelmintic value of tobacco midrib powder against, 533.

Roup, etiology and vaccine preparation, 535.

Rubber-seed oil, Florida, U.S.D.A. 725.

Rumanian civil code, new, and agrarian legislation, 256.

Ruminants—

- digestive diseases resulting from abnormal conditions of fore stomachs, 388.
 fasting metabolism of, 373.
 parasites of, treatment for removal, U.S.D.A. 813.
 rumen gases and bloat in, 388.
- Run-off—
 and rainfall from watersheds—
 and terraces of Fort Hays Conservation Experiment Station, 442.
 of Missouri Valley, compilation, U.S.D.A. 442.
 of Texas Experiment Station, U.S.D.A. 154.
 and soil erosion, effect of slope on, rain simulator studies, U.S.D.A. 442.
 silting, and stream flow, effect of vegetation and watershed treatments, U.S.D.A. 108.

Rural—

- community(ies)—
 of an Alabama county, 266.
 of New York, migration from, selective factors in, [N.Y.]Cornell 267.
 school services in, Ark. 120.
 credit, *see* Agricultural credit.
 labor, *see* Agricultural labor.
 leadership, analysis, 688.
 life in process, treatise, 688.
 people, U.S.D.A. 687.
 people, social attitudes of, [N.Y.]Cornell 834.
 schools, *see* School.
 society, organization and changes, treatise, 411.
 zoning for Missouri, 115.
 zoning in South Dakota, possibilities, S.Dak. 411.

Rust—*see also* Cereal rusts, grain rust(s), and specific hosts.

- causing injury to ash trees in New Hampshire, U.S.D.A. 199.
 fungi, taxonomy, Ind. 200.
 of woody plants of Colorado, 489.
 species on *Juniperus* in Oklahoma, 212.
 tropical, descriptions, 773.

Rutabagas, *see* Swedes.

Rutgers University, notes, 432.

Rye—

- culture experiments, Mont. 612.
 foot disease, new cause of, 773.
 smut infection of susceptible and resistant selfed lines, histology, 347.

Ryegrass, endophytic fungus in leaves of, 206.

Rynchospora macrostachya, extension of range of, 159.

Saccharomyces cerevisiae strains, varieties, or races, biochemical classification, 171.

Saissetia oleae, *see* Black scale.

Salad dressings, soybean flour as emulsifying agent in, 839.

Saliva of Eskimos, biochemical studies, correlated with dental caries, 555.

Salmonella—

- bovis-morbificans* fatal to sheep, 247.
california, new type isolated from turkeys, 535.
choleraesuis group, biochemical and serological studies, Ky. 103.
 group, acid agglutination in, 671.
titchfield n.sp., description, 821.
pullorum—*see also* Pullorum disease.
 agglutination by micro-organism in turkeys, 821.
 colonies, identification by macroscopic plate test, 677.
saint paul n.sp., description, 821.
 spp., from domestic animals and birds in South Africa, antigenic structure, 523.
 spp., in normal hogs, 530.
suipestifer—
 endocarditis caused by, 391.
 group, biochemical and serological studies, Ky. 103.
 infection in canaries, first recorded case, 677.
typhimurium—
 fatal to sheep, 247.
 from South African animals, serological variants, 523.
 notes, 398.
 Salsify wilt, cause, 350.

Salt—

- accumulation by plants, biochemistry, 167.
 balance in irrigated areas, 444.
 spray damage from recent New England hurricane, 11.
 stabilization of iodine in, 507.
 water spray, wind-driven, effect on trees, 199.

Salts, movement, effect of irrigation, Idaho 298.

San Jose scale—

- control, Idaho 357, N.Y.State 642.
 females, rendered unproductive by lime-sulfur, 647.

Sandy beaches, microscopic fauna of, 595.

Sap, ascent, effectiveness of root pressure on, 450.

Sarcocystis in birds, bibliography of, 535.

Sarcophaginae and relatives in New York, 221.

Sardines, canned, analyses, Me. 694.

Sarson, insect pollinators of, 495.

Sartwellia flaveriae, toxicity to goats, 819.

Sauerkraut—

- canned, quality, relation to composition, N.Y.State 152.
 paraffin sealing, as aid to preserving vitamin C and preventing brown discoloration, Wis. 693.

Sausage tree, movement of organic solutes in, 741.

Sausages, sulfur in, 127.

Sawfly (ies)—

- black wheat stem, Ohio 225.
 leaf-mining, new species on violet, 642.
 pine-feeding, *Eænterus* parasites of larvae, review, U.S.D.A. 87.

Scabies, eradication, U.S.D.A. 813.

Scale(s)—

- control, dry lime-sulfur plus oil in, Idaho 357.
 dormant spray for, Pa. 495.
 insects—*see also* Black scale and Red scale.
 biological control, status, 792.
 in Virginia apple orchards, 789.
 new predaceous beetles on, introduction from Trinidad and Brazil, P.R. 640.
 on bamboo, biological control, P.R. 640.
 on citrus, development and control, 218.
 predators, establishment of introduced species, P.R. 640.

Scellus, new, with key to males, 787.

Schistocerca paranensis, resistance of corn to, 645.

Schizophyllum commune, notes, 351.

School(s)—

- elementary, teaching conservation in, 268.
 lunches using farm surpluses, U.S.D.A. 271.
 population, changing, and its implications, 266.
 services in rural communities, Ark. 120.
 tax collection by districts, percentages in or near oil areas, Okla. 827.

Science and agricultural policy, U.S.D.A. 687.

Science, application, in crop production, U.S.D.A. 751.

Scirpi, American, phyto geography of, 593.

Scirtothrips citri, *see* Citrus thrips.

Sclerosis, multiple, treatment with nicotinic acid and vitamin B₁, 850.

Sclerotinia—

- bifrons* on poplar, 69.
fruticicola apothecia, destruction, 58.
fruticicola conidia, respiration, 628.
fructigena causing fruit brown rot, 201.
laza, cause of blossom wilt of fruit trees and ornamental shrubs, 201.
 rot of beans in New York, U.S.D.A. 199.
sclerotiorum and *S. trifoliorum* in culture, production of apothecia, 344.

Sclerotium—

- bataticola* charcoal rot, notes, U.S.D.A. 342.
hydropitulum notes, 346.
oryzae-sativae, notes, 346.
rolfsii on flax, U.S.D.A. 342.
rolfsii, perfect stage, Tex. 770.

Scoliidae species, parasitic on Japanese beetles, U.S.D.A. 503.

Scolytus multistriatus, *see* Elm bark beetle, smaller European.

Screwworm(s)—

- and blowflies, U.S.D.A. 784.
 larvae, lateral migration and depth of pupation, 650.
 larvae, nutritional requirements, 650.
 larvae, tests with, Tex. 813.
 lateral migration and depth of pupation of larvae, 494.
 toxicity of organic compounds to, 84.

Screwworm(s)—Continued.

toxicity of phenothiazine and related compounds to, 84.

Scurfy scale, control, N.Y.State 642.

Scurvy, effect of vitamin C on calcium, phosphorus, and nitrogen metabolism in, 711.

Scutellista cyanea, parasite of black scale, Calif. 791.

Scutigera immaculata, see Centipede, garden.

Sedimentation studies, U.S.D.A. 823.

Seed(s)—

agricultural, establishing standards on, 469.

analysis and law enforcement, application of tolerances to, 470.

analysis, complete and modified, comparison of time required for, 470.

analysis, purity, training of beginners in, 469.

blower, new, and distribution of weed seeds in, 470.

certification in Maryland, 319.

control, fundamentals of, 469.

control in Tennessee, 469.

disinfectant, chlorine gas as, U.S.D.A. 774.

germination—

advantage of alternating temperatures over constant temperatures in, 16.

effect of vitamin B₁ and phytohormones on, N.Y.State 618.

tests on replicate samples, results, 470.

hard, policy for evaluation, 470.

hard-coated, dormant, germinative power, determination, 16.

industry, progress in, 469.

inspection in Kentucky, Ky. 329.

laboratories, and extension services, opportunity for cooperation between, 469.

laboratory record card data, 469.

large crop, weights of, N.Y.State 618.

laws, State, application to dealer and grower, 470.

marketing, 469.

price v. seed quality, 469.

sample and its limitations, 469.

selective disinfection, 481.

testing in Alabama, 469, 470.

testing, use of glass wool as substratum, Conn.[New Haven] 464.

tests for 1940, N.H. 616, N.Y.State 616, Vt. 616.

treatment, efficacy, effect of pathogen, environment, and host response, 58.

treatment of cereals, new machine for, Okla. 770.

treatment with chemicals in dust form, Tex. 757.

treatment with indolebutyric acid, effects, 470.

weed, see Weed seeds.

Seedbed preparation studies, Tex. 753.

Seed-corn maggot, pest of red cedar seedlings, 222.

Seedling injuries, induced by chemicals dissolving from germinator trays, 470.

Selenium—

absorption by plants from soils under natural conditions, 22.

feeding repeated small doses of, effect on horses, 820.

in grasshoppers feeding on seleniferous vegetation, 499.

in plants and soils, S.Dak. 727.

in plants, toxic amount for red spider, 793.

in soils, in the United States, and toxic vegetation, U.S.D.A. 14.

in soils, use of indicator plants for locating, 307.

in toxic plants, U.S.D.A. 725.

poisoning, chronic, of rats, effect of dietary protein, 417.

poisoning, chronic, studies, 102.

poisoning in rats, liver glycogen values, 524.

poisoning of livestock, S.Dak. 813.

toxicity, effect of glutathione on, 524.

use by chicks, S.Dak. 802.

Semen—

bovine, buffering capacity of, 610.

bovine, characteristics, effect of storage temperatures, 610.

bovine, preservation in yolk-phosphate diluent and field results from use, 610.

improved artificial vagina for collection, 463.

of stallions and jacks, preservation of motility, 463.

Senecio alkaloids, hydrogenation, hydrolysis, and structural results of isatidine, 814.

Septicemia, hemorrhagic, tests with immunizing agents, S.Dak. 813.

Septobasidium pseudopedicellatum, notes, 636.

Septoria—

cornicola leaf spot of flowering dogwood, U.S.D.A. 342.

leaf blotch of *Lobelia*, 200.

sp. on *Campanula*, 200.

spp., spot disease of citrus caused by, 636.

Sequoia, shoot apex, vascular differentiation in, 592.

Serangiella new genus, erection, 223.

Serangium—

new genera and species of ladybeetles related to, 223.

n.spp., description, 223.

Serica peregrina, parasites of, U.S.D.A. 503.

Serratia marcescens, effects of light quality, 16.

Serum—see also Blood.

antigonadotropic, rate of loss of activity in vivo, 29.

carotenoids, determination, 150.

progonadotropic, mechanism of action, 30.

Setaria macrostachya, seed germination, 43.

Settlers, white, in the Tropics, 154.

Sewage—

- from given system, uniformity of character, N.J. 823.
- treatment, activated sludge process, N.J. 823.
- treatment plant, reducing size of sedimentation tanks, N.J. 823.

Sex—

- control in animal production, 748.
- development in rats, effect of oestrogens, 750.
- expression in willows, 26.
- hormones, *see* Hormone(s).
- variation in iron utilization by rats, 276.

Shaft louse, effect of phenothiazine, 74.

Sheep—*see also* Ewe(s) and Lamb(s).

- and goat breeds, crossing for fleece and meat production, U.S.D.A. 747.
- artificial insemination for breeding, advantages, limitations, and uses, U.S.D.A. 316.
- artificial insemination, results from, Idaho 316.
- botfly, *see* Botfly, sheep.
- breeding flock, winter feeding practices, Miss. 374.
- breeding season, effect of length of day, Ga. 89.
- Corriedale, dual-purpose breed, 230.
- dosed with phenothiazine, urine examination, 817.
- diseases, *see specific diseases*.
- effect of breeds on lamb and wool production, 226.
- effect of feeding and breeding on lamb and fleece production, Utah 796.
- effect of phosphorus deficiency on protein and mineral metabolism, 374.
- fasting metabolism of, 373.
- feeding, grazing, and management, U.S.D.A. 794.
- gastrointestinal parasites acquired during winter season, 247.
- gastrointestinal parasites, control, 388. [N.Y.]Cornell 813.
- Hampshire, twinning, increased by selection, Okla. 747.
- horns in, genetics of, 605.
- identification by tattooing, 658.
- index of purchasing power, N.Dak. 537.
- internal parasites, control, Ga. 105.
- large-scale production in New York, [N.Y.]Cornell 795.
- louse control, Ga. 74.
- maggot-fly problem, New Zealand survey, 84.
- Merino, cross-breeding, for fat-lamb production in South Africa, 375.
- Merino, in New South Wales, selection for wool production, 172.
- Merino, prenatal growth in, 800.
- metabolism of nicotinic acid in, 799.
- native, improving lamb- and wool-producing quality, Ga. 89.
- nematode parasites, recovery from pastures, 248.
- nutrition, role of nicotinic acid in, Tex. 796.

Sheep—Continued.

- on summer range, management and utilization of forage by, Mont. 655.
- outbreak of *Listeria* in, 391.
- parasites, external, Tex. 787, U.S.D.A. 784.
- parasites of digestive tract, treatments for control, [N.Y.]Cornell 813.
- phenothiazine therapy in, 529.
- poisoning, *see* Livestock poisoning, Plant(s), poisonous, and *specific plants*.
- production, Utah 828.
- Rambouillet, merits, 91.
- ranches in southwestern Utah, value of efficient management, Utah 115.
- range, improvement, application of genetic principles to, 313.
- rate of grazing and effect on progeny, Mont. 656.
- record of performance in, Mich. 230.
- roundworms and tapeworms, diagnosis and treatment, Mont. 672.
- Salmonella* infection, two mortalities from, 247.
- Scottish breeds and crosses, meat qualities in, 91.
- sperm membrane of, chemistry and cytology, 315.
- tapeworm, possible intermediate hosts, other than oribatid mites, 526.
- Texas bighorned, status, Tex. 782.
- tick control, Ga. 74.
- trucking v. trailing, from winter to summer range, Utah 91.

Shelterbelt—

- plantings, studies, Ind. 196.
- trees, development, effect of ground covers, S.Dak. 757.

Shigella gallinarum, notes, 677.

Shot hole borer, European, in British Columbia, 505.

Shrew, damage to seed and seedlings on cut-over Douglas fir lands, U.S.D.A. 641.

Shrub(s)—

- common to North and South American deserts, floristic significance, 24.
- for wildlife on farms in Southeast, U.S.D.A. 641.
- pests and diseases, 637.
- seed handling, improved methods, Okla. 757.
- seeds, viability, N.Y.State 618.

Sickness and medical care among rural bituminous coal-mining population, Ark. 121.

Silage—

- alfalfa-molasses and corn, and alfalfa hay, comparison for fattening steers, Pa. 506.
- alfalfa-molasses v. molasses-soybean, Pa. 517.
- alfalfa, preserved with molasses or phosphoric acid, type of fermentation in, Pa. 517.
- corn, carotene content, U.S.D.A. 662.
- corn v. legume-sorghum, for dairy cows, S.Dak. 806.

Silage—Continued.

- corn, value in fattening ration of calves, Ind. 226.
- corn, with ears left on, feeding value for beef cows, W.Va. 796.
- feeding value, U.S.D.A. 662.
- from hay crops, making and feeding, Mich. 90.
- from marrow stem kale cut in various lengths, quality, 656.
- grass—
- and mixed hay v. alfalfa hay for dairy cattle, Wash. 383.
 - forage harvesters to speed up making, Wis. 678.
 - harvesting equipment, N.J. 805.
 - practices and costs of production, N.J. 831.
 - preservatives for, Wis. 662.
 - silos pressures developed by, N.J. 805.
- harvesting, Ind. 254.
- hay-crop and corn, relative cost, Ohio 110.
- hegari, utilization of grain in by beef cattle, Ariz. 89.
- juices, corrosive action, protection of silo walls against, N.J. 805.
- legume and grass, preparation, 508.
- legume, as poultry feed, Tenn. 381.
- made with mineral acids and crops rich in protein, microbiology, 797.
- molasses, feeding value, [N.Y.]Cornell 805.
- molasses-grass, loss of nutrients and fate of molasses, N.J. 805.
- phosphoric acid—
- chemical changes and effect on acid-base relations in animal body, [N.Y.]Cornell 805.
 - chemical changes in, 227.
 - feeding value, [N.Y.]Cornell 805.
- sorghum, production, handling, and feeding, by use of trench silo, [Okla.] Panhandle 90.
- Silk—
- and weighted silk fibers, chemical identification, 717.
 - artificial, see Rayon.
 - cultivated and wild, description, 570.
- Silpha* spp., larvae, comparative study, 224.
- Silting, run-off, and stream flow, effect of vegetation and watershed treatments, U.S.D.A. 108.
- Silver—
- as fungicide, 482.
 - sprays with promising fungicidal and adhesive properties, 628.
- Simulium* spp. new to science, 221.
- Sinusitis in turkeys, 253.
- Sipha flava*, predator of, rearing, liberation, and recovery, P.R. 640.
- Sires—see also Bull(s).
- proved in dairy herd improvement associations, list, U.S.D.A. 97.
- Sirups, farm-made, research, U.S.D.A. 725.
- Sisal leaf foot disease, 634.

- Sitodiplosis dactylidis* n.sp., attacking seed heads of cocksfoot, 221.
- Sitophilus granarius*, see Granary weevil.
- Skeleton, human, growth and composition, 552.
- Skim milk—
- dried, supplements in low-cost diets, effects, 272.
 - fresh and frozen plain, superheated, and sweetened condensed, for ice cream, 667.
 - plain condensed, manufacture for ice cream making, 242.
- Skins, see Hides.
- Skunk, parasites of, in Illinois, 641.
- Slag, quenched, new type, nature and liming value, 303.
- Slime molds, studies, 23.
- Slips, women's, buying guide, U.S.D.A. 429.
- Smoke columns, visibility, factors affecting, 197.
- Smoke tree wilt, due to *Verticillium*, U.S.D.A. 342.
- Smut—see also Cereal smut(s), and specific hosts.
- diseases of cereals, 345.
 - fungi, physiologic specialization and genetics of, 28.
 - of India, taxonomic studies, 200.
- Snail, brown, infestations, 493.
- Snakeroot, white, poisoning in Arkansas, 814.
- Snapdragons—
- in cold storage rooms, ethylene injury to, 339.
 - new tetraploid, N.Y.State 617.
 - requirements for soilless culture, Ohio 765.
- Snow—
- injury to conifer plantations, Mich. 626.
 - surveys, Utah 823.
 - surveys, photographic method of making, Colo. 678.
- Snowball bushes, deformed by aphids, N.Y. State 647.
- Soap substitutes, new, unsatisfactory for home laundering, Mont. 717.
- Social—
- and economic research, sampling method in, bibliography, U.S.D.A. 834.
 - and economic survey of Beadle County, South Dakota, 120.
 - insurance and agriculture, 545.
 - planning, local, long-time experiment in, 688.
 - science courses required by agricultural colleges, Tenn. 268.
 - sciences, survey in, 688.
- Society of American Foresters, historical summary, 478.

- cooperation in, 688.
 - in the South, 688.
- Sociology—
- contribution to agriculture, U.S.D.A. 687.
 - rural, selection and recruitment of personnel in, 688.

Sod(s)—
 native, base-exchange capacity, Colo. 588.
 new, introduction for observation, Tex. 753.

Sodium—
 chlorate, toxicity, in Yakima Valley soils, W.Va. 739.
 chlorate, toxicity, relation to nitrates, N.Dak. 184.
 deficiency, extreme, effect on mineral metabolism of rats, 699.
 hypochlorite, bactericidal efficiency against *Phytophthora scpedonica*, 627.
 hypochlorite, merits for seed treatment, 484.
 oleate, concentration-mortality curves for solutions toxic to eggs of *Lygaeus kalmii*, 360.

Soil(s)—
 acid forest, characteristic fungi of, 202.
 acid, of Mississippi, lime requirements, Miss. 15.
 acidity, effect of crops, R.I. 13.
 acidity, effect of heavy applications of dusting sulfur, 619.
 acidoids and basoids, thermal stability, 155.
 aggregation, solution concentration as possible factor, 299.
 Alabama, phosphorus removed from, 178.
 alkali, *see* Alkali.
 analyses, sampling for, field variation as factor, 178.
 and liming materials, 582.
 and water conservation studies, Tex. 299, 823, Va. 589.
 and water losses, effect of manure and shallow tillage, Idaho 298.
 bacteria, activities, Utah 735.
 bacteria, nutritive requirements, relation to rhizosphere, 302.
 bacteria, physicochemical behavior, relation to soil colloid, 589.
 boron deficiency in, Conn.[New Haven] 442.
 boron deficiency in, sunflowers as indicator plant of, 468.
 chemistry and physics, research, U.S.D.A. 734.
 Coastal Plain, nitrogen, organic carbon, and pH of, effect of green manure crops, 177, 301.
 conditions, relation to response from green manure, 179.
 coniferous timber, studies, Idaho 298.
 conservation—
 accomplishments for, U.S.D.A. 736.
 balanced vegetative program for, 177.
 effect of cover crops and manure, N.J. 759.
 effect on yields, farm income, and time required for farm operations, Okla. 827.
 in South Carolina Piedmont, U.S. D.A. 736.

Soil (s)—Continued.
 conservation—continued.
 not new problem, but of increasing acuteness, Miss. 141.
 on flue-cured tobacco farms, management aspects, Va. 683.
 possible, U.S.D.A. 687.
 program, costs and results in western Pennsylvania, Pa. 682.
 program, effect on farm operations, Okla. 402.
 records from cooperative studies in vineyards at Hammondsport, U.S.D.A. 589.
 studies, 236.
 conserving cropping system, adoption, possibility of higher incomes from, Wis. 682.
 conserving crops, percentages of increase, Ohio 736.
 crop-producing capacity, Mont. 612.
 deficiencies, plant tissue tests for, N.Y. State 582.
 dynamic properties applied to elements of implement design, Ala. 109.
 erosion—
 and rate of infiltration, Ariz. 13.
 and rebuilding of eroded soils, W.Va. 736.
 and related land use conditions, U.S.D.A. 736.
 and run-off, effect of aggregation on, 736.
 and run-off, effect of slope on, rain simulator studies, U.S.D.A. 442.
 bibliography, U.S.D.A. 588.
 control, economic phases in, 255.
 control, effectiveness of trashy fallow and contour seeding, 736.
 control, in California and Nevada, U.S.D.A. 300.
 control, planning for, 412.
 control studies, N.J. 735.
 control work on highways, U.S.D.A. 823.
 in United States, cost and extent, U.S.D.A. 736.
 measurement plats, effect of different amounts of rainfall, Miss. 300.
 measurements and control experiments, U.S.D.A. 300.

fertility—
 and improvement, Tex. 753.
 effect of lime, manure, and commercial fertilizers on yields, Ind. 179.
 greenhouse study, Tex. 735.
 plant growth as index, Pa. 442.
 relation to land use, N.J. 735.
 studies, Mont. 612, U.S.D.A. 734.

formation, electrochemistry of, 588.
 freezing, 12.
 from granitic materials in Mojave Desert, properties, 738.
 from regional cotton wilt plats, chemical and physical studies, 178.

Soil(s)—Continued.

- fumigation—
 in bulk for white-fringed beetle, U.S.D.A. 493.
 midge control by, 503.
 with chloropicrin and carbon bisulfide for tomato diseases, 351.
 with chloropicrin, response of tomatoes to, 208.
- gray-brown Podzolic, movement of anions through profile, 155.
- greenhouse, peanut hulls v. other organic materials for use in, Ala. 44.
- heating cable, electric, for warming milk and melting ice in roof gutters and downspouts, Idaho 399.
- irrigated, salt balance in, 444.
- lateritic, effect of calcium and magnesium on physical properties, 177.
- leaching studies, Conn.[New Haven] 442.
- magnesium deficiency in, induced by high rates of potash fertilization, Ind. 179.
- microbes, commercial use, N.J. 735.
- microbial activities in, 739.

 breeding, applications of reproduction physiology to, 314.
 brood, comparison of protein mixtures for, Ind. 227.
 Duroc-Jersey, desirable types, Okla. 747.
 milk production, effect of frequency of nursing and litter size, Idaho 372.
- Soybean(s)—
 and soybean products, nutritive value and mineral deficiencies for swine, Ind. 227.
 and soybean products, studies, U.S.D.A. 725.
 breeding, Ind. 178, [N.Y.]Cornell 751, P.R. 613, U.S.D.A. 751.
 carbohydrates of, Ind. 150.
 carotene from, chromatographic identification and biological evaluation, 731.
 constituents research, Ind. 150.
 cultural and harvesting tests, Ariz. 33.
 culture experiments, Tex. 753.
 edible, rise of, 183.
 effect of preceding crop, 320.
 feeding to pigs, effect on gains and method of producing firm carcasses, N.C. 659.
 flour as emulsifying agent in salad dressings, 839.
 for hay, seeding rates, Miss. 34.
 for hay, seeding tests, Utah 753.
 goitrogenicity of, 511.
 ground, for calves, Ind. 226.
 hay phosphorus, availability to white rats, 657.
 improved, U.S.D.A. 751.
 in rotations, response to fertilizers, Ind. 179.
 injury from locust leaf miner, 369.
 inoculation, Ind. 179, Tex. 753.
 meal as protein concentrate in turkey starting rations, Idaho 372.
 meal, oil, and proteins, industrial uses and suitable varieties, N.Dak. 440.
 meal v. cottonseed meal, 373, Ark. 655, Ind. 226.
 milk, possibilities of, 183.
 mosaic, insect transmission, 775.
 nodule bacteria, studies, 448.
 oil and meal, current consumption, 182.
 oil, glycerides, separation of, Ind. 150.
 oil meal, effect of varying level for fattening calves, Ind. 226.
 oil meal, solvent-extracted, effect of replacing with soybeans in low fat ration, Mich. 656.
 oil, nonfat constituents, Ind. 150.
 oil, sterols from, preparation, Ind. 150.
 oil, tolerance of chicks for, 511.
 oil, vitamin A-suppressing factor in, 228, Ind. 234.
 or soybean products, effect on milk production, Ind. 234.
 papers on, 182.
 production, variety recommendations and characteristics, N.C. 41.

Soybean(s)—Continued.

- proteins, digestibility, U.S.D.A. 725.
 raw and cooked, protein of, supplementary effect of cystine and methionine on, 510.
 response to phosphate and lime and to inoculation, Ga. 34.
 role in human nutrition, 183.
 salted, improving quality of protein in, Wis. 693.
 seed germination and growth, effect of fertilizer placement, Miss. 34.
 technical papers on, 755.
 varieties, chemical composition, 726.
 varieties, cystine content, 726.
 varieties, high yielding, extend harvest period, Miss. 319.
 variety-date of planting tests, N.J. 751.
 variety tests, Ariz. 33, Ga. 33, N.J. 751, Pa. 464, 472, P.R. 613, S.Dak. 752, Tex. 752, Utah 753, W.Va. 754.

 contact, La. 358.
 copper, see Copper.
 deposition and retention on apples, Pa. 496.
 dormant, dinitro v. tar oil, 74.
 equipment, materials, and methods. Kans. 333.
 materials, new and safer, Pa. 495.

Spray(s)—Continued.

- measuring inoculum potential and coverage index, 627.
 mixtures, role of lime in, relation to arsenical and copper injury, N.J. 760.
 nonpoisonous, [N.Y.]Cornell 786.
 nonpoisonous, for leaf-eating insects on shade trees and shrubs, N.J. 786.
 oil, see Oil spray(s).
 orchard, low temperature tar oil in, 76.
 practices and fruit diseases, 351.
 pyrethrum, prolonging toxicity, 496.
 research, W.Va. 787.
- residue(s)—
 and removal, U.S.D.A. 784.
 as affecting the processor, 78.
 from lead arsenate, ratio of lead to arsenic in, 643.
 loads of arsenic, lead, and fluorine, Idaho 357.
 removal, use of sulfamic acid in, Ind. 185.
 tolerance, change in, aid to apple and pear growers, N.Y.State 215.
 stickers, N.Y.State 630.
 timing and selection to reduce arsenical residue on crops, N.J. 760.
- Sprayer operated by compressed air, description of and drawings, 361.
- Spraying—see also Dusting and specific crops.
 aerial, tests with concentrated mixtures for, 75.
 and dusting methods, concentrated mixtures v. standard, U.S.D.A. 493.
- Spruce—
 Christmas trees, retarding needle fall on, 626.
 fir type of southern Appalachians, early planting experiments in, 198.
 gall aphids, control, Mont. 786, N.Y. State 642.
 Norway, vegetative propagation, 767.
 sawfly, European—
 larval disease prevalent in heavy infestations, 654.
 notes, U.S.D.A. 784.
 parasite, establishment in United States, 654.
 white, propagation by cuttings, 767.
- Spurge, leafy, introduced into Utah, Utah 43.
- Squash(es)—
 breeding, Ga. 44, N.Y.State 618.
 bug, studies, Conn.[New Haven] 494.
 bug, synonymy, morphology, and life history, Conn.[New Haven] 646.
 foot rot, new, due to *Fusarium* sp., Conn. [New Haven] 480.
 Green Gold, new variety, 719.
 improvement by inbreeding and recombination, Conn.[New Haven] 471.
 mosaic virus, insect transmission, host range, and properties, 627, 789.
 seedless fruits from varieties, 617.
 summer, heterosis in, and possibilities of producing F₁ hybrid seed, 187.
 vine borer, studies, Conn.[New Haven] 494.

- Squirrels—
 damage to seed and seedlings on cut-over Douglas fir lands, U.S.D.A. 641.
 equine encephalomyelitis virus in brains of, 250.
 gray, population study, Tex. 355.
- Stains, methyl violet and Nile blue, use, 600.
- Stains, old Gruebler hematoxylin and eosin compared with current American, 18.
- Stallion sperm, preservation of motility, 463.
- Stamens, comparative morphology, 169.
- Standards of living of New Zealand dairy farmers, 267.
- Staphylococci—
 avian, pathogenicity, 527.
 from food poisoning, effect of organic acids, sugars, and sodium chloride, Mich. 698.
 in herds free from streptococcus mastitis, and effect on milk composition, 808.
 of animal origin, studies, 526.
 riboflavin production of, [N.Y.]Cornell 806.
 strains isolated from outbreaks of arthritis in chickens, 676.
- Starch(es)—
 grain, anatomy of, 16.
 grains and plastids, double-staining, for permanent preparations, 600.
 research, U.S.D.A. 725.
- Starlings—
 attack on warble-infested cattle in Great Plains area, 73, 356.
 male, sexual activation, relation to daily exposure to light, 177.
- Statistical—
 analysis, methods, treatise, 287.
 methods for medical and biological students, treatise, 287, 858.
 methods, solution of normal equations giving standard errors of constants, 859.
 methods, treatise, revision, 858.
 procedures and their mathematical bases, 858.
 reasoning, elements of, treatise, 718.
- Steers—*see also* Cattle, beef.
 and rabbits, relative ability to digest pasture herbage, 228.
 choice yearling feeder, grain and silage winter ration for, Okla. 795.
 fattening—
 beet-top silage for, N.Dak. 508.
 comparison of protein-rich supplements for, [N.Y.]Cornell 795.
 in dry lot in summer v. in winter, rate and efficiency of gains, Idaho 372.
 rations compared, Tex. 796.
 roughages for, comparison, Pa. 506.
 shelter v. no shelter for, Ala. 88.
 sorghum grains v. corn for, S.Dak. 795.
 value of peanut hay for wintering, Ala. 88.
 feeder, relation between conformation and their feeding and slaughter efficiency, Ariz. 89.
- Steers—Continued.
 finishing with grass and grain, W.Va. 659.
 phosphorus requirements and adequacy of home-grown feeds, Idaho 372.
 yearling, pastures for finishing, W.Va. 796.
- Stellaria media*, chloroplasts, isolated, reduction of ferric oxalate by, 165.
- Stem rust, migrating South to spend winter, U.S.D.A. 768.
- Stenodiplosis geniculati dactylidis* from cocksfoot, 221.
- Stercum murrayi*, role in heart rot and cankers of living hardwoods, 637.
- Sticktight flea, distribution and hosts, 74.
- Stictoccephala festina*, *see* Alfalfa hopper, three-cornered.
- Stimulation and anesthesia, protoplasmic nature of, 744.
- Stinkbug(s)—
 damage to flax, Tex. 787.
 notes, Tex. 787, Utah 787.
 Say's, notes, Colo. 642, Mont. 786, N.Dak. 499.
- Stock, *see* Livestock.
- Stock foods, *see* Feeding stuffs.
- Stocks—
 double-flowered, selection, U.S.D.A. 757.
 in cold storage rooms, ethylene injury to, 339.
 requirements for soilless culture, Ohio 765.
- Stockyards fever, *see* Septicemia, hemorrhagic.
- Stomach—
 lesions in rats on vitamin A-deficient diet, 560.
 poisons, toxicity, effect of temperature, 359.
 worms—
 anthelmintic efficiency of compounds related to phenothiazine, 672.
 anthelmintic efficiency of Lentin against, 248.
 in sheep and goats, Tex. 813.
 in sheep, control, 818, Ga. 105.
 larvae from eggs in cattle feces, culturing large numbers, 526.
 larvae, third stage, accessibility to grazing animals, 816.
 phenothiazine as anthelmintic for, 396.
 resistance of sheep to, Tex. 813.
- Stomacoccus platani*, control, 218.
- Stomatitis, mycotic, of goats, 673.
- Stomatitis, vesicular, U.S.D.A. 813.

- Storms crossing Alaskan coast into Canada, peculiarities of, 585.
- Storms that have caused great floods, 11.
- Strategus quadrioveatus*, protective seed treatments, etc., against, P.R. 640.
- Strawberry (ies)—
 ascorbic acid in, varietal differences, 423.
 Bellmar variety, leaf variegation or June yellows in, U.S.D.A. 342.

Strawberry (ies)—Continued.

- Blakemore, number of leaves in November, relation to number of flowers the following spring, 53.
breeding, N.J. 761.
breeding for disease resistance, Conn. [New Haven] 471.
control of white grubs in, 85.
crown borer, poison bait for control, 357.
culture, Kans. 763. Mont. 617.
culture, South Atlantic and Gulf Coast regions, U.S.D.A. 763.
effect of leaf removal and crown covering, 622.
effect of straw mulch on, 53.
everbearing progressive, yellowing in, 627.
farms, management and cost study, La. 830.
fertilization, N.Y.State 618.
flower formation, effect of nutrient elements at time of, 622.
improvement and outstanding seedlings, 760.
inbreeding experiments, Conn.[New Haven] 47.
leaf roller, American, biology and control, 75, 501.
leaf roller, American, control, 75.
Massey, description, N.C. 622.
methods of retarding ripening, Mich. 192.
plants, survival, effect of ice, 53.
production, prices, returns, etc., N.H. 685.
protecting from root worms and white grubs, 359.
red core root disease, 778.
red stele disease, 210.
red stele disease. breeding for resistance to, U.S.D.A. 756.
root knot nematode affecting, 60.
root weevil, Utah 787.
roots, effect of high soil temperature, Okla. 757.
rootworm, Mont. 786.
rootworm as nut pest, 370.
seed size in, 763.
spraying, promising results, Ark. 630.
Tennessee Supreme, a new variety, Tenn. 54.
variety tests, Mont. 617.
virus diseases, 635.

Stream flow—

- in Missouri River Basin, 824.
siltng, and run-off, effect of vegetation and watershed treatments, U.S.D.A. 108.

Streptococci—

- descriptions, classification, and distribution in milk, 393.
 β -hemolytic, in equine infections, 249.
hemolytic, associated with bovine udder, 818.
hemolytic, infections in horses, sulfanilamide treatment, 675.
heterofermentative, fermentation end-products of, 520.
in swimming pool water, 745.

Streptococci—Continued.

- isolated from equine encephalomyelitis, toxic substances produced by, 105.
lactic, action of disinfectants on bacteriophages for, 520.
mastitis, detection, efficiency of examination of incubated milk samples for, 388.
mastitis, efficiency of soaps and other disinfectants in destroying, 670.
of bovine mastitis, studies, N.H. 395.
of unusual types, mastitis caused by, 395.
other than *Streptococcus agalactiae* in cow's udder, 527.
taxonomy, physiology, and morphology, [N.Y.]Cornell 806.
- Streptococcus*—
acidominimus, 816.
agalactiae, differences within species, 393.
agalactiae, gas-forming and proteolytic variant of, 527.
lactis, growth and acid formation, inhibitory effect of rancid milk on, 665.
lactis in mastitis milk, growth responses, 238.
paracitrovorus, effect of glucose on anaerobic dissimilation of citrate by, 455.
thermophilus, notes, 522.
- Strongyles in horses—
control, [N.Y.]Cornell 813.
phenothiazine as anthelmintic for, 397.
- Strongyloides* spp., tests of phenothiazine against, 396.
- Strongylosis, equine, control, 397.
- Strontium lactate, radioactive, secretion in milk following intravenous administration, 808.
- Strychnos nuxvomica*, culture, P.R. 618.
- Students, college—
ascorbic acid metabolism of, Utah 836.
nutritional status and blood values, W.Va. 841.
- Stumpage and log prices for 1938, U.S.D.A. 341.
- Sturmia rhodesiensis* n.sp., parasite of cotton bollworm, biology, 83.
- Suckleya suckleyana*, poisonous to livestock, Colo. 668.
- Sucrose taste thresholds of rats and humans, 697.
- Sudan grass—
and buffalo grass, comparison, Tex. 753.
bacterial stripe. resistance to, Tex. 770.
breeding, Tex. 753.
Helminthosporium blight, resistance to, Tex. 770.
hydrocyanic acid in, factors affecting, Colo. 612.
rust, resistance to, Tex. 770.
seed as carrier of many disease fungi, U.S.D.A. 768.
stands, increases in by seed treatment, U.S.D.A. 768.
strains, grazing tests, Tex. 752.
- Sugar beet(s)—see also Beet(s).
black root control, strip method of soil treatment for, 58.

Sugar beet(s)—Continued.

- black root, notes, Mont. 630.
- breeding, U.S.D.A. 751.
- byproducts, feeding value, Idaho 372.
- costs and returns, Mich. 831.
- crop sequence effects on, Mich. 183.
- culture, Minn. 327.
- diseases and pests of, atlas, 206.
- diseases in Mexico, U.S.D.A. 769.
- effect of preceding crop, 320.
- fertilizer experiments, Mont. 612.
- flowering, photothermal induction of, 467.
- Fusarium* yellows, Mont. 630.
- hybrid vigor in, 41.
- irrigation tests, Tex. 753.
- leaf spot resistant variety, new, 206.
- losses, reduction by rotation and manure, U.S.D.A. 751.
- phosphate deficiency in, Mont. 630.
- production practices, Mich. 756.
- rasping machine, description, 7.
- research, U.S.D.A. 725.
- root disease, phosphate applications for, U.S.D.A. 769.
- seed industry, domestic, expansion and dependence on superior varieties, U.S.D.A. 751.
- seed production, domestic, as outgrowth of breeding for disease resistance, U.S.D.A. 751.
- seed production studies, Ariz. 33, Tex. 752.
- seedling diseases, greenhouse experiments for control, 58.
- variety for early planting with resistance to diseases, U.S.D.A. 751.
- variety tests, Mont. 612, Tex. 752, Utah 753.
- Verticillium* wilt, 64.
- webworm, Mont. 642, 786.
- yellows virus, green peach aphid as vector, 65, 365.
- yields, increase by nitrogen fertilization, U.S.D.A. 751.

Sugarcane—

- and cane sugar, U.S.D.A. 725
- aphid, yellow, predator of, rearing, liberation, and recovery, P.R. 640.
- beetle, effect of lime in reducing injury by, La. 358.
- beetle, studies, 495.
- borer—
 - Amazon fly as parasite, 368.
 - in Barbados, 219.
 - injury, varietal susceptibility of cane to, La. 358.
 - new races of parasites of, P.R. 640.
 - parasites, receipt of new strains from Brazil, P.R. 640.
 - parasitization, by *Metagonistylum minense*, and hyperparasitization of latter by *Trichopria* sp., P.R. 640.
 - studies, 495, U.S.D.A. 784.
 - Trichogramma* spp. as parasites, La. 358.
- breeding, U.S.D.A. 751.

Sugarcane—Continued.

- breeding, relation to colchicine seed treatment, 615.
 - chlorotic streak—
 - effect of hot-water treatment for, 207.
 - in Louisiana, 206, 207.
 - spread, U.S.D.A. 768.
 - cold-tolerant, U.S.D.A. 751.
 - disease, description and history of spread in Puerto Rico, 206.
 - diseases and pests, 200.
 - distribution of mineral elements in, 293.
 - farms, social study of labor and tenancy, La. 119.
 - Fiji disease, transmission, 60.
 - for sirup, variety tests, Tex. 752.
 - leafhopper, Indian, bionomics and control, 363.
 - mosaic, insect transmission, 495.
 - nitrogen nutrition, amounts-of-nitrogen test, 615.
 - nitrogen-potash-sunlight relations, 615.
 - production, integration of climatic and physiologic factors, 308.
 - quality, effects produced by different soils, 299.
 - root stimulation by ethyl alcohol and other substances, 305.
 - sirups, antianemic potency, Miss. 427.
 - stalk, inversion of sucrose in different parts, 437.
 - treatise, 183.
 - variety tests, P.R. 613.
 - windrowing and storing, following injury by freezing temperatures, U.S.D.A. 468.
- Sugar(s)—*see also* Lactose, Sucrose, etc.
- in blood, *see* Blood sugar.
 - in plant materials, determination, Shaffer-Somogyi reagent for, 729.
 - natural and refined, effect on oral lactobacilli and caries among Eskimos, 697.
- Sulfanilamide—
- effect on parasitic infections of laboratory rats and mice, 244.
 - in tobacco, toxicity, 15.
 - progress in use in animal diseases, 243.
- Sulfapyridine—
- in avian tuberculosis, 244.
 - in cattle, pharmacology, 388.
 - progress in use in animal diseases, 243.
- Sulfur—
- and sulfur compounds, relation to insect control, [N.Y.]Cornell 786.
 - calcium, copper, and zinc, studies, 582.
 - composts and acid development in soils, Tex. 735.
 - compounds, organic, bacteriostatic and bactericidal action, 524.
 - compounds, vapors from, therapeutic action, 59.
 - containing compounds, utilization for growth, 132.
 - determination in biological material, 8.
 - dioxide, effect on vegetation, 449.

Sulfur—Continued.

- elemental, effect on chick growth and bone ash, 95.
- in foods, 127.
- placement, Ariz. 13.
- spot and trench applications, diffusion of acidity outward from, Tex. 735.
- value in preventing coccidiosis mortality, 106.

Sunflower(s)—

- as indicator plant of boron deficiency in soils, 468.
- crown gall, secondary tumors and tumor strands in, development, 775.
- for silage, variety tests, Ind. 178.
- seedlings, boron absorption by, 449.
- varieties, forage yields, Tex. 753.

Sunlight and ascorbic acid in tomato, 596.

Superphosphate(s)—

- for cotton, with and without limestone, Ga. 34.
- granulation of, U.S.D.A. 734.

Supply schedules, long-time and short-time, 255.

Surplus, thirty million customers for, U.S. D.A. 687.

Surra complement-fixation test, preparation of antigen for, method, 525.

Swamp fever, *see* Anemia, equine infectious.

Swedes—

- effect of boron, Mont. 617.
- feeding experiments with laying ducks 233.
- fertilizer experiments, R.I. 34.

Sweet corn—*see also* Corn.

- breeding, Tex. 752.
- breeding, use of hybrid vigor in, 745.
- carotene in, 847.
- hybrid and inbred strains, quantity of pericarp in, 759.
- hybrids and inbreds, new, wilt resistance in, Ind. 200.
- hybrids and varieties, testing, Pa. 471.
- hybrids, development, Conn.[New Haven] 471, Iowa 331, S.Dak. 757.
- hybrids, new yellow, N.Y.State 619.
- inbred lines, quality, Ind. 150.
- inbreds and crosses released by Illinois Station, Ill. 45.
- irrigation, Okla. 757.
- production, chief limiting factor in, P.R. 640.
- spacing, N.Y.State 618.
- variety tests, Pa. 472.

Sweet peas, requirements for soilless culture, Ohio 765.

Sweetclover—

- breeding, S.Dak. 752.
- culture experiments, Tex. 753.
- disease, hemorrhagic, preparation of concentrates, 814.
- disease of cattle, identification of toxic compound causing, Wis. 668.
- drainage requirements, Minn. 536.
- red clover, and alfalfa as hay crops, comparison, Ind. 178.

Sweetclover—Continued.

- seed viability in, farm demonstrations as measure, 470.
- variety tests, Tex. 752.

Sweetfern blister rust of pitch pines, 637.

Sweetose, use in making jelly, jam, and fruit butter, 547.

Sweetpotato(es)—

- and tobacco, cross-inoculations with *Fusarium* from, 629.
- breeding in Louisiana, technic in, 34.
- culture experiments, Tex. 753.
- diseases in Indiana, 350.
- experiments, Tex. 753.
- fertilizer experiments, Conn.[New Haven] 464, N.J. 751, Tex. 753.
- Gold Skin, fertilizer applications for, 182.
- growth, effect of green manures, Ind. 179.
- improvement, 34.
- marketing, trends and preferences in, 34.
- meal as feed for fattening cattle, Ga. 89.
- new uses, 34.
- plant production, Miss. 756.
- pox control through pH adjustment, N.J. 769.
- production, Miss. 319.
- production, experiments with electricity in, 178.
- soil rot in Louisiana, 350.
- starch in, estimated from moisture content, 41.
- storage diseases, control, 350.
- uses as starch, food, meal, silage, or hay, Miss. 319.
- variety tests, Ind. 178, Tex. 752.
- vines as feed for livestock, Miss. 372.
- vitamin A content, effect of fertilizers, 557.
- water relations in, 177.

weevil—

- flight of, La. 358.
- fumigation with methyl bromide for control, 652.
- notes, U.S.D.A. 784.
- overwintering in the field, La. 358.
- wild hosts of, La. 358.
- yield and keeping quality, relation to fertilization, 41.
- yield and shape, effect of height of bed, 178.

Swimming pool water, coliform bacteria and streptococci in, 745.

Swine—*see also* Pig(s) and Sow(s).

- artificial insemination for breeding, advantages, limitations, and uses, U.S.D.A. 316.
- autopsy examinations, R.I. 101.
- calcium-phosphorus ratio for, Ind. 226.
- diseases and parasites, in Brazil, 249.
- diseases due to nutritive deficiencies, 388.
- erysipelas—
 - agglutination test for diagnosis, 388.
 - distribution in United States, 388.
 - in human family, 388.
 - in South Australia, 674.
 - in turkeys, 389.
 - studies, Idaho 389, U.S.D.A. 813.

- Swine—Continued.
pulmonary edema in, 249.
- Sycamore—
anthracnose, 637.
scale control, 218.
- Symphoromyia atipica*, studies, 503.
- Symptomatic anthrax, *see* Blackleg.
- Sympycnus* genus, in Utah, 503.
- Syngonium podophyllum albolincatum* leaf spot disease, 353.
- Systochus vulgaris*, immature stages, external morphology, 368.
- Systenmia acicola* n.comb., notes, 638.
- Tabanidae—
of Antilles, revision of family, 221.
of Delaware, Del. 368.
- Tabosa grass, control, Tex. 753.
- Tachinidae species, parasitic on Japanese beetles, U.S.D.A. 503.
- Tachytrechus*—
North American, key to males, 221.
tahoensis n.sp., description, 221.
utahensis n.sp., description, 221.
- Taeniothrips inconsequens*, *see* Pear thrips.
- Taeniothrips simplex*, *see* Gladiolus thrips.
- Tangelo(s)—
Pearl, new citrus variety, description, 337.
rootstocks for, and fruit seed content, 337.
- Tannin—
canaigre tubers as source, tests, Tex. 757.
function in-host-parasite relations, in white pine blister rust, U.S.D.A. 638.
native canaigre and sumac as sources, U.S.D.A. 756.
- Tanning materials, U.S.D.A. 725.
- Tapeworm(s)—
fringed, early embryonal stage in life of, 671.
infection of chicks, effect on growth rate, 251.
infection of sheep and goats acquired during winter season, 247.
of poultry, anthelmintic value of tobacco midrib powder against, 533.
of poultry, meal beetle larvae as intermediate hosts, 223.
of sheep, control, Ga. 105.
removal from chickens, tests with miscellaneous substances, 251.
- Taphrina bacteriosperma*, new host for, 780.
- Tar oil, low temperature in orchard spray, 76.
- Tarnished plant bug, factor in reducing vetch seed yields, Ala. 73.
- Tarsonemus approximatus narcissi*, *see* Bulb-scale mite.
- Tartar emetic, toxicity to bees, 654.
- Tax(es)—
delinquency, rural, in Oregon, Oreg. 113.
exemption, homestead, in United States, U.S.D.A. 262.
law, proposed graduated land, in operation, Okla. 402.
of farmers in rural urban fringe area, effect of city expenditures, Wis. 682.
- Tax(es)—Continued.
problems of farm property in Maryland, Md. 538.
uncollected property, on mortgaged real estate in Montana, Mont. 112.
- Taxation—
and valuation of forest land, U.S.D.A. 683.
forest land, in Michigan, U.S.D.A. 539.
revenues, collection and expenditure, Tex. 828.
rural, U.S.D.A. 687.
- Taxodium distichum*, development of foliage leaves, 311.
- Taxonomy and floristics of the Americas, 446.
- Tea, effect on energy metabolism of children, Tex. 836.
- Teeth, decay—
experimental, inhibition by fluorine in absence of saliva, 555.
of Eskimo children, dietary and metabolic studies, 554.
of Eskimos, effect of natural and refined sugars, 697.
of Eskimos, relation to saliva, 555.
role of diet in control, 853.
- Teleonemia scrupulosa*, synonymy and distribution, 499.
- Temperature(s)—*see also* Climate and Soil temperatures.
and humidity control, laboratory equipment for, 17.
and pressure variations, coupling between tropospheric and stratospheric, 585.
changes, daily, and solar constant variations, 153.
daily variation, effect on plant development, 599.
relations and control in greenhouses, 734.
upper soil, and shelter, comparison, 153.
- Tenants, assets available for purchasing farms, Wis. 682.
- Tenebrio molitor*, *see* Mealworm, yellow.
- Tenebrio obscurus*, *see* Mealworm, dark.
- Tennessee counties, basic data on, Tenn. 261.
- Tent caterpillar, eastern, birds eating, 366.
- Teosinte—
annual, adaptation test, P.R. 613.
annual, susceptibility to lesser cornstalk borer, P.R. 640.
seed germination, effect of soil fumigants, Tex. 771.
- Tephrosia*—
effect of exhausting food reserves from, P.R. 600.
insecticidal plants attacked by *Phyllonorycter* n.sp., P.R. 640.
toxicaria, toxicity tests, P.R. 640.
- Tetrastia meticulosalis*, notes, P.R. 639.
- Termite(s)—
biology and control, Conn.[New Haven] 494.
desert, injury to range grasses, Tex. 787.
desert, notes, Tex. 787.
notes, Mont. 786.
soil poison treatments, duration of efficacy, 359.

- Terraces and diversions, planning of, U.S.D.A. 823.
- Testosterone—
and methyl testosterone, androgenic and gynecogenic activities, effect of route of administration, 173.
methyl, inactivation in castrate male rats, 461.
propionate—
effect of small doses on testis, 175.
effect on female roller canaries under complete song isolation, 318.
effect on sex-life of female rat, 318.
growth-stimulating effect, 317.
injection, effect on growth of comb, testes, and ovaries in chicks, 462.
production of persistent changes in genital organs of rats by, 461.
role in inhibition of ovulation, 460.
small doses of, response of testis to, 461.
treated female rats, masculinization, 749.
- Tetany, treatment, with one massive dose of vitamin D, 567.
- Tetrachlorethylene emulsion as anthelmintic, 523.
- Tetracnemus peregrinus*, parasite of long-tailed mealybug, 365.
- Tetranychus*—
sp. on red clover, Idaho 357.
spp., distribution and food plant records of, U.S.D.A. 785.
tetarius, see Red spider.
- Tetraploids, colchicine induced, in dioecious and monoecious species of Amaranthaceae, 605.
- Tetrastichus*—
injuriosus, hyperparasite of black scale, Calif. 791.
spp., parasites of four-spotted tree cricket, 505.
spp., parasites of willow insects, 225.
- Texas Station, report, 859.
- Textile(s)—see also Fabric(s).
fabrics and yarns, resistance to moths, method of test for, 650.
fiber(s)—
and fabrics, effect of climatic exposure on, 428.
atlas, 570.
chemical identification, 717.
newer manufactured, developments in, 571, 572.
finishing treatments, technical evaluation, 139.
special finishes for, evaluation, 717.
- Theelin injections, blood calcium levels of fowl following, 233.
- Thelephora* spp., notes, 351.
- Theobroma*, Brazilian species, 159.
- Theresia claripalpis*—
from Trinidad, rearing and liberation, P.R. 640.
new physiological races, P.R. 640.
São Paulo strains, rearing in laboratory, P.R. 640.
- Thermobia domestica*, see Firebrat.
- Thiamin—see also Vitamin B₁
assay fungi, 22.
deficiency and bisulfite binding substances, 706.
effect on yeast growth, 22.
in food, effect of cooking, 706.
in frozen-pack garden peas, factors affecting, 418.
in quick-frozen food, 694.
in rumen content of cattle, 799.
in wheat products and return of germ to flour, 419.
minimum requirement for growing pigs, 377.
of processed meat products, 132.
properties, food sources, and stability, 847.
synthesis, by excised roots of corn, 304.
- Thielaviopsis basicola*, cultural and pathogenic habits, 632.
- Thiocarbamide, feeding experiments, 700.
- Thiourea, feeding experiments, 700.
- Thistle rust fungi in Great Britain, 632.
- Thrips on citrus fruits, 645, 790.
Thrips tabaci, see Onion thrips.
- Thurberia weevil, U.S.D.A. 784.
- Thyanta custator*, U.S.D.A. 784.
- Thylakentrin, proposed name for follicle-stimulating hormone of anterior pituitary, 609.
- Thymectomy at birth, effect on spermatogenesis in rats, 175.
- Thyroid—
activity, relation to periodic ophthalmia, 674.
gland in lambs, effect of lack of iodine in ration, Colo. 668.
relation to thymus in chicks, 510.
secretions, effect on feather development in pigeons, 462.
tissues from rats and fowls, histological studies, Colo. 668.
- Thyroidectomized rats, effect on lactation and growth, 461.
- Thyroidectomy, effect on production, quality, and composition of eggs, 515.
- Thyronectria austro-americana*, diseases of *Gleditsia* caused by, 68.
- Thyroxine—
and hypervitaminosis-A, interrelation, 131.
effect on social order in flocks of hens, 461.
- Thysanoptera—
cocoon-spinning, 499.
new American, descriptions, 217.
- Thysanosoma actinioides*—
early embryonal stage in life of, 671.
studies, 388.
- Tick(s) —
and relapsing fever in United States, 794.
eradication, U.S.D.A. 813.
studies, U.S.D.A. 784.
- Tillage machinery, principles of hitches for, Pa. 536.
- Tilletia tritici*, dwarf race, studies, 633.

- Timber—*see also* Lumber and Wood.
 fallen, measurements, Conn.[New Haven] 478.
 farm-grown, marketing, N.J. 766.
 salvage, in trees killed by bark beetles, 370.
 wind-thrown, decay and other volume losses in, U.S.D.A. 780.
- Timberland, private, forestry on, U.S.D.A. 478.
- Time preference and conservation, 255.
- Time, use of, relation to home management, [N.Y.]Cornell 286.
- Timothy—
 breeding, 321, [N.Y.]Cornell 751.
 composition and nutritive value, effect of mid-June fertilization, N.J. 805.
 selection and inbreeding in, 321.
- Tin as chloride or sulfate, effect on plant tissues, 741.
- Tinea*—
ditella from grain stores in Great Britain, 361.
insectella from grain stores in Great Britain, 361.
- Tingitidae, new—
 from Eastern Hemisphere, 499.
 South American, 217.
- Tiphia* spp.—
 colonization, N.Y.State 642.
 parasitic on grubs of *Anomala* and *Serica*, U.S.D.A. 503.
- Tissues, living, effect of velocity of crystallization on freezing point, 16.
- Tmolus echion* larvae, injury to pineapples, 501.
- Tobacco—
 and potato rotations, Pa. 464.
 and sweetpotato, cross-inoculations with *Fusarium* from, 629.
 assimilation of ammonia nitrogen by, 164.
 breeding, U.S.D.A. 751.
 Bright, plant nutrient absorption by, time and rate, 178.
 budworm, enemy of cotton in Peru, 219.
 Burley, seasonal movements in prices and sales, Ky. 408.
 callus cultured in vitro, production of auxin by, 17.
 cost of production, P.R. 831.
 curing, equipment for experimental work in, 177.
 curly top virus, acquired immunity to, U.S.D.A. 768.
 disease(s)—
 in Kentucky, U.S.D.A. 768.
 resistant types, produced at University of Kentucky, 634.
 survey in Wisconsin, U.S.D.A. 199.
 downy mildew—
 control, 203, Conn.[New Haven] 480, Miss. 350.
 immune variety, U.S.D.A. 751.
 notes, U.S.D.A. 769.
 etch virus, quantitative measurement, 628.
 farming, economics of, Va. 258.
- Tobacco—Continued.
 farms, management aspects of soil conservation, Va. 683.
 fertilizer experiments, Conn.[New Haven] 464, Pa. 464.
 flea beetle—
 host plants, relative importance, 781.
 in plant beds, tests of insecticides against, 494.
 notes, Pa. 495, U.S.D.A. 784.
 test of insecticides against, 652.
 flue-cured, fertilizer recommendations, N.C. 328.
 frogeye disease, recent research in Ceylon, 634.
 Granville wilt, crop rotations for control, 629.
 high-nicotine, production, U.S.D.A. 751.
 insects in 1937, U.S.D.A. 785.
 insects on flue-cured type, control, U.S.D.A. 493.
 insects on sun-grown cigar type, U.S.D.A. 493.
 Institute of Puerto Rico, reports, 328.
 irrigation and harvesting experiments, Conn.[New Haven] 464.
 leaf, amide synthesis in, Conn.[New Haven] 437.
 leaf spot diseases, control, Pa. 480.
 leaves, *Bacterium tabacum* invasion of, mechanism, 627.
 microflora of aging cigarette leaf, 745.
 midrib powder, anthelmintic value against poultry tapeworms and roundworms, 533.
 mosaic, size stability under different conditions, 635.
 mosaic virus—
 effect on cellular oxidation, 629.
 increase, and changes accompanying nitrogen compounds in detached tobacco leaves, 58.
 nucleoprotein, action of electrolytes on solutions of, 486.
 protein, refractory diffusion method, study, 776.
 purified, solubility studies, 207.
 relation to ascorbic acid, 635.
 varieties which localize it, 635.
 moth larvae, effect of insecticidal residues in cured tobacco, 357.
 moth, notes, U.S.D.A. 784.
 necrosis virus, comparative host ranges, 344.
 new virus disease with delayed symptoms, 65.
 nitrogen nutrition, effect on virus inactivation, 629.
 plant beds, soil treatments for, 627.
 plants deficient in potassium, starch formation in, 165.
 production and consumption in Manchuria, U.S.D.A. 411.
 ring spot recovered plants, experimental production of symptoms in, 629.
 ring spot virus, comparative host ranges, 344.
 roots, nematode disease of, U.S.D.A. 59.

Tobacco—Continued.

- seedbeds, sterilization with chloropicrin, U.S.D.A. 768.
- seedlings, growth, use of ground peanut hulls in promoting, U.S.D.A. 751.
- soils of Union of South Africa, 739.
- streak and yellow dwarf of potato, comparison of viruses, 631.
- survey in Puerto Rico, U.S.D.A. 768.
- through three centuries, 469.
- varieties resistant to cabeça virus, 207.
- vein-banding necrosis, 207.
- viruses, classification and nomenclature, 350.
- warehouses, open, fumigation tests in, 357.
- white Burley, cost of curing with artificial heat, Ky. 117.
- white Burley, quality, effect of temperature and relative humidity during and after curing, Ky. 328.
- wildfire and seedbed sterilization, 481.

Tocopherol—*see also* Vitamin E.

- α -, additions to normal diet, effect on lactation, 713.
- α -, another lower homolog of, 728.
- α -, prevention and cure of muscular dystrophy by, 713.
- d*L-alpha, prevention of deficiency disease in chicks by, 506.
- and its acetate with natural vitamin E. therapeutic equivalence, 714.

Tomato(es)—

- acid content, effect of soil moisture, 332.
- and tobacco worm, Calif. 792.
- and tomato products in rations of fur animals, 93.
- ascorbic acid in, Ga. 122.
- ascorbic acid in, relation to sunlight, 596.
- bacterial disease, [N.Y.]Cornell 769.
- bacterial ring rot, 628.
- bacterial wilt, southern-grown plants as sources in Indiana, Ind. 200.
- big bud, in Pacific Northwest, 58, 351.
- breeding, N.J. 758.
- bronze disease, thrips-transmitted, 645.
- bushy stunt virus—
 - diffusion constant, 208.
 - purification by differential centrifugation, 207.
 - sedimentation rate, 208.
- canned, effect of calcium and potassium fertilizers, 473.
- canned, vitamin A in, effect of storage, 557.
- canned, vitamin C destruction in, prevention, Wis. 693.
- canning, factors affecting acidity, N.Y. State 618.
- collar rot epidemic traced to setting of infected plants, Ind. 200.
- collar rot, nitrogen nutrition of seedlings as affecting susceptibility to, Ind. 200.
- comparison of nutrient solutions for transplanting and for packing for shipment, 188.
- copper fungicide tests on, 628.

Tomato(es)—Continued.

- copper in, 731.
- culture and fertilization, Ga. 44.
- curly top, in southern California. U.S.D.A. 199.
- curly top resistance, development and testing, Utah 771.
- curly top virus, wild varieties resistant to, Idaho 342.
- defoliation—
 - aspects of, U.S.D.A. 342.
 - diseases, new sprays and schedules for, Conn.[New Haven] 480.
 - diseases, notes, U.S.D.A. 630.
 - diseases, resistance to, Ind. 200.
- diseases—
 - control, Ga. 60, R.I. 60.
 - in Indiana, Ind. 350.
 - in Mexico, U.S.D.A. 769.
 - in Utah, Utah 771.
 - in western Tennessee, U.S.D.A. 59.
 - notes, Tex. 770.
- early blight, dusting tests for, Tex. 770.
- effect of hardening treatments, W.Va. 758.
- Essary, fruit characters and yielding capacity, Tenn. 472.
- fertilization, new methods, 472.
- fertilization, studies, N.J. 758.
- firmness of, N.Y.State 618.
- Florida, marketability, effect of maturity, 473.
- fresh and canned, factors affecting quality, Ind. 185.
- fruit pox etiology, Tex. 770.
- fruit rot, caused by *Phytophthora capsici*, 347.
- fruitworm, studies, Colo. 642, Ga. 74, Tenn. 792, Tex. 787, U.S.D.A. 784, Utah 787.
- Fusarium* wilt, Tex. 770.
- green, salting, Mich. 584.
- greenhouse, foliar diagnosis as index of nutritional needs, 46, Pa. 471.
- greenhouse, root knot nematode control, R.I. 60.
- greenhouse, yield, effect of size of fertilizer application, 473.
- growth, relation to phosphorus concentrations in nutrient supply, N.J. 758.
- high vitamin C content, breeding, S.Dak. 757.
- hybridization, 760.
- improvement, Pa. 471.
- irrigation, Okla. 757.
- leaf blight, control by spraying, N.Y. State 630.
- leaf blight in Philippines, 635.
- leaves, *Phytophthora infestans* on, 351.
- mineral deficiencies in, injection for diagnosis of, 449.
- mosaic, virus causing and its transmission by seed, Ind. 200.
- mulching, N.J. 758.
- new varieties and selections, Utah 758.
- Ohio-packed, quality and retail prices, 269.

Tomato(es)—Continued.

on Sassafras sandy loam, availability of replaceable potassium to, 332.

Phomopsis fruit rot, 629.

phyllod flowers, morphological and anatomical features, 776.

pinworm, Calif. 792.

planting methods, Utah 758.

plants—

culture and training, R.I. 44.

greenhouse, spacing, Okla. 757.

handling for long transit, U.S.D.A. 757.

northern- v. southern-grown, N.Y. State 618.

protection, use of aster cloth houses for, Okla. 757.

southern-grown, treatment, U.S.D.A. 756.

training, W.Va. 758.

treated with chemicals, induced formation of β -gentiobiosides in, 20.

use of nutrient solutions in transplanting water for, 188.

production, improved methods, Ga. 187.

production without pollination, 332.

protection from beet leafhopper, Idaho 357.

pruning, Tex. 758.

psyllid, Colo. 642, Mont. 786.

response to fertilizer ingredients, 188.

response to soil fumigation with chloropicrin, 208.

ring spot virus—

comparative host ranges, 344.

transmission from currant to tobacco, 628.

root knot and wilt, soil fumigation with chloropicrin and carbon bisulfide, 351.

root knot nematodes, U.S.D.A. 489.

roots, excised, growth, and heterosis in, 593.

roots, excised, response to β (4-methylthiazolyl-5)-alanine, 304.

rot due to soil mold, Colo. 774.

rotations, value of cover crops in, N.J. 758.

seed, development and differentiation of seed coat, 592.

seed production, Ind. 185.

seed tests, 769.

seedlings transplanted from sand, damping-off control in, 627.

soil fumigation with chloropicrin for, R.I. 60.

spotted wilt, studies, 776, U.S.D.A. 59.

spraying, R.I. 44.

sprays for *Alternaria* control, timing and dosage, 628.

starter nutrient solutions for, W.Va. 758.

stem rot or canker, 209.

streak disease in New Zealand, 209.

time of pollen tube extension through style and rate of fruit growth, 331.

toe rot, new fungi causing, 630.

unstaked, pruning, 188.

Tomato(es)—Continued.

value of rye and vetch green manure crops for, W.Va. 758.

variety tests, 331, Ga. 44, Pa. 472.

Victor, description, Mich. 188.

vitamin C in, Utah 836.

wilt *Fusarium*, single-spore isolates from, pathogenic and cultural variation, 777.

wilt resistance of Riverside variety, 65.

wilt-resistant varieties, breeding, U.S. D.A. 757.

yields, effects of copper sprays, 629.

Toria, insect pollinators of, 495.

Tornadoes in United States during 1884, synoptic conditions accompanying, 153.

Tortoise, Florida gopher, arthropods found in burrows of, 73.

Torulopsis n.spp. on grapes and in grape products in California, 171.

Toxymus putchellus, parasite of willow insects, 225.

Toxoplasma, avian, organisms described as, 527.

Toxoptera graminum, see Green bug.

Tracheae, penetration by different fluids and results, 788.

Tractor(s)—

costs in Michigan, Mich. 679.

rubber tires for, Ind. 254.

Trade—

agreements, reciprocal, new method of tariff making, U.S.D.A. 687.

domestic and foreign, fields of International Confederation of Agriculture in, 110.

foreign, meaning for agriculture, U.S. D.A. 687.

internal, in farm products, barriers to, U.S.D.A. 687.

international, reduction of obstacles to, viewpoint of agriculture, 110.

Tradescantia generative cells, effect of colchicine on division, 310.

Trametes spp., notes, 351.

Transpiration—

effect on mineral uptake in plants, 449.

in horticultural plants, environment-control chamber for study, 164.

in wheat, effect of leaf rust, 774.

of a leaf from earliest stage to its fall, 17.

rates in plants, significance of ethereal oils in, 450.

Transportation problem of agriculture, U.S.D.A. 687.

Tranzschelia pruni-spinosae discolor, uredio- and teliospores, germination experiments, 772.

Tree(s)—

bleeding canker disease, additional hosts and locations for, U.S.D.A. 768.

coniferous, see Conifers.

diseases—

latest findings of trade importance, 779.

leaflets on, 637.

Tree(s)—Continued.

- diseases—continued.
 systemic, control, 68.
 virus, of forest and shade species, 68.
 distribution, studies by diameter classes in virgin timber stands, Pa. 478.
 evergreen, *see* Evergreens.
 for Washington farms, Wash. 341.
 forest, photosynthetic activity, Vt. 197.
 freezing injury, U.S.D.A. 768.
 growth as index of rainfall and temperature, 296.
 hardwood—
 bleeding canker, tree injection for control, 628.
 in forest nurseries, soil fertility standards for, 766.
 living heart rot and cankers associated with *Stereum murrayi*, 637.
 of Arkansas, volume tables for, Ark. 57.
 resources and industries, Ark. 57.
 Ustulina vulgaris decay in, 69.
 husbandry, outstanding needs for research in, 779, 789.
 important East African, comparative ages, relation to their habitats, 159.
 inoculation for disease and insect pest control, 637.
 migration, trends, in Kansas, 341.
 pests and diseases, 637.
 pests of orchard and city, Okla. 786.
 physiology, 24.
 ring(s)—
 analysis, technic, 454.
 as record of precipitation in western Nebraska, 296.
 of California redwoods, problems in dating, 296.
 series in Douglas fir, photographs showing features important in correct interpretations, 296.
 seed handling, improved methods, Okla. 757.
 seedlings, damping-off of, 779.
 seeds, forest, germination, [N.Y.]Cornell 766.
 seeds, viability, N.Y.State 618.
 shade and street, safeguarding against disease, N.J. 769.
 shade, insect injury to, 75.
 shade, protecting from insect damage, Ill. 216.
 shade, *Sphaeropsis* canker and dieback on, 68.
 shelterbelt, *see* Shelterbelt(s).
 species, development by experimental forest nursery, Ind. 196.
 toad, coast, mating and oviposition in, 357.
 trunk pressures, internal, attempt to record, 25.
 uprooting, disturbance of forest soil resulting from, 339.
 varieties, Mont. 617.
 weed, killing, value of chemicals for, Pa. 478.

Tree(s)—Continued.

- wound dressings, 758.
 Treefern fiber for orchid baskets, P.R. 618.
 Trematodes, new species, from herons, 641.
Trialeurodes vaporariorum, *see* Whitefly, greenhouse.
Triatoma—
 heidemanni, natural infection with *Trypanosoma cruzi* in Texas, 393.
 sanguisuga, *see* Conenose, bloodsucking.
Tribolium castaneum, *see* Flour beetle, red.
Tribolium confusum, *see* Flour beetle, confused.
 Tributyrin agar, use in dairy bacteriology, 240.
 Trichina infection in swine, detection, 388.
Trichinella spiralis—
 larvae, in heart, liver, stomach, and kidney of experimentally infected swine, 530.
 larvae, in vitro effect of immune serum on, 245.
 transmission of immunity to, from infected animals to their offspring, 244.
 Trichinosis—
 situation, U.S.D.A. 813.
 spread, relation to municipal garbage disposal, 393.
 studies, Mass. 124.
Trichocereus spachianus, structure of shoot apex, 592.
Trichodectes—
 crassus, parasite of raccoon, 783.
 ovis, notes, Ga. 74.
Trichoderma—
 spp. from pinewood soil, 202.
 spp., relation to mushroom diseases, control, Pa. 480.
 viride, effect on corn seedlings, and role as plant pathogen, 346.
Trichogramma—
 minutum, egg parasite of oriental fruit moth, U.S.D.A. 502.
 spp., parasites of sugarcane borer, La. 358.
 Trichogrammatidae from Palearctic region, new genera and species, descriptions, 788.
Trichomonas—
 bonasae in ruffed grouse, 399.
 fetus in heart blood of an aborted fetus, 818.
 gallinae, pathogenicity for baby chicks, 107.
 gallinae, transmission from chicken to other birds, 822.
 gallarum, redescription, 535.
 Trichomoniasis, unusual case, and suggestion for chemotherapy, 396.
Trichopoda pennipes, parasite of squash bug, Conn.[New Haven] 646.
Trichopria sp., notes, P.R. 640.
Trichopsylla lotoris, parasite of raccoon, 783.
 Trichostrongylosis—
 in calves, yeast as adjunct to anthelmintic treatment, 817.
 treatment, tests of various drugs, 248.
 treatment with copper sulfate and nicotine sulfate, 672.

- Trichostrongylus*—
azei, test of phenothiazine against, 531.
 larvae, third stage, accessibility to grazing animals, 816.
retortaeformis, parasite of rabbit, 72.
 species, studies, 73.
 tests of phenothiazine against, 396.
vitrinus in sheep and anthelmintics against, 818.
- Trichuris ovis*—
 anthelmintic efficiency of Lentin against, 248.
 tests of phenothiazine against, 396.
- Tridentaria implicans* n.sp., description and parasitic relations, 212.
- Tridymus salicis*, parasite of willow insects, 225.
- Trifolium* species, adaptation to different ecological environment, 177.
- Trimethylamine as a plant sex hormone, 17.
- Tripsacum*, *Euchlaena*, and corn, genetic and cytological relations, Tex. 753.
- Trogoderma khapra*, reactions to light, 788.
- Trout—
 migration of, Pa. 495.
 nutritional requirements, [N.Y.]Cornell 781.
 tagged, taken by anglers, Pa. 495.
- Truck crop—
 and garden insects, U.S.D.A. 784.
 diseases due to soil mold, Colo. 774.
 diseases in Tidewater Virginia, control, Va.Truck 483.
 insects, Tex. 787.
- Trucks, see Motor trucks.
- Trypanosoma*—
cruzi, natural infection of *Triatoma heidemannii* with, 393.
 from wild birds of Mexico, 214.
- Tubercle bacilli—
 growth on malate media, effect of zinc on, 671.
 human and bovine types, differentiation, 671.
- Tuberculin and other diagnostic tests, U.S.D.A. 813.
- Tuberculosis—
 avian, frequency and source of infection for man and animals, 676.
 bovine, 818.
 bovine, eradication in United States, 671.
 dark adaptation in persons with history of, Ariz. 121.
 effect of diet on resistance to, 855.
 eradication, U.S.D.A. 813.
 in sheep, bovine type, 672.
 in starling, 399.
 vitamin C in, 712.
- Tuberculouslike lesions of swine, role of *Corynebacterium equi* in, 530.
- Tulip—
 anthracnose, notes, 59.
 diseases, [N.Y.]Cornell 769.
 root and bulb rots caused by *Pythium*, 200.
 1 virus, separation from lily-latent by cytological methods, 58.
- Tulip tree, seed formation, viability and collection, 478.
- Tumidiscapus orchelimumis*, parasite of *Orchelimum*, 506.
- Tumor-producing agents, viruses of, 669.
- Tung oil, research, U.S.D.A. 725.
- Tung oil, solvent extraction from press cake, U.S.D.A. 725.
- Tung tree, hardness in, relation to dormancy, U.S.D.A. 756.
- Turf—
 disease, new fungus, 629.
 fine, experiments with, N.J. 751.
 injury by chloropicrin, R.I. 60.
- Turkey (s)—
 blood protozoan infection in, 535.
 bone deformities in, Utah 796.
 broad breasted Bronze, concentrate feeding, 516, 661.
 broad-breasted Bronze, description, and value of breed, 516.
 composition, effect of age and sex, 510, 516.
 cross-breeding for better market quality, W.Va. 748.
 effect of artificial illumination, Pa. 463.
 eggs, hatchability, improvement, Okla. 748.
 eggs, need of turning during latter stages of incubation, 510.
 fecundity, effect of lights, 510.
 feeding and confinement rearing experiment, Mich. 661.
 feeding grasshoppers to, 516.
 feeds, Utah 657.
 flocks, small, stoneyard for and management practices, Mich. 234.
 hatchability, effect of soybean meal, S.Dak. 802.
 intestinal mucosa, post-mortem autodigestion of, 253.
 management, Kans. 382.
 marketing, Tex. 828.
 meat production in, Utah 796.
 minimum yard space for, Okla. 802.
 need of vitamin A supplements for, S.Dak. 802.
 paratyphoid studies in, 389.
 poult, cottonseed v. soybean meals, Okla. 802.
 poult, effect of lights, Okla. 802.
 poult, protein levels in rations for, Ind. 233.
 pox virus, egg propagation of, 532, 822.
 production in Missouri, Mo.Poultry 97.
 purebred and crossbred, body weights and measurements, 510.
 riboflavin requirements for breeding, Colo. 655.
 small-type, development, U.S.D.A. 747, 794.
 sorghums and millets for, S.Dak. 802.
 starting and growing rations for, Ind. 227.
 starting rations, value of soybean meal as protein concentrate in, Idaho 372.
 strains differing widely in body weights, Ind. 173.

- Turkey(s)—Continued.
value of electric lights for, Ind. 227.
whole oats for, value, Pa. 507.
- Turnip(s)—
aphid, notes, Tex. 787, U.S.D.A. 784.
beetle, red, Mont. 786.
effect of boron, Mont. 617.
greens, ascorbic acid in, Ga. 122.
greens, changes in vitamin C content during boiling under different conditions, 423.
mosaic, host range in New Zealand, 209.
seedlings, light requirements, Pa. 471.
- Turpentine still buildings and equipment, U.S.D.A. 733.
- Tur-pod fly parasite, life history and morphology, 225.
- Twigs, dry preservation, in natural form and color, 602.
- Twinning, in farm animals, 456.
- Tylocladerma fragariae*, see Strawberry crown borer.
- Typhlocyba pomaria*, see Apple leafhopper, white.
- Typhoid bacillus, preparing antigenic substances from, 102.
- Udder, cow's, suspensory apparatus and circulatory system, U.S.D.A. 662.
- Ultramicroscope, recent results with, 430.
- Ultraviolet—
irradiation and vitamin C metabolism, 283.
light sources, efficacy in killing bacteria suspended in air, 22.
- Umbrous, coat character in mice, case of dominance modification, 28.
- Uncinula jaborosae* n.sp., on leaves of *Jaborosa integrifolia*, 344.
- Undulant fever treated with sulfanilamide, 671.
- U. S. Department of Agriculture—
Library, notes, 143.
report of Secretary, 859.
yearbook, U.S.D.A. 686.
- Urea—
hydrolysis in soils, nature of catalyst causing, 157.
nitrogen, utilization by chicks, Nebr. 94.
utilization by lactating cows, Wis. 662.
- Uredinales of Colombia, 344.
- Uredinales, flexuous hyphae, 627.
- Uredineae, Argentinian, little known, 632.
- Uredo ingae* on *Inga uruguensis*, 632.
- Urinary calculi, Colo. 668.
- Urine—
ascorbic acid in, determination, 439.
nicotinic acid determination in, 9, 274.
of mare, oestrin content, relation to oestrous cycle, 610.
- Uromyces phaseoli typica*, notes, U.S.D.A. 199.
- Uromyces scirpi*, studies, 201.
- Ustilago*—
bullata, host specialization in, 482.
hordei, effect of X-rays on chlamydospore germination, 773.
zeae—see also Corn smut.
physiological forms, in Argentina, 632.
- Ustulina vulgaris*, on sugar maple, 69.
- Utah College, notes, 432.
- Utah Station, notes, 432.
- Utah Station, report, 859.
- Uterus—
masculinus of rabbit and reactions to androgens and oestrogens, 174.
of cats, response to injection with oestradiol benzoate, 460.
of rabbit, changes in with advent of pregnancy, 30.
pseudopregnant, of mouse, hypertrophy in following mechanical stimulation or treatment with vitamin E, 31.
weight of rats and mice, effect on progesterone and amniotin combinations, 750.
- Vaccines, studies, Idaho 389.
- Vagina, artificial, improved, for collection of stallion and jack semen, 463.
- Vaginal smear in rat, inadequacy as index of ovarian dysfunction caused by diet, 175.
- Vallisneria spiralis* leaves, growth in nutrient solution, effect of β -indolyl acetic acid, 446.
- Valonia, potassium isotopes in, separation, 166.
- Vanilla—
curing, processing, and extract preparation, P.R. 582.
cuttings, immersing in dilute nutrient solutions, effect on germination, P.R. 618.
damage by *Ecpantheria icasia*, P.R. 639.
disease of unknown cause, P.R. 630.
latex, toxicity, P.R. 582.
- Variocose ulcers, vitamin B₁ for relief of pain in, 703.
- Variety testing, use of trial grounds for, 470.
- Vegetable(s)—
affected by boron deficiency in eastern Virginia, Va. Truck 759.
and fruit market, Knoxville wholesale, buyers and buying problems, Tenn. 264.
and fruit market, Knoxville wholesale, taxes and regulations, Tenn. 408.
and Potato Council, Northeast, 110.
and vegetable products, research U.S.D.A. 725.
auctions, small-lot country, operation, U.S.D.A. 832.
breeding experiments, Tex. 757.
Chinese, dried, sugared, and salted, vitamin C in, 282.
conserving quality and food value, Mont. 693.
cooking in salted water, mineral losses in, Ind. 269.
cultivation requirements, [N.Y.] Cornell 759.
culture experiments, Tex. 757.
defoliation diseases, new sprays and schedules for, Conn. [New Haven] 480.
- disease(s)—
and pests, 200.
control, use of fixed copper compounds in, 347.

- Vegetable(s)—Continued.
 disease(s)—continued.
 on Chicago market in 1939, U.S.D.A. 342.
 on New York market, U.S.D.A. 199, 769.
 resistant varieties, for home garden, U.S.D.A. 759.
 effect of hardening treatments, W.Va. 758.
 fertilizer placement for, Pa. 471.
 fertilizer requirements, Okla. 757, R.I. 44.
 fertilizers for, Conn.[New Haven] 442.
 Florida, vitamin C in, effect of maturation and cold storage, 564.
 for Great Plains area, testing, U.S.D.A. 757.
 freezing preservation, Utah 836.
 freezing, vitamin A losses from, N.Y. State 693.

albo-atrum wilt of cotton, in Texas, U.S.D.A. 342.
 as plant pathogen, importance of, 488.
 disease of chrysanthemums and other greenhouse plants, [N.Y.]Cornell 769.
 hosts, in California, U.S.D.A. 342.
 sp., isolated from roots of salsify, 350.
 wilt of sugar beet, 64.
 wilt of tomato, resistance of Riverside variety to, 65.
- Vetch(es)—
 breeding and selection for disease resistance, Ga. 60.
 bruchid, notes, U.S.D.A. 784.
 disease of unknown cause, 480.
 diseases, seed-borne, problems of, N.Y. State 202.
 hairy, as green manure for cotton, Tex. 753.
 reaction to pea aphid, varietal differences in resistance, 646.
 seed germination and growth, effect of fertilizer placement, Miss. 34.

Veterinary—see also Animal diseases.

- bacteriology, textbook, 813.
- education, need and significance of veterinary preventive medicine, 388.
- medicine in America, history, 100.
- students, infection from horse cadavers used for dissection, 391.

Vibrio fetus, cause of abortion in sheep, 528.

Vibrio septique infection, treatment with sulfapyridine, 102.

Viburnum aphid, control, N.Y.State 642.

Vicia villosa, impermeable seed, viability, 470.

Vinegar generator for farm or small manufacturer, Mich. 679.

Vine-mesquite, seed germination, 43.

Vinyl resin fibers, chemical identification, 717.

Vinyon, new textile fiber and yarn, 572.

Violets—

- cytological, breeding, and physiological studies, Vt. 185.
- of Alachua County, Florida, ecologic notes, 159.

Virginia College, notes, 861.

Virginia Station, analytical index and list of publications, Va. 141.

Virginia Station, notes, 861.

Virus(es)—

- activity, measuring, accuracy of local lesion method, 629.
- and inclusion bodies, relations, 669.
- animal, tabulated list, 669.
- animal, variation in, 669.
- natural and experimental transmission, 669.
- nomenclature and classification, proposed system, 629.
- of tumor-producing agents, 669.
- plant and animal, U.S.D.A. 725.
- preservation, low temperature storage cabinet for, 344.
- propagation in host, 669.
- recent electromicroscope findings on, 430.
- serum control, U.S.D.A. 813.
- sizes and methods for determination, 669.
- species as antigens and acquired immunity to virus infections, 669.
- studies, handbook, 631.

Vitamin A—

- activity of carotene in different vegetable fats, Ind. 227.
- additional, for improved feeding, U.S.D.A. 794.
- and nightblindness, 419.
- and thyroxine, interrelation, 131.
- biological standardization, 280.
- deficiency—
 - and dark adaptation, new technic, 556.
 - blood analysis correlated with visual test, 702.
 - effect on malposition of chick embryo, 512.
 - in cattle, pathology of kidney in, 388.

Vitamin A—Continued.

deficiency—continued.

- in children, cutaneous manifestations, 559.
- in diabetes, 854.
- in dogs and rabbits, hematology of, 508.
- in man, experimental, value of adaptometry, 279.
- in rats, keratoconus experimentally produced by, 131.
- prevalence and importance, 129.
- revealed by blood analysis, Okla. 795.
- deficient diet, stomach lesions in rats kept on, 560.
- deficient diets, visual adaptation in adults on, photometric measurements, 130.
- egg oil as source, Okla. 795.
- for calves, green hay as source, Pa. 517.
- in blood of children, relation to biophotometer tests, 559.
- in canned tomatoes, effect of storage, 557.
- in cheese, 281.
- in chicks, effect of anterior pituitary extract, 510.
- in colostrum from cows, 519.
- in distillers' residues, 507.
- in eggs and tissues, effect of rations of hen, 510.
- in hay and silage, 657.
- in light white casein, 280.
- in liver of Chinese children and adults, 701.
- in liver of man and animals, 279.
- in liver of man, histological demonstration, 558.
- in liver, ultraviolet absorption and Carr-Price reaction, 279.
- in market milk, 848.
- in peas, frozen-pack, factors affecting, 418.
- in peas, raw frozen, cooked, and pressure-canned, 123.
- in quick-frozen food, 694.
- in rat liver, state of, after feeding various forms of the vitamin, 701.
- in rats, histological demonstration, 558.
- in serum, determination, 150.
- in sweetpotatoes, effect of fertilizers, 557.
- intake, dark adaptation as index, 128.
- metabolism, determined by rhodometer, R.I. 122.
- methods of assay and occurrence in food, 556.
- mobilization from its stores in tissues by ethyl alcohol, 702.
- nutritional requirements for, U.S.D.A. 836.
- palmitate, crystalline, preparation, 438.
- properties, food sources, and stability, 847.
- requirement(s)—
 - and values, and estimation of carotene, Ind. 268.

Vitamin A—Continued.

- requirement(s)—continued.
 - effect of age, 127.
 - of calves, U.S.D.A. 662.
 - of chicks, 510, Pa. 507.
 - of dairy cows, Ind. 234.
 - of dairy cows for production of butterfat of high vitamin A value, 235.
 - of man, 279.
 - of pigs, 376.
 - of poultry, Idaho 372.
 - reserves, depletion, in range cattle, time required for, 658.
 - response of induced prothrombin deficiency to, 715.
 - stability in irradiated milk, Wis. 664.
 - status of families in different economic levels, 419.
 - studies, Ariz. 121.
 - supplements, need of for turkeys, S.Dak. 802.
 - suppressing factor in soybean oil, Ind. 234.
 - suppressing factor in soybean oil, adsorption from, 228.
 - value of Ladino clover, Idaho 372.
- Vitamin. anti-gray hair, isolating in pure crystalline form, Wis. 693.
- Vitamin, antihemorrhagic, *see* Vitamin K.
- Vitamin, antineuritic, *see* Vitamin B₁.
- Vitamin, antirachitic, *see* Vitamin D.
- Vitamin B₁—*see also* Thiamin.
- action on growth of mycorrhiza, 743.
 - and chick nutrition, 510.
 - and riboflavin in economy of food utilization, Ark. 703.
 - and riboflavin in milk, 519.
 - and riboflavin in milk, effect of pasteurization and sterilization, 519.
 - and white flour, 560.
 - consumption, relation to exercise, 849.
 - deficiency—
 - in adults, metabolism of pyruvic acid in, 133.
 - in diabetic patients, peripheral neuropathy due to, 850.
 - in man determined by blood cocarboxylase, 704.
 - therapy of Cook County Hospital for, 850.
 - deficient diet and Wernicke's disease, identity of lesions from, 850.
 - effect on development of flowering plants, 451.
 - effect on seed germination, N.Y.State 618.
 - effect on transplanted fruit plants, N.Y. State 618.
 - excretion of subjects on different Indian diets, 131.
 - for relief of pain in varicose ulcers, 703.
 - in bean varieties grown in two localities of Michigan, 281.
 - in blood, estimation, 9.
 - in Chinese plant beriberi remedies, 703.
 - in distillers' residues, 507.

Vitamin B—Continued.

- in vegetables, effect of quick-freezing and canning, 561.
 - preparations, assay, 439.
 - pyrimidine component, photochemistry and absorption spectroscopy of, 16.
 - pyrimidine component, ultraviolet inactivation of, 16.
 - relation to plant growth, 22.
 - requirements of rats, effect of exercise, Pa. 507.
 - review of literature, 849.
 - saturation studies, 704.
 - supplement, effect on growth of infants, 849.
 - treatment of *Aleurites fordii* with, P.R. 618.
- Vitamin B₂ complex—
- deficiency and graying fur in rats, 419.
 - deficiency, effect on pigeon dermatitis, 234.
 - filtrate factor, properties, 561.
 - liver filtrate factor of, 281.
- Vitamin B₃—
- analogues, antidermatitic effect, 562.
 - and pantothenic acid, relation to factor W studies, 421.
 - crystalline, natural and synthetic, identity, 562.
 - deficiency, studies, Ala. 131.
 - effect on liver and body fat, 709.
 - effect on yeast growth, 22.
 - hydrochloride, synthetic, negative effect, in nutritional deficiency in man, 562.
 - in meat, destruction, Wis. 693.
 - method for assaying materials for, Wis. 693.
 - properties and food sources, 847.
 - toxicity, 563.
 - urinary excretion, in rat, 562.
- Vitamin B complex—
- and fat metabolism, 709.
 - and its constituents in functional digestive disturbances, 702.
 - deficient diet, effect on intestinal yeast flora of animals, 228.
 - factors, requirement for dogs, Wis. 693.
 - factors, requirements for lactation and growth of nursing rats, 420.
 - filtrate growth factor B_w in, 282.
 - new factor SB in, evidence, 848.
 - rumen synthesis of, 807.
 - studies, 506, Ala. 131.
 - supplement, nature of, relation to ability of homocystine to replace methionine in diet, 133.
 - synthetic, reproduction in rats on, 848.
- Vitamin B_p, proposed name for antiperiosis vitamin, 513.
- Vitamin C—*see also* Ascorbic acid.
- concentration in blood during and after pregnancy, 136.
 - deficiency in cattle lacking vitamin A, Wis. 669.
 - deficiency on exclusive diet, 712.
 - destruction, during bovine digestion, Pa. 507.

Vitamin C—Continued.

- destruction in canned tomatoes, prevention, Wis. 693.
- effect on calcium, phosphorus, and nitrogen metabolism in scurvy and osteomalacia, 711.
- feeding intermittently, effect on guinea pigs, 136.
- in citrus fruits, effect of nutrient deficiencies, U.S.D.A. 756.
- in dried, sugared, and salted Chinese vegetables and fruits, 282.
- in fruits and vegetables, 852.
- in health and disease, newer knowledge, 282.
- in tomatoes, Utah 836.
- in tuberculosis, 712.
- in vegetables, 135.
- in watermelon varieties, 283.
- intradermal dye test for, evaluation, 710.
- loss from frozen vegetables in storage, 566.
- metabolism and ultraviolet irradiation, 283.
- nutrition and capillary fragility, 852.
- nutritional status of Montana college women, Mont. 693.
- potency of citrus fruits, effect of maturation and cold storage, 564.
- stability, to heat, Pa. 517.
- synthesis, by rats, Pa. 507.

Vitamin D—

- carriers, assays, Conn.[New Haven] 228.
- effect on lead in blood and bone, 699.
- effect on phosphorus metabolism of rachitic rats, 137.
- for poultry, S-4 Type sun lamps v. cod-liver oil as source, Ohio 804.
- in blood of dairy cattle, compared with potency of milk produced, 385.
- in distillers' residues, 507.
- in milk, assay, N.J. 805.
- milk, inspection, Conn.[New Haven] 271.
- one massive dose as shock therapy for rickets and tetany, 567.
- potency of milk, effect of sunlight and feed on, Ariz. 122.
- potency of milk of different breeds, S.Dak. 806.
- properties, food sources, and stability, 847.
- requirements of chicks, Tex. 796.
- requirements of dairy cows, S.Dak. 806.
- requirements of ducklings, 510.
- requirements of pigs, 376.
- response of induced prothrombin deficiency to, 715.
- studies, 582.

Vitamin E—*see also* Tocopherol.

- and neuromuscular diseases, 714.
- aspects of function irrespective of relation to reproductive system, 852.
- deficient rats, dystrophic, phosphorus metabolism in musculature, 228.
- deficient rats, muscular dystrophy and creatinuria in, 284.
- determination, 584.

Vitamin E—Continued.

- properties, food sources, and stability, 847.
- relation to nutritional muscular dystrophy, U.S.D.A. 662.
- requirements of male and female rats, differences in, Idaho 372.

Vitamin G, *see* Riboflavin.

Vitamin H—

- attempts to isolate, 285.
- curative of egg-white injury and presence in different foods, 284.
- curative of egg-white injury, orally v. parenterally administered, 567.
- physicochemical properties, 286.

Vitamin K—

- compounds, synthetic, effect on prothrombin concentration in man, 852.
- concentrate, antepartum and neonatal ingestion by mothers, effect on plasma prothrombin in newborn infants, 569.
- effect on chicks with avitaminosis K due to diet or to obstructive jaundice, 853.
- properties and food sources, 847.
- response of induced prothrombin deficiency to, 715.
- synthetic, and prothrombin levels in obstructive jaundice of rats, 568.
- synthetic, treatment of hypoprothrombinemia with, 569.

Vitamin K₁—

- natural and synthetic, antihemorrhagic activity comparison with proposed standard 2-methyl-1,4-naphthoquinone, 714.
- oral and parenteral toxicity, 567.
- oxidation-reduction potential, 439.
- synthesis, 294, 439.

Vitamin M, isolation and relation to susceptibility to bacillary dysentery, 853.

Vitamin P occurrence in milk, 853.

Vitamin(s)—

- deficiency—*see also* Avitaminosis and *specific vitamins*.
- and abnormal bone growth of chicks, 513.
- anti-gray hair, in dogs and silver foxes, 506.
- deficiency, pathology of nervous system in, 704.

for war, 847.

in foods, 846.

in meat, effect of quick freezing, S.Dak. 847.

in milk that prevents stomach ulcers in guinea pigs, Wis. 693.

nomenclature, 846.

sources and physiological values, 556.

studies, 510.

unrecognized, relation to perosis, 506.

Voles, field, susceptibility to equine encephalomyelitis, 249.

Vultures, turkey, in central Iowa, 492.

Walnut(s)—

- bacteriosis control, bordeaux mixture v. insoluble copper sprays for, 58.

- Walnut(s)—Continued.
 blight, control with copper sprays, 487.
 buds, damage by strawberry rootworm, 370.
 English, composition of shell, 727.
 Manchurian, testing, S.Dak. 757.
 Persian, leafhoppers infesting, 363.
 production, soil moisture, root distribution, and aeration as factors, Oreg. 55.
 trees, fumigation, 647.
- War, World, and present war, effects, U.S. D.A. 256.
- Warbler, black-throated green, eating tent caterpillars, 366.
- Washington Station, notes, 862.
- Wasp, dagger, enemy of white grubs in Java, 654.
- Wasps, parasitic on larvae and pupae of ants, oviposition habits, 793.
- Water—
 and sewage problems, results of investigations in, use of, N.J. 824.
 and soil conservation studies, Tex. 299, 823, Va. 589.
 and soil losses, effect of manure and shallow tillage, Idaho 298.
 application efficiencies in irrigation and relation to methods, Utah 823.
 bound, in normal and puddled soils, Ariz. 13.
 conservation, effect of cover crops and manure, N.J. 759.
 conservation planning for, 412.
 control, design of structures for, application of hydromechanics to, Utah 823.
 culture, *see* Plant(s), culture.
 drinking, iodine in, Tex. 727.
 drinking, warming, U.S.D.A. 823.
 duty of, *see* Irrigation water.
 facilities, small, development in arid and semiarid sections of country, U.S.D.A. 823.
 flow, sediment-laden, designs for suspended-load samplers, U.S.D.A. 824.
 ground, studies in Arizona, Ariz. 108.
 heaters, electric, for dairy farms, Ind. 255.
 hyacinth, entomogenous fungus on spider mites on, 212.
 infiltration into soil, rate and its measurement, U.S.D.A. 824.
 lifting devices, home-made, Mont. 678.
 pollution by industries of State, N.J. 824.
 power utilization, Mont. 678.
 repellency of cotton hosiery, 573.
 state of, in doughs, 546.
 supply—
 farm, ponds for, Iowa 678.
 household, copper or brass piping for, N.J. 823.
 of Eloy district, Arizona, Ariz. 399.
 of Hawaii, 254.
 of United States, Missouri River Basin, 824.
 of United States, Ohio River Basin, 678.
- Water—Continued.
 supply—continued.
 studies based on snow surveys, Mont. 678.
 volume made available daily by root growth, 744.
- Waterfowl damage of crops, protecting by reflectors and revolving beacons, 213.
- Watermelon(s)—
 fruit thinning, 189.
Fusarium wilt, varietal resistance, Tex. 770.
 seedless fruits from varieties, 617.
 seeds, proteins and other nitrogenous constituents, 273.
 variety tests, Pa. 472.
 vitamin C in ten varieties, 283.
 wilt resistance, breeding for, Ga. 60.
 wilt resistance in Klondike R-7, Idaho 342.
 wilt resistant varieties, testing, Okla. 757.
- Watersheds, small, analysis of hydrologic data for, U.S.D.A. 442.
- Waxes, chemical products from, U.S.D.A. 725.
- Weasel(s)—
 in central Iowa, winter and spring habits, 783.
 male, reproductive cycle, 608.
- Weather—*see also* Meteorological observations and Meteorology.
 analysis and forecasting, textbook, 441.
 and climate of Connecticut, 12.
 and crops, 12.
 and plant diseases, 585.
 Bureau, report, U.S.D.A. 734.
 data, U.S.D.A. 12.
 forecasting terminology, 585.
 information, presentation to public, improving, 585.
 records and insect control, W.Va. 787.
 reports from off Pacific coast, proposal for, 585.
 station, automatic, 152.
- Webworm(s)—
 beet, control, Tex. 787.
 on velvet bentgrass, control, R.I. 75.
 sod, biology and control, in California, 647.
 sod, notes, Pa. 495.
- Weeds—
 control, Utah 613, 753.
 control experimentation, results from, 334.
 control, implements for, Ind. 254.
 control, in lawns and turf, merits of chemicals for, N.J. 751.
 control symposium, 329.
 important Michigan, Mich. 616.
 killers, chemical, U.S.D.A. 725.
 lawn, control, R.I. 34.
 new, introduced into Utah, Utah 43.
 of vacant lots in outskirts of Mexico City, 617.
 of Valley of Mexico, pollen grains, morphology, 601.

Weeds—Continued.

- pasture, control, 89, Tex. 753.
 potential pest of major importance to Hawaii, 617.
 seed determinations, 469.
 seeds, factors in killing, R.I. 60.
 seeds in commercial vegetable seeds, 469.
- Wells, pumping, for drainage of lands waterlogged from underlying artesian basins, Utah 823.
- Wernicke's hemorrhagic poliomyelitis in man, lesions of, and those produced in pigeons by vitamin B₁-deficient diet, identity, 850.
- West Virginia Station, report, W.Va. 859.
- Wheat—
 after-harvest sprouting in, breeding significance, 43.
 after soybeans v. after corn, Ind. 178.
 allergens, studies, U.S.D.A. 725.
 bran, feeding value, 656.
 breeding, Ga. 33, Ind. 178, Mont. 612, [N.Y.]Cornell 751, Okla. 752, Tex. 752, U.S.D.A. 751, Utah 753.
 breeding for smut resistance, Ariz. 33.
 browning root rot, control, 347.
 bunt, *see* Wheat smut, stinking.
 combining v. binding, Pa. 464.
 comparison of red clover, alfalfa, and sweetclover in rotations with, Ind. 179.
 corn and barley, comparison in diet of chickens, 802.
 crop insurance, all-risk, under Federal Crop Insurance Act of 1938, 256.
 culture experiments, Mont. 612, Tex. 753.
 dwarf smut in Montana, U.S.D.A. 59.
 experiments on dry land, Utah 753.
 feeding value for poultry, S.Dak. 802.
 fertilizer experiments, Idaho 319, W.Va. 754.
 fields, preharvest sampling, experiment in, Iowa 184.
 flag smut, U.S.D.A. 199.
 flour, *see* Flour.
 foot disease, new cause of, 773.
 foot rot growth, effect of thiamin, its components, and heteroauxin, 743.
 foot rots in Kansas and Colorado, U.S. D.A. 59.
 for sheep, cattle, and swine, feeding value, 229.
 freshly harvested, effect of ethylene, 43.
 futures, U.S.D.A. 408.
 futures of Liverpool, price relations, 543.
 futures, trading, relation to price movements, 255.
 germ oil, effect of feeding to poultry, 512.
 germ oil, effect on semen production of cockerels, 512.
 germ treatment of muscular dystrophy and nervous diseases, 714.
 germination and growth, effect of nutrient salts in organic mercurial seed disinfectants, 62.

Wheat—Continued.

- grade, milling, and baking qualities, effect of severe weathering, Mont. 612.
 hard red winter v. hard red spring, Kans. 184.
 harvesting machinery, effect on insect control, 74.
 heads, rate of transpiration from, effect of awns, 756.
 high v. low calcium and phosphorus-carrying, nutritive value, Utah 753.
 Idaed spring, behavior, Idaho 319.
 improved, U.S.D.A. 751.
 in rotations, response to fertilizers, Ind. 179.
 insect survey of 1940, Ohio 215.
 insects, notes, 789.
 leaf rust, U.S.D.A. 59.
 leaf rust races collected in Oklahoma, 627.
 leaf rust resistant Sanford variety, adapted to Georgia, 347.
 leaf rust resistant varieties for control, Okla. 770.
 leaf rust resistant variety, new, Ind. 200.
 Lemhi behavior, Idaho 319.
 light-weight, seed value, Mont. 612.
 loose smut, varietal resistance to, 629.
 marketing, cooperative, Okla. 827.
 Marquillo spring, transference of characteristics to winter wheat by crossing, Kans. 502.
 Marquis, soil temperature and growth, 469.
 mineral content, Utah 753.
 North Dakota durum, quality studies, 42.
 of different grades, cars shipped into and from Enid, Okla. 827.
 pentaploid hybrid, chromosome number and behavior in, 745.
 permanent wilting in, initial water-supplying power of soils at onset of, 16.
 phosphorus nutrition, 17.
 phytin in, effect of variety and treatment, 725.
 plant, effect of various plant foods, Ind. 179.
 plants inoculated with *Helminthosporium sativum*, use of water by, 62.
 powdery mildew, effect on yield, Ind. 200.
 prices, Chicago, relation to trading and daily price changes, 255.
 production, control of soil erosion in, 737.
 products, vitamin considerations in, 419.
 protein percentage, factors affecting, Utah 616.
 Punjab, biochemical and technological study, 42.
 respiration rate, relation to freezable water, 599.
 rhizosphere of, microbial population in, 447.
 root rot losses, relation to weeds, 62.

Wheat—Continued.

- rust—*see also* Cereal rusts, Rust, Wheat leaf rust, and Wheat stem rust.
 migration, airplane spore traps for study, 483.
 resistance, breeding for, Tex. 770.
 resistance in H-44 and Hope wheats, inheritance of, 313.
- seeds, fungus spore load carried by, hemocytometer method for detection, 470, 481.
- shorts, coccidium-growth-promoting potency of, 524.
- smut, stinking, growth, effect of thiamin, its components, and heteroauxin, 743.
- smut, stinking, physiologic races, Idaho 342.
- spikelet, formation in ear, 599.
- spring, breeding, Idaho 319, S.Dak. 752.
- spring varieties, heat resistance of, N.Dak. 161.
- spring, varieties in South Dakota, S.Dak. 42.
- spring, variety tests, Idaho 319, Utah 753.
- spring, yield, relation to soil moisture at seeding time, U.S.D.A. 751.
- stem rust—
 and leaf rust, seedling reactions of varieties to, 345.
 and old and new varieties, N.Dak. 204.
 fungus, population trends in parasitic strains, U.S.D.A. 768.
 immunity, transference by hybridization, 62.
 in 1939, control, U.S.D.A. 768.
 resistance in Hope variety, effect of light and other factors, 63.
- storage, profitableness to Oklahoma farmer, Okla. 681.
- stored, pests, Okla. 786.
- straw, hemicelluloses of, 7.
- subsidization and exports, 542.
- take-all growth, effect of thiamin, its components, and heteroauxin, 743.
- Thatcher, development and widespread use, U.S.D.A. 751.
- transpiration, effect of leaf rust, 774.
- v. corn for hogs, Ga. 89.
- varieties for North Carolina, N.C. 616.
- varieties, grasshopper injury among, 497.
- varieties, time of maturity and variety yields, N.Dak. 469.
- variety tests, Mont. 612, Okla. 752, Tex. 752, W.Va. 754.
- winter—
 alone v. diversified cropping, U.S.D.A. 751.
 breeding, Idaho 319, S.Dak. 752.
 effect of soil treatments on nitrates, soil moisture, and yield, 183.
 soft red, winter hardiness and quality in, Ind. 179.
 variety tests, Idaho 319, Utah 753.
 yield and quality, factors affecting, Ind. 179.

Wheat—Continued.

- winter—continued.
 yield, composition, and quality, effect of leaf rust and artificial defoliation, Ind. 200.
 yield, effect of seed treatment on seed shriveled by stem rust, Ind. 200.
- world, planning and economic planning in general, treatise, 689.
- world situation, 1939-40, 685.
- world, survey and outlook, 117, 542, 685.

 and milling and baking quality, effect of fertilizers, Okla. 752.
 and protein content, effect of legumes and manure, Idaho 319.
 effect of awns, Tex. 753.
 effect of lime, manure, and commercial fertilizers, Ind. 179.
 in Delta area, Miss. 319.
 increase from phosphate applications, Pa. 442.
 potential, soil moisture content as criterion, U.S.D.A. 751.

Wheatgrass—

- beardless, at three stages of maturity, digestibility and nutritive value, 797.
- bluebunch, composition, effect of stage of maturity, Idaho 372.
- crested—
 at three stages of maturity, composition and digestibility of nutrients, 797.
 culture experiments, Mont. 612, S.Dak. 752.
 dwarf, notes, Idaho 319.
 for beef production, seasonal changes in value, Mont. 656.
 for regrassing abandoned cropland and other uses, Mont. 612.
 hay and seed yields, effect of ammonium sulfate on, Idaho 319.
 strains, characters, Mont. 612.

Whey—

- as source of vitamins and vitamin products, 847.
- dried, browning, [N.Y.]Cornell 806.
- pH determination in, by color indicator paper, 294.
- powder, feeding value for pigs, 93.
- rennin in, inactivation, effect of heat and pH, 100.
- solids in candy, 811.
- utilization, U.S.D.A. 805.

White ants, *see* Termite(s).

White grub(s)—

- biology, control, and taxonomy, Tex. 787.
- dagger wasp enemies of, in Java, 654.
- in strawberries, arsenicals for control, 85.
- in Zanzibar, search for parasites of, 369.
- notes, [N.Y.]Cornell 786, Okla. 786.
- protection of strawberries from, 359.
- species in Saratoga Forest Tree Nursery, 651.
- studies, Ind. 212.

- White pine blister rust—
control, U.S.D.A. 768.
control in Michigan, 488.
function of tannin in host-parasite relations, U.S.D.A. 638.
mycelial extent beyond cankers on *Pinus monticola*, 488.
spread in 1940, U.S.D.A. 768.
studies, 480, Conn.[New Haven] 480.
susceptibility of southern gooseberry to, U.S.D.A. 769.
susceptibility of whitebark pine to, U.S.D.A. 768.
- White pine—
early development and survival, 624.
lumber, cost of production in New England, U.S.D.A. 56.
lumber from old-growth v. second-growth, 626.
propagation by cuttings, 478.
rate of diameter growth, factors affecting, Vt. 197.
spacing and rate-of-growth trials, Ga. 56.
vegetative propagation, 767.
- Whitefly—
greenhouse, control, efficiency of *Encarsia formosa* as parasite, Mich. 87.
rhododendron, 216.
- White-fringed beetle—
biology, 494.
studies, U.S.D.A. 493, 784.
- Wildlife—
and farming practices in eastern Texas, Tex. 782.
conservation and mosquito control, relation, 368.
environment in marshes, blasting to improve, 490.
in land planning, 213.
in United States, status, 70.
refuge, Lake Mattamuskeet, 213.
refuges, Federal, administration of, 213.
relations, ecological, Tex. 782.
review, 213.
shrubs for, on farms in Southeast, U.S.D.A. 641.
technology, 213.
- Willia anomala*, production of citric acid by, 169.
- Willow(s)—
insects, parasites of, 225.
leaf beetle, imported, life history and control, U.S.D.A. 651.
sex expression in, 26.
watermark disease, host-parasite relations, 488.
- Wind—
dissemination of angular leaf spot of cotton, 627.
scale, geostrophic, design for, 586.
velocity, effect of forest cover on, 12.
- Windbreaks, *see* Shelterbelt.
- Wine(s)—
superior, from Concord and Niagara grapes, production, N.Y.State 693.
table, commercial production, Calif. 295.
volatile acids in, 582.
- Wire—
and fencing, atmospheric exposure, Tex. 823.
and wire products, atmospheric corrosion, Ind. 254.
high-strength, for concrete reinforcement, data, Colo. 677.
- Wireworm(s)—
and potato injury, [N.Y.]Cornell 786.
biology and control, Pa. 85.
control, clean summer fallow as aid, 358.
control, effect of substitute crops and rotations, 85.
Gulf, in Florida Everglades, 223.
in Florida Everglades, 223.
populations, reducing, alfalfa as aid in, Idaho 357.
sand, control, La. 357.
studies, Conn.[New Haven] 494, N.J. 786, U.S.D.A. 784.
wheat, on potatoes, biology and control, [N.Y.]Cornell 369.
- Wisconsin Station, notes, 862.
Wisconsin Station, report, 718.
Wisconsin University, notes, 862.
- Women—
capacity to perform maximum anaerobic work, effect of gelatin, 843.
college, vitamin C nutritional status, Mont. 693, R.I. 122.
pregnant and nursing, vitamin A requirement, 279.
- Wood—*see also* Lumber and Timber.
British Columbia softwoods, sap stain, mold, and decay in, during transit overseas, 781.
floor finishes, care and maintenance in the home, R.I. 857.
fuel, decayed, chemical composition and calorific value, 629.
preservatives, for prevention of *Lyctus* attack, experiments in Great Britain, 504.
products, preservative treatment, Conn. [New Haven] 478.
rots, fungus, methods of distinguishing, 627.
sections, prevention of curling, 454.
sound and decayed, nitrogen in, relation to loss in weight during decay, 780.
weatherproofing and fireproofing, W.Va. 827.
- Woodchuck(s)—
as soil expert, 492.
susceptibility to equine encephalomyelitis, 249.
- Woodcocks, American, banding, Pa. 495.
Woodland and pasture combination, studies, Tex. 753.
Woodlots, farm, management, Ind. 196, Kans. 341.
- Woody—
ornamental plants for Ohio, selected list, Ohio 55.
plants, ornamental, attractive to birds, 213.

- Wool—
 fibers, classification and description, 570.
 large-scale production in New York, [N.Y.]Cornell 795.
 Merino, cystine in, relation to physical attributes, 800.
 Merino, sample, fiber fineness, determination, 855.
 production, inheritance, dam-daughter comparisons indicating, Okla. 747.
 reworked, addition, decrease of fabric strength from, S.Dak. 855.
 samples, small, accuracy for shrinkage tests, Tex. 856.
 shrinkage research, Mont. 717.
 substitutes, U.S.D.A. 855.
- Woolly aphid, *see* Apple aphid, woolly.
- Worms, parasitic, mechanism of acquired immunity in infections with, 523.
- Wound(s)—
 and wound hormones, effects, 17.
 treatment and dipterous larvae, 85.
- Wyoming Station, notes, 576.
- Xenopsylla cheopis*, *see* Rat flea, oriental.
- X-rays—
 and plant nucleuses, interaction, N.Y. State 618.
 lethal and dissociative effects on bacteria, 311.
- Xylosandrus germanus* transmits Dutch elm disease, 357.
- Yam beetle, bionomics, 504.
- Yeast(s)—
 and mold on dairy utensils, agar slice method for detection, 521.
 ash from spectroscopic analysis, mineral composition, 15.
 bakers', carbohydrate and lipid assimilation in, 17.
 brewers', dried, alcohol-precipitate factor from, effect on chicks and hens, 514.
 cell suspensions, oxygen consumption rate, relation to oxidation-reduction potential, 17.
 compressed, viability and baking properties, effect of storage temperatures, 414.
 dietary essentials for pigeons, and their relation to vitamin B₆, 282.
- Yeast(s)—Continued.
 growth rate, photomicrographic study, 170.
 growth, relation to inositol, thiamin, biotin, pantothenic acid, and vitamin B₆, 22.
 growth stimulation by minute quantities of copper, Wis. 582.
 on grapes and in grape products in California, 171.
 relation to problems of food preservation and food quality, N.Y.State 693.
 riboflavin in, 151.
 strains, biochemical classification, 171.
 vitamins, role, in growth and lactation, [N.Y.]Cornell 805.
- Yellow-fever mosquito—
 development of *Plasmodium gallinaceum* and production of gametocytes in, 534.
 eggs, viability, 85.
- Youngberry (ies)—
 blackberry dwarf affecting, U.S.D.A. 342.
 canes, overwintered, canker and die-back disease, 58.
- Youth in agricultural villages, 834.
- Zagrammosoma* n.sp., parasite of new leaf miner of *Tephrosia*, P.R. 640.
- Zakuklivanie disease of grain, and vector, 203, 646.
- Zeldia odontocephala* n.sp., on potatoes, 70.
- Zephyranthes* species, chromosomal determinations, Tex. 757.
- Zinc—
 accumulation in soil under long-persistent vegetation, 158.
 feeding to pregnant mares, effect, 249.
 phosphide as rodenticide in orchards, 641.
 sulfur, calcium, and copper, studies, 582.
 toxicity in peat soils, [N.Y.]Cornell 735.
- Zinnia—
 seeds, tests, N.Y.State 624.
 the State flower of Indiana, history and development, Ind. 196.
- Zoology—
 medical and veterinary, index-catalogue, U.S.D.A. 523.
 names of genera and subgenera in, with bibliographical origin, 639.
- Zooplankton, relation to metabolism of lakes, 595.

HEADQUARTERS OF STATE AGRICULTURAL EXPERIMENT STATIONS
