But the principle of the polar fish is the same, and it is impossible to get as much sport out of him here as in the temperate zones, owing to the ice, which bars such sport for the greater portion of the year. They are caught by means of holes cut through the ice, and the amount of satisfaction derived is about equal to that of pike or pickerel fishing under the same circumstances. Whenever the native traveler goes to the water he always takes a dog, he always makes allowance for fishing by making a hole in the ice, and enough to draw through this icy avenue the largest salmon that may perchance be swimming in that lake. He sometimes gets deceived in this calculation. I was once on the upper surface of seven or eight feet of ice, with a twelve-inch salmon on the under, separated by a ten-inch hole and connected by the strongest kind of sinew line and stout Limerick fish-hook. My efforts to get together were finally crowned with success by one of the natives, who enlarged the hole in the ice with the chisel. These holes are dug with two instruments, the ice chisel consisting of a bayonet, a mortising chisel, a sword point or such like instrument fastened on the end of a ten or twelve-foot pole about two inches in diameter, and an ice scoop, consisting of a saddle holding about a pint, made of the splayed base of a ten-foot wooden pole. The hole is dug about a foot or eight or ten inches in diameter, and cut as deep with the chisel, and its contents removed with the scoop, and this alternating process kept up until the water is reached, which wells up to nearly a level with the upper surface of the ice.

A REMINISCENCE OF UTAH.

HAVING seen but very little in the FOREST AND STREAM in regard to the game of Utah, it is the purpose of the writer to mention some of the small game that can be found in certain portions of the Territory. While from a strictly scientific standpoint, the matter presented may not be very instructive, the perusal of this article may be the means of giving some slight information regarding the section of the country referred to.

In the northwestern corner of Utah, about thirty-five miles from the Nevada line and twenty-five from the Idaho line, is the Rosebud Mining District, and it was the good fortune (or otherwise) of the writer to spend nearly a year in this camp. It is right on the borders of the "Great American Desert," and close by the old emigrant trail, over which so many poor pilgrims have passed their weary way during the great excitement of the Pacific coast. The camp proper is situated in the foot hills of the Goose Creek range of mountains, and the district extends to the Raft River Range.

During the year the writer sojourned in the land of the Mormon, he had plenty of spare time to ramble over the hills and mountains, and so was enabled to gain a very good insight into the ways of the inhabitants, birds and quadruped. Many very laughable affairs happened in the West, and many strange sights and scenes are always in the memory of those who have dwelt in the mountains. A person meets strange characters, in fact all those one meets are strange, for it is not the common kind that emigrates West. They stay at home and do as their fathers did before them, and in many respects they are very different from his brothers (it may be more utterly so than his) in that matter, he is different) who strikes out for himself, and wanders forth into the world seeking his fortune by land and sea. And among these men you will find characters that it only needs the hands and brain of a Dickens to make as immortal as the characters to which the great novelist has given life. We of "Rosebud Camp" had our characters, with so many more pilgrims headed their way, but I will not attempt to enter into any description of the mines or mining of the region, suffice it to say, that as far as the writer knows the camp is at this time deserted, for though there seemed to be plenty of good indications and great quantities of rich lode, no one has been able to strike out of the desert, and it was in the fall of the year when the writer "struck" the "camp" in the morning of what proved to be a very rainy day. After having ridden twenty-five miles on horseback, getting thoroughly damp, to say the least, he spent the night on the floor of an empty building, vainly trying to keep warm with one pair of blankets. It was cold enough to snow, too, so one can imagine that his introduction to the Rosebud was not so pleasant. He had some disagreeable things to have an ending, and after a month or so I was very happily situated in a little house of my own, where I had two bed rooms and an office.

My first experience in the way of shooting was the pursuit of what we called "mountain hare." I am at a loss to classify the animal. Baird gives a number of hares that seem to me the same thing, and I imagine to my regret that the naturalist is in the same dilemma. The mountain hare in Utah has to those Baird describes as the prairie hare (*Lepus yesteris*) is its taking a white fur in the winter. You will be out in the hills to-day, and a hare will jump up from beneath a little bush with its suit of gray and dirty white, and at night the snow falls; the next day you start the same hare—and lo and behold! he is white. No doubt the chances are not so sudden, but it really seems so, and the transition back to the summer garb is done as quickly. The

are very large, and I have seen some of them whose backs appeared as broad as that of a lamb as they went hopping up the hillside. They frequent the high foot-hills, and I never found them below the best hills, where the real plain commenced. When started from their form they hop off very awkwardly, as though one leg was in very bad shape; and if not shot at, or but slightly startled, they will stop after going a little way and sit up. By keeping quiet and following slowly the possible way down them around and to get near enough to shoot. They seem to skulk and dodge, especially when among the low mountain cedars. But start them by shooting at them, or scare them in some way, and then see them go! Their great long ears will flatten out on their backs, and nothing but a streak of white can be seen lying along the ground—and such jumps! I have started them down a hillside, where the snow lay so that their tracks could be seen, and the distance they would cover with one leap was prodigious. For fear, however, that some may say, "That's another Western yarn," I will not venture to name any exact distance.

The hares are not very hard to kill, excepting in the winter, when their coat is very thick, and then it will stop short in certain ways. But one or two shots in the right place will do the work, and I have killed them at quite long distances with No. 5 and No. 6 shot. They are good eating, and our fresh meat ran low. I would take my gun, saddle fork and bridle, and have my horse and a good cook would stuff and roast, and serve hot. Charley D., the party who boarded the men, would help himself liberally and then remark: "Rabbit is pretty good chuck, if you hear me." I used to think something that the men did not agree with him, especially when the price of table board was \$7.50 per week. They probably thought it was too dear eating.

Poor Charley, he needed money badly, and I for my part did not begrudge him what he could make. He had been in the army and came out crippled with rheumatism. He spent a year in bed and got up with his body four inches shorter than when he lay down. His shoulders were all hunched up and his internal organs crowded together. It was with difficulty that he could walk in the rarified air of the camp, and he would have to stop and rest every few minutes when climbing the hill near his house. We were only about 1000 feet above the sea level. He had done a great deal of work and had drifted West to Oregon, then back to Utah. Here he started a little store and boarding house. While the camp lasted he did well, and would have "made his pile" if the thing had not "petered." From Utah he went to Idaho, and was one of the few who ever made any money on the placer claims on Snake River. He sold out there and went to the Wood River country, and this winter wrote that he had "made his pile," and now was going to rest and take care of himself. The next mail brought the news of his death. This is only one of many sad cases—the best years of a man's life thrown away searching for that which he never lives to enjoy. Charley was a good, whole-souled fellow, and many a pleasant trip we had together. He would mount my pony with his shotgun while I would tramp alongside, and off we would go for the "jacks" on the plain.

Although Charley was nearly a cripple, he was a good shot with rifle, shotgun or pistol, especially with the latter. When he first struck camp he was possessed of a little .22-caliber Smith & Wesson revolver, which in that country, as anywhere in the West for that matter, is laughed at as "no good." So the boys used to "devil" Charley about his "pop." One day one of the boys had just purchased a fine black stouch hat of the best quality, and extra large brim, and a coat of the same. Charley was laughing about Charley's pistol and said that "he would just as soon let him shoot at him twenty-five yards off." Charley said that "he did not want to shoot at him, but he would bet he could hit his hat." So the fellow put up the hat, thinking at the worst it would only be a hole the size of a pea if it was hit. Charley took aim and fired away. The hat was inspected, and it was found that by chance the ball had just struck the crown of the hat, and it was cracked, cutting a slit in it like a knife had ripped it. The hat was then returned, and "the lugh that followed can be imagined, and the poor chap had to buy a new hat and "set 'em up" for the boys, while Charley afterward was allowed a little peace about his "pop."

The "jacks" that we used to hunt were "jack rabbits"—that is we called them—whether they were the genuine "Texas hare" (*Lepus arizonae*) I am at a loss to state. Still I think from Bart's description that they are the same. They were not as large as the mountain hare, nor so good eating, and they lived principally on the white sage, and their flesh tasted at times very strongly. There was a species of sage which was known locally as "rabbit brush," which seemed to be a favorite food; and wherever it was found there the "jacks" would be in abundance. Near Kelson, Utah, on the stage road into Idaho, there is a patch of this brush, and here the ground seemed to be alive with rabbits. I had heard wonderful stories of the number to be seen, but was inclined to be skeptical. At last I visited the locality and I saw more rabbits in one day than I ever saw before in my life. They would jump up from beneath your feet, in front, to the right, to the left, and all around you, until it seemed as if the whole plain were nothing but jumping, hopping rabbits. No doubt that there are other sections of the West where they are as plenty, but I never saw such a sight before nor since.

It was quite the thing to get up rabbit-shooting parties in Kelson and to go out and kill a wagonload. It was no trick to shoot them there, but where they are less plenty it is good sport, for a little excited the jack rabbit is anything but slow. The coyote will pick them up, it is said, but I won't vouch for it. I know that nothing in the shape of a dog that I ever saw, excepting the greyhound, has any business with a rabbit. One of the best dogs I ever saw was evidently a cross of several breeds, but he was a great runner for a cur. This dog rejoiced in the name of Quartz, like Mark Twain's "cat," and was a great character. Quartz would follow his master when he went to work, and if the work happened to be near the surface, he would sit and watch the men put in a blast. When the fuse was set on fire, he would retire with the men and wait eagerly for the shot to off. As the first sound of the blast was heard, Quartz would get right among the falling rocks and dirt, and if the shaft happened to be where the rocks would roll down hill, he would start after them and try to pick them up. Many a narrow escape did Quartz have from falling rocks, but he seemed to bear a charmed life and always just escaped. He would sometimes follow the wagon to town, and on the way would tackle every "jack" that started along the roadside. Sometimes the "jack" would take the road,

and then we were treated to as pretty a sight of a "stern chase" as one would care to see. Quartz would just about hold his own for the first hundred yards, then in spite of his most strenuous efforts would begin to "get left." When the rabbit had increased his lead a little more, Quartz would come back, wag his tail, and look at us as if saying, "Didn't I make him run; just wait till next time and then see me catch him." Then he would trot along quietly until the next "jack" got up, when the performance would be repeated. Quartz was ambitious, but he never "got there."

Sometimes when I did not care to ramble far with my gun, I would go just back of my cabin into a deep gulch or cañon, and walk slowly up through it, watching sharply for the little cotton-tail rabbit, which inhabited the cracks and crevices in the rocks. These rabbits were evidently the same species as the gray rabbit (*Lepus sylvaticus*) by Baird, and resemble the rabbit I used to shoot and trap at home in New Jersey when a boy. Though they average smaller, they are better eating than the larger rabbits and hares of the mountains, probably because they feed on other things besides sage. They inhabit rocky places, and though I have seen them on the plains, it was always near rocks or among stones of some kind.

There was still another kind of rabbit that I used to bag occasionally. This was known locally as the "brush rabbit," but I cannot find anything mentioned among the rabbits in any of the books I have read. I have never seen one, but I think it is not a genuine rabbit. I always found them in the larger sage brush, near water. They lived in burrows. Hair was dark brown, ears short; general appearance that of a small cotton-tail, excepting color and ears. However, I used to shoot them and then helped them, so if they are not rabbits, they are at least not a poisonous article, as I live to tell the tale.

Among other kinds of game that frequented the locality was the sage hen (*Circus cyaneus arizonensis*). They lived during the fall and winter would come in quite large flocks and alight on the bare hillsides where nothing but a very small stunted sage brush grew. The leaves of this plant, however, seem to be the chief food of the sage hen. They are not a hard bird to approach, except in very windy weather; still as a general thing a person can not walk right on to them. By keeping out of sight most of the time, so as not to attract attention, a person can get very close to a flock. I have stood in my cabin door and heard the whistling of the wings of a flock as they flew to some hill a half mile or so away. Taking my gun, which always hung in my room ready for use, I would start for the hill. If the birds were on top of it I would go up some gulch where I could keep partially hidden; but if they were on the side I would go up the opposite side and circle round until I came on to the flock. This was generally easy work, as the hills were flat and the birds were tame. They were very tame, seldom rise until I was within shooting distance. Once in a while, however, I would "get left," and before I got in sight would hear the roaring of their wings as they went off for another hill. A little patience and a good deal of "leg work" would generally get the birds, however. After they were secured they did not amount to much for the table, especially if they were old and the winter nearly gone. They were rarely so fat. But if young and killed early in the fall they are not so bad. These birds were very long, as I learned to my cost. I shipped two East to have them mounted for a scientific society. It was winter and I thought they would go through all right, but they arrived "too ripe" for use.

Up in the pine, some distance back of camp, one could find the blue grouse (*Tetrao obscurus*), but they were not plenty. Over the range on the "Goose Creek" side the country was more thickly timbered, not an acre of heavy timber there were more plenty. I did not get over the range, therefore my acquaintance with this bird was limited—for I saw very few of them on our side of the mountains.

About four miles from camp at the foot of the main range was the head of a small stream called Rosebud Creek. In the high grass and weeds near the wet ground was quite a resort of the sharp-tailed grouse (*Pediculario phasianus*) or as we called them, "yellow-billed" birds. These birds I never found away from springs or streams, that is at any distance. They will lie in the grass quietly until tickled up, and at times a person will walk nearly over them. They are not hard to kill, and it is good sport shooting them. Their size compares favorably with that of the partridge of Michigan, though I do not think they will average as large. I used to go over to the creek after grouse, and while there would call out a chucker who lived in a cabin on his banks. This man was known as "Whisky Bill," "Cock-eyed Bill" and "Preacher Bill." The first two names I could account for, for whisky was a "strong hold" with Bill, and one of his eyes was a little crooked; but the "Preacher" part I cannot explain. This party was a little short man, seemingly shorter than he was, as his head sat right on his shoulders without any neck to speak of. He had been all over the West; was a trapper, stage-driver, pony express rider, miner and I don't know what else. He would come to camp after flour and supplies, borrow all the books, papers, etc., he could find, shoulder his gunny sack and tramp back to his lonely cabin, where he would stay all alone for days and sometimes weeks. He was a great reader. One winter when trapping in the Rocky Mountains, he ran out of everything readable excepting an old Bible, which by some strange chance happened to be in the cabin. This he read through and was the last man ever to pick a quarrel or have any trouble with anyone; but he was not afraid of being shot, as was proved by a rather laughable incident that occurred in "town."

One day Bill borrowed a mule and went to town (a railroad station), and there, in due course became gloriously drunk. When it became time for him to go home, he sought the mule and was trying to mount the beast. Just as he was about to do so, a man who had been with him once with a revolver, the balls singing very near Bill's ear, but he did not seem to notice the shooting. One of the crowd helped him to hoard his mule, and he sailed off, colors flying. Whether it took a long time for an idea to work itself through his muddled brain, or whether the ride home sharpened his faculties, no one knows, but the next day Bill appeared in town, still "full," as he had taken a supply of the creature with him, and after he had made up his mule, he hunted for the man who had done the shooting. Rolling up to him in an unsteady way, he began in his peculiar nasal tone with, "Say, look'er Gassy, I want to know who in—I—er was shootin' at, and yer want to be keerful. If yer want to shoot at me, why all right; ain't any objections. But don't shoot towards that mule agin, for you might hit the mule, and he ain't mine; so mind,

don't do it agin," and off he went, satisfied that if there was any more shooting the borrowed mule would be respected.

Of all the mean, contemptible animals that roam the Western plains and mountains, the coyote (*Canis latrans*) is the meanest. We had a fair supply near and around our camp. Some quiet, "stilly" evening after all had retired and were "sleeping the sleep of the just," a sound would be heard like the wail of a lost spirit, then another like the yell of a maniac, then a succession of horrid sounds, until it would seem as if pandemonium had broken loose among the devils, great and small, were holding high carnival over the happy event. A person not acquainted with the character of the beasts would imagine that at least fifty of them were in camp, when three, or at most four, was the extent of the gang. It was not often that we got a shot at Mr. Coyote. He would always "hob up serenely" when we did not have our guns handy. Charley had a few chickens for a short time, but coyotes love chickens, and Charley's died young. Scraps of meat and anything in the line of eatables were cleaned up nicely by these scavengers, and many other things which a person would not imagine they would touch would likewise be gobbled.

On clear bright mornings, when the wagon would start for "town," it would not go more than a half a mile from camp, when away off to the right or left would be heard a yell, and in a moment another in reply from some other direction. It then would be necessary to stop a moment or two away two or more coyotes would be following, to pick up the excrement dropped by the horses. We had a good joke on my brother while he was with us. One day he went to "town," with Charley after a load of supplies; and they did not start to return to camp until nearly night. It was dark before they were home, and as they had a load J. was walking to lighten the pull over a bad place. He fell behind a little way and presently looked behind him. There, right at his heels, were, as he supposed, two dogs. Charley had stopped to allow J. to catch up, and as the latter reached the wagon, he said: "Whose dogs are these, Charley? Charley glanced back and burst out: 'Dogs! hang it man, those are coyotes.'" J. climbed on the wagon and roled the rest of the way. Not that he was afraid, but then the roads were good. The wolves had been attracted by the smell of meat, and were following the scent. There was not the slightest chance of their being dangerous to them, but it made his brother go to find the brute at his heels.

The principal way coyotes are hunted is with poison. The offal of slaughter pens is doped with strychnine, and as they always hang around such places a good many are captured. Another method is to take a good stout stake, bore holes in it and fill them with lard and poison. The wolves will lick out the lard little by little, and lie down and die. I have heard of instances where coyotes would band together to attack the lard and even man, but I suppose that these accounts are true, at least I have no good reason to doubt them; but I personally never saw more than three or four coyotes together at one time, and they were anything but bold. Dogs and coyotes will interbreed and some of the dogs that follow the Shoshone Indians around can hardly be distinguished from coyotes. They are a hungry, sneaking, mean-looking lot.

There were a few foxes about our camp, but it was not often that we could get sight of one; and I only succeeded in getting a shot once, and then the distance was too great for the fine shot used. They were the prairie foxes (*Vulpes macrotis*), and they are a beautiful animal.

A description of the game of our camp would be incomplete did I fail to mention the animal known as the mule. Many may think a mule queer game, but I can assure them there is much game in a mule; and though plenty of game is made of the restive mule, there is nothing more so more. It is a subject without limit, for "yes, verily," no man can comprehend the vagaries of the mule's character, especially of the Western mule. I believe that the further West one travels the more mullish he finds the mule. Here is a little incident to illustrate this point: We had hired a man to haul some lumber, etc., from the C. P. R. R. to camp. His team consisted of six animals—three horses and three mules. The freighter, who was a patient, straitlaced, things out and hit Moll a cut with his blacksnake. Then he stepped back, and yelled this time directly at the obstinate one, "Stand up, Moll." But Moll shook her head as if to say "couldn't think of it," and stood still. P.—the freighter—then walked up, and with the butt of his whip gave Moll a fine training, but it was of no use, so she would not. I stood watching the proceedings, wondering what would come next. P. unbuttoned the harness (Moll meantime started like a lamb and looking as innocent as a baby), and getting a large lash rope from the wagon fastened it to Moll's neck; and after leading her quietly to the rear of the heavy wagon, he tied her head down as near the wheel as he could. Then he took off his coat and vest, laid down his hat and threw his braces back. Walking to the woodpile he picked out a slab about five feet long and an inch or two thick, and with one hand he beat that mule for fully five minutes. Then he took her back, and put her in the harness; and she—pulled—no, sir, not much! Out she came again, and once more back to the wheel. Some more medicine. To vary the dose this time, the butt of the heavy blacksnake was applied over her head; this seemed to have some effect, as she began to hang her head and shake it. Putting the harness to her once more, P. stepped back, and put on the lard and yelled "Stand up, Moll." The freighter, who was a patient, straitlaced, things out and hit Moll a cut with his blacksnake. Then he stepped back, and yelled this time directly at the obstinate one, "Stand up, Moll." But Moll shook her head as if to say "couldn't think of it," and stood still. P.—the freighter—then walked up, and with the butt of his whip gave Moll a fine training, but it was of no use, so she would not. I stood watching the proceedings, wondering what would come next. P. unbuttoned the harness (Moll meantime started like a lamb and looking as innocent as a baby), and getting a large lash rope from the wagon fastened it to Moll's neck; and after leading her quietly to the rear of the heavy wagon, he tied her head down as near the wheel as he could. Then he took off his coat and vest, laid down his hat and threw his braces back. Walking to the woodpile he picked out a slab about five feet long and an inch or two thick, and with one hand he beat that mule for fully five minutes. Then he took her back, and put her in the harness; and she—pulled—no, sir, not much! Out she came again, and once more back to the wheel. Some more medicine. To vary the dose this time, the butt of the heavy blacksnake was applied over her head; this seemed to have some effect, as she began to hang her head and shake it. Putting the harness to her once more, P. stepped back, and put on the lard and yelled "Stand up, Moll." The freighter, who was a patient, straitlaced, things out and hit Moll a cut with his blacksnake. Then he stepped back, and yelled this time directly at the obstinate one, "Stand up, Moll." But Moll shook her head as if to say "couldn't think of it," and stood still. P.—the freighter—then walked up, and with the butt of his whip gave Moll a fine training, but it was of no use, so she would not. I stood watching the proceedings, wondering what would come next. P. unbuttoned the harness (Moll meantime started like a lamb and looking as innocent as a baby), and getting a large lash rope from the wagon fastened it to Moll's neck; and after leading her quietly to the rear of the heavy wagon, he tied her head down as near the wheel as he could. Then he took off his coat and vest, laid down his hat and threw his braces back. Walking to the woodpile he picked out a slab about five feet long and an inch or two thick, and with one hand he beat that mule for fully five minutes. Then he took her back, and put her in the harness; and she—pulled—no, sir, not much! Out she came again, and once more back to the wheel. Some more medicine. To vary the dose this time, the butt of the heavy blacksnake was applied over her head; this seemed to have some effect, as she began to hang her head and shake it. Putting the harness to her once more, P. stepped back, and put on the lard and yelled "Stand up, Moll." The freighter, who was a patient, straitlaced, things out and hit Moll a cut with his blacksnake. Then he stepped back, and yelled this time directly at the obstinate one, "Stand up, Moll." But Moll shook her head as if to say "couldn't think of it," and stood still. Rocky Mountains is "Pacific Coast" to the people there. It is always the "Coast" and the "States," speaking of East and West. A person from the East would be at a loss to understand the jargon of a mining camp west of the Rockies. It is bad enough East, but not to be compared with that on the western slope. "Chinook," Spanish, Indian and English all mixed, and queer are the expressive used. A person always employs the most common or shortest words that will convey the meaning. Did Longfellow write that? Why, the danged old fool, he oughter not to have said, "I could tell him mur'n he ever d'raimed off;" and we all thought he could, as he had lived with them. Poor old Jake; these same "danged" "Tujons" got him at last, and from all I could ever find out his bones lie bleaching in some quiet nook in the fastnesses of the Big Horn Mountains. And some others went in prospecting and never came out, and as the Sioux were "bad" at that time, it was easy to account for it.

I must relate a little incident showing how "Chinook" is used in the far West to express thoughts that to one East would seem out of place spoken in the jargon. Charley D., when in Oregon, attended Sunday school, and some of the "Webb-foot" maidens were in his class. The lesson was on the crucifixion and the question was, "What did the Jews do to Jesus?" For an instant no one answered, the teacher felt unaccountably, and looking forward eagerly, shouted out, "They manloosed him" ("manulosee" is to kill in "Chinook").

I could relate many stories, but I am afraid it would tire the general reader, as all do not take the interest in the West and its ways that the few do who have had a little experience themselves.

The glory of Rosebud has departed and the human inhabitants thereof have scattered far and wide. The grave has claimed its share and the "boys" will never meet again on this earth. The unpleasant events which occurred we will try to forget. The pleasant memories of the past we will cherish, and as they are brought to our minds while living a different life amid strangely different scenes we will think of Rosebud city in all its glory, blooming like its name-sake in the dreary fastness of its mountain home.

PRAIRIE DOG.

THE LAST OF THE GROUSE.

"CAN you drive over here for our last hurrying of the birds to-morrow, before we go south," wrote the son of a neighboring land a few days ago, and keeping the invitation he backed by pleasant company at least fair sport, I most willingly set back an acceptance by the mounted gillie, whose horse was pawing the gravel outside the porch of the Highland lodge which formed my temporary abode, while his rider compared the recent "bags" of rival estates in the broadest Galic with our own keeper.

Looking out of my window the following morning the prospect was wondrous fine. All the higher spurs of the rugged neighboring mountains lay shrouded in snow where a few hours before they had been green and fertile. Truly the hind of winter was coming down upon the land and in a little time even the few still occupied shooting lodges would be bare and empty of their summer pilgrims. But we judge things as they affect ourselves, and the snow would make little difference to-day, since it was confined to the higher ranges, while our working ground for the time would be on comparatively low-lying moorland.

Breakfast over, myself and "J." climbed into the waiting dog-cart, in which guns with cartridges *quantum suff.* were ready stowed away, and tucking in the wolfskin rugs, for an autumn morning in the Highlands before the sun is over the hills tops is none too warm, J. picked up the ribbons, flicked the sleek-coated chestnut and away we went down the drive, our cigars aglow and our minds full of pleasant anticipations.

Half an hour's sharp trotting brought us to the beginning of the long avenue which led to our entertainer's noble mansion, where arriving we had a hearty Highland welcome from him and his assembled guests; but the hour being already somewhat late, the necessary introductions were hurried over, and then, as usual, following the head keeper down a winding path into the hills below the house.

The morning was lovely, cold and clear as could be wished, while our "fighting line," winding through a deep forest of firs, was really a picturesque sight. First went the keeper in his national dress, a man of strength and stature, and an awe to all the poachers far or near; then our host, P., discussing the merits of a new trout fly with an Assuan tea planter, R., whose gun, carried over his shoulder, had recently been dealing out death and destruction to snipe on the plains of Northern India, on their heels came our host's son talking to "Uncle P.," as he called that relative of his, and two cousins, both in Athole tartans. These, myself, J. and one other young laird made up the party. We wound down the narrow path in single file, the occasional gleams of sunshine breaking into the cool shade of the forest to gladden the eye, and the bushes and trees, some of which had having dipped into a lovely Glen, thick with amber fern and silver birches, we crossed a rocky torrent bed, scaled the opposite bank, and soon found ourselves by a thatched cottage, where keepers with numerous dogs in leash awaited our arrival.

Now chaff and fun had to be given up, for we were about to begin the serious business of the day, and our host, an unwearied hunter, led the way, across a patch of rocky ground, through a gap in a stone wall, and there we were on the breezy hillside, knee deep in heather, breathing such nectar as dwellers in towns never dream of, with in front a limitless expanse of mountain and moorland undisturbed as far as the eye could see by a trace of civilization. "Can this mighty, uninhabited expanse be in the overcrowded British Isles?" wondered, but my host sniffed the great of battles afar off, and stopped all musing by an imperative "Come along!"

Our first position was behind a broken-down stone wall, where the keeper dropped us some seventy-five yards apart, and with our faces all to the eastward whence the birds were to be driven up. This turned out to be but a poor sort of cover, for though the wall in front of each shooter had been built up to serve him the better, yet to be so placed it was necessary to raise the cover down, either of which positions are fatal to good, rapid shooting. The best screen

in driving game is always found to be one that comes up to the neck of the shooter when standing, thus allowing him to turn rapidly and giving him a clear shot in every direction. We occupied our "marks," such as they were, and making ourselves comfortable awaited in silence the arrival of the first bird, amusing ourselves meanwhile with our delightful surroundings—numberless mountains fringing in an amphitheatrical of purple moor, all rugged and grand, some just tipped with snow at the highest points, and gleaming silver where the sun lay upon them, and purple in the shadows of the ravines. The wind from these snow-fields, now that we had no trees to shelter us, was as cool and fresh as it could be, sweeping over the wide expanse of moors, and bringing to our ears the far away bleat of mountain sheep, or the melancholy whistle of a plover, whose sharp cry could be heard from a distance of several miles. But the sun was warm overhead, and our pipes smoked fragrantly, so we waited with contentment for the battle to commence. Presently a distant shout comes floating to us, and the guns all down the line are to be seen directly on the *qui vive*; cartridges are hastily arranged, caps nervously "cramped" down on their wearers' heads, and all eyes are directed over the wall to get a wider view of the plain in front; and soon the grouse comes down the slope of the line, and the last man on chine, and his gun immediately breaks the silence of the hills, the white puff of smoke sailing away over the heather to leeward. Then some black game go over to the right under a regular fusillade from the batteries down there, and it becomes obvious that though we cannot see them, yet the beaters are all among the birds down the hill slope.

Soon my turn comes, and I see R. making signs to me under cover of his ambush and taking a peep at the moor in front; there is a large covey coming "dead" for my stand. It is always an exciting moment, even to those who think little of driving as a legitimate sport. The birds appear skimming lightly over the tops of the heather, seeming almost stationary for some time though traveling at a great pace, and being dead or nearly so out of them, but the second or two and they are within forty yards, and as my gun speaks the forenoon bird drops, the others going at such a pace as on such near acquaintance as we are now seems fearful, rise to clear the wall, passing overhead like meteors, in another second are retreating over the heather behind the line. I fired again, R. fired, my brother fired, and the coming of the last bird, who stood in my stand, died by me, and to our astonishment, when we thought it was all over, "Uncle P.," far away down the line, also sent a couple of charges of shot up in our direction, but without bagging either any of us or of the grouse.

We get a few more shots and then the beaters arrive, the retrievers are unslipped, the shin picked up, after which we walk in line over some rough ground where the dogs find a wounded bird or two and put up a lowland hare which our host says in good style.

At the next broken-down dyke we disperse again to our posts, spending the interval, while the beaters walk round the moor, in adding to the screens as our fancy suggests, and making our seats comfortable in the manner set by our luxurious friend the Assuan planter, whose first care at every stand is a springy seat, or a heater, on which to stand, and a pipe by me, and to our astonishment, when we thought it was all over, "Uncle P.," far away down the line, also sent a couple of charges of shot up in our direction, but without bagging either any of us or of the grouse.

The cannoning is soon brisk up and down the line—the two young gentlemen in tartans getting a little "off their heads" with excitement, and showing themselves freely to great mistake in grouse driving, sweep the neighborhood by their well-served guns, while "Uncle P.," who, by a judicious and philanthropical foresight of the head keeper, is always their companion, far away down on the left, also gets a "wee bit duff," burning much powder with great satisfaction to himself but little effect on the bag. We up in the center, however, behave ourselves with decorum, never firing at any bird, but our own, and carefully noting a general note of where such of them as we may bring down will be found when the beaters come up. I have heard of this latter matter being settled in a very cut-and-dried manner with the help of a pencil and sheet of cardboard, the latter being divided by lines into quarters, with a circle where the divisions meet in the center to represent the stand; the shooter carries a supply of paper, and divides the ground into quarters, and drives into imaginary quarters, marks with the pencil as nearly as he can the vicinity of every bird, as he brings it down, on the sheet of paper—a cross for dead birds and a dot for probable manners, this record being handed over to the keepers when they come up; an arrangement, I fear, which, though it may read well enough, would need a shooter as many-minded as Cæsar to carry out in the heat of the fight. By the time the sun high up in the sky points to a little past midday, being all more than ready for lunch, we seek a sheltered nook, cut deep through the moor by the ceaseless labors of a sparkling streamlet, where, on a broad, sunny rock well out of the wind, we find luncheon spread and our host's charming daughter in the neatest and most reasonable of costumes ready to welcome us, while the big man in his side mantle hill and valley, and the two young gentlemen, until a sign from his master's hand informs him we are lawful intruders, when he forthwith subsides into the heather.

It is by no means the worst part of the day, the provender is ample and varied, cold grouse pies, flanked by such salads as must surely have grown in celestial kitchen gardens, a sirlon of the finest stalled beef, pastry of fairy lightness, and the drink magnificent, all in her side mantle hill and valley, and the two young gentlemen, until a sign from his master's hand informs him we are lawful intruders, when he forthwith subsides into the heather.

But after twenty minutes or so there comes a shout mel-

lowed by distance echoing over the corrie, and soon a devoted band of little brown birds are on the wing coming along all in a bunch. "They come nearer and are just within long range, the cock bird leading and the rest 'twinkling' over the heather behind him, when the report of the gun of some impetuous individual, whom we have no time to see, disturbs the stillness, and as the covey breaks up to right and left we all get our chances, thinning their numbers sadly until they are out of shot behind us.

Other drives follow, bringing up the bag to a very respectable total considering the lateness of the season, but so much alike in the details of the slaughter of the unsuspicious little brown birds "butchered to make a Roman holiday," that it would be but tedious to narrate them all, and then we have finished the final beat and troop homeward as the sun sets, not quite so early as in the morning but well pleased with the day's shooting. "Nor are our consciences, whatever the tender-hearted may suppose, overhardened with the manner of our sport, for we feel that at this time of year we could not have got near the birds in any other way, and finally, as our entertainer remarks with a sigh, handing his gun to the keeper, "It is the last beating they will get until next August."

LONDON, England.

Natural History.

A SALMAGUNDI OF NATURAL HISTORY.

In Two Parts—PART II.

By JOHN DEAN CATON, LL.D.

A FEW minutes before the appointed time the Major made his appearance, smoking his corn-cob pipe charged with the strongest kind of native tobacco, and took his seat in the place which he occupied yesterday. He puffed away with an energy which seemed to say, that he would do in this year what he had done in the last. The boys came running up from all directions as if they feared they might lose a single word, and there were a number of larger growth gathered with the rest.

Presently the Major knocked the ashes from his pipe, which he carefully placed in his pocket and began:

"Good morning, young gentlemen, and I hope you will always conduct yourselves as to deserve that appellation. And you are prompt to the time—promptness in all things is of the highest importance, especially in meeting appointments. I have strong hopes for those who get up in the morning betimes and are alive and prompt all day.

"I hope you have well couched over what I told you yesterday so that you remember it all. If I could only know this of half of you I should feel richly rewarded for my trouble and feel encouraged to go on with the lesson—and the hopes of your fond mamma might not be altogether groundless. Let me see—where was I? O, yes, I now remember. We were at Lake Gratiot, which is on the easterly side of the Kewanan Peninsula, which juts far out into Lake Superior. There are many of these beautiful little lakes in that Lake Superior country, and Lake Gratiot is the only one I have ever seen which did not abound in brook trout. The shores are thickly bed with springs and in many of them the springs boil up in the bottoms, which you can see to a great depth through the clear water where the ever restless white sand is perpetually dancing as if it tries to lay still and could not for a single moment. Such places are the paradises for the brook trout, where they gather about in great numbers, and hold their solemn meetings. They usually lay quite still, and feel wanting their food, and then they start up and chase around as if there was a fiddler among them. It looks, however, like a grave council of sachems, rather than a dance of young folks, but you frighten them once and as quick as a flash of lightning they will disappear, many of them in that boiling sand, and I don't know but they go down to the very bottoms of those great boiling springs, and there they stay for a long time, and after a still rain, but they will reappear, one by one, and finally the meeting will be called to order again.

"One curious thing is that most of the trout in a lake are nearly of the same size. I have caught a string of twenty that would not vary an ounce in the weight of each, but sometime you will take an old patriarch of four or five pounds that will fight you like a buffalo bull, and make you as sick as you can get, and then you are not up to the work, will smash it for you—but this is uncommon.

"Again you may take a little fellow that has strayed away from his mamma, but that is more uncommon still. The fingerlings are found mostly in the running streams which generally head in some of the little lakes—while the old fellows go on their travels—and bring up in Lake Superior, though I have sometimes caught a few in the same lake fine strings of small trout by throwing, but from the gravelly beach, while the larger ones hang about the rocky bluffs not far from shore, and the blacker the rocks the more likely you are to find the big trout. But they do not stay in the big lake all the time after they go there. I once saw a big school of trout run out of the lake up into the Huron River, and strange to say, they changed their color very soon after.

"Now all the trout you take in Lake Superior are of a silvery white color, while those you take in the streams are of a very dark color, even the beautiful red on the belly and fins has a dark, clouded shade.

"The reason of this is very plain. The lake waters are as clear as crystal and colorless, while the waters of every river I ever saw which empties into the Great Lake are stained to a wine color, no doubt by vegetable matter. They are cold and tasteless, and quite transparent, and as pleasant to drink as fresh spring water, and, but for the color, you would declare them perfectly pure; and the fact that brook trout abound in them is convincing proof that they are practically pure. The coloring matter seems to be held in solution rather than in suspension, and seems to be perfectly innocent of harm.

"The trout in the little head lakes are not as white as those in Lake Superior, although the water seems as colorless; nor yet are they as dark as those found in the colored streams. It may be they change their quarters frequently in search of food.

"But the remarkable uniformity of size in a given lake remains to be accounted for, and it may be that I can't do it very satisfactorily, but will make a guess which you may think is better than you can do for you like.

"This trout, although he is so very beautiful, is still a cannibal, especially when rations run short—will enjoy a breakfast of his own babies. I am sorry to say such bad things of my beautiful favorite, but why shouldn't he love

trout, if we do, and beside, families get so scattered there that no one knows who his father is, and so vice versa, and who knows but that it is such delicate food that makes them so toothsome a dish for us. If Patii can improve her voice by singing on a long line, why may not a trout improve his flavor by eating choice morsels?

"Well, the foud mammas, knowing the danger, keep the youngerlings down the stream, where there are so many good hiding places, till they get large enough to take care of themselves, or it may be, to help themselves to a younger brother, when they get off on voyages of discovery in large schools of the same age, and bring up in the little lakes. Sometime, no doubt, a little fellow plays truant and messes off to the lake, but he is soon gobbled up. I dare he has time to practice on a fly or a baited hook. Now if this explanation don't suit you, then find a better one for yourselves.

But I slid away from the gallinippers onto the brook trout without knowing it. Well, I am glad of it. We had been so long among those horrid massagers, and slab-sided hogs, and the pesky gallinippers, that it made me sick, and I had to go to something beautiful and charming just to settle my nerves. But even God made those quail-like things, no doubt, though I never could find it out, and it was necessary, you should know something of them to qualify you for the greatness before you, if you answer the hopes of your dear mammas, and I'll try to do my share in the discouraging job, even if it does make me sick."

"But, Major," called out a tall grout, stripling, who had seemed particularly interested in the trout question, "you started out all right with the prairie chickens and the deer, which I don't call prairie chickens, but did you ever swished off into another track, which runs you into a nest of vipers, where you floundered along till it made us all shudder with their ugliness. Now, can't you top off where you began and make us feel a little more jolly at the end?"

"Good for you, my darling," responded the Major, "There is some hope for a lad that loves the beautiful in nature and dislikes the ugly, if God did make them all; and I will give you my doubts about the surpents. But let the preachers settle that if they can."

"Yes, yes, get back to the prairie chickens and the deer, where we began; and I only wish I had time to tell you about the wild turkey, too, whose plumage is the gayest, glittering with the softest and the most charming colors, exquisitely blended, of all American birds, not even excepting the humming bird. I have seen hundreds of them in a flock within a few miles of where we are now. In the fall the old birds strut about, and raise their feathers till they looked as big as a barrel, and you would think they must burst with pride and self-importance, and you could hear them gobble in a continual chorus full a mile away; and then they would fight. O my! It was the battle of the Wilderness over again, where the Grants and the Lees fought for the mastery. But we must leave them for another time.

The prairie chicken is not a very beautiful bird, but he is good all the same. He is not a smart bird. Indeed, he is much troubled with a disease which often afflicts boys, called 'the poos.' They haven't sense enough to go south to warmer countries in cold winters, but hang around here and freeze and starve to death, when they could fly in a single day to where they could make themselves comfortable. Although they generally make short flights, they can fly for miles at a time if they choose, as I have seen them do.

In cold weather they expose themselves by sitting on ground on fences and trees where the wind can get a fair rake at them, while in warm weather they always sleep on the ground under some big leaf on the prairie where they can't get a breath of fresh air, and where all the varmints in the country can easily find them. They always make their nests on the ground, where the snakes and such are hunting for them, and if a nest escapes them it may be drowned out by floods, for they are apt to select a low ground for their nesting places, in very low water the water is always exposed a short crop of chickens. If they would only select safe nesting places, like the crow or the blue jay they would multiply faster than rabbits, for they are good layers and good setters, and I never found an addled egg in a nest after the brood had left it. The eggs are small, and the average number set upon may be from twelve to sixteen, but they are exposed to many casualties which very young, but when they are ten days old they can fly pretty smartly, and can take some care of themselves.

"These prairie birds are, however, funny fellows, sometime. The spring of the year is the season of courtship with them, and it doesn't last all the year round as it does with humans, and they do it in rather a loud way, too. And instead of taking the evening for it as many people are inclined to do, they take the early morning for it. Early in the morning as soon as the day dawns you may see them assemble in parties, from a dozen to fifty, together on some big dry knolls, where the grass is short, and their goings on would make you laugh, if you could. The cock birds have a loose patch of naked, yellow skin on each side of the neck just below the head, and above these on either side just where the head joins the neck are a few long black feathers, which ordinarily lay backward on the neck, but which when excited they can pitch straight forward. Those yellow naked patches on either side of the neck cover snaks, which they can blow up like a bladder whenever they are angry. These are their ornaments, which they display to the best advantage before the gentler sex at these love feasts. This they do by blowing up these air sacks till they look like two ripe oranges on each side of the neck, projecting their long black ears right forward, ruffling up all the feathers of the body, till they stand out straight, and dropping their wings to the ground, and then they look just lovely, as you can't find a maiden more so, as they cast side glances at them, full of admiration and of love.

"Then it is that the proud cock, in order to complete his triumph, will rush forward at his best speed for two or three rods through the midst of the love-sick damsels, pouring out as he goes a booming noise, almost a hoarse roar, only more subdued, which may be heard for at least two miles or so still morning air. This heavy booming sound is by no means harsh or unpleasant to the contrary, it is soft and even harmonious. When standing in the open prairie at early dawn listening to hundreds of different voices, pitched on different keys, coming from every direction, and from various distances, the listener is rather soothed than excited. If this sound is heavier than the deep key notes of a large organ it is much softer, though vastly more powerful, and may be heard at a much greater distance. One who has heard such a concert can never after think or forget it."

"Every few minutes this display repeated itself, but not only one, but more than twenty cocks going through

this funny operatic act once, but then they seem careful not to run against each other, for they have not yet got to the fighting point. After a little while the lady birds begin to show an interest in the proceedings by moving about quickly a few yards at a time, and then standing still a short time. When these operations are completed by a large number of birds at a time, it presents a funny sight, and you can easily think they are moving to the measure of music.

"The party breaks up when the sun is half an hour high, to be repeated the next morning and every morning for a week or two before all make satisfactory matches. It is toward the latter part of the love season that the fighting takes place among the cocks, probably by two who have fallen in love with the same sweethearts, whose modesty prevents them from selecting between them.

"These birds can't smell enough to tell a roscobud from a polecat. I guess their eyesight is pretty fair, and they know just enough to fly when they are badly scared—sometimes. When they do get up they fly straight away with a very rapid motion of the wings and a whirring noise, which will raise every individual hair on your head if they get up near you and you are not expecting it. They are an easy mark for the sportsman and are very welcome to the table.

"They have been confined in the woods, and used to catch them in box traps and confine them in loose pens made of poles, where they would eat and fatten well, and the hens would lay their eggs in the spring, but were not inclined to set upon and hatch them. I believe they could be easily domesticated with proper management.

"The winter of 1832 was the hardest winter ever known in this country within the memory or tradition of the oldest Indian. The snow was four feet deep all over the north half of this State, and it was a great year for me. This was very bad for both deer and prairie birds. Not one in a thousand lived to see the naked ground again. In 1833 I marched with my regiment across the Grand Prairie, and we did not start a single head of either. Before the big snow, hundreds, or more of them, would have been started. By 1835 on the same route, many were met with, and in 1838 they were as abundant as ever, and the deer were everywhere. For instance, I have been over three years, and the white settlers only killed a few for their own use. In that year I counted over sixty in one drove, only sixteen miles from Chicago, and you could cross a prairie nowhere without jumping a deer. The Indians were never hard on the prairie chickens. Not but that they wanted them, but they could not get them in paying quantities. They could not smell them out like a pointer dog, and they never tried to shoot them on the wing, so the birds had it pretty much their own way.

"But the deer! The deer, the most beautiful of all living things—barring the ladies, which I only do for politeness's sake. His graceful form, his light and elastic step, his bounding leaps as he rushes through the forest or over the plain, his mild, bright eye and majestic mien as he stands in the running stream, form a combination of fascinating charms in no other animal brought together. If that aesthetic fellow who has lately been roaming through this country milking the gentle folks could see one wild deer in his uncheeked freedom, he would surely expire with delight or say, 'I will look no further for the beautiful.' How I ever had the heart to kill one of these I cannot tell, and yet I never felt a self-reproach, while I never ceased to admire. Surely we are strange combinations of inconsistencies.

"The deer has some peculiarities which I may mention: In the first place they have no gall sack on the liver. This is true of all the deer family, and so one wild deer in this remarkable, is that vegetable poisons have no effect upon them. For instance, the deer will grow fat on the green laurel, while a single mouthful will kill a sheep.

"A deer will eat tobacco whenever he can get it, and probably he would grow fat if he could get enough of it. Offer the first tame deer you meet with some tobacco, and you will surely make him your friend. Whether this is so with natural poisons, I do not know, I reckon it is not. I feel very confident that he would as likely be effected upon venomous bites, like the log. He has as great an antipathy against the massager as any good Christian. Any man worthy of the name, even if he is going for a doctor, will stop to kill a massager, and so will a deer. I once saw a prairie buck loping over the prairie, as if he was to a great smart hury, when he stopped suddenly and turned his head to windward. Presently he began stopping along, as carefully as if he was walking on eggs, looking intently over every foot of ground before him with a very sharp eyesight.

"I say, Major," cried out a freckled-faced, shock-headed and sandy-haired graced-looking stripling who had stood for an hour, one bare foot resting on the other, where he had balanced himself with great precision, "did that old buck tell you what doctor he was going for, or what member of his family was sick?"

"The Major looked and looked at the impertinent youth for an instant, and said: "Boys, take that sickly looking youth home at once and put him to bed with hot blocks to his feet, and ice to his head. He is in great danger and prompt remedies should be applied." It was evident the sympathy of the crowd was with the Major, who had so often interested and instructed them. The boy was hustled out of the ring in a trice, and when all became quiet again the instructor proceeded:

"As I was saying, that deer stopped short in his tracks, turned his head to windward and sniffed the air for half a minute, and then turned in that direction and stepped along very lightly and cautiously, looking intently before him. Now you must know that the deer has not a very sharp eyesight, though his eyes look as if he could look right through a board fence, but his senses of hearing and smelling are sharp enough to make up, and more too. He can smell an enemy further off than he can see him, and he can hear the breaking of a twig or the rustle of a leaf, at an astonishing distance, and tell by the sound what caused it.

"Presently that buck stopped stock still, and looked intently at some object a little way before him, with his neck curved down for a few seconds, and then jumped high in the air and lit about six feet away upon all four feet bunched together, and took a full run, like a rail, or a mallard, ten feet, and then turned his head to look at the tracks where he had struck. After a short survey he pursued his way as if nothing had happened. I might have shot that deer, but I wouldn't—no, not much, though I was in want of meat bad. I well knew the Christian work he had been doing and felt like shaking hands with him as a brother. I would have starved before hurting a hair of his hide.

"After he had gone on (for the doctor it may be) I went up to see the tracks he had made, and sure enough there lay

the mashed remains of a big massager, which looked as if he had been run through a sausage mill. Those four double hoofs, almost as sharp as bay knives, loaded with about 180 pounds of venison, had just cut the thing all to pieces. There wasn't a piece left big enough to wiggle.

"Now, who shall say that a deer hasn't got sense and courage as well as beauty? I could spend a whole day in telling you of incidents that would bear this, and if his argument wasn't so toothsome and nourishing I just think it would be a sin to kill him. I never killed one unless I needed the meat, or somebody else did, and when I killed him I loved him still.

"I must write a cook book some day just to tell how many ways venison can be cooked, each one better than another. I will only speak of one now which is not mentioned in the latest almanacs. Take the spare-rib of a deer, pulp it on one end of a sharpened stick, and stick the other end of the stick in the ground, leaning it toward the fire, sprinkling it with a little salt and red pepper, or, in want of these, use clean hickory or maple ashes lightly. Half a dozen of these at the back side of your camp-fire will be ornamental, and in the morning you will find them useful. Go to your cellar or hemlock bows and sleep till an hour before daylight. Then get up and you will just hanker to pick those bones. Go to the woods, and in the first streak of light, listen to the concert of the squirrels and the birds as they awaken to greet the morning light, and if you keep still and look sharp you may see a big-horned buck, or a doe and her fawn, on their morning walk, and now, boys, I think we have said enough for one day, so let's go home and get our dinners and tell your mammas you have been to school."

"Stay, Major," called out an intelligent-looking lad, who had been attentively listening in silence the whole time. "Tell me about that pilot plant that you signited to cross this valley."

"Well, I will," said the Major, "for it won't take long. There are two plants that grow abundantly on the wild prairies which indicate to the observing traveler the cardinal points, or the points of the compass, unless, indeed, he is completely turned round, when he may take north for south and east for west. Hence these are indifferently called the compass plants or pilot plants. Both are of the sunflower family, and have flowers like it, only smaller. One is also called the rosin or turpentine weed [*Siphonium laciniatum*—Ep.], and is the most abundant. While it is met with on the high rolling prairies, it grows most luxuriantly on low ground, where it sometime occupies the ground to the exclusion of all other plants. It only seeds once in four or five years, when a stout seed stalk shoots up, from four to eight feet high, with a fuzzy coat, with small leaves shooting out occasionally along its course. This stalk is saturated with a gummy fluid strongly resembling the sap of the pine tree in smell and taste. Wherever a stalk is broken or the bark fractured this substance exudes, and as it dries it crystallizes in drops from the size of a shot to that of a half-ounce bullet. It is as clear as amber. The children of the period used to gather it in considerable quantities and used it for chewing gum, for which it is the best known substance. It cleans the teeth and gums of all kinds of parasites and keeps the breath sweet, and breath and promotes general health. That explains why it was that all the log cabin girls of former days had such beautiful pearly teeth, as white as the snow and as sound as a rootabaga. You can tell one of those log cabin girls by her teeth yet whenever you meet her, and it is all owing to the prairie gum, but remember they could only gather much of it once in four or five years, so they had to lay in a good supply at intervals. They used to cut the roots extensively, which, if you could get them, would be a very high price, for that would a girl give for beautiful teeth, provided she is of any account herself.

"Horses eating prairie hay never have the leaves, and the leaves of the pilot plant, more or less of which is found in all wild upland hay, have the credit of this. The leaves of this plant grow out in a bunch of from five to twenty, close to the ground. They are from four to twenty inches long, with a strong center rib and deeply serrated edges. The center is called the fingered-leaf pilot plant. The fingers in the middle of this leaf may be six inches or more long and two inches wide, and the indentations between them reach to within an inch of the center stem. These leaves spring from the roots, which are large and of a soft, woody, fibrous structure. They are readily cut off by the breaking plow, and die at once.

"The other pilot plant [*Siphonium teretifolium*—Ep.] is of the same family, but differs from the first in several particulars. It has a large palmate leaf with finely notched edges. It may be from ten to fourteen inches long and half as wide. It widens gradually from the bottom to one-third its length, and then gradually diminishes in width to a point at the end. It, too, springs from the root, which is smaller than the other. It, too, secretes a resinous substance, but is much less rich than the first. It has the resinous odor, but it does not exude in sufficient quantity to crystallize, and so no gum is gathered from it. Its bearing years occur more frequently than those of the other resin weeds—a very few of both will be found in fruit every year. Its fruit stem is longer and more slender, and is as smooth and glassy as if finely polished. It is much more tenacious of life and will bear transplanting. It grows on drier ground and not in such dense bodies, but is scattered over the high prairie. Of the first number, the roots and the roots were found clustered together, especially on the higher grounds, sending up a dozen or twenty seed stalks in a cluster, which when in bloom may be seen at a great distance.

"I once took a friend, who had just arrived from the East and was supposed to be far gone with the consumption, out riding. The road passed through a large field of the rosin weed in full bloom, and almost as dense as a field of wild roses. It was some distance from the road, and I had a delightful resinous perfume. Directly we entered this field, covered all over with a golden mantle high above our heads, he drew a long breath, and requested me to stop, saying that he could now breathe freer and fuller than he had for a long time. He seemed to be in positive delight as he freely inhaled that healing atmosphere. Every pleasant day after, I took him to the same place, with the same result. He began to improve immediately, and in a month's time felt so well that he began to look about for business. That was thirty-five years ago, and he has never complained of his lungs since that healing, and is a well now. That the fragrance of the rosin weed is soothing and healing to weak lungs I am certain, and I have no doubt the same is true of chewing the gum."

"But how about the compass part of it, Major?" cried out a lad who was evidently becoming impatient at so much detail.

"Yes, and that is the best," said the Major. "It is these clusters of large leaves, springing right from the ground as described, which point the course. Their edges point to the north and south, and their sides face to the east and west. This is not so with all of them, and perhaps not with any of them exactly; so that if you depend upon any single leaf you would surely be misled. This is their condition approximately, all or nearly all varying somewhat to the right or left of the true course. But with out error correct another and take the average, and the true north and south are pointed out exactly. I speak of what I know, for I have often set my compass and studied carefully cluster after cluster of these leaves, and of both kinds, and always with the same result. It is not necessary to study minutely every leaf in order to determine the right course. The moment the eye rests upon a cluster of leaves it almost intuitively calculates the average and determines the course."

"I could tell you some marvelous stories of the results from observing these plants, but I have told enough for one day, and so we will declare school dismissed."

As the Major arose from his seat and turned away he saw me writing on a barrel-head just behind him, where I had taken down every word he had said.

"A chief's name, your father's notes."

"And faith he will, Major, with your leave," said the scribe. "It was too good to lose. It was throwing pearls before swine."

"Not so, my friend," rejoined the Major. "There is sure to be some one or more among those boys that has it in him to make his mark in the world, and what I say may whet his appetite to seek for more knowledge. You ask my advice and then do as you like. You are a pesky set after all. If a man has a little wits at night, why, then, in his sleep you will have every word of it in the paper the next morning. At any rate leave out those big things I said in the fore part of my talk. I had to put them in to get the boys' attention."

"No, no, Major," said the reporter, "that would spoil it. Those were exaggerations, and too understood by everybody. When we say a million, we are simply understood to mean a great many."

"And that is the best," said the Major. "It is these clusters of large leaves, springing right from the ground as described, which point the course. Their edges point to the north and south, and their sides face to the east and west. This is not so with all of them, and perhaps not with any of them exactly; so that if you depend upon any single leaf you would surely be misled. This is their condition approximately, all or nearly all varying somewhat to the right or left of the true course. But with out error correct another and take the average, and the true north and south are pointed out exactly. I speak of what I know, for I have often set my compass and studied carefully cluster after cluster of these leaves, and of both kinds, and always with the same result. It is not necessary to study minutely every leaf in order to determine the right course. The moment the eye rests upon a cluster of leaves it almost intuitively calculates the average and determines the course."

"No, no, Major," said the reporter, "that would spoil it. Those were exaggerations, and too understood by everybody. When we say a million, we are simply understood to mean a great many. When you told how you were handicapped by the massagers, you only told that they are very plenty and ugly, and strike at everything that comes within their reach, and either from the form of their fangs or viciousness they are apt to hang on when they do bite. Now this I well know to be true. I once had a pointer dog was ranging through the prairie at a good pace, when he suddenly reared up and threw up his head violently, and up went a massager more than four feet into the air. He had bitten the dog in the cheek when he was on the run, and it took a violent jerk to throw him off. And then, too, was proved the efficacy of that rattlesnake weed which did you such good service on that trying occasion. I took in the dog and drove to a cabin about half a mile away, dog in one of that root which grew within a hundred feet of the house, and he was all right in some ten minutes, and the dog with a pint of it, and bound the rest onto the wound as a poultice. By this time the head was swollen large enough for two heads, and very soon the dog was in a comatose state, and so continued for ten hours, when I went to bed never expecting to see that dog again alive. When I looked out of the window the next morning I was rejoiced to see the dog running about apparently as well as ever, and he never after showed any sign of the injury he had received. So you see you were only telling simple truths, though in strong language, no doubt. But, Major, I do think it was rather hard on the boys to have to chew the roots for that big poultice. Certainly if there were any demercks about there with which they could have brused them."

"Not so," said the Major. "By mixing the root with human saliva its efficacy was increased. Have you yet to learn that human saliva has wonderful remedial effects in certain conditions, while it is actually poisonous in others. It may be taken into the stomach not only with impunity, but is absolutely essential to the healthy action of that organ, while it is poisonous if taken into the circulation; such is the case also with the virus of a rattlesnake. You may suck the poison from the wound made by the rattlesnake with perfect impunity, if then the new place in the mouth, and indeed that is the best thing to do, can be done quickly. Human saliva counteracts or neutralizes other poisons similar to itself. Hence it is that it so quickly relieves the pain of a mosquito bite or even a bee sting. It is an excellent remedy for all cutaneous irritation, and still it is hurtful if it gets into the circulation. I have heard of several cases where most serious consequences have resulted from human bites, and if a virulent poison had been introduced into the blood. Indeed, miasmas and lues can be caught in the blood, and undergo precisely the same change when brought in contact with human saliva that they do when touched by the virus of the viper. I expect it will not be long before the scientists will prove us all to be only an improved breed of vipers, and that our bites should be equally avoided. I think I have seen people who are not much improved in the breeding either."

"Thank you, Major," I said, "I now see why you made the boys chew that root poultice. As to the gallinipper hairpins, if that was an exaggeration it only amounted to the statement that they have fearful long and stout bills, which is undeniably true. You made them pretty large, to be sure, when you made fish bait of them, but—"

"Stop there," cried the Major, "that was true in fact, for Jim Boal did catch a fine yellow perch in Gratio Lake with one of your bait, and we could not have caught a whole mess of them only we would have had to bait the hook every time, which made it too slow for them when they were ready to almost jump out of water at any thing."

"As for that old saw, I admit I made her rather thin when I forced her through a three-inch space, but all that breed were mighty thin and slab-sided. I know I made her a better-smucker hunter than they would average, but everybody knows they went for them as if they both hated and loved them."

"I don't know of any thing else that I have said that needs any explanation or qualification, so I will bid you a good day, hoping that you may live long and prosper."

SNOW BUNTINGS IN A TREE.—Not to be outdone by "Taxidermist" in your issue of March 8, I want to report what I saw last evening. On Monday we had a fall of about a foot of snow, and since then snow buntings have been more plenty than at any time during the winter. Wanting some specimens, I went out on Wednesday, but succeeded in getting only two good ones. After business hours yesterday I went over the same ground and did not see a bird until I

had got inside the city limits, when I saw a flock of fifteen birds, and on getting near them I saw they were horned larks. Not waiting any, I thought I would so have shot one, but I could not get them and watch them. When within about four rods, on looking beyond then I saw a flock of 200 or 300 birds, and as they seemed to be more restless than the larks, I concluded they were buntings. I passed the larks without disturbing them, and when within good gunshot they took wing, and I fired one charge of No. 12 shot among them, killing one and winging another. After securing them, I went on and winging another. After securing them, I saw that the larks took about fifteen or twenty rods and alighted again. I retraced my steps to take another look at them, when to my surprise I saw the buntings retrace and alight among them. I shot among them as they got up, killing one lark, one bunting and winging another. The larks flew from me, while the buntings passed by me, crossing the street, and, to my great surprise, all alighting two or three feet apart four rods from the street. After securing the two dead birds, I took about fifteen or twenty rods, and before I had overtaken it, it had reached the fence, passing under it into the street. While I was getting over the fence I saw one of the larks alight by the side of the wounded bunting (probably taking it for its mate that I had killed) and then on the rail of the fence, and remained there until I had secured and pecked away the bunting. A man passing a few to a cross fence about four rods from me, and I returned, and I do not know that it was a pair, but as there were fifteen in the flock, there must have been one without a mate, and I tried to console myself by thinking that in some respects birds are like human beings. As I passed to the opposite side of the street, and near the tree where the buntings had alighted, two meadow larks flew out of it and went the street in front of me, and they were the first of the season. I do not know that it is uncommon for snow buntings to alight in trees, but I have never seen or heard of their doing so before. I was much surprised when "Taxidermist" reported the horned lark doing so, but now I do not doubt it.—J. L. D. Lockport, N. Y., March 23).

MEADOW LARK AS WINTER RESIDENT.—I read with great pleasure Mr. Enty's chapter on "Our Winter Birds," in your last number, and through your columns would like to ask that gentleman whether he has ever noticed the lark as a winter resident. I have seen and shot this bird in the winter of '76 and '77, at which time I was teaching school in the Blue Ridge Mountains (Adams county, Pa.). On Christmas day of that year I went rabbit shooting, and while crossing a rather marshy spot had flushed a meadow lark, which I killed; and as the report sounded, a woodcock flew, which I killed with my other barrel. The lark, and likewise the cock, were the heaviest and largest birds of the two species that I ever saw, and oh, ye gods! such delicate and juicy morsels never crossed any man's palate. While narrating this fact to the stage driver from Gettysburg, I made the remark that though I had read of winter woodcock, I had never seen or heard of a winter meadow lark. This gentleman told me that he knew of several large flocks flying the year around in the meadows around Gettysburg. The following winter I attended a normal school training school for feeble-minded children at Media, Pa., and here, on our own grounds, I saw proof of this fact in two large flocks which remained all that winter with us, becoming very tame during the cold weather; we fed them the whole winter. Just about a month ago, while crossing the fields, in our country and near the city, my young sister flushed a lark, which I have since seen several times in the snow field. If my memory serves me right, I saw some birds of this kind which I have had access, give the lark as a migrating bird, and from the facts stated above I should think differently. Another point, the bird I shot in '76 was a male, which I proved by dissection, and two which I shot from the flocks at Media were also males; this would seem to give strength to the theory I once heard, that it is only the females which migrate. Mind you, Mr. Editor, I am doing no more than write what I have seen or heard, and cannot make a dogmatic assertion one way or the other. I can only hope others will give some observations on the bird which, if not hunted as game, is at least interesting as an ornithological study, and the bird which I have no doubt others beside myself used as a target when taking their first lessons in wing-shooting.—MEDICUS (Baltimore, March 23).

THE PTARMIGAN WINTER.—Last autumn (1887) we had published in the Quebec *Chronicle* a letter relative to the probable recurrence of the willow grouse or ptarmigan (*L. albus* Aud.) this winter. The prediction or surmise has proved correct as the following clipping from the Ottawa *Citizen* of March 2 will show: "It was reported to-day by a farmer from the neighborhood of Pembroke that ptarmigan had been seen in the vicinity of the town. It is curious that if such be the case, none have been observed in other localities generally visited by this polar bird during the severe winter south of the Arctic latitudes." Some weeks ago another notice of the recurrence of the ptarmigan appeared in one of the Manitoba papers and was copied in the *Montreal Witness*. Of late years this bird has been very scarce and reports have been received at some of the Hudson Bay outposts, stating that Indian families, whose sustenance depended almost entirely on these birds, were in a starving condition. When the snowfall is very heavy in the north the birds appear to perish in large numbers—not from cold, but owing to the willow brush being covered up. During such winters there is a large migration southward of the ptarmigans, and numbers are killed by hunters and lumbermen to the northward of the St. Lawrence and Ottawa rivers. Some twenty years ago I have seen the birds brought into our markets in Montreal and Quebec in large numbers, but since then they have almost completely disappeared. This, then, has been a "ptarmigan winter," and a cold and severe one too it has been.—H. G. V. (Montreal, March 3).

FEW AGAINST THE HOUSE.—No less than four woodcock have met death in the same manner, i. e., dying against the house; and the last fell tried it while we were all sitting on the piazza one fine summer evening, "twixt daylight and dark"—Zip bang! and poor little longbill was struggling his life away on the gravel walk at our feet. I gathered him in, and I have him mounted; and a fine bird he is. The bill was unimpaired, but the top of his head was badly smashed, and the feathers were all gone. He was in elevation, and is painted a half color, which may account for these frequent casualties. It is also located at Bay Ridge, L. I., on the line of flight of the migration, which would seem to have something to do with it, as three of the victims were found late in autumn.—DICK.

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

SMOKE MEMORIES.

WRITE THE SECOND—A POT SHOT SPOILED.

"A peaceful pipe the shepherd plays."

THREE o'clock on the morning of July 4 each year always found the "royal four" at the "Water Hole" on the Sag Harbor turnpike. First, a cast was made by the dogs on the east side and then we commenced the real work on the west side of the picnic toward the brick kilns (gone for more than forty years). I have shot through almost every kind of cover for summer birds, but save a small amount, Montauk nothing could compare with this cover. We had to crawl through and beneath the densest tangle of bull brier and wild rose, getting our shots not through skill, but by intuition, luck, or whatever you might call it, for it was impossible to put the gun to shoulder for a sight. Birds were plenty, but rarely left this dense cover. However, we usually got a dozen birds and thought ourselves paid for all trouble.

One time we had a New York chap with us who could outshoot Daniel Boone (let him tell it). We worked the bull brier gully, as well called it, but our new friend had not made a shot. This was nothing against him, for we old chaps, who knew the whole racket, sometime were in the same plight when we had got through the thicket, but at least we hadn't a bird and perhaps had made several shots.

After picking up a few birds at several places further ahead, the party divided for a short time to meet at a very likely place, which would require the four to work in a thorough manner. The New York gentleman and the writer were to follow a drain through a short meadow to where it met a creek and await the arrival of our friends, who took both dogs for a different kind of game.

The trysting place was lovely. Some large willow trees grew a short distance from the bank of the brook and the cattle had made a wallow or resting place under their cool shade. The other side of the brook was a thicket of wild rose and a few alders. Where we halted a little knoll topped with a clump of bushes gave us cool shade with a delightful view through the willow flows, brook and rose bushes. We both enjoyed it, and while waiting our friends for our pipes and chatted of the sport so far and prospects for the remainder of the day.

As we talked we spied two woodcock under the shade of the willows, and motionless silently watched them. I never before had such an opportunity to study their natural movements, and I know my companion never had, for he asked me what kind of birds they were. They could not have been thirty feet from us, and we, lying upon the bank as we did, were not perceived so long as we remained motionless. For a full quarter of an hour we watched these birds here, eat, plume themselves and meditate. How pretty they were—graceful, stately, moderate in their meal! It seemed to me that they heard the worm ere they thrust their beaks into it, and that they faintly noted, in their own way, the head on one side, quite near the ground, and the tail on the other, and suddenly turn and thrust the long beak into the soft earth, but I noticed not always successfully.

A sound from my companion caused me to look toward him, and none too soon—the pot-hunter had quietly raised his gun and was drawing sight upon our pretty neighbors, intending to pot them where they stood. I threw up his gun as fast as I could, and the birds were gone, but there was nothing too bad for me to be called for spoiling his shot. I had to tuck in to pot him, and while our wordy war was in progress our companions came up, and after hearing the story, were so indignant that Mr. New Yorker was then and there invited to leave our company, as we considered ourselves gentlemen, and not pot-hunters. We were very considerate, and, our little club, that a man who shot a game bird sitting was not fit company for us, and we did not hesitate to say so.

A true sportsman does not go out for meat; that is of secondary importance with him. I had rather spend a day in the woods and fields, coming home with an empty bag, happy if I have been able, as on that day, to come face to face with nature. I have been into a nut forest for several years, and have had great adventures, but I have never shot for I was well paid to sit still and watch them *as natured*. I didn't want meat. Whether I should carry this feeling so far as to sit still and watch a grizzly who was watching me, I don't say. Perhaps he might want meat. REYNOLDS, Boston, Mass.

WINTER AT INDIAN LAKE.

IT is March 19 and no more sign of spring than January 20. It is cold and the snow is fully four feet deep on the level. It has been the longest and hardest winter known for many years past. The great amount of snow has given rise to the most extraordinary and great adventures, and some that they have been killed to some extent in some parts of the Adirondacks. In this part of Hamilton county, I think, they have not been killed to any amount; I have heard of only two within fifteen or twenty miles from my place of business. As I do business with all the lumber camps in this section, I have had good opportunity to get information. I was through the woods of several camps after early winter, thinking at the same time what sport I would have in two months later in season, but I was very much disappointed when in September I wrote to some friends in the city to come and join me in the sport to find that the many flocks of teal and other birds in the spring were reduced to the old birds and from one to three half-grown chickens in each flock. Of the two hundred that I shot during the season, I did not find the several birds in young birds. My usual number of these birds for the season is from three hundred to three hundred and fifty, and about fifty woodcock.

Woodcock are getting more plenty every year in this section. I shot about twice as many last season as the season

previons. No one cares for woodcock here but myself; not one in ten of the inhabitants know what they are. Many an old farmer has told me that they had seen some in the dry trees about their farms, after my inquiring of them if they knew of any—they meaning of course the red-headed woodpecker.

One fine morning the drumming of the cock grouse not over three hundred yards away from my doorstep. It is very tempting to the small boy with the old musket, and once in a while to a big boy, too. It is a great pleasure to the lover of the gun to be able to steal an hour or two from his business on a bright October day and return with two to six birds. I have done this time and again and without going more than half a mile from home. Once, two years ago, I stood on my doorstep looking across the garden at my little patch of woods that lay away, when I noticed four full-grown grouse playing in the sand. It did not take long for me to step inside and get my gun from its case and secure the whole four after flushing them two or three times. You cannot do the same from your office, but you can enjoy your short wild winter better than we can four feet of snow for six months. O. S. T. M.

CAPTURING A GROUSE ALIVE.

A bird in the hand is worth two in the bag.—Old Proverbial Remark.

THESE are many peculiar incidents happening in the life of every sportsman when afield which never appear in print, and so fall to add either to our knowledge or pleasure. I do not mean great events; not escapes from fire or flood, but those which may be very simple and yet peculiar as well as interesting.

Every time I see the words "ruffed grouse" in the articles appearing almost weekly in FOREST AND STREAM, I am reminded of a number of just such incidents in which I have figured when in pursuit of that noble bird. I was born and brought up within hearing of his drum beat, and the habits, haunts and tricks of this king of the woods are as familiar to me as is my mother tongue. The incident of which I write occurred some ten years ago.

At that time my "right-hand man" was Duke, honest, earnest old Duke, whose grandsire, straying from his baronial estate in times gone by, was gobbled up by a Jersey farmer and put to the menial task of furnishing the motive power to a dog churn, until one day, "Squire" Smith, in search of fun and feathers, happened that way, and thenceforth the dog occupied his legitimate station among the canine nobility, and from his loins came Duke—proud as a peacock, he sleeps now under the Norway spruce in the garden there.

It was late in November. A thin coating of snow lay in patches upon the ground, and it was almost too cold for agreeable field work, but the air was bracing and so we hurried away on this particular afternoon to a famous ground known as the Deep Hollow, and a favorite haunt with me when time was limited. Following an old log road to an almost impassable fence, I swung to the right and left a gently sloping hillside, with here and there a towering beech or maple tree, and now and then a hemlock. So open in fact was the ground at this point that I was musing as I walked upon the time when this hillside was in its primeval glory—with its giant pines and oaks, and all this slope was dim and obscure and weird—when like a flash a full-grown grouse appeared seemingly from nowhere, passing me within twenty yards to my left, and moving with incredible celerity. As I swung my gun from my shoulder my gaze was arrested and my aim changed from the swiftly flying grouse to that of an immense hawk in close and deadly pursuit. The situation was explained. So close was the pursuer that his eyes and beak were plainly visible, and as I pulled he doubled up like a pocket knife and fell dead; then as an encoeur I gave him the other barrel. I can never forget the contrast presented in these few seconds—the pursued presenting innocence and helplessness, the pursuer with outstretched beak, ugly talons and glaring eye, strength and ferocity.

Even in this short space of time I had found leisure to mark down the grouse, for instead of taking to the swamp for cover, the bird dropped on the open hillside at the base of a large rock. Duke by this time was laboring under strong excitement, and from his actions I knew had marked the bird as well as myself; so moving up to within fifty feet of the grouse, I had the pleasure of seeing Duke assume one of his characteristic postures.

Expecting each moment to see the bird flush with the customary rush and whirl, and scattering of dead leaves, I was in no haste; but as no such thing happened, I slowly moved step by step toward the rock, until at last I laid my hand upon it, reaching as it did about breast-high on the lower side and sloping into the hillside above. The difficulty made the circuit, then I boisterously repeated the jeremiad, kicking up the leaves with my feet as I moved, and still Duke drooled and trembled. Then I laid my gun upon the rock, and "hunted without a gun," but I did it on my knees, pawing away the leaves and feeling into every nook; still no bird.

By this time things began to seem queer and uncanny, and to give vent to my pent-up feelings I picked up a pretty good row about these things on my lone launter. To swing the club I determined not to give up the search; so, seating myself upon the rock, I critically surveyed the scene and noted all places and objects. The nearest tree was a chestnut, ten yards to the left; between it and the rock, I now discovered three or four chestnut sprouts projecting above the bed of leaves. On these sprouts were a few scattering leaves fluttering in the wind, the whole forming a kind of net. As the chestnut tree was about two or three inches in depth, not deep enough to cover a full-grown bird. Moving from my position I carefully parted the sprouts, when to my surprise I found a bed of leaves a foot deep, and snugly hidden away within their depths a full-grown unharmed female grouse.

Now I was truly in a quandary, and with my gun out of reach and the bird under my nose, so very dared to stir; but I did the best thing possible under the circumstances—stooped quickly down, grasping her with both hands, and removed her from her hiding place.

Having no cord with me and desiring to take her home alive, I got down upon my knees, placing her upon my back between them; this relieved both hands, which I employed to unfasten my suspenders, and then tied her as best I could and placed her in one of my game pockets. I found I could do no more hunting that afternoon. Do not be disappointed in inquiring birds at all points of the compass, and would stiffen out every time he got my wind; then I would break

his point by moving up and showing him the live bird, at which times his antics were laughable.

From the time I caught the bird until I reached home, my captive made no attempt to escape. After showing her to the family I carried her out to the trees, and tossing her high in the air, I had the satisfaction of seeing her wing her way on strong and even pinion to her native bills.

Now the question arises, Was this a case of lypomania or was it not? Was it a suspension of will power and so muscular power through fright, or did my act of laying her on her back and gently pressing her with my knees while lying produce this strange passive state in this wild thing?

I have experimented with the common barnyard fowl, laying them upon their side back on the floor and gently pressing them, and I have found that a suspension of will power was produced, the time depending in each case upon the conditions under which the experiment was conducted. Under very quiet conditions I have had them remain in this position for ten minutes. I think it can be done by anyone who chooses to try the experiment.

If there is anyone among your readers who has had the pleasure of catching a full-grown and unharmed ruffed grouse with his bare hands, I would like very much to see his experience in print. FALCON.

WHITE MOUNTAINS, PA.

RABBIT SHOOTING.

BY PAUL PASTOR.

IN the winter time, when our Northern woods are deep with snow and all our game birds, save the hardy and unapproachable grouse, have taken to the water, whether climes, little feather-footed puss affords the true sportsman some glorious sport.

There is a charm about rabbit shooting, in the deep, still, white woods, that rightly endears it to the gun lover. Planted comfortably in the vicinity of some zig-zag runway, knee deep in his snowy shooting pit, the sportsman stands alert and listens to the must of the hounds. The flushed woods ring with the eager baying of the dogs, now far away and now growing fainter and now approaching, warm, quick cry, that causes him to tighten his grasp on the trusty barrels and peer sharply down the white aisles and spaces of the trees, expectant every moment of the bounding, noiseless form of frightened puss. It will need a quick eye and a steady hand to stop her in her bounding flight. I know of nothing which stirs the sportsman's blood more quickly and thrills all his nerves more keenly than this waiting for the little white fugitive on the wide whiteness of the snow.

There are sportsmen who pretend to think that rabbit shooting is tame, and do not care to take part in it. I cannot help but think that they are lacking in something which goes to make up the complete and perfect sportsman. No sport surely could have more of the fascinating charm of anticipation in it than rabbit shooting, and as for skill and difficulty—which form the spirit of the sportsman's pursuit—it will fall to some sturdy who has never tried it to claim that puss is dull and easy shooting. I have known crack shots in the field and on the wing to miss the bounding rabbit again and again. She comes up so noiselessly and unheralded, white as the snow and only to be distinguished by her motions and long fawn-colored and pink ears. Likely as not that it is in a thick, brushy place that you see her, or between the close-standing stems of young saplings. Now let the contemplations with shot and with the sublime end of his gun comes up in quite a rapid fashion after all, for a man who is to shoot tamely and for the pot. His eye glances along the barrels with an anxious alertness; the muzzle of his gun swings through a swift half-arc, his fingers nervously contracting and then relaxing on the trigger, as he alternately trusts and doubts his aim; and finally, with a sheepish look, he lowers his breech-loader and puss disappears in the thickets. "Oh well, I haven't got the hang of it," he says. "Wait till the rabbit comes round again." The rabbit comes, but not in the same path. She darts across the open space in front of him. He fires—and there is a great sputtering of snow about a foot behind frightened puss. She survives, comes directly across him on the right, plunges into the brush, and is out of sight before he recovers sufficiently to use his other barrel. Old rabbit-shooters like to get a concerted young dead-shot and trap-shooter in the "nest" in winter. They have lots of fun with him, and he learns a thing or two. After he has once got the knack of it, however, he doesn't despise rabbit shooting, and he enjoys the sport all the more, from having found out by experience that it is sport.

I think our best sportsmen are getting over their foolish prejudice against the "hairs." They are coming to learn that it takes as much skill to hit a rapidly moving object on ground as in the air, indeed, so much, that it is more difficult, for there are apt to be more embarrassing obstacles in the way in brush shooting, and in the fields the range is usually greater than in bird shooting. I have always enjoyed my winter rabbit shooting as keenly as the pursuit of any other game, and I do not find that the sport clogs upon me by reason of too easily earned success. I miss a rabbit as often as I miss a bird, and with as good an excuse. And then, where rabbits are reasonably plenty, the sport is right lively and as interesting as any. It is not the walking deer, all day beside the expected runway of a fox, and then, after right reynard has made his long circuit, and the excited baying of the hounds proclaims his return, seeing him suddenly swerve aside and go over the top of an adjacent hill and disappear for the night.

Rabbits run nearly in a circle and take a brief course, if well followed by the hounds. They do not often return exactly to the place where they were started, but somewhere within a few rods of it they are sure to pass. If several dogs are running the sportsman must keep his eyes open for "scared" rabbits; they may come up at any time from any direction.

A rabbit should never be shot except when it is in motion. It is almost brutal to mow the poor little creatures down when they stop to listen for the dog, or to catch the direction of some unexpected sound. Treat them fairly as they treat you, and in endeavoring when you have as many as you need for the table, or for a friend, and I warrant you, brother sportsman, you will agree with me in saying that rabbit shooting is one of the most exhilarating and delightful sports with dog and gun.

As for the proper dog to use, I think the best, taken all in all, is the ordinary foxhound, trained, as much as possible, to run rabbits alone. Beagles are too lazy and dumpy, and spaniels are too dependent enough. The foxhound is a large, strong of limb and deep of chest, and possessed of a pertinacity and endurance which is of great value in this

kind of sport. He will sometime leave a rabbit trail if he strikes the fresh track of a fox, but can generally be recalled or recaptured, if the sportsman is provided with a team. I have very often found it necessary, however, to resort to this expedient. Foxes venture into thick cover far less than would be supposed; and when the rabbits are once fairly started and the dogs in full cry, there is little danger of their seeking a fox track on the outskirts.

The season with us is so late this year, that we are enjoying the rabbit shooting close up to the first of April, and may yet be able to make an "April fool" of the sportsman who thinks "rabbit shooting is as easy as turning over your hand."

THAT SCREAM AGAIN.

Editor Forest and Stream:

Just about the time I had done with "secreds," but it seems that criticisms and answers are still in order. The last comes from a gentleman who signs himself "Picket" (FOREST AND STREAM March 15).

The article savors strongly of "sarkasm," ridicule, burlesque; loose rather than logical; rather superficial than solid. It commences with: First, "Nessmuk" is "well right." "But he does not go far enough." "There never was a horse worth \$500," etc. Second, Again: "There never was a gun worth over \$25." "Nessmuk" has better sell those Damascus barrels and buy a Zulu gun at \$5," etc. Third, "There never was a diamond worth \$100. I will bet my choicest cyuoidie," etc. Fourth, "When you come to talk about pictures, language is inadequate." (I should say so) Fifth, "Land is another thing that people are great fools about. I own a lot on which you could raise as much garden stick, or build as fine a house, as on a lot," etc. Dear "Picket," what does all this amount to? Wherein is the point? Sixth, "Look at gold for another thing." Just so. "But for this we could make gold, that would look just like gold, and not one man in ten could tell the difference. Wherein is its value?" Just so. As to the concluding remarks of "Picket" about "Nessmuk philosophy," they may be relegated to the "Regions of Gimli" (or bore-dom).

I have tried to be brief. I wish to be honest; to be square. Let us resume.

First, The \$500 horse (make it \$5,000 if you like). Foot up all the names of the winners; also the losses. Give us the list of English paces, *et id genus omne*, who have won and lost; who have squandered and lost large estates in a single year. Make a business thing of it. Do not count the suicides, the ruined. Only give us the square business proceeds of profits and losses. When you get down to this, divide the remainder by the number of first-class racers who have assisted at the rascality of race-tracks, and give us the result in round numbers. Give us, by my remaining balance, place it to the winners. And report.

Second, "There never was a gun worth over \$40." Who said that? I did not. I have said, time and again, that I admire a thing of beauty; that I admire a poem; a painting—

"But not through thick and thin,
Nor think it such a thing as never hath been."

If the Zulu, or the army musket, were just as good as my Damascus barrels, I would take them. But they are not. They are ugly. They are unwieldy. They are unsafe. They are not sport. They look like an army arm. Who shall dictate that I take such an unwieldy weapon into the field? Who does "Picket" pick-it up in this style? I expressed plainly my love of the beautiful in flies, rods, Damascus barrels, paintings, fine chronos, etc. And "Picket" calmly relegates me to the Zulu gun and army musket. I take in no 5-cent chronos. I do take in Prung's best chronos. I take in no \$5 Zulu gun, nor army muskets. I take in no \$200 hammerless sacragans, either. I do take in a plain, business shotgun at a sensible price. Much ink has been shed in abusing the "Zoo" and musket, mostly by men who can afford more costly outfits, and whose ire is aroused at being crossed in the field by a grunting darkey or "low-down" white, with one of these guns. I have witnessed this thing often, and it tickles me hugely. It is true that the gentleman sportsman, with his costly gun and high-priced setter kills four birds to the sickly one, but what of that? What business has the darkey there, as show? Or the poor, shiftless white? They ought to be at work, laying up a stake to thank the poorhouse in old age. That is about the argument. The insolence of wealth. The vulgarity of money without culture. The arrogance of dollars, gotten honestly or otherwise—but gotten. And it is one of the most humorous things I know, to see one of these high-toned, sportsmen cut off on a heavy coil of grouse by a sphyro-floated darkey with a \$5 "Zulu." I always think of Byron's "Deformed Transformed."

"The rascals have as much right as he."

After more than fifty years experience I can safely say that the most brutal trick I know of is the fact that three deer were shot down in a lick at one time and left there to rot, without even having their throats cut, one of them being a doe with a full breast of milk. The deed was done by a noted "Clericus," not unknown to fame as a preacher and *literateur*. Any old North Woods guide can give the name, which I withhold on account of his family.

"If I have any fault it is depression."—Byron.

Let us return. "Picket" drags in gold versus bogus, pure diamonds versus paste, with city versus country lots, etc.

"And such a lot of skinkie-stinkie-stink as puts me in my faith."—Hobson.

These similes and comparisons seem to me irrelevant. But as most readers read without reflection it may need that I reply. Firstly, the pure diamond is a thing of ad within itself. Its past imitation does not contain one grain of the material which makes up the pure article. The imitation is a fraud, likely a crime. The pure diamond is only a bit of crystallized charcoal, and the man who gives up a life competence for a glittering piece of nonsense that can neither give him food or shelter may well be called a fool. But a pure diamond is very beautiful, and the fortunate fool who has more money than brains may do worse than pay it out for a thing of beauty that will last forever. In these times it will sell, and the paste imitation will not.

The same holds true of gold. There is no metal like it, or having the same qualities. If the civilized world chooses to take it at a certain value, can "Picket" or "Nessmuk" reverse the decision? And is a bogus imitation pure gold? As to the land question, it seems to me so far-fetched and irrelevant that it may well be left to the deniers in corner lots, agents, etc.

The assumption that I would take a painting according

to the cost of the property it represents is a trifle flippant, but hardly requires an answer. It may be suggested, however, that if two pictures are equally well executed, equally true to nature, so that the best judges cannot agree as to which is the original, and the copy, that the value of the pictures cannot be so very different. A fine painting is not a bank note. The value is dependent on execution and fidelity to nature in the one case, on the genuineness of signature in the other. The material, colors, canvas, etc., is the same on both pictures, the artistic skill not distinguishable. One may be a copy; but both being alike true to nature, neither is a counterfeit.

And this statement of yours is fair and apt, only that the \$25 picture and liver and white is not a copy. He may have a longer and better line of ancestry than his \$1,000 cousin, only it is unwritten. His blood, bone, muscle, and entire make-up are essentially the same as the pedigreed Laverack or Diewellu. In the field he is tougher, harder and less liable to nervousness and gun-shyness. If he works just as well as the field-winners, why is he less valuable? As for the inflated "potatoes" dog, for instance, "pedigree" are like potatoes—the best part underground."

NESMAUK.

WELLSBORO, Pa., March 21.

THE MAINE DEER QUESTION.

Editor Forest and Stream:

After an absence of some over two months I am hence once more. It looks a little different from what it does in the summer above there. Cleft Rock Hall (the dining-room) is buried in a snow drift; and while wondering just where Camp Avernus was I stuck the heel of my snow-shoe square into the flu of the chimney. I have dug the cook-room door out, shoveled out the snow, and had my hat and its works through the cracks, have had my supper, turned the plate, cup and saucer bottom side up all ready for breakfast, and as I stretch out before a blazing fire and pull the wrapper off from the last FOREST AND STREAM, I realize that "you never feel so much at home as when in your own shlang."

And what better can-pine companion can a man ask for than a FOREST AND STREAM right out of the wrapper? "Summer shooting" attracts my attention, and after reading it carefully I am glad to know that there is one man left in the world who has courage and fairness enough to stand up and say: Give the other side of the question a chance, let it be decided on its merits, and not by prejudice and misrepresentation. And while I do not by any means claim to be the looked-for advocate, there is an explanation that I beg leave to make in behalf of myself and the rest of the "other" teachers who are shy of many brought down on ourselves by asking for summer shooting of moose, deer and caribou in the three counties embracing and in the vicinity of the Rangeley lakes. We did not by any means ask for the whole State of Maine, as has been represented. The slaughter of deer that has been going on in our State the past season is nearly a hundred miles from us. I believe that the whole number of deer killed in these three counties from October 1 to January 1 would not exceed ten. We did not have been much fairer in our worthy critic, the Boston Herald (that got so well posted upon the Maine deer question), to have allowed this instead of trying to make us shoulder the eighteen hundred deer claimed to have been killed and marketed from the eastern portion of this State?

There they are professional market-hunters, and want to market their deer, and they are not market-hunters, but they look to the sportsman, as well as our trout. That position asking for summer shooting was signed by every man, I believe, in our region that it was presented to who is interested in our sporting travel. It is likely that we who have been brought up here and spent much of our time in the woods, have worked and invested our money in this business, know nothing about it, that we would ask for, as you pointed, the privilege of killing the moose that is leaving the golden age for us. Will some one who would really know what a deer was if he saw one, please tell us where the value in the Rangeley region deer is if summer shooting is not to be allowed?

I'll admit still-hunting on the fall snows is much the fairest and most proper way to hunt them, but owing to the hardships and uncertainties it will never be practiced to any extent by city sportsmen in our region. Jackshooting, in my estimation, comes next. In either of these ways the deer are not taken advantage of by dogs or deep snows; they are not driven to the pond, and if there is anything in the looks or smell of their favorite watering place that they don't like they make their shot short. If everything works well, the wind, the weather, the boat, the jack, the gun, the guide, and most of all, if the shooter has plenty of quail and curlew, he may be successful. If any man has a flock that there is anything lazy about sitting perfectly still in a box six or eight hours, let him try it.

The fawn question, I am aware, is a very important one, and by the mother does being shot as early as July, in many cases they would die. But very few of them would be deprived of their mothers, I think, for I believe that when the fawn is dependent on its mother she will leave it in the evening or early in the forenoon if it is in the evening and in the early morning. She then leaves her fawn hidden back in the bushes. Watch her as she feeds, and every few seconds you will see her raise her head and look and listen in the direction of her fawn. Is a State law needed to protect the deer in this condition? I think not.

As long as there are deer in our forests they will be hunted in one way or other by people of one class or another. Good feeling and public sentiment go much further in the woods than the fear of the law. There is such a thing as fashion even among woodsmen. As long as summer shooting is not practiced, there will be crust hunters in the winter. Allow summer shooting, and I honestly believe that no law can be made that will better protect the deer. Then the cruster sees more money in leaving them for the summer sportsman than in killing them. If any man has a flock in the deep snow and turn to pieces by dogs, is it not the doe every time? and does not the killing of the doe at this season of the year mean death to just as many others as if she was killed the day her young was born?

The deer are very plenty in our region, much more plenty than they were five years ago. And as long as dogs and crusters are kept down they will remain abundant. They will never be decreased by jacking, for the reason that the places where they can be jack'd is but a peck compared with the territory of good feeding ground where they cannot be. It was with the best intentions that we asked our Maine Legislature to grant summer shooting, but not even September was opened for us. More law was what was wanted to keep down the "restless poacher" and the "game thief."

Under the many obligations that we are in the Rangeley region at least) to the visiting sportsman, and as dependent as we are on their patronage, I think we cannot do better than to offer them the best we have, and try to please all classes. We can say that there are not just as pure-blooded sportsmen that enjoy jackshooting as there are that enjoy trout-fishing? My only reward for the trouble I took to do what I could for what I sincerely believe would be much to the advantage of the State of Maine, the visiting sportsmen and the game, was unjust censure from a leading newspaper which at least might have been expected to give a fair deal. And if whoever encouraged the Boston Herald to write up the fish and game question was really interested for the public good they should have cautioned it to not be too extravagant with its censure, then I think that the article last fall on fish propagation and the two articles this winter on the game question would have had a much better effect, especially with the people who know and look on both sides of the question. It may have been better if "Clarius's" suggestion had not started me agoing, or if I could not have found pen, ink and paper night, but I feel that I have been unjustly accused and have a right to say so; and when the Boston Herald publishes the statement that "the Maine game commissioners say that" a certain person "has done more prospective and actual harm to the deer of Maine than the best of Legislatures can repair in many years," and the commissioners say that they did not say so, it looks as though the advocates of summer shooting were not the only ones in disgrace.

CAPT. F. C. BARKER.

CAMP BEMIS, Rangeley Lakes, Me., March 17.

SUMMER SHOOTING.

Editor Forest and Stream:

In several recent numbers of the FOREST AND STREAM we have appeared articles in which the subject of "Summer Shooting" has been discussed pro and con, and we now beg leave to add our mite to the "con" side of the question. While we acknowledge that we are at present in the minority, we are glad to know, nevertheless, that the FOREST AND STREAM is on our side, and we believe in the right on this question, as it always is on others, and we are confident that among the minority will advocate the same question they are in the majority. As for the reformers of old found that at last the cause of the few became the cause of the many.

Although we have read, yet we cannot barken into the plea for deer shooting in July, even though that is the only month when our friend can satisfy his ambition to be called the "Deer Slayer," nor are we able to follow in the wake of "Clarius" and men of his "class" who advocate the killing of woodcock in July, for they too closely resemble the renowned "Rev. Adirondack Murray," who openly boasted of killing dogs in the early summer months.

Who are the advocates of summer shooting? Men who keep summer boarding houses and hotels, and wish to advertise "god hunting and fishing within a stone's throw of the house;" market-shooters, who supply their tables with game, and would do so, if the law did not prevent; and the law protects until the first of September, as they would a woodcock; and "Clarius," who advocates it from purely selfish motives, and has no regard for the laws of God or Nature.

This snare "Clarius" says that "something must be trusted to the honor of men. As a knight of the trigger, I would not object to countenance the public outcry on summer shooting if a half-grown grouse should suddenly rise up before him, for I believe he would, if possible, bring it to bag as soon as would an unprincipled market-shooter.

If "Clarius" needs exercise we would suggest that he borrow a "Rosinante" of some friend, and with his "Don-Quixote" ideas he can undoubtedly dig enough "imaginary foes" to keep him busily engaged during his vacation. Getting this done, he could then go to the public outcry, and, but invidiously as a roaring lion, seeking what half-fed birds he may bring to bag.

If "Clarius" has the "strange fascination for the trigger" that he says he has, let him go forth on a bright October day when nature has had time to fully mature the birds, and we think he will then feel, as he probably never has before, what it is to have a complete void of offense, and know that he has not crossed the law by cutting a grouse.

We heartily endorse every word written over the signature of "W." in your issue of March 23. As he says, to shoot a game bird when it is not fit for game is murder, and in July the woodcock are not fully grown, have no fat about them, are weak, immature things, and can be easily shot by any man who knows how to hold a gun and pull a trigger. In August the birds, young and old alike, are moulting, and are therefore weak and sick, and not fit to serve on the table until September.

His defense of the farmers is also well timed, and we trust that ere long "Clarius" and other advocates of summer shooting may see the folly of their ways and become possessed of a little of that charity that "thinketh no evil."

Hudson, N. Y., March 26.

PLANKERS.

Editor Forest and Stream:

There is, among sportsmen, at least among those who put their views in print, one subject which seems to induce acrimony. Need I mention it? It is, of course, spring and summer shooting. The latest impetus and newest life given to the controversy has been the good-natured, and rather faithful challenge of "Clarius," the bright and pert reply of "Otherus," a sedate rejoinder by the former, and a large number of soter remonstrances from everywhere against "Clarius's" heretical views.

I have some reluctance in entering the arena, and do not propose to become a combatant further than to state an inference from my own limited experience. It has been said—*non est in rebus nisi veritas*, which is a maxim. From all accounts, the reasoning from data supplied by one section of the country may fall in another, where the same conditions are lacking. So, arguments which are unanswerable on one statement of facts, may sustain the reverse of the proposition where circumstances entirely different exist.

Recreation, I take it, is the indulgence in an occupation which is at the same time innocent and agreeable. It is distinguished from rest or repose, which is a cessation from all occupation, by the addition of the element of activity, mental or bodily. It implies a change from our ordinary pursuits or business, although they may be in themselves both innocent and agreeable, and it may be far more arduous and exhausting than they.

All animals are benefited by recreation, whether they be

wholly, or half, or quarter, or not at all "brain-workers," from "Clarius" himself down to the horse in the elder press "turned suddenly out to grass."

I assume that the form of recreation most agreeable to all the readers of FOREST AND STREAM is the pursuit of game, be it clothed in fin, fur or feather, which was the business of our ancestors (post-humans), and which is our pleasure. We should, therefore, have the widest opportunities to pursue all forms of game consistent with its preservation in reasonable abundance.

We should not destroy game except within reasonable seasons. We should not kill the parents when rearing their young, nor the immature offspring, and the seasons should be arranged to prevent the probability of such an occurrence. But the seasons should be arranged to suit the interests of the game, and so arranged, too, as, if possible, to give the pursuer—the brain-worker or what you will—an opportunity for an outing at any time in the year.

Let us look at the matter of shooting woodcock in July. I can only speak for my own section of the country. I am not morally, but I know the habits of woodcock here. The birds arrive in Southern New Jersey in February in large numbers. They immediately begin to nest, and by the middle of June all are full grown, and they are abundant. By that time the swamps and meadows have become dry, and by the opening of the season in July all but a few birds have disappeared. In August these, too, have gone, and no more are seen until October, when the fall flight of scattered and scattered birds yields an occasional trophy to the quail-shooter. The spring birds are abundant; they rear their young with us; there are but few birds in summer, and the fall birds are purely migratory, and yield but one or two days' good shooting, immediately after the first severe frost. There are none of these numerous birds shot in the spring by the inhabitants, as I believe. Few are they in summer, one who knows their haunts ea, in the cool light of evening secure a half dozen, giving himself recreation and furnishing a delicacy appreciated by his own table or by his invalid neighbor. Not fit for the table? Far more welcome is he than later in the more mature autumn traveler, lean from his long light, and contesting supremacy with snipe and quail, and rail and canvas-back.

The old protest, that if there is no summer woodcock shooting we should have no summer shooting at all, carries some weight, and is applied to the death of a snipe or curlew in spring diminish the game supply more than if it had occurred the previous summer? He has raised no young in the interim, nor has he begun housekeeping.

We are told, too, that we should give up spring shooting of snipe and bay birds. I have never seen any valid reason as applied to this locality. The birds do not mate or breed here, they are travelers returning to their summer residences. Why should the death of a snipe or curlew in spring diminish the game supply more than if it had occurred the previous summer? He has raised no young in the interim, nor has he begun housekeeping.

One word in regard to the "persecuted farmer." We are told that he is damaged by summer shooting. One man, I think the "Otherus," says that fields (sic) have been posted because of summer shooting. From the standpoint of my location, this seems extraordinary.

The State claims dominion over the game; it undoubtedly has it; it is one of the *jure regalia*. The State can ordain when game may be killed, and by whom. But the State can give the right to no man to go on another's land to slaughter the game, although it can prevent the owner. Therefore the "persecuted farmer" has no grance to kill game on his own land, but he has on a footing with the other citizens of his State in this respect. But he can prevent its appropriation by any other person, at any time, in season or out.

What has this to do with summer shooting? My observation is that many farmers wish to protect their quail. They like to see the birds about their farms. Occasionally they will give permission to a sportsman to shoot a few, but if they see the birds exterminated, or anything like it. But I have yet to see the man who objected to shooting woodcock.

The summer shooter is an object of wonder to them, not unmixd with good-natured contempt. The idea of a man who can live in an office, in cool linen, facing a South Jersey swamp, in the uniform of a tramp, wading knee deep through mosquitoes, and biting the heads of flies, and fighting uncountable mosquitoes, for the sake of a few "mud snipes," not half so good as chicken, gives them material for plenty of uncomplimentary gibes. I never heard of any farmer objecting to summer shooting. Of course if, as suggested by the "other us," and others following of his ilk, this or any other "sportsman" should break fences, wound cattle, or do any other wrong, and if the pursuit of his recreation should have caused him to have cause for complaint, and could redress his injuries under the laws.

But why the more occasion for offense in summer than in fall? PSITTACUS.

NOTES FROM CHICAGO.

[From our own Correspondent.]

YOUR correspondent at this point has had little to chronicle lately, as the season is just betwixt and between—neither the proper hunting, and assuredly not the proper trap-shooting season. Pigeons for the latter are scarce, and the ducks have only recently arrived on our waters. The hunting for the past ten days, however, has been very fair. During the game has now are all kinds of ducks, such as bluebirds, spiketails, pintails, mallards, greenings, blue-bills, teal, hutberlall, widgeons, and in fact nearly every kind known to northern lakes and rivers. The late cold snap has sent them south again, that is, nearly all of them. The lakes are partially frozen up, and only running waters remain open. Still the boys bring in good bags every trip. John Giespie, John Wiggins, and several others, I think, have returned from the fishing lakes. Bob Hyman, William Haskell and Ed. Hoy returned Friday night from a ten days' shoot on the Mississippi River, near Davenport, Ia. They had fully twenty-five dozen ducks of all sorts, and enjoyed some splendid shooting. Fred Taylor arrived back from Lake Senacliwin Thursday, leaving John Kleinman still there. Taylor brought back a good many ducks, and reports the shooting fine. All the club-bags will be teanted in the next forty days, with sunny skies above.

Clarence Schutt, one of the leading members of the German Hunting Club, came near being drowned on the Kaukaakee last Monday. He was pushing a boat through the floating ice to gain the swamp on the east shore near Thayer's Station, when he overturned the craft and, weighted down with game bag, shot, etc., he soon found

the bottom of the river. His huge hunting dog sprang in from the overturned boat and seized him by the coat. A farmer near by put out in a flat boat and pulled over where Schmitt had gone down, succeeded in getting him safely into his boat. It was a narrow escape from a watery grave.

The death of S. H. Thrill has been profoundly felt through this section of the country, and letters from sportsmen all over the State expressing regret and condolence for his family have been daily received by his friends. The Illinois State Sportsmen's Association met Monday, March 26, at the Palmer House, to draw up suitable resolutions of respect for his memory.

At the time of the heavy frosts and rain storms this year about January there seemed reason for thinking that most of the quail in Illinois, Northern Indiana, Iowa and Nebraska had been killed off in the open fields. Now more encouraging reports are being received by local sportsmen from everywhere. A letter to the FOREST AND STREAM correspondent from Jerseyville, Ill., says that the informant has heard from all through Central Illinois, and that about two-thirds of the quail survived, and that the shooting will be better than last year. From the same informant it is learned that with a good breeding season and a let up on the breaking of game laws there will be fine quail shooting next fall.

ANOTHER HETEROODOX SCREED.

Editor Forest and Stream:

I have seen a great many articles in your paper on the subject called "The Protection of Game," and most of the writers blame the "market-shooters" and "pot-hunters" for being the excuse for the scarcity of game, so as to need protection. But if there were no "market-shooters" nor "pot-hunters," the so-called "gentlemen sportsmen" would kill more game, and they would soon find that the game still needed protection. The only way to protect game is to stop killing it entirely, which would be the law of the land, and to hunt only where it is plenty, if one hunt at all.

As far as the "market-shooter" is concerned, I think it is a great deal better for a man who kills large quantities of game to sell it (so that many folks who are not able to spend the time and money to hunt themselves, can have a taste of game once in a while), than it is for a "gentleman sportsman" to go on a shooting trip and kill to throw away. I read an article in a paper a while ago, where a sportsman started after woodcock the day the law was off, and the conductor told him it would be no use to go to the place, as a gentleman had been there two or three days before and shot sixteen. This made my gentleman sportsman mad, but he thought he would go there anyway, thinking there might be a few birds left, but he found none; so he said he would see if the game could not be protected, and the game laws lived up to, and he would put that "law breaker" through if he could find out who he was. Now, I ask the question, would the game laws be better protected if he had found the sixteen woodcock instead of the man that broke the law? I say no. He would have shot all he could. The fact of it is, the rich "gentlemen sportsmen" want to have all the shooting themselves, and only go in for "protection" so that they can slaughter more themselves when they go out.

Now, I can see no fun in shooting from forty to a hundred grouse, or ten, day for a month at a time unless you sell them. If I wanted real sport, I had rather work hard all day for ten good fat ducks or grouse, than to murder a hundred or so. There is no skill about it where they are so thick that all you have to do is to take out and put in shells and fire away. There is no sense in a man—even if he is worth millions—shooting more game, or catching more fish than he can use when he is off on his annual "shooting or fishing trip." I have read your paper from No. 1 up to No. 10, and I must say I am sick of seeing in every paper a howl from a so-called "gentleman sportsman" saying "Death to the market-shooter!" "Down with the pot-hunter!" "We must protect the game!" "So we kid-gloved hogs" will have more to shoot and more to brag about! Of course I do not mean to say that all "gentlemen sportsmen," rich or poor, are hogs, but I am afraid a great many of the rich ones are. I think those "sportsmen" who hire guides to hunt out and help shoot the game, ought to be placed in the same category with the "skin-buffers, who have hundreds of buffaloes to rot on the plains."

I think the "gun and rod clubs" organized all over the United States for the protection of game, ought to have a pro once in a while to brace them up to their work; they claim to be in favor of protecting the game, but as soon as the law is off, each member seems to vie with the rest as to who will kill the most game, and I believe there are a hundred birds killed now with a gun as there were one before there were any "rod and gun clubs." As soon as a club is formed in any town, a number of the merchants, ministers, lawyers, doctors, clerks, etc., who make up almost wholly the great crowd called "gentlemen sportsmen," join the club, a great many of whom never fired a gun in their lives, except when boys, nor caught fish either. But after they have been a few times to the wilderness of "York State" or "Illinois" or "Iowa" or "Nebraska," they are glad to call themselves "true sportsmen," and tell of their experiences, and set themselves up as men able to give good advice on all subjects relating to gun and rod, when they do not know the first thing about the subjects mentioned, but rely on their guides to place them on the best runways for deer, or the best holes in the ponds and streams for trout, and with their help kill and catch more than they can use, and then leave a few of the former and large quantities of the latter to rot, just for the reason that their vacation comes only once a year, and that they must bring to bag all they can in the two or four weeks they have to spare for the purpose, so that they can brag when they get home as to what great sportsmen they are, and what large quantities of game they got. If this is being a "true gentleman sportsman," I do not wish to join the band.

My idea of what a sportsman ought to be, is a man who has used the rod and gun most of his life, who understands the nature and instinct of all the objects of his pursuit, who when in the woods or on the plain, and by the lake or stream, can by his own skill fill his bag, can paddle his own canoe, row his own boat, build his own camp, tie his own flies, and find his way home with no need for a guide, who enjoys being out in the open, free from care or trouble, who does not kill just for the sake of killing or bragging; who is a hunter every day of the year, and who is not a "gentleman red or black" gentleman sportsman or market-shooter, shall have just as good a time as himself, so long as they are not hogs, and do not kill everything they can find on their

tramps, but after killing enough for a meal, and perhaps for a friend, are ready to quit and go home, and leave what is left for some one else or for another year; and finally, one who lives up to the game laws, no matter what anyone else does or says, and who never breaks a game law.

Now as far as the "market-shooter" and so called "true sportsman" are concerned, there is but little difference, one kills for profit, and the other for pleasure, and both kill the same quantity of game. The "market-shooter" is the best one of the two, for his game is sold to the market man, and then bought by people who have no time nor money to shoot themselves, while the "gentleman or true sportsman," after he has shot enough for himself, and a few friends, keeps on shooting to throw away. It is just as Frank Forester says in his "Manual for Sportsmen," page 298, viz.: "The fiat of wanton destruction has gone forth against all the wild inhabitants of the woods, the fields, the marshes, and the waters, as irrevocable as that against the red Indians, for profit, for pleasure, for mere recklessness and the love of useless slaughter, the work of extermination is going on eastward, and westward, from the salmon rivers and trout streams of New Brunswick and Nova Scotia, to the prairies and plains of the great North-western Mountains. And again: "Many years will not elapse before no species of game, whether bird, beast, or fish, perhaps no wild animal, not so much even as a thrush, or a bluebird, will be left to enliven the fields, or the forest, and then too late, when the beautiful toil of the sportsman has no longer an object, and the table of the luxurious epicure is deprived of its choicest dainties, America will bewail its shortsightedness, neither more nor less than that of the clown who slew the goose with the eggs of gold."

In a very few years more, and his prophecy will come true. How can it be prevented? I say it will help a great deal toward it, if the gun and rod clubs all over the country would protect the game the whole year through, and for a term of years where the game is scarce, instead of only protecting it through the close season, and then beginning to slaughter it the minute the law is off. It is a great deal better to "hunt without a gun" where no game is scarce, than it is to lay the whole cause on the head of the "market-shooter," when the fault-finders are so much to blame themselves.

I ask all the so-called "true sportsmen" why they call a market-shooter or anyone else that knows enough, and is able to kill more game, or catch more fish than they can, a pot-hunter. Now I think there is a good deal of honor in being a first-class pot-hunter, so far as being able to pick out a good tender piece of meat, and a good day for market, is concerned. A POOR OLD MARKET-SHOOTER.

ST. AUBURN, VT., FEB. 25.

HINTS ABOUT LOADING.

Editor Forest and Stream:

Permit me to call the attention of your readers to an accident that happened recently to a friend of mine. Although such an accident might be avoided by the exercise of no other degree of intelligence than a well-hred collie dog is supposed to possess, yet, I am convinced from inquiry and observation, that very many of those who have occasion to use and load shot shells (and especially those living in the country) are guilty of the same act that caused this accident, viz., deapping and reappaling loaded shells held in the hand. The young man had been out shooting and one shell missed him. As he was about to load the cap at the end of the shell (a Draper) and removed the primer, placed a new one on the nipple, and holding the shell in his hand with the butt down, attempted to force the primer home by light blows or taps on the stone hearth. Result—an explosion. The shell burst and his hand was shattered and maimed for life. If he had placed his hand over the muzzle of a loaded muzzle-loading gun, and held it there while forcing a cap on to the nipple by repeated blows of the hammer until an explosion took place, he would not have been more careless. Further comment unnecessary.

I learn by your issue of the 15th, that Dr. Piffard, of New York, has invented a new shell, in which he claims to have the advantages of both paper and metal shells, with the defects of neither. It seems to be his opinion that by using metal shells as heretofore constructed the shooting qualities of a gun are impaired by the use of wads too large for the bore of the gun, etc., and I think this is true as such shells are usually loaded.

After much experimenting I have adopted the following method of loading metal shells when I desire extra hard shooting with a light gun: I use a 12-gauge; powder, 23 drs. Dupont's "choke-bore" No. 7, to which I add 1 dr. best fine powder (putting fine powder into shell on top course). I then put on to the powder a heavy cardboard 11-gauge wad, and a 10-gauge muslin-edge, then an 11-gauge wad, and a piece of harness leather (of about same thickness as felt wad), with from 1/2 to 1 1/2 ozs. chilled shot (if coarse shot, use not to exceed 1 1/2 ozs.), with 10-gauge pink-edge wad on shot. By placing the 10-gauge pink-edge felt wad between the cardboard and leather wads I succeed in expanding the felt wad so that escape of gas is impossible, more so than with two pink-edge wads alone on powder; and beside, all of the wad pass from the gun undisturbed by powder or shot, the leather wad reaching the muzzle perfectly flat and true with the bore of barrel. This gives a pattern remarkably free from bunches or open spaces. By using powder as stated, I obtain better penetration than any amount of coarse powder will give in my 12-gauge, 28-inch barrel, 74-lb. Fox gun. In fact, I have yet to see the gun of any gauge that will give better penetration, or that is more certain to kill a duck or grouse at any distance.

I have experimented for the purpose of ascertaining how much powder of size grain No. 3 Orange "ducking" can be hurled up clean in a full 12-gauge breech-loading gun. I placed a board target, with the surface smeared with lard, two rods away from the muzzle of my gun; I aimed and shot, both with and without shot in shell. This I repeated many times, with more or less powder, cleaning target when necessary and putting on more lard. With 24 drams powder and ounce shot could not find my unburned powder either in greased surface of target or along the board upon path leading to it. With 3 drams without shot I found some unburned powder both on target and along path, and continued to find increased amount of unburned powder as charges were increased up to 4 drams. But I found less when the shot was used in the shell. With 24 drams coarse and one dram fine powder, I could not find any unburned powder in any part of the shell, and the shot much heavier than with 4 drams coarse, with a trifle better pattern and with less loss of the gun.

Any one who will take the trouble to force, with a large

rod, one or more 10-gauge felt wads through a full 12-gauge gun from breech to muzzle will at once see why a uniform pattern cannot be obtained. When only 10-gauge wads are used the center of the uppermost wad will be raised in a convex form, causing dispersion of shot from center of pattern. Now place a leather wad 11-gauge on top of a 10-gauge felt wad and force through same barrel. The leather wad will reach the muzzle perfectly flat and true with the bore of the gun, and will give an even distribution. Some guns using 12-gauge metal shells are only 13 or 14 gauge at muzzle. In such guns use on top of felt wads and next to shell a leather wad that will just fit bore at muzzle, and a corresponding pattern will be the result. The same principle applies to any gauge bore, and am well convinced from my experiments that using two pink-edge wads alone on powder will not give as good penetration as a single pink-edge placed between cardboard and leather wads of proper size. This is due, in my opinion, to the fact that the single felt wad thus placed expands laterally to a greater degree, thereby more effectually preventing the escape of gas with less friction.

Perhaps some other correspondents may add to my notes a description of their own experiments in loading.

WILLET, N. Y., March 20, 1883. M. E. B.

NEW JERSEY GUNNING GROUNDS.

THE following list of the names and addresses of equipped gunners of the New Jersey coast, with the shooting points at their command and their rates, is taken from a late issue of the Coast Pilot.

CAPE MAY COUNTY.

CAPE MAY CITY—80 miles from Philadelphia, by West Jersey Railroad, via Market street wharf. Enoch Schellenger, Harold Schellenger, Jerry Schellenger, Charles Seiffelinger, Reek Hand, Joseph Hand, D. W. Pearson, James Clark, A. P. Hildreth, E. C. Taylor, F. Sidney Townsend, Col. J. L. Lansing, Clark Brothers. Rates, \$2.50 per day and board.

CAPE MAY COURT HOUSE—60 miles from Philadelphia, via West Jersey Railroad. Charles E. Foster, William H. Foster, E. C. Wheaton, S. F. Hewitt. Rates, \$2 per day and board.

DEPTFORD—One mile from Cape May Court House. Lewis Ludlam, Benjamin Hawkins. Rates, \$2 per day and board.

DENNISVILLE—Four miles from Seaville on West Jersey Railroad. Edwin W. James, Joseph Blizzard. (Upland and Sound shooting.) Rates, \$2 per day and board.

SEAVILLE—61 miles from Philadelphia, via West Jersey Railroad. F. Shute. (Upland and Sound shooting.) Rates, \$3 per day and board.

TOWNSEND'S LEEF—Via Seaville. William Sutton, Howard Rice. Rates, \$2.50 per day and board.

TUCKAHOE—Six miles off Woodbine Station on West Jersey Railroad—total distance, 62 miles. Major W. B. Brown, Thomas S. Clark. (Jund and Rivers.) Rates, \$2.50 per day and board.

BEESELY'S POINT—Reached via Pleasantville, West Jersey and Atlantic Railroad—total distance, 67 miles. Thomas Clauser, John Clark, William Stites. Rates, \$2.50 per day and board.

Gunning resorts in Cape May county are in and about the various sounds and thoroughfares, as Cape Island Sounds, Grassy Sounds, Jarvey Sounds, Cresse's Thoroughfare, Great Sounds, are well-known and available points in this county.

BURLINGTON COUNTY.

TUCKERTON—Capt. Wm. Gaskill, Capt. Joseph P. Shourds, Hazleton Jones, Samuel K. Shourds, J. G. Downs, James Marshall, Lewis Parker, Samuel Shourds, Jr., Wm. A. Mathis, John Sprague, Henry Shourds, Wm. Horner, Wm. R. McDaniel, Noah Marshall, Charles Horner, Abram Price, Edward Parker, Mason Price, Peter Parker, James Horner. Rates—\$2.50 per day and board.

Available gunning points in Little Egg Harbor Bay accessible from Tuckerton: Gautt's Point, Gautt's Cove, Jerimie's Point, Jerimie's Cove, Rose's Point, Rose's Cove, Hester Sedge, East Sedge, West Sedge, Johnny Sedge, Johnny Sedge, Shelter Island, Parker's Island, Middle Island, Storrey's Island, Hester Island, Bunches Island, Big Bunches, Barrel Island, Goose Bar, Buntion Sedge, Little Island.

OCEAN COUNTY.

TOMS RIVER—Vincent W. Applegate, Lane Applegate, George Irous, Samuel V. Pierson, James Robinson, Fred Grant, Israel Hoffinger, John Grant. (Bay gunning.) Equipped sportsmen with yachts. Rates—\$5 per day and board, boats and equipments.

CHADWICK'S—John Applegate, Charles Sceman, William H. Gaunt, William Vannote, James Lovelaud, Gilbert Chadwick, Weston Chadwick.

MAX CHIEF—69 miles from Philadelphia on Tuckerton Railroad, via Pennsylvania Railroad by Market street wharf—122 miles from New York City. James Horner, Samuel Parker, Abram Price, Edward Lorton, Richard Cramer, Job Parker, William Horner, Abram Pharo, Aaron Pharo, Lewis Parker. Rates—\$2 per day and board. Well-known available gunning points in Little Egg Harbor Bay accessible from West Creek: Ham's Island, Sheep's Head Island, High Island, Little Island, Beach Meadow Point, Egg Island, Marshelder Island, Parker Island, Sand Point.

MANAHAWKIN—65 miles from Philadelphia on Tuckerton Railroad; 118 miles from New York City. Frank Martin, Humphrey Martin, Dal Cramer, Lewis Laman, Joseph Cramer, Joseph Cramer, William Letts, E. B. Ohliphant. Rates—\$2.50 per day and board.

Well-known available gunning points in Little Egg Harbor and Barnegat bays accessible to Manahawkin: Egg Island, Thoroughfare Island, Lazy Point, Gulf Island, Bear Island, Parker's Point, Oyster Point, North Point, Red's Fishing Point, Main Point.

BARNEGAT—80 miles from Philadelphia via Tuckerton Railroad, 113 miles from New York City via Central New Jersey Railroad. Henry Grant, John Horner, Scurr Burr, Jefferson Woodmanic, Charles Sprague, James Cox, Jesse Birisall, Augustus E. Cramer, Charles Ridgway, Geo. H. Vannote, Jarvis Ridgway, Alphonso Bayres. Rates—\$2.50 per day and board.

Well-known available gunning points in Barnegat Bay, accessible from Barnegat, Harvey Cedars, Barnegat Inland, Barnegat Bay, Barnegat Island, Carver's Island, Little Sandy Island, Lovelady's Island, Voll Sedge, Gulf Island, Big Sandy Island, Marchelder Island, Sloop Sedge, High Bar, Clam Islands, South Point of Gunning River.

NEW MAINE LAWS.

INSECTIVOROUS BIRDS.

An act to amend section fourteen of chapter fifty of the public laws of eighteen hundred and seventy-eight, relating to insectivorous birds. Be it enacted by the Senate and House of Representatives in Legislature assembled, as follows:

Section fourteen of chapter fifty of the public laws of eighteen hundred and seventy-eight, is hereby amended by adding thereto the following words, viz:

"Under a penalty of not less than one dollar nor more than five dollars, for each bird, or in possession except alive," so that as amended said section shall read as follows, viz:

Sec. 14. No person shall kill or have in his possession, except alive, any of the birds commonly known as larks, robins, swallows, sparrows or orioles, or other insectivorous birds, crows and hawks excepted, under a penalty of not less than one dollar nor more than five dollars for each of said birds killed, or in possession except alive.

An act to confer upon sheriffs, deputy sheriffs, police officers and constables, the powers of game wardens and their deputies. Be it enacted by the Senate and House of Representatives in Legislature assembled, as follows:

Sheriffs, deputy sheriffs, police officers and constables are hereby vested with all the powers conferred by law upon game wardens and their deputies, and shall be allowed for their services the same fees as are now prescribed for sheriffs and their deputies.

MOOSE, CARIBOU AND DEER.

An act to amend chapter fifty of the public laws of eighteen hundred and seventy-eight relating to the protection of moose, caribou or deer. Be it enacted by the Senate and House of Representatives in Legislature assembled, as follows:

Section 1. Section three of chapter fifty of the public laws of eighteen hundred and seventy-eight is hereby amended by inserting the word "hunted" before word "killed" and by substituting the word "September" for the word "October," so that as amended said section shall read as follows:

Sec. 3. No person shall hunt, kill or destroy with dogs any moose within this State, under a penalty of one hundred dollars for every moose so hunted, killed or destroyed; and no person shall between the first day of January and the first day of September in each year, in any manner hunt, kill or destroy any moose under the same penalty as above provided.

Sec. 4. No person shall hunt, kill or destroy with dogs any deer or caribou within this State, under a penalty of forty dollars for every such deer or caribou so hunted, killed or destroyed; and no person shall between the first day of January and the first day of September in each year, in any manner hunt, kill or destroy any deer or caribou, under the same penalty as above provided.

Sec. 5. No person shall hunt, kill or destroy with dogs any moose, deer or caribou, under a penalty of forty dollars for every such moose, deer or caribou so hunted, killed or destroyed; and no person shall between the first day of January and the first day of September in each year, in any manner hunt, kill or destroy any moose, deer or caribou, under the same penalty as above provided.

Sec. 6. No person shall hunt, kill or destroy with dogs any moose, deer or caribou, under a penalty of forty dollars for every such moose, deer or caribou so hunted, killed or destroyed; and no person shall between the first day of January and the first day of September in each year, in any manner hunt, kill or destroy any moose, deer or caribou, under the same penalty as above provided.

Sec. 7. No person shall hunt, kill or destroy with dogs any moose, deer or caribou, under a penalty of forty dollars for every such moose, deer or caribou so hunted, killed or destroyed; and no person shall between the first day of January and the first day of September in each year, in any manner hunt, kill or destroy any moose, deer or caribou, under the same penalty as above provided.

Sec. 8. No person shall hunt, kill or destroy with dogs any moose, deer or caribou, under a penalty of forty dollars for every such moose, deer or caribou so hunted, killed or destroyed; and no person shall between the first day of January and the first day of September in each year, in any manner hunt, kill or destroy any moose, deer or caribou, under the same penalty as above provided.

Sec. 9. No person shall hunt, kill or destroy with dogs any moose, deer or caribou, under a penalty of forty dollars for every such moose, deer or caribou so hunted, killed or destroyed; and no person shall between the first day of January and the first day of September in each year, in any manner hunt, kill or destroy any moose, deer or caribou, under the same penalty as above provided.

Sec. 10. No person shall hunt, kill or destroy with dogs any moose, deer or caribou, under a penalty of forty dollars for every such moose, deer or caribou so hunted, killed or destroyed; and no person shall between the first day of January and the first day of September in each year, in any manner hunt, kill or destroy any moose, deer or caribou, under the same penalty as above provided.

MOOSE, CARIBOU AND DEER.

An act for the protection of moose, caribou and deer. Be it enacted by the Senate and House of Representatives in Legislature assembled, as follows:

Section 1. No person shall kill, destroy, or have in possession from the first day of September to the first day of January in each year, more than one moose, two caribou or three deer, under a penalty one hundred dollars, or every moose and forty dollars for each caribou or deer killed, destroyed, or in possession in excess of the said number, and in case of conviction all such moose, caribou or deer or the carcasses or parts thereof shall be decreed by the court forfeited to the use of the party prosecuting, and the provisions of sections twelve, thirteen and fourteen of chapter one hundred and thirty-two, but the warrant may be issued on complaint of said warden or either of his deputies.

Section 2. Any person owning or having in possession dogs for the purpose of hunting moose, caribou or deer, or that are used for such hunting, shall be liable to a penalty of not less than twenty nor more than one hundred dollars.

Section 3. The penalties prescribed in this act may be recovered in the manner provided in the provisions of section five of chapter fifty of the public laws of eighteen hundred and seventy-eight.

SALMON AND TROUT.

An act for the protection of salmon, land-locked salmon and trout. Be it enacted by the Senate and House of Representatives in Legislature assembled, as follows:

Section 1. No person shall fish for, take, catch, kill or destroy any fish in any waters, except tide waters, with any net, seine, weir or trap, under a penalty of fifty dollars for the offense and ten dollars for each salmon or land-locked salmon, and one dollar for each and every other fish so taken, caught, killed or destroyed.

Section 2. No person shall kill or destroy any land-locked salmon less than nine inches in length, or any trout less than five inches in length, under a penalty of five dollars for each fish so killed or destroyed, and ten dollars for each and every land-locked salmon or trout so killed or destroyed. Any person having in possession any land-locked salmon or trout of less than the above dimensions shall be deemed to have killed or destroyed them in violation of the provisions of this section.

Section 3. No person shall take, catch, kill or have in possession at any one time for the purpose of transportation more than fifty pounds in weight of land-locked salmon or trout, or of both together, nor any such fish transported in violation of the provisions of this section shall be liable to seizure, on complaint, and shall be decreed by the court forfeited to the use of the party prosecuting. Any person having in possession more than fifty pounds in weight of the fish aforesaid, shall be deemed to have taken them in violation of this section.

Section 4. All penalties imposed by any of the sections of this act may be recovered in the manner provided in section twenty-six, chapter seventy-five of the public laws of 1878.

OTHER LAWS.

The following acts were also passed and have become laws: An act to prevent the taking of trout from Tappan's Pond and Grinnell's Pond in the town of Kingfield for the term of three years.

An act for the better preservation of black bass in Penesse-wassee and Hobbs's ponds in Norway.

An act to regulate the taking of fish in Mouson, Elliottville, and Williamantic.

An act relating to fines and penalties recovered for violation of the fish and game laws. (This act provides that all fines and penalties recovered for violation of the fish and game laws shall be paid one-half to the complainant and one-half to any game and fish protective society or any other sportsman's association organized under the laws of the State and located in the county where said fines were recovered, provided that they spend the same in the propagation and cultivation of trout and salmon for the fresh-water ponds and lakes of Maine, to be done under the direction of the fish commissioners. The fish commissioners shall designate to which it shall be paid in case of there being more than one society in the same county.)

An act to prohibit the taking of fish from Messabasic Pond and its outlet in the town of Alfred.

An act to prevent the taking of trout from Bryant's Brook and Beaver Brook in the town of Scarborough.

An act to prohibit the taking of fish from Bungeawent Pond in the towns of Alfred and Lyman.

An act to repeal Chapter 193 of the Public Laws of 1874, and of Section 17 of Chapter 50 of the Public Laws of 1875, relating to taxidermists, and all laws authorizing their appointments.

An act making Sunday a close time for game and birds of all kinds. SAMPOON.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

BROOK TROUT.

This fish is in season on April 1st, as follows: California, Connecticut, Iowa, Massachusetts, Minnesota, New Jersey, New Mexico, New York, North Carolina, Pennsylvania, Rhode Island, Virginia, Washington Territory, and Wisconsin.

If then you chance to read this treatise, it shall seem no otherwise to thee than the way of an ordinary traveler—sometimes fair, sometimes foul; here champagne, there enclosed; barren in one place, better syle in another; by woods, groves, hills, dales, plains, I shall lead thee.—Burlin's Anatomy of Melancholy.

TOT'S TROUT.

BY MRS. FRED MATHER.

O BEAUTIFUL TROUT with the crimson dot; My grasshopper waits for you; I know that you're hiding below that root, And to reach you I'll wet my shoe. I've borrowed a line from brother Ben, A hook from Cousin True, And I've hurried away from my kitted old doll, To pay a visit to you.

I saw you yesterday under the boat With the polka dots on your side, Your olive green mantle shaded with black, And your fins spread out so wide. You were real mean to go way so soon When I just put in my hands; I only wanted to smooth your back, And tell you about the land.

We've got the loveliest violets here, Paucists and Jacobins, Scarlet runners, and primroses with white, That will exactly match your fins; And just the dearest golden girls, Some of them dusted with blue; So, now, little troutie, just bite my hook, And then I'll show them to you.

I'll show you the nest that the wren has made In a hole in the linden tree, With two of the cunningest little eggs, And nobody knows it but me. I'll show you my dolly and all her clothes, My kitten and Bennie's big dog, The place where the humble bees go in the barn, And the moss on the old hollow log.

Come, beautiful trout with the peary side, My grasshopper's getting all wet, Bennie is calling and I must go home, Or dolly will worry and fret. Now, come, little troutie, do not, so hard! You are pulling me into the stream; And you've taken the grasshopper off from my hook; I just think you are real mean.

BOYHOOD REMINISCENCES—II.

THE SWAMP TROUT—BAGGING SUCKERS.

OLD Hunter had two places, perhaps more, where he was wont to go in a secret manner, from which he brought home large trout. He was a shrewd character, and produced only a few at a time, just enough to fill an order for a trout breakfast or to dispose of without attracting too much attention.

One of these places was discovered by that famous woodchuck shooter and pickerel fisher, Scott, who while skittering for his favorite fish, discovered Old Hunter in a boat out in the middle of the reservoir, where he knew the water was at least ten fathoms deep. Now, he reasoned, the old man would not be there for his kind of fish, for pickerel don't lie in deep water, but nearer shore where there is feed. He tried to get nearer to find out what he was after, but the old fellow immediately rowed away. The next day Scott heard that Judge Mason had bought two trout of Old Hunter of nearly two pounds a piece in weight. Now, this reservoir was built to supply water through feeders to the Chenango Canal. There were two of these reservoirs, and on high ground, letting water into the summit of the canal. They were made from springs and brooks that passed through them. We all knew there were trout in the brooks, both above and below the reservoirs, for we had

caught many a one, but none over a pound. And we knew, too, that there were cold, terribly cold springs in the middle of the big waters, for we had swam across them and been chilled to our very bones. In fact, one of the most promising young men—a student at the university—lost his life, having been seized with cramps while in bathing there. He was an excellent swimmer, but the extreme cold on a warm summer's day doubled him up, and before assistance could reach him he sank. Yes, we knew about the cold springs, but none of us dreamed of their being full of tremendous big trout.

Scott was on hand the next day, and he was a very fortunate fisherman on big trout for some time. How we hoys go to hold of it I have forgotten, but Old Hunter was disgusted.

The second secret of his I discovered. I was picking strawberries on a side hill that sloped down toward a dense swamp, some two miles out from the village. I saw Old Hunter with his tin pail on his arm; his red tippet betraying him a quarter of a mile away, for he always wore it in summer as in winter. Old Hunter I now discovered stealing into the swamp. What is he after there, I wonder, "Yarbs," I suppose. For the old fellow had more or less knowledge of the healing powers of certain plants, at least he had the credit of this; and was often commissioned to gather certain kinds from time to time. "Yarbs," I guess. But why does he sneak in that careful way, and look around as if he didn't want it known that it was he and he there? I guess I will investigate.

I crawled on my hands and knees down to the fence, across the road, and through another fence, and was in the swamp ahead of him when the old man went in. It was a wet and boggy place fed by springs from the hills on both sides, and from which ran a small brook. Tradition said there used to be trout in the brook, but there were none, or but a few little ones, in our day. By careful dodging I did not betray myself, but kept within seeing distance of my object. When near the middle of the swamp he stopped and laid down his pail. With his hatchet he cut open a hole or stump, and thence took out five white grubs. Then from some inner pocket he brought out a fish line, and baited the hook with one of the grubs. Well, I had to laugh quietly to myself; going to fish in some hollow stump or hole for a woodchuck, I guess—when, behold! The ground where he stood was boggy and lumpy, with here and there small spaces of water, none of the surfaces of water being larger than a good-sized fish-bait. The ground was so spongy and lumpy that when he stepped on it, the old man stepped on a bog and dropped his baited hook over into what I supposed was water not more than a few inches deep, but to my utter amazement the line ran under and off at one side at least ten or twelve feet. A subterranean region of unknown proportions was there. It was not a minute before out came a trout of not less than a pound and a half; then another, until he had five wet not less than seven pounds of the very best of the most superb trout fish in the world, for no country nor climate can or does furnish anything so good as a wild speckled trout out of a cold spring. These were placed in his pail and carefully covered up with leaves, and the cover securely tied down; and then the old fraud stole out on the other side of the swamp, to go away around the village, two miles or more, and come in from a different direction. Oh, he was a cunning 'coon!

It was not long for me to get a fish-line and grub, and I caught six splendid fellows. How black they were, how fat, how short, and broad across the back, but genuine speckled trout. How cold and hard and, ye gods, how delicious. How the folks opened their eyes when I brought them home; and what a breakfast—words cannot do it justice. The memory of their sweetness, their plumpness and flavor takes me back nearly forty years. Alas! the swamp is long gone, cleared off and drained, making way for the farmer's grass. I wonder how many of those magnificent beauties perished thus, of no benefit to anybody. I don't think we caught them all; for they grew shy; and sometime wouldn't bite at all—but they were there.

Old Hunter found the ground trodden down (he was very careful himself in that respect) and he knew his secret was in somebody else's keeping. He caught me there one day, and his wrath was vehement, and as much as right as he. He said I was a fool and idiot to give away my way, and catching so many and by not being more cautious in my approaches, etc. Well, he was right, but I was a boy.

Bob Uplam was the famous trouter of that region in later years, and I, am told, even yet. He used to have some sacred spots to which he would slip off and bring home big strings, but he never had the *Bonanza fontinalis* (how is that for any classic?) I had for awhile.

Talking of trout, I remember one of another favorite way of fishing. Did you ever hook suckers through the ice? Ah! that was fun. The canal and the different feeders furnished good feeding grounds for certain kinds of fish of the coarser varieties, especially suckers; and suckers in the winter were not bad eating, especially when you were so far from the coast, with no railroad near. Fresh fish, instead of salt cod or mackerel, were at a premium.

The way we caught suckers, and sometime pickerel and perch, was to go about five together, three to hook, and two to drive and change about. Our implements were three large hooks, fastened together in triangular shape; or better, a tool in the shape of a hay rake, only that the teeth were parallel with the rake's tail. Having cut three holes in the ice, thrown in a few white beans or some corn to light up the surroundings, we lay down over the hole, our hooks near the bottom, the handle of the rake's tail grasped firmly in one hand, and both sharp, of course, and pointing upward. The others of the party having gone above some ways on shore, then approached us on the ice with big clubs or a big chain, thumping the ice between them, thus driving the fish by us. And they came in schools, sometime big ones. As they passed over our hooks we jerked up, landing them on the ice, then thrust the hook into the hole with celerity to repeat the operation until the school drove by. All the while we would be and some distance ahead and cut fresh holes and then again others, until we thought we had sufficient of the fish for the day. On our way back we picked up our spoils at the various holes. Generally, we had a large hand-sleigh to draw them home on the ice. Sometime when we struck a big school, two expert hookers—for it was no slow business, I tell you—would land on the ice from one to two bushels at one drive, and to be repeated in less quantity until the school is used up.

One of our biggest times, I remember, was a litter cold day; but the excitement kept us warm. We drove the Lebanon feeder for several miles. We hagged (haggling suckers, think of it!) sixteen bushels, a one-horse lumber-wagon load. There were five of us, and we had suckers

enough each to give away to our friends and the poor of the village. Doc Havens was a famous hooker, as well as trout fisher. He was along that big day. I don't believe he has forgotten it. It took a quick man to snatch a pickerel, for they went by like a flash, but the Doctor could do it. When there was a chance for pickerel in the streams or reservoirs, they used to make a drive (which I didn't like), until I got older and could handle the hook like a veteran.

"Well, those were great days.
"If our foresight was only as good as our hindsight?"
Yes, that is so. But it does an old fellow go to go back to them. Yes, I am getting garrulous again. Good-night.
JACOBSTAFF.

TROUT OPENING IN FULTON MARKET.

THE annual display of trout on the opening of the season will take place in Fulton Market, New York, on Monday and Tuesday, April 2 and 3. Mr. Blackford sent out the following circular to trout breeders and others some weeks ago:

DEAR SIR: In addition to my usual trout display, I desire to give an exhibition of as many specimens of the various kinds of fish as have been hatched out or raised by fish-culturists of this country.

I should esteem it a great favor if you would send me a few specimens from the hatchery under your charge, accompanied by a label giving name, age, and all particulars necessary for the instruction of the public. All specimens should be shipped so as to arrive here early on April 1 or 2.

The object of this exhibition is to create a greater public interest in fish-culture. Trusting I am not troubling you too much I remain,
E. G. BLACKFORD.

We are informed that in answer to this he will have both the rare and beautiful "Dolly Varden" trout and the rainbow trout from the United States salmon ranch at Baird, Shasta county, Cal.; the handsome "Clark's trout," *Salmo clarki*, from Nevada, as well as specimens from our Eastern *Fundulus* from all parts of the East. The New York Fish Commission will send specimens of different fishes from its hatcheries at Cold Spring and Gold Springs, Mr. Jas. Annin and other private breeders will send their contributions, and the South Side Sportsman's Club of Long Island and the Suffolk Club will be well represented. The whole of the new market will be thrown open on that day; the dealers in meats, fish and game will endeavor to make a display for the public which will be attracted by the "trout opening" of Mr. Blackford. This gentleman has, by his energy and large expenditures, earned the thanks of the public for the establishment of trout day, and his opportunity to compare the fish from different localities, and so to educate anglers to the observance of the different species and varieties. We will give our readers at a distance a good report of the exhibition, which will be one that many will regret their inability to see.

The invitation to the opening this year is in the style of Mr. Blackford's former ones, and will, of course, be more artistic, we hardly think it as beautiful as former ones. The cover contains a fair mermaid, without her traditional comb and glass, holding a slip which winds about and is inscribed "Opening of the Trout Season of 1883." Below is the verse:

"And when ye thunders from I wait
To take, and he devours my bait,
My pleasure 'tis to then invite
My friends to share in my delight."

On the inside is a rainbow and a Dolly Varden trout, side by side, while above and looking down through the water the brook trout is gazing at the strangers. A little nondescript in the middle seems contented to stay in the background. On the opposite page is the invitation and a water scene with rods and reel in the foreground.

THE WALL-EYED PIKE.

(*Stizostedion*, Raf.; *Luciperca*, Cuv.)

THE following communications on this neglected fish will prove of interest:

I was much interested in the report in your columns of the 15th regarding wall-eyed pike. As you press a wish for further notes on this subject, I will give you some facts that are largely within my own knowledge.

I have seen large numbers of wall-eyed pike caught at the St. Clair flats and on the St. Clair River, above the flats. The wall-eyed pike is a game fish, nearly, if not equally as game as the black bass. It is a bold biter, especially during the mouths of April and May, they are then leaving the lakes, going into the rivers before their spawning season. During these months it will give the angler ample opportunity to exercise his skill. I have never seen them taken with the artificial fly, but I have seen numbers of wall-eyed pike taken with minnows, which is the usual bait at the St. Clair flats.

In April and May they are trolled for with a spoon in the St. Clair River, and I have seen as many as eight large pike, weighing from two to ten pounds each, taken in less than two hours. As a rule they are bold biters, and fight well for life and freedom. In the latter part of June and July they are spawning; then it seems they cannot be induced to take any kind of bait, and it is as well, for at such times they are not fit for food, and ought not to be caught. I have seen the wall-eyed pike taken with an apparatus called a "bobbing line," a piece of coarse line from eighty to one hundred feet long, with four large hooks fastened together in the center of the ground, and lead weights and floats well spaced, attached to the end below the hooks. They take this fishing tackle with a small skiff and row out in the stream and cast the line; the lead sinks to the bottom, and as the boats drift slowly down with the stream, the hooks are dragged or jerked along the bottom, as the angler keeps his arm continually in motion, which jerks the hooks along the bottom in this way. The fish is hooked in any and all parts of the body when it is struck, the hook is then taken in hand over hand, and the fish is taken apparently without a struggle.

The wall-eyed pike can only be taken in this way during the months of June and July, when they are spawning, then they seem to have no life in them, and nothing to do but float around the bottom of the river. Of course such fishing is not sport, and an angler who fishes for sport would blush with shame to take them in from the stream in this manner. At any other season—except June and July the angler who attempts to take the wall-eyed pike either with the rod or the trolling line and spoon, will find plenty of sport and

ample opportunity to test their skill. The wall-eyed pike is strictly a game fish, and as a food fish he is second to none.
WISCONSIN, March 19.
MARTIN E. O'BRIEN.

My experience with the wall-eyed pike may throw some light on their game qualities. I have taken them in Bloek River with ordinary tackle, live minnows for bait, and found them hard fighters and free biters. I have also taken them in the Upper Onondaga. This river is clear, swift, and has a rocky bottom. My mode of fishing there was to use a light float, live minnow, a yard long leader, and seventy-five yards of line. I would then find a rapid and let the bait drop down with the current. The river abounds in bass and I caught them often than the pike, but I never could see any difference in game qualities between the two. I never tried them with a fly. I never fished for any of our fish with a fly, nor did I ever take one on a troll. My experience is that they differ very much from a chunk of wood, as your first correspondent thinks. Let him try them in cold, swift water and he will change his opinion at once. If living in sluggish water they might lose their game qualities. Bass caught in the lagoons near here are not so game as the same fish caught in mountain streams. Piscator.

LITTLE ROCK, ARK., March 19.

Presuming that your "wall-eyed pike," or "pike perch," is what we in Canada call pickerel, or in the Province of Quebec "doré," I beg to add my humble quota of information regarding their habits, etc. One moonlight night some years ago, I caught one on a red bass fly when proceeding to shore after fishing near the St. Lambert's end of the Victoria Bridge, Montreal. Since then I have heard of several cases where the pickerel was taken on a troll. In St. Lawrence, Ottawa and Rideau rivers, the blue jay is their favorite. To succeed I am told that it is necessary to allow the flies to sink an inch or two below the surface of the water. We count them here as next, in point of sport, to the black bass. They grow, in the rivers above mentioned, from nine to fifteen pounds, and the larger ones fight vigorously when not yanked in the hand over hand with a trolling line. The pickerel is a game fish, but not when feeding they are somewhat like their cousins, the pike, not very particular.

OTTAWA, Province of Ontario.

I see in your issue of the 15th inst. that you invite contributions on the subject of the pike-perch. This fish is known in this locality as the salmon, and is comparatively rare. As a fly fisher, I regret to say that I have not afforded as much sport to the angler as either the small or large-mouthed variety of the latter. In taking the bait he strikes very tamely, and when hooked keeps close to the bottom, never, in my experience, leaping out as the bass does. This fish is much scarcer now than formerly. I have been told by competent authorities that ten or twelve years ago they were numerous as the bass; but at present, if the number of each caught in a season be any indication, our streams do not contain one pike-perch to a hundred bass. I am at a loss to account for this diminution in numbers, as they are only caught by anglers who are fishing for bass, never, so far as I know, being caught in nets or seines, or taken on troll lines. They bite best in early spring and late fall, and very early in the morning and late in the afternoon. The largest specimen I have seen was a specimen weighing eleven pounds, and was caught in a trap on the "Massed Shoals." A friend of mine caught one in Cypress Creek, near Florence, Ala., that weighed nine pounds and some ounces. This fish was killed with very light tackle. The largest fish of this kind I have ever heard of was caught in a stream near this place, and is said to have weighed over seventeen pounds.

SAVANNAH, TENN., March 21.

A GROWL FROM GRIZZLY GULCH.

A FEW miles north of this place (our present camp) and about one hundred and twenty miles northeast of Denver, at an elevation of 8,500 feet in the Rocky Mountains is situated a body of water called the Lost Lake. Any person in this vicinity can testify that there is not another body of water of the same size in Colorado that is inhabited by trout of all sizes in such numbers as said lake. Nor is this lake unknown to the money-making guide. In the fall of 1882, under the leadership of one of these guides) came a party of five Eastern tourists to the Lost Lake. Game was plenty, mountain air was abundant, and trout was to be had by the hundreds within two hundred yards of their tent. Here for some four weeks this party of tourists remained living like kings and enjoying themselves only as the lover of rod and gun can enjoy themselves in the heart of the Rocky Mountains. They had all the game they could eat, and ten times more trout than they could make any use of.

The time came when they deemed it necessary to again turn their steps toward the rising sun. This party of tourists came here for recreation and sport with the rod and gun, and you may learn from what I have already written, that their desires were fulfilled to the utmost. Now would not any ordinary Eastern man be satisfied with such results? I sincerely hope so. But these hogfish flew over their heads, and the light of day dawned the morning on which they started on their homeward journey they obtained a quantity of giant powder, then taking a quantity of brown soap they made waterproof esings, inserted the powder therein, ignited the fuse and tossed them into the lake. These bombshells exploded with terrific force, killing the trout by the hundreds, and on the next morning the surface of the lake and its shores were one mass of dead trout of all sizes. But the anglers were gone, and they might well thank their lucky stars that the party of miners and ranchmen did not know their whereabouts, for nine out of ten chances there would have been news of another necktie party had the infuriated inhabitants overtaken them. The writer would like to know if these five are what you call trout boys. I should say that this includes the old saw and the pig and the peck-thru-in. If it were possible for me to find out the names of this party I would cheerfully give them to you in full; but as it is I cannot find any clew to their names, nor do I know where they were from. All I do know is that they came here from the East.

In December last an old hunter and myself started on a two-weeks' hunt. We turned our steps toward a favorite hunting locality in the Cheyenne and Rocky Mountains. On our arrival, however, we found deer signs fresh and plenty. Now it happened that a party from New York city who claimed to be sportsmen (under the leadership of a guide), arrived at said grounds on the same day, and pitched their

tent within a mile of our cabin. The first thing that greeted our ears on the following morning before daybreak was the crack of a rifle, then another and another and another, and this was kept up all that day and for the six days following. They were armed with repeating rifles, and it seemed to be their object to see who could shoot away the most ammunition.

It is hardly necessary for me to say that that party of New Yorkers did not see a deer the whole week they were there. Nor did we for I do not believe that there was an antelope, and the miles of either camp as long as that party remained. But greatly to our relief they took their departure on the eighth day, cursing the luck and the Rocky Mountains. My friend and I remained a few days later and got five deer.

Now the writer would like to know if this is the kind of stuff of which the majority of Eastern sportsmen, tourists, etc., are made. If so, for our sake and their own good they had better stay at home, and be contented with reading the FOREST AND STREAM and with what sport their native State affords them, for such vagabonds as the above will never make friends in the Rockies, nor will they ever be satisfied with their hunting here. But let the sportsman who is a sportsman come out here and he will be welcomed by all, and will find friends at every camp-fire; and he can make up his mind that he will have a good general time.

GRIZZLY GULCH, Colorado.

SILVERTIP.

EARLY FLY-FISHING.

OLLIAN, A. D., 231, a native of Macedonia, says: "I have had a receipt in form of the following method of catching fish in Macedonia. In the river Axos, which runs between Berana and Thessalonica, there are fish which are ornamented with spots of different colors, but the names they bear are best learnt from the people of Macedonia. Their food is the flies which frequent that river; and these flies differ from any that are found elsewhere; for they are not of the bees and wasps, but they unite in themselves the likeness of all these insects. The people of that country call them *lappuri*—horseflies; and as they fly near the surface of the water they are easily discerned by the fish, which therefore glides gently to the place where their shadows fall, and, just as a wolf snatches a sheep from the flock, with a gulp it seizes the fly and instantly plunges with it into the depths of the stream. This has been noted and copied by other fishermen, but with success. The people of that country play the natural fly which will scarcely bear to be handled, but they imitate it by art. A small quantity of purple wool is wrapped around the hook and a couple of wings are added from yellow neck feathers of a cock. The rod and line are each four cubits long, and this contrivance when skillfully cast on the stream is found eminently successful."—From *History of the Fishes of the British Islands*, by Jonathan Couch, Vol. IV., page 228.

NORTHERN MICHIGAN ONCE MORE.

Editor Forest and Stream:

When a boy I remember of reading that two knights armed "cap-a-pie" met one blue at the junction of two roads, in which stood a large shield. After saluting one another, one knight remarked on the blackness of the shield, "Not so," quoth the other, "It is white;" which the first knight contradicted; and so one word led to another, until they agreed to fight it out. Couching their lances, each charger was spurred forward with his greatest speed, and when the shock came knights and horses rolled in the dust. As the two warriors lay groning on the ground a third traveler came up and they appeared to him to settle the dispute. He, wiser than they looked at the shield on all sides before giving his decision. Then chiding them for their hastiness, he informed them they were both right, as the shield was black on one side and white on the other.

It may be that your correspondent, "W. D. T.," and myself are looking at opposite sides of "the shield." However, before we are challenged to enter the lists again by any worthy champion, I would like to finish this point and then retire. "Prairie Dog" does not expect to find trout on a mud flat, nor "Under waving rushes," but he not only expects to, but has found them in streams where, though the country is much more rugged than Northern Michigan, it is more easily traversed, and where a person would not lose as much blood. My map of "W. D. T." had found such streams he might "swear some." It may be a pleasant surprise to find that they enjoy it to fish in the rain, camp in the rain, and live in a beautiful state of dampness. I can and have stood considerable wet myself, but must confess I have a hankering after the dry spots, other things being equal.

It may be my "feet are tender," though I imagine if "W. D. T." had followed me in some of my wanderings his would have been caloused. If "W. D. T." had been careful to read just what I said in regard to the fish of Northern Michigan he would not have attacked the article in quite the style he did. Your correspondent, "G. H. W.," in issue of March 8, at least shows a willingness to admit that all might not think alike.

"W. D. T.'s" axiom must be of the kind of old saws Mark Twain calls frauds, for I will vouch for trout not being a fraud.

Discussion is a fine thing, and it is also a fine thing that we all do not think alike or all want to always visit the same section of the country. And also that each person sees certain sections of the country in a different light from his neighbor. I do not for one moment contradict "W. D. T.," but I would like to ask him to reply to a question. First, if he has visited a country where trout were numerous, and where other things being equal, climate nearly perfect, food of course not perfect, I don't claim that for any, scenery grand and everything harmonious; second, he then visits a place he has heard much in favor of, finds it greatly overestimated, finds a great many things conspiring to make it unpleasant, does not find the fish he expected to and knows he could have done better elsewhere; third, how would he decide, which place all, climate nearly perfect, food of course not perfect, I don't claim that for any, scenery grand and everything harmonious; second, he then visits a place he has heard much in favor of, finds it greatly overestimated, finds a great many things conspiring to make it unpleasant, does not find the fish he expected to and knows he could have done better elsewhere; third, how would he decide, which place all, climate nearly perfect, food of course not perfect, I don't claim that for any, scenery grand and everything harmonious; second, he then visits a place he has heard much in favor of, finds it greatly overestimated, finds a great many things conspiring to make it unpleasant, does not find the fish he expected to and knows he could have done better elsewhere; third, how would he decide, which place all, climate nearly perfect, food of course not perfect, I don't claim that for any, scenery grand and everything harmonious; second, he then visits a place he has heard much in favor of, finds it greatly overestimated, finds a great many things conspiring to make it unpleasant, does not find the fish he expected to and knows he could have done better elsewhere; third, how would he decide, which place all, climate nearly perfect, food of course not perfect, I don't claim that for any, scenery grand and everything harmonious; second, he then visits a place he has heard much in favor of, finds it greatly overestimated, finds a great many things conspiring to make it unpleasant, does not find the fish he expected to and knows he could have done better elsewhere; third, how would he decide, which place all, climate nearly perfect, food of course not perfect, I don't claim that for any, scenery grand and everything harmonious; second, he then visits a place he has heard much in favor of, finds it greatly overestimated, finds a great many things conspiring to make it unpleasant, does not find the fish he expected to and knows he could have done better elsewhere; LONG LAKE.

FLUSHED with victory and laden with spoils the enthusiastic sportsmen came marching home. Some from Blue Mountain, Eagle and Utowana lakes; many from the queeny Raquette, and a host from the lovely and picturesque waters of Forked and Long lakes, the most beautiful and romantic watering places in the great Adirondack wilderness and the "Idle-wood" for sportsmen. The waters of the Raquette are, so to speak, literally alive with speckled beauties and beauties that are not speckled. I have reference to the celebrated black bass. Trolling through the waters of this magnificent lake is enjoyed, not only by the male portion of our sporting fraternity, but by the ladies who accompany them to enjoy the health-giving sports of the great Adirondack wilderness, and to paddle their light canoes upon the bosom of the lake at sunrise and sunset, quaffing the balmy breeze.

Who is it that dare say, "I have never seen Forked Lake?" What may we say of the rest of the world as to be out of the fashion, and, not to see Forked Lake implies as much. Trout fishing, and bass fishing along its shores cannot be excelled. Just let old Capt. Parker, the renowned musician, for music we know hath charms to soothe the savage breast, but that the fish are savage, paddle you around the shores of the Forked, and don't forget when you go to take your trolling line, and all of the paraphernalia requisite for such a party, to be sure to visit Blue Mountain Lake. Seek and make the acquaintance of the versatile Commodore—the veritable Commodore Henry Bradley, of the Raquette Lake Steamboat line—and my word for it, he will post you as to every little nook, where with line and hook, you can while your pleasant sporting hours away. I can assure the sporting fraternity that the old Commodore can, to a nicety, post them as to the various spring holes along the Marston River, and the speckled beauties seem to court the presence of even enthusiastic sportsmen.

We must not forget Long Lake with such residents as Robert Shaw, Esq., Albert Hamner, Jerry Plimby, and the world-renowned Indian guide, Mitchel Sabbates, who lives in that most enchanted locality. The scenery at this matchless watering place cannot be surpassed. 'tis the Mecca of the wilderness. The view from Edmond Butler's Mammoth Hotel is exquisitely beautiful, really enchanting. A Long Lake abounds in fish of the finest quality, no sportsman should fail, if an epicure, to test their favor. The guides located at this lake are fine specimens of manhood, obliging and courteous to all strangers, and trustworthy. If a Long Lake guide, and this I say to their credit, should tell you that he was posted in all the ins and outs of a piscatorial region, you can believe him. You can shoulder your rod and follow and follow him wherever he leads. Such is the character of the much abused guides, not only of Long Lake, but of the whole wilderness.

Dr. T. C. Durant and son will, the coming season, place upon the charming waters of Long Lake a magnificent steamer. This will be hailed with delight by many of our sportsmen.

A sportsman never makes a down or show of himself. I have actually seen a young man who, as he thought himself, was a sportsman, was dressed in the most fantastic style, he was dressed in a corduroy suit, his coat had as many pockets as Joseph's coat had patches, around his waist was a broad leather belt, and to this was hanging a four-pound ax with halve, on the opposite side was a large bird-bag stuffed with paper, rags, towels, socks and various other things, sticking in his belt was a hatchet, a No. 3 carpenter's hatchet, across his shoulders he carried four fishing rods, and hanging from his belt, he carried a pair of his boots, the handles of two large bowie knives protruded, and in his hip pocket a navy revolver was stowed away among cigarettes and fine cut tobacco. Poor fellow, he marched to the battle-field, and, marched home again.

Two-SPINED STICKLEBACK.—Bridgeton, N. J., March 18.—A fortnight ago, while crossing the marshes along Delaware Bay from duck shooting, I picked up in the melted snow in the path made by gunners going to and from the blinds, a fish which was unknown to me and which was equally strange to professional fishermen to whom I showed it and in my pocket, and an hour afterward, while collecting in a bog, I picked up another of the same kind, which swam about in the most vigorous manner, though rather torpid when found. When I returned home I unfortunately forgot to bring it. I will try to describe it, and if my description fits any known fish, please give the name on enclosed card. The fish was about 1 1/2 inches long, of silvery whiteness, barred transversely with very faint gray stripes close together. Its shape very similar to that of the "fooly" or "cuffie" cuttle bone. The accompanying drawing shows my recollection of the appearance of the fish and of his singular weapons.—F. S. J. C. [The fish is undoubtedly the "two-spined stickleback," *Gasterosteus bicuspidatus*, DeKay, although it has three spines on its back. It grows to a length of 2 1/2 inches, and is found in both brackish and fresh waters. The spines on its belly, "back of the throat," represent the ventral fins.]

THE UNITED FISHERMEN.—The "Society of United Fishermen" was organized last May in Salina, N. Y., for the protection of the trout streams of the township. A subscription list was made up containing fifty names of gentlemen, each agreeing to pay one dollar in cash any conviction should be made of persons violating the fish law. A reward of fifty dollars for evidence was then offered, and we managed to secure to the extent of one hundred and a second has twenty-five days in jail, and both cases have been simply in the Criminal court. They are now to be presented by the district attorney, according to the law, in the Circuit court,

and conviction before the jury is almost a certainty. The subscription has been met promptly and the informant has his reward. The fishermen here feel quite elated, as these men are old offenders and dared some one to take hold of them. The conviction has created a great stir, and it looks as though the noted streams of this township might again afford pleasant sport. We are to put in 30,000 brook trout this spring from the State, and last year 15,000 Californians were planted. A man brought up this spring, after netting bait fish, four quacker-looking little fish, new to him, and submitted them to us, who were on the lookout for the California trout. They were all right save the heads, which looked more like a sucker without the sucking apparatus. They were spotted, apparently well-scaled, and fine correct and large. We packed one off by mail to Mr. Seth Green, who wrote us the following: "The fish you sent is not a California trout; it is a minnow. I saw the same kind of fish in South Carolina. I never saw it in this State." Would somebody advance a theory how this South Carolina fish came in our waters?—ISAAC W. [The name "minnow" covers perhaps a thousand different species. Many of them inhabit the waters of the Atlantic slope from Maine to Georgia. Send us a specimen and we will try to identify it.]

THE LEHIGH VALLEY.—March 23.—From the Lehigh valley the following from an ardent angler speaks thus of the trout-fishing prospects as soon as the season opens: "Nearly all of our trout streams are good for the first few warm days in April, but they are fished out very soon. It is not worth while to come up, however, before the snow water is done running, and there is lots of snow in the mountains yet. A warm rain would bring it down and clear the beds of the streams and make elegant fishing."—HOOB.

Game Fire Flickerings.

"That reminds me." THE incident related in "H. L.'s" communication of Brooklyn, strikingly approaches a story once told by a veteran duck-hunter of this vicinity. Being out one day in pursuit of ducks, he espied a flock, but they were out of range and could not be approached sufficiently near with the boat to be shot. However, he didn't allow himself to be out-generaled, and quickly divesting himself of his equipments he plunged into the water and dived to where the ducks were quietly floating upon the water. He first seized two by the feet, bound them securely with string and then fastening them to his own person he continued his exploit, until he had secured seven pairs, at which point the remaining flock light. He returned to the shore, set his traps, and struck the four o'clock hour, but the ducks he had so strategically caught, fully satisfied, he said, with the day's adventure. W. K. M. SALEM, Pa.

Belonging to the regiment (fourteenth Tennessee Confederates) was a man who stammered in his speech very loudly. Late one evening while the "boys" were gathered around the camp fires, the stammering soldier saw a squirrel in a tree. Pointing his finger at the squirrel, he exclaimed excitedly: "L-l-l-look b-h-boys at t-t-that squi-squ-*g-pore in his hole!*" BIRRO. FORT ROYAL, Tenn.

"Pica's" advice to "Clericus," (in your issue of March 23) that he should "rent a trap and buy a lot of clay pigeons" to shoot, instead of going woodcock shooting, reminds me of the story of the small boy, who asked his father to take him to the circus, but that if he was a very good boy, he would take him the next afternoon to see his grandmother's grave. A. D. 1883. NEW YORK, March 24.

Fishculture.

THE DETROIT HATCHERY.

A REPORTER of the Detroit Free Press has visited the hatching station of the Michigan Fish Commission, at Detroit, in charge of Mr. Oren M. Chase, and this speaks of the place and the glass jars invented by that gentleman: "Probably not one-half of the residents of the city are even aware of the fact that there is a State hatchery within its borders, and no more than one in fifty knows its location. It is on the north side of Atwater street, just east of Dequandre street, a long, one-story wooden building, living a small distance from the city, and the entrance is a rather wide doorway, plainly but comfortably furnished. Here E. O. Chase, son of Superintendent O. M. Chase, and an assistant pass a tiresome and uneventful existence, one being on duty by day and the other by night.

Upon entering the main room the visitor at first hears nothing but the tinkling and splashing of fallow water, and sees nothing but rows of jars filled with a moving mass of the funniest looking corpuscles imaginable, a little larger than grains of tobacco, whitish-brown in color, looking like nothing else in nature, each dotted with two black specks and each speck unmistakably an eye.

Along each side of the room, but a few feet from the walls, there is a double frame work of simple construction, but constructed in form. It is about eight feet high, and runs the length from end to end there is a tank probably about a foot wide and deep. A few inches beneath this tank there is a shallow trough. On the outside of the frame there are narrow ledges or shelves upon which stand the jars, looking much like an apothecary's shelves. A few inches above each jar a wooden faucet projects from the side of the tank. A short section of rubber tubing connects the spigot with the glass tube above mentioned, through which stand the jars, looking much like a row of jars on each side of the tank, standing all in contact with each other. Below the first there is a second combination of tank, trough and jars. The double row of apparatus upon the second frame is somewhat lower than upon the first, to secure a flow of water.

The water enters the building by an iron pipe and, strange as it may seem, the pipe is only an inch and an half in diameter. The pipe runs along the ceiling and discharges into the highest tank. It is through this pipe that the water flows through the glass tubes to the bottom of as many jars, the water rises up through six quarts of eggs, flows out of the little metal spout attached to the jars into the upper trough; and along the trough, the water flows through a fine screen to remove all foreign bodies, then around into the upper tank of the second frame, and so on until it has passed through four sets of jars, when it flows into the large tank upon the floor, where now are the large whitefish.

The fish, which are now being hatched, have revolutionized the artificial propagation of fish. Formerly the eggs were

placed upon trays immersed in running water. Daily each tray was taken from the water, and all dead eggs carefully removed with a feather, requiring great care and constant labor.

The glass jars are about fifteen inches in length and six to seven inches in diameter. They are open at the top, taper nearly to a point at the bottom, and have wide, flat, horizontal flanges around the top is a strip of metal, with a flat spout about two inches wide at one side. Standing in the center of the jar is a glass tube less than an inch in diameter and slightly bell-shaped at the bottom. This bell mouth is pushed into the narrow neck of the jar but for three projecting ears that hold it up about a sixteenth of an inch, the purpose of which will be seen further on.

To fully describe the industry of fish hatching, Mr. Chase led the way to a large tank in the rear end of the room, in which there were six or eight meters, as they are called, as kettles. Thrusting a kind of paddle beneath one of the beauties, he raised it to the surface of the water and picked it up without a single protest on the part of the fish. Said he: "Take in the fall, previous to December 1, we get our whitefish, and taking them very few as they are drawn from the water, press gently upon their sides and secure the ova in paas, in which is placed a little water. After securing the eggs of two or three, the milk of the male fish is secured in water set to flowing through the tubes. This is about all there is of it until the hatching commences, about the 1st of April. The water of the Detroit River is excellent for our purposes, being pure and of very even temperature. By warming it even a few degrees, these eggs, that will not hatch for two weeks at our water, will be hatched in a few days. When the water used in hatcheries comes from shallow streams, its temperature is changed by the early spring rains, and the eggs hatch much earlier. They are not so strong and healthy, however, as those hatched.

"You will observe," said Mr. Chase, as the end of the busy watercourse was reached, "that every egg is constantly in motion. Look through every jar in the room and you will not find an egg that is not moving about. This is regulated by the current being set through them to keep the eggs in motion." "I observe many dead eggs in the jar. In the days when trays were used it was considered necessary to immediately take out of a jar every few minutes, however, by merely destroying the live ones with which they were in contact," said the reporter.

"By the use of the jars, that becomes unnecessary, for the continued motion prevents contamination. After an egg has been set to flowing through the tubes, it is about all there is of it until the hatching commences, about the 1st of April. The water of the Detroit River is excellent for our purposes, being pure and of very even temperature. By warming it even a few degrees, these eggs, that will not hatch for two weeks at our water, will be hatched in a few days. When the water used in hatcheries comes from shallow streams, its temperature is changed by the early spring rains, and the eggs hatch much earlier. They are not so strong and healthy, however, as those hatched.

"How many of these jars have you in operation?" "Two hundred and five." "And how many eggs in a jar?" "From 100,000 to 150,000. There is one that has 200,000 in it. In all, we have 40,000,000 eggs in the hatchery."

"All whitefish?" "Yes. As soon as these are hatched we shall go to collecting whitefish eggs. That will be early in April and they will hatch in a month. After that we shall go to Troy, N. Y., to get eels. We get them there in immense quantities, from three to five inches long. They are placed in mud lakes, where none will come in. The pickerel will be planted principally in interior lakes, and the whitefish at Petoskey, Traverse City, Grand Haven, South Haven, St. Joe, Saginaw Bay, Whitefish Bay, and in Lake Superior. A few are to be planted in some cold and deep inland lakes.

"How is this planting done?" "As soon as a fish hatches he makes his way directly to the top of the jar, swims out into the trough, and round down to the bottom. They hatch very rapidly after they commence; so rapidly that a man cannot count those passing out from a single jar. The tank soon becomes alive with them. Then we scoop them out with a net, put them in big tin cans, like milk cans, and express them off to be planted. That is done by holding the can down to the level of the water and pouring them out."

"Do not pick and the other fish-velves make sad havoc with the fry?" "Not to the extent generally supposed. These little fellows are very quick and nimble, and, being so small, can easily get away from a pike. Come down the 1st of April and see them go down through these troughs. You will then realize the meaning of the word 'speed'."

SHAD.—The season for shad in the Hudson's very backward on account of the ice about Albany. The first run has not struck in yet, being nearly two weeks late. In the Susquehanna they are taking many. The Havre de Grace fishery and the Chesapeake fishery are the best of the State, and the city which will be shad. These nets will average about four hundred feet each in length, with a depth of about twelve feet, and will be fished by about thirty boats, requiring the services of two or three men per boat. The average catch per day is about 100,000 shad, and the price during the season ranges from \$10 to \$35 per hundred. Of shore fisheries we only have two, Spencer's Island, near Lapidum, operated by Jurett Spencer & Sons, and Shinnock's Fishery, at Spotswood Island, operated by Messrs. Burres & Co. There are also eight boats, owned and operated by Silver & Co., Courtney & Co., Wm. Ewing, Coale & Bailey, S. E. Penning, Osmond & Co. (2), and Brown & Co. These shore and boats fishery employments to fill from four hundred to five hundred shad, and represent an investment of \$100,000. In addition to above is the old Donahue's Shore on the "Battery," which has lately been fitted out and rigged up in the most scientific manner, by Major Ferguson, of U. S. Fish Commission, which will operate solely for scientific purposes. The shad caught will be placed in the reservoir prepared for their reception and be utilized for spawning purposes.

AMERICAN FISHCULTURAL ASSOCIATION.—At a meeting of the Executive Committee held at Mr. Blackford's in Fulton Market, New York, on Saturday, March 24, it was decided to hold the next meeting at the Cooper Institute, New York, on Wednesday, May 10, 1888. Mr. J. W. Mather and Phillips were appointed as a committee to solicit papers to be read at the meeting. It was voted to send engraved diplomas of honorary membership to the Crown Prince of Prussia, Herr von Bohm, Theodorits Garlick and John D. Jones.

THE NEW JERSEY COMMISSION.—Trenton, March 24.—The Governor sent the Special Land, operating by the Senate to be a fish commissioner in place of Maj. E. J. Anderson, whose term has expired. The nomination was rejected on Thursday, the 23d, and on the same day the Governor nominated Mr. William Wright, of Newark, now Sheriff of the city, to be fish commissioner, and he was confirmed the next morning.—JERSEYMAN.

Brackett and Ed. Ward, second; J. Hopkins, third, and H. S. Stall-
 ighth event, birds—T. C. Fielding and J. S. Sawyer, first; J. C.
 Foster, second; J. Hopkins and B. H. Sanborn, third.
 Seventh event, birds—F. T. Noble, first; J. Hopkins, second; G.
 W. Furrington and E. I. Brown, third, and A. L. Brackett, fourth.
 Eighth event, birds—F. T. Noble, first; A. L. Brackett, second,
 and D. S. Short, third.
 Ninth event, birds—T. C. Fielding and F. T. Noble, first; B. H.
 Sandborn, second, and A. L. Brackett, third.
 A scrub match and a consolation match was shot off, the origina-
 tion of which not allowing the so-called cracks to enter, was a scrubby
 kind of consolation to the non contendeers, resulting as follows:
 Scrub match—Ed. Ward, first; G. W. Furrington, second, and A.
 F. Adams, third.
 Consolation match—A. L. Brackett, first; J. Sawyer, second, and G.
 R. Durand, third.—T. C. F. Sec.

UNKNOWN GUN CLUB.—The regular monthly match took place
 on Thursday, March 22, at Dexter's, Long Island. First in order was
 the shoot-off ties from the previous match for a handsome valise,
 with the following result:
 Knebel 25yds. 1 1 1 1—4 Rathjen 25yds. 1 1 1 0—3
 Lemken 25yds. 1 1 0 0—2 Tamford 25yds. 0 1 0 0—1
 Van Staden 25yds. 0 0 0 0—0
 Regular match, 17 members participating, birds very strong flyers.
 Condition were 7 birds, handicap prize, 30yds. boundary, one barrel, gun
 below the elbow, club rule for three prizes on the classified plan. The
 score is below:
 Knebel 25yds. 011110—5 Van Staden 25yds. 101011—4
 Lemken 25yds. 011110—4 Pope 25yds. 101111—4
 Chichester 25yds. 110101—3 Doshier 25yds. 100000—1
 Bohling 25yds. 111100—4 Ehlen 25yds. 101000—2
 Pankon 25yds. 101111—4 Schwabler 25yds. 011110—4
 Tamford 25yds. 011011—3 Appel 25yds. 101111—6
 Rathjen 25yds. 001110—4 Greif 25yds. 100010—2
 Mader 25yds. 000—0 Miller 25yds. 101010—3
 Schmutz 21yds. 0000—0

CHICAGO, March 24.—As soon as the pigeons can be procured, and
 Cal Bond is doing his best to get them, there will be two matches
 between local sportsmen shot off, both most likely the same day, at
 Kleinman's grounds, at Grand Crossing, out a ways from this city.
 These matches are between Harry Torday and Mike Eich, 50 birds
 each, ground traps, 30yds. rise, both barrels, and a triangular match
 between O. W. Roche, Thomas Starg and Charley Kerns, 25 birds
 each, same conditions as the other match. Although it is said that
 both matches are for the birds alone, still there will be a little stake
 on the result. Talking of matches, it would do any one's heart good
 to hear the opinion local sportsmen entertain of Capt. Bogardus. It
 is no longer "dear Bogey." He came very near playing upon his
 friends here too much, and losing the many he used to have.

THE FOUNTAIN GUN CLUB of Brooklyn had a very pleasant
 reception at their club rooms last Monday evening.

RAYMOND CLUB.—Friday, March 23. Quite a number of the
 Raymond Club met at their grounds, at Wellington, to carry out their
 usual programme of skeetshooting and matches at clay pigeons. In
 the six-shot gun sweepstakes, Messrs. Kirkwood, Starks, Wildbeell,
 Goodrich and Locke being the principle winners in the order men-
 tioned. Messrs. Stank and Kirkwood had three matches at 10 birds,
 25 yds. rise, guns not exceeding 3 lbs., 3 drams powder. Mr. Stank
 winning the first and second and Kirkwood the last. The 20-bird
 scores were as follows: C. T. M. Stark 17, D. Kirkwood 15, W. B.
 Widdereel 12, G. Charcoalier 12, L. S. Kennedy 12, A. G. Locke 10, F.
 C. Waterman's, C. J. Goodrich 7.

CINCINNATI, O., March 23.—A remarkable awakening has oc-
 curred in the shooting fraternity in this vicinity, and the coming
 season promises to bear rich fruit in the way of close trigger con-
 tests. The recent Louisville meeting, pronounced by all to be the
 finest exhibition ever given in the West, has enthused the oldtimers
 to the highest notch. There is a movement on foot to secure 15
 stockyard grounds and fit it up as a permanent shooting ground,
 and give occasional exhibitions during the year. There are in this city
 two prominent gun clubs, the Cincinnati and Independent. The
 former has a limited membership of twenty-five, while the latter
 numbers one hundred. It is more than probable that, during the
 summer, teams will be made up from these clubs, and a battle for
 the local championship. Negotiations are now pending between the
 Independent and Columbus, Ohio, clubs, to arrange for a series of
 three shots, one in this city, one in Columbus, and the third to be
 determined by the flip of a copper. The Columbus Club contains
 some excellent material, and stands at the head in the central part
 of the State.

One of the first local shots, who is also a prominent gun dealer, is
 endeavoring to arrange a match to finally determine that much
 mooted question of the championship of the three cities of Cincin-
 nati, Covington and Newport. By the terms of the match, which
 have not been finally settled, an entrance fee of \$10 will be charged,
 and each contestant will be required to try his skill on the following:
 Ten birds, English rules, from five ground traps. Ten birds, 25yds.,
 plunge traps, one barrel. Five double rises, English rules, ground
 traps. Five double rises, American rules, plunge traps. Ten clay
 birds, five traps, unknown angles. Twenty explosive balls, mole
 traps, five angles. A liberal prize and a handsome badge of victory
 will be given to the winner. This match will undoubtedly attract
 the attention and receive the hearty co-operation of all the gunners
 of the three cities. Mr. Billy Caldwell, formerly a well known shot,
 who has fired of the gun, has again taken up the sport, and will,
 no doubt, make it interesting for some of the cracks.

Yachting and Canoeing.

To insure prompt attention, communications should be ad-
 dressed to the Forest and Stream Publishing Co., and not to
 individuals, in whose absence from the office matters of im-
 portance are liable to delay.

HULL, Y. C., Mass.—Commodore Laubert, who has been at the
 head of the club since its formation, will retire from office at the
 end of his term, carrying with him the best wishes of the mem-
 bers. Vice Commodore Perkins, who has worked late and early to
 bring the club to the position which it now occupies in southern
 waters in his yacht Gitana, to whom the commodoreship has been
 offered, it is understood is not averse to accepting the office, and that
 Vice Commodore Perkins will be content to remain in his present
 position. About 25 new members will be added at the annual meet-
 ing, among them the commodores of four of our largest clubs.

NEW YORK Y. C.—An invitation has been received by this club
 from the Royal Nova Scotia Yacht Squadron to extend their cruise,
 which is to take place the early part of August, to Halifax. Noting
 that an impulse for extended sea-travel has been developed gen-
 erally by the members of this club, and by none more than by the
 Commodore, we hope to hear shortly that arrangements are made
 to accept the invitation. Nothing will be done until the Commodore
 has approved the models of the new craft built, so much as experi-
 ence in Boston's yachting waters. Among the new members who
 have enrolled at the club are: Wm. W. Furrington, Beverly
 Ward, J. A. Dostwick, George S. Huntington and George C. Cooker.
 Mr. Superintendent J. E. Hildard, of the Coast Survey Department,
 was made an honorary member.

THE PROGRESS IN YACHT BUILDING.

THE progress in yacht building, and that of the modeling of yachts
 in this as a subject that now, as a nation, we are much more interested
 in than at any time since the land we dwell in was first discovered.
 For reasons why it is so we have only to recognize that until the last
 few years we were among the chief maritime nations, if not the
 chief.
 That the subject is now claiming our statesmen's attention more
 than it has done since that time is not to be wondered at, for, let re-
 ports reach us as they may of this or that small dividend being re-
 ceived by the British ship owner, more particularly by the steam-
 ship owners, who do claim part of our carrying and passenger trade,
 it must not be lost sight of that these same Britidiers are every
 year adding new steamships to their fleets, and can it be imagined
 that this would go on if they were not getting fat out of their busi-
 ness?
 Allying that such is the case, and, if not alone for profit, we are
 ever to become a great shipping nation again, and that such improve-
 ments shall be imported into the craft doing our home trade as may
 be fairly claimed as having its precedent in the improvement im-
 ported into the model and build of yachts, we say, is not yacht mod-
 eling and the construction of yachts a subject worthy of our serious
 attention?
 Think of all the fishermen roused upon our coast, and the adjoining
 waters they are hourly employed upon, and is it possible that a
 single improvement in either type or model carried out in the yachts
 we build, is not eagerly copied by the builders of the vessels our noble
 fishermen—men from whom we select those who manage our yachts
 —risk their lives in during the heaviest of storms, for our daily re-
 quirements?

Now, to give impetus to this great fact, and to induce the rising
 generation to know more of the beauties and life-giving properties of
 ocean cruising, fully recognizing that we begin at what may be fairly
 called the stepping stone, we publish in this issue the lines of a new
 sailing boat, one which is within the means of most young fellows
 having a taste for the briny to possess, and one which, from certain
 provisions in her construction and outfit as a sea-going boat, and that
 of the expense which generally follows of caring for a sailing boat
 can be greatly reduced.
 If the proportions of this little craft are studied, it will be found
 they are such that a boy who knows scarcely anything more than
 port from starboard, can, when exposed to sea-water, come to no
 harm, and when he has paid a visit to 103 South street and seen
 one built from the same lines, we shall be surprised if he does not
 scrape the necessary dollars together and either build one for him-
 self, or give some boat builder the job to build him one for the
 coming season. We will publish all details of her rig and outfit by
 the time he has got the hull ready for them.
 To return again to the matter of acquainting our young yachting
 sailors of the road they should take, has been already partially
 vented in our columns in the articles we have published under the
 heading of "Single-Builders," several specimens of which little craft
 are now to be seen in the shops of W. Stephens, at New Brighton,
 Staten Island.
 To return again to the more extended idea of the good to be done
 by yachts being built of good construction and speedy proportions, we
 would not omit mentioning in this praise due to a few of the yachting
 community who have built boats of this type, and as the few
 that now exist will soon be put to the test of their superior qualities
 with the usual type of our fleets we have already hope that it will
 not be long before the attention of those who build the sailing craft

HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS
 FOR THE CURE OF ALL DISEASES OF HORSES, CATTLE, SHEEP, DOGS, HOGS, AND POLTRY.
 FOR TWENTY YEARS Humphreys' Homeopathic Veterinary Specifics have been used by Farmers, Stock Breeders, Livery Stables and Turfmen, Horse Railroads, Miners, etc., and have cured many cases of Trach, Hipodermes and Menstruaries, and others handling stock, with perfect success.
 Humphreys' Veterinary Manual, (20 pp) sent free by mail on receipt of price, 25 cents.

"Highest Quality" Fish Hooks.

Anglers are so familiar with our name and Trade Mark and the quality of our goods, that we have no hesitation in calling them to witness to the excellence of all hooks made by us. Though our hooks have always been fully equal to any ever made, about five years ago we came to the conclusion that anglers would welcome a very high grade of fish hooks—something far beyond what they had ever used. Consequently we perfected arrangements for the manufacture of what has become so widely and favorably known as "Abbey & Imbrie's Highest Quality" fish hooks. All boxes containing these hooks have our trade mark and the words "Abbey & Imbrie's Highest Quality," distinctly printed on the label. Also the name of the hook, viz.: "Sprout," "O'Shaughnessy," "Aberdeen," "Carlisle," "Sneek Kendall," or "American Trout." When "snelled" on silk worm gut or gimp the hooks are put up in packages containing one-half dozen of hooks. Each one-half dozen is labeled.

Our goods can be obtained of any first-class dealer anywhere. If there is no first-class dealer in your town or city let us know. We fill no orders from anglers residing in cities where a dealer keeps our goods in stock. If anglers will insist on seeing the label on the goods they purchase, they will protect themselves and us from a grooving and flagrant imposition.

Kynoch's Patent "Perfect" Brass Shells

MANUFACTURED BY
Kynoch & Co., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base. Use either Winchester or Wesson primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weigh less than paper shells, and in consideration of their reloading and other advantages, are really cheaper than the paper. They also shoot stronger and closer, and can be loaded heavier, as inside diameter is nearly two gauges larger. They possess a great advantage over all other brass shells, as owing to the thin metal they can be closed (as represented in cut) by simple use of the thumb or fingers, and straighten out to original shape when discharged. These goods have already gained a wide and favorable reputation in Europe, and in the opinion of many prominent sportsmen will soon supersede to a great extent the old style of both brass and paper. Samples will, upon application, be mailed (without charge) to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or in case lots only (2,000 shells) by

HERMANN BOKER & CO.,
 SOLE AMERICAN AGENTS. 101 & 103 Duane Street, New York.
 WILLIAM READ & SONS, Boston, Mass., Agents for New England States.

We also carry a large stock (at all seasons) of Kynoch's regular thickness brass shells, adapted to the Berdan Primer. Price materially lower than the American make of same quality.

THE OPENING RIFLE SEASON.

THE Board of Directors of the National Rifle Association at its regular meeting on Tuesday last elected Gen. U. S. Grant as the president of the association. The post has been vacant since the annual meeting in January last, and after some persuasion the old war general has been coaxed into giving his consent to an election. He is not to do much, apparently, beyond allowing the use of his name, for nobody, of course, supposes that he will bring much knowledge of shooting matters to that already possessed by the workers on the range.

The association needs just now a strong popular backing. It needs a liberal fund available at once for the heavy expenses connected with the getting up of the team for Wimbledon and the sending of it over to the English battleground. The match was made in a plucky and commendable spirit by the directors as the representatives of the American people. It has been thus far a truly international affair. The Americans were defeated last September because with all the talk which has been current here about the native skill with the rifle, we had neglected an important chapter of the art. We have gallery shots so good that the proposed match with foreign riflemen was allowed to fall through by them. In off-hand work and in the finest of long-range shooting we have shown our ability to pile up victory on victory, but a very valuable style of military shooting had not been touched, and this vulnerable point was hit upon by the British riflemen as a fair one to attack. After the acceptance of the challenge time was so wasted and opportunities so neglected that we suffered a wholesome drubbing. It showed many things, but particularly that we could not win with the rifles then in existence.

Now we stand on the eve of the preparation for a renewal of the battle. Much has been done during the winter, as our readers have been informed from time to time. Now we have guns from which excellent results are confidently expected, and with energetic work on the part of a few men a winning may more than offset the whipping of September last. It will be a point of advantage to have the team composed of new men, at any rate of men who have not frequented the ranges and tried experiments of various sort in a desultory fashion, until they are so stuffed with prejudices and notions that they are most unmanageable as team

material. Fresh blood for the fresh battle is one of the first demands.

The Board have determined upon a programme of matches intended as preparatory drills, but in the meantime much work can be done. The spring is now fairly upon us, and already the crack of the rifle is heard every day. Some of the intending competitors for places on the team are settling down very finely to work, making big scores with rifles in every respect fully within the conditions of the match. The modification of the conditions which held for the last match has done much to encourage systematic practice, and we shall be disappointed if encouraging scores are not met with from the very start.

SPORTSMEN AND FARMERS.—This is an old and much vexed subject, but as yet by no means settled. In another column we publish a pertinent communication, which is written in a temperate tone and contains many admirable suggestions. There is in reality, as we have reiterated, no cause for quarrels between respectable sportsmen and respectable land-owners. When a farmer is churlish and refuses to admit a sportsman to his land, the very strong probabilities are that the farmer has at some time been imposed upon by a man with a gun or rod. There is nothing in the pursuit of agriculture to create an extraordinarily long suffering disposition; and without such a spirit a farmer cannot be expected to forgive this rowdyism from which he may have suffered, and to welcome with open arms the next gunning stranger. But if the sportsman be a gentleman, and disposed to employ tact, he can generally succeed in convincing the land-owner of this, and so enjoy the coveted privileges. Our correspondent's story of his personal experiences is instructive; we hope that others will supplement it by contributing a relation of their own.

FOR THE LONDON EXHIBITION.—On Thursday, the 5th, two of the American staff sailed in the steamer Grecian Monarch for London. They were Lieut. McClellan, of the U. S. Coast Survey, and Mr. Reuben Wood. Mr. Wood goes out, as our readers are already aware, to arrange and exhibit the angling display of America in the care of the U. S. Fish Commission. He bears letters to prominent anglers on the other side, and will sample the game qualities of the trout and the salmon before he returns. He will be back about August 1, and we then hope to hear that he has had a good trial of fishing in foreign waters, and also that he has had an opportunity to witness a casting tournament in England, and perhaps taken part in it.

THE NEW YORK FISH COMMISSION.—Mr. Roosevelt has returned from his Florida trip in rigged health. We met him in Fulton Market looking over Mr. Blackford's trout display, and he spoke of the trip as a pleasant one. Mr. Green returned some weeks earlier and was at the point of death from pneumonia last week, but has now passed the point of danger. On the 24th of last month his death was announced on the bulletin board of the New York Evening Telegram, but the report was contradicted the next day and we refrained from alluding to it at that critical time. We hope by the time he reads this that he will be on his feet again.

THE SUNDAY FISHING CLAUSE of the New York Penal Code came up in the Assembly last week and afforded occasion for a vast flow of bosh from the sapient Solons who debated it. It is not at all surprising, but certainly very humiliating, that the members at Albany should fritter away their time over such trivial things to the neglect of many other matters of real importance. The amendment to allow fishing as a recreation on Sunday was lost by a vote of 50 to 42.

ENGLISH PIGEON SHOOTING.—The farcical Sunday fishing debate in the New York Assembly last week has a counterpart in the absurdities of the speeches in the English House of Commons upon the proposed abolition of pigeon shooting. We have a special letter from a London correspondent, which will be printed next week.

THE FOX RIVER FISHWAY CASE.—In this case are involved some of the important principles of riparian rights. We give in full the able and lucid argument of the counsel for the People.

"AMERICAN KENNEL REGISTER."—The first number of the Register will be issued next Tuesday. Its success is already assured.

HUNTING WITHOUT A GUN.—IV.

WHEREVER civilization and improvement have, for a hundred years or so, laid hands upon the country which God made and man for the most part spoils, there is but little woodland left but that of second growth, and this is yearly dwindling as some new industry arises and calls for trees of size and kind before of little value. Such woodlands, if they have not the grandeur and solemnity and mystery of the primeval forest, have beauty and their seasons of silence and some secrets of their own to keep from the world at large.

The trees were set in their disorderly order by the oldest and best of landscape gardeners, who plied her art before Adam delved or Eve span, and whose severe but kindly hand thins, prunes and trains them. She gives them beauty, and in the hush of noon and eve and night, and in the deadness of winter, such silence that one, being in the midst thereof, may believe himself as far as he would wish from his fellows. She gives them also plants and their flowers, birds and beasts and their nests and lairs and ways of life to hide cunningly.

For what is left us, let us be thankful—for the trees that since the pioneer's axe laid low the giants of the old days have grown to fair estate, and shade a soil that no plow has rumbled, where the unstirred leaves may lie and molder where they fall and nurture moss and ferns and the shyest wild flowers; where a hare may yet crouch, a grouse drum, a woodcock bore the mold, and where some trees have grown old enough to take squirrels and woodnicks, and raccoons and swarms of wild bees to their hearts.

Into such saved places it is good for one to go, weaponed or weaponless. If he leaves his gun at home, he may see more but have less to show for his outing; yet what one has to show for his hunting not always counts highest in the long run.

One cannot go far in such woods before he will be reminded that he is not very much apart from his kind though out of sight and hearing of them. He will come upon traces of the ruthless axe, stumps, chips and wasted wood, and among the sprouts, the brands and ashes of the choppers' fires, or a rank weed of herds' grass grown up from the chance-sown seed of a team's baiting.

He may find an apple tree in the midst of the woods, which he shall know more by its blossoms or fruits than by its manner of growth, for it has taken on the wild natural ways of its companions, and strives upward toward the sky, mingling its lithe slender branches with those of the birches and maples. One is first aware of it when, in blossom time, he scents an orchard fragrance in the woods and sees out-of-place flowers aloft with all the wild bees about them, or when in autumn he finds the forest leaves strewn with farm fruits. It is like coming upon a sheep astray in the woods, only this strayed one seems quite at home here. However it was planted, by bird or squirrel or wood-ranger's cow, or by hunter or chopper who tossed aside the close-gnawed core of his dessert, it is a godsend to present generations of bees, birds and rodents, and its racy fruit would sting delightfully with its "bow-arrow tang" the palate of him who wrote the history of the wild apple as only one who loved it could.

But one will find traces to lead him back far on the trail of time. Rocks as old as the world with the same kinds of mosses and lichens that grew on them centuries ago. The stump of an ancient pine, barkless, moss-covered and outwardly gray, but with the terebinthim odor and flavor of its prime well preserved in its hollow heart. When its tiny needles first pricked the daylight, perhaps no adventurer had sailed across seas to these shores. When it was in its lusty youth what a new old world was this! Did the great tree go where in colonial times all good pines were supposed to go, namely, "in the masting of his Majesty's navy?" Likelier it went to the first sawmill built on the nearest stream, and then to the boarding of the thrifty settler's barn, where the broad boards, now as gray as the parent stump, shelter to-day the grandson's herds and erops. Many generations of a departed race have trod this undisturbed soil, beneath whose surface the old roots lie just as they writhed their way so long ago, and they are sound yet though dead, good for kindling or a torch. No hunter can look at nor touch them without veneration when he remembers that they have outlived a race of hunters, for every hunter has fellowship with all peoples and generations of hunters. That is a "touch of nature that makes all the world akin."

The descendants of the old tree are growing all about here and the ground is covered thickly with their fallen leaves, a

carpet of rich color, soft and noiseless to the tread, and on this hillside so slippery that one may go down it nimbly as one can climb it. If one were hunting only for game that he might kill, he would likely enough overlook the rare pine drops that grow here, so like the tawny mat of needles out of which they rise.

Here are godly trees, yet they do not reach for the immitable sky as their ancestor did. Their topmost shoots scarcely overlook the surrounding growth, and they stretch their long limbs out into the twilight of the woods so low that the green leaves on the nether branches brush the fallen dead ones, and they all sing the old pine's old song of the far-away sea, and they brood such silence and solemnity of shades and sepulchral coolness, that one feels a kind of dread creeping over him. The atmosphere is pantherly. This quality is inherited, for just below where the last pine blotch the pasture with their dark shade, the Catanonut Spring bubbles out at the foot of a great rock, and there, eighty years ago, a girl bleaching her web of homespun linen, was beset by a panther, and only saved by her faithful dog.

Why should not a panther come here now? The woods are dark and wild enough, and not a sound of civilization to be heard. As the daylight dies the shadows creep up like panthers stealing on their prey, and no more silently than the great cat might tread this soft footing. A twig snaps mysteriously, the pines heave a mournful sigh, and as the shadows deepen, a bit of phosphorescent wood glares at you like eyes aflame with baleful light.

As now you almost hold your breath to hear a devilish yell tear the heavy stillness, if your hand could but feel the comfortable chill of the good brown barrels of your helpful gun, your back would not suffer that uncomfortable and unaccountable chill which reminds you that it is not always pleasant to go hunting without a gun. R. E. R.

The Sportsman's Tourist.

A SONNET.

SUGGESTED BY A DRIVE IN EARLY SPRING.

'TIS sweet to have a quiet mind,
Upon a genial April day,
To see the wood-paths emerald-limed—
Forerunners of the flowers of May.

To see the buds confidingly
Unfold their treasures to the sun,
And purring brooks unobtrusively
In their old channels run.

To watch the clouds sail far above
This waking earth, like peaceful drama
Of our lost youth, of youth's lost love,
Until our better being soars

Rising, like ether, from frosts of time
Into a life of summer prime. O. W. R.

HAUNTS OF THE SALMON

In Canada and New Brunswick.

BY CHARLES LANMAN.

THE writer of this paper claims to have been the first citizen of the United States who ever visited Canada to take salmon with the fly. That event took place thirty-five years ago, and his experiences since then would fill an ample volume; but in the following paragraphs he proposes to give merely a running account of the favorite rivers of the Dominion, together with some of their personal associations.

With very few exceptions the haunts of the salmon are so far removed from the settled portions of the country that the sport of fly-fishing cannot be enjoyed without camping out or living in the rudest of cabins. Indeed, the only stream that I have visited where this was unnecessary was the Jacques Cartier. This stream empties into the St. Lawrence about thirty miles west of Quebec. In the score of mere beauty it is certainly unsurpassed. Forty years ago it abounded in salmon; then came a time when, because of noise and flau beau-fishing, it was a barren stream; but it subsequently reaped some benefit from the protective laws, and the best localities for sport having passed into the possession of private parties, it was again blessed with the presence of the royal salmon. Of late years the central locality for sport has been at a place called Dery's Bridge, about six miles from the mouth of the river. At this point, and within the space of two miles, I once took twenty sketches, and these were so entirely unlike each other in character that a stranger could hardly believe them to have been taken on one river. Here there were only two houses where anglers could be accommodated; they were owned by Frenchmen named Dery and Trepanier, the latter a farmer and a splendid fisherman, and the former the keeper of a regular little inn; very much such an affair as would have made Walton happy—so quiet, so picturesque, so comfortable, and frequented by such a charming brotherhood of men—English army officers and French gentlemen.

Dery's inn occupied a spot immediately on the bank of the stream, at the western end of the bridge, and while there was a splendid waterfall just above the bridge, there was a gorge below, and directly under the bridge a very large and deep pool, where hundreds of salmon could be often seen balancing themselves and resting in their nether element prior to resuming their journey from the St. Lawrence to their spawning pools, a hundred miles in the wilderness. At the foot of the gorge just mentioned there is a pool called the "Hospital," which was the very perfection of a spot for fly-fishing. An Englishman once caught ten salmon there, between the hours of four and eight in the morning; but he was not the individual who fought with a salmon at the same spot for nearly two hours, and then had to mourn over the untimely departure of his game. Although the landlady Dery was not herself very much of a fisherman, he had a son who excelled all of the tribe. When the

fish would not rise to his fly, the visiting anglers knew there was noise in trying; and when that was the case, and a fish was really needed for the pot, he was wont to descend a rope ladder, suspended over the pool under the bridge, and take out with his gull a few salmon bolder than himself. He was the only man, moreover, who had the hardihood or courage to throw the fly directly under Dery's bridge, for where he secured one after hooking him, he lost a dozen that rushed down the gorge to the Hospital pool, carrying all before them. That the excitement of salmon fishing—to quote from myself—is sometimes contagious, the following incident will prove: I had hooked a large salmon at a spot known as the Black Rock, when Trepanier gave me a second hooked shad, which I secured on the other side of the river to run down and witness the fun. After my salmon had made his third magnificent leap, and I was keeping him away from a dangerous rock, my spectator became quite frantic, and, to my astonishment, plunged into the stream, and, just as Trepanier had gaffed my fish, up came the stranger to my side out of the water—panting like a "spent swimmer," as he was. He had crossed the river—kicking a few fish under the chin, perhaps, as he passed along—simply for the purpose of having a look at my prize.

Although Trepanier's exploits were not as daring as those of young Dery, he used to kill quite as many fish in a season, and upon the whole was better acquainted with the river. I once saw him hook a salmon at a famous place called the Schute; he followed it to the foot of an island, played it half an hour in a pool below the island, when the fish started up stream again, soon seeming ready to give up the battle, when it broke away, and Trepanier, making a rush, caught the salmon in his arms.

At the present time the fishing pools on this river are owned and protected by gentlemen residing in Montreal and Quebec, from which places it is now reached by railway. Not so, however, when it was in its prime; for then it had to be reached by private conveyance, and the industrious anglers often took their servants as well as private stores.

But the most productive salmon rivers of Canada all lie eastward of Quebec, and on the northern shores of the River and Gulf of St. Lawrence. Of these the total number of satisfactory streams is twelve, viz., the Musquaroc, Trinity, Nipmewar, Montreal, Saint Anne, Mingan, Comine, Nainshamun, St. Margare, Escoumieu, Godbout and Moisie; but in the present paper I shall speak only of the four last named. The starting place for visiting all these streams is Quebec, and the most approved method is to charter an appropriate three-masted French smack, supplying her with all the tent equipment and the good things of life, suitable for camping in the wilderness. The time for starting, after having arranged with the Dominion authorities for the necessary privileges, is in the early part of June. That storms will occasionally retard the impatient anglers and cause them to seek shelter at some of the ports on the great river is more than probable, but as these are generally charming *habitat* villages the detentions are not irksome.

There are many funny people to be seen in these French villages, hunters with red caps, colonies of Romish priests scandalizing along the streets, and the old and the old Harry as a flock of crows. But let the wind is now fair and we must continue down the Lower St. Lawrence.

Before us is a panorama of superb mountains, upon we reach the mouth of the Saguenay; we enter, and pass up that magnificent river, which this pen first described for American readers, in 1848; and reaching the St. Margare trinity, get our canoes and fly in a canoe, and starting upward soon begin to throw the fly. The fishing pools on this river are few in number, but the fish are large and the scenery very wild and interesting. But its fame has been especially enhanced by the fact that it was here the Prince of Wales caught his first salmon in Canadian waters in 1860, having been escorted to the river by Mr. David Price, of Quebec. My own success in the Saint Margare was never very good, but streets, and the foundation of a cable on this river, which I remember with rare pleasure. The guests were French Canadians and educated Indians; and while the solitary fiddle did not cease that of Ole Bull, the dancing of two or three of the French girls, while one of them was playing on a banjo, was simply rich and rare. As to the Saguenay, into which the Saint Margare enters, it is indeed a grand, gloomy and peculiar. It was seen this year by the late Sir John A. Macdonald, St. Lawrence the extract of Niagara, the great cave of Kentucky, the chasm of Talulah, and the Mississippi River, he has enjoyed the five great natural wonders of the Atlantic slope of North America.

And now for a glimpse of the Escoumieu, which empties into the St. Lawrence about twenty miles from the Saguenay. It is a smallish, but a fishy stream, and is the ancestral home of the muskies and black flies in the world. Its best pool for salmon is only about half a mile from its mouth, but this one is superb. It was here that the deponent captured his first salmon, and to which river he was introduced by Mr. David Price, twelve years before the latter threw the fly with the Prince of Wales at the St. Margare. Prior to that time the said deponent had chiefly devoted himself to the stream known as the Lower Saguenay from ten to fifteen pounds could not be jerked out of the water like half-pound trout. Turning aside to select a new fly his feet slipped and away went his hat upon the laughing waters.

Another east and there seemed a prospect of success; but when he fancied that his fish was on the opposite side of the river, great was his amazement to find the fisher standing on the air almost under his nose. He, however, the same made a plunge and started for the St. Lawrence, when common sense told the angler that he must follow on. In his first effort to pass a rock his coat was caught by the limb of a tree, and partly separated from his body. He was then compelled to cross a pool, and the moment his heavy boots were filled with water, one of them came off his foot and went floating down the stream. He, however, the fisher, was resting about two hundred feet from the fisherman, and probably wondering as to the meaning of all this commotion; but in process of time he was finally captured about five hundred yards from the spot where he had been deceived, and, although very happy, the angler presented the appearance of a man who had reached the end of a mispent life.

That particular salmon weighed thirteen pounds, and the thirty-five years which have since passed away have not been able to banish him from the angler's memory. Whatever it may be now, it is certain that in former years the Escoumieu was one of the most prolific salmon rivers in Canada, and it is a matter of record, but a doubtful one, that Sir John Macdonald once killed four hundred salmon there in a single week.

And now for the Godbout. According to the late Harrison Stephens of Montreal (of whom more anon) this is the finest river for salmon in Canada. It is sixty miles long, but the fly-fishing pools, of which there are fourteen, are scattered over a space of but five miles. For the most part, the anglers are obliged to fish in their canoes, although there are a few places where the fly can be cast from the shore or from big houlders. During the ten years preceding 1874, there were taken here with the fly alone not less than 3,687 salmon, weighing 42,000 pounds; and in that year the keeper of the river, one Nicholas Comeau, between the 8th and 17th of July, killed 365 fish, weighing 3,873 pounds, which is undoubtedly the most successful fishing ever recorded. This river belongs to the Hudson's Bay Company, and it is leased by them to the anglers, five of whom alone can be accommodated on the river. Those who visit it should supply themselves with everything that they may need, for during their sojourn on the river they must expect to be entirely excluded from the world until their return to Quebec.

But further removed from civilization than the Godbout is the much more extensive stream called the Moisie. Here there are only two good localities for fly-fishing, but these are both first-rate and within twelve miles of the mouth. It is at this point that the mountain lands begin, and where the river has a fall of about sixty feet within a space of five or six miles. These rapids cannot be ascended in canoes, and those who would travel up the river have to make a portage of one or two miles. There the river is supposed to have its rise more than two miles above the high water, but as the river has never been fully explored the knowledge of its character is limited. It has been, however, for several centuries a route of travel for the Labrador Indians residing in the interior, who annually visit the Gulf coast for the purpose of getting glimpses of civilization and such necessities as they can afford to purchase from the anglers. The Moisie is a fine stream, and killing salmon in the Moisie will have to travel about a thousand miles before reaching his home again, and there are not many who care to make that pilgrimage for any purpose more than once or twice in his day and generation. For the best account extant descriptive of this river and of other parts of this wild region the reader is referred to a very interesting work on "The Labrador Peninsula," by Henry Youle Lind, published in 1865. As to the man who has fished the Moisie most frequently and with the greatest success, his name is James Strachan, formerly of Toronto.

Passing by with reluctance the York and Dartmouth rivers, at the eastern extremity of Gaspé, we now come to the Caspé, which empties into the Bay of Chaleur. It rises in a small lake bearing the same name, which is about seventy-five miles from the mouth of the river, and is a tributary of the Chichee mountains. There are no falls of sufficient height to prevent the passage of birch canoes, by which alone it is navigated. Its shores are lined with forests of pine, cedar, tamarack, spruce and birch; it abounds also in beautiful fish; and the scenery is altogether very charming. Not only salmon, but large trout are found in this river, which promises to be, if not ruined by poachers, the best of the kind on the whole of the Dominion of the angler. The hamlet from which it is most easily visited is New Richmond. The fishing with the rod begins about fourteen miles from the sea, at the foot of a mountain called Picapaco, and so continues for about thirty miles to a tributary called the Salmon Branch. Among the visitors to this river in 1874 was Mr. Chester A. Arthur. While ascending the river in a party of three, he was visiting the Boston men encamped at the foot of the pool there, and in that camp the strangers were treated with great hospitality. In 1882, after the said Arthur had become President, the duty devolved upon him to appoint a new Justice on the Supreme Bench, and, remembering the pleasant days he had passed on the Caspé, he appointed to the vacancy the man in gray who had so kindly entertained both the parties concerned. Other people of note have since visited the Caspé, among them the Marquis of Lorne, who did well there as an angler, even as did his brother-in-law, the Prince of Wales, on the St. Margare. But this was not the origin of the well known saying that salmon fishing is a "royal sport."

Passing westward from the Caspé, and after traveling for a few miles in a vessel or on wheels along the magnificent Bay of Chaleur, we come to the lovely Restigouche. Four good rivers, all of them abounding in many attractions, conspire to make it worthy of its fame—for salmon, for beautiful scenery, and for the many worthy residents from Scotland residing in its valley. As with the river already mentioned, so with the Restigouche—a whole volume could not exhaust its many and varied attractions. In fishing with the fly, the particular haunts of the river, near the mouth of the Matapédia, but you have to fish from a canoe, and although I am no novice in the management of that craft, I do not fancy it for fly-fishing. At the spot designated I once had a fearful time with a drunken Indian; and when, a few years ago, a party of New York anglers purchased this portion of the river, I felt certain that they had bought a very bad bargain. The river is a very good one, although it was in that vicinity that I caught my biggest salmon, a twenty-six pounder. Prior to the building of the railroad which now connects Halifax with Quebec, and across the Restigouche, the leading man of this region was Adam Ferguson, whose home, called Athol House, always reminded me of Daniel Webster's Marshfield farm. His father lived on the river, and before him, and now, the best boat export about two thousand barrels of salmon, caught in front of his own domain, the latter was thankful if he could export three hundred barrels; and it is a well-known fact that in other days salmon have been taken here in nets which weighed sixty pounds.

But as fly-fishing stream, pure and simple, the Nepisquit bears the bell, so far as New Brunswick is concerned. About twenty miles from Bathurst, there is a very good lake, about which it is impossible for the salmon to go, and within that limit there are five or six noted places for fishing, where, when the season is at all favorable, the grandest sport is to be enjoyed. Formerly the river could only be ascended in canoes, but now there is a passable road along the river to the Grand Falls. So fascinating was the sport here in former years, that an Englishman named

THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance, Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH

cation that made such unity of purpose and such union of effort in the accomplishment? The position of the old beaver above the tree indicated leadership, but no order, by word or sign, was given; it seemed to know what to do, and just how and when to do it.

The falling of a tree across a stream and building a dam against it, is one thing; felling a tree so it should not vary a foot from a given line, the old dam, showed an engineering skill you may possess, but which I should hesitate to assume. We must define the instinct as directing a few things without forethought or previous knowledge; and repeating the same methods ever afterward. The beaver builds the same cells, of the same material forever. The first and the last nest of the bird are precisely alike, and animals who dig holes in the earth have each a fashion peculiar to itself, which does not vary; even the acquisitiveness of the ground squirrel is no thought for the morrow, since he hoards in the spring with all the industry of a man.

But the beaver goes far beyond this. Instinct is overlapped by reason until separation is impossible, and all division lines are obliterated. He selects with engineering skill the site for a dam, then builds of such material as is at hand and of such shape as the exigencies require, varying both as circumstances indicate; and conducting all with a degree of intelligence that trends closer upon the heels of humanity than that of any other creature living. Why, an animal so gentle, so large, should be left outside the pale of civilized life, deified human association by clumsy form and unseemly personal habits, is one of the mysteries in nature not yet solved, but such is the fact. To him the step of civilization is simply and inevitably annihilation.

What we need is more of this wild native life. An animal in captivity will, perhaps, every condition of free life violated; say a bear chained, or one with a halter about his neck and leaden collar, history will tell us how he suffers for the study of natural history to say the least; an ox drawing a plow would be better. And now that men of high intellectual taste and culture fly more and more to the wilds of nature for summer recreation, may we not hope and expect more of that inner life in nature found just in proportion as the tracks of men are less frequent.

SNAKE NOTES.

I noticed in your recent issues, a letter on the breeding and habits of snakes. I can give some light on the subject from personal observation. One day last August my brother and I were fishing along the rocky bank of Big Flatrock Creek, the southeast fork of White River. We heard a little rustling in the leaves and weeds in front and at our right, and I got up to see what the matter was, and there we saw a large black snake doing his best to swallow a water snake half as long as himself, and had it half way down when we first saw him. My brother and I got some rocks, and before long he disgorged his prey in a rather dilapidated condition, but not dead. No doubt the latter was thankful to us for our timely interference, for he was going down a long black tunnel to another country. We measured the black male and found him to be seven feet in length and the water snake three feet six inches; and the latter was larger in the largest place than the black snake was around his neck or throat, and when first seen was swallowed down past the largest part of his body, head downward. On another occasion, earlier in the year, I killed a black snake, and, thinking it large, I opened it and found nine young snakes in it, some twelve or thirteen inches long and about as large as a penknife. They were alive, and I considered I did good work in killing ten snakes in a day.

HAMMELLESS.

GREENSBORO, Ind., March 12, 1888.

In your issue of March 1, under the heading, "Breeding of the Rattlesnake," etc., it says: "He keeps the breeding site as prepared from the egg." Another writer sets aside the egg theory by saying "That his brother and others saw a female rattlesnake delivered of nine small snakes—eight alive, one dead."

I have had some experience with rattlesnakes, or "eauary birds," as we call them, during some fifteen summer vacations in Pike county, Penn. Last August, in returning from a trip after berries, and nearing home, on the track of the Erie branch, I saw a snake in the "water" making an afternoon meal on the grease from the car axles. As his head was in fine position near the rail, a well-directed stone killed him. I carefully carried him home, having only to cross the Lackawanna, and as he was such a beauty, and wishing to preserve the skin as well as secure the oil, I carefully skinned it, after cutting off the head and consigning it to the fire, when, to my surprise, on opening the snake I found fifteen eggs, resembling a peean nut in size and shape. About two weeks previous to this a snake was opened at this same yard containing nine full-sized eggs. Now if snakes are not propagated from the egg, what were these fifteen eggs for? I have three fine skins and rattles from Pike county in my cabinet, and will take pleasure in showing them to any one interested in "rattles."

C. H. STYLES.

1,419 LEXINGTON AVE., N. Y.

[That snakes can swallow animals much larger through than they themselves are, is a well-known fact. As for the eggs of the rattlesnake, we would suggest to our correspondents that there is nothing necessarily inconsistent in the differing views expressed by them, for many snakes are known to be ovoviviparous, i. e., the eggs are hatched within the mother. Let them remember the ancient truth, Omnia vivunt ab ovo.]

NEW JERSEY WINTER BIRDS.—Noticing that this week's FOREST AND STREAM has observations on our winter birds, I will send you a list of those I have observed and procured (with a few exceptions) during the past three winter months: Red-shouldered hawk, marsh hawk, sparrow hawk, sharp-shinned hawk, barred owl, mottled red and gray owl, downy woodpecker, yellow-bellied woodpecker, hairy woodpecker, common crow, blue jay, "Bob" White, robin, meadow lark, bluebird, white-bellied nuthatch, tufted titmouse, black-capped chickadee, ruby-crowned kinglet, pine grosbeak, purple finch, song sparrow, snowbird, tree sparrow, goldfinch (yellow bird), English sparrow, white-throated sparrow, redpoll linnet. The robin made his first appearance during the last few days of February. Bluebirds are with us all winter. The pine grosbeaks were seen the latter part of December; barged two females.—OLD TURKEY, (Long Hill, N. J., March 15, 1888).

241. Great Scaup Duck—*Fuligula marila* Aud., Cs. 720; *Fuligula marila* Ridg. 614.—Common during migrations. Sometime abundant in autumn.

242. Little Scaup Duck—*Fuligula macroura* Aud.; *Fuligula affinis* Ridg. 613; *Fuligula affinis* Cs. 721.—Found here during migrations, but not very common.

243. Ring-necked Duck—*Fuligula rufifrons* Aud.; *Fuligula collaris* Ridg. 616; *Fuligula collaris* Cs. 722.—Uncommon. Mr. Boardman reports this species as having been known to breed near Princeton, Me., where "adults with young were seen, and eggs have taken near St. Stephen, New Brunswick." But these cases may have been exceptional ones. The species breeds in an irregular occurrence elsewhere throughout the State. There was one shot at Scarborough, Me., May 1, 1879. A number were shot in Cumberland county in the spring of 1882, an unusual occurrence. Of this number two males were shot at the mouth of the Presumpscot River, March 31, 1882. Three of this species were shot at Great Pond, Cape Elizabeth, in April; one was brought to Portland from Gray, April 14, and several others were shot near Portland in April.

244. Ruddy Duck—*Fuligula rubra* Aud.; *Eristomys rubra* Ridg. 634, Cs. 741.—Not uncommon during autumn migrations. This singular little duck, with its broad bill and large feet, seemingly out of proportion to a body scarcely larger than that of a teal duck, and a stiff tail which appears as if the feathers had been scraped with a knife, is of an exceedingly unassuming nature, and easily shot wherever found.

245. Redhead Duck—*Fuligula ferina* Aud.; *Althya americana* Ridg. 618; *Fuligula ferina americana* Cs. 723.—Uncommon; an irregular visitor.

246. Canvas-back Duck—*Fuligula calliserrana* Aud.; *Althya calliserrana* Ridg. 617; *Fuligula calliserrana* Cs. 724.—Uncommon; an irregular visitor. In October, 1874, there were procured two ducks by a shot into a flock of fowl in Casco Bay, near Portland. One of these proved to be a canvas-back duck, and the other a redhead. I have shot the latter species at Scarborough, and have seen at various times a number of canvas-back ducks which were shot in Maine. A pair, male and female, were shot at Great Pond, Cape Elizabeth, Nov. 1, 1880.

247. Golden-eyed Duck—*Fuligula clangula* Aud.; *Clangula glaucion americana* Ridg. 630; *Clangula glaucion* Cs. 725.—Abundant. A few breed in the interior and northern part of the State. Abundant in the estuaries and bays along the coast throughout the winter. Locally termed "whistler" on account of the loud whistling produced by the wings of this species when in rapid flight.

248. Iceland Golden-eyed Duck—*Clangula islandica* Ridg. 619, Cs. 726.—Uncommon, except on the eastern portion of the coast, where it is commonly found in winter, and is probably there a regular visitor. Adults may be easily distinguished from the preceding named species, by the form of the bill and the white patch on the sides of the uials differing from that of the common golden-eyed ducks or "whistlers."

249. Buffle-head Duck—*Fuligula albola* Aud.; *Clangula albola* Ridg. 621, Cs. 727.—Common. Arrives early in April. Autumn migrations in November and extending into December. Occasionally a few remain on the coast throughout the winter.

250. Long-tailed Duck—*Fuligula glacialis* Aud.; *Harelda glacialis* Ridg. 628, Cs. 728.—Very abundant along the coast. None breed here. Locally termed "old squaw." Its cry is well expressed by *Cuculus*, the name applied to the bird by the Micmac Indians of Canada. Many ducks of this species remain along our coast throughout the entire winter; but the greater portion of the vast numbers of migrants pass to the south. During the fall and early May thousands arrive at Casco Bay, where they are detained for the superior quality of an abundance of their favorite food, the little crustaceans, commonly known as "sand-fleas," which are easily obtained by the ducks in this broad shoal bay with its smooth sand bottom. Here the old squaws remain until the third week of May, when they have acquired the perfect plumage of spring, and have become very fat. Unlike others of our sea ducks they appear to be polygamous. At the time of their departure for their nesting places in the far northern region there occurs a great assembly of all the birds of the species in the bay, and during the latter part of each day, flock after flock will rise from the water and circle about, frequently ascending so high that a flock of a thousand or more is nearly lost to view, appearing to the unaided vision as a faint cloud of moving dust. These evolutions are sometimes prolonged for several days, as if the birds were training themselves for their intended long flight in the upper air. Occasionally a flock of many hundreds will make a trial trip inland of a half hour's duration, or even for a longer time, and return again to the bay. At such times the birds are especially active during the dusk of evening. It is then that a flock returning high in the air from an inland trip will set their wings upon approaching the shore, and descend at an angle of forty-five degrees with such velocity as to produce a roaring sound to be heard at a long distance, especially when the flock is a very large one, and the descent is commenced from an altitude of many hundred yards.

The final departure is almost invariably made late in the day, or after sunset, and the birds take a course nearly north over the land. But few are to be seen the third day after the departure of the foremost flocks of this great assembly, excepting the usual number of birds which are barren or incapable of the long journey. Such of these as are not captured by fish or seals remain here throughout the summer, and moult in July.

No other species of ducks mingle with the long-tailed ducks in their migration. Indeed none of their associates upon the bay would be capable of sustaining the speed of this species, the flight of which exceeds in rapidity that of any other duck known here. On account of their rapid flight, swiftness, and great tenacity of life, they are the most difficult to kill of all our ducks, and hence afford excellent sport to all who are fond of fowl shooting. They readily come to decoys in May, and no means of shooting in vogue will drive them away, except that of sailing to them on their feeding places; a method effectual in causing them to abandon the vicinity where practised.

251. Labrador Duck—*Fuligula labradorica* Aud.; *Compsolemus labradoricus* Ridg. 624, Cs. 729.—Extremely rare. Mr. Boardman has obtained several specimens in the course

of many years. The species was not uncommon on the New England coast in winter fifty years ago, and probably is not yet extinct. A single specimen, a female, was shot in Casco Bay, near Portland, near Grand Menan Island, in April, 1871, by Mr. S. C. Cherrill, who is well known to our bird collectors. Since that date, a specimen has been killed in Michigan, at Delhi Mill, April 17, 1872, and its skin preserved in the collection of Mr. A. B. Covert, of Ann Arbor, Mich., the fact having been reported in FOREST AND STREAM.

It is quite probable that a very few ducks of this species yet visit our coast in winter. Should any be shot here, they would be likely to fall into the hands of fishermen, and would be unrecognized and unreported. This species might be confounded with the "old squaws" by gunners who are not observant of the differences of the birds they shoot.

252. Harlequin Duck—*Fuligula histrionica* Aud.; *Histrionus histrionus* Ridg. 632, Cs. 736.—Not very common, but of regular occurrence along the coast in winter, frequenting the outermost islands and ledges. Loosely termed by the fishermen and others "lords and ladies," to designate the sexes, which are unlike in plumage. That of the male is rich and variegated, and the term "lord" is not inappropriate as regards the costume of this bird, but the female is a very plainly dressed "lady."

These ducks are very active, expert divers, and generally wary; and as their haunts are not easily accessible but few of the birds are secured.

253. Eider Duck—*Fuligula mellisima* Aud.; *Somateria mollissima dresseri* Ridg. 627a; Cs. 734.—Abundant throughout the winter along the coast. A few yet breed in Maine. Loosely termed "sea-ducks," or "sea-ducks and drakes" by gunners and fishermen. Although some of the closely allied species of scoters are frequently found on our lakes, the eider ducks confine themselves exclusively to the coast. These are the largest ducks known on the Atlantic coast of America, the adult males averaging a weight of more than five pounds each, the females weighing about a pound less. Their food here consists of shellfish, usually procured from ledges, and sometime in ten fathoms of water. They arrive from the North late in October and in November, and depart early in April for their breeding places. They are generally mated before this departure, and while migrating in the spring, and before flying in long lines, the drakes and ducks regularly alternate in a series of more than distinguished from the uniformly dark-colored females by their white backs and fore parts, conspicuous at a long distance.

In the autumn migration, however, the flocks present a different appearance, and the sexes are not then generally mixed in flocks composed of adult birds. When migrating they usually fly low over the water, and far enough from the shore to clear all headlands, without much altering their course. Vast numbers, however, fly across the land at the head of the Bay of Fundy. When thus passing over the land, if frightened by a great noise, they will swoop down close to the earth and sometime alight a near shot.

While snipe shooting on the Tantamar marshes I once brought a huge flock down by shouting and discharging one barrel of my gun, and when they were wooded, a shot came within the range of which was loaded with No. 9 shot. Their strong bones and dense plumage render them as difficult to kill as Canada geese. Occasionally, they come in contact with telegraph wires, and such an instance occurred near Monoton Junction in New Brunswick, whereby a dozen from one flock were left dead or crippled on the ground. The weather was thick, and the flock, frightened suddenly by shouts, swooped down at a place where there were many wires.

Although many eider ducks are annually shot on our coast by fishermen gunners, but few others trouble them. The sport is usually cool, rough, and oftentimes dangerous, except during the autumn migration. Yet there are sportsmen who are not deterred by the exposure and danger of winter shooting on this coast, and a knowledge of the habits of the birds is necessary to kill many of these ducks, although they are many and usually frequent the most inaccessible places.

The eider duck lays a complement of five pale green eggs which are deposited usually during the month of June and July. The nest is composed of down which the duck plucks from its lower parts for this purpose. Sometime the nest is placed upon the bare rocky shore, sometime on the turf of a grass grown island, and at other times on the ground which is covered with sphagnum moss. When the duck lays the nest voluntarily it covers the eggs entirely with the down composing the border of the nest. After the first egg has been laid, each succeeding one is deposited at an interval of a day or two, until the set is completed. Often each egg may be numbered in the order laid, by a comparison with the others in the same nest. The eggs quickly become soiled by contact with the body of the bird, and an egg two days in the nest appears darker than one just laid. Washing with water will not restore the shade, but it may be restored by scraping the eggs. More than five eggs are rarely found in a nest, and in the isolated instances of more than six having been found in one nest, it is probable that they were laid by two ducks, as ducks of this species breed in communities. The males do not assist in the incubation, but at this time associate together in flocks, and their plumage is in its best condition. That of the female is much soiled, and the hardy ducks would prove of great value if domesticated, and perhaps could be cross-bred with domestic ducks to advantage. Their feathers and down are valuable, and their flesh, naturally of good quality, could be much improved by a diet of grain. The eggs are of fine flavor, and very large.

For many years a great business was carried on by vessels sailing from Halifax, Nova Scotia, and returning from the northern breeding places of snowfall with cargoes of fresh eggs. The eggs of the eider ducks were most sought, on account of their superior quality. The ordinary note of the eider duck is a genuine quack, not unlike that of the mallard, and quite different from any of the cries of the scoter ducks. Although rarely found on fresh waters, or even in the mouths of tidal rivers, salt water is not essential to their existence. They were raised in the district of the four counties of the omnivorous domestic duck will eat, although in a wild state the eider ducks subsist chiefly upon shellfish, such as mussels, etc. The readiness with which this species becomes domesticated may be illustrated by the incident below related, concerning an eider duck which undoubtedly had been raised or kept in captivity.

One summer evening, at dusk, an eider duck was observed on a pair of domestic ducks in the dooryard upon one of the inhabited islands of the Bay of Fundy. An attempt was made to decoy the ducks into a pen, but the eider duck flew to the shore, about a hundred yards distant from the house.

At daybreak the next morning I again observed the duck in the dooryard. A trail of corn was now laid extending into a pen, and the tame ducks fed along the line, followed by the stranger, until all three were within the inclosure and captivity.

The owner of the premises had at various times hatched and raised eider ducks, but none within two years, and he did not remember the loss of any at a previous time. After some days' confinement, during which it was well fed on corn, the eider duck was released. It continued to come to the house at night when the domestic ducks returned from the bay, where they spent each day, and became so tame as to suffer a near approach without immediately taking to flight. One day, while we were on an excursion in a small boat and three miles from home, this duck appeared and flew about us, coming to a familiar cack repeatedly within twenty yards of the boat.

This duck probably had been reared in captivity, and perhaps had that season suffered a destruction of its nest and eggs, and therefore sought the nearest mate in the barnyard drake, which passed each day about the shores, and returned home at night. An eider duck will not lay its eggs a second time in a nest once robbed, but seeks a new nesting place.

In the domestication of these eider ducks there is an open field for a poultry fancier, and one that might be filled to future profit by this improvement of our domestic varieties.

254. King Eider Duck—*Fuligula speculabilis* Aud.; *Somateria spectabilis* Ridg. 639, Cs. 736.—Not very common. Probably some visit our coast each winter, but never in abundance. The habits of this species are more northern than those of the common eider ducks. The king eider ducks appear to be much less wary than those of the other species. I once saw some king ducks in July, near a locality where the common eider ducks were breeding, but the plumage of these ducks was immature and I failed to find any breeding place of this species.

Quite a number of king ducks were shot in Casco Bay near Portland during the spring of 1875, and also of 1876, but all of these were immature birds, and I have not known of any adults in perfect plumage taken on our coast.

The females of this species much resemble in form and plumage the female of the common eider duck, except that they are of smaller size than the latter.

But the male king eider duck may be easily identified even before maturity, by the form of its bill, which has an abrupt rise on the upper mandible near the base, making the outline of the bill quite unlike the rather uniform slope of the upper mandible of the bill of the common eider duck.

The eyes of the king eider duck are yellow, those of this common species are brown. In size it is about one-fourth less than the more common species known here. Although a coast duck, the king eider sometimes strays inland. In the FOREST AND STREAM of March 8, 1877, the capture of a specimen near Syracuse, N. Y., was reported; and in the same journal was reported (December 25, 1879) the capture of eleven in Niagara River, Nov. 23, 1879. These latter probably were from the north, via the St. Lawrence River.

255. Velvet Scoter, White-winged Scoter—*Fuligula fusca* Aud.; *Melanotosia leucocoma* Ridg. 632; *Oidemia leucocoma*, Cs. 738.—Abundant during migrations, and some remain on our coast throughout the winter. This is the largest of our scoters, all of which are locally termed "coots." Many flocks of this species annually take their departure from Saco Bay, during the month of May, and fly northward in the air over the land. A few of the other two species of scoters known here likewise migrate home in the spring, and their breeding places are likewise inland in the far north. Unlike the eider ducks, the scoters do not breed on the coast, although a few remain here throughout the summer, and I have observed some here at that time which apparently were mated.

256. Surf Scoter, Patch-head Scoter—*Fuligula perspicillata* Aud.; *Pelecanus perspicillata* Ridg. 633; *Oidemia perspicillata* Cs. 739.—Abundant during migrations. Locally termed "patch-head coot." The immature birds of this and the next named species are locally known as "gray coots." 257. American Scoter, Black Scoter—*Fuligula americana* Aud.; *Oidemia americana* Ridg. 630, Cs. 737.—Abundant during migrations. Locally termed "butter-bill coot." This species is quite common on some of the Maine lakes during the October migration. It is the smallest and fastest flying of the three species of scoters known here.

258. Buff-breasted Merganser, Gosander—*Mergus merganser* Aud.; Cs. 742; *Mergus americanus* Ridg. 636.—Common during migrations; arrives from the South in March and April. Occasionally some remain on the coast throughout the winter. A few regularly breed in the interior and eastern portions of the State. Largest of the mergansers, and locally known as the gosander or greater sheldrake. Apparently its haunts are more northern than those of the next two species.

259. Red-breasted Merganser—*Mergus serrator* Aud.; Ridg. 637, Cs. 744.—Abundant during migrations. Arrives from the South in April and May. Breeds commonly throughout the State. Lays from twelve to eighteen eggs in June, and the young can fly well in August. Much the most abundant species of merganser in Maine. Locally known as the common sheldrake. 260. Hooded Merganser—*Mergus cucullatus* Aud., Cs. 745; *Lophyrus cucullatus* Ridg. 638.—Common, but never abundant during spring and autumn migrations. Arrives in March and April. Probably a few breed here. Locally known as the "little sheldrake" or "hooded sheldrake."

FAMILY SULAIDÆ: GANNETS. 261. Gannet—*Sula bassana* Aud.; Ridg. 650; Cs. 746.—Not very common, and now rarely taken on our coast. A few years since one was picked up on the land at Seaboard after a severe storm. The bird was shot here, and does not often come very near the shore, but few are captured. No other species of gannet is known on the coast of Maine.

FAMILY PELICANIDÆ: PELICANS. 262. Cormorant—*Phalacrocorax carbo* Aud., Ridg. 642, Cs. 750.—Abundant along the coast during migrations. 263. Double-crested Cormorant—*Phalacrocorax dilophus* Aud., Ridg. 643, Cs. 751.—Abundant during migrations along the coast. The two cormorants are locally termed "slugs" by fishermen. None breed on the coast of Maine, although some remain here throughout the summer. These are chiefly immature birds, which keep together in flocks and habitually resort to the same ledges each night to roost.

264. White Pelican—*Pelecanus americanus* Aud.; *Pelecanus erythrorhynchos* Ridg. 640; *Pelecanus trochyrhynchus* Cs. 745.—A rare straggler from the South. This species has been taken in the Bay of Fundy, and Mr. Boardman informs me that one frequented the St. Croix River one autumn,

and was seen there repeatedly by many persons, but was not captured.

265. Frigate Pelican—*Tachypetes aquilonis* Aud., Ridg. 639, Cs. 761.—A rare straggler from the South. Mr. Ruthven Deane has recorded (Bulletin N. O. C., Jan. 1879) the occurrence of this species on the coast of Nova Scotia. Mr. Andrew Dowses, of Halifax, N. S., procured the specimen, which was "shot outside of Halifax harbor, October 16, 1876." As this bird passed from the South along the coast to the east of Maine, it may perhaps be mentioned here quite as properly as other coast stragglers.

[TO BE CONTINUED.]

MOCKING-BIRD IN MASSACHUSETTS.—While out with my gun to-day, I had the rare good fortune to secure a specimen of the mocking-bird (*Mimus polyglottus*). I was returning home, and as I had to pass very near a small snipe meadow, I thought I would look along the edge and see if I could not find a snipe. I had hunted it over thoroughly without success, and was starting for home, when I observed a bird fly over a river near by and alight on the other side. As the bird looked strange to me, I determined to get it if possible. I walked back nearly half a mile to a bridge, crossed the river, and walked back on the other side. Before I reached the place where the bird alighted, I saw it in company with some sparrows. It was hid and would not let approach near enough to shoot it with small shot. When I got within about thirty-five yards I fired, and had the satisfaction of seeing the bird drop into the water. I pulled it out, wet and dripping, but otherwise very good. Upon skinning I found it to be an adult female. Its crop was completely filled with bugs, flies, and other small insects. This is the first I ever knew to be seen or taken here. Mr. Samuels, in his "Birds of New England," says: "This bird is so exceedingly rare in New England, that it can scarcely be regarded otherwise than as an accidental visitor, and Massachusetts is certainly its northern limit." Dr. Elliott Coates, in his "New England Bird Life," says: "The mocking-bird is practically restricted to its northward extension to the Carolinian fauna, and has but once been observed beyond Massachusetts, where, as also in Connecticut and in Rhode Island, it is a rare summer resident—if, indeed it be of more than casual occurrence." He also says: "According to Allen, writing in 1864, it has been known to breed in Springfield, Mass., several times within five years, and two pairs nested there in 1860."—JOHN C. CATOON (Taunton, Mass., April 26.)

SNOW BUNTINGS AND MEADOW LARKS.—Hartford, Conn.—Editor Forest and Stream: "J. L. D." is rather surprised to learn that snow buntings will alight in trees. I have noticed them do this in New Hampshire, Vermont, and Maine very often. "Medicus" will find meadow larks during the winter months in Connecticut Valley as far north as Northampton, Mass., but not as numerous as in the fall of the year. Game has wintered well here (in the market), as we have quail, grouse, pigeon, venison. The game laws are not enforced here, as woodcock shooting began in July, the law not being off until October.—FLICK FLICK.

MEADOW LARK AS WINTER RESIDENT.—Philadelphia, March 31.—Noticing "Medicus's" interesting communication in your last week's issue relative to the wintering of the meadow lark in Pennsylvania, and noting his having killed one near Mead, Pa., recalls the time, not seven years ago, when the then open fields around West Philadelphia, to the writer's knowledge, were the resorts of a large flock of these birds, especially in very cold weather, and when snow lay on the ground. It has been known to breed every winter in the stump fields on the line of the Baltimore pike just beyond the county line. Both male and female birds quite often remain with us all winter, at least used to.—HOMO.

Camp Fire Flickerings.

"That reminds me"

OLD Bill Lauc, of Shinnecock Bay, is never at a loss for an answer. One night, after a cold day on the bay, when more whiskey had been slaughtered than ducks, we all sat around the camp fire, and when snow lay on the ground, personal experiences in field and "marsh." The yarn grew more and more improbable, till the climax came from Doctor M., of Brooklyn. The good Doctor is of an imaginative turn, but too much bad luck or bad rum had made him forgetful of the fact. At last he said: "I was out shooting one day and struck a bunch of quail. It was in the old muzzle-loader days. My dog had come to a point. I flushed the birds and when they were on my snappy A. What was my surprise when a bird fell. I walked up, picked it up and it was stone dead! Now how do you account for that, Mr. Lane?"

Bill looked at him with a sly twinkle in his blue eye, changed his foot, thrust his hands deeper into his pockets, and said: "Wal, now, I shouldn't like to account for that, Doctor M." There were no more stories told that night.

THE JUDGE.

Have you heard of the wedding of S., one of Long Island's best-known "sports"? Devoted from infancy to dog and gun. A good fellow, but a bit wild; untamed, perhaps. He was married the other day; and for the first time since childhood entered a church. He tells the story himself: "I'm friendly to the parson mentioning to me with his book, I couldn't understand it and began inquiring about him. Again he raised it to his chin and brought it down, 'Still I couldn't make it out. At last he whispered, 'Down charge, close?' Then I knelt; and that was what he wanted." THE JUDGE.

Scene—Caroline county, Maryland; sun two hours high. Yours truly out "squirrelin'" armed with a long rifle, passes through a cornfield in which are two "cuddled genin'" industriously engaged in husking corn. The usual "flovare-you" is exchanged and work suspended for a minute examination of the rifle. Darkey No. 1 takes it, aims at several cornstalks, says: "Yes, tolerbul good gun, mooses long es ole Uncle Ross'es do." "Why," said I, "is his any longer?" "Oh, bress yer, yes, child; why, he was out squirrelin' this mornin' on sun of squerel an' big gun." Uncle Ross puts up an bistis a cap on 'im, but she doan go; lays her down, looked in ther 'n' n' on seed ther charge comin', puts her up agin quick en killed ther squerel dead."

Darkey No. 2 now elimus in, and says: "Saved ole Uncle Ross er right smart er trouble do ef he'd pulled trigger fore hee lookin'." H. L. BROOKLYN, LONG ISLAND.

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such notices?

FARMER VS. SPORTSMAN.

IF we are to continue to roam at will with dog and gun through the covers, or follow unmolested the trout brooks that course through the meadows of the farmer, it would be wise to stop and consider, and see if we cannot do something to remove the prejudice that exists toward our class. It is not pleasant to ride a dozen miles to a splendid cover that you enjoyed shooting in last year, and find posted the notice "No shooting on these premises," or to journey to a fine trout brook you have fished with good success for years, and while still sitting in your wagon read on a board posted where the brook crosses the road, "No fishing allowed."

I fear, however, that shooters and fishermen are very largely responsible for this state of things. Mark you, I do not say sportsmen, for to my mind a true sportsman must be a gentleman, not necessarily wealthy or highly educated, but a large-hearted, whole-souled fellow, who would scorn to do a mean act. If all who use the rod and gun were of this class there would be little trouble, and the grounds of the farmer would very rarely be found posted. But unfortunately there are some who belong to the shooting and fishing fraternity who conduct themselves as though they thought the farmers, on whose grounds they were trespassing, had no rights which they were bound to respect. I have seen a man deliberately tumble the top of a wall down because he was too lazy to climb over it, and I have repeatedly seen where a rod of wall had been literally torn down to take out a rabbit. I have also seen the tall grass that had been ruthlessly trampled down when it was about to cut, and because of these things the sportsman must suffer.

Farmers are a class not mean or stingy, quite the reverse, as many of us can testify. When I was about a dozen years old my father gave me a gun and fishing-rod to use, and for more than thirty years I have used them faithfully. Not the same old twenty-gauge muzzle-loader, or the same old twenty-foot rod; they have long been laid aside for others of improved pattern. But for more than thirty years I have used the rod and gun. I have indulged in this recreation in all the New England States, and during all this time I think I have never been ordered off from a farmer's domain but three times, and only twice in my own State. On these occasions I simply obeyed and indulged in no abuse. In one of the cases the owner was a New Yorker who spent his summers on his farm, and I was aware that shooters had been ordered off, but as the land was not "posted" and the cover a favorable one, I concluded to take my chances. The report of my gun soon brought the old man, who delivered his message, and I quietly left. Not long after I was out shooting with a friend, and toward night, after a very successful shoot, I arranged with my friend to look through a piece of cover, while I drove the horse around to the one where I had been ordered off, and where he should meet me. I found the owner at home and asked the privilege of looking through the cover. He met me pleasantly enough, but proceeded to state his grievance. He said that a brood of partridges had been hatched and reared there, and he had hoped to get one for his wife, who was very fond of them; but that as soon as the law was off the hunters from the city came there and killed them all, and he didn't get one; that he cared nothing for the woodcock, and had no objection to my hunting, but that if I killed a partridge he wished I would give it to him for his wife. I hunted out the cover, killed a partridge, gave it to him, and the pleasure he received was as great as mine.

I have hunted the cover the past ten years, and have killed lots of birds there, and have never thought that I had paid dearly for the privilege.

Another case happened last fall at one of our best covers for flight woodcock, which is situated about four miles from the city. Two members of our club had just commenced to shoot there one morning when the owner came out of his house and commenced to yell as soon as he was within hearing, and kept it up until he got up to my friends, whom he ordered off in language more forcible than elegant. Now, my friend S. is a gentleman, and nothing would have induced him to indulge in such language himself; beside he had just flushed a woodcock and had him marked down, and was, therefore, very anxious to remain. So he began to reason with the man, told him that he would do him no harm, that he only wished to hunt the cover for woodcock, and to "go off at half cock" when farmers approach. "I'm right behind that bunch of alders; you take my gun and shoot him while I go round and put him up." The fight was all out of the farmer, and he replied, "I can't shoot anything; let me sear him up for you." And so he did, and S. killed the woodcock, and it is needless to add that he and his friend hunted the cover as long as they pleased. The farmer's excuse for the attack was that somebody not long before had shot at his crows out of "unassessin'" and, therefore, was down on all hunters. Now my friend had replied to the man in like manner what would have been the result? If no blows, at least a disagreeable quarrel, and he would not have hunted the cover, beside the farmer would have retained the same opinion of hunters; whereas he learned that a hunter could be a gentleman, and he no doubt returned to his house heartily ashamed of himself. I firmly believe that if sportsmen would only learn not to "go off at half cock" when farmers approach them in a coarse, boisterous manner and order them off; but instead would show them that a sportsman is a gentleman, they could generally so arrange matters as to be allowed to remain, and in most cases would be invited to come again.

I am aware that there is another side to the question, and that there are mean men among farmers. Of course there are; and that is true of every class. There are farmers who hunt, or pretend to hunt, but are not sportsmen; they don't want it themselves, neither will they allow you to hunt on their premises; they think a sportsman is a loafer; they hate a dog, etc. Not much can be done for these men; nothing would induce them to think differently. They would be glad if they could induce their neighbors to think and act as they do in these matters, but they cannot; they haven't much influence anyway, and best of all, this class of men is not large. In any event, to do it we fall into the hands of the order of our class to go, and we had no need to tell them what you think of them. Such men are gener-

ally despised by all mankind, and they know it well enough.

That this class of farmers have very little influence I was thoroughly convinced while attending a meeting of the Worcester County Grange, a little more than a year ago. The meeting was held in one of the halls in this city, and the afternoon session was open to the public. It had been announced in the daily papers that the following subject would be discussed:

"Whereas, The sportsmen of this State have caused a law to be enacted that makes the shooting of game by farmers on their own premises at certain seasons, to wit, a criminal offense, and

"Whereas, Certain representative sportsmen in this vicinity have offered a reward for the detection of offenders, thereby constituting themselves keepers of game to which they have no title; and

"Whereas, The object in view is additional sport to the shooting generally and not the good of society in general; therefore

"Resolved, That the agricultural community and united legal action, especially the enforcement of the trespass act, cause its interests to be protected and maintained.

I was at that time president of the Worcester Sportsmen's Club, and I received an invitation to be present. Being a county meeting it was quite a large affair, the members of the sub-granges from the various towns being present with their wives and daughters. It was as honest and intelligent looking a body of people as one could wish to meet, and I had a great deal of curiosity to see how the subject would be handled. I am pretty thoroughly acquainted in the neighboring towns, and as I took my seat in the rear of the hall and looked about I saw many familiar faces. A large delegation was present from my native town and I found myself surrounded by men and women who were my boyhood friends and schoolmates. I cannot give a detailed report of that meeting; but as the discussion progressed I was very glad to see that a large majority of the farmers present recognized the fact that not all lovers of field sports were loafers and scoundrels. Some very pleasant things were said of our club, for which I felt deeply grateful.

The other gentlemen was, however, represented, and after several members had been named, was announced. He arose and walked slowly to the Speaker's desk and began to unroll his manuscript; and while doing so looked about him in a very confident way, as though he were entirely satisfied with the paper he was about to read. Now, this man was from my native town, and I have known him long and well. He has wealth, considerable ability, is well educated, the owner of one of the finest places in the town, and of course, an influential member of the grange. But the idea of his having prepared an elaborate paper on the subject under discussion struck me as being decidedly absurd. I should not have been more at sea endeavoring to deliver a lecture on astronomy than was this man with the subject he was trying to handle. He has not a rod of cover on his place where a game bird would be likely to live, and I doubt if he ever saw a man with dog and gun on his domain. I have no idea, not the slightest, that he could tell a shotgun from a rifle, a setter from a St. Bernard, or a woodcock from a quail, and yet this man read to us as though he thought he had the whole thing "down fine" and wanted us to understand that he couldn't tolerate a "so-called" sportsman. He quoted in a sarcastic way from the speeches made at the annual dinner of the sportsman's club as they appeared in the daily papers, also from the game laws "so selfishly framed by the shooting fraternity that a farmer's boy could not spare woodcock." He then proceeded to urge his claims as natural and only owners of the game, and urged his hearers to see to it that the trespass act was enforced. And how was this mastery effort received? Was he applauded? Very faintly. It was apparent that it was too rank for their tastes. After the reading of this paper the "worthy master" announced that "there was a representative sportsman in the hall and he thought the members would be glad to hear from him." Of course, I rose to that position. I must say something, and I did try to say a few words that should help to remove the prejudice that exists toward our fraternity. I shall not soon forget the many kind greetings I received from the members of the Worcester County Grange at the close of that meeting.

And now, brother sportsmen, let me say that I believe it is possible for us to so conduct ourselves toward the farmers that which we have so often covered or the trout brooks, in nine cases out of ten we shall be kindly received. K.

WORCESTER, MASS., March 27, 1888.

NOTES ON THE QUAIL OF TEXAS.

I SEND an account of some things I have noticed of quail in Texas. Arriving in December at Port Dnuean, on the Rio Grande, Texas, I was told that the old ordinance sergeant could not make more than fifty quail. He said, "Oh, no, plenty. Fifty quail a town is never on the bank, but you will never get more than two shots at a covey, for they go straight to Mexico." This seemed strange, for there is more than half a mile wide. Yet I found that he had told the truth. After losing a number of birds shot over the water and swept away by the rapid current, I always took my duck dog with me, and it was a novelty in quail shooting to have my birds retrieved from the river.

I could always find them in the morning or late in the afternoon, seldom in the middle of the day, and finally came to the conclusion that they were hatched in Mexico and roosted there, and came over to feed. Had they found out that Mexicans do not shoot quail? Did the old birds practice the young on long flights before they started over the river with them? The birds were the Texas variety of the common brown quail (*Callipepla squamata*). Back from the river they flew no further when flushed than Northern quail usually do. They do not tie to a dog as well as the Northern bird. Once, however, I was for weeks on a road little traveled except by Mexicans, and I found them so tame that they would not even squat when my dog pointed, but move slowly along not twenty yards from me. They probably had never been disturbed for years.

The blue or scaled quail (*Callipepla squamata*) worry a goodly dog. He must point going about half a mile, if he keeps anywhere near his bird. They seldom fly unless hard pushed, and are very fast runners. I prefer to tie my dog up, and if the weather is hot shoot from horseback. I never hesitate about shooting them on the ground, and it is no contemptible feat to knock them over as they dart from bush to bush. They seem to fully understand the necessity of keeping some obstacle in range between themselves and the man that is after them. They will squat, then, if they see a man, and will not fly until he is within ten feet. I have found a covey that I could not get with my gunshot on one

day, to be tame the next. There had been no change of weather, and I am unable to account for this difference. They are larger than the common quail, but I do not consider them as good on the table. I have repeatedly had one of each cooked to test this.

The Massena quail, called also black quail (*Cyrtonyx masena*) lie like stones. I once saw a pointer catch a full-grown unvounded one. They are trying on the nerves. Your dog points, perhaps, when there is no cover but short grass; you can see nothing and go slowly forward. All at once, with a peculiar chatter (that don't steady you a bit) they start up in front, behind, and to the right and left. I have seen good shots stand open-mouthed, not able to make up their minds which way to shoot. A full-grown cock Massena is such a beautiful bird that you smooth down his feathers carefully before you put him in the game pocket. To my taste they are better eating than any quail I have tried.

I believe that in Texas the quail have two broods. My journal says: "July 29, 1882, shot ten common quail, almost full grown." And again, "September 20, 1882, saw a covey of common quail barely able to fly." The belief that they raise more than one brood seems to be general in the Southwest Texas.

I think it is rare that quail in Texas are killed by snow or cold in winter. Cold rains and floods in the nesting season and when the birds are young affect the increase very seriously. Hawks rarely make great havoc among them. A hawk in a tree or hovering near one spot is a good sign that a covey of quail (probably scattered) is close by.

What quail do for water when the whole country is dried up and there are no dews, is a mystery. I believe they occasionally travel considerable distances for it. I accidentally learned that they do come to water at times. It was this way. I was shooting near Fort Clark, Texas, late in the afternoon, and found a covey in a small clump of bushes that grew by the edge of a small pool. I followed the scattered covey and killed several. Then went back to the pool to let my dog drink, and he pointed a second covey in the same spot I had found the first. I shot some of the last covey and found them to be younger and smaller than the first. I had been gone about twenty minutes, and they had come to the water during that time. They certainly were not there when I first got up, as the covey was scant and my dog went over it thoroughly. It was three miles from the pool to the nearest water.

The quantity of quail in the vicinity of Fort Clark, Texas, last fall, was something wonderful. As I heard a sportsman express it, "every egg must have hatched." I have frequently killed as many as I wanted before breakfast. Many hundreds were killed, but their number was so great that plenty must have been left to breed. On account of the heat, shooting there is hard on man and dog before the middle of October. T.

Fort Lyox, Colorado.

A NORTH CAROLINA MEDLEY.

ABOUT the 10th of the present month (March), having a bird desire, or taking it as my friend and kinsman, Teedel at my request, to go with me, I set out with dogs, for a short jaunt into the upper part of our county, to see if we could find some sport with quail shooting in that section and the contiguous part of the county of Montgomery. We expected to meet our hunting companion, whom I have hitherto, somewhat emphatically, called Bishop Crickett (but of whom I shall hereafter speak in reference to the wisdom of his name), and for an hour and with him, make an afternoon ramble among the birds in the lowlands, just above the confluence of Little River with the Pee Dee. But from some cause we failed to be greeted by his genial smile, and went to work by ourselves. We soon started a small covey, and succeeded in getting two birds, when we heard the welcome voice of our friend Tom, the son of the gentleman whose hospitality we proposed to enjoy during the approaching night, and for an hour and a half, we had a most successful day. So sending our buggy forward by one of the "newly enfranchised American freemen," we took to the fields lying along the river, and hunted in the direction of the residence of our host. Birds were not numerous, and we succeeded in getting only eight.

Just before night, we had reached a point in the lowlands, not more than a fourth of a mile from the dwelling, which was quite marshy, but destitute of cover.

As we approached the dwelling, a well-known sound which the snipe always emits as he rises from his feeding ground. We saw more than fifty of them, but as they were at long range, we could only get three or four. Soon after reaching the dwelling, our friend Crickett made his appearance, and after the "inner man" had been delightfully satisfied by the abundant contents of the harder and punty, which the wife and daughter of our host knew so well how to spread, we went into the parlor, and discussed all sorts of matters, from hunting and fishing, and dogs and guns, and rods and lines and hooks, down to questions of finance, and revenue and taxation, American and European, diplomacy and statesmanship, with an occasional allusion to Venor and Wiggins, and other sapient guessers at the coming state of the weather. Before retiring to my bed we had agreed to go down to the meadow in the morning at an early hour, and pay our respects to the snipe. After this agreement, my companions endeavored to keep me up, so that they might enjoy, for a longer time—so they said—"the feast of reason and the flow of soul," which I always contribute for the delectation of my associates. It is due to endeavor, however, that I should say, I believed then and believe now, their object was to gain by flattery what they feared they could not get in any other way—an escape from tedious breathing, which they have often told me was as unpleasant as the courtship of the well-to-do small fry, however, and the three were soon engaged in a fusillade at the birds, which had collected in large numbers. But, as before stated, they were too wild for much sport, and each one that we got cost us several shells. If there had been cover for the birds in the meadow, I have no doubt we could have bagged several dozen before breakfast. I have never seen them so numerous. And they were equally plentiful ten days after the first shot, and were still in the trap. Here, therefore, these birds have usually made their appearance in our section during the early part of April; but this year, being decided

by the weather prophets of Canada, or the balmy atmosphere of February, they started upon their summer tour.

After breakfast, being joined by Tom, who has an excellent gun, which he hangs well with "pussy" moral force, advise him that she has sprung from her "form" to the briars or sedge, but which is rarely held (when a part-ridge (quail) is whirring rapidly off, we set out for new fields, hoping to find game more abundant. We got up but few, however, in a walk of several miles, and when we stopped for lunch (we always call it "snack"), we had not exceeding thirty birds. In the afternoon we found quite a number of coveys, and some very large ones (to say the least of the coveys, and some very large ones) but owing to the fact that the thickets in which they took refuge were very dense, we were placed under great disadvantage, and our bags were less swollen than we could have wished. Our entire day's hunt only brought us about thirty birds, beside several rabbits which Tom's special art had brought down. We reached our resting place after night, and, as usual, highly enjoyed the reception which awaited us.

The next day, facing a cold north wind, we set out for what was once, no doubt, a "happy hunting ground" for the pre-historic race, if one may judge from the existence of a mound having a base of about fifty feet, and an altitude of twenty, which is situated near the margin of Little River, in Montgomery county, about two miles beyond the Rich Hill. When I was a boy I thought this relic was the work of the Red Lords of the Soil, "mound-builders" as they surveyed, but the researches of archaeologists seem to establish the fact that the people who did this unexplained work were of a rather higher type of civilization, and existed before the country was occupied by the "sons of Alknonook" or other chiefs of the Indian race. I confess I do not know what sort of people constructed this and similar "earthworks," and have not the slightest idea of the purposes which they had in view. In my mind, they had very little work to do or they would not have had time to pile up so much useless dirt.

And I am frank enough to admit that I am equally ignorant of the uses which this or some other people had for those elegant specimens of handicraft which are called discoids, several of which were found about seventy-five feet from the high lands in the immediate neighborhood of this mound. An award of the Soil, "mound-builders" as they were named, assert with great positiveness that they had exactly the same uses as the modern glass ball or clay pigeon, so called, except that the sportsman, instead of a two hundred dollar breech-loader used a spear, a javelin or an arrow, and shot at it as it was rolling. I trust I shall be considered as giving no unpardonable offense if I venture to suggest that if such was the fact, they who indulged in the practice had very poor ideas of economy, for even now, with all the modern labor-saving implements for working on stone, it would take an exceedingly skillful lapidary to make one of these discoids out of quartz in less time than a week. Then, when hatchets were of stone, "and other things according," it may be safely assumed that the manufacture would have required the labor of more than a man, and to apply all this to the "use" of "making a round stone, to be shattered at one cast of the javelin or flight of an arrow, would be evidence that the people who made them were entirely ignorant of physical economy, especially as a softer stone could be easily had, and out of which, even with rude tools, several could have been made in a day. Without further words upon the subject, I simply say that I regard the statement as entirely unworthy of belief.

After the day's sport, we passed within a hundred yards of it, and stopped our buggy for a moment. This day was to decide the long-pending contest between Teedel and Crickett for the champion belt. Like Balfour of Brerley and Bothwell, as described in "Old Mortality," these two worthies were so intent in their purpose to succeed in achieving a personal victory that they did not regard Tom and me as worthy of their notice. With firm step and flashing eye they entered the list, and Teedel, by a narrow margin, won the head, saying to him, "Be smart, master, and Teedel will give you good victuals to-night." At his suggestion I, as his subaltern only—his mere bird marker—talked puppy talk to Branch, and promised him, if he would stand up to Nip, I would give him a big pone of plain corn bread. Crickett successively fondled and flattered Jack, Jack and Jenny, and Tom only smiled his approval of the warlike preparations. And then the combats commenced, the meeting early in the afternoon. Teedel charged Crickett, and Crickett preferring Tom to me, because T. rarely hit, and had so little confidence in his skill that he never claimed a bird that anyone else said he shot at, while my disposition was to claim every bird that fell. Of course it was a slaughter. Sometimes I do hit one, when no one else is near.

We turned to the left, going along the margin of the hills, with the third sportsman, and Teedel, and Nip, and I. We had not journeyed far before Nip was in that attitude which sportsmen regard as "glorious," with Branch "seconding the motion" in gallant style. T. was on the bird side of a small brook which I was unable to cross. The covey was flushed and each got in both barrels. He missed with one barrel, while I was more fortunate, and both claimed to have shot at another bird which fell. Here the score stood at one and a half to one each. Pursuing, we flushed one covey, which both got, wounding but not getting. The others flew up wild fifty yards off, and made good their escape. Going down into the bottom Nip again stood, my dog backing, and T. got to my one. The other part of the covey we could not locate; so going on some distance, in a beautiful level field, Nip flushed a very large covey while going down the wind, and T. got a bird. The others settled along the side of a ditch near where we was, and waiting for my cousin to come up, he both approached the cover. All the birds but three fell on his side, and he got one with each barrel; I had the same luck. He and I each got two more birds and wounded three others between us. Just before this we heard and saw the other "team" having a high time with a covey scattered in the stubble, but when we started our covey in such splendid ground, "high beat our hearts with hope elite," for we confidently expected the Elysian pun we soon should win, by laughing our route in the direction of the ford where we left our buggy, we found several other coveys, but generally too close to covers.

It is sufficient to say that when our hunt ended and we counted our trophies, Teedel had seventeen and a half and I fifteen and a half—thirty-three in all. Two of them he killed before I joined him. He shot a 16 and a 13. Not long after ward C. and Tom walked up and shot a 15 and a 12. The bodies having been left with the wife of a gentleman, at whose house they got a table dinner. Of the twenty C. claimed sixteen and a half and Tom the others.

THE TYRO'S FIRST "PARTRIDGE."—"Great Heavens, Charley! What Was That?"

[DRAWN FOR THE "FOREST AND STREAM" BY W. H. McDUGALL.]

When it appeared that the contest was so close, C. tried hard to convince Tom that he was not entitled to one of the birds which he claimed, but he refused to make the concession. Cricket challenged to another trial, alleging as a reason that we found more birds than they, and had, of course, a better chance. To this "the Lieutenant-General to the Earl of Mar"—your correspondent—replied that if he had had Tom with him, his score, instead of being fifteen and a half, would have been fully twenty-two and a half. Nevertheless the two rivals met again not long afterwards, and at the end of the day T. had eighteen and C. twelve. Still he is not satisfied, and the gauntlet is down again.

Now, Messrs. Editors, and especially the presiding genius over the dog department of the FOREST AND STREAM, I beg to ask a question: My dog Branch, a thick-set, white and lemon setter,

"Whose parvies tail, wi' upward curl,
Hangs o'er his hurdles wi' a swirl,"

is one of the gamiest little fellows you ever saw. He is as active as an antelope—I never saw one, but am told they are "some" in the use of the legs—a splendid ranger, stanch as a dog ought to be, an excellent retriever, but he finds but few birds. He is lacking in self-reliance, and when hunting with another dog, seems to be content with acting the part of "second fiddler." His appetite is one of his distinguishing characteristics, and he has no special choice as to the quality of his food. Plain corn bread is his usual diet, and after having disposed of a large piece, he watches, with keen vision, to see if any of the others have left any of their rations. If so, he cleans it up, and then looks as if he was not half satisfied. Why does he not find the birds? Teedel says that his nose is hot, and that unless a dog has a cold nose, his olfactory organs are so insensitive that he is incapable of smelling well. His nose is hot, as a general thing. What must I do to reduce his temperature? Is he right in his assumption? Is a hot nose evidence of such physical disorder as impairs his sense of smell? Can the owner of "my dog Trim" answer this question of nosology?

With wind up of this mystery I shall cease to trespass, until the *aves scribendi* again seizes me with its deadly fangs. When it does, your readers may get ready for another indolition, and be prepared to read or skip some observations upon what I saw, heard and felt in other efforts to distinguish myself as a respectable disciple of Nimrod. WELLS.

ROCKINGHAM, N. C., March 27, 1888.

[A hot nose is generally to be accepted as evidence that the dog is out of condition. It is also the general rule that a dog with a poor-nose cannot have a sharp scent. We have known exceptions to this rule.]

OSWEGO, N. Y., March 28.—Several flocks of wild geese have recently been seen flying north high over our city.—M. B. R.

THE HUNTING RIFLE.

IN offering some remarks on this fruitful theme, I wish to be understood as referring strictly to the hunting rifle; and if I refrain from offering any "hints to novices," it is because that when I see a first-class "theoretical" rifleman miss a 700-pound moose at eighty paces, standing broadside on, it has a remarkably depressing effect as to the utility of said "hints." And again, if I gave any, they would differ so radically from those in the excellent series of articles by Mr. Van Dyke, "The Rifle on Running Game," that the bewildered novice would either lay down his rifle in despair, or take it up with a firm determination to trust in his own capabilities alone, which last is the correct thing to do anyway.

In the course of my hunting experiences, I have shot a good many deer on the run with the rifle, but I certainly never aimed ahead of any one of them. Neither do I know of a hunter in these parts who claims to have ever killed one in that manner, and I doubt if such a one can be found. If the animal's flight was continuous, like a bird's, the system of aiming ahead might answer; but as it comes to a dead halt at the end of every leap, to aim just ahead of that point and pull, will result in a miss to a dead certainty.

I confess to a feeling of admiration for Major Merrill's courage, if not for his discretion, in taking up the endgels for the muzzle-loaders in preference to the breech-loader as a hunting rifle. The latter is so immeasurably superior in everything that makes up the conveniences of a hunting arm, that the battle is a hopeless one. Nineteen-twentieths of all my large game have been killed with a muzzle-loading rifle. So I speak from long experience; about the most bitter part of which was to shoulder my empty rifle and start for camp, through sheer inability to reload, with fingers frosted from contact with the blistering steel barrel, the game standing in full sight, and the thermometer—42°.

That the muzzle-loader is a little more accurate arm, I believe; but it is to be borne in mind that this superior accuracy depends on the proper use of the loading-muzzle, the guide starter, the swage and the balances; none of these are available in the hunting rifle, and so the superiority vanishes. When using the elongated bullet and loading the muzzle-loader in the woods with a common pocket starter, the chances of placing the axis of the bullet true with the line of flight, are decidedly in favor of the breech loader; the greater range and force of the muzzle-loader I believe to be wholly due to the greater amount of powder used, in proportion to the size of bore, and not at all owing to the mechanism. I believe our gun-makers make a grave mistake, when they enlarge the bore of our hunting rifles, instead of lengthening the bullet, and increasing the charge of powder in the shell. In regard to the two targets shown by Maj. Merrill, as the difference might easily have been in the marksmen instead of the guns, they prove nothing, and again, it is safe to say that if the owners of the muzzle-loader were to make half a dozen targets, with the same

gun, over the same range, the difference between any two of them would undoubtedly be greater than that between the breech and the muzzle-loader; so that from the hunter's point of view it is merely accidental.

For a hunting rifle the Winchester has, until quite recently, been in my estimation a long way ahead. Its many merits, and its one defect, are getting to be pretty well understood among practical hunters: of the former are its shapely outline, its nice balance, excellence of workmanship, rapidity of fire, ease of manipulation, the beautiful working of the carrier-block being unapproachable by any other arm, and great accuracy within its range. Its one defect is its very high trajectory, and consequent lack of force, caused presumably by shallow grooving, slow twist, and bullet short in proportion to its diameter. Some two years ago I wrote the company manufacturing the above arm, respectfully representing that if they would put a different form of their gun on the market, one say of 38 or 40-cal., using 60 gr. powder, and bullet elongated sufficiently to be somewhat heavier than the one now used in the 44-cal., it would meet the wants of the hunters in this section and would, I felt confident, meet with a large sale. I received an equally respectful reply, stating that they were already manufacturing a 60 cr. Winchester, which was meeting with ready sale, and that they thought it would fill the bill. Six months after I saw in your columns the advertisement of the Marlin rifle, "40-cal., 60 gr. powder, 360 lead," caught my attention instantly, and I prevailed upon a friend of mine, who was about to order a new rifle, to send for one. Its superiority over my model 73 Winchester was so great that I disposed of the latter forthwith and purchased one of the new Marlins. A faithful trial of it for the past year, including four weeks deer shooting, in which I brought down the game at considerably over 300 yards, has fully satisfied me that it is by far the best hunting rifle for forest shooting in the market, and as such I can confidently recommend it.

In sighting the hunting rifle, the front sight should be made as low as possible, by which I mean that the necessary elevation should be given by the block, and not by a high front sight. Therefore the ordinary knife blade sight is about the worst possible in forest shooting, because under certain conditions one always shoots "from the block," instead of the top of his sight, and if the former is far below the latter, the bullet goes clean over. What I mean is this: If the hunter, not dreaming that there is a deer within half a mile of him, on turning a corner, or a bush, comes instantaneously upon a deer in full view within twenty or thirty yards of him, he invariably sights from the top of his block instead of the point of his sight. Why this is so I will not even attempt to discuss. It requires years of practice, and great power of self-control, before one even becomes cognizant of the fact, and among those I have met who have discovered and acknowledged it, I never saw one who had overcome it. Bill Nye, a well-known hunter on the head waters of the Raquette, after, to use his own words, fighting against it for five years, knocked out his front sight, and in-

serted an ivory block with an inked groove down the center of the back edge, to guide his eye, and no sight at all on the top. As for myself, after losing a good many deer from an impulse which I tried in vain to control, I adopted a front sight, which I consider better adapted for cover shooting with the rifle than any I have ever seen. The following direction will enable anyone possessed of requisite skill in the use of tools to make one:

An iron or copper block should be fitted into the dovetailed slot in the front end of the rifle barrel, of sufficient height, so that when a fine sight is drawn over the top of it, the gun will not overshoot at any distance. The target should be simply a horizontal line half an inch wide drawn across a board or other material, say a foot in width. This should be placed at the distance of a semi-circular groove in the wishes his point blank to be—which for me is thirty paces. Then taking a careful rest and holding the top of the block even with the top of the line, and drawing a very fine sight, fire at the line. If the block is as high as it should be the rifle will shoot under. Now, without removing the sight, carefully file down the top, trying it occasionally till the gun shoots into the line. Now remove the block, and with a nail, or hatchet, make a semi-circular groove in the top of the block, say 3/4 inch in depth; in the bottom of this groove saw the slot for the insertion of the sight; after carefully entering the saw, by slanting it to the right and left, the slot can be cut dove-tailing. Each end should then be lightly reamed with a drill. A piece of coin silver should be used for the sight; this can be upset so as to fit the dovetailed slot, driven in from one end, and both ends riveted so that it is perfectly self-aligning, the intervention of heat or solder. This sight should then be filed down till the straightedge shows it to be just as high as the top of the block. Now insert the block, and drawing a vertical line across the horizontal one on the target, forming a cross, aim at that, and drive the block carefully home till the bullet cuts the intersection of the cross. This sight will be found satisfactory at all times, except when the bushes are covered with snow, and then it is rather difficult to keep clear.

MAINE.

THE GREAT DEER DESTROYER.

I notice the following paragraph upon the rounds of the sporting press: "When the far-famed Oxford Gun Club take down the little foxes and sort foxes with blood in their eye, the foxes turn pale in the woodlands, and the deer tremble upon a thousand hills."

I wanted to be a deer destroyer, and with the deer destroyers go, but they would not take me in. They said "I couldn't shoot a deer, any more than a hog could catch a clam."

When the great Gun Club came back from Rangeley, bringing home no pile of deer skins, no scalp of conning fox, my soul was filled with gladness as the waters fill the sea. A little bird from the north land has whispered in my ear this true story which I tell:

The dying leaves, like wounded birds, were fluttering down from off the autumn trees, when first the great Gun Club pitched their tents by Rangeley's famous waters. One morn as the first, faint flush of coming dawn tinted the eastern skies, a man, with the matchless form of a Hercules, rose softly from under his blanket, and with steps noiseless as an Indian's when he walks the trail of death, passed out into the darksome woods. In his hands he carried a rifle, in his belt a little black bottle could be seen. It was the Great Deer Destroyer going forth to slay all the deer in Rangeley before his comrades should awake. As he strode swiftly along the dim forest pathway he chuckled and talked unto himself.

"Now, his eye fell upon the surrounding hillsides, faintly seen in the early light. "Aha!" he cried, "ye hills eternal, your sides shall be dyed in deepest crimson with the life blood of the many deer my strong right arm shall slay." Now he stood upon the breeze-swept hilltops, looking down upon the early glory of the lake, stretching afar before him, lovely as an artist's dream of paradise. "Aha!" he cried again, "ye matchless inland ocean, your waters shall be dark, your waves shall be dyed with the blood of the deer, my never-failing rifle shall lay low in the throes of death. Aha! aha!" And he danced in wild joy upon the hilltop. "Aha! Behold me, great Sun! Look down upon me, ye god of the morning. 'Tis the Great Deer Destroyer, just come up from the city of Death!"

He came to a deep, dark, wood-crowned dell, through whose intermingling branches the sunlight never shone. As he stood in the level depths, in the shadow and in the gloom, a great rushing and crashing fell upon his startled ear, like the rushing and the crashing of some mighty beast or prey, bursting through the scattering underbrush as a whirlwind in her rage. "Nearer, yet nearer, that dread rushing and crashing came; it seemed to fill all the wide-extended forest, and the distant mountains caught and echoed back the direful sound. The Great Destroyer's face turned pale, his heart stood still with terror, his legs trembled and shook like trees in a gale of wind. "Nearer, yet nearer, louder, still louder, the rushing and crashing came. It burst upon the affrighted Destroyer's ear like the crack of coming doom.

What was it? What mean those direful sounds? Was it some terrible lion, snared on Africa's sands, who had broken its confining chains, rushed to the woods, and become the terror of the hills? Was it some still more terrible man-eating Bengal tiger, from India's jungle fall, which had burst asunder the mighty bars of iron which caged it, eaten up the circus of which it was the glory and the pride, and gone forth into the wilds of Rangeley to devour the sons of men?

Crash! crash! crash! It is almost on him now. The Great Destroyer became wild with terror. He ran to the east; he ran to the west; he ran to the north; he ran to the south; he ran in circles, in Bengal, there, everywhere, till he fell with terror he knew not where he hid. And ever as he ran he cried: "Help! Help! Save me! Save me! What shall I do! What shall I do! I'm killed! I'm killed!"

Crash! crash! crash! on the very hills above him now. With a wild, despairing shriek, like the awful cry of a lost soul, he flung down his rifle and fled as never mortal fled before. Over fallen trees he leaped, over oozy pools he bounded, down the forest path he flew swifter than ever he had fled before, before the following hounds.

Into the just-awakened camp the terror-struck Destroyer leaped. "Save me! Save me! Save me!" he shrieked; and then fell upon the ground and rolled over and over in an abandon of utter terror.

"What's up? What's the matter? Who's killed? Who

is it?" came from every side. "A—man—eating—tiger," he panted in gasps, "his—jaws—all—red—and—dripping—with—the—life—blood—of—victims—slain—is—hot—upon—my—trail. Save me—save me—what shall I do—o—deer—o—deer—what shall I do—m—m—"

They didn't stop to hear any more. They just dropped fishes, preparing breakfast, rifles, everything, and climbed the nearest trees, as never squirrel climbed them since first the world began.

Long they waited; long they listened, but no blood-dripping tiger came. All was still. Gathering courage from the silence they came down from the trees. Picking up their rifles they began to trace back again the late flying Destroyer's trail.

Their faces were pale; their hearts beat quick; they carried their rifles at full cock, but they saw nothing, heard nothing, save the song of the autumn birds, and the chirper of the happy squirrels as they leaped from tree to tree. Soon they came to the deep, dark dell, where, gleaming in the dim light, the rifle of the Destroyer lay. They must be close upon the man-eating tiger now. Down flat upon their bellies they crept like snakes up the hillside, keeping their eyes upon the best tree to climb. They reached the top; they crawled down the side.

They found the demon tiger's track. They rose to their feet and stood looking upon those dreadful tracks in a dazed and bewildered way. The Great Destroyer, his brain in a wild whirl, had followed in the rear, stumbling along over root and brier like one walking in a dream. He now came up. He looked upon those awful tracks, and if possible became paler than before. There, right before them, in the fall glare of the morning sun, lay the tracks of that dreadful beast that had almost scared their lives away.

The tracks were the tracks of deer. The dread tiger, the awful demon of the woods, was a herd of deer going down to the river to drink.

For about five minutes the Great Destroyer stood as motionless and speechless as any stick or stone. Then, stretching his brown hands toward the sun, he cried aloud, like a man in more than mortal anguish: "Rise ye great like and cover me; rise ye hills and crush me; open earth and hide me from the mortal eye!"

O, how I would like to be a great deer-destroyer and with the deer-destroyers stand, and have a pretty, harmless, darling little rifle, and hold it in my hand. A. WARD, JR., OXFORD, MAINE.

DUCK SHOOTING ON THE HUDSON.

LIVING as I do, on the banks of this beautiful river, I have an occasional chance to get a rap at the ducks on their flight north in the spring, of which I always take advantage; not that I make any particularly large bags, but there is something very charming to me to drift about among the cakes of floating ice on a crisp winter day, getting an occasional shot and an immense amount of enjoyment. Thinking it might interest some of your readers I give a description of a day's shooting I had in the vicinity of Croton Point on March 19.

The boat I used is something on the style of a Bamegat sneak, only longer and narrower, being sixteen feet in length by three feet four inches extreme beam. Every thing is painted white, including the canvas screen fitted on the forward deck and projecting about eight inches on each side to hide the short paddles which are used when after the birds. White jackets and caps, a fifteen-pound eight-horse hammerless Greener, and we are ready to start.

At six o'clock in the morning, on the day in question, I found my man and boat all ready. I had hoped to get off before anyone else, but was informed that two boats were already out. However, "better late than never," and soon we were among the drift ice. Unfortunately the wind began to blow, and we were obliged to keep under the lee of Croton Point. We made fast to a large cake of ice, and drifted along, keeping a sharp lookout. Finally comes a little grebe bobbing furtively within gunshot and I am tempted, but better thoughts prevail, and I spare the little beggar. I am soon rewarded, for here comes a flock of pintails, about a dozen, and as they are in the middle of the ice about five hundred yards away! I feared we could not get to them, as the ice was packed so closely, but we discover a lead, and are within one hundred and fifty yards, when bang! some one fires in the distance and up they all jump! Wicked words are uttered, but needlessly, for they alight again after flying but a short distance. Now we are getting very close, but so much do we resemble the neighboring cakes of ice, that they never catch our hands. "Here goes for a pot shot," but I can only get three together, kill two and am fortunate enough to get another pair when they jump.

In picking up our birds we find that one has evidently seen a hard winter, as a chip hat would certainly disgrace him for weight. However, the other three were in very fair condition. After poking about in the ice for some time, I discover to my regret a flock of thirty or forty. As they are in open water, it is doubtful whether we can get to them, but of course conclude to try. When within about three hundred yards, part of them fly and the rest appear to be very uneasy. Another hundred yards and more take their departure, leaving only the redheads and a few pintails. Up get the latter, but we are going so fast before the wind that we are within sixty yards of the redheads before they rise. They swing to the left, and—bang goes two ounces of ammunition shot, backed up with eight grams of powder. Down come four; bang again; burrah, three more! Now the fun begins. Some are crippled, but a few more shots and they are all mine—seven beauties!

I conclude after this, that we had better pull back to the point, as it was beginning to be pretty rough. My man Andrew was of the same opinion. We were almost ashore when what should I see but an old crane whistler coming straight for us. "Down!" whispered I, seizing my gun. Andrew drops his oars and we crouch in the boat; at a very lively rate he comes straight ahead. As soon as he is in range, I jump up—he sheers off and I put in ahead about four feet and make a colander of him. He falls beautifully. What nicer shot can a man have than a duck flying from right to left at an angle of forty-five degrees, providing said duck is within reasonable range. It gives one every chance to put his gun in the right spot.

"There is a pair of ducks over toward Cray-Buckey Point," says Andrew, "shall we go for them?" Well, I should say so; closer inspection shows us that they are wildgeese. We got up to them nicely, they jump, unless the first, by hokey! but settle the second.

After this we see nothing for a long time, conclude to

land, and I take a most delightful sun-bath under the lee of an old fish-house for at least an hour. Finally the wind dies away, we get in our boat and row for the channel. We see a flock of black ducks all asleep, and just as I am counting on a telling shot our veteran pokes up his head, sees us, and away they go. I let drive and cut down a pair, which is a sheer piece of luck, as they were too far away; but today is one of my lucky days.

This last of our ducks up, and we return home tired out, but with fifteen fine birds. I seldom have this success, but always have a thoroughly enjoyable day.

F. BRANDRETH.

SING SING, MARCH 29, 1888.

THE OTTAWA CONVENTION.

AS it was evident that such an important event as the dog show would call together large numbers of sportsmen from all parts of the Dominion, advantage was taken of the occasion to call a meeting to consider several of the very important questions arising out of the violation of the game law and prevalence of pothunting. The meeting was held in the City Council chamber, which was placed at the disposal of the sportsmen for the occasion. There was a large attendance, among those present being many who were regularly delegated to attend to represent either some sporting club or some section of country. The following were among those present: Mr. O'Brien, M.P., Muskoka, representing a meeting of sportsmen at Gravenhurst; W. F. Whitener, Commissioner of Fisheries; Robt. P. J. Pitt, Wolf Island; J. B. Walkem, Portmouth; Capt. Campbell, St. Hilaire, Quebec; Dr. Hurhuff, F. J. Buswell, J. D. Patterson, G. Goun, C. Goun, Ottawa, Sheriff Sweetland and A. W. Throppe acted as secretaries.

In opening the meeting the chairman called attention to the thinning out of game by pot-hunters, many of which lived outside of the Dominion, and explained that it was hoped to do some means of putting stop to this slaughter. He felt certain that the Government would give great weight to the opinions of such a large meeting of representative sportsmen. The next speaker was Wm. P. Lett, City Clerk of Ottawa, and a prominent sportsman of many years standing, who in the name of the sportsmen of Ottawa extended a hearty welcome to their friends from a distance. He gloried in being a sportsman, even though some might say sporting instinct was a relic of barbarism. His words of welcome were responded to by Herbert C. Jones, of Winnipeg, who thanked the sportsmen of Ottawa for their reception, and while on his feet took occasion to advocate the formation of a Dominion Sportsmen's Society to promote the protection of game.

Dr. J. T. D. Mackenzie illustrated the importance of systematic attempts to protect game by a reference to the sportsmen of own county, Addison, Ont. His words of welcome by stating that he had hunted in the county for a number of years, he stated that American "pot-hunters" were killing on the deer and partridge which used to abound in the county. In a single train last fall he had seen thirty-one deer carried out of Canada to be sold in the States. Four years ago he traversed the county on foot, and by the beaten road shot five partridge. Now traveling the same road no partridge were to be met, but boys armed with old guns were to be met at every turn, who would tell you that they were making men's wages in killing partridge, which eventually found their way to the New York markets. The remedy for all the destruction of game, he continued, was to prevent the exportation of game. He hoped that the meeting would confine its attention wholly to the point that night. Ontario had a fairly good game law. Let them now endeavor to get a short act passed by the Dominion Government to prevent the exportation of game. They should be able to do this, and such an act, if passed, would do a great deal toward saving the game of the country from "pot-hunters."

Judge Jillett advocated the stoppage of spring shooting, and a motion was carried to that effect as given below.

Mr. Lett submitted a motion urging the Dominion Government to pass an act stopping the exportation of game from Ontario.

Mr. O'Brien, M. P., spoke very emphatically in favor of such an act, and advocated the necessity of officers being appointed by the Sportsmen's Association to enforce the law. He stated that over 3,000 carcasses of deer were taken out of Muskoka by the Northern railway during the season just closed. However, he thought it might be going too far to stop exportation all through the season. He would suggest that the exportation should be made illegal only after some date in November, so that American sportsmen, who really come for sport, could kill deer and send home one occasionally. The comparative warmth of the season up to November would, he held, prevent "pot-hunters" taking advantage of such exception in the law to send deer to market in large quantities.

Dr. Hurhuff opposed making any such exception in an act such as that proposed. It would leave an opening through which a coach and four might be driven. Otherwise he would be heartily in favor of a preventive act.

Mr. Gill, of London, spoke of the work of the Fish and Game Protection Society of his district, and stated that they hoped shortly to effect something satisfactory, as they had arranged to co-operate with the societies of Hamilton and other places. He referred to the rapid decrease of game throughout Ontario, and hoped that such an act as that under discussion would be secured.

Mr. Shaw, of Perth, emphasized the destructive effect of pot-hunting in Lanark and indorsed heartily a Dominion act to stop the exportation of game. But the Ontario act rendering illegal the exportation of dead deer was a dead letter, because there were no officers to enforce it, and if a Dominion act were passed it, too, would be a dead letter, unless rangers were appointed by the Sportsmen's Association to enforce it.

Dr. McKenzie remarked that if the Dominion would pass the act desired it might also provide to intrust its enforcement to the customs revenue officers, which would settle the matter.

An amendment was here offered embodying the exception to the proposed act mentioned by Mr. O'Brien, but the

WALL-EYED PIKE OF THE GENESEE.

I READ with great interest the notes of correspondents on wall-eyed pike in FOREST AND STREAM of the 29th, and as the fish is well known and much sought by anglers in this vicinity, I make a slight contribution to the general fund of information on the subject.

I have been fishing for them with more or less persistency from schoolboy days until the present, or well nigh twenty years, and have had average success. Older anglers tell me that the fish were formerly more abundant than they have been of late years, and that long ago there was no difficulty in taking them by the dozen with hook and line, where it is not easy of late to get a "strike" at all. The only water near this city in which they are abundant is that part of the Genesee River between the lower falls and Lake Ontario, a distance of about five miles, and nearly all the fishing is done within a mile of the falls. The water is from six to fifteen feet deep, and has a rough, rocky bottom, on which there must be a ton of leaden sinkers and miles of fishing line lost by contact with the boulders.

I have never known any pike to be caught here except during the months of June and July. When the snow melts early and the water in the river becomes clear in April, some of the more enthusiastic anglers venture to try for pike in April and are occasionally rewarded by a large fish, for it is believed by the fishermen that three varieties of pike come up the Genesee. In April and May a large, dark-colored fish, denominated the "blue pike," is caught; their weight is as high as ten pounds. After they disappear it is the general belief that the yellow pike succeeds to the dominion of the water. This fish is generally from two to six pounds in weight, and some have been taken which the spring balance show to weigh ten pounds. I do not pretend to give the weight of the big fish which everyone loses just as it is about to be lifted in the boat, but some of my acquaintances have told me, and no one doubts a fisherman's word, that they have hooked and played pike near the island which is the general belief that the yellow pike succeeds to the dominion of the water. These big fish, I know of any kind to be taken with a hook later than June, but until July 1, if the season, including water, temperature, wind, etc., is favorable, one may chauce to catch a dozen or more in a few hours.

Seth Green used to fish here and could tell you, I presume, of good sport (Seth is just now recovering from a very severe attack of pneumonia, which prostrated him soon after his return from the South, where he was sporting for several weeks with Robert B. Roosevelt). Jacob A. Lockstar, city editor of the *Morning Herald*, has cast many a line in the pools and knows what it is to bring home a big string of pike. He and a friend from "sweet Corna Cork," T. W. A., were the first ones I ever knew to fish for pike with a spoon hook, and they caught half a bushel full one afternoon. They trolled deep and baited the hook with a strip of fat pork. I heard of their hook and line, and I had the plan which I custom prescribed, to use a single hook with a strip of crimson cloth tied a few inches above the hook, half a dozen common earth worms wiggling on the barbed steel, and a three-ounce sinker fifteen inches above the hook. I have since tried the spinning or spoon hook and prefer it. The current of the river runs from three to ten miles an hour where we look for pike, and one person must give his whole attention to keeping the boat in position, moving up and down or across the current of the stream where experience has shown that the pike most do congregate.

The best hours for fishing are from sunrise until about ten o'clock, and from three P. M. until sundown. The river is from thirty to fifty yards wide, and on a pleasant day during a good season ten to fifteen boats can be seen on the fishing ground at once. It is a rather romantic spot for angling, as the banks of the river ascend over a hundred feet and almost vertically, which circumstance allows the wicked "small boy" to stand on the bank above and endanger the angler's life by pelting him with stones. Prudent fishermen sometime carry a revolver for the purpose of intimidating the festive youth overhead, but apart from this source of danger the contemplative fisher meets with nothing to disturb him.

I presume that trained ichthyologists will smile at my classification of the pike, but they are welcome to do so, for I make no pretense of knowing anything, and I have scientifically and merely record what I have heard. None of our pike make a good fight. M. C. N. ROCHESTER, March 31.

WALL-EYED PIKE.

I HAVE read with considerable interest the views of several correspondents of the FOREST AND STREAM in regard to the wall-eyed pike, or pike perch. As this is one of our most abundant fishes in this section of the country, what little I am able to say may interest some of your readers, and at this season of the year, just before the break up here, perhaps I can be a little more liberal to the wall-eye in my views, than I otherwise would be after having captured hundreds, and the longing and excitement had some what subsided.

The peculiar nature of the country here in the great park region of Minnesota furnishes splendid opportunities for fishing. The many beautiful lakes and swift running streams keeping the water clear and cool seem to just suit the wall-eyed pike, for they are found in great numbers, and large fat fellows they are. There seem to be several branches of the family, for some are very light colored, while others are equally dark. In the spring of the year, as soon as the water begins to flow into the lakes from the thawing of snow, the hickereel or grass-pike begin to run up the stream to spawn. In a couple of weeks, say about the first to the middle of May, the wall-eyes follow and then great numbers are speared. Everybody has a spear in this country, from the ten year old boy to old men. No mercy is shown the fish, but wagon-loads are carried away every day, and there is no law to protect them and bar this wholesale slaughter. No idea can possibly be given of the immense numbers that are found in these small streams from April to June.

The Pelican River lies just south of this village and drains many of the largest lakes in the park region. It is about

twenty feet wide at this point, and averages perhaps a foot or two in depth. The bottom is hard and gravelly and the water is clear as crystal. The fish run so thickly here that a boat descending the stream in spawning season drives the fish ahead in such numbers that a wave is raised by them often a foot in height. This is a common occurrence and can be seen at any time during the month mentioned above. After the spawning season is over the fish retire to the lakes again, and then the rod and reel come into active use. As

said before the pike is one of the most common fishes here, and in fact is probably the most taken by every other one of the different varieties. They are not good biters by any means, but whether it is from the good living they find or their natural disposition I am unable to judge, and would like to hear how they act elsewhere. Certain it is that in the opening of the season they bite much better and harder than later on. I have never seen them taken with the fly in these waters, but I think they could be very easily, for in fact I have seen spring entirely out of the water for insects, time and again. I have also drawn a baited hook swiftly over the surface and had them dart up at it, and have sometime secured them in this manner. The common mode of fishing for them here is with a heavy bait in the deep water. They take it very quietly, and you seldom feel them on the hook until you begin to pull up. The way you generally find that you have a fish is to see your line move off at an angle—pretty sure sign that the end of the hook is occupied. Occasionally you receive a good hard strike, but it is a rare occurrence with the pike.

The black bass are also very numerous here, and some of the finest specimens I have ever seen have been taken. Four-pounders are of common occurrence, and some run even as high as six and six and a half pounds. They strike very well, and it is always an easy matter to tell whether a pike or bass is tugging at your line. For my part, I like the flesh of the pike much better than the black bass in this locality. The meat is finer, harder and of a clearer color. Of course I all have their preference, but I think this is the popular opinion among the fish-eating community here.

I have fished considerably in different parts of the country, and I believe that in no part of the West are such fine catches made as are taken here. A prominent Indiana sportsman, here last summer, says he has fished in the waters of nearly all the States and Territories, but never saw anything that equalled our fishing here. He went out with a party of three, and after fishing till 1 P. M., but twenty fish were taken. They then moved along some distance to the inlet of a good sized lake. Right at this inlet there is a small bay, ten feet square, with the water quite deep and still. A strong wind was blowing directly in from the lake, and rolled the waves up well. The fish under these circumstances always congregate here in large quantities. In one hour they had increased their string from twenty-five to one hundred and thirty-seven. Nearly all were wall-eyed pike, with several bass, pickerel, etc. They stated that their hooks hardly touched the surface of the water before they were taken, and a fish or two were swinging in the air continually. It took the breath clear away from the gentleman from Indiana and he made the statement referred to above. I have seen still more than this. One party of seven was that of a party of three who spent a whole day at Detroit Lake without weighing anchor. They took over three hundred fish, two-thirds wall-eyes. The wall-eyes alone filled an apple barrel to overflowing, and a large box beside.

Of course all this fish slaughter is useless, but while the fish do bite the fishers will fish, at least until our Legislature passes laws to the contrary. I have heard of many Parties getting off for a day's fish are bound, ten to one, to give with each other to see who can make the greatest haul. Now I have told what I know about the wall-eye here and should like to see other readers of the FOREST AND STREAM come up and state what they know. One thing I can assure all sportsmen. If they want a pretty, quiet place to spend the heated season, where sufficient fish and game is found to insure good sport, they should be here. I am pleased to state that this season will witness ample accommodations for all, and I would be pleased to give detailed information to parties inquiring. Below I give you a synopsis of the game law passed by the late Legislature of Minnesota: Ducks from the 1st of September to the 15th of May, prairie chickens and grouse from the 15th of August to the 1st of October, partridges, pheasants, etc., from the 1st of October to the 1st of January. The season for stringing salmon has been extended from the 1st of November to the 1st of December. H. P. HAMILTON.

DETROIT, Minn., March 25.

PHILADELPHIA ANGLING NOTES.—March 31.—There is a poor outlook at present for our trout fishermen who resort to Pennsylvania State as soon as the condition of the streams after the opening season, April 1, permits. No one as I can find out will attempt a trip now, as the mountains are yet full of snow, and this will have to disappear and run off before fishing will be worth trying. The backwardness of the season has caused the coming of the shad up the Delaware late this year. Many gilling skills have started down the bay and are already fishing there. All that is wanted is a few days of warm, spring-like weather, and the shad will run. Big preparations for the season are being made at Gloucester and Howell's Cove fisheries.—Homo.

NEW HAMPSHIRE TROUT SEASON.—FRANKLIN FALLS, N. H., April 2. *Editor Forest and Stream*: In your leading editorial of March 22 you have stated that the season for trout is commencing April 1 in this State. By referring to FOREST AND STREAM of December 7, 1892, and also to "Fish and Game Laws of the State of New Hampshire" I find that the close season is from September 30 to April 30. I direct your attention to the above as you may mislead some of our more ardent (or verdant) anglers. Trout fishing here, at present, could be neither pleasant nor profitable, owing to the great amount of snow which still remains, an average depth of about two feet.—H.

ROUTE TO THE NEPAGON.—Will some one of your readers who "knows the way" to Nepigon be so kind as to inform the writer through the FOREST AND STREAM of the shortest time route to Nepigon from Chicago, and what the time is? Also, how far must one ascend the river to obtain good trout fishing? By so doing he would much oblige one who would like to know.—ANGLER.

AS WE GO TO PRESS we learn of the death of Mr. William Mills, senior partner of the firm of William Mills & Son, dealers in fishing tackle, 7 Warren street, New York.

THE TROUT DISPLAY.

THE new Fulton Market was in gay attire on Monday and Tuesday last, and trout and roses were there in profusion. Mr. Blackford had a display that in some respects exceeded and in others fell behind his efforts of former years. It exceeded former displays in the matter of the number of large Western trout and the introduction of electric lights in the tanks of live fish, while it fell behind in the number of private exhibitors. Canada was well represented by a great quantity of wild trout, which were in good condition, much better than in former years. They were long shapely fish, very dark, and with bright red bellies. A pair of Canadian "sea trout" attracted much attention, and anglers disputed as to their being *fontinalis*, as the large specimens lose their crimson spots in salt water. Brook trout from many parts of New York State, Rhode Island, Connecticut, Massachusetts, Minnesota, Pennsylvania and Vermont graced the tables and nestled in the moss divisions which separated them. The South Side Sportsman's Club of Long Island sent many live trout which showed well in the evening by the electric lights suspended in their tanks. They were startled by it at first, but gradually lost fear of the strange brightness.

RAINBOW TROUT.

The display of the rainbow trout (*S. irideus*) was the best ever made in the East. Six specimens, ranging from eight to sixteen pounds, stretched their lengths on the slabs and looked larger than they were. These specimens were taken in Paper Mill Creek, Marion county, Cal., and were not as bright as some smaller specimens sent by the U. S. Fish Commission from the salmon breeding ranch at Baird, Shasta county, Cal. The pair of live rainbows of two and a half and three pounds, raised from the egg by the South Side Sportsman's Club, attracted much attention; their delicately spotted sides, red central lines and brilliant opercles enabled the most careless observer to decide that they were of a different species.

THE MINNESOTA FISH COMMISSION.

The Minnesota Commission sent from their State hatchery specimens of California salmon, brook trout, land-locked salmon, lake trout and hybrids, wall-eyed pike and yellow perch. The specimens ranged from half a pound to two pounds, and were in good condition.

DOLLY VARDEN.

A single specimen of the Dolly Varden trout, *Stizostedion malma*, was sent by the U. S. F. C., and greatly interested fish culturists. The fish would weigh about six pounds and it was spotted with large crimson dots all over its sides and high up the back, and is no doubt a beautiful fish when fresh from the water. It is rare in its own country, and fish culturists have not yet succeeded in obtaining its eggs. No doubt it will be a valuable acquisition to our Eastern game fishes when once introduced.

EMBRYO FISH.

In the glass hatching jars on Mr. Blackford's tables were infantile specimens of brook trout, German trout, salmon and land-locked salmon from the Cold Spring hatchery of the N. Y. Fish Commission, and some eggs of the rainbow trout from the same place.

OTHER FEATURES.

Many large striped bass and other fishes were displayed, and the floral decorations were much admired by the gentlemen as well as by the ladies, of whom there were a great number present. C. M. Roberts and trout made from different flowers, made a bright picture, and proved a treat to thousands who never have so good an opportunity of seeing such an exhibition as that yearly set out by Mr. Blackford. At Middleton & Carman's there was a fine display of trout from near home, and a large earp which swam contentedly in a globe. Inside the market, all was new and bright with freshly painted stalls. The dealers in butter, meats, game, and fish were hurried to get their new stands in order and to move in for the benefit of the crowd which the trout were sure to attract. One curious feature was the pair of axolotls sent from France by Mr. Charbonnier to Mr. Blackford, and which had laid many of their large gelatinous eggs in the tank. These animals were albino, and their parents came originally from Mexico, where they are said to be eaten; in fact, the army of Cortez is reported to have fed largely upon them. They have four legs and external gills, and resemble the so-called protists or "tizard" of the great lakes.

VISITORS.

All day, from five in the morning until 9 at night, a constant stream of visitors passed through the part of the market next to Beekman street, and which is known as "Fish avenue." Ladies came in great numbers toward the middle of the day, and the restaurants were busy to get their fish all shapes to the hungry. In the crowd we noticed many anglers whom the recent cold storm had kept away from Long Island, and who, if they were deprived of catching trout, were determined to see them in all their various shapes and color. Among them we noticed Prof. E. L. Youmans, ex-Gov. Gibbs of Oregon; Fish Commissioner Hon. R. B. Roosevelt, John E. Devlin, George Shepard Page, President of the Piscicultural Association; Assistant United States Treasurer, H. Thomas C. Acton, Leonard Jerome, Jordan L. Mott, John Ford, and Earl Grosvenor, son of the Duke of Westminster, of England; Prof. Rice, of the Johns Hopkins University; Francis Endicott, President of the National Rod and Reel Association; Chas. M. Everts, of Vermont; Dr. E. Bradley, President of Blooming Grove Park; A. N. Cheney, of Glens Falls; Charles Hallock, H. C. Weston, Superintendent of the United States Fish Commission; H. Thompson, Secretary Bistby Club; William Mitchell, Charles E. Murphy, Dr. Geo. M. Eddy, Prof. A. M. Mayer, Bouten Wood, B. F. Nichols, Charles E. Peeks, Fred Malleon, Samuel J. Guthrie, and a host of others to whom we nodded as we passed through, but whose names have at present escaped us. Taking it all in all it was a great day for the worshippers of Saint Salvatours.

ANGLING BOOKS.—The collection of angling books belonging to the late Lorenzo Prouty is now offered for sale. Mr. Prouty was an angler well known to our readers as being for the past quarter of a century at the head of the fishing tackle department of the late firm of Bradford & Anthony, Boston. During this time he collected many books on angling, and no doubt many of his friends will be glad to obtain a memento of him in the shape of one of his books, especially when it is known that the sale is for the benefit of his widow and child. A short time before his death Mr. Prouty had decided to withdraw from the firm above named

The Kennel.

FIXTURES.

BENCH SHOWS. April 3, 4, and 5, 1888. Western Pennsylvania Poultry Society's Eleventh Annual Bench Show, Pittsburgh, Pa. Entries close March 19. Class, Lincoln, Superintendent. C. B. Eiben, Secretary.

FIELD TRIALS. November 19, 1887. Eastern Field Trial Club, Fifth Annual Trials, at Hill Point, N. C. Entries close July 1 for 1888. Members' Stake, Nov. 17; for the All-Aged Stake, Nov. 1. W. A. Coster, Secretary, Flatfish, Long Island, N. Y. December, 1887. National American Kennel Club, Fifth Annual Trials, at Grand Junction, Tenn. Dr. Bryson, Secretary, Memphis, Tenn.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose offices from the office matters of importance are liable to delay.

"AMERICAN KENNEL REGISTER."

As announced in our last issue, the Forest and Stream Publishing Company, at the request of many of their patrons, have undertaken the publication of a monthly register, The American Kennel Register is a record of all kennel events necessary for the information and guidance of breeders, exhibitors and owners of all breeds of dogs.

Its leading feature is the "Pedigree Register" of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is given to each dog, and an index will be compiled at the close of the annual volume, thus making it a complete work of reference. The pedigree registration fee is twenty-five cents, payable in advance.

Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs for sale, and deaths.

Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include field trials.

Space will be devoted to all matters of importance to breeders and those interested in dogs, the object being to render the American Kennel Register a complete record of the topics of the day.

The Register will be published on the fifth day of each month. All matter intended for publication must be in the hands of its editor by the first day of the month.

The initial number, however, will be published April 10, and all entries must be received by to-morrow, April 6, at the latest.

Entry blanks will be sent on receipt of stamped and addressed envelope.

The American Kennel Register will be sold by subscription only. The subscription price is one dollar per year.

Address American Kennel Register, P. O. Box 2,882, New York City. Make drafts and money orders payable to the Forest and Stream Publishing Company.

OTTAWA BENCH SHOW.

[Special Correspondent Forest and Stream.]

Our first show is now a thing of the past. Except for the absence of Mr. Charles Lincoln, we might say it was a perfect success. Our general superintendent was detained in Pittsburgh, and an additional party of work fell to the share of Messrs. Viers and Allen in consequence. The successful management of the show is largely due to these gentlemen. The benching and feeding of the dogs left nothing to be desired.

The task of judging was in first-rate hands, and there were no complaints of the judges, for hardly no one is better qualified than Major Taylor, of Lexington, Ky., to adjudicate upon the sporting classes, and Mr. J. F. Kirk's decisions in non-sporting classes, fox-terriers and spaniels appeared to give general satisfaction.

The quality of the dogs exhibited was remarkable and the classes were well filled.

Altogether we have very good reasons for being proud of our show, and it is to be hoped that it is only the forerunner of many good ones to come.

The Drill hall was singularly well suited for the purpose, being commodious and well ventilated. The judging rings were stationed at one end of the building, and great interest was taken in examining the judges at work.

His Excellency, the Marquis of Lorne, Governor-General of Canada, opened the show, and appeared to take a lively interest in the exhibition. He was a frequent visitor.

A special feature of the show was the collection of sportsmen's goods, which, though small, made up in quality what it lacked in quantity.

One of the attractions of the show was the celebrated Comet, the English setter belonging to the Dominion of Canada Kennel Club, and which gained such notoriety through the progress the English Kennel Club of his pedigree by Purcell-Llewellyn. He is a handsome blue belton dog with a grand head.

The display of English setters was a very excellent one, particularly those from the kennel of Mr. Bailey Harrison, of Tilsbury, who was singularly successful in carrying off the prizes. It is safe to say that there was not a bad one in all the classes of English setters.

In Irish setters the principal entries were from the kennel of W. N. Callender, of Albany, and Dr. Jarvis, of Claremont, and they were a lot of beauties. Such a collection of fine specimens is rarely seen even at the large shows. Old Rory O'More shows signs of age, but is still a hard one to beat on the bench. He was not entered for competition, however.

Major Taylor awarded the prizes in Gordon setters to the large, heavy type, ignoring those of smaller, lighter make; but there were some excellent specimens of the latter present, notably Brant, owned by Bradley & Donville, of Hamilton. He is perfect in coat and color, and he looks a rare workman. Brant will be heard of yet when the new standard of lighter-made dogs comes into fashion.

The pointer classes were not very well filled, but two or three good ones were shown. Chief Constable Draper's dog is a handsome dog of great quality, and looks fit for hard and stylish work in the field.

Champion Irish water spaniels brought out Mike, belonging to Mr. J. D. O'Leary, and he received many encomiums from sportsmen who are fond of duck-shooting. The judges expressed a high admiration for him and scored him 95 points out of 100.

The open class of water spaniels brought out some good ones; and first and second winners were very excellent. The second prize bitch, owned by Mr. Bailey Harrison, win in time

beat the other, as she is only a puppy yet, and her top-knot has not yet developed.

The clubber spaniels were represented by two, but neither of them has any great merit. There was a very fine show of spaniels, field and cocker, especially among the blacks. Dr. Niven's Lass o' Broda is a very good one. The Hornell Spaniel Club's Hornell Ruby is a very handsome puppy and will develop into a clipper yet. Altogether the display of spaniels is the finest ever seen on this continent.

The show of foxhounds and beagles was very large, and some excellent specimens were shown. D. O'Shea, of London, as usual, was well to the fore.

Deschamps and Gray had some very fine entries. Fox-terriers were exceedingly good, the kennel of Messrs. L. & W. Rutherford, of New York, being a treat to see. It is a matter of regret that Mr. Richard Gibson, of Iderton, was unable to present with his dogs, as he owns some of the best in the country.

Mastiffs were only fair. The entries in St. Bernards were very numerous, and the judges asked that they be divided into two classes, dogs and bitches. This was lucky for the dogs, as Lady Abhoss, owned by Mr. F. W. Rothera, of Sincce, would have beaten the dogs.

Newfoundlands had some good entries, and the winner, belonging to Mr. Henry C. Bentham, was well. He is a huge dog, but active and well built.

The collie classes were very excellent, and the judge was lavish with his favors, which were all well merited. The show of bulldogs was extremely good, and of very high quality. The judge remarked that it was a splendid class, and showed the honors thickly.

Bull-terriers were very poor, and Mr. Kirk very properly withheld the first prize.

Scottish terriers were first-class. Not a bad specimen in it. Skyes were a rather mixed lot. A number of people enter half-bred Yorkshires for Skyes, but the judge made an excellent selection in the winner. He is a grand young dog, belonging to Mr. A. D. Gray, of Toronto.

The Bedlington terriers attracted much attention, although their beauty is somewhat dubious except to a fancier, who prizes their workman-like look.

The Yorkshires were not a good lot. Pugs were numerous, but with one or two exceptions were not of much account. Two English ladies sent out ten dogs and they had many admirers among the fair sex.

A very excellent spitz owned by Mrs. William Roger of Ottawa deservedly won first prize in the foreign breed class. As a matter of fact, the miscellaneous class contained a number of nondescript mongrels, but a very handsome white English terrier, belonging to Mr. Scholes of Toronto, carried off first prize, and a King Charles spaniel belonging to the same gentleman took second. A huge dog, belonging to Mr. Stewart of Montreal, and bred between a St. Bernard and mastiff, was very much admired, but only for his size and strength, as no points of breeding were apparent.

LIST OF ENTRIES.

- 1. Champion English Setter Dogs.—Dominion of Canada Kennel Club's Comet, H. Bell's Harry's Duck-Lark.
2. Champion English Setter Bitches.—H. Bailey Harrison's Belle's Pride.
3. English Setter Dogs (except pure Liveracks).—Lindsay Russell's Bon A. G. Chisholm's Prince Royal, James Leslie's Spot, H. Bailey Harrison's Clifton, G. C. Conroy's Grip.
4. English Setter Bitches (except pure Liveracks).—Wm. Dangleford, Jr.'s Nona, Wm. Hudson's Bill, T. G. Davey's Grace Belle and Lodelandie, H. Bailey Harrison's Countess Adelaide, Grace B. and Countess Vic, and T. G. Davey's Blanche.
5. English Setter Dogs of pure Laverack pedigree.—T. G. Davey's Lava Rock.
6. English Setter Bitches (of pure Laverack pedigree).—Dominion of Canada Kennel Club's Carline, W. Peters Price's Pet Laverack.
7. English Setter Dogs, under 18 months and over 12 months.—No entries.
8. English Setter Bitches, under 18 months and over 12 months.—Thos. Hutcheson's Nellie Lee, H. Bailey Harrison's Countess Vic, D. O'Shea's Lilly, Forrest Kennel Club's Forest Dora and Forest Lily.
9. English Setter Dog Puppies.—Wm. Hudson's Pilot and Tim, H. Bailey Harrison's Alford, Wm. Hudson's Polo, R. W. Boyle's Dashing Boy.
10. English Setter Bitch Puppies.—T. G. Davey's Nellie, H. Bailey Harrison's Grace B., Genevieve, Lulu and Medie, A. A. Francis's Genevieve Belle.
11. Champion Irish Setter Dogs.—W. N. Callender's Rory O'More, Wm. Jarvis's Nimrod.
12. Irish Setter Bitches.—W. N. Callender's Lady Berkeley and Nora O'More, Wm. Jarvis's Noreen.
13. Irish Setter Dogs (except pure Laveracks).—Wm. O'More, Jr.'s Assheton Point, G. W. Joseph's Echo VII, John Ryan's Wild, H. W. Wells's Rover, Joseph Jarvis's Sall-a-Mor and Kerry, Miss Orange's King, Wm. B. Galloway's Rexford, Rory O'More, Jr.'s, and H. B. Galloway's, Jarvis's Echo, J. B. Barrow's Barney.
14. Irish Setter Bitches.—Alfred Geddes's Fannie, John Ryan's Dublin Boss, Thos. J. Egan's Nellie, Wm. Jarvis's Mox, John O'Connor's Drish Col, F. G. Woodhouse's Cora.

Class 15—1st, Gral; 2d, Clav.
Class 16—No entries.
Class 17 and Class 18—Prizes withheld.
This closes the judging to-day.

PITTSBURGH, April 4.
The attendance yesterday was the best that the Society has ever known on the first day. The Bench Show Derby brought out a grand lot of youngsters and was a decided success. There were forty-one nominations. Eight of them faced the judge, who thought well enough of them to give each a ribbon. First prize went to Count, Jr.; second to Fairy III., and third to Lady Thander; *viz.*, Novelty; *hic.*, Fortia; *c.*, Sallie H., Fairfax and Premier.

PITTSBURGH, April 4.—P. M.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS \$4 A YEAR, 10 CTS. A COPY, SIX MONTHS, \$2.

NEW YORK, APRIL 12, 1883.

VOL. XX.—No. 11.
Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be returned. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsmen throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C. London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications, Forest and Stream Publishing Co., Nos. 39 and 40 PARK ROW, NEW YORK CITY.

---	--

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

DEATH OF B. H. G. VICARS.—The many hundreds of our readers who came into contact with the secretary of the Ottawa Benevolent Society, lately held, will be inexpressibly shocked and grieved to hear of his untimely death, at his home in Ottawa, Wednesday, April 5. To his energy and labors in the cause of the Dominion of Canada Kennel Club may be, in the greatest measure, ascribed the singular success of their inaugural bench show, and to his indefatigable exertions in this direction, while suffering from a severe cold on his chest, the fatal termination of his illness is mainly due. He was thirty-three years of age, and had many friends. Holding a public position as Paymaster of the Indian Department, he was universally beloved and respected. Of quiet unassuming manners, the energy and indomitable perseverance that characterized the man, were not apparent on the surface, but all who were fortunate enough to own his friendship, knew how steadfast and true he was. The Dominion of Canada Kennel Club has sustained a severe loss in his death, and will find it impossible to replace him. Without him it would never have arrived at its present solid proportions, and he spared no effort, at whatever cost to himself, to further its interests. His sad and premature end is mourned by thousands.

THE NEW YORK SOCIETY.—We have heard it intimated that the Game Protective Society of this city, once a power in the land, is gradually becoming "fired," and has ceased to give its important work the attention absolutely necessary if the organization is to retain its prestige and usefulness. It is said that beyond holding its monthly dinners the society has of late shown no signs of existence. This is exceedingly unfortunate. The New York Society for the Protection of Game has a large membership and a generous bank account. It appears to lack only one thing, that is enthusiasm, and we believe that there is plenty of this left, if it could only be utilized and properly directed. As the society is at present constituted, there is very evidently something radically wrong. What is it?

ROD AND POLE.

A CORRESPONDENT writes: "It has been agreed to refer a technical dispute for your decision. What is the correct expression for a grown stick used for fishing, or let the stick be jointed. Is it a fishing pole or a fishing rod? One side of the question is that a long stick, or say a pole, becomes a 'fishing rod' when used for fishing; other side is that 'fish pole' is a perfectly correct expression. Which is which?"

The exact period when a pole arrives at the dignity of being a rod is as obscure as the day on which a boy ceases to be such and is invested with the proud title of man. There are poles which are unmistakable poles, as there are fine rods which no angler would insult by designating them poles. But there are also all the intermediate gradations, non-descript things whose true name and character are involved in doubt. We own a fine rod, one of the most elegant and excellent tools that ever filled an angler's hand and eye, and on producing it to the eyes of a gaping rustic have seen a chill extend each way from its forules until the shrinkage spoiled the varnish when the yokel called it "a nice pole."

Frank Endicott draws the line at bark. In his vocabulary a pole is a stick with bark on it, and he splits it as fine as this: "If the alder pole cut at the brookside is fished with in its natural state it remains a pole. If it is peeled from the butt for two-thirds of its length, and the bark left on the tip, as we properly did in boyhood days, it at once is elevated to be a rod." Who can dispute the authority of the President of the National Rod and Reel Association?

A question of this kind should be calmly discussed, and presented in a fair manner. We have not the slightest wish to force our opinions upon the dissenting but our correspondent, nor upon other anglers. That a man is entitled to his opinions, is too true an axiom to be quoted, and as we wished to get at the sentiment of the best anglers on this subject, we telegraphed the question to President Arthur, now fishing in Florida. He promptly replied: "I know nothing of fish poles, except that there are snad poles in the Hudson River.—Arthur." We never heard that General Arthur belonged to the hand-line committee, and we are in doubt if the telegraph rendered our question intelligently. We next sent a message to the Hon. James Geddes, Assembly Chamber, Albany. He replied, "I know what hop-poles are and hoop-poles; have heard of bean-poles, but fish-poles are something that I never heard of." Now, Mr. Geddes is an angler who handles a rod in good style, and don't even know what a pole is—in connection with fish.

From this we draw the conclusion that the two last-named anglers do not know as much of poles as we do, for we have seen darkey boys down South using a pole so heavy, that they could not hold it, but with which they "shung" the odious catfish from his native lair high into the blue empyrean. We confess that we don't know much more about this subject, and will be glad to learn something concerning poles, if they have an occasional connection with fish.

WILLIAM MILLS.—We regretfully announced the death of Mr. William Mills as our last issue went to press, too late to give the particulars. Mr. Mills was the senior partner in the fishing tackle house of William Mills & Son, 7 Warren street, New York. He was born in England in 1822, and would have been sixty-one years old next September. His early life was spent in a manufactory of fish-hooks and needles, and for many years he was engaged in their manufacture for the American house of T. & T. H. Bate, 7 Warren street. He came to this country in 1853, and in 1857 became a partner in the firm of T. H. Bate & Co., at the same place. He had entire charge of the business of the firm, and with his son succeeded to it, under the new firm name. About nine years ago he gave up active business to his son, Thomas B. Mills. He had an extensive acquaintance and was highly esteemed for his probity and thorough business qualities. He died quite suddenly from the effects of a severe cold, which at first seemed to have little effect upon his vigorous constitution. He leaves three children, and will be missed by a large circle of friends.

"AMERICAN KENNEL REGISTER."—The initial number of the Register has been mailed to its subscribers, and with the paper in their hands, owners and breeders of canine stock may judge for themselves of its merits. We are much pleased to acknowledge the hearty welcome already accorded to the undertaking. All persons desiring to avail themselves of the privileges of the Register, are reminded that entries for the May number should be in hand at once.

POACHERS AND PROVIDENCE.—The man who fell through the bridge on Sunday and broke his leg was consoled by the assurance that his calamity was a dispensation of Providence; that he had no business to be crossing the bridge on Sunday, and that the broken bone was a direct and just punishment. This is comforting philosophy; and we commend it to Mr. H. Babcock, of Bradley, Me., who was out deer hunting in the close season last month. One Neddo was also out hounding deer; and when he shot a deer, the bullet went on and wounded Babcock, almost fatally. Another gentleman who may profitably study this subject is the Somerset county hunter, in the same State, who, while deer hunting last month, shot himself in the arm. Both of these unfortunates may come to the conclusion that their misfortunes are the direct visitations of Providence; but the Maine Commissioners appear to think differently, or, at all events, they do not consider the providential punishment sufficient, and are only waiting for the deer shooters to recover before collecting the fines. This is most assuredly "rubbing it in" with a vengeance.

MASSACHUSETTS ASSOCIATION.—The annual meeting of the Massachusetts Fish and Game Protective Association was held April 6. The treasurer's report, which was accepted, shows the expense of the year to be \$404.00, with a balance on hand of \$267.93. The following officers were elected for the ensuing year: President, John Fottler, Jr.; Vice-Presidents, Hon. Thomas Talbot, Hon. Daniel Needham, Walter M. Brackett, Charles W. Stevens, II. T. Rockwell, C. T. Jenkins, T. T. Sawyer, Jr.; Treasurer, James R. Reed; Recording and Corresponding Secretary, E. S. Toby, Jr.; Librarian, John Fottler, Jr.; Executive Committee, Ivers W. Adams, Warren Haggood, Dr. J. T. Stetson, F. R. Shattuck, William S. Hills; Committee on Membership, W. M. Brackett, Walton C. Taft, George Mixer. Two new members were elected into the association. Colonel Samuel Webber, one of the Board of Commissioners of Fishing of New Hampshire, was present and made a few remarks on black bass fishing in that State.

THE PILOT'S BRIDE.—In our last Christmas and New Year's numbers Mr. John Easmond gave an account of the wreck of the bark Trinity, on Heard's Island, in the Atlantic. The crew, it will be remembered, expected to be succeeded by Capt. Fuller, of the Pilot's Bride, and when the months passed by and the Bride did not come, the Crusoes of Heard's Island concluded that Capt. Fuller had broken faith with them. It has just transpired that the latter was himself cast away on Desolation, where his crew underwent an experience very like that of the Heard's Island party. They saw the Marion when she took off the Trinity's crew, but they were unable to attract her attention, and she, unconscious of their misfortune, passed by. They were finally rescued by a New London ship, sent out to their relief, and arrived home last week. What a volume of romance might be written about these barren isles of the Southern Hemisphere. This is the brief outline of one more chapter in the dismal history of Desolation.

AN INCREDIBLE STORY.—The New York Herald of April 6, in the course of an account of President Arthur's preparation for his fishing trip to Florida, reports the following: "During the afternoon one of his Cabinet officers called and discussed affairs of State while the President was examining the joints of his favorite rod. 'What do you expect to catch?' asked the head of the department. 'So long as I do not catch cold, which is the easiest thing to do here in Washington at this season of the year I shall not regret the trouble the trip costs me,' was the reply." Now, we utterly refuse to credit the Herald's statement that the President said any such thing. The "catching cold" joke is a great deal more ancient than the Pyramids. It has been repeated with damnable iteration several million times, in all languages; and we are certain that Mr. Arthur, on the occasion referred to, did not make use of it.

SEVERAL COMMUNICATIONS have been received too late for insertion in this issue. Correspondents are particularly requested to favor us with their contributions as early as possible previous to the issue in which they wish them to appear.

OUR READERS will confer a favor by sending us the names of such of their friends as are not now among the subscribers of the FOREST AND STREAM, but who would presumably be interested in the paper.

HUNTING IN THE MIDDLE AGES.

"By hunting one avoids the sin of indolence, from which springs all mortal sins; and, according to our faith, he who avoids the seven mortal sins will be saved; therefore, the good sportsman will be saved."
—Gaston Phoebus.

THE good people of the Middle Ages were so fond of hunting as we are to-day. Kings, ecclesiastics and peasants took part in the sport, and game being plenty and hammerless breech-loaders lacking, the "gentlemen sportsmen" of those days probably never had any occasion to write caustic letters to their sportsman's journal anent the depredations of pot-hunters. Hunting, as it was then followed, was divided into three branches. Venery, one branch of the sport, as defined by M. Elzgar Blaze, was "the science of snaring, taking or killing one particular animal from amongst a herd." Hawking or falconry was the training and using of birds of prey to hunt feathered game; and fowling (*Pouilleries*) was the destroying, in a sort of go-as-you-please way, of all the birds which made havoc on crops and fruits.

Charmagne was the greatest hunter of his time. With a troop of knights and "ladies fair," accompanied by hounds and a gang of beaters, he would ride at the head of his company into the forest, attacking with spears such animals as came in his way. The beaters and dogs first scurried through the woods, blowing horns and making a great hub-baloo, driving the wild bores, bears, wolves, stags and what-not into a inclosure of cloths or nets, where the poor things couldn't get out without running the gauntlet of the emperor and his knights. Sometimes an irate porker would rip up a horse or two with his tusks, or a demonstrative bear would hug the life out of half a dozen beaters, and then there was fun, you can be sure. The knights would boldly attack with their lances, while the ladies, at a safe distance, would cry, "Ain't it awful!" (in French, of course), or giggle behind their fans when some smartey who wanted to show off got the seam of his hose and smallethoes ripped up by a stag's horn.

Falconry or hawking was the gilt-edged sport of the Middle Ages, as only the nobility could afford this costly pastime. The birds used were the gyrfalcon, saker hawk, lanner, merlin and sparrow-hawk, the last being the smallest, and used only in the pursuit of pigeons, quail and small birds. The birds were imported at great cost from Sweden, Iceland, Turkey and Morocco, and enormous sums were spent in their training and equipment. They were considered the noblest of birds, as far superior to an eagle as we would deem a grackle superior to a mad-hen. The leather boots worn on their heads were embroidered with gew-gaws made of gold and pearls, their perches were gold-mounted, and the glove on which they were carried by their owner was made of richest stuff adorned with costly jewels. History doesn't state whether they were fed on Dresden or Sévres china, but it does say that no other birds were permitted to eat from the dishes used by the falcons.

Their training was undertaken by the head falconer whose rank was the highest of any of the servants of the nobility. That his position wasn't exactly what a politician would call a "soft snap" we can imagine from the amount of learning necessary to the complete education of a falcon. The young bird was first made familiar with men, horses and dogs. When his fear of these was overcome, a checkcord was attached to him, he was allowed to fly a short distance and was then drawn back to be fed. Afterward he was permitted to catch a wounded bird or hare, near his preceptor, and his prey was taken away from him before he had an opportunity to tear it in pieces. On his returning to his perch on the hunter's thumb he was invariably fed, so that, his dietic sentiments being worked upon, the bird was never anxious to put too great a distance between himself and the source of his nourishment, especially as he was hunted on an empty stomach. After being taught to obey the whistle, the voice and the signs of the falconer, two silver bells were attached to the bird's legs, and the falconer reported to his noble lord that his pupil's education was complete. If, however, the sweet bird-graduate refused to come back to the lordly thumb on his first trial, or couldn't be lured by an imitation bird of cloth with a favorite piece of flesh as bait—presto! off comes his trainer's head, and his lordship advertises for a new falconer, with references. What painstaking pedagogues we would have if that rule were law in these dark ages!

They had sportsmen's clubs in the Middle Ages, too, with Free Mason tendencies, having signs, passwords and grips, lucky numbers and emblematic colors. Gérard, Duke of Cleves, created in 1455 the order of Knights of St. Hubert, into which only those of noble blood were admitted. As a badge they wore a gold or silver chain formed of miniature hunting horns, from which was suspended a small likeness of the patron saint. Perhaps it was this club which made the first attempt on record to stock a country with foreign game. Anyhow, we are told that in the time of Charles VIII, rindcer were imported into France from Lapland, and pheasants from Tartary. The latter thrived, and our French friends are shooting their descendants to this day; but the men who took the job of bringing over the reindeer forgot to fetch along enough icebergs to last through the dog days, and the result was that the warm climate enervated the once hardy reindeer. They acquired habits of indolence, became corpulent, and instead of running away

when hunted, they would lie down quietly, chew their cud, and pass themselves off on the dogs for new milk cows, so that the noble lord would experience much the same soul-stirring excitement in the sport as he would by going out in his barnyard and killing his best Jersey heifer with a meat axe.

In the National Library at Paris is an illustrated manuscript treating of the art of hunting, written by Gaston Phoebus, whose simple and sound views on the future salvation of sportsmen will be found at the head of this article. The author lived in the earlier portion of the Middle Ages, and his writings and sketches may be accepted as accurately representing modes of hunting in those days. He has drawn pictures of dogs that are perfect representations of modern greyhounds, and several that would pass for pointers if it were not for their heads, which are contracted like the head of a bulldog. The only rough-coated dogs represented are two, which resemble the setter in all but the head, that appendage having the appearance of a "cutting" from a bulldog grafted on a setter's body.

The "shooting-iron" of Phoebus's time was a cross-bow, the arrows used having long, sharp metal points for penetrating the thick fur and tough hides of bears and wild boars, while those used for hares and such small game had a conical-shaped terminus like a potato-masher, probably of lead, to stun the quarry. Leopards imported from Africa, our author tells us, were used for hunting animals the same as falcons for hunting birds, and he gives us an illustration of a huntsman seated on a horse, with a leopard ensconced on the crump behind him. The sardonic smile on the leopard's face seems to intimate that, in default of other game, he would have no scruples about gobbling up the huntsman and his horse.

Some of our modern hunting stratagems are shown by Gaston Phoebus to be nothing new, after all. Out on the Western prairie geese are often approached within gunshot by a sportsman driving an ox-cart, or concealed behind a grazing horse. In this ancient manuscript is an illustration of a hunter approaching his prey in a cart, with a "blind" of twigs and leaves built around him; and another represents a hunter stealing toward a body of wildfowl, holding in position a piece of cloth cut after the pattern of a horse. They must be geese indeed that would take this bandy-legged hunter and his cloth for a grazing horse. It is interesting to note that "tolling" was practiced in those days—not on ducks, but on woodcock. There can be no mistake about it, for the drawing of the woodcock is perfect. The hunter was completely covered, except his eyes, in cloth of a dead grass color (in autumn), and on spring the woodcock would lie at full length, waving a scarlet cloth back and forth. The foolish woodcock, impelled by curiosity, would approach nearer and nearer, until the hunter, able to slip a noose over the bird's head, would yank him to kingdom come. An amusing way of trapping birds was to distribute small mirrors around the forest. When a he-pheasant, in his post-prandial saunter, caught sight in the glass of what he probably supposed was another he-pheasant mimicking his motions, he would haul off to "knock him out," and at the first crack down would come a rock, and there would be no more post-prandial saunters for Mr. Pheasant. Sometime a number of stool-birds were set loose from their cage, and cords covered with bird-line attached to them. Then divers other birds that might seek their acquaintance would become so firmly attached to them that they couldn't tear themselves away when they had finished their call, and were forced to stay to dinner, which they attended in address uniform, sometimes reclining on pieces of toast, with drawn butter poured over them.

Old German legends are notorious for telling some pretty tough stories, and they have given us some on hunting, which, although we repeat them, had better be taken *en grano salis*, as we cannot vouch for their strict up and down truth. In one of them it is stated that, when beasts were being pursued, if they ran into the arms of a saint or into a sanctuary, their lives were always spared. This fact getting noised around among the animals, they wouldn't skip for their dens when alarmed, but would cut cross lots for the nearest church or abode of a saint. One day a huge bear, finding the chase growing too hot to be comfortable, burst into the cell of a saintly monk while the latter was piously engaged in deepening the color of his nose with a bottle of Veuve Cliequot. It seems that this particular saint wasn't aware of the arrangement between animals and those in religious orders, and while the bear, in his untutored, bearish way, was trying to explain that it was necessary for him to repose in the monk's arms in order to save his life, the monk fired the bottle at the bear and took a back-somersault out of the window, the bear following. But the more the latter insisted on seeking his embrace the harder ran the saint, counting his beads wrong end foremost in his haste, and you could have played checkers on the tail of the holy man's casock until the hunters caught up with the bear and killed him.

Another legend relates that a hunter sold his soul for an enchanted arrow that never missed its aim, and another swapped his soul for an arrow that would carry an enormous distance. What a haul of souls the devil could have made if he'd had a few choke-bore breech-loaders and thread-wound cartridges to dicker with!

In the Middle Ages hunters died about the quantity of game they killed just as they do now.

The Sportsman Tourist.

HUNTING THE MOUNTAIN GOAT.

"Here's a health to the FOREST AND STREAM."

FOR ten long hours we have been toiling up the side of this rugged mountain, and when at last, by the overhanging roots and branches, we pull ourselves up the last steep pitch, and catch the cool breeze from the surrounding snow peaks, and know that for the present our climbing is at an end, we feel like embracing somebody. And when later W. W. shoves a cup of hot punch under our nose, and asks us, "very much obliged to say something as a toast, and why not the one that heads this article. And so here, some three thousand miles away from you, and four thousand feet above the sea level, we reach out our hand to the FOREST AND STREAM as an old friend.

My party consisted of Mr. H., Mr. W. and Mr. K., gentlemen who, having a few days' respite from poring over pay lists and balance sheets of this end of the Canadian Pacific Railway, very wisely elected to spend it with rod and gun, beneath the shade of Douglass firs, by the side of the noisy stream, or

"Up where the canyon's dizzy trail
Leads to the snow divide."

Our camp was pitched on one of the numerous ridges which make up the summit of this portion of the coast range. To the south this ridge rose with an easy grade till its crest was reached some two hundred feet above the level of our camp ground, at which point it was intersected by others running at different angles.

Along the crests of these ridges one may travel for miles, having in many places only a few yards on either side between a man and a fall of five or six hundred feet. A few yards north of our camp the ridge terminated, or rather broke off abruptly, forming a pretty sheer precipice, at the foot of which, five hundred feet below, nestled in a setting of green and gold, was a beautiful little lake some four or five hundred yards in extent.

Although at our feet the heather bloomed with the freshness of summer, everywhere on the wooded slopes the varied tints of the dying year met the eye, and a step higher up the sight was lost in a confusion of snow peaks and storm-wet enclaves.

If I had laid down his rifle and was busy with his pencil and sketch book when Leammux, who appeared to be more concerned about the welfare of his four dusky companions than with mountain scenery, came up, and pointing up the ridge, asked if it was our intention to feed his Indians on white man's muck-a-muck, or the flesh of the mountain goat, which he much preferred, if I would be kind enough to lend him my rifle he would see that their first supper on the top of the mountain would be made from the juicy ribs of that animal. We turned and looked in the direction pointed out by the Indian, and sure enough three goats were in sight, two on the left slope of the ridge, and one on the right. H. at once started in pursuit of the two, while Leammux and I stole away toward the single one.

I did not understand until some time after our return home, why it was that Leammux was so concerned about my success, and put on such a terrible scowling look every time I made a failure. The reason was this: He had made a wager with his companions that I would kill more game than anyone of the party, and to this day he believes I sold him; and it has already cost me a cast-off coat, a pair of old gun boots, and a worn-out hat to get him to recognize me when we meet. As we left H. no sooner was the latter out of sight, than the old fellow started on the run, urging me forward, in hopes that I would get in my shot first. But I took my time. It was H.'s first sight of these animals, and I was anxious that he should make a success of his first shot at them.

At length we reached the point where the goat was first noticed, when Leammux suddenly ducked down behind a block of granite and commenced jerking his long bow arm in the direction of the top of the ridge, while every feature of his greasy face, every contour of his huge mouth, said as plainly as if he had shouted through a trumpet, "Why in thunder don't you shoot?" I looked but could see nothing on the heather-covered slope but a few blocks of gray granite and here and there a patch of snow. I was about to take a glance toward the Indian, when quick as a flash one of the patches of snow threw up its head and disappeared over the crest of the ridge. The Indian stood up, and just then two shots were heard in the direction of H. Leammux stuck up two fingers, uttered the word "*moa*" (two) and stepping past me with the air of an offended Sitting Bull, strode off to camp without once looking behind him. H. had better luck and had knocked over two goats; and long after we had retired to rest, our dusky guides squatted round the camp-fire, and with pieces of moose-horn goat-horn blowing between them, spun out yarns of deeds done by mighty goat-hunters of their tribe who were now defunct.

The next morning we had our breakfast over by daylight. The Indians were just finishing theirs. My companions were in the tent fixing up for the day's hunt, while I, with my back to the fire, was leaning over a rock enjoying a quiet smoke. Suddenly the tread of some animal, coming along the face of the cliff, brought my ears to my ears. Now, as before stated, the ridge, a few rods north of our camp, broke off almost perpendicularly, leaving a face some 500 yards wide. Still, on a previous visit here, I had noticed a trail along which goats had made their way across this face from one slope of the ridge to the other.

This trail came out upon the more level ground, directly in front and about twenty yards from me. So I kept my eyes on that point, rather carelessly, though, because I could not imagine that any wild animal of such size would be so near to our camp with all the bustle of the morning meal going on. I had not long to wait. Presently the head, then the shoulders appeared, and finally the whole body of a monster wild goat stood before me. I suppose the animal was surprised, for it stood stock still, and subsequent events proved that I was not only surprised, but completely dumbfounded. I fired, my rifle, cocked it, but in bringing back my hand in some unaccountable don't-know-how-it-was-done way the piece was discharged in the air. The goat wheeled and disappeared under the cliff. A hop, step and a jump brought me to the edge of the cliff just beyond our tent, where I again came in sight of the goat making his way along; and this time he was over two hundred yards away, and at what distance I fired three shots at him, which

scarcely had the effect of quickening his pace; and were it not for the fact that my companions noticed that every shot struck about a foot over the goat's back, I would have pronounced him bullet proof.*

I suppose I looked ridiculous, and from Leammux's standpoint, probably so, when I, with a man, with the reputation of being the best shot in the neighborhood, shoots three times at an animal nearly as big as a mule and misses it, I dare say he ought either to blame his rifle or apologize. But I did neither. I simply threw my gun over my shoulder and gave the order to disperse over the ridges.

We had scarcely gone half a mile from the camp, when a shout from the Indian we had left in charge brought one of our number back, to find that a large goat—probably the same—had been shot, and was about to charge on the left flank of the tent. Two or three shots from a rifle, however, had the effect of making his goatship raise the siege and go away, if nothing more.

Now it is a curious fact that, with the exception of H., every shot fired during the hunt missed its mark. And this, too, with men having a fair record with the gun, and an experience of twenty years in the mountains, during which time they have had a number of opportunities to shoot larger kinds of game peculiar to the province. During the day a black bear ran the gauntlet of W. and K.'s rifles, and the brute got away, leaving no crimson stain on the bank of snow over which he scampered. The last act of the hunt was performed in the following manner:

While on the top of one of the ridges, H., myself and Leammux discovered a goat lying in a shady nook on the side of a cliff about a thousand yards away; a discussion arose as to the best means of getting within shot, and we finally decided to go straight down the slope and take our chances of getting into the bushes, some half way down, unobserved. So down we started, the old Indian taking the lead, his supple body twisting around the corners of granite blocks and morning along the depressions in the ground, while H. and myself followed, "each stepping where his leader stepped."

There are many interesting moments in the life of a hunter. The catching of the first deep notes of the approaching hound, the bending over the prostrate form of his first deer, and the quiet smoke by the night camp-fire, are all enjoyments worthy the best of nature; but the act of approaching within shot of some coveted quarry, the matching of human experience and cunning against the keen senses of an alert and wary animal, is to my mind the cream of a hunter's experience. The breaking of a twig, a false step, the rustling of a fern, the chirping of a bird, may cost you a deer, or draw sigh for hopes departed with the fleeing game. Or perhaps at the last moment, when a few more steps would bring you within a possible chance, a fitful puff of wind carries forward the scent of your presence, and then with blood trickling from half a dozen wounds from pointed rocks and thorny brambles, you come to a halt and watch the coveted prize recede in the distance. The odds are, in my opinion, always with the game, but nerve and patience can often bring victory to the side of the hunter, and win or lose, I always find the excitement worthy the effort.

An hour's creeping and worming down the long slope brought us to the verge of a deep cañon, across which we had to shoot, at least it was as near as we could approach and be in sight of the game. However, we were satisfied with the distance, and also felt sure of the goat, because, if he attempted to escape, he would have to go one hundred yards before he could get within range of our rifles. It was more than double that distance to reach the top of the cliff, so we took it cool; and a difference of opinion arose as to the distance across. I asserting that it was between two hundred and fifty and three hundred yards, while H. thought it much less. At this point Leammux, who was standing just behind me, thinking to give me one more chance to redeem my character, bent forward, and pretending to brush some ferns from my eyes, suddenly whispered that distance was about the same as that at which I had shot the bear, referring to an occurrence which took place about a month previous. Now the distance referred to was only about one hundred yards, and the idea that my judgment should be thought so far astray, simply irritated me; so I shoved the old fellow away, telling H., impatiently, that I was going to shoot at two hundred and fifty, the latter replying good-naturedly, "You are right, and I will go."

Just then the goat discovered us, started up the cliff, but changing his mind, wheeled, and was making for the timber below, when two streams of sparks and smoke shot out from a clump of bushes and two leaden messengers sped away across the cañon to find a resting place in some of the crevices in the cliff, and the goat kept on unhurt. Again the deep echoes echoed back the reports of our rifles and still the goat kept on toward the timber. This time, however, the goat was a little behind me with his shot, and watching his effect I saw the dust scatter from a point on the cliff about a foot above the goat's back. I shouted to H., to "fire lower," that we were shooting a foot too high, when the latter, throwing forward his rifle, and muttering something that sounded like "I told you so," pulled the trigger, and the poor goat, just as he was making his last leap toward the cover, was pierced through the shoulders and fell a distance of a hundred feet down. This broke the link in the line of friendship between myself and Leammux, and when I reached out my hand and congratulated H. on his good luck, the old fellow muttered something in the guttural language of his tribe, which if interpreted no doubt would be, "Well, that lets me out on you," and started out in search of an easy place to go down the cañon after the dead goat.

A few goats were found on the summit, while a hundred yards below in the timber, through which it was simply impossible to follow them, the ground was everywhere cut up with their hoofs, a circumstance which even the Indians could not account for, as during the summer and fall months and until driven below by the deep snows the summit is their home.

Nowwithstanding our bad luck we had a most enjoyable trip and glorious weather throughout, and my companions learned something of the habits of an animal with which they had never before seen. They also shot three, and as the skins at that time were of little value, and the three carcasses were really all that we required in the way of a change in our muck-a-muck department, why, we hadn't much to grieve about. When a hunter shoots merely for the sake of adding to his bag, when he continues to take life with no

thought as to whether his victims shall be turned to some benefit or rot where they fall, he ceases to be either a gentleman sportsman or a pot-hunter, and becomes a rapacious brute, whose ignorance and shrink-like propensities ought to render him, from a place round the camp-fire,

During one of our rambles on the summit we crossed over a place of several hundred yards in extent filled up with broken rock which had toppled away from an adjoining cliff. This place had every appearance of being the abode of a colony of marmots or rock-whistlers, but as it turned out was now entirely deserted, the cause of which Leammux told in the following story, which, perhaps, it will be as well to take *cum grano salis*:

"Many very fine Douglas Indians came to shoot sheep (mountain goat) and finding this place, and wishing to kill some of the squ-uks (marmots), without encroaching on their seat stock of powder and shot, be thought themselves of the following plan. Some of their number went down in the timber and gathered a large quantity of gum from the fir and pine trees. This they melted and poured on the different sentinel rocks, that is the high pinnacle rock which is generally found directly over the entrance to the squ-uk's house, and upon the top of which the little fellow sits down to take his regular watch and give warning at the approach of danger by sending forth his long half human whistle. Well, the pitch was poured on, and when the squ-uks came out and took their accustomed stations, they soon found themselves lost to the rocks, when the Indians came up and knocked them over with clubs. This was repeated many times until the squ-uks discovered the trick, and being thoroughly disgusted at this mode of warfare, and not wishing to be exterminated by such a veritable set of pot-hunters as the Douglas Indians were, they picked up their household goods, their young and feeble ones, and in the stillness of the night, beneath the silent stars, they stole away, crossed Scamour Creek, and made themselves a new home among the snow peaks where the Douglas Indians dare not follow them."

A few straggling members of the Bohemian waxwing (*Amphispiza bilineata*) were noticed here this winter, once in January and once in March, only about a dozen altogether. Robins (*Turdus migratorius*) arrived Feb. 20. Western bluebirds (*Sialia mexicana*), March 1. Black brant (*var. alpestris*) March 4, but our weather for many weeks back has been so extremely mild that the great army of our northward migrants and summer residents may be upon us any time now. Magpies (*Pica hudsonica*) left for their breeding grounds, beyond the Cascades, nearly a month ago.

Deer have not been so abundant on this (south) side of the inlet, but are apparently as numerous as ever on the north side; and considering that the conditions in the matter of food and cover are equal, and that six years ago deer were plentiful all along the south shore, it is a question worthy of debate as to what has brought about this change. My own conclusions are already formed, and if the readers of FOREST AND STREAM will forgive me for opening a question which for the last year has been thoroughly discussed in its columns, will give them, remarking, however, that they come from one having a very strong prejudice against hounding deer, at least to that extent with which it has been practiced for the last ten years at Burrard Inlet.

My experience with hunting on Burrard Inlet extends back ten years, and during that period the south side has been the great hounding ground for all parties living in the neighborhood, and consequently the sport. Deer were just as plentiful on the north side, but owing to a number of streams putting in, on the mountains, the practice of hounding on that side proved a failure from the first, and during the years above mentioned no hounds have been used there to my knowledge. On the other hand, that side has always been, and is still, a successful ground for the still hunter, both white and Indian.

Now here are two stretches of country some twelve miles long, separated by a sheet of water from a half to two and a half miles wide. At a certain period deer were fairly plentiful on both stretches. The conditions of feed and cover have kept about the same, and, until the last year, when the building of the terminus of the Canadian Pacific was commenced on the south side, the encroachments of civilization were about equal, and yet to-day there is little or no use for the hounds, while the still-hunter continues to shoot his game whenever he wants to. JOHN PANXIN.

SUMMIT OF MOUNT ROY, NORTH ARM BURRARD INLET, BRITISH COLUMBIA.

ROUTE TO THE NEPICON.

"ANGLER'S" inquiry as to the shortest line route to the Nepigon in the POSTER AND STEAMER of 5th Inst. may be answered in several ways. The absolute shortest line route would be by rail to Marquette, and thence across the lake to Red Rock by steam tug, which can always be procured at Marquette. But this is expensive.

Or "Angler" may take one of the Lake Superior steamers at Chicago for Sault Ste. Marie, and thence by Canadian steamer to Red Rock. If close connection is made at Sault Ste. Marie, he may reach the Nepigon on the fourth or fifth day after leaving Chicago. This is the cheapest route. But only a few of the steamers touch at Red Rock, and much time may be lost at Sault Ste. Marie. If the party is large, say eight or ten, a tug can be had ordinarily at Sault Ste. Marie at from \$100 to \$150, making the cost little more than by steamer. The cost of tug from Marquette will ordinarily be about the same.

Or, if the Canadian land does not touch at Red Rock, passage may be taken for Sault Ste. Marie or Prince Arthur's Landing, and boats or tug secured to the Nepigon. The distance is seventy-five miles from the former and about ninety or ninety-five from the latter place. If sailboat is employed a camping outfit will be necessary, as the trip may take from two to four days, depending upon wind or oars. But I suppose no one will go to Nepigon without camping outfit, including a good mosquito bar.

In returning, one can ordinarily get boat or canoe to Red Rock, or time his return by the call of a steamer. With a party of ten or more arrangements can be made with a Canadian scumner from Sault Ste. Marie to Red Rock ordinarily, and for return at about a given time.

I have more frequently taken voyagers and Mackinaw boat from Sault Ste. Marie on steamer. By so doing one has the means of coasting back to Sault Ste. Marie or to Sibley Inlet to reach the Nepigon.

But one visiting the Nepigon must not be too limited as to time, for adverse winds and fogs are apt to foil havoc with the best laid plans. I have been ten days from home before casting a fly, and I believe six days was the shortest time.

A few trout—occasionally a fine one—can be taken at Red Rock. Twelve miles above, however, they begin to be plenty. In fact, it is seldom any are taken between Red Rock and Camp Alexander. The rapids above Camp Alexander and Cameron's Pool about forty miles from Red Rock, have good fishing. But Cameron's Pool is a very hard place to reach, and is seldom visited. There are numerous rapids and pools above, clear up to Virgin Falls, where the lake becomes the river, thirty-seven miles from Red Rock. Cakes and provisions can always be had at Red Rock, and excellent Indian guides.

I omitted to state that a day can probably be saved by taking the Grand Rapids and Indiana Railroad to Mackinaw (on the Straits) and meeting the Lake Superior steamer at Mackinaw. FISHMAN.

April 7, 1883.

Natural History.

THE PANTHER OF THE McCLLOUD RIVER.

Panther concolor.

THE panther of the McCloud River, Cal., although known in different parts of the country under the various names of panther, cougar, painter, puma, and California lion, is nevertheless the common panther of North America, the scientific name of which is *Panther concolor*.

In color, weight and general appearance the McCloud River animal differs less from the panther of the Atlantic Coast than might be expected. The panther skins that I have collected in Northern California look much in color and quality of fur like the skins of Eastern panthers that anyone seeing them would suppose that the two creatures had lived side by side, instead of 3,000 miles apart and in totally different climates. As to size, the panthers of the Pacific Coast do not seem to differ much from those of the Atlantic coast, and all the skins of the McCloud panther that I have measured do not vary four inches in length from what I have supposed to be a fair average measurement of the Atlantic Coast animal, viz: seven feet six inches from the tip of the nose to the tip of the tail, after the skin has been tanned.

It should be mentioned, however, that a skin taken freshly from the animal will measure, without stretching it very hard, twelve or eighteen inches in length more than the tanned skin, and consequently the statement of a hunter that he has killed a panther whose skin measured six feet does not necessarily imply that the creature was much, if any, above the average in size. As to their weight, I cannot speak positively from my own experience, as I have never had the opportunity to weigh one, but judging from the apparent weight of the animal when fitted with the arms, I should say that a panther whose skin when tanned measured seven feet six inches would weigh about 25 pounds.

There is only a bear track on our side of the river anywhere near the house is very rarely, if ever, seen, and the hunts of the bears seem to have fallen several miles further back into the mountains than when we first came. It is the same with the deer. During the first years of our residence on the McCloud we had to go but a short distance from the house for deer, and almost any forenoon an Indian could go out and get one and return before dinner. Now, as a rule, we expect to go several miles from the house to get a deer on our side of the river, though on the other side the deer keep much nearer, as do also the bears. The panthers, on the other hand, were scarce when we came, but have increased and come nearer ever since we have been there. Such a strange statement as this would naturally be received with some incredulity, but the fact is easily accounted for.

Before white men came into this region panthers had to depend entirely upon wild meat for their subsistence, and the meat of some of the animals in this place as another. When white men came they brought domestic animals with them—sheep, horses, cattle and hogs. This changed the face of affairs for the panthers entirely. They found that there was not only other food to be had beside what they hunted in the mountains and forests, but that this new food was obtained with far less difficulty than their former food was, and that it occurred in the most abundance around the huts of men.

It was no trick at all for a panther that had spent his life hunting and watching for the wary and fleet-footed deer, to come down off the mountain bank at night and steal a calf or a pig from the neighborhood of a human habitation. He always knew where to find them. He was always sure of obtaining one, and was also sure of never falling to secure a easy victim. One can readily see that with white men's farms offering these inducements, the panther would gradually abandon his long and laborious hunts in the mountains for deer and other wild game, and when hungry would come down the mountain side and seek his meal in the rich quarry of domestic animals, waiting for him on the settler's ranch in the valley, and it is easy to see also that panthers, in seeking a suitable dwelling spot for themselves and their young, would not be guided so much by its convenience to places that deer frequent, as by its nearness to easy access to the live stock of the ranchman.

The cat family, as is well known, are a curious mixture of boldness and cowardice. They are the most cowardly of all animals by day, when they can be seen. Panthers share this peculiarity with the rest of their family, and trusting probably to their agility, quickness and stealthy softness of their step, they venture at night, when they cannot be seen, into dangerous places that a bear or deer would never think of going into.

It is undoubtedly this trait of cowardly boldness at night which has kept the McCloud panthers about the river, and caused them to increase in the vicinity of human dwellings. Bears and deer will not come around human habitations, knowingly, by night or day, but panthers and lynxes and wildcats as well, although as shy and wary by day as any animal that inhabits the woods, seem not to be afraid at night of taking any risk of danger from men. Consequently, they will often venture down to a hunter's back, into the wild, uninhabited regions on the approach of man, because they do not dare to come near enough to steal his domestic

*Several months ago I received the skin of a mountain goat to tan, and in cutting it across the butt I found it to be, at that place, one men and a quarter thick. Leammux told me he once shot a goat which had been killed by another's horn entangled in the snaw, the skin having closed over it.

animals, and prefer the greater safety of remote regions, the panthers have not only not been frightened off, but have apparently become more numerous. This is the present condition of things on the McCloud River to-day. The panthers are nearer, more abundant and bolder than ever. The settler who lives on the ranch just across the south line of the reservation which we occupy, said last fall that the panthers came down to his house almost every night, and the ranchman just above the reservation also had a visit from them at least three times a week.

One night when Mr. Loren Green was returning from the fishery to the trout ponds four miles above, an animal which he supposed to be a panther sprang from a tree to the ground just behind him, and wounded his dog which was following him.

Summer before last a panther came to the house of our next door neighbor on the west side of the river, and was shot in a tree close to his house.

One day when Mr. Loren Green was going from his house at the trout pond, to his boat to fish, a panther followed him for several rods through the adjoining bushes. Mr. Green thinking it was a large dog. When Mr. Green, after examining his lines in the river, came ashore, the panther met him at the boat-landing and was soon after joined by another panther near by. Mr. Green barely escaping from them by shoving his boat quickly back into the river, and evading the panther which then followed him for about ten or fifteen minutes, during which time he was joined by his mate. Not very long ago, as our stage was coming down the road, the driver saw three panthers trotting in front of him. Having stopped the frightened horses, several of the passengers, who were returning from a hunting trip, got out and fired at the panthers with their rifles.

At Upper Soos Springs, which, although forty miles from the fishery, is, in respect to the surrounding country, in similar conditions, a child of the hotel proprietor was seized by a panther a very few yards from the house, and was shot as it was in the act of carrying the child off.

A few seasons ago, some stockmen drove a band of horses and colts into the McCloud River cañon, for the purpose of pasturing them there through the summer. The panthers first killed colts, then the smaller horses, and finally one spring upon the panther which then sprang upon his back. The rider barely escaped with his life, and the next day the stockmen drove their horses out of the valley to safe quarters.

These instances show how the panthers must have increased in our neighborhood, for when we first came there we did not hear anything in particular about them, and were not molested by them. Now they are destroying considerable numbers of dogs, pigs, calves and colts. They are most destructive to the dogs, so much so that those having hog ranges in the vicinity, when computing the expected increase of their band, allow 20 per cent. for the annual loss by panthers.

It is difficult to acquire much knowledge of the habits of panthers in their wild state. There are some peculiarities about the McCloud River panthers, however, which have been noticed. They will always run from a dog, no matter how small he is. An undressed trapper is as good to chase a panther with as the largest hound. When the panther finds that the dog is closing upon him, he will always jump up into a tree. He will not climb the tree like a bear, but will jump up to one of the branches, and I have heard old hunters say that they had seen panthers jump over twenty feet perpendicular into a tree, and that when the panther's paw would kill the dog, perhaps, but the panther never stops to give the blow. It is quite possible that the panther jumps into the tree so as to be in a position to pounce upon the dog when he comes up, but whether this is their reason for resorting to a tree, or whether it is simply because it is the cat's nature to run, as it is the nature of the dog to chase, it is left to either case that the panther always runs from the dog, no matter how small he is, and never trusts to face him.

The behavior of the panther is no less peculiar after he has jumped into the tree, for when there, he watches the dog constantly, no matter how near the hunter comes up to him. This makes it a comparatively safe and easy thing for the hunter to shoot a treed panther if the hunter has a dog with him, for while the panther's eyes are fixed on the hunting and excited dog, the hunter can go up near as he pleases, and take as slow and deliberate aim as he pleases. As long as the dog remains barking under the tree and absorbing the panther's attention, the hunter is perfectly safe. All he has to guard against is wounding the panther without actually killing or wholly disabling him, in which case the victim might in his dying struggle encounter the hunter and do him a serious injury.

Panthers are usually loafing about by day. It is believed that they are in the habit of hiding in trees in the daytime, partly perhaps for safety, and partly for the purpose of watching for food. On the McCloud River, however, I believe they spend the day for the most part in the inaccessible parts of the limestone cliffs which cap the mountain summits across the river from the fishery. These limestone cliffs and pinnacles are high, steep and very difficult of access. They are usually followed a panther's trail far up the side of Mt. Persphone. The panthers' tracks grew thicker and plainer as the mountain side grew steeper, and the limestone cliffs came nearer. When about three thousand feet up the mountain became very steep and precipitous and ended in a blank, smooth, vertical wall of rock about twenty feet high. The panthers' tracks continued up to the very base of this rock, which of course having reached, they generally believe that the panthers' tracks were safe for everything. No Indians could follow them there, no dogs could track them there, no white hunter with his rifle could reach their inaccessible retreat. In these cliffs they were safe.

It is my impression that the panther, finding so safe a retreat here, and one that is, at the same time, so near their food, make these limestone cliffs their home, and rear their young there. The panthers' tracks and the tracks that lead to our houses, come from these cliffs, and the tracks that lead from our houses return to the cliffs.

It would seem that a panther's life when he does not voluntarily risk it by excessive boldness must be extremely free from danger. No denizen of the mountains or forests is his equal. In California he is called a lion and he is well named, for like the lion, he is master of the forest. It is generally believed that the grizzly bear is the most powerful of the wild animals of America, but the McCloud River Indians say that the panther always kills the grizzly when they have a fight. They say that the grizzly bears are afraid of the panthers, and that the panthers spring on their shoulders and eat their throats with their teeth. I imagine,

however, that a panther never attacks a grizzly bear face to face. I myself have seen places in the mountains where the ground has been torn up by what must have been a desperate conflict between the grizzly and the bear, and the Indians have found dead bears that panthers have killed, but they say they have never found dead panthers that bears have killed. The Indians say that there seems to be the same natural antipathy between panthers and bears that there is between cats and dogs, and that the panthers are always trying to kill the young cubs of the bears, and the bears are always trying to kill the panthers' kittens.

Panthers are seldom killed on the McCloud River, I have heard of only one or two that Indians have killed with their arrows.

It is difficult to poison or trap them, as they are so suspicious of the bait. I have heard, however, of many panthers being killed by poison in other places, and I suppose if the McCloud panthers got hungry enough they could be poisoned, but while food is as plentiful for them as it is now, it is difficult to poison them. One exception to this should be mentioned. They are in the habit of burying anything that they capture and do not eat up at the first meal. For instance, if a panther gets a deer or a hog he eats what he wants, and then digs a hole in the earth with his claws and buries the remainder. If now anyone should find this buried meat and should poison it, the panther would be killed for he will eat the meat that he has buried himself. I will merely add in conclusion, that in consequence of the difficulty of killing the panthers, they are likely to maintain their hold for many years yet in the limestone cliffs bordering the McCloud River, for although settlers are now beginning to come into this region, the chief effect of these settlements upon the panthers will be to furnish them with a larger supply of domestic food, and to drive off the hereditary enemy of the panther, the bear, while the rocky retreats where the panther makes his home will remain as inaccessible as ever. LIVINGSTON STONE.

THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance, Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH

FAMILY LARIDÆ: GULLS, TERNS, ETC.

266. Pomatorhinus Lestrinæ—*Lestrinæ pomatorhinus* Aud.; *Stercorarius pomatorhinus* Ridg. 697. Cs. 765. Mr. Boardman mentions this species as "rather common" in autumn and winter in the Bay of Fundy. This species is probably of regular winter occurrence off the coast of Maine.

267. Richardson's Lestrinæ—*Lestrinæ richardsoni* Aud.; *Stercorarius crepidulus* Ridg. 698; *Stercorarius parasiticus* Cs. 766. Not common. September 23, 1874 an immature lestrin of this species was brought to me for identification. It was shot at Scarborough, and the specimen was preserved by a taxidermist of Portland.

268. Bulfinch's Lestrinæ, Longtailed Lestrinæ—*Lestrinæ parasiticus* Aud.; *Stercorarius parasiticus* Ridg. 699; *Stercorarius bulfinchi* Cs. 767.—Apparently the most common of the three species of lestrin known on our coast. The lestrin is locally known to fishermen as "marlinpike" or "gull-clasnet," being so termed on account of its long pointed tail and its habit of chasing the gulls, and compelling them through fear to disgorge the recently captured food, upon which the victorious bird makes off the coast of Maine. The German word of "Jäger," meaning hunter, is commonly used by ornithologists, and our best American authorities use this noun to designate a bird of any of the various species known to this continent.

GULLS.

269. Glaucous Gull—*Larus glaucus* Aud., Ridg. 660. Cs. 768.—Occurs along the coast in winter, chiefly offshore. Not very common, and adult birds in perfect plumage of maturity are rarely seen here. This is one of the largest gulls, being nearly or quite equal in size to the great black-tailed gull. The glaucous gull never has black markings upon the wing tips, and the plumage of the young or immature birds is light brownish gray.

270. White-tailed Gull—*Larus leucopterus* Aud., Ridg. 671. Cs. 669.—More common than the preceding named species, and not infrequently abundant. Gulls of this species are seen in flocks during migrations, associating with other gulls in winter, and sometime frequenting the harbors. The gray immature or young bird resembles the "herring" or silvery gull of similar age, but is much lighter colored, especially on the wings. Both immature and adult birds of this species are usually distinguished from the herring gull, by a familiar observer, even at quite a distance with the aid of a field-glass, by the absence of black upon the wing tips. But there is a phase of plumage, immediately preceding that of perfect maturity, in which this gull has the outer surface of the first four or five wing-feathers (primaries) marked with a dusky or ash-gray color, more or less obscure, but sometimes quite prominent and resembling pure black as on that species, yet so dark as to be in marked contrast with the pale pearl-blue of the greater portion of the wing. I presume this to be the form to which Dr. Elliott Cones alludes in his "Birds of the Northwest," (page 624), as *Larus "chaleopterus"*, described as "exactly like *leucopterus*, except on the primaries, which are ashy-tinted, this is the prevailing character of *glaucens*," or glaucous-winged gull ascribed to the Pacific coast of North America.

271. Black-backed Gull—*Larus marinus* Aud., Ridg. 663. Cs. 771.—Common along the coast, except during the summer. None bred here. This is the largest of all the gulls known in this country. It frequents the outer islands and rarely, if ever, is found inland.

272. Silver-backed Gull—*Larus argentatus* Aud.; *Larus argentatus smithsonianus* Ridg. 664a; Cs. 778.—Abundant. Some remain along the coast throughout the winter. Gulls of this species regularly breed here, but not in large numbers. Although usually breeding in communities, isolated pairs are occasionally found nesting. A few breed about the inland lakes of Maine. The complement of three birds is laid down in June or July in a nest. The eggs vary greatly in color, proportions and size. Some are much blotched or spotted, others nearly immaculate. The colors vary from light blue, ashy gray and green to various shades of brown, green and brown being the prevailing colors. The eggs equal in size those of the domestic turkey, and form a staple article of food in some localities. They are considered of superior flavor to the domestic hen's eggs,

and command a higher market price. Many thousands of these gull's eggs are annually taken upon the islands of the Bay of Fundy and coast of Nova Scotia and New Brunswick, and are in some instances the price of taking the eggs leased by the owner of an island, the terms requiring that no eggs shall be taken after a certain date, usually June 25, thus allowing time for the birds to lay more eggs the same season and rear their young, and no birds are killed during the nesting time. When boiled the yolks of their eggs are a reddish hue. The "white" portion has a bluish tinge, and is opaque than the "white" of a hen's egg. The custom of collecting the gull's eggs after June 25 is both wise and humane, for at that date nearly all of the nests have been twice robbed, but the birds will lay more eggs, although often less than the complement of three, and the season is yet long enough for the successful hatching and rearing of the young. The strict observance of this custom prevents the birds deserting such localities, and they will return to the same nesting places, year after year. Upon one island that I have visited, a valuable eggging privilege has been developed by careful protection. While large numbers of gulls and eider ducks were deserting neighboring islands where they were indiscriminately robbed and killed, their numbers rapidly increased upon the island referred to, until an annual yield of several thousand eggs was attained and kept up. Audubon related this visit to the Bay of Fundy and Labrador in 1833, that he found the herring gulls so wary that even at their breeding places but few could be obtained, not more than a dozen having been shot by six men in a single day. I have found them thus wary at breeding places, which had been indiscriminately devastated, and where the birds had been habitually shot at. But upon one of the same islands visited by Audubon, I have walked in open view within a dozen yards of gulls upon the nests without any disturbance, while others were circling about within easy gunshot range. This change was brought about solely by judicious protection of the birds. After the breeding season, and when the young birds have become well-grown and fully fledged, they are frequently killed and eaten by the fishermen and others.

The size, material, and location of the nests vary greatly. Some that I have seen in trees were equal to a bushel basket or more. Others were built upon the ground, and some were built at the tops of spruce trees thirty feet or more from the ground, some upon the ends of the branches and some upon fallen trees. Such as are placed upon trees are generally composed of twigs, moss, and dry grass, and are frequently used and improved by additions for several years in succession. Many nests are placed upon or under logs or upon the ground in the open woods, or in the swamps, and are sheltered by fallen drift-wood, and the rocks. The nests are usually well hollowed, with an inside diameter of six or eight inches. The average size of the eggs is about two and three-fourth inches in length by two inches breadth. Many nests are smoothly lined with grass, but none with feathers. I once found a nest upon a ledge and in the shadow of an overhanging rock, composed entirely of grass, wet seaweed, and containing a freshly laid egg. Unlike many seabirds, the gulls do not pluck themselves so that the hard body may rest on the eggs during incubation.

Formerly great numbers of silver gulls were accustomed to breed upon the island of Grand Menan, in the Bay of Fundy, but they have been driven away, excepting comparatively few that breed upon inaccessible places about the cliffs at the southern end of the island. The island is supposed to have never been cleared chiefly by foxes. About eight or ten years ago several foxes were liberated upon this island. A person who had been accustomed to take eggs whenever he could find them, was forbidden by the owner of the land most resorted to by the gulls for nesting. In a spirit of revenge this poacher of eggs deliberately procured some live foxes and liberated them upon the island, and has hitherto been known there. These foxes multiplied, and the gulls, as also the thrushes and other small birds, decreased in a marked manner in consequence. The foxes destroyed the eggs and young birds, and the adults whenever possible. Nor were these depredations confined to this one island, but extended to such of the adjoining islands as were accessible to the foxes, by way of the flats at low tide, and on ice in winter.

The spite of an individual possessed of the spirit of the notorious "dog in the manger" was thus gratified at the expense of all the inhabitants of these islands, to whom nature had supplied an annual harvest of wholesome food, and the destruction of the insectivorous birds by the foxes is a serious matter to the farmers. A year or two after the introduction of the foxes to Grand Menan, one of the neighbors of the island, and the person who had brought this curse to the locality actually had the effrontery to claim remuneration for the loss of "his fox."

Gulls of this and other species are locally known as "gray gulls" along the coast of Maine. The eggs of the silvery or herring gull are hatched early in June, when the nest has not been robbed. The young are covered with dark gray down that forms a thick warm covering for the birds until they are able to get on the ground or rocks the young birds can leave it and actively run about, catching insects expertly when very young. They grow very rapidly, and are fed by the parents until fully fledged, when the plumage is of the same general dark gray color as the down he nests it. This gray suit is worn for a year, but it gradually becomes a lighter shade.

While wearing this subordinate color of the first year, the gull has hazel eyes, bill nearly black, and the feet are of yellowish lead color. When the second spring arrives the breast and belly have become white, the head nearly white, the bill yellow, the mantle bluish. The tail is now nearly white, but has a broad brown bar across its tip, by which one can readily distinguish the comparative age of the bird. A change of full size at two years of age. The mature plumage of the gull is all mature and bright until the following spring, when the plumage, including head and tail, is pure white, except the "mantle" of light pearl blue color that extends across the back, and the wing tips, which are black, with white subapical spots. The bill is then of a clear, bright yellow color, with a carmine spot on the lower mandible. The eyes are pale straw color, eyelids yellow, and feet a rich color.

No gulls of immature plumage are common. Such bills usually appear in communities during the breeding season, however, and when their haunts are visited by man they will often manifest as much apparent alarm as if nests had been made, and I have seen them show great concern about the nests of other gulls, darting down and circling about with repeated cries even after the real owners of the eggs or fledglings had ceased to do so.

The most ordinary cry of the gull consists of their short notes, "ac-a-cac," repeated at frequent intervals. But gulls,

as well as other birds, have a varied and expressive language. When suddenly alarmed their cries are very discordant, but when undisturbed upon their nests a soft, cooling cry, not at all unpleasant to the ear, is sometimes uttered, especially at the approach of a gale. On an early November day, when the air is clouded and chilly, and the earth brown and cheerless, the cries of the gulls have a dismal sound, yet I have often been assured of fair weather by such cries; and I have felt oppressed by their ominous silence before an approaching storm. But how exasperating are their cries of warning when one is attempting to approach a flock of geese or ducks for a shot. Not content with balking themselves out of danger, the gulls when once fully alarmed will circle about in utter confusion, and cry out between danger, and as such are recognized by fowl other than of their own species. The ducks and geese that frequent the same haunts as the gulls so well understand the language of the latter that no attention will be paid to any cries except those of warning.

The silvery gulls, but no other species of gulls, are to be found on the coast of Maine throughout the entire year. Great numbers migrate hence in autumn, but the places of their wintering are not the same as those of the northern breeding places. At times, when extremely cold weather covers the shores and flocks with ice, the gulls all leave, but return so soon as the ice is gone and an abundance of food can again be obtained. Although the gulls are the scavengers of the sea and not fastidious about their food, they subsist chiefly upon shellfish and small fishes, and fish weirs are sometimes frequented by them for the young herrings, etc., that are to be found. I have seen these gulls perched upon the stakes of a fish weir, but never upon trees, except during the summer at their breeding places, where the woods will be white with them. But at no other time, even in the same localities, are they accustomed to alight upon trees.

During the summer the shellfish known as "sea urchin" forms a staple article of food for them, and the gulls excavate this fish without breaking its shell. Not so with clams and mussels, however. These are taken up in the air by the gulls and dropped upon the beach or rocks for the purpose of breaking the shells. Although these shellfish are the common food of the birds, the gulls never swallow them with the shells whole, as do ducks of various species.

There is a popular fallacy that gulls and vultures are gifted with the sense of smell to a wonderful degree, and can scent their food far away. It is a fact, however, that the sense of smell is barely developed at all with birds. But the gulls have very keen vision, and when one espies food at a distance in the air over the sea, the motion of that bird betrays the fact to either of its species far away. These hasten on wing to the spot, and by their movements show to gulls still more remote that some prey has been discovered. A lot of offal thrown from a vessel at sea will immediately attract the gulls near by, and perhaps but one or two birds will at first be seen. Yet soon others will make their appearance, one after another, coming from all directions, until a host is assembled.

Gulls may often be decoyed by various methods. One of the most simple and successful that I have tried, is by means of a pair of gull's wings. These should be cut from the bird close to the body, and placed with their upper edges together. Then grasping them about the joints with one hand, they can be made to extend and close by alternately clenching the hand and partially relaxing the grasp. The operator should be well hid from view and only the wings exposed. The motion will attract the attention of that bird, and at a distance, and by its resemblance to a gull hovering over its prey, frequently decoy the bird sufficiently near for a killing shot.

273. Ring-billed Gull—*Larus zonorythecus* Aud.; *Larus delawarensis* Ridg. 669, Cs. 778.—Common during migrations. None bred here.

274. Kittiwake Gull—*Larus trilatrytes* Aud.; *Rissa tridactyla* Ridg. 658, Cs. 732.—Common along the coast during migrations and in winter. None bred here.

275. Laughing Gull—*Larus atrifila* Aud., Ridg. 683; *Chroicocephalus atrifila* Cs. 786.—Not common. Occasionally a small community is found breeding on the coast of Maine, and apparently this has occurred with some regularity within the last few years. The species occurs here as a summer visitant from the South. It has occasionally been seen in Casco Bay, and as far east as the Bay of Fundy. Mr. Boardman reports there as "very plenty" in the summer of 1879 in the latter region.

276. Bonaparte's Gull—*Larus bonapartei* Aud.; *Larus philadelphia* Ridg. 675; *Chroicocephalus philadelphia* Cs. 788.—Abundant during migrations, and a few immature birds remain along our eastern coast in summer. None of this species breed here. They arrive from the South late in May, and sometimes acquire the perfect plumage of the breeding season on passing farther north. I have seen mature birds of this species in Casco Bay as late as June 11, and observed adult birds on the eastern coast of Maine upon August 8 of the same year. Yet none are known to breed here, nor upon any of the Grand Menan group of islands in the Bay of Fundy. The southward migration extends throughout the autumn, and small flocks of these gulls tarry not uncommonly on our coast until December.

The first arrivals from the breeding places in August usually consist of a few male birds, which remain here and pass through the summer moult. The species becomes more abundant here in October and November.

These small gulls are quite unvarying, and may be easily approached upon the water by a boat, or decoyed by waving a white handkerchief. They are gregarious at all seasons, and small flocks are to be seen about our harbors and estuaries industriously fishing sand during November. The fish are procured by the birds flying over the water at a slight elevation, and suddenly pouncing upon their prey. They do not plunge into the water, however, in the manner of the terns.

277. Sabine's Gull—*Larus sabini* Aud.; *Xema sabini* Ridg. 677, Cs. 790.—Very rare. While watching some Bonaparte's gulls near Bluff Island, Scarborough, Me., May 31, 1877, I observed a gull of similar size and mode of flight to those of the latter, but with the black cap of the former, succeeded in decoying this bird near enough to my boat for a shot, and secured the rare specimen. It was an adult female Sabine's gull, having the perfect plumage of the breeding season.

In May, 1878, my friend, George A. Boardman, Esq., procured a fine specimen from Indian Island, near Eastport, Me., an adult very nearly to perfect plumage. It was the only one of the kind to be seen in the far North, and the capture of but a very few specimens within the limits of the United States has been publicly recorded. Sabine's gull may be distinguished from other small gulls, even when

flying, by the black outer edge of the wing. Otherwise it resembles the common Bonaparte's gull when on the wing.

STERNAE. TERNS.

278. Gull-billed Tern—*Sterna anglica* Aud., Ridg. 679, Cs. 792.—Not common. Of irregular occurrence along the coast. I have shot terns of this species at various times in Maine, where it appears to be of rather rare occurrence, and the species is nowhere abundant upon the Atlantic coast of America. A flock numbering several dozens visited the marshes at Scarborough in September, 1868. I shot three specimens from this flock and could have easily killed many more. Mr. Boardman reports a single specimen taken on Grand Menan Island in August, 1879. I procured an adult specimen at Scarborough, Me., May 21, 1881, but saw none other of the species at that time.

279. Caspian Tern—*Sterna caspia* Ridg. 680, Cs. 793.—Rare. This tern is here named upon the authority of Mr. Boardman, who reports its occurrence upon our coast. Specimens have been procured by him at the mouth of the St. Croix river so recently as the autumn of 1877.

280. Wilson's Tern, formerly taken at Terns, *Sterna hirundo* Aud., Cs. 797; *Sterna fuscicollis* Ridg. 686.—Abundant in summer. Breeds commonly along the coast. All the terns are locally known in Maine as "nackered gulls."

281. Arctic Tern—*Sterna arctica* Aud.; *Sterna macrura* Ridg. 687, Cs. 799.—Abundant in summer. Breeds commonly along the coast. Although associating freely with the Wilson's tern, these two species do not intermingle their nests, although sometime communities of each are found breeding upon one small island. In such instances each species shows as much apparent concern about an intrusion upon the domains of their neighbors as upon their own. For a perfect identification of the eggs the collector should observe the birds upon them. The "variety *Portlandica*," which has black bill and feet, is of not uncommon occurrence here.

282. Dongall's Tern, Roseate Tern—*Sterna dongalli* Aud.; Ridg. 688; Cs. 800.—Not common. Although abundant along the coast of New England further south, but few terns of this species visit Maine, and none are known to breed here.

283. Least Tern—*Sterna minima* Aud.; *Sterna antillarum* Ridg. 690; *Sterna superciliosa antillarum* Cs. 801. A rare straggler from the south. Of irregular occurrence only.

284. Sooty Tern—*Sterna fuliginosa* Aud., Ridg. 691, Cs. 804.—Accidental; a single specimen reported by Mr. Bathen Deane Bull, Nat. Hist. Club, Jan. 1, 1880, as obtained by Mr. George L. Fernald in the town of Parkman, Piscataquis county, Maine, October 5, 1878. This bird was "picked up in the road and died next day."

285. Black Tern—*Sterna nigra* Aud.; *Hydrochelidon lariformis surinamensis* Ridg. 698; *Hydrochelidon lariformis* Cs. 806.—Rare. Of irregular occurrence along the coast, usually in autumn. I shot a specimen at Scarborough, Aug. 18, 1865. Other specimens have been shot there at various times. The species occurs also at Scarborough, in June, 1878, and in September of the same year. In the autumn of 1879, Mr. Boardman obtained three adults from the Bay of Fundy, from Grand Menan Island. In Bull. N. O. Club, July, 1882, two specimens are recorded [by Nathan Clifford Brown] for Maine, taken in the autumn of 1881, one at Scarborough, and one at Well's Beach.

286. Black Skimmer—*Rhyacionia nigra* Aud., Ridg. 656, Cs. 809.—Rare. Of occasional occurrence only, and no record of its appearance so far north as Maine previous to 1879. In the early autumn of that year a number were shot on our coast. Mr. Ira S. Shalis, of Wells, shot one of two seen at a creek of Well's Bay, Aug. 28, 1879. Mr. Boardman reports seven specimens shot in the Bay of Fundy, where many were seen during the autumn of the same year. Mr. Harry Merrill informs me of one that was shot by a fisherman near Martinus Island, Me., in the summer of 1881, and the specimen was sent to Bangor.

[TO BE CONCLUDED.]

SNAKE NOTES.

I AM reminded by your notes in FOREST AND STREAM, for April 5, of a large black snake which I killed near Farmington, Conn. I was driving with a lady and saw his snakeship cross the road just in front of us, his head nearly reaching one side of the narrow mountain roadway before his tail reached the other. The horse was a quiet one, so, my companion assenting, I armed myself with a stone and followed the snake into the bushes, where I was fortunate enough to give him a mortal hurt. I had no means of measuring him but with my whip, which was not so long as he was, but on one end of the whip, and on the other end, and on reaching home, made him seven feet and eight inches long. I think he must have been fully eight feet, as the contraction of his muscles prevented him from lying perfectly straight when I measured him. He was the largest native New England snake I ever saw, and as a constrictor would have been a formidable antagonist.

This reminds me of the speed of the black snake. I was once passing through some open woods in the same vicinity when I came upon a large and beautiful specimen. I should say that it was some six feet long and of a glistening blue-black. He at once took to flight and I after him. I was a fairly good runner then, but he went at least twice as fast as I could, and soon disappeared. There is a tradition in that region of a snake called a "racer." I know it is laughed at by naturalists, but I have never been able to rid myself of the idea that this was something more than the ordinary black snake of the Northern States.

CHARLES LEDYARD NORTON.

PHILADELPHIA, April 6.

SPRING IN MASSACHUSETTS.—NEWTON, MASS., March 29.—Spring at last seems to be near us, for already we have noticed the return of our feathered friends from the South. On Sunday, February 18, while driving along beside a meadow, we saw the first robin, and the poor fellow seemed to be badly used up with thence and snow on the ground, and the raw, cutting wind. Since then I have seen more, and bluebirds also. The first flock of the season was noticed on Tuesday, the 27th inst. It has been a very hard winter, and we fear that the quail have suffered, as we have not heard of any being seen since December.—TOM ALLY.

SNOW BENTINGS.—FERRISBURGH, Vt., March 31.—Tell "J. L. D." that it is neither uncommon nor common to see snowy buntings alight in trees here. I have often seen them so perched.—AWAHOOSE.

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

DEER HUNTING IN THE ADIRONDACKS.

By Jos. W. SOUTER.

CHAPTER I.—ROUTES.

ONE prominent trait of the true sportsman is the habit of "fighting his battles over again." This habit is acquired not from a love of boasting or desire for notoriety, but from a generous desire that all mankind may be sharers in the pleasures which are so dear to him.

This desire, coupled with a wish to oblige my sportsmen friends who have asked for a history of our two last sporting trips, lends me to again attempt to picture the sport of "deer hunting" in the Adirondacks. As these hunts are necessarily very much alike, I prefer to avoid the risk of wearying the reader with repetitions and simply give such data of our trips as in my judgment may prove of interest, supplemented by a description of the methods commonly employed in hunting this noble game which may interest those who contemplate enjoying the sport at some time in the future.

Our party for the fall of '81 consisted of Perry Ross and Edward Gray, of Gausseport; George Edmonds, of Battle Creek, Mich., and myself, with "Mincey" Sprott as our *chef de cuisine*, royal, god follows all. We camped three weeks at Indian Clearing on Moose River, Hamilton county, N. Y. During this time we killed twelve deer, beside a quantity of other game, among which I would mention several specimens of the genuine spruce grouse or "Canada partridge," a *rare avis* in this latitude. A short time before we retraced our party was reinforced by the arrival of Messrs. Herbert and Wesley Sprott and John Washburn, of Fortville.

The personnel of our party last fall was Samuel Hewitt and Benajah Allen, of Stillwater; John Chase, of Wilton; George Edmonds, of Battle Creek, Mich., and myself. The scene of our operations was located on Cedar River, our "old hunting ground." Although deer are not as plenty here as "farther in" on Moose River, still there are enough for good sport. Our party secured, by the way, three of which were magnificent specimens. We were very kindly taken in and cared for by "Rich" Potter, whose place is located on the Cedar five miles above Cedar River Hotel. I would say in passing to those who desire to hunt this locality, or Moose River, you cannot do better than to place yourself under the guidance of Mr. Potter. He is not only an expert hunter, but is also an old hotel keeper and knows the wants of his patrons, and can both the ability and desire to supply them at reasonable prices. His house is comfortable, and his outfit of dogs, canoes and other impedimenta will be complete for next season's sport. And lastly, but not least, his wife is not only an intelligent lady, but is also an excellent cook, a fact to be appreciated after starving at some of the resorts for sportsmen in that vicinity.

Moose River, the paradise of the deer-slayer, is reached via Adirondack Railroad to North Creek, thence by stage to Cedar River, thence by private conveyance eighteen miles up the Cedar, three miles across the divide to Moose Lake, and nine miles down Moose River to the "Indian clearing," which is fifty miles distant from North Creek. The road, I presume it is called a road through courtesy, for the last fifteen miles of the route is formed by simply cutting the trees and hauling the logs from the line of travel. Rocks, roots of trees, and mud holes, alternate with distressing frequency. "Variety of the species of life" is a correct saying, but what it consists in being benched about upon the "sooty" side of the axle of a lumber wagon that is continually thumping over "pebbles," slightly larger than the one with which David slew Goliath, or climbing over huge rocks, veritable boulders, only to be soured in a mud hole beyond, one gets to thinking that that sort of "snice" is not the most desirable thing in the world. But *nil desperandum*, it leads to the "happy hunting grounds."

"Indian Clearing" is about three miles in extent by one mile in breadth. It is almost entirely covered with buckeherry brush, which yield large quantities of berries in their season. It possesses an interest from the fact that there is a legend respecting it to the fact that it was made by the Iroquois Indians prior to the French and Indian war. The most probable theory of its existence is that it resulted from one of the tremendous forest fires which occasionally sweep over such wilderness regions. Whatever the cause may have been the cause of its existence, it certainly requires but little effort of the imagination, as one floats over the murky depths of the "upper" or "lower stillwater" and listens to the wretched hooting of the owl, the croak of the raven or the splashing of trout, to picture this as once one of the favorite stamping-grounds of the scalp-hunters, or in fancy to see the traditional hire-brand canoe and painted warrior, plumed with eagles' feathers, "gliding down the winter river" from Moose River, or rather the south branch of Moose River, of which I am writing, is the outlet of Moose Lake, a beautiful sheet of water embosomed in the primeval forest and surrounded by mountains, which stand like grim sentinels jealously guarding the gem which mirrors their rugged grandeur. The river flows westward in a succession of rapids and stillwater. The most important of the latter are termed the "upper" and the "lower," each being about one and one-half miles in extent. The upper stillwater, which is opposite of Indian Clearing, has at its lower extremity an artificial dam, built by William Wakely to facilitate lumbering operations. The lower stillwater is about one mile below the upper, and is pronounced by those whose opinions are entitled to respect "the most beautiful stretch of running water in the Adirondacks," and in this opinion I fully concur. At its lower extremity is a natural dam of rocks, and one Rock Dam. The precipitous tributaries of Moose River from Moose Lake, to this point are: From the north, Silver Run, five miles below Moose Lake; Summer stream at Indian Clearing, and Red River, at Rock Dam. From the south, Otter Creek, opposite Indian Clearing and Indian River, at the upper end of lower stillwater.

There are as yet but limited facilities for enjoying sport at this point on the Moose. The well-known guide "Lige" Camp is proprietor of a well-appointed house for the accommodation of sportsmen, which is pleasantly located at Moose Lake.

After testing his hospitality, I can say his house is neat

ably stands the best chance of surviving the murderous rain of lead. At last the magazine of the Winchester is empty, and the fortunes of the day depend upon the single cartridge in the gun.

"Hold on, stranger, don't shoot any more or you'll fill this lake with bullets and that deer'll run or swim or lead. Now wait till I get him by the tail; don't fire yet! Put the muzzle closer his ear; hold on; the gun boys round so you'll miss him now. Stiddy there; now give it to 'im."

"There, you've done it at last, and there is 175 lbs. of meat and a pair of antlers for you. The former we will take to your hotel, and you can point with pride to it while you brag of your exploit to your admiring friends. The latter will do more imperishable fame for you; for mounted over the top of your rifle, your powder city residence, they will be voiceless witnesses to unborn generations of your nightly achievement to-day. *Uta trawii Florida nativi.*

"I am conscious of the fact which has been noticed no doubt by the reader, that the scenes described in this article have had their commencement in the early morning. Well now I am going to treat you to a change.

It is night in the balmy month of June. No light from any stars penetrates the blackness of darkness which rests like a shroud over the head of a wood-creeper, a woodcock, a woodcock, and which is a fit companion for the dastardly deed about to be consummated upon its tranquil bosom by two individuals who are just pushing off from shore in a canoe. On the bow of the canoe stands the "jack," its powerful light reflected far ahead by a bright sheet of tin placed just back of it and which renders invisible the canoe and its occupants. In the stern sits the guide silently and swiftly propelling the light craft by an almost imperceptible movement of the paddle. In the center sits the sportsman (?) armed with—Heaven defend us—a shotgun—a double-barreled breech-loading shotgun. He is evidently determined to slake his thirst for revenge with gore. Last season he tried to shoot a deer ahead of the hounds, and although getting several fair shots, failed. Later he tried still-hunting, and it is almost useless to add, failed again. But now—

"Keep still, oh ye heavens!"—the glory which *impulsively* has shined so many times, is about to be won. They have not proceeded far before the watchful guide discovers the gleaming orb of a deer directly ahead and as they approach he is soon plainly revealed in the light of the "jack," breast deep in water, and looking wonderingly at the strange apparition approaching him. Nearer, and still nearer, comes the bewildering light, until its glare is scarcely a rod from the stupefied animal. Our "zore" swifly propelling the light craft by an almost imperceptible motion he seizes his gun, but in attempting to raise it, both barrels are discharged, luckily without injury to anything. There is a terrible snort and rushing through the water, and that deer, let us hope, is spared for a more glorious taking off. "Buck fever" is the only comment indulged in by the tactful guide.

On they go skirting the shore of the lake, and four times within as many half hours is the silence broken by the thunder of the shot, the 10-gauge and distributor, each time sending a deer scampering out of the water and up the hillside, two of which are badly wounded. And now as they are passing a little cove, the splash—dip, splash—plash, of water plainly indicates some animal moving about among the water lilies with which the cove is thickly studded. A single sweep of the paddle heads the canoe toward the cove, and sure enough there stands a doe peacefully grazing. Our "zore" is about to raise his gun, but is somewhat recovered from his attack of "fever" and as the deer stands broadside about twenty feet distant, he succeeds by a grand coup de main in riddling the poor animal with thirty-two large buckshot, and at last he is a hero. With what pride does he survey the victim of his deadly aim. "With what rapture does he exclaim, "At last I have killed a deer!" The modesty of the fellow is astounding. Instead of killing one deer he has slaughtered just five. Two of his victims are now struggling in the sports of death on yonder hillside, and soon carnivorous birds and beasts will be tearing the putrifying flesh from their bones. Two little helpless fawns will wait and bleat in vain for the mother he has so foully murdered, until they die of starvation, or become an easy prey to some rapacious animal. We insist that he shall have all the glory to which he is entitled. To secure one deer he has destroyed five.

The above is a truthful picture of "floating" for deer as practiced by the average summer tourist, and by which method more deer are destroyed than by all other methods combined.

Reader, if you are ever tempted to "float" for deer, I beg you will heed the advice I am about to give you. Take the money you would have to spend during your trip and with it buy a good fat cow, tie her to a tree, then choose your dinner anywhere from five to twenty feet will answer, then if you are not sure of your aim, rest your gun or screw it in a vice, and then—shoot her. Use a Gatling gun if you are anxious to see blood flow freely. By adopting this plan you will be entitled to fully as much credit for skill, be subjected to less discomfort, and secure more meat than you would, were you to "float" for deer. If you have unbounded confidence in your skill and desire to do something particularly brilliant, give the cow the run of the barnyard when you can your battery upon her. Killed at the first fire under these conditions, the exploit will win more fame for you than you can ever secure behind the "jack."

I shall say but little about "watching at tickles" and "erusting," for the reason that the former is not a very destructive method, and the latter, although at one time deer in certain sections were literally annihilated by it, is now nearly obsolete.

The above state of affairs has been brought about by earnest effort on the part of sportsmen, aided latterly by the guides, who at last have been brought to see that "crusting" was "killing the goose that laid the golden egg," and who have done much by word and act to bring the reprehensible practice into disrepute.

In conclusion I would say, if this short article, on a subject about which so much might be written, shall lead deer-hunters to renounce objectionable methods, and pursue the sport in a sportsmanlike manner, its main object will have been accomplished.

MAINE GAME LAW.—Dixfield, Me., April 7.—Editor Forest and Stream:—I would in your issue of March 29 a mistake in the Maine fish and game laws, and in your "New Maine Laws," you say close time from January 1 to September 1 for moose, deer and caribou. It should read January 1 to October 1. September is a close month.—HENRY O. STANLEY.

HOW TO HANG UP A DEER.

IN my rambles over the country I have often been struck with the number of quite experienced hunters who did not in the least understand how to hang up a full grown deer unassisted. I herewith send directions, so that any person of ordinary strength can hang up the largest buck.

After inserting a gambel in the hind legs of the animal in the usual manner, cut a couple of crochets about eight feet long, then bend down a spring sapling and insert the top under the gambel. Now place your crochets, but outward, at right angles to the sapling, hook one of them into the sapling, just below the gambel, and place its butt so it will not slide; now, with the top of the other crochets in your hand, lift up on the sapling, pressing it against the crochets

at the same time. When as high as you can get it, insert the other crochets above the gambel. If the sapling is not strong enough to hold the weight of the deer, carry the foot of this crochets toward the other end of the thing is done. If the deer is very large, or your muscular energy small, you can start with crochets three or four feet long and then use longer ones. A good hatchet is very essential; the double-edged hatchet of "Nessmuk's," a cut of which you published some time ago, was shown to me by my old friend, H. L. Leouard, then just from Pennsylvania, in 1853. I had one made in Bangor, and after using it for two years discarded it for a much better pattern, which Leonard himself originated, a diagram of which I enclose. One edge should be ground very thick for cutting bones.

PENOBSCOT.

CHEESEQUAKE CREEK.

THERE is probably no locality in these United States, of less than Cheesequake Creek, in New Jersey. Standing, as it does, first on the list of the famous (?) River and Harbor appropriations, it has attracted universal attention and comment of a not over enviable nature. But though its name has come to be familiar in our mouths as household words, not two persons in a thousand have ever seen it, save in print or on the map.

Cheesequake Creek (a corruption of its Indian name *Chesiquaque*) has been so often made the subject of newspaper reports that a description of it at this late date would be as flat, stale and unprofitable as the snipe-deserted marsh and meadow, through which it winds. Its history is in no wise different from that of many other places, whose charms lie mainly in their rural retirement and secluded quiet, added to the natural beauty of their situation.

For a century and a half it has been a famous spot for hunting and trapping, and a great resort for followers of fur, fin and feather. But alas! its glory has departed, and another must be added to the fast-increasing list of "have-beens." The whistles of Bob White and Will Willet are not heard now-a-days as often as the whistle of the locomotive; and railroad tracks have supplanted those of foxes, hares, minks, "coons and 'possums, which once were plentiful.

Time was when a dozen or more woodcock might reward a search along the meadow's edge, where now the noisy trains rush by, and from the porch of the "Old Tavern" you might plainly see the yellow-legs approach the blinds where unexpected death awaited them. At night the sail-hoes were alive with black ducks, and by day the teal and spigails dabbled in the creek. To be sure the "Old Tavern" still remains, a curious relic of antiquity which has outlived many storms and generations. But that is about all. Everything else has changed. As you step off the cars you will hardly know the place, with its prim station, iron drawbridge, and telegraph poles. Its very name is in danger of oblivion, and one is reminded of the Israelite who met a stranger whom he thought he recognized: "Vy, Moses, how you vas changed! So help me, my tear boy, I would never haf known you!" "Excuse me, sir, but my name is not Moses." "Vat? Goot heffens! Your name changed, too?" Yes, it is called Morgan now on the time-table, and thousands of others to and from the New Jersey seaside pass it daily unaware of its identity.

But let me not give the impression that "Cheesequakes" as a hunting ground, has passed wholly into history. Good bags may still be made there now and then. A storm will bring wild ducks into the creek quite often, and in August or September one may strike a very decent flight of bay-birds. Porch and striped bass are still fairly abundant at the falls, and even a crab-eater may be seen as ever. Moreover Charley Applegate, late David Webster, "still lives," and as long as his conversation continues to be adorned with the wealth of expletive and simile which enriches his vocabulary, Cheesequakes will never lose its hold upon the interest and affection of the brotherhood. Never, never!

But aside from this attention, "The Creek," as we call it, enjoys another most distinct distinction of which neither time nor railroads can rob it. It is the best place for hawk shooting in the State, and may be in the whole country. Every spring, along in April, there will be three or four days during which a strong westerly wind, with bright, warm sunshine, will prevail. This is the kind of weather that the hawks love to migrate in, and on these days I am always on the spot before the birds begin to arrive by seven o'clock, and the cream of the shooting is in the forenoon.

A glance at the map will show you that New Jersey lies directly in the path of the spring migration from the Middle Atlantic States. You will also see that it is cut nearly half way in two in the middle by Raritan Bay, which extends some fifteen miles westward from Sandy Hook, and varies from two to six miles in width. Now, hawks do not like to cross broad water, and when, having sagged off toward the coast by reason of the strong west wind, they reach the bay near Sandy Hook instead of crossing it to Long Island or Staten Island they turn to the left and follow the south shore until they come to South Amboy at the head of the bay. This course carries them across Cheesequake Creek, near its mouth, just where the railroad and county bridges span it,

and at that spot, within a space of two hundred yards between the tavern and the bay shore, as many as 800 hawks of all sizes have been shot in one day.

A singular fact in connection with these migrating birds is their apparent boldness and indifference to man. They are so oblivious of our unwelcome suspicions of danger, and the sight of a man with a gun running at top speed to intercept them, as is often done, seldom alarms them or causes them to change their course at all, a procedure which is so utterly foreign to their nature at other times as to seem very remarkable.

As for the propriety of this annual slaughter of the hawks, I presume it is open to question, there being much to be said on both sides. But concerning the spot itself there can hardly be two opinions among those who have enjoyed it. When there is a good flight on there may be five or six birds in sight and coming toward you at the same time. You can see them for half a mile or more, and there is no little excitement in the prospect. The shooters are strung out from ten to thirty miles apart, and when even a single hawk is coming there is always a delightful uncertainty as to who will get the shot. Sometimes half a dozen gaus will be sniped in succession at one end, and he may escape unhurt after all, or come down only at the last moment.

Of late years the hawk shooting at Cheesequakes has fallen off considerably, owing, we think, to the increase of those who are on the lookout for them along the coast, whereby many are killed before they reach the creek, or even the bay at Sandy Hook. But even now a strong west or northwest wind, if warm, will bring hawks, in varying numbers, all through the month of April and even as late as May.

PENOBSCOT, N. J., April, 1883.

SYRACUSE SHOOTING GROUNDS.

I TAKE much pleasure in adding to the general stock of good places two more, which I consider most excellent for both fishing and shooting. The first, Otisco Lake, situated in the town of Otisco, Onondaga county, N. Y., distant from Syracuse twelve miles south; accessible by rail and stage; expense from Syracuse, one dollar. At the village of Amber, situated at the foot of this lake, will be found a first-rate country hotel, kept by one Samuel Boutwell, who would most cheerfully answer any correspondence and give such information as might be desired either as to spring or fall fishing. I have no hesitation in saying to the boys that this is a good place to hunt or fish. The first and last are at the present time quite plenty. Shooting especially must be good there for the next two weeks. Hotel fare, one dollar per day.

The second place I would mention is Big Sandy Creek Pond, situated north from Syracuse forty-five miles. Here I am confident may be found the finest feeding ground for ducks and snipe in the State of New York. A marsh covers a thousand acres with a most luxuriant growth of wild rice, cedar, etc., attracting large and numerous flocks of ducks and snipe, both spring and fall. A first-class sportsman's hotel is here, kept by Mr. George Wood, and at the moderate price of \$1.50 per day. Mr. Wood is himself a thorough sportsman, and a most excellent shot. Guides can be secured at very moderate rates, if desired; good boats, and plenty of them, to accommodate all of our readers at all times, and free of charge. Should any of your readers wish to give me a visit, and find they will find in Mr. Wood a competent and obliging man, and true to the interests of all who may give him a call.

The route from here, is via Northern Railroad to Pierpont Manor, and from there eight miles by stage; railroad fare from here \$1.50, and stage fare \$1. By writing to Mr. Wood or telegraphing he will meet parties with his own team and transport them safely from the railroad station for the regular stage of three dollars. As for Mr. Wood's table, from personal experience I announce it good. Mr. Wood telegraphs me that game is more plenty, especially ducks, snipe, and wild geese. These grounds are less than twenty-five rods from Lake Ontario, nothing intervenes save a high bank of sand washed up from the lake. The marsh is well sheltered and very beautiful to the eye of a sportsman. A fine place for point shooting or decoying.

Mr. Wood's address is George Wood, Lake Erie Point, Woodville, Jefferson county, N. Y. Mr. S. E. Kingsley, Amber, Onondaga county, Boutwell can be reached by mail; Wood either mail or telegraph. S. E. KINGSLEY.

FREEDMAN AND QUAIL.

THE recent discussion in the columns of the FOREST AND STREAM relative to the destruction of the game by the freedmen has interested us very much, and being situated in a country where both Sable and the quail flourish, I feel qualified to express an opinion on the matter. I must say, in defense of the darkey, that I have never known of a dozen quail being killed by him with a gun, and I have never known of more than a few dozen having been trapped. In proof of the assertion that the negro is not a quail hunter (though he will shoot one if he sees it sitting perfectly still, and he has his gun), I cite the fact that I find on almost every outcrop where I find the bird, the bits of the coverts and those of the finest and fullest coverts, in the immediate vicinity of the darkey cabins. Since no birds have been taken from the coverts, it follows that the darkeys have not troubled them, and this with the full knowledge that the quail are there, for the negroes can at any time direct you to a covey or two within a few rods of their humble doors. Almost every darkey in Eastern North Carolina and Eastern Virginia thinks that he must plant a pea patch. The pea is a staple article of food for the family. Some are always left on the vines and become dry in the field. The quail is as fond of peas as is the freedman, and naturally seeks the pea patch, can there be found in all his glory, feeding at times up to the very door of the cabin.

On a recent hunt, not far from the village, in company with another gentleman, we found three full coverts in a little five-acre "open ground," which had been "cut down" and the brush left on the ground by the family of negroes living in the cabin hard by. Now, so near were these fine coverts of birds to this cabin, that we had to withhold fire many times after scattering the birds, for the whole family of darkeys were about the door to see us shoot, and were in the line of fire. These birds, three fine coverts, had been rarely within 100 yards of that cabin, in which a large family were living. The head of the family owned a gun, and we did not find time to hunt. The darkey, however, did not hunt quail, because he didn't feel sure of killing on the wing, and didn't look for them on the ground. Nor is this any isolated instance. I can do today, with my setter, find

least a dozen coveys of quail within 100 rods of negro cabins.

The freedman here is a hunter, but not a quail hunter. He delights in shooting squirrels, coons and some kinds of birds, but they must sit still. He has of late years become an inveterate fox hunter. He keeps his own hounds and follows them well, and not infrequently does he bring sly reward to grief. He does it fairly, too, for the dogs must catch the fox, as Sambo cannot hit him on the run. I timed a hunt one moonlight night some weeks ago from my front stoop, and in just ninety minutes their hounds picked up the first fox. Returning the hounds struck another trail, and in a little more than three hours they had the second fox by the brush—two full grown foxes in four and a half hours' running.

The freedman here as a class work, but there are exceptions to the rule; some prefer to loaf, but are too lazy and worthless to hunt for a living. We have lots of negroes and plenty of quail, showing that the supply of quail is not cut off in this section by the freedman. If any of our Virginia friends doubt this statement let him or them visit me after the first of November next, and I will give him some as fine shooting as this country affords. Although my dogs are not "prize winners," my gun is not a \$300 hammerless, and I do not belong to a "gun club," I "won" take a back seat unless some of your "gentleman sportsmen" prove that their dogs find more birds and stand stancher and retrieve better than mine, and that they can bag more birds right and left than I can, I believe in "Nesnik's" "sereed."

A. F. R.
BELVIDERE, N. C., April 4, 1888.

PHILADELPHIA NOTES.—April 7.—The last few pleasant days have brought snipe into market. Nearly all of the birds came from within a radius of fifty miles of Philadelphia, but few, however, had been killed on the Philadelphia grounds. Yesterday four or five were bagged on the Darby Creek meadows near Kilbuck's, and I have heard of two having been shot on the Broad street grounds. It is reported that the meadows on the New Jersey shore opposite Chester, on both sides of Raccoon Creek, are in good condition for birds, and that the Chester (Pa.) and Bridgeport gunners killed some last week. If the grounds on Raccoon Creek between Bridgeport and Swedesboro, six miles distant and especially the Broad street grounds, were bagged on a favorable day next week, I am sure a number of snipe could be found. A skiff could be used and both sides worked, starting from Bridgeport in the morning and the night spent at Swedesboro; but take a license along.—HOMO.

THE "BLACK HEARTS" MIGRATION.—Detroit, April 7.—Editor Forest and Stream: Years ago, when quite a young man, living in Ontario on the shore of the lake of same name, we were visited regularly every year by flocks of a species of small plover, called by our local sportsmen "black hearts." The peculiarity of their coming was in the fact that they came only on a certain day, the 24th of May, and remained no longer. The following day an occasional one might be seen, but the "flocks" had disappeared as mysteriously as they had appeared on the previous day. Before the day mentioned I have frequently hunted over the same ground, or rather, marsh, and in no instance did I ever see a flock of these birds. As we have had some discussion about the matter, would ask attention to the above from sportsmen in the neighborhood of Port Hope and Cobourg, as to why they know of the strangeness of their appearance.—HIND SIGHT.

HAWKS IN VERMONT.—Harford, Conn., April 6.—In a brief tour to Vermont a few days since, in talking gun and dog, I understand that there is a fine for shooting over a dog in that State. In shooting there last season I found in my State more hawks than game, averaging two or three hawks every day. If every shooter would pay his respects to hawks the grouse supply would be on an increase. The hawks are so thick the farmers put bottles and red rags on long poles to keep them away from poultry. There should be a bounty of such a sum as to induce the "boys" to get out the old queen's arm and pepper the hawks. One pair of working hounds are more desirable than more any other shooters in the country. And where hawks are plenty I do not wish to try any shooting on game birds.—FLICK FLICK.

WEIGHT OF GAME BIRDS.—Scranton Pa.—A correspondent to one of your December issues asks if six and a half ounces is a heavy weight for quail. I had a nice bunch, killed over my pointer, and thinking them very fine weighed them. They weighed the same as your correspondents', viz., six and a half ounces; one weighed seven ounces. I also had a nice young hen grouse weighing up at the time; it weighed one pound and five ounces. One pound and a half is a good average with us; have killed one and three-quarter pound birds. A friend who has bagged many a one during the past twenty-five years says two pounds was his heaviest, although he saw one said to weigh three pounds. The Western quail for sale in our markets last fall would not weigh over five ounces, I think.—B.

MINNESOTA NOTES.—Mantorville, Minn., April 8.—Quail have fared badly, more having frozen to death this winter than at first supposed. As the snow melts off, their bodies appear in sight frozen as hard as iron. A woodman says that he saw at the very best fifty quail and a few partridges, within a week, frozen in the snow-drifts; they seemed to have been snowed under, and were unable to get out. Deer are very scarce in this part of the State, and bunting them out of season ought to be punished. Wild geese, ducks and song birds have appeared in limited numbers this spring. The geese and ducks seem to have business farther north, and do not stop here.—DELL WELLS.

WATSONTOWN, Pa., April 9.—Quite a number of snipe have made their appearance in this section. We have a number of quail wintered over, and our prospect for this coming winter's quail shooting is better than it has been for a number of years. The hawks have proven the great destroyer of quail in this section of country. Our game laws have been amended by offering a bounty for hawks, minks, foxes and skunks, the enemies of our game birds.—J. R. H.

DEER IN ALABAMA.—Hale County, Ala.—Deer are on the increase here; good many hunters, but little nick lagged. We find that hounding the deer does not run them off. We could not still hunt them, as they stay in the swamps. No pot hunters here.—MARK IVEL.

ONTARIO NON-EXPORT LAW.—London, Ont., April 7.—Editor Forest and Stream: The deputation appointed at the meeting of sportsmen in Ottawa, on the 20th inst., have been successful in obtaining their request. The Honorable the Minister of Finance, in his budget speech, on the 30th ult., in the House of Commons at Ottawa, recommended the absolute prohibition of the export of quail, deer and turkeys from the Dominion, so that for the future we shall be free from the annual invasion of market shooters.—W. C. D. GILL.

ALABAMA.—Birkville, April 4.—We have had perfectly magnificent sport among the quail the past season, and although the killing was unusually large, I am surprised to see more birds left over than I have ever known before. The annual snipe visit to this section was a disappointment to the expectant gunner. Birds few and wild. Plover plentiful now, but quite poor, hardly fit to eat.—C.

CHARLESTON, Ill., April 5.—This has been the poorest spring for waterfowl shooting in ten or fifteen years. One of our best week Benjamin Tracy, Jr., of Lafayette township, in this (Coles) county, shot an albino crane that was six feet and seven inches in height, and measured seven feet and eight inches from tip to tip of its wings. It is going to have this large bird mounted.—FOX SQUIREL.

WILDEAT HERBIVOROUS.—New Hampton, N. Y., April 2.—In the stomach of a very large wildcat, recently mounted by my brother, was found the partly decomposed body of a gray squirrel and a quantity of "browse," showing that either from necessity or choice they sometimes subsist on buds and twigs.—C. B.

CAMP CHEST.—Can any of our readers furnish us with specifications (and a drawing) of a camp mess-table suitable for an army officer to take into the field with him?

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

PIKE-PERCH.

THE pike-perch, one of our native fishes, is called salmon, and while it ranks rather low as a fighter, is deservedly popular with epicures, nor does the angler disdain the sport of its capture. Native residents assure me that it attains a weight of twenty and twenty-five pounds, but I have never killed one larger than eleven—but that one one which got away, etc. There is certainly no handsomer fish in our rivers, and the assertion that a salmon well served is unequalled by any rival taken from the same stream rarely provokes controversy. The deliciousness of croppies and rock-bass as pan-fish is unchallenged, and the snappers have among the guild whispering advocates of their superior flavor, but the pike-perch is a universal favorite, and needs protection, as do all other fishes, for in open violation of law the employes engaged upon the improvements of Big South Fork of Cumberland River, the most noted pike-perch stream in the State, now have traps erected near their camp, and are taking the fish in large quantities, when the stage of water is propitious—which has been its condition nearly all through March, the best month for their capture in Kentucky. It is a natural inference that the engineer in charge is cognizant of the law and its flagrant infraction, for he is a Kentuckian, and it behooves the legal functionaries to thoroughly investigate the violations and mercilessly punish violators. Raftsmen who lately passed the scene of present operations told me that two traps have been put in, and a large catch was made the night before their passage. Traps at other points mark the improvements (?) of our favorite stream up to now. Shame! Shame!!

KENTUCKIAN.

SOUTHERN KY., April 2, 1888.

The pike-perch or glass-eyed pike is called in Ohio "salmon," and in Canada "pickeral" or "dore."

This species was abundant in Lake Michigan and the Northwest, forty years ago, and was highly esteemed as the best fish in those waters except the whitefish. In the spring, when the pike-perch were running into the rivers to spawn, large numbers were taken in seines and brought to the Chicago market. I have seen specimens there, weighing from fifteen to twenty pounds, the average being perhaps four.

In those days I have taken this pike with rod and reel from the Chicago pier; at the mouth of the Calumet River, and at the junction of the Fox and Illinois rivers, always in deep water with live bait. I have never seen it taken with fly or spoon. I have found it a strong and hard fighting fish, not so active as the black bass, which was our principal object of pursuit, and which was more abundant, more generally distributed, and more willing to take a bait. I think it more gony than the Northern pike, and superior to it or the bass as a food fish, being fine, flaky, of excellent flavor, and with few small bones.

I have also taken this species at Alexandria Bay, River St. Lawrence, while fishing in deep water for bass, with live bait. My average weight with the rod has been about two pounds.

The pike-perch world, I believe, be a valuable fish for introduction into the deep lakes and rivers of the Northern Atlantic States, being, as I think, superior in quality to any of the fresh water species, except some of the Salmonidae. In the large and deep lakes of Sweden and Norway, the pike-perch is said to reach a weight of thirty pounds.

S. C. C.

Since writing the last letter, I have read the articles of several correspondents in the FOREST AND STREAM, and it is plain to be seen that many of them have confounded the grass pike or pickeral with the pike-perch or walleyed pike. The wall-eye is much shorter and thicker set than the pickeral, and a fish of six or seven pounds is an exception. They average about three pounds. At least that is my experience with them in the West. It is very easily distinguished from

other fish by the peculiarity of the eye, which is not clear and bright as in other fish. The pickeral resembles the muscalonge, while the wall-eye is very much like the trout of the great lakes. I do not think the wall-eye is very "gamy" in any locality. Occasionally, however, you find them so, as I have found them here. I do not think the name by any means. The pickeral, or as they are sometime termed, the "long snouts," are very different. There is, perhaps no gamier fish, for they will fight as long as breath lasts, and I have seen them snap at stray fingers after being landed in the boat.

I. P. II.

Our correspondents will bear in mind that the "wall-eye" is a true perch and has spiny rays in its dorsal and anal fins, while the pike, or "pickeral" of the States, *Esox*, is a soft-rayed fish, they will not get them mixed as to names. They should also bear in mind that what is variously called the pike-perch, wall-eyed pike, and even salmon in different parts of the United States, is termed "pickeral" and "dore," in Canada, where the fish called "pickeral" in the States bears the old English name of pike. The pike-perch is not a true pike, but was so-called because it appeared to be a perch with the savage habit of the pike.]

In your issue of December 28, 1882, I noticed an editorial on "Wall-eyed Pike," asking why some one has not written up this beautiful fish. In a later issue I noticed an article on the same fish, claiming they could hardly be classed with the game fish, etc. I had intended answering you on this point, and this last stirred me up. If your correspondent was right with me last June and had seen one break the second joint of my rod, he would have thought them game enough. I admit that the breaking was due partially to my striking too hard, but I had just missed a beauty and was bound to have this one, and did, after a "nip and tuck" tussle, though with a broken rod. The scene of this day's fishing was on Minnehaha Creek, about 200 feet from its entrance into the Mississippi River.

They are about the first fish to bite in the spring in this section, and, to my thinking, the handsomest fish we have here. You rightly call him the "king of the perches." I use a nine-foot bass rod, and the most killing bait I have found for them is the "phantom minnow," rigged with a white fish, and swung and put about three "BB's" shot on the same fish, claiming they could hardly be classed with the game fish, etc. I had intended answering you on this point, and this last stirred me up. If your correspondent was right with me last June and had seen one break the second joint of my rod, he would have thought them game enough. I admit that the breaking was due partially to my striking too hard, but I had just missed a beauty and was bound to have this one, and did, after a "nip and tuck" tussle, though with a broken rod. The scene of this day's fishing was on Minnehaha Creek, about 200 feet from its entrance into the Mississippi River.

MINNEAPOLIS, Minn., April 2, 1888.

ON MAXINCUCKEE.

MAXINCUCKEE is a lovely little lake in Northern Indiana, of crystal clearness, margined with rolling shores and beautiful woods, pebbly beaches, picturesque outlines of grass and trees, and vistas of delightful perspective. It is the eye of nature, gleaming bright at times, and again suffused with tears; now closed in the icy slumber of winter, now twinkling with the mirth of spring, and again flicking and blinking with April showers, or flashing with fierce energy in response to the loud overtures of aggressive storm.

Beautiful in repose, it is capable of grand displays, when aroused by the blasts of Boreas. Clear as a mirror, a glass for Narcissus in gentle mood, it gets awfully dark and sullen on occasions, and carries its threats into dire execution. But it is always beautiful, even in its turmoil, when crested wave ride swiftly to shore, and seems to disappear like wreaths into the woods and fields. In spring and summer, when the odors of the flowers, and the songs of birds, furnish the essentials of paradise, then Maxincuckee surpasses the "vale of Cashmere," and is an alluring Mecca for those who do homage at the shrine of nature.

Once, when coming from a three-hours' excursion, with at least twenty pounds of black bass and wall-eyed pike in the bottom of the boat, which my attendant was rowing at a lively rate abreast of a rapidly-gathering storm, one of my lines attached to rod and reel, and which I was trolling, suddenly tightened and came near jerking the rod into the lake.

"Jewillkins, Charles! put the boat about. Got a ten-pound bass on. Julius Cesar, how he pulls!"

It was no easy task to stop and come round against the wind and make headway backward, so to speak, or hold the boat so that the game could be properly handled. At least a hundred feet of line ran out before the maneuver could be executed. In the meantime the line was pulled tight and the monster tugged and jerked, and the boat was hard to manage, the wind increased every moment, and the now angry waves rose and showed their white teeth until it seemed that the elements and all the accidents and incidents possible were conspiring to prevent the capture of the "boss" fish of Maxincuckee.

But he was on, well hooked, in fact, as was quickly shown, and unless we were enticed, or I was pulled overboard and towed around the lake, it would take a give up. Charles was hard on all his strength, now on the right, now on the left, according to orders, while I, braided in the boat, took advantage of every turn to keep the line taut, and hold the quarry to his work.

Soon the rain came and the wind grew furious, and the waves leaped into our skiff like pirates. Still the contest was kept up for twenty minutes, when we got the customer under control, and Charles, dropping his oars, seized the landing-net and deftly thrust it—out in a slender, tenacious branch—a sunken tree! That was all.

I jerked the hook off with an impatient slam bang, exclaimed *Se transit gloria mundi!* and added feebly, "we'll go in to supper."
JEROME BURNETT.

SEA BASS AND BLACKFISH.—A good place for sea bass and blackfish is at Pelham Bridge, on the N. H. R. R., at the station called Bartow-on-the-Sound. The best place I know of for blackfish is Bridgeport, Conn., out to Black Rock by stage from the station.—M. L.

SOME EXPIRED REEL PATENTS.

THE first patent ever granted by the United States for a fishing-rod reel was issued to John A. Bailey, of New Jersey, Aug. 5, 1856.

This invention consists in having the crank-shaft work laterally in a socket attached to the end plate of the reel, and having a bevel wheel attached to the crank-shaft, acted upon by a spring, so that when not pressed inward by the person holding the reel, it will be kept out of gear with the reel.

In the cut (Fig. 1.) A represents the reel frame, of the usual form and construction. B is the reel pivotally fitted in the frame A. To one end of the axis or shaft, C, of the reel, a bevel pinion, D, is attached, and E is a spring which is attached to the end plate, A, of the frame. This spring has a circular aperture, F, made through it, so that it may yield without interfering with the pinion, D, the spring being a flat metal plate. An aperture, G, is also made through the outer part of the spring, and a pin, C, attached to the plate, A, passes through the aperture, G. The crank-shaft, F, is hollow and has a beveled wheel, G, on its inner end. The shaft is allowed to slide laterally in a collar, H, attached to the end plate, C, of the frame. The spring, E, bears against the bevel-wheel, G, and keeps it out of gear with the pinion, D. The pin, C, fits into the end of the shaft, F. It represents the operating crank.

By this arrangement the reel, B, when the crank-shaft, F, is not pressed inward, is free therefrom, and the line may consequently be thrown outward a greater distance than when the usual reels are employed, because there is no friction to overcome except that occasioned by the rotation of its own shaft or journals.

Before the date of this invention the reels generally used were permanently connected by gear wheels with the operating handle, and consequently the friction therefrom offered considerable resistance to the line as it was thrown out.

The next invention, granted Feb. 10, 1857, to Edward Deacon, was for effecting the same purpose as that above described.

Referring to the cut (Fig. II., a) A is the reel fitted within a frame formed of two plates, A, A, connected by rods, B, B. The frame has the usual box, B, B, one side to inclose the gearing, C, D. A sleeve, G, is placed on the crank-shaft, F, within a socket, C, on the outer side of the box, B. In the sleeve, G, a slot, A, is made, having side notches, C, C, as shown (in Fig. II., b). The pin, F, of the socket, C, fits in the slot, A.

The crank, H, is secured by a nut, G. The crank-shaft is shovd in or out, so that its wheel, D, may be in or out of gear with the pinion of the reel-shaft by merely shoving the sleeve inward or drawing it outward. The notches, C, C, serve to lock the wheel, D, in either position. Deacon varies that the pressure upon the crank in the Bailey reel, above mentioned, renders the winding up of the line a difficult operation, and that a person is liable to forget that pressure upon the crank is requisite in order to connect the crank with the reel-shaft. He says the spring also is liable to lose its elasticity, and the parts may thus be rendered inoperative.

August 9, 1859, William Binghamurst, of New York, devised a fishing reel so constructed that when the line is wound up it shall form a ring instead of a cylinder, thus providing efficiently for its drying without the necessity of unwinding the line and spreading it out, while at the same time the weight and cost of the reel are reduced.

From the plate, A (Fig. III., a), attached to the reel in the usual manner, projects the pin, P. The disk, D, rotates thereon and carries the divided rings, B, B (shown by the drawing in Fig. III., b and c). These rings form the skeleton of a tubular ring, in the inside of which the line is very easily coiled through the openings. To guide the line in its winding and unwinding, and prevent the escape of any loose coil, if such should exist, the opening formed by dividing the rings is filled, in all but a small portion of its extent, by means of the ring, A. This ring is kept from rotating by means of the braces, C, F, which are attached to the plate, A (see in Fig. III., b).

One of these braces is forked, and has attached a loop or guide through which the line passes. Aside from the great reduction in weight and cost over a reel constructed in the ordinary manner, the general form is much more convenient for carriage in the pocket, as the whole thing, line and all, forms a flat disk of no very great dimensions; but the great advantage consists in the complete exposure of the line, whereby it is enabled to dry rapidly and thoroughly, and is prevented from decaying. In the common form, with the line on the reel becomes wet, either from a wetter submersion or from winding over portions of the line over it, it is difficult for the central portions of the line to dry, covered, as they are, by the outer layers. In this reel there is but a small portion of the line covered, and the whole surface is fully exposed to the air. It would seem that the line can be wound with rapidity, thus dispensing with the complicated and expensive gearing for that purpose. The inventor asserts that one turn of the handle takes up more than seven inches of line.

The "Palmer reel" (1860) employs a traveling or reciprocating line-guide attached to the reel, and operating automatically in such a way as to cause the line as it is wound up to be adjusted evenly on the shaft of the reel. Figs. IV., a and b.

The reel, A, is of ordinary construction, A being the frame and B the box which contains the multiplying gear, C, D, through which the reel-shaft is rotated. The operation of the line-guide is as follows: In order to wind up the line evenly on the reel, A, the upper end of the lever, G, is shoved upward and retained in that position by the nut, M, being screwed up against the outer side of the box, B. In this position of lever, G, the pinion, J, is in gear with the wheel, C, and as the crank, E, is rotated a rotary motion is communicated to the shaft, B, and which, through the medium of a half-nut attached to guide, B, gives a reciprocating movement to the line-guide, D. By moving the whole length of bar, C, on which it is allowed to slide freely. The screw, A, at each end of the shaft, B, unite with each other and the half-nut in consequence of being attached to the pivot, P, of the line-guide, D, is allowed to incline itself in either position to conform to the pitch of the screw-threads of shaft, B, and thereby permit the change of movement of the guide at each end of the shaft. This reciprocating movement of the guide causes the line to be wound evenly on the reel-shaft. When the line-guide is not required—as, for instance, in casting out the line—the upper end of lever, G, is shoved down to the inner end of socket, H, thereby elevated, and the pinion, J, consequently thrown out of gear with the wheel, C. The line-guide, D, is forked at O for the passage of the line between.

The object of Dougherty's invention is to provide an efficient means for controlling the delivery of the line, so ar-

ranged that it does not interfere with the winding-up mechanism, and so that also the angler may operate the device for controlling the delivery by the same hand which controls the rod.

The frame of this reel has two shallow heads (Fig. V.), A, B, connected by crossbars, C, one of which forms the base by which the reel is connected to the fishing-rod, C. The spool, D, on which the line is wound, is of the usual form. One of these heads, A, contains the winding mechanism, consisting of a cog-pinion secured to the spool arbor, and a cog-wheel attached to a counter shaft which extends through the head, and is fitted with the hand-crank, E, for winding the line. The other head, B, of the frame contains the friction brake, consisting of a spring, M, partially encircling a smooth-rimmed wheel, F, secured to the arbor of the spool, D. One end of this spring brake is fastened to the reel-frame, and the other to the outer end of an arm, N, secured to one end of a brock-shaft, G. This rock-shaft extends from one head of the reel to the other, and is fitted at its center with an upright thumb-plate, G, so that the thumb-plate, rock-shaft, and arm, N, constitute a lever by means of which the spring, M, may be made to engage the wheel, F, to control the unwinding of the line. The device is so arranged that the angler can apply his thumb to the brake without removing his hand from the rod. This thumb-plate has a set-screw, C, so arranged as to vary and limit the distance to which the former can be moved, whereby the brake power and degree of strain upon the line can be adjusted to the strength of the line.

With a reel thus constructed the angler may hold the rod with his hand in such a position that the thumb of that hand can be applied to the thumb-plate of the controlling mechanism, so that he can control the running out of the line the instant he ceases to wind it up by the application of his other hand to the crank-handle.

WASHINGTON, D. C.

[TO BE CONTINUED.]

WEAKFISH COMING.—Phila., Pa.—The hard crab is showing himself in numbers; this is a sure sign of the near coming of the weakfish to the waters of Delaware Bay.—HOMO.

THE ADIRONDACKS.

IN reading your editorial in last week's issue in relation to the trout fishing to commence on Long Island to-day, I could not help noticing, residing as I do on the northern borders of the Adirondacks, the great contrast that there is between the two localities in regard to the forwardness of the season. There, you say, the ice has been out of the streams for a month; while here the streams and ponds are no free of ice that they were in January, and the snow in the woods is from four and a half to five feet deep. The thermometer here yesterday morning, April 1, stood only 6° above zero at 7 A. M. Slighting has been good here up to within a day or two, and has been since December 1. The past winter has been the coldest for many years, and the month of March was the coldest and most stormy of any. The only signs of spring here yet are a robin or two that have made their appearance during the last week, and the crows, which have been back a week or two. They have always remained here all winter heretofore, but this winter was too much for them, and they left sometime near January 1 for a warmer clime. The English sparrows that for several winters previous to this have been here in large flocks in the streets and dooryards, have all disappeared this last winter. Whether they have gone south, where it is warmer, or have perished with the severe cold, I cannot say. As none have yet returned I think very likely that they all perished. In place of sparrows and crows we have a new kind of bird, which I never saw before this winter. It is a brown bird, somewhat smaller than a robin. They come in flocks of from ten to twenty. Some of them have a reddish head, which I take to be the cock bird. They do not seem to care for the cold, for they will sit on the trees in the dooryard and sing or whistle a plaintive note when the cold is below zero.

I do not hear that the ruffed grouse have been injured or have perished by the cold weather to any extent. The snow has been very deep in the woods all winter, and the ruffed grouse has a way of burrowing under it in cold weather, where they keep from the cold.

While there has been a great complaint of the scarcity of the ruffed grouse in most all other parts of the country for the last few years back, they have been very plenty here in

Franklin county, both in the Adirondacks and in the strips of forests that are scattered over the county. In the months of September and October you can hardly pass through a pile of woods of any extent without being accosted by a hawk or two. I think the cause of their remaining so plenty here is that they are never snared. I have never known or heard of a partridge or ruffed grouse being snared in Franklin county, and I have been in most all parts of it where snares would be likely to be found. I wrote you some time ago that a lumber company was about purchasing a large portion of the Adirondack wilderness that is known as the St. Regis Falls, and that it was about to be constructed a railroad from some point in the district to connect with the Ogdensburg & Lake Champlain road at Moira. They have purchased upward of 100,000 acres and have it surveyed, and have obtained a charter for the road, and have the timbers for building the bridges on the ground, and expect to have the road in running order by another fall. It is called the Northern Adirondack Railroad in their charter. For the present its southern terminus will be at a point on the Middle St. Regis, known as the Five Mile Level, about three miles east of St. Regis Falls, where they are building a large mill for sawing their lumber. The past winter they have had three gangs of choppers cutting timber on the land. The land they have purchased comprises all of the territory about the headwaters of the three branches of the St. Regis River. It takes in all or but a few small lots of townships No. 13, 14, 15, 16, 17 and the south half of No. 10 and 11. By taking a look at Stoddard's map of the Adirondacks, where the numbers of the townships are given, you can see what a large tract of territory this company has purchased. It extends to within a short distance of Meacham Lake and Paul Smith's, on the St. Regis Lake, on the east, and to St. Lawrence county on the west; and is, I claim, one of the best, if not the best, portion of the Adirondacks for deer and other game, as well as for trout fishing, that is now to be found in that region. As to the effect that the lumbering business will have on the hunting and fishing in that territory, my opinion is that for three or four years to come it will not be greatly injured by it. But a railroad running into the heart of a good hunting and fishing country will make it so easy of access that it will, I believe, in a few years, be so overrun by sportsmen and others that, as in all other places that are much frequented, the deer and trout will get scarce as the number of hunters and anglers increases.

The lumbering itself does not, I think, injure the hunting or fishing to any great extent; deer are always found plenty around clearings where the underbrush is left, and in the woods that are partially open, as those are that have been lumbered in. Trout fishing will continue good until the streams and ponds are over-fished, or until saw mills are built on the headwaters of the streams and the dust from the mills kills off the trout, as is the case in many streams in the older settled parts of the country. For hunting or fishing I believe that at the present time there are but very few, if any, localities of near the same extent that will equal the tract of territory purchased by this company. Until within a year or two it has been but very little frequented by sportsmen residing outside of this or St. Lawrence counties. There are at present three hotels, or houses, within it that keep accommodations for sportsmen. One is at St. Regis Falls, on the northern shore of the tract, and there is a post office, Daniel McNeil, proprietor. The other two are at Blue Mountain, eleven miles further south and near the center of the tract, and within a short distance of the Sixteen Mile Level of the Middle St. Regis, which runs through the center of the St. Regis district. From south to north. One is called the Blue Mountain House, Henry Phelps, proprietor; the other the Forest, home, Merrill & Co., proprietors. Post-office address of both St. Regis Falls, N. Y., April 2, 1888. ADRIAN OXBACK.

A TESTIMONIAL TO REUBEN WOOD.

BEFORE Mr. Wood sailed for the London Fisheries Exhibition, he was in the office of Forest and Stream. In the course of conversation we noticed a portion of a badge peeping from under the lapel of his coat, and inquiring about it, Reuben, with his characteristic modesty, replied: "It's only a little badge the boys gave me before leaving Syracuse." We found it a large and elegant one. From a scroll there are two bars dependent, to which a bundle of fishing rods is hung; a miniature reel is placed in the center, a twining fishing line hangs below which is crossed by other rods. A large gold medal is engraved on these, on which the portly figure of Uncle Reuben is engraved in the act of wading a stream. The likeness is good, and by the angle at which his ever present cigar is tilted, we see that he has just struck a four-pounder.

From the Syracuse *Sunday Times* we learn that the presentation was made in the presence of about thirty friends, and was accompanied by the following remarks by Mr. Damon Coats:

Mr. Wood—I have been requested by the members of the Onondaga Fishing Club and others of your friends in Syracuse, to say a few parting words before you leave us to attend the International Fisheries Exhibition. We wish to express to you our appreciation of your valuable services to the club, our admiration of your wonderful skill as an angler and your enthusiastic love of the sport—you never failing fund of good humor, good nature and good fellowship at all times; but more than all, we appreciate by your associates while in camp and following the trout stream—our personal regard which has grown stronger day by day through a long series of fondly remembered years—our gratification at your appointment on the duties of which you are about to enter, and our congratulations to you, and no less to those who have so kindly and so wisely selected you for a position for which you are so well qualified and admirably fitted. They have been a pleasure to address you for several special reasons, I presume, except that I have known you long and intimately, and have, if possible, of all your friends, the strongest attachment for you. I have witnessed a great many wonderful displays of your skill, both in the tournament and upon the stream. I have seen you take trout where there was "no fishing"—at least it was so placarded on a board nailed up hard by. I have seen you lure and land two-pounders from ponds where I had supposed only the smallest fry could find room to lurk. I saw you take seven trout, weighing ten pounds, from a pond where you mistakenly supposed you had permission to angle, with such celerity that the wrathful proprietor discovered the capture of the last and smallest one only. Oh! how handsomely you did apologize for taking that one—forgetting all about the six other victims of your skill then swaying in

your capacious pockets. I saw you at the inlet of Ox-bow Lake—from one position and without a single miss—sit in the bow of a boat and take thirty-six hennies in less than a half hour, and then, without leaving the boat, but with sixty feet cast and reeled in through fifty feet of fly rods. I am here and now publicly forgive you for the torture you then inflicted on me—compelled, as I was, to crouch in the stern of that boat for a mortal hour and a half, while you serenely smoked and angled.

But I may not dwell on these incidents of our piscatory life. I must pass to the business of this meeting. Your friends and those of your honor of claiming you as one of us. Our attachment for you is very sincere. We wish you, on a prosperous voyage, a delightful sojourn abroad, a faithful, successful and agreeable accomplishment of your share of the objects of the mission, and a safe return to us and to your home. And we hope you may, while in Her Majesty's dominions, have an opportunity to give an exhibition of your skill in fly-casting by killing a few of the trout and salmon in those foreign streams—using, perchance, some of the tackle with which your skill has won prizes in tournaments in your native land.

And now, "Reub Wood," I have to say to you, in behalf of these your Syracuse friends, that they claim a property in you. We spare you for a time to "Uncle Sam" for this occasion, but we claim to have you back again. And we mean there shall be no mistake about it. We mean to secure your return to us as far as in our power, beyond all mistakes and against all hazards. And so we are going to put our mark on you for more certain identification, should you at any time unfortunately get lost in the mazes of London, bewildered in its fogs, mingled with the smoke-clouds of your own inevitable, everlasting cigar.

Please, then, except and wear this badge, "Reub," presented to you as a slight token of our great esteem and love. We mean by the gift to do you honor. We know you will do honor to the gift.

OUR ANGLING PRESIDENT.

NO matter what the judgment of the future may be upon the administration of President Arthur, his fame as an angler is established for all time on the strength of that fifty-pound salmon. It is now in Florida seeking his favorite element, and he will have the success with which he took the black bass that he has had with the salmon, and capture the biggest one on record. The New York *Sun* has been interviewing Mr. Francis Endicott, the bright and genial president of the National Rod and Reel Association, who has fished with President Arthur on many occasions, before the latter fished so deeply in political streams. Mr. Endicott said:

Gen. Arthur is a good salmon fisher and has the highest record of any man in this country. But it is not alone as a salmon fisher that he excels. He casts a salmon fly beautifully, he casts a trout fly superbly, and he casts a bass bait equal to anybody. Those three things require entirely different styles of casting, and excellence in either depends so greatly upon the temperament of the angler and his practice, that it is an exceedingly rare thing to find a person who is capable of doing all three very well. It is because Gen. Arthur does these things that rare combination of capacities in so marked a degree that I unhesitatingly pronounce him not only the first magistrate, but the first angler in the land."

Mr. Endicott said this in a manner that implied his regard for the latter title as a prouder one than the former. Drifting into the grateful current of reminiscences, he continued:

"Some years ago, when Gen. Arthur was Collector of the Port, we went down together to work Munsell's Pond, on Long Island, and he received a kind invitation from that genial gentleman, Mr. William Floyd-Jones, to fish in Massapequa Lake, which is pronounced by Mr. Spencer F. Baird, United States Fish Commissioner, the finest preserve in this country. It has been made by damming a large brook, and that stream, before pouring into it, winds through five miles of woodland belonging to Mr. Floyd-Jones. The trout are very large in size, and I suppose we caught a hundred of them that day. Of course, we caught the largest. The others we replaced in the water. The General cast a beautiful fly; yes, beautiful. He throws to such a distance and with so much precision that I think he is the finest amateur caster that I have ever seen. I took the trouble to measure one of the President's casts, and it was seventy-eight feet. He makes the regular overhead cast, not the Wye cast, that Pritchard uses. We had a strange old oysterman named Hugh Montgomery to row us on the lake, and, by the way, he is the only man I ever saw who could manœuvre a boat with two men in it so as to give both an equally good chance to fish. I gave the General what is ordinarily deemed the best place in the boat, the stern, myself taking the bow, and as Hugh rowed us along the old head of the stream, in the middle of the lake, two or three times I raised a fish and failed to hook him. But each time, Gen. Arthur, casting where I had missed the fish, hooked him. The inevitable result of my raising a fish was his taking it, and, of course, he got the laugh on me. I told him I had got tired of that. "Never mind, Endicott," said he, "you have the spasms of raising them. I know nothing like the excitement an angler feels in raising a fish, seeing it come to his fly."

"As we were going down there on that occasion an incident occurred that was characteristic of the General. We were crossing South street, just to the James slip ferry, when our attention was called by a loud shouting and, looking up, I saw a big, trident-looking fellow, driving a pair of horses attached to a large truck, dashing furiously toward us, while he shouted for us to get out of his way. I did so, skipped across the street as quickly as I could, and turned to look back. There stood Gen. Arthur just where he was when the truckman's yells were first heard by us. The pole of the truck was raised high, and the driver, who stood on a firm and plaid, looking steadily between the horses' heads into the eyes of their driver, who was exerting his utmost strength to rein in the animals. When they had come to a full stop, the General calmly continued on his way, without a word to the driver, but when he reached my side he said to me: "I'd give twenty-five dollars if I were not collector of the Port for about five minutes. I have no doubt that even if that truck had been driven by the collector of the Port, Gen. Arthur is, I think, one of the coolest, most courageous, self-contained, and plaid men that I know. He very seldom loses a fish, but when he does, even then he shows no excitement or disappointment."

"Yes, I have gone fishing with him very frequently, but the incidents of one trouting excursion are much like those of another. I have not been salmon fishing with him, but

have been told by those who have how beautifully he casts his fly and how adroitly he manages his fish, and have every reason to believe that he is quite as expert an angler for salmon as I know him to be for trout. He does not seem to care much for weak fishing, has some on it sometimes, but did not seem to take much interest in it. He is very fond, however, of taking the big bass that they get off West Island—out from Newport—and from the stands of the Squib-nocket Club on Martha's Vineyard. They catch bass there running all the way from 10 to 65 pounds weight, and that, you will readily understand, is a very different sort of fishing from trouting, yet President Arthur is equally at home in it.

"Yes, Commissioner French has been off fishing with Gen. Arthur, but French doesn't know much about angling. He means well, no doubt, but is too busy a man to give to the gentle sport that calm contemplation and practical experience and study that make the perfect angler. Really he would not be able to tell a trout from a shiner if you were to paint some spots on the shiner."

Police Commissioner French did not seem to have a consciousness of his real position as an angler when interviewed by a reporter on the subject, but he spoke of President Arthur's abilities as a fisherman in the tone of an authoritative expert. President Arthur, he said, is pre-eminently the best salmon fisher in this country. Others may rival him in catching bass and trout, but when they come to salmon, there he is justified of all. Mr. French did not feel that he would be greatest in narrating any reminiscences of his concerning the recreations of the President of the United States.

Mr. L. W. Winchester, president of the National Express Company and treasurer of the National Rod and Reel Association, said: "I have been salmon fishing with General Arthur, and he is unquestionably a very expert angler. He has taken the largest salmon ever caught with a fly in this country. It was this year, in the month of June, on the Canadian rivers, I forgot which one, but not the famous Resigouche, I think. That salmon weighed fifty pounds after its arrival in New York. I don't know of any man who can throw a better fly or kill a salmon quicker or in better style than President Arthur can. He used to be a member, and is yet, I believe, of the Resigouche Salmon Club, of which I was formerly president. It is a pity that Mr. R. G. Dim is not here, as he would be the best authority on the subject of fishing, for they have gone together, camping out and fishing, for years, in many places, and he knows more about the subject than anybody else."

NORTHERN MICHIGAN.

WHOEVER would have thought an angler, and such I took "Prairie Dog" to be, would take offense at my letter to "Prairie Dog." It is because the FOREST AND STREAM allows the little doggies to bark, as well as the big dogs, that I had my little say. I spoke of Michigan as a fine fish country. Other folks' experience does not satisfy me, and as for giving offense, I was farthest from my thoughts. I wanted "Prairie Dog" to try again and again, and he will conclude after all Michigan is not so bad a place as his fancy paints it.

A few words in answer to his queries: We have tramped twenty miles for a string of trout many times. We have waded the feeders of the Boardman River for four or five miles, and then walked nine miles to camp, and was dark when we were stumbled out, the woodpile like "G. H. W." We strike into the woods, miles away from the railroad and always find trout.

Did we ever fish in a country where mosquitoes and fly-pests are unknown? Aye! I'm there! The first fly we ever cast was in a stream running through a grand old park where trout were trout, and not fingerlings; where three or four of them were all an angler cared to kill; but "Prairie Dog" is a real angler, and he would not be satisfied with Pennsylvania, Michigan and Wisconsin. I care not for the mosquito's nibble; we are not dainty dandies afraid of sun- or copper-colored skies; we prefer to push into the forest primeval to find the wild trout that lurks under the gnarled and knotted roots of the sunken trees.

"Prairie Dog," my best friends have blamed me because I have given away the location of some of the best streams that an angler ever cast bait into, and now they pounce on me honorably not to write to the "ceased papers," as they call them, telling them of a new stream we have found. I am growing conservative, as I find one stream after another depleted by dear old "Nesmith's" trout-hogs, as he so aptly describes them, and think the advice of my friends worth following when they say "let the hogs find their own streams."

In conclusion, "It is not so bristly as you imagine, and would have been glad to have given you pointers of some good streams, but cannot promise freedom from 'skeeters,' we 'grin and bear them.'"
W. D. T.
CHICAGO, April 6.

FALLISH OR BLACK BASS?—Nearly ten years ago the writer was one of a party of four who subscribed an amount sufficient to stock the mill pond at Swedesboro, known as Black's Pond, with black bass. Two of the party, not having ever seen a black bass, went to Hagerstown, Md., where the fish were to be delivered to them, and had them put upon the cars, expecting what they dimly saw swimming at the bottom of the cask to be black bass. They were safely taken to Swedesboro, where they arrived late in the afternoon, and were at once taken to the millpond and deposited there. No sign of black bass has since been noticed in this body of water, which is well suited for the growth of this fish, but there has appeared within ten years thousands of chub, or fallfish, which had never been noticed before in Black's Pond, and which could not have found a way there unless they had been deposited. It may be that my two friends who were entrusted with the fish, were not so particular, and were at once taken to the millpond and deposited there. No sign of black bass has since been noticed in this body of water, which is well suited for the growth of this fish, but there has appeared within ten years thousands of chub, or fallfish, which had never been noticed before in Black's Pond, and which could not have found a way there unless they had been deposited. No sign of black bass has since been noticed in this body of water, which is well suited for the growth of this fish, but there has appeared within ten years thousands of chub, or fallfish, which had never been noticed before in Black's Pond, and which could not have found a way there unless they had been deposited. It may be that my two friends who were entrusted with the fish, were not so particular, and were at once taken to the millpond and deposited there. No sign of black bass has since been noticed in this body of water,

THE LATE DR. GEORGE M. BEARD.—The few words I send to you must not be regarded as an adequate expression of my regard for the man and his untold influence. I have no words to make the attempt. His example as it pertains to future sportsmen, from a guide's memoranda, can only be referred to. Not to be forgotten are the days in his company in the Adirondacks and at Second Connecticut Lake. His departure from "Uncle Tom's" was like the coming of a storm, and the morning sun after it not more genial than his countenance as it appeared unexpectedly at the east window. His home in your city will tell the story of his love. Nature's studies suspended above those of science. Here he had been out with laugh and returning to camp he held up for inspection one of the trout taken in several years. Some one of the party volunteered to weigh it. "Stop; let me think of estimating my enjoyment by the number of pounds of fish taken from nature's preserve. Ned, go there to-morrow with my friend and let him see what remains." His generous nature had reserved the trout for a friend. You that love the gentle art, when your larder is supplied with trout from the waters he loved, do you can see the ripples on the shady pools in advance of the boat, lay down your rod and look in the clear water, and if you are tempted, while gliding past those waving fins, to take one more, recall the last words of a brother sportsman and look "Higher, higher."—**NED NORRIS**, Second Connecticut Lake, New Hampshire.

BLACK BASS FISHING NEAR DETROIT.—Buffalo, N. Y., April 7.—In reply to your inquiry I send the following as worthy of mention: Take the banner at the foot of Shelby avenue, Detroit, Mich., at 9 A. M. A little over two hours' pleasant ride up Detroit River and across Lake St. Clair will land you at the Star Island House, kept by Jas. Sleuam, Esq. The accommodations there are good, the table well supplied with all the delicacies of the season, the charges are moderate, a good billiard table and piano on the premises, and every attention paid to visitors. The black bass are plenty from the first of August to the first of November. The fish are large and very game, averaging three and a half pounds, with now and then a six or seven pounder. I think the fish run larger than those at Put-in-Bay, or any place I have visited, and it is a noted fact they are unequaled in flavor. I always found plenty of bait, such as chub, minnows and crawfish, and good boats with experienced boatmen to place you on the fishing grounds, where, if you have any knowledge of fishing and good tackle, I can see no reason why you cannot take a large share of sport. There is a large ice-house well stocked with ice, making it easy to slip your friends a share of what you catch, per American Express; no charge for ice or box. Take it all in all, I know of no place where I have had so much sport with so many of the comforts of home. In my next I will say something about the fishing in Niagara River.—**DEEP TROLLER.**

MAINE POACHERS.—The following extracts from a letter just received from Hon. Henry O. Stanley, Commissioner of Fisheries and Game for the State of Maine, will doubtless be of interest to many of our readers: "We are making life a burden to the poachers in Maine, having done more the last year than ever before. Take the share of sport, in Massachusetts, deer and caribou out of season. The larger part of the poachers were from out of the State. Mr. Stillwell is aggra on the commission with me, and we are doing our duty, and mean to protect the fish and game in Maine, and shall go for all violators, be they whom they may, whether gentlemen if there are any worthy that name, countrymen, loafers, or what not. The game laws has given us the means and good laws, and the people are generally with us. Maine is going to be the banner State for sportsmen and tourists. We see the benefits accruing. It is a source of wealth worth cultivating, and money used in protecting her fish and game will reap an abundant harvest every season, and repay manifold to the industrious, fortunate inhabitants of Maine. I love the dear old State! God bless her grand old forests, mountains, hills, lakes and streams!"—**GEO. SHEPARD PAGE.**

ALLOTTOUR GAR SHOOTING.—Galveston, Texas, March.—Some days ago while wading along the edge of an open slough, my attention was attracted by a commotion in the water. Closely watching for five or six minutes, I came to the conclusion that it was caused by some large fish. Having a shotgun heavily charged, I aimed at what I thought to be about two inches under the spot, and "let drive," distance 10ft. It caused a commotion at any rate; if a torpedo had suddenly exploded I don't think the water could have cut up more. After it had subsided I cautiously advanced to see the result of my shot. Judge of my surprise when upon approaching the spot I found I had killed three fish known here as alligator gars. I picked up the smallest (about two feet long), and carried it ashore, where, after the closest examination, I failed to discover a single gunshot wound. Please tell me if you think concussion killed them. I am sorry now that I did not examine the others.—**NEMO.** [Fish are often killed by concussion, and this may have been an instance of it.]

INFORMATION WANTED CONCERNING WHITEFISH.—*Editor Forest and Stream:* The fish and game commissioners of New Hampshire will plant a large number of whitefish fry in our waters this spring, and having only a little knowledge of the habits of this fish, and that little was obtained from the last seven volumes of *FOREST AND STREAM*, my desire for information and the extent also to which this variety of fish is distributed, prompt me to ask the *FOREST AND STREAM* for such facts relating to it as will be of interest and profit to whitefish anglers and culturists.—**DRAKE.** [We do not know that the whitefish is angled for; still as it must feed it might take a hook. It is a toothless fish and feeds largely upon small crustacea at the bottom of deep lakes, where it remains at all times, except when in the streams to spawn. Its own habits are unknown. We will be glad of any accounts of its taking the hook. We believe that an occasional one has been taken, but do not know that it is regularly angled for anywhere.]

One of the twenty shares of the Willamette Club, par \$250 (lake, club-house, land, etc., in Catskills) for sale for \$225. George W. Van Sichten, 90 Nassau street, N. Y.—*Adv.*

FISHING IN IOWA.—Cedar Rapids, Iowa, April 5.—In a recent issue "L. K. M." wished information as to fishing at Spirit Lake or Lake Okoboji. I have made inquiries from a person well acquainted with them. He says go to Rock Point, about three miles out of, and on Spirit Lake, east side. Good fishing for pike, perch, pickerel, croppies and silver bass; some black bass, but not many. Best time, May and June. Tackle such as is generally used for black bass. A good many pike-perch are caught here, but black bass are more abundant. Thirty years ago pike-perch were plenty here. Live minnows are the best bait, but we used to catch them with pork; sometime red flannel and pork for bait. They are generally found in the corners of a swift current. Some of them are eight and ten pounds, average about two pounds; gamy fish.—**W.**

Fishculture.

THE MILWAUKEE HATCHERY.

A REPORTER of the Milwaukee *Sentinel* has visited the new hatchery of the Wisconsin Commission at that place, and gives the following account: "They are just beginning to hatch," said Martin E. O'Brien, Superintendent of the State Fish Hatchery branch at the Exposition Building, to a reporter yesterday afternoon. Mr. O'Brien was attentively watching the jars of the hatchery in the basement at the northeast corner of the great structure, as the reporter went down the stairs from the office floor and asked how they looked. To those who have never visited the Milwaukee branch of the hatchery, and even to those who have dropped in occasionally, the spectacle is one of absorbing interest, and it is not surprising that they stop to reply a call. The hatchery was not under way during the last summer's exposition, and the whitefish eggs received shortly after are just beginning to hatch. The eggs are distributed in some seventy large glass jars, arranged in a substantial rack in the center of the room, but their appearance cannot be described. They must be seen. The jars are about fifteen inches high and six in diameter. They are filled to within a few inches of the top with semi-transparent drops just about the size of No. 2 shot.

"These are whitefish eggs," explained Mr. O'Brien. "There are 16,000,000 of them altogether—about 200,000 in each jar. They came from Green Bay last November, and as this is the only hatchery in the State that grows the fish, the great variety of the changes possible than can be had anywhere else. When the eggs were first put in there was nothing to be seen about them, but in four weeks or so the eyes began to show. The black curling line of the body does not show for three months. At the hatchery in the Northwest corner of the city, more than a hundred hatchlings were seen. One whitefish will spawn in the neighborhood of 25,000 eggs, but in the late or river a great many fail to impregnate, or are eaten by other fish, and lost in various ways. These will all be hatched by April 15, when the jars will be filled with the eggs of the wall-eyed pike. The pike spawn comes from Saganaw Bay, and one pike gives about 50,000. They hatch in thirty days, as the water is warmer."

"What is done with them when hatched?"

"Shipped away to stock different waters through the State. Some orders have been received lately for these, subject, of course, to the approval of the commission."

PENNSYLVANIA NOTES.

TWO gentlemen owning fish ponds in the limits of Philadelphia county, unknowingly stocked them with German carp imported on the 15th of August, and now are confronting goldfish. The consequence now is, they have a most plentiful crop of cross breeds, inferior to the carp as a food fish, and not so ornamental as the goldfish.

Philadelphia anglers are still overhauling their tackle, trout flies are being looked over, and the fish are venturing on the mountains; next week will see many away, your correspondent among the number. Rock fish (striped bass) are being taken in the Brandywine, at Wilmington, with sturgeon roe; the bait is a filthy one, but very taken at this season of the year, when it is the natural food of the rock fish in the Delaware River and tributaries.

We hope the attempt to stock the Perkiomen Creek which flows into the Schuylkill above Philadelphia, with rainbow trout will not be abandoned. The fry will only furnish food for the black bass, with which the lower portion of the stream abounds. Why can't the rock bass be introduced into the creeks of Philadelphia and Delaware counties? He would require take the fry of the rock fish, and a few more amusement than the smelt and catfish, their new sea occupants.

FISHWAYS IN OREGON.—Corvallis, Ore., March 27.—We have no regular fish commission in Oregon, our law makers have not woken up to the importance of such an office. The great abundance of the finest fish in the world in all our streams free for everybody, seeming to them, no doubt, a never failing source of pleasure and profit to all, but as times are coming, we trust, as a few genuine lovers of fish and fishing are making the importance of guarding our resources in the line felt more and more each year. The act, providing for the erection of the fishway at the falls of the Willamette, so provides for the appointment of a commission to superintend the construction of same, in fact placing the whole matter under such commissioners' control, and Mr. Wallace Baldwin has been selected by the governor for such commissioner. He is preparing to erect a McDonald fishway at the falls. Our Legislature also passed a game law at its last session, protecting mountain trout during spawning time, but, as we have so many streams emptying directly into the ocean, in which there are no trout, or brook trout, salmon trout and sea trout, that the question must arise every time whether the violator of the law has taken a genuine brook trout or a salmon trout, and as not one in a dozen of our administrators of justice knows the difference, it can but only lead to a law that is a mere mockery. However, there is a pretty general disposition to obey the law and I think it will have good results. Our salmon fishing interests are the second commercial interests of the State, the export value of salmon only being exceeded by the value of the lumber, and the people are slowly waking up to its importance.—**OREGON.**

THE MINNESOTA COMMISSION.—The seventh and eighth reports of the Minnesota Commission on the Land and Fishery mention is made of Dr. William Moulton Sweeney, who died Aug. 14, 1882. His son, Dr. William Montgomery Sweeney, succeeds him. A detailed report of valuable plantings is made, which looks up to 1,685,000 fry of different species in the two years. Of these there are salmon, land-locked salmon, Lake Superior trout, brook trout, wall-eyed pike, perch, carp, and rainbow trout. An act for the construction of fishways, approved March 11, 1878, follows, and the appendix contains "Carp and Carp Culture," by Milton D. Peirce.

THE MICHIGAN COMMISSION.—This commission, as at present organized, consists of: 1883, Andrew J. Kellogg, Detroit, 1884, Dr. J. C. Gray, Grand Rapids, 1885, J. H. Bissell, Detroit, commission. Oren M. Chase, Detroit, Superintendent; Herschel Whitaker, Detroit, Secretary. Applications for fish, and the examination of waters, should be made to the commission, Grand Rapids, Michigan. The business of the commission should be addressed to the secretary.

SALMON IN AUSTRALIA.—Australians now lately received the results of a very interesting experimental pisciculture. In Sir Samuel Wilson's fish-rearing establishment at Ereidoune, Victoria, a number of young salmon were hatched from eggs forming part of a shipment sent from England to New Zealand four years ago. A number of these young salmon were placed in a narrow stream, in which a stream of water was allowed to flow, and prevented from getting away to the sea by gratings at the outlet. These fish are now about seventeen inches in length, and this season one pair of them were taken from their own stream, and sent to France to the pond. These eggs have been hatched successfully, and 350 healthy young salmon have been reared, of which 300 have been liberated in one of the most suitable rivers in Australia for this fish, being one of the streams falling from the Australian Alps in Gippsland. The remainder of the young salmon are retained for observation. This experiment, having resulted successfully, leads to the hope that the efforts which have been made during the last eighteen years by the governments of the Australian colonies, and the energy, enterprise and large expenditure of Sir Samuel Wilson, Mr. J. A. Youl, C. M. G., and other gentlemen, may before long be crowned with complete success, and that the introduction of the salmon may be as certain as is now that of the salmon trout and brown trout in Australian rivers.

NORTH CAROLINA COMMISSION.—We have the report of the Board of Agriculture of North Carolina, which contains the report of Mr. S. G. South, Superintendent of Fisheries, for the year 1882, being his second biennial report. By co-operation with the U. S. Commission, much good work has been done. Extensive additions have been made to the hatchery at Ayova, Bertie county, and it is now complete and capable of turning out one million shad per week during the season. Near Raleigh eight carp ponds have been built and others at Morgantown. A pond in Oakwood Cemetery has also been leased for the same purpose. Dr. Campbell has granted the Commission many privileges at his laboratory, where the hatchery is located. This hatchery has an eight-horse power boiler, steam pump, and 100 hatching vessels through which the water flows. A telephone connects with the fishery, and the water of every hand are moved in this to attend to it. The hatching is done in iron tubs with great success. The rainbow trout is believed to be adapted to the waters of this State, and is growing in favor.

THE AMERICAN FISHCULTURAL ASSOCIATION.—The date which we gave in a former issue for the next meeting of the association has been changed. It was not possible to obtain the room at the time named. The meeting will be held at the Hotel Hamilton, 110 Broadway, New York City, on Wednesday and Thursday, June 6 and 7.

THE CALIFORNIA COMMISSION.—Mr. S. R. Throckmorton, having resigned the position of Fish Commissioner, Mr. J. Redding has been appointed in his place.

The Kennel.

FIXTURES.

BENCH SHOWS.
May 8, 9, 10 and 11, 1883.—Westminster Kennel Club, Seventh Avenue, New York City.
London, New York City.

FIELD TRIALS.
November 10, 1882.—Eastern Field Trials Club, Fifth Annual Trials, at the residence of Mrs. Derby close July for the Members' Stake, Nov. 17, for the All-England Stake, Nov. 1. W. A. Coster, Secretary, Flatbush, Long Island, N. Y.
December 10, 1882.—National Field Trials Club, Fifth Annual Trials, at Grand Junction, Tenn. D. Bryson, Secretary, Memphis, Tenn.

To insure prompt attention communications should be addressed to the *Forest and Stream Publishing Co.*, and not to individuals, in whose absence from the office matters of importance are liable to delay.

"AMERICAN KENNEL REGISTER."

THE initial number of the *American Kennel Register*, published last Tuesday, contains the pedigrees of dogs of various breeds; the Washington and Ottawa prize lists; New York premium list; and National American Kennel Club Derby entries; also editorial articles, "The Use and Abuse of Specials," and "Champion Titles."
Entries for the May number of the *Register* should be in hand as soon as practicable; no entries for that issue will be received later than May 1.
For terms of subscription, etc., see our advertising pages.

EASTERN FIELD TRIALS CLUB.

THERE was a meeting of the board of governors of the Eastern Field Trials Club Tuesday evening. Letters were read from Mr. Lullier Adams, of Boston, Mass., and Mr. D. C. Bergenthal, of Indianapolis, Ind., accepting the invitation of the club to act as judges of the Field Trials at High Point, next November. It was also announced that the club had great satisfaction by all those present. The club and the gentlemen who intend running their dogs, as well as the public, are to be heartily congratulated on securing the services of gentlemen so eminently capable of deciding upon the merits and demerits of the performances of the dogs in the field. The third judge has not yet been announced; we hope to be able to give the list complete next week.
Letters were received from the secretary of the New Orleans Gun Club, stating that Mr. H. M. Short, of Middleton, Tenn., who was debarred from participating in the trials of the club, had been reinstated. It was voted that Mr. Short be also reinstated in this club. Upon a reconsideration of the vote of the club, it was decided to accept the resignation of Mr. Short, and the Members' Stake, it was unanimously decided to rescind the vote. We stated in our issue of March 15, that we believed that the club, after carefully considering the matter, would rescind its vote, and we are pleased to announce that our confidence in their good judgment was not misplaced.
It was voted that four general meetings of the club instead of one be held each year, and that these meetings be held for the purpose of discussing matters of interest to the welfare of the club and for the promotion of the welfare of the members. These meetings will be held on the first Tuesday of January, April, September and November, except that this year the first meeting will be held on Tuesday evening, May 8, when the club will send the diameter to Longwood, Messrs. J. O. Donner, A. E. Godfrey and H. E. Hamilton were appointed a committee to make arrangements for the dinner, which is ample assurance that "it will be good to be there." It was voted that members leaving the country for a lengthened period should not be excused from paying their dues. A few resignations were received and some new members proposed.

After adjournment there was a very agreeable social reunion and many of the brilliant future prospects of the club were exchanged. Everything promises well for the most successful meeting at High Point next November that has yet been held. Assurance is given by many prominent members of the club, and all agree that they will be present with their dogs to enjoy the pleasure of the meeting, and to compete for the honors of victory.

THE PITTSBURGH DOG SHOW.

THE seventh annual Bench Show of the Western Pennsylvania Poultry Society, held at Allegheny City, Pa., last week, was one of the best that the association has given. The show was held in the Coliseum building, just across the river from Pittsburgh. The place is easy of access and well adapted for the purpose, and the arrangements were excellent. From the opening to the close there was a constant throng of visitors who all appeared delighted with the exhibition.

The extra champion class for English and Irish setters was better than to be won. The best interests of breeder and exhibitor will not be advanced by cheapening the highest honor to be achieved upon the bench. Let us leave but one champion in each class until a better one shall fairly earn the title. The rule requiring a dog to win two firsts in the same class shows before he is eligible to compete in the champion class is one that should be adopted by every bench show association in the country.

Major J. M. Taylor, of Lexington, Ky., judged the setters, and the spaniels and foxhounds. Mr. James Mortimer, of New York, judged the remaining classes. The judging was not satisfactory, as usual, in the classes assigned to Major Taylor. We know him to be an excellent judge, and for this reason we were greatly surprised at his decision. He undoubtedly had his reasons for placing his dogs as he did. These reasons we failed to comprehend; nor did we succeed in obtaining from him any satisfactory explanation of the matter.

Mr. Mortimer handled most of his classes in a manner that showed him to be a capital judge. His decisions, with few exceptions, were heartily indorsed by both exhibitors and the public. The society are under great obligations to Mr. Mortimer for so acceptably filling the place made vacant by the illness of Mr. Kirk, who telegraphed at the last moment his inability to be present. On Thursday evening Gen. J. B. Sweitzer, in behalf of the association, in well chosen words presented Major Taylor and Mr. Mortimer with magnificent gold-mounted cameras beautifully engraved. Following are our comments upon the dogs.

ENGLISH SETTERS.

Class 1, extra champion English setter dogs. Thunder, the only entry, was absent. In class 2, for bitches, Petrel II. was the only one entered. He was entered in this class, was transferred to the open class. Petrel II. was looking well, although not quite at her best. Class 3, champion English setter dogs, was won by Plantagenet, who was in good form, although not quite so well as usual. A Washington Sparrow-hawk bitch in Class 4 was looking well, although heavy in whip. Class 5, for English setter dogs, brought out some very good ones. Prince, who won first, was fairly entitled to the place. Royal Sultan, who was given second, had in general a fair condition, but his eyes are very bad. His coat and feather are capital, and this is about all that can be said in his favor. He is flat-ribbed, with an ordinary back and loin and rugged hips. His forelegs are good, but the pasterns, who they are very poor; the hind feet are merely legs continued. There were five or six in tiering that should have been placed over him. Royal Ranger, who won third, is a capital dog and was very well shown. He is a fine, large dog, with good body, legs and feet. His quality and condition fairly entitled him to second place. Spout, who was placed fourth, was also in capital condition. Fairy Prince, who got vhc., although not in prime condition, we thought should have been placed third, and Dun Juan, although not in good condition, we thought should have been placed fourth. There was not much to choose between Fairy II., who won fourth, and Daisy Queen, who was vhc., although we rather preferred Daisy Queen. She is a capital animal, of good form and a beautiful mover. She was at her best, but not enough to lose her to the place. Fairy I. was looking well, although not at her best. The commendations were best bestowed. We should have given another letter to Gertrude, who was looking better than we ever saw her. We also thought of Roy and his mother, but they were not in the class. Laverack should have had an h.c., as she is a nice one in the dog puppy class. Connt T. was first. He is a grand young dog, and if nothing befalls him he will be heard from again. Napoleon got second, a capital animal, but not so good as the one he was given. Royal Joe, Jr., who was given vhc., is quite a good one. We also thought well of Premier, who was unnoticed, and considered him entitled to at least an h.c. The bitch puppies were better than the dog puppies. They were well placed, except that Sallie H. should have been vhc. She is rather small, but a rattling good one, built for a flyer and a stayer. Take them altogether, the English setters were a grand lot, and would be well worth study with those of any show. The bitches were especially fine.

IRISH SETTERS.

The Irish setters were also very good, although there were not half so many present as last year. In the extra champion class Berkeley was the only entry. He was in capital form. There were no entries in the champion class. It was looking like a bad year for the Irish setter. He was looking like his best. Flora, the only entry in the bitch class, was not in good form, as she has just weaned a litter of puppies. The open dog class brought out in Glenchoe, who won first, one of the best youngsters that we have seen. He is a grand dog of the best type, and he makes it exceedingly warm for the best of them. He is a large, well-proportioned dog of the true type and proper color. Fred, who won second, is also a very promising animal, and will undoubtedly be a grand mover. Some from age up to the bitch class, only Gladys won first. As we said of her a year ago, she is a very hard one to beat. She was very well shown. Juno, who won second, is also a capital animal. She was in good condition except her coat. There were two good puppies, but not much to choose between them.

GORDON SETTERS.

The Gordon setter classes were a failure, only three in the open class and one puppy patting in an appearance. Rupert II., the best one, is a good dog, but he was shown in such bad condition that it was difficult to make any awards in the class. There were eight entries from Baltimore, but none of them were present. We heard many comments upon the absence of these dogs, and in view of the fact that they were representatives of the best of the breed, we thought it very singular that they should fail to appear. Mr. Malcolm informed us that his dog Malcolm was very sick and that he did not dare to leave him more than one day to attend the show, and that if his dog were to come from home he would be glad to send their dogs unless he could take care of them during the show.

POINTERS.

The pointers were not quite up to the average of last year. There was no doubt owing to the classification which placed the large and small in one class. This we believe to be a mis-

take that the society cannot afford to repeat. In the champion dog class King Bow, who won in this class here last year, was given the prize. He was looking well, but should have given place to Le Gity, who was less faulted. Don was in capital form and as usual well shown. He was also in good condition, but something was wrong with his hind legs and he could scarcely move. We examined him the next day and found him nearly over it. In the bitch class Lady Romp II. was the only one entered. She was well shown. In the open dog class was entitled to his first and Perth to the second he received. In the bitch class Countess Bang was given first. She was very well shown and is quite a nice animal, but not so good as Lillie II., who won second. Although just off her puppies and not in the best condition, she should have beaten Countess Bang easily. Luck was in splendid condition and well deserved her vhc. We also liked Creomore, who was given h.c., better than Chess, who was vhc. The puppies were very good, we thought them right placed. Princess, who got vhc., is a little one of great promise. She will be heard from again.

IRISH WATER SPANIELS.

There were only two present. Mike, in the champion class, was a very good one. Polly Wog, in the open class, is a fair specimen, only he has too small a body for his legs.

SPANIELS.

Benedict was done in the champion class, over 28lbs. He was in capital form and well deserved his ribbon. In the open class for black field spaniels, over 28lbs., Hornell Bonanza had it all his own way; he was well shown. There were no entries in the puppy class, and only one dog showed up in the black under 28lbs. This was Hornell Dandy, a very good one. In the cocker spaniel class, other than black, Hornell Ruby won first; she is a capital animal, although shown a trifle heavy. Princess Ogla, who won second, is also quite a good one. In the puppy class Hornell Ruby again won first.

FOXHOUNDS.

There was but one foxhound among the three shows, and he was placed second.

BEAGLES.

There were three good ones in this class; we thought them well placed.

BENCH-LEGGED BEAGLES.

Major, who was given first, is a capital specimen. Countess, who was given second, was the only other entry in the class. She was clearly more than a show dog, and should have been better than Major. The puppy was also good and well placed. We thought Music, who received c., a very promising one, and think that she will be as good as any of the class next year, although the others are ahead of her now. Clipper, unnoticed, we also think well of, and is a toy to compete with the others.

DACHSHUNDE.

There were only two shown. They were rather pretty, but too small. They were properly placed.

FOX-TERRIERS.

The fox-terriers were a grand lot. They were few in number, but their quality was excellent. Champion Royal, the only entry, was shown in a very good way. Lancelot, who won second, is also a nice dog. He is a little off in ear, which we imagine beat him. The bitch class brought out the best one we have seen in this country. Diana is a fox-terrier of the best of her sort to the tip of her tail. She was in first-class condition, but easily won first. Viola, who won second, is a very fair animal. Mona, who won vhc., we did not like so well as Nellie, who was unnoticed. Warren Kacker, who got c., was not in the class. She is a nice one, looking quite so well as when at Washington. We hope that she will come out all right, as she is a wonder, but we fear that she will not mature well.

DREYHOUNDS.

There were no good class. They were rightly placed.

MASTIFFS.

The display of mastiffs was very fine, and in quality much to be desired. In the champion class, Nemo, who won first in the dog class, is a grand specimen of this noble breed. He stands nearly thirty-two inches at the shoulder, and is well put together. He was very well shown, considering that he has just arrived from England. Turk, who won second, excels in size, weight and quality. He is a grand specimen. He is a very fine, symmetrical dog, with more quality than any animal shown, and with fifteen pounds more flesh his chances for first would have been very good. Ting, who won vhc., is also a capital animal, but not so good as the others. He has a powerful chest and good skull, legs, feet and tail. He is one of the most solid and compact dogs that we ever saw. His ears are carried back too far, and he is a bit too long in muzzle for a first-class show dog. He is a big dog. He does not show so well as he did at Boston last year. He is in much better condition, but appears to have grown coarse, especially in head. Hector, who got c., we thought should have changed places with Duke. He has an excellent body, legs and feet, although he is rather weak in head and carries his tail badly. Bob, unnoticed, was a rank impostor without a single mastiff characteristic. Creole won first in the bitch class, although she is nearly a wreck on account of her age. She has a wonderful head and has been a grand bitch but her day is over and she should retire, before she is beaten by an inferior animal. Cleopatra, who won second, is a grand animal, with the finest mastiff head in the show. She is a bit leggy and a trifle light in bone, but she is a grand animal. She is a grand animal, as she is a capital animal, a trifle show in body perhaps, but with the best of legs and feet, and nearly perfect all over. Dinah II., who won h.c., is also a very good specimen, although under-sized; she is of the proper type and full of mastiff character, and over the top she has and muscle and is a capital mover. Dolly Varden was not brought before the judge. We liked her exceedingly; she is a real good one, and without doubt will make a capital brood bitch. Jess, who was also h.c., is good in body, legs and feet, but rather weak in head. She will show better next year.

ST. BERNARDS.

Bonivard (rough-coated) was the only St. Bernard shown. He is simply grand, and one of the best we have seen.

NEWFOUNDLANDS.

Mayor of Bingley of course captured first. Duke, who was second, is a Newfoundland and a very promising one, too. Matt, who was vhc., is too small. He is of good type and exceedingly well built; his coat is of the best. Leo, who was given h.c., is a very fair animal, but not so good as the others. They were not a good lot, Lion who was given first, being the best.

COLLIES.

The collies were a capital lot. Rex was the only one to appear in the champion class. He was in good condition. In the open dog class Robin Adair won first. He has rather a poor eye and was lacking in top coat, but otherwise he is a capital animal, very well put together, and one of the best

movers we ever saw. Sandy, who won second, we did not like for the place; his wonderful coat undoubtedly pulled him through. Guido, who was vhc., should have been second. He is a capital dog and well shown. Had his carriage been anything like that of Robin Adair he would certainly have captured first. Talsina, who was also vhc., we thought well of. He is quite a good one, although not shown in good condition. Lado O'Kyle, who was h.c., was looking well and fully deserved his ribbon. Fulu Princess, in the bitch class, carried all before her. She is a capital bitch, as good as any we have seen. Jean, who won second, and Iona, vhc., were both very good, with not much to choose between them. Playaway was in capital condition, but was not of condition, but well deserved the place. There were three very good puppies shown. Donald, who won first, has a wonderful coat for his age, which undoubtedly carried him through. Kitty Mack, who won second, also has a good coat and carries herself well, but like Donald, she is off in head. Fly, vhc., has nearly as good a coat as the others, and a much better face. She also moves well, and we fancied her the best of the lot. The others were too young to compete with these.

BULLDOGS.

Romulus was the only bulldog shown worthy of mention. He is a remarkably powerful, well-made animal throughout, with good bone and well muscled. Sir Archer, who was given second, should not have been noticed. He was, perhaps, better than Jack S., who was not in the class. Judge, who was third, should not compete, was in fine condition.

BULL-TERRIERS.

Young Bill, who won first, was the best in the class. He begins to show his age, and is losing his muscle. White Silk, who won second, is an elegant looking dog, showing a little more of the terrier than of the bull, and with a little too much slight under the jaw. Little Bennett, who was vhc., is a fair animal, with rather a coarse tail.

SCOTCH OR HARD-HAIRED TERRIERS.

There were several varieties in this class, the best of which was the Irish terrier Garry Owen, who won first. He is a grand dog, and was greatly admired by all. Our old favorite King, the little Duke, who was second, well deserved her second. The others we did not fancy.

SKYE TERRIERS.

Mack, the only one in the champion class, was looking better than when we saw him last, although he still lacks in coat. Pepper, who won first in the open class, is a fair dog, but not so good as when we saw him last. Judge, who won second, was looking well. We thought him fully the equal of Pepper. Flirt, who was vhc., was all out of condition.

YORKSHIRE TERRIERS.

This was a fair class, and we thought them properly placed.

FUGS.

In the champion class, George again defeated his old rival, Roderick, but he had not much to spare, as Roderick was in very good condition and showed up the best that we ever saw. George paid a graceful compliment to his worth by presenting him with a magnificent basket of flowers. The open class was divided into a dog and bitch class. Sambo, who won first, we do not like for the place so well as Joe, who was placed second. Joe has much the best head, but was not shown in good condition. Ellie, who won first in the bitch class, was looking her best. She is a capital animal. Vixen, who won second, is also very nice. We also liked Diana, who was vhc. Nearly all of the others were not in good condition.

BLACK AND TAN TERRIERS.

Vertigum, who won first, had not much the best of it, as Reveller, who got second, is very close to him; but they are very good dogs.

TOY TERRIERS UNDER 5 LBS.

Flora, who won first, is a tau of no particular breed; she is a very pretty toy, but was much preferred for first Pip, a nice black and tan, who got vhc.

KING CHARLES SPANIELS.

There were no entries in this class.

ITALIAN GRUYHOUNDS.

First went to Verona, a nice little fawn. Beanty, who was given a special medal, would have shown much better had he been in good condition. He is the idol of his little mistress, and it was the unanimous verdict that the medal was well bestowed.

POODLES.

There was but one in the large class, Morio. He was bred by the Czar, and is a very good specimen of the Russian. In the class under 25lbs. there were four nice little whites shown. Bess, who won first, is a grand dog, with close curls.

MISCELLANEOUS.

There were only two shown in this class, both borzoians. Captain, who won first, was a grand dog, and we recommend him to the public. He is not well formed and stands badly on his legs. Elsa, we thought, should have been first; she is very well formed although too small.

SPECIAL PRIZES.

Some dissatisfaction was expressed at the manner in which the specials were awarded. The chief cause of complaint was that the system adopted was not fair, and that the prize is liable to go to an inferior animal, owing to the neglect, through ignorance or carelessness, of the exhibitors to enter for it. The result is that the public, who do not understand the matter, are deceived regarding the merits of the animals shown. While every laudable to advocate anything that would cut off a source of income, generally very much needed by the association holding shows to insure them against loss, we can but believe that in most cases the special prizes should be awarded to the best animal exhibited should receive them. Take, for instance, special E, for the best English setter, dog or bitch, entered in the open classes. There were only four dogs eligible to compete: Prince first in the dog class; Duke II. second; and Daisy Queen and Gladys in the bitch class. Neither of these were entered and the prize was given to Petrel III., a capital animal, it is true, but she was only third in her class and consequently the prize did not go where it properly belonged. There were several similar cases. We only give this to illustrate the matter, and trust that all associations holding bench shows will give the subject careful consideration. The first special was the Bench Show puppy. This was a grand dog, and it was a great credit to the society. There were forty-one nominations, eight of whom put in an appearance. There was not a bad one in the lot. Many of the decisions in the specials of course followed the awards in the regular classes. In these cases we will make no further comment. In class E, for the best cocker or field spaniel, Hornell Ruby was given the prize. This was a wrong decision. Benedict was clearly entitled to the cup, as he is nearer perfection as a field spaniel than Ruby is as a cocker. In class C, for the second best mastiff, we thought rightly placed over Creole. In class E, for the best collie, dog or bitch, Princess was an easy winner. The same may be said of Diana, in class A, for the best dog, and of the other specials. In class G, for the best brack, Mr. A. H. Moore's Lady Romp II. and Countess Bang, and Mr. G. N. Appoll's Brown and White, and the other brack, and the other specials, which would have gone to the other brack, W. W., a solid silver water pitcher, by Messrs. Bailey, Bank-

planting the cane some four inches below the waterline, "is your meta centre. Now, heel the cutter and see where it will go." A boy pulled to the upper end, finally intersected the waterline, and the old man with much satisfaction, said: "Now, you see, in the first instance your meta centre was lowered as you careened your vessel, and in the other it was raised, and you can't get it to a point in the cutter where she will capsize, and that's the difference. Now, you understand it, don't you?"

The reporter replied, doubtfully and politely, that he did. The conclusion FOREST AND STREAM draws is, that those who wish to run down the cutter form of model, should be allowed to go on with their tall talk and rapid nonsense, but steer clear of facts, such as the old scientist quoted has made plain to them; for they evidently know little of their meaning.

We think at the same time, if lives are lost by taking the flat-iron type of boat to sea, that such composers of trash as appeared in the *New York World*, should be held to answer for the impression made on the otherwise ingulged minds of the many who are about to build for themselves sea-going boats.

MEASUREMENT OF KEELS AND CENTER-BOARDS.

Editor Forest and Stream.
The difficulty of classing centerboards and keels in a club in which the former are not numerous enough to be formed into a class by themselves, has given rise to a discussion on the fairest means of measuring the boards. The rule of measurement adopted by the club in question, is somewhat crude, as it leaves deep metal keels untaxed, and tends to cut down freeboard, the yachts being built with freeboard also deep keeled, with very low freeboard, especially an idships, where the depth is taken, and with decks arched from covering board to center. It is simply a three dimensions rule—length x breadth x depth, and the product divided by 150 to give racing tons. It is faulty, also, in giving depth a greater value than breadth or length, as may be seen from the following examples:

	Length	L.W.L. Breadth.	Depth.	Tons.
	ft.	ft. in.	ft.	
Marquitta, centerboard.....	30	6	2 1/2	1 89-150
Masco, centerboard.....	30	1	2 1/2	1 11-150
Miranda, centerboard.....	32	7 1/2	2 3/4	2 143-150
Lily, keel.....	33	2 1/2	8	3 14-150
Veleur, keel.....	39	2	9	3 79-150

The difference is most apparent in the case of Lily and Veleur. Lily's 8ft. greater length and 1ft. greater beam, being actually made inferior to the 1ft. 3/8in. greater depth of Veleur. Again, Miranda's 1ft. 10 greater length, and 1 1/2in. greater beam, count less than Veleur's 1ft. 3/8in. greater depth. She has about 3ft. of board. All the above, with the exception of Veleur, which shows a high side, have very low freeboard.

It is now proposed that during the ensuing season centerboards shall be kept down during a race, as all the boards being of iron, for the sake of giving weight low down when on a wind, as well as lateral resistance, the raising and lowering them is a violation of the rule, which strictly prohibits shifting ballast in any shape whatever. A recommendation is added to alter the rule of measurement to length, L. W. L. extreme heavy mean draft, product divided by 150. This is a step toward the adoption of a length x sail area rule, which finds favor with many who have given it consideration. The present Y. R. A. rule is inadmissible for evident reasons. Mr. Dixon Kemp's rule, rejected by the Y. R. A. in favor of their present imperfect one, would be used best to the length x sail area, as under it the yachts named above are much more equitably measured, as may be seen by a comparison:

	L x B.	L x B. x Depth.
	Tons.	Tons.
Marquitta.....	1.300	150
Masco.....	1.00	1.09
Miranda.....	1.00	1.76
Lily.....	3.19	2.95
Veleur.....	2.37	3.69

Kemp's rule measures them more fairly, I think. ROCOE-CROIX. HADAM, N. S.

We quite agree with R. C. Movable keels must be recognized as of a fixed quantity. The rule of measurement adopted by the Scandinavian Y. C. of New York.
Length in L. W. L. x sail area.
4,000—tons.
Tacking but slightly the stern or overhauling stern, and limiting all flying kites to a proportionate area of the lower sails, we are persuaded will yet be the prevailing rule of adjustment. The Yacht Race Association of England are gradually approaching the adoption of this rule, and will do so after founding about a mile longer trying to see how, what is termed sea-going, cruisers can be classed with real sea-going racing yachts.]

AMERICAN STEAM YACHTS.

MESSERS. WILLIAM CRAMP & SON, of Philadelphia, have added another powerful steam yacht to our fast increasing number of large ocean steam yachts. All the work turned out by this firm is now on our coast built by them, that is the Levantia yacht, named Atlanta, and owned by Mr. Jay Gould, of New York City, forms but a résumé of their usual sound and well-finished work. In the Atlanta the spar and rig, has a life imparted into her which is sadly wanted in the steam yachts of this country. We will evidence a march in the right direction of our native talent in naval architecture. Our contemporary, the *Iron Age*, writing on the subject of our American steam yachts a few days since, says:

"Steam yachts in America during the past few years have been vastly increased in size and fitted with materially improved machinery. Speed has been the objective point in the construction of these boats, and builders of hulls, as well as engineers, have taxed their ingenuity severely to that end. The *Star* and *Corsair*, of the New York Club, followed by other large vessels of similar type, marked the beginning of the improved steam yacht in this country. True, many boats, unobtrusive in appearance, and of a type which were to be found on the lists of some yacht clubs for years before, but they were of indifferent account and only fit for inland waters. Specialists are now desisting this type of pleasure craft, and size, power, rig, and accommodations are being looked after with a nicety of detail which means that in the near future the fleet of American steam yachts may be pointed to with pride. The cruising steam yacht, containing all the conveniences of a home, and able to make a voyage of any reasonable length, with marked economy in the consumption of coal, is not now in the undeveloped state it was a few years ago, and the number of new boats of an improved type which will be seen during the coming season justifies the belief that the days of worthless steam toys have passed, and the illustrious launches of a few years ago are being replaced by productions by naval architects of established reputation, fit for any service."
The construction of yacht boats of steel by American builders shows that the improvements made in this important particular in England have not passed unnoticed in this country. Again, though the list of our large steam yachts are from this country, a complete discussion in engineering circles regarding the use of steel for yacht building. The construction of steel yachts in Europe has demonstrated the nature and uses of this material for the purpose, more well understood. Many advantages are claimed for steel in its adaptation for plates and frames of yachts, and it is not unlikely that the results of this construction in this country may think it best to build a steel steam yacht at no distant day."

BOSTON, April 6.—The annual meeting and election of officers for 1893-94 of the South Boston Y. C. was held on Wednesday evening, April 4, and in point of numbers was the largest ever held by the club. The officers elected are as follows: President, H. M. Clark; Vice-Rugles; Vice-Commodore, Henry Hussey; Fleet Captain, James Donovan; Treasurer, Thomas Christian; Secretary, John Whinniet; Race Officer, James Bennett; Stewards, H. M. Clark, Charles W. W. Morris. It is to be regretted that the Commodore-elect does not at the present time own a yacht. The annual reports showed the affairs of the club to be in a flourishing condition, and the members were admitted and several others proposed. The club gave the last masquerade of the season on Thursday evening.—*DEADWEAT.*

NEW CUTTERS.—Our Detroit correspondent writes us to say that Wad is building a 25-footer, which is over a foot deeper than any yacht on our river of 25 feet or less. The length is 25 feet, 4 in., 4 ft. deep clear of the beams, and will draw over 8 ft. of water. She is to be ballasted with 2 1/2 tons of boiler plate punchings. Wad will carry a mainmast and a foremast. The cutter is to be a gaff ketch, with staysail and jib to match. Dean & Co. are also busy with another little cutter, which will be ready in about three weeks for trial.

SMALL CUTTERS.

THE LEAD OF THE STAYS TO THE TOPMAST, ETC.
[THE illustration showing the lead of the stays to the topmast, is especially for those who have made inquiry about the hoisting and securing of the topmast for small cutters. We illustrated our issue of March 22 the masthead of a ten-tonner, which shows the topmast when in position and fitted. The athwartship view in the illustration of this week shows the spread given to the topmast backstays by the cross-tree, the head and pole of the topmast with the (topmast) stay leading to the bowsprit end, and the bowsprit end, and from thence on board the boat, will make the mode of securing the topmast of many cutters quite plain. If A is put in line with A, B with B, etc.—all athwartship stays, and those which led aft when running before the wind, are called backstays. We have shown but one of these backstays as being all that is required for small cutters.

post. The advantage of a boat being thus fitted with two backstays on either side is, that, scudding before a hard blow at sea, it is always best to haul down at least one reef in the mainsail, it gives better play to all the halliards, and with reefs hauled down, it sometimes happens that a jockey topsail can be carried. It is on such occasions, that a double athwartship backstay becomes useful, as, with the extra athwartship stay led aft, the jockey topsail may be kept on a boat when, to carry the whole mainsail, would be ruining the sail and chafing and straining all the blocks and ropes holding it in place.

In fitting the topmast rigging—the backstay and topmast stay are called the topmast rigging—some people make what is called a splice, so that one depth of the rope only is round the pole of the topmast. We have witnessed several accidents when this mode is adopted, by the splice drawing slightly, when too much strain comes upon the seizing, or serving, around the splice. It is better for each athwartship stay to have a separate eye from the starboard shroud.

The above remarks about the eyes for the topmast rigging are also applicable to the main shrouds, and particularly so as applied to the pendant of the main runners. The practice of trusting to the main runners being secured, by being put in position before the main shrouds are placed, with the notion that the shrouds will slip them sufficiently when assisted by a seizing to the after shroud and to each other at the after part of the mast, is pondering too much to accuracy, as the seizing soon gives way, and the pendants have been known to draw away allowed to be fitted in this way. The pendants should be fitted in this way. The pendants should be fitted with separate eyes, and put on to the masthead after the shrouds are in place, thereby giving more room for the horns of the gaff working round the mast than if put into position before the main shrouds are in place.

In a letter from Hon. Mrs. Pavy, Castle Grey, Limerick, Ireland, Brown's Bronchial Trochies are referred to.—"Having brought you 'Bronchial Trochies' with me when I came to reside here, I found that after I had given them away to those I considered required them, the poor people will walk for miles to get a few. For Coughs, Colds and Throat Diseases, they have no equal. Sold only in boxes. Price 25 cents.—*ADU.*"

HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

FOR THE CURE OF ALL DISEASES OF Horses, Cattle, Sheep, Dogs, Hogs & Poultry. For Twenty Years Humphreys' Veterinary Specifics have been used by Farmers, Stock-breeders, Horse R. R., Travele, Hippodromes Menageries and others with perfect success.

- LIST OF SPECIFICS.**
 A. A. Cures Fevers and Inflammation, Milk Fever, Spinal Meningitis, Hog Cholera, 75c.
 B. B. Cures Founder, Spavin, Siftiness, 75c.
 C. C. Cures Distemper, Nasal Discharges, 75c.
 D. D. Cures Bots or Grubs, Worms, 75c.
 E. E. Cures Cough, Hoarseness, Pneumonia, 75c.
 F. F. Cures Cabs or Grubs, Pyloric, 75c.
 G. G. Prevents Abortion, 75c.
 H. H. Cures all Urinary Diseases, 75c.
 I. I. Cures Eruptive Diseases, Mange, &c. 75c.
 J. J. Cures all Diseases of Digestion, 75c.
 Veterinary Case (black walnut) with Veterinary Manual, (20 pp.), 10 bottles of Medicine, and Medicator, \$5.00
 Medicator, 35

These Veterinary Cases are sent free to any address on receipt of the price, or any order for Veterinary Medicine to the amount of \$5 or more. Humphreys' Veterinary Manual (20 pp.) sent free by mail on receipt of price, 5 cents.

Pamphlets sent free on application. HUMPHREYS' HOMEOPATHIC MED. CO. 109 Fulton Street, New York.

AMERICAN Kennel Register.

A MONTHLY RECORD.

Its leading feature is the "Pedigree Register" of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is given to each dog, and an index will be compiled at the close of the annual volume, thus making it a complete work of reference. The pedigree registration fee is twenty-five cents, payable in advance.

Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs for sale, and deaths.

Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include field trials.

Space will be devoted to all matters of importance to breeders and those interested in dogs, the object being to render the American Kennel Register a complete record of the topics of the day.

The Register will be published on the fifth day of each month. All matter intended for publication must be in the hands of its editor by the first day of the month. Entry blanks will be sent on receipt of stamped and addressed envelope.

The American Kennel Register will be sold by subscription only. The subscription price is one dollar per year.

Address American Kennel Register, P. O. Box 2,823, New York City. Make drafts and money orders payable to the Forest and Stream Publishing Company.

BRAIDED FISHING LINES.

The great superiority of a properly braided line over a twisted or laid line, has increased the demand for braided lines enormously. This demand has induced a number of manufacturers, entirely unacquainted with the requirements of anglers, to put on the market a quantity of perfectly worthless goods. Many of these lines are undersized and short of marked length; nearly all of them are made of poor material and on old-fashioned machines. Anglers will please take notice that all of our best braided lines—cotton, linen, raw silk, boiled silk, oiled silk, enamel, and polished waterproof tapers—are labeled with our full firm name and trade mark, except the enamel fly lines on cards, which bear only our trade mark and the name of the Empire City Braid Co., whose agents we are.

Orders received from persons residing in cities in which the dealers keep a full line of our goods will not be filled at any price.

Kynoch's Patent "Perfect" Brass Shells

MANUFACTURED BY

Kynoch & Co., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base. Use either Winchester or Wesson primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weigh less than paper shells, and in consideration of their reloading and other advantages, are really cheaper than the paper. They also shoot stronger and closer, and can be loaded heavier, as inside diameter is nearly two gauges larger. They possess a great advantage over all other brass shells, as owing to the thin metal they can be closed (as represented in cut) by simple use of the thumb or fingers, and straighten out to original shape when discharged. These goods have already gained a wide and favorable reputation in Europe, and in the opinion of many prominent sportsmen will soon supersede to a great extent the old style of both brass and paper. Samples will, upon application, be mailed (without charge) to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or in case lots only (2,000 shells) by

HERMANN BOKER & CO., 101 & 103 Duane Street, New York. SOLE AMERICAN AGENTS.

WILLIAM READ & SONS, Boston, Mass., Agents for New England States.

We also carry a large stock (at all seasons) of Kynoch's regular thick gauge brass shells, adapted to the Berdan Primer. Price materially lower than the American make of same quality.

UPTHEGROVE & McLELLAN, VALPARAISO, IND. HOLABIRD

SHOOTING SUITS

Of Waterproofed Duck, Irish Fastian and Corduroy.

Unequaled in Convenience, Style, or Workmanship.

WRITE FOR CIRCULAR.

THIS

Is our Skeleton Coat or Game Bag; weighs but 15 ounces, has seven pockets and game pockets. It is of light material, dead grass color, and will hold the game of a successful day without losing a hair or feather. It can be worn over or under an ordinary coat. We will mail it to you for \$2.00. Send breast measure.

B. F. NICHOLS & CO., BOSTON, MASS., Manufacturers of

HEXAGONAL SPLIT BAMBOO FISHING RODS, REMOVED TO 153 MILK STREET.

We are obliged to have more room in our factory and greater facilities for manufacturing our goods to meet the increasing demand. We have received the highest award and silver medal at the Massachusetts Charitable Mechanics' Association Fair for our superior goods. Send for catalogue.

Farrow's Book.

216 pages, bound in Cloth and Gilt. Sent free by mail on receipt of one dollar.

Spirit of the Times:—"The work is interesting and sketchy." N. Y. Herald:—"Gives very useful hints to marksmen, and besides tells an interesting story of his adventures with the rifle." Private letters:—"More than I expected." "I read it until 2 o'clock at night."

Target and Sporting Rifles selected and tested. Shotguns, full choked or modified. Patterns submitted. Send stamp for catalogue and discount. W. MILTON FARROW, Newport, R. I.

Kennedy Repeating Rifle

The Latest and Best.

Greatly superior to any other Magazine Rifle yet made. The solid metal in line of fire at time of discharge renders the Kennedy ABSOLUTELY SAFE.

These rifles are made .44 cal. 40 gr., and .45-cal. 60 gr., using the same ammunition as other magazine rifles.

Can be obtained from any first-class gun dealer in the United States and Canada.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, APRIL 19, 1888.

VOL. XX.—No. 12.
Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Sanson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted.

THE PATENT COFFEE MILL.

THERE is a certain ingenious little contrivance sometime employed in grocery stores which is known to the initiated as the patent coffee mill. The machine is fastened to a partition of the wall, and into it is poured for grinding, the coffee just purchased by the customer. The clerk turns the crank and the buyer sees, or thinks he sees, his pure Old Government Java or Mocha coming out of the mill again. The product which he beholds is, however, only one-half or one-third pure coffee. The rest is browned beans, parched peas, burnt bread crusts, or whatever else the economical merchant may have put into the concealed compartment of the mill, on the other side of the wall. The genius who devised this mill is said to have reaped a rich reward as the fruit of his ingenuity, and is reputed to be worth as much as the Connecticut quarry owner who ships his stone to manufacturers of granulated sugar.

Unfortunately the principle of the patent coffee mill is not confined to the humble cross-roads grocery. Its workings on a more magnificent scale may be studied at the respective capitals of the several States, when the wise heads there assembled come to the annual grinding of the game laws. That which ostensibly goes into the mill as pure and honest game protection is when ground out again only one-sixteenth protection and the rest destruction.

The mill under the big dome at Boston some years ago gave out such an adulterated product; and Boston markets have since then been receivers of what is equivalent to stolen goods, namely, Maine game illegally killed and shipped out of season. The process of grinding is now in active operation at Harrisburg, where the Philadelphia marketmen are attempting to open their stalls for the same ill-gotten merchandise. At Springfield, Ill., the crank has of late been vigorously turned by the Chicago game dealers, chief among them a professed sportsman game dealer, whom we recently showed knowingly to be a receiver of contraband goods in the form of Minnesota game illegally killed and shipped out of season. Neither at Albany do "the grinders cease because they are few;" nor yet is "the sound of the grinding low." Quite the contrary; the grinders are many, and the grinding is loud.

Among the bills, amendatory of the present statute, introduced this year at Albany, is one known as the O'Connor bill. This provides for summer shooting and (by opening the game market) for winter shooting up to February first. In other words, the public is given to understand that the result of the passage of this bill will be game protection, whereas in truth it will be game destruction. Mr. O'Connor, we understand, does not occupy a position corresponding to the proprietor of the grocery store; he simply acts the part of the clerk, and turns the crank of the mill "by request." He doubtless means well enough. The public, however, will not consent to be duped by such a shoveling in of burnt crusts from the other side of the wall as this is.

Another piece of legislation on the patent coffee mill principle bears the name of Mr. Grady. Whether he is the responsible party, or, like Mr. O'Connor, merely the clerk, we are at present uninformed. Neither position is an enviable one, for in this Grady bill, which was introduced into the Senate week before last, is embodied a heterogeneous combination of preposterous abominations. The responsibility for this would be a grievous burden to be borne by one pair of shoulders. The Grady bill, like the O'Connor bill, permits summer shooting, and by extending the selling season to February 1, insures the destruction of game in this State and at the West for two months after the legal killing season has expired.

But the bill goes much further than this in absurdity. It seeks to graft on to American game legislation the most obnoxious and ridiculous principle of private ownership of wild game. Section 20 permits the creation of private parks by advertising a description of the property, and provides that all the birds, fish and game of, in, or upon such territory shall be the private property of the owner or lessee of the premises, and further that to effect such a result but one signboard shall be necessary on every 500 acres in excess of 10,000. This section, in short, gives the right of appropriating all the game in a given part of land by proclamation only, and when it does this it affords proof positive of either the stupidity or the inordinate monopolistic greed of its framer. By its provisions individuals and clubs would be empowered to proclaim themselves proprietors of all the game on a given tract; and could let out the slaughter of it when and how their caprice might suggest.

If Mr. Grady knows anything whatever about the principles underlying game legislation—and having introduced a bill on the subject, he probably does, *jeu nature*, is public property until it shall have been reduced to possession by capture. And even an idiot might comprehend that signboard proclamation is not capture, for can in any conceivable way reduce the game to the lawful possession of the parties erecting the board. The Senate committee who reported this bill, if they were at all competent to decide upon the merits of a proposed game law amendment, should have understood that this Section 20 of the Grady bill is just so much meaningless bosh. Even should it become a law, this section could not stand a minute when brought to the test of the courts. But we cannot believe that the bill will fail to be defeated, as it richly deserves to be.

The radical trouble with much of the attenuated game legislation of the country is that those who dabble in it are, like the framers of the Grady bill, either so lamentably selfish or so blissfully ignorant that it would be far better for the public did they let the matter entirely alone. It is an unfortunate fact that ninety-nine men out of every one hundred in the community care little or nothing about the game law, and the hundredth man is apt to be imbued with the overpowering conviction that the first, last and only thing needful to protect the game is to amend the law so far as it concerns his own particular little duck pond. Selfishness all too often rules the day; game protection means the bringing of the game lawfully within reach of one special gu just when the owner of the gun wants it there.

The mills are grinding on; and the grinding is said, in a small way, to be profitable to some one.

Hon. E. D. POTTER.—We rejoice to learn that the veteran angler and fishcultivist, Hon. Emory D. Potter, of Toledo, who has been lying at the point of death from pneumonia, is now convalescent. Mr. Potter's age is somewhat against him in a struggle with the reaper, but he has passed the turning point and is now out of immediate danger. His hosts of friends, both in and out of the Currier Club, will read this note with satisfaction. Mr. Potter is one of those men who should always be with us; we have too few of them.

MATCH CHANCES AND DANGERS.

THE preparations thus far made by officials of the National Rifle Association bid fair to produce good results in the International match, provided only that they be well backed up by individual effort. And just here should be the answer to much of the very unreasoning criticism which has already begun to pour itself over the work in hand. The programme to be followed in getting together the team has been published, and under it there need be no fear on the part of any really capable competitor that he will not be taken in as a member of the team—should his merits entitle him to that honor. The committee entrusted with the making up of the American squad may fairly be trusted to use their best endeavors to select from the not over large field, such a dozen men as will leave no better man at home when the sailing day comes. There may be prejudices, but they can be fought down, and under the sharp eye of a vigilant press, it is pretty certain that the team, when made up, will be a really representative one in merit as in other qualifications.

The field of selection is a narrow one, and more's the pity. It is a disgrace that, out of nearly fifty States in the Union, about one-tenth of the number only should have anything worthy, the name of a National Guard out of which a choice can be made. This is one of the most significant lessons of the entire contest, and one which thus far has been so entirely overlooked. It does not appear that the defeat of last year has roused the executive of a single one of the States, so delinquent in this matter, into anything like a sense of its shame. Had the defeat been one more of men than of rifles, this fact would have been brought into holder prominence; but, compared with the situation in Great Britain, that in America appears the more disgraceful. There every section of the kingdom is able to send forward men fit to compete for places on a representative team. Here a few dozen letters would reach about every available candidate. Still the battle is confined to the dozen before the butts, and so, with a well-drilled and thoroughly competent squad to send over, our directors need not fear the great army of very competent shots throughout Her Majesty's realm, but whose skill cannot avail the dozen chosen to meet the Americans. This makes the situation the more hopeful, and renders the outlook a more encouraging one.

One of the real stumbling blocks in the way of making up of an harmonious team is that of the captaincy. It is perhaps the most advisable way to permit the selection of the leader by the shooting men, not merely the sanctioning of a nomination made by a board of directors who are themselves non-shooting men. The captain should be a marksman, and he should be thoroughly aware of what every man under him is doing. A man with certain set notions as to rifle or ammunition is not fit for the post. Such a one soon becomes a nuisance and a hindrance by insisting upon the adoption of his pet hobbies. The idea that since there is some money to be spent, the directors should put their own man in the supreme control of the team, is not a valid reason for taking the power of choice out of the hands of the team. The amount at best is but trifling, and under proper rules this could be accounted for exactly without handicapping the efforts of the team by placing over it a man who may not command the confidence of the men who do the shooting. The captain can more readily mar than make a victory.

The great point to be borne in mind is to put the shooting men in such a frame of mind, and consequently condition of body, as shall enable them to do their very best in the match. After having stood the heat and effort of the preliminary competitions for places on the team, it is fair to assume that, as individuals, the men are competent, and the effort of the captain is to be directed toward making the men a compact, single-willed whole, rather than a collection of disjointed, though, perhaps, earnest workers for victory.

This result is the more likely to come under the direction of a captain chosen by the men, than under the rule of an outsider, who comes as the mouthpiece and the agent of a set of managers. If there is to be such a manager, create a new office and let him be styled captain, if the title is a tickling one; but then let there be a shooting-master or something of that sort, who shall be a man able to help the men technically, while his interest is as great toward one as another and his entire allegiance to the team in its work before the targets. With such a directing spirit, success may be looked for; without him it may only be prayed for.

INDIAN FOLK-LORE.—We publish to-day a charming bit of Indian folk-lore from Hudson's Bay.

Natural History.

THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance, Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH

FAMILY PROCELLARIIDÆ: PETRELS.

287. Ice Petrel—Falmarus glacialis Aud.; Ridg. 705, Cs. 314.—This great petrel of the northern seas and ordinarily occurs off the Maine coast, although as yet I have failed to obtain a specimen, either through my own efforts or others'. The species has been taken near the coast of Massachusetts, as well as at Nova Scotia. Dr. T. M. Brewer recorded the capture of a specimen which was caught alive "on a cockpit, on the eastern part of George's Bank," off the coast of Massachusetts, October 28, 1878. (Bull. N. O. C. Jan., 1879.)

288. Leach's Petrel—Thalassidroma leachi Aud.; Cycnocheilus leachii Ridg. 723, Cs. 823.—Abundant along the coast. Breeds commonly upon the islands along the entire coast of Maine. Nests in holes, excavated by itself in the ground, and deposits its single egg in June. The egg is white with faint ring of pink spots about one end. The two ends are nearly equally rounded. This is the only species of petrel known to breed in Maine. The birds are very active at night about their breeding places, but remain fairly quiet usually throughout the day. Their cry is not very often heard during the day, but in the evening it is uttered rapidly and incessantly, while the birds are on the wing. This cry may be expressed by the following syllables: "aeet-taitee-aeet-aeet-aeet-lra-aeet," the first notes uttered very rapidly, but the last three with a perceptible pause between them.

289. Wilson's Petrel—Thalassidroma wilsoni Aud.; Onychoprion wilsoni Ridg. 722, Cs. 828.—This species is of not uncommon occurrence off the coast, but rarely comes to the shore, and none breed here.

290. Greater Shearwater or "Hagden"—Puffinus cinereus Aud.; Puffinus major Ridg. 709, Cs. 832.—Common at the offshore fishing reefs; generally known as the common "hagden."

291. Sooty Shearwater, "Black Hagden"—Puffinus fuliginosus Ridg. 714, Cs. 837.—Common at the offshore fishing reefs; generally known by fishermen as the "black hagden." Probably every species of Puffinus of occurrence along the New England coast might properly be named for Maine, but I have included only the species whose capture here I can vouch for.

FAMILY COLYMBIDÆ: DIVERS.

292. Great Northern Diver or Loon—Colymbus glauciatus Aud.; Colymbus torquatus Ridg. 736, Cs. 840.—Abundant, breeds about the lakes throughout the State. Nests upon the ground near the water, and in June lays two or three dark olive-brown eggs, with as yet irregularly marked with a number of blotches or spots. A few loons of this species are found on the coast throughout the winter. The spring migration occurs in April and May. This largest of our divers is locally well known as the common "loon."

293. Black-throated Diver or Loon—Colymbus arcticus Aud., Ridg. 738, Cs. 843.—An arctic species and not known to occur here in the black-throated plumage of perfect maturity. Audubon writes (Birds of America) that young birds extended their wanderings southward beyond the limits of the United States. This loon is a little larger than the species next named, and smaller than the great northern loon or loon, which it most resembles in form. This resemblance is very close in immature birds, but the adults are easily distinguished apart. An immature male black-throated loon was shot on the coast of Washington county, Maine, December 6, 1881, and its skin was preserved by Mr. A. Eddy, who kindly sent the specimen to me for examination. Skins of this species are so rare in collections, that but little material is available upon which to base a diagnosis of the characteristic features of immature birds. Audubon names the number of tail feathers as sixteen for this species, and eighteen for the great northern loon, although twenty is a more common number for the latter. But this feature (number of rectrices) of waterfowl is so variable as to be, by itself, of little if any value for diagnosis of species.

In maturity the coloration of plumage is sufficient to distinguish either of the two species named, but not so with young birds. Nor is a comparison of the general size of immature birds of especial value in this case, as individual loons vary greatly in size.

The bill of black-throated loon is relatively as well as actually somewhat shorter than that of the great northern loon, especially as regards depth, and this appears to be the prime diagnostic feature of the species, taken in connection with the wing measurement. It is upon these two features, bill and wing, that I base the identification of Mr. Eddy's specimen, which I am constrained to regard as a black-throated loon (C. arcticus) killed in its second year at about seventeen months of age.

In the original collection of the Boston Natural History Society at Boston, Mass., there are five immature specimens labeled C. arcticus, and one specimen without a label that appears to be one of the same species. I have examined these five specimens, and here give some measurements of them in comparison with the corresponding measurements of Mr. Eddy's specimen. The latter was freshly mounted when I examined it. The others have been mounted many years, and the contours of their bills may have become slightly changed by long drying.

I do not give the "length of bill along the ridge," which may be differently measured by collectors, and which is a measurement that varies in dried specimens from the same taken from freshly killed ones. My measurement to the nostril is less open to variations. The term "nostril," as thus used, refers to the anterior limit of the nasal aperture, and not the nasal opening.

This is a well-defined point upon all specimens, whether fresh or dried, and hence I measure the "width" and "depth" of the bill at this point, which is a constant one. The ordinary measurements of the depth and width "at base of bill" are subject to great variations for the same specimens in the hands of different persons, since the exact point defined as the "base" is likely to be variously determined, and a slight longitudinal difference in making such measurements causes very appreciable discrepancies. The "wing" measurements below given were taken by means of a tape line passed under the wing and drawn taut from the "head" to the "tip" of the wing. This method of measuring the wing

is objectionable, but sufficient for comparisons in this connection, as all the specimens were thus measured. My usual method is to measure the wing of a large bird on its curve or outside edge, and not its chord below. The measurement from "bill tip to eye" is to the anterior angle of the eyelids. Following are measurements of the black-throated diver or loon (Colymbus arcticus), given in inches and decimals of inches. The specimens Nos. 1, 2, 3, 4 and 5 are those named above as being in the Boston Natural History Society's collection. Nos. 1 (labeled 8148), 2 (labeled 8149), and 3 (labeled 8150), being in the Fresnaye collection; No. 4 in the Theodore Lyman collection; and No. 5 without a label. No. 6 is the specimen in the collection of Mr. N. A. Eddy, Bangor, Me.; No. 1 from the "North Seas," is in my collection in perfect summer plumage; No. 2, "N. Europe," is immature; No. 3, "N. America," is immature; No. 4, adult; No. 5, immature; No. 6, Maine, an immature male:

Table with 6 columns (Bill, Tip to eye, Tip to nostril, Width at nostril, Depth at nostril, Gonyx) and 6 rows (No. 1, No. 2, No. 3, No. 4, No. 5, No. 6).

Edge of upper mandible: No. 1, decurved; No. 2, slightly decurved; No. 3, decurved; No. 4, straight, except tip; No. 6, recurved. Edge of lower mandible: No. 1, decurved; No. 2, slightly decurved; No. 3, decurved; No. 4, slightly recurved; No. 6, recurved.

294. Red-throated Diver, or Loon—Colymbus septentrionalis Aud., Ridg. 740, Cs. 844.—Abundant during migrations, passing north late in April and early in May, when the species is abundant, and often flying in small flocks of a dozen or more. This is the smallest of the three loons known to occur here, and is locally termed "cape racer" by gunners and fishermen. Occasionally adult specimens in the perfect plumage of the breeding season are shot here in May, yet it is uncommon to procure them with the rest of the throat perfectly developed. The greater number killed along this coast have the throat white without any trace of red.

FAMILY PODICIPIDÆ: GREBES.

295. Red-necked Grebe—Podiceps rubricollis Aud.; Podiceps albicollis Ridg. 731, Podiceps hyperboreus bolleoides Cs. 847.—Common on the coast during migrations, and a few remain here in winter. Spring migration occurs in April. Specimens in the plumage of the breeding season are obtained here in spring. This large grebe is sometimes mistaken for the red-throated loon or "cape racer" when on the wing. It appears to be a marine bird almost exclusively, and is not found on the lakes here, although occasionally frequenting the mouths of rivers as well as estuaries.

296. Horned Grebe—Podiceps cornutus Aud., Cs. 848; Dytas arcticus Ridg. 732.—Abundant during migrations. The most common grebe known here. The spring migration occurs early in April, and during this month I have shot specimens of this species and of the red-necked grebe in the perfect plumage of the breeding season. At such times there were considerable quantities of fine feathers in the stomachs of the birds of both these species, which apparently had been plucked by the birds from themselves during the moult just completed. Possibly a few horned grebes breed in Maine, at least occasionally, as specimens are sometimes found in the lakes during the summer.

297. Pied-billed Grebe, Dobeckie—Podiceps carolinensis Aud.; Podilymbus podiceps Ridg. 735; Podilymbus podiceps Cs. 852. Not uncommon in summer about the lakes and streams, and probably it breeds here regularly.

FAMILY ALCIDÆ: AUKS, GUILLEMOTS.

298. Razor-billed Auk—Alca torva Aud.; Utemania torva Ridg. 742, Cs. 877.—Common along the coast in winter. A few breed off the coast of Eastern Maine. A single egg, white, with reddish brown blotches, is laid early in June. The spring migration occurs here in March and early in April. The food of this species consists of marine algae, crustacea, etc., and the flesh, as compared to that of other seafoal, is of fine texture and palatable.

The flight of the razor-billed auk is usually swift and straight, the wings beating rapidly; but occasionally the bird performs a succession of singularly long beats with their wings, without diminishing the speed of flight however.

299. Puffin—Mormon arcticus Aud.; Fratercula arctica Ridg. 743, Cs. 854.—Common along the coast in winter, locally known to fishermen as "sea parrot." A few breed here. A single white egg is laid in June, in holes in the ground or under the rocks. The food of this species consists chiefly of small shrimps and other crustaceans.

300. Little Guillemot, Dovekie—Mergulus alle Aud., Alle nigricans Ridg. 152, Cs. 863.—Abundant on the coast in winter. Not bred here, nor is the plumage of the breeding season acquired before departure for the north in early spring. This diminutive guillemot is locally termed "ice bird" by the fishermen. It is entirely marine in its habits, but occasionally is driven upon land by severe storms. I have the skin of a little guillemot picked up alive from the ground in Gorham, Cumberland county, Me., immediately after a great ice, in September, 1893. This was unusually early in the autumn for the species to arrive on the Maine coast. The bird was shot by Henry Merrill in the harbor of Pushaw Lake, near Bangor, Me., in November, 1879. I have known of the occurrence of this species in abundance in the harbor at Portland, Me., during a severe winter.

301. Black Guillemot—Uria grylle Aud., Ridg. 760, Cs. 871.—Abundant. Locally termed "sea pigeon" by fishermen. The most common species of guillemot on the Maine coast. Breeds commonly eastward of the Kennebec River. Two white eggs, blotched with dark brown, are laid in June, usually in crevices of the cliffs, but also various other places are selected. I once found a bird sitting upon its two eggs far within a hollow log that was lying upon a rocky beach where it had been washed up by waves during some great storm. This bird I captured and kept alive for some time, feeding it upon "rock eels," etc. It had become very tame when finally liberated. Mr. Harry Merrill informs me that the first guillemot of this species was shot at Sebec Lake in 1878. The black guillemots and their eggs, both in the greenish-black summer plumage and the more attractive plumage of winter, and would form an attractive addition to a zoological garden.

The change in coloration of plumage occurs very early in the spring. Mr. Boardman informs me that he has obtained a specimen "in the middle of February, changed to black, and one the last of January two-thirds changed." But usually the change does not acquire its summer appearance before April. In the month of March the black guillemots are

After dark the Waterhen crept ashore and went to his grandmother's wigwam, where he procured two gun flints, which he tied to his webbed feet; then went to the edge of the lake and waited for morning. At daybreak the hunters came to settle the Waterhen, and, waiting until all hands were well out into the bosom of the lake, trod sharply on the fungi (which were lying full of water around the lake) with his flint-shod feet, and let the water free and drowned all his pursuers. (The flints cut the webs of the bird's feet, which can be seen still.) The lake soon filled with water up to its old level, but no living thing floated up, and nothing was alive near it excepting only the Waterhen himself, who was swimming about on its calm surface, and the widows of the waterhen, walling and kicking up a racket on the edge of the lake.

After only a short while, however, first a Bear, then a Beaver, came out of the water and ran ashore. These beasts and also many others who had been turned into waterfowl and remained swimming about in the lake, were the revived bodies of those whom the Waterhen had flooded, transformed now into the shapes and sizes of the different beasts and birds of the present time.

Near by was a smaller lake filled with grease, into which some beasts, as the Bear and Beaver, dived; others, as the Deer, only dipped their backs, some more some less, as the Rabbit, who contented himself with dipping in a pav and oiling under his forelegs and between his shoulders. This accounts for the greater or less amount of fat on the different animals. The last animal who came to the lake of grease was the Squirrel, who was so grieved to see most of the others so large compared with himself, that he cried so hard as to make the striped appearance round his eyes we yet ead notice.

While they were standing in a row after the process of bathing or greasing was over, confused with all they had undergone and not knowing what to do with themselves, the Great Spirit appeared to them and told them that they would have to serve as food for the human race, by whom they had been hunted and ever since. NISTASKESI.

MOOSE FACTORY, HUDSON'S BAY, BRITISH AMERICA. [TO BE CONTINUED.]

BAIE DES CHALEURS.

HEALTH and pleasure seekers will be glad to learn that excellent accommodation is now being prepared to receive a number of visitors who may wish to enjoy the fine scenery and beautiful spots in the Province of Quebec.

Carleton, as I found it last summer, is a remarkably pretty sea-shore village, with good stores, good roads, daily mail, telegraph communication, and connected with Campbellton (a station of the Intercolonial Railroad about thirty miles off) by steamer three times a week, or can be reached daily by the road, and is, therefore, easy of access. The majestic Frigidiferous Mountains completely shelter it from northern winds so disagreeable at other watering places. Opposite the village is Carleton Point, projecting one and a half miles out, on each side of which is a beautiful sandy-bottomed bay, also sheltered from winds from either one or other direction, and consequently affording safe and pleasant bathing and boating.

The Baie des Chaleurs, or in English, "Warm Bay," is not remarkable for the heat of its English, but is sufficiently warm to be enjoyable, and not so cold as many other localities where one shivers in July; the climate during the summer months is simply delightful. This grand bay divides the Province of Quebec from that of New Brunswick; it is said to be about twenty-five miles wide at its entrance, and 100 miles long, and gradually narrows till it reaches its end, where the celebrated Restigouche River meets it. On both sides there are over sixty rivers running into the bay, nearly all of which abound in salmon and trout; it has always been noted for its large-sized salmon, ten or twelve often filling a barrel with 200lbs. of cleaned fish.

Among the specimens prepared by me for the London exhibition are the salmon from the Cascaopia River, near Carleton, weighing respectively 47, 44 and 41 pounds; the sea trout are large in proportion and in immense numbers. The bay is also the resort of codfish, mackerel, herring, and the shells, lobsters, and the numerous waters of the adjacent mountains are renowned for caribou, moose and bear hunting, especially the caribou, which are very numerous. Along the shores and rivers may often be found thousands of wild geese, brant, ducks and plovers. Experienced guides and boats or canoes are to be procured at very reasonable rates and there are few places can boast of so many attractions for the sportsman as Carleton. The great drawback here is the want of accommodation; this disadvantage will now be furnished by our respected townsman, Mr. Joseph R. Michaud, passenger agent of the Paspungic Railroad at Quebec, who has secured the necessary property to do so to a limited extent this season, and will probably build a large hotel for future wants, and I am sure the visitor will be treated in such a manner as to greatly enhance the pleasure of the trip.

Being frequently asked, where can one go for sea air and bathing or fishing and shooting below Quebec, from what I saw on my visit last summer, I would say try Carleton. J. T. GREGORY.

QUEBEC, April 2, 1883.

A GROUSE IN TOWN.—NEWTON, MASS., April 10.—Robins and song birds are quite plentiful with us now. On Thursday, 5th inst., on Fast Day, the writer saw a large flock of geese and heard of another flock, as well as a few stray ducks being seen. Something happened yesterday entirely out of the usual course. Quite a large bird was reported as being seen sitting on the ridge-pole of a newly built house in a highly settled part of our ward. Curious to know what the bird was, I went out to write my paper, and to my surprise I found the bird to be a full-sized partridge. On inquiry I learned he had been there about half an hour, and as he was not disturbed, seemed to be quite contented with his perch. He remained in all about three hours on his elevated place, before taking wing. Is this not something very unusual? and how do you account for the occurrence?—TOM ALLEY.

ILLINOIS DUCK SHOOTING.—April 10.—Fowling has not been near so good on the Illinois River as usual. The night has not been heavy and of short duration, so far as I can judge our quail are pretty well used up—at least I have never seen them so scarce at this time of year. Jack snipe are now here with a rush, but I am happy to say that but very few shoot them here in the spring.—BYRKE.

commonly found moulting, and then present a mottled black and white appearance of the lower parts. The spring moulting appears to include the plumage of the entire head, neck and body; the summer dress being chiefly formed by a new growth of feathers, instead of merely a change in coloration of the old plumage.

302. Foolish Guillemot, Long-billed Murre—*Uria troile* Aud.; *Lousia troile* Ridg. 763, Cs. 874.—Not common. This is the "foolish" or "common" murre or guillemot of authors, but it is not very common at any time on the coast of Maine, where it occurs, however, during the autumn, winter and early spring. There appears to be some confusion among writers concerning the two species of murre found on this coast. For the Atlantic Coast of the United States the term "common" is inappropriate to this species. The published descriptions of the two species are at best meagre, and as unsatisfactory to ordinary students as are the names applied. This species may readily be identified by the length of bill, which measures one and a quarter inches or more from tip to nostril. In full maturity the long-billed murre may be easily distinguished, but for immature winter specimens the bill forms the most characteristic feature for identification, as will be seen by the comparisons given in the notes of the next named species.

303. Brünnich's Guillemot, Short-billed Murre—*Uria brunnicchi* Aud.; *Lousia arva* Ridg. 764; *Lousia arva* 876. Common off shore along the entire coast in winter, and sometime abundant. Usually arrives from the north late in the autumn or early in the winter, and returns in April. This species is the "Brünnich's," "large-billed," or "thick-billed" murre of writers, and may be distinguished from the preceding named species by its comparatively short bill, of one and an eighth inches or less in length from tip to nostril.

The readers for whom these lines are written may thus identify, by measurement of the bill, any murre obtained on the Atlantic coast of North America, without reference to technical ornithological descriptions of other specific characteristics.

But little has been published about our murre since the time of Audubon, who gave, in his Birds of America, some account of their habits as observed in summer at Labrador, as also full descriptions of these birds. But various discrepancies may be noted that suggest the possibility of not only concerning the two species having been mixed. Audubon mentions the long-billed species (*troile*) as "more or less abundant during winter on the coast of Massachusetts and Maine," and the short-billed species (*brunnicchi*) as "occasionally procured in Maine." In fact the reverse is true.

But if an one inquires of our coast gunners or fishermen concerning the "large-billed" murre, and the "common" murre, he will be told just what Audubon has told us. The explanation is simple. In the published writings of ornithologists the name "large-billed" and "thick-billed" have hitherto been applied to the murre that has the smallest bill, and is common every winter on our coast, while the name "common" has been applied by the same authors to the species of murre that comparatively is not common on our coast at any time. Audubon's measurements are also confusing, and a reversal of the files of species to which he applied them will be necessary to approximate them to my own notes, and I therefore quote the following from "Birds of America."

Table with 2 columns: Uria troile, Uria brunnicchi. Rows: Length to end of tail, Length to end of claws, Extent of wings, Wing from flexure.

These measurements indicate U. brunnicchi as the largest of the two species, but such is not the fact. From my own notes I select for comparisons the following measurements:

Table with 2 columns: Long-billed Murre, Short-billed Murre. Rows: Length to end of tail.

The measurements of wing and extent intergrade, as do also the measurements of tail. The species brunnicchi of the species troile exceeds that of the species brunnicchi. The weight of the latter in lean condition is from one and a quarter to two pounds each.

The following table of measurements taken from my own notes will afford a convenient comparison of the most important dimensions of these two species. All measurements are given in inches and decimal fractions thereof:

Table with 4 columns: Foolish Guillemot or Long-billed Murre, Brünnich's Guillemot or Short-billed Murre, Adult, Young, Winter, Winter. Rows: Tip to apparent angle of feathers, Bill (tip to nostril), Depth at nostril, Width at nostril, Gonyx, Tarsus, Wing-Chord, Wing-along edge, Length to tip of tail/about.

The references to "nostril" mean the anterior border of the nasal aperture. Wing measurements are made with a tape line from bend to tip over the edge, and not the chord of the curve. It will be observed that the most characteristic measurements of the two species are lengths of bills, and are almost the sole measurements that never intergrade. Each species may also be distinguished by the following general comparison of characteristics:

Long-billed Murre (troile or arva).—Bill, tip to nostril, about three times its depth. Tip to angle of gonyx about two-thirds of tarsus. Tonia of upper mandible bare at base, dilated, yellowish.

Short-billed Murre (brunnicchi or arva).—Bill, tip to nostril about twice its depth. Tip to angle of gonyx about one-half of tarsus. Tonia of upper mandible feathered at base.

ADDENDA.

Willow Ptarmigan or Grouse—Lagopus albus Aud., Ridg. 474, Cs. 563.—There appears to be no reliable evidence that this species ever existed in Maine. In "Birds of America," Mr. Audubon has stated that he "felt assured it exists in Maine, as well as in the northern districts bordering on the great lakes." And further states that "Theodore Lincoln, Esq., of Dennyville, in Maine, shot seven one day, and mentions, Mr. Lincoln has informed me that he could not remember ever finding the ptarmigan in Maine, and that "probably Mr. Audubon referred to those shot further North."

Mr. Lincoln speaks of the Canada grouse (Tetrao canadensis Aud.) as "spotted grouse," and it is my belief that the

incident of the seven birds shot in one day near Dennyville, Me., related by Mr. Audubon, was properly referable to the "spotted" or Canada grouse. Mr. Manly Hardy, of Brewer, Me., writes me as follows: "Besides my own chances for observations in Maine, New Brunswick and Canada East, I have taken great pains to inquire of all my fur collectors and hunters about ptarmigan, but I can find no instance of its capture in the region of the coast. A hunter who resided for twenty years near Gaspe, has extensive dealings in the Restigouche and Metapedia region, and knows the whole of that country, assures me that this bird is never found south of the St. Lawrence River, below Quebec."

I have fished in summer through various parts of Maine and New Brunswick, and hunted on the "south shore" of the St. Lawrence River in winter, and all my own observations and inquiries have resulted in repeated failure to find any evidence of the existence of the ptarmigan south of the St. Lawrence River. This species (L. albus) is a common resident on the island of Anticosti, in the Gulf of St. Lawrence, however, and abundant in Newfoundland.

Prairie Owl—Scotia emiclararia Aud.; Spizella emiclararia hypogaea Ridg. 408, Cs. 487.—In 1879 an owl of this species was left in Portland, Maine, for a taxidermist (Mr. Arden Nelson, Jr.). No person ever called for the bird, which was alive with Mr. Nelson, although it was winged, broken, and no further news of this specimen can be learned. It may have been a straggler from the plains in the West, but more probably was brought East in a cage.

Trumpet Swan—Cyanus buccinator Aud., Cs. 688; Swan buccinator Ridg. 589.—Some years ago (prior to 1868) a swan was seen at Scarborough, Maine, during several consecutive days. The late Caleb G. Loring, Jr., to whom the common swan (C. americanus Aud.) was well known, observed this bird repeatedly fly from the bay and circle about over the marsh high in the air, uttering cries which led Mr. Loring to believe the bird to be a trumpet swan.

Tufted Puffin—Moronotus cirrhatus Aud.; Landa cirrhata Ridg. 745; Fratercula cirrhata Cs. 556.—The following record of this species is given in "Birds of America" by Audubon: "The specimen from which I drew the figure of this singular-looking bird was procured at the mouth of the Kennebec River in Maine. It was shot by a fisherman, a man well standing in some floating nets in the winter of 1831-32. For one individual was seen." As fifty years have elapsed since this occurrence without a similar record for the coast, the species is only mentioned in this connection.

Great Auk—Alca impennis (Linn.), Ridg. 741, Cs. 878.—Although this species is now generally supposed to be utterly extinct, it undoubtedly once existed upon the coast of Maine. Bones found at various places in Maine have been referred to this species. (See the "American Naturalist," v. p. 578.)

[The notes already printed close the body of Mr. Smith's history of Maine birds, which has contained much that is of interest to our ornithological readers. The author has, however, expressed his intention of making some supplementary remarks, which will appear next week. The value to ornithologists of such lists, when they are carefully and judiciously compiled, is very great, and we feel sure that the present one has been highly appreciated by those interested in the subject with which it deals.]

MASSACHUSETTS WINTER NOTES.

Birds wintering at Taunton, Mass., and vicinity during the winter of 1892-3.

BY JOHN C. CARROON.

THE following brief notes of the past winter, and of the birds at Taunton and vicinity, I take from my notebook:

December, 1892, came in with snow on the ground, and during the month there were sixteen days of sleighing. The lowest point reached by the mercury was on the 4th, 3° above zero. During the month there were eight days of rain, and on eight days twelve days perfectly fair. The month as a whole, averaged 10° colder than December, 1891.

A few robins (Turdus migratorius), and bluebirds (Sialia sialis) were seen and heard at various times during the month. Saw golden-crested kinglets (Regulus satrapa) in company with chickadees (Parus atricapillus) every few days. A number of brown creepers (Certhia familiaris) remained here during the month. Yellow-rumped warblers (Dendroica coronata) were quite abundant, found them in swamps and near a river. Saw flocks of goldfinches (Astragalinus tristis) from time to time, and song sparrows (Melospiza fasciata) remained with us throughout the month. Snowbirds (Junco hyemalis) and tree sparrows (Spizella monticola) were quite common; crows (Corvus frugilegus) common; blue jays (Cyanocitta cristata) very common, saw them every day that I went out. A small number of hairy and downy woodpeckers (Picus villosus and P. pubescens) were seen during the month. Golden-winged woodpeckers (Colaptes auratus) were quite plentiful. Great horned owls (Bubo virginianus) were seen several times. Several barred owls (Strix nebulosa) were seen once. One of them was observed in a small swamp near the city. On the 24th a handsome adult saw-whet owl (Nyctala neotoma) was brought to me that was shot at this place.

This is the first to my knowledge that has been taken here in the winter. Several years ago I saw red-tailed hawk (Buteo borealis), eagle (Haliaeetus leucocephalus), and osprey (Pandion haliaeetus) on the coast of Maine. The latter was taken from a hole in a decayed tree. There were three of them, and two were so tame that they alighted on my hand, but the other one was savage, and if I put my hand near him he would fly and peck at it as hard as he could. Their favorite food was small fresh fish cut up fine. They were the handsomest young owls that I ever saw, but they all died before they reached their full growth. Saw red-tailed hawk (Buteo borealis), eagle (Haliaeetus leucocephalus), and osprey (Pandion haliaeetus) on the coast of Maine. The latter was taken from a hole in a decayed tree. There were three of them, and two were so tame that they alighted on my hand, but the other one was savage, and if I put my hand near him he would fly and peck at it as hard as he could. Their favorite food was small fresh fish cut up fine. They were the handsomest young owls that I ever saw, but they all died before they reached their full growth. There were three of them, and two were so tame that they alighted on my hand, but the other one was savage, and if I put my hand near him he would fly and peck at it as hard as he could. Their favorite food was small fresh fish cut up fine. They were the handsomest young owls that I ever saw, but they all died before they reached their full growth.

January followed December without any great change in the temperature. Ten days of sleighing. The lowest point reached by the mercury was on the 13th, 10° below zero; the highest on the 21st and 30th, 50°. During the month it snowed on nine days and rained on five. The coldest day was on the 13th, when the thermometer stood at 3° colder than January, 1892. The morning of the 13th had the honor of showing up as the coldest of the season. Mercury dropped all night, and at 7 A. M. it reached its lowest point, 10° below zero. At 12 M. the mercury had climbed up to 40° above zero. A change of 50° in five hours is a little peculiarity of New England. The snow storm, which reached us on the night of the 9th, proved to be the most severe of the season. The wind blew hard from the north, and large drifts

were piled up, and travel to some extent delayed. At noon the mercury had not risen beyond 11° above zero, and the few people that had to be encountered a first-class blizzard.

Bluebirds (Sialia sialis) were heard singing at various times, and a pair of them were seen in a meadow once during the month. Golden-crested kinglets (Regulus satrapa) and chickadees (Parus atricapillus) were common, and on the 23d I shot quite a number of the former, nearly all of them being adults. On the 24th I shot one of a pair of yellow-rumped warblers (Dendroica coronata) the only ones I saw during the month. Although I did not see any pine grosbeaks (Pinicola enucleator), several flocks were seen, and a few were taken. Saw a large flock of redpoll linnets (Egithus hiemalis) once during the month. Goldfinches (Astragalinus tristis) were seen often in large and small flocks. A pair of song sparrows (Melospiza fasciata) was found by me wintering in a little sheltered valley. Snowbirds (Junco hyemalis) were common. Tree sparrows (Spizella monticola) were abundant from the beginning to the end of the month. Crows (Corvus frugilegus) were seen occasionally, but were not as common as in December. Blue jays (Cyanocitta cristata) were common. Hairy and downy woodpeckers (Picus villosus and P. pubescens) were noticed at different times, the hairy being more common than the downy woodpecker. Golden-winged woodpecker (Colaptes auratus) were quite plentiful, a flock of them wintering in an old barn, where I saw them flying in and out of some holes near the top. Great horned owls (Bubo virginianus) were seen a few times, and on the 4th, a handsome adult was brought to me. A barred owl (Strix nebulosa) was seen once. A hawk was seen a number of times, which from the description must have been a red-tailed hawk (Buteo borealis). Saw ruffed grouse (Bonasa umbellus) quite a number of times, and found quails (Ortyx virginiana) from time to time in an old corn field feeding on the weeds and corn that had been left there.

February has been remarkable as a month of ice and snow. Nearly every snowstorm turned into rain, which froze, making one successive sheet of ice. There was excellent sleighing nearly all of the month. The mercury fell during the month to 6° above zero. During the month it has snowed on eleven days and rained on nine; eleven days perfect fair.

A flock of robins (Turdus migratorius) and bluebirds (Sialia sialis) were found in the early part of the month wintering in a pine swamp on the outskirts of the city. Golden-crested kinglets (Regulus satrapa) were seen quite often. Chickadees (Parus atricapillus) very common. I saw brown creepers (Certhia familiaris) a few times. On the 5th I shot a yellow-rumped warbler (Dendroica coronata), the only one that I saw during the month. I saw a flock of pine grosbeaks (Pinicola enucleator) once. They were on some willow trees over a river. Redpoll linnets (Egithus hiemalis) became common about the 15th, and during the month I secured some good specimens. Goldfinches (Astragalinus tristis) were abundant. A few song sparrows (Melospiza fasciata) began to appear on the 27th and 28th. Snowbirds (Junco hyemalis) were seen every few days. Tree sparrows (Spizella monticola) were particularly abundant. Crows (Corvus frugilegus) were more common than in January. Blue jays (Cyanocitta cristata) were plentiful all the month. Golden-winged woodpeckers (Colaptes auratus) were seen occasionally. Hairy woodpeckers (Picus villosus) were seen now and then, and I shot several from the trees in my back yard. Saw downy woodpecker (Picus pubescens) once. A few screech owls (Scops asio) began to show themselves in the latter part of the month. I saw ruffed grouse (Bonasa umbellus), and quails (Ortyx virginiana) often, and from what I have seen they have wintered well.

The first two days of March were warm and springlike, but this soon gave way to very cold and blustering weather, which, with the exception of a few days, remained so throughout the month. We had some of our coldest weather in March, the thermometer falling to 10° below the zero in the morning of the 8th, and 6° below on the 9th. We had a few snow storms in March, the most that fell at one time was three inches.

A flock of goldfinches (Astragalinus tristis), redpoll linnets (Egithus hiemalis), and pine linnets (Chrysomitris pinus) remained near our house nearly the whole of the month. A screech owl (Scops asio) was brought to me on the 1st. The morning of the 2d was very pleasant. When I awoke in the morning I heard song sparrows (Melospiza fasciata) singing, and soon after breakfast a flock of six robins (Turdus migratorius) alighted on a tree near the house. During the day a few bluebirds (Sialia sialis) made their appearance. The first bird to arrive from the South was a fox sparrow (Passerella iliaca), which I saw on the 4th. On the 10th I secured two shore larks (Eremophila alpestris) out of a flock flying on a field. March 11, I saw a cooper's hawk (Accipiter cooperii), and a small flock of yellow-rumped warblers (Dendroica coronata). I saw a chipping sparrow (Spizella domesticus) on the 13th. I observed on the 16th a flock of ten male redbird blackbirds (Agelaius phoeniceus), and a flock of wild geese (Branta canadensis) were seen flying over. While walking near a spring-brook on the 19th I flushed a large woodcock (Philohela minor), out of some low bushes near by. A flock of purple grackles (Quiscalus purpuraceus) was seen on the 24th. A pair of pine grosbeaks (Pinicola enucleator) stopped here on the 25th. I saw a single white-bellied swallow (Iridoprocne bicolor), and shot a mockingbird (Mimus polyglottus) on the 26th. On the 28th I shot a cowbird (Molothrus ater).

Although I did not see a single shrike (Lanius borealis) during the winter, yet the local press contains an account of the killing out of the English sparrow, caused by this bird being introduced. On the 2d of March I found a pine linnet (Chrysomitris pinus) in the crotch of a bush with its head and neck eaten off. I have no doubt but that it was done by a hater bird, as it was near the house and I had not seen any hawk about. I find the birds that have wintered at Taunton and vicinity are:

- Robin (Turdus migratorius). Bluebird (Sialia sialis). Golden-crested kinglet (Regulus satrapa). Chickadee (Parus atricapillus). Brown creeper (Certhia familiaris). Yellow-rumped warbler (Dendroica coronata). Great northern shrike (Lanius borealis). Pine grosbeak (Pinicola enucleator). Redpoll linnet (Egithus hiemalis). American goldfinch (Astragalinus tristis). Hairy woodpecker (Picus villosus). Hairy woodpecker (Picus pubescens). Song sparrow (Melospiza fasciata). Black snowbird (Junco hyemalis).

Tree sparrow (*Spizella monticola*).
Common crow (*Corvus brachyrhynchos*).
Blue jay (*Cyanocitta cristata*).
Hairy woodpecker (*Picus villosus*).
Downy woodpecker (*P. pubescens*).
Golden-winged woodpecker (*Colaptes auratus*).
Great horned owl (*Bubo virginianus*).
Screech owl (*Scops asio*).
Barred owl (*Strix nebulosa*).
Saw-whet owl (*Aegolius acadicus*).
Red-tailed hawk (*Bubo borealis*).
Ruffed grouse (*Bonasa umbellus*).
Quail (*Oryzopsis virginiana*).

THE SOCIETY OF TAXIDERMISTS.

THE third annual exhibition of the National Society of Taxidermists, which opens in Lyric Hall, 723 Sixth avenue, on May 1, to continue five days, will be of great interest to all lovers of birds and beasts. Sportsmen will be especially interested in the groups of game birds, medallions and panels, and above all, the groups of painters and setters "at work." Mr. Hornaday's striking group of an English setter and covey of quail, entitled, "Coming to the Point," which attracted so much admiring attention at the Boston exhibition, and later in the National Museum at Washington, will be seen here, and there are several other fine "bird dogs" entered to compete against it.

The first exhibition of the society was held in Rochester in 1850, and the second a year later in Boston. Both were very highly praised by the press of their respective cities, and visited by admiring crowds. The display in this city will be larger than both the former one together, and the variety of objects will also be much greater. The objects of the society are to develop and improve the art of taxidermy until it shall rival those of painting and sculpture, and also acquaint the public with taxidermy as a fine art. Once a year the members meet to hold a competitive exhibition to compare work and exchange ideas. Those who know affirm that a vast improvement is already noticeable in the work of the members. The society contains over seventy active members and stands high in the estimation of artists, scientific men and sportsmen.

A very interesting feature of the coming exhibition will be a taxidermist's workroom, complete in all its appointments, with the taxidermist himself at work.

The opening reception will be held on the evening of April 30, to which admission will be by invitation only, but from May 1 to 5 the display will be open to the public, and it will be several years before another will be held here.

SOME SOUTHERN CALIFORNIA BIRDS.

THE mocking-bird (*Mimus polyglottus* Linn.) of this vicinity is a bird somewhat larger than the Eastern bird, having a tail much more graduated, and differing somewhat in color. Its habits are similar to those of the Eastern mocking-bird, and it is very fond of staying around houses if unmolested. They remain here all the year, but are not so plentiful in winter as in the summer. They are generally found in the vicinity of brush or cactus, and seem to prefer valleys. The fruit of the cactus furnishes them the major part of their food. The nest is generally built in a thick bush or cactus not far from the ground, and is composed of twigs, leaves and grass, and is lined with hair when this can be obtained, and root fibres. The eggs are four to six, pale green, with blotches of brown scattered over them, mostly at the large end. This bird is unequalled as a singer, and its melodious powers are very great. While singing it will often leap from the bush into the air, and then descend to the ground, and then rise again into the air, imitating all the while numerous birds and some animals. The mocking-bird is 10 1/2 inches in length, and 14 inches in alar extent, wings, 4 1/2 and tail 5 1/2. Its color above is ashy brown, the center of the feathers being slightly darkened, the under parts are white with a faint brownish tinge, and the tail has a tinge of ash across the breast. The wings and tail on the upper side are black. The bill and legs are black.

The sickle-billed thrush, which is a very good singer, is a much larger bird than the mocking-bird and does not imitate near so many birds, but many of its notes are much sweeter than those of the mocking-bird. The sickle-bill, however, lacks the life that the mocking-bird has. The mocking-bird during nesting season sings very frequently at night; it usually sings near the nest during the day. In winter it is very shy.

The shyest bird that we have here, especially during nesting season, is the California cactus wren (*Campephilus vociferans* Linn.). The male I have never been able to see during the nesting season, and the female only twice. The male is a very peevish little bird, and seems always to be quarrelling. This species usually builds as high up as it can get on the branch of the cactus. The nest is large, from nine to twelve inches in length and four to six inches wide. Most of them have thick walls, but in some the walls are so thin that the thorns pass through them. The habits resemble those of most wrens, and it subsists chiefly on insects, but eats some berries. It passes much of the time on the ground.

The most common little bird that we have here is the blue-winged lark (*Eremophila alpestris* Wilson), known also by the name of grass lark, and sky lark. During the nesting season in May and June the male rises into the air, sometime out of sight, in a zig-zag circle, singing a sweet and varied song. The voice will gradually die away, and then as the bird commences to descend will gradually grow louder; the bird alights in nearly the same place that it started from. The nest is made in a small depression of the ground under a bunch of grass or a small bush, composed of twigs and grass. The eggs are a pale white, with darker spots sprinkled over them. They may be four or six. In the fall they gather in large flocks. Their food consists of small berries and insects. I have seen one on a tree or bush.

The most brightly-colored bird that is found here is the western oriole (*Icterus bullocki*, Sw.). The upper part of the head and neck is shiny black, and a black line runs from the base of the bill down onto the throat, the under parts being an orange-yellow, and a broad band on the wings is white. They arrive here about the first of March and resort to the orchards, where they eat considerable fruit, but pay for that by destroying insects and singing their sweet melody. Their nest is very pretty, usually built in a tall tree and out at the end of a branch. It is composed of twigs, straw, horsehair, twine and wool. If horsehair or twine can be procured they are sure to use a liberal quantity and make it very strong. It is built in the form of a purse

and is suspended near the forks of a branch. The eggs, numbering from four to eight, are a bluish white, with winding streaks of black around the larger end.

Another very common bird is the Cassin's flycatcher or Cassin's kingbird (*Tyrannus vociferans* Sw.). This is a bird worthy of examination. The head and neck above and on the side is rather dark bluish-ash; but if we stop and examine the top of the head more closely, we find, by ruffling the feathers, a spot of brilliant yellowish red. The bird has the power to throw open these colored feathers, and when on the crest looks almost like a small flower, and during the day you will see this sly creature sitting on a post near bee hives with its head down, as if asleep; but when a bee goes to light on this flower the bird is not asleep, for it gives a sudden snap and almost invariably captures a bee. The rest of the upper parts are olive green, tinged with gray; the upper tail coverts nearly black, and under part, in general, bright sulphur yellow; the bill is black and the feet grayish. During the nesting season, the bird, for the space of four months, this bird might serve as an alarm clock for those who desire to rise at daylight. It generally sings from the tree top, its notes being much more musical and louder than those of the other flycatchers. This nest of this species is very firmly built, being 5.00x2.50 inches externally and 3.25 across the cavity. The eggs are white, with large scattered amber blotches, thickest at the larger end. This bird is destructive to all insects.

JAMES C. WADSWORTH,
Vice-President San Diego Historical Society.

FOOD OF THE WATER MOCCASIN.—New York, April 9.—While floating down the Oklawaha River, in Florida, one day during the week of 1881, I hunted water turkeys, and noticed numbers of moccasins lying on the logs and branches of trees lining the shores and overhanging the water. When approached they had an ugly habit of lying very still until our boat was almost directly under them, when, with a great commotion and a splash into the water (uncomfortably close to us), they would disappear—the first notice we had of our proximity to them. After a while, being on the lookout, I secured three or four of their glossy brown skins, with the assistance of my choko-bore generally taking their heads off, being at close quarters. One, however, not having been badly hit, soon showed signs of returning life by moving around and cutting up antics, in anything but a pleasing manner, in the bow of the boat, which caused much uneasiness on the part of my sable attendant, who assured me repeatedly while dodging around and jumping from seat to seat in the boat: "Dey's pisin, saah, boss! fo' de Lord dey's pisin, saah!" However, we soon gave him the quietus with an oar. "Was then I noticed that this particular snake's case demanded an unusual share of my attention, as his "breadth of beam" was something astonishing. I resolved to investigate his "bread basket," and upon returning to the landing did so, when I found it contained a black bass (trout, South) of about ten ounces weight, intact. Whether his snakeship took the fish alive or whether he found him dead, floating on the surface of the river, I am unable to say, though I incline to the latter belief. The bass was larger in circumference by about two inches than the snake (when removed from its stomach) and nearly a third as long.—BLACK PRINCE.

COLORADO BIRD ARRIVALS.—Pueblo, Col., April 7, 1883.—*Editor Forest and Stream.* The spring is unusually back here, and I incline to the latter belief. The bass was larger in circumference by about two inches than the snake (when removed from its stomach) and nearly a third as long.—BLACK PRINCE.

Camp Fire Flickerings.

"That reminds me."

JOHN is a rival of Andy's in the competition of catching the biggest bass. Several years ago Andy caught a three-pounder, and John grew correspondingly green with envy, and since that time he has been endeavoring to beat the season was over.

One day John, Andy and Jake were hard at it on the banks of the beautiful Swatara, when John observed a big bass jump from the water some distance from shore. Several times the fish emerged, and then John resolved to go for him. Taking a boat he rowed out and threw a live bait to the bass. He wouldn't strike, but continued to flop in a singular fashion, and John cautiously rowed up to him, placed both hands under him, and threw him into the boat not only a seventeen-inch bass but also a ten-inch catfish.

John was exultant, and at once declared that Andy's insignificant three-pounder was cast into the shade by this double haul. On examination, however, it was discovered that the bass in endeavoring to swallow the catfish had been perforated as to his head by the spines of the catfish, one of which protruded through his right eye. Andy and Jake at once claimed a fourth share, and John, taking the advantage of the bass by approaching him on the blind side, and refused to allow the cigars, though the double catch may have slightly exceeded in weight Andy's bass. However, John's claim was for length, and the case is still in *satis quo*.

Here's another: Joe McC. was fishing at the above place with a live frog for bait. For more than an hour he waited in vain for a bite. Pulling up to examine his bait he found on the shore, who to his extreme surprise and pleasure (?) he found Mr. Frog sitting calmly on the rock by his side enjoying his *atium crug*. Joe declares that the batrachian winked at him with the most consummate impudence.

Some time I'll give you my snapper story. JUVENIS.
LEBANON, Pa.

While out West I heard the following version of the famous crow and turkey story. My friend said: I was South a few years ago, and two of my friends, named Charlie and Henry —, brothers, went out camping with a darkey. I saw the darkey afterward and asked him what

success he had had, and he said: "Yer see, Mars Henry sud we'se 'go in cahoot.' Well, we got fo' coons." "How did you divide?" "Well, Mars Henry he takes two, and Mars Charlie he takes two, an —" "What did you get?" "Well, I don't know," scratching his head; then brightening up, "I reckons I gets the 'cahoot.'"—OSI01.10.

Nick Bareo, of Crystal River, Florida, well known throughout Hernando and Levy counties of that State as a general fellow, tells this one of himself. One afternoon, taking his double-barrel on his shoulder, he started through a piece of pine woods surrounding a small hamak to look for a yoke of oxen, and as he turned the point of the hamak, he saw a white side, two feet out and scattered off through the pines not twenty yards in front of him. He stopped a little and watched them, saying to himself, "What a shot; if I had my gun I could get them both." As they disappeared over the ridge, he remembered that he had his gun on his shoulder, and then ran after them; but too late, of course.

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

MY LAST DEER HUNT IN OHIO.

BY D. W. C.

IN a few years there will be no more stories to tell of the capture of this noble game in the Middle States. Here and there, in the inaccessible swamps and mountains a few scattering deer may yet linger, but most of them have fled before the ax of civilization, or have fallen at the crack of the hunter's rifle.

Forty-seven years ago, in company with Oliver H. Perry, a cunning hunter and a generous friend, occurred "My First Deer Hunt in Ohio," an account of which was published in FOREST AND STREAM. Then, in Ohio, Pennsylvania, New York, Illinois, Indiana and Michigan the "woods were full of them," and the sport of the still-hunter unbounded, but now, except in the North Woods of New York, and in the wilds of Michigan, the "sport" has become excessive labor and their capture a lucky scratch.

As an evidence and a record of what has been, for the entire past half-century, of the deer in the FOREST AND STREAM and fire his heart or compose him to slumber, I will recount, in truthful language, my last deer hunt in Ohio, twenty years after my first:

A light snow was falling on one Friday in the latter part of December, 1856, when meeting an old hunter he said:

"There are two or three deer in Parma, near Lake Abram, and if it were not for a confounded lawsuit my official duties oblige me to try to-morrow, I would go for them. This snow will make good tracks of 'you go'."

"Can't you adjourn your case, or get a substitute to try it, and go along with me? If we start early and strike a trail while they are feeding in the morning and undisturbed, we may see them first and get one."

But nothing I could urge seemed to swerve him from what he conceived to be his duty to the State as prosecuting attorney, deeply as he seemed to regret the chance to try his double-barrel revolving rifle of his own invention.

Parma township, in Cuyahoga county, and Lake Abram are about twelve miles from the city of Cleveland, and at that time the Columbus Railroad was running a construction train through the west part of the town, and within two or three miles of the lake, starting at the foot of Superior street at 5 o'clock A. M.

Having got my traps together, or ready for a start at the drop of the net, I concluded to take the 5 o'clock construction train and get off at Everett's Mills, but as there is many a slip between the cup and the lip. When I got down there I could see, in the thick gloom, the tail end of the construction train crossing the Cuyahoga bridge. There was nothing left but to go back home or go afoot. It was about seven miles to Everett's Mills, the snow moist and the tracking splendid; by smart walking on the track of the railroad I could turn into the woods a little after daylight—certainly before sunrise.

A way I went at a lively pace, and with a little running where the ties were gravelled I was able to turn to the left into the thick woods north-west of Lake Abram when it was just light enough to see a track. Scarcely had I penetrated the thick undergrowth along the margin of an old "slashing," when I struck the trail of a deer whose tracks, meandering and close together and leading from bush to bush, indicated, as every old hunter knows, that the deer was feeding and unalarmed. Here was my chance, if properly taken, to steal along cautiously and still, peering into every thicket, every old tree-top, among every jumble of old logs, see him before he could see me, and get one shot before starting. Should I fail in this, a long chase before I could tire him out would be inevitable. When the trailing is good, and the deer started early in the morning, a good traveler can run a deer down so as to keep him in sight and get within shooting distance by four o'clock, provided no rest is given him, but you run when he runs, and only walk when he walks.

Following this plan of approach, I stealthily crawled along, crouching behind logs and bushes, keeping behind trees, and looking sharply everywhere.

Presently, in the top of a beech tree which had been felled when the leaves were on and the main body carried away for wood, I saw a slight motion. Instantly, but so slowly that no movement could be detected, I flattened out and crawled to a tree for better and more deliberate observation. Bringing the tree-top in view again, I could plainly see the horns of a deer and the outlines of his body, but the distance, about twenty rods or one hundred yards, and the thick leaves and intervening trees and bushes, prevented me from seeing just where to hit him fatally. To get over this appeared next to impossible; nothing remained but to shoot at what I could see, or await his next approach of the cover and take the chance of his going out the other side and be hidden from my sight. I waited awhile and began to tremble with the "back fever." That decided it. My rifle was slowly run along the side of the tree, my teeth set and my nerves braced up to repel the tendency to shake, and sighting at what was visible the sharp crack of my rifle resounded through the forest. I was not much surprised to

see him scamper off, for there was no certainty as to what part I had aimed, but I was rejoiced to see his leaps short and erratic and his tail down.

Hastily reloading, I lost no time in trailing him up on a brisk Indian lope. Soon I came to where he had lain down, and discovered by the bleeding in his head that I had hit him in the upper part of the right hip. There was plenty of blood along the trail as I moved rapidly on, but I could not get a glimpse of the buck, so warily did he watch his buck track from every knoll and cover. I must run him down, grinding up my loins, the question, not of speed but endurance, began in earnest.

It was but little after sunrise when the race began, and although unrelentingly kept up, I did not get sight of that deer until after three o'clock. I chased him over to the east branch of the river, then northeast around the southerly end of Lake Abram; thence over to the Columbus road nearly; then northwest to near the place where I started him; thence again up the southwest side of the lake and down on the other side, until near the road, where the track showed the deer was walking and steering toward a large patch of recently felled timber, called a "chopping." There was a high fence between the chopping and the clearing. Now is my time to close the race. He will lie down in that chopping, and if I leave the track and come up on the leeward side of him he cannot escape.

Leaving the track, I made a circuit to the left, and was about to turn into the slashing when I heard a dog barking furiously and evidently coming toward me. I guessed the cause instantly, and my heart sunk to zero. I feared he would chase my deer out beyond rifle shot, and, as it was getting late, the trail would be lost and the deer, too, in the darkness. I stood still and watched what would be the upshot of this new complication, when I saw two deer, one about fifty yards ahead of the other, running at great speed, and a large black dog about one hundred yards from the hindmost deer, coming diagonally toward me. Kneeling down I brought my rifle on a level, with a view of taking one or the other as they ran by, having chosen a clear open space along the bed of a dry creek where they must cross at nearly right angles. I soon saw that the hindmost deer was coming much nearer to me, so I let the foremost one pass and waited until I sighted on a level with his body and the tip of his nose and fired. He braced his forefeet out and stopped instantly. The dog came up while I was reloading, and the buck wheeled around and stamped at him. I walked along a few steps to get a tree, when the dog saw me, curled his head between his legs and ran back out of sight. Believing I had hit the deer fatally, I held my gun on him and walked slowly toward where he stood, panting and apparently troubled for breath. When within about four rods, thinking, as he stood up boldly a perfect picture of strength and beauty, that he might run, I aimed at his head and was just pressing the trigger when the noble fellow sank on his knees and rolled over on his side stone dead. The race was up, and I was the victor. I wanted to sit down and look at him for an hour, but there was no time to be lost; he must be dragged to the road before dark, and it was then four o'clock.

In removing the entrails to lighten the dragging weight, I discovered that he was the same deer I had wounded in the morning, my first shot hitting him endwise through the upper part of the right hip, and disabling but not breaking the bone; my second had struck through about half an inch of the lower part of the right leg.

I dragged him to the road, and hearky, within twenty rods of what was then called the "Stone Tavern," about twelve miles from Cleveland. While watching and waiting for a chance to ride to the city, I ate a hearty supper, and arranged with a Dutchman, who was going to town to market, to deliver my buck at my house the next morning.

After smoking my pipe and to learn going toward the city appearing, I shouldered my gun and trudge along, hoping to be able to catch a ride. But no—all were going the other way. I had already walked and run over fifty miles since I left my home in the morning before five o'clock, so you may easily guess that the twelve miles before me looked long and wearisome. Well, it was two o'clock at night before my head was on my pillow in my own home. The deer came the next morning before I was up, the venison was duly divided, and amid thanks and congratulations, my hardest and last deer hunt was ended.

CLEVELAND, O., April 1893.

MINNESOTA GAME NOTES.

NOT WITHSTANDING the unusual length and severity of the winter, small game seems to have suffered very little. No crust has formed on the snow to imprison the ruffed grouse, and the dozen or so that I have seen within the past week looked as plump and healthy as though they had passed the winter in Florida. This immediate locality, being largely timbered, has never produced a large crop of pinnated grouse, but several large coveys are now in the neighborhood, and they, too, look to be in excellent condition. "Bob White" has never, to my knowledge, taken up a claim in this county. Deer are unusually scarce, and a claim has been found hard and slept cold during the past four months. Occasionally I come across a trail in my rambles, and last week a fine large buck came out and looked our little village over; but unless the killing of deer is prohibited for a term of years, the glory of that sport has largely departed from Minnesota. Ducks and geese are beginning to arrive, and doubtless the supply will soon equal the demand. Gray and black squirrels are found in abundance, and in prime condition for the table. I have had some nice sport with them frosty mornings this spring.

Wildcats are sufficiently numerous to cause sad havoc in poultry yards and among young lambs. I think at least a dozen of the bob-tailed nuisances have been killed in town this winter.

Occasionally wolves treat us to one of their infernal concerts, but rarely do the detestable brutes meet their just deserts.

One of my neighbors went out for a recon hunt last week, and, without gun or dog, captured five.

I recently had a bloodless encounter with a huge panther, the only one seen in this locality for years.

I understand that arrangements are being made to provide entertainment for a brief period of the winter on many of our lakes, to visit our beautiful lakes. Certainly no more healthful or promising fish and game locality can easily be found.

J. FRANK LOCKE

FILLSBURY, MINN

A TRIP AFTER QUAIL.

DURING the month of February last, Teceel, Mnd, Wells, Jr., the odontist, and your correspondent, got everything in readiness for a sporting tour around the Cleveland Springs. The Springs are situated in a beautiful spot, well fixed with a view especially of suiting the convenience of two of our friends, who reside in what was once called "the city of magnificent distances," one a banker, and the other an attorney; and another who lives, and, I trust, flourishes, in that smoky location at the confluence of the Allegheny and Monongahela. It so turned out, however, much to the regret, no doubt, of all these gentlemen, and certainly to ours, that business engagements prevented their participation in the sport which we had reason to believe lay in store for us. The very pleasant and generous gentleman who is the proprietor of the springs, had given us assurance that birds were quite as numerous in the section around him as they were on a former visit of ours and with this we held out the promise to our metropolitan friends, and to him who lives at the confluence aforesaid, that a reasonable quantity of shooting could be had; and besides, they could drink, to repletion, of the waters of as fine a sulphur spring as flows from the bosom of earth. And, all this at such a charge as would demonstrate that the proprietor had no idea of making a fortune out of his sporting guests. The table, we knew from past experience, would be supplied with "the best the market affords," and perfect freedom allowed to those who found shelter under the roof trees. If they could have joined us I knew them well enough to believe they would have had an exceedingly enjoyable time, even though they may not have distinguished themselves very much by their successful achievements in the field. It is certain that we could have killed as many birds as we could have consumed, and when night came, and before retiring to rest, they could not only have entertained us but been themselves entertained by the comicalities, and eccentricities, and weaknesses, and unavailability of one of our companions. We all hope that, at some future date, nothing will intervene to prevent our meeting where birds are abundant, weather propitious, and dogs well trained to the business in hand; and we will endeavor to demonstrate to them that this good old State is destitute neither of respectable gentlemen nor enticing amusements. If this should meet the eye of either of them he will understand the invitation is sincere and comes from one whose "tongue knows no flattery."

According to agreement, our friend who was to entertain us met us at Shelby with the necessary teams for our transportation; and our dogs, Nip, Branch, Argo, Lena and Jack, the last named a pointer, without education, got an opportunity of stretching their limbs, somewhat cramped by railroad transportation. They "skipped on, through dirt and mire," at a lively rate for two miles, the condition of the roads in that section, so we contented ourselves with remaining on the exercise of a due quantity of patience on account of the slowness of locomotion. Then the welcome sight of the main building and the white cottages around the springs betokened that a place of rest and refreshment had been reached. Dinner was soon announced, and hunters and dogs were abundantly supplied. Inasmuch as the afternoon was lowering, with rain enough to make walking quite uncomfortable, we contented ourselves with remaining under shelter, trusting to have plenty of time during our stay to indulge all our shooting propensities. This pleasant anticipation was doomed, as many others have been and many others will be, to great disappointment.

On our way from home, our companion, whom I have hitherto in several communications called Mud, but whose name is something made out of mud, and after being finished after being molded into rectangular blocks, dried and burned, constitutes a very essential part of all edifices, to whatever purposes they may be applied—a gentleman of education and high social worth—flattered himself that he would have the good fortune to have Mac, our host, as his hunting companion, whom he knew he could beat in the use of a gun. His "first sweet draught of glory" he took in contemplating his daily triumphs in the surety that he would never doubt his own superiority of opinion that with his little 16-bore he could "lick out" his competitor and be emphatically the "Big Ike" of every day's tramp. Soon after getting to the springs we duly advised Mac of the anticipated joys of Mud, and urged him to do his utmost to deprive his antagonist of all his expected joys. The next day we separated, Teceel and I going together, while Mud and Mac, with the odontist as a member, took another hunting ground. Our party had long tramp, our dogs hunted well, and we did some gentle shooting, but only succeeded in getting sixteen birds, each bagging the same number. Being generally within hearing, we were aware of the fact that the other party were doing no little shooting, and expected that on their arrival at the house they would report a corresponding quantity of booty. We were looking forward, too, to beholding the face of Mud, radiant with smiles, and his tongue glib on the excellence of his sclopette performances. If I am not sure there is any such word as the last adjective I have used, and if there is, that I have given it its proper signification. But, like many other persons who write for the press, I use it for the purpose of impressing my readers with the conviction that a man who uses sesquipedalian words of recondite signification is possessed of unusual attainments. But when the glooming had come and the trio made their appearance, the vision of Mud plainly indicated that his anticipations had been mere "castles in the air," "baseless fabric of a vision." He had a melancholy and dissatisfied look—the very personification of disappointed ambition.

"What luck, Mud?" anxiously inquired Teceel of the disconsolate Nimrod.

"Oh, let Mac tell it. I am disgusted with the whole business, and feel like pulling him out once." Mud plainly indicated that his anticipations had been mere "castles in the air," "baseless fabric of a vision." He had a melancholy and dissatisfied look—the very personification of disappointed ambition.

"Thirteen I believe," modestly answered our host.

"How many did Mud get?"

"I think he claimed to have killed three, but I am not sure that he got more than two of them."

"How many did you kill?"

"Eight."

"Did Mud shoot much?"

"Oh, yes; he shot over twenty times."

"Now, Mud, you are a pretty fellow; coming all the way up here with your prouder little Scott, that an unappreciative Chatham darkey thought "mout" have cost you nearly fifty dollars, bringing that you were going to beat Mac any way; and yet, on the first trial, got sadly used up. I

reckon you will hardly call out to John Tole from behind the enonymus hedge, and ask him if he has heard the score of the Cleveland hunt. Now will you?"

"Hardly," meekly answered the great disappointed.

After much more hot/door logicomely we retired to our beds, slept soundly, and were ready for breakfast the following morning, our friend with the clay name, as usual, bringing in the bear. At home he fills the important position of a justice of the peace, and has contested the habit of doing everything with judicial deliberation. Indeed, he is a living exemplification of "Curia vult advisors." In this, and many other respects, he differs, very widely, from a certain magisterial official, who derived his civil authority from a military strap who ruled over us some years ago. This fellow, who might have not fully disagreed a pickaxe or dungfork, was certainly ignorant of his duty, not longer after he wrapped the emtic around him was engaged in a conversation with some gentlemen, who were forced to tolerate him, and in the progress of it expressed great surprise at the hesitancy of our real judges in pronouncing an opinion or a judgment upon matters at issue in their courts. "Why," said he, "I find no difficulty in deciding all questions which come before me. Just as fast as a lawyer raises a 'pin' I crush it away and dispatch business! The law—why it ain't nothing to learn."

The weather was exceedingly unpropitious during most of our stay at the springs, and in consequence, we did comparatively little hunting and with poor success. The last day came, and though the sky was gloomy, and light showers occasionally fell, Mnd, Mac and I had the hardihood during the afternoon to venture out to Buffalo Creek, a distance of about four miles, and six miles from King's Mountain station on the Atlantic and Charlotte. We got out there we heard repeatedly what we supposed to be the gun of Capt. W. B. R. Tell, who has a flourishing school at the station named, and who, on Saturdays, indulges his fondness for shooting to relieve himself from the weekly moil of "teaching the young idea how to shoot." We found several coveys, and Mnd and I did some fair work. Just before seven, after we had started for home, one of our dogs set birds in the mid of the road. We got out of the vehicle, and each one of us got a shot; I only getting a bird. Pursuing Mud got seven shots, and no meat. I was else observed to hear, not only the report of his gun, but his observations, as Boh White whirled away to some other retreat from disturbance. Though ordinarily very slow in his movements, I know no one who can shoot with more rapidity or so well as my friend, getting the second barrel after each discharge he would catch a despatching look toward his comrade, and lugubriously ask, "Mac, didn't I hit that bird?" Now, Mac is a truthful man; but, being full of the "milk of human kindness," is soaverse to saying anything to wound the feelings, that when he is put upon his "overdiv," he manages, while sticking to principle, to make his utterings as soft and soothing as possible. His answer early in the evening was, "Well, I thought I shot him." I saw something white near by, and I reckon it could hardly have been the wad." Whatever it was, it is certain that no birds went into his pocket. Just as we were about to enter the carriage, we met with a man who lived in a house near by, who, in a conversation told us that an old lady was sick at the house with "new money."

We had gone on about a half mile, facing a keen north wind which made us wring our blankets closely around us and inspired us with no temptations to indulge in conversation, when Mud suddenly removed the covering from his face, and with slow, measured voice disturbed my reverie by saying:

"I'll—tell—you—how—I—happened—to—do—such—a—bad—shooting—this—evening. The—old—lady's—sickness—bothered—me."

"Then, whether it did," said I. "You didn't know it until after you had got through."

"Oh, yes I did. Didn't we see the doctor's horse there as we went on?"

"Certainly, and the doctor, too; but it does not follow—or, as you judicial gentlemen sometime say, non constat—somebody is sick whenever you see a doctor."

He subsided into silence, which he maintained until the birds which made us wring our blankets closely around us and inspired us with no temptations to indulge in conversation, when Mud suddenly removed the covering from his face, and with slow, measured voice disturbed my reverie by saying:

"Nothing, except sympathy. He heard that a good lady was in the neighborhood, and did some bad missing in consequence of the information."

At this he "smiled a smoky smile," and inquired how long it was before supper. To his great satisfaction this was soon announced, and at the table he wreaked his vengeance on the birds which had escaped by devouring quite a quantity of those which had been put in the frying-pan.

Then we sought the fire again, and talked over the incidents of the day, until your correspondent, who is a "Jack at all trades," suggested that he would proceed to sketch Mud's picture, just after one of those misses, occasioned by sympathy for a woman's bodily sufferings. Paper was handed him, and very soon he had several pictures of the unfortunate sportsman ready for inspection. Mac was so highly pleased with them, that he begged the limner to give them to him, so that he might have them framed to adorn his walls, or make one wall adorn another. He has then, now, and visitors to this health resort, during the coming summer, who are fond of the fine arts, can amuse themselves by looking at them, if they will ask the proprietor for the privilege. Teceel wanted me to sketch Mud's appearance at a store in Montgomery county, while he was giving admiring glances at the proud father of female triplets, weighing 31, 32 and 33 pounds, and, no doubt, sincerely wishing that such a pair of honorary visitors should be his. Teceel wanted me to sketch Mud's appearance at a store in Montgomery county, while he was giving admiring glances at the proud father of female triplets, weighing 31, 32 and 33 pounds, and, no

invariably: "Hardly, I can't go." Change the subject, talk a half hour on other matters, get up to leave, and you hear the inquiry: "What is that you said about a hunt?" "Oh nothing, you can't go. I mentioned it only out of politeness and have nearly made other arrangements." Just as you are ready to leave for the field, in stalks Mud, fully accoutred, with his fat legs stuck in his boots, ready for a match which would fag out a Blackfoot Indian brave. "Do you need any shells and wads for the coming season?" "Hardly. Got plenty." Scan for them and after they come tell him that they cost so much, and he must pay. Out comes the money, and he gets the articles. "We are going to shoot at balls in the meadow this afternoon; will you go there?" "Hardly. I have no loaded shells." After you have reached the grounds, his tall form is seen coming down the hill, belted with well-loaded 16s, ready to try his twenty ball. And at these he shows well—when there is no sick lady in the neighborhood. His head, this, he has irrepressible curiosity and unbounded credulity. If he sees you reading a newspaper, he wants to know the subject engaging your attention. If you have an old shank bone in your hand he inquires what it is. If you pull something from your pocket and turn round he is anxious to learn what you have. Tell him that the shank bone is a turkey yelcer and instantly he gets hold of it and slices it, and you are assured that it is a turkey yelcer, trying to produce the coveted sound. But, as before said, with all his harmless oddities, he is a capital fellow—one of nature's noblemen—and in all things which he undertakes, after you get him at it, ready to do his full part.

We have good guns and fair dogs, and, besides, can occasionally bag some game when we find it; but, alas, it is scarce, and seemingly becoming scarcer. If the diminution could be traced to the Hazzard and Ludin's Rand and the "American Wood Powder" companies will soon have to exclaim: "Our occupation's gone!" As to Bob White and the woodcock and the snipe, but few years will pass before it can be said: "Their name has perished from the earth." We shall still, possibly, have some robins, larks and doves; but I have no faith in inventing a game bird out of the guinea fowl. I know no remedy for this; if I did I should tell it, and give the gratitude of many good people.

Chicago, and many other places, enjoy in the month of May at Waccamaw Lake. He has an invitation to a courteous and agreeable gentleman, who lives upon his banks, to join his friends, A. S. M. and J. D., make his hospitable house his and their home, and have all the sport we can get in taking bread from the water, eating them at the table, and otherwise making himself pleased with whatever the locality can afford. I may, on some future occasion, have time to write an account of the pleasures of which I hope now to partake. WELLS.

MARCH 21, 1893.

A BIT OF WINTER SUNSHINE.

SPRING is coming. The winter has held us in a steady grip, and March has not much like his predecessors, but the snow is silently stealing away, and we are now well have plenty of open water in our lakes. For a month past the familiar whistle of the mallard's wings has sounded above our heads, the crows have cawed for spring, the chipmunks and red squirrels have displayed unusual activity, and nature has seemed to be getting on a "good ready" for spring business and spring sports. The "run" of the pine trees take place, and many of them will be spent or shot on the marshes and in the rivers. A good many have been taken through the ice this winter, and many on the lower lakes. Little fishing has been done here except by the boys, and their aspirations cease with perch.

It seems to me that our Grand Traverse winters have some decided advantages over those of some other districts further south where I have lived. I don't like the constant succession of freezing and thawing weather with its detestable mud, which in Central Illinois and many other places makes it a hard matter to carry a pair of boots across a cornfield when you happen to be looking for quail. Our ground has not frozen this winter, and the deer could easily reach their food at an time; in fact, some of the spruce vegetation has a good start under the snow.

One day took down my gun, and walked down to the river. The poodle followed me, and no matter how that all was right, that being his chief employment, no matter how he is getting on in years, and has assumed the principal charge of the family. He is called "poodle," not so much from his breed, as from his diminutive size—he weighs ninety-eight pounds.

The poodle sat upon his hanches and saw me lay my gun in its rest, and shove the boat into the water; and then as the poodle stepped and the little craft not away, he rose, satisfied that his duty had been fulfilled, and returned to the house.

How spicily pungent is the aroma from the freshly cut pines, as we pass a small clearing on the river's bank. How pleasant the sunshine, glinting from the edges of the ice which borders the swift current, and falling amid the dense masses of shadow, cast by the tangled cedars on the virgin pine. Truly, it is good to be here. The scream of a blue jay comes from above, and a shadow flies across our water. But, ah, old fellow, you and your comrades have kept pretty quiet through the long winter, it is time you were on the warpath again. It has often amused me to note the difference between the actions of a wild jay, and of one which had become accustomed to the presence of mankind through kindly treatment. During several winters, I had a shaft attached to one of the pillars of my piazza, on which we kept food for the winter birds. They seldom came before the snows, and when they did at last put in an appearance it was comical to see the air of confidence with which an old beneficiary of the institution would alight and begin pecking at the food, while his companions, more accustomed to the slings and arrows of outrageous boys, than to kindness, would hold aloof, perhaps requiring two or three visits to accustom them to the feeling that they were so near our windows.

While I have been busy with these recollections, my boat swings wide in the current, and crushes the delicate fringe of ice-work along the trunk of a half-submerged cedar. Instantly, a splash, and up from the other side of a matted tangle of logs and brush, with cry and flutter, rise two beautiful mallards a hundred yards away, with the green head of one shake shining in the sun, as he takes his way across the frozen ice. What a sight! See there is life amid the snow and ice after all—and see that milk gliding along the surface of the water like a serpent over the land. And what is that in the edge of the open water of the river where it shows clear and

black against the snow? Yes, three of them, winter ducks; but I believe they have seen me. Yes, there they go, well, never mind. I didn't expect any game, but just came out for air and exercise. Then remarked the "still small voice": "That being the case, why did you pull on 'em with the left barrel at extra long range? Answer me that." There may have been something in the query, but I'm all out of practice anyhow.

But soft!—I have turned, and another shell slides into the barrel, and on they come before the wind down river. They swerve to the left, and just brush the tops of the tall cedars as they whistle past, but the old tude-bore swings well forward of their line of flight, and the heavy reports ring across the echoing ice. Crash! crash! through the cedars—there you are, my friends, and now I come to think of it, I did mean to bring home a dinner, if I could. I remember saying something to that effect before I left the house. X. CENTRAL LAKE, Michigan, April 7.

TWO BEAR HUNTS IN FLORIDA.

BY NED BUNTLINE.

DOCTOR HENSHELL'S interesting descriptions of his winter cruise in the Flower Land of Ponce de Leon carried me back on Memory's tireless wing to four years of hard service in the Seminole war, from 1836 to 1842, and over the very grounds, only much more of them, which the Doctor covered without peril, except from wind and waves. When I was there the rifle of the keen-eyed red man rung out the death knell of many a brave man, and not a step could be taken, even in the very outskirts of the few towns in the Territory, that was free from deadly peril.

Many persons were killed and scalped within sight of St. Augustine, and the road from there to Jacksonville is yet lined with the graves of victims of the Indians' hate.

In the Everglades, where the Doctor made one visit, I have spent many watchful, active weeks hunting out the cunning fowls, and the Big Cypress, Okochobee and the whole ulow of lagoons and islands on the entire coast were as familiar to me then as the streets of New York have been since.

But to my story. In 1840 we captured a sub-chief named Chiee, who had been outlawed by the tribe for running away with another sub-chief. He was a fighter, as one of our men killed outright by his rifle and another mortally wounded proved when we took him.

Our taking him alive was ordered, for the purpose of securing him for a guide, for it was thought, outlawed as he was among his own people, he would not hesitate to lead us to their camps and hiding places. But he was true to his race. Though we gave him life and treated him and his squaw and baby well, he never showed us an Indian camp until after it was deserted, nor put us on a trail fresh enough to follow with a chance of success.

Of course he was kept under guard when in camp, but I used sometimes to take him out in my canoe to see him spear fish. He could see a fish further and strike it more surely with the grains than any one else I ever have seen.

One day I sat in the stern of my canoe, my rifle between my knees, while I used my paddle to steer and propel the canoe along the outer shore of Upper Matcumbe, the next island on the reef-above Ludlan Key.

It was turtle-laying season, and suddenly a huge black bear stalked out on the beach on the hunt for turtle eggs—a favorite food with them.

He was not one hundred yards off, and Chiee, who was nearest, as he lay on his knees, on whispered:

"Give me gun—me shoot bear?"

Thoughtlessly and very foolishly I reached the rifle forward, and in a second he had it in his hand.

Then, as he cocked it, he gave me a look that chilled every vein in my body. It said as plain as words could have expressed it:

"I'll kill and scalp you and then paddly off a free man!"

We were out of reach of help—I really thought my time had come.

But through life a rare gift—stoical presence of mind—has been mine. Seared as I really was, I did not show it; but quietly, with a smile on my face, said:

"Shoot the bear, Chiee, or he'll turn and get off in the woods!"

Perhaps he thought of the scarlet blanket I had given his squaw and a nice flannel I had bought for the papoose to roll up—perhaps he had to leave them behind, as he must have done had he shot me. Any way the stern look of fiery hate left his visage. He muttered:

"Good! You no 'fraid of Chiee!"

Then turning, he raised the rifle to his shoulder, held it but a second for aim, fired, and the bear fell, shot stone dead—the half-ounce yager ball going through his head just below the base of his ears, the very spot for sure work.

Handing me the empty rifle, which I quickly reloaded and kept in my own hand thereafter, Chiee paddled to the beach, and we soon had a four-hundred-pound bear in the canoe and were heading back for camp on Ludlan Key.

My next bear was killed only three days later.

Jim Egan, one of our pilots, who had been down to Key West to see his family, came back with a dog, which he said was good for bear, deer or any other four-footed game.

I thought I'd try for the head, as I had all tracked up with bear signs, the animals ranging there in the night for dead fish, turtle eggs, etc.

So I took the dog and half a dozen seamen in one of our boats and went up to the upper end of Matcumbe and let the dog out, following him myself with a couple of men armed with muskets. I carried my double-barreled Maubout, an English gun, flint-lock originally, very old, but the best I ever had shot through.

The dog was off as soon as he touched ground, yelping at every jump, running through the thick growth of sea grape, manogany and I know not what other trees, at a rate which left us far behind.

But soon we heard sharp, continuous harking, and one of my men said he had tread the game.

We pushed on, and in a distance of perhaps eighty or ninety rods came up to where we could see the dog tearing around at the foot of a thick-leaved tree not over twenty feet high, and perhaps ten inches in diameter at the root.

Getting closer we saw, to our astonishment, one old bear, a very large one, and two cubs about half grown.

I was but a boy in years, though an acting lieutenant in rank, and as soon as I got up in easy range I told the men to each pick a cub and I'd riddle the old one.

I had thirty or thirty-five number one hucksbot in my barrel and had no idea the old bear could take that dose and live long enough to growl.

We all three fired together. One cub fell dead, the other scored a clean miss, while my bear came down just as full of fight as she was of lead.

The dog was under her as he came, and one terrific jag with her forepaws and a dig with her hinder ones finished the poor cur outright. Then she rose and made for me. I was busy shoving down another load in my gun, but she would have been on me before I had the wad down, had not one of my men shoved his hayoner upon his gun and met her with its full length of steel between the forelegs as she rose for a hug.

It took two or three thrusts to disable her, and by that time I had my gun reloaded, and I gave the second cub, yet in the tree, a quietus in the shape of thirteen bucksbot right in his face as he looked down savagely at the slayers of his mamma and brother.

We were a proud set of hunters, you bet. We had been gone but a little over an hour and wet back with three bears and no loss but one many dog.

Jim Egan vowed he'd never forgive me for letting him be killed. But a five-dollar gold piece and the pelt of the old bear satisfied him, and he smoked the pipe of peace from a plug of "old navy" that came from the same hands.

Next time I'll tell you how the wild hogs tread me on Sanibel Island, near the mouth of the Caloosahatchie, and of killing something beside a deer on a fire-hunt on the same island.

A HUNTING HORN.

HOW TO MAKE, BUT NOT TO BLOW, YOUR OWN HORN.

YOU are pleased to say to a correspondent from Birmingham, N. Y., who makes some inquiries as to blowing horns, that I can probably give him all needed information upon the subject; for I am well skilled in that line of mechanism. It does not become me to show my own horn in regard to it, but I can safely say that I have the capacity to make one which is good enough for me, and can give anyone who is a born mechanic such instructions as will enable him to be successful without "spoiling a horn."

While on a visit to a well-known city, situated not far from Mason and Dixon's line, I became acquainted with Hon. John E. Keena, now a Senator from West Virginia. Both of us being fond of the horn, and both of us sportsmen, we naturally drifted into subjects connected with a sportsman's life and accoutrements. Keena is a fox-hunter, and all fox-hunters ought to have a horn. He asked if I could tell him where he could get a good one. I asked him if he had any mechanical genius, and being told that he could at least make a hen-coop, I stated that I could easily give him the desired information—"Make it yourself." I gave him the instructions, and when I met him again, several months thereafter, he invited me to call at his room and see a specimen of his handiwork. I did so, and he exhibited to me two horns of his own make which were quite equal in tone and finish to any which ever came from my practiced hand.

And now for the instructions. Get a steer horn, from 14 to 18 inches long, not over four years' growth. Let it be as greatly furcated as possible. With a small wire, measure the length of the hollow, and mark on the outer side where the solid horn commences. Saw off the tip about an inch and a fourth above that. Force a small piece of pointed timber in the horn, and nail it, so that in working you can keep the horn confined and steady. Then draw from the tip down the horn, for an inch or more, four lines along the center of the horn. Now fasten the horn by the piece of wood a vice, and with a small bit, bore the hole, using your line to guide you. This will enable you to hit the apex of the interior core. After this is done, saw off the tip, at the base of what you want for the funnel, and with a drawing-knife and a wood rasp and a sharp knife and sand-paper, shape it to suit yourself. My idea is to have it a gentle funnel-shape. When all this is done, if the hole is too small, it may be reamed out with a leveled bit. Take out the piece of wood, and try the tone. If it suits, cut off the butt end, and all is right. If you wish a tone, then take off a half inch at a time, until you are satisfied. If you wish a polish, rub it with a woolen rag, tallow and powdered charcoal.

If your correspondent will follow these directions and fails, I will be ready to "qualify" that nature never meant him for a mechanic, and if that is his trade he had better quit it and go to something else. I succeeded in my first effort, and have the horn now. It is as good an one as ever was blown by a hunter's lips. This horn was made in Arkansas in 1856. I have made many since that time, and they are scattered around among my friends in this State and South Carolina, the disciples of Ninrod, who often make them ring over hill and vale, at the opening and close of a hunt.

Some years ago I had the pleasure of a hunt in one of the seaboard counties, and there met a plain, but worthy old fellow, who had become possessed of the idea that he was "called" to blow the horn of Zion. I thought then and think now that he was laboring under a gross error as to the author of his mission. That hunt and some of its incidents I have heretofore narrated in the columns of the FOREST AND STREAM. He had a rusty old horn, whose tone was very much like that of many I have heard in our country, about the hour of 12 M., used to call the laborers from the field for the purpose of "refreshment." One such was as good as another for that. I felt kindly toward the old man, and promised to give him a horn, which would not only look better, but sound better. So, about two months thereafter, I forwarded it to my friend, Col. T., to be delivered. He got it on a Saturday, about 8 o'clock in the morning, and immediately sent his son with it. The preacher's horse was already saddled to take him to a place about ten miles off, where he had an "appointment" for that day. As he got the horn he put on his spectacles and looked at it all over. Then he put it to his mouth and blew, with short intermissions, for nearly half an hour. Placing it in a drawer, he mounted his steed, met his hearers, but held forth that day with a sermon a full hour shorter than usual, so as to enable him to get to his horn again. So soon as he reached home and stabled his nag, he got out the musical instrument and made the woods echo with its cadences. One such was as good as another for that. I believe, however, to think that the fact was somewhat highly colored.

I may as well say that I think no sportsman's horn should be longer than twelve inches. A short horn is so much more easily handled in the woods than a long one, and besides has, to my ear, much more music in it.

If your correspondent alluded to desires a pretty horn, and to keep it so, he must not let it rust. That it will do, unless he gives it attention. It should be dried always after a hunt, with soft flannel, and rubbed with tallow occasion-

ally. He should observe, also, that in making the horn he does not get it too thin. It ought to be nearly, if not quite, an eighth of an inch thick. If so, it is less likely to get cracked, and besides, can be heated to a better shape.

Now, if I have succeeded in giving your correspondent, or any of your readers, a point of information touching the subject of which I have written, I shall esteem myself as fortunate.

WELLS.

INCIDENTS OF A FRONTIER MARCH.

IN August, 1879, I was with a small detachment of neuneight men and ten horses—in Long Valley, on the Payette River, Idaho, when we suddenly came upon an old female grizzly bear with two cubs. One of the party—an old bear hunter—dismounted and another, mounted, started after the bears. The old one would rise up—she seemed as full as a man—look at the advancing man and horseman, then get down and trying to keep her cubs in front made for the woods, 200 to 300 yards away. As soon as the men began firing she ran off leaving her cubs, which were soon dispatched.

The night before this occurred—just as we were going to camp—a large cinnamon bear and a cougar (mountain lion, panther, *Felis concolor*), jumped from the banks of the little stream and were selected for a bivouac. The cougar roared, covey before the shot and made the forest resound with the most terrific yells I ever heard. Notwithstanding a recent visit to the *Naturalist* states that panthers do not yell. The cinnamon also escaped.

These animals were not twenty yards apart when we first saw them, and we were not more than twice that distance when they jumped, as our horses did too.

The horseman in the chase after the cubs rode two or three times almost over a fine buck, which was lying in the tall grass. The hunter, bent his head down close, and did not stir. After the cubs were secured, a man walked up to within a few yards of the deer and fired; he jumped up and ran off, but was brought down very prettily by the next shot before he got out of range. We left the deer and bear, to push on to camp, intending to return in the morning. Returning we found only a portion of the deer left—the rest having been eaten by our old bear or a cougar. Being short of rations we skinned the cubs, but found their flesh so strong as to be unpalatable. Black and cinnamon bear meat is not unpalatable, but from grizzly, young or old—spare me. Now we worked on over mountains, through burning forests, for eight days, with only a foot-heron and a salmon to stretch out the three days' rations we started with, is all too personal to be of general interest. We found that coffee grounds eaten after drinking the decoction were of considerable service in keeping up the strength.

The railroad has now almost reached Boise, and made accessible the Payette (upper) and Salmon River mountains, where it can be found as fine sporting ground as America affords.

T. E. W., U. S. A.
VANCOUVER BARRIERS, Washington Territory.

In a recent issue of "P. E. B." of Weld, Maine, says some two things of the bear's nature. He says, "the mothers of all animals stand by their young and fight for them as a general rule, especially if the infant is in danger and gives the alarm of distress." This latter clause is one of the principal incentives of the bear's anger toward mankind, as I may partially illustrate by the following incident:

In the winter of 1878-79, while stopping at Crystal River, Fla., some timber cutters came up from the islands on the coast, and reported a bear's nest with young, and went to Nick Barco and myself to return with them and watch the young ones. We started the next day, arriving on the ground just before sunset. All hands being anxious to see the bear and hear the cubs playing among themselves, as had been reported, we determined to go to the nest that day. We accordingly went within twenty-five or thirty feet of the nest, and could easily hear the cubs, but could not see them, and we decided that the wisest course would be not to disturb them until we were sure that the mother would not be disposed of, as if we set them to crying beforehand, the mother would realize their danger and fight more than we desired. This theory proved correct in this instance. After about a half hour of searching, and wishing for the bear to show herself, Nick discovered her through the brush, walking toward the nest, and when within about two feet of it he fired a charge of buckshot into her side, when she immediately returned into the thick brush the same way she came, growling and snarling the way. About one hundred yards from the nest, she lay down, and never got up. After satisfying ourselves that she would not come back, we took the young—three altogether—one having a few white hairs on his breast. The young were quite small—could be held on the hand or put into an ordinary business-coat pocket. Their eyes were open and blue, but they had no teeth when taken. They began to eat their teeth about two weeks after.

A. B. D.
NEW HAVEN, CONN.

THE NEW YORK SOCIETY.

THE last of the spring meetings of the New York Association for the Protection of Game was held at Pinard's on the evening of Monday, the 8th. The President, Hon. R. B. Roosevelt, was in the chair. Mr. Thomas N. Cuthbert, Secretary, read a communication from Mr. William J. Waldon, Rouse's Point, N. Y., calling attention to the large quantity of fish caught by nets in the waters of Lake Champlain and in that vicinity during the spring and summer months. The writer asks if there is no law in the State of New York whereby fish caught by nets in the waters of other States, but sent to the former State for transshipment or sale can be seized, or if there is no fish or game commission in that vicinity to look after that unlawful traffic. Surely, the writer adds, something should be done without delay to stop it. The communication was referred to the Committee on Game Laws.

The Townsend and O'Connor bills for the amendment of the existing laws for the protection of game, now before the Legislature, were discussed and referred to the Legislative Committee on Game Laws, with full power to act upon behalf of the association in relation thereto.

A communication from the State Association was received asking for prizes to be donated to the coming convention. After some discussion it was decided not to offer prizes for pigeon shooting. A motion was then made to encourage fly-casting at the fall tournament of the Rod and Reel Association by offering a prize. This was also lost.

The Chairman appointed Dr. John W. Greene, ex-Senator Alfred Wagstaff and Mr. Wisner H. Townsend delegates to

the annual convention of the State Association for the Protection of Fish and Game, at Niagara Falls.

Mr. Myers thought that trout should not be exposed for sale out of the month of April, as it was plain that they had been caught the day before. The President remarked that the association had this question before them often before and had declined to express any opinion on it. He then asked Mr. Blackford, who was the guest of the evening, to give his views on the subject. Mr. Blackford said that it was a question that had been put to him often. He instructed his men to serialize all boxes of fish sent to and received from April 1st. A law allowed their sale at that time and he did not see why he should decline to sell them as long as all other dealers had them. For himself, he was a strict observer of the laws, and if it appeared best to make the law so that trout could be caught on the first day but not exposed for sale until the second he saw no objection to it. All dealers would then be on the same footing.

Mr. Blackford also said that the difficulties in the way of enforcing the game laws were growing less year by year. The public were being educated up to the matter, and market-dealers appeared to be willing to do all in their power for the protection of fish and game. He understood that a bill before the Legislature proposed to increase the number of State Game Constables by appointing eight additional men, and suggested that the association should use its influence to secure the appointment of two, to be located in New York and Brooklyn.

At the close of the meeting the members of the association enjoyed their customary supper, which was served by Pinard. After coffee and cigars had been served, President Roosevelt gave an interesting history of his fishing and shooting experiences in Southern waters.

DAKOTA WILDFOWL NOTES.—Crow Creek Agency, D. T., April 4.—

We have just had a second edition of *Went* here. About three weeks ago the ducks and geese began to show themselves. As we were having some fine warm weather the Indians began to plow, and had sown considerable wheat, when we had a radical change; the thermometer went from between 70° and 80° down below zero in six or eight hours, and since then we have had a continued series of snowstorms until last Monday, when the sun came out and the wind came from the south. The ducks and geese are at one took advantage of the weather and the first were quite heavy. Since then the wind has changed into the north, and the flight of geese has about stopped again. The ducks still stay around. I went out last night and got my first ducks for the season. I killed three bluehills, one mallard, one redhead, and one green-winged teal. I killed them in some little pond holes that were filled by the melting of the snow. Some of your correspondents complain of the incredible negro "uh hahs" in the Southern States. I don't see why that poor negro with his \$2.50 Zulu is not as much entitled to his ducks and geese as is the white sportsman with his Westley Richards hammerless gun, with Whitworth's patent fluid compressed steel barrels at \$775.00.) Here it is the poor lone Indian, and he does not have the Zulu, but the antiquated old muzzle-loader or musket cut off. You will generally find him just ahead of you, and if he does not make out to kill the game, he will surely scare them away.—P. T. BURNETT-SA-HA.

DAYTON, O., April 9.—Millions of mallards and fat little teal are now warming in the preserve marshes at the lakes of Ohio, Indiana, Illinois and Iowa, and the hunters are hanging away. It is too early yet to write of fishing, but mention that the true knights of the joint rod are planning for the May raid among the bass of old Erie. Woodcock came to the Miami Valley about the middle of March, although not plenty. Snipe are coming in, and the hunters, so long idle or croning over stories of former exploits, are rigging up for the hunt. On Erie, April 9, several parties went to the Cayuga lakes, while others hunted through the marshes at Byron and Frost's. Gustav Sander and Charles Wheslen bagged seventeen snipe and twenty-two plover; John W. Dickson and Adolph Sander got an equal number with the first party; John Stocklein and Mike Donohue brought in nine; and the next day Phil. Wenz bagged twenty-four birds. (Quail were so scarce last fall that the dogs had to run time and therefore will require careful handling in the field.) Hunters in this section are showing preference from settlers to pointers. A blue party of young black ducks (wild), caught on Lake Ontario, were presented to Phil. Wenz, a miller below Dayton. Last fall they started to fly away, but, making a circle of several miles, came back, and flying around for awhile, returned to the pond near the mill and have never since tried to leave, although often uneasy. The hen has been laying, and two broods of young ducks will be hatched.—SINEX.

CHICAGO NOTES.—Chicago, April 14.—Chicago sportsmen have had a surfeit of shooting, and in spite of all this, there is little news to chronicle. The ducks have been very plentiful in all varieties about the city, but the game law of the State of Indiana closes on ducks to-morrow, Sunday, April 15, and as most of the Chicago clubs have their club houses in that State on the northern water courses, it can be seen by the readers of the FOREST AND STREAM, that this will throw a damper on the boys. Still many are out industriously looking for snipe. The latter seems scarce as yet. Abe Klinnman, the veteran shot, has just returned from Lake Seneca. He has been there for six weeks and killed plenty of ducks and some snipe. He reports the shooting at this time. Bluebirds lake as being very good, but says he left only little flocks. Ed. Price and James Watson returned yesterday from English Lake, where they had a fine time. Wirt Dexter, our great local sportsman, has been enjoying good shooting at New Barton Bay, on the Mississippi River, just above Keittsburg, and where he has a steam yacht as a hunting boat. Lydston, Eich, Organ, Pond, and the rest of Chicago's great hunters have been out to the various club grounds. Matters are quieting down.—SPECIAL.

MAINE NOTES.—Oxford, Me., April 13.—Wild ducks were seen to-day for the first time this spring, flying northward in small flocks. The boys are having fly sport banging away at the muskrats, of which there are plenty. Excellent black bass fishing can be obtained here after the first of July. fish, guides, etc., at reasonable prices; also good pickerel fishing. The Oxford Gun Club voted to go to Rangeley the 1st of June. Now look out for deer.—L. N. E.

MAINE DEER BUTCHERS.—Oxford, Maine, April 16.—

Editor Forest and Stream: For several years a herd of deer have been known to roam about the vicinity of North Waterford, and have been allowed to go unmolested, though at times their winter exiles have been within a few rods of the highway. On the 27th of March some men came from Lovell, Me., and gave chase and captured two deer, which they took away in a pung. A few days after they captured a third doe and two bucks, which later, being unwell, were latched up to a tree and very conveniently strangled themselves while the men were taking the doe away. Another deer was run down with dogs, and was said to have been so mangled that it was necessary to kill it, and was dispatched by Stockham, Mr. paries. This is considerable indignation expressed by the North Waterford people, and without doubt the matter will be thoroughly investigated. The law prohibits hunting for or destroying in any manner any deer between January 1 and October 1; and, it would seem that this properly came under its provisions, to say nothing of the premature birth and death of a pair of young fawns after the capture of one of the does. This style of hunting is getting to be a little too common. Only a few days before a similar case was reported from one of the towns further north, and I have been told that parties in Newry have been indicted and fined for a similar offense. The law is evidently intended to protect the deer through close time, and I fail to find any provision for taking them, even alive, during that time. These cases will probably settle the question. Any person may lawfully kill any dog found hunting deer. If people will generally follow the example of our North Waterford neighbors, there will be less difficulty in enforcing the game laws, and there will be more game.—SYLVAN DALE.

WILD TURKEYS IN CALIFORNIA.—

We find the following item in the Los Angeles *Times* of recent date: "Wild turkeys are now to be seen on sale at San Francisco poultry stands—the first that have been noticed by the press of that city, we believe. They are claimed to be the produce of the same wild turkeys of California, came from California, and are selling for thirty cents the pound. The *Call* says the progenitors of these birds were brought from the East at a cost of \$40 each, but we have an impression that the first wild turkeys brought to this State were imported some years ago by Judge Cato, of Ottawa, Ill., and placed on the Island of Santa Cruz, where they have thrived and multiplied greatly. They now afford fine shooting. The American wild turkey is a noble bird, and there is those who hold that it should have been given the place of the national bird of freedom instead of the eagle. Its acquisition by California will prove a substantial gain to the game list." This is the first we have read or heard of there being wild turkeys in this State, if we may except an instance in which some domestic turkeys left a ranch near Pico, Placer county, last year, and took to the brush, where they were at last accounted, having become as wild as any sportsman could wish they had not been killed. The man who hunted and in the course of time furnish good sport for gunners.—Sacramento Bee.

PINNATED GROUSE FOR DELAWARE.—

The Delaware State Game Association are about planting one hundred prairie chickens in their State. There are many sections of Delaware where the pinnated grouse will thrive, and we are sure this enterprising society will see to it that the birds are protected. The association intends also to stock the waters of the State with game fish. Another prairie grouse was this season placed in the Delaware River by the New Jersey Fish Commission.—HOMO.

Philadelphia, April 16.—It is positive that some of the pinnated grouse put out in New Jersey by the West Jersey Game Protection Association have lived. Several have lately been seen near Hammonton. Mr. John S. Davis, well known in Philadelphia as an ardent and observing sportsman, while shooting near Andalusia, N. J., during the past season, put up one, which he certainly identified as a prairie chicken, and another bird during the same day which he thinks was of the same species. The first got up near him, and he heard the peculiar note which the pinnated grouse gives when started. Mr. Davis knows what a prairie chicken is, and with the writer on Western trips has shot it.—HOMO.

MICHIGAN.—Grand Rapids.—

J. Hazard Cart, of Pleasant P. O., Kent county, Mich., killed an American woodcock (probably a last year's bird) on Cranbury Lake, lying partly in Alpine township, Kent county, and partly in Wright township, Ottawa county, Mich., on the 11th of April, out of a flock of forty-two birds. This bird measures six feet three inches from tip to tip of wings, and four feet one inch from end of bill to tip of tail. Weight 14 lbs. 8 ozs. It is in immature, slaty and reddish-brown plumage. My informant could not tell us to the size or color of the rest of the flock. The evening before this bird was killed a large flock passed over this city, swinging around from north to west and northwest in the direction of Cranbury Lake. That night a severe storm struck us from northeast.—E. S. HOLMES.

TENNESSEE.—Nashville.—

L. Valentine, Burt Bray, and J. N. Brooks, recently killed one hundred snipe and twenty ducks, near Bowling Green, Ky. Several fine bags of snipe have been made here, the birds being more numerous, and remaining longer than usual.—J. D. H.

MINNESOTA.—Mantorville, April 10.—

Ducks have not been as plenty before for three years as they are this spring.

MESSRS. W. C. BIRCHMOR, R. S. GILLIAM, JIM PORTER

and Frank Gilliam tramped down in Greene one day last week to take a bird hunt. They passed one farm and kept up such a shooting that all the negroes thought that there was another war on hand. One was burning brush, and he threw his coat in the fire and ran to the house and labbed, hallooing judgment. Another said he heard some powerful bluffs over about Fowells' mills, and a white man said he'd be d—d if ever he'd happen to see another cool-headed old farmer had his children cutting briars, and he sent them all to the house and locked them up, and whipped some of them because they looked out the cracks. That was a day of demoralization that county, and the next day some of the white people came on down and swore on a bill of exchange against the parties, but the hunters compromised. This is no exaggeration, but strictly facts, and they bagged fifty-seven birds.—Oglethorpe (Ga.) Echo.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals. The absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

OLD ANGLING BOOKS.

A SHORT time ago we noticed the new edition of the "Bibliotheca Piscatoria," by Messrs. Westwood and Satchell. The revision by Mr. Satchell was entirely a labor of love, and he has rendered angling literature a great service by not taking his information at second hand, and in consequence his book is of the greatest value possible and one that the buyer of angling books can not well dispense with. As instances of the thorough manner in which he has done his work we cite the following:

The "Treatise of Fysshynge," etc., attributed to Dame Juliana Berners, or Barnes, was looked up, not only in the different editions, but also in the manuscript. The only known manuscript of the "Treatyse of Fysshynge," printed in the 1496 edition of the "Boke of St. Albans," formerly in the possession of Mr. Herbert, afterward of Mr. Haslewood, and now in the famous Denison collection, has been examined by Mr. Satchell, who finds it to contain an independent text of a date not later than Professor Skeat than 1450. It is drawn from the same original as that printed in 1496, but instead of the "readings between it and the printed copy" being, as alleged, (Pickering's reprint, 1837, preface) "very few and unimportant," it varies the phrase throughout, and in many places varies the sense, besides containing many short passages not included in the printed version. Mr. Satchell is preparing the text for publication, and as it is unfortunately imperfect, will supply the lacunae from the edition of 1496, which will also be printed by him with a bibliographical introduction, the matter on each page of the two volumes being made to correspond to facilitate comparison of the two texts.

The same careful search in Walton's work has revealed some new points regarding the first (1653) edition of the "Compleat Angler." Mr. Satchell has noticed that there exist two impressions of this book, or certainly of signature E, and he would be glad to have the reports of possessors of the volume as to which of the two their copies belong. One has the woodcut at the foot of page 81, with the words "the description of a trout" above it; the other has the woodcut in the text, seven lines from the bottom of the page, and without superscription. The three copies in the British Museum are all of the latter form, while several copies in other collections prove to be of the former.

Mr. Satchell's address is: Thomas Satchell, Downshire Hill House, London, N. W., and we hope that any of our readers who may have the books in their possession will communicate with him.

WITH HACKLES AND GENTLES.

IX.

An Angler's Look "Around and About."

"Fishing weather's coming, lads,
The winter dies away;
Hark and behold your days awhile
Trot the streamlets of their smiles,
The landscape of its grace."

IN this fleckle climate the first day of April is far from a genial one, but, at its approach, the angler begins to feel in a different mood than for long days past, and eye and hand take the "line of direction" to the sludges where his hand hooks repose and to where his tackle is stored. His fishing blood begins to warm and his pulse to be feverish, and at the least suggestion of his pastime his thoughts run riot.

"Sleeping we dream of what, awake, we wish—
Dogs dream of bones and fishermen of fish."

—On a passably fine day in early spring it is pleasant to walk by an old fishing-haunt and see the swollen stream prepare itself for the "open" season. To let the thoughts "hark back" to past successful days, hither and yon, or to forecast the possible creels yet to be. Even to look upon a favorite "water" from afar is very pleasant, and one returns to his fire and "Walton" with a new and grateful zest. After such a reflective, or prospective, glance, it is need to "overhaul" one's "kit" and make ready for the first cast of the season.

This fly, or that leader, may have pleasant tales to tell of by-gone sport, and a glance into the well-worn creel will reveal—O, what fine specimens of conditioned trout, to be forever served up for memory to dine on. There are many streams in the walks and drives of the angler that make him sad, because they are no longer tenanted. To the eye, how promising are many such! The water runs clear, but his shadow no more startles the wary fish, and the ripples of the mimic waves seems to sound the gentle requiem of long-stout trout. Literally "fished to death" have such streams been, and by those (the more shame to them!) who should be far above the ignominy of bringing fingerlings to creel.

Other streams there are, whose waters run defiled and muddy with the refuse of factories, and this is a sad sight, both to the trout and beauty-lover as well. In some cases a little care or money might have saved the waters their foul degradation, and the trout might be as lusty there to-day as in the "forest primeval," before greed and utility had barred beauty an equal right to its own.

Many a time and oft have I stood upon a certain rude bridge I wot of, a ledge spanning as likely a bit of trout water as one need see, and sought a "rise." It seemed as if there must be fish in that "deep," and I would not cease trying till I have been compelled, again and again, to do so from lack of any known lure. Then have I filled my pipe and sipped "it might have been." This refrain is as bitter a charge for a pipe as it is for the bear, and after a little the "fragrant leaf" seemed to be void of solace, and I turned the ashes upon the lonely waters, where they dispersed like fond hopes upon Life's fleeting tide. Ent, availed, melancholy, the growing, budding year is no time for sadness, and the fisher's heart

should not long brood over a fishless water. There are well-stocked streams yet to be cast upon, and the time is not far distant when the now troutless ones will be cleft with their swift fins and glowing with their bonnie sides. Let us take heart of grace, enjoy with gratitude, and "pre-serve" with zeal.

"'Tis life to young anglers in early spring time,
In the spring time all so fair,
Through the meadows to go, where primroses grow,
As breathing the sweet, mild air,
When the buttery comes and the great bee hums
Round the sweet, waxed, bee-gone dale,
And a 'twelv' 't'wixt," sing the dicky birds sweet,
Then the heart of the angler is glad."

The first spring duty (due to his own personal self) of the angler is to see that his tackle, in every minute detail, is in prime and thoroughly usable order. Rods, flies, leaders, reels, lines and hooks are a mockery and a snare—to the tempter, not to the fish—if they are in a condition to prove a failure at the critical moment. I once fished with a friend who had left his bait behind him, at home, distant several miles. Fortunately, I was well provided to share with him; but "it might have been" otherwise, and our long-expected fishing day have proven a blank one—i. e., as to well-stocked creeks. This, too, has been a humorous and unusual "accidental occurrence" to a careful and precise angler. Therefore, the more careful ought those of an opposite class to be. Hold hard, there! My homily is ended, brethren of the angle, and its application may be made by whomsoever will.

The winter, also, is ended, and the face of nature begins to smile; the meadows will soon be "wearin' of the green," and, before we are aware, the May fly will be dancing its legs over many a "trouty water," and may we be "lucky to see." To see? Yes, to see and feel the resistance of the trout as we "strike" and prepare for—what the fish may be preparing for us!

"Fishing weather's coming, lads,
The winter soon shall pass away;
Hope and spring will gain the day,
And sport delight your eyes."

O. W. R.

FLORIDA FISHING.

I HAVE just returned from a four months' trip to Florida and traveled quite extensively over the State, including the Kissimmee country, Indian River and the lake region. Everywhere I went I tried the fishing, and on the whole, the results were not satisfactory as to the catch, but I enjoyed the fishing all the same.

I first tried fishing for black bass in the large lakes about Maitland and Winter Park in Orange county, in the month of December, but while I saw plenty of fish jumping, it seemed almost impossible to take them, although I tried live bait, trolling, bobbing, and fly-fishing, at all times of the day and in all kinds of weather.

An old settler told me there was hard to take because the water was too clear. So I do not go to the clear water lakes of Florida for fishing at the same time of the year that I did. The month of January I passed at Kissimmee city on Lake Tahopkegalia, and in this lake I had all the fishing a sportsman could wish. The water in the lake is coffee-colored like the water in the St. John's River. The lake is about twenty miles long and about twelve miles wide in its widest part, and has a uniform depth of about twelve feet, and contains plenty of large-mouth black bass, pickeral, grinnel and catfish. I saw a man there who told me he caught a black bass by trolling that weighed fifteen pounds. The largest fish I caught was an eight-pound bass, five-pound pickeral, and a twelve-pound cat. The grinnel are very plenty, large and very voracious, and give good sport with rod and reel. The twelve-pound cat I captured with an eight-ounce fly-rod. The blue cat are not to be despised; they are very fishy and afford excellent sport.

I reached my particular favorite sport by pulling across the lake from Kissimmee city to the mouth of a run a few hundred yards to the northward of what is known as Excelsior Island. There is a deep hole there, and I have had four fish hooked on four different lines at the same time, and as three of them were attached to light fly-rods, you can easily imagine the sport and excitement.

F. W. DICKINS.

VERMONT AND CANADA NOTES.

I HAVE at this moment received a letter from an old sporting friend who resides in Franklin county, Vermont, giving me the welcome news that the lovers of the rod and gun in that county have at last thrown off their lethargy and have formed a society there for the purpose of protecting fish and game, and also making an earnest effort to restock the depleted waters in that vicinity. Hon. Herbert Brainerd, one of the State Fish Commissioners, offers to procure for the society a quantity of *S. fontinalis*, rainbow trout and land-locked salmon fry, so that they can begin their work at once. You have started the ball, and now, gentlemen, keep it rolling. It will be uphill work at first, but energy and perseverance will surely overcome all obstacles.

Two of the most noted net-fishermen of Swanton, Vt., Messrs. Donaldson and Helliker, were a short time ago arrested while pursuing their nefarious work, and we are watching the action of those who have taken their punishment in hand, to see if it will be dealt out to them as they deserve, in full measure, or that it will be allowed to fizzle out and no good results come out of it. These men have openly violated the fishery laws for years, and have made it standing fast at the very worst, and in spite of the game officers continue to do so.

I passed the Matapedia and Restigouche rivers a few days ago and they were firmly ice-locked, and will continue in that state for some weeks yet. The trout and salmon season in the province of Quebec and Maritime provinces will open late.

Let the pike-perch, or as we call them "dore," taking fly, is a common occurrence to take them in the St. Lawrence, Ottawa and Richelieu rivers, during the months of July and August, after sunset, on a white-winged fly, but during the daytime a live minnow is the most killing bait. In our old Northern rivers they are a game fish, first cousin to the black bass, and when broiled are nearly equal to the bass in flavor.

STANSTEAD.

—RUTLAND, VT., APRIL 10, 1888.

THE SECRETS OF SALMON GROWTH.

[From Blackwood's Magazine, February, 1883.]

ALTHOUGH the salmon has been asked, again and again, to render up the secrets of his life, it steadily refuses to reveal the mystery of the time-table of his progress: from the moment it quits his watery nest till the period when it finds an honored place on our dinner-tables, many of its movements are shrouded in mystery. As was said once upon a time by the Ettrick Shepherd, who was a keen observer of the habits of *Salmo salar*, "Whereabouts it goes to when it is putting on its flesh, or how long it takes to garrish his bones, neither me nor Chanley Purdie can tell—it's a wonder." And a problem, to the students and purports, it still remains. How many are the days of a salmon in the water, and to use another phrase of James Hogg's, "How the fish fills its time" from its cradle to its grave, are still puzzling questions alike to naturalists and fishery economists; while to the general public the tale of growth of that or any other fish is, at all times, as a seal-a-book. When pater-familias is selecting the middle-cut of a choice 33-lb. fish with which to grace his dinner-table and honor his guests, it may probably occur to him to ask himself, "How long has the age of that fine salmon perchance may be, but the fish-merchant is most likely as ignorant as himself, and cannot tell him. Notwithstanding that the fact of its origin and incomings has been frequently diagnosed, the time-table of salmon life is full of mysterious blanks; it is in vain that men have assiduously watched these fish and taken note of their growth, and tried to find out at what periods they become reproductive, and at what age they die—such labors have not added much to the sum of our knowledge. It is all taking the salmon with which we were started as a basis of argument—the 33-lb. fish referred to—it would be interesting indeed if its age could be correctly determined. Absurd stories and ridiculous conjectures have, we know, been at various times circulated about the rapid growth of this fine fish, but most of the tales told have required a very large pinch of salt to make them palatable, so manifold are the perplexities which beset the growth of this "monarch of the brook," and so numerous are the instances of a salmon having to encounter before it attains a weight of 33 lbs. arduous! One of the controversies which environed the early life of the salmon has been singularly difficult to "put to silence." The "parr question," as it was called, had lasted and raged for sixty or seventy years, during which period the war of words and letters had been imbued with such a wonderful amount of vitality as to keep all who were interested in the natural and economic history of the salmon in a perpetual state of excitement. The part question is an old story now, but it is one which will bear to be told in a brief fashion.

Long ago—and to-day as well—many rivers were fished at a particular season to be populous—to swarm, in fact, with a small finger-marked fish, which in Scotland was known as "the parr," but in England was called a "samlet" or "brandling." Sixty years since there were men, naturalists and other experts, who said that these tiny things were distinct fish, and that the young salmon, or young parr, of the more learned of the brethren—Sir Humphry Davy was one of them, Dr. Knox the anatomist was another—said the parr was hybrid. Mr. Yarrell was pretty much of the same opinion, although he was less decided in his utterances than some other naturalists. In one place he states the prevalence of an opinion that parrs are hybrids and all of them males. His reason for saying that "the parr is not the young of the salmon" is, "I have seen no parrs swimming about." "That the parr is not the young of the salmon," in its, of any other of the large species of salmonidae, as still considered by some, is sufficiently obvious, from the circumstance that parr by hundreds may be taken in the rivers all the summer, long after the fry of the year of the larger migratory species have gone down to the sea."

To have said in those days that the parr was the young of the salmon was to court abuse, and to be ridiculous; but for all that, there were men of original views who were of the belief that the little fish which were so plentiful were undoubtedly salmon in an early stage of growth, and that, in time, they would obtain the dignity of scaled fish, and be recognized as smolts—"smolt" being at that date the name given to the recognized young of the salmon. Among those who so believed was James Hogg, to whom reference has already been made; he reputedly declared, "with all his might," that he had seen very many of these tiny things—his own words, that he had more than once handled a parr just as they were becoming smolts. "Have I not held them in these hands many a time," said the Shepherd, "just as the scales were forming upon them? In fact, I have a hundred times rubbed off the newly-formed scales, and seen with my own eyes the marks of the parr, and no mistake about it." The Shepherd certainly shed some degree of light over the darkness which then prevailed, and down to his day has surrounded the salmon. Moreover, the Shepherd was patriotic in his views—he knew that thousands of the parr were annually captured to fill the frying-pans of Tweedside, and his plea was, "Spare these young ones; let us rather eat them in a year or two, when they have become of an age to afford sport to the angler and food to the people."

Another person who entered into the parr controversy with enthusiasm, but at the same time with more method than the Shepherd, was Mr. Shaw of Drumalrig, forester to the Duke of Buccleuch. Mr. Shaw, being at first a little awkward in his method of manipulation, contented himself with privately gathering salmon eggs from the "redds" on which they had been deposited by the female fish, and placing them in an enclosed place saw that they produced parr; but on announcing his discovery and the method of it to some friends, he was told he had made a mistake, and that his fish were not true parr but young salmon. "They must be young salmon," was said, "because that you got them from a salmon-trout (the Nith), and by such a mode you are not to be driven from his purpose, and to mislead his discovery he caught one day a few parr—it was on the 11th of July, 1833, that he did so—and kept them in a pond until they had changed into smolts, which they did between April and the middle of May, 1834. Yet in the face of such a fact Mr. Shaw and his "theory" were still discredited. To make sure of his ground, therefore, he repeated his experiments with a dozen parrs of larger growth, which he took from a salmon-trout (the Nith), and by such a mode the satisfaction of seeing them become smolts—the change from parr to more advanced stage of salmon life requiring a period of two years to accomplish.

On this very remarkable point of salmon biography Mr. Shaw met an opponent who traversed his views, Mr. Young of Invershin, gamekeeper to the Duke of Sutherland, had

also been experimenting on the young salmon, with a view to determine whether or not parr grow into smolt, and at what age the change from the first stage to the second took place. Mr. Young said the change took place in a period of twelve months, while Shaw maintained that two years elapsed before the parr assumed the scales of the smolt. Curiously enough, both in the sequel proved to be right; but the difficulty which had arisen was not settled till the salmon nursery of the river Tay had been in use for a period of two years. Shaw, when he became thoroughly interested in the experiments he had undertaken, and excited by the opposition which was offered to his conclusions, buckled to his work in such a way as to astonish his opponents. His ultimate triumph was complete in its every detail. "I compelled my enemies to admit," he said, "that I had proved the parr to be the young of the salmon, and the salmon to be the parent of the parr."

It seemed the very irony of fate that Mr. Robert Buist—who had been in his day a commercial salmon-fisher in a large way of business, and who had hotly championed and decried the Ettrick Shepherd's discovery that parr were the young of the salmon—should, as superintendent of the Tay fisheries, have to proclaim not only that parr were young salmon, but also that of each hatching a moiety became smolts at the end of one year, while the other moiety did not assume the scales or become imbued with the migratory instinct till they had attained the age of two years. This point of salmon growth may be held to have been finally settled by the operations conducted at Stormontfield, which began in the year 1858, and are still continuing. No one can explain this peculiar problem of parr life—how it comes that of two eggs deposited at the same time by the same fish, one becomes a smolt and seeks the salt water twelve months earlier than a fish born of the other egg! Various experiments have been tried, and what progress has been made in the operation of nature has been arranged, but without avail. The young fish which seek the sea at the end of the first year are well mixed, there being a due proportion of males and females—the same holding good of the half of the brood which remain in the ponds. Nor has the size of the salmon from which supplies of ova and milt for artificial spawning are obtained anything to do with the solution of this remarkable problem. A 40-lb. female fish may provide the eggs and a 2-lb. male the milt, without any disadvantage. None of our fishery experts, nor any of the naturalists of the period, have been able to solve this remarkable riddle in natural history.

For the salmon's first entry in the time-table of its life there now exists reliable data; and to insure precision of statement, we shall enter the figures in their order, which is as follows:

Salmon eggs taken from the gravid fish. Let us say from the 11th November 1862, till the 11th December of the same year, and fertilized with milt obtained in the same manner and at the same time from Tay salmon. These fish came to life in (first egg broke on the 12th) March 1863—the hatching process (it was an open winter) occupying about 115 days; in some years 120 days elapse before eggs hatched in the open air burst and the young salmon are released from their fragile prison. About 10th May, 1864, the first division of the crop of young fish (total of 1863) began to leave the Stormontfield ponds as smolts, and the migration continued till about the 25th of the same month.

At the date of their migration these young ones would be, say, fourteen months old.

The other moiety of the fish was left in the pond (or rather would have been left, had not the pond burst and the fish escaped into the river) for another year, and would not get into smolts till the 10th of May, or twenty-six months old, being at that time in the river Tay.

To this point the fish can be watched and traced—has been in reality watched and traced for a period of thirty years—with the utmost accuracy; and before speculating further on the salmon's tenure of existence, it may be permitted us to state that the parr cannot exist in salt water, nor can the eggs of the salmon be hatched in the sea, as has been sometimes affirmed; that the experiments have been tried, and failed. On the other hand, smolts clad in their panoply of scales have been carried from the river Tay to Stonehaven in Kincardineshire, a distance of sixty miles; and upon being placed in a salt water pond at once took kindly to their new habitation, and rapidly became of greater size and weight. In about six months three of the smolts in question were seen, and by that time they had doubled their size.

Among the curiosities of parr life may be mentioned the fact that specimens of these fish have occasionally been taken with their milt well developed. This circumstance was first noticed and tested by Mr. Shaw of Drumknair, who stated that with the milt of a parr—he it is noted a fish about the size of a minnow—he had successfully fructified the eggs of a large salmon; and a similar experiment, with like result, was tried at Stormontfield. As regards female parr, none have been observed with their roe so developed as to give hope of their being able to perpetuate their kind; by far the greater portion of the females in their first year seen destitute of the most rudimentary signs of ova.

As may be supposed, the operations carried on at Stormontfield were taken advantage of to ascertain some facts as to the rate of growth of the fish. Various modes of marking the departing smolts were at different times adopted, so that, when any of them were caught, they might be recognized. Having some personal knowledge of what was done, the mode of marking the smolts, and having more than once been present at the annual census of these fish, the writer claims to speak with some little authority upon this matter. First of all, let it be stated that the dangers to which the young fish are exposed are so manifold and regular in their occurrence, that it has been calculated by some fishery economists that not above one, or at the very most two, eggs in each thousand deposited by the female salmon arrive at maturity as taking fish. This is a statement, however, which may be accepted with a considerable degree of reserve. That a very large percentage of the eggs of all fish are never hatched we know; it is a fate, as will by and by be shown, incidental to the conditions under which the parent salmon and other fish deposit their ova; but to believe that only one or two out of each thousand eggs come to maturity as fish for the table, would imply such an enormous number of breeding salmon on the river as to be quite out of the question.

To provide the salmon stock of the Tay, for instance—from which stream it is necessary every season to take 70,000 to 80,000 salmon to pay rent of fishing stations and wages of fishermen, wear and tear of fishing-gear and interest of capital employed—would require a greater stock of "spawners" and "milkers" than its tributaries have apparently room to contain. It is impossible to make up a census

of the salmon population of the river Tay, but it is certain that at all periods of the year it must contain perhaps over a million fish of all ages. From the parr—of perhaps 100 to the pound weight—to the comparative giant of the water, which weigh from 25 to 40 lbs. In the months of April and May, for instance, there will be in the river at the same time parr about two months old, parr fourteen months old, and parr just changing into smolts, as two-year-olds. There will also be spring salmon, and probably a few grise, coming land" of all ages and dimensions, ascending and descending the river by day and by night; the capturing of marketable specimens for sale will be going on actively as well, so that the time-table of salmon life, as regards the Tay, or, indeed, any other stream, will be full of the most varied figures, if one could tabulate them with any degree of accuracy. The annual renewal of the Tay stock, if the estimate referred to were to be adopted, would require between 2,000 and 3,000 female salmon weighing 25 lbs., and each guaranteed to produce 20,000 eggs; a similar body of male fish would be necessary—although, as a matter of fact, one male will suffice to spawn the eggs of several females—but, curiously enough, the sexes are far from being equal in number. If we take into account the fish stolen by poachers, the number of breeders indicated would be insufficient.

In consequence, then, of the mortality incident to fish life, a very large number of any particular brood would require to be marked to insure one or two of them being recaptured either as grise or larger fish; therefore, when we say that on one occasion sixty-four smolts were marked by a particular cut in the dead fin, and that no less than five of these fish were afterward identified (in the course of about ten weeks), we believe we are stating that which pretty nearly amounts to an impossibility—namely, that seven per cent. of the smolts (70 per 1,000) return to their native water as well-grown fish. In some cases, indeed, the circumstances are such that there would be more of the marked fish in the waters than those absolutely caught. If there were other five, that would represent the return of 140 per 1,000, which would detract from the value of all previous calculations as to the percentage of destruction. The smolts, when marked, would probably be about five inches in length, and of corresponding girth. The date of the marking operation was 24th May, 1893, on which date the smolts were sent from the ponds; the period of recapture being as follows:

Aug. 16.—A grise weighing 9 lbs. was reported as having been caught, and as having the mark made on it when it was a smolt.

Aug. 20.—Another of the marked fish (taken as a grise, weighing 5 lbs. (Both of these fish were identified by Mr. Buist and Mr. Brown, who performed the operation of marking).

Aug. 23.—Another marked fish taken which weighed 24 lbs.

Aug. 26.—A marked grise captured, but weight not given.

Sept. 19.—A grise of 7 lbs. taken, also bearing the pond mark.

The weights of the four fish given show an average growth of something like 6 lbs. as having taken place within say a hundred days, or, at the best, at the least, within a period indeed of eighty-four days. This rate of growth, too, is wonderful when compared with that of the smolts placed in the salt-water pond at Stonehaven; these fish only doubled their size in six months, when they would be some nine inches long, and about twelve ounces or thereabouts in weight. Verily the quick rate of increase of size in the sea is marvellous as a fact in the natural history of the salmon. As regards the value of this striking change of place, as regards the £ s. d. of the matter, it is also of the greatest importance; it means that, from being an article of almost no money value, smolts become in less than one hundred days fish worth eight or ten shillings each at the wholesale rate. It is not stated whether or not the 9-lb. grise contained roe or milt, which is to be regretted, because at the weight indicated the fish presumably would be seeking a place in which to deposit its eggs; and to add to the curiosity of the situation, these fish might be able to spawn their eggs to be hatched, and this moiety of the brood be going to the sea at the same time as their uncles and aunts! Founding on these facts, the time-tables of salmon life now stand as follows:

Of the same brood, one moiety has remained in the ponds from the date of hatching as parr, weighing probably an ounce, while the other moiety, having attained to the scales of the smolt, have gone off to the sea, and have returned as grise of the average weight of 6 lbs.

That the markings of the smolts referred to were carefully made is certain, and that Mr. Brown, teacher, Perth, and Mr. Buist, superintendent of the River Tay Fisheries, thought the fish which they saw to be the fish marked at Stormontfield, there need be no hesitation in believing. These gentlemen acted throughout in good faith. Our own doubts arise, not so much from the mode of marking which was adopted—marking the dead fin, however, is not always convincing in the event of recapture when a reward is offered, seeing that the mark may be and has been imitated—but from the large percentage of fish retaken—a number that previously would have been voted as purely imaginative, considering the destruction which takes place among the smolts when they reach the sea. Some naturalists have calculated that not above two or three in each thousand of the smolts that descend from the upper waters of a river to the sea will return as living fish. At the mouths of all salmon rivers there awaits the annual advent of the smolts an army of enemies with keen appetites, so that the carnage which takes place is positively dreadful. Moreover, it has been surmised by one or two naturalists that half of the smolts remain in the sea for a year before seeking to return to the place of their birth. Of the sixty-four fish marked in the ponds, therefore, if half remained in the sea, and none at all fell victims to their enemies either going or coming, five, according to all showing, was an extraordinary number to recapture; and the fact being taken for granted, the question then arises, whether or not the rates of increase will continue—that is to say, will a fish, which adds 6 lbs. to its weight in a hundred days, attain a weight of 20 lbs. within a year? Should that be so, the 33-lb. fish of our imagination, not to mention the 40-lb. fish of two years of age, while its brothers and sisters might still have been parr.

Before going further, it may be as well to recur in more exact figures than has yet been done to the mortality which, during the earlier stages of its growth, attends the progress of the salmon. Assuming that a 25-lb. female fish of the salmon kind will, in the course of the season, instinctively deposit on the redds 20,000 ova, it becomes of great interest

to know how many of these will hatch and yield young salmon, and how many of these young salmon will live to multiply and replenish their kind. Of one hundred eggs deposited under natural conditions of spawning, it may, we think, be assumed that not more than five will become fish. The following figures may be accepted as being representative of the position. They are not, the reader may rest assured, taken at haphazard, but after much inquiry and thoughtful consideration of all the circumstances which attend natural spawning.

The eggs being voided by the female salmon in running water, for instance, in consequence of the percentage being fertilized by the milt of the male fish, which is also, of course, discharged in the running stream. The number of eggs in each hundred which escape fertilization may be stated at, say 52.

Of the fertilized ova, a large percentage is devoured by enemies of all kinds long before it has time to hatch; the number may be put at 15. Again, some eggs prove barren, others produce monstrosities, while a great number are washed into places where they cannot hatch, the heavy floods of the winter season so often break up the redds, on which the eggs have been deposited. Under this head, then, it will be a fair calculation to put down 20 eggs, making 87 in all, and leaving only 13 in each hundred to become in due time table-fish and breeders of the future.

It would be quite possible to present even a darker picture than this of the destruction of salmon ova. A common trout, for instance, has been captured with as many as 700 salmon eggs in its gullet. While the keeper of the ponds at Stormontfield one morning shot "a long-legged heron"—when it was dying the bird vomited fifty of the young salmon which it had been feeding upon. The perils of the parr have been thus related by Mr. Buist:

"When the young fish come to life and burst the shell, they lie in a helpless state for five or six weeks, during which water-beetles, slugs and other insects prey upon them unceasingly. After they get into a swimming state, they are devoured by fish of all kinds, and also by sea-gulls and other birds. In the next stage, as fincliny parrs, they are exposed to the ravages of pike, trout, eels, and even salmon themselves. From the stomach of a yellow trout I have seen not fewer than ten full-grown parr cut out—the specimens may be seen in the Perth Museum; and we have cut parrs out of the stomachs of every one in a shoal of forty to fifty pike, captured in the act of devouring them."

Taking note of the 120 fish per thousand, which are all that come to life out of that number of salmon eggs, it will be seen how they are disposed of; and the perils to which they are subjected from poachers will be recounted. But to the list of the more common evils which hinder the growth of our salmon—many of them, no doubt, the result of the varied "pollutions" which are permitted to flow into our rivers—falls to be added a new horror. We are alluding to the outbreak of *ascopolepis ferax*—a disease or growth of a fungoid kind, which in a brief period has played such havoc in the waters of the classic Tweed, as to have resulted in the destruction of over 14,000 fine fish of all sizes in the course of a season! Such a number of deaths in so short a period must prove an enormous factor of growth, and, as a result, a large percentage of mortality must tend, for some years to come, to lower the average weight of the Tweed fish, and also to decrease the value of Tweed salmon both for table use and breeding. No solution of this new problem of salmon life has been yet arrived at, and in consequence no cure has been devised. A Royal Commission, which traveled the country to inquire into the cause of the outbreak, was unable to do more than to evidence—the Commissioners not being able to arrive at any definite conclusion as to a cause, far less to formulate a remedy. It has been actively asserted during the prevalence of the epidemic, that it is a result of the chemical manures which are washed off the adjacent lands in times of flood; but it must not be forgotten that a similar disease is said to have been known sixty years ago, when farmers did not use chemical manures, and it would be difficult to find evidence to the contrary. There are some writers on the subject who believe the disease to result from the over-stocking of the water. But in the days when the Tweed yielded over 200,000 fish in the course of the season, there was no disease—at any rate the disease did not then become epidemic; yet now, when the Tweed is perhaps not yielding a fourth of that number of marketable salmon, and is at any rate presumably not half so populous with fish as it once was, the disease has been much worse in that river than in any other salmon stream—more than half of the big fish in the Tweed having died this season (1881–82) from being attacked by the deadly fungoid growth. In some of the other salmon rivers of Scotland the disease has also proved most fatal.

That a considerable annual mortality exists at all times among the adult fish of all salmon streams we know, although the exact extent of it is seldom proclaimed. As a matter of fact, the salmon, from its cradle to its grave, is pursued with the greatest industry by a perfect horde of relentless enemies. But when all is said and done that can be said and done, and all the *pros* and *cons* of the salmon disease have been well discussed, it will probably be found that the severity of the attack is due to the impure condition of the water, or, at all events, is aggravated thereby. There is, we think, evidence that this is so from the fact that the outbreak of *ascopolepis* has been most destructive in those waters which are most subject to pollution. In the river Tay the mortality from fungoid growth has only reached 2,000 fish—plenty, of course; but, considering the relative magnitude of the streams, far less than in the Tweed. Many opinions have been offered as to the cause and spread of this fungoid growth, but no two persons are agreed upon the matter. In the columns of our local newspapers, correspondents are found engaged in a hot battle about the cause, but it would serve no good purpose to dissect the numerous theories which have been stirred on the subject. As a step towards a remedy, let us first of all have the purest of pure water, instead of water thick as sirup, with "matter in the wrong place." When salmon find themselves in a clean, clear-flowing stream, disease of all kinds will assuredly disappear, or at all events greatly abate in its intensity. In the meantime, if it once was, the disease has been in the river Tweed should have been made to lose, in all probability, about a third of their capital stock of fish from this loathsome disease.

[TO BE CONCLUDED.]

Two quail hunters in California recently discovered a vein of coal which is said to equal the best Pennsylvania anthracite.

Fishculture.

TO FISHWAY EXPERTS.

THE following, headed a circular to experts in the construction of fishways, has been issued:

U. S. COMMISSION OF FISH AND FISHERIES, }
WASHINGTON, D. C.

DEAR SIR—An appropriation of \$250,000 has been made by Congress for the construction, by the Commissioners of the District of Columbia, of a fishway at the Great Falls of the Potomac for the purpose of enabling shad and other food fishes to ascend to the upper portion of the river. The plans and specifications of the work are to be furnished by the U. S. Fish Commission.

The construction of a fishway at this point involves very great engineering difficulties in view of the height of the rise and the rocky nature of the bed of the river, and the very great exposure of any structure to the floating ice. The extreme rise is about 50 feet, on a horizontal base of about 700.

Desiring of securing the assistance of those most competent to advise in this matter, I would respectfully invite you to furnish any suggestions that may present themselves to you in this connection.

Should you be sufficiently interested in the matter to investigate the subject in its details, I will take pleasure in sending you more specific data, as also a copy of the map representing the contours and grades of the portions of the Potomac River involved in the inquiry.

Very respectfully yours,

SPENCER F. BAIRD,
Commissioner.

THE ILLINOIS COMMISSION.

WE have the report of this commission for the year ending September 30, 1881. A reconnaissance of the Illinois River was made, and it was found that a great amount of illegal fishing was done, in some instances steamboats are employed. Complaint has been made of the great mortality among the fish at various points on this river. The people had a theory that it was from the refuse from glucose factories and distilleries, and while the Commissioners do not in anywise dissent in this regard, they guardedly say: "The investigation we find that great quantities of fish die every year from some cause or causes that do not exist in other streams and in other parts of the State."

The Commissioners have experimented with carp, paying particular attention to their habits and peculiarities, and their conclusion is that they are the coming food fish of this country. They are satisfied that "if a proper interest can be created, it will pay to raise this fish, and when they will be cultivated generally on farms as are chickens and hogs, and that when the small amount of trouble and expense necessary for raising and feeding them is considered, their importance as a food producing source will be appreciated. When the facts taken into consideration that the buffalo, the coarsest of our river fish, now commands a price that makes them a luxury, retailing even at river points at eight to ten cents a pound, when a few years ago they could be bought for eight to ten cents a fish, averaging from six to ten pounds, the importance of introducing the carp will be seen."

As to the future of Illinois fish, the Commissioners say: "With a proper enforcement of the laws, fishways over dams, a successful system of work in planting native fish, a proper interest in the cultivation of the carp and the trout will be solved. Illinois should and could be the best stocked State in the Union."

A brief statement of the plan of work adopted is given. The Commissioners have adopted the following: "The Iowa Commission, i. e., taking young fish, thousands of which annually perish along our rivers, either by the drying up or freezing out of the small ponds, lakes and low places. These fish are left there by the receding waters after an over-flow of the river banks and are utilized for stocking the streams, by gathering and distributing them. These fish, as early in the season as the low places can be reached by wagon or boat, are taken out by means of a small meshed mosquito net, being necessary to take the first, a larger mesh being used later in the season. Gangs of men, provided with suitable outfits, are sent into the bottoms, drawing these low places with seines, and where transportation is easily possible they are put into tanks holding about twenty-five gallons of water, and forwarded to the shipping points as may seem desirable. When transportation facilities are limited, the finer varieties of game fish only are selected for shipment, the coarser ones, such as buffalo, catfish, perch, etc. are put into the nearest deep water, the dogfish and gars being destroyed."

CANADA AT THE LONDON EXHIBITION.

AT the coming Fisheries Exhibition Canada will be well represented. The exhibit is now being packed at the fish breeding establishment at Newcastle, and will be forwarded south by way of Halifax, where are additions to the exhibit now being prepared in Quebec and the Lever Brothers, which he taken up. Mr. Willnot has been fortunate in securing some beautiful specimens, and the trout and salmon families appear to be complete. The great bulk of the fish and fish-culturing outfits have now been tested by the exhibition, and are placed in position in the cases in which they are to be shown.

A collection of aquatic insects, such as are detrimental to fish eggs, will form a part of the exhibit. Certain flies, it seems, drop their larvae in the water, which sink to the bottom of the stream, get attached to and feed on the fish eggs. There are other insects to be found on the algae, and they feed on the juices of these plants. Small fish feed on aquatic insects, and these are taken up by larger fish, which in their turn often meet a similar fate by more formidable occupants of the water.

A case of mink, skinned, in the act of catching fish is an attractive part of the exhibit. The model of the hatchery at Newcastle, measuring about twelve by four feet, will be taken to the exhibition. It will be in operation while on exhibition, and the pans and troughs holding the eggs will be kept constantly supplied with running water, so that the successful operation of conducting the two fishery establishments in Canada may be shown. Small models of tugs and craft used on Canadian waters in the fishing industry have been made. A perfect model of the steamer Frances showing the whole of the machinery, and the process of preservation in actual operation. Refrigerators and freezers for keeping the fish fresh for market will also be among the list of objects.

A pretty feature of the exhibit when arranged in the 10,000 feet allotted to it in the Albert Hall, London, will be the

Canadian emblem. In the center will be a mast thirty-five feet high. This will be supported by hollow wire stays, inside of which will be placed lobster and salmon cans bearing different colored labels. The design is in the shape of a pyramid, and along the top of the mast will be twenty feet, will be arranged a tier of fish barrels, over which will be a layer of fish boxes. Suspended around the mast higher up will be a number of lobsters, above which will be the Canadian coats-of-arms of the different Provinces. At the foot of the coats-of-arms will be a stuffed bear. The animal weighed fifty pounds when caught, is a remarkably large one, and well mounted. Above the coats-of-arms will be a stack of fishing rods, spears, drop nets, etc., from which will hang Canadian Jacks and Royal Standard. Placed in smaller pyramids about the emblem will be canned delicacies from the canning establishments which would provoke the appetite of the most fastidious gourmet. A painting of the fishery establishment at Newcastle, by Shrapnell and Widdly, will be taken with the exhibit. It is a bright, happy picture, and executed by an artist of no mean ability.

THE TEXAS COMMISSION.—The report of the Commissioner of Fisheries for 1882 is at hand. Knowing the difficulties that he has had to contend with in the way of indifference to the subject in the Legislature and a consequent lack of funds, we are surprised at the amount of work done in the distribution of carp, to which his energies have been mainly devoted. He is of the opinion that the rainbow trout will thrive in parts of Texas, and 3,000 were planted in the Comal River, near New Braunfels, and 1,000 in Barton's Spring. The fish have lived and are now from six to eight inches long. The U. S. Commission has planted shad in Texas, but with what success time will show. Lobsters will be planted in Galveston Bay.

THE NEW JERSEY COMMISSION.—Two new appointments having been made in this commission to fill the vacancies caused by the death of Dr. Benjamin P. Howell and the resignation of Maj. E. J. Anderson, the new board met at Trenton this week for their session. Mr. Theo. Morford of Newton, was elected chairman, and Mr. R. S. Jenkins of Camden, secretary and treasurer. Sheriff W. Wright, of Newark, is the other member, his appointment having been recorded in our pages last month.

The Kennel.

FIXTURES.

BENCH SHOWS.

May 8, 9, 10 and 11, 1888.—Westminster Kennel Club, Seventh Annual Bench Show, at the Crystal Palace Garden, New York City. Entries close April 23. Chas. Lincoln, Sup't.

FIELD TRIALS.

November 19, 1888.—Eastern Field Trials Club, Fifth Annual Trials, at High Point, N. C. Entries for the Derby close July 1; for the Members' Stake, Nov. 1; for the Aged Stake, Nov. 1. W. A. Coater, Secretary, Flatfish, Long Island, N. Y.

December, 1888.—National American Kennel Club, Fifth Annual Trials, at Grand Junction, Tenn. D. Fryson, Secretary, Memphis, Tenn.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

"AMERICAN KENNEL REGISTER."

Entries for the next number of the American Kennel Register should be sent in at once.

MY DOGS SANCHO AND NEPTUNE.

YOU know, my dear Sancho, the shooting is o'er,

That the gun o'er the meadows may thunder no more,

You know with regret the "close season" is here

And the end of the fun is the end of the year.

That in hedge-row and wheat field, in stubble and weed,

The covets of quail unmolested may feed;

That in intricate swamps, where rivulets run,

The woodcock have vanish'd and silent the gun;

That far in the forest a squire's retreat

The wings of the partridge securely may beat.

So, farewell to the sports of woodland and field,

The last shot is fired, the last volley peal'd!

Old Neptune braved child of bleak Newfoundland!

Your joys are all over at hayside and strand.

The snipe have all fled from meadow and marsh,

While the honk of the geese rook discordantly harsh;

The brant and the duck in phalanx no more

Stretch across the broad bay, or culvert the shore,

Nor enter your old master, with bob and decoy,

To follow the sport with assistance a-joy.

While you sit with a dash and a splash on a swim

Would plunge for the fowl and bear them to him.

I sit by my friend's flickering brazier

And muse o'er the past with its glorious days;

I think of the morns of October so bright,

When flush'd the gray skies with the bloom of the light,

And all the gay birds are color'd with sky;

All the obdurate hum'd with the slow of the kite;

When joyous, light-hearted, I pass from the gate

To range o'er the billowy uplands a-ate.

To plunge in the woodland's dim, glimmering shade,

Where the whirl of the partridge was heard in the glade,

Or pass thro' the dry stubble-fields of the grain,

Where the shocks of the wheat so lately had lain,

Where the quail were at feed, or hid in the hedge

In tussocks of weed or hillocks of sedge.

Oh Sancho be frugal with eyes all a-ape.

Alert for the faintest first scent of the game.

And now by my hearth, in sluggish repose,

Half-watching the flame o'er the ember that glows,

Lie Neptune and Sancho, both idly at rest,

In comfort luxurious, so perfectly blest!

Half-awake, half-asleep, they blink as the blaze

In their slumberous senses so fitly plays.

And methinks, as I gaze in their eyes, I can trace

The thoughts and the musings that wrinkle their face.

They are thinking, mayhap, of their triumphs again,

Of the autumn foray, or the summer campaign—

Of the covets they rout'd, of the flocks they pursued

By the hedge, in the field, or at edge of the wood;

And I know that when drowsy with sleep ye recline,

What exquisite dreamings and visions are thine,

For you will see and you yelp, and your paws seem to move

As if in pursuit of the game of the grove.

GREENPOINT, L. I. ISAAC McLELLAN.

CANINE ARISTOCRATS AND PLEBEIANS.

I AM at last wending my way homeward, and in transitu I breathe the sulphur-laden atmosphere and almost constant rain of the last summer and autumn of Germany, and the smoke-filled fogs of London, where I shall probably remain a month. In my other letters I have threatened to write you in regard to the fish culture establishments I have visited and the dogs I have seen.

I approach the latter subject with hesitation, for each week as I perused your "Kennel Column" I became more and more convinced that what I did not know I furnished a great deal more matter than I did, and about dogs, but if that sacred column thus sickened me, it supplied the antidote for I found also that what I could say no one else had, and hoping that the cause of this omission might prove to be want of knowledge upon the subject, and not want of sufficient interest, I resolved, in my capacity of "sporting tourist," to introduce to you and their notice one or two species of European dogs. I shall not ask you to place them in your well-kept kennel, but give them a bunch in the column to which you have assigned me.

On the s. a. I will dissent criticism by owning up that except as playfellows I have but little knowledge of the sporting dogs of the various varieties of which so many beautiful specimens have been described, praised and illustrated in the FOREST AND STREAM. So I won't try to write of them, but eliminating them at once, divide the dogs of Europe into two classes.

Class I.—the aristocrats. Class II., the plebeians; the first living only to be pets, the latter laboring o' live.

Of Class I. I have seen a great deal. Who has not that has spent time in cities of either the Old or New World? And of them I know little that I even think to be new. Pet dogs have been in fashion for a period far beyond the range of history. A plaster cast at Pompeii shows vividly the dying agonies of a dog, and before the picture a Roman to date A. D. Shakespeare soothes King Lear with his spaniel, more faithful than his children. Mary, Queen of Scots, adored her spaniel, which, after her execution, was found trembling under her clothing; and Madame de Sevigné wrote poems extolling the virtues of her pet, which, perfumed and decked with ribbons, need not have envied the favored pug of the present day.

But pet dogs have been always in fashion, the fashion in them has often changed, and in certain cities of Europe dogs are the rage which in others are but slightly cared for. A pleasant afternoon stroll on the boulevards or Champs Elysees convinces one that, with the French ladies at least, there is an independence, and no favored breed monopolizes the petting, from the dainty little Italian greyhounds, shivering, although well blanketed, through all gradations of size and style up to an occasional bloodhound. All are unuzzed and held in leash, the dangers from the dogs themselves being thus reduced. But there are others. The man who cannot face calmly the contemptuous glance or angry words of fair women should select the unfashionable side for his promenade. Obeying their natural instincts, the pets diverge to the right or left to "hold a woman's coverts short and sweet" with some favored one of the other sex, or, yielding in a moment to brief interviews with flunkies and yard boys, they are being led to the kennel, where they are being punished and quarantined by their fair leaders, whose composure is unruffled under circumstances which would seem trying; but let a masculine leg become entangled with the cord and—well, its owner will wish it hadn't. "Pardon, Madame," fails to recompense.

In Italy the men seem to be more given up to the pet dog mania than the women. The officers are generally handsome men, and their uniform becomes, then greatly, but on the Pincio and in the Borghese they add to the charms of themselves and their surroundings the attraction of a pet, on which they can practice, for the benefit of admiring darts, their arts of caressing. I saw one fine-looking fellow coming on horseback down the hill from the Pincio; he was resplendent in his gold-adorned costume, and every woman he passed turned for another look. So one looks for in Italy a little grayhound, which at intervals he would lift and kiss.

In Heidelberg, the bloodhound was at a premium, and wherever one sauntered or sat, scar-faced, bright colored-capped students strolled or sat beer-drinking, and with every group was one, at least of this species.

In Frankfurt-am-Main and in Honnberg les-Bains, the dog was the dachshund and this dog, which I never saw in our part of the world is, I am told, of special value, for he is not only a very affectionate pet, but a very brave and useful little fellow. The first one I saw I thought was a deformed black and tan terrier, for his markings, even to the spots over the eyes, were identical with those of the terrier. When I asked his owner and my landlord (Mr. Schlotterbeck, who keeps the Quatre Saisons Hotel at Honnberg les-Bains so comfortably that anyone who has once been his guest, will be so again) about him, he gave me his points in writing, which I will quote, and thus justify myself for using your columns to give mine host a free "Ad."

"The badger dog or dachshund is the most peculiar and strangest of all dogs. It is not a cross from different dogs, but is to be considered as a primitive race, whose origin and home cannot be clearly traced; the long body, borne by the crooked legs, which are somewhat turned in, the large head and the long muzzle with the strong teeth, the long, hanging ears, the strong paws, with sharp claws, and the short smooth scaly hair, denote the breed; the tail is thick at the root and pointed at the end, and is generally carried upward, seldom stretched out; the color of the coat is either black, with tan or brown spots on the paws, breast and muzzle, or it is of one color, a rusty red; there are, however, also some spotted specimens. Above the eyes are two small light spots. It is a strong, bold animal; it is useful in hunting on account of its small size, and can be used in pursuit of any kind of game, because it shows the greatest valor and perseverance in the most dangerous chase. A good dog will penetrate with eagerness into the hole of a fox or badger and will not rest until he has driven out his arch enemy, on which occasion it will sometime happen that a dog remains working nearly a day under ground, and sometime gets severely hurt.

The length of the dachshund is about 90 centimeters (36 inches) from muzzle to tip of tail, which is about 20 centimeters long. Its height at the shoulders is from 25 to 28 centimeters (8 to 9 inches), and its weight from 6 to 8 kilos. (12 to 15 pounds)."

The value of these dogs varies; that of Mr. Schlotterbeck, having distinguished himself several times in contests with foxes and badgers, was held at fancy figures; but a good, pure blood pup can be bought for 50 marks (a mark is about 25 cents).

At Aix-la-Chapelle, six hours from Honnberg, I saw in

four months but two of these dogs, while at the latter place they were abundant. At Aix the Elm dog was the favorite, and magnificent dogs they are. Another German friend, Mr. Black, gave me the points of this noble species, rather surprising me at the beginning of our conversation by the intelligence that in Germany there were but three kinds of emines, known as "doggen," viz: the mastiff, the Ulmer and the Danish; all the other varieties are "hundes." At Mr. Lieck's dictation I wrote:

General Appearance.—The Ulmer has not the heavy appearance of the mastiff, neither the slender form of the hound, but between the two it holds a middle; with great head and high, strong but elegant figure, long stride and proud bearing, the tail generally hanging, but when under excitement at horizontal. The points of a good dog are:

Head.—Moderately long with high frontal and somewhat compressed at sides, then broader and flat over the eyes, the forehead in profile being but little higher than the top of nose, rising at rear from front view; the nose and jaws strongly built, the bridge of the former being slightly concave; the upper lip hangs slightly over lower jaw, with marked wrinkles at corner of mouth; under jaw neither protruding nor receding.

Eyes.—Small and round, with sharp expression, with well-developed eyebrows.

Ears.—Set high, and when clipped, as is the custom, standing upright, unclipped they droop.

Nose.—Long, vigorous and lightly curved; broad at breast.

Neck.—Broad, arched and deep.

Back.—Long and rounded, crop short, moderately sloping to the tail root.

Tail.—Broad and strong at root, tapering, not long, seldom reaching beyond the "sprunggelenk" (which I made out to be the muscles of ham just above knee).

Body.—Well drawn up at rear.

Legs.—Fore: Shoulders slanting, upper parts very muscular, running slightly outward at knees. Hind: very muscular ham, lower leg long and strong with angle similar to greyhound's.

Feet.—Rounded and pointing straight ahead, toes well rounded, claws strong and curved.

Udder.—Short, fine and thickly set.

Colors.—There are three marked varieties which are given precedence in value, thus:

1. The "getammte," ground color, golden brown, yellow or gray, with dark flame-shaped splashes, nose, eyes and claws black.

2. The "one-colored," yellow, slate to ash gray, or white with light gray at snout, around eyes and along spine; eyes and claws dark.

3. The "spotted or tiger dog," ground color, white or silver gray, with irregular shaped dark spots, eyes "glassy," nose and nails sometimes flesh-colored.

Points.—Forehead too much compressed, or in the profile too high; deep set, broad or hanging ears; short, plump trunk too narrow chest, concrete back, rounded crop with deep set tail, too narrow or too wide turning forelegs, or curves in the same; protruding knees, feet turned either way, white feet on the dark colored dogs, broad, spreading toes; curved tail, color like a fox, flesh-colored noses on any except the tiger dogs. Some of these Ulmers are as large as the largest bloodhound.

The plebeian dogs of Europe, especially of Austria, Belgium and Germany, however greatly they may differ in breed and style, have one strong point in common, for nearly all are well broken to harness, and perform for the agriculturist in the country, and for all sorts of trades in the city, the labor elsewhere demanded of horses and mules. The teams range from one dog to four, and once I saw six, four ahead and two under the wagon. Three is a very common number, the middle one being in shafts, the two outer in traces.

In Germany they are generally hitched ahead of the wagon, tied in Belgium to the rear axle and run under the vehicle.

The dogs of milk carts, garbage collectors and fish peddlers are so well trained that they could go their rounds undriven. In Aix it is quite common to see a cart consisting of a long pair of skids resting on the axle, and between the two dozen kegs of beer. Baggage is carried to and from the station by them, and one in Vienna with but slight aid on up-grades from the dienstmann, drew my baggage, over one hundred kilograms, to the hotel.

Many of them are fearfully overworked, and lie down panting at every stoppage, but when at work pull for all of their weight. They are not shod in any way, and many of them soon wear out, their feet cracking and tearing. I have seen but few cases where these animals have been used for anything but the lower classes of laborers. There is here in Antwerp a crippled gentleman, who has a noble team of four large dogs, of which he uses two or all four, as he sees fit, for carriage dogs, having a very natty laundry just big enough for one. PISERCO.

ANTWERP, Belgium, Nov. 25, 1882.

THE NEW YORK BENCH SHOW.

FOLLOWING is a complete list of judges for the New York dog show which will be the closing season to each breed. For Irish setters and black and tan setters—Jno. C. Higgs, Esq., Delaware City, Del. For English setters and pointers—Maj. J. M. Taylor, Lexington, Ky. For spaniels and small non-sporting dogs—J. F. Kirk, Esq., Toronto, Canada.

For mastiffs, St. Bernards, berghunde and other large non-sporting dogs—James Watson, Esq., New York city. For collies, terrier breeds—Dr. J. W. Downey, New Market, Frederick county, Md.

SPECIAL PRIZE LIST.

The Eastern Field Trial Club offer the following prizes for dogs that have run and been placed in any of the field trials this year held in America:

- A.—For the best pointer dog, a club medal suitably engraved.
- B.—For the best pointer bitch, a club medal suitably engraved.
- C.—For the best English setter dog, a club medal suitably engraved.
- D.—For the best English setter bitch, a club medal suitably engraved.
- E.—For the best Irish setter dog, a club medal suitably engraved.
- F.—For the best Irish setter bitch, a club medal suitably engraved.
- G.—For the best black and tan setter, a club medal suitably engraved.
- H.—For the best kennel of large-sized pointers, to consist of not less than five owned by exhibitor, a club medal suitably engraved.
- I.—For the best kennel of small-sized pointers, to consist of

not less than five owned by exhibitor, a club medal suitably engraved.

J.—For the best kennel of English setters, to consist of not less than five owned by exhibitor, a club medal suitably engraved.

K.—For the best kennel of Irish setters, to consist of not less than five owned by the exhibitor, a club medal suitably engraved.

L.—For the best kennel of black and tan setters, to consist of not less than five owned by exhibitor, a club medal suitably engraved.

M.—A gentleman sportsman offers a special prize of \$25 for the best English setter dog or bitch.

N.—George C. Sterling, Esq., of New York, offers a pair of imported baccharat vases, value \$25, for the best English setter dog in the open class.

O.—The Westminister Kennel Club offers \$30 cash for the best English setter puppy.

P.—The Messrs. Bruce offer as special prize one year's subscription for the best black and tan setter.

Q.—A member of the Westminister Kennel Club offers \$20 cash for the best black and tan setter puppy.

R.—A member of the Westminister Kennel Club offers \$15 cash for the best pointer dog, to be the get of Sensation.

S.—A member of the Westminister Kennel Club offers \$10 cash for the best pointer bitch, to be the get of Sensation.

T.—A member of the Westminister Kennel Club offers \$30 cash for the best pointer dog puppy.

U.—A member of the Westminister Kennel Club offers \$20 cash for the best pointer bitch puppy.

V.—A member of the Westminister Kennel Club offers \$30 cash for the best Irish setter puppy.

W.—A member of the Westminister Kennel Club offers \$20 cash for the best large-sized canine puppy.

X.—Messrs. Kensington and Sons offer a special prize of a brace of pistols in the service for the best greyhound.

Y.—Messrs. L. W. and R. Rutherford offer \$35 for the best fox-terrier dog, got by one of their stud dogs, or bred in their kennels. Also \$25 for the best bitch, same terms and conditions. Dogs do not count.

Z.—The Westminister Kennel Club offers \$25 cash for best pug, dog or bitch, entered in the open classes.

AA.—The Westminister Kennel Club offers \$10 cash for best croquet dog in the open class, entered by one exhibitor.

BB.—A friend of the Westminister Kennel Club offers \$25 cash for the best mastiff dog or bitch.

CC.—A friend of the Westminister Kennel Club offers \$25 cash for the best foxhound bred in this country.

DD.—The U. S. Cavalry Company, of Lowell, Mass., offer 500 of their new water-proof shot shells for the best English setter dog or bitch in the show.

EE.—Thomas H. Terry, Esq., offers \$10 cash for the best collie dog got by either of his stud dogs and one of his pure bred champion Tweed II. Bitches.

FF.—A friend of Irish setters, owned by the same person.

GG.—J. G. Heckler, Esq., offers gold medal for best Chesapeake Bay dog or bitch.

HH.—J. G. Heckler, Esq., offers gold medal for the best canine puppy.

No entries are required to be made for the special prizes that are offered as above, except classes A to L, but it is necessary that all dogs, to enable them to compete for the special prizes, must be enumerated in the premium list issued by the Westminister Kennel Club.

The award in the other classes will govern the awards in the special classes as far as practicable without any rejudging. Entries close April 23. CHAS. LINCOLN, Supt.

PRE-NATAL INFLUENCE.

ONE of our correspondents writes us: "Allen, in his book on American cattle, refers to the dog, and says, 'With regard to the dog, it has often been observed, and indeed it seems to be a matter of notoriety, that a well-bred bitch, if she has been impregnated during the same year, we have yet to see an instance that would lead us to believe that the above is true. This, of course, is only negative evidence, and as well-known writers maintain the contrary, we are inclined to think that it is not soundly true, and should never feel sure about breeding a bitch that had previously had offspring by a cur. Our attention was first called to this subject many years ago by reading an article in the *Scientific American*, entitled 'The Cur and the Quagga.'"

Some cases were given, among them that of the mare and the quagga, to be presently noted. It has also been stated that the use of jacks in the State of Maine had so affected the mares that the horses bred there a few years since were all spotted.

In the fourth edition of the "Handbook of Physiology," by Drs. Kirke and Paget, published in London, 1870, we find the following reference to this subject: "Nothing has shown what the cur makes for the case of impregnating the ovum, or which is more remarkable, the cur makes for the development of offspring all the characters in features, size, mental disposition and liability to disease which belong to the father. This is a fact wholly inexplicable, and is, perhaps, exceeded in strangeness by none but those which show that the seminal fluid either directly, or more probably through the medium of the mother, may exert such an influence not only on the ovum which it impregnates, but on many which are subsequently impregnated by other males."

"It has often been observed, for example, that a well-bred bitch, if she has once been impregnated by a mongrel dog, will not bear thoroughbred puppies for the next two or three litters after that succeeding the copulation with the mongrel. But the best instance of this kind was in the case of a mare belonging to Lord Monson, who, while he was in India, and wished to obtain a cross-breed between the horse and the quagga, caused this mare to be covered by a male quagga. The offspring of this kind was in the case of a mare, in the shape of its head, black bars on its legs and shoulders, and other characters. After this time she was three covered by horses; and every time the foal she bore had still distinct though decreasing marks of the quagga, the peculiar characters of the quagga being more or less marked, and never again impregnated, but on the three following occasions impregnated by horses. Of the various theories which have been advanced in explanation of this singular fact of which many practical men are so conversant, the most weighty as also recently promulgated by Dr. Alexander Harvey, according to which the constitution of an impregnated female becomes so altered and tainted with the peculiarities of the impregnating mare, through the medium of the fetus, that she necessarily imparts her characteristics to any offspring she may subsequently bear by other males."

Should our correspondent care to investigate further he will find Dr. Harvey's articles which are entitled "On the Fetus in the Uterus of the Female," and "On the Mental and Moral States in either Parent as Influencing the Nutrition and Development of the Offspring," can be found in the *Monthly Journal of Medical Science* for 1844 and 1845, and also in a paper on "Cross Breeding in No. CCCLIX of the same periodical, which was then called the *London and Edinburgh Medical Journal*."

BENCH SHOWS AND JUDGING.

Editor *Forest and Stream*:

A sincere desire to see an improvement in all breeds of dogs prompts me to enter the lists, and break a lance in behalf of bench shows and judging generally, and particularly in behalf of that of some of the classes in the recent exhibition at Washington. I don't think any one who has taken an interest can be fully aware of the purposes for which bench shows were created, and are held, or they would not be so eager to play at "cut and thrust" with their pens.

It is not a mere mental just defense at my hands, and perhaps will not bless me for my tilt in the midst of the tournament.

But having great faith in the results accruing from well-conducted canine competitions and critical judgment, I want to see a few words from you, and I hope your readers will perhaps will not blame me for my tilt in the midst of the tournament.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, APRIL 26, 1883.

VOL. XX.—No. 18.
{ Nos. 29 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 49 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 35 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications,

ANSWERS TO CORRESPONDENTS.

SUCCESS OF FISHCULTURE.

NOTWITHSTANDING there are frequent reports of the successes of fishculture in the pages of FOREST AND STREAM; the reports of the United States Fish Commission; the State commissions; the successes of the Deutsche Fischerei Verein, the Société d'Acclimation, of Paris, and in Holland, and other countries, there is still an occasional skeptic. A Russian professor, A. J. Malngren, has made a report to the Russian Government, in which he discourages the breeding of fish in Finland, because, as he alleges, the artificial breeding of fish, especially in the United States and Canada, has proved a failure. There is an adage that one must go away from home to hear the news, and it strikes us that the adage is true in this case. Where can the learned professor have obtained his information concerning the status of fishculture in the United States and Canada?

The only fish that has failed to appear, after streams have been liberally stocked with it, is the California salmon (*Oncorhynchus ginnat*), when transplanted to the East. In its native habitat this fish has been steadily kept in the rivers by artificial propagation, notwithstanding the enormous drain of the canning industry, which threatened to exhaust the supply. Had there been no propagation on the McCloud River, the canneries of the Sacramento would have exhausted the supply long ago.

The salmon of the Atlantic (*Salmo salar*) which at the settlement of the country inhabited all the rivers as far south as the Housatonic River, in Connecticut, were exterminated by the early settlers before the adoption of fish protection in America, and have been restored to some of the streams. A few salmon were left in Maine, and from these the eggs were taken, and they are now plenty in the Penobscot and are becoming so in the Merimac River. The most thorough proof of the influence of fishculture was shown in the restocking of the Connecticut River with salmon. There had not been one of these fish taken in it for twenty-five years, and many persons argued that the conditions had been so changed by dams, sewerage and impurities from paper mills, etc., that salmon could not now live in it. The U. S. Fish Commission, in connection with the Commissioners of the New England States, thought it worth a trial, and for two or three years they planted salmon in the headwaters. Three years afterward salmon appeared in the river, only a dozen or so, but enough to show that some had lived. The fourth year large numbers were sent to market

by the fishermen at the mouth of the river, who had pound nets arranged so as to stop every fish. Two years later, when the plantings were exhausted, no more salmon were taken. The State of Connecticut would not prohibit her fishermen from capturing all of them at the mouth of the river before they could spawn, and the States lying to the north declined to expend more money for the purpose unless the fish could have a chance to ascend the stream. But the trial was a grand success, as it proved that the river is still fit for salmon, and that with fair play fishculture can again restore the Connecticut to its former productiveness.

Other instances might be cited, but we will merely refer to the success of the culture of land-locked salmon in the Adirondacks, where it was unknown before; in California of the shad, which was a stranger to Western waters; the wonderful growth of carp in America since its introduction a few years ago; and the keeping up of the stock of shad in the Hudson, in spite of increased fishing. The work referred to has all been done by the States and the general Government, and in fact, it could not well be done by private means, and the work in the United States, so far from diminishing, is increasing each year.

To write this seems to us to be needless work. It is known to all who pay attention to this matter, and we regard it as being very much like an argument to prove that two and two make four. Reaping without sowing must eventually exterminate the corn, and the planting of fish here the same relation to future yields as the planting of corn does to the harvest. If the planting is intelligently done, and the necessary conditions of soil and water are properly secured, there will only remain the chances of accident or enemies of the young crop to contend with in order to secure a harvest.

We commend this to Prof. Malngren, and hope that, in all fairness, he will embody it in his next report to his government, in order that Finland may not be too far behind in a knowledge of what is being done in foreign lands.

THE BOY AND THE GUN.

THE boy, bless his heart, is closer to nature than the man. He is a savage in civilized attire; he steals and lies without a blush of shame, persecutes and domineers, and delights in noise and destruction, and will do and dare anything to satisfy his untamed cravings. To make an uproar and kill something nothing quite so well serves him as gunpowder, and for its employment nothing serves him so well as the gun.

Boys have grown particular of these later years, as have the grown-up savages on the frontier, and we must have breech-loaders and 'catridges'; but when we graybeards were boys any tube of iron with a lock and stock was a prize. No matter how it missed fire, kicked or scattered, when it did go off you felt it as well as heard it, and it would sometimes kill a chipmunk or a robin, and so frighten a woodchuck that after one shotted salute from it he would keep his hole for half a day. What a big Injun was the boy who owned or had borrowed such a gun, and how all the other boys gathered about him to watch the mysterious process of loading. What a wise fellow was this to know that he must first put in the powder, and how much of it, and on top of it a wad of tow or wasp-nest or newspaper, and then the death-dealing pellets of precious shot poured out of a vial, and then more wadding. Then came the grand final act of priming. It was thrilling to see him place a G. D. cap between his teeth while he covered the box and returned it to his pocket, then cock the piece and put the cap on to the nipple. What if his thumb should slip from the striker as he eased it down! Sometimes it did, and then what a delightful scare if nothing worse; what shame for the unskillful engineer amid the jeers of the envious, gunless crowd.

But nowadays, alas, almost any boy may have a gun, and only he is enviable who has the best. Well, if he will only use his dangerous toy as he should, let him have it, for the sporting instinct is strong in the young savage. And who for pure love of it is such a naturalist? Is it not he who notes the first comers of spring, meets the chipmunk and the woodchuck at their thresholds when they first come forth from their winter sleep; finds the earliest birds' nests, and knows where the squirrels breed? The sportsman who enjoys his sport-most is he who loves nature best; and who of all the guild enjoys his day with the gun with greater zest than the boy?

Yes, let the boy have his gun, a sound, well-made one, but teach him how to use it—carefully, temperately, humanely. Always as if it were loaded, never out of season, nor too often in season, and never for mere love of slaughter,

THE ALBANY BILLS.

AMONG the game bills introduced at Albany the three most prominent are the Townsend, the O'Connor and the Grady, this last being another form of the second. The Townsend and O'Connor bills were introduced into the Assembly; the Townsend bill was favorably reported by the Committee on Game Laws, passed by the Committee of the Whole and sent to the Senate. Here the Committee substituted for it the Grady bill, being under another name the O'Connor bill which had been defeated in the Assembly. These bills have already been adverted to in our columns and their respective merits noted. The Townsend bill is the only one of the lot deserving support. Its framers had solely in view the protection of game, which is the legitimate aim of a game bill. This is more than can be said of the Grady bill. A fourth bill, known as the Grady compromise bill, is a modification of the original Grady bill, and has been adopted as a substitute for it in the Senate. The "compromise" is on the crow and turkey principle. "You take the crow and give me the turkey; or, I'll take the turkey and you can have the crow." A choice bit of the "turkey" is an open market for woodcock from July 1 to February 1; another piece is the practical immunity from inquisitive detectives with search warrants; a third morsel is the sign-board proclamation scheme. In the rush which is always the order of the day at the close of the session, it is important that friends of game protection in the Legislature should closely watch the proceedings to see that the Townsend bill is not forgotten nor the Grady bill put through. The law is better as it stands than it would be if amended as Mr. Grady proposes.

THE CANOE MEET.—As has been announced in our Canoeing column, the next meet of the American Canoe Association will be held at Stony Lake, near Peterboro', Canada, August 10 to 24. A large representation of American and Canadian canoeists is expected, and the meet promises to be in every way a success. The route to Stony Lake is to Lakefield via Peterboro' from Port Hope or Belleville, which points may be reached from the east or west by the Grand Trunk Railway. Port Hope is also reached by steamer from Rochester, N. Y., and Canadian ports. From Stony Lake, after the meet, many delightful routes will be open to the canoeists, one of these being the Otomabee River, Rice Lake, and Trent River to the Bay of Quinte, and thence to the Thousand Islands. Provisions may be obtained at Peterboro' or Lakefield. Arrangements will be made to have all supplies required forwarded to the camp. Milk, butter, potatoes, eggs, etc., can be obtained from settlers in the vicinity. Fish are abundant in the lake. Maskinonge are caught by trolling. Spoon and other trolling baits of all kinds are used. Black bass may be caught by trolling or by still-fishing. In the latter case frogs, crawfish, grasshoppers or fat pork being used, and occasionally artificial flies.

THE USUAL MUDDLE.—With the approach of the time set for the meeting of the American and British teams comes the rush of explanatory letters, and there is now a possibility of a hitch in the arrangements over the wind-gauge question. According to a cablegram from London on Monday last, the British Rifle Association refused to allow the American regulations, giving the use of the wind-gauge. It was thought that the correspondence which was opened by the American managers immediately after the conclusion of the last match had cleared away all possible misunderstandings, but now a fresh cloud arises, which may require an expenditure of pen and paper before it is dissipated. It is to be hoped that the cablegram only reflects a slight error in the reading of the correspondence, and not a determination on the part of the British authorities to go back to the antiquated regulations of the last match.

THE MICHIGAN LEGISLATURE has been overwhelmed with all sorts of proposed game law amendments this year, and as one way out of the middle a consolidation of all the bills has been effected. The result, if the bill becomes a law, will be a good one. Chief among the changes is a provision which throws upon the possessor of game out of season the burden of proof that it was legally killed. This is an important point.

THE EARLY BIRD PRINCIPLE is presumed to be a commendable one. In these days of competition and rivalry, enterprise carries the day. So, at least, believe certain Essex county, N. J., gunners, who have "opened the ball" and are now bagging woodcock. If this is not enterprise it is hoggishness.

The Sportsman Tourist.

A REMINISCENCE.

BY HENRY E. BAKER.

HOW oft in yipps beside yon crystal stream
That slowly ripples 'neath the birch-trees' shade,
The white the glaze to the foliage settle
Their forest notes till all the place did seem
Enchanted, and I had my fancy dream
Of Genii and their deeds, until afraid
As evening came adown the forest glade,
Where all was still except the owl's shrill scream
From bower remote, and o'er the pathway, lined
With huge shapes that rose on either hand,
Not daring in my dream to look behind,
I've sped until upon the road I'd stand
And see the lamplight gleaming through the blind
To light the tramp back from Fairy Land.

HALIFAX, N. S., April 10, 1888.

AMONG THE BONIN ISLANDS.

"SWEETLIPS" and I were having good times, and were happy. Among points in which our tastes agreed were great fondness for fishing, and a considerable disinclination for hard work, and to us had been assigned for our day's duty the supplying of our camp with fish, and we were fishing.

Our camp was not in the Adirondacks, and we tramping down a mountain brook; nor on either of the islands which dot the great lakes and the St. Lawrence, and we sitting at ease in arm chairs, lazily watching the outer ends of stiff rods for the electric twitch which proclaims a strike. "No dainty, deceiving fly, nor hasty tippet upon formed our weapon, nor were we wasting time and patience in searching for good grounds. In the broadest sense, for we were catching all sorts of fish, and in the narrowest sense, for our gear was of the simplest—we were fishing.

For once, at the least, in our lives, we had struck the right place, at the right time, and we were making the most of it.

We had but to lower our pork-baited cod hooks to such depth as might suit, and immediately haul in, perfectly certain that if from the bottom our hook would bring with it a gorgeous-hued rockfish, almost every time of a different species, and in size ranging from five to fifty pounds; and if from mid-depth some other odd fish of less brilliant hues would be sure to detach himself from the schools beneath us and pay us a visit.

There was but one drawback. "Sweetlips" was very lazy, and I very little, and there is hard work as well as play involved in the bringing of a lively fifty pound fish through as many feet of water, and into the boat. But this was just the kind of hard work we liked.

Our anchor lay fully ten fathoms below us on a bed of many colored coral, the surface of which was broken up into crevices, grooves and deep pools. But that we knew the depth we should have judged it far less. The water was wonderfully clear, and seemed to have the properties of a magnifying lens, for every little fish was as plainly visible as were the monsters which lay idly sleeping, or with hardly a fin quiver stole in and out of the openings in the bank; and the vibrations of the tentacles of the anemones, and the expansion and contraction of the polyps, thousands of both of which ornamented the coral were easily detected. Conchs, cowries and many other shellfish were also abundant. So plainly could we see everything that we had frequently endeavored to capture some of the fish by lowering the baited hook to his nose, but had as often failed, for generally the selected fish was sluggish, and perhaps enjoying an after dinner nap, others, livelier and hungrier, would rush in—and be taken in—instead.

We were seated in a little dugout canoe fishing with hand lines, and our locality was over a coral bank which forms one of the reefs near Coffin Island, one of the Bonin Islands, a group lying just north of the Ladrones, in the Pacific Ocean, about 19° N. These islands were discovered by Capt. Nathaniel Coffin, of Nantucket, while on a whaling voyage, and have for many years been resorted to by whalers to renew supplies of fresh provisions and water. The group consists of six or eight islands, of which but two, namely, Bonin and Coffin, are inhabited; the former by a settlement of thirty or forty people, mostly ex-American whalers, their wives brought from some of the islands to the eastward, of which they were natives, and their progeny; and the latter (at the time of my visit) by two white men, three Raven Island women and their children, one of the men indulging in two of the wives.

The settlement on Bonin Island called Port Lloyd had a governor and common council, and the people seemed very happy in their isolation, cultivating quantities of yams and other vegetables, and furnishing these, with pork, turkeys and goats to the whalers in exchange for clothes, groceries, etc. They had two or three good whale boats, and very often killed whales, cutting them in on the beach.

At Coffin Island the two male inhabitants supported themselves in the same manner. One named Robinson, and called Captain by the other, was a man of considerable education. His ownership of sextants and other instruments of navigation, and quite a library, made it probable that he had been an officer on a whaling ship captain, and his isolated mode of life indicated that it was quite possible that our sailors' views as to his having been a pirate in his young days were correct also.

Although so far away, Coffin Island is a part of the United States, and it became so in this way: At the date of our visit the Pacific Mail Steamship Line was being spoken of as among the developments of the future; and it was considered that a coaling station somewhere between San Francisco and Hong Kong would be necessary. For Perry had not yet made his treaty with Japan, and its rich resources in coal were unknown to the outside world. Commodore Perry, then in command of the East Indian Squadron, was directed to cause surveys and explorations of certain groups of islands (among which the Boninis were included) to decide upon their suitability for such a station.

The sloop of war Plymouth, Captain John Kelley, was sent to the Bonin on this duty, and from her, by way of Port Lloyd, an expedition, consisting of two lieutenants, one midshipman, and thirty men, and in the launch and first cutter been sent to survey this, the most southern of the group, some thirty miles away.

Our surveying and exploring occupied us for over a week, at the end of which time the Plymouth stood over to pick

us up, and was anchored in a harbor we had selected and charted. "Then with pomp and circumstance" we took possession. A tall flagstaff was raised, under which was buried a "casket" (in this case a preserved mac tin-case), containing coins and papers. From the flagstaff a noon, saluted by a salute from the American flag was floated, and on the staff was fastened a copper plate, with date and other suitable inscription, to show that on this, the day of September, 1853, our captain, in the name of the United States of America, took formal possession of the island. Then, after appointing Captain Robinson to be U. S. Consul, we sailed away for China; and I have never heard from there since. I presume, though that a guess, that in the time our Consul up on the casket, appropriated the coins, sold the flag to a whale ship, and used the halliards to secure wild pigs, would not be far out. So, at least, I guessed in 1877, when, being then in command of the Blue-light, I met at Nantucket lineal descendants of Captain Coffin, and referred to this incident in a letter to your paper.

"Sweetlips" and I formed part of the surveyor's expedition, my duty being to watch tide gauges, and his to help me. We were but boys of sixteen, and on one tide at least rather neglected our duties, as I will show in good time. "Sweetlips" was not his real name, only a pet name given him by the sailors on account of a personal peculiarity. He was a long, slab-sided, lean and lanky youth, with skim-milk and watery blue eyes, long yellow hair, a waxen face covered with freckles, and a large pair of thick, protruding, pulpy, crimson lips, hence his sobriquet. A very "Sant bones" always-in-trouble, never-to-be-found-when-wanted, no-use-to-anybody but, "in everybody's mess but nobody's watch," but with nothing bad in his character. We were the only boys in the ship; I had been kind to him, refraining from reporting many little delinquencies; many a slice of soft-tack he had shared in mid-watch, and he was devoted to me—hence our companionship on this occasion. His real name was Jordan, by which I shall call him in future.

An hour or more of success had covered our dugout's bottom with a solid, deep layer of fish, and ourselves as thoroughly with seals, blood and slime, when there came a change. Almost simultaneously an unusually heavy tug at each line and sudden let up proclaimed danger, and our lines came in easily, for they were hookless, and after reefs this was repeated.

The origin of our difficulty was but too apparent. Between us and the bottom, at varying depths, an immense school of large sharks were gliding to and fro, and all of the rockfish had disappeared. Gradually the school worked upward, and soon in all directions the great cocked-hat shaped fins were seen cutting the surface.

We were, very evidently, the attraction; undoubtedly, if they can smell, they scented our blood-soaked garments. They made of us a center, with their cut at a wide angle.

It seemed as though they were considering how best to utilize us. A great fellow, not less than twelve feet long, came once toward the canoe, until his nose nearly touching, and his diabolical eyes glaring at us, he slowly snuck enough to clear our bottom and came up within two yards on the other side, head toward us. This began to look like business, and it would evidently not be a great while before the business might begin.

Fortunately, the sharks did not know their own power, for with one good blow from any one of a dozen big flukes they could easily have provided themselves with rations; and, as there were at no time less than three or four, and sometimes a dozen surrounding us, the supply would have been short, and very quickly disposed of.

"Short" events (in the fishing line) interested us no more, and we were very thankful when, having cut away our anchor line—for we dared not attempt to weigh—we started for the cove, into the very foot of which, and even into shoal water, some of our enemies pursued us.

On the beach, to welcome and help us, care for the canoe and fish, stood Caroline, and I must pause in my adventures to introduce her. I wish I could do it in terms to satisfy myself, but it is very hard after so many years to have seen clearly my fault, and my fault in this line to do full justice to so very early an experience.

Caroline was the daughter of Capt. Robinson, who was a handsome, fair-skinned, brown-haired Englishman, and one of his wives a fine-looking Raven Island native.

"She is a rare combination of beauties inherited from both parents; from her mother the erect straight figure, tall, lithe and graceful, supple as a panther, and quick as a bird in every movement; from her father glow like a hidden light; great black eyes, now mild and gentle as seals, and in a moment flashing with excitement. About twelve years, thus a child in age, but already more than child, not quite a woman; teeth perfect, features regular, and altogether as pretty a girl as one could wish to see."

Please be sure and not omit the quotation marks. The original of the above description I find in my log book, now thirty years old, and it is evidently the work of a very young and rather spoony writer, but I had to use it or else omit a description, and as Caroline will soon turn out to be the heroine of my yarn, I could not thus slight her. There is more about her in the same faded blue ink, but I think it is well to let it stay where it is.

The first day of our arrival I was the first and only boy heart of the little maiden. I was the first and only boy who had ever seen us in my bare buttocks and silver slippers were to her, as they (not mine) are to more sophisticated maidens, even to the present day, irremissible. The mercury in my artificial horizon, the mirrors of my sextant, my watch, and, above all, my stock of fish hooks, carefully displayed, had, step by step, overcome the timidity which at first caused her to fear and shun; and that evening when, with the rum furnished by the natives (not by her father), many of our crew were drunk, she said to me, "Oh, that little community—'but it in stays,' as they call such performances—and I rescued her from a brute who was kissing her most lustily, she screaming with fright, my conquest was complete. She came to our tent, and was made much of and comforted by the lieutenants (now admirals) and myself.

From this time out she was my constant companion, playing for my guide in my rambles through the woods, no well-broken pointer could more quickly detect a bird; no well-trained red bird pusher more surely mark its fall, and no retriever gather it more quickly; and her delight when I made a successful shot, was far beyond my own.

And at times she would take me in her little canoe, warning me to keep very still, paddle me to reefs where beautiful shells were to be found, or to fishing places where, in

shoaler water, we could soon get all we wished of smaller fish, untrouled generally by the large ones. Once though, a small shark, not over four feet long, took my hook, and I brought him to the surface, and fearing to haul him into the canoe, was about to cut my line, when she stopped me, and I could not get the time to average part of her composition. She had a long, sharp, dirt-shaped knife, and with her eyes blazing, watched for a quiet moment, and sunk the blade to the middle in a spot she well knew, and unerringly struck just back of the head, severing the vertebra, killing the fish almost instantly. I had seen hints of this savagery before, when in the woods she chased, captured, and joyously killed a wounded bird.

Our woods tramps we had to be a little careful and not get too far away, for in some localities there were great droves of wild hogs, which would attack a person on sight; these were the descendants of a few which, I was told, were put on shore many years ago by Capt. Howe, an American whaler, and had increased and multiplied greatly. The men, Capt. Robinson & Co., hunted them with Australian bounds, of which they owned several. They were trained to seize the pig by the ears and hold it until it was secured by ropes. Generally a sow, big with young, was selected, transported to the house, and then penned. At the time of our visit there were about a dozen pigs, old and young, in this pen, the stakes of which were fully ten feet high; had they been not over six, I am sure the pigs could have jumped them. They were very wild and savage, but the pork was good.

One incident of the first evening I shall never forget. The night was clear and brilliant; our tent occupied a bit of a horseshoe surrounded by high mountains, and right over our heads, over two thousand feet up, was the summit of a precipice, whose base was not a hundred yards from us. To this clambered some of our rum-inspired Jaels, and about midnight I heard, for the first time, from this summit, "Way Down on the Swance River," sung by one of our foretop-boys, a "Swance River" man," who was the owner of a most melodious tenor voice.

I must return to my fishing. Caroline, when told of our trouble with the sharks, said: "Shark like pork very much; not like crab, all other fish like crab better." And in reply to our query where we could get plenty of crabs, she volunteered to guide us to the spot. Jumping into the canoe, under her guidance, and having paddled about two miles, we came to a great cove bored out by the action of the sea in the face of the rocks. We had passed it once when surveying, but there was then a stiff breeze, and the wide black cavernous mouth was belted by a line of foam and breakers, and the intruding waves caused a tremendous roaring—altogether it did not tempt one to enter. This day, however, it was calm and smooth, and fortunately the tide was well out; although, as we afterward found, rising. Except that the entrance was wider, perhaps by six or eight feet, this cove in many respects resembles the famed Blue Grotto at Capri.

Paddling in until we could wade ashore, we sent Caroline back with the canoe, to remain off the entrance and wait for us; and, plunging in, we scrambled toward the crescent-shaped beach of white pebbles which, after turning a slight angle, fronted us. Hundreds of bits, some of them of enormous size, few larger than our feet, and all of them of the same scintillating array of colors of crabs of all sizes and description, from tiny fiddlers to fellows as big as a dinner-plate, all making for the crevices in the walls. The beach was about fifty feet from the entrance, and the height of the cave from the low water surface about fifteen feet; but at the entrance this was reduced to about eight feet. At the beach the height was still less, and we had to stoop in chasing the crabs to the rear, where they were found, and as lands crabs could enter. Among the pebbles were conchs, cowries, harps and other rare shells, all dead and empty, and we wasted precious time in gathering them, but soon settled down to our work, first doffing our shirts, which we transformed into bags. Crab catching is not an easy matter; they run fast and bite hard; but they were so abundant that gradually we accumulated a good stock. Only a part of the entrance was visible, and holding at arm's length our wide eyes, this side or that, the crabs avoided, and our chase led us further than we thought, we finding large crevices, into which the crabs easily entered, and we, also, after them.

We took no note of time, and although after a while we heard our little sentry calling on us to hurry, we failed to do so, until with bags well filled we saw that our crescent beach had vanished. One looking on, and holding at arm's length our wide eyes, this side or that, the crabs avoided, and our chase led us further than we thought, we finding large crevices, into which the crabs easily entered, and we, also, after them.

We took no note of time, and although after a while we heard our little sentry calling on us to hurry, we failed to do so, until with bags well filled we saw that our crescent beach had vanished. One looking on, and holding at arm's length our wide eyes, this side or that, the crabs avoided, and our chase led us further than we thought, we finding large crevices, into which the crabs easily entered, and we, also, after them.

Outside we could see a fresh sea breeze had sprung up, and the cavern was fronted by a line of breakers, outside of which Caroline had been compelled to take the canoe. Between us and the breakers was a space of comparatively still water. We saw at once that we were in for trouble. Treading water long enough to untie our shirt sleeves and release the prisoners we started for a tussle. Jordan was ahead and nearly to the exit when he stopped suddenly and fairly sprang backward, with the shout, "My God, sir, look there!" One look sent my heart down, for, right in our path, in the still water there projected the snout of a shark, which our morning's experience taught us was a large one.

We lost no time in getting back to shoal water, and, standing immersed to our arm pits, held council. For all that we knew to the contrary, the cavern would, at high tide, be filled to the roof, hence to stay there was to drown, and we dared not attempt to pass that frightful sentinel. There was but one course to be taken, and that a hard one—that we were to open to the exit, and that we had to clamber covered with limpets and other shellfish; we must slither out by them. With Jordan leading we started on our scramble. The task at first proved easier than we had thought; we were both good climbers, and our chase after the crabs had given us both valuable experience.

As we neared the exit we could see the girl, shouting and evidently in great anxiety. She did not see us, nor the shark; but between us were the waves, and Jordan, reaching a tolerably safe foothold, cut a large mound from the rocks and threw it at the shark in hopes of scaring him away. The result was not promising. The splash did attract his attention, but only to attract him as well, and he made for the spot.

Caroline caught sight of us, and at once came as near as she could to our assistance, but we had taken the largest of the canoes, and her strength was not equal to her will; if

fingers, by its being accidentally caught with the meat. They have a way of rapidly rolling over and over when they bite anything, until the piece is twisted out. If they were very large they would not be very good pots to have round, especially if children were exposed.

The little swamps had been dry so long that the water was all gone except in a few shallow holes. I saw something swimming about in a little pool about six feet in diameter. I sat down on the sand bar thrown up around the hole, which had probably been there for years, the work of the alligator when digging the hole. Soon the nubby nose and little green eyes of a young alligator popped up; then another, until I counted six or eight. I was not more than four feet from the water, but as I kept still, the little fellows did nothing but eye me sharply. Pretty soon I heard a strange chucking sound, and a big bunch of a nose and a pair of huge green goatee eyes were thrust up a little too close and familiar, I thought, considering the short acquaintance. I sat quite limber on foot, ready to take leave in case the old lady should harbor a notion to scoop me into the family circle. The stare of sixteen or eighteen eyes was embarrassing, as my audience seemed to expect something of me. Carefully I backed down and out, and the audience suddenly and silently disappeared. I tried to snare the old one, but she pulled out of the nose I fixed, and was not at home for callers for several weeks. By fixing a sack under water and pulling a string I closed the hole behind three of the little ones, which are the pets I now have; three feet each. The bay has filled up with water, so I have not been able to catch the rest, but expect to soon. KNECK.

LAWRENCE, Fla., April 1.

A skin and skeleton of the Florida crocodile (*Crocodilus americana*) is in the National Museum at Washington, specimen number 14,874. They were received from Prof. H. A. Ward, of Rochester, N. Y. The museum would like more specimens.

THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance, Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH.

SUMMARY.

THE following classification of the birds already enumerated in this catalogue may prove of interest to its readers.

CLASS A.—Residents, or species found here during the entire year; 33 species.

CLASS B.—Summer Visitors. Species found here in summer, and with but few exceptions of regular occurrence; 113 species.

CLASS C.—Winter Visitors. Species found here in winter, but usually not at any other time, and with few exceptions of regular occurrence; 21 species.

CLASS D.—Migrants. Species found here during migrations, but with few exceptions not at other times; 67 species.

CLASS E.—Stragglers or Irregular Visitors; 63 species.

A.—Residents, or species found here during the entire year; 33 species.

- 1. Oven-crowned Kinglet.
2. Black-capped Chickadee.
3. Hudsonian Chickadee.
4. White-throated Sparrow.
5. Red-bellied Nuthatch.
6. Brown Creeper.
7. Common Crossbill.
8. White-winged Nuthatch.
9. Domestic Sparrow.
10. Raven.
11. Crow.
12. Blue Jay.
13. Pileated Woodpecker.
14. Hairy Woodpecker.
15. Downy Woodpecker.
16. Black-backed Three-toed Woodpecker.
17. Banded-backed Three-toed Woodpecker.
18. Great Horned Owl.
19. Long-eared Owl.
20. Barred Owl.
21. Screech Owl.
22. Hoopoe.
23. Long-billed Noddy.
24. Golden-crowned Kinglet.
25. Blue Jay.
26. Pileated Woodpecker.
27. Hairy Woodpecker.
28. Downy Woodpecker.
29. Black-backed Three-toed Woodpecker.
30. Banded-backed Three-toed Woodpecker.
31. Great Horned Owl.
32. Long-eared Owl.
33. Barred Owl.
34. Screech Owl.
35. Hoopoe.
36. Long-billed Noddy.
37. Golden-crowned Kinglet.
38. Blue Jay.
39. Pileated Woodpecker.
40. Hairy Woodpecker.
41. Downy Woodpecker.
42. Black-backed Three-toed Woodpecker.
43. Banded-backed Three-toed Woodpecker.
44. Great Horned Owl.
45. Long-eared Owl.
46. Barred Owl.
47. Screech Owl.
48. Hoopoe.
49. Long-billed Noddy.
50. Golden-crowned Kinglet.
51. Blue Jay.
52. Pileated Woodpecker.
53. Hairy Woodpecker.
54. Downy Woodpecker.
55. Black-backed Three-toed Woodpecker.
56. Banded-backed Three-toed Woodpecker.
57. Great Horned Owl.
58. Long-eared Owl.
59. Barred Owl.
60. Screech Owl.
61. Hoopoe.
62. Long-billed Noddy.
63. Golden-crowned Kinglet.
64. Blue Jay.
65. Pileated Woodpecker.
66. Hairy Woodpecker.
67. Downy Woodpecker.
68. Black-backed Three-toed Woodpecker.
69. Banded-backed Three-toed Woodpecker.
70. Great Horned Owl.
71. Long-eared Owl.
72. Barred Owl.
73. Screech Owl.
74. Hoopoe.
75. Long-billed Noddy.
76. Golden-crowned Kinglet.
77. Blue Jay.
78. Pileated Woodpecker.
79. Hairy Woodpecker.
80. Downy Woodpecker.
81. Black-backed Three-toed Woodpecker.
82. Banded-backed Three-toed Woodpecker.
83. Great Horned Owl.
84. Long-eared Owl.
85. Barred Owl.
86. Screech Owl.
87. Hoopoe.
88. Long-billed Noddy.
89. Golden-crowned Kinglet.
90. Blue Jay.
91. Pileated Woodpecker.
92. Hairy Woodpecker.
93. Downy Woodpecker.
94. Black-backed Three-toed Woodpecker.
95. Banded-backed Three-toed Woodpecker.
96. Great Horned Owl.
97. Long-eared Owl.
98. Barred Owl.
99. Screech Owl.
100. Hoopoe.
101. Long-billed Noddy.
102. Golden-crowned Kinglet.
103. Blue Jay.
104. Pileated Woodpecker.
105. Hairy Woodpecker.
106. Downy Woodpecker.
107. Black-backed Three-toed Woodpecker.
108. Banded-backed Three-toed Woodpecker.
109. Great Horned Owl.
110. Long-eared Owl.
111. Barred Owl.
112. Screech Owl.
113. Hoopoe.
114. Long-billed Noddy.
115. Golden-crowned Kinglet.
116. Blue Jay.
117. Pileated Woodpecker.
118. Hairy Woodpecker.
119. Downy Woodpecker.
120. Black-backed Three-toed Woodpecker.
121. Banded-backed Three-toed Woodpecker.
122. Great Horned Owl.
123. Long-eared Owl.
124. Barred Owl.
125. Screech Owl.
126. Hoopoe.
127. Long-billed Noddy.
128. Golden-crowned Kinglet.
129. Blue Jay.
130. Pileated Woodpecker.
131. Hairy Woodpecker.
132. Downy Woodpecker.
133. Black-backed Three-toed Woodpecker.
134. Banded-backed Three-toed Woodpecker.
135. Great Horned Owl.
136. Long-eared Owl.
137. Barred Owl.
138. Screech Owl.
139. Hoopoe.
140. Long-billed Noddy.
141. Golden-crowned Kinglet.
142. Blue Jay.
143. Pileated Woodpecker.
144. Hairy Woodpecker.
145. Downy Woodpecker.
146. Black-backed Three-toed Woodpecker.
147. Banded-backed Three-toed Woodpecker.
148. Great Horned Owl.
149. Long-eared Owl.
150. Barred Owl.
151. Screech Owl.
152. Hoopoe.
153. Long-billed Noddy.
154. Golden-crowned Kinglet.
155. Blue Jay.
156. Pileated Woodpecker.
157. Hairy Woodpecker.
158. Downy Woodpecker.
159. Black-backed Three-toed Woodpecker.
160. Banded-backed Three-toed Woodpecker.
161. Great Horned Owl.
162. Long-eared Owl.
163. Barred Owl.
164. Screech Owl.
165. Hoopoe.
166. Long-billed Noddy.
167. Golden-crowned Kinglet.
168. Blue Jay.
169. Pileated Woodpecker.
170. Hairy Woodpecker.
171. Downy Woodpecker.
172. Black-backed Three-toed Woodpecker.
173. Banded-backed Three-toed Woodpecker.
174. Great Horned Owl.
175. Long-eared Owl.
176. Barred Owl.
177. Screech Owl.
178. Hoopoe.
179. Long-billed Noddy.
180. Golden-crowned Kinglet.
181. Blue Jay.
182. Pileated Woodpecker.
183. Hairy Woodpecker.
184. Downy Woodpecker.
185. Black-backed Three-toed Woodpecker.
186. Banded-backed Three-toed Woodpecker.
187. Great Horned Owl.
188. Long-eared Owl.
189. Barred Owl.
190. Screech Owl.
191. Hoopoe.
192. Long-billed Noddy.
193. Golden-crowned Kinglet.
194. Blue Jay.
195. Pileated Woodpecker.
196. Hairy Woodpecker.
197. Downy Woodpecker.
198. Black-backed Three-toed Woodpecker.
199. Banded-backed Three-toed Woodpecker.
200. Great Horned Owl.
201. Long-eared Owl.
202. Barred Owl.
203. Screech Owl.
204. Hoopoe.
205. Long-billed Noddy.
206. Golden-crowned Kinglet.
207. Blue Jay.
208. Pileated Woodpecker.
209. Hairy Woodpecker.
210. Downy Woodpecker.
211. Black-backed Three-toed Woodpecker.
212. Banded-backed Three-toed Woodpecker.
213. Great Horned Owl.
214. Long-eared Owl.
215. Barred Owl.
216. Screech Owl.
217. Hoopoe.
218. Long-billed Noddy.
219. Golden-crowned Kinglet.
220. Blue Jay.
221. Pileated Woodpecker.
222. Hairy Woodpecker.
223. Downy Woodpecker.
224. Black-backed Three-toed Woodpecker.
225. Banded-backed Three-toed Woodpecker.
226. Great Horned Owl.
227. Long-eared Owl.
228. Barred Owl.
229. Screech Owl.
230. Hoopoe.
231. Long-billed Noddy.
232. Golden-crowned Kinglet.
233. Blue Jay.
234. Pileated Woodpecker.
235. Hairy Woodpecker.
236. Downy Woodpecker.
237. Black-backed Three-toed Woodpecker.
238. Banded-backed Three-toed Woodpecker.
239. Great Horned Owl.
240. Long-eared Owl.
241. Barred Owl.
242. Screech Owl.
243. Hoopoe.
244. Long-billed Noddy.
245. Golden-crowned Kinglet.
246. Blue Jay.
247. Pileated Woodpecker.
248. Hairy Woodpecker.
249. Downy Woodpecker.
250. Black-backed Three-toed Woodpecker.
251. Banded-backed Three-toed Woodpecker.
252. Great Horned Owl.
253. Long-eared Owl.
254. Barred Owl.
255. Screech Owl.
256. Hoopoe.
257. Long-billed Noddy.
258. Golden-crowned Kinglet.
259. Blue Jay.
260. Pileated Woodpecker.
261. Hairy Woodpecker.
262. Downy Woodpecker.
263. Black-backed Three-toed Woodpecker.
264. Banded-backed Three-toed Woodpecker.
265. Great Horned Owl.
266. Long-eared Owl.
267. Barred Owl.
268. Screech Owl.
269. Hoopoe.
270. Long-billed Noddy.
271. Golden-crowned Kinglet.
272. Blue Jay.
273. Pileated Woodpecker.
274. Hairy Woodpecker.
275. Downy Woodpecker.
276. Black-backed Three-toed Woodpecker.
277. Banded-backed Three-toed Woodpecker.
278. Great Horned Owl.
279. Long-eared Owl.
280. Barred Owl.
281. Screech Owl.
282. Hoopoe.
283. Long-billed Noddy.
284. Golden-crowned Kinglet.
285. Blue Jay.
286. Pileated Woodpecker.
287. Hairy Woodpecker.
288. Downy Woodpecker.
289. Black-backed Three-toed Woodpecker.
290. Banded-backed Three-toed Woodpecker.
291. Great Horned Owl.
292. Long-eared Owl.
293. Barred Owl.
294. Screech Owl.
295. Hoopoe.
296. Long-billed Noddy.
297. Golden-crowned Kinglet.
298. Blue Jay.
299. Pileated Woodpecker.
300. Hairy Woodpecker.
301. Downy Woodpecker.
302. Black-backed Three-toed Woodpecker.
303. Banded-backed Three-toed Woodpecker.
304. Great Horned Owl.
305. Long-eared Owl.
306. Barred Owl.
307. Screech Owl.
308. Hoopoe.
309. Long-billed Noddy.
310. Golden-crowned Kinglet.
311. Blue Jay.
312. Pileated Woodpecker.
313. Hairy Woodpecker.
314. Downy Woodpecker.
315. Black-backed Three-toed Woodpecker.
316. Banded-backed Three-toed Woodpecker.
317. Great Horned Owl.
318. Long-eared Owl.
319. Barred Owl.
320. Screech Owl.
321. Hoopoe.
322. Long-billed Noddy.
323. Golden-crowned Kinglet.
324. Blue Jay.
325. Pileated Woodpecker.
326. Hairy Woodpecker.
327. Downy Woodpecker.
328. Black-backed Three-toed Woodpecker.
329. Banded-backed Three-toed Woodpecker.
330. Great Horned Owl.
331. Long-eared Owl.
332. Barred Owl.
333. Screech Owl.
334. Hoopoe.
335. Long-billed Noddy.
336. Golden-crowned Kinglet.
337. Blue Jay.
338. Pileated Woodpecker.
339. Hairy Woodpecker.
340. Downy Woodpecker.
341. Black-backed Three-toed Woodpecker.
342. Banded-backed Three-toed Woodpecker.
343. Great Horned Owl.
344. Long-eared Owl.
345. Barred Owl.
346. Screech Owl.
347. Hoopoe.
348. Long-billed Noddy.
349. Golden-crowned Kinglet.
350. Blue Jay.
351. Pileated Woodpecker.
352. Hairy Woodpecker.
353. Downy Woodpecker.
354. Black-backed Three-toed Woodpecker.
355. Banded-backed Three-toed Woodpecker.
356. Great Horned Owl.
357. Long-eared Owl.
358. Barred Owl.
359. Screech Owl.
360. Hoopoe.
361. Long-billed Noddy.
362. Golden-crowned Kinglet.
363. Blue Jay.
364. Pileated Woodpecker.
365. Hairy Woodpecker.
366. Downy Woodpecker.
367. Black-backed Three-toed Woodpecker.
368. Banded-backed Three-toed Woodpecker.
369. Great Horned Owl.
370. Long-eared Owl.
371. Barred Owl.
372. Screech Owl.
373. Hoopoe.
374. Long-billed Noddy.
375. Golden-crowned Kinglet.
376. Blue Jay.
377. Pileated Woodpecker.
378. Hairy Woodpecker.
379. Downy Woodpecker.
380. Black-backed Three-toed Woodpecker.
381. Banded-backed Three-toed Woodpecker.
382. Great Horned Owl.
383. Long-eared Owl.
384. Barred Owl.
385. Screech Owl.
386. Hoopoe.
387. Long-billed Noddy.
388. Golden-crowned Kinglet.
389. Blue Jay.
390. Pileated Woodpecker.
391. Hairy Woodpecker.
392. Downy Woodpecker.
393. Black-backed Three-toed Woodpecker.
394. Banded-backed Three-toed Woodpecker.
395. Great Horned Owl.
396. Long-eared Owl.
397. Barred Owl.
398. Screech Owl.
399. Hoopoe.
400. Long-billed Noddy.
401. Golden-crowned Kinglet.
402. Blue Jay.
403. Pileated Woodpecker.
404. Hairy Woodpecker.
405. Downy Woodpecker.
406. Black-backed Three-toed Woodpecker.
407. Banded-backed Three-toed Woodpecker.
408. Great Horned Owl.
409. Long-eared Owl.
410. Barred Owl.
411. Screech Owl.
412. Hoopoe.
413. Long-billed Noddy.
414. Golden-crowned Kinglet.
415. Blue Jay.
416. Pileated Woodpecker.
417. Hairy Woodpecker.
418. Downy Woodpecker.
419. Black-backed Three-toed Woodpecker.
420. Banded-backed Three-toed Woodpecker.
421. Great Horned Owl.
422. Long-eared Owl.
423. Barred Owl.
424. Screech Owl.
425. Hoopoe.
426. Long-billed Noddy.
427. Golden-crowned Kinglet.
428. Blue Jay.
429. Pileated Woodpecker.
430. Hairy Woodpecker.
431. Downy Woodpecker.
432. Black-backed Three-toed Woodpecker.
433. Banded-backed Three-toed Woodpecker.
434. Great Horned Owl.
435. Long-eared Owl.
436. Barred Owl.
437. Screech Owl.
438. Hoopoe.
439. Long-billed Noddy.
440. Golden-crowned Kinglet.
441. Blue Jay.
442. Pileated Woodpecker.
443. Hairy Woodpecker.
444. Downy Woodpecker.
445. Black-backed Three-toed Woodpecker.
446. Banded-backed Three-toed Woodpecker.
447. Great Horned Owl.
448. Long-eared Owl.
449. Barred Owl.
450. Screech Owl.
451. Hoopoe.
452. Long-billed Noddy.
453. Golden-crowned Kinglet.
454. Blue Jay.
455. Pileated Woodpecker.
456. Hairy Woodpecker.
457. Downy Woodpecker.
458. Black-backed Three-toed Woodpecker.
459. Banded-backed Three-toed Woodpecker.
460. Great Horned Owl.
461. Long-eared Owl.
462. Barred Owl.
463. Screech Owl.
464. Hoopoe.
465. Long-billed Noddy.
466. Golden-crowned Kinglet.
467. Blue Jay.
468. Pileated Woodpecker.
469. Hairy Woodpecker.
470. Downy Woodpecker.
471. Black-backed Three-toed Woodpecker.
472. Banded-backed Three-toed Woodpecker.
473. Great Horned Owl.
474. Long-eared Owl.
475. Barred Owl.
476. Screech Owl.
477. Hoopoe.
478. Long-billed Noddy.
479. Golden-crowned Kinglet.
480. Blue Jay.
481. Pileated Woodpecker.
482. Hairy Woodpecker.
483. Downy Woodpecker.
484. Black-backed Three-toed Woodpecker.
485. Banded-backed Three-toed Woodpecker.
486. Great Horned Owl.
487. Long-eared Owl.
488. Barred Owl.
489. Screech Owl.
490. Hoopoe.
491. Long-billed Noddy.
492. Golden-crowned Kinglet.
493. Blue Jay.
494. Pileated Woodpecker.
495. Hairy Woodpecker.
496. Downy Woodpecker.
497. Black-backed Three-toed Woodpecker.
498. Banded-backed Three-toed Woodpecker.
499. Great Horned Owl.
500. Long-eared Owl.
501. Barred Owl.
502. Screech Owl.

This classification is made in the order of relative importance as it appears to the writer, although the migrants may be regarded as a class of equal importance with the winter visitors. Stragglers rank last in importance and interest as a rule, although some individual instances are of ornithological importance.

In reading the Catalogue as published I notice many errors of a typographical nature, perhaps due to carelessly written manuscript, but I trust that readers will comprehend such errors.

In the preparation of these notes for publication in FOREST AND STREAM the writer has endeavored to avoid as much as possible all technicalities and to express explicitly and with simplicity such items as were selected for the object in view.

Considers of an inability to convey any information of value to scientific ornithologists, and of the truth of the saying that "there's nothing new under the sun," I have published in this connection such of my notes as seemed of probable interest or value to readers who, like myself, are observers and students of birds and their ways, and in seeking to secure the knowledge of natural history find a constant source of pleasure.

By a continuance of observations, additions can be made to the list of species enumerated for this region, for the territory is extensive and remarkably varied as regards distribution of species.

In conclusion I wish to say to collectors, taxidermists, sportsmen and others that it is always a pleasure for me to receive birds or skins sent for examination or identification, or any notes in regard to birds. Already I am obtaining agreeable recompense for my labor in preparing this local list of birds by new correspondence and the receipt of specimens, and I hope for a continuance of such favors from all those to whom I have been indebted in the past.

PORTLAND, ME., U. S. America. EVERETT SMITH.

THE STUDY OF NATURE.

AS the game laws will probably not be altered or repealed so that professional men and others may hunt and fish during their summer's vacation, let me suggest to such persons that they then study nature and make a specialty of some branch of natural history.

I know a clergyman who several years ago began the study of ants during a summer's vacation. He found the study so pleasant and interesting that he continued it during succeeding vacations. He published a book on the subject. As a scientist he is well known. Now he also studies spiders. One vacation he came to Texas to study its ants, whose homes here are curious and wonderful. It then told me that his entomological studies had given him health and much pleasure.

A clergyman once told me that he thought it was small business for a man to be looking after "bugs" and other insects. I asked him who made the insects. After a short time he replied, saying that he supposed God did it. He had not thought of them as the work of God, and hence worthy of the attention and study of man.

Geology, also, affords a grand study for all. Everyone should know at least the main features of the earth, its rocks, and at least its most common minerals. But the value of such studies is too well known to need any recommendation. A knowledge of them gives never-failing pleasure to all rambles among hills and mountains, especially where nature shows herself in her grandest forms of rock-work.

Botany presents a large and inviting field of study everywhere in the country, especially in the summer, and even in the winter the trees can be known and studied. I have often thought that sportsmen with general knowledge of botany, particularly of trees, would have their means of pleasure much increased. Nor would they then be tempted to kill more game than necessary. When their larler at camp is well supplied with meat or fish they might make notes on the different species of trees around; their size and height. This would give an increased and more permanent value to their communications, which already many of them have made. For observations of other branches of natural history. Much has been said about the many rare species of forest and stream, but very few details of the actual forest have been given in the columns of FOREST AND STREAM.

ARTIST, TEX., April 9, 1893. S. B. BRUCKLEY.

CAROLINA Doves' Nests.—Editor Forest and Stream: I may be a goodly number known to many of your readers that the Carolina dove (*Zenaidura macroura*) has a peculiar habit of incubation. A few days since I found one sitting on two eggs in an old robin's nest, reconstructed by a few new twigs placed inside. A day or so before I found one sitting on her eggs in a cedar tree, on a newly constructed nest, formed very loosely of small twigs, on a projecting limb about eight feet from the ground. Again, during the spring of 1881 I found a dove sitting on two eggs laid on a stump in a thick wood, without a twig or anything pertaining to a nest.—OLD TURKEY (Long Hill, N. J., April 23, 1893).

TURKEY BUZZARD IN MAINE.—The following is taken from the Lewiston (Maine) Gazette of April 20: "The bird recently shot by Abel Sanborn, of East Fryeburg, which was supposed to be a white-headed eagle, proved to be a turkey buzzard (*Cathartes aura*), a very rare species in this northern latitude, of which only two specimens have been reported in our State." The same bird, or another of the same species, was seen here several times, and a number of persons were within gunshot of it, but, supposing it to be an eagle, would not shoot.—R. A. GUSHEE (Applenton, Maine).

DO SQUIRRELS EAT FISH?—A friend of mine, driving out last Sunday, when near a brook, saw a red squirrel run along the rocks lining the brook with something alive in its mouth. He stopped his horse, and when the squirrel came across the rocks in front of him, it stopped twice, and the living thing came to the surface and appeared to be the wriggling tail end of a fish about as long as a finger. On starting the horse the little fellow scampered off into the bushes with his prey.—C. GERBER, Jr.

WHITE PELICANS IN IOWA.—Charles City, Ia., April 16, 1893.—There was a large flight of white pelicans at this place on the 15th inst., estimated at over 1,000, and every one who could scrape up a gun or a shooting party of any kind was out after them. One was killed by M. G. Towor. A common rat was run into the river here by some boy, and, after swimming 100 yards to the opposite side of the river, recrossed, not much the worse for the swim.—ZIP KOON.

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

SOME LIARS I HAVE KNOWN.

A GOOD portion of my past life having been spent around the sportsman's "flickering camp-fire," it has been my good or evil fortune to meet with many characters to whom truth was indeed stranger than fiction.

The individuals to whom we allude do not lie for gain or self-advantage, but are men whose mental and moral idiosyncrasies render them prone to exaggeration, who, like the Indian magician, will, with me, lie, and wonder, from a budding fact grow a sky-clearing squaw.

These narrators, who draw upon their imaginations for their facts, may be classed under several heads. First, the "conscientious exaggerator," who really believes that the tale he tells is true, or very near the truth. Next comes the "romancer," who, "of imagination all compact," can, from the "airy nothings" of his brain, rear castles as enchanting as ever rose at the command of genii of the lamp.

Of the former class I recall the case of a big game land, birdly, your straight-forward, cold-blooded, matter-of-fact liar, who tells his story with a voice and manner so earnest and convincing, that the listener finds himself started as with a shock at the least shadow of an unbelief. To this latter class belonged old Dave W., who, although he claimed to own a large cotton plantation on Red River, and also to have at one time represented his native State in the halls of her Legislature, was, at the time of which we write, living upon the bank of the Sandlower River, in a shanty so small that, not unlike the Irishman's ancestral palace, one might have almost reached his arm down the chimney and unlatched the door.

Standing one day upon the bank of this most beautiful of Southern rivers, I saw my neighbor, Ben H., riding up, with his Winchester lying across his lap. As I knew that Ben would shoot at anything, from a baldheaded eagle to a cotton-mouth moccasin, I pointed out to him a water turkey (as the state bird is generally called) sitting motionless upon the limb of a dead tree overlooking the river, and some three hundred yards distant. Alighting, Ben elevated the sights of his rifle, and, resting it against a tree, sighted and fired. By accident the lead sped true to its mark, and the bird fell dead upon the water beneath. Just at this moment old Dave, with his slow, gliding, still-hunter walk, came up to where we were standing.

"A pretty good shot, I sent to him, as coming to a halt he leaned his long hunting rifle against the tree under which we stood.

"Pretty fair, pretty fair," he replied; "enmost as good as I wost made myself."

"Well, Dave, tell us about that shot," I said.

Hitching up his pants and making them more secure with a thorn, which he had substituted for a button, he sank slowly down upon a projecting root, and began as follows: "You see, I was walking me and Tom Powell was a rafting up on Sky Lake endurin' the high water of '88. We was so busy a-cuttin' out our float road we didnt have time to hunt, so one day just afore sundown we found out we didnt have any grub. So what does I do but pick up old Betsy, which she was a long Kanectuck rife what I had named after a gal I was sweet on, what lived down on Big Chafferlar, an' says I to Tom, says I, 'I'll git er duck.' So I walked down to the bank of the lake, an' I all seed was three woolly-heads about a quarter of a mile from shore. Says I to myself, 'It's duck or no meat, an' anyways I'll tryer.' So I up an' drawed a course bead on the nearest one, an' when old Betsy spoke if that duck didnt turn over on his back dead as a door-nail my name ain't Dave. Well, thinks I to myself, 'One duck wot's he much for two hungry men,' so I loaded up old Betsy agin, an' by that time them other two ducks was clean a-mose out of sight. You see they didnt fly when I shot the first one, but kept a-swimmin' across the lake. So I flung up old Bets an' gin er squint long her top side, an' then I gin her a kinder fill'er pulled trigger, an' would you a-believed it killed both of them yuther ducks, for they was swimmin' in a line, you see."

"How far off, Dave," said Ben H., "do you think those last ducks were when you pulled trigger?"

"That's hard to tell," answered Dave, "but as near as I can come to it, it must a been about two half a ways at the time. I and I think he was a paddling about a four-mile lick all the time."

As neither of us made any remarks on this extraordinary shot, Dave took a chew of tobacco and continued, "That was about as long a range shot as I ever knowed, exceptin' wotst, an' that was the time a fellow shot me clean through, down at the mouth of Big Sandlower."

We did not then of his excess any surprise at this last remark, only Ben said, "Well, Dave, tell us how that happened."

"Well, you see," he went on in his low monotonous matter-of-fact tone, "twas while I was a workin' a long old Billy Tucker jest about the month of this yer very river, when one day we boys found we had our run short o' lead for bullets. In them days we didnt have these yer new-fangled guns (gittin' at him, sure enough, the first hole he come along, bang! bang! went their shells, fill it up!) and a bit that you'd a thought another war had done broke out down the river. Well, 'twas pretty much the same thing every boat, an' I think we must a dug about a hundred an' fifty pounds o' lead outer that hawk every time one went by. Howsomer, after a while the thing leaked out, an' as we had enough lead to last us about ten year, we took our game down."

"Well, one day old Capin' Wiley he landed his boat at old Billy's camp an' called me to come aboard, an' when he'd got me ahind the pilot-house, says he, 'Dave,' says he, 'I'm going to have er big load or them that shootin' fellows up from Picketsburg next trip, an' I want you to have er old Billy's peck deers down on the pint when you hears me a

blowin' down the river. You see,' says he, 'I wants ter bet them tinn fellows that we will see a deer soon as we strikes the Saw-ower, an' he wont be a dead deer neither.' 'All right,' says I, 's'posed as how you'll go havin' in what you will.' 'All right,' says he. Well, in about a week I hearn the old Argo, that was the name o' Capin' Wiley's boat, a blowin' down the river, so I gits a head o' cabbage an' I tells them deers down to the pint. Well, presently I seed the boat push her nose round the bend way down the river, so I laid that cabbage down on the sand an' I crept into the edge of the bushes, an' tinn I set down a thinkin' all the time how much my havans in that bet would be, when the first thing I knowed something 'bout as big as my fist took me "dap" right in the small of my back, an' when I turned around an' seed er puff up white smoke curl up from the hurricane roof of the boat, I knowed then I was shot for certain. You see, one of them shootin' fellows had one uv them old-fashion Dutch yawgers that carried about a pound an' a half ball, an' he had pluzged me clean through, though that boat must a bin at least five miles off when he pulled trigger on them deers, for I hearn afterwards it was by accident he hit me."

"Pretty near killed you, too, didn't it, Dave?" said Ben W.

"Yes, pretty nigh," said Dave, very slowly, as he took another chew of tobacco, "had me up fer enmost a week."

Alas for poor old Dave. His body "lies a mouldering in the ground," and he will lie no more. He has crossed over to the "spirit land." He has gone to the "spirit land," and doubtless the "spirits," as he has never called the demon in his "evil" brown jug, "more deadly far than 'Dutch yawgers"—had need to do with his unlively taking off. Peace to his bones.

TUCKAHOE.

THE GRADY COMPROMISE BILL.

UTICA, N. Y., April 21, 1892.

Editor Forest and Stream: I have the Compromise Bill, Senate Doc. 435. We have carefully read it. Your editorial, "Patent Coffee Mill," is as applicable to this as to the O'Connor bill. This bill is all cleaner than the one it preceded. It specifies the New York market practically without limit, especially on woodcock, to supply summer resorts from July to February. New York is the great center from which illegal game is distributed over the whole country. With the allowed month for sale after open season, both July and August are open to them, by which the "law-breakers" can "skin" the whole State, while the law-abiding, who need no law, get entirely "left." The "private park" scheme is the most dangerous one for the sportsman's interests ever put forward. It opens the whole of the public for health and recreation is in danger of being turned into a vast "monopoly" for the supply of the New York markets, and that too in the near future upon mere proclamation. Sportsmen going to the Adirondacks will soon find themselves "not invited."

The whole plan of this bill is as bad as possibly can be: it is as bad as no law, or worse. It is a mere gross aid sham. The penal section abolishes the present accumulation of penalties for each bird, fish, etc., so that for the immense profits of New York markets, a receiver of illegal game and fish in "monopoly," is imposed a mere paltry penalty of twenty dollars, which they can cheerfully pay for the monopoly privilege.

The section allowing the "surrender" of game "illegally killed," in "exemption of civil and criminal prosecution," is a beautiful piece of sentimental philanthropy, for the benefit of the few thousands who merely shoot, for pleasure, and not for game. It nullifies the whole law.

I cannot go over the whole bill; the above is a specimen. We shall take measures to defeat it, and it will be defeated, even if we get no amendment of benefit this year. It is to be hoped that sportsmen will wake up to the full sense of the dangers and mistakes of seeking special privileges, and of looking for their interests in a bill gotten up by the paid attorney of New York market men and pushed with champagne and cigars.

VICE-PRES. Utica Fish and Game Protective Association.

ILLINOIS GAME NOTES.

DUCKS, geese and a few swans plenty here this year, on all the small streams, more so than for several years past. A large number of them may be seen in the Illinois. One killed nine ducks at one shot last week.

Small game, as prairie chickens, rabbits, quail, etc., in abundance in season. Quail so plentiful that in flocks of a dozen or more they will alight in trees not fifteen feet from the house where I am stopping. Lots of foxes, "the woods are full of them." Any number of rabbits, their tracks may be seen in the snow all around the houses and barns inside the corn fields. During the winter season, traps set every night within forty feet of the house. A farmer recently came in here with 204 to sell. They hunt them with dogs and ferrets, also chase them into snow drifts, where, unable to run, they are slaughtered with clubs.

The game laws are neither respected nor enforced. Parties go out daily for chickens, quail, and rabbits. Natural result, the supply is fast decreasing, which, as far as the natives are concerned, is well enough. Scerves them right. Was voted by some friends to go with them after quail, being informed game laws weren't enforced, but although longing for the sport, positively refused out of principle, condemning their action in strong terms.

Taking a trip down through the western part of Kentucky, Tennessee, Mississippi and Louisiana, I saw any number of negro boys along the route of the railroad, out with shotguns. Was informed that they kept the game shot entirely away from the whites. They were open season for the whites. Several of these darkies having immense rabbits which they had shot, or twice the size of any to be found in this part of the country.

JOHNS, Ill., April 13.

MEETING CITY, Mont., April 15.—At the second annual meeting of Butte City, Mont., and Cinn. Club, the following officers were elected: President, F. C. Beck; Vice-President, Henry Young; Secretary, Fred. Gilbert; Treasurer, E. S. Paxson. We have a club of thirty-five members, who are all good fellows, and take a great interest in its welfare, and regard the game law like true sportsmen. A committee was appointed to do all in their power to bring to justice certain parties who have for a long time been disregarding as well as breaking the law, by holding water quail parties. Although a cold wind with dashes of snow prevailed, some good scores were made. Our treasurer made a hit and carried away the medal, which, by the way, was a leather one of fine finish, and shows excellent workmanship.—B. UTRE.

DAVY CROCKETT'S RIFLE.

THROUGH the courtesy of Col. Bob H. Crockett, of DeWitt, Ark., we have enjoyed the rare pleasure of handling the historic arm once used by his grandfather, the famous pioneer, bear-killer, statesman and patriot, Davy Crockett. The rifle was presented by the young Whigs of Philadelphia, Crockett then being on a tour through the North. The maker was Constable, of Holyland, N. Y., who put it up in the highest style of the art. The lines of the gun are well shown in the drawing which we have had prepared and publish herewith. The pistol grip is a beauty; we have never seen one its superior, nor did we ever hold any other rifle that "came up" so well as this grand old arm of Davy Crockett's. It shoots as well now as ever.

The mountings are coin silver, finely engraved, with representations of deer, bear, alligator and raccoon. Beneath the stock, just in front of the trigger guard, is, or was—all that the outline having been worn away by constant usage—the Goddess of Liberty, with the words "Constitution and Laws." Upon the top of the octagonal barrel is the inscription in letters of gold sunk into the barrel:

Presented by the Young Men of Philadelphia to the Hon. David Crockett, of Tenn.

The bore takes thirty-two balls to the pound. The gun has been in constant use since first the original owner carried it back to Tennessee, and innumerable deer, bears, turkeys and other game have fallen to its discharge. We trust that the present owner may live many a year to use the heirloom.

Holding the rifle in our hands and "drawing a bead" on the sparrows perched on the wires across the street, our thoughts went back to the "Antiochography," that classic among the books in the American boys' library. We have not read it, years ago when we used to play "I spy the wolf" if we missed it, nor is the play. From Crockett's own account of his life we have taken out a few paragraphs to serve as settings for the rifle. They are not so satisfactory as we could wish—extracts rarely are—but they may invite some of our friends to a perusal of the book, in which event justice will be done to the hero.

David Crockett was born in 1786 in what is now Eastern Tennessee, the country at that time being infested with Indians. Beyond the incidents of the hovering of a canoe with his brothers upon the brink of fall in the river, and his uncle's shooting a man in the woods by mistake for a deer—he tells us little of his childhood, which appears to have been brief and very quickly merged into early manhood. They were giants in those days, and cast in heroic mold. What with subduing the wilderness, fighting Indians, and keeping the larder supplied with bear meat, the Tennessee settler had a man's work before him, and the children could waste but little time in the frivolities of youth. When twelve years of age our hero began to make up his acquaintance with hard times, and plenty of them—an acquaintance which grew more intimate all through his life, to its tragic close in the Alamo. One winter Crockett made a foot journey of four hundred miles into Virginia; the following year he ran away from home; at fifteen he returned and worked a year to "fill" some of his father's debts; at sixteen, not knowing the letter of the alphabet—he fell desperately in love, seriously contemplated matrimony, and was jilted. His lack of education, he thought, was one cause for his failure in the love suit, and he determined to remedy the defect.

"I thought I would try to go to school some; and as the Quaker had a married son, who was living about a mile and a half from him, and keeping a school, I proposed to him that I would go to school for five dollars the week, and work for him the other two, to pay my board and school fees. He agreed I might come on those terms; and so it I went, learning and working backward and forward, until I had been with him nine or ten months. In this time I learned to read a little in my primer, to write my own name, and to cipher some in the three first rules in figures. And this was all the schooling I ever had in my life up to this day. I should have continued longer, if it hadn't been that I could not get on any longer without a wife; and so I cut out to hunt me one."

His life was now an odd mingling of hard work, hunting and love-making.

"I had by this time got to be mighty fond of the rifle, and had bought a capital one. I most generally carried her with me wherever I went, and though I had got 'back to the old Quaker's to live, who was a very particular man, would sometimes slip out and attend the shooting matches, where they shot for hire. I always tried, though, to keep it a secret from him."

"Just now I heard of a shooting match in the neighborhood, right between where I lived and my girl's house, and I determined to kill two birds with one stone—to go to the shooting match first and then to see her. I therefore made the Quaker believe I was going to hunt for deer, as they were plenty about in those parts; but, instead of hunting them, I went straight on to the shooting match, where I joined in with a partner, and we put in several shots for the beef. I was mighty lucky, and when the match was over I had won the whole beef. This was on Saturday, and my success had put me in the finest humor in the world. So I sold my part of the beef for five dollars in the real grip, for I believe that was before banknotes was invented; at least, I had never heard of any. I now started out to ask for my wife, for, though she was the steady wife, she was not the steady girl. I had never said a word to her parents about it. I had always dreaded the undertaking so bad that I had put the evil hour off as long as possible, and, indeed, I calculated they would me so well the wouldn't raise any objection to having me for their son-in-law. I had a great deal better opinion of myself, I found, than other people had of me; but I moved on with a light heart, and my five dollars jingling in my pocket, thinking all the time there were but few grocers in the neighborhood."

He had won his beef, but his flow of humor was quenched when he came to the house and found that his intended bride had fitted him for another fellow. "Down-spirited" over the unhappy termination of this second suit, Crockett was hunting one day in the forest, brooding like the melancholy Jacques, when coming to a cabin where dwelt a Dutch widow and her "ugly" daughter. He was confronted with the babe of the ever-soothing old dame; "there was as good fish in the sea as had ever been caught out of it," and through the kindly offices of the same friendly match-maker, he was introduced to a pert young Irish miss, of whom he says, "I must confess I was plucky well pleased with her from the word go." But here again turned up the troublesome and ubiquitous rival, "so attentive to her that I could hardly get to slip in a word edge-ways." I began to think I

was barking up the wrong tree again; but I was determined to stand up to my rack, fiddler or no fiddler."

Then transpired a bit of woodland romance which is well worthy to be written in outside of Snecuser's verse:

"It was about two weeks after that I was sent for to engage in a wolf hunt, where a great number of men were to meet, with their dogs and guns, and where the best sort of sport was expected. I went as large as life, but I had to hunt in strange woods, and in a part of the country which was very thinly inhabited. While I was out it eluded up, and I began to get scared; and in a little while I was so much so, that I did not know my way home, nor any thing about it. I set out the way I thought best, but it turned out with me, as it always does with a lost man, I was wrong, and took exactly the contrary direction from the right one. And for the information of young hunters, I will just say, in this place, that whenever a fellow gets bad lost, the way home is just the way he don't think it is. This rule will hit nine times out of ten. I went ahead, though, about six or seven miles, when I found night was coming on fast; but at this distressing time I saw a little woman striding it along through the woods like all wrath, and so I cut on foot, for I was determined I wouldn't lose sight of her that night any more. I run on till she saw me, and she stopped; for she was as glad to see me as I was to see her, as she was lost as well as me. When I came up to her, who should she be but my little girl, that I had been paying my respects to. She had been out hunting her father's horses, and had missed her way, and had no knowledge where she was, or how far it was to any house, or what way would take us there. She had been traveling all day, and was mighty tired; and I would have taken her up, and toted her, if it hadn't been that I wanted her just where I could see her all the time, for I thought she looked sweeter than sugar; and by this time I loved her almost well enough to eat her."

"At last I came to a path, that I know'd must go somewhere, and so we followed it, till we came to a house, at about dark. Here we staid all night. I set up all night courting; and in the morning we parted. She went to her home, from which we were distant about seven miles, and I to mine, which was ten miles off."

Such devotion could not fall off its reward, and Crockett settled down to domestic life on a farm. But, as the years went by, he was tired at length of the unproductive life he led out for country where bears and deer were more abundant. "The Duck and Elk river country [in Tennessee] was just beginning to settle, and I determined to try that. I had now one old horse, and a couple of two-year-old colts. They were both broke to the halter, and my father-in-law proposed that, if I went, he would go with me, and take one horse to help me move. So we all fixed up, and I packed my two colts with as many of my things as they could bear; and away we went across the mountains. We got on well enough, and arrived safely in Lincoln county, on the head of the Mulberry fork of Elk River. I found this a very rich country, and so new that I began to distinguish myself as a hunter, and to lay the foundation for all my future greatness; but mighty little did I know of what sort it was going to be. I fear and smaller game I killed abundance; but the bear had been shot out of the hills before, and were not so plenty as I could have wished."

In 1813 Crockett volunteered in the Creek War, feeling "wolfish all over." But his services as a hunter appear to have been more useful than as a warrior; for the troops were often in more danger of starvation than of being scalped, and Crockett's rifle was busy in providing "meat" for the troops.

"As the army marched, I hunted every day, and would kill every hawk, bird and squirrel that I could find. Others did the same; and it was a rule with us, that when we stopped at night, the hunters would throw all they killed in a pile, and then we would make a general division among all the men. One evening I came in, having killed nothing that day. I had a very sick man in my mess, and I wanted something for him to eat, but I had nothing. I went to the fire of a Captain Cowen, who commanded my company after the promotion of Major Russell, and informed him that I was on the hunt of something for a sick man to eat. I knowed the captain was as had off as the rest of us, but I found him boiling a turkey's gizzard. He said he had divided the turkey out among the sick, that Major Snully had killed it, and that nothing else had been killed that day. I immediately went to Snully's fire, where I found him boiling another gizzard. I told him that it was the first turkey I had ever seen have two gizzards. But so it was, I got nothing for my sick man. And now, seeing that every fellow must shift for himself, I determined that in the morning I would come up missing; so I took my mess and cut out to go ahead of the army. We know'd that nothing more could happen to us if we went than if we stayed. For it looked like it was to be starvation any way; we therefore determined to go on the old saying, 'run hog or die.' We passed two camps, at which our men that had gone on before us, had killed Indians. At one they had killed nine and at the other three. About daylight we came to a small river, which I thought was the Scamby; but we continued on for three days, killing little or nothing to eat, till, at last, we all began to get unarily ready to give up the ghost, and lie down and die; for we had no prospect of provision, and we knew we couldn't go much further without it."

"We came to a large prairie, that was about six miles across it, and in this I saw a trail which I knowed was made by bear, deer, and turkeys. We went on through it till we came to a large creek, and the low grounds were all set over with wild rice, looking as green as a wheat field. We here made a halt, unshod our horses, and turned them loose grass. "One of my companions, a Mr. Yanzaut, and myself, then went up the low grounds to hunt. We had gone some distance, finding nothing, when, at last, I found a squirrel, which I shot, but he got into a hole in the tree. The game was small, but necessity is not very particular, so I thought I must have him, and I climbed that tree thirty feet high, without a limb, and pulled him out of his hole. I shouldn't relate such small matters, only to show you that I had a very hungry man to get to something to eat. I soon killed two other squirrels, and fired at a large hawk. At this a large gang of turkeys rose from the canebrake, and flew across the creek to where my friend was, who had just before crossed it. He soon fired on a large gobbler, and I heard it fall. By this time my gun was loaded again, and I saw one sitting on my side of the creek, which had flew over when he fired; so I blazed away, and down I brought

him. I gathered him up, and a fine turkey he was. I now began to think we had struck a breeze of luck, and almost forgot our past sufferings, in the prospect of once more having something to eat. I raised the shout, and my comrades came to me, and I went on to our camp with the game we had killed. While we were cooking two of our mess had been out, and each of them had found a bee-tree. We turned into cooking some of our game, but we had neither salt nor bread. Just at this moment, on looking down the creek, we saw our men, who had gone on before us for provisions, coming to us. They came up, and measured out to each man a cupful of flour. With this, we thickened our turkey soup, and our men, who were tired, and had no dinner with us, and then went on to our camp.

"We now took our tomahawks, and went out and cut our bee trees, out of which we got a fine chance of honey; though we had been starving so long that we feasted to eat much at a time, till, like the Irish by hanging, we got used to it again. We rested that night without moving our camp; and the next morning myself and Yanzaut again turned out to hunt. We had not gone far, before I wounded a fine buck badly; and while pursuing him, I was walking on a large tree that had fallen down, when from the top of it a large bear broke out and ran off. I had no dogs, and I was sorry enough for it; for of all the hunting I ever did, I have always delighted most in bear hunting. Soon after this I killed a large buck; and we had just gotten him to camp when our poor starved army came up. They told us that to lessen their sufferings as much as possible, Captain William Russell had had his horses led up to a shot for them to eat, just at the moment that they saw our men returning, who had carried on the flour."

"We were now about fourteen miles from Fort Deatur, and we gave away all our meat and honey, and went on with the rest of the army. When we got there, they could give us only one ration of meat, but not a mouthful of bread. I immediately got a canoe, and taking my gun, crossed the river and went to the Big Warriors' town. I had a large hut, and I offered an Indian a silver dollar for my hut full of corn. He told me that his corn was all 'shustee,' which in English means, it was all gone. But he showed me where an Indian lived, who, he said, had corn. I went to him and made the same offer to him. He could talk a little broken English, and said to me, 'You got any powder?' You got none, he said, but I had. He then said, 'He swap my corn for powder and hulls.' I took out about ten hulls, and showed him; and he proposed to give me a full hull of corn for them. I took him up mighty quick. I then offered to give him ten charges of powder for another hut full of corn. To this he agreed very willingly. So I took off my hunting shirt, and tied up my corn; and though it had cost me very little of my powder and lead, yet I wouldn't have taken fifty silver dollars for it. I returned to the camp, and the next morning we started for the Hickory Ground, which was thirty miles off. It was here that General Jackson met the Indians, and made peace with the body of the nation."

In 1821 our hero "gave his name" as a candidate for the State Legislature. He knew nothing of "the Government," and he knew nothing of the "people." He was a simple man, his glib competitors; but his mother-wit and skill with the rifle carried him triumphantly through. "I went first into Heckman county, to see what I could do among the people as a candidate. Here they told me that they wanted to move their town nearer to the center of the county, and I must come out in favor of it. There's no devil if I knowed what this meant, or how the town was to be moved; and so I wrip'd him, and got the idea ready for the town. I then called 'non-committal.' About this time there was a great squirrel hunt on Duck River, which was among my people. They were to hunt two days; then to meet and count the scalps, and have a big barbecue, and what might be called a tip-top country frolic. The dinner, and a general treat, was all to be paid for by the party having taken the fewest scalps. I joined one side, taking the place of one of the hunters, and got a great many scalps. I killed a great many squirrels, and when we counted scalps, my party was victorious"—and later, when they counted the election ballots he was still ahead, and took his seat.

In 1827 Crockett was elected to Congress. In this envuvas he played the famous "coon-skin trick, which he relates as follows:

"Well, I started off, with my rifle on my shoulder, dressed in my hunting shirt, and my rifle on my shoulder. Many of our constituents had assembled there to get a taste of the quality of the candidates at orating. Job Snelling, a gaudier-shanked Yankee, who had been caught somewhere about Plymouth Bay, and been shipped to the West with a cargo of codfish and rum, erected a large shanty, and set up shop for the occasion. A large posse of the voters had assembled before I arrived, and my opponent had already made considerable headway with his specifying and his treating, when they spied me about a rifle shot from the camp, sun-terug along as if I was not a party in business. 'There comes Crockett,' cried one. 'Let us hear the Colonel,' cried another, and so I mounted the stump that had been cut down for the occasion, and began to bushwhack in the most approved style.

"I had not been up long before there was such an uproar in the crowd that I could not hear my own voice, and some of my constituents had assembled there to get a taste of the quality of the candidates at orating. Job Snelling, a gaudier-shanked Yankee, who had been caught somewhere about Plymouth Bay, and been shipped to the West with a cargo of codfish and rum, erected a large shanty, and set up shop for the occasion. A large posse of the voters had assembled before I arrived, and my opponent had already made considerable headway with his specifying and his treating, when they spied me about a rifle shot from the camp, sun-terug along as if I was not a party in business. 'There comes Crockett,' cried one. 'Let us hear the Colonel,' cried another, and so I mounted the stump that had been cut down for the occasion, and began to bushwhack in the most approved style.

"I had not been up long before there was such an uproar in the crowd that I could not hear my own voice, and some of my constituents had assembled there to get a taste of the quality of the candidates at orating. Job Snelling, a gaudier-shanked Yankee, who had been caught somewhere about Plymouth Bay, and been shipped to the West with a cargo of codfish and rum, erected a large shanty, and set up shop for the occasion. A large posse of the voters had assembled before I arrived, and my opponent had already made considerable headway with his specifying and his treating, when they spied me about a rifle shot from the camp, sun-terug along as if I was not a party in business. 'There comes Crockett,' cried one. 'Let us hear the Colonel,' cried another, and so I mounted the stump that had been cut down for the occasion, and began to bushwhack in the most approved style.

had no train after me, and not a voice 'shouted 'Huzza for Crockett.' Popularly sometimes depends on a very small matter. Indeed, in this particular it was worth a quart of New England rum, and no more.

"Well knowing that a crisis was at hand, I stuck into the woods with my rifle on my shoulder, my best friend in time of need, and, as good fortune would have it, I had not been out more than a quarter of an hour before I treed a fat 'coon, and in the pulling of a trigger he lay dead at the root of a tree. I soon whipped his hairy jacket off his back, and again beat my way toward the shantee, and walked up to the bar, but not alone, for this time I had half a dozen of my constituents at my heels. I threw down the 'coon skin upon the counter and called for a quart, and Job, though busy in dealing out rum, forgot to point to his chalked rules and regulations, for he knew that a 'coon was as good legal tender for a quart in the West as a New York shilling any day in the year.

"My constituents now flocked about me and cried 'Huzza for Crockett.' 'Crocket for ever,' and lauding the tide had taken a turn, I told them several yams, to get them in a good humor, and having soon dispatched the value of the 'coon, I went out and mounted the stump without opposition, and a clear majority of the voters followed me to see what I had to offer for the good of the nation. Before I was half through, one of my constituents moved that they would hear the balance of my speech after they had washed down the first part with some more of Job Snelling's extract of corn-stalk and molasses; and the question being put up, it was carried unanimously. It wasn't considered necessary to tell the yeas and nays, so we adjourned to the shantee, and on the way I began to reckon that the fate of the nation pretty much depended upon my shooting another 'coon.

"While standing at the bar, feeling sort of bashful while Job's rules and regulations stared me in the face, I cast down my eyes and discovered one end of the 'coon skin sticking between the logs that supported the bar. Job had slung there in the hurry of business. I gave it a sort of quick jerk, and it followed my hand as natural as if I had been the rightful owner. I slipped it on the counter, and Job, little dreaming that he was barking up the wrong tree, shoved along another bottle, which my constituents quickly disposed of with great good humor, for some of them saw the trick, and then we withdrew to the rostrum to discuss the affairs of the nation.

"I don't know how it was, but the voters soon became dry again, and nothing would do but we must adjourn to the shantee, and as luck would have it, the 'coon skin was still sticking between the logs, as if Job had flung it there on purpose to tempt me. I was not slow in raising it to the counter; the rum followed, of course, and I wish I may be shot, if I didn't, before the day was over, get ten quarts for the same identical skin, and from a fellow, too, who in those parts was considered as sharp as a steel trap and as bright as a pewter button.

"This joke secured me my election, for it soon circulated like smoke among my constituents, and they allowed, with one accord, that the man who could get the wild whip of Job Snelling in fair trade, could outwit Old Nick himself, and was the real grit for them in Congress. Job was by no means popular; he boasted of always being wide awake, and that any one who could take him in was free to do so, for he came from a stock that sleeping or waking had always one eye open, and the other not more than half closed. The whole family were geniuses. His father was the inventor of wooden nutmegs, by which Job said he might have made a fortune, if he had only taken out a patent and kept the business in his own hands; his mother, Patience, manufactured the first white oak pumpkin seeds of the mammoth kind, and turned a pretty penny the first season; and his aunt, Prudence, was the first to discover that corn husks, steeped in tobacco water, would make as handsome Spanish wrappers as ever came from Havana, and that oak leaves would answer all the purposes of filling, for no one could discover the difference except the man who smoked them, and then it would be too late to make a stir about it. Job, himself, bragged of having made some useful discoveries; the most profitable of which was the act of converting mahogany sawdust into cayenne pepper, which he found was a profitable and safe business, for the people hereabouts so long accustomed to having dust thrown in their eyes that there wasn't much danger of being found out.

"The way I got to the blind side of the Yankee merchant was pretty generally known before election day and the result was that my opponent might as well have whistled figs to a mule stone as attempt to beat up for votes in that district. I beat him out and out, quite back into the old year, and there was scarce enough left of him after the canvass was over to make a small grease spot. He disappeared without even leaving a mark behind, and such will be the fate of Adam Huntsman, if there is a fair fight and no gouging.

"After the election was over I sent Snelling the price of the rum, but took good care to keep the fact from the knowledge of my constituents. Job refused the money and sent me word that it did him good to be taken in occasionally, as it served to brighten his ideas; but I afterward learned that when he found out the trick that had been played upon him he put all the rum I had ordered in his bill against my opponent, who, being clated with the speeches he had made on the affairs of the nation, could not descend to examine into the particulars of a bill of the vendor of rum in the small way."

In 1829 he was re-elected to Congress. The honest old "backwoods bear hunter" had won great fame among the Whigs by his course at Washington; and when in 1834 he made a tour through the North, his progress was a continued ovation from Baltimore to Boston. In Philadelphia, on his first visit he was proffered the rifle:

"I was hardly done making my bow to those gentlemen, before Mr. James M. Sanderson informed me that the young Whigs of Philadelphia had a desire to present me with a fine rifle, and had chosen him to have her made agreeably to my wishes. I told him that was an article that I knew something about, and gave him the size, weight, etc."

While he was in New York, there was considerable curiosity to witness an exhibition of his skill as a marksman, and this desire he gratified by a visit to a Jersey City range: "I now started to Jersey City, where I found a great many gentlemen shooting rifles, at the distance of one hundred yards with a rest. One gentleman gave me his gun, and asked me to shoot. I raised up off-hand, and cut within four inches of the center. I told him my distance was forty yards, off-hand. He loaded his gun, and we walked down to within forty yards when I fired, and was deep in the paper. I shot a second time, and did the same. Colonel Mapes then put up a quarter of a dollar in the middle of

a black spot, and asked me to shoot at it. I told him he had better mark the size of it and put his money in his pocket. He said, "fire away." I did so, and made slight-of-hand work with his quarter."

Returning to Philadelphia upon the adjournment of Congress, he found the rifle ready:

"Next morning I was informed that the rifle gun which was to be presented to me by the young men of Philadelphia, was finished, and would be delivered that evening; and that a committee had been appointed to wait on me and conduct me to where I was to receive it. So, accordingly, in the evening the committee came, and I walked with them to a room nearly fornic the old state house; it was crowded full, and there was a table in the center, with the gun, a tomahawk, and butcher knife, both of fine razor metal, with all the accoutrements necessary to the gun—the most beautiful I ever saw or anybody else; and I am now happy to add as good as they are handsome. My friend, John M. Sanderson, Esq., who had the whole management of getting her made, was present, and delivered the gun into my hands. Upon receiving her I addressed the company as follows:

"Gentlemen: "I receive this rifle from the young men of Philadelphia as a testimony of friendship, which I hope never to live to forget. This is a favorite article with me, and would have been my choice above all presents that could have been selected. I love a good gun, for it makes a man independent, and prepared either for war or peace.

"This rifle does honor to the gentleman that made it. I must say, long as I have been accustomed to handle a gun, I have never seen any thing that could near a comparison to her in beauty. I cannot think that ever such a rifle was made, either in this or any other country; and how, gentlemen, to express my gratitude to you for your splendid present. I am at a loss. This much, however, I will say, that myself and my sons will not forget you while we use this token of your kindness for our amusement. If it should become necessary to use her in defence of the liberty of our country, in my time, I will do as I have done before; and if the struggle should come when I am buried in the dust, I will leave her in the hands of some who will honor your present, in company with your sons, in standing for our country's rights.

"Accept my sincere thanks, therefore, gentlemen, for your valuable present—one which will keep as a testimony of your friendship so long as I am in existence."

"I then received the gun and accoutrements, and returned to the hotel, where I made an agreement with Mr. Sanderson and Col. Pulaski to go with them the next day to the Jersey shore, at Camden, and try my gun.

"Next morning we went out. I had long been out of practice, so that I could not give her a fair trial. I shot altogether well, and was satisfied that when we became better acquainted the fault would be mine if the varmints did not suffer."

Returning home with his gun he was greeted by many friends, who gathered around to inspect the arm:

"A large fellow stepped up and asked me why all the members did not get such guns given them. I told him I got that gun for being honest, in supporting my country, instead of bowing down and worshipping an idol. He looked at me and said, that was very strong. "No stronger than true, my friend," said I.

"In the course of a few days I determined to try my new gun upon the living subject. I started for a hunt, and shortly came across a fine buck. He fell at the distance of 130 steps! Not a bad shot, you will say. I say, not a had gun either. After a little practice with her, she came up to the eye prime, and I determined to try her at the first shooting match for beef.

"As this is a novelty to most of my readers, I will endeavor to give a description of this Western amusement.

"In the latter part of summer our cattle get very fat, as the range is remarkably fine; and some one, desirous of raising money on one of his cattle, advertises that on a particular day, and at a given place, a first-rate beef will be shot for.

"When the day comes every marksman in the neighborhood will meet at the appointed place with his gun. After the company has assembled, a subscription paper is handed round, with the following heading:

"A. B. offers a beef worth twenty dollars, to be shot for, at twenty-five cents a shot. Then the names are put down by each person, thus:

D. C. puts in four shots,..... \$1 00
E. F. " eight "..... 2 00
G. H. " two "..... 0 50

"And thus it goes around, until the price is made up. "Two persons are then selected, who have entered for shots, to act as judges of the match. Every shooter gets a board, and makes a cross in the center of his target. The shot that drives the center, or comes nearest to it, gets the hide and tallow, which is considered first choice. The next nearest gets his choice of the hindquarters; the third gets the other hind quarter; the fourth takes choice of the fore-quarters; the fifth the remaining quarter; and the sixth gets the lead in the tree against which we shoot.

"The judges stand near the tree and when a man fires they cry out, 'Who shot?' and the shooter gives in his name; and so on, till all have shot. The judges then take all the boards and go off by themselves, and decide what quarter each man has won. Sometimes one will get nearly all.

"This is one of our homely amusements—enjoyed as much by us, and perhaps more, than most of your refined entertainments. Here each man takes a part, if he pleases, and no one is excluded, unless his improper conduct renders him unfit as an associate."

"This is all that Crockett has told us about the rifle. In the latter pages of the Autobiography there are references to "Betsy," but this was his flint-lock, which he took to Texas, leaving the Philadelphia rifle with his elder son, John W. Crockett, from whom it has descended to the present owner. One description, that of a shooting match at Little Rock, Ark., on his way to Texas, we quote:

"As there was considerable time to be killed, or got rid of in some way, before the dinner could be cooked, it was proposed that we should go beyond the village, and shoot at a mark, for they had heard I was a first-rate shot, and they wanted to see for themselves whether fame had not blown her trumpet a little too strong in my favor; for since she had represented "the Government" as being a first-rate statesman, and Colonel Benton as a first-rate orator, they could not receive such reports without proper allowance, as Congress thought of the Post-office report.

"Well, I shouldered my Betsy, and she is just about as beautiful a piece as ever came out of Philadelphia, and I went out to the shooting ground, followed by all the leading

men in Little Rock, and that was a clear majority of the town, for it is remarkable that there are always more leading men in small villages than there are followers.

"I was in prime order. My eye was as keen as a lizard, and my nerves were as steady and unshaken as the political course of Henry Clay, so at it we went, the distance of a hundred yards. The principal marksman and cow-boy had never been beat, led the way, and there was some pretty fair shooting. I tell you, at length it came to my turn. I squared myself, raised my beautiful Betsy to my shoulder, took deliberate aim, and smack I sent the bullet right into the center of the bulls-eye. "There's no mistake in Betsy," said I, in a careless sort of way, as they were all looking at the target, sort of amazed, and not at all over-pleased.

"That's a chance shot," (I heard) "and you had the reputation of being the best marksman in those parts."

"Not as much chance as there was," said I, "when Dick Johnson took his darkey for better for worse. I can do it five times out of six any day in the week." This I said in as confident a tone as "the Government" did when he protested that he forgave Colonel Benton for shooting him and he was now the best friend he had in the world. "I knew it was not altogether as correct as it might be, but when a man says about some thing he has done, he measures you out answer no how, and 'the great' and 'the best' had set me the example that swaggering will answer a good purpose at times.

"They now proposed that we should have a second trial, but knowing that I had nothing to gain and everything to lose, I was for backing out and fighting shy, but there was no let-off, for the cock of the village, though whipped, determined not to give up, so to it again we went. They were now put upon their mettle, and they fired much better than the first time, and it was what might be called pretty sharp shooting. When it came to my turn I squared myself, and turning to the prime shot I gave him a knowing nod, by way of showing my confidence, and says I, "Look out for the bulls-eye, stranger." I blazed away, and I wish I may be shot if I didn't miss the target. They examined it all over and could find neither hair nor hide of my bull, when says I, "Stand aside and let me look, and I warrant you I get on the right trail of the critter." They stood aside, and I examined the bulls-eye pretty particular, and at length cried out, "Here it is; there is no snakes if it hadn't followed the very track of the other." They said it was utterly impossible, but I insisted on their searching the hole, and I agreed to be stuck up as a mark myself if they did not find two bullets there. They searched for my satisfaction, and sure enough all came out just as I had told them, for I had picked up a bullet that had been fired and stuck it deep into the hole without anyone perceiving it. They were all perfectly satisfied that fame had not made too great a flourish of trumpets when speaking of me as a marksman, and they all said they had enough of shooting for that day, and they moved that we adjourn to the tavern and liquor."

The story of Crockett's part in Texas is well known, it belongs to the history of our country. Mortified by his defeat in a third canvass, he announced to his constituents a determination to "quit the States."

"I told them moreover of my services, pretty straight up and down, for a man may be allowed to speak on such subjects when others are about to forget them; and I also told them of the manner in which I had been knocked down and dragged out, and that I did not consider it a fair fight, any more than they could in any other case. I then told them pretty strong I tell you, and I concluded my speech by telling them that I was done with politics for the present, and that they might all go to hell, and I would go to Texas."

Joining the Texas forces at San Antonio, Crockett was one of the devoted little band who perished at the Alamo.

"Before daybreak, on the 6th of March, the Alamo was assaulted by the whole force of the Mexican Army, commanded by Santa Anna. The battle was in progress until daylight, when only six men belonging to the Texan garrison were found alive. They were instantly surrounded, and ordered by General Castillon to surrender, which they did, under a promise of his protection, finding that resistance any longer would be madness. Colonel Crockett was of the number. He stood alone in an angle of the fort, his huge Bowie knife in his right hand, and in his left his rifle, which he held across his forehead, while around him there was a complete barrier of about twenty Mexicans, lying flat dead and dying. At his feet lay the dead body of that well known character, designated in the Colonel's narrative by the assumed name of Thimberlick, his knife driven to the hilt in the throat of a Mexican, and his left hand clenched in his hair.

"General Castillon was brave and not cruel, and disposed to save the prisoners. He marched them up to that part of the fort where stood Santa Anna and his murderous crew. The steady, fearless step and undaunted tread of Colonel Crockett, on this occasion, together with the bold demeanor of the hardy veteran, had a powerful effect on all present. Nothing daunted he marched up boldly in front of Santa Anna, and looked him sternly in the face, while Castillon addressed "his excellency," "Sir, here are six prisoners I have taken alive, how shall I dispose of them?" Santa Anna looked at Castillon fiercely, flew into a violent rage, and replied: "Have I not told you before now to dispose of them? Why do you bring them to me?" At the same time his brave officers plunged their swords into the bosoms of their defenceless prisoners. Colonel Crockett, seeing the act of treachery, instantly sprang like a tiger at the ruffian chief, but before he could reach him a dozen swords were sheathed in his indomitable heart; and he fell, and died without a groan, a traitor in his brow, and a smile of scorn and defiance on his lips. Castillon rushed from the scene, apparently horror-struck, sought his quarters, and did not leave them for several days, and hardly spoke to Santa Anna after."

A Colorado farmer has invented a duck-hunting outfit which discounts the California man's cow. He stripped the hide from a bullock and mounted it on a wire skeleton, which looked as natural as a living animal. He cut away the belly of his wire bullock for his body, and he cut two holes in the stunner to take sight through. When he wanted a duck shot he drops his skeleton over his head and starts out for the tides. He can walk right into a flock of ducks without startling them, and has on one or two occasions returned home with his hiding place full of fat ducks. He has never been shot at, and he all he wants when he takes his gun, for he marches into a flock and turns both barrels loose at a time. He usually bags the whole flock. He has applied for a patent.

During the last season the Teal Club of San Francisco used 15 sacks of grain in baiting their ponds, and they killed over 4,000 ducks.

WINTER IN THE ADIRONDACKS.

APRIL 3.—The roads are so soft we cannot get a team any where, how long they may continue in this condition we cannot tell to-day. I put on my snow shoes to visit some traps up the brook. I could not get about a mile and a half miles, but it is further than I have walked at one time since December 1, and when I got back to the house I had to lie down. It was rather discouraging as walking has always my stronghold and a great pleasure to me. I saw many tracks of small game, and among others there was a whole family of partridges had crossed the brook. I am very glad to see so many signs of partridge. I was very much afraid many had been killed by the severe frosts, but having got through so far they will now be all right. We have not begun snaring yet, and as things look now there will be no use tapping.

Yesterday the law allowed trout on the table, and we had them, there has been no fishing through the ice this winter; not a person has put a hook in the water during the close season. The ice is now thirty inches thick, and in the places where we usually get our best fishing there is from two to four feet of snow on the ice, so you can imagine how much fishing will be done. A good thaw would make the ice unsafe, as the snow or snow or top ice would go through the lower ice like hot water through a cloth.

This morning the thermometer marked two below zero, but rose to forty-six above in the middle of the day, and made more impression on the snow than any day, I could see the tops of the highest stumps sticking out. I have four men at work getting in supplies for the season, cutting wood, filling ice houses and such light work. The team has been all day on the road from Malone, and at 9 P. M. had to leave the sled with its load in the road about three miles from the house, the horses completely used up by slumping in the snow, which is still four feet deep. The sun does not waste it at all, only softens the top enough in the day time to make a hard crust at night. The deer are having a sorry time; there has been no crusting down any where near the lake, but I hear there has been quite a number of deer killed in the next town north of us. I visited the letter box this morning for my mail, and on my way out saw three partridges, they looked as plump as ever. The foxes continue as thick as ever, one of the men shot one on the ice in front of the house last week, the next morning I saw one near the barn.

The bluejays are now constant visitors, and last night I heard an owl. Last week our old visitors, the fish crows, came back. They have nested in the swamp east of the barn every year since I came here. They always come a few days ahead of the bluebirds and robins. I shall expect to see the bluebirds as soon as there is bare ground enough for them to stand on.

April 6.—No chance to get a letter out yet. The snow is so soft a horse could not get out to the post-office.

As I wrote somewhere in the letter, I expected to see a bluebird as soon as there was bare ground enough for him to stand on. Day before yesterday the men felled a dry spruce and made a fire of the branches. It made one bare spot, and before the ashes got cold a bluebird was on hand with his song. Yesterday a robin gave us a few notes, then left, but a pair of ground sparrows have come to stay. This thaw has settled the snow about one foot, and if it thaws twenty-four hours longer at the same rate we will be obliged to let down the top bar to get over. We can now see the board next below the top one on the barn-yard fence.

Some time ago I saw in the FOREST AND STREAM a call for information in regard to Joe Call. I have waited to see some response, but have seen none. Almost anyone in Essex county could give many points. Several members of the family now live in Jay, Essex county. One son works in the forge of the J. & J. Rogers Co. I have written to Jay asking for some facts, and if I get anything worth while will give them to the FOREST AND STREAM. I have often heard him in this section tell of his great feats of strength. Many of them seem incredible, and they are told for truth, and I think the story of Call's life would be very interesting. He certainly had a great reputation as a wrestler.

April 7.—Snowed from the first night to the last, and one of the men is going home, so I have a chance to send to mail. I had lots more to say to you after reading the last batch of papers.

A. R. FULLER.

MEACHAM LAKE, FRANKLIN CO., N. Y.

AN OLD HUNTER.—Phin Teeple, an old hunter of Wayne county, Penn., last fall, while about a mile from the village of Prosper, was saved from the road by a large coon, having no gun, and only his dog with him, the animal was with difficulty put to flight. Knowing that the bold actions of the cat were prompted by her having some kittens near by, old Phin, who is now over seventy-five, at once made search for the youngsters, and by aid of his dog, soon discovered and secured the pair and returned home with them in his overcoat pocket. The following morning he returned to the spot with one kitten, and tying it to a bush, soon brought the old one over enough to him, which he shot. Phin has secured of 3,500 deer he has killed in his lifetime, and a score of 400 bears, all shot with a rifle he still has, which bears the name of "Settler." Teeple remembers the time when there were elk in Wayne county, and calls to mind the last pautner shot in his county in 1851, by Ed. Queik, of Blooming Grove. Since 1879, Phin has given up hunting in Wayne and Susquehanna counties, going into Butler, where game is more plentiful. There have been more deer. Pike county this season than for several years past, and many have been killed. It is a pleasure to meet Phin Teeple, and we have no doubt he has as many hunting exploits to relate as had old Mat. Browning, who for forty years hunted in the central southern portion of our State and Northern Western Maryland. I shall have some unpublished account of old Browning's doings with the rifle, which will be given me by his son of an old hunter, who was at times his companion in the woods.—Homo.

THE RETURN OF THE DUCKS.—Appleton, Me., April 10. —I live within stone's throw of the St. Georges River, and within a few miles of many ponds, both large and small, and so I have a good chance of seeing both ducks and geese. The first ducks were seen Friday morning, April 6, and that morning a large flock of geese went over here on their way north, the largest one seen here for several years. Since that time there has been a steady flow, but no one has been able to shoot one. All of the ducks seen here as yet have been black ones, but those that have been shot were in poor condition. It promises to be a good season's sport.—R. R.

THE STAKED PLAIN.—Our frequent contributor, "N. A. T.," has just been over the Staked Plain, Texas, and reports game plenty: I found my old friend, the Staked Plain, literally swarming with game as I passed over it. I must have seen from the ear windows 50,000 antelopes. The pay-car, which was just ahead of me, ran into a herd of buffaloes, about twenty-five miles east of the Pecos, and the chase on board killed four. I would not have thought that there was a man on board that car who could hit the side of a mountain at ten feet distance, but they did very well on buffaloes. It was, however, an accident, no doubt—a mere accident. Had they known how to shoot, they might have killed a hundred. This morning I was at Red Lake, seven miles from Marienfeld. It covers fully 2,000 acres, and is a beautiful sheet of water. The wind was blowing strongly, and the lake sent forth a sound much like the gulf on Galveston beach, but of course not so loudly. A few hundred yards from it there is another lake of several hundred acres. Both were swarming with ducks. The water in each is pretty salty, but the cattle seem to like it. There are thousands of lakes on the Staked Plain. It is the sportsman's paradise. If I should ever come up here on a sporting expedition, I should bring with me a canvas canoe in order to get at the myriads of geese and ducks that swarm these lakes. With a canvas canoe and a gun, and a few ducks. Without a canoe it is a mere chance to run all day at all; and if you do, you often cannot get them unless you have a dog.

FARMER AND SPORTSMAN.—East Douglas, Mass.—I am a farmer, and my lands are always open to any sportsman who deserves the name, for I do not class as sportsmen men who are guilty of the acts which, among certain classes of land-owners, has called down condemnation on the whole race of hunters. Some of them have had cause enough to make them wroth, as I have good reasons to know. How many sportsmen would hear with calmness the death or crippling of a favorite dog out of "pure usefulness"? It is not all we have to consider in rearing to find a fine hound wounded to the death by some neighbor and geese by hundreds. Without a canoe it is a mere chance to run all day at all; and if you do, you often cannot get them unless you have a dog. As your correspondent "K." says, some seem to think that we have no rights that they are bound to respect. I claim to be a humble follower of Nimrod and Walton; no one better enjoys a day's sport with rod or gun than I do, but when things come to the pass that the amount of property destroyed exceeds the value of the game ten-fold, it is time to draw the line somewhere. The panther which has terrorized this section so long turns out to be a wolf; so it seems some of the persons who saw him must have drawn on their imaginations rather strongly.—AMATEUR.

WATERFOWL IN THE NORTH.—We print the following extract from a private letter received from a friend who is living on the Upper Allegheny on Northern Montana. He says: "For the past few days the snow has been melting down, and now lies on the ground at the depth of a foot or more. It has been a complete surprise to the waterfowl, which commenced to arrive about the 5th of March. The lakes and streams are again frozen over, and only the rifts on the rivers are open. I have had some good sport shooting swans and geese with the rifle, but owing to the dangerous condition we were in, I have not been able to get on a good deal of what I have killed. I carry a long fishline with me on the end of which is tied a ball of lead; back of that, several feet apart, I have fastened on three large fishhooks. I throw the line out directly over the floating bird, draw it quickly back, one of the hooks catches on to the fowl, and I drag it ashore. Isn't this an ingenious device? I was out day before yesterday for an hour or two with an Indian, and we were trying to catch a bear. He had set a trap on the bank, when five swans rose out of the river near by. With his Winchester the Indian dropped three of them before they got out of range. I do not think that waterfowl are weather prophets. I have noticed during my residence out here that they begin to arrive from the 7th and the 15th of March, and we often have severe storms later. The swans which I have killed are very fat, but the geese very poor, the breast bone being very prominent.

THE COOKING OF GREBS.—Cut off the meat from the breast, taking off the skin, and put the meat into cold water with considerable salt, and let it soak over night. Then rinse off with clean water and put it into your kettle with cold water enough to cover it; add a very small quantity of saleratus, and let it parboil six or eight minutes. Then pour off the water and again cover it with cold water, and add four or five small onions and a few pieces of carrots. Let the cook slowly together until the vegetables are nearly done, then take them out and reserve some of the water for gravy. Now cut some carrots and parsnips into strips (as for julienne soup), and fry these together in butter until done. Next put a few slices of bacon into a roasting pan, placing the breasts of the grebe and vegetables over the bacon; pour in some hot water and the water previously saved and put them on the stove, and let them cook together until the meat is done. Then take out your meat and vegetables (leaving the bacon in), place them on your platter and set in a warm place. Set your pan with the water and bacon in over the fire, add some Worcestershire sauce (sherry wine if you wish), thicken, and let it cook about five minutes, and then pour it over your dish of grebe, and they are ready for the table. Crab-apple or currant jelly are very good served with them.—D.

ENFORCING THE DEER LAWS.—Canton, N. Y., April 19, 1883.—At the last term of the Court of Sessions of St. Lawrence county, Chester Young, of the town of Fine, was tried and convicted for pursuing deer with dogs on the 17th day of October last. He was sentenced by the court to pay a fine of \$30 and to stand committed until the fine should be paid. The same defendant pleaded guilty to a second indictment for the same offense on the 18th day of last October, and was fined \$20. George Walker and Alonzo Green, of the same town, were indicted, tried and convicted for unlawfully killing a speckled trout, and sentenced to pay a fine of \$20 each and to stand committed until the 15th day of October last. Lenox Smith, of New York city, pleaded guilty to an indictment for killing a deer in the month of June, 1882, and was fined \$50. The authorities, in cooperation with the St. Lawrence Game Club, are securing the enforcement of the game law in this county.—L. P. H.

KENTUCKY GAME NOTES.—Our principal game to come in is the partridge. The birds are in fine condition, having passed a very open winter. Being scarce last fall, they were hunted but little, and there are now many full coveys. If a dry June should favor us, we can count on fine shooting next fall. Our club played havoc with hawks by raising a fund to pay a bounty for their destruction. The result shows plainly in the field. A year ago last fall I hunted, and often, by observing a hawk, found a covey of partridges which they were watching. Now we may travel all day and not find one. Squirrels are in moderate numbers; being migratory, cannot say they will be plenty. Young ones half grown already in the adjacent mountains. Report comes of more ruffed grouse than usual. Our superintendent of some quarries says he can be heard in all directions drumming.—VAN. (Mt. Sterling, Ky.)

SANFORD, Fla., April 14.—A good many quail have been killed this year, but not many deer. The breeding season seems to be backward, as I have noticed several coveys of birds within a day or two that have not paired off; the close season for me begins April 1. Some weeks ago I saw a few doves going past at a pretty good rate, about forty yards off. I shot one with No. 6 shot, and when I picked him up found him to be a very curiously marked partial albino, mottled all over, every third feather or so being white. It is the only albino dove I have ever seen. Have seen no ducks this year except on the river. There are frequent heavy rains; rather earlier than they usually come. President Arthur arrived in Sanford Saturday, the seventh, and has been to Lake Tohopeulga, where he did some fishing.—TRUMB.

MAINE.—SIBYRIA, Croosook Co., Me.—It is gratifying to be able to state that through the increased vigilance of the game wardens there has been less erusting done than in previous seasons. Warden McLain and his assistants, by their presence in this vicinity, have deterred many outsiders from venturing into the woods, and restrained the local hunters as well. Hunters and lumbermen agree that moose deer are more plentiful than for many years, while the ducks are greatly in excess of any former period. The Indian hunters who ravaged the moose yards last year in the Munsungan country have given the region a wide berth, fearing, doubtless, the vigilance of Warden McLain, who gave them a close call last season.—WARFIELD.

IOWA.—Burlington.—Duck shooting on the river, in the sloughs and ponds, and in the lakes on the islands up the river, of which there are a great many, has been very good this spring. Sportsmen have gone from here in the morning and returned in the evening with from 80 to 100 ducks, of both the mallard and pintail. Now it is getting too late, and but few birds are brought in by our best shots. Jack snipe are reported quite plenty in the lowlands opposite the city, on the Illinois side, and south of us on our own side of the river.—DISEUR.

BELLEVILLE, Ont., April 19.—The spring migrants are well on once more. Ducks are plentiful, and some good bags have been made, but the birds are in very poor condition. A few days ago a woodcock was picked up on one of the streets of the city. It was unburnt, and soon recovered after being placed in a cage. Its weight was seven ounces. A pair of horned grebes (*Podiceps cornutus*), male and female, were recently shot at Wellers Bay, a few miles distant. They are rare visitors to this part of the country.—R. S. BELL.

WRIGHTSVILLE, Pa., April 23.—We have had, and still have, some very fine duck shooting on the Susquehanna, but mostly at redheads and coots; very few mallards and canvasbacks have made their appearance. No snipe as yet, but they are expected every day. What few quails were not chased and scared away last fall have wintered well.—RAZOR.

PHILADELPHIA, April 19, 1893.—The New Jersey Game Protective Society met yesterday at Hellemann's Hall, Camden. A balance of \$450.97 was reported in the treasury. A committee was appointed to find out why the Game Committee had not reported what disposition to make of \$500 appropriated to stock the district.—HOSIO.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

ANGLING FOR WHITEFISH.

IN your issue of April 12 a correspondent requests information in regard to angling for whitefish. This delicious and choicest fish lives in Moosehead Lake in this State, of which water it is a native. They are quite plenty in that lake, and are caught by a hook baited with angle worms, pork or live bait. The former is considered the most preferable as a bait. They are always on or near the bottom, and are taken in water of about thirty feet in depth. They are from one to two pounds in weight, and are wary, timid and cautious in taking a hook, yet they are caught with fair success every summer. There is no fish in this region more highly prized for food than is the whitefish of Moosehead Lake. J. F. S. Monson, Me.

IN FOREST AND STREAM, April 12, "Nemo" asks information about the whitefish, and the editor remarks that he does not know that the fish is ever angled for. While at Moose River settlement in the year 1861, I met a man who was fishing through the ice for this fish, and made a business of it. He said he fished with set hooks and entirely in the night time, and near the bottom. The kind of bait he used I cannot remember. I know but little of the fish, as there are none in this part of Maine, but several ponds at and near Moose River are full of them, and they are a nice table fish. J. G. R. Brewer, Me.

THE PIKE-PERCH TAKES THE FLY.

OF the many articles relating to pike-perch in your paper I have not read a single one fly-fishing. This fine fish affords us. In my own country they go by the name of "pickercil," which I will hereafter call them, and are considered one of our finest fish and are protected by our game laws. Our river pickercil are far ahead of the lake or sand pickercil, as we call them, and are far gamier.

May 15 the open season begins, and on the banks of our river, the Grand, any morning can be seen a great many of fishing sports with spoons, spinners and minnow, and pickercil are the best of the best. On the banks of the Grand, "Say Mac, what have you got, black bass?" By the way he fought I thought he was a pickercil; better luck next time.

Most of our black bass for the last few years are wormy, which is never the case with our pickercil; besides, when they are from one to three pounds weight we prefer their flesh to that of the black bass. But the best of our pickercil fishing begins on or about July 15, when the water in the river gets low and finds its best time. At night, about 7 P. M., we start for our fishing ground and fish to ten or eleven; no moonlight night, but a dark, cloudy one is preferable. We use salmon or bass flies, and sink them about a foot deep and move very slowly. There have been some very large fish caught here, the largest I believe weighed about eleven pounds, but the largest I myself had the pleasure to assist in landing was seven and a quarter pounds, and if any of my angling friends had been present they would never again complain of the pickercil being a sluggish fish and not gamy; and as for being rascious, well it is a fact, he is so, but this I can confidently say, as many pickercil as I have caught and cleaned, I find them far more particular in their habits than the bass, and always when I go fishing for pickercil I take the swiftest part of the river, as they are generally there, and very seldom, unlike the bass and pike, in still water. Now I think the pickercil is sadly abused, and all on account of the mixing up of the names of the two fish, pike and pickercil, and the name of the angler who like FOREST AND STREAM would fly-fishing at night time for them they would have the same respect for them that I have. The Grand River is considered to be one of the finest bass and pickercil rivers in Ontario. At Port Maitland, its mouth, and just below the great government dam at Dunnville, is as fine a place for trolling or fly-fishing for these two fish as one would want to have.

When tired of that, if a chance is taken, you can try their hands as hangers in a five or ten pound channed cat, and occasionally, while trolling for bass, a muscatonge is hooked. Around Bradford the fishing is not quite so good as it is further down the river, although within seven miles of the city there are quite a number of good trout streams. Two weeks from to day will find myself, rod in hand, following up my favorite stream, and during the summer you may occasionally hear from

BRADFORD, Ontario.

LITTLE MAC.

I see in your issue of April 12 an article written by "H. P. H." wherein it is plain to be seen that many of your former correspondents have confounded the grass pike, or pickercil, with the pike perch or walleyed pike. I can perceive but one article where this mistake has been made. It is in your issue of March 10, wherein you say you saw a pike-perch caught in a trap on Mussel Shoals that weighed eleven pounds, and his friend took one in Cypress Creek that weighed nine pounds. A pike-perch will not go in a creek, or on shoals; they stay in deep and clear water. The pike will not go in impure water and if put there he will not live.

Fifteen years ago pike-perch were taken in Saginaw River by tons with seines, now it is so depleted of pike that fishermen have nearly abandoned it altogether. What has caused this but the numerous sawmills, and salt locks from which the refuse has been cast in the river? Now the only time the pike is taken is in winter and early spring, when the river is frozen over and the sawmills and salt wells are not in operation. A few years ago one of the fishermen had a large pond dredged on the shore of Saginaw Bay; it was twelve feet deep, one hundred feet wide, and three hundred feet long, and inside the pond there was a small creek that emptied into the pond, and at the other side there was an outlet made with sheet piling so that the creek water was running through the pond continually. In April this fisherman had about four hundred barrels of pike-perch put in the pond; two months later, when they went to take them out, they could not find a live pike in the pond.

Another instance is where C. W. Gauthier, a large fish dealer in all kinds of lake fish, had a fish pen built on the St. Clair River in the spring of 1887. During the months of May and June he had about five hundred barrels of pike-perch put in a pen. More than two-thirds of them died. Others have tried to keep them in pens, or ponds, but all with the same result. In regard to the game qualities of the pike-perch, there seems to be a vast difference of opinion, but I think that all those who are not prejudiced, and have had the pleasure of taking the pike either with the rod or trolling line and spoon, will vouch for his gaminess. "H. P. H." says that a pike-perch weighing from six to seven pounds is an exception. I have seen hundreds of pike taken that weighed from ten to twelve pounds, and I have seen specimens taken weighing from fifteen to eighteen pounds. The pike-perch in Canada are called "pickercil" by those speaking the English language, and called "dore" by the French Canadians. MARTIN E. O'BRIEN, MILWAUKEE, Wis.

Allow me to "drop a line" into the stream in re walleyed pike, or, as here called, dore.

First, as a game fish. Here it is the first fish caught in the spring. As soon as the water in our rivers becomes clear, after the freshet, rods and poles are got out, minnows caught, and early in the morning, or near sunset, the lovers of forest and stream who cannot wait for the tardy trout, muster on the rocky shore of the Magog where it joins the St. Francis, to welcome the first fish of the season.

We use no slinker, as the eddies are sufficient to draw the bait to the required depth, two or three feet. The bait is held on a small line, but not so as to prevent the current running clear, after the freshet, rods and poles are got out, minnows caught, and early in the morning, or near sunset, the lovers of forest and stream who cannot wait for the tardy trout, muster on the rocky shore of the Magog where it joins the St. Francis, to welcome the first fish of the season.

When he stops the fisher begins to feel the greatest thrill of enjoyment to be experienced in the whole fight. He gives his game a moment to get the bait into good position, then strikes. Now it is the fish that is excited, not the man. All you need know what follows when a good trout is struck. Well, what follows now comes as near as possible to that, the highest standard of sport. The dore (here) does

not equal the black bass, but the game in a black bass is different from that shown by a dore.

It is certainly a good fish for sport. In a fortnight or three weeks after the first are caught, a spoon bait with a rod takes (or is taken) well, either from shore, where the current is swift, or trolling from a boat. This lasts till the middle of June. I do not think a dore was ever caught here in July. As for size, the largest one I ever heard of in this neighborhood was caught about six miles below here and weighed eighteen pounds. The largest one I ever saw weighed eleven and one half pounds.

Secondly, as a table fish. Honestly, I must say I think it is better to give away your catch at the first abode of poverty you pass than to carry it home. If you do the first you will experience a lightness-of-heart-edness. If you give your game to the cook, look out for bones.

Now, gentlemen, I am only speaking of dore as I find them here. "Kentuckinn" and "S. C. C." say they find them good. I am glad of it, and I well know that fish vary in many ways, according to the waters from which they are taken. Here the flesh of the dore is watery and full of small bones. Cook it as you will, it tastes but half cooked still. (rhyme accidental.)

To sum up, they are a welcome fish, and in a week or two I hope to see my rod make that bow which all the disciples are glad to look upon as homage to the one they woo.

SUREBURN, Quebec.

WATSON.

I am pleased to see that the walleyed-pike (locally pickercil) has been receiving that attention in your columns which so valuable a food-fish deserves. Pickercil were formerly very numerous in the Bay of Quinte, but their slaughter was so persistently carried on during the spawning season that although still comparatively plenty, their numbers have been greatly reduced. Between the middle of April and the 10th of May they ascend the rivers hereabouts and deposit their spawn; and, although the fishery officer does all in his power to protect them, many of these fine fish, ranging, generally, in size from three to eight pounds, fall a prey to the spear, the scoop-net and the bow of the poacher. Worse than the poacher, even are the red-head and salt well men, and the Red Head bullhead, which close to follow the pickercil and feast upon their spawn. Time was, and that not many years ago, before the pickercil were protected, that as many as from fifty to a hundred wheelbarrow loads of them were taken daily in the rivers during the spawning season. Not one-twentieth part of that number are now captured. During the greater part of the year the pickercil remain in the deep water. Many are taken by seines in the early summer and autumn, and are still greater number are caught throughout the ice during the winter, at which time they are at their best. Very few fall to the lot of the angler, but I have seen them taken with the fly at points very near the mouth of the river in June and July. Those so captured usually weigh not more than a pound or two, and they afford fair sport.

R. S. BELL.

ROUTE TO THE NEPICON.

IN answer to inquiry of "Angler" in FOREST AND STREAM of 19th inst., I will say that there is no regular steamer communication between the two places. The Canadian steamers from Duluth down the lake sometimes touch at Red Rock, however; so that the communication is about as frequent and about as uncertain with one end of the lake as the other. There is never any difficulty in reaching Prince Arthur's Landing or Silver Islet from either Duluth or Sault Ste. Marie. Steamer advertisements cannot be entirely relied on, and I have known cases where tickets purchased and held in assurance of landing there by steamer officers were not successful in getting people to Red Rock. A fog or a brisk wind has been sufficient "stress of weather" to make an excuse for not complying with the contract.

Immediately about Sault Ste. Marie, that is, on the rapids, the fishing is somewhat exhausted by August, although good earlier. There are some good streams within a half day's time, however, although the trout rarely exceed twelve ounces in weight. Larger are taken on the rapids, and a few miles below on the American side. As to the latter, I speak from information only. Agawa River is three days (on the average) from Sault, and Béchewana Bay about one and a half or two days. Some of the rivers running into that bay have fine fishing. Most excellent fishing can be had along the lake shore above Goulais Point and on the lake front of the island in the bay. In fact, few points on the lake surpass it.

If "Angler" should be at St. Paul he ought by all means to go, via Lake Superior, to Boston, whether he can stop at fish or not. FISHERMAN.

FISHING THROUGH THE ICE.

A FEW wintery since I wished to go fishing through the ice, and never having the pleasure of doing so, thought a little advice from retired fishermen would be acceptable.

On interviewing an old gentleman with hoary locks, he said in reply to my question, "When is the best time to go?" "Well, you wait until the south wind blows two days, and unless the wind changes, you will have no chance; if it is needed to go when the wind blows from the north." Old gentleman No. 2, same question: "Never go when the ice cracks, or when it is 'squally,' or snowing. You cannot catch any when it is zero weather." Old gentleman No. 3, same question: "After a thaw and the wind not blowing from the east. Now, you cannot catch anything when the wind blows from the east, mind that."

Life being short, and my stay being limited, I must go now. I forget to mention that the day I did come, and you never saw anything like it. For my special benefit New England weather was on a "tantrum" wind blowing from all quarters, snow flying, and thermometer at zero. Horse hitched up and we started. As we had about four miles to go to the pond we had ample time to reflect on the advice as given by friends. After gathering up overshoes and live bait which was quite well distributed over the beautiful snow, I forgot to mention that the day I did come, and you never saw anything like it. ording to old fishermen, were against me, and had good luck. Fish are as hungry one day as another, and all you have got to do is present something acceptable to them and they are yours, "barring accidents." Of course it is nice to go when it is fine weather, but any one fond of fishing does not wait for a day with everything just as he would like to have it.

FRANK FRACK.

SPIRIT LAKE, IOWA.

THERE are a chain of three lakes, viz., Okoboji, East Okoboji and Spirit Lake, lying in the midst of an almost boundless prairie, with only a few of the highest peaks of the Alleghenies and the Rocky Mountains. The waters of the Okobojies are pure and limpid, with a gravelly bottom, and abound with fish, though the greater quantities are pickerel, with fair black and rock bass fishing at the upper end of Spirit Lake. The lakes are fairly equipped with a flotilla of row, sail and steam pleasure craft, which, by the way, can be hired without causing one to think he has bought the boat and then has to return it. The town of Spirit Lake is quite a little village, situated upon the west side of East Okoboji and upon a high bluff overlooking it and Spirit Lake. There is one hotel in the town. A new hotel, just built, will be opened this summer at the isthmus, and two miles from the town.

The surrounding country is as fine chicken country as ever the heart of sportsman could wish, though in justice to the brother sportsmen we are compelled to state that last season there was a scarcity of chickens; in fact to such an extent that one was almost willing to confess it more work than sport to hunt the pinnated beauties with anything like a fair prospect of a bag. We are told, however, that the prospect for good shooting this season is better than for some seasons.

A few hours' ride over the solidly-constructed railroad owned by the B., C., R. & N. Company connects the locality with Davenport and the East via Burlington.

L. T. DORSEY.

THE SECRETS OF SALMON GROWTH.

[CONCLUDED.]

THE Tweed has an evil odor in another direction; it has a bad reputation of being a "most poached" salmon river in Scotland. Some of those who dwell on the banks of Tweed and on its tributary streams have long been pre-eminently poachers. As a decreased nobleman used to say, "not all the king's horses and all the king's men could keep the Tweed free from poachers, who infest both sides of the river and who, not contented with taking an occasional clean fish, make their greatest efforts when the salmon are on their spawning beds and in a condition the least suitable for food. No person has been able to guess the number of fish which fall a prey to the Tweed poachers. Over 200 persons are annually convicted of poaching or other offenses against the Tweed Acts, and probably more than double that number escape punishment by their superior dexterity in carrying on their ignoble traffic. It would probably prove a low estimate to say there are 600 poachers on Tweed and tributaries, and that each of them on the average will bag ten salmon per annum, or 6,000 fish in the course of the year, which is, perhaps, about a fifth of the entire marketable salmon of the Tweed. The salmon killed by poachers are, of course, all or nearly all prematurely killed. It may be assumed, without any stretch of the imagination, that every one of the poached fish would, under the natural conditions of their lives, have survived, on an average, two years longer, and they would undoubtedly have increased in money value as they increased in weight. In the face of the mortality from disease and the depredations of the poachers, it is very questionable if even 25 per cent. of the salmon hatched in the Tweed and its tributary streams ever attain to a fair degree of longevity, or are permitted, as they ought to be, to multiply their kind for a season or two. It is needless to say that a salmon is never more valuable at any period of its life than when it is engaged in repeating "the story of its birth," and to kill a gravid fish when at work on the spawning beds is that that is abhorrent to all sportsmen from disease and the most rural districts of Scotland, is no longer a "pastime" that gentlemen dare wink at, but has become a trade of the most necessary kind—a trade which must be put down with the high hand. An oft-repeated "excuse" of the poacher is, that birds and beasts belong to nobody—that they are here to-day and away to-morrow; but it surely stands to reason that if a partridge or hare is not the property of the person who gives it room to feed and breed, no person but exercise of the powers of logic can make it out to be the property of the poacher.

Returning, however, to the main question—the growth of the salmon in all its varied stages—we come now to the fish when it is known as a grilse. The principle which regulates the growth of the parr, and smolts of one-half of a hatching becoming smolts a year sooner than the other half, has, as we have indicated, never been discovered. Of the rapid growth of the smolts in the salt water, we have already offered what may be termed "staggering evidence"—evidence from which it is difficult to escape, and which, whatever we may think of it, has, at a later stage of salmon growth, been pretty well corroborated by persons whose experiments were conducted with very great care. As we have hinted, it has been asserted that a moiety of the smolts which reach the salt water do not return to the river till the following year, when they are known as spring salmon, and have assumed considerable dimensions, ranging in weight from 6 lbs. to 10 lbs. Indeed some naturalists have gone the length of saying that none of the smolts return from the sea in the same season as they go there, but that all of them pass a winter in the salt water. From Mr. Young, of Inverurie, we obtain, in an incidental manner, the information that grilse of 4 lbs. weight are able to spawn.

The knowledge obtained by Mr. Young, in the way of ascertaining the length of the life of the salmon, has in part been already detailed; he experimented on the growth of the parr, and proved conclusively that parrs become smolts; but his chief honor, in connection with the setting up of the natural history of the salmon, lies in his having contributed a considerable amount of reliable information as to the ratio of growth of the adult fish. Mr. Young, who had at one time charge of the salmon fisheries of his Grace the Duke of Sutherland, selected for this purpose a pair of fish of 4 lbs. weight, so as to lessen the chances of any blunder being committed. Salmon—a grilse, it is said, becomes a salmon after it has spawned—of that weight were always plentiful, and could be easily found on the reefs after they had fulfilled the great function of their lives; but after they had spawned, the se-

lected fish would probably have weighed 5 lbs. At any rate, no fish above or below 4 lbs. weight were submitted by Mr. Young to the operation of being marked. The identification of the fish was provided for by means of the insertion of rings, formed of copper wire, into certain parts of their fins, which was done in such a manner as not to hurt or incommode the salmon in any way whatever.

The experiments of Mr. Young were continued for several years, and always with the same result, of a great addition to the weight of animals marked. The grilse were, of course, operated upon in the fresh water; they were caught, in fact, while resting after the operation of spawning. On returning from the sea, all those which were captured exhibited a fine healthy appearance, and had acquired a large increment of flesh—the increase in their weight ranging from 5 lbs. to 10 lbs. There need be no hesitation in accepting Mr. Young's facts and figures (he was an exceedingly careful man as proofs of the rapid growth of the adult fish, and of the accuracy of Mr. Young's statistics, are necessary, it is to be found in the history of the marked fish, manipulated by his Grace the late Duke of Athole, who took much interest in the rate of growth of the salmon, personally marking some of the fish, and recording the results of some remarkable instances of increase of weight. One of the most noteworthy of the Duke's experiments may be here recalled to recollection. A fish, marked by his Grace, was caught at a place forty miles from the sea, and was taken to the salt water, fed, and returned to the space of thirty-seven days. The following is the Duke's entry regarding this particular fish: "On referring to my journal, I find that I caught this fish as a kelt (spawned salmon) this year, on the 31st of March, with the rod, about two miles above Dankeld bridge, at which time it weighed exactly 10 lbs.; so that, in the short space of five weeks and two days, it had gained 14 lbs." The Duke's plan of marking was by means of tickets attached to the fins, marked for the purpose and numbered for identification, the date of each marking and capture being carefully registered for future reference.

With regard to the mode of marking young salmon, there has, from time to time, been much controversy. Harking back for a moment to the markings made at Stormontfield, it may be mentioned that on one occasion as many as 1,250 smolts were marked by cutting off the second dorsal fin; and of these, marked in this manner, 100 may have been captured the same season as grilse (weight not stated), which, not, be it observed, two per cent. of the number cut. In the following year, 1,135 were marked by means of a cut on the tail, and "a few" of these were caught as grilse; at the same time as these smolts were cut in the tail, 300 were marked by means of silver rings inserted in the fins; but not one of these was ever seen again. It is well said by one who knew a great deal more of the salmon than most other men—Russell, of the *Scottish Fishery*—that the fish can be placed in the system of marking by cuts: "Anyone that, by examining the heaps of fish as they are tumbled from the nets, or by any other means, has had an opportunity of observing the great number and infinite variety of marks and hairings, produced for the most part, it would appear, from encounters with marine enemies, will have a strong distrust of any such tests." All the marks which have been tried have each in turn been decided; and in each case the fish have returned to wit—meu have been over and over again invited to doubt the evidence of their senses. They have been asked to believe that a grilse never becomes a salmon, but remains for all time a grilse, and nothing but a grilse. This phase of the salmon question need not, however, be discussed here at present, as Russell said, in reviewing the grilse controversy, "There are men in existence who would deny their fathers." It is passing strange that in many of the accounts of the growth of grilse into salmon, which has been disproved a hundred times, is still occasionally cited in the hot arguments which sometimes occur when discussing the natural history of the salmon.

It is only right, however, to admit that many of the persons who maintain that the grilse is a distinct member of the salmon family are quite able to advance excellent reasons for their opinion, both in the case of the diamond-shaped scales of the one, and the oval-shaped scales of the other—as well as in the more forked cut of the tail, and differences in the number of the fin-rays, as also in its habits and the less pronounced flavor of its flesh. A fish-merchant of rare intelligence, and who is an occasional contributor to the newspapers on phases of the natural history of the salmon, says he has never had a doubt on the subject, and that a real grilse never becomes what we call a salmon, but remains all its life a distinct and well marked member of the family; "that," he says, "is my deliberately formed opinion, after an experience of the fish extending over 40 years, during which time I have passed many thousands of them through my hands."

Although in the opinion of the present writer, there is a vast preponderance of evidence in favor of the grilse becoming a salmon, he never objects to hear an expression of opinion or fact from others; and it is a fact that, on one occasion, as many as 11,000 eggs of a female salmon were fertilized by milt from a grilse—no difference of any kind being observed in the fish so long as they were under observation. This experiment was very successful; only thirty of the total number of eggs were added. The proper understanding of the natural history of the salmon is still much impeded by unsolved problems; it is a peculiar fish, able to live either in fresh or salt water. No do the fish of one stream become another, or mistake one another; but are the breeders of one tributary water ever found, except from misadventure, in any other affluent. Salmon, it may perhaps be set down, exist in distinct races; a Tay salmon can be easily enough distinguished from one which has been bred in Tweed.

Let us now ask, as we near the completion of our labors, how many of our salmon are spared to die a natural death; or, rather, of what period of their lives they would die if old age, if they could escape from the toils of their most intelligent enemy—man? In considering this phase of salmon river economy, we shall exclude deaths from the mysterious epidemic which has for a season or two been depopulating our rivers of some of their finest fish—*Suprolegnia ferax*. It has already, we will assume, been made sufficiently clear that the greatest mortality among our salmon occurs at a stage when they are least able to fight their enemies in countless thousands. As those which live grow older, they become more able to seek their food and to contend with their enemies. Of a hundred fish under 1 lb. in weight, it is certain that about a half will be killed or die of starvation; but of a similar number who have obtained a weight of 6 lbs., two-thirds probably will live and thrive for a given period; and so, as the fish grow older and escape the perils of their

young, their chances of life increase. The average weight of the salmon now being purveyed for table use runs from 17 lbs. to 184 lbs. The 136 fish captured by anglers in Loch Tay in the beginning of the present season (1882) averaged 194 lbs.; last year had the year before that the weight was still higher, the average being 214 lbs. The heaviest salmon captured in Loch Tay this season was 55 lbs.

Big salmon are happily nowadays not a matter of great rarity. Every season two or three of the finer smolts, most of them captured, and this year has not proved exceptional—indeed some very fine specimens have been secured. The writer personally examined, within a week after the opening of the river Tay, a dozen fish, each of which weighed more than 80 lbs.; and his opportunities of observation were confined only to one source of supply from that river.* Season after season the average weight of salmon has increased, and is still increasing, although about sixteen years ago the weight of salmon commenced to decrease in a way that gave rise to some doubts, and this year indicated that the capital stock of fish had been broken up. At the time indicated all smolts were, so to say, being prematurely killed, the average weight having fallen to a little over 15 lbs.—so that, as a rule, the life of a salmon, was at that date not a prolonged one; thirty and forty pounders had become exceedingly rare, and in those days there were no giants to delight the ichthyologists; many, as has since been shown, salmon which weighed from 50 lbs. to 40 lbs., and even heavier fish, are captured every day during the season. And we know from indications equally unmistakable that the capital stock of fish in our rivers is undoubtedly increasing—hence the number of large salmon which are recorded as being occasionally captured. It is quite true, however, that both during this season and the two which preceded it, the take of salmon was upon the whole not up to the mark, but that probably resulted from causes other than the scarcity of fish; for, in a late season we personally saw, in the course of about twenty hours, some fine fish ascending to the upper waters of Tay, not one of which would be less than 20 lbs. in weight. That was after the nets had been taken off the river; and an old fisherman with whom we conversed assured us that there was always a fine run of fish as soon as the close time began, "just for all the world as if the salmon had waited till the way was cleared for them."

No official statistics of the number of salmon which are annually caught in rivers of the United Kingdom are taken; but from the number of boxes of these fish which in the season are sent from Scotland to Billingsgate, a pretty good guess can be made of the total salmon production of the land of "the mountain and the flood." Thus, in 1881, including fish from the Tweed, there reached the great wholesale bourse of London 29,724 boxes of salmon, each box of which weighed 50 lbs., and the low wholesale average of one shilling per pound weight, the sum of money paid by London to Scotland in 1881 for its venison of the waters would amount to £192,930; and taking it for granted that our home consumption of salmon would be equal to about 8,000 boxes, a sum of £60,000 would thereby be added, making a total of £252,930 (the annual value of our Scottish salmon fisheries, from the Tweed to the Tay, and from profits to losses of fishing stations, before the net rental cost be struck. The price of a shilling per pound weight, which we have quoted, is probably too low, as at certain seasons of the year salmon in London brings from half-a-crown to seven shillings a pound weight. The salmon retail of Scotland, while it is undoubtedly more than double that of England, is certainly not half that of France, and the latter country exports every year from Ireland over half a million of pounds sterling. From these figures it will be obvious that, if by some means we could add a few pounds to the average weight of our fish, it would tend to largely increase the money value of our salmon supply. Assuming it to be possible that four pounds could be added all round to the marketable fish, that would, at the wholesale rate of one shilling per pound, add six shillings to the price of each salmon, and at a rough guess increase the value of our Scottish salmon supply more than £300,000 per annum.

And now to conclude. If the writer were to be asked to say, "on soul and conscience," how old the 50-lb. fish was which was captured this season in the river Tay, he would be loath to commit himself to an opinion, even after thirty years' experience of the fish of the salmon both on Tay and on Tweed. It is one of the misfortunes which attend on fishery, that there exists a plentiful supply of figures with which to prove anything about that fish that wants proof! We have already given figures to show that salmon grow at the rate of at least five pounds a season, and that is a rate of growth which we have always found practical fishermen ready to admit. There comes, however, a period in its life, we believe, at which growth either altogether ceases, or becomes greatly slower than the rate of increase which is incidental to the early years of its life. Will there be any salmon over twelve years of age? We once landed an 80-lb. fish, but it bore upon it no mark by which we could find out its age; it might, for all that we could see by a careful examination, be twenty years old, or it might only be ten. It will be not a little curious if the problem of salmon growth should ultimately be settled at the antipodes. The salmon has been acclimatized in our Australian colonies. What date of its introduction by man, and what date it is well known, so that when a large fish shall be caught, there will be almost no doubt as to its age. The salmon, we are told by some experts in fishery economy, never adds to its growth while it inhabits the fresh water—it is in the sea it finds its productive feeding grounds; it is in the great deep it puts on its annual increments of flesh—"cleads its bones," as James Hogg used to say, "from which it returns a larger and more valuable water-larva increased in size and greatly advanced in value. Upon one occasion, when we landed a 33-lb. Tay salmon that had just been netted, we put the question to its captor, an old fisherman, "What do you think its age will be?" and he replied without any hesitation, "I would say, sir, that she's a six-year-old, if she's a day." There is every probability that his estimate was a correct one, and having given his reply, we shall, for the present, take leave of the salmon as an object of natural history.

* At the close of the present season, a 50-pounder was taken in the Tay (by net); and more than one specimen weighing 45 lbs. was captured in the same way. The date of its introduction by man, and what date it is well known, so that when a large fish shall be caught, there will be almost no doubt as to its age. The salmon, we are told by some experts in fishery economy, never adds to its growth while it inhabits the fresh water—it is in the sea it finds its productive feeding grounds; it is in the great deep it puts on its annual increments of flesh—"cleads its bones," as James Hogg used to say, "from which it returns a larger and more valuable water-larva increased in size and greatly advanced in value. Upon one occasion, when we landed a 33-lb. Tay salmon that had just been netted, we put the question to its captor, an old fisherman, "What do you think its age will be?" and he replied without any hesitation, "I would say, sir, that she's a six-year-old, if she's a day." There is every probability that his estimate was a correct one, and having given his reply, we shall, for the present, take leave of the salmon as an object of natural history.

TROUT IN LONG ISLAND.—The reports indicate a good season for trout on the island. At Great River, the presence of Messrs. Willard and Imbrie, some fine fish have been taken. Last week, Mr. Chapman took between twelve and fifteen fish. Mr. Imbrie has made a good score earlier in the season. The shad fly, a kind of gray gnat, seems the favorite; it is sometimes dressed with white wings. Mr. Endicott has been the guest of Mr. Peeks on the north shore, and has had good sport. At the South Side Club the members have had good fishing, and some large fish have been taken.

BIG BLACK BASS.—I am informed by Fish Warden Elias Sindle, of Greenwood Lake, that a dead big-mouth bass was found floating in the lake early in this month, which must have been the patriarch of the New Jersey big-mouths. It weighed when taken from the water eight pounds, and measured twenty-six inches from end to end. Mr. Sindle also stated that he caught a pickerel in the lake about two weeks ago, weighing six and a half pounds. These were big fish. Is there evidence of so large a black bass being found here, in the waters of this locality?—J. W. G.

TROUT IN THE ADIRONDACKS.—Potdam; St. Lawrence County, N. Y., April 16.—We are having most delightful weather here just now, and as a natural sequence, the local anglers are talking fish and fishing. The first catches of the season, in the waters of this county, were made last week. Good luck is reported. A week ago we had big snow banks and winter weather; to-day the ice and snow have entirely disappeared, and the mercury is "looking over" 60.—W. S. R.

Fishculture.

FISHCULTURE IN NEW ZEALAND.

OWING to the irregularity or total absence of the records of the proceedings of most of the New Zealand acclimatization societies, it is not an easy task to collate anything approximating a complete account of the work done by them. Enough, however, is on record to show that, for a young colony whose population is almost entirely engaged in the hard, practical battle of a very difficult and untried life, the expenditure of money has been made with a view to supplementing, by the importation and propagation of foreign game birds, animals and fish, the sparse supply of animal life with which nature has furnished the country. The first acclimatization society in New Zealand was established in 1834, in the province of Otago, in the Southern Island, and since that date Auckland seems to have followed with equal success in the same line. The Auckland Society was first organized in 1837, and since that time societies have been formed in Wellington, Hawkes Bay, Wanganui, Nelson, Marlborough and Greymouth.

The importations, propagations and distributions of the principal kinds of fish to which these societies have turned their attention, are, as nearly as could be ascertained, the following:

CALIFORNIA SALMON (*S. ginnala*).
In the end of the year 1870 a shipment of ova was received from San Francisco, and 130,000 of the ova of the colony of which 100,000 were sent to Canterbury; 65,000 of these were successfully hatched there and liberated in eight of the most suitable rivers of the district. In May, 1880, on a special application in that behalf presented to the Government, a consignment of 100,000 ova was sent to Otago, 80,000 of which were hatched and turned into the Kakanui stream three months after their arrival; but the report of that acclimatization society for 1881 states that no certainty of the existence of the adult fish in the district can be given. On the arrival of these ova, several reports of large fish, answering the description of the salmon, having been occasionally caught there in fishermen's nets.

A considerable number of *S. ginnala* ova have also been sent to and turned out in the Southland rivers, but there is no information as to the results.

In the North Island districts of Auckland, Hawkes Bay, and Wanganui, and in Nelson and Marlborough, in the northern part of the South Island, large numbers of the fish have been turned out on the rivers, but there is no evidence of their existence in any of these places, and it is conjectured that the average temperature of the streams and coastal waters is too high for their successful propagation.

BRITISH SALMON (*S. salar*).
Attempts to acclimatize this national fish have, according to the records, been confined to Otago, Southland and Canterbury, in the South Island, and have met with but doubtful success. Of 200,000 ova imported in 1868 to Otago, but 1,500 were hatched and turned out, and in 1876 a further instalment of about 3,000 young fish were hatched in Otago and liberated in the Aparima River in Southland. At this latter date, too, 150 young fish were hatched and turned out in Canterbury; but the evidence of the existence of this fish in the rivers on the coast of the North Island is so fragmentary that it is difficult to ascertain in the case of *S. ginnala*. Devotees of the rod, however, still live in hope of enjoying many a fight with specimens of both these magnificent game fish in our Southern waters.

SALMON TROUT (*S. trutta*).
The importation of this fish has also been confined to Otago and Southland, the ova having been originally obtained from Tasmania in 1870. Altogether some 1,200 young fish have been liberated in the rivers of these districts, and a good many specimens have from time to time been taken in Otago harbor by fishermen in their nets. This fish is still closely preserved by law, and the opportunities for ascertaining their condition and habits are limited. There can be, however, little doubt that they are well established in our Southern waters, and may fairly be expected to form at no very distant day a staple portion of our marine commodities.

BROWN TROUT (*S. fario*).
This favorite fish, the original supply of which came from Tasmania, has succeeded most remarkably in many parts of the colony. Otago made the earliest importation, of 800 ova, in 1838 and has since imported two lots, of 1,000 each, in 1869 and 1870. Most of these were successfully hatched and reared, and the fish has succeeded so well in the Southern districts that it has been able not only to stock all its own suitable streams, but also to send large supplies to other parts of the colony. Between 1865 and 1880 that society has distributed more than a 1,000,000 ova, and about 500,000 young trout have been turned out in most localities with marked success. The first importation of the Canterbury Society of 800 of these ova from Tasmania in 1867 was a failure. Subsequent attempts, however, met with better success, and breeding has been carried on with great success in the Southern districts of Marlborough, Hawkes Bay, Wanganui, Wellington, Auckland

and Greytown have been indebted for their supplies of trout mainly to Otago and Canterbury. In but few of the Northern districts, however, has this fish attained the size and numbers which it reaches in the South, and in some of the former its progress, if any, is but slow.

For some years trout fishing has, in its season, rejoiced the heart and created the talk of the anglers of Canterbury and Otago; and, though none of us here can boast of such large numbers and weight as those recorded as made by our trans-Pacific cousins, still we believe we can show larger specimens of *S. fario* than any other part of the world. The fact that many of our trout weigh up to sixteen pounds weight in the Southern rivers, and some of this size may be seen in our museums. Fish of 10 to 16 pounds are comparatively common, while the average weight of salmon from the North Island is about 10 pounds. It is not probable that they are not everywhere as abundant devotees of the gentle art have more than once reported trout estimated at twenty pounds as seen in some of the Southern rivers; but, as none of these have been on the scales, their weight cannot be vouched for. There is, however, a little doubt if there are bigger fish yet in our waters than ever came out of them.

A report recently published in the proceedings of the Colonial Institute here shows the total number of trout bred and distributed through the colony by the various acclimatization societies up to the present time to be 343,000; and there can be no question that this excellent game fish is not only admirably suited to our waters and climate, but has also been thoroughly well established here.

AMERICAN BROOK TROUT (*S. fontinalis*).
A consignment of ova of this fish was conveyed by the Auckland Society in 1877, of which 400 survived and were distributed, but it does not appear to be definitely known what has become of them. No other society seems to have attempted its acclimatization, owing, no doubt, to the unattractive facility with which the brown trout can be obtained.

AMERICAN WHITEFISH (*Coregonus albus*).
The first importation of this fish to Auckland in 1877 was a true importation, 130,000 ova being sent to Otago, and 20,000 were sent to Canterbury and 50,000 to Otago, met with a similar fate, a few only surviving and then perishing by a short time. In January, 1880, however, an importation of 500,000 ova from San Francisco was received by the Colonial Society, and 200,000 were sent to Canterbury and 300,000 to Otago. Of the successful earlier career of the 300,000 transmitted to Canterbury an account appeared in FOREST AND STREAM of March 11, 1880. The greater part of these ova were in excellent condition and hatched rapidly; but, owing, it was supposed, to the hot weather and the consequent high temperature of the water, thousands of the young fish perished daily. Within a month of their arrival their numbers were reduced to 28,000, and it was decided to remove 20,000 of the survivors to a piece of water similar in situation and character to Lake Coleridge, in the middle of the Southern Alps and fed by streams from the glaciers. The journey was successfully accomplished, and the young fish liberated in the lake under conditions which fully justify the expectation that they will establish themselves there.

Of the same shipment of ova, 250,000 were delivered to the Otago Society, and were at once conveyed to its hatching boxes at Queenstown, located on a small stream running into Lake Wakatipu, a piece of water similar in situation and character to Lake Coleridge. The majority proved to be in first-rate condition, and hatched out freely; but, as in the case of the Canterbury contingent, the young fish survived only a few hours. This mortality was attributed to the comparatively high temperature of the water, which averaged fifty degrees, extreme range being five degrees. As a last resource, the survivors, some 3,000 or 4,000, were liberated in the lake, and as they appeared vigorous, it is hoped they foundered. No further success to have been heard of these fish in either of the lakes, but time may show a successful result. A few of this shipment of whitefish were also sent to the Nelson Society, but, as was to be expected, they perished, the temperature of the water there, they were a total failure.

CATFISH (*Etheostichus calus*).
Auckland seems to be the only place which has attempted to introduce this fish. A shipment was procured in 1877 from America, but only 100 appear to have survived and been liberated, and there is no record of their having been heard of since. Besides the sea, lake and river fish enumerated above, the perch and teal have been successfully acclimatized by some of the societies of the North Island, but there is no record of nearly 1,000 of these fish among settlers who have ponds suitable for them.

WELLINGTON, N. Y., February, 1883.

THE NEVADA COMMISSION.—The report of the Commissioner of Fisheries of Nevada, for 1881-82, is at hand. It gives the laws relating to fish and the duties of the Commissioner in relation to the fisheries of Nevada, which was read before the California State Sportsman's Association by H. G. Parker, Fish Commissioner of Nevada. This paper gives a good account of the character of the streams and the habits of the fish in that State, and also of the various deposits found east and north of the Forty Mile Desert and within the territory receiving the waters of the Carson and Humboldt rivers. Here the absorption and evaporation is so great that during the fall months the level of the large volume of water carried down these rivers can be seen. There is enough, and its saline character has impressed the Commissioner that they were suitable for salmon, and he has stocked them with that fish. In the Maggie, Mary, and Pine creeks, the principal tributaries of the Humboldt in Nevada, are found the best quality of finest flavored trout. The same may be said of the trout of the Humboldt. These fish, from one-half to six pounds in weight, in color and shape are said to resemble more the trout of Northern Pennsylvania, or several species west of the Rocky Mountains. We think that it is the beautiful "Dolly Varden" trout that is referred to; the report further says: "A more warlike water cannot be found, and the fish is more voracious than any of the gorges through which these streams course make a day's angling most enjoyable. A more choice repast cannot be served than from these delicious, white-fleshed, firm trout, sure to be ready on the spit when the oven is camp-fire lighted." Land-locked salmon, rainbow and Eastern brook trout, catfish and perch, or white bass, have been planted, and in most cases evidences of success have been found.

THE KENTUCKY COMMISSION.—Mr. Griffith has stocked the Asylum Ponds, at Anchorage, Ky., with carp spawners, so there will be a beautiful supply in due time. One pond, stocked with Prof. Baird's carp two years, has a large number of ten inches long. One caught a few days ago weighed six and a half pounds net, was pronounced fine eating by a good judge. The hatching house is running.—VAN.

THE LOSS TO THE FISH COMMISSION.—The report that a large portion of the goods sent to the London Fisheries Exhibition have been lost as sea is untrue. It arose from the fact that some boats which were stored on the deck of the ship were blown away. One caught a few days ago weighed six and one-half pounds net. They can easily be replaced.

THE PENNSYLVANIA COMMISSION.—Philadelphia.—It is reported that Mr. Mather, of this city, is about ready to fish hatching, and the Fish Commissioner is looking about for a new site for the State fish hatchery.—HOBO.

The Kennel.

FIXTURES.

BENCH SHOWS.

May 8, 9, 10 and 11, 1888.—Westminster Kennel Club, Seventh Annual Bench Show, Madison Square Garden, New York City. Entries close April 23. Class—Hounds.

FIELD TRIALS.

November 19, 1888.—Eastern Field Trials Club, Fifth Annual Trials. At New York, N. C. Entries for the Derby close July 1; for the New York, N. Y. for the All-England Stake, Nov. 1. W. A. Custer, Secretary, Flatbush, Long Island, N. Y.

December, 1888.—National American Kennel Club, Fifth Annual Trials at Grand Junction, Tenn. D. Traylor, Secretary, Memphis, Tenn.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

"AMERICAN KENNEL REGISTER."

Entries for the May number of the American Kennel Register should be sent in at once. No entries for that number will be received after next Tuesday, May 1.

NEW YORK BENCH SHOW.

Editor Forest and Stream:

In addition to the classes announced to be judged by Mr. James Watson, he will also judge greyhounds, deerhounds, and wehlers. Mr. J. Kirk, of Toronto, will judge the new class of terrier poodles, and Major J. M. Taylor will judge foxhounds.

The club hope to see a large assemblage of sportsmen here, as the Eastern Field Trials Club will hold an important meeting, and the New York Club will probably be formed among the various greyhound fanciers of the country, so that these dogs may be brought under prominently before the public.

Below you will find a list of the additional special prizes which have been donated, such as you published the first list. Special Bitch, which you published last week, should read "for the best brace of greyhounds, dog and bitch," and not for the best single greyhound.

ADDITIONAL SPECIAL PRIZES.

W. H. Ashburner, Esq., of Philadelphia, offers a year's subscription to FOREST AND STREAM, the best bench dog, bitch, dog and bitch, or dog of pure Liverock, if owner does not compete.
A member of the W. K. C. offers special medal for the best dog or bitch, the get of the bulldog Beau.
A friend of the W. K. C. offers a solid silver cup, value \$50, for the best dog or bitch of pure Liverock pedigree, exclusive of winners in championship classes at any show in America.
A friend of the W. K. C. offers a piece of solid silver plate, value \$50, to the best English setter dog under three years of age.

A friend of the W. K. C. offers a gold medal for the best brace of Irish setters, dog or bitch, sired by champion Rufus.
Maj. C. F. Ulrich offers a solid silver salad bowl, for the best collection of collie bitches of not less than three, to be owned by one club.

A member of the W. K. C. offers a club medal suitably engraved for the best bull-terrier, dog or bitch, to be judged without regard to color.
A member of the W. K. C. offers \$30 for the best English setter brood bitch, to be shown with two of her progeny of the same litter, quality of the progeny to be considered together with the dam in judging.

The W. K. C. offers a club medal, suitably engraved, for the best kennel of collies, to consist of not less than five, owned by exhibitor.

Alfred Boote, Esq., offers a gold medal for the best five collie pups, under 12 months, owned by one exhibitor.
Messrs. J. S. S. E. and S. S. E. offer a handsome bronze antique clock in plaque for the best greyhound dog in the show that has never before taken a first prize.

The following prizes, made by the Medford Fancy Goods Company, are offered by the New York Sportsman for dogs in the open classes, not champion classes:

- Red Irish Setter.—To be given to the best dog or bitch, silver lined chain collar, lined with plush. Value \$50.
- Pointer.—To be given to the best dog or bitch, a fine grain leather collar, set with mountings. Value \$25.
- Bull-Terrier.—To be given to the best dog or bitch, a fancy hand-stretched leather collar, with fancy nickel mountings. Value \$25.
- Bulldog.—To be given to the best dog or bitch, a fine hand-engraved leather collar, with fancy nickel mountings. Value \$25.
- Collie.—To be given to the best dog or bitch, a fine hand-engraved leather collar, with fancy mountings. Value \$30.
- Pug.—To be given to the best dog or bitch, a fancy leather dog harness, with finely plated gold trimmings. Value \$25.

Many other special prizes have been offered.

CHAS. LINCOLN, Sup.

GREYHOUND MEDAL.—It will be remembered that Mr. Lotz of Chicago, at the time of the Cleveland Show, offered a gold medal for competition between his greyhound, Doubleshot, and Mr. E. Dawson's greyhound, Spring. The dogs were to have met in London, Oct. soon after the Cleveland Show; but Doubleshot being out of condition, Mr. Dawson won the medal by default. He has placed it in our hands, to be given to the best greyhound dog, which has been offered to offer to the best greyhound dog or bitch in the show.

NEW YORK, LAKE ERIE & WESTERN RAILROAD COMPANY, OFFICE OF THE GENERAL PASSENGER AGENT.—New York, April 12, 1888.—Chas. Lincoln, Esq.: Replying to your favor of the 10th inst., we will transport free of charge our dogs, which have been allowed to attend the exhibition at the Westminster Kennel Club Bench Show, to be held in New York, May 8 to 11, 1888, when accompanied by their owners or care-takers; but those who desire to avail themselves of this privilege must make application for tickets for passage for the Westchester Street, 21 Cordwain street, New York, either personally or by letter, and it must also be understood that it is agreed that only one dog will be carried for each person in charge of same presenting a ticket. If, however, any person should desire to take more than one dog, his application for passes for same will be considered. Very respectfully, JNO. N. ABBOTT, General Passenger Agent.

A QUEER COPARTNERSHIP.—During a visit to my farm yesterday afternoon I noticed one of my greyhounds which has been allowed to attend at a mouse hole, and about twenty feet back stood one of my Skye terriers backing her. His muscles were as fixed as a piece of statuary, in which position he remained until the bitch moved on, when he made for the hole and went to work to scratch it with his claws. A true Skye terrier. The bitch is evidently in the habit of finding the holes for the little terrier, for it seemed thoroughly understood by them both. I suppose the setter's scolding would be much more acute than with a greater cuss.—SAMUEL G. DIXON (Philadelphia, Pa., April 20).

your journal last week. You make me say "cow-backed" instead of "cow-backed" where I allude to a friend's setter puppy. Again you have substituted the word "setter" for "pointer" when I say I do not like a "stirky wavy-coated" pointer in color. I have a lemon-colored setter, but am not an admirer of the washed-out lemon color we find in some pointers. This is a mere matter of fancy. The great Hamlet was the first of the lemon and white pointers, but I must confess that to my vision he was heavy, had a handsome head, but a weak liver and white. Every eye to his taste, as the old woman said when she kissed the cow. Accept, Mr. Editor, countless good wishes for the bright future of FOREST AND STREAM, which brought me many a glorious hour in my pen and home last winter, and consider me faithfully yours, STUART TAYLOR.

AMERICAN COCKER SPANIEL CLUB.—*Editor Forest and Stream:* The annual general meeting of the American Cocker Spaniel Club will be held on Wednesday, the 6th prox., at the Westminster Kennel Club's Bench Show, Madison Square Garden, New York. Special prizes will be given by the club for the best cocker spaniel, dog and bitch, exhibited by members, and the Cocker Spaniel Produce Stakes will be quite an interesting event of the show, as the prizes will amount to quite a handsome sum. Any cocker breeders or admirers who wish to join the club and take part in the proceedings at the annual meeting are requested to communicate with J. F. Kink, Hon. Secretary, 44 Kings Street, West, Toronto.

RUSSIAN.—Following is the pedigree of the brindle and white smooth-coated St. Bernard imported in December, 1877, when five months old, from the kennel of Mr. Macdonald, England: *Sire*—Monarque II. (6,388), (Champion Monarque 13,340)—*Nm*—Champion Monarque by Souldan out of Diana. *Nm* by Champion Tell (8,20) out of Dido. *Champion Tell* by Hero out of Diane. *Diane*—Bonnet (Barry II.)—*Famita* (6,451). *Barry II.* by Champion Tell (2,58) out of Dido. *Famita* by Barry (Souldan)—Diane out of Toni.

EASTERN FIELD TRIALS.—*Editor Forest and Stream:* Through an unintentional oversight it was omitted to acknowledge and return thanks to Messrs. Tatlam, manufacturers of shot, for their generous donation to the F. F. T. Club, through George W. Cooke, Esq., last autumn. Hoping this explanation will be excused me as acceptable. I am respectfully, W. A. COSTER, Sec. E. F. T. Club.

LOWELL BENCH SHOW.—West Foxford, Mass., April 17.—The Middlesex Association will hold their second bench show at Lowell, Mass., on Friday, April 13, and 14, 1934.—*CLIAS.* A. ANDREW, Superintendent.

GREYHOUNDS.—A meeting of greyhound owners and persons interested in the breed will be held in one of the rooms of the Madison Square Garden, Tuesday, May 8, at 7 o'clock P. M.

KENNEL MANAGEMENT.

☞ No Notice Taken of Anonymous Correspondents.

G. C. H., Syracuse, N. Y.—Breed your Laverack setter bitch to a Laverack or Llewellyn dog.

W. R. C., Brooklyn.—Reduce her feed and give plenty of exercise. She will probably be all right on Wednesday, the 6th prox., if Philadelphia. The fits may be due to worms, but she will probably outgrow them. Give one-half teaspoonful syrup of hickory every other day for a week. Keep it cool.

Four Wazze, Mich.—A well-bred pointer, about two years old, is suffering badly with diarrhoea. It has attacked his neck all under parts, feet and legs. Have tried a great many remedies, but cannot check it except temporarily. He eats well, but keeps thin. Can he be cured? Ans. Wash thoroughly with any strong soap, then soap on sulphuric acid, neutral sulphuric acid, 1 part to 4 of water. Do this the morning on every day for a week, unless skin becomes inflamed, then stop. Following this up by a sulphur treatment, applied freely, we have cured many cases of this kind.

F. B. N., New York.—Since a filly, two weeks ago, my eight months colic pup has been comparatively staid and active, and also seems to be doing his appetite. I have tried to see if he coughs quite frequently, as though there was something in his throat. His nose is cold most of the time. He seems very timid when in the backyard and will get into the stable when he hears the noise of passing wagons, but does not notice them at all while I am exercising him in the street. Ans. Gain his confidence and he will probably outgrow his timidity. For the cough, let him have a teaspoonful of cod liver oil one hour after eating.

S., Troy, N. Y.—A liver and white pointer, like breed, about nine months old, at all times, has a white, yellowish, greenish, and blackish, silvers of wood, paper, buffons, and in fact any article he can get to his mouth. He is lean, and at times the white of his eyes is bloodshot and watery. He has a habit of rubbing his head and neck muck mixed together, but it does not like it and sometimes goes all day lamer than he is, though he will eat most greedily. He is kind and playful, and will get into any trap. He is a good and immense power ball hunt. Imported from the New York show, 1833, by Mr. Chas. H. Mason.

C. H. F., Montpelier, Vt.—My shepherd dog, eight years old, commenced bleeding from the ears, and it seems to be coming from around the teeth. When stepped in one place, it starts out in another. Dog is very weak and nervous. Dais little, drinks well, but is bright, now and then. I have had two doctors, who say they know not the disease or cause. Ans. Do probably suffer from some toxic disease, but I have had a good deal of success in the use of tannin or persulfate of iron is to be recommended to check bleeding. This is usually effective. Should bleed again, try Mousier's solution of iron, obtained at any drug store. Make topical application, drying spot from which the blood starts with a cloth and then painting the surface with the solution, using a camel's hair brush. It is important that the dog's strength should be kept up. To that end give quinine and iron, and feed beer tea, strong broths, or raw meat.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of each animal:

1. Age or sex.
2. Breed.
3. Sex.
4. Age or sex.
5. Date of birth, of breeding or of death.
6. Owner of dog.
7. Name of dog.
8. Name and address of person on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ See instructions at head of this column.
Champion—By Mr. Wm. L. L. L., La Grange, Ill., Minn., for pointer bitch, whelped March 28, 1883, by Dilley's Ranger out of White Lily.
Champion—By Mr. L. A. L., Minneapolis, Minn., for pointer bitch, whelped March 28, 1883, by Dilley's Ranger out of White Lily.
Dash III—By Mr. H. E., Hamilton, New York, for pointer dog, whelped March 28, 1883, by Dilley's Ranger out of White Lily.
Champion—By Mr. Wm. W., Lodi, Cal., for pointer bitch, whelped March 28, 1883, by Dilley's Ranger out of White Lily.
Champion—By Mr. Wm. W., Lodi, Cal., for pointer bitch, whelped March 28, 1883, by Dilley's Ranger out of White Lily.
Champion—By Mr. Wm. W., Lodi, Cal., for pointer bitch, whelped March 28, 1883, by Dilley's Ranger out of White Lily.

Thomas did not claim said name in FOREST AND STREAM, I consider my puppy the most rightful owner of the name. I desire to avoid confusion in the future, I intend using my puppy for stud purposes.—*Ann. C. Krowka.*

IMPORTATION.

☞ See instructions at head of this column.
Friday Night—Greyhound (Masters' Prince—J. H. Sailer's Sally), Friday Night is a black dog, with white feet, is 13 mos. old, and is brother to Mr. A. Sailer's Saturday night winner of the Lyttan Cup. It is a very good quality dog, with a fine head, and an immense power ball hunt. Imported from the New York show, 1883, by Mr. Chas. H. Mason.

Rifle and Trap Shooting

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

HUNTING RIFLES.

Editor Forest and Stream:
I want to say a few words on hunting rifles with your permission. I shall avoid all attempts at anything like scientific minutiae, and concentrate on the things that every gunner, who has the least interest every lover of this truly royal weapon.

In the first place, as to accuracy. To have accuracy and uniformity in the shooting qualities of a rifle, it must be made with accuracy. This depends, beyond controversy, upon having a straight and symmetrical tube, and in having the metal of a homogeneous density quite throughout. In the second place, the barrels should be made of a number of rifles, as we find them on the market, are either crooked in the barrels or else unevenly bored. This is not strange when we consider the fact that the gunner, who is the maker of the rifle, is of metal, expansion, contraction, etc.

Some rifles have given unusual results as to accuracy, and have been known for a wide area remarkably close-shooting guns, their worth being altogether intrinsic, as there was nothing ornate about them. I have seen a Sharps carbine last fall while hunting on the plains, that had "gone through the war," and looked as though literally used up, that would give as good, or better results in long-range shooting, say from 200 to 300 yds., as the best guns in the field. No care was taken with it. When we started on a camp hunt it was thrown into the wagon with the camp rubbish, left lying on the ground, seldom ever cleaned, and yet this arm never missed fire, was remarkably successful in hugging game and in killing clean. There is no other way to account for this, except that the metal was homogeneous, and the metal straight and even. Now, if we may possibly suggest something crooked, like fence posts, after being bored. When this is the case, no mechanic can straighten them and keep them straight.

It is a common error to suppose that the most foolproofness about this matter, the better for the practical hunter. A gun that has to be cleaned and oiled after each discharge is worthless in the hands of a hunter, who is sure to get it out of order. If the rifling is too close and the gain too prominent, you have constant fouling and necessarily inaccurate. Then, there is another fault in our rifles, and that is, that they are made with a too narrow conventional in case you have a tight shell or impacted bullet in front of the chamber. My first buffalo hunt was with a guide who used a rifle of this kind, and we were unable to get a shot at a buffalo, carried a wing-stick in his gun, about a foot longer than the gun barrel, and when we dismounted to shoot the wing-stick had to be cut off, and the rifle was then used to shoot the buffalo. I have seen a hunter for whom the fusilade ended. I wrote to a prominent manufacturer, enclosing the necessary three-cent stamp to prepay postage, and asking him to send me a rifle of this kind, and to see if I could get something on the style of our old muzzle-loaders. After waiting for some time, I received the reply that this was only a matter of taste, and that he would like to see the rifle, and that he would like to see using one of his heavy guns at the time, and rather liked its shooting qualities. So I took it to a friend who was a practical gunsmith and had a rifle of this kind, and he was able to see the rifle, and to see its place, which was more than satisfied me with the utility of this gun. Not only this, but the general appearance of the arm was much improved, and it was a pleasure to see the rifle, and to see it seen fit. Since this time I notice that a rifle is being built by the Massachusetts Arms Co., called the "Pacific rifle," which I know must be appreciated by every hunter who has a rifle.

Now, one other suggestion. A self-ejecting single breech-loader, without concealed hammer, of say, thirty-eight caliber, seventy grains of powder, and a bullet of 100 grains, and you can get a shot enough for anything this side of the Rocky Mountains, and one hundred and forty grains of powder to five hundred grains of lead is not a bad thing, and it takes but a few minutes, and you can afford to fool with them with a less deadly weapon.

These suggestions may be looked upon by some as the whims of a humorist, but I think that the successful hunter, and the sportsman, who is one who makes the best rifle, will be the man who builds a

according to the whims of those who use the rifle, and not the one who adopts a certain model that will, theoretically, proclaim all goods alike as being equally good. Occasional.
SEATTLE, Mo., April, 1882.

I have for many years carried a Sharps rifle on the barrel of which are two small steel shells holding a slender steel rod, the whole being pushed into a little hole in the barrel. One may never need to use this attachment, but if he should want it, he would want it very badly.

MUZZLE vs. BREECH LOADERS.

Editor Forest and Stream:
I notice in your March 26th issue Mr. James Duane's reply to mine of April 1st.

My reply is courteous and I have read it with much interest. I presume others have been much interested also. I was very well satisfied that he had made a mistake instead of myself. I was sure that he would explain himself. He said that the bullet might contain the J. H. Brown target of January 8, 1882, with the recent target made so (said by Mr. Farrow, with Mr. J. H. Brown's new muzzle loader rifle). The J. H. Brown target I referred to in my communication (March 23) was presented by Mr. Berg, of Danversport, Vt., and is said by him to have been made by Mr. Brown. But as yet, and strange to say, no one has been forward to show me this target, as a genuine full-sized target, with its centre exactly coinciding with the centre of a dollar circle as the true bulls-eye shot at, and unless this is done, I cannot say that the target is a true record, nor do I believe it can be proven up as Mr. Berg presented it. I make no charge of wrong here, as an error may have been committed, but I must say that I am not satisfied that it is a true record, nor do I believe it can be proven up as Mr. Berg presented it. I make no charge of wrong here, as an error may have been committed, but I must say that I am not satisfied that it is a true record, nor do I believe it can be proven up as Mr. Berg presented it.

If your readers have understood me correctly it is that I have taken an open stand in favor of the muzzle-loader vs. the breech-loader for accuracy in the use of this rifle. This is not to say that I am not an ordinary hunting rifle, and the breech-loader must use the put-up ammunition of the makers, and the short corollary hunting bullet is not a good thing, and I am not a fan of the breech-loader, and other kind of rifle, ammunition and shooting, because one point is as much as we can attend to at the same time. No one can deny that the muzzle-loader is a much better rifle, and I am not a fan of the breech-loader. If your readers have understood me correctly it is that I have taken an open stand in favor of the muzzle-loader vs. the breech-loader for accuracy in the use of this rifle. “THE FAIRY” MINNOW.

This is by far the best artificial minnow ever made. It is a great improvement on the "Phantom," which has long been considered the best of all minnows. When put into the water it almost immediately becomes as soft as velvet and as tough as leather, besides having the exact appearance of a real minnow, even in the matter of scales. Our Phantom has been imitated, and so, no doubt, will this be. Anglers will find our name on every box containing one of these minnows, and our well-known trade mark on the card to which each minnow is attached.

The above minnow is No. 7. The following are the various sizes we keep in stock. Nos. Inches Long 4 2 2 1/2 3 3 1/2 4 4 1/2. Orders received from anglers residing in cities in which the dealers keep a full line of our goods will not be filled at any price.

AMERICAN Kennel Register.

A MONTHLY RECORD.

Its leading feature is the "Pedigree Register" of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is given to each dog, and an index will be compiled at the close of the annual volume, thus making it a complete work of reference. The pedigree registration fee is twenty-five cents, payable in advance.

Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs for sale, and deaths.

Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include field trials.

Space will be devoted to all matters of importance to breeders and those interested in dogs, the object being to render the American Kennel Register a complete record of the topics of the day.

The Register will be published on the fifth day of each month. All matter intended for publication must be in the hands of its editor by the first day of the month. Entry blanks will be sent on receipt of stamped and addressed envelope.

The American Kennel Register will be sold by subscription only. The subscription price is one dollar per year.

Address American Kennel Register, P. O. Box 2,832, New York City. Make drafts and money orders payable to the Forest and Stream Publishing Company.

\$72 A WEEK. \$12 a day, at home easily made. (Costly outfit free.) Address Trux & Co., Augusta, Maine.

Harrison's Celebrated Fish Hook. Registered.

Whereas, it having come to our notice that some unprincipled house, to gain their own unworthy ends, and to attempt to damage our good name, having spread reports to the effect that the manufacturers of the above hooks are defunct, we now take this opportunity of informing the American and British public that such reports are utterly false. The same efficient staff of workpeople is employed as heretofore, and we challenge the world to produce a fish hook for excellence of temper, beauty and finish in any way to approach ours, which are to be obtained from the most respectable wholesale houses in the trade. Signed, H. HARRISON, BARTELET & CO., Sole manufacturers of Harrison's Celebrated Fish Hooks, Redditch, England, (December, 1882.) Manufacturers also of Fishing Tackle of every description. Sewing and Sewing Machine Needles.

KYNOCH'S Patent "Perfect" Brass Shells, MANUFACTURED BY **KYNOCH & CO., Birmingham, Eng.**

These shells are made of extra fine thin plate metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be re-loaded as often as the trigger makes. Cost only about half as much. Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads any two sizes larger than gauge of shells. Or can be effectually crimped with tool (as represented in cuts) and straighten out to original shape when discharged. The crimping tool also acts as a reducer, an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by our agents generally, or shells in case lots only, (2,000) and crimpers not less than one dozen, by

HERMANN BOKER & CO., SOLE AMERICAN AGENTS, 101 & 103 Duane Street, - New York. WILLIAM READ & SONS, Boston, Mass., Agents for New England States.

ANSWERS TO CORRESPONDENTS.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

INDEFINITE CONDITIONS.

IN the management of the British interests in the International match Maj. Scriven has replaced Maj. Waller as secretary of the special committee having charge of the matter. With this change come intimations of a possibility of misunderstanding as to the exact terms of the match, and it is particularly unfortunate that in all the cloud of correspondence which has been going on back and forth for some time past between the two associations, no one should have taken the simple precaution of writing out the conditions of the match, and by an exchange of copies fix definitely the basis upon which the contest was to be fought. In the pettiest medal match the exact conditions under which each contestant shoots his string of shots is carefully laid down, but when an important match like the International contest is brought up, there are a lot of complimentary generalities, and when a practical point in shooting is touched, the fact comes out that these hazy rules and regulations which are supposed to govern the match may mean anything or nothing.

In 1882 there were concessions on both sides. When the British team men reached here they found the Americans with pistol grip rifles, having sights which, while they were not fine enough to be styled match sights, were a great remove from a military model. The conditions of the match had been doubly at fault in failing to har out what should not be allowed, and in omitting to specify, exactly and beyond question, what was to be permitted in the match. There had not been enough of knowledge on each side of what the other side was doing in the way of improving the military rifle. The British arms came as revelations to the American marksmen, and only the presumption which ignorance inspires could have led the Americans to hope for a victory under the circumstances.

It is an open question whether a victory was ever really expected or worked for. It is pretty certain that something very close to an assurance of winning had to be

held out to induce the British team to cross the ocean. Among the other pleasantries proffered the visitors was a well-arranged opportunity of breaking the line of American victories before the butts. The previous contests had been managed by the riflemen. The men who shot the match had control of the preliminaries, and did not go into the battle with anything like the overwhelming handicap which weighted down the gallant twelve who fought the match of September, 1882. With the end of that match came a demand that some chance be left open for a victory which the Americans might hope to win if they worked for it in 1883. Changes in the rear and front sights were asked for, and also a modification as to the date of enlistment of men who might take part in the match.

Readers of the FOREST AND STREAM are familiar with the application of the American Board of Directors for a modification of the conditions and the reply of the British Committee. Secretary Seabury, for the American riflemen, asked for "the use of the wind-gauge," and Sir Henry Hallford suggested "that the wind-gauge on the back sight, which is likely to be adopted by our regular army, be permitted hereafter in all military breech-loader matches at Wimplesdell." Now comes up a cloud of doubt as to the interpretation of what a wind-gauge really is. Shall it be an accurately graduated sight capable of the finest scalings, or shall it be some sort of a sliding cross-bar which is set with a push over and held only by the friction of the parts? The British council have been great sticklers for what they term a "service" arm, which means generally, when it is defined, a weapon which in some way has found favor in the eyes of the British army or volunteers. While the council were preparing the conditions of the match of 1882 it meant a rifle with a fixed rear sight so far as any lateral motion was concerned, though for years before the New York State model arm, and the arms sent out from the Springfield Armory, bore rear sights which could be shifted for wind by the turn of a screw. The same board which declared the thin harley-corn front sight of the American rifle did not come within their notion of a service arm, are ready to accept a rear wind-gauge which is nothing more than a bar held to the uprights by the pressure of a spring.

Suppose such an arm should fall on the ground, the heavy iron front sight would possibly get battered, while the unstable wind-gauge would be pretty certain to slip out of position, whereas the thin steel foresight of the American arm would stand any amount of ill-use, while the rear sight once set by a turn of the screw remains so until changed by the hand of the rifeman.

The fact is that the service arm of the future is to be something far nearer the match rifle than the snap-shooting weapons which have formerly made such noise in the hands of troops. At present there is no fixed standard. Surely the arms used at the last match will not be placed under that heading, for they were mere target appliances made to provoke bulleseyes over certain know-ranges, fitted with ammunition which would not bear the rough transport of an active campaign, and in many minor respects far different from what an experienced army officer would select to put into the hands of the general run of soldiers. The use of such a shifting term as "service arm" is sufficient to keep the conditions of any match in an unsettled state, for the service arm of to-day may be the discarded arm of to-morrow.

A MOMENTOUS QUESTION.

LAST March the Litchfield, Conn., *Enquirer* published the following:

We hear a curious law point discussed. A man was driving across our lake recently, near where some holes had been cut and lined fixed by a fisherman. He noticed that there was a tile at one of the holes, sprang out, pulled in a three and a half pound fish, flung it into his sleigh, and was off before the fisherman could reach him. Was it a theft; or, in other words, to whom did that fish belong? It seems probable that it belonged to the man who pulled it out, for the rule about game—fish, fowl, or fowl—is that it belongs to whoever actually gets possession of it, and to no one till in his actual possession. Pretty sharp practice, though.

The way in which the case is put renders it doubtful to whom the fish legally belongs. Legal right is often the reverse of moral right. If the fish legally belonged to the traveler in the sleigh who pulled it out, then a bird killed by a sportsman but not yet picked up will belong to the one who may grab it first, even though the shooter has advanced to it and is bending over to reach it. We know of many men who, while not qualified to administer law, would substitute justice in the case of a man trying to claim their game which, according to the code, has not yet been reduced to possession, by being placed in the bag. We probably know a thousand such men, and it would be worth a journey to see the man-

ner in which they received a person who claimed their game between the shooting and the retrieving of it.

Anglers, as a class, have the reputation of being more gentle than other people, whether so or not the Census Bureau has no definite information, but we think we may possibly know a score or so of the contemplative fraternity who would not be so lost in their contemplation that they would not feel their blood flow faster at the sight of a man taking a three-pounder off their line, and if near to him, something might drop, perhaps the fish alone, perhaps more than the fish.

The *Enquirer* asks, "Was it theft?" This we cannot answer. The man might have only borrowed the fish for scientific purposes, such as to learn how long it would take to loil it, or to find out what sauce was best with it. It might have been a fish that stole a hook from him last summer and he only wished to see if the hook was there yet, or it might have been a fish that had been taking off his young ducks; we cannot say. All these things would have to be fairly presented before a correct decision could be arrived at.

We notice the absence of a most important element in this case. We have only the bare fact that one man cut a hole in the ice and put in a hook, no line being mentioned, and that a passer by noticed a bite on the hook and pulled in a fish and drove rapidly off. The person who reported the case probably saw it from a distance through a telescope, for there is no record of any conversation. The failure to give the remarks of the fisherman is fatal to a correct understanding of the case. His views might have been expressed in few words, or at length, but what he said on that important occasion has been lost. We should have been pleased to have heard him sum up. What did the fisherman say?

GUIDES AND TOURISTS.

THE relation of his experiences in the Adirondacks by "Piseco" is timely. He bewails the decadence of morals and manners among a certain class of guides, and the existence of a most pernicious system whereby the "hotel guides" heed the unfortunate tourist who falls into their clutches. "Piseco" is undeniably right in his censures of this class of so-called guides.

It is equally true that the particular class of Adirondack tourists who support these "hotel guides" is a very different class from that of the old-time tourists, who could appreciate a genuine guide's services. It must be remembered that the majority of visitors to the Adirondacks are not sportsmen, in any good or bad sense of the term. Most of them are mere pleasure-seekers with no aspirations to anything other than flitting away their time in the beaten round of summer hotel life. If the old guides have degenerated, or been superseded by a new class of designing funkies, no one is more to blame for this than the summer tourist who has created the change. The greenhorn, who rigs himself out in buckskin toggery, with a feather flying in his scalp lock, does not want one of the genuine old-time guides, nor would one of these honest woodsmen care to serve him. The cockney generally has more money than brains, and dispenses the first liberally to conceal his lack of the second. He wants to be put on to the spring holes and to have his fish hooked and "batted in" for him, and for this he is content to pay whatever the attendant may ask.

There is another class of men who visit the Adirondacks. They hire all the guides in a district, pay them four or five times as much as their services are actually worth, and often add liberal presents. Mr. H. Polhemus, of Brooklyn, is reputed to have given one of his guides \$1200 as a gratuity. These men employ a big force, pay big wages, secure a big slaughter, and have the satisfaction of a big brag. No wonder "Piseco" claims that the guides are demoralized. They are but human after all, and the same rule must hold good in the woods that obtains elsewhere: men who are paid extravagantly by rich men will not do the same work for other men for honest wages.

There are yet, however, as our correspondent is careful to say, many good guides in the Adirondacks. We have found that the Brown's Tract men are, as a rule, intelligent and trustworthy. They are alive to the necessity of proper game and fish protection and propagation. They are coming to understand that when the deer and trout go, their own occupation must go, too; and so they refuse the demands of the cockneys to be led to game out of season. The Brown's Tract guides have lately clubbed together, and have sent one of their number, John L. Brinkerhoff, down to the Cold Spring hatchery for land-locked salmon with which to stock Fulton Chain. The Brown Tract region is more difficult of access than some of the other Adirondack resorts,

which the lumberman was well supplied. Community of interests and congenial tastes brought the two classes in contact, and they coalesced. And each furnishing to the common stock his share, they lived happily together in the wilderness.

The sportsman furnished the sinews of war, and the lumberman those of wood and iron.

Beside the lumbermen there was another class from whom spring the very best of guides; these were the men of the Leather Stocking type, of whom my friends "Nessmuk," Alvah Dunning, and Sebattis are examples, men who went into the woods and spent their lives there, because they loved them, and found more real happiness in pursuit of the moose, deer, bear, beaver, mink, otter and martin, than the outside world could give them. These men, however, were not in season, would for companionship, their occupation being gone, join with kindred spirits, and unpaid contribute their skill and knowledge.

After a time the moose were exterminated, the beaver driven to unknown localities, and the other fur-bearing lake angels' visits; the deer became less abundant, and the axe of the lumberman, combined with the saws of the mills, had denuded of forest vast spaces of land, dwindled rivers to creeks, and polluted their waters. Their sport, too, was gone, and these foremen, as they must live, they unwillingly began to accept a moderate pay for their services, and from New York to Canada, and east and west, from Lake Champlain to the St. Lawrence, through the entire breadth of Essex, Clinton, Warren, Hamilton, Franklin, Herkimer and St. Lawrence counties, that great wilderness which to us of the Northern States, and of New York especially, is worth as much as is the National Park of the United States, to the entire country, they tramped, and camped, dependent upon nature for their supplies, and their own craft to obtain them.

Let me digress right here, and for myself—and I hope and believe all others fond of the woods—express my thanks to State Senator Fred Lansing, whom I am proud to claim as a friend and schoolmate, for the earnest efforts he has made and is now making to preserve to us forever this wild country, and in his efforts, the changes of which I will speak as having already gone too far will go further into the end.

These changes are but natural results. Civilization is following up the pioneer, and the hot and pent-up cities overflow into the wilderness.

For one real hunter or angler who comes into the woods there are hosts who care little for either pursuit, and the business of guiding has assumed large proportions, and instead of being a very necessary and being a very independent man, now nearly all are members of associations. There are Blue Mountain guides, Saranac guides, Long Lake guides, Fulton Chain guides, St. Regis, Raquette, and I don't know how many others, and a migratory sportsman finds that he cannot depend upon a cordial reception being given to his guide if he takes him into the limits claimed by a body of which he is not a member, and as a very large proportion of the employes are utterly inexperienced in woodcraft, and depending upon the hotels, demand very little of their guides, a very inferior class of men have intruded themselves into many bodies of guides, claiming the title and demanding the pay.

Every season thousands migrate to the woods—invaluable in search of health, emulated Saratoga habitues in search of change, and in many instances, and being a very independent man, now nearly all are members of associations. There are Blue Mountain guides, Saranac guides, Long Lake guides, Fulton Chain guides, St. Regis, Raquette, and I don't know how many others, and a migratory sportsman finds that he cannot depend upon a cordial reception being given to his guide if he takes him into the limits claimed by a body of which he is not a member, and as a very large proportion of the employes are utterly inexperienced in woodcraft, and depending upon the hotels, demand very little of their guides, a very inferior class of men have intruded themselves into many bodies of guides, claiming the title and demanding the pay.

By and by they will want to make a little trip on the lake, "go sailing" they generally call it, but the sails are of white fish; and will ask for a "guide," and will be astonished to find that the guides are shown into the dining-rooms, parlors, bedrooms, as their wishes dictate, and after shaking off the dust of travel, they can adjourn to the parlor and listen to pianos, or to the dining-room, and from a well-arranged menu select their dinner.

Or if disposed for a longer trip will take passage in a little steamer, and be carried in her past many places, where they will be informed there desired to come every night, "here used to be a great place for trout."

Wandering about listlessly, costume, style, everything out of place in the brilliant throngs on the piazza, or perhaps sitting on the railing at the far end timidly smoking his pipe and gazing through the windows of the parlor at the evolutions of a german, may be seen now and then some innkeeper sportsman, who like myself on one occasion, after two weeks of slanting out, has selected this route to get out of the woods.

Against all of which I have nothing to say. Thousands of people do get a great deal of pleasure in the life described, and he who don't think it quite fills the requirements can go further and fare worse or better, according to his tastes. All that induces me to bring it in is to base a question. Are the young men who row these ladies and children necessarily to be considered as "guides" and paid as such? Are they guides?

I will answer my own questions, and say, by no means; then, when I shall have finished this letter, will "pounce for replies" from others.

I will give briefly my views as to the qualifications a guide should possess, and the duties which he owes to his employer. But perhaps I cannot do better than to describe instead of define a guide, and a rowing guide, as being from my own experiences, select two strongly contrasting ones.

Many years ago, being in miserable health, feeble, fretful and helpless, I was ordered to the woods by my physician,

At that time I was utterly verdant in everything connected with woods life, having had no experience, and left to my own resources, would have starved in the midst of plenty, and have lost myself a hundred rods from camp; not to go into particulars, I was worse than an ordinary tourist. It was John Leonard, a guide on the Raquette River, took charge of me, and devoted himself to my service. John and I will furnish good originals for pictures of a good guide, and of a man who needed the utmost of a good guide's service. He was not a large man but very wiry, and no man on the river could send his boat up the setting pole rapids in better style, nor tire him out on a tramp.

He began his duties at once by overhauling my kit and rearing me up a guide on the transients. Thus, saving double carries, and himself furnished many things I lacked. He selected camping grounds, felled trees and peeled bark for our slanties, filled up balsam beds, shelves and racks, kept the camp-fires and smudges going night and day, prepared and cooked the meals, washed dishes and, nights or early morning, left me sleeping to slip away and return with venison or fish.

When through restlessness I wearied of one spot and proposed to go to some other, he, while heading the labor shouldered his boat, he cheerfully acquiesced, broke camp, shouldered his boat, which hung on the start about nine-tenths of our load, and to be soon increased by part of the other tenth, would start on a long carry, often by a blind trail, where his axe came frequently into service, I struggling along with perhaps my rod and creel only, growling and grunting and blaming him unjustly, never once getting put out nor falling to humor my whims.

When opportunities served he was unwearied in teaching me woodcraft. From him I learned when and how to peel bark, how to keep up a camp fire during hard rain, where to look for balsam gum to dress a wound, to cook trout, skin, not pluck, a partridge, and in short he gave me a very good start, and during the time we were together performed nearly all of the labor required to support us both comfortably. I may say all, for undoing my blunders sometimes cost him as much as my efforts saved. When he paid, this man, who had no teaching, mink and muskrat, was very contented with his guide's pay, \$2.50 per day, and expressed gratitude for the little gift of gear I made him, not \$10 worth altogether, and of the provisions which he had saved by the substitutes of venison and trout.

Now, I don't wish it to be understood that I think that every guide should, to earn his money, perform for his party all that John Leonard did for me, but the nearer they are willing and able in case of emergency to approach to it the better they will be, and the more nearly do they come to the real description.

Guides should not be expected to do menial work, but they should not, as some of them now do, class as such many little services once cheerfully rendered, nor should they take offense, as some I have known have done, at errors on the part of inexperienced employers. One of the best guides I ever employed kept my wading boots most thoroughly greased, and I had had him to look for me, and other things that I might appear well at a dance. I found then just where he drew a line—the first was guide's business, the second lake's. And nowadays they have full opportunity to learn what are the duties of the latter class while lounging about the hotels and fooling with the cooks and chambermaids.

Two years ago I made another woods trip, and during it I became prejudiced of the spirit of discontent, to which this letter owes its origin.

I had been delayed so that July was well advanced when I dismounted at the door of the Forge House, at the foot of Fulton Chain, from a "trusty steed" that had one day given me a glorious gallop across the clearing between the woods. The house I had been in correspondence and exchanging messages with, Mr. Perry, the landlord of a very pleasant camp on Third Lake, and with "Sam Dunnekin," a new recruit, and with "Sam" doing my duty as a most excellent guide, and presumed that I had completed all arrangements and would be furnished with "a first-class, experienced guide," Dunnekin, whom I had tried to engage, having an engagement. Unfortunately I had written that I was a stranger to the locality, and as such I was treated and taken in.

The "experienced guide" furnished me, turned out to be a man who had the slightest knowledge of the ordinary duties of a guide. He has a youth of perhaps twenty years, strong, intelligent, good-tempered and obliging, but except that he could row a boat better and further, his claims to be a "guide" were but little better than my own.

I did not expect much, I knew that Perry, his cook and chambermaid, would attend to most of my wants; but I did think that as by this time the trout were gathering on the spring-holes, my "guide" could be able to guide me to them in the vicinity. In this he failed utterly, and a long, hard day's work, rowing, paddling, poling, tramping and wading for miles of the North Branch, resulted in nothing. We didn't find a trout, and I doubt if we found either of the spring holes, if we did, my "guide" didn't know it.

The next day was devoted to the lake. There were places where the lakers could be taken, for others caught them. But we rowed in vain; and at last I gave in to his suggestion, and tried the lake resort, boy fishing, for I was hungry for a fish.

The result was the same; and I afterward found that my "guide" didn't know the likely spots for hikers, and further that his boy had not been baited.

I have no doubt but that by this time that young man has developed into quite a good guide; he had it in him, and absorbed eagerly such woodcraft as I taught him. For instance, getting into the boat, he smashed my rod at the end of the line, and according to his ideas, for we had no gnet, and there was no way of getting out of the imprisoned fragment. When I made a little fire, burned it out, and produced from my kit a bit of broken glass, and dressed down the joint, he was astonished.

Well, I wasted two of my twelve days, and paid this boatman full guide's wages and his board bill—just as much as it would have cost me to have had the services of any of the first-class guides, who would have given me the worth of my money in pay, and let the part of fish I resolved to emigrate; so, proceeded leisurely up the lakes and through the outlets into the Raquette.

In passing I must express myself as in accord with "Nessmuk" in his comments upon the devastation produced by the backing up of the waters of Sixth Lake by a dam. Acres of forest are submerged, and the boat route lies through lines of blazed, dying trees.

My object in visiting the Mountain Lake, at which place I hoped to find an express package of costume more appropriate for that off-shoot of Saratoga in the wilderness;

but stopping for dinner at Bennett's, "under the henlocks," I was so enraptured with the beauty of the surroundings, and so well satisfied with my dinner, that I resolved to stay for two or three days.

That evening I was quite content, after my rather fatiguing day, to enjoy the verandah, listen to the singing of some young people out on the lake, and chat with the very pleasant people I found there, and the next morning I had no disposition to give up my comfortable bed before breakfast time. That day it was cool and shady in the woods, and the "hunters' camps," with their balsam floors, were very enticing; just far enough from the house to seem a little lonely, but not so far that the dinner well was out of the evening, though after a thought I would like to spend a couple of hours casting along the shore for black bass, with which the lake is well stocked, and of which many small and sometimes a larger one come in every evening to feed on insects under the projecting branches. To my surprise and disgust I could not hire a boat nor a boatman, although plenty of the former were hauled up on the beach and platform, and a dozen of the latter were grouped near by smoking their pipes.

I had spent the previous evening stretched out on the balsams in the guides' camp, an enormous shanty, and had been treated with perfect civility, and listened with great comfort to the songs and yarns. One of the former, in which "Old Alvah" details some experience of his own with "Ned Buntline," you should, if possible, secure. I had then and there, I presume, expressed my intention of making but a short stay, and when I approached this group, and endeavored to engage a boatman for a few hours, I could see plainly that all hands were much interested in the proposed transaction, also that my chances of success were very limited. The spokesman informed me, civilly enough, that if I wanted to be rowed I must engage a guide by the day. Representing that I had no intention of so doing, but would willingly pay a fair price for a shorter service, I was told that "they didn't do business in that way," and there could be no mistaking the contemptuousness of the remark, as obtained by me as a "tenant," which was manifested by derisive grins, while I was negotiating, and sardonic chuckles as I turned away discomfited and uncomfortable.

I sought the landlord, and I am sure that he would have very gladly accommodated me if he could. He was shrewd enough to appreciate that, as landlord, his interests would be injured by any failure upon his part to do his utmost to insure a pleasant time to his guests, but it was evident that he had no time to take any such pains, and I was obliged to the guides of which he himself had been, and still was, upon occasions, one of the best.

As a compromise, finding that I could row myself, he loaned me a boat. I say loaned, advisedly, for he would not take pay for its use, and thus infringe one of the rules, which was against hiring boats out. He did not tell me this, and it may not have been his reason for refusing, but I was told by good authority that this was the probable reason.

I had been rich enough, or foolish enough to pay a guide's day's wages and board, viz., four dollars, for the trifling service which I wished, which any boy could have rendered, and which I got along very nicely without, I found that the sum would have been only one-third of the total cost of the two hours' row, for through a system of constructive mileage, peculiar to this section, would have to pay in addition two more days' wages. It is assumed that when the boat was disengaged Blue Mountain Lake guides—as those who row upon the Raquette are designated—are at their homes at Blue Mountain, and that they are justly entitled to wages for the two days spent in coming from and returning to their homes, as indeed they might be if the journey to and fro necessarily preceded and succeeded each engagement, and if they had to in consequence "spoil two days"; but in this case, and in the case of the boat, as well as of the disengaged Blue Mountain Lake guides—as those who row upon the Raquette are designated—are at their homes at Blue Mountain, and that they are justly entitled to wages for the two days spent in coming from and returning to their homes, as indeed they might be if the journey to and fro necessarily preceded and succeeded each engagement, and if they had to in consequence "spoil two days"; but in this case, and in the case of the boat, as well as of the disengaged Blue Mountain Lake guides—as those who row upon the Raquette are designated—are at their homes at Blue Mountain, and that they are justly entitled to wages for the two days spent in coming from and returning to their homes, as indeed they might be if the journey to and fro necessarily preceded and succeeded each engagement, and if they had to in consequence "spoil two days"; knowledge of woods life and of congenial tastes, and share with them in the heart of the woods the labor and rest, the loneliness and quiet which are incident to camp life, and which form half of its charms.

These guides should realize that in permitting these boatmen to compete with them on even terms they do themselves injustice.

The woods landlords should realize that in sustaining the extortions of these boatmen they do it at the expense of their own interests, for a large majority of those who uo visit the woods care little for hunting or fishing, but who appreciate the delightful climate, the indescribable sensation of rest and freedom from annoyance of all kinds, which they lust realize while longing on the wide, shaded piazzas with books and cards or chess, and with ladies the occupation of fancy work, and for children the croquet, and all are contented to let the hot-looking lakes all gathering the day and spend their time in the cool woods gathering mosses and ferns.

Toward evening though, nearly all would enjoy a row. Two hours a day would cover the average need for this, and thus complete each day with another pleasure. But as I have shown, this pleasure is denied them, unless, indeed, they are willing to submit to extortion, and to pay a man daily a big day's wages for doing nothing but to be around the guides' camp.

There are some very pleasant places that I know of where the landlords have broken clear of this system. At Fletcher's, on Parker Lake; at Paul Smith's, on St. Keris; at Rude's, on Lake Piseco; at Andrews' and Sturgis', on Lake Pleasant, a boat or boatman can be hired for such periods as are desired.

Undoubtedly there are other places, and I would be glad if the list were increased, for by scratching from my list of available places where I have not been, yet what I wished unless I paid for what I neither wished nor got, I have reduced my resources.

I hope that in this rather hastily written paper I have succeeded in making it clear that I fully approve of paying a real guide full wages, and believe that no more than earns them, and that my growl is at those only who, claiming to be guides, are paid as such for little or no guide service. My views in regard to the number of guides cannot be given on this subject are very fully given in a letter published by you in July, 1876. If you will glance over that you may think it worth while in this connection to republish some of its statements upon which I based an argument that if the guides could be made game constables and protectors, many of the present evils would be diminished. PRESCO.

INDIAN FOLK-LORE.

[The following stories have been collected during a residence of some years among Indians who have not yet come into contact with any whites with the exception of the servants of the Hudson's Bay Company, so that these legends may fairly be considered to be free from the taint of civilization and to represent Indian stories in their primitive state. The number of matters contained in this connection are the animals common to the country, especially as to the origin of anything peculiar as to size or markings on them. Animals having the gift of speech are given both to stories of this continent and to the East, witness various stories in the "Arabian Nights' Entertainments," where animals has this power. I have taken great care to make no additions, and to leave them as they were told to me. Many of them have almost a familiar look, such as the Climbing Boy, which certainly has some likeness to Jack and the Beanstalk, and the story of the Metaczo to the Roc in Sindbad the Sailor.]

II.—The Climbing Boy.

A BOY and his two sisters lived together in a tent. One day the boy went out hunting, as usual, and seeing a squirrel, he shot an arrow at it, but the arrow stuck in the tree. The boy climbed up after it, and when he came near he blew it to shake it down, but the arrow went higher up. So he climbed again and blew, but it went still higher. This lasted some hours, when he found himself able to step on to firm ground, covered with squirrel tracks and marks of all kinds of animals. After staying there some days, he returned to his sisters and told them what he had discovered. They agreed to go to his new country with him and determined to live on the bank of the creek. After he had found the tree, making his sisters go up first, telling them when they came near the arrow to blow it. This they did; and in time reached the country, where they built a tent. He hunted all day and never the game scarce. Soon he had collected enough squirrel skins for a coat, which his sisters made for him. The first day he put it on and walked away from the tent until he came to a path in the snow, when he laid himself right across the track. After he had lain there some time he saw a great fire wheel rolling along the path toward him, but he would not move, so the sun stopped and asked him to get out of the way, but he said he should not, when the sun rolled right over him, burning his new coat, which made him very angry. He shouted to him that he would be revenged. When he got back to his tent he had his sisters make him lines of sinew, with which he made a snare right across the path. After a time it became quite dark, when he cried out, "I have done it, I have done it." His sisters asked him what he had done. He said, "Made it dark." But he found that he would be obliged to let the sun go, for he could not see to hunt. He found on trying to release him that he burned his fingers. Then he asked the animals to help him; but they found it too hot work. At last the mouse managed to go away along the snare, but in doing so burned his nose. After this he lived in the sun for a long time, and married his sisters and peopled the country.

IV.—The Beaver Wife.

A man wanted a wife, so he looked about for one to please him, but could not find one among all the girls he knew. One day he met one called The Beaver. She had lovely teeth; this he liked, and he went to her father and wished him to marry her. He went to her father and asked him for his daughter, and was told that he might marry her if he liked, but that if he did he would have a lot of trouble; and the father refused to part with her unless the suitor promised to make a bridge across every stream he came to for her to pass dry-footed. This the suitor promised to do. He married the girl and lived very comfortably with her for two years, when he went as usual, overhunting, leaving his wife to make a new camp. As usual, he made bridges over all the creeks he came to. At last he came to a dry one. Over this he made no bridge, but walked on for about a mile, where he hung up his bag to show where he wished the camp to be made. He then went on and made his snares. It rained while he was doing so, and he returned early expecting to find the camp. But when he came to the

place, there was his bag but no camp. Going back to look for his wife, he came to the creek which had been dry in the morning, but was full of water; and what astonished him more was that a large beaver house was built that he had not noticed before. He then determined to break it, but while he was trying to break in, he heard his wife's voice inside telling him to go away, for his neglect to put up a bridge had changed her into a beaver. He tried many times to take the house, but always failed. His forgiveness cost him his wife and his two children. NISTROSKIK.

MOOSE FACTORY, HUDSON'S BAY, BRITISH AMERICA.

RIPARIAN RIGHTS.

NEW YORK, APRIL 30, 1883.

Editor Forest and Stream:

The season for salmon angling is at hand, and in view of the recent decision as to riparian rights in the Exchequer Court of Canada, and more recently confirmed by the Court of Appeals, also in the "Fox River" case, in the Supreme Court of Illinois, the following extracts from these decisions may be of service in preventing disputes as to such rights by many parties not cognizant thereof.

AN OLD ANGLER.

In the Exchequer Court of Canada. Christian A. Robertson and the Queen. Judgment by the Hon. Mr. Justice Gwynne:

Page 10.—"The public have merely the right to use the river for passing to and from upon it, in the same manner as they have a right of passage along a public road or foot-path through a private estate, but the right of fishing in such a river by the riparian proprietors is a right of property vested in such proprietors in virtue of their being seated in the 'Abene's' of the stream '*ad medium filium aque*' (to the middle thread of the water), which *prima facie* all proprietors of land adjoining an inland river are. 'Riparian proprietors' is a term applied by the civilians to the owners of watercourses, and the use of the same significant and convenient term is more fully introduced into the common law; the soil of the river itself, and consequently the water, may be often divided between two opposite riparian owners; that is, the land on one side may be owned by one person and the land on the opposite side by another. When such is the case each proprietor owns to the middle, or what is called the 'thread of the river.'"

Page 11.—And *Hale*, "Jure Maris," p. 5 of Hengram's tracts, says, "Fresh water rivers, of what kind soever, do of common right belong to the owner of the soil adjacent, so that the owners of one side have of common right the property, that is, the property of the soil and consequently the right of fishing, '*usque ad filium aque*,' and the owner of the other side, the right of soil or ownership and fishing unto the '*filium aque*' on their side."

Chancellor Rush in his commentaries says: "It was a settled principle of the common law that the owners of lands on the banks of fresh water rivers, above the ebbing and flowing of the tide and the exclusive right of fishing as well as the rights of property opposite their respective lands '*ad medium filium aque*,' and when the land on each side of the river belonged to the same person he had the same exclusive right of fishing in the whole river, as far as his land extended along the same. The right exists in the river of that description, though they be of the first magnitude and navigable for rafts or boats, but they are subject to the '*ius publicum*' as a common right of every man."

Page 15.—"Crown grants of land adjacent to rivers above the ebb and flow of the tide are presumed to convey to the grantee the bed or soil of the river, and so to convey the exclusive right of fishing therein to the middle thread of the river opposite to the adjacent land so granted."

"When the exclusive rights of fishing does not already exist by law, consisting of ungranted lands, no exclusive rights of fishing could be legally established by any person."

And in the Fox River case, FOREST AND STREAM April 5, page 193:

"Where such proprietor owns the land on one side only of the stream, his right to the land and to the use of the water, whether used as a power to operate mills and machinery, or merely as a fishery, extends only to the middle thread of the stream as at common law."

THE STATUTE OF OHIO vs. JNO. SHANNON.

Syllabus.—Under Section 38, Chap. 8, Title 1, of the Crimes Act of May 5, 1877, it is unlawful to shoot at, or kill wild ducks on the lands of another person, although within the channel of a navigable river, when the owner has set up, in a conspicuous place on the shore, a board inscribed in legible English characters, thus, "No shooting or hunting allowed on these premises."

Exceptions to the Court of Common Pleas of Sandusky county.

Shannon was arrested on a warrant issued by a Justice of the Peace of Sandusky county on complaint of George G. Tindall, charging a violation of Section 38, Chap. 8, Title 1, of the Crimes Act of May 5, 1877. The section provides:

"Whoever, having received verbal or written notice from an owner of inclosed and improved lands, or any lands the boundaries of which are defined by stakes, posts, water courses, ditches, or marked trees, his agent, or a person in charge thereof, not to hunt thereon, shoots at, kills or pursues with such intent on such lands, and, the birds or game mentioned in Section 27, 28 and 30 of this chapter, and whoever shoots, kills or pursues, with such intent any of such birds or game on the lands of another upon which there is set up in some conspicuous place, a board inscribed in legible English characters, thus, 'No shooting or hunting allowed on these premises,' or pulls down or defaces any such board, or the letters thereon, shall be fined," etc.

Among the birds or game mentioned in said Section 29, are "wild ducks," and the complaint charged Shannon with shooting and killing wild ducks on the land of Tindall, situated in said county, etc.

Shannon, having been bound to appear and answer said charge in the Probate Court, was there tried, convicted and sentenced. On the trial, a bill of exceptions containing all the testimony was taken, and upon proceedings in error, in the Court of Common Pleas, said judgment was reversed. To this judgment of reversal the Prosecuting Attorney, under Sections 38 and 39, of the Crimes Act, said he took exceptions, and the same are now submitted to this court.

The uncontradicted facts appearing in the Bill of Exceptions are, in brief:

That Tindall was owner and in possession of a tract of land in said county bounded on one side by the Sandusky River, a navigable stream;

That Shannon on the 29th of October, 1877, when the killing of wild ducks was not prohibited by statute, was in a

skill on the Sandusky River, between the middle thereof and the shore owned by said Tindall, from a middle position he shot and killed wild ducks swimming in and flying over the water between said shore and middle of the river;

That boards inscribed in legible English characters "No shooting or hunting allowed on these premises" were set up in conspicuous places on said shore;

And that Shannon had been duly notified by Tindall not to shoot or hunt on his lands.

It also appears, that the position occupied by Shannon on the river was within the limits of navigation as used by boats and other water craft engaged in commerce;

And also, that the public generally had been accustomed to fish, and kill wild ducks, in the same location, in and upon the river.

Upon this state of facts the State of Ohio seeks the opinion of this court. Did the Court of Common Pleas err in reversing the judgment of the Probate Court?

John M. Lemmon, Counsel for the State.
Everett & Fowler, Attorneys for Shannon.

McIlwaine, C. J. This case and *June vs. Purcell*, decided at this term and reported ante, having a question in common, were considered together. In that case it was held, that the title of a riparian owner of land bounded by a navigable stream in this State, extends to the middle or thread of the stream.

It follows upon the principle announced in that case, that the locus of the offense alleged in this, though upon the surface of a navigable stream, was within the boundaries of Tindall's land, and was embraced in the literal meaning of the notice, "No shooting or hunting allowed on these premises."

It is true, however, that the right of Tindall to so much of his land as was covered by the waters of the Sandusky River, the same being a navigable stream, was not exclusive, but subject to the right of the people to use the same as a highway, so that the entry of Shannon within the bounds of Tindall's premises, to wit: within the limits of this public highway, did not, *per se*, make him a trespasser; and clearly, an action against him for trespass, *quare clausum frangit*, could not be maintained.

It was claimed by defendant, that his conviction was wrong, because, as is claimed, this section of the statute applies only to persons who wrongfully break and enter the close of another contrary to his expressed will.

The provisions of the statute were not intended to punish trespassers *quare clausum frangit*, merely because they have been guilty of a trespass; but were intended to punish the act of killing, shooting at, or pursuing game on the lands of another, against which notice may have been given as provided in the statute; so that a person rightfully on the premises of another may commit the unlawful act, as well as one who commits a trespass by entering upon the premises.

It seems to us, that whatever change this statute may have made in respect to the law in relation to trespass on real property, the main purpose of the Legislature was to confer upon the owner of land within this State the exclusive right to hunt and kill the designated game upon his own premises, and to protect him in such right, provided he complies with the prescribed conditions in regard to notice.

And with regard to notice, if the lands be "inclosed and improved," or if the boundaries be "defined by stakes, posts, water courses, ditches or marked trees," verbal or written notice "not to hunt thereon" will bring the offender under the operation of the statute.

But if the lands be not "inclosed and improved," or if they be not "defined by stakes, posts, water courses, ditches or marked trees," as well as where they are so defined, the owner may bring himself and his lands within the protection of the statute by setting up in some conspicuous place thereon, "a board inscribed in legible English characters, thus, 'No shooting or hunting allowed on these premises.'"

And in such cases, all persons engaged in shooting at, killing or pursuing the designated game, must take notice not only of the statute, but of the setting up of such board, and also of the extent or boundary of the lands on which the same is set up. And in respect to this notice, it makes no difference whether the land or any part thereof be covered by water or not.

It is claimed, however, that this statute was not intended to protect lands covered by the water of a navigable river.

A majority of the court can see no grounds upon which lands covered by navigable streams should be excluded. They are as much the subject of private ownership as in navigable streams. There is no distinction made by the terms of the statute.

True, navigable streams in this State are declared to be public highways; but the right to use a public highway is not abridged by protecting the owner of the fee in the exclusive right of killing game therein. Travel and commerce are not thereby hindered.

And as the power of the Legislature to protect game, or the exclusive right of the owner of land to kill the same on his own premises, is as ample over land covered by water, whether navigable or unnavigable, as it is over dry land, and as there is no attempt to distinguish between them in this statute, we must hold that all alike are within the protection of this statute.

Exceptions sustained.

White, J., did not concur.

I. E. L. DeWitt, Reporter of the Supreme Court of Ohio, do hereby certify that the foregoing is a true and correct copy of the syllabus statement of facts and opinion of said Court, as announced by the Chief Justice of the Ohio vs. John Shannon, and is as the same shall appear in Vol. 36, Ohio State Reports.—E. L. DeWitt, Reporter Supreme Court of Ohio.

THE NEW HAMPSHIRE LEAGUE.—At the annual meeting of the Fish and Game League the following officers were elected for the current year: President, John B. Clark; Secretary, Charles L. Richardson; Treasurer, Frederick Smith; Vice-presidents, Marcellus Eldridge, Portsmouth; Luther Hayes, Milton; E. B. Hodge, Plymouth; W. A. Fletcher, Concord; V. C. Gilman, Nashua; W. H. Shurtick, Colebrook; John Clement, Troy; Gilbert P. Whitman, Manchester; Herbert F. Norris, Manchester; G. V. Pickering, Laconia. The annual address was delivered by Hon. Jos. B. Walker, his subject being "The Forest and Game of Hampshire." Several essays were read; we print them elsewhere.

AN ANGLER'S NOOD.

HERE will woods dusky shadows fling,
Here birds nest through dim arches ring,
While each muscicæ seems to sing
With joy, yet still unseen.
Wills drops of molten silver bright,
As clear as air, as dark as night,
First calm, and then in sudden flight,
See there the streamlets slich.

Natural History.

NOTES ON THE STICKFISH.

Verrillia Blakei, Stear.

THE history of the discovery of this singular poly is:
As early as 1858, or at least 1859, a Portuguese fisherman,
at Burrard Inlet, sent some of the "sticks" to Mr. F. G.
Claudez, the chief assayer of the Government assay office,
at New Westminster, a chemist of more than ordinary
ability, who pronounced them to be largely composed of
phosphate of lime. This set at rest the question as to which
kingdom they belonged, and shortly afterward Mr. Dietz
sent some of the "sticks" to the Academy of Natural
Sciences at San Francisco, California, which led to their
being placed before scientists in various parts of the world.
There was some difference of opinion as to what they really
were, some supposing them to be a species of gigantic sea
pen, while many disciples of Darwin thought the connecting
link between the animal and vegetable kingdom was at last
obtained. Numerous inquiries were made from various
places for information respecting them, and requests made
for specimens. Many specimens of the complete animal
were sent to various scientific establishments, put up in different
arsenicals, alcohols, and other preparations, but none of
these, I believe, reached their destination in good order,
the happy medium for strength of the preparations not being
arrived at, and in consequence some specimens in strong
preparations were dissolved, while other weaker ones did
not succeed in preserving the tissues. A Captain Lawson,
of the United States Coast Survey Service, then stationed
on Puget Sound, Washington Territory, applied to me
through a friend of his and mine in Victoria, to obtain
specimens, have them put up in a tin tube, and the tube then
filled with glycerine, which he was of the opinion would
answer the purpose of preserving them for transmission to
California.

Some time subsequently, Mr. George Dietz, the resident
partner of the firm of Moody, Dietz & Nelson, mill owners
at Burrard Inlet, sent some of the "sticks" to Mr. F. G.
Claudez, the chief assayer of the Government assay office,
at New Westminster, a chemist of more than ordinary
ability, who pronounced them to be largely composed of
phosphate of lime. This set at rest the question as to which
kingdom they belonged, and shortly afterward Mr. Dietz
sent some of the "sticks" to the Academy of Natural
Sciences at San Francisco, California, which led to their
being placed before scientists in various parts of the world.
There was some difference of opinion as to what they really
were, some supposing them to be a species of gigantic sea
pen, while many disciples of Darwin thought the connecting
link between the animal and vegetable kingdom was at last
obtained. Numerous inquiries were made from various
places for information respecting them, and requests made
for specimens. Many specimens of the complete animal
were sent to various scientific establishments, put up in different
arsenicals, alcohols, and other preparations, but none of
these, I believe, reached their destination in good order,
the happy medium for strength of the preparations not being
arrived at, and in consequence some specimens in strong
preparations were dissolved, while other weaker ones did
not succeed in preserving the tissues. A Captain Lawson,
of the United States Coast Survey Service, then stationed
on Puget Sound, Washington Territory, applied to me
through a friend of his and mine in Victoria, to obtain
specimens, have them put up in a tin tube, and the tube then
filled with glycerine, which he was of the opinion would
answer the purpose of preserving them for transmission to
California.

I caused the specimens asked for, some five or six in number,
if I recollect rightly, to be put up in the tube, and
eighteen pounds of glycerine was required to fill up the
empty space; the tube was then sealed up, and forwarded
to Capt. Lawson, who was by him sent to some scientist for
identification. I was afterwards informed that the specimens
arrived in perfect order, were classified, and received the
present double name in honor of Prof. Verrill, of Yale
College, and Dr. Blake, of San Francisco. As notes were
not made at the time, dates, of course, must be approximate
only, but they are as accurate as a person can reasonably be
supposed to give after such a lapse of time as fourteen or
fifteen years.

Now, as regards the animal or animals, so to speak, with
out going into a scientific description, which I confess I am
unable to do, perhaps a few remarks concerning them may
be of interest in connection with the foregoing statement.
They are caught only at Burrard Inlet and vicinity, as far
as is at present known, although the entire coast has been

fairly prospected by parties fishing for dogfish from Queen
Charlotte's Sound to Olympia, at the head of Puget Sound.
The dog-fishermen are the only ones who do, or would be
likely to catch, animals, and they have only found them
in this one locality. So far as can be ascertained, no
other place produces them, and did they exist elsewhere,
they would have probably been procured ere this.

Their mode of capture is in this wise: The gear for dog-
fishings is a line or rope resembling the ordinary clothes line in
size, of a mile or more in length, with pieces of cod line at-
tached every two feet, and thereabout, to which are fastened
codfish hooks. The main line is anchored at both ends,
and the fisherman is usually kept underdrumming in
taking off the dogfish, and rebaiting the hooks. When he has
reached one end, he turns around and undercuts to the other.
The dogfish, in their endeavors to get loose after being
caught, entangle the line about the stickfish, and the latter
is brought to the surface when the line is lifted.

All circumstances seem to justify the idea or view that
the stickfish, having no locomotive functions, are attached
to the bottom. The fact that they are only to be found within
a very limited area, confirms this belief, for if they were de-
tached, the strong tides prevailing where they are found,
would necessarily disperse them over a greater space than
they are known to occupy. Other circumstances seem to
indicate that the stickfish in its normal state assumes an
erect or vertical position, and not a horizontal one. For
the dogfish, if the natural position of the poly were a horizon-
tal one, would be obliged, in order to entangle the lines about
it, to swim under and over the stickfish, while if the posi-
tion is in an erect one, the same effect would be produced
by swimming around it, which is more likely to be done. The
large bulbous appearance of one end of the stickfish makes
it seem likely that it is imbedded in the bottom, which is
also of a sandy nature, and the belief that were it not so
planted it would be of wider distribution, is not at all un-
reasonable.

Another feature favors this idea. The stick itself is spiral
in structure, and this characteristic is associated with the
idea of strength as exemplified in trees growing in exposed
situations, they being of greater spiral construction than
those in sheltered localities. If the position of the animal
were horizontal no great strength would be necessary in an
erect one. This matter can only be settled by means of a
submarine diver, as the great depth at which this animal is
obtained—fifty fathoms—prevents any chance of the
matter being studied from the surface.

The sticks which are the stem or base of the animal, aver-
age seven to eight feet in length, and at the thickest part
are much the size of an ordinary black lead pencil; they
taper at both ends, but much more abruptly at one than the
other, and the smaller end is reduced to an extremely fine
needle-like point. When stripped of their gelatinous or
viscous covering (the living tissues) they present a white
pulsat surface except that portion to which the animal is at-
tached near the large end, which is rough and coarse as
contrasted with the other portions. After a short time the
sticks split or check longitudinally, in the manner of wood,
and they then present an appearance similar to that of a peeled
osier or willow wand, hence their local name of "stickfish."

The sticks are elastic to a high degree, so much so that
the idea has been suggested of using them as tips for fishing
rods, but I do not know if any action has been taken in
this respect. When bent beyond a certain limit they break
short off and do not splinter as does wood.

The sticks are covered with a gelatinous mass from one
end to the other, which is the animate portion of the poly,
which, being composite in its character, is made up of an
immense number of individuals united in one common
whole, and resembles in some respects the coral poly, which
lives within its limy structure. The stickfish is attached to
the outside. In appearance the whole animal resembles to
some degree the arm of the octopus or squid in color and
texture, wanting, of course, the sucking discs of the latter
animal. The thickest part will probably be about one and a
quarter inches in diameter, and the larger end is furnished
with a large bulb considerably thicker than any other por-
tion of the poly, and the appearance of the shape of the
entire animal may be said to resemble an onion with a long
single stalk. This bulb is to be imbedded in the ground
for the reasons before assigned.

When exposed to the air the gelatinous covering shrinks
rapidly and dries hard, and then resembles dried skin or flesh.

These polys are to be obtained at any season of the
year, and procuring them is only a matter of slight expense.
The places where they are to be had are comprised within a
radius of a few miles. Burrard Inlet, the western terminus
of the Canadian Pacific Railway, lies in lat. 49° N., long.
123° W. from Greenwich. The Shelton grays (*Astrophiola
scutellata*) is sometimes found clinging to this poly.

The agent of marine and fisheries department of this place
has forwarded some of these animals to the international ex-
hibition to be held next summer, where no doubt many of
your readers will have an opportunity of seeing them.

NEW WESTMINSTER, B. C. J. C. HUGHES.

LARGE LEATHER-BACK TURTLE.—We are indebted to Dr.
H. C. Yarrow, of the National Museum, for the following:
Guaymas, Mexico, April 13, 1883.—S. P. Baird, Esq.,
Smithsonian Institution: Dear Sir—On the 11th inst. there
was caught in this harbor one of the largest leather-back
turtles (*Dermatocelys coriacea*) I have ever seen. I tried to
purchase it, so as to present it to the institution, but the
fisherman asked for a price forty times the amount offered.
Idea, but nevertheless took its measurements and weight.
This species is not known on this part of the Gulf, and, in
fact, has never been seen near or within 100 miles of
Guaymas by any of the fishermen or captains of the coasting
schooners. There has been one or two caught at Altata, a
small port down the coast, but they were quite small, not
weighing over 150 pounds; but this one is the largest ever
seen in the Gulf. I would prefer to buy the skin to send over
seen in these waters. As he is still alive, the parties that
bought him intend sending him to San Francisco by next
steamer, and you may again hear of him from there. I here
give you his measurements while alive, so you can better
judge of his size: Length, 8 ft. 2 in.; height, 3 ft. 1 1/2 in.;
width, 4 ft. 2 in.; circumference, 8 ft. 11 in.; circumference
of head, 3 ft. 4 in.; circumference of tail, 2 ft. 1 in.; length
of neck, 3 ft. 4 in.; length of tail, 3 ft. 9 in.; length of fore
limb, 3 ft. 10 in.; length of hind limb, 2 ft. 4 in.; width of
fore fins, 1 ft. 4 in.; width of hind fins, 1 ft. 2 in. It is a
male turtle; weight, 1,102 pounds. I only regret that my
means would not allow me to purchase him for the institu-
tion, for I am sure it would have been a specimen worth
having.—H. F. ABERG.

SPRING BIRDS OF NEBRASKA.

BY A. HALL.

THE following is an annotated list of the birds that came
under my observation while on a three months' collect-
ing tour in the vicinity of the Platte River, in Southeastern
Nebraska, from March 1 to June 1, 1880:

- 1. Wood Thrush—Turdus missillianus Gm.—Arrives about the
middle of May, frequents thick, wooded streams, where
it breeds. Nest usually placed in the crotch of a low bush,
although I have often seen it saddle upon a limb of a beech
tree in the Eastern States. It is composed of grass and
mud, lined with fine rootlets. Eggs four or five in number,
of a pale green color. This species is apparently not very
abundant.
2. Catbird—Mniotilta carolinensis Gr.—Arrives first week in
May, breeds in low bushes, in which is built a very rough
nest, composed of weeds and grass, lined with fine roots and
hair. When nesting near a house, bits of cloth and feathers
are often used. Eggs dark green. This species is very fond
of its home or favorite haunts, never straying more than
twenty rods the whole summer. To verify this fact, I saw
one with a white feather in its wing that remained within
such limits all summer.
3. Brown Thrush—Harpophycus rufus Cab.—Arrives
about the last week in April. Nests in low bushes, brush
heaps and upon the ground. Eggs, pale green, dotted with
reddish brown spots.
4. Eastern Bluebird—Sialia sialis Hald.—A common sum-
mer resident. Saw them lighting upon weeds in a thin
grove of cottonwoods.
5. Ruby-crowned Kinglet—Regulus calendula Licht.—A
regular migrant. Breeds in high latitudes, and winters on
our southern border. A very fine songster for so small a
bird, uttering a very sweet, plaintive warble at short inter-
vals the whole day long.
6. Western House Wren—Troglodytes domesticus park-
manni Aud.—This species is a shade lighter than its Eastern
representative. Its habits are the same, but it can eclipse
it in its song, which lasts from early morn till eve, and is
much louder. This bird has a variety of nesting places. I
once hung a coat upon a cherry tree, in one of the pockets
of which a nest was placed, and the old bird reared her
young there, seeming well pleased with her novel home.
7. Long-billed Marsh Wren—Ictanobrya palustris Cab.—
Shot one on the Platte in May, where they probably
breed.
8. Horned Lark, Shore Lark—Eremophila alpestris Boie.
—Resident and abundant in small, scattering flocks. I saw
them in company with McCow's and chestnut-collared
buntings. I am positive that they breed here, for I shot a
female that contained an egg fully developed.
9. Titlark—Anthus ludovicianus Licht.—Not uncom-
mon. I saw them near small pools of water and on fresh-
plowed land, but never saw more than one at a time.
10. Missouri Skylark—Necorvus squamif., ScL.—This
species arrives from the South early in May and breeds near
the Platte River. They had already piled and hegu to
carry material for a nest by the middle of May. They were
very shy and generally flew up out of range, therefore I
took but a few specimens. I regretted that I was unable to
remain long enough to study their breeding habits and hear
their beautiful song.
11. Black and White Creeper—Mniotilta varia V.—Ar-
rives about middle of May.
12. Orange-crowned Warbler—Helmintophaga celsata Bd.
—A common migrant. Arrives in the last week in April in
company with the Tennessee warbler. The Helmintophaga
are the most active of the warbler family, and are always
busily engaged collecting the insects which form their prin-
cipal food. This species is easily identified by the concealed
orange patch on crown.
13. Tennessee Warbler—Helmintophaga peregrina Cab.—
Habits same as preceding. I think it is more common than
the orange-crowned warbler.
14. Sumner Warbler—Dendroica aestiva Bd.—Very
abundant. Breeds in June. I once found a nest of the
species made wholly of cotton batting which it had picked
up to the door-yard.
15. Yellow-rumped Warbler—Dendroica coronata Gr.—
Very rare in this locality. Only one specimen seen in April,
hopping about in low underbrush, and occasionally darting
to the ground in pursuit of insects. Its habits here appeared
to be strictly terrestrial, but in Ohio, early in April, they
will be found in oak timber, darting about, high up in the
tops. Late in the fall they are seen feeding upon various
kinds of berries; they occasionally winter in Ohio, where I
saw one January 12, 1883, the thermometer standing then
at zero. The stomach was filled with berries from the red
cedar, and the bird was in a good condition.
16. Maryland Yellowthroat—Geothlypis trichas Cab.—
Common. Breeds upon the ground. This species is terres-
trial in its habits, but it is often seen singing from the tops
of trees.
17. Yellow-breasted Chat—Icteria virens Bd.—This species
is easily recognized by its bright yellow throat and breast
and plain olive green back, wings and tail. One unaccus-
toned to its loud, boisterous croakings would not believe
that so small a bird was capable of making such a noise.
18. Scarlet Tanager—Pyranga rubra V.—Rather rare.
19. Bank Swallow—Otocoris riparius Boie.—Saw this species
breeding in colonies in the sand bluffs on Loup River.
20. Bohemian Waxwing—Amphisp. geryonius L.—A com-
mon winter visitor. Arrives in large flocks from the north.
It is easily identified by the chestnut-colored patch on under-
tail coverts. Breeds in the fur north.
21. Townsend's Fly-catching Thrush—Myiadestes town-
sendi Cab.—A fine specimen of this species was sent me in
the flesh, Feb. 9, 1880, by my friend, Frank W. Powell. It
was taken on Wood River. I think its occurrence purely
accidental and know of no other record of its occurrence in
Nebraska. This bird is said to be one of the most beautiful
of the species of the mixed States, and exceeds the mocking-bird
in the sweetness of its notes. It is found throughout the
Rocky Mountain range in the vicinity of juniper and cedar
trees, as they feed largely upon the berries. They are also
expert fly-catchers. But little is known of its breeding
habits.
22. Bell's Vireo—Vireo belli Aud.—This is the commonest
species of the family in this locality, and in fact it was the
only one I observed. But there are several others found
here which I did not notice.
23. Great Northern Shrike—Lanius borealis, V.—Not un-
common in winter. I saw them perched upon weeds watch-
ing for mice, which they pounce upon like a hawk and carry
off in the bill. They often impale them upon thorn trees
whence the name butcher bird.

24. White-rumped Shrike—*Lanius ludovicianus*, var. *caecithorax* (Sw.) Coes.—This species breeds in Dakota and probably in Nebraska.

25. American Goldfinch—*Stragalinus tristis* (Cab.)—Breeds in the mountains of Italy. Seen in small, scattering flocks in winter, feeding upon seeds and buds.

26. Snow Bunting—*Phoebastria nivalis* (L.) Meyer.—A regular winter visitor. Arrives from the north in large, roving flocks in company with Lapland Louspur.

27. Lapland Longspur—*Centropus lapponicus* (L.) Kamp. A regular migrant. Saw thousands in cornfields in April. None seen after May 13.

28. Chestnut-collared Longspur—*Centropus ornatus* (L.) Arr.—Breeds in the south in large flocks, scattering over the entire country. They are the most restless and the most difficult birds to shoot I ever saw. No sooner do they alight upon the ground than they are up and off, flying in a zig-zag manner, uttering a sharp squeaking note. I shot nearly all of my specimens on the wing, it being almost impossible to see them on the ground. Nearly all the birds taken were mouthing about the head and neck. They arrived from the south during the first week in April.

29. McCow's Longspur—*Rhyphidopus macrurus*, Bd.—Common migrant. Saw them in full song in May. The best way to shoot these birds is to watch them at the river. Hundreds of them come off the prairie every day to drink and bathe, so that I killed twenty-two of them at a single discharge with 00, dust shot. They are very pugnacious birds, fighting among themselves like our English sparrows (*P. domesticus*). I have often seen them chasing the horned lark.

30. Baird's Sparrow—*Passerculus bairdi* (Aud.) Coes.—A regular migrant. But one specimen was taken, late in May. It may be more abundant in June, like *C. bicolor*, which is rare in May, but common in June. This species breeds in Dakota and probably in Nebraska.

31. Savanna Sparrow—*Passerculus sandwichensis* Ridg.—Arrives the last week in April, and is quite abundant during migration. The first specimen I shot I took for *P. bairdi*, but on comparing the two species I found differences. *P. bairdi* is a trifle larger and is stouter built; the plumage is lighter. They are hard to distinguish at a distance.

32. Baywing Bunting—*Pooecetes gramineus* Bd.—Breeds upon the ground. Arrives early in May. Abundant.

33. Yellow-wing Sparrow—*Colinus passerinus* Sp.—Abundant everywhere in open prairie, and is a great singer in its humble way. Its song sounds much like the squeaking of some grasshopper than that of a bird. It flies but a short distance, when it plunges or tumbles headlong into the grass as if it were shot.

34. Leconte's Sparrow—*Colinus lecontei* Aud.—Leconte's sparrow is apparently rare in this locality. But two specimens were taken in May. Its manners are the same as those of the preceding; flight rather feebly, flying but a short distance, when it drops into the grass like a stone. I think they breed here. I saw one, which I shot, hopping about in some bushes near the river. The second was shot as he topped the grass.

35. Lincoln's Sparrow—*Melospiza lincolni* Aud.—A common migrant, known by its streaked breast and absence of the dark center spot.

36. Common Snowbird—*Junco hyemalis* Sel.—A regular migrant from the north, seen here only in wooded streams.

37. Oregon Snowbird—*Junco oregonus* (Townsend) Coes.—Not so common as preceding; easily distinguished from foregoing by the chestnut patch on back and tinged on sides with pink.

38. Clay-colored Sparrow—*Spizella pallida* (Sw.) Bp.—An abundant migrant, breeding in Dakota.

39. White-crowned Sparrow—*Zonotrichia leucophrys* (Aud.) Sw.—A regular migrant. But few were seen, as this species do not carry long before leaving for their northern breeding place; arrives from the south in May.

40. Lark Finch—*Chondestes garsoneri* (Say) Bp.—Abundant; breeds. This species is easily identified by their long tail, two outer feathers of which are white, which show very distinctly when the birds are on the wing. In Dr. J. M. Wheaton's "Birds of Ohio," he says: "This species is unknown in Ohio. I saw a pair here (in an Ohio) June 25, 1887, discharging themselves in the road. A nest was found within one and a half miles of Lake Erie, in 1880, by a young oologist. I also obtained two specimens in the flesh from W. H. Collins, a taxidermist, of Detroit, Mich., who says that they are not uncommon in that vicinity."

41. Lark Bunting—*Colinus bairdi* (Townsend) Bp.—This species arrives the last week in May, and is very wary and difficult to shoot. The male arrives in advance of the female. Nests commenced in June, and the nest is placed upon the ground. The eggs plain green. I was unable to remain to study their habits, which somewhat resemble those of the bobolink.

42. Black-throated Bunting—*Spiza americana* Gm.—I met this species on the lowlands of the Loup River only, where they breed. They were very abundant here, singing upon every towhee.

43. Common Towhee, Chewink—*Pipilo erythrophthalmus* V.—Not uncommon; frequents thick underbrush, breeding in brush heaps and upon the ground.

44. Arctic Towhee—*Pipilo maculatus arcticus* (Sw.) Coes.—In company with preceding. Identified by conspicuous white lines lengthwise of back.

45. Bobolink—*Dolichopus oxygaster* Sw.—Abundant, breeds upon ground in high grass.

46. Cowbird—*Molothrus ater* Gray.—Common. Deposits its eggs in the nest of other birds, smaller than itself, except the chewink. The yellowbird (*C. tristis*) completely outgenerals this bird by building a nest directly over its eggs, forming a double nest, or a nest in a nest. One of this description is in the Kirtland Museum, at Cleveland, Ohio.

47. Redwing Blackbird—*Agelaius phoeniceus* V.—Arrives early in April in company with yellowthroats.

48. Yellow-headed Blackbird—*Xanthocephalus icterocephalus* Bd.—A regular migrant. But few were seen. It has a bright yellow head. Females are smaller, no larger than a cowbird, and are plain brown, and are called buffalo birds by the residents, as they are often seen around cattle.

49. Meadow Lark—*Sturnella magna nigretta* Ridg.—Abundant; breeds. Song different from Eastern representative; not so harsh, more of a warble and very pleasing to the ear. Plumage has a pale, faded appearance.

50. Baltimore Oriole—*Icterus galbula* Gm.—Abundant. Builds in the tall cottonwood; nest suspended from an outer branch.

51. Rusty Grackle—*Scolecophagus ferrugineus* (Gm.) Sw.—A common migrant. Does not arrive long before leaving for its northern breeding place; arrives in small flocks in April.

RATTLESNAKES.

By OTTO LUGGER.

[Read before the Maryland Academy of Sciences, April 2, 1883.]

THESE reptiles are found only in North and South America. Lake Champlain is about the most northern point in the eastern part of the United States where they have been found, while in the western part of the continent they live as far north as the British possessions, on both sides of the Rocky Mountains. They cannot exist in places where Indian corn will not thrive well. In the beginning of the century there were so very numerous that two men, who regard rattlesnakes for their own, highly valued fat, killed in three days 100 specimens. With the advancing civilization, or, rather, with the increase in the number of hogs, these snakes were soon exterminated in most places.

Upward of eighteen species, not including *Atractaspis*, are described as inhabitants of the United States, nearly all of which occur in the West and Southwest. Our rattlesnakes fall in two genera—*Crotalus* and *Candiotus*—readily distinguished by the details of the markings. In the former the top of the head is covered with a large number of small asymmetrical scales like those on the body; in the latter the same region is shielded by a definite small number of large flat plates symmetrically disposed. The Maryland rattlesnake is a widely-dispersed species of Eastern North America, the only other species of the same portion of the continent being the diamond rattlesnake, of the South Atlantic and Gulf States. The best-known species of the genus *Candiotus* is the common massasauga of the interior States and of the plains. Texas, New Mexico and Arizona furnish the largest number of species.

The ascribed characters of our rattlesnake are found not to hold good when sufficient series are examined. Certain ascribed features of coloration are altogether uncertain, as specimens vary interminably in the distinctness of the dorsal blotches and in the details of the markings. This appears to be due in part to age, as the smaller snakes are usually the most boldly blotched, while on the other hand the larger the markings are nearly obsolete. The distinctness of the pattern of coloration also depends somewhat upon season, the markings being clearest just after the shedding of the skin. But whatever the markings, the general color of the snake always corresponds with the general color of the surrounding country. Thus from the mountains of the Blue Ridge Mountains passes that color, those from Oklahoma and vicinity are gray, and one snake, found upon white sand near Cranberry Summit, was called in that delightful village "the great Albino snake of the mountains."

The average length of our rattlesnake is less than three feet, and the caliber of the body, even in the largest examples, is relatively inferior to that of the several Western and Southern species. As in the case of other species, there is a regular annual or, perhaps, as in some other ophiidians and as in saurians, a more frequent casting of the skin. During the moult they are reported to be specially venomous, but probably upon no other foundation than that at this time their sluggishness results in the accumulation of a large supply of the poisonous fluid.

The rattle is evidently a modification of the upper skin, and is very likely nothing but a row of transformed scales. But nothing is known of the use of this organ. How the rattles are formed and how they work is a mystery. Some have asserted that these rattles were a continuation of the vertebrae of the tail. Rattlesnakes that have been kept for many years in captivity showed an increase in size, sloughed frequently, but never produced an additional button to the rattle, which proves the fallacy of the generally-entertained idea that the snake, with every new moult, added one more button. The snake does not possess an rattle at all until it is several years old, and fifteen or eighteen jointed rattles are said as many as have ever been found. Rattles that contain more are, upon closer examination, usually found to be clever combinations of two to more tail ornaments. The number of rattles, though, of course, increasing with age, is not an infallible clue to the age of a specimen. It is far from proven that the rattle of one is really older than that of another, the growth of the organ must depend largely, as in all parallel cases, upon the vigor of the reptile, which is not the same at all periods of life, granting even a continuous state of perfect health. The purpose subserved in the economy of the snake by this singular organ has been the subject of much speculation and discussion. It is difficult to perceive of what use the rattle can be, either in procuring prey or avoiding enemies. We do not know, for instance, how many times at all the pursuit of prey while the actual result of its use as a means of self-defense is the reverse of beneficial to the serpent, since the sound serves to direct and provoke attack from all enemies which the animal has good reason to fear. The theory that the rattle is a part of the serpent's means of terrifying its intended victim, used as an adjunct of other supposed powers of fascination, may be safely held in check, and it is proven that this peculiar influence is ever exerted to the extent of preventing its prey from seeking safety in flight. The notion that the rattle is intended to serve as a warning, and thus offset the venomous nature and highly dangerous powers of the serpent, is contrary to all analogy; since animals are endowed with attributes for their own good, irrespective of the result upon others, and would require a faith in the intervention, for the benefit of the dominant species of the community, of special Providence, and that it is no thoughtful person who has suggested that the rattle may be used to call the sexes together, and thus serve a useful purpose in the perpetuation of the species—an hypothesis less unfeasible than some of the others which have been advanced. Another supposition, made irrespective of final causes, is that the rattle has resulted, in the course of time, from the continual agitation of the caudal extremity of these highly nervous and sensitive creatures, and that it has no other function than to serve as a means of warning. It is not entirely satisfactory. One thoroughly established fact concerning the rattle is that its practical operation is injurious to its possessor by provoking attack from those who can cope with it successfully. It may be suggested that, inasmuch as to an unpracticed eye the rattle and its sound cannot be distinguished from the rattling of some of our large grasshoppers, it may serve the purpose of attracting within reach of the fangs of the snake the many birds who greedily devour these insects. But even this would be of very little benefit to his snakeship, since it is nocturnal in its habits. The rattle has been heard at times when no apparent cause of irritation to the snake existed, and it has been re-

ported in which a biped was drawn within reach of a rattler, thinking it a grasshopper.

Rattlesnakes prefer localities where rocky and sunny ridges and inroads abound, surrounded by valleys full of springs and creeks, meadows, etc., and which are frequented by low bushes and herbs. Being very much affected by low temperatures, the snakes change their resting place during the day almost every hour. If the morning is clear and warm, the snake bathes itself in the dew, and afterwards selects a quiet place in a smooth road, or upon a flat stone, to sun and dry itself; later, toward noon, the snake frequents dry and shady places (that are not too far from a sunny spot) if no dew fell during several nights, the snake moves toward the banks of creeks or brinks of rivers, and there, in the shade, never ceases to rest, even during its prey during the night. But is very unpleasant to these nervous reptiles, and makes them very sluggish. Their favorite dwelling places are different, according to localities. In unfrequented places they live socially in so-called rattlesnake dens; in populated places the solitary snake finds a shelter under rocks, in hollow logs, in holes made by other animals, like that of the ground-squirrel, and in the crevices among the banks and bluffs of the Mississippi River, in Illinois, I saw frequently the heads of rattlesnakes sticking out of the enlarged holes of the cliff swallows, whose nests afforded them a snug and safe retreat. Near the farm-houses they are found seldom in large numbers, excepting during their love season; here they live in cracks of rocks, in old stone walls and under out-houses, in hollow trees and under flat stones, in wood-piles, under dwelling houses, in rat-holes, and sometimes under the eaves itself, as I had the pleasure of finding once in Michigan. Quite soothing to the feelings and conducive to sound sleep.

Most observers describe the rattlesnake as a slow, sluggish and awkward animal, and Monsieur Beauvois even declares that few snakes were as good-hearted as it. It is very true that the rattlesnake never attacks animals, if not wanted, and it feeds the same never bites unless provoked and scared, and always rattles before biting. But this is only true of the snake as seen by day, when in a dormant condition. After dark, when fully awake and intent upon catching food, it is an entirely different being. Rapidly moving without so much bending as other snakes, establishing long distances are passed over in a short time; when chasing a bird the velocity becomes simply wonderful; and upon its food, the snake never bites unless provoked and scared, and always rattles before biting. But this is only true of the snake as seen by day, when in a dormant condition. After dark, when fully awake and intent upon catching food, it is an entirely different being. vary from the slightest amount of poisoning to one fatal. This depends altogether upon the amount of venom absorbed in the system and the rapidity of its diffusion through the circulation—matters which turn upon the amount of venom in store at the moment of striking, the vigor of the animal at the time, the penetration of the tooth, the part of the body struck, and finally the state of health of the person attacked. No positive specific antidote is known. Surgical means of preventing dispersion of the poison through the system, and alcoholic stimulation to the highest pitch, are the usual resorts.

"While the venomous properties of these reptiles, not easily overrated, should suffice to insure due caution in capturing or killing them, it is as well to remember that the utmost range of a rattlesnake's blow is less than its own length. They may readily be captured alive by pinning under the neck with a forked stick, and may be banded with impunity, when not too large and powerful, if seized immediately behind the head. In case of a strong snake, however, the power of constriction is sufficient to paralyze the muscles of both arms, as in the case of a person who had seized two of these reptiles at the back of the neck. He had to be relieved by a bystander. A method employed in the South to capture the diamond rattlesnake is, perhaps, worthy of mention. A silk handkerchief is fastened to the end of a pole, which is held toward the reptile, which strikes fiercely at it. The fangs and teeth become engaged in the fibre of the silk, and a dexterous movement of the stick readily pulls out the fangs, and the reptile can be approached with safety.

There seems to be a special and peculiar enmity existing between the rattlesnake and copperhead and the blacksnake and kingsnake, these two latter species waging a constant warfare against the former, and invariably conquering. After the conflict the vanquished is eaten by the victors. In one case a large blacksnake had seized a diamond rattlesnake, and entwined two or more folds behind his head, and several six or eight inches further back, then by muscular effort had torn the body. It is a well-known fact that both rattlesnakes and copperheads will endeavor to get away from the kingsnake, and in the South this beautiful and harmless species is protected in consequence of this fact.

The peculiar life relations of the prairie dog, burrowing owl and the rattlesnake, are well known. When competent observers, familiar with the animals, disagree, as they have, respecting the kind and degree of relation between them, we need not be surprised at conflict of opinion in the books of naturalists who never saw either of them alive. No little bush is in type respecting the harmonious and confidential relations imagined to subsist between the trio, which, like the Happy Family of Barrow, lead Utopian existences. According to nursery tales, in this underground elysium the snakes give their rattles to the owls to play with, the old dogs cuddle the owlets, and farm out their own litters to the grave and careful birds. When an owl and a dog come home, paw-in-wing, they are often mistaken by their respective progeny; the little dogs nosing the owls in search of the maternal fowl, and the old dogs left to wonder why the baby owls will not nurse. It is a pity to spoil a good story for the sake of a few facts, but as the case stands it would be well for the Society for the Prevention of Cruelty to Animals to take it up. First, as to the reptiles, it may be observed that they are, like other rattlesnakes, dangerous, with snakes even more so. They are shy of the hunters, and are after no good when they do enter. They wriggle into the holes, partly because there is no other place for them to crawl into on the bare, flat plain, and partly in search of owl eggs, owlets and puppies to eat. Next, the owls themselves are simply attracted to the villages of prairie dogs as the most convenient places for shelter and nidification, where they find eligible, ready-made burrows, and are spared the trouble of digging for themselves. Community of interest makes them gregarious to an extent unknown among rapacious birds, while the exigencies of life on the plains cut their lot with the rodents. That the owls live at ease in the settlements and on familiar terms with their four-footed friends is an undoubted fact; but that they inhabit the same burrows or have any intimate domestic relations is quite another thing. It is no proof that the quadruped and the birds live together that they are often seen to scuffle at each other's heels into the same hole when alarmed; for in such a case the two simply seek the nearest shelter, independently of each other. The probability is that young dogs often furnish a meal to the owls, and that in return the owls and the dogs are benefited by the exchange.

After the reading of the paper, Dr. Christopher Johnston showed by blackboard diagrams the peculiar formation, etc., of the fang of the rattlesnake.

AMERICAN TAXIDERMISTS' EXHIBITION

THE annual exhibition of this society, now being held at 419ie Hall, Sixth avenue, between Forty-first and Forty-second streets, is well worth a visit. There is much to be seen there that is interesting and beautiful, and yet it must be confessed that as an exhibition of the taxidermal art it is something of a disappointment. The visitor enters the hall, expecting to find all the work of a very high order, and instead of this he sees amid much that is good, a great deal that is commonplace, and more or less that is positively bad, and unworthy of a boy who has not yet mounted a hundred specimens. On the other hand there are a great number of pieces, which, while they are like nothing in nature, are still extremely beautiful, and which show how the skins or horns or heads or hoofs of birds and beasts may be tuned into most attractive ornaments for the parlor, the dining-room, or the boudoir. It is in this respect that the present exhibition deserves high praise, and is most successful.

The society this year exhibits with many excellent productions, much that is really very wretched. It could scarcely be otherwise, for all that is sent in for exhibition must be accepted, or else jealous and heartburning would arise, and the exhibitors whose pieces were rejected would feel that they had been badly treated by the society. We may first refer to the heads of the ruminants, which are hung high up on the walls of the hall. No. 705 is an excellently mounted head of a Virginia deer, not looking forward after the ordinary method, but somewhat turned to the right. The pose is a graceful one, and the work very creditable. Passing by the door of the side room, a beautiful caribou head is seen on the wall, and above it to the left is a moose head, which is a real triumph. On the other side of the caribou, and above it, is an elk head, with the horns in the velvet, which looks like nothing in the earth beneath, or the waters under the earth. The same is

true of the elk head and the wuile deer head on the other side of the stage. They are hopelessly bad, and the men who put them up had never seen the animals in life. If they had they could never have distributed the stuffing about the skulls as has been done, making the head so wide across the eyes and bringing them down to a gullet point on the nose. Only two or three antelope heads are seen on the walls, and they are neither very good nor very bad. There is a capital mountain sheep's head and a good Virginia deer's head to the right of the stage.

On the stage at the rear of the hall, stand male, female and young moose, and a bighorn. The latter is excellent, and so is the young moose, but the same cannot be said of the adults. They are stiff, and their necks are not thick enough, and are too long. In the center of the room, is a called Tartar hunter attacked by tigers, is very striking, and the horse extremely lifelike. The hunter has captured the tiger's cubs, and as he is riding away, the old ones have sprung upon his horse. One of them he has shot, and at the other he is striking with a dagger. The conception, though not a new one, is well executed, the only weak point being the man. In the front of the hall is a spirited group; two lions fighting over an antelope which one of them has killed.

There are three groups on exhibition representing dogs pointing birds, and we wish that we could say that any one of them is thoroughly good. A white, with a little red set, standing a levy of quail, is on the right of the door as we enter. The background and all the accessories are excellent, but the dog looks like no setter that we have ever seen. He is long and thin, and has a very small head, a minute head in fact. Evidently the skin has been very much stretched. The head is very fair, but the rest of the body is all out of proportion to it. Not far from this, but across the aisle, is another dog, this one a brown and white pointer, standing a pair of ruffed grouse. The case, the ground and the birds are even better than with the setter. The dog's head, neck, legs, and tail are extremely lifelike, but the body is not good. It is round and without shape; the body of a dog, in fact, which is so fat that not a bone is visible. The flanks are not drawn in, not a rib nor a vertebral spine can be seen. A dog shaped like this could not and would not hunt an hour. Just in front of a window is a black and white pointer on quail. There is no background, and owing to its being directly against the light it cannot be well seen, but it is the best stuffed dog on exhibition. The attitude is not nearly so well chosen as that of the other pointer, but it is all over a dog, and were it as well shown as the other two it would far surpass them. One of the group of smaller animals and birds, of all grades of excellence, from perfect to absurd. Two of the most strikingly beautiful are a group of duck bills (*Querula baydonii*), and one of terrapins. In these the water is represented by glass, and the whole work is done so perfectly that nothing is left to the imagination.

Among the bad groups, bad in taste and execution, are a group of blue-winged teal, and one of herring, gulls and terns. Near the windows, Wallace has a remarkably fine series of owls, a handsome pair of black-backed gulls, and a group of gulls, and a pair of terns. Some beautifully stuffed herons (Nos. 141-2) are deserving of a close examination. Near the brown pointer and partridges, is a pretty group of game birds, ruffed and pinioned grouse, and woodcock and snipe, very nicely done, though the association is, of course, utterly unnatural. There is also near here a beautiful group of woodcock and young. A number of dining-room pieces—ducks hanging on shields or panels—are to be seen, some of them very good, others only passable. A canvas-back and an old squaw on the south wall are by no means satisfactory, while some beautiful harlequins on the north wall are excellent. The most many stuffed single birds and animals. Most of the latter are very good, and so are some of the birds, but judging from the character of the work, we should imagine that most of the taxidermists had never seen a grouse or a quail alive. These stuffed grouse are pretty and graceful, and their feathers are beautifully smooth, only—none of them are shaped like grouse.

It is impossible to speak of all the pretty things that are here in the way of decorative taxidermy. On the north wall near the window and opposite it on the south, are a vast number of beautiful and tasteful objects. There are some beautiful peacock and owl screens, and some charming effects are arrived at by putting half a bird against an appropriate background in a frame. Thus a little white heron stands against a dark blue plush or a black velvet, a woodcock against a light background, a green trogon against white, and a northern hare in winter dress against black, a shoveller and a cock of the rock against blue and white respectively. Then there are all sorts of queer and fanciful devices, in which owls are brought into play, many of them ingenious and some very pretty. One of the most spirited and a thing to see at this exhibition is a dying little white heron, pierced by a golden arrow.

A noticeable feature of this exhibition is the plaster casts of fishes and reptiles, of which there are quite a number, all of very fine. The society has also secured the loan of the working models of a number of Mr. Kenys's groups of animals, and these make a fine show.

Enough has been said to show that there is a great deal to be seen at the present exhibition, which we presume will be a financial success.

"NEVER TOO OLD TO LEARN."—I have seen snow buntings since boyhood (and that is not a few years), but never until the 23d ult. saw them alight in a tree, and now "Phek Bluk" and "A waioose" sing that "it is not uncommon for them to do so." I have also been informed by Mr. J. H. Langille that he has often seen them alight on trees, but I think he still has doubts of the horned lark doing so. I said in my last that I did not doubt that "Taxidermist" saw them in a tree, but when I see them do it I shall probably be just as much surprised as I was when the snow bunting did it. In the article "Some Southern California Birds," in your last issue, the last sentence in regard to horned larks reads: "Have seen them in a tree or bush." I presume it should have read, "Have never seen them in a tree or bush."—J. L. D. (Lockport, N. Y., April 29).

"SHAMING SICK" and "WHO SAID RATS?" the well-known pictures published some years ago by the *Illustrated Sporting and Dramatic News*, of London, are issued as a colored supplement to that journal of April 14. The *News* is one of the handsomest papers published, is of a healthy tone, and reflects great credit upon its editors and publishers. The American agents are the International News Co., Beekman street, New York.

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

LOST ON THE SNIPE MEADOWS.

THE old adage, "two's company, three none," for once at least was not true. Although it may have applied to other parties, it certainly did not to ours.

On the 11th of September I left my house in Portland on a trip to the town of Raymond, for the purpose of spending a few days among the game birds of this State. Upon arriving on the grounds I found the birds quite thick and a prospect of good shooting. The next day I mailed a letter to a couple of friends in the city, inviting them to come up and spend a few days with me. By 9 P. M. we were making ourselves at home.

The next morning at 8 o'clock we were on our way to the Moose Meadow. It was quite dark when we arrived on the grounds and not a duck in sight. Five, ten and fifteen minutes pass. Whir, whirl! splash, splash! and four birds alight on the water not thirty yards from us. Jordan gives it to them sitting and I take them on the wing. Result two birds. Another fifteen minutes pass. Two teal silently wing by White, who is on the other side, and drop into the water several hundred yards away. I cautiously creep that way and—whir—away they go, bang—a clean miss; bang—miss for Jordan. An hour silently passes away.

The place in which we were gunning is situated thirty miles from Portland, and within a circuit of several miles there are not more than fifty houses. It is one of the best places for ducks in this State. There are three large meadows, connected by means of a brook, and the outlet of all is into Sebago Lake. The upper, or Moose Meadow, is the smaller and the best and principal feeding ground, and here the birds congregate at mornings and evenings. The center and largest is the Great Meadow, and the lower the Little Meadow.

Having watched the ducks for several mornings, I found that their plan was to come to the Moose Meadow mornings and nights to feed, and, if undisturbed, to stay there during the day, which when started to proceed to the lower meadows.

We formed our plans accordingly. Surrounding these meadows is a heavy growth of pine and oak, in which, if unacquainted, one is liable to get considerably "mixed up in his reckoning." Gray squirrels and partridges are plenty, and a few woodcock. There is one drawback to the duck shooting, and that is that the meadows are becoming rotten, and one cannot walk everywhere without some caution; but with a boat this is offset, and, if so provided, one could enjoy sport "fit for a king." There are several semi-pot-hunters there, but, with three exceptions, they do not little harm beyond getting the birds so scarce, and make them wild enough to make a good score something to brag about.

The morning of the 15th was foggy and rainy; nevertheless we started for the Great Meadow, walking along the shore and starting a few birds, which went to the Moose Meadow. We soon reached the head of the pond, and, turning right, inside of fifteen minutes we were standing on the dam at the foot of the upper meadow. We took our positions and awaited developments. A half hour slipped by with no birds. Leaving my blind, I cautiously worked my way along the side of the meadow, and proceeded to the head without starting a bird. Owing to the extreme drought of this year, the greater part of the meadows, which generally is under water, is high and, for the most part, dry. Still, one must proceed with some caution. From here I commenced to work down toward my companions, and had covered about half the distance when four ducks rose from the middle of the pond, and proceeded straight away from me, too far for a shot, but going toward Jordan. A puff of smoke, and three swung to the right; another puff of smoke, and only two proceed onward, with increased speed.

Continuing on my way I saw a lark from under a log, on which I fired, and a very peculiar foot shot, and a pair of teal, the results (only on the duck), fired. Upon covering so which I found myself well deep in the soft mud under the log, and the duck proceeding on his way. I managed to get out, and vowing vengeance on all the ducks in creation, I walked on and managed to flush a woodcock and snip that early shell on him, but marked him down, and upon again starting him he came to lag. Rejoining my companions we wended our way homeward. That evening we watched and waited, but being without a boat it was too dark to find our birds if we shot any.

The following day we visited some of the adjacent towns. At daylight the next morning we were on the meadows, and at six o'clock left for a favorite partridge ground. Dinner time found us with two ducks, no partridges and four gray squirrels. As the morrow was to be our last we decided to be absent all day. Leaving the house at 4 A. M., we scoured the woods and upper meadow, and were quite lucky. About noon we sat down on an old tree at the head of the Great Meadow, and while conversing on various topics I saw a bird drop into the brook not one hundred yards away, and notifying the others I started for him and Jordan followed. The duck rose some fifty yards away, circled around to the right and passed directly over White, who coolly brought him down, and he is now mounted in the latter's room.

About three I started for the house, but the others remained, and on the way shot a hawk measuring forty-two inches.

After supper went to the post-office, and on returning home was astonished to hear that my friends had not yet arrived and that probably they were lost. After carefully considering we came to the conclusion that if they were anywhere on the upper meadows, or in fact this side of Glover's Ridge, they could hear us; therefore I heavily loaded six shells, and going to the top of a small hill fired two charges in quick succession and eagerly awaited a response. A minute passes; again I fired. Hullo-o-o-ah!—no, that was a loon; again I fired. The echo runs through the woods seemingly with noise enough to be heard miles away. But no answer came to our waiting ears. Solemnly we wend our way toward the house.

For an hour we sit around the stove, and then the host and his wife retire, but for some time I sat with my head in my hands and my elbows on my knees. About 9:30 an hour I awoke when I hear whir and imagine I hear Jordan's voice. "Never they come, and I am not mistaken, for it is them, and a more dilapidated and thoroughly tired out

couple was never seen, but they were happy, for five ducks told the story of their skill. After they had stowed away their supper, we draw our chairs around the stove, and White told their adventure as follows: "After you left Sam he hunted me up and together we started to wade to a small island, and easily reached it, not going over our knees. A small blind stool on one side, and of this we at once took possession about 5 o'clock. One of the green-winged teal started out of the lily pads (which are two feet high) and swims out into open water. I take a careful aim and fire, but he never kicks, and lies motionless on the water. As soon as retrieved we settle down again, but before sundown manage to get a diver. As soon as it grows dark the fun begins. The birds fly in all directions. Whirr! on the right, whirr! on the left. A long black streak can be seen in the northern sky, which soon develops into a flock of twenty-seven ducks, which I took to be black ones.

"Yes," said I, interrupting him, "they are black ones, and come from a small pond away over in the woods, where they stay during the day, and come to the meadows to feed at night and depart before daylight."

"We waited for them to pass by near enough for a shot, but they gave us a wide berth." We gathered up our birds and started to return to the shore, but to our surprise we could not see it. We had been looking at the bright sky so as to get the outline of the birds against it, and on looking into the dark were blinded for a few moments. Taking a long stick in one hand we felt our way toward the shore, which we succeeded in reaching in about a half hour. Once on shore another difficulty presented itself, *z. e.*, which way was home? Luckily we had set our compass before leaving, and holding a match we soon found the requisite direction. We struck into the woods and traveled for some time, then we stopped and lit a match to make sure.

We were traveling very nearly in the right direction when we struck the old logging road which leads from the main road to the meadow. This we followed till we reached the tall pines where they logged last winter, and here we lost the path while in this growth, for it was as dark as night, and here we hunted our last match in order to make sure of our course, which, luckily for us, had been nearly correct. Stumbling on, over stumps and fallen trees, first one and then the other was ahead, and the hind one had to take the bushes as they switched back, which was very pleasant; speaking now and then to make sure we were together, at last we came out on the shore of the meadow.

"Yes," said Jordan, "and I swore that it was some one we had not yet visited, but White said it was the Great Meadow."

"We walked up the shore of the meadow until I found the rocks where the road comes in. Turning in here we followed it as long as we could, and several times we found ourselves in the brush, but managed to strike the road again, and after about a half-hour's work we came out in the main road. Our trials were now over, for in fifteen minutes we were here. Now, I move we go to bed, for it's most eleven."

The next morning was spent in packing, and our host, who owned a good horse and double-breasted wagon, offered to deliver us at our respective houses in the city for one dollar each, and we gladly accepted his offer. SMALL.

OUR WOODCOCK SHOOT OF 1882.

I know a lot of the readers of *Forest and Stream* are crack shot, good talker and lover of the Irish red, to come and have a hunt with us for woodcock, which invitation he accepted, and we had a right jolly good time. On his return he had published in *FOREST AND STREAM* an account of the trip. That was the time when we "got 'em."

This year he came again and we didn't "get 'em," so I will undertake to tell it this time, and although he dubbed me "little one" last year, I shall not do any more, and call him "giant," if he is over six feet tall and wears No. 12 boots.

From September 1 to November 11 Charlie and I had watched our favorite grounds for woodcock, visiting them as often as twice a week, and some days we did not see a single bird. The most we saw in any one day were four, and we had about made up our minds that there were no birds this year, and that we were going to give up and record this as an all year dog run, woodcock and English snipe as there did not appear to be any. On Monday, November 13, we heard that so many woodcock had been flushed by persons out walking the day before that we said, "It is all right; they have come at last and we must be off." We telegraphed Will. "If you have faith enough, come on and we will go to the hill to-morrow." It was quite evident to us that he had the necessary faith, as he arrived with the 2 P. M. train in the morning and was ready, and very soon after we took another train. I have remarked before that he was a good talker. After the usual hand-shaking and looking at the dogs, he cocked his hat on the back of his head and opened up: "Say, we'll get 'em to-morrow; they are here. I saw them shooting last on the river; saw them from the ear window, and just as I left home a farmer's boy brought in several woodcock and the woods is full of 'em. Oh, it is all pleasant to-morrow we will then." He then they will then they warn side hill in the young alders. 'Til bet this minute there are fifty birds in the piece in front of the old school house." And so he talked on until the brakeman shouted "Jordan." We picked up our gun cases, and, taking the dogs by their chains, alighted.

The first man we saw was our genial friend, the Doctor. The Doctor's house is a two-story frame building on Jones street. As to the size of it, in the talk with his wife, and also his general opinion of all of the Doctor's friends that he is doing himself a great injustice in not securing a patent on it. I have known every room in this house to be full, yet when some of the Doctor's friends would drive up, he would say, "Drive around to the barn; then come in and stay all night." I wondered where they would sleep, but the Doctor invited another room was added to the house and prepared for guests. This building has store-room, Doctor's office, sitting-room, dining-room, library, and sleeping rooms *ad infinitum*. The Doctor's wife is one of those large-hearted women who occasionally meet with, just as ready and willing to entertain the Doctor's friends as he is to have them entertained. The Doctor—why every one knows him; his name is household word for miles around, and he spends a portion of his summer vacation, he has hosts of friends, and many of the guides will testify to kindnesses shown them in visiting the sick, extracting teeth, and relieving their suffering.

On one occasion while at his house, having returned at about seven in the evening from an all day's hunt, he found that there was a call for him to go and see Mr. W., living about five miles from the village. The Doctor says, "Well, I am glad of it, as Mr. — was here yesterday and wished me to come and see his hound." And he did go; made both calls, and it appeared to me that he was more particular in his treatment of the hound than he was of Mr. W.

The Doctor marched us to the dining-room, and after a good hearty supper we returned to the office, where we enjoyed our pipes and the evening passed pleasantly talking over the past, and receiving calls from our old friends Messrs. White, Allen, Jay and others, and our good Methodist brother that always says, "Well, look at all the dogs." And, by the way, there was quite a show. First, there was Charlie's Don, (Old Reliable) and I shot a brace of field trial winner, and a first-class dog on game. Will had Stump, a red Irish, winner of first prize in New York in puppy class in 1882, and first in open class in Washington in 1883. The Doctor's Fred (Laverack) and my red Irish Daisy (litter sister to Snapp) and Jay's water spaniel. At 10 o'clock we took a short walk to give the dogs a little exercise and see what the weather prospects were for the morrow, and then retired.

We were up in the morning and found that the Doctor's wife had made breakfast ready for us, and as usual (never forgetting the dogs, she had the pudding ready for them) the lunch basket and jug of coffee for us. Now, the Doctor's wife is a firm believer in the coffee sign as to the success of a day's hunt that she never allows a sportsman to leave the house without it. The morning was clear and cold (but we had known woodcock to be here later than this), and the black ponies took us along at a rattling pace, and we reached the hill about 10 o'clock. Charlie and Will left us to hunt up on the south side. Doctor and I were to ride on a quarter of a mile further and then hunt the north side, and we were to meet at the old pond. John was to wait for us with the team at the old school house.

We climbed over the fence; Fred and Daisy went to work, quartered the ground high and low, and at last there was a faint showing of game. Daisy stopped, half pointed, but it was a false alarm, and she started on the way up, and did not find either woodcock or grouse. This was not at all encouraging, as this piece afforded us some very fine sport last season. We separated again, Will and Charlie locating on the north side of the pond, the Doctor and I on the south side, until we again met at the school house, and after comparing notes we found that we had drawn another hawk. We all climbed into the wagon and started for the piece at the head of Green Bay. "This was our last place for woodcock, and the Doctor remarked, "Look here, boys, I told you there was no use of hunting for woodcock; they have not been here, and this is an off year." We were soon satisfied of the truth of this, for we hunted this cover thoroughly, and not a bird did we find. In this piece last year in about one hour we bagged twenty-five woodcock.

We returned to the wagon, and after spreading down robes and blankets sat down to a lunch such as can only be prepared by a woman that knows the wants of hungry sportsmen. In Will's report of our hunt in 1881, he failed to mention the fact that his red Irish Larry ate up all the lunch, and when he jumped out of the wagon to hunt the first piece, he had the empty basket hanging on his neck, and if the present owner of Larry should happen to read this, I wish he would call to mind if at the time the dog was purchased he was warranted by Will to "eat up all the lunch." After lunch we started off on our last place, which I wish there were no woodcock, we will start and try the grouse in a small piece on our way home." We did stop and try them. "They were up in trees, would not lay for the dogs at all, and we killed just one, although Will declares that he knocked off both wings and legs of another with his "far-killing" Greener, and from the appearance of a pine tree (and since reading "Mark West's" account of his grouse hunt) I have concluded that Will used his right barrel to take off the top of the tree, and his left to knock the bird over in an adjoining town, as we could not find her. But we did find this little grove full of snags, and if snares were ever thoroughly torn up and destroyed, these were then and there. This was the last of the day's hunt, and we drove home. Total number of birds killed in eight hours' hunt, one ruffed grouse. I hope that this will never be accused of slaughtering game in this day's hunt.

The next day the Doctor's professional duties were such that he could not be with us, and we thought we would try for grouse, knowing that there had been a brood or two raised in one of our favorite woods; but it was a hard place to get a shot at them, the woods being almost entirely young pines. Here we go; Will working on the edge to my left and Charlie to my right. We had just started and the cover when Charlie came in and said, "He's on, here he is," and just at that moment out they go right over my head, but not a bird did we see. The puppies looked a little surprised. "What is that you say? Old Reliable surprised? No, no, you don't know that dog or you never would ask such a question." There he stood, straightened out at full length, without the slightest motion of a muscle, making a picture that can't be described with a pen. You stand and see it, Charlie steps and off goes the bird without giving us a glimpse of him. We hunted this piece for two hours, the dogs doing some very fine work. Charlie and Will each killed a grouse, and I didn't bring a bird to bag. Methinks I hear some reader say, "Well, I can't see where you had any sport in that hunt." There is just where you are mistaken. I own up that I am not a good shot, and Charlie has often accused me of watching the dogs and allowing the birds to fly away, to which charge I am obliged to plead guilty.

To me a day's sport with rod or gun is not the number of fish in the creel or birds brought to bag.

"Game bag flat, with naught to boast of,

Barely took an ill-timed sneer,

Every well and favored marksman

Levels not a sleek-skinned deer."

It is the rest from all business cares, the knowing that for a time, at least, that ledger and ledger balances are not to be thought of, and I can never recollect the many benefits derived to soul and body from these excursions to woods and lakes. To me they are numberless and they never end. I take my place at the desk ready for duty, and while at work my thoughts will carry me to the dog side all day long. In the morning I will get up at 6 o'clock, and when weary from the labors and cares of the day I return home, and while seated around the cheerful fire with my wife and boys, one of the boys will say, "Papa, now for a story. Tell us about your first visit to the Adirondacks, or Obed's falling to sleep watching the runaway on Old Whiteface, or your quail hunt

in Ohio, or your first visit to the woods of Michigan;" and this is why they never end, and I will know that—

"I am richer, wiser, stronger,
For these brief relaxing spells,
And the voices of my dear ones
Shall seem sweet as Euter Bells."

And as has been said before, among the multitude of blessings vouchsafed me by a kind Providence I count my passion for hunting and fishing chief, and I am sure that I am healthier and happier for having found pleasure in my excursions to mountain and forest, lakes and streams.

PLANKERS.

Hudson, N. Y., April 24, 1893.

THE HUNTING RIFLE.

Editor *Forest and Stream*:

I do not desire to take part in the pleasant though spirited discussion going on in your columns as to the relative merits of the breech and muzzle loader, for it is already in the hands of those competent to handle it. All the suggestion I would make would be that a match between the two classes, with the usual conditions, be shot, except that there should be no wiping after each shot. That is really the true test of the two systems, for a rifle is useless, except as a toy, that cannot be used with sufficient accuracy under those conditions. The muzzle-loader, being to a certain extent cleaned in the act of loading, is apt to have the advantage, but it will point out where the defect lies with the breech-loader.

My object in writing this communication is, however, to utter a mild protest at the patronizing and *ex cathedra* criticism of your correspondent "Penobscot," in the issue of April 5, in regard to Major Merrill's opinions and experiences on rifle matters. I am aware that gentlemen are fully able to take care of himself, but I cannot refrain from "dipping in an ear" where he may not think proper to do so. Major Merrill is, by education, profession, opportunities and extended experience, superinduced by a careful study of the subject, a rifleman in the highest sense of the term; a rifleman of nearly half a century's experience, most of which has been obtained among the big game of the frontier; a rifleman, in my opinion, who has forgotten a great deal more than most of us younger riflemen ever knew. In truth, he may be designated as the Nestor among the riflemen of the eastern States, and therefore behooves "Penobscot" to be a little more cautious in his criticisms.

Now, what are Major Merrill's opinions on rifle matters? I always read with care what he writes, and this is my understanding of them: He admits the superiority of the breech-loader, with all its defects, as a weapon of war, or where dangerous game is encountered, and where rapidity of fire is essential; he claims the superiority of the muzzle-loader for accuracy as a target rifle, where the rifle is allowed after each discharge; he claims the superiority of the muzzle-loader for accuracy either at target or game, where consecutive shots are fired, without wiping, and claims this latter is the true test of any rifle.

Now, how many experienced riflemen are prepared to take issue with him on each of those three positions? All will agree with him on the first position, and there will be few to dissent with him on the second, with the breech-loaders as at present constructed. As to the second, wherever you find a rifleman of experience who disagrees with him, you will find an equally experienced one who agrees with him. There will be a great many who think that in the hands of equally skillful riflemen there is very little difference in accuracy where wiping is allowed. I take it, there are few riflemen who will disagree upon this with the above views.

Now it seems pertinent to inquire from what standpoint of experience does "Penobscot" fulminate his criticisms on Major Merrill's opinions: "Upon what merit doth this our Caesar feed?" and in prosecuting this inquiry we will take his own account of it. The amount of game he has killed offers no criterion from which to judge of the extent of his experience, for it may mean twenty or it may mean fifty. The first statement or opinion given that causes a doubt, at least as to a looseness of observation, is that the deer (and so on to be the Virginia deer) comes to "a dead halt at the end of every leap." In this he will find few if any to agree with him who have seen many deer run. The deer's feet are, at times, at "a dead halt," especially when at a slow gait, leaping over brush for instance, but his body is always on the move, and when going at a good gait its movement is very uniform. When at full speed his feet, like those of a race-horse, scarcely appear to touch the ground, and he goes like a shot.

His next statement with regard to hunting in weather whose temperature is -42°, and without gloves, will astonish those with much experience in hunting in cold weather; for so I understand the words, "fingers frosted from contact with the blustering steel barrel." I think it will be the general verdict that anyone who goes hunting in such weather without gloves, and very warm ones at that, knows very little about either cold weather or hunting; in fact, that he needs a guardian. Furthermore, manipulating a breech-loader without gloves would result in the same "blistering" experience by contact of the fingers with the steel of the lever and the trigger-plate and lock.

Now let us test the soundness of his judgment as to the best rifle for deer hunting. He has only used two breech-loaders, the Winchester '73 and the Martini '40 caliber, both repeating rifles, to both of which he gives high praise, with the preference to the latter, and thinks it "by far the best hunting rifle for forest shooting in the market." Now I say, such are the last arms a man of solid experience would take into the woods for hunting deer, premising at the same time they both are very good rifles of their class. In timber you rarely get a deer, and one good caliber, better matter where you put him in the body—hams, hunch, lungs or shoulder. There are such rifles. No rifle, however, shooting a solid ball of small caliber is that rifle. It is simply cruelly to hunt deer with such rifles, unless the animal is shot through both shoulders, or through the heart, or the spinal column is touched, the chances are it will hide in the bush to die a lingering death, unless there is snow on the ground or you have a very large snow-drift. A wind lung shot, in a few instances of fawns, being literally shot to dogs. I know instances of fawns being literally shot to dogs of grown deer that were mutilated by as many shots and then getting away in full view on the open. Such instances are in the experience of all who have hunted deer much with the small caliber solid ball, and this paper has frequently been full of such experiences. If "Penobscot" will read that most excellent book, Mr. Van Dyke's "Still-

Hunter," he will find the subject fully treated in this regard.

Furthermore, it is generally conceded among those who have tried both of the above that the good single-loader is superior for killing large game in the hands of hunters equally experienced. It is also less liable to accident, for it never shoots except from the muzzle.

It should have occurred in a moment to one of his supposed experience why the 73 model Winchester had such a high trajectory instead of ascribing it to his "shallow grooving, slow twist and bullet short in proportion to its diameter."

Whereas the true cause is its short barrel, light ball, thin, smooth charge (forty grains) behind it and comparatively large caliber.

It would seem impossible to get a flat curve for any distance from such a combination. Just why the Marlin forty-caliber has a flatter trajectory is that all the elements of its make-up are more favorable in this rifle, smaller caliber, longer powder charge, heavier ball, greater powder proportion and longer barrel.

This review of "enob-cock's" communication is made with the most kindness and respect, and as a reminder that his experience with the rifle is not of such a character as to enable him to criticize one with Major Merrill's extended experience.

C. H. I.

THE "SCREED" IS CONCLUDED.

Editor Forest and Stream:

I know that some builders talk of ten-pound emoes in "ads." I just want to meet one in the North Woods. No, when they talk thus they lie under a mistake. Sickness, haps and mishaps, from piled-up railroad trains to pneumonia, meet us at every turn; but, accidents, sickness and death aside, I am as sure to make that cruise as you are to turn in when you start for your berth, and my sceptical friends, who already have \$200 accidental insurance on me, are not going to let me off. Though, as it is only \$7.50 on the \$1,000 for six months—well, I think it a business investment. I hope, if I am caught in a blizzard on Riquette, Long Lake or the Tippers, and the eggshell swamps me, they will pardon my persistence if I happen to scramble ashore by the help of the air cushion, which I shall always have aboard, and, if I am drowned, will they, remembering they have had a winning thing of it, kindly pay me a liberal percentage to Mrs. Nesmick, my deceased Johnny? No, boys, I have been fairly drowned twice. No man born of woman was ever drowned three times. It wouldn't take a strong rope to hang me, but a bear trap on one leg and a grindstone on the other wouldn't drown me in ten fathoms.

And "Picket" pays his last respects to me in a few "last words." It is hardly worth his while. Of course not. But a few last, superfluous words to show up the utter absurdity of "Nesmickian philosophy" may be enjoyed by his utterly utter friends, men of means, so to speak, men who can afford the "best" of everything. Things not to be had by "men of moderate means." Just so. Now, by the sharp way in which "Picket" ignores my remarks on the destruction of game, forests, etc., and catches at my question, "can a counterfeit, then, be worth more than the original?" and by the cunning way in which he catches at my words, "old pictures, diamonds and dogs, I judge he is a New York legal sharp." He misses his dog, rightly. He says "a thing is worth what it will bring in the market." I will be as brief as possible.

Firstly, I will answer my own questions, to wit: The "counterfeit presentation," if it be a picture, may be worth, in popular estimation, much more than the original. If it be the counterfeit of a guinea, or golden eagle, or a dozen other things, then not. The value of a picture depends on the taste and fancy of the purchaser. I don't quarrel with it.

But, "a thing is worth what it will fairly bring, etc." If this were true, the toe-nails, shin-bones and skulls of saints and apostles, with bits of the "true cross" (chipped from a gate-post, probably) would have a steady and appreciable value. In point of fact, they are each and all rubbish. An old Roman coin (really worth \$3.20) would be worth \$500. A pair of glass eyes, one of the true forked snipe, would be worth \$5,000 in China or Corea. Actually it is worth as much as the same weight of forked parsnips. No more. There was a time—not so long ago either—when sharp business men in Holland paid \$10,000 for a single tulip bulb. What would it be worth to-day? Could anything go further to prove the childlikeness of the adult brain? And our Simian ancestry? And all this arises from what I said about dogs, and the value of a name.

And I repeat it and can prove it. From the days of Homer down to the present time the dog has had his admirers and advocates. He has been the pet of peasant and prince, and mostly a nuisance to their friends and neighbors. He is at best a half-reclaimed savage, with an always present tendency toward retrogression, surreptitious mutinon, and upping the heels of the casual stranger. I know whereof I speak, and I have a right to speak of the dog. The first dog of a person's property I ever owned was a dog. This was fifty-six years ago. From that day to this I have never been without a dog—sometimes as many as ten; often three to five. It was hard to take in a law that outlawed my pets, as property, making it legal for any one to kill them when found at large without a muzzle. I see the justice of it now. I see, too, the absurdity of mixing up our pets as property, with gold, horses, diamonds, etc. Legislators and courts have some peculiar ways. In the other world, hounds and slaughter them *en masse*. The public paying the cost, as a measure of public safety. State Legislatures do not pass laws against the horse, ignoring him as property, and binding the State to pay for the sheep he may kill. They do all this as regards the dog; and wisely.

As to "Picket"—the best are scarce, and only to be had by men of means." True as regards gold, bonds, city lots, diamonds, etc. Not true as regards the dog; he is an exception.

There are several millions of dogs (see census report) infesting this land; spreading rabies, destroying sheep and cattle, and, in a general way, making intolerable nuisances of themselves. Perhaps in twenty, as a herder or hunter, may have some pecuniary value. If the other nineteen-twentieths were dumped outside the Gulf Stream, it would be a blessed boon to the country. (Try a vote on it).

Comparing a first-class picture with a dog is an utter absurdity. Comparing a Raphael or Titian with a dog raiser and trainer, is worse. It does not require a high order of genius to run a dog yard.

As to "Picket's" offer of getting his "choicest eyoodle," I am afraid I cannot meet him. His choice eyoodles seem to have cost him considerably more than \$100 each. My C. is only valued at \$10. I would add too, that if, however, "Picket" will consent to stake his "choicest eyoodle" against a healthy, young yascutus, terms of meeting, etc., to be left with the editor of FOREST AND STREAM, I will do my best to interest him. And, with fun for all, and with malice toward nothing less than hydrophobia, I take leave of the "Screed." NESMICK.

NOTES FROM ROCHESTER.

IN the occasional notes which I have sent you during the last five or six years, I recollect but few from which it was possible for the reader, if he were a sportsman, to derive any satisfaction by hearing of a place, not remote from civilization, where game could be called abundant. I rather think that many of your correspondents have had the same experience, and that a considerable proportion of the interesting communications you receive detail events of the days that are no more, when birds were abundant and the shooters less numerous. From your city correspondents especially it is rare to hear of good shooting at their doors, and when an opportunity presents itself, to record a contrary state of facts, one should not fail to "make a note of it." There has been, and is, an extraordinary flight of snipe over this part of the State this spring. Several satisfactory bags have been brought in by residents of the city, but the most sport is said to have been enjoyed by a gentleman who got rid of over forty cartridges and shot eight snipe. The market shooters, as usual, have had the cream of the sport. Two Ontario countymen sold over a hundred snipe here within the last ten days, bringing in over fifty on two occasions. Hartman, of Greece, a hard hunter, has bagged over sixty, and numerous cases are reported in which non-professional shooters have been well rewarded for their labor in tramping the wet fields for "winged flies." Snipe have not been so abundant for several years.

A great many ducks have also been taken in, and while I was in a blind on Round Pond, on the shore of Lake Ontario, last Friday, waiting for ducks, I saw a flight of hawks that reminded me of those described recently by one of your New Jersey correspondents. In the space of about two hours, more than twenty hawks went past the blind, flying from west to east. None of them came within gunshot, but they included several varieties, large and small. Some of them were very, almost white, a color I never saw on a living hawk before.

While I was waiting the marsh for a widgeon that came down suddenly, it occurred to me that if one were to carry in his boat two light boards he could use them for walking on marshy ground, where neither man nor dog can go at present. By carrying one board and walking on the other in succession, one could go safely over almost any quagmire. I heard yesterday of a man who had been so roughly informed on this subject, that the wild pigeons are nesting in Southern Missouri, and he thinks there is little chance of a flight east of the Mississippi this spring. He expects that they will go into British Columbia.

Robert Tanguay, the widely-known Franco-Irish-American sportsman and inventor of fishing tackle, has returned from a six month's visit to Florida, where he had a world of adventure on field and flood. He has "hung out his shingle" in the form of a fish in the Massasoit Hall block and resumed fly-tying, an art in which he has no superior. He is ready at any time to lay down the most delicate fly that ever deceived a "spotted beauty" to tell of a fight he saw in the St. John's River between a porpoise and a shark, or some other noteworthy incident he beheld. I was slightly astonished when he told me that the breast and drumsticks of the lilttern (known generally by a less euphonious name) are quite spatchable, but he got on very well as a sportman when he said that "we eat everything except buzzard in Florida."

Charles Green, whose excellent guns you advertise, has increased the capacity of his manufactory and opened a show room on West Main street, where the sporting events of the day are duly disseminated and new campaigns planned.

ROCHESTER, N. Y., April 28.

M. C.

RUFFED GROUSE.

(Read before the New Hampshire Fish and Game League, by Dr. Henry Wheeler.)

THE subject of my rambling talk before you to-day, will be the ruffed grouse or partridge, *Tetrao umbellus*, which is found in all the wild, mountainous sections of our country, from the extreme north, far into the Caucasus and as far south as Georgia, and in fact, all over this vast continent to-day. Twenty-five or thirty years ago, every hillside and sunny valley, even the mountain tops, were alive with these birds. In early spring, on a warm, snappy morning, you could hear the drumming of the old cock birds in almost every direction. A very peculiar but pleasant sound, winding off like the rumbling of distant thunder.

When a boy of fourteen, my home was in the Green Mountain State, and with an open bird-gun, three feet long, of Revolutionary fame, I could easily bag eight or ten birds before dinner. But now, with riper years and experience, with my noble Gordon setter and breech-loading gun, I could not bag as many in two days.

The birds commence pairing in March and April; their nests are very rudely formed, but the most solitary places are chosen for incubation, and the hen lays from eight to twelve, and sometimes fourteen, eggs. The young leave the nest almost as soon as hatched, and follow their mother bird in search of food. One of the most wonderful sights I ever witnessed in any game bird, was when the mother and her brood had been suddenly surprised; her hasty, warning note sent every chick beneath a leaf, and by careful search I could not find nor scare from their safe retreat a single bird. I looked with perfect astonishment as she, with a peculiar, chucking sound, threw herself almost beneath my feet, hopping over my gun, and in a twinkling, as though hardly wounded, thus seeking to allure me away from the presence of the young birds. And through this shrewd, cunning and deceptive strategy, she outwits the crafty fox, the cunning weasel, the perfumed pole cat, and a host of other enemies. The majestic old cock bird does not assist the hen in making her nest, or caring for the young, neither does he half protect them against their destructive enemies, but prelates on some old log or stump on the sunny hillside, and pleases to ravine, he may be heard drumming away at a time. If the weather is clear, it can be heard a long distance off and the sound is pleasant and fascinating, especially to the farmers' boys. The cock resorts to the same spot, if not disturbed, during the whole breeding season, and adopts this poetical way of calling the hen into his august presence, and in fact

is the only sure method that he has of wooing his mate from her cold retreat during the period of incubation.

I have no objection to saying that the partridge, if not mated, can show a finer and larger number of young birds the first of September, than any other game bird with which I am acquainted, when we take into consideration their numerous and destructive enemies.

The male birds associate together in small bands until the autumn, when they mingle together indiscriminately, young and old, and ought to be thoroughly protected until this takes place.

Andon says that late in the autumn the partridge makes partial migration from the northwest to the southeast. I have no doubt of this, for in some seasons when the birds have been shot off, or have been scarce during the fall, we find on the approach of winter there is a goodly number again.

Audubon also denies the commonly received opinion that several of these birds can be shot from the same tree without disturbing the others, shooting the lowest ones first. In this opinion I shall beg leave to differ.

My friend, Mr. Powers, our late successful fish commissioner, once pointed out to me a tree from which he shot seven partridges, one after another, and said, jocosely, it was not a wonderfully good day for partridges, either, but the tree was an exceptionally good one. The flesh of the ruffed grouse is white, and far more juicy and delicate than the prairie hen, and when cooked by an old woodsman, or an expert in the culinary art, rivals the woodcock, some birds exceed in point of flavor. I prefer the woodcock, but either one will tickle the palate of a hungry sportsman, and is the most delicious repast ever set before king, prince, potentate, or even the Game and Fish League of New Hampshire.

Annihilate snares, and thoroughly protect this most beautiful and valuable of all our game birds, from January 1 to September 1 (October would be better), and in a few years they would be comparatively plenty again. The snare is the most destructive mode of capturing the ruffed grouse. More than one-half of the birds brought to the markets in our larger cities, are taken in this way. I was in the interior of Maine a few years ago, and went into the back room of a village store where there were some five hundred partridges nicely hung up awaiting transportation to Boston market. I carefully examined the birds, and did not find a shot mark on a single one. Maine has since passed a law which exempts the taking of 1 1/2 bushels of ruffed grouse, to protect them from an occasional wine-shooter and sportsman from other States, but really against the partridge hunters and boys within her own borders.

The next mode of capture, in order, is with the terrier or em, crossed with the spaniel, which, when well trained, will follow the scent of a partridge unerringly, and when the bird takes to wing, will rush through the woods as lively and give voice as freely as a thoroughbred cocker spaniel, following the bird until it takes to a tree, then the tone of voice changes from a yap, yap, yap, to a full-throated bark, which is kept up incessantly until his master approaches, when the bird falls an easy prey to the most ordinary skill. I have a friend in the country who has a dog of this description, who, with him and an old muzzle-loading gun, can capture more partridges in one day than any three of our crack shots, over the finest setters or pointers, and two hundred dollar breech-loading guns, in the same length of time. The best and most objectionable method I will mention, is by shooting on the wing. The true sportsman or a well-trained setter or pointer. The former I consider far preferable. He should be of ripe age, steady and stanch, with nose fine enough to find and point his bird from thirty to fifty feet, as it is almost impossible for a dog to approach nearer, even in the most favorable covers.

These wild birds are always on the wing, and at the least intimation of danger they are on the alert. Their start must be the nerve, quick the eye and unerring the call that brings this lightning-flying bird to bay when once on the wing. It would be a crack shot that could bring down five ruffed grouse in a single day, and would be spoken of in the best papers as something wonderful, and I would make my best bow to the sportsman who could do it, and invite him to join the Manchester Shooting Club.

The true sportsman, who seeks health and pleasure, will be satisfied to bag half a dozen grouse, or woodcock, in one day, and will return home rested and refreshed, with an appetite that will do justice to the trophies of his skill. There is something intensely exciting in this kind of sport which is indescribable. It thrills through every nerve and muscle, eye, the very soul itself, of the sportsman. Watch your noble dog as he stands stanch and steady, with his nose within thirty feet of every ruffed grouse, with nostrils dilatating at every nerve and muscle rigid, eager, flashing eyes, waiting for his master to give the word to flush the bird. The sportsman and his intelligent dog are now in perfect harmony, equally sharing the pleasure of the moment and anticipating the next. The picture is worthy the pencil of the finest artist and a place in the gallery of art. Now the word is given the dog to go on; he creeps cautiously and callie toward the bird, which takes to wing as quick as the lightning's flash, but is handed by a steady eye, and as the report of the breech-loader is reverberating through the air the fluttering of the grouse is heard in the thicket close by. The dog, which is now at charge, is ordered to seek the dead bird, eagerly springing forward carefully picks it up and brings it to land without disturbing a single feather. This, gentlemen of the Game and Fish League, is true sport, such as only the true sportsman can fully appreciate and enjoy, and will not endanger the extermination of the beautiful ruffed grouse, the gamiest bird of the forest.

PHILADELPHIA—April 26.—Snipe shooting until the late storm, which our farmers call the yearly catbird storm, had been quite good at the Delaware and Maryland grounds south of Philadelphia. The birds had settled down and seemed contented, but since the blizzard they have become very restless and do not sit still, and in some places have entirely disappeared. Some sprigged ducks are still on the marshes, and we will doubtless have them with us until spring weather sets in warm, which this season will come suddenly.—Homo.

In an interview with Dr. Carver, published in the *Daily Palladium*, of New Haven, April 16, the champion marksman expresses his sentiment on pigeon shooting as follows: He said that he had noticed that there were many more birds in the air than he shot rather than the so-called city pigeons. For his part he did not like to shoot live pigeons out of humane sentiments, and he would advise that the cruel practice be discontinued. He said he had gladly tried the champion cup into the melting pot if it would break up the cruel system. It was as much of an exhibition of skill in shooting at a target as to shatter clay pigeons as it was to send quivering birds to their death.—Alec.

MISSOURI.—Norborne, Carroll County, April 23.—This is one of the best, if not the best, resorts for snipe and general wildfowl shooting in Northwestern Missouri. Game has not been plentiful this spring, but some of the local hunters have been averaging their five dozen snipe a day for the past three weeks. The biggest bag I have heard of was eleven dozen killed in one day by two guns. I have been trying some Kynoch perfect brass shells, and find them anything but perfect. They persistently miss fire, expand after a few shots, and when crimped are an unmitigated nuisance, as it takes five minutes to get them into the gun. I tried a hundred. Am off to California in a few days, where I hope to tackle some grizzlies, etc., next winter.—F. W. B.

BALTIMORE DUCKERS.—The Harewood Ducking Club, of Baltimore, Md., whose club grounds are at Harewood on the Gunpowder River, below the railroad bridge, numbers twelve members. The club score for the season from Oct. 16, 1882, to April 10, 1883, shows a total of 1,968 birds, divided as follows: 37 canvas-backs, 1,323 redheads, 134 blackheads, 88 widgones and baldpates, 309 coots, and 129 miscellaneous, including mallards, teal, crowsills, etc. One swan killed weighed eighteen pounds.

THE GRADY BILL was defeated.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absences from the office matters of importance are liable to delay.

—ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing grounds. Will not our correspondents favor us with notes of desirable points for angling excursions?

"Like Briny for whom the Fowler spreads his net,
And trazes them in with whistler and a stele:
Or fish when bayted hookes old Anglers set,
Which luten, brings them some unto their bale.
So that old Angler-for-mens-oules, some wymes
With sweetened baytes, and some with suble gnyms."
—Sir John Stradling, "Ditties Poems," (1625).

PIKE FISHING IN FOX RIVER.

IN a river of some breadth and unequal depth, even "fishers behind the net" score good luck sometimes. Though I am late with this sketch, several others having preceded me on the subject of wall-eyed pike in response to your invitation for contributions, yet I may have the good fortune to be admitted to your royally generous columns.

Fishermen are usually practical men, and I have noticed that the articles on this subject have not been of a theoretical or scientific character, but have had their birth in actual experience. The fish under discussion I have had the sport of catching and the pleasure of eating. The Fox River (Ill.) wall-eyed pike are as plentiful as black bass, and though not quite so gamy on the hook, they are, to my taste, no less sweet and luscious on the plate. I recall one morning in the summer of 1880 when three friends drove up to my house in Batavia, with the shout, "All aboard for South Elgin fishing grounds!" Being too fond of the sport to allow such an opportunity to pass by unimproved, I abandoned my projects for the day, jumped into my fishing regiments, seized my fly-hook and rod, and joined the merry company, who had so kindly reserved a seat for me in their carriage. The morning was beautiful and the drive of eleven miles up the river delightful. We stabled the horses at South Elgin about ten o'clock, and then tried for bass, first with the fly and then with the spoon, until noon, with poor success. Neither would lure them. After luncheon we took out our rods and casted into the river. With these for bait the fun commenced. One after another we landed them. This moment it was a bass and the next a pike—a genuine wall-eyed. Sometimes three or four would be taken in one spot in quick succession, several of the heaviest weighing four pounds each. It was easy to distinguish between the bite of a bass and that of a pike; the bass would take the bait quickly and move off rapidly, while the pike was more deliberate, and when we "struck" and the fish felt the hook, he would at first resist, and struggle with a violence equal to the bass, but tire out and yield sooner, seeming to lack the power of endurance that the bass possesses.

We enjoyed three hours of exquisite sport, and at four o'clock reeled up our lines and unjoined our rods with a feeling of reluctance, for the fish were still biting nicely. However, each of us had about as many as we could conveniently carry back to the village where the carriage was (we had fished a mile down stream), and drove a drove of eleven miles before us. It is hard, though, for a real lover of the sport to stop fishing while the fish seem unwilling that you should. But then any humane man, out of charity for the fish, and consideration for his fellow men who may fish after him, will stop when he has enough, and not stay to kill just for his own self-gratification.

—Apropos "Does the maskinogee leap?" Yes, I've seen 'em, no mistake!
H. H.

PATERSON, N. J., April 21, 1888.

WHAT A DAY BROUGHT FORTH.

IT did seem to my impatient spirit that spring would never come. I had looked over my tackle carefully, found my faithful rod all right, packed my fly-hook, reel and ball-box carefully in my reel, had my old cod looked over, and was in every sense ready for the first of April and its attendant trout-frying. But imagine my disappointment when that day opened a veritable "All Fools' Day"—sour and wet, with patches of snow visible on the neighboring hills-tops, telling of snow water in the streams and general bleakness. So what could I do but nurse my impatience and wait for better weather. In a few days it came, and two or three pleasant days made me resolve that "Providence and the weather permitting," the morning of April 10 I would find me working of the accumulated biliousness of the winter, and trying, at least, to infuse that happiest time of all the year to me—the trout season.

Thanks to our new baby, who, like others of his kind, is an early riser, I was up betimes on the morning in question,

and could have shouted like a boy when I looked out upon the breaking of a fair day as one could wish to see. The rosy fingers of the dawn were mellowing the east, and the birds were singing in that joyful strain that ought to soften the heart of the most confirmed misanthrope. Everything pointed to an auspicious time, and, swallowing a hearty breakfast, I was soon climbing the mountains to the east of the town.

When the six o'clock whistle sounded, I was eight hundred feet above the plain, and, pausing for breath, took in the beautiful scene below me, than which no lover was ever vouchsafed to mortal eyes. I will not attempt to describe it, that valley stretching away toward the Genesee, dotted with villages, hamlets and sinuous water courses. But as I stood on that lofty summit all aglow with my unworldly exercise, the soft sun brightening my face, I was happy and thankful to a kind Providence for the privilege accorded me of living in so beautiful a world, and having health and inclination to enjoy its beauties.

While resting, I was attracted by a rustling in the leaves over the fence in an adjoining wood lot. Peering through the fells I saw two large raccoons on the ground rooting like hogs for last year's acorns. So silent were they upon their foraging that I at once made up my mind they were just out from my window, and although a bestial creature lay in my hip pocket, I was content to walk toward them in peace and watch their motions. Yet within about twenty-five feet, I heaved a small rock in their midst, and watched them scuttle away on their plantigrades, only to stop within easy gunshot and gaze at me wonderingly.

Leaving the "coons" to themselves, I took a brisk gait, and in half an hour was beside a stream that for many years has yielded sport to fishers in this county. The rippling brook, beset by busy fishermen, straggling feebly through the alder and sumach to hold its own, and keeping up nobly, despite its manifold harassments.

With trembling fingers I adjusted my tackle and, with a good fat worm for bait (don't talk to me of flies in April), made my first cast and drew a blank. Moving down the stream I found more or less level overhanging the water, and after repeated casts no results I came to the conclusion that I was too early in the season, and, wasting no time in regrets, started for the main stream. Stopping at the house of a farmer friend, through whose lands the stream ran, and who kindly allows me the privilege of fishing, I received the cheering intelligence that the water was very high, and to fish would be folly. Nevertheless, I started for the bank-full creek, and was soon busy casting here and there, but nothing rewarded my efforts. All the old holes I knew so well were totally obscured by the rushing torrent.

Arriving at an abrupt turn in the stream, where ordinarily the best pool for trout was located, I mechanically made my cast, thinking meanwhile of the sport I had enjoyed at the same place in times past, when suddenly came that delightful shock that no fish but the speckled trout can send tingling through one's nerves. Down below the supple-wooded, and in another moment an eight-inch lay on the bank, with me as the only fisher in the visible "first trout of the season." I admired the beauties of my prize a moment, then consigned him to my basket.

Encouraged by my success, I went to work with renewed vigor, and by dint of careful angling had by noon ten beauties, the largest fully nine inches in length. Thinking this would do for the first time, I reeled up and started on my four-mile walk as happy as though my success had been pronounced in the case of our first and only delightful lay-out! Wasn't I strengthened in body and mind by this communion with nature? Didn't I have trout enough for a nice breakfast for the little family? And, best of all, hadn't I got rid of that consuming trout fever that had been so persistently eluding me for a month, and all in a legitimate way, too? Yes, indeed. Now I could go about my daily duties, for a time at least, without being harassed by visions of angling that could not be realized.

The time is coming when trout fishermen must learn to be content with small baskets and large enjoyments. The success with rod and reel must be made secondary to the delights growing out of the outing. The guild must let "books in the running brooks" supply the place of trout. Then, and not till then, will the full delights of angling be ours to enjoy, and I have written the above little sketch of a day beside some of those waters to which I will not for non-augore's sake fish where trout are scarce.
H. W. D. L.

SHAD.

WE have several times expressed a personal preference for the shad as a table fish above any fish that we know. This, of course, is to be modified by certain conditions, as: the fish must be a large one of six pounds or over, fresh run, and properly cooked. A small shad is always dry and flavorless. The following poem by George Alfred Townsend (Gath), written from New York to the Cincinnati Enquirer, we think worth repeating:

"Shad are now caught here. In an old country shad would come in with a fete day. The world has not their equal for fineness, indescribable frothiness like a watercress, and delicacy, yet with satisfying potency. One shad is the measure of the representative family. The father's partiality is shown to the shad in the home. From birth to bones the shad's epic is like a silver spirit—less, less, translucent, unresisting, like the passage of the moon through the rivers and the sea. Migratory, but with childhood memories of locality; fruitful religiously, and even in the dream of young children and large gentle families, they seem like the spring laubs of the water, grazing the infinite fields of sheen. What dangers they pass through, going and returning, the water-cress in the time of Terod never had. Provided with nothing to make haste with, with tiny teeth and miniature fins, they course the ocean like the silver galleons of old days, beset by pirates but protected by the saints. Although the royal guest at feasts and poor men's tables, they are, like all enduring utility, peasant-born. The martyred menhaden is their cousin; the herring is their step-brother. To see them caught is like seeing angels fall—so peacefully, so fashioning, and in the butcher's shambles they are like children, not to be struck by the light of skies. This is my only poem on spring this year."

With four feet of snow at Connecticut Lake, and the Connecticut River being frozen by this lake, the water is cold and slow in coming. In conversation with a prominent dealer, who handles about 50,000 each year, he says the shad increase in size every year. In 1852 they were very small, and decreased in size for a few years, and for a

time the dealers began to think that they were going out the little end of the horn. They catch many which weigh seven pounds, an occasional "barren" one weighing ten to twelve pounds. When the shad get up to Holyoke, Mass., considerable fun for the fly-angler is expected. They take the fly, a special one, quite readily. With 200 feet of line and a six pound shad, you can get one and get it in "boy's play" to land your fish; the water being very soft and many boulders in it, the chances rather favor the fish. "Whops," or alive, are cheap, selling for about ten cents per dozen; they are used for dressing for land when they are much cheaper.
ERIC FRICK.

HARTFORD, Conn., April 28.

THE SUNDAY FISHING LAW.

Editor Forest and Stream.

I desire, as one of the many, to enter my most earnest protest against the recent act of the Legislature, which emphasizes and attempts to galvanize into life the long-since dead-letter-law making it a crime to go fishing on Sunday. I consider such act to be pernicious in its effects and reprehensible in its character, and I very much question whether any action of the Legislature for many years could be more so.

While it must always be conceded that religion and the keeping of the Sabbath (a part of religion) is entitled to the utmost love and veneration, it should be likewise observed that nothing can be more hurtful to both than even the appearance of hypocrisy in such matters. It would be difficult to find any amusement, pleasure, or recreation more innocent and harmless in its effects than fishing. Thousands are infatuated with the rest, absence of care, solitude, peace, and excitement of hope and fear that accompany it. They leave it with regret in the fall and look forward to its coming in the spring. Many of our ablest, most prominent and best men, including many of the clergy, whose names might be mentioned, have become stern votaries of its pleasures and influences, and have spoken in the highest and most eloquent terms of its healthful and beneficial tendencies upon body and mind, as the result of the open air exercise, and the sweet rest, and the noble thoughts and reflection. It would be pedantic to cite them.

If any pleasure or pastime is permissible on Sunday, it seems to me this should be. It has nothing akin to "work" or "labor." It is "rest" in its clearest sense, carrying with it full opportunity for the admiration of nature and deep reflection upon the goodness of the Author. It affords an escape for one day in seven from the noise, haste and life of the world, especially in cities, and prevents temptations to other pleasures of more questionable nature. It with that determined zeal which seems to be chronic with the enthusiastic fanatic to do what does not belong to him to do, and which produces effects directly the opposite of what he claims, a Legislature solemnly, at this day, enacts that it shall be a crime to indulge in this recreation on Sunday.

The motive for this legislation is somewhat flimsy. It cannot be the question, "What are men to do on Sunday if that is based on voluntary action, not compulsory; besides, why permit public excursions, open gardens, Sunday excursions, boating, and a host of other matters, each one of which is clearly less innocent than fishing? How come it that cars are run, engines worked, boat-houses kept actively employed, and a host of other activities allowed, on the same platform as week days, in pointed defiance of Exodus xvi, which says, "Work not, and labor of man, words and cattle." Will any man have the effrontery to call these works of necessity or charity, as contradistinguished from fishing? Certainly none but the bigot, and the characters of whom Mazzetta speaks as motivated in their opposition to bull-hailing, not by the pain to the bull, but as antagonistic to the pleasure of the spectators.

Let these men who talk about "moral grounds" honestly answer the question, "What are men to do on Sunday who toil from early morn to dark during the entire week, compelled to do so for wives and children? To whom Sunday is the bright spot of their existence. For them it was designed; to give them a right to be protected in the enjoyment of it, against the oppression of the wealthy and powerful, who, but for the high mandate, would give them no rest or recreation. Are they to follow the footsteps of these rich Sabatarians who have six days of virtual leisure? This is the logic of it."

Such laws are evil in their effects. They engender a hatred to their authors and a determination to despise and defy a religion so oppressive. Well may a legislator announce himself as "an old fogey" advocating such a law based on the principles of that class of Puritans who came to this country because they were persecuted for being religious, and whose descendants are now attempting to compel others to adopt their crude, severe notions. Such laws never have been and never can be, wholly enforced. The multitude will not obey them. The few who are reached look upon the thing as despotic, and detest the despot. No country has force sufficient to carry them out, and therefore they become mere disgraceful, as confessed weakness.

As for their effects on the subject, an anecdote is not out of place. During the Scotch rebellion a woman applied at one of the stations to obtain forage for her cow. She was presented with an ironclad oath of allegiance, and was refused because she would not take it. "Well," said she, "if you think to crush the rebellion by starving my poor old cow, go ahead. When that dies, I'll fight you till I die of starvation myself." So we say, if you can make religion by taking away the happiness of the poor, go ahead. Their self-solace of recreation is a necessity and charity to them. They cannot and will not follow the train of mournful, long-faced, pharisaical teachers, to whom many innocent pleasures are sins and laughter and bright smiles offensive; who revel in self-castigation, sackcloth and ashes, and come threatening with their (!!!) influence those who are otherwise unwilling to bow to their notions of what the true design of the Sabbath was.

No one will dispute that necessity and charity are exceptions to the Mosaic law. The courts have so decided. In one of the cases of prominence the judge distinctly says: "The object of the law is not the enforcement of the conscience, but the protection of those who desire and are entitled to the day." "Is this only the rich? 'It is a law of nature,' says the judge, 'that one day in seven should be observed as a day of relaxation and refreshment, if not for public worship. We cannot see a necessity and charity to them. They cannot and will not follow the train of mournful, long-faced, pharisaical teachers, to whom many innocent pleasures are sins and laughter and bright smiles offensive; who revel in self-castigation, sackcloth and ashes, and come threatening with their (!!!) influence those who are otherwise unwilling to bow to their notions of what the true design of the Sabbath was."

No one will dispute that necessity and charity are exceptions to the Mosaic law. The courts have so decided. In one of the cases of prominence the judge distinctly says: "The object of the law is not the enforcement of the conscience, but the protection of those who desire and are entitled to the day." "Is this only the rich? 'It is a law of nature,' says the judge, 'that one day in seven should be observed as a day of relaxation and refreshment, if not for public worship. We cannot see a necessity and charity to them. They cannot and will not follow the train of mournful, long-faced, pharisaical teachers, to whom many innocent pleasures are sins and laughter and bright smiles offensive; who revel in self-castigation, sackcloth and ashes, and come threatening with their (!!!) influence those who are otherwise unwilling to bow to their notions of what the true design of the Sabbath was."

Religion and oppression, forbidden by the constitution of this country.

The Legislature has the power—that they should properly have the power—to regulate the Sabbath, can hardly be gainsaid. But that is a regulation to prevent a fisherman compelling a person who don't like it to go fishing, or in other words, preventing any person improperly interfering with another's peaceable observance of the day. It is a power which should be exerted, keeping in view the beneficent object of the Creator to distinguish Sunday from the other days of the week; and the feller, who needs it, may have recreation at any other time, when he should not be forced by the oppressor, who does not need the recreation, to do any manner of work, neither he, nor his man servant nor his maid servant, nor his cattle, nor the stranger within his gates.

The Sunday divine law is to check legislators themselves, and prevent them from oppressing the poorer classes and taking from them the "recreation and refreshment" they are entitled to, and any interference with them and their innocent enjoyment is a violation of that higher law, and should be so regarded. OMEG, New York.

BLACK BASS IN NEW HAMPSHIRE.

Read before the New Hampshire Fish and Game League at its Hon. Officers' Meeting.

THIS game fish, *Micropterus salmoides*, or as classed by Dr. Henshall, *Micropterus dolomieu*, the small-mouthed bass, now so well known to every fisherman in Central and Southern New Hampshire, was a stranger to our waters but a few years ago, and is to us the substantial result of the labors of the fish commission, and that board of gentlemen will pardon me if I say their introduction is the only practical result in which the fisherman has shared the benefit. To be sure we have had demonstrated to us that the salmon may ascend our rivers through the several winding fishways, and being relieved of the obstructions which exist in the sea, but he would be an erratic fisherman who would visit our streams in the almost forlorn hope of capturing a specimen of this excellent fish; while in nearly all of our streams and lakes he may well expect to meet with success in bass fishing.

Bass were first introduced by the fish commissioners to our waters, from Lake Champlain in 1848, James Massabie, Silvanus, Penacook and Fitch, and in 1870, Wilson's and Pellet's, and they were stocked in 1870 and 71 waters in Meredith, Canada, West, Concord, Dover, Hillsboro, Mansville, Hillsborough, Warner, Sutton, New London, Andover, Loudon, Croydon and Concord were supplied. Previous to that time I learn that they had been placed, by private enterprise, in ponds near Wolfeborough as early as 1844 or '65, and about the same time in Milton Three Ponds in Milton. Since 1871 about eighty waters have been stocked by the commissioners, including Black and Contoocook rivers, until now every stream of considerable size, south of Grafton county, is well stocked by the fish raising out from ponds and lakes. All this has been accomplished without the aid of artificial hatching. Indeed, as Seth Green, that veteran authority on fishing and fish, well says: "Their natural increase is so great and their growth so rapid that it is better to be an object to fish-hunters to attempt their artificial propagation."

That the wonderful increase and prosperity of this game fish should be a cause of congratulation to every true sportsman would be expected, and that every lover of fishing should rejoice at the result, we would well believe; but, strange to say, the grumbling and croaking of some, either from malice or ignorance, have raised a cry against the bass, and prejudiced many against the fish that should be its warmest adherents and friends. I have tried to analyze the reasons for this cry, and can only reach one conclusion. It is an absurd, silly, and unwarrantable cry.

The detractors of the fish are unable to catch them, for no one who has ever felt the rush of the bass, listened to the click of the reel and hissing line, seen the gleam of the fish as back and forth he rushes to escape from the cruel steel, watched him as he leaves the water with a mighty bound and with bristling fins shakes his open jaws to relieve them of the hook, and thus in ever-varying devices fights long and hard against the fate, that at last weak and exhausted, he rests in the landing net, could ever join the ranks of those who mourn the introduction of this fish, that by his peculiar fitness for our waters must be many years be acknowledged the game fish "par excellence" of America. The time allowed to me is too limited to be occupied in a criticism of those who say "Bass won't bite," and fear that chubs, suckers, horn-ponds, pickerel and flat sides will be exterminated by them, except to say that by a careful study of the bass and the use of suitable bass tackle, they are enabled to see their mistake, they will then be as strong adherents to the right as they are now opponents. The habits of the bass should be studied well by the fisherman. Leaving their winter quarters in deep water, about a month or six weeks before spawning, they can then be found in shallow parts of the lake or pond in schools of large numbers, but soon afterward pair off and prepare for breeding. The spawning season in this State is from the first of May, according to the lateness of the season, the spots varying in their nests being a gravelly or sandy bottom or rocky ledge in from three to six feet of water. These beds or nests are saucer-like depressions, usually about twice the length of the parent fish, and formed by the bass by fanning and scouring from the bottom all refuse and vegetable matter with the fins and tail. Here the female deposits her eggs, which eggs are hatched in about eight to twelve days, the young when hatched being nearly perfectly formed and about one-half inch in length.

The instinct of the bass amounts almost to parental affection in the care of its nest, and later in the defense of its young. When frightened from the bed they at once return and resent the presence of anything thrown upon it. Taking advantage of this characteristic of the bass, some persons that pot-hunters take them in large numbers by dropping the bait upon the bed and keeping it there till the fish, as if in sheer desperation, swallows it to get rid of its obnoxious presence upon its hatching-ground. An instance of this kind of fishing came to my knowledge last season, where a young man caught seventy pounds of fine fish in one afternoon, in Wakawan Lake, in Meredith.

Leaving the spawning beds the young grow very rapidly, a year old measure from four to five inches, and at two years weighing about a pound, and gaining about a pound per year until they reach their maximum weight. Six to eight pounds are said to be the limit of their growth,

although I am inclined to think that under the most favorable circumstances they will grow still larger, as in a large, deep duck pond or lake well supplied with food.

In the winter when bass are doubtless hibernating, burying themselves in the mud, crevices, or rocks, under weeds or stunted logs in deep water, as you have all observed that with the increasing cold they work into deeper water, and upon the arrival of winter are seldom caught.

Knowing this much of the growth, increase and habits of the fish, it is each man's own fault if he fails of bass fishing. Select some gravelly or rocky point or ledge, which runs out boldly into deep water, get a boiler and some shelving rocks and a few logs, and cross your sport with a few places of large bass; get your boat into position quietly, making no more disturbance than is absolutely necessary in anchoring and fishing, with face to the sun to avoid as much as possible the shadows of the rod upon the water, and then keep quiet, devote your whole attention to fishing. I believe quiet and careful fishing to be important if you would be successful.

One would think the man who started out for trout accompanied by a band of music to escort him around the lake or down the stream, yet many good trout fishermen fish for bass as though the fish were both blind and incapable of hearing. While less timid than the trout, which darts away at the sight or sound of a strange object, the bass is hardly less suspicious, and while standing his ground holdly, he seldom, if ever, is captured while his suspicions are aroused. For this reason his opponents, fishing for hours, perhaps, in plain view of the fish, sing and shouting the time away, which by so doing he is obstructing in, and willfully and foolishly coming into the boat, are heard on all sides, saying, "Bass ought to be cleaned out, they won't bite."

No reasonable man would expect a game fish to do so under these circumstances. That they are thus wary makes a breeze that will ripple the water almost a necessity, and one of the requisites of a good day for bass fishing.

One other word about the time to fish. Don't fish the next day after a severe cold storm, when the water has been disturbed and is cold and cheerless. Bass bite best when the water is warm. Select a day after three or four days of extreme heat, when there is a fine ripple on the lake, and you have the model day.

For bait the helgramite, frog, minnow, cricket, grasshopper, worms and shrimp can be used, but I have found them successful in the order named. The helgramite, a flattened and spindle-shaped worm, generally two or three inches long, has six legs and two pairs of antennae. The body is composed of rings, has a fringe that has the appearance of legs, with two hooks for a tail. They feed upon decayed wood and vegetation, and can be found under flat stones, snaken plank and other submerged objects in the shallow portions of a stream. They are a reliable bait, living a long time on the hook, and can be kept alive a long time in a box of damp, decayed wood. Frogs are easily obtained and they are a very desirable bait. The striped or grass frog is preferable, when the body is about an inch long. Hook them lightly through the skin of the back or through the body between the hind legs, so as not to injure them, and allow them the free use of the legs to swim about in the water. When rightly hooked, they will swim as readily as though not attached to the line, and make a very tempting and attractive bait. I have seen a bass rise for a frog swimming in this way, from a distance of thirty feet, as nearly as I can start at an attractive day.

When using the frog, or other large bait, be patient, and do not strike your fish too quickly. He will often start away with the bait and then stop in a manner that will lead you to believe he has dropped it, but on drawing up the line you will feel a succession of slight jerks; it so let him have it longer, for he lifts the bait crosswise or reversed in his mouth, keeping your thumb on the reel so as to feel his every motion, and when he starts away after this short pause, then strike and you have him well hooked. Then, of all times, the angler must keep cool. Don't hurry your fish; the longer he plays the more sport you have. Give him only as much line as he takes in his rushes and recover it as quickly as possible, being sure to keep the line taut at all times unless, after one of his magnificent bounds from the water, you lower your tip as he falls to recover the strain again as soon as he is in the water.

When he is thoroughly exhausted, and not before, take in your fish, being sure to bleed him as soon as he is in the boat; then if you keep him in the shade, when dressed and on your table you have a fish of which you may well be proud. A short, light rod is the better bass rod, a nine-foot lancewood rod with ash butt being the best I ever used for bait fishing. A rod of this length can be made light and easy to handle, and yet as strong as desired. It is elastic, yet firm, and is well adapted to a fish with more ease and security than when longer and, as a consequence, heavier. Always have a good working reel with about a hundred feet of line and a good supply of leaders and hooks.

Of the great variety of hooks I have found the Smeek hook the most desirable, although the sprat and the O'Shaughnessy hook will always be found reliable. I will not discuss the fish as a fly-fishing fish, since I have never learned that in fishing in this way any different rules should be laid down than those that govern fly-fishing for trout or salmon, and for the additional reason that I have come to believe that the larger fish are more likely to be captured by bait-fishing.

When well equipped, treating the fish as an intelligent inhabitant of the water, and a prize well worthy of capture, and his own captive you need make the best of it, and all your earnings as a sportsman, one can find no better or more desirable sport than angling for this fish, that pond for pond is the gamiest fish in America. He is eminently an American fish, with habits and characteristics peculiarly his own. With a hardiness far surpassing the trout, combined with all his dash and vigor, the strength and leap of a salmon, to which he has joined a system of fighting known to no other fish, the bass, I believe, is entitled to take the place of trout loved out, that are very becoming, less by force of circumstances, occasioned by climatic changes, the gradual drying up of trout streams and the increasing number of fishermen, that from all parts of the Union crowd into our State during the summer season.

In what I have written I have not intended to eulogize the bass, but simply to give him the credit that I believe belongs to him as an excellent game fish, and one that is destined to be the fish of our state, and if by this short essay some one who is now his opponent should be led to fish more understandingly, and thus meet with success, I shall be satisfied.

LAKE SUPERIOR FISHING GROUNDS.

NOTICE that "Angler," in a recent number, inquires about trout fishing in the vicinity of Duluth, in case time does not permit of his going to the Nipigon. If he will leave the boat at Bayfield, Wisconsin, he will be central to some good fishing grounds; both trout and bass. About one day's drive from Bayfield will bring him to the Brule of Woods River, said to be one of the best trout streams in Wisconsin, and which is visited by St. Louis anglers every season. The little river has fine pools, which afford the dy-caster a fine field to try his skill.

The country is wild, and a camp outfit will be in order; also a boat or material to make a raft. Bass fishing is not good, but the fish are plenty, and fine ones, too. On the road will be passed Pike Lake, one of the finest lakes in the Northwest for bass fishing. I have fished in many of the Michigan lakes, but this, in the language of our teamster, "lays over" them all for bass. There are plenty of deer, and if the angler is possessed of a shotgun and ordinary skill he can have some grand sport jack-rabbit shooting.

If after landing at Bayfield he prefers easier work he can take the tri-weekly tugboat to Isle Royal, up the north shore, and will be assured of some fine sport and the largest speckled trout in North America, not excepting the Nipigon beauties; or he may take a sailing yacht and skirt along among the Wisconsin lakes, and return to Wisconsin Bay, forty miles, with fine fly-fishing for large trout in the deep, shady holes along shore until he reaches the mouth of the Brule (Iron-Isle) mentioned, and which he may then ascend with his small boat for river fishing. Or if the angler would new fields explore, he can take his outfit aboard the train of the new railroad just completed to Bayfield within the last eight months and go back in the Wisconsin woods where he will find most of the little streams stocked with more or less speckled trout. There are good hotels in Bayfield, with fish and wabson every day. It is a high, dry, healthful location, with the best water and central to any amount of hunting and fishing grounds. At least I found it so last August. C. W. E.

BOWLING GREEN, APRIL 24, 1883.

TROUT FISHING.

I HAVE been fishing, and after getting on the much abused angler-worm from the cellar, where it has been carefully and patiently taken care of during the winter months, and setting rod and reel, I started for a favorite stream. Everything seemed in my favor, but my hopes were to be crushed. On coming to a favorable place where the brush was too thick to progress, I gathered up my big boots, stepped in and waded a short distance and made a cast. As my line and wadding worm went over a little fall, off went a nibble. With considerable "supposed" caution I made one step, and the entertainment began. Kercheck! Down went the supposed fisherman, and some of the contents of body and high kicking would have secured a large share with the man could they have been respected in the tumble. I had by a very nice movement stuck my rod in the opposite bank, and after gathering up myself and rod, I found the tip broken, not a very fine condition of things.

But to my "speckled beauties." On getting my line in hand I found that the fish was making things somewhat interesting. He must be a "whopper;" if he breaks away he would weigh two pounds sure. Now a dash under a rock, then under a log, now sinking. "Now you must come in and see your humbly servant. Oh! what a fine sucker!" Could my friends have seen my "pliz" they would have said I was about to visit a dentist. After going ashore and leaning against a stump I took a very careful inventory of dry goods, and found that wet goods were considerably ahead. My collar was the only thing dry about me. The music which issued from the base of that old stump was not "Finch" music by a long chalk. "No! but never gone, also my pet angler-worms, rod broken, wet to the skin, and somewhat lame from the contortions, what to do was an important theme. After mature thought and considerable exertion "Home, Sweet Home" came to my mind. Did I tell anybody? Not much.

A short time after I tried it again, and in endeavoring to eclipse all previous efforts in securing a larger creel of fish, I gathered up all the implements of warfare, including the "No. 13" and "No. 14" hooks, which were undoubtedly manufactured in the upper story of the factory, for they seemed to have an inclination to "ascend upward" on the slightest provocation. I will warrant them to get three falls out of five on any ordinary occasion. On reaching the bank of a very nice looking stream I made my maiden cast, which consisted in casting myself, with the aid of the No. 13 and a cly bank, into the raging water. Landing without undue exertion, I had a difficult piece of engineering and after the absorbing process was completed I made a break for the bank and at last stood on it. After getting drained I heard voices, and turning my moistened optics I saw some ever-prevalent "small boys" were with me. Small boy says: "Tell in, Mister, didn't yer?"

Fisherman: "How the dickens did you know I was fishing?"

Small boy: "O'mars seed you coming down the road, and shakin' it. Oh, boys, there is that city fellar again; now you go out and see he does not break his neck."

Fisherman: "Now you run home, little man, for there is liable to be an accident to some member of your family right away."

Small boy: "An't you the fellar they make so much fun of, and say you can't catch frogs nor nothing, and so."

Fisherman: "Get away, a far here, and busten, too."

Small boy: "I'll go home and get you to come down, for everybody says you fear down more faces and scare the fish more than a menagerie."

Fisherman: "Not another word," and away skips the future president.

Another very difficult cast and away goes the line. In passing over a stone something seizes the bait, and the reel is humming, until my line is all over, and I busten, too. A few feet more I do not stop the unknown, and I wonder what under the sun I have hooked, and I keep running down stream. Something has got to be done, or we shall be down to the Gulf Stream. Another twist, and had there been a young cot at the other end I could have stopped him just as well.

Ha, ha! he slows up a little; now for the work, for I must have considerable of it in an hour. As there has not as yet appeared considerable of it in an hour, I very carefully I begin to reel in, and another start down the stream follows. Not receiving any rations nor boat, it was imperative to have an understanding with the other end of my favorite line.

When you get in that deep water you and Pickle Pickle

AN ALL-AROUND ROD.—"Nessmuk" has defied the accepted tenets of the rod makers, and added a fly-typer where the rod makers thought it did not belong. He writes: "The rod is ready for pickerel, bass or trout. Of course, it is not a perfect fly-rod—no general rod can be. But it will take, first, pickerel, second, bass, third, catfish or haddock, fourth, trout, either with bait or fly. I take no stock in fly-casting tournaments. Don't care to throw more than twenty-five feet of line, with five foot leader. Usually much less. Have my own notions about flies and "casts." My favorite cast is fall-fly, large, well-cleaned red anglerworm, with bit of white pork for head. Two feet above, a red hackle, queen, or royal conclusion, according to water and above that by years' experience has proved to me that the best fly will take three-fourths of the trout. Red hackle is next best."—**NESSMUK.**

TENNESSEE NOTES.—The glorious and wise law-makers in our General Assembly repudiated one-half the debts, compounding with the defaulting State treasurer, licensed gambling at poker, seven-up and horse racing, and amended the very lenient fish laws so as to permit gigning, seining, trawling, etc., to be carried on at will. Fishing and hunting may be considered dead here for years to come, and our sportsmen will either have to seek recreation elsewhere or burn up their tackle and accoutrements, for they will never need them more in what, with rational protection, would be the finest place for game and fish on the American continent.—**J. D. II.**

SALMON IN OREGON.—Vanhooker Buttricks, April 18.—The salmon catch this far is reported as very light, \$1.10 being paid by the canneries for each fish. Four years ago fifty cents per fish was the price. Few if any salmon reach the Portland market. It was informed yesterday that there were 350 miles of seines stretched in the Columbia River every night except Sundays. Comment is unnecessary.—**T. E. W.**

Books.—Mr. Westwood has written an introduction to the "Secrets of Angling," by John Denny, which will accompany a reprint of that poem. Mr. W. Satchell will print it, as also a new edition of the same gentleman's "Chronicle of the Complete Angler." The Orange Judd Co. have republished the "Scientific Angler," by the late David Foster, with notes by W. C. Harris.

CARE OF WORMS.—Good, lively bait can be made in the following way: Wrap up some of the common earth worms in a piece of carpet or flannel cloth, put them in a box full of dirt, and leave them for two or three days. At the end of that time they will be a bright scarlet color, and when you open the cloth they will spring about one-half foot in the air.—**M. L.**

THE TARPUM AS FOOD.—A correspondent writes to know something of the edible qualities of the tarpum. We have never eaten it, and do not remember to have seen any allusion to its taste quality. It looks like a good, wholesome fish, and doubtless many persons have eaten it. Who can give us some information on the subject?

ROUTE TO THE NEPIGON.—Prince Arthur's Landing, Lake Superior, April 14, 1883.—In answer to "Angler," re "Route to Nepigon," in your last issue, come by way of Duluth and Prince Arthur's Landing, and take boat to Nepigon, Good fishing anywhere from month of river up stream.—**J. J. O'G.**

BLACK BASS IN THE POTOMAC.—Falling Waters on the Potomac River is said to be a prime ground for black bass. This point and all the way up to Williamsport, on the same stream, I am assured, can't be beat for large fish.—**Homo.**

The GRADY BILL was defeated.

Fishculture.

SALMON FOR THE DELAWARE AND HUDSON. LAST week the United States Fish Commission sent a carload of 25,000 salmon fry to the waters of the upper Delaware, and the shipment is to be followed by another of the same size. Prof. Baird intends to test the possibility of acclimating salmon in both the Delaware and the Hudson, and has sent some of the salmon from the Cold Spring Harbor hatchery in the head waters of the latter river in a few weeks. The fish are the Eastern salmon, *S. salar*, the eggs of which came from the salmon breeding works of the United States Fish Commission at Bucksport, Maine. It is well known that the rivers of Connecticut and the southern limit of the salmon at the discovery of the country, but it is possible that in the Hudson and the Delaware the difficulties in the way of the salmon were merely mechanical. The falls on these rivers presented a bar to their ascent to the streams above, which contains insect and crustacean life necessary to the growth of the fry, as well as suitable spawning grounds. By placing the young in the trout brooks in the Adirondack region they should find all the conditions requisite to their growth and descent the river to the sea at the proper time. There seems to be no good reason why the rivers named may not become salmon rivers in time, if the stocking is carried on for a few years. The experiment is comparatively inexpensive and is well worth trying. Should the fish survive and return, they will be captured in the lower portions of the rivers, for the obstructions above forbid their ascent to the brooks. We shall watch the trial with great interest, and hope that our people will realize the value of the fishery and return, they observe that show the presence of salmon in the rivers. Stray salmon have been taken in the Hudson as high as Troy, and a few years ago some four or five thousand fish were placed in the Delaware and several adults were afterward taken, showing that the temperature and chemical conditions of these rivers are not fatal to this fish.

"My election to the United States Senate has been a great satisfaction to me, of course," said Mr. Crane, of West Virginia, to some friends who were congratulating him recently; "and I, of course, am very grateful to my friends for it. But I tell you frankly, gentlemen, that neither it nor any of the steps I may take in my political career has given me so much genuine pleasure as the fact that my bound pup took the premium at the dog show the other night."

In the will of the late Richard O'Connor, Falls of Schuylkill, Pa., is a provision to the effect that \$10 a week be paid for the support of his dog Spot, the remainder of his estate being bequeathed to the German Catholic Society of his home.

The Kennel.

FIXTURES.

BENCH SHOWS.

May 8, 9, 10 and 11, 1883.—Westminster Kennel Club, Seventh Annual Bench Show, Madison Square Garden, New York City. Entries close April 23. Chas. Lincoln, Sup't.

FIELD TRIALS.

November 19, 1882.—Eastern Field Trials Club, Fifth Annual Trials, at High Point, N. C., started by close July 1, for the Members' Stake, Nov. 17, for the All-Aged Stake, Nov. 1. W. A. Coster, Secretary, Flatbush, Long Island, N. Y. December, 1882.—National Field Club, Fifth Annual Trials, at Grand Junction, Tenn. D. Bryson, Secretary, Memphis, Tenn.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

THE NEW YORK SHOW.

THERE are, including the puppies, 1,120 entries for the Westminster Bench Show next week. These entries are distributed as follows: 41 mastiffs, 49 St. Bernards, 5 bergs, 1 bundle, 8 Newfoundland, 20 greyhounds, 5 deerhounds, 113 pointers, 159 English setters, 50 black and tan setters, 97 Irish setters, 7 Chesapeake Bay dogs, 6 Irish water spaniels, 8 field spaniels, 45 cocker spaniels, 10 foxhounds, 10 beagles, 6 dachshunds, 71 collies, 23 bulldogs, 56 fox-terriers, 80 terriers of different breeds, 40 pugs, 6 King Charles spaniels, 2 Blueheims, 2 Japanese spaniels, 6 Italian greyhounds, 26 in miscellaneous classes. The judges, as already announced, are: For Irish sets, black and tan setters, John C. Higgins, Esq., Delaware City, Del. For English setters, pointers and foxhounds, Maj. J. M. Taylor, Lexington, Ky.

For spaniels and small non-sporting dogs, J. F. Kirk, Esq., Toronto, Canada. For mastiffs, St. Bernards, bergiunde, greyhounds, deerhounds, dachshunde, and other large non-sporting dogs, James Watson, Esq., New York City. For collies and beagles, Dr. J. W. Downey, New Market, Frederick county, Md.

FORM AND COLOR OF SETTERS.

Editor Forest and Stream: Col. Stuart Taylor condemns the setters and pointers exhibited in New York last year, because, with many other things, they were "not in the line." Now, I think, if in this he speaks in accordance with the highest standards, for which he professes such deference. "Stoneheuge" says the chest should be "deep rather than wide." Idstone says, "I dislike a wide chest—I never saw a fast dog with a wide chest." "The dogs that knock up and retire to hunt in bad weather are always square-built, wide-chested ones. Those with a deep chest, ragged ribs, and which are as narrow as a rail, are always ready to gallop and never trot, which is a sign of distress." At the first trial in the field ever held, the worst goner was the stoutest and sparest dog there * * * while Dandy, a ragged, narrow dog, hunted bravely in spite of his "weak appearance" upon which some of the bystanders insisted. It has the view expressed by these authorities been discarded?

Col. Taylor also says the dogs at the New York show of '82 were a "wretchedly colored lot." I wish he would be more specific in his criticism, and tell us just how their color was faulty. From the catalogue the 172 entries of English setters may be classified as follows:

- Black and white, blue belton, etc.....58
- Black and white, blue belton, with tan.....41
- Orange and white, red and white, etc.....29
- Lemon and white, lemon and black, etc.....12
- Liver, liver and white, liver and tan, etc.....12
- Black, black and tan.....3
- Color not given.....3

The colors Col. Taylor particularly objects to seem to be lemon and white and liver and white. There does not appear to have been any preponderance of either. By the way, speaking of liver color, it is a matter of fact that whenever the time when liver and white was not a recognized setter color, I think he is mistaken. He speaks of it as a color only for spaniels and pointers. But it is generally believed that the setter is a spaniel. A "setting-spaniel" was formerly called a **PICKER.**

BREEDING FOR SEX.

THAT there is a very general desire among breeders of domestic animals to possess the power of regulating the proportion of males to the sexes at will, I think, made evident by letters on the subject which appear from time to time in your Journal and others devoted to the interest of stock owners. In regard to poultry, one tells us that the more globular-shaped eggs will produce pullets, and that the more oblong cockers; while another says that if the eggs are looked through by a strong light, so as to show the position of the seminal clot, a whole clutch of hens may be secured by rejecting those eggs showing it in the center, and selecting those wherein it position is at one side. I presume we may brush aside both theories as purely fantastical.

In regard to dogs, we are constantly being reminded of the old, and I had thought exploded, theory, that the sex of the progeny is determined by the position of the male when the alliance takes place—that is that if the embrace is permitted during the early days of heat, the whelps will be mostly bitches; if about the middle of the period the sexes will be about equal, and if toward the end nearly all will be male pups.

In your American contemporary, FOREST AND STREAM of the 8th ult., a case is recorded of a litter by the well-known collie Marcus; the dam of the litter having visited him at the commencement of her heat, the result was nine puppies, all bitches but one.

I remember some months back seeing a letter in the Journal from the Rev. E. Spencer Tideman, recording a somewhat similar result. I think more than one instance with his Dandie Dimonts; and all of your readers must have had instances in support of the theory brought under their notice.

I must say I can place no faith in the theory dependent for support on comparatively isolated facts when I find that the results are opposed to the largest collection of facts at our disposal.

The swallow does not make a summer—and if I may digress for a moment, neither do I live for September, 1881, that number left my house, and beaten back by the gales, which readers will remember as exceptionally severe at that time, returned after being away just a month—returned to find their home occupied by the sparrows, who had filled it with hay and bits of string, and a piece of the latter getting cut, crawled around the leg of one swallow as he left after an inspection of the nest, he himself suspended for a short time, and so in perfect safety, with a few stragglers, he remained after a short fly round, disappeared, and I presume, that all, and to return to the dog question, it appears to me that to establish the theory, none but males in the one case, and none

but females in the other case, should be produced; or otherwise the theorists have contradictory fact to deal with which they will find hard to explain.

But if it would be considered a very convenient thing if we could arrange the comparative number of the sexes at will; but I fear the theorists have in this, as we are all apt to do; in so many things, allowed the wish to be father to the thought.

Dairy farmers would take very good care to secure good breeding seasons, if they had it in their power to secure all they calves; and dog breeders, who sell, would take care to have mostly dogs, and only enough bitches to secure what they consider a sufficient multiplication of their particular variety.

Fortunately, as I think, fanciers can do nothing of the kind any more than they can produce colors at will by exposing to the vision of dogs excited by the sexual passion, such as they desire the progeny of the union to exhibit; for, however incredible that theory may be, I suppose it has, in most intelligent inroads, melted like snow before the sun of a clearer knowledge and a higher appreciation of the wonders of creation, which is as natural and appropriate result.

To come to collated and registered facts as to the relative numbers of the sexes in dogs, there is one point which, in considering the figures I propose submitting, should not be lost sight of, although I can not pretend to say it has any effect or influence upon the result. The fact, therefore, that in the system of dog breeding that prevails, the dog is compulsorily more polygamous than he would be in a state of nature, or perhaps it would be more correct to say that procreation in the case of dogs comes from whelps from which are restricted to a comparatively speaking few that are of necessity polygamous; while the generative impulses of others are compulsively repressed. Darwin gives the births of 6,518 greyhounds consisting of 4,407 males and 2,111 females; that is in the proportion of 110 males to 100 females.

I have lately counted up the number of puppies of all breeds (but, practically, greyhounds, foxhounds, pointers, beagles and some other breeds are excluded) to be 3,491, consisting of 1,947 males and 1,544 females, or a fraction over 4 per cent. excess of males.

What the proportion might be in a state of nature or even under domestication had unrestricted intercourse between the sexes, I have no means of knowing. I do not think it is a reason for supposing that the proportion would be materially altered. What we want is a far larger body of facts, and I wish now to appeal to you, sir, to give us the result of the registration of puppies in your most valuable record of these interesting events. If I remember rightly, your registry has been in existence some three years, and the figures accumulated must be great. No doubt in your registry, and that of your contemporary, there will be some duplicates, but not, I should think, to the extent to make it necessary with conclusions to be drawn from the facts recorded.

I think, too, it would also be of great benefit if we could have statistics, from the heads of your several departments, of the number of horses, cattle, sheep, swine, rabbits, cage-birds and poultry, as these embrace all the monogamous and polygamous.

I should be glad to see the opinions and the experience of breeders expressed in your columns on this very interesting and important subject, so that by the free interchange of thought and of acquired knowledge we may each add to the store of the other.—**Hugh Dalziel in Live Stock Journal.**

NEW YORK FIRE DOGS.

[CONCLUDED FROM PAGE 252.]

MAKE J. MCNAMARA, driver of Engine No. 23, at 235 West 41st Street, over a mile high, a carriage and Nellie. She is about four years old. She does not run to fires, but has been taught to trip the lever which connects with the machinery that unlatches the horses and throws open the doors of the engine house and catches a rubber ring in the little dog jumps up and catches a rubber ring in the neck of the instant her weight pulls it down the machinery is set in motion. She then darts behind the two horses in their stalls, which are situated on each side of the engine, barks at them until they go to the pole and then runs back into the carriage yard behind and drives the horse to the hosecar. When the reporter called at the engine house Foreman David Conner permitted Nellie to "trip the horses" a number of times. All six horses are well trained, especially the off-lying horse. In five seconds' time Nellie would pull down the lever, and the horses and retire to a place of safety on the stairs. The horses were hitched to the pole and the men were at their posts in exactly three seconds.

One of the most famous dogs is Jack, a three-year-old coach dog, who was born and brought up in the city. He is wonderfully intelligent. Jack belongs to Hook and Ladder Company No. 6, at No. 71 East Canal street, of which John H. Kehoe is foreman. Jack goes out with the fire. He is first to hear the buzz of the telegraph. If up on the third floor when the call comes he is the first member of the company down. He never dresses, but goes to the fire as he is. Jack always follows the fire engine on the first flight of stairs, and is an ordinary Christian, but in his anxiety to get to the horses he will roll down the second flight. He drives the horses to the pole and runs ahead of them, barking. Jack is known to thousands of persons, and his barking informs them that the fire is near. He has been seen to jump up and down in a game better than a man could. Jack is always first in the building. At night he looks for the fireman's light, and often when the smoke is thick and he cannot see the men know they are about by hearing him sneeze. If there is a fire and the apparatus does not go out Jack sits down and howls in his disappointment and cries as if his heart was broken. Sometimes the horses step on him, but he gets on three legs while the fire out, but often when he feels home he is laid up for the day. He has been seen to jump up and down in a fire escape and walk up and down a peaked roof that was at an angle of forty-five degrees. He will go anywhere the men do. At home he is fastidious, disliking the smell of the smoke which is high above him. He has been seen to jump up and down Jack goes across the street, where he sets up a howling until the clearing is over. But at fires he does not mind the densest smoke or the heaviest shower baths. About a year ago Jack was in a fire in Cold Spring Harbor, where he was on the fifth story down to the floor beneath, but he was not injured. A short time after this there was a fire at the corner of Albany and West streets. The water was about five miles deep in the office. Jack saw a large anchor in the room, which he proceeded to accept. The smoke became so dense the men were driven out, but Jack refused to leave and the men had to go back and carry him out. In domestic life Jack is looked upon as a great success. He frequently accompanies the family to dinner, and sits at the table, and is so well seated at the table, and it is said his manners are refined. So socially among his own kindred he is a great favorite, and if all the stories told of him be true, he is "one of the boys" and the first of his kind. He was first reared in the fire company and the first to startle the men. Shown at the fire, he is a barber shop a block off they always hear Jack's warning bark in time to jump out of the chair and to catch the apparatus as it runs out.

One remarkable dog that have died in the service, Bill, of Engine No. 17, is remembered by the whole force. He was a large black mouzel, and originally belonged to State Senator Bauden when he kept a baker's shop in Ludlow streets between Broome and Delancey streets. One of the boys of the Bill away from the shop, and he was finally manialed with the company until 1880, when he died. He was then buried with much ceremony in the yard back of the

headquarters of the Fourth battalion in Clinton street. When Bill was initiated into the service he became an enthusiastic fire lad. His owner mourned his loss, and on one occasion sought him at the engine house and carried him back to the bakery. There he remained for several weeks, but one day fate happened, as the engine was being started, something big, the excitement was too much for Bill's nerves. He made a preliminary circuit around the baker's shop and plunged, *à la Bateau*, through the large glass window, the crash of glass was terrific, and the damage done very great. The Senator was much increased. He ran out on the pavement, shaking his fist at the dog, shouting "Go it, you black, black fire dog, and don't you ever come back again!"

About two years after Bill joined the Fire Department he met with a serious accident. He ran out on the second story window of one of the houses on Cherry and Rutgers streets. The last drove the line down and poor Bill fell from the scuttle ladder to the ground floor. Both of his hind legs were broken. They were set in splints and he again was able to get about. He broke out in the vicinity way much for the plucky dog. He slipped to it on his splints and then managed to crawl home, but he was laid up for many months afterward. He would have nothing to do with any fireman save those of his own company. He was greatly interested in the fire department and found Bill at a fire and sent him home. He would ascend a ladder to the first floor and work him through the building to the roof. Nothing could hinder him from going to a fire. He was his essential as the engine was started. He was on the second story window of one of the houses on Cherry and Rutgers streets to join the engine as it went by. During five years of Bill's stay in the service he had a small spaniel as a companion. This dog was named Major, after Chief Bates, when battalion chiefs were ranked as majors. The dog was killed by a bullet after Major and backed him in all his fights. Major was run over and killed in Avenue C by Engine No. 11 when going to a fire.

Met was a mongrel with a slash of collie dog in his composition. He was the old timer of the force. He was a remarkably intelligent dog, and possessed a large slice of originality. He joined Engine No. 25 in 1867, and was called Met, an abbreviation for Metropolitan, after the name of the department. He died in 1879, and was buried in the cemetery of Engine No. 6 at the Sixth Ward Hotel fire 1888. Met was still and handsomely mounted in a glass case, and is now in the possession of Jim Ballantine, of Engine No. 30. One of Met's peculiarities was a decided antipathy to all policemen. He would endeavor to clean his teeth on the leg of every "cop" that came in his way. This was so well known that the Broadway squad would give the street a wide berth when they heard Engine No. 30 and Met on the way. Although he would be so sure of himself, he was never known to attempt to molest a woman or a child. His special delight was to carry off as trophies the coat tails of guardians of the peace. In the days of this pioneer fire dog it was the custom to carry the dogs of the department to the old and old Post-office towers. Although the bells in Trinity and St. Paul's were very similar in sound, Met was never known to have mistaken them once. But, although he had the power to distinguish between the bell sounds for the fire world and in the next, a neglected education, he was never known to be out of the stables. He was a brave, fearless dog, even to foolhardiness. He created a great sensation when Gunter & Son's fire store was on fire, the same night that St. Patrick's Cathedral was burned. Met was on duty at the fire, and, along the burning corner of the roof, much to the anxiety of the guests of the St. Nicholas Hotel and the thousands of persons who crowded Broadway. They expressed so much alarm lest he would be killed, that he was obliged to carry him down.

Among other dogs in the Fire Department is Major, a large, seventy-pound coach dog, of Engine House No. 13, in North William street. "Major" is too fat to run to fires now, and he is confined from the department. He is a dog of the free-lunch route, and at Tom Deady's bidding, going to a neighboring bakery for rolls. Nellie Gray is the name of a half pointer and half coach dog at Truck House No. 1. She guards the place, and is very particular. Her owner has a cat some time ago that would jump upon the driver's seat when the gang somoned and go to all the fires. Chief Reeves, at Engine No. 30, in Spring street, near Varick, owns a remarkably intelligent black setter. And there is a fire dog at Engine House No. 4, in West 12th street. He is a dog that is used to go to fires, and Boat No. 33 now owns a Newfoundland dog of great intelligence. —New York Herald.

THE BLACK SETTER.

"STONEHENGE" in his "Dogs of the British Islands," describing the English setter, says: "The color of coat (value five points) is not so important in English setters, a great variety being admitted. These are usually classed as follows in order given: (1) black and white, ticked with large splashes, and more or less marked with black; known as blue belton; (2) orange white, freckled, known as orange belton; (3) black and white, with small spots of black and white; (5) black and white with slight tan markings; (6) black and white; (7) liver and white; (8) pure white; (9) black; (10) liver; (11) red or yellow." "Stonehenge" is regarded as the highest authority. He puts the color of coat at five points, and names black as a true color for an English setter, yet a black setter has never had a chance to win in our past bench shows, although there have been perfect types of this handsome setter shown time and again. Almost the first order the judge gives is: "Take those black dogs out of the ring!" and they are taken out disgraced. Now, why is this? It is because the black setter is worthless as a beauty, or as a field dog? We think not.

The best setters we have ever seen in the field have been black. We have shot over them for a month at a time with only Sunday and a day now and then for rest, and they have been fast and strong when all the other dogs were worn out. Whether on the Western prairie or in the Connecticut swamps, we have found them the same—true, honest, staunch and athletic.

The first field trial run in this country, we believe, was won by Mr. H. C. Fritchett's Black setter Knight. Dogs like Mr. Ernest Mau's Kate, known in years past to almost all the sportsmen who shoot in Florida; Mr. Newton Clark's Sam; who ran so well at the Eastern Field Trials some years ago; Mr. Halsey's Sport, well known to Long Island sportsmen, are of the class of black setters. Although there are many more of this race equally good, it is the black setter that we look at, yet they all have the same stigma of being black naps. The judges in the past have banished them in disgrace because of their color, and value of color is five in one hundred points. It is a pity that owners of dogs of this type, you that, although your black setters are very handsome, are true types of the English setter, according to the highest authority, are first-class field dogs, in short, have all the good qualities which make a bench show dog, but that you banish them, yet you cannot win even a mention with them. But this year the W. Stunister Kennel Club have offered a special prize for the best black setter. This is a step in the right direction, and I trust that owners of dogs of this type will get for them a favor which has long been withheld, and which none deserve more fully than the black English setter.

WOOD POWDER.

New York, April 24, 1888.

LEWIS AS A TRAINER.—Pittsburgh, April 28, 1888.—Editor Forest and Stream: I have just read Col. Stuart Taylor's remarks on Lewis in your issue of 23d. I have no

intention of acting as the champion of Lewis, or anybody else, nor do I know anything about the constitution of Young Bill, and there is something about their whole lot of dogs that I never understood, but the reference to the lost collie (Mr. J. W. Burgess's Flora) conceals the very important fact that she was a dog of the same breed as Taylor's dog. It is his own case to bring up a matter in which, for courtesy's sake, I will say he is uninformative, I am at a loss to see. Lewis never told me why he did not inform Mr. Burgess of her escape, but I can easily suppose that he was unwilling to do so while he had hopes of her speedy recovery. I know he had indications of her loss posted up all around the neighborhood, and spent all his spare time hunting her; and I can find it very excusable for a man just starting in business on his own account to be unwilling to face the loss of a dog. As to Taylor's dog, I think an animal would be found, a remark on this particular subject would have come with a better grace from Mr. Burgess, as the bitch is certainly a grand one. I do not know how she escaped, but do know that she is the wildest animal I ever saw. I was with her at the Washington hotel, and she brought her out of the kennel to show me her improved condition, and in five minutes she was through the fence and two hundred yards away, and Lewis had half an hour's chase for her. How she got out I don't know, as the gates were all shut, and all the setters were running around without getting out. Lewis took my Tiny four months since, when he was a savage, and dangerous to approach when kennelled, and to-day there is no gentler, more trusting and faithful dog in the world. (He is a mastiff.) I have seen Lewis in the city in the winter and spring, and I have always found him hard at work; his feed is abundant, and I know is well and thoroughly cooked. He made a great mistake in taking so many dogs after the Washington show, but he expected to get good pay, and this he could not get. I wanted Mr. Lee's Turk to go into his hands, but his engagement with Creole stopped him, and I had to surrender my claim on him for Tiny, as Turk was too big. I have no complaint from Mr. Lee of Turk's condition. My Tiny is a picture of health. Dr. Alsop's Bantock (mastiff) is in Lewis's hands, and she is as fine as silk. So I will try to offset Col. Taylor's attack on a man just commencing business for himself, and will try to do so by pointing out to you some more confidence in Lewis than in any other dog man I have met; that I know he is careful, and that I prove my faith in him by now putting up at his place kennels for four months, and by carrying on my business as usual. I have no trainer has his dogs under better control, and none can be kinder or gentler than he is. I have never seen nor heard of him doing more than sniffing a dog's ears, although I have no doubt he can, and uses the whip when necessary, although it just means the same to the dog as it does to the man. I have no personal interest in Lewis further than a friendly one, and have told him of things that I thought he was wrong in, but I do protest against such an unjust attack as Col. Taylor's. I have no objection to his attacking me, but I respect of a man trying to make a start in life for himself. —W. WADE.

April 30.—I desire to add to mine of the 23d inst. First I will show you a picture of Lewis, but without having had any communication whatever with Lewis on the subject, and secondly, that I have seen Lewis since, and to my great surprise, he says that he never had a line or word from Col. Taylor on the subject. This leaves Col. Taylor in the position of having attacked a dog he never saw, and to my great means of making his living, without giving him a single chance for explanation or defense. —W. WADE.

MY WONDERFUL DOG.—Oxford, Me., April 30, 1888.—I have been reading a report of "Keenard's" wonderful dog, and as I have a very wonderful dog myself, I will give you my experience. I have a dog of the name of "Keenard," whether he is a bloodhound, beagle hound or a barnyard hound I don't know, not being versed in dogbery; but this I do know, he will chase anything from a cat to a fox that will stir him up. I have a dog of the name of "Keenard," who is very intelligent, and has a little fun, and I was not disappointed. It was good running, and Dick was soon off singing at every board (he has got a double-pointed mouth). I made up my mind to be a fox, and I had a dog of the name of "Keenard," who is very intelligent, and has a little fun, and I was not disappointed. It was good running, and Dick was soon off singing at every board (he has got a double-pointed mouth). I made up my mind to be a fox, and I had a dog of the name of "Keenard," who is very intelligent, and has a little fun, and I was not disappointed. It was good running, and Dick was soon off singing at every board (he has got a double-pointed mouth). I made up my mind to be a fox, and I had a dog of the name of "Keenard," who is very intelligent, and has a little fun, and I was not disappointed. It was good running, and Dick was soon off singing at every board (he has got a double-pointed mouth). I made up my mind to be a fox, and I had a dog of the name of "Keenard," who is very intelligent, and has a little fun, and I was not disappointed. It was good running, and Dick was soon off singing at every board (he has got a double-pointed mouth). I made up my mind to be a fox, and I had a dog of the name of "Keenard," who is very intelligent, and has a little fun, and I was not disappointed. It was good running, and Dick was soon off singing at every board (he has got a double-pointed mouth). I made up my mind to be a fox, and I had a dog of the name of "Keenard," who is very intelligent, and has a little fun, and I was not disappointed. It was good running, and Dick was soon off singing at every board (he has got a double-pointed mouth). I made up my mind to be a fox, and I had a dog of the name of "Keenard," who is very intelligent, and has a little fun, and I was not disappointed. It was good running, and Dick was soon off singing at every board (he has got a double-pointed mouth). I made up my mind to be a fox, and I had a dog of the name of "Keenard," who is very intelligent, and has a little fun, and I was not disappointed. It was good running, and Dick was soon off singing at every board (he has got a double-pointed mouth). I made up my mind to be a fox, and I had a dog of the name of "Keenard," who is very intelligent, and has a little fun, and I was not disappointed. It was good running, and Dick was soon off singing at every board (he has got a double-pointed mouth). I made up my mind to be a fox, and I had a dog of the name of "Keenard," who is very intelligent, and has a little fun, and I was not disappointed. It was good running, and Dick was soon off singing at every board (he has got a double-pointed mouth). I made up my mind to be a fox, and I had a dog of the name of "Keenard," who is very intelligent, and has a little fun, and I was not disappointed. It was good running, and Dick was soon off singing at every board (he has got a double-pointed mouth). I made up my mind to be a fox, and I had a dog of the name of "Keenard," who is very intelligent, and has a little fun, and I was not disappointed. It was good running, and Dick was soon off singing at every board (he has got a double-pointed mouth). I made up my

boom being very long. From the accompanying diagram it will be seen that this class of boat when hoisted is virtually a flat-bottomed craft, and is anything in the world but a cutter, which the writer has called "Fendeur," a splitter, or "Fendour," as we say in English, a cutter, which in the general sense and with respect to the principles involved means a vessel whose speed is mainly due to her facility for cutting the water, her comparatively narrow sectional area offering but little resistance, such a boat being narrow and deep.

Typically opposed to this class are those of great beam and light draft, or what is the same thing, those boats which have a comparatively large and broad sectional area.

It is manifest that boats of this latter class cannot rely for their speed upon the facility with which they cut through the water, but on the contrary are forced to depend upon the ease with which they glide over its surface.

All yachts and smaller-sized sailing craft fall, by virtue of their shape and weight, into one of these two classes. These two factors determine the displacement of the vessel as well as the relative position of the centers of gravity of the vessel, and the displaced fluid upon which the stability of any floating body depends. No mere similarity of detail of any kind in construction will render similar in principle two boats belonging respectively to these two classes. They may both be, for instance, straight-timbered, as in the case of the Fendour and the Onward, but they are as widely separated in the principles governing their action as it is possible for them to be. The Fendour pattern, and all the deep-draft boats, depend for their stability upon the low position of the center of gravity of the entire system, while the class for the same property depend upon the buoyant effort of the displaced water, which is crowded away by the submerging of the lee side of the boat.

Carrying the analogy a little further, it will be seen with respect to the displacement of these two classes of vessels, that while one in all positions has the figure of the displaced fluid symmetrically divided by a plane through the stem and stern posts, or nearly so, the other only fulfills this condition when on an even keel; in all other positions there being a great difference in the amount of water displaced on either side of the plane referred to, until, in the extreme cases, when the light draft boat is hoisted down, we find the displaced fluid almost entirely to one side of this plane. To illustrate this ask how often boatmen have looked over the windward side and seen the upper edge of their centerboard above water? and how few, on the contrary, ever saw an iron keel in that position? Did it never occur to them to consider at such a time what were the relative displacements of two such boats? In all discussion of nautical construction it should be ever borne in mind that we are dealing with mechanical forces. Their intensity, points of application and direction give us the results. The principal factors determining these points are the displacement of the vessel, and the figure or shape of the displaced fluid, as well as its position with respect to an axis or plane of symmetry.

These things make a boat's stability.

F. J. PATTER.

[We give below the midship section of the Fendour as it appeared in our issue of the 8th February, and a copy of the section our correspondent "G. E. N." sent us of the Onward, the original of which will be found in our issue of February 22.]

The Fendour section, and the section represented by our correspondent "G. E. N." to be that of the Onward, are also shown carried to the same angle as our correspondent, "F. J. P." has shown the corrected section of the Onward. Reading carefully the comment of "F. J. P." on this type of model, represented by Onward, as compared to that of the Fendour type of model—independent of the difference shown to exist in what the Onward is to that which "G. E. N." represented her to be—we need only add that all our correspondents on this Fendour type of model will feel satisfied that "F. J. P." has not alone made it plain that Fendour would have a safe sea-going boat, while Onward belongs to that class of model which are dangerous even in the hands of experts, but that his knowledge of the principles which should guide the naval architect is based on a thorough cognizance of the subject at issue.]

THE RATING OF YACHTS BY SAIL AREA AND LENGTH.

THE following remarks appeared in the London *Field* from the pen of Mr. W. Baden-Powell, of canoe reputation, will be read with great interest by all our leading yacht committees.

FOREST AND STREAM has repeatedly advised that the rule of admittance known in America as Commodore Lee's be adopted. It is a rule of admittance adopted after much investigation by the officers of the Seawanhaka Y. C. of New York, and found to work well with the many classes of boats that meet in our races—some deep and narrow, with lead keels and small area of canvas, and others of broad and shallow proportions and large area of canvas.

We quoted the Seawanhaka Y. C. rule in our issue of April 12.

Mr. Baden-Powell is evidently right in his conjecture that large displacement and small sail area will be the result. This will encourage good modelling and insure good sea-going qualities, if the design is properly calculated and balanced. It will not at the same time give all the prizes to the man who spends the most money for lead

THE BOY'S SEA GOING BOAT.
(See issue of April 26.)

and canvas, as long, narrow and deep boats with any quantity of lead will pay for their ability to carry more canvas than those ballasted in a manner which will leave them ships to start with, and ballasted in such a manner that the ballast can be removed for the purpose of lightening their hulls for races, or in the case of grounding where it is not pleasant to stop.

The boat with staidal stability alone will be heard no more of, as yacht owners will soon be tired of paying for the maintenance of crews if they cannot have accommodation somewhat equal to the cost of maintaining such flat iron byes of model.

Mr. Baden-Powell's remarks about ketch rig versus yawl rig, scarcely call for comment further than our protesting against advising any more hideous rig than the yawl rig being supplanted by the ketch rig. If a man is afraid of his ability to take the mainmast of a cutter when it blows hard and the sea is rough, and keep her under command until he gets the trysail onto her, or if he wants to save the expense of an extra hand for reefing, or if he is afraid to spoil his cutter by rigging her a yawl, but a ketch rig belongs to traders, not yachts.

To do away with these wretched rigs it would be best to rate any rig a cutter if she was not over fifty feet on the water line. Mr. Baden-Powell writes as follows:

"since it was announced a week ago, that the first step had been taken toward taxing sail area, many bright visions have been enjoyed by those who, so to speak, inhabit the yacht racing world. The fantastic nature of some of these visions is simply marvellous. With one it is the solemn funeral of the whole yawl family; with another, the glorious ascent to warmer regions of those spar-breaking spirits, Jib topsails; while with a third, the complete annihilation of the 'Dead March,' especially decreed for the condemned 'lead masts.'

"That a rating by sail area \times L \times W length, may, and probably will, have a beneficial effect on racing is hard to actually judge. The precise result of such a rating—in regard to its effect on construction equipment, and performances—can only be asserted on conjecture. Apart from any possible influence of a rating—of any particular rig, probably the straightest conjecture is that such a rule will foster large displacement, small sail area, and moderate ballast (using the last two terms advisedly, as in comparison with the present forecast, under the tonnage rule, of extraordinary displacement and lead keels; not by any means that it will place 'uffers' on a footing with 'creaks'; the common or garden variety of performance can do that, for those who are unspornisally enough, to 'enjoy witnessing such farces or to benefit by them.

"The question of rig allowance or rating, if carefully considered. Under the rating rules up to the present, time success has chiefly been gained by 'setting every stitch of canvas to woo the freshening wind,' and it would be advisable to insist on lead to keep every stitch of canvas drawing. But will not the effect of the proposed rating rather incline our hearts to set less canvas, and perhaps to carry less lead? If so, we at once come to those yaws. What she leaves off her mainsail and topsail she puts on in her mizzen. Now a very small reduction of the jib and slight increase of fore-foot will keep the balance of center of effort and center of lateral resistance right, so as to permit the reduction of the mizzen and its spars to 'swear-by' in such a rig—which is practically a saug cutter—40 reverts both to a yawl's allowance and also allowance for smallness of sail area. From a seaman's point of view, I have always had an aversion to the yawl rig, and naturally dread giving a bad rig benefit which may tend to foster its being, and cause it to increase and multiply. I am well acquainted at a certain tonnage, and under the existing racing rules, the yawl rig, if not a necessary evil, is, at any rate a successful evil: a 30 or 100-ton cutter's main boom is not a pleasant size of stick to handle, and at say 120 tons of modern construction—well, the sooner she's turned into a schooner or yawl (for racing) the better for life, limb and peace of mind, and probably for success. But the question of limitation is the small yawl, why she should be pondered to, and encouraged by fine allowance for 'inferiority' of rig, I can't imagine; it cannot be said of her, as with a cutter her boom would be dangerously large and unmanageable. If, however, it is acknowledged to be an inferior rig, why should it be penalized by racing?

"The really saug and useful rig for cruising is the 'ketch,' a thoroughly seaman-like rig. Why should not a ketch boat have an allowance, intermediate between a yawl and a schooner's allowance, or even a schooner's allowance?

"If inferior rigs are to be penalized by a time allowance for 'inferiority' in the classes of 80 tons and under, then certainly create the 'ketch' class with suitable allowance, and in a short time, no seaman would be found owning a yawl.

"But the important question now is—if racers are to be rated, for time allowance, by sail area \times length, must not the minimum area of mizzen, compared to area of mainmast, be fixed? If the sail to mizzen in a schooner, be clearly defined? If not, 'sail area coupled with rig allowance' will soon produce, at all tonnages, especially in the small classes, 'schooner' with a mainmast and fore-plans, but with a small 'swear-by' foremast and foresail, and 'yawl' carrying the smallest apologies for mizzen.

"In my opinion the yawl's mizzen should not be less than a quarter of her mainsail area; the 'ketch's' dandy not less than one-third of her mainsail; and the schooner's foresail not less than half her mainsail.

"Yaws, ketches and schooners of under 80 tons' measurement, should receive the 'rig allowance' only when competing in 'cruising' or 'cruiser' matches. Of course, 'cruising' races are not of the same nature, and upward must be tolerated, though the arbitrary allowance between rigs creates no true test of relative speed in different states of wind and sea. Class racing should be all means 'straight racing'—'fancy' allowances for supposed inferiorities, the prizes should go to 'perfection,' not to 'imperfection.'

"The proposed rating by sail area, multiplied by length on the load line, will not be far off being a 'rating by stability'; it is as simple a rule as could well be put forward, and, at any rate, is well worth trial; curves of stability and data as to the center of effort should be used in racing yachts and 'fast cruisers' would produce more accurate results, and perhaps satisfy theorists; but for practical and quick working at regattas, the simple sail and length rule is best.

"It must, however, be borne in mind that this 'rating' rule is only put forward for the purposes of time allowance at present, and the suggestion is accompanied by a recommendation to amend the existing rule by tonnage rule. If the rule is freely utilized during this season, simple data will be at hand to guide in the consideration of its future status—whether as a time allowance indicator only, or as the rule of classification or power gauge."

"There is no other article so valuable for popular use in cases of lame back, local rheumatism, lumbago, neuralgia, congestion of the bronchial tubes, coughs, affections of the lungs, and torpid liver as BENSON'S CAPSIC PAIN EXPELLERS." So writes H. H. Kane, M. D., Physician-in-Chief of the De Quincey Home, New York. Prompt, powerful, clean. Price 25 cents.—*Adv.*

ANSWERS TO CORRESPONDENTS.—(Continued.)

F. LAKE, Minn.—Can you give me a few hints for catching salmon said to have been planted in Minnesota lakes? Should I fish deep and in what month? Ans. If the fish are there they should rise freely in June or July, or you might try trolling for them in deep water if the waters about the shores are warm.

M. L. New York.—Can you tell me of a good place to go fresh water fishing, within 25 or 30 miles of New York City? 2. What kind of fish will there be at the Fishing Banks in May, and what the best time of year to go there? Ans. You had better go to Long Island streams. Perch can be taken in Croton Lake. After June you can take black bass in Greenwood Lake. 3. Porgies will be on the Banks in May, but not as plentiful as a month later. The fishing is usually good here all the summer.

A. J. New York.—Will you kindly let me know if it is impossible to drown a fish when it is in the water on a line? Ans. If a fish is towed behind a boat, after it is tired and cannot rise its mouth open, I think that it would be drowned. Ordinarily a fish is reeled in exhausted, but not drowned. We think it possible to drown a fish under the conditions named, because the breathing apparatus is stopped by what on the action of the gill covers, which open and close with the mouth.

GUY FLINTS, Norwich, Conn.—"J. A. S." asks for gun flints. I have a flint-lock gun that was carried in the war of 1812, that is in good order yet. A few years ago the gun and a handful of flints came into my possession. If "J. A. S." will send me his address and a stamp to prepay postage, I will send him a couple. I tried the old gun on woodcock once, but found it rather slow for snap-shooting, but I did manage to kill one quail, the bird going straight from me.—J. R. Tracy.

C. R. W., Hialeah, Idaho.—Suppose two gun barrels are identical in respect to material, gauge, and style of bore; with the exception that one barrel is 30 inches long and the other 32. Will the 32-inch barrel shoot better, or show shot a great deal more than the 30-inch barrel? If charges to be used in both? Ans. Practically there may be no difference; for actual service in the field one gun will do just as well as the other; the 32-inch barrel will have a slight advantage over the shorter one. A charge suited to the shorter barrel will also practically do for the larger one.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. SIX MONTHS, \$2.

NEW YORK, MAY 10, 1883.

VOL. XX.—No. 15.
Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 448 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 385 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications, Forest and Stream Publishing Co. New York City.

With its compact type and its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

SELECTING THE TEAM.

ON Monday morning next, at Creedmoor, will open the series of four competitions which are to determine who shall make up the American team of 1883. The general preliminary conditions of those test shoots are already well known through the notices which have been sent out calling upon riflemen to compete. The committee in charge have fixed an admirable working plan for each day's work, and every precaution has been taken that the shoots shall be scrupulously fair to each contestant. On each day the six ranges will be fired over, seven shots per man at each. There may be practice up to 10 o'clock, but none from that time until the opening of the competition at half-past 10. Then the men will be called to the firing place by lot, two at a time, and fire through their seven rounds alternately. No one except the scorer will be permitted within twenty-five feet of the firing point, and it will thus be a test of individual merit of the most exacting sort. Fair weather is to be hoped for, and then with these scores before them there ought to be no difficulty in determining who are the most available men to put into the team ranks.

It is imperative that no time be lost in having a captain selected to head the team, so that practice on a sensible no-sing basis may be at once proceeded with. Time is short, and while the shooting thus far this season has been most encouraging, yet it is idle to suppose that victory at Wimbledon will be ours unless to that individual ability be added the strength which comes from a united front against the dangers of tricky winds and shifting lights. Luckily, there is to be no experimenting on ammunition by each man for himself; that senseless proceeding has been cut off and uniformity on this very important point was assured from the very start. The Americans have been granted a very important concession from the original conditions in the use

of the windgauge, and the absurdity of having a match fully a decade behind the times will not be repeated as in 1882. British conservatism has been broken down to this extent, and it now remains to be seen whether or not our team can secure a winning score. If defeat comes, then it is difficult to see where another match is to come from. With the return of a victorious American team there ought to be no trouble in keeping up a series of international shoots.

The forlorn hope of a victory which many of those who watch rifle practice here indulged in last year has changed to a very fair prospect of a successful trip this year. With shooting appliances greatly improved, the men have shown a steadiness which augurs very well for an excellent result. It is now merely a question of individual merit and a long, strong pull together. The rifle will do everything which can reasonably be expected. It is not one whit behind the English weapon, so that the question now is whether the twenty odd years of persistent drill and practice before the butts which each member of the British team will have enjoyed can be overcome by the pluck, intelligence and hard work of the American. With a good team system put into play we feel safe in looking for an American victory.

THE RIGHT MEN FOR THE PLACE.

THE interesting relation of his Arctic adventures narrated in FOREST AND STREAM by Lieut. Fred'k Selwata, teaches more than one lesson. One of the most important of these is in strong confirmation of the views set forth by our correspondent, Mr. J. C. Hughes, in our issue of June 29, 1882. In this communication the author called attention to the folly of placing the attempts to reach the high northern latitudes wholly in the hands of men who by education are unfitted for a struggle against adverse circumstances on land. He says:

In connection with Arctic expeditions that have from time to time been undertaken by various countries, one especial feature has always presented itself to my mind. It has always appeared to me that the expeditions have not been composed of the right kind or stamp of men, and I have always, when reading the journals of any expedition that has fallen under my notice, been strongly impressed with the belief that, had the members of the expeditions referred to been composed of a different class of individuals, much better results would have been obtained, and much suffering and, in many cases, loss of valuable life avoided. My idea is that such Arctic expeditions should include a certain proportion of a class of men commonly known as North American trappers, who for a trip of this nature possess certain qualities eminently fitting them to assist in undertakings of this kind.

Were we shrank not among the bravest of the brave, they would naturally shrink from undertaking a voyage that at any time is liable to be changed to a land or ice march, when all their nautical lore and experience does not tell for much, and perhaps be thrown upon a land trip in an inhospitable country where to save their lives might be a matter that would tax the abilities and best efforts of even of the very natives of the country, viz., notwithstanding a life of study of the various contrivances possible to be accomplished, have often sufficient to do to eke out a scanty subsistence during the long and dreary winters of northern latitudes.

Reverse the position and place men of the type of Kit Carson, Daniel Boone, Joe Meek and other prominent trappers, at sea in a vessel of the best class, equipped and fitted with all the appliances that science could suggest and money procure; leave them to their own devices, and what would they make of the situation? Go ashore further, place them at a moment's warning in mid ocean in a ship's boat with scanty supply of provisions, insufficient supply of water, and what would they accomplish, or be expected to accomplish under such circumstances? And yet the hardy and intrepid navigator cast upon the ice is placed in almost as bad a situation in many ways as the landsmen would be in the former mentioned case.

One very noticeable circumstance is apparent to readers of the various narratives of all former expeditions, and this is, that so such men as Eschberg or Espinoux, Joe, who accompanied Capt. G. F. Hall, were due the salvation of the party, who, unaided by their efforts, would have surely perished by starvation, while Hans and Petersen, in the voyages of Kane and Hayes, showed no less prominence in their admirable fitness as members of a northern expedition. Indeed the annals of all the different exploring voyages teem with abundant evidences of the necessity of incorporating men of different classes in parties of the kind alluded to.

While reading Strain's narrative of the trip across the Isthmus of Darien, which terminated so disastrously to several of the party, I could not help being struck with the disadvantages he labored under for want of practical men as a component part of the command, for, while they were traversing a country having considerable game, the rivers of which affording a generous supply of fish, although provided with arms and ammunition, they were unable to secure enough food for their maintenance, and while possessing personal bravery, indomitable courage, ability to encounter and endure great hardships, a large portion of the command died from hunger, after the loss of their simple and only fish hook. Had such men as I have mentioned been attached to the party, how long would it have taken them to make other fish hooks out of portions of their guns or camp utensils, bones, etc.? The knowledge that a piece of wood or bone, pointed at both ends, tied by the middle to a line, and when baited, laid alongside or parallel

to the line, but when swallowed by a fish and a sharp twich given would become a toggle fastened in the fish's gullet or maw, and consequently with gross feeding fish, such as catfish and others inhabiting tropical waters, becomes one of the most efficient fish hooks to be had, might have been the means of saving the entire party. Spears, cat's, nets, traps and other appliances would have been within the scope of such men, who would have needed nothing but the wood that grew on the banks of the streams and an ordinary knife to fashion them into appliances for the capture of fish and game. Many of the animals of North America being nocturnal in their habits, seldom offer an opportunity to mankind to secure food by shooting them, but traps, when set by experienced trappers, meet the difficulty and supply food and clothing obtained by no other means.

Nobody ever makes a trip, takes a hunt with, or remains in the company of an experienced hunter and trapper, without learning new wrinkles and contrivances. Books do not treat of forest lore as they do of other sciences. The only place to obtain education in this branch is the school of experience, and the study is of such magnitude that it is never completed. Necessity being the mother of invention, perhaps there is no other class of men who are so often placed in positions requiring for success ability to adapt themselves to circumstances; hence the value of their services in all matters requiring prompt measures, decision, and capacity to make the best of the situation. How important it is, therefore, that the very best material should be selected for all such hazardous undertakings as Arctic explorations.

How many men of even average intelligence can procure fire without matches and when procured, does it strike one man out of a thousand, when needing fire for warmth at night (clothing being insufficient), that the proper plan is to build two or more fires, and lie down between them and thus almost do away with the necessity for blankets at all? No, it does not; but he builds one big fire that he can't get near, if fuel be plenty, and the unfortunate person presents the unhappy condition of being nearly roasted on one side, while being nearly frozen on the other, and after various feats of ground and lofty tumbling, morning returns to find him more tired than when lying down the night previous. Many other examples of the devices, contrivances and shifts appertaining to a knowledge of forest life might be introduced here as illustrative of the correctness of the theory involved in this article, but those mentioned will perhaps suffice.

There are representative men of the class spoken of who will leave the settlements, make a trip through an uninhabited region (occupying months in duration) alone, and live well and be glad, vary, no matter how rigorous the season or inclement the weather, where to a party provided with a much better outfit such a journey would simply mean death by starvation, unless some of the party were skilled in the mysteries of woodcraft. The one would live, so to speak, upon the fat of the land; the others would scarcely see a bird or beast on the trip.

It is enough in all reason to send out men who are willing not only to have the dangers of the seas with which they are acquainted, without endangering their valuable lives in a land or ice march of which they must, from the condition of their past lives, know little or nothing.

It may be said that the natives of the country are the best persons to be had in the capacity of guides, hunters and auxiliaries. This is decidedly wrong, the argument being good to a limited degree only. The white race the world over is superior as a class to any other; they are better skilled in the use of firearms, means of travel, endurance, and in many other ways. What a white trapper would learn in a few days in Greenland would enable him to discount the average native in anything, except perhaps the management of a kayak or something of like nature. Then there is a moral courage that is associated with education and civilization, that frequently is of the utmost importance, which in matters requiring decision of character and judgment, more than makes up for a large amount of physical courage, since superstition, going hand in hand with ignorance, renders the uneducated native of very little account in many affairs.

The heroism of seamen is too well understood to need any praise, but from the very conditions of their education and training, it is apparent at once that they are at a great disadvantage when forced to face on land a condition of things which might appal even the natives themselves. They are not accustomed, as are the trapper and mountaineer men of the West, to depend for their comfort, and even life, on the country and its indigenous animals. They know nothing of the game and fish, nor of its habits, and so may starve in the midst of plenty. That landsmen, and especially those brought up in the rough school of the mountain and forest, would add inconceivable strength to any Arctic expedition is very clear.

If we remember the story of the hardships and dangers undergone by the early explorers of America, we see an analogous condition of things; the early Spanish and French explorers in Florida and the South, though passing through a country swarming with game and abounding with fruits and vegetables, often starved to death, or only relieved their wants by robbing the Indians of their maize.

How different is the case in the last Franklin search expedition. Lieut. Selwata and his men lived on the country, adapted themselves to the customs of the natives, took lessons from them in hunting, house building, dog driving and a dozen other subjects, and really underwent little or no suffering. This shows very clearly what can be done by men thrown on their own resources, who take advantage of every circumstance, even in the frightful climate of the extremest north.

The article from which we have quoted has been exten-

sively copied throughout the country, without any credit to the author, however, and upon the text thus furnished a number of sermons of considerable length have been preached. The closing articles of Lieut. Schwatka's series make a reference to it, at this time very appropriate.

Although the U. S. Government has in no way recognized Mr. Schwatka's important services in the Arctic, other nations have been more appreciative. The French Geographical Society has awarded him the triennial gold medal for Arctic exploration. This honor has fallen three times before to Americans, Dr. Kuee, Dr. I. I. Hays and Captain Hall having each received it. It is interesting to note that this medal was awarded to Mr. Schwatka over Professor Nordenskjöld. As has been well said, the only order Schwatka had conferred upon him by a grateful republic was an order to join his regiment.

ADIRONDACK SURVEY NOTES.

XVII.—YOUNG FROGS.

IN Harrigan's play of "McSorley's Infation" when the hero of the piece wants the nomination for corouer and addresses a meeting of colored men, he says: "When the learned gentleman who spoke last kem from Africa—" and when the whole meeting rises to smite him, he exclaims: "Hould on, gentlemen; it is not of the gentleman himself that I'm speaking, but of his pra-historic progenyators." So it is not of the frogs themselves that I propose to write this time, but of their "pra-historic progenyators," the tadpoles.

Whether you call the larval frog a tadpole or a polywog, for the names vary in different places, it is a queer fellow. What round, well-fed punches they have, and what an innocent look beams from their eyes, and how they wiggle off in schools from the warmest water they can find near the shores when you approach. A serious-minded person once asked me: "What is the difference between a tadpole and a polywog?" I answered him that it was a disputed point among naturalists: that one school held that the animal was a tadpole only in its first few days, while it had external gills; another, that it was a polywog for some months, until the legs sprouted and the tail began to shorten, and then it arrived at the tadpole stage, but that the latest authority, the learned Rana Palustris, held that the tadpole was the male and Miss Polly the female. This left him room to ponder on differences and to practise some original investigation.

One day I was down by the outlet of a pond with a landing net collecting small fishes, and among the weeds and other things there were some tadpoles at every haul. They were remarkably fine ones, and in the hope of finding a specimen far advanced toward froghood, I sat down and looked them over. Some boys came down to see what was going on. They were bright little fellows, full of questions about everything around them, and of course they wanted to know about the polywogs. I never could find it in my heart to gny a boy of that kind. Bless them, if their minds would always remain as bright, and their love of nature always cling to them, how happy they would be. So I gathered them all around me to tell them about the tadpoles, when one opened the subject with, "Now, honestly, Mr. M., are these polywogs really and truly young frogs?" "Yes, really and truly, they are young frogs. See! here is one that has its legs already visible under the skin." They could not quite make it out, however, and with a scalpel I removed the skin and showed them a rudimentary limb. That ransed their desire to know all about them, and I was led into a lecture on the subject, and had a most attentive class, for the boy is always a naturalist, and only by the withering touch of "business" does he lose his taste for natural history. This is what I told them:

In April the frog lays her eggs in the water. They are surrounded by a jelly-like substance and all hang together, making a bunch often three times as large as the frog that laid them. They float among the weeds, usually near shore, and hatch in a week or ten days. The green scum that you see on the water, and which is called by many "frog spawn" and "frog spittle" is a vegetable growth with which the frog has no connection, except that it grows in the water where he lives. When the eggs hatch the larval frog is shaped much as these tadpoles are, but the gills are outside of the neck; they are afterward inclosed by the outer skin which closes around them, leaving this little opening for the water to pass out. The change from a caterpillar to a butterfly is not more wonderful than the change from a tadpole to a frog. The whole structure is changed. A frog is a lung-breathing animal that was formerly elassed with the reptiles, but is now, with the tritons, salamanders, toads, etc., in the class Batrachia. These are all cold-blooded vertebrates whose nearest relatives are the fishes, and whose young are all tadpoles. Now there is no definition of a fish which can exclude a tadpole, and we only deny that it is a fish because we know that it comes from a batrachian egg and will in time change to that higher class. It has a fin, as you see, all around its tail; it has a skin like some fishes, and now you see where I have laid its head open there are beautiful gills. You may have heard people say "a tadpole grows some legs, his tail drops off, and he is a frog." That is all true except the tail part, this is absorbed, not shed. The tail is of great use to the tadpole, but the frog is a good swimmer without it, and it would be a great waste of material to throw away the tail after grow-

ing it to such a size. The fact is, that the tadpole first sprouts a small pair of hindlegs, then the forelegs appear and the tail begins to shorten. After this, the little sucking mouth which you see in the tadpole, which is formed for sucking the slime from plants and the flesh from dead fishes, begins to change into the broad mouth of the frog, which is better adapted to catching insects. These are the external changes which any careless observer may note, but more wonderful changes are going on inside. The gills are also being absorbed, and a little pair of lungs are growing, and at first the adolescent frog comes up to the surface and takes a mouthful of air just to try his new lungs and strengthen them. In time the gills are gone, and he can breathe the air at any time. The intestines are changed from this great convoluted mass, fitted to a vegetable diet, to a shorter arrangement, better fitted to a carnivorous menu. So, you see, boys, there is more in the growth of a tadpole than you thought for, and if you will only watch the growth and habits of all living things, you will not only be interested, but will better understand your own life.

The boys showed the greatest interest in the dissection and the explanations and will never forget the lesson. No doubt they will instruct other boys in the beautiful changes that are going on in the larval frog and teach them to see beauty even in a polywog.

I have been tempted to write out this incident because I have found boys of sixty years old who have been fishing all their lives who knew no more of tadpoles than the class I found that July day on the shores of Clear Pond. They had a tradition that a tadpole became a frog, somehow, and they believed, but never absolutely knew it, because they never took the trouble to keep some specimens and note the change. They were content to take the word of others that the change was made, but only had an indefinite idea that to grow legs and lose the tail was all that was requisite. Some of these jolly old boys, I hope, will be glad to know what I told the young boys who were my students for half an hour, and whom I hope to meet again with an increased appetite for knowledge of nature and of the "pra-historic progenyators" of frogs.

F. M.

THE "WINTER TALKS ON SUMMER PASTIMES," which were contributed to our columns by the late George Dawson, have been collected into book form, and are published by the Forest and Stream Publishing Co.

The Sportsman Tourist.

NIMROD IN THE NORTH.

BY LIEUT. FREDK SCHWATKA, U. S. ARMY.

VI.—Dogs and Dog-Sledging—Part One.

I DOUBT very much if there is a domestic animal in the world that is so essential to the welfare of a people as the dog is to the natives of the north, especially those of the American Arctic.

It is the horse for drawing vehicles, their male for packing their effects, their hunting dog for the chase—and by the chase alone do they subsist—and in ease of great extremity the bitter morsel by which they avert starvation.

"How large are the Esquimaux dogs?" is a question I have been asked more than a score of times for every Esquimaux dog I have ever seen. I always answer that they are about the size of a rook. There is a general impression among people of the temperate zone that these dogs are a distinct breed, and that a description of any one taken here or there would, with very slight modifications, serve for any. The Esquimaux dogs are about as distinct a breed as the breed of cats at home, although a far more useful animal in every respect. There is a sort of general similarity in their pointed, wolfish ears (if they have not had them broken in wrinkles over food, as the great proportion of those that I have seen in North Hudson's Bay seem to have) and in their shaggy coats of warm hair. But, after all, I have seen them when full grown of all sizes, from a small pointer to a small Newfoundland, and with coats as shaggy and beautiful as the latter and again as coarse and straight as the veriest mongrel; while one may have a muzzle like a fox and another a mug like a bulldog, although the latter is rarer and a medium between the two very common. A dog patient visiting the Arctic would have to bring every color that he had ever used with all the combined breeds at home, while one who trusts these animals would find enough variety of dispositions to exercise the brain of a genius. So different are their sizes that the native dog-driver generally has a harness for each, and he always knows its assignment when the dogs are hitched up in the morning for the day's work, as the collar of one that would pull his ears as it was put on might be almost too large for the shoulders of some little runt that had been dwarfed in his puppyhood by too good or bad treatment.

The big dogs lord it over the smaller ones in a thousand disagreeable ways, although their pugnacious insolence does not always reward them with the best to be had. If in the way of food the morsels be made very small, the active little fellows will be almost sure to get the greater part of it, for the very first reception of food among a number of them is a tussle among the belaguerers, in which the conservative, or rather the harrier, wins. This the native dog-driver knows, and as his partiality is all toward those that do the most work—that is the big fellows—such distributions are not very common. Another source of common annoyance to the little dogs and the masters of both, is when the snow-house is completed, and its long passageway of snow blocks has been built, and the little ones crawl into it for the night's rest, in which they are usually not disturbed by the larger dogs unless a storm comes up and then they are sure to want this protected berth, and walk in to take it on the general principle that "might makes right." A fight of course ensues, for even the small dogs, knowing the inevitable result, feel that they can hardly give up such a warm berth without some show of rights. The result is that the snow block closing the igloo door is generally knocked in, and

the inmates, or some one of them, gets up, stick in hand, and with vigorous blows clears the passage of all dogs, without regard to "age, sex or color." This is repeated at interesting intervals throughout the night if it continue stormy.

I believe I have already said, in a former article in the Forest and Stream, that the well-trained Esquimaux dog never barks in the presence of game, and that, seldom barks at all; but it must not be inferred thereby that they are not a noisy race. Their half-starved condition keeps them in a chronic state of belligerency, growing and fighting over everything that bears even a resemblance to food. During the night, especially those cold, bright, moonlight ones so common in the Arctic winter, they will frequently utter a very strange concept of prolonged howl, which makes sleep almost impossible. The native driver, awakened by the fearful din, may attempt to suppress it by sharp shouting "Yager! Yager!" at the top of his historian's throat. This in the small closed igloo sounds not unlike a 15-inch gun in a turret, and one feels like the small boy that would rather have the chills than take the eulogistic. They are particularly prone to these midnight revels when tied up, a course which it is necessary to pursue in the early autumn to prevent them scavenging after the snow has begun to melt, and grazing near by, and driving them away. At this time they are razzled, so that their howling noise may not frighten the game, and unless some very energetic canine liberates himself, the sleepy man may have comparative quiet.

Every time they are harnessed to the sledge, the first crack of the whip to start is a signal for what might be called in frontier parlance "a free fight." The first dog struck makes a hell-gent spring for his nearest neighbor, who in turn retaliates on the next, and so on until, like the proverbial row of upright bricks, they are all down in a matted mass of hair, harness, and howls, which the native driver at once proceeds to unravel with the butt end of his whip. Having taken their preliminary "bitters," they are then ready for a serious start and trot along the rest of the day in a manner worthy of Barnum's happy family.

They are generally a most unbearable nuisance. Two or three heads can always be seen nodding about the road, or stealing anything eatable that may be left unwatched for a moment, and then ensue a noisy wrangling over the capture which generally ends in some big aggressive dog, when, by the way, has not risked getting his head broken at the igloo entrance, walking off with the spoils, unless speedily recalled by the inmates, which in case of eatables, unless of unusual size, is very rare. While traveling the inmates are not quite so much of a nuisance, but are large enough to hold everybody when properly "spooned," and store all the harness, meat, and so forth, in as small an igloo as possible alongside. When everybody has retired the dogs commence their engineering to get the contents, scratching away as if for dear life, until a punter-like yell from the native driver frightens them away; but he is very lucky indeed if he is not compelled to get up once or twice during the night and repair some damage they have done. This can be forestalled by pouring water on the snow, converting it into ice, but with the careless indifference so characteristic of the Esquimaux, they seldom do this until the dogs have demolished several small store igloos and stolen their edible contents. When one reflects that these animals are only fed every other day even when there is plenty of food for them, and oftentimes only every third or fourth day, if the canine larder is not very full, their voracity is easily more than satisfied.

On King William's Land at one time, the dogs of Henry's party returning from Terror Bay to Gladman Point, were seven days without food, doing hard work all the time; the party itself, meanwhile, being nearly three days without anything to eat. I have known them to eat sole-leather, pistol holsters, canvas gun-covers, oil-cloth clothes, tarred rope, cloth saturated with grease, and *en route* to Back's River had them devour a pair of India-rubber over-shoes that I was depending upon for summer wear, as if their consciences were not sufficiently elastic without them. We had been fortunate in securing a few reindeer while returning homeward along Back's River, most of which we found well inland from the river, and it was also this fact, added to many other reasons of a sporting character, that induced my natives to ask me to leave my baggage behind. This season I was very fortunate in securing a few rapidly disappearing fish that we had bought of the Esquimaux at the mouth of the river, gave the poor dogs but few scanty meals, which, coupled with the razor-edged weather in the depth of an Arctic winter, told terribly upon them, and before we had left the river we had lost one fine dog, and so drained the vitality out of the rest that we increased the mortality to twenty-six out of fifty-five, which was equal to Chapin's. It was, I believe, indeed, to be compelled to notice the silent sufferings of these faithful companions as they slowly fell by the wayside, with a seeming devotion as if this sacrifice was self-imposed to aid as much as possible on our uncomfortable journeyings.

Ravenous as they are, tearing everything to pieces not actually wood or iron, or falling fearlessly into the igloos in quest of food, they are faithful respectors of their human companions, not even ones attempting to harm the little children who wander innocently among them, pelting them with toy whips, when half an hour afterward they would be savagely tearing a dead starved companion, limb from limb, to secure the hide, which was nearly all that was left of him. Every time one of the party entered the igloo they wedged themselves in along with him, so tightly that it was almost impossible to move, hoping thereby to steal some stray morsel of meat and when such a motion made was intently watched, and if it bore a resemblance to giving them anything eatable, they would make a rush that would pile the pack around you in a most alarming-looking but harmless way, until something else drew their attention in another direction. These facts have sometimes led persons to believe that "assault with intent to do bodily harm" were the motives actuating the Esquimaux, with the exception of the fact that the Esquimaux dogs has been that when starving, if they desire to make a meal off of their human allies, it would take more effective means to prevent it than those recorded where the imagination of the writers conceived that their lives were in danger. The Esquimaux of my acquaintance knew of no such cases.

The endurance of the Esquimaux dog is his most conspicuous quality of character. He is a creature who has no more resemblance in tenderness of flesh than the Indian squaw of the West, carrying her two-bushel basket of potatoes strapped over her head to the Agency building a couple of miles away resembles a Fifth avenue belle, with just enough strength to roll her eyes in her head at the mention of the last novel. I have more than hinted at this already in the previous paragraphs, but have not given the

most conspicuous cases by any manner of means. On the 14th of October in 1879 one sledge of my party, with thirteen dogs, I believe, found itself at the head of Sherman Inlet, essaying the Dangerous Rapids at the mouth of Back's River, fully one hundred miles away and across a perfectly unknown country. That day we fed our dogs a tolerable meal only, for not a reindeer had been seen since in early October the forming ice in Simpson's Straits had allowed them to cross on their southward migrations, and our supply of sealion was getting low. One of those doubtless stories, which I think that knowers do not meteorological law except that of persistence, now set in and continued in its varying moods until the 7th of December, during all of which of course we made very slow progress. Eight days after, on the 22d, we again felt them very lightly (having fed them four or five days before the 14th of November), for we were now in a hilly country, hardly knowing when we would reach the rapids. Seven days after, on the 29th, we gave them a tolerable feed, as we now for the first time saw our way clear to our desired point. Again, on the 5th, six days after the last feed, we reached the rapids, tore down a native cairn of fish, and as the natives were absent, put a knife and a few trinkets in the debris of the rocks as payment, according to the custom of the country, and gave our poor polar puppies a most regular feed. Not one fell by the way, although the nineteen of them were so thin and weak that I can only say that I think they were truly equal to any half dozen of them before we left the head of the Inlet, when they were in the best condition on my trip of nearly a year in length. I doubt if there are a dozen dogs in the temperate zone that would have lived half way through that ordeal of three weeks in the depth of an Arctic winter.

[TO BE CONCLUDED.]

THOSE BONINS.

HERE is a hand to "Piseco" for revising the old memories. I wonder how many of the readers of his lively paper in the FOREST AND STREAM for April 26 ever saw the Bonin Islands? Here is one. And how his descriptions melted away the long hard years between, and brought me face to face with the old scenes. I can see it now; the volcanic islands, crowned by their eragry tops with tropical verdure, and a brood of cullow islets scattered about them like the little Lord's castles, and the low hills and palm groves; the huge black hills and towering spurs of the Susquehanna and Saratoga mirrored in its glassy bosom. June, 1853; that was long ago. "Piseco" doubtless remembers the Saratoga, but not likely her captain's clerk. We were there on our way with Commodore Perry to Japan. He was at the Bonins in quest not of the Holy Grail, but of a coal station; the rest of us were after whatever might turn up. Four days of novel adventure. Did some fishing, too; not with split bamboo, though bamboo was plenty enough, but with cod-line and seine. To be sure we did not have a Kanaka fairy to pilot us, nor get penned up in a sea cave by a shark; but we visited the cavern all the same—the one at Port Lloyd I mean—and chased crabs on the beach. We crawled through, too, for this cavern has a small opening from its inner channel directly across the reef, and I remember tugging from a seam in the rocks close by a very respectable specimen of an opal.

The seine gave us abundance of mullets, and trips in the third and fourth cutters to the reefs outside brought in chelonids enough to make turtle soup for the whole ship's company for weeks. Two or three of those enormous armor-plated sea turtles were carried to sea with us, and when the men were washing down decks in the forenoon it was a favorite amusement to trot out the turtles and have a ride, or two, on their backs. How much the turtles enjoyed it I never informed us, but doubtless it was better fun than being steamed up in the ship's coppers for sure.

One calm, lazy afternoon, the first lieutenant proposed a fishing party outside. The captain's gig was borrowed for the occasion, and into the stern sheets he stowed himself, the doctor and I went to the fore, and the rest of the crew on board's crew put us on our fishing ground in a very few minutes. And there we lavished all our seductive arts, but only one solitary fish would persuade to leave the briny and "come in out of the wet." That one I had the honor of catching, and a gorgeous craft he was as he came sailing over the thwarts. We were fishing in some eight or ten fathoms. Looking over the side the perfectly limpid water showed us the floor of the ocean, or rather a submarine garden of rainbow-hued coral, and shoals of what appeared at that depth to be minnows, as variegated and as brilliant as the coral. At last a nibble! I could see the tiny spot of gold as he cautiously essayed a lunch off my hook. Another nibble, and I had him! And he darted toward the surface with more *modesty* and less volition than he was accustomed to. He was about as long as my finger when he so suddenly left home, but when I laid him to rest on the bottom of the boat he was twelve or fifteen inches in length, and from stem to stern one glowing splendor of scarlet, more brilliant than any goldfish I ever saw. "Good for you, scribble!" "Isn't he a beauty!" "Rah for our side!" We held a naval court martial over our prize, and concluded to send him on board the flagship and let Mr. Fleine (the artist of the expedition) make a "sketch" of him. "That was what he wanted," said the "Piseco" will look in Commodore Perry's Japan Expedition, Vol. II., page 111. (Description, p. 257), he will find that fish on a reduced scale, but accurately so respondent as in life, but a tolerable "skateath."

No more nibbles, and so we landed on the little rocky islet just off the southern head of Port Lloyd. It had no beach, and its eragry sides went sheer down into the transparent depths. A low jagged point gave us a chance to handle ashore. The boat rose and fell with the surf. We had to watch our opportunity, and jump. The feet were accomplished, and no bones broken, nor a single soul hurt in the sea. We found the little island supporting a denser population to the square acre than Belgium or even London—not quite the same genus, but enjoying life just as much, and attending strictly to business. Most of the inhabitants were "setfing," a monotonous life, I fancy, but producing plenty of dividends. They showed no signs of fear—but I am ashamed to say that because they did not know the species we belonged to. Not one of them got away from her nest, even to make her manners. And we strolled among the myriads of gannets and sea gulls and shags, so densely crowded that we could scarcely move without stepping on them, leisurely examining their plumage, discussing their habits, and even handling their eggs. They meanwhile kept up a constant gabbling and chattering, which was their way of expressing their indignation. We did not kill a bird, but left them to their peaceful business of populating

the cliffs and waves. That was the nearest I ever came to actually attending Chauncy's assembly of Pookles.

We left these charming islands Saturday morning, June 18. The last thing I did on shore was to fill all my pockets with lumps of chalcodony, which lay scattered among the pebbles on the beach. Some of them were beautiful specimens; and, as I was showing my treasures, after I got on board, Lieut. — said eagerly (peace to his ashes! he cried at the right word, but his tongue slipped) "Now, clerk, when you get back to the States, will you take some of these stones to a dilapidated man who has the initials 'J. S. S.' I did, and that 'dilapidary' did some elegant work. And some of my lady ladies wear those chalcodony to this day. J. S. S. BANGOR, ME.

Natural History.

VARIOUS MATTERS.

RESPECTING the adaptation of animals to their surroundings, a circumstance takes place in British Columbia partaking of the marvelous, but which is a "true bill" nevertheless. Pigs living upon the clear water rivers learn to dive after the salmon lying dead on the bottom of the streams, and the interesting sight may be witnessed of a sow diving for a salmon, and when obtained taking it ashore for her little ones.

Again, wolves (*Canis lupus var. occidentalis*) in the summer season, live to a great extent on the numerous berries growing in this part of the world, a matter of surprise to many, as the wolf is generally considered to be strictly carnivorous in its habits. I have not been fortunate enough to see the animal myself in the act of feeding, but have been informed upon the most trustworthy statements of others who have done so, and I have seen the excrement of wolves containing a large amount of berry seeds, upon islands where there were no dogs, and where it was thus impossible for it to be theirs. I do not know that the latter ever partake of this kind of food, though it is possible that they may, as it is stated that dogs in Italy play sad havoc with the vineyards when gaining access to the grapes there growing.

In this region fresh water does not appear to be an article of necessity to the fish-eating deer (*Oreamus columbianus*), as on some islands of the Coast Range, where there are desolate of fresh water, deer are found fairly plentiful. They drink salt water, or do the heavy dew afford enough for their requirements?

Perhaps there is a grain of truth associated with the popular idea that bears lick their paws. Along toward spring the outside cuticle of the soles of bears' feet becomes hard, dried, and dead, and peels off in large pieces, leaving the soles of the feet with an exceedingly soft and sensitive covering. While the sole is becoming detached, it appears to annoy ursus, who endeavors to assist the course of nature by tearing it off with his teeth, and then licks the soft sole with his tongue. Perhaps he derives the same pleasure from this that the average boy enjoys in nursing a sore toe, or an elderly party in petting a favorite corn. The nutriment, however, to be derived from this barbaelical feast, could be obtained equal to the amount of blood that could be extracted from a turnip. This circumstance may have given rise to the story.

On emerging from his den in the spring, the bear is a "tenderfoot" in the literal acceptation of the word. Those persons who have had the outer skin of the palms of the hands and soles of the feet peeled off after recovering from scarlet fever, will keenly appreciate the bear's unhappy condition at this period, and until the soles of his feet become again hardened, he does not travel far from his den, and which place he nightly returns until "well healed," and if found before this time, becomes generally an easy prey to the hunter, who has the black gentleman at a considerable disadvantage at this particular season.

The tappen or plug which seals, so to speak, the intestines of bears during hibernation is not confined to this animal alone, being also found in the racoon (*Procyon lotor*); but on account of its small size in the racoon, the animal is not so conspicuous, and consequently not so often noticed.

The early arrival of waterfowl from the north is not the harbinger of an early winter, as many suppose, and which idea has in fact ripened into a very general belief. The birds are not driven southward by the stress of weather in the hyperborean regions to seek more favored climes, but an early migration is due to an early spring and warm summer. The birds, in fact, do not migrate southward, but rather an opportunity of gaining their arctic haunts much earlier than in average years, and the warm weather accelerating the production of a young brood, the latter are, therefore, strong in body and wing at an earlier date than is usual, and when thus ready, the natural migratory instinct impels them to take their southward journey. It is due more to this than any other cause that we occasionally have an early arrival of waterfowl in the fall. Of course, cold weather is a factor in causing all birds to leave localities, where ice and frost deprive them of their customary food, but the first-named circumstance is really the main one.

This matter was brought to my notice by a valued friend of mine, whose long course of observation on the Atlantic coast, in California, the Rocky Mountains, and here, entitles his opinion to the greatest consideration; and my own experience satisfactorily as to the correctness of his views in respect to autumnal migration. The birds, if alone the only incentive, we should have all the waterfowl at about the same time, but any person who is familiar at all with their flight is aware how they come straggling along, the vanguards being weeks ahead of the rear of the army.

There is no great difference in individuals of the same kinds of ducks and geese, consequently the weather would affect all alike, and we would then have, if severe weather were the governing factor, the same general migration, similar to that enacted in New York city, on the first of May by "the lipped without feathers" of Plato.

The transmission of physical defects, such as stumpy tails, etc., to their progeny, is of common occurrence in dogs; but a remarkable case came under my notice a short time ago. A black and tan terrier bitch was lamstrung by accident. The pups she afterward bore, were all well formed, but one of her pup's pups, *i. e.*, her grandson, was born with the same defect that the grandmother suffered from, and in the corresponding hind leg was as lame as was his grandmother. The limb was as useless as if the taddon achilles had been severed by a surgical operation.

A very interesting anecdote was related to me of a Hudson's Bay trader (since deceased) by name Allard, combining, through one event the record of a remarkable ease of acci-

dental death, an illustration of erudility of native races, and the adaptability of some men to turn a trivial circumstance to important personal advantage; the story runs in this way:

One time when Allard was traveling from Astoria, in Oregon, to another trading post of the Company's at Vancouver, now a garrison town of the U. S. Army, by canoe, manned by an Indian crew—at that time the only means of travel in that then wild region. While turning a point on the river, a flock of swans (*Cygnus buccinator*) then and still plentiful on the Columbia River, were surprised and took wing. The Indians, though armed with the trade guns furnished by the Hudson's Bay Company, made no attempt to shoot them, as they had not learned to shoot on the wing at that early period.

Allard, however, playfully lifted his paddle, took imaginary aim at the flock, and uttered a loud "Bang!" when, to the astonishment of all, the leader of the flock tumbled down on the surface of the water, and, after struggling like any wounded bird, by the time the canoe reached him had given up the ghost, and sank into the canoe, to add to their scanty supply of dried salmon and hachweed. The wily trader was too shrewd to show any signs of surprise at this unlooked-for occurrence, and treated the matter as if it was a commonplace affair, but at camp that night, being of an inquiring turn of mind, took his knife and cut up the bird himself for the purpose of ascertaining if possible the cause of death, and was successful, the solution of the apparent mystery being this: The swans had been feeding on their favorite food, the "wampus" of the Chinook Indians (*Scyllaria variabilis*), and a large bulb had lodged in the throat of the unfortunate bird, and death resulted from suffocation. Allard wisely kept this fact a secret, and in this way turned the matter to profitable account, his supernatural powers, manifested in such a marked manner, giving him great prominence among the Indians. Taking care not to attempt a repetition, and resting upon his easily earned laurels, he went afterwards down to Indians of that locality by the soubriquet of The-man-who-shoots-the-swans-with-a-paddle. J. C. HIGGINS, NEW WESTMINSTER, British Columbia, Feb. 22, 1882.

THE SEA-SERPENT.

THE following extracts from the *American Monthly Magazine*, of 1830, or thereabout, are interesting in connection with the articles already published by us in reference to the sea-serpent.

WASHINGTON, Sept. 2, 1817.

"MY DEAR SIR—The description given in our newspapers of a sea-serpent, lately seen in and about Cape Ann Harbor, has brought to my recollection one of this species.

"On a passage I made from Quebec, in 1787, in a schooner of about eighty tons burden, while standing in for the Gut of Causo, the island of Cape Breton being about four leagues distant, one of the crew cried out, 'A shoal ahead.' The helm was instantly put down to tack ship, when, to our great astonishment, this shoal, as we thought it to be, moved off, and as it passed athwart the bow of our vessel, we discovered it to be an enormous sea-serpent, four times as long as the schooner. Its back was of a dark green color, forming above the water a number of little hillocks, resembling a chain of hogheads. I was then but a lad, and being much terrified, ran below until the monster was some distance from us. I did not see his head distinctly, but saw the small boat had hid myself in the cabin, said it was a large whale, and I had hid myself in the cabin, said it was a large whale, and I had hid myself in the cabin. I remember the tremendous ripple and noise he made in the water, as he went off from us, which I compared at the time to that occasioned by the launching of a ship.

"My venerable friend, Mr. —, of your city, was a passenger with me at the time. He will corroborate this statement, and probably furnish you with a better description of this monster, for I well recollect him, and was standing at the bow of the vessel, with great courage, to examine it while the other passengers were intent only on their own safety.

"At Halifax, and on my return to Boston, when frequently describing this monster, I was laughed at so immoderately that I found it necessary to remain silent on the subject, to escape the imputation, of using a traveler's privilege of dealing in mere romances."

On the evening of September 9, Capt. James Riley was at my house, and said that he knew Capt. Folger of Nantucket, who was occupied on a whaling voyage in the Southern Atlantic Ocean, about twenty years ago. On the cruise he saw an animal of uncommon size floating on the sea, off the coast of Brazil. Capt. R. then commanded a very large French-built ship, and the floating carcass was four or five times as long as his vessel. It attracted the attention of several whalers, who secured it, and had brought away great portions of the flesh. He visited the body of the creature and satisfied himself that it was an enormous kraken. He hauled all his boats upon it, and his men ascended it and lived upon it as if it had been a rock or island. They remained on it and near it for the purpose of killing the whales that came to devour it. In this they were so successful that by continuing there they took whales enough to load their vessel and complete their cargo. The back of the kraken was high and dry enough for them to stand upon, and they remained on it for their game. And when from this point of observation they discovered a whale coming to make a meal, they lamed their boats from the top of the dead kraken, and made an easy prey of him. The substance of the monster's body was skinty, membranous and gelatinous, and destitute of the fat and blubber for which the whale is remarkable.

At Cape Weyle, being on a voyage from London to Archangel, in the year 1803, saw floating on the ocean in about the latitude of 68°, a mass of solid matter of a dirty, whitish color, which, when he descried it, and for some time after, was believed to be an island of ice. On approaching it, however, he ascertained it to be an animal substance of an irregular figure, as if lacinated, decayed, and eaten away.

The remnant of the carcass was nevertheless full as large as the brig in which he sailed, whose capacity was one hundred and eighty-nine tons, and length seventy feet.

This enormous body was the food of animals both of the air and of the water. For, as he sailed within a few rods of it, he saw great numbers of gulls and other scavows, sitting on it and flying over it, those which were full retiring, and the hungry winging their way to it for a repast. He also observed several calcareous creatures swimming round it; some of them were white as a bird's milk, and exceeded the vessel in length. Others were smaller, but appeared to belong to the grampus and porpoise tribe. He considered them all as regaling themselves with its flesh.

Near one extremity of this carcass he distinguished an

appendage or arm hanging down into the water, which, from his acquaintance with the sepia, he concluded to be that of the animal, being probably the only one left after the rest had putrified or been devoured.

Such was likewise the opinion of a navigator of much experience and long observation in the vicinity of the North Atlantic then on board, who remarked that the corrupting lump was intolerably fetid and offensive to man, and would, if the brig was suffered to run against it, impregnate her with the foulness and stench for the whole voyage. She was accordingly kept to the windward of the lump, thus avoiding it, but the stench was, notwithstanding, extremely noxious and disgusting.

On conversing with mariners in the White Sea, such occurrences were spoken of by them as too common to excite much attention or any doubt.

Afterward, while at Drontheim, in Norway, Capt. N. disclaimed with practical men concerning things of this kind. The prevailing idea was that such drifting lumps were by no means uncommon, but that the purpose of fragments of whale squids; that these were sometimes borne away by the Macström current, and engulfed and dashed to pieces by its whirlpools, and thus these broken trunks and limbs sometimes cast on shore and sometimes tossed about on the sea.

It is supposed that squids and whales inhabit the same tracts of ocean, because the former furnishes food for the latter, at least for the ecaudates, orco, and other toothed and voracious species.

SPRING BIRDS OF NEBRASKA.

BY A. HALL.

52. Common Crow—*Corvus frugivorus* Bairr.—This species is a very shy bird in Ohio, but here it is quite tame, and takes but little notice of man. They are often seen following the plow in the fields.

53. American Magpie—*Picus rustica hudsonica* (Cob.) Ridg.—An irregular visitor. I am told that they were quite common years ago, but now they are rarely seen in this vicinity.

54. Blue Jay—*Cyanocitta cristata* (L.) Strickl.—This species is rare in this vicinity, but once seen, April 30.

55. Kingbird—*Tyrannus carolinensis* Id.—Common; breeds. Arrives in May.

56. Arkansas Flycatcher—*Tyrannus verticalis* Sw.—Saw this species in open prairie, perched upon weeds, watching for their insect prey. Habits like the preceding, but not so common.

57. Say's Pewee—*Sayornis sayi* Bd.—Saw this species only on wooded streams. It was very shy and I was able to procure but one specimen.

58. Night Hawk—*Chordeiles pictus henryi* Cass.—The night hawk is exceedingly abundant here. I have counted upward of fifty at one time as they were darting about in their catching insects. When perching, this species sits lengthwise of a limb, generally roosting upon a tree, while the whip-poor-will roosts upon a log or the ground. These two species are often confounded, but are distinguishable by the conspicuous white wing bars of the night hawk. This variety, *henryi*, is lighter and grayer on the back than its eastern representative, but there are no other marked differences. It nests upon the ground, and lays but two eggs.

59. Belted Kingfisher—*Ceryle alcyon* (L.) Boie.—Common, breeding upon suitable streams of the West. Nests in a hole in bank, excavated by the bird. Eggs pure white.

60. Hairy Woodpecker—*Picus rufinus* L.—A regular migrant, but not abundant. Specimens taken.

61. Red-headed Woodpecker—*Melanerpes erythrocephalus* (L.) Sw.—Not uncommon in spring. I saw no woodpeckers in this vicinity until April.

62. Golden-winged Woodpecker—*Colaptes auratus* (L.) Sw.—Abundant. Breeds in May.

63. Hybrid Woodpecker—*Colaptes hybridus* Baird.—Abundant in company with preceding. Examined several specimens. The one now before me has red maxillary patch (black feathers hardly noticeable), wings and tail underneath, yellow orange, shafts reddish. I may be wrong in placing this as a distinct species. Would like to hear from some one upon the subject.

64. Red-headed Woodpecker—*Colaptes merriami* Sw.—This species is rather rare here, but I succeeded in taking an undoubted specimen of this species.

65. Great Horned Owl—*Bubo virginianus* Gm.—One specimen taken. I think its occurrence here accidental, as there is no heavy timber suitable for breeding.

66. Short-eared Owl—*Isto asperipennis* Pall.—Resident and abundant. Breeds in May. Found nest in hollow of willow stem, fifteen feet from the ground, in which about two feet from the top, upon decayed wood, two white eggs were deposited. This species generally nests upon the ground in burrows.

67. Burrowing Owl—*Speotyto cunicularia hypogaea* Cs.—This species is exceedingly abundant, breeding in the burrows of the prairie dogs. On approaching one of these dog towns, you will see these little owls perched upon one of the innumerable little mounds that mark a village, standing erect upon their long legs, and nodding until their heads almost touch the ground. They are quite tame at first, and are then easily secured, but after a few shots, they become very shy and fly up out of range. I never saw them take to the holes unless wounded. I dug into several of these holes for eggs, but failed to obtain any; I succeeded in finding one, however, within a foot of the entrance of a hole. It was pure white and fresh. This was last week in May.

68. Marsh Hawk—*Circus cyaneus hudsonicus* (L.) Cs.—On the great plains of the West I saw this species in great abundance; skimming about in all directions in quest of mice and small birds upon which they subsist. The nest is placed upon the ground and is composed of dry weeds and grass only. The eggs are five in number, of a dull white color, with light bluish taint. Upon approaching a nest of this species the old bird flew off and crept about just above my head, uttering in rapid succession the notes *hoo, hoo, hoo*, and as soon as I had retired a few rods, she at once returned to her eggs. I did not remove them for several days, but visited them daily, and at each approach the same performance would be gone through with. Occasionally the female would fly off and bring her better half to the rescue, but he being a great coward kept at a respectable distance.

69. Swallow-tail Kite—*Elaenoides forficatus* Cs.—A regular visitor. While walking along Wood River one very windy day, I saw a fine specimen of this beautiful species dart into the brush and light upon a small tree, and as he sat there struggling with the wind, I easily crept to within

easy range and added another rare bird to my list. This is the only one I saw.

70. Lesser Falcon—*Falco mexicanus* Licht.—This species is apparently not very abundant in this locality. I saw but two, and they were following up the streams. It was impossible for me to shoot one even to get a shot. The pair I saw flew directly over my head, but before I could raise my gun they were out of range.

71. Richardson's Hawk—*Falco richardsoni* Ridg.—Not uncommon. Plumage lighter on back than its Eastern ally, but no other marked differences save about same.

72. Sparrow Hawk—*Falco sparverius* L.—Abundant. Breeds. The Ohio hawk which offers a homony on all hawks, ought to be banished so as not to include this beautiful and useful species. The sparrow hawk kills great numbers of mice and noxious insects, and therefore should be protected instead of being killed.

73. Swallow's Hawk—*Buteo swainsoni* Bp.—This species is very abundant. Among migrations almost every tree contained one. They were quite tame, and easily approached. They do not tarry long before leaving for their breeding places in Northern Dakota and Northwest.

74. Long-legged Hawk—*Archibuteo lagopus sancti johannis* (Gm.) Ridg.—This species is very abundant in winter, and subsists entirely upon mice, frogs and small rodents. It seldom if ever preys upon birds.

75. Ferruginous Long-leg Hawk—*Archibuteo ferrugineus* Licht.—Breeds in Nebraska, but is accidental. One was taken near Grand Island, Neb., in winter of 1881.

76. Fish Hawk, Osprey—*Pandion haliaetus* Sav.—Not uncommon on Platte River.

77. Golden Eagle—*Aquila chrysaetos* Cuv.—An irregular visitor. I received a fine specimen of this species in the flesh, shot January, 1881, from my friend F. W. Powell.

78. Turkey Buzzard—*Callisitta voca* L.—Common. Arrives from the South early in April, and probably breeds.

79. Carolina Dove—*Zenaidura macroura* Bp.—Abundant, nesting upon the ground, on the banks of wooded streams. Found one nesting in trees.

80. Sharp-tail Grouse—*Pedicularis phasianellus columbianus* Cs.—This species is no longer a resident of Northeastern Nebraska, where it once used to breed. A few winter in company with the prairie hen, breeding in North Nebraska and Dakota.

81. Pinard Grouse—*Caprimulgus rapido* Bd.—Abundant, and becoming more so every year, notwithstanding the destruction of thousands of eggs every year by prairie fires. I found several nests of eggs destroyed in this way.

82. Virginia Partridge—*Ortyx virginiana* Bp.—The quail, or Bob White, is quite abundant, but is confined mostly to thick wooded streams. I have, however, seen them far out upon the open prairies. They are seldom shot by the residents who say that they are too small to kill.

83. Killdeer Plover—*Charadrius vociferans* Cass.—I was very much disappointed in not seeing more plovers. I had expected to get several species, and this is the only one of the family I saw. The killdeer arrives the last week in March, and breeds in May.

84. Avocet—*Recurvirostra americana* Gm.—My friend F. W. Powell shot a fine specimen of this species upon the Platte River in the spring of 1882.

85. Wilson's Snipe—*Tringa wilsoni* Cs.—Apparently not very common. I took two specimens, male and female, which were the only ones I saw. They probably breed upon the Platte.

86. Wilson's Snipe, English Snipe—*Gallinago wilsoni* Bp.—Apparently rare in spring; but one specimen was seen on the Platte River.

87. Semipalmated Sandpiper—*Ereunetes pusillus occidentalis* Cs.—Common in winter. I have examined several of this so-called Western semipalmated sandpipers, and I think it identical with *E. pusillus* of the East. Would like to hear from others upon this subject.

88. Least Sandpiper—*Aerotromas minutilla* Cs.—Common on Loup River, feeding upon the mud bars. When standing perfectly still upon these bars they would run around me like chickens.

89. Baird's Sandpiper—*Aerotromas bairdi* Cs.—This species arrives from the south in small flocks in April, and is the most abundant of the family.

90. Great Marbled Godwit—*Limosa fedra* Ord.—A common migrant, frequenting the sand bars of the Platte.

91. Greater Tattler—*Totanus major americanus* Gm.—A regular migrant; common. This species is easily identified by its long, yellow legs—hence the name. Frou the throat of one I took a fish three inches long.

92. Lesser Tattler—*Totanus floripes* Gm.—Regular migrant, common.

93. Bartramian Tattler—*Bartramia longicauda* Cs.—Commonly known as upland plover. Arrives last week in April. Breeds in May. They are very tame and are often killed by the herders with their long whips.

94. Long-billed Curlew—*Numenius longirostris* Wils.—Common on the Platte, and also upon dry places, where it feeds upon various insects. It utters a prolonged whistle that can be heard a great distance. Breeds on the Platte in June.

95. Eskimo Curlew—*Numenius borealis* L.—This species arrives upon the wheat fields in April in small flocks and is then very shy. I succeeded, however, in shooting five by getting a horse between myself and the flock and urging him sidewise until within easy range.

96. Great Blue Heron—*Ardea herodias* L.—A common migrant, seen on wooded streams only.

97. Zetteren, Sandpiper—*Botaurus nigritans* Cs.—Common. Breeds in May.

98. Whooping Crane—*Grus americana* (L.) Temm.—A common migrant. While camping upon the Platte River, I had a good opportunity to watch these beautiful birds as they came in from the prairies every evening. Usually fifteen or twenty were seen together, flying close to the water's edge in single file. They would alight upon a sand bar at a distance of perhaps fifty rods from me, carefully folding their beautiful wings and strutting proudly about. This species is very shy, and impossible to take with an ordinary shotgun. I offered a bounty of five dollars apiece, but failed to secure a single specimen. The white crane arrives about the middle of March, and none are seen here after April 20.

99. Sandhill Crane—*Grus canadensis* (L.) Temm.—This species is as large as a turkey, and is very good eating. They seem to delight in mounting high in the air, and soaring in a regular manner as the turkey buzzard, uttering, as they go, a coarse, rolling, rattling note, somewhat like that of the tame pigeon, but very much louder. They breed upon the Platte in June.

100. Carolina Rail—*Porzana carolina* (L.) V.—A very rare

migrant. I saw but one specimen on the Platte. My friend, F. W. Powell, is a very close observer of birds, tells me that he never saw it before.

101. Coot, Mud Hen—*Fulca americana* Gm.—Common. Breeds upon small lakes near Loup River.

102. White-fronted Goose—*Anser albifrons* Gm.—A rare migrant. One specimen was taken upon the Platte by F. W. Powell in spring of 1881.

103. Snow Goose—*Chen hyperboreus* Boie.—Locally called here. It is the most abundant of all the geese I saw upon the Platte, and the most difficult to shoot, as they fly very high and seldom come within range. As they sit upon the sand bars they look, in the distance, like huge snow banks. They leave the Platte for their northern breeding places the last week of April.

104. Canada Goose—*Bernicla canadensis* Boie.—Regular migrant, but not so common as the following. Locally called "Mississippi goose."

105. Hutton's Goose—*Bernicla canadensis huttoni* Cs.—Same as preceding, but smaller. Hunters who make a business of shooting geese for their feathers tell me that one man has been known to kill forty in a single day with a shoulder gun. I saw hundreds of them sitting upon the ice early in March. All geese leave the Platte by the last week of April. I do not regard a spring goose as fit to eat. They are lean and taste very fishy.

106. Mallard Duck—*Anas boschas* L.—Regular migrant. A few remain to breed.

107. American Widgeon—*Mareca americana* Gm.—A regular migrant, but not common.

108. Green-wing Teal—*Querquedula carolinensis* Steph.—A common migrant, frequenting the small streams. Are considered worthless as food, being too small.

109. Blue-wing Teal—*Querquedula boschas* Steph.—A regular migrant, but not so common as the preceding.

110. Shoveler Duck—*Spatula clypeata* Boie. Saw them in company with teal. Not common.

111. Merganser—*Mergus merganser* L.—A common migrant.

112. Hooded Merganser—*Mergus cucullatus* Bth.—Occasionally seen in winter, but rather rare. Mr. T. W. Powell shot a pair in the winter of 1880.

113. White Pelican—*Pelecanus erythrorhynchos* Lath.—Occasionally seen on the Platte River.

114. Franklin's Rosy Gull—*Chroicocephalus franklini* Rich.—Rather rare. Saw a small flock of five flying up the Platte River, which were the only ones I saw.

THE MAINE TAXIDERMIST LAW.

Editor Forest and Stream:

The Maine Legislature of 1883 has repealed "all acts and parts of acts authorizing the appointment of taxidermists," and also Section 17 of Chap. 50 Pub. Laws of 1878. Chap. 50 relates to "game and birds," and Sect. 17 reads as follows: "The provisions of this act shall not apply to taxidermists commissioned by the Governor with the advice of the council, to take and kill birds for scientific purposes, provided they kill the birds for such purposes only."

Since law has been enacted as a substitute whereby the cause of science may be legally advanced, and so far as I can learn, the only argument in favor of the repeal of this law was that it had been violated and its privileges abused. Such an argument can be applied to some of our most wise and beneficent laws, and the policy of total prohibition of reasonable privileges not only fails in practice to remedy abuses, but really aggregates evils, and increases the mischief arising therefrom. Yet the aggressive zealots of the law, so often arising, and punished even with constantly repeated examples before them, of the fallacy of their theories. Upon such a reasoning one might advocate a perpetual close time for game, because the privileges allowed by existing laws have been, and always will be to some extent, abused; and, indeed, the constant efforts for the enactment of more rigid laws, so often urged by theoretical zealots, and so often arising, and punished even with constantly repeated examples before them, of the fallacy of their theories. Upon such a reasoning one might advocate a perpetual close time for game, because the privileges allowed by existing laws have been, and always will be to some extent, abused; and, indeed, the constant efforts for the enactment of more rigid laws, so often urged by theoretical zealots, and so often arising, and punished even with constantly repeated examples before them, of the fallacy of their theories. Upon such a reasoning one might advocate a perpetual close time for game, because the privileges allowed by existing laws have been, and always will be to some extent, abused; and, indeed, the constant efforts for the enactment of more rigid laws, so often urged by theoretical zealots, and so often arising, and punished even with constantly repeated examples before them, of the fallacy of their theories. Upon such a reasoning one might advocate a perpetual close time for game, because the privileges allowed by existing laws have been, and always will be to some extent, abused; and, indeed, the constant efforts for the enactment of more rigid laws, so often urged by theoretical zealots, and so often arising, and punished even with constantly repeated examples before them, of the fallacy of their theories. Upon such a reasoning one might advocate a perpetual close time for

birds, and among these correspondents are gentlemen of scientific attainments well known here and elsewhere. Are all these persons to be classed with poachers, absolutely prohibited by law from further observations and study of our birds, or obliged to restrict themselves to "hawks and crows"?

I have been in the habit of obtaining birds for study, often preserving their skins and skeletons, either for my own ornithological collection or for that of the Portland Natural History Society, of which I am a member. As for game, I am not loath to seek it elsewhere than in the State of Maine, but with the greatest that I am prohibited the continuance of the study of natural history at home. I am already an involuntary offender against the law, and am likely to be so in the future, by "having in possession" specimens of insectivorous birds.

Birds are sent to me for identification or examination, freely killed ones as well as skins, from North, East, South and West, often from regions far beyond the limits of Maine or New England; yet now I am liable to arrest and a heavy fine for having in possession any "insectivorous" bird. What shall I do when dissection reveals to me insects in the stomach of a bird in my possession? Even the shrikes or "butcher-birds," which attack canary birds if exposed in their cages at windows, and kill many of our small native birds, are insectivorous, and cannot now be killed either for scientific purposes or as a nuisance, except under the liability of heavy legal penalties. The law now stands as follows:

"No person shall kill, or have in his possession, except alive, any of the birds commonly known as larks, robins, swallows, sparrows, or orioles, or other insectivorous birds, crows and hawks excepted, under a penalty of not less than one dollar nor more than five dollars, for each of said birds killed, and the possession by any person of such dead birds shall be prima facie evidence that such person killed such bird."
—[Approved Feb. 26, 1883.]

This enactment, and the repeal of the taxidermist law effect a legal prohibition, under severe liabilities, of the practical study of ornithology as applied to the larger part of our small land birds, forbids the capture or possession at any time of such birds, for any purpose whatever, and provides a penalty for shooting some of our game birds, even in the open season provided by our game laws.

Such extreme measures are to be deplored by all who have a practical, scientific and knowledge of this subject. To the advocates of such prohibitory laws leaving no practical ground, or sympathy with, either field sports or scientific study, probably there will seem no room for regret at these recent enactments. But all better informed persons deplore such extreme and undesirable measures. As a class our farmers are always interested in the protection of little birds, yet they have sufficient intelligence to know that it is only by the scientific observations of those desiring their attention in the study of ornithology that the public generally is informed as to what birds are beneficial to agriculture, and what ones are injurious to crops. And to learn this it is necessary to kill many birds, at all seasons, and by dissections learn just what forms the food of each species in certain districts, what kinds of birds subsist upon noxious insects, what ones subsist upon grain, birds, etc., and many other facts of which a thorough knowledge has not yet been fully developed.

Even the old taxidermist law, imperfect in some respects, may be deemed preferable to the extreme laws recently enacted, if energetically enforced. The enforcement of the old taxidermist law in regard to "scientific purposes only" would alone correct many of the alleged abuses.

To those inclined to commit abuses, if there are any such among our taxidermists, this new law will barely prove an even countercheck.

Others may hold such extreme laws in open contempt, and the large class of ornithological students, sportsmen and others taking a practical interest in birds, who feel under a moral restraint and strive to respect our laws, will be the ones to suffer by being deprived of favorite pursuits.

Let our birds be protected by practical laws, such as can be enforced. Such laws should be framed with all the liberality consistent with the object in view, and then will be supported by the public, both in sentiment and deeds.

I would suggest to all interested in the subject that active steps be taken toward remedying this matter as it now stands by presenting a bill for enactment at the special session of our Legislature next August. Provision should be made for the appointment of taxidermists as heretofore, and it might be well to provide that all such appointments should be made upon the recommendation of an officer or the officers of some natural history society incorporated in this State. A clause prohibiting the taking of moose, caribou, deer, woodcock, grouse, quail, dusky ducks, woodducks and Bermanian sandpipers, or "upland plover," for any purpose whatever, except during the times allowed by the current game laws of the State, would be a guard against attempts to shoot game under false pretenses. A well drawn law properly presented to our Legislature by some one thoroughly informed on the subject would probably be readily enacted.

EVERETT SMITH.

PORTLAND, MAINE, APRIL 28, 1888.

HOW SNAKES SWALLOW.

SPeAKING of snakes and their elastic throat capacity, it occurs to me that sixty years as naturalist and half a century as taxidermist would not usually bring several points of interest under an eye not totally blind. By practice a man will sit or stand motionless longer than he can at first believe possible, and it is only when this art is acquired that animal life is fully over-reached. They seem to recognize life in a great measure only by motion.

I have had a creature touch my boat with his nose and pass on only a little suspicious. I have had a humming bird bring suspended within a foot of my own nose for half a minute looking me squarely in the eye, and as I did not even wink, return to flowers within an arm's length, with the very proper conclusion, You look like a man but I believe you are only an old stump.

Snakes approach their victim like the hour hand of a clock. There is no perceptible movement. One little spot of the body moves, while all the rest is fixed. The head moves by an impetus from the tail, perhaps, and when striking distance is reached, the muscles are relaxed for the final spring. This is made with no regard to what part of the object is reached. If a frog is caught, as is often the case, by a hind leg, that leg goes down first, while the body follows in a bunch. If a snake catches a neighbor by the head, as the water snake, lately referred to, was caught, he goes down head first; if

caught by the middle, as I once knew to be done, he is swallowed double, and in this case the swallower was but six inches longer than the swallowed. The seven red squirrels I took from the body of my black snake followed each other head first, a most positive evidence of fascination, since it is hardly possible that such unbroken succession could be the result of any other process. But the snake is not the only creature that swallows "big things." I once cut from the throat of a hawk the foot, leg, shoe and a shorter blade of the entire of a muskrat. I once took from the neck of a weasaver a snake thirteen inches long whose head girth was double that of the duck. I cut from the throat of a heron a chicken as large as a woodcock, and sat almost an hour as "Crowner's quest" before it got through my thick skull what those soft yellow feet and bill belonged to. This capacity for extension is common among birds and reptiles, owing to the flexibility of the posterior connection of jaws, or mandibles, they being held together by muscular contraction, and not by bony joints as in mammals, distension does not produce dislocation.

B. HORSFORD.

SPRINGFIELD, MASS.

NOVA SCOTIA SPRING NOTES.—As I expected, our spring has commenced earlier than usual, and I think it will be generally found that after a steady cold winter like that we have experienced, which is a somewhat rare phenomenon in our province, the succeeding spring will have a fairly even temperature. The first croaking of frogs, which is both animal and vegetable life. The first harbinger of spring, a snow-bird (*A. hyemalis*), put in an appearance on April 30, and, on the 31st, the first creeping thing observed was the well-known caterpillar, of *Pyrrhoxestia isobella*. The temperature, however, hardly rose above 32 degrees until April 3, when, with the thermometer at 38 degrees in the shade, and a warm sun making itself felt in sheltered south aspects, the common housefly and a few other species of *Diptera* began to buzz about the windows. The first "murmuring" willow (*Salix*) began to open its catkins. April 5, song sparrow (*M. melodia*) first heard singing. April 6, white-clover (*T. repens*) leaves just opening. April 7, plenty of robins (*T. migratorius*) about. April 10, thermometer at noon 57 degrees; a lovely, warm, summer-like day. First croak of frog heard this season, about 6 P. M., in a neighboring swamp. Last year the first croak from that place was heard April 18, so that the frogs awoke from their winter slumber eight days earlier this year than last. This is unusual occurrence, for from close observation for many years, I have found the time of first croaking to vary, as a rule, but a few days either way.

In 1875, first heard April 18; in 1880, April 16; in 1881, April 17; in 1882, April 18. In some especially early seasons I have heard them even a few days earlier than this year. In 1865 I registered April 6 as the date, but that is the earliest I have. On April 12 the first purple grackles, called here "swamp robin," (*Q. porphyrio*) appeared. This was a close, damp day, with a heavy southwest wind, and thermometer at 55 degrees. In the evening we had a perfect serenade from croaking frogs in the swamp. April 13, first butterfly (*V. antipus*) of the season seen—one of last year's stock. April 15, a glorious day, with the thermometer standing at 60 degrees in the shade, and 94 degrees exposed in south aspect to the sun—a general awaking of animated nature; woodpeckers hammering, frogs croaking, several *Culex* and *Aedes* larvae (one very large) about the mud-vents of insects, especially small *scarabæ*, filled the air.

As last, therefore, after one of the most severe and steady cold winters we have experienced for years, we may congratulate ourselves that we are commencing a glorious spring, which I trust may prove the forerunner of a still more glorious summer. I must not omit to mention a singular fact in regard to the Northern migration of the wild geese this spring. Not a single flock has been observed passing over this portion of the province up to date, which they kept to the eastward outside the coast line, or have they taken a line more to the westward—over Maine and New Brunswick? I have never known them to fail us before.—J. MATTHEW JONES, (Fern Lodge, Nova Scotia.)

A PARTRIDGE MYSTERY.—It is hardly safe to brag of personal charms and accomplishments; it is apt to exaggerate, but I do think a good deal of my eyes, especially when directed along the gun barrel with game in the distance. Once, however, I must acknowledge they came near proving a failure. I was out shooting warblers in May, looking at trees to get a better thing than I saw in my hand. A partridge almost under my feet. I thought nothing of it at the time, but the next morning in the same place, up flew a partridge in the same manner. Looking down I discovered a nest full of eggs. "Well, old Biddy, I came near stepping on you; I will keep away and not disturb you again." The third morning I thought I would look at the bird on her nest. There was a cow path not five feet from the nest, which was close against a pine tree, and along this path I had passed a dozen times without seeing her from her home. I walked slowly along the path, looking squarely down on the bird, but saw nothing. "Well, that is great, anyhow." I turned about, walked again past the tree, and was again at fault; I could not see the bird, I did not see the leaves about the nest, "I could not see nothin'!" Like Rip van Winkle, I began to doubt whether it was me or somebody else. A third time I came abreast of the nest and stopped. I stood in the same nervousness and could see nothing, but here the bird got up herself and winked. I saw to motion of the eyelid, then I saw the bird. Now, "my brethering," if you can explain this phenomenon please do so, for I cannot. I will only forbid personal allusions as to what might have been the cause, and say it was nine o'clock A. M., and I had no empty flask in my pocket.—B. HORSFORD (Springfield, Mass.)

RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—Received by purchase—One female tiger (*Pelis tigris*), one male leopard (*Pelis pardus*), one male oryx antelope (*Oryx leucorhinus*), two crowned cranes (*Grus coronata*), one male *Colinus*, one male *Chalcophaps indica*, two black storks (*Ciconia nigra*), one crested pelican (*Pelecanus onocrotalus*), one rhea (*Rhea americana*), seven male swans (*Cygnus olor*), two summer ducks (*Querquedula*), one female and two male mallard ducks (*Anas boschas*, six male and six female), one male American wildgoose (*Mareca americana*), two yellow-bellied songsters (*Labrus lutescens*), and two towhees (*Spizella breweri*). Received by presentation—One male Virginia deer (*Cervus virginianus*), two opossums (*Didelphis virginiana*), one red fox (*Vulpes canadensis*), one woodchuck (*Spermophilus*), one great horned owl (*Bubo virginianus*), one mockingbird (*Mimus polyglottus*), one duck hawk (*Falco columbianus*), two blackbirds (*Agelaius phoeniceus*), one red-winged blackbird (*Agelaius phoeniceus*), ten alligators (*Alligator mississippiensis*), ten water snakes (*Diplocheilus fasciatus*), one black snake (*Coluber constrictor*), one water snake (*Agkistrodon aquaticus*), one green snake (*Opheodapsis major*), one king snake (*Lias carolinensis*), one blacksnake (*Agkistrodon constrictor*). Born in the garden—One snake named *Agkistrodon constrictor*, one snake named *Agkistrodon constrictor* (*Coluber bethleemensis*), and one young dove (*Cathartes aura*).

NORTH AMERICAN REPTILIA AND BATRACHIA.—Number 21 of the Bulletin of the United States National Museum consists of Dr. H. C. Yarrow's Check List of North American Reptilia and Batrachia, with a catalogue of specimens in the U. S. National Museum. Such a check list as the present was greatly needed, for it is nearly eight years since Cope's similar publication appeared, and within that time there have been many additions to that list, and many new discoveries, especially changes in it. Happily the work has fallen into good hands, and has been well done. Dr. Yarrow's qualifications for the laborious task which he has just completed are well known to laborers in the field of science, and the pamphlet shows everywhere evidences of ability, experience and general fitness for the task. The collection of reptiles in the institution has been divided into two series, called reserve and general collections. In the former are included all the type specimens that have been described by the earlier writers on North American herpetology; all those specimens identified by Prof. Cope, at the time he studied the entire collection of the museum; specimens of the same species from different geographical areas; specimens which show abnormalities from the type descriptions or variations of color or scale formula. This collection now embraces 469 species and over 4,000 specimens—an unrivalled collection of North American reptiles. In preparing this list the geographical limits of "North America" have been somewhat extended, and for Dr. Yarrow's part these have been drawn from the extremity of the California peninsula easterly to the mouth of the Rio Grande, forming its southern boundary. The nomenclature and classification employed in the list are substantially those employed by Prof. Cope in his list published in 1875. Besides the bare check list, the following important lists are included in this paper: Check list of the reserve and general series of North American Reptilia and Batrachia; notes on Testudinata; list of specimens of North American Reptilia and Batrachia deposited by the National Museum; and indices to the generic and specific names of the Reptilia and Batrachia mentioned, to their common names, to the localities whence they have been obtained, and to the contributors to the collection.

TENNESSEE OWL.—Portland, Me.—This little owl of the north, but slightly larger than the common Scudian owl—that is the smallest owl known in the New England States—is not a very common species within the limits of the United States, although it may be a regular winter visitant, and it is not improbable that it will be found breeding in the northernmost part of New England. I am indebted to Mr. Montague Chamberlain, of St. John, N. B., for notes concerning the occurrence of Tennessee owl in some of the New England States. One shot by Mr. James Garnett, of Garnett's Stream, ten miles east of St. John city, in the middle of August, 1880. Mr. Garnett shot another at the same place December 31, 1881. Audubon recorded the occurrence of this species at Bangor, Me., "in the beginning of September." For a note of its capture in spring I am indebted to Mr. A. M. Tufis, who obtained a male specimen taken at Dexter, Me., in April, 1877; also a female specimen taken near Lynn, Mass., November, E. S. Dyer, writes me that he obtained one taken in Penobscot county, Maine, January 15, 1882, and two taken in the same county January 23, 1883. Two were taken near St. John, N. B., and sent to that city February 17, 1882. Mr. C. A. Creighton has informed me of one taken at Waldoboro, Me., in January, 1881. And I am indebted to Mr. Ralph Miller, of Portland, Me., for a specimen taken by him alive, by hand, in this city, March 3, 1883.—EVERETT SMITH.

THE CRUSADE AGAINST THE ENGLISH SPARROW.—The question as to whether the English sparrow is an insectivorous or granivorous bird is receiving a great deal of attention at the hands of scientific bodies and the farming community throughout Pennsylvania. The opinion prevails that it is granivorous, and it is only when it is out of living when there are no birds or seeds to subsist upon. At a recent meeting of the West Chester Microscopical Society, an organization having among its members a number of gentlemen well versed in ornithology, the merits and demerits of the English sparrow were fully and freely discussed. The sentiment of the society appears in the following preamble and resolutions: *Whereas*, Outward observations and post mortem dissections have demonstrated that the English sparrows are not insectivorous birds, but are destructive to some of the cereals and the buds of the plum, peach and pear trees and grape vines; therefore, *Resolved*, That our Senator and Members of the House of Representatives at Harrisburg be requested to urge the repeal of all laws that prevent the destruction of English sparrows.—OCCASIONAL.

VULTURES IN MAINE.—Portland, Me.—In the autumn of 1874 two vultures (*Cathartes aura*) were seen in the town of Standish, Cumberland county, Maine, and one of them was caught in a trap. My friend N. C. Brown, of this city, has publicly recorded the capture of a vulture of the same species in Union, York county, Maine, in December, 1876. Another specimen was taken at March 1882, near Mt. Pleasant, in East Fryeburg, Oxford county, Maine, by Mr. Abel Sanborn, who reports the fact to me as follows: "A dead lamb had been thrown out, and was visited by the 'turkey buzzard,' which I shot through an auger hole in my barn." This is the third vulture of record as taken in Western Maine. Its skin has been preserved.—EVERETT SMITH. [The capture of this last specimen was announced in FOREST AND STREAM of April 30 last.]

THE LATE MIGRATORY BIRDS.—We shall doubtless have this spring a migration of all the late-coming birds in a body, as it were. May 5 to 12, when the season is an average one, are the dates the writer has always looked for the warblers in. If the birds do not appear in their usual order, gradually, but the backwardness of this season will delay the little songsters until the last moment, when they will all go through together. So, likewise, may we expect the spring flight of shore birds, especially the robin, snipe, brown-buck and black-breasted plover, and those who will kill them in May must catch them during the few days they will be seen on the coast.—HOMO.

THE MURRES.—In my closing remarks about the two species of murres known on the coast of Maine (FOREST AND STREAM, April 19, 1888) there occurs an error in application of the descriptions of the "Tomia." "Tomia of upper coast" should have been "Tomia of upper coast," and the short-billed species (*brunneicollis*), and "Tomia" (rather than "Smith") applies to the long-billed species (*tride*).—EVERETT SMITH.

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such interesting and desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

TRANSATLANTIC NOTES.

INCLOSE some extracts from a letter received lately from a friend, who is now traveling in Europe:

"I have been away now more than eighteen months, and can hardly realize that it is so long a time. Last winter we were quite busy traveling in Egypt, going up the Nile to the second cataract, and in the spring through Palestine and Syria to Greece and Constantinople and up the Danube to Vienna.

"On the Nile I found game birds much less plentiful than I expected to see them, although if one took the time a good deal of sport could be had along the banks. There are a great many birds of fine plumage, herons, penguins, cranes, etc., and any quantity of pigeons.

"We traveled through Palestine and Syria, camping out on our way to Damascus, and in one section of the country we passed through we secured up any number of quail; but as I had neither dog nor gun it was only an aggravation.

"Here in France [writing from Paris] guns generally used are of 14 and 16-bore, 12-bore are rarely seen, and 10's are absolutely unknown.

"Waterfowl shooting in France is very little, if any, practiced. I see ducks hung up for sale, but they come from Holland. The only kind I have seen have been redheads, and another that is mallard or looks like it, the red call at about one dollar each. Partridges, which are considerably smaller than ours, bring about seventy-five cents each, and quail, at this season, forty-five or fifty cents each; earlier, when more plentiful, thirty cents each. A great many pheasants are sold here. I don't think we have them in America, at least I have never seen them; they are birds of fine plumage, larger than our partridge (ruffed grouse), and much better eating, and sell at eight or ten francs each. All kinds of game and poultry here are sold by the piece, and as you can judge are very dear. M.C.

THROUGH THE WILDS OF TUCKER.

HEARING of an undiscovered country in the Cheat River district in Tucker county, West Virginia, I assembled three congenial spirits to accompany me in an exploration and hunt.

Ed. J. Clair, Syd, and myself left here on September 27, via the Pittsburgh division of Baltimore & Ohio Railway, and after four hours' ride along the banks of the Youghiogheny River, through some very grand and lofty mountain peaks, we topped one hour at Cumberland, Ind., for dinner and change of ears, and at four in the afternoon were bowling swiftly toward Rowlesburg, W. Va. There we disembarked, to the immense edification of the well-dressed passengers, for we were truly most wonderful to behold. Ed. J.'s gold-rimmed spectacles sadly accorded with his toggery, which was made up of a part of painfully ragged and short trousers, a blue shirt with worn, a battered rubber hat and a satchel slung to it, and a ten francs each. All dressed much after this fashion, Clair and myself excepted, for we two were distinguished by heavy leather leggings and two murderous looking rifles, his repeating Winchester, and mine a .45-caliber Sharps.

The train moved on amid three rounds of applause; and here we were at a place that looked the "abomination of desolation"—a wooden platform well whitened with wind and rain, two wretched wooden benches which answered the purposes of general stores, post office and doctor's office. This scene was enlivened by four plain farm dwelling houses perched prominently upon the ledges of the surrounding rocks—and well, we saw five men walking around languidly and smoking home-sawed tobacco in the leaf.

We procured some crackers and cheese, but failed to get a team to move our luggage to St. George, the county seat twenty-five miles distant on our route. After a short parley we decided to leave our saddles and blankets to be hauled over the next day, and we would move to St. George by means of the poor man's steed—"shank's mare." We slung our rifles across our shoulders, placed our revolvers prominently in the belts and started to foot it, 12.20 P. M., expecting to make the town by dark (7:30 P. M.). We were in good spirits, for the day was bright and warm, but after the first seven miles up and down innumerable wild spurs of the range we began to talk less and perspire more. At the eighth mile we came to a place where the road branched, and all concluded that we must have bread or blood. The former being more after our stomachs we knocked at the door, which frowned upon us from its second story down in all its faded country glory. The first knock brought no response; at the second a small girl came to the door. She stared at us for nearly one minute and then said, "What do you want?" We insinuated that we would like to buy some dinner and have some milk. "We have bread and apples, but I'll see." Soon a large girl came to the door, and said, "Yous folks 'll have to take dry bread and apple butter." "Bring it out," we chorused, and soon we were refreshed and prepared to do the rest of the twenty-five miles.

Again we trudged along the monotonous road, lined on either side by dense forests of oak, beech and hemlock. About three o'clock in the afternoon a drizzling rain came on and added to our many discomforts; and at four o'clock we were all wet through to the skin. By this time I had contracted a severe cold and my back and legs ached fearfully. But I bore up until darkness set in; and then told the boys I was unable to go further on account of my luck. As happy fortune would have it, we now saw a small light through the brush, away down the mountain side; and going to the log shanty we engaged a mule from Mr. John Gordon, the bearded proprietor, and in his company the procession moved on, your humble bestriding the mule.

At 8:30 we forded the Cheat River twice and entered the populous town of St. George. Being too tired to look about, we stopped before the hotel, a long two-story white frame, with flagstones in front of the porch, and entered the common room of the house, which was destitute of carpet and furniture, if we except two old chairs and a kitchen table. Mr. Hawkins, the proprietor, greeted us each by a hearty shake of the hand, and said: "Clear me, and supper will be ready in ten minutes. My ole woman won't expectin' you, but I'm

glad you've come. Set down and take off your shoes." Soon we had dried our clothes, eaten supper, and were ready to retire. Clair and Ed. were assigned a double bed next to Syd, and myself, and at eleven o'clock we were gratefully tucked under the sheets. At midnight we were aroused by a smothered groan from the next room, followed by horrible imprecations while the wall resounded with peculiar knocks. This continued until daybreak, and then we dressed and called upon our restless neighbors—a sight pitiful to look upon. Ed., completely dressed, was seated stonily upon the only chair of the apartment, smoking a cigarette, while poor Clair, in his shirt and socks, was making a bloody onslaught upon an aggressive bedbug.

"Hello, fellows, what's all the racket about?" we cried as we entered. "Well, come to the bed and look. I'm going to leave right after breakfast," said Musty Ed. "Look at this sheet," he continued: "we have been fighting lugs ever since we went to bed, and I killed thirteen with mine own hand. You see Clair is half frantic," and indeed, he looked hideous, his face covered with bites and a dangerous light in his eyes.

After breakfast we met our friend Gordon, of the night before, who had come up to offer his team. At 8 A. M. we were all under way in a two-horse springless wagon, and old Hawkins waved us a farewell as we rolled out of town. At the end of the first three miles the road was simply a trail six feet wide, winding along the edges of tremendous precipices, and through fertile bottom lands watered by the beautiful little river Cheat, which we crossed six times within the next thirty miles. This river is so grandly picturesque that it deserves special mention. It originates near the St. George region, drawing its volume from many small mountain creeks and springs. It is very shallow and pebbly in some parts, and very frequently we find deep, quiet stretches of perhaps a half mile in length fringed on either side with noble trees and hemmed in by the lofty peaks of the Blue Ridge. The river in places is very swift and contains plenty of trout and black bass. For two hundred and fifty miles it flows onward through this unbroken wilderness and empties into the Monongahela River four miles above the town of Geneva, W. Va., and one hundred and four miles above Pittsburgh, Pa.

The end of our journey was the region thirty miles from St. George, called "The Canaan," or as the natives pronounce it "Canaan." We had covered twenty-five miles of this rocky road without meeting a single team, when we espied an old square log shanty to the left of the road in a small clearing on the mountain side. "Guess we'll have to hunt here, fellows, unless you can take such a notion," said the man in the shanty, who had just finished his house while the rest watched the team. When we were close by we saw a hoary-headed fellow working away at a sawhorse, his old flannel shirt thrown well open, showing his hairy bosom, while his feet were displayed in all their pristine glory, naked and large. We saluted, and he, with a cool nod, continued to saw. "Can we put up here for the night?" we quavered in weak voice.

"Go about the house and see the women folks, I ain't got nothing to do here," he replied, and he finished his work, we knocked at the back door and found his wife, Mrs. Long, very old and very homely, but withal very pleasant. She said we might stay, but added, "We keut give you much."

Up we came with the team, unhitched near the front door and tied the horses to the wagon wheels, giving them some oats which luckily we brought with us. We sat upon the front door and looked at the old breech-loading shotgun, and soon the boys began to come in from the field. The clans gathered steadily until we had an admiring crowd of six people, who proved to be members of the immediate Long family. There were Jake and Pete, and last, but not least, among the boys Charles, a cadaverous rustic of eighteen summers. The boys, as usual, gathered around the guns and examined the Winchester carefully; but popular favor seemed to settle upon the old breech-loading shotgun, and we saw Mr. Jake, who was rigged like his companions in a short pair of pants and a nondescript garment which looked to me like a cotton flannel night shirt, took me aside and spoke as follows:

"If you men want to get shot of that 'air shotgun, I kin sell it for you."

"Ask Syd," I replied, and soon S. was undergoing a confidential examination. The old man in the sawhorse, the patriarch of the clan, then looked at the breech-loader coldly and said "he had seen them new-fangled guns twenty years afore," which was an astounding revelation to us.

After each man had fired a ball at a knot on an old tree, the old woman opened the door and invited us in. "Come in, men, and eat; you hev been tolu yonselfs aroun' a heap, and I ain't got much though."

We needed no second bidding, but went in and sat solemnly down to the feast of hot chicken, hot cabbage, and corn pone. The old man and the two boys pitched unceremoniously into the viands, and used their knives in place of forks, and being in Rome, we followed suit. After our meal was finished, Mrs. Long called the two young ladies of the house in, and they shyly sat down to the dismantled tables, and made a clean sweep. About half-past eight that evening some neighbors from South Fork arrived, and soon we were deep in the pleasures of "an apple paring, clothing scanty, were good workers, and we all pored away in silence. This monotony was broken twice by Pete informing Chas. E., Sr., that "Ball Duncan would be over tomorrow to git them potatoes," which piece of information the patriarch acknowledged by a grunt.

At 9 P. M. we monopolized the only lamp and ascended the rickety stairs to our bedroom. Here two unattended beds stared us in the face, but we had learned our lesson at St. George, and all fought hard for the third couch in the middle of the floor, preferring it to the beds. Luke and Ed. were the lucky fellows, so I proceeded to undress, or rather to dress, for the coming fray. I buckled my leggings tightly, put on an extra coat, and enveloped myself in a rubber blanket. Then I climbed upon the undisturbed bed clothes and sought pleasant dreams. Owing to these precautions I lay awake, and was fully up and under by the next day. We pushed on to Mr. John Eason's house, upon the top of the Alleghenies, and in the heart of the Canaan region. We found he had been burned out completely, but had rebuilt his house and barn upon a smaller scale. He was unable to keep us all in his one extra bed room, so, as we were five miles from the next neighbor, I slept in the hayloft. At midnight or thereabout I heard a faint rustle in the hay. I lay still and listened. A faint sawing rustle came on, and I saw a large copperhead snake near me, and if I move he will spring and bite. Five minutes more of suspense, and I rose quietly, revolver in hand,

and to my intense relief found it to be one of Eason's old foxhounds, which had come up to be company and snout. Next morning a cold drizzle and plenty of mud made the outlook anything but cheerful, and notwithstanding that Eason assured us of some black bear and a couple of bucks back on the mountain, we concluded to beat a retreat from this howling wilderness. After breakfasting upon some Eason's venison steaks (our first decent meal since leaving Cumberland) and after a pleasant chat with Mrs. Eason, who was, like her husband, an educated and refined person, we left at nine o'clock and stopped for a short time at Long's to trade my Sharp's for a little black bear. Chas. E. said, "I kalklate 'll fetch some hear meat in with this 'ere. If yous fellers want to get shot of your shotgun, I kin sell it." From here we passed slowly to Cumberland and thence to Pittsburgh, sadder and wiser men. E. P. HODGERS

Pittsburgh, Pa.

TRAP AND FIELD SHOOTING.

"The time of the singing of birds has come, and the voice of the turtle is heard in the land."

NOTWITHSTANDING we have no game laws in this State worth the name, the approach of warm weather gives our bird and animal sportsmen a season of great activity. Mating has about commenced, and there is a quail enough left in all parts of our country to raise an abundant crop of young. If the weather shall prove propitious for incubation and rearing, and no enemies shall prey upon the eggs or chicks, we may reasonably hope, when November comes, to have the opportunity of using many a shell in the field. Indeed, in some localities the remaining birds are more numerous than they have been for several years past.

Our summer pastimes will soon perhaps give me such patience enough to wait for frost for shooting, and will, in consequence, commence at an early day to rig up our trap and try our skill at puff or glass balls. I confess I do not like either, and would be glad to get some of another kind, which I have seen advertised—made somewhere in New York—but the place of manufacture of which has escaped my memory. The one I allude to is not the clay pigeon, but the explosive ball, and you can, perhaps, give me such information as will place me in communication with the manufacturer or some dealer from whom they can be had.

We have no club here, and can raise only four persons who can be relied upon to enter the lists for a friendly competition. For this reason, and for us other—and we have other reasons—we have no contests for medals, badges, prizes, pools, or any wagers. We shoot "for the fun of the thing," and need no special inducements to "try the sides of our mutant." Our ambition is of that barren sort which delights only in honor. "The almighty dollar" does not sharpen our vision or steady our nerves. Sometimes when one or more of us get away from home, and meet with those who need the other incentives, we try to be not deficient in politeness, and get up a "serab team" to shoot against obedient adepts. In such cases we do not expect any success, and are content to come out of the contest about the middle of the week that we have achieved "glory enough for one day," and are fully compensated for the loss of the "entrance money." None of us have guns larger than 12, and nearly all use 16's. This size is ample for small game, and being light, our physical powers are exactly suited. We want no chokebores, but guns which will allow considerable margin or freedom of aim. Of course we do not calculate on killing at long range except by accident, and our success has never been any reason for our success.

In our trap shooting we pull the string for each other, and the party who sits at the cord acts as judge. Nor do we care very much if the butt of the gun is a little above the elbow, or, indeed, how the gun is held, so that it is below the shoulder. In other words, we allow all the advantage which a sportsman takes when he is in the field hunting birds. On that arena such stringent rules are not recognized, and our contests have never been any reason for our success. "BALTIMORE DUCKERS."

AN article in the FOREST AND STREAM of May 3, headed as above, and giving a free advertisement to a place on the Gunpowder River, locally known as "Harewood Farm," is calculated to mislead a portion of your readers. In the first place, there is no such club in existence as the "Harewood Ducking Club." Ten gentlemen did pay a small fee last season for the privilege of shooting at this place, so cleverly advertised. I am personally acquainted with the "members" and will never be induced to do it. I can name five of the ten, whose addresses for the entire season did not number 800 waterfowl, of every description—coots, old squaws, baldpates and redheads. I am quite intimate with two of the "club," one of whom told me this morning, that he had not killed as many as fifty ducks during the season, and that he was in the blind one day in every week. This gentleman says he has had enough of ducking shores on which market gunners are privileged to shoot. "The man in occupation at Harewood is a market hunter—he sells his duck. That so many ducks were at Harewood as is claimed in the article alluded to, is doubted. Certainly not half that number were brought to bag by the "members" from this city, and they, everyone, live here. But as the renter and his brother were in the blind from daylight until it was too dark to shoot, and permitted the decoys to remain out on Sundays as well as every day and night in the week, they may have killed ducks that none of the "members" know anything about.

The writer of the puff already alluded to, forgot to state that tolling is the chief feature at Harewood, and that a majority of the ducks were killed in that way, and not over decoys, for when the winds are adverse and the tides are low, the decoys are high and dry, and so remain for hours. Now, some "true sportsmen" consider tolling fun. I regard it as being exactly the same as shooting quail while yet sitting in a boat in a cove—on their own terms.

The shooting privileges at Harewood are for rent. The writer has been informed that it is the intention of the man who rents this farm, to endeavor to get up a club of New

York or Philadelphia sportsman, and reserve the privilege for himself and brother to shoot as heretofore.

My advice to whoever rents it is to expressly stipulate that no one save members of the club are to be permitted to fire a gun on the shore under any consideration.

A shrewd market hunter, up to the sharp practices of a black duck shooter, would rent to a club of gentlemen for three or four hundred dollars—enough to pay expenses if the ducks do not come in remunerative numbers, as often happens—and by casually remarking as the contract is being drawn up, "I would like to reserve the privilege for myself and a friend to shoot when none of you gentlemen are around," will manage to sell more ducks than the ten or a dozen gentlemen will kill during the season. Has not this been the experience of every sportsman who has been caught in the trap so ingeniously laid?

GUNPOWDER.

THE GAME OF CALIFORNIA.

NOTWITHSTANDING the enterprise and extensive circulation of your paper, I have noticed in its columns few any account of the sportsman's paradise, California. I do not believe that any State in the Union is favored with such abundance and variety of game, both small and large, as this.

From the little striped chipmunk—a minute simile of a squirrel—to the ponderous grizzly bear, almost any species of game native to North America may be found. For game birds we have numerous varieties—valley quail, mountain quail, doves, pigeons, grouse and sage hens, and for water-fowl almost everything desirable from the swift little teal to the wild goose, honker and swan. Our rivers are stocked with many kinds of fish, principally salmon for two or three months of the year, salmon trout, whitefish, suckers, catfish and shad, the two last having been transplanted from other waters, while our mountain streams afford unequalled trout fishing, and contain several species of brook trout both large and small. Were I granted space I could not do half justice to the subject in describing the many varieties of game and fish in the forests and streams of California, and will confine my remarks to such sections of the State as I am the most familiar with only—the foothills and mountains.

The northern portion of the State is for the most part broken and mountainous. From the Coast Range on the west to the Sierra Nevadas on the east the country is broken and comparatively thinly settled. There is ridge after ridge of high mountains and lesser hills, and comparatively little land that can be utilized, except as a range for stock. The mountains are mostly covered either with heavy timber or dense undergrowth, according to their altitude. Throughout these mountains game abounds, comprising deer, bear, grouse, quails, rabbits, etc. In some sections trappers succeed very well in their season, the best grounds for fur being high up the mountain streams.

For deer and bear, probably, the counties of Shasta, Siskiyou, and Trinity are not excelled by any in the State, although the chances of success in hunting are somewhat more difficult than in sections where the game is less abundant but more easily accessible. During the fall and winter deer are driven from the mountains into the valleys by storms and snow, and generally seek localities where the mast is heaviest. They are tamer at such times than others, and are often found within sight and hearing of the settlements. It is no uncommon occurrence for residents of the valleys to be able to hunt in the mountains, to shoot deer, or occasionally a bear, from their doorway. In fact, I know of a stockman, who, when he desires a venison, has only to keep a lookout in the morning and evening and wait for one to come within gunshot, and he is rarely without a supply of such game in his larder. So plentiful are deer in places, that they make themselves obnoxious by their raids upon gardens or grain fields, paying their visits by night. An angry farmer in such a county, finding his corn trampled in fact they frequently choose the highest points, and in fact their crossing places, and ignore a gate even when left open. A hunter will stand outside a fence, look around awhile, flap his mule-like ears, wag his piece of a tail, and then merely loaf upward and alight upon the inside with exceeding sang froid. He will then express satisfaction with another wag of his tail, and proceed to prospect for such game "trucks" as he may prefer.

Many parts of the country, however, where deer were once plentiful, they are now scarce or extinct, and, unless the laws provided are more strictly enforced, they are likely to be entirely exterminated in time. Although the mountains afford a comparatively safe retreat, the deer are driven out by snow to the valleys and foothills, and are there killed in great numbers. Parties frequently kill them for their hides alone—making a profitable, although despicable business thereby. The result of this is a becoming obvious, and all true sportsmen are endeavoring to enforce the laws and prosecute these infamous characters in the future.

The Sacramento Dec is an able ally of the sportsmen of the State and is doing good work in denouncing transgressions of the game laws and in aiding to establish such laws as will protect fish and game from unlawful destruction and extermination, and its efforts are greatly appreciated.

I have found over a large scope of our country and occasionally through the mountains, that many of our sportsmen are endeavoring to enforce the laws and prosecute these infamous characters in the future. The California lion is the most destructive of our mammals. They attack cattle, colts, hogs, or almost any kind of stock and frequently do much damage, although they are not plentiful except in some parts of the mountains. The so-called lion is little different from a tiger, of a light red-yellow color, long tail, and about the size of a large dog, only longer, and is cat-like in stealth and treachery. It is said they seldom attack persons, but to hear one howl, and know what it is, is sufficient to terrify a person considerably. I have heard them when alone in the mountains, several miles from everywhere in particular, and I have been terrified—to state it mildly—and have regretted that such unnecessary animals existed.

The bear is like that to a human—a woman, in distress, and I blantly proclaim that there is nothing soothing about it, and to make it worse you can't tell exactly where it comes from, nor how far off it is. They are not good to eat—but they are good actors. They are game in one sense, but are not much sought after. I do not seek any—always inclined to leave them alone—or together, or any way to suit themselves. So I abstain from arraying their affairs before the public.

I intended to detail a hunting excursion, but will reserve it for a future letter, as this is already long. E. A. C. SALTA, California, April, 1883.

GAME AND FISH PROTECTORS.

SECTION four of the law reads: "For the purpose of the more effectual enforcement of the provisions of this act, the game and fish protectors shall be subject to the supervision and direction of the commission of fisheries, who shall divide the territory of the State into protection districts and shall assign to each protector his district, and shall have authority, also, to assign for temporary duty in any district, a protector from any other district. The said commissioners shall require of each protector, at the close of each calendar month, a report in writing, and in detail, stating the service performed by such protector during the last preceding month, including an account of the suits commenced at his instance, the disposition made of such suits, the result of any brought to trial, and the condition of any undisposed of; and no payment for services performed, or traveling expenses paid by any protector shall be made until the claimant shall present to the comptroller, in addition to the usual oath of performance and payment, a certificate from the said commissioners that he has made the report required by this act and has in all other respects faithfully performed his official duty. The commissioners of fisheries shall report to the Governor all cases of dereliction or neglect of duty of any protector which shall come to their knowledge, together with such evidence as they may have touching the case, and the Governor shall have authority to remove from office any protector so reported to be delinquent, after giving him an opportunity to be heard in his defense."

TEMPERATURE AND SHOOTING.—In the report of the Chief of Ordnance for 1882, which has just come to hand, we find the following interesting report of some experiments made at the Frankford Arsenal: "During December, 1881, and January, 1882, very extensive experiments were undertaken to determine why our velocities obtained in summer were so much higher than those obtained in winter, when the same charge was used, the only seeming variable being the difference in temperature of the atmosphere. Some 326 velocities were taken, with the cartridge and rifle both warm and cold, the air through which the bullet passed being about the same temperature. With the cartridges and rifle warmed by a temperature equal to that obtained in summer, and cleaned between each shot, our velocities were 1,356 feet; and with cartridges and rifle cold at a temperature of thirty-two degrees, the cartridges being kept at that temperature long enough to insure the same case having that degree of heat only, gun not cleaned between shots, we obtained only 1,295 feet velocity; a difference of some 61 feet. We also found that the pressures under these different circumstances varied between 29,300 pounds when warm to 25,050 pounds when cold, and the fouling varied from 7.6 grains with cold gun and cartridge to 5.4 grains with warm gun and cartridge; our conclusions from these experiments being that the effects of the use of both cartridge and rifle are to decrease the amount of the fouling and an increase in the pressure of the gases and the resulting velocities; also, that the temperature of the air through which the bullet passes has very little effect upon the velocities, and that care should always be taken to have cartridges and rifle at a uniform temperature when taking velocities."

THE GUNNISON COUNTRY.—During the year 1880 I spent about eight months in the Gunnison and San Juan country in Colorado. My headquarters were at Mountain City, about sixty or seventy miles from Leadville. Such a paradise for large game I have seldom heard of. My "parl" and I had a cabin on the banks of Castle Creek, which emptied into Roaring Fork River, two streams of which I could tell many wonderful trout stories. There were three German brothers, who were working a claim seven miles above on the Maroon Creek. Theo. carried a Sharps rifle, Jim carried a breech-loading shotgun, an excellent shooter, too, the other one carried the day with his revolvers. They started bear one afternoon about five o'clock, but had not been gone more than an hour when they came back very much excited, saying they had killed a grizzly bear. It seems that when a mile and a half from the cabin they heard bushes crackling behind them and saw the bear following them. Theo. fired at once and struck the bear in the right side of the face. Jim, scared nearly out of his senses, fired his barrels of his shotgun loaded with buck-shot and fortunately broke the bear's backbone. They soon put an end to him. Three such scared Dutchmen are seldom seen. The bear was a very large cinnamon, and we all had a feast on bear steak.—P. S. (Buffalo, N. Y.).

ONONDAGA COUNTY, New York.—I believe I could yoke in with "Nessmuk" on many points. I observe he don't have the "whisky bottle" among his equipments, and own that I am at a loss to understand why so many sportsmen cannot go out for a day's shooting, even at glass balls or clay pigeons, without a whisky bottle or a keg of lager. I have been fox-hunting the past winter where some of the party were often carried home by the foxes, going with wonder that some men objected to fox-hunting. I have had such hunting parties, and concluded they didn't care to have their sons acquire a taste for hunting and whisky combined. Game of all kinds has nearly left these parts. We found where four partridges had been eaten by foxes this winter, and I believe foxes eat more than are killed by sportsmen.—NOVICE.

NOTES FROM COLORADO.—Como, Colorado, April 30.—Duck shooting here in South Park has been rather poor this spring. The ducks have been plenty, but very wild. However, I have shot twenty in three days' hunting. Most of the ducks are redheads, mallards and gray ducks. Yesterday I drove to a lake six miles from here to dig me a blind, and saw the first flock of curlew I have seen in the park. I find it very difficult to judge the distance of game at this altitude (9,500 feet). The air is so clear, that the game appears much nearer than it really is. This makes duck shooting much more difficult than on my old hunting grounds, on Lake Champlain.—F. B. J.

DOWN THE MISSISSIPPI.—May 3.—I have found plenty of duck down the Mississippi, that is as far as I am. The first day out from Louisville I saw three flocks of mallard, the third day out while I was sitting on the boiler deck I saw three single ducks, four pairs, and nine large flocks within a half hour; the fifth day out I saw seventy-five ducks within five minutes and within four miles of Vicksburg. I expect to see many more before the trip is over.—JEM.

SNIPES SHOOTING.—The snipe have made a late appearance on the Jersey meadows this year. Mr. Justus Van Leugerke was out on the first of the week, and reported nine killed out of ten found; and this in the wake of two other gunners. In Connecticut, we are informed, Lyme is a good point for snipe shooters. Go to Clark's Hotel and engage the services of "Bill" Flint, who is a good guide for the Essex meadows and the Ely meadows near by.

A GALA DAY.—Muncy, Pa., April 22.—The oldest sportsman that you've met for many years so many ducks have not been seen on the river at this place as on Friday last. It was a grand old holiday for sportsmen. The little steamer Full Moon, owned by Captain John M. Bowman, steamed down on Muncy Dam, a beautiful sheet of water, and on their return home the captain and party shot forty-seven ducks.—FULL MOON.

MISSISSIPPI.—Brookhaven, April.—Quail shooting the past season was unusually good. The freedom of this section is one of Bob White's most harmless enemies. Neither his trap nor army musket has much to do with the extermination of our favorite game. I know of but one turkey in the county who shoots on the wing, and he being an industrious fellow spends very little of his time hunting.—I. L. G.

TEXAS QUAIL.—Indianola, Calhoun County, Texas, April 30.—We are having a very cool, backward spring, and there are some ducks here yet. If some of your readers wish to shoot quail they ought to come out in this section; across the bay from us, three miles, there are thousands, and they are hardly ever shot at.—A.

THE OWL CLUB has been organized at Lynn, Mass., for the promotion of gunning and fishing. The membership is limited to eight. The constitution is printed in a dainty little pamphlet, with a design on the cover like a *Psi Upsilon* initiation card. We wish the *Bubo* a long life.

BLACK FLIES AND MOSQUITOES.—To the many repellants already noted in these columns, we add another, namely, citronella, the oil of the lemon verbena. This is agreeable to use, has a pleasant odor; and our informant tells us it is as effective as the oil and tar combination.

THE SEDALIA GUN AND SHOOTING CLUB held a meeting at the Park, Sedalia, Mo., last Monday. The officers are: J. W. Trader, President; E. C. Evans, Vice-President; J. C. Parmerlee, Secretary; John Montgomery, Treasurer; F. Houston, Attorney.

Camp Fire Flickerings.

"That reminds me."

SPEAKING of digging a blind "reminds me" of the novel method of concealing himself used by an old friend of mine. "Bank" was possessed of an extraordinarily large understanding, and was never known to black his boots. When duck hunting, he would lie down on his back, and put his feet up in the air, which would effectually screen him from the observation of the ducks. In this way he would often come home with his bag well filled, where others would utterly fail. F. B. J. COLORADO.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

"Fishing, if I, a fisher may protest, Of pleasures is the sweetest; of sports the best, Or exercises the most excellent; Of recreations the most innocent. But now the sport is marred, and wot ye why Fishes decrease, and fishers multiply." —Thomas Bastard, in Collier's "Poetical Decameron," Vol. 2, p. 105.

A TRANSFORMATION SCENE.

Editor Forest and Stream: Will you accept a short story? I was going to add "a fishy" one, only some might object that adjective in its wondrous sense, and imagine that truth was not the basis of the narrative, which it certainly is.

Colonel D. T. and Mr. II. were spending a few days at their fishing and shooting lodges on the island of Long Point, Lake Erie, some time ago, and one afternoon were quietly yet quickly, capturing some fine green bass, and enjoying their sport.

The Colonel hooked one that he deemed a three-pounder, and gave the gamy fellow plenty of time and line, inasmuch that uninitiated onlookers might imagine almost that he was flying a kite in the lower world, or exercising some fractious phantom cot, which, like the solar eclipse this year, is invisible to us; but nevertheless the Colonel's head, like his band, is calm and cool, and experience has taught him the value of the maxim, "a lost fish is cheaper than a broken rod." At last he does its work, and the apparent three-pounder begins to show himself on top of the water. I say "begins" because it took quite a while to show all of himself, for he was no longer a three-pounder, but a thirty-pounder; he had grown in the struggle; he had likewise changed his name from bass to muscogelon. A wonderful life he must have led during the past ten minutes. Silently did the gentlemen look at one another, then at the fish. Quietly did the attendant exchange the landing-net for a gaff-hook. Not a word was spoken; not a muscle moved, only the color in the angler's face, yet I doubt if all the glory fields of glory through which the gallant Colonel had passed found him thinking more in the same period of time, than did this change in his piscatorial luck. The gaff-hook is softly lowered by a somewhat shaky, excited hand, and the fish is also lowered by a somewhat similar disposition, and both disappear, the first into the scow and the latter into twenty feet of water, and

once again the Colonel finds himself obliged to exercise his patience and discretion, but at last succeeds once more in quieting his prisoner sufficiently to bring him in view, when strange to say, his no longer the same thirty-pound muscogee, but he was retreated within the skirts of the three-pound bass again.

Oh! horrors! Is my mind wandering? Is it April? Are my eyeglasses telescopes, that I have turned end for end and seen deceptively? or are any other kind of glasses to blame and account for the phenomenon?

We give it up, as the Colonel did, in a sort of "laissez-faire" manner, and content ourselves watching the hand lower the oar, and fiscally get it, and take possession of the first supposed three-pound bass.

If I may be allowed to speculate on the above, I should guess that the muscogee mistook the bass for bait and caused the whole mistake, which when discovered he disgorged and so did the Colonel disgorge (not the bass), but a few words and epithets.

POET ROWAN, Ontario.

QUIET SPORT.—II.

BY MILLARD.

KISSING the lily-pads, waltzing with ferns and butter-cups, nodding to every bush, rippling the lake and deliciously pugged with the resinous odor of pine and balsam, came the early morning breeze. The morning light shimmered over the lake, and struggled among the trees long before the rising sun gave it a few hours of solidity. "Birds with music-finding bosoms" were pouring forth their treasures of wild melody; and then came the softest blush in the east, as our cook prepared to struggle with flannel flap-jacks.

Such mornings belong only to the forests, where each one comes "like a maiden's love, full of bloom, purity and freshness." There is wine in the air, which produces an exhilarating effect, but does not put your eyes in mourning. It is not associated with headaches, nor will it cause you to be fined ten dollars as a promise of future good behavior. It is a cordial of almost incredible virtue.

Cook's flap-jacks were light and tender, the coffee clear, the bread tolerably light. Roy had caught four fine trout, which the cook hurriedly disguised in a salt and pepper suit, with pork trimmings; and we scattered over lake and inlet and outlet, as we fancied.

Ward, as we remarked when we left the staid old town of Grosvenor, was a real lover of the woods, but he was a plebeian angler, ignorant of the niceties of fly and fighting and break of the trout. He knew naught of trout fishing and excellence. The slimy angler worm, the fat grub, and the dull third and steady pull of bottom fishing, were to him the beginning and the end of his piscatorial experience.

He had always spoken depreciatingly of the little imitation gnats, fine flies, and light rods, but had been prevailed upon to invest in an outfit, and had accordingly provided himself with a most formidable lot of fishing tackle, always insisting that he expected to derive about as much sport and pleasure as a mosquito would extract from a snow-bank. But when he saw the ease and grace with which Glen delivered his flies, the intensity of his faith in his own ability to perform as well, and the fervor of his zeal approached the sublime. He knew he could do as well with an hour's practice. He paddled his raft to one of the favorite parts of the lake and commenced to flourish his flies, which he did as awkwardly as a cow would dance on ice or a nun eat corn from the cob.

Glen, without speaking distance, advised and cautioned him, and noted a gradual improvement in his method; and after he had snapped off a few flies he thought he began to get the "hang of the thing," and took it up—*in fact* went it alone. It was a fishing day every inch of it. The trout were in feeding mood all around, but Ward missed three rises with an accuracy and precision real to wonder. His roscate pretensions were fast vanishing. His patience and his fly-book had been well tested, and he began to think fly-fishing was not as easy as his fancy painted it. There he was, during the long morning, crouched on his raft, a premium specimen of a piscatorial misadventurer. Mr. Micawber would surely have stopped waiting for something to turn up: Job would have lost his submissive reputation and said, here, old fellow, take my hat, and Patience come down from off the monument and goak to bed. All these things were his. His raft would surely have been awarded no honor above highly commended.

After long waiting, and when even he had commenced to fidget with anxiety, presto! a flash, and he had accidentally struck. The trout's movements were quick and subtle enough to disconcert a tyro, and he had his own peculiar way of dealing with matters and things. As he "flashed from the full-fished water" our friend was not polite enough to drop his tip like a gamester. The handsome fellow deserves your most respectful bow. Do not let him injure his tail by having it come in contact with your leader, Ward was suddenly seized with a nervous and excitable paroxysm, and consequently his first impulse was to grow the least mite pale, which paleness rapidly developed into as near an approach to whiteness as a living face can. His looks changed from eagerness to uncertainty, from uncertainty to despair. He was as badly off as a man with two doctors on his wrists. As his position of his position and surroundings increased it showed that his case had developed into buck-ague—the tip of his rod broke, and the leader parted. "Great Cæsar dead and turned to dust; could that little trout have escaped and left me thus?"

Ward was as pious at home as he was excitable here. He read his Bible in preference to Boacacio, and his walk was upright. Let us draw a veil before him and forget the strong, nervous Saxon he employed in deploring his ill luck, lack of nerve or needless excitability. He did not relax in expressing his own opinion of himself, but we will, for others have forgotten themselves. The rise, strike and escape were so sudden that it seemed a dream, but here's the tangible evidence that mischief had been done. A man as sadly demoralized as the Knight of the Sorrowful Countenance after his attack on the windmills, a missing leader and a broken rod, were more than circumstantial evidence of trout's late presence in the air.

Despondency reigned supreme in his corporosity, and deprecatingly dubbing himself the Jonah of the party, he paddled aboard to seek the comfort the shanty afforded, and there we found him when our morning fishing was over, and we returned for a bite and a loaf until the late afternoon fishing on the lake. As Ward's rod was broken and there were several others to be repaired, Roy, a good amateur workman, offered to supervise the putting of them in order. It was a delightful lounging place; and not thoroughly

rested from yesterday's tramp, we employed our time between loafing and the little trifles that help make a camp a pleasant place.

Beds of boughs were made; the roof of the shanty patched up; some underbrush, which had a bad habit of switching us as we went to and from the lake, cut out; the spring was deepened, and several seats were built; the great master job was the table which the cook erected yesterday, for it was away up in the air. It was a grand looking off place for the birds. If we leave it so, perhaps some one will stumble across its magnificent ruins in the ages yet to come, and will say of it: "There were gnats in those days, for here is the evidence of their one-time existence. How wonderful, and to what lofty dwarfish growths have we descended. How they would have mortified the deodades of the human corpus. However, as posterity had never done anything for us, we consulted our own convenience, by chopping off a few feet from the table and lowering it to a level with our chins.

Meanwhile Roy was busily employed in repairing the rods that had suffered during the morning's sport.

*Twixt the camp-fire and the shanty sat the expert tackle-mender.

In the land of spruce and hemlock,

In the land of running water,

Mending fishing-rods of bamboo,

Rods of lancewood and of greenheart.

Some were prying and some were planing,

Busted at the tip or root-place,

While some others scarcely scratched were.

He was thinking as he whittled,

Whittled on the joints and whistled—

Doing these three things at once—

Of the sport he'd have to-morrow,

When the morning sun was shining,

Shining if it wasn't cloudy;

If 'twas cloudy, all the same,

When it rained we've higher water.

Out to catch the Fontinalis,

Speckled brook-trout, prince of fishes,

Would the old man surely chance it?

When the old man goes a-fishing,

When the brook water is higher,

Its waters creeping up the bank,

"Whirling round and round and downward,"

You can shout your affirmative.

You can take your affidavit.

He would take his rod and chance it.

Where the rod was badly damaged,

Where the pole was busted badly.

He'd kind er' paste it up with glue

And use a quantity of silk,

Winding round and round and tying,

And then kind er' kalsomine it,

Kalsomine it with some varnish

That be carried in a bottle.

Soon the rod grew convalescent,

Eye-and-by-grew well as ever;

Then the old man stopped his whittling,

Stood erect and stopped his whistling,

Handed Mr. Ward his greenheart.

"There's your rod, old fellow, with a new lease of life, but don't do any more quick, heavy lifting with it. A slight movement of the wrist produces a wonderful movement in the tip of the rod, and it will serve you many a good turn if you treat it right."

ANGLING FOR WHITEFISH.

IN your issue of April 26 is an article on angling for whitefish. I have seen a great many whitefish taken in various ways, with pound nets, gill-nets, seines and with spears. Some were taken with the hook, or rather I do not know of one instance where this fish has taken the hook. They are sometimes hooked in the body and taken from the stream in that way, but that is not of very frequent occurrence. I know of different persons who have angled for them in the Detroit River in the fish pens where there were thousands of whitefish, and I do not know of one instance where they have been successful in taking one. It is an established fact that the fish does not feed on animal food. I have made inquiries of different fishermen on Lake Erie, Lake Huron and Lake Michigan, and only one opinion is found to prevail among them. They say the whitefish will not take the hook.

This fish is sometimes speared through the ice at night, by cutting a hole about two feet in diameter out of the ice, and three feet underneath, the object of this being to better facilitate the landing of the fish. The hole made, a stake is usually stuck in the ice to support the light. Everything being ready, the spear is taken in hand and developments awaited. The light attracts the fish, and as he slowly rises to the surface, the fisher ever on the alert, plunges the spear into him and the fish is taken.

The natural home of the whitefish is the great lakes and rivers, although they will live in inland lakes where the water does not reach a very high temperature. The average weight of this fish is about two pounds, although I have seen specimens taken that weighed from twelve to fourteen pounds. It is possible that there may be instances where this fish has taken the hook, but it is not probable. A great many persons have confounded the whitefish with the lake herring; and in fact if you take a whitefish weighing one and a half pounds, and a herring of the same weight, it would require an expert to tell which is which. They are nearly of the same color, their fins and scales are nearly the same, and a whitefish and herring weighing one and a half pounds each would be nearly of the same structure or form. There is one way by which the whitefish can be distinguished from the herring. The upper part of the whitefish's mouth is the longest, which is the reverse with the herring, the lower part being the longest. The herring are often taken with the hook during both summer and winter, and I do not think it matters what kind of bait is used. They are a very good food fish if taken when the water is cold, but if taken during the months of July and August from streams where the water is warm they have worms in them. This fish is not to be compared at any time with the whitefish. Those who cultivate whitefish for their sporting qualities will find their labor lost. But as a table fish it has no superior among our fresh water fishes.

MARTIN E. O'BRIEN.

MILWAUKEE, WISCONSIN.

[We have been told of two or three cases in which the lake whitefish have been taken on the hook, but such occur-

rences are unusual, and we presume, accidental. We know, however, that the Rocky Mountain whitefish will readily take a fly, for we have caught a great many of them in Montana in this way. Standing on the rocks in one creek we have, in three successive casts, taken, on a red lily as a tail fly, a trout, a grayling and a whitefish.]

WOODMONT ROD AND GUN CLUB.

WE supplement the frequent notices in these columns of the Woodmont Rod and Gun Club of Washington, D. C., with the following particulars, which are extracted from the Washington Star.

The character and purposes of the club will be pretty well understood by its title; but they are still further emphasized by its corporate seal, which includes as its appropriate device an antlered deer's head and two conventional dolphins on a shield, which is supported by a heraldic scroll bearing the legend "Protect and Enjoy." This is in plain English, as it ought to be, in order that the honest unlettered hunter or angler may be able to understand it without securing the services of an interpreter or referring to an English-Latin dictionary on the fly.

Like most of the successful and useful organizations of its class, the "W. R. & G. C." was born in a modest and humble way, though its founders took the wise precaution of starting at the beginning a well-located and ample field for its operations. This was found in a large old estate situated in Washington county, Md., bearing the appropriate title of "Woodmont." It lies a little above and nearly opposite Great Cacapon station, on the Baltimore & Ohio Railroad, about one hundred and sixty miles west of Washington. The original purchase consisted of 2,028 acres, but this amount has since been considerably increased by later purchases, and in order to extend the hunting privileges as well as to properly protect game, etc., the control of a large additional acreage has been secured by lease. The estate is situated on the north or left bank of the Potomac, as already stated, and extends from the river on the front to the old National Road in the rear, and from the base of the Tonoloway Mountain on the east to the crest of Siding Hill Mountain on the west. Less than ten years ago this estate was offered for sale for \$22,000, but of course it cost the club no such sum. With the exception of about one hundred acres the entire estate, with its leased dependencies, is heavily wooded with fine large timber, and in places with heavy undergrowth, which furnishes a most excellent cover for game of all kinds to be found anywhere in that section of the country. Deer and turkeys are by no means scarce, while small game, both fox and quail, are plenty in the woods, and in season ducks are plentiful on the river.

The advantages presented by Woodmont as a resort for anglers may be at least partially understood when it is stated that the estate has a frontage of three-quarters of a mile on the famous Potomac fishing grounds in the vicinity of Dam No. 6. The locality affords opportunities for both deep or still water and rapid water fishing. Below the high water runs for several miles over a rocky bed, thus furnishing a long stretch of tumbling cascades, circling eddies, and quiet pools, ever greatly affected by game fish of all varieties, and always so tempting to the angler's eye. Above the dam there is a level or pool extending some three miles to the westward, in which the water is always deep and still, and beyond this lake-like sheet of quiet water shoals and a swift running current are met again. All these are much fishing done by members of the club or its guests. In fact, there was seemingly less than the usual indulgence, whether numbers or time be considered, yet the catch for the summer added up 1,296 bass, weighing 556 pounds, or nearly half a ton in all. Perhaps the majority of these were taken with live bait, but a very fair proportion fell a victim to the seductive fly—not a few of the members declining to use any other device.

In addition to the bass, trout, having been there for nearly thirty years, may now be considered as acclimated and thoroughly at home, the Potomac at this point has been liberally stocked during the past two years with land-locked salmon, and large numbers of young brook and California trout have been placed in the streams emptying into it in that locality. It is too early yet to judge of the final results of these experiments, but a number of small salmon were taken last year, showing that there is every reason to believe that the enjoyment of the angling fraternity will be soon and greatly augmented from this source.

The living accommodations of the club consist of a large new and fine club house, situated on a high bluff, overlooking the river and a beautiful range of country beyond, which cost, with its substantial fittings, about \$6,000. The building contains a fine club room, a large dining hall, a magazine room, store room, three room-servants' rooms, and ten large fire chambers, all comfortably furnished. In front, and running around each end of the building, is a covered portico twelve feet deep. In the rear of the main building, and connected therewith, is the kitchen, and also ample quarters for the superintendent and his family. In connection with this establishment there is a stable and other necessary outbuildings, an excellent cement-lined cistern, holding more than 12,000 gallons of water, and an ample stock of excellent ice. Near the center of the estate, two miles back from the river, and in the midst of the best shooting, is a comfortable hunting lodge, containing six rooms, suitably furnished. This and two or three other houses situated at different points on the estate are occupied by the game wardens of the club, who look after its interests generally, and see to the enforcement of the game and fish laws of the State.

Already the efforts of the organization in this direction have been productive of the most encouraging results. Immediately upon entering upon proprietorship it turned its attention to the general protection of game in the vicinity, under the provisions of the Maryland laws, and the prevention of poaching on its own premises, which are formally "posted," in accordance with the requirements. Through its means the trespassing and law-breakers have been arrested and punished so that now close seasons are beginning to be observed, and private rights are respected to a greater extent than ever before. In consequence game has steadily

and rapidly increased on the estate, not only by natural increase and the protection of its own premises, but by additions to it from other and more frequently hunted sections of the country; and the woods may now be said to be fairly well stocked with deer, turkeys, pheasants and all kinds of small game.

To make all these advantages available frequent and quick means of access are of course necessary. These have happily been secured through the valuable co-operation of the management of the Baltimore & Ohio Railroad, which was not slow to see the benefits which would accrue to itself from a liberal policy in this respect, but was wise enough also to realize the fact that the only real estate and other property of a club is an object, not merely the pleasures of its own members in view. Understanding the extent to which the propagation and preservation of food supplies is becoming a factor in national economy, it has shown every disposition to aid and encourage, the club in its efforts in this direction, and to afford its members and their guests every accommodation possible. It has accordingly arranged a half rate fare and issued special round trip tickets, good until used, for the benefit of the club, and all trains are directed to stop at Great Cacapon station, for arriving and departing members, when requested by one of them to do so. Under this excellent programme members may leave Washington by the 10:15 A. M. express, and be on the club grounds by 2 P. M., in time for a good afternoon's gunning or fishing; or after angling or hunting all day, they may leave there after 6 P. M. and arrive at home by 9:30, in time for a ball or party or a good night's sleep.

The Chesapeake & Ohio Canal Company has also afforded all possible facilities to the club, and through its friendly aid and that of the railroad company, telephonic communication between the club house and the railroad station, a mile distant, has been secured—a matter of convenience to the members of the club and their guests.

The members of the club who first started it as a private association soon saw the necessity of a stronger and more flexible organization, in order to hold real estate and otherwise better carry out its objects. With this end in view a special act of incorporation was procured from the Legislature of Maryland in March, 1882, and under this charter it now exists and carries on its affairs. By the terms of its constitution the membership is limited to thirty-three, and the initiation fee is now fixed at \$500. To each member one share of stock is issued, the possession of which entitles him to all the privileges and advantages of the club and a proportionate share of its property, as in other corporations. If, however, he sold or disposed of as other stock, in open market, but under the by-laws can only be transferred back, in the event of resignation or death, to the club, at such price as may be fixed by the committee of management. This provision is necessary, as anyone can see, to secure only a desirable membership; and in order to still further insure harmony and congeniality in the club it is provided that a single member's objection voted shall prevent the election of any applicant for membership.

At the present time the roll call contains twenty-nine names, leaving only four vacancies, and these, it is understood, the club is in no hurry to fill. The members at this date are as follows: F. A. Ashford, A. W. Bacon, Marcellus Bailey, John A. Baker, J. H. Baxter, R. J. Bright, R. C. Drun, B. E. J. Ellis, Earl English, A. H. Evans, R. D. Evans, T. Harrison Garrett, George H. Gould, H. W. Guice, C. M. Williams, Lee F. B. McGuire, W. C. McIntyre, D. M. McKe, Warner Miller, Crosby S. Noyes, H. F. Picking, George M. Robeson, George P. Rowell, Thomas Russell, Frank Taylor, J. M. Tinker, W. C. Wood, Levi Woodbury.

To the most of the gentlemen comprised in this list the people of Washington need no introduction; but for the benefit of strangers it may be said that it includes prominent private citizens, members of both houses of Congress and distinguished officers in the military and naval services of the country. As would naturally be the case, most of them reside in or are identified with Washington, but the list also comprises enough of membership belonging elsewhere to give a distinctly liberal and cosmopolitan character to the club, the prime objects of which are good fellowship, healthful recreation and rational enjoyment.

It need scarcely be largely secured, not for its members alone, but for their friends as well, who from time to time are entertained by them. Indeed, hospitality has already strongly marked the history of the club so far. Among its guests, or guests of individual members last summer, were many persons distinguished in all walks of life, including the President of the United States, and the coming season promises to be even more brilliant and pleasant in this respect than any that has preceded it.

At the annual meeting of the club, held Thursday evening, the following officers were unanimously elected: President, S. H. Kaufmann; Vice-president, E. H. Picking; Treasurer, Thomas Russell; Secretary, W. C. McIntyre; Committee of Management, the president and treasurer, ex-officio, and Messrs. Levi, Woodbury, W. C. McIntyre and F. B. McGuire.

By the official reports presented the club was shown to be at a prosperous and flourishing condition, financially and otherwise, and measures were taken by the meeting, which was unusually full and spirited, to make still further additions and improvements, which will greatly increase the value and desirability of its fine property and promote the comfort and enjoyment of its members and their guests.

Before adjourning, the thanks of the club were unanimously voted to the retiring president, Mr. A. H. Evans, in recognition of his long and able devotion to the interests of the organization, of which he has been the chief and active officer since its foundation several years ago.

THE STATE IN SCHUYLKILL.

THE Philadelphia Fish House Club, which is better known among the members of the association as "the State in Schuylkill," gave a banquet and fifty-five anniversary feast at the club house, on the banks of the Schuylkill, near Gray's Ferry, on the 2d inst.

Organized in 1732, the society has kept up a line of feasts yearly. The territory of "the State" is on the east bank of the river, and was once famous for its fishing grounds. Coal tar and the poisonous refuse from the gas works has long since driven every vestige of the finny tribe from the stream. Not that the organization still holds to the old site, and what is lacking in the way of fish in the Schuylkill is brought to their kettles and pans from more fertile waters. Every member of the club, no matter of what calling, and every invited guest, be he president of the United States, general of the army, admiral of the navy,

person or prince of the rain, is obliged to don a white apron and a straw hat and do his part in the cooking and providing the refreshments. The party partake of the world renowned and seductive fish house punch, that originated and was first "brewed" at the club house. Yesterday a grave judge was observed peeling potatoes, a person picking strawberries, a prominent lawyer opening oysters, and a noted statesman scaling shad for planking. Under the trees a large kettle boiling and sending off its savory steam of cooking chowder was stirred by one of Philadelphia's gentlemen, having two sucking pigs as they were being barbecued.

The dinner was rated a success, and when the sun set the American flag was lowered from the "castle," as the fish house is called, and the "citizens" and their guests left their "State" sober and in good spirits after an enjoyable day.

Honio.

THE UBIQUITOUS SILAS.

IN THE FOREST AND STREAM of October 13, 1881, page 1213, was published a little sketch taken from the Kings-ton *Freeman* and duly credited, entitled "A Shady From Life." It was as follows:

"The subject of these lines is usually found in the barroom of a country hotel. Old and weather-beaten is he, with the grime of toil upon his wrinkled hands, and his aged form bent with the weight of years. He is conscious in the dim, unlighted way that he has been hardly used; that in the battle with fate he has received some blows below the belt, which have effectually removed what little hope he may have had of sunning the light. And now, from the summit of his eighty years, he looks back over the long and dusty way he has trod with weary, aching feet, and drearily wonders how he has succeeded in climbing so high. Even now he can be seen at Man's Hotel, on the Saugerties road, in the taproom of the famous old hostelry, sitting in an armchair tucked back against the wall, his few silver locks covered with the remains of a straw hat, his ruddy face trousers supported by one suspender, and his feet thrust stockinged into a pair of cowhide shoes. He has succeeded in finding, in the barroom, a few dollars, and he has a bag which he has hidden at some time in the dim past contained tobacco, and his trembling fingers search for the morsels which have collected in the corners of the bar, and he has a look of intense interest in the face and the inside of his leather-like cheek, with an expression of intense satisfaction. After patiently listening to the conversation of a couple of snags returned from a fishing trip to the Schoeples, the fossil suddenly becomes insistent with life. "You fellows can't catch no fish!" he vehemently remarks. "Why not?" "Well, I don't know how," and he warns to the subject and the blood commenced to move in his unmyx-like veins, he continued, patently and proudly, "I don't see us in'n' any new-fangled fish 'em, no, s'pose you 'er dobsis an' I'll pull 'em on my line when I'm arter bass; jis' give 'em a grasshopper an' I'll pull 'em out faster'n y'e kin take 'em out of the water. I've been fishing 'em for a long time, an' I've got 'em on the face of one of his listeners, confirmed his remarks by an appeal to a friend: "I'll leave it to Silas Jones over there." "See, Silas, ain't it so?" and Silas solemnly affirmed it was true as follows:

"The aged Walton went on: "I seed a feller—sort of stretchy chap—down 't the bridge 'tween the dam an' the mill, an' he had a pole an' a fish that he darn fool stood turnin' the handle 't that little clock, an' the fish runnin' round 'em 'round 't the little fishin' pole, an' he said 't the God's truth, Silas!" To which forthwith interrogation Silas nodded vigorously: "if he didn't monkey an' monkey," continued the aged Walton, "I don't see us in'n' any new-fangled fish 'em, no, s'pose you 'er dobsis an' I'll pull 'em on my line when I'm arter bass; jis' give 'em a grasshopper an' I'll pull 'em out faster'n y'e kin take 'em out of the water. I've been fishing 'em for a long time, an' I've got 'em on the face of one of his listeners, confirmed his remarks by an appeal to a friend: "I'll leave it to Silas Jones over there." "See, Silas, ain't it so?" and Silas solemnly affirmed it was true as follows:

"The "study" may be recognized as the faithful delineation of a character, such which we are all more or less familiar. The sketch is in truth so lifelike that we believed when we first saw it, as we do now, that it must have been taken from the living subject by an "artist on the spot." We can conceive of no good reason for questioning the actual occurrence of the incident, in 1881, as here recorded.

The New York Herald of April 29, 1883, reported, under the caption "A Lesson in the Gentle Art," the following: "Two well equipped New York fishermen stepped into an old fashioned barroom on the north shore of one of our lakes. As they took two empty glasses on the bar an aged person, who sat tucked back against the wall, remarked:

"You fellows can't catch no fish." "Why not?" inquired one of the two. "I don't see us in'n' any new-fangled fish 'em, no, s'pose you 'er dobsis an' I'll pull 'em on my line when I'm arter bass; jis' give 'em a grasshopper an' I'll pull 'em out faster'n y'e kin take 'em out of the water. I've been fishing 'em for a long time, an' I've got 'em on the face of one of his listeners, confirmed his remarks by an appeal to a friend: "I'll leave it to Silas Jones over there." "See, Silas, ain't it so?" and Silas solemnly affirmed it was true as follows:

"The *Herald* neglected to give the date of this occurrence, but we determine very nearly when it must have happened. As the first session on Long Island did not open until April 1, this little scene was enacted subsequently to that day. Again, it must have been in the last of the month, for the *Herald* is a newspaper, and would not publish as news anything that was much more than forty-eight hours old. Its enterprise as a news gatherer has made the *Herald* one of the modern wonders of the world. It does not deal in stale intelligence nor in stale news. The meteor, that, that intelligence may be taken from the *Herald* of April 29, 1883, and be accepted as proof positive that the facts happened just as there narrated, and at a date closely approximating that of the paper's issue. Moreover, the report is so lifelike that we are compelled to acknowledge its truthfulness.

Now a careful reading of these two accounts will show a most remarkable coincidence of details and a marvelous similarity of language in the conversation. There is here, in fact, a very close identity of words and phrases, and different and independent writers, which so far as we know is unparalleled by anything recently published, unless it be in some of the translations of the *Dies Ire*, or by the biographical labors of certain friends of Bret Harte.

But the most astonishing part of it is the ubiquity of Silas, who is on hand in the Ulster county barroom in 1881 and again in the Long Island hostelry in 1883, ready in each case to back up whatever he is saying, corroborating the same, and in each case to be accepted as proof positive that the facts happened just as there narrated, and at a date closely approximating that of the paper's issue. Moreover, the report is so lifelike that we are compelled to acknowledge its truthfulness.

to out, and it appears that for some inscrutable reason this unfortunate Silas is bound to him—as Chang to Eng—and must ever follow in his peregrinations, nodding vigorously in a never-ceasing St. Vitus dance affirmation. We shall not be surprised to find the two bobbing up serenely in another barroom next spring, and by and by, perhaps in about five years from now, they may reach the Rockies, where the old man will try the big fish.

WHAT THE FISHERMAN SAID.

Editor Forest and Stream:
In the last issue of FOREST AND STREAM you publish "A Momentous Question," in which you quote a story of a man who had some hooks in holes through the ice, and another man came in a sleigh and pulled out a big fish and made off with it. In your editorial comments you wonder what the fisherman said. As the man drove off before the fisherman could reach him, the latter must have spoken in a loud voice, in order to be heard, and I imagine that he shouted something in it is strain: "Bless your dear old hury, you blessed fellow, if you come this way again don't hurry off so, and I will make it pleasant for you. May be fish sit easy on your stomach, bless you." At least he could have said this.

O. K.

Editor Forest and Stream:
What did the fisherman say? Why he never uttered a word. As I am the profane old fellow who found that the boys had loosened the tail-board of his wagon and led his apples into the street to hear him swear, he just stood still and looked amazed. When he was asked why he made no remark, he answered: "No use; I couldn't do justice to the subject."

Editor Forest and Stream:
The fisherman might not have said much, but his pantomime would have been worth seeing. R. G.

THE PIKE-PERCH.

Editor Forest and Stream:
I see in your issue of April 26 a communication from Mr. O'Brien, of Milwaukee, Wis., in the course of which he states that I have manifestly confounded the pike-perch with grass-pike or pickerel. Mr. O'Brien gives as his reason for making this statement "that the pike-perch never goes on shoals or enters creeks, but inhabits deep and clear water."

It is plain to me that Mr. O'Brien has been misled by the words Cypress Creek and Mussel Shoals. I suppose that the former term suggests to him a sluggish, muddy stream, with banks knee-deep in ooze; when, in reality, the stream in question is a deep, flowing rivulet, with bluffs of limestone and gravelly bottom, and when underlaid by freshets is as clear and pure as spring water. Mussel Shoals, too, is the name applied to a portion of the Tennessee River extending over forty miles in length, and consisting of rapids and shallows, varied with deeper water. The fish of which I spoke was caught in a trap at the Bainbridge Ferry, at the foot of the shoals. I did not see the fish taken from the trap, but saw it afterward in Florence, where it was sold by the capor and I "assisted" at its consumption.

I do not claim to be an authority on fishes, but I certainly know the difference between the pike-perch and the pickerel, the widely differing dorsal fins of the two fishes being sufficient to distinguish them to even the most superficial observer. The pickerel (*E. velutinus*) never is found here, so far as my observation extends, of greater length than ten or twelve inches, and in other than sluggish streams and ponds.

The pike, or, as it is sometimes called here, the jack (*E. lucius*), is sometimes taken in the same water in which we find the pike-perch, *Lepomis americana* of DeKay, and *Stizostedion americanum* of Girard, but in the streams of this vicinity they are rare, and I have never seen one caught here that would weigh over three pounds. WILL.

TENNESSEE.

VERMONT TROUT AND DEER.

IN Vermont they have plenty of deer remaining in the upper town of Essex county, and I have seen the tracks of caribou, but New Hampshire is my hunting resort until Vermont has an open season. Of trout they have an abundance to supply future camping parties at all the lakes, ponds and streams I shall mention. Within a few hundred yards of the water lives "Uncle Steve," one of the wealthy few of this village, and as fond of fishing as of money. He continues to make excursions after trout in various directions. Recently he said to me: "Do you want to go fishing with me to the handsomest body of water out of doors? Forty years ago I went to the top of Montaduck Mountain to look out a route for a sabbie line, which I located through to Little Averill Pond, which is nearly a mile long." That is where he wished to go. The country about it is unchanged; the same good old woods. I have been to "Uncle Steve's" lookout within a few days on snowshoes. The pond is one of many in that unbroken wilderness, fifteen by twenty miles in extent, and forty years have not destroyed its valleys and mountains. If they had wiped out the degenerate sons of the race of crust hunters there would be no more desirable breeding ground for deer in New England.

In here is the source of Castbrook River, of Quebec, and of the Nulhegan River, which runs in other parts of the State, to Grand Coulee. Last autumn Amass Ward, the guide, gathered several hundred pounds of spruce gum, using Leach Pond as a home camping ground. He said a sure way to return there was to follow the deer trails until they became well defined and led to the pond, which is one and one-half miles from Little Averill and sixty rods from Averill Lake, four miles in length and over a mile in greatest width. The northern stream outlets in Canadian settlements. For wild grandeur, bold headlands, and large trout on rocky shores, go to Little Averill, three miles south of which is Lewis Pond, another summer feeding ground for deer.

Leach Pond is twelve miles from this village, which is thirteen miles by stage route from North Stratford, on the Grand Trunk Railroad. Ward cut a trail from Leach Pond to the Nulhegan River, which, he says, is alive with trout in its smallest branches. There are four miles of "dead water" in the stream, and it is most often visited. I do not know that a party of sportsmen have ever explored it. Several years since a party of farmers and their help went out by compass. One man cut his leg and was carried home on the back of his workman. They did not return to get the trout which they reported in great numbers. Using Leach Pond as a camping place, which can be reached with a backboard

wagon, daily excursions can be made to the various others, and not make long journeys with camping outfits, which must be the way of doing it, as there are no palace hotels, with fly nets and trout looking for a fisherman.

COLEBROOK, New Hampshire.

NED NORTON.

SMELT WASHED ASHORE.—The Burlington (Vt.) Free Press of May 5 reports a hard night for the smelt; Last Wednesday night was a disastrous one for the smelt in our lake. Thousands were washed in with the drift wood and cast upon the beach of Burlington Bay. Two men who were on hand at the time gathered up fifty dozen, taking them in their hands as the waves rolled them in. A south wind blowing fresh from the heavy sea, and the next morning the beach presented the appearance of a general shipwreck. The drift wood laced the sands, piled up in high, low windrows. In the midst of this lay the mangled bodies of the unfortunate smelt, several hundred occasionally in the run of a few feet, and as many more buried beneath the sands. What a ghastly parody on the act of swimming, these creatures of the deep wrecked in their own element and cast up by the waves. Some wily fishermen thought themselves fortunate to capture a few dozens of these wretched smelt in a day's fishing, and had well concluded the species were dying out. The sudden appearance of several thousand thrown up in one night would not certainly be an argument in favor of this theory. The greater part of the fish were stranded on what is called Job Reed's Bay on Rock Point, and what the destruction was in other parts of the lake we are unable to say. Before these fish were much sought after for food this general destruction in wind storms was of frequent occurrence, and the farmers who owned the land adjoining the lake were accustomed to gather them up and feed them to their hogs. This might appear to be a reversion of those days of plenty. It is likely that a large school of smelt allowed themselves to drift in from the lake and being caught before they were aware on the shallows, and entangled and bruised amid the churning drift wood thus met their untimely fate.

TROUT IN THE ROCKIES.—Como, Colo., April 30.—I see in your paper of April 19, a communication from Rice, Colo., in relation to trout fishing. Now many of your readers may be in Denver the coming summer with limited time and still a desire to see something of Rocky Mountain trout fishing. To such I can suggest a very pleasant trip that will only consume a day of their time. Rigged with your rod, line and flies, take the morning train on the D. S. P. & F. R. R., and get off at either Buffalo, Pine Grove, or Estabrook, in Platte Canon. If you select the last-named place you will find yourself at the head of Deer Creek Canon, through which you have just passed. The train arrives there about 11.30 A.M., and you can return on the down train which leaves about three o'clock P.M., which will give you about three and a half hours to enjoy the fishing, and also the scenery, which at this point in the canon is grand in the extreme. If you wish you can wait and return on the night train, which leaves Estabrook at 3.30 A.M., and arrives at Denver at seven o'clock A.M. Of course you will not expect to fill your basket in so short a time, though a few miles higher up the Platte I have often taken from ten to twelve pounds of trout in an afternoon, and I have no doubt the same can be done near Estabrook. If you have not an outfit with you, a convenient place to buy will be at Clark & Boswell's gun store, Taylor Block, Sixteenth Street. There you will find a good assortment of fishing tackle, and the proprietors being well acquainted with the ground over which you will fish, can advise you as to just what you will want.—F. B. J.

THE BEST BAIT FOR TROUT AND BLACK BASS.—I speak from the experience of thirty years, and I never saw anything equal to it. Take the neck and head of a speckled or red fowl; cut the neck off down to the breast, and save the skin with the feathers on. Do not remove them until you want to bait your hook; then cut a strip like a worm and remove the feathers, but do not remove the little bright, glistening hair on the neck. This hair is a most enticing odor, and being tough, hangs on well and looks like worms. I have caught a basket of trout with one bait. Sometimes you may want a bait like a bug or grasshopper, or a large miller; this you can closely imitate by leaving on one or two feathers. Sometimes by cutting from the wattles, near the bill, with a feather or two, or a piece of the comb and a piece of the little feathers attached, will lure a trout when nothing else will. Thirty years ago I used to save two or three necks of fowl for this purpose, and about the middle of the fall, so that I could have them in the spring, when 'twas difficult to get worms. They are so much better than worms, but a fresh neck is somewhat better than a salted one.—GEORGE WILLIS.

BASS FLIES.—We have lately seen some new bass flies devised by Mr. A. N. Cheney, which are very showy, as bass flies should be. At the opening of the season we hope to test their merits on the capricious bass. It is a matter of regret that this fish is so unreliable as a riser to flies, for when it is in the mood to take them there is no gamier fighter. Mr. Holberton will soon issue a plate of "Standard Bass Flies," as a companion to his trout flies, and no doubt it will make a very bright picture with its large and gaudy colored imitations of insects. It is now in the printer's hands, but will require to be colored by hand, as was his former plate.

FISHING IN RICE LAKE AND TRIBUTARIES.—The Ottawa government has set apart for the propagation of fish during the space of three years that portion of the Ottonabee River from Lock's Bridge, Peterboro', to its inlet at Rice Lake, the waters of Rice Lake and tributaries, with the River Trent down to the Bay of Quinte, in the Province of Ontario. These reserved waters are placed under the special charge of Chas. Gilchrist, Esq., fishery officer, Harwood, to whom application for permission to fish must be made. Foreigners will be required to pay at the rate of \$1 for each angling permit for the season.

A MAMMOTH COD.—The largest specimen of the common Atlantic coast codfish (*Gadus morhua*) I have seen was displayed at the market in this city April 11, 1888. It was caught by a boat fisherman off Wood Island, about twelve miles from Portland, April 9. I noted the following measurements: Length (central), 66in.; length of head (opercular flap), 17.5in.; girth of head, 32in.; weight, 100lbs.—EVERETT SMITH (Portland, Me.).

MAINE SALMON.—Augusta, May 4.—The following is from the Kennebec Journal: "Salmon are running quite freely in the Penobscot River, according to information by private sources, and they have been offered in the Bangor market for seventy-five cents per pound. It appears that in the new fish law in this State, protecting trout and land-locked salmon, the little salmon proper, were overlooked. A land-locked salmon under nine inches in length cannot be taken and sold, but sea salmon of any size may be taken and sold. The commissioners and wardens find that the little salmon on their way to the sea, in the Penobscot, are taking the bait freely and being caught, but the new statute which reads 'land-locked salmon under nine inches in length' cannot protect them. It is a curious fact that the Penobscot is the only river of the United States that runs eastward, the salmon ascend and descend to the sea. Formerly nearly all New England rivers were stocked with these valuable food fishes. This river is the only one left where the true sea salmon eggs could be procured for propagation. Every State in the Union must come to the Penobscot for salmon spawn for restocking rivers that have been unwisely depleted. Prof. Atkins in the government hatching grounds at Orland, has had wonderful success in propagating salmon. The fecundated eggs have not been a part of the world, and were successfully hatched. Even the rivers of Australia boast of Penobscot salmon, the eggs having been shipped there."—JAMES.

SOUTHERN SUCKERS.—We have in our Alabama streams three distinct species of the "sucker-fish." The first and most choice species is a large, well-formed fish, of dark color, with fins inclining to red, which we call "red horse." In the late winter and early spring this is a fine table fish. The second species, in size and quality, resembles the first, but is entirely white in color. This we call the "white sucker." The third species is more unattractive in size and appearance than either of the others. The back inclines to a dark gray and the belly to a bright silver in color. It is shorter and flatter than either of the other species, with a more pointed bump on the back. Its run is a little later than the others, and it is not inclined to take the hook, but is taken in great quantities in "fall traps." It is by no means equal to either of the other species as a table fish. This fish we call carp—*Catostomus*. There are these different species, properly named? If not, what are their correct names?—E. M. STEVENS. [We think your names are correct. The suckers belong in the family *Catostomidae*, but there are nine or ten genera. The name "red horse" is applied to two or more large suckers with red fins and tail; the genus is *Myxostomus*. The "white sucker" is probably closely related. Your carp may be one of the "carp suckers," genus *Carpoides*; if so, it has a very long and high dorsal fin. We doubt if either one of the fish you mention belongs to the genus *Catostomus*. The latter has small scales.]

THE TARPUM AS FOOD.—Manchester, N. H., May 6.—In your issue of the 3d a correspondent asks regarding the edible qualities of the tarpum. While securing points in favor of the tarpum as a game fish and studying the chances of his capture with rod and reel, I instructed a friend living in Florida, whom I knew lived within fifteen minutes' walk of a large pool which always has tarpum in it through the winter months, to capture one of them by hook or crook, any way to get him, and send me the fact regarding the quality of the flesh, weight and strength of the back, and the contents of its stomach. He captured two in one evening with the graius, or lilly iron, one weighing 150 pounds, the other somewhat smaller, and he says: "They are very good eating, tasting quite similar to shad. Their stomachs were filled with green moss, which grows on the bottom of the river where caught. The latter portion of the sentence would indicate that they did not eat much, but since we live in fresh water pools, although I know they will take a smaller bait when trolling, and often a spoon. I believe if angled for with a cane rod about seven feet long with a reel hanging from 700 to 800 feet of 21-thread line, from a boat with a good man to propel it and throw the fish, their capture would be possible, and would give the most exciting sport to be had anywhere."—A. B. DODGE.

Fishculture.

THE VIRGINIA COMMISSION.—We have the annual report of the Virginia Fish Commission for 1887. It contains most excellent cuts of the Spanish or bay mackerel; the Northern weakfish, or gray trout, the Southern weakfish, or salmon trout, and of the halibut on the dam on the Rappahannock River, near Fredericksburg. The cuts are those drawn at the Smithsonian Institute, by the U. S. Fish Commission, in which every fin ray is of the proper length and can be counted, making it easy for any one to identify the fish. The Commission has achieved many important results with a small appropriation. Black bass have been colonized and increased until their capture in the Shenandoah, Rappahannock, James, and New rivers, is a chief attraction to summer visitors besides furnishing a large amount of food to the people of Virginia. Brook trout have been planted to a limited extent, but in quantities to compensate for the drain of unlawful fishing. The land-locked salmon has not proved to be adapted to Virginia. The California trout promises to be one of the most valuable additions to the warmer States. The planting of shad has been followed by results commensurate with the work done, while the German carp fills an important gap in the food fishes by occupying large areas of water in which the native fishes do not thrive. It will find a congenial home in the muddy streams of Southside, and a portion of Piedmont. The results of some experiments in the transportation of carp in a limited supply of water, by Col. McDonald, are given, and they show that very little is necessary. Then follows a list of the most important food fishes of Chesapeake Bay, with notes of their habits, migrations, etc.; a short note on fishways, with notices of those built in Virginia; and some general recommendations as to future legislation concerning the control of fishing. There is also a tabulated list of all fish planted in the State since 1874; a list of water plants for carp ponds, by Lester F. Ward, and a similar one by F. L. Yeakim, which originally appeared in FOREST AND STREAM. It is a very interesting and valuable report.

GOLDEN IDE.—Mr. E. G. Blackford has received from Germany 480 small golden ide, or gold ore, as they are sometimes called. One hundred of these were a present from the Deutschen Fischerei Verein, and the remainder were purchased. This is a beautiful fish, much superior to the common gold fish.

THE LONDON FISHERIES EXHIBITION.—The London Daily News of April 17 says: "It is a significant fact that the first exhibitor to put in an appearance at the great International Fisheries exhibition is John Chinnaman. His country is something remote of any that will be represented, but he is something more than a passing curiosity in his part of the world, and while others are taking a preliminary survey of the ground he is patiently progressing with the decorations and furniture of his department, getting ready his junk models, nets, diving bridges and traps. This is the result of an accident, but an example of one of the qualities which make the Chinaman a formidable rival all the world over in the field of labor. The exhibits in most of the other departments are not yet unpacked. The first consignment from the United States as we expected to see was from the States of Maine, and Sweden, Newfoundland, and the Bahamas are among the countries which have taken time by the forelock. The Canadian exhibits, which will be brought by ship to the point of London, are expected to arrive. As one of the Horticultural Gardens' ponds is in the rear of the Canadian section, it is intended to have an Indian float in a birch canoe to show how the apparently crank little craft is handled and how fish are speared. Manitoba and the northwest territories have not been able to contribute, but there are exhibits from Prince Edward Island, New Brunswick, Nova Scotia and the provinces of Ontario and Quebec. The Canadian section will be rich in wonders of natural history, the stuffed birds and fishes of the country will be seen in his collection at the Horticultural Gardens. If the Canadian specimen arrives in safety it will therefore be the veritable No. 1 of its race. The latest cargo of exhibits, which arrived yesterday, was from Italy, and they are thus deservingly by our Naples correspondent." An interesting party of English naturalists arrived in London will be the collection of marine animals contained in three hundred and fifty bottles or tubes sent by Professor Dohr, director of the Naples Zoological Station. By new specimens forming a fine natural museum. Among the specimens are immortalized in spirit with very little or no safety of their original beauty of form. The alteration of the original date fixed for the opening from the first to the twelfth of May will make Whit-Monday the first public day, and the crowds that will necessarily be expected to see the exhibition will be the necessarily untired staff. The entire business, however, is being admirably managed, and the members of the executive committee, with Mr. Birbeck, M.P., and the Marquis of Salisbury, have been very successful in their efforts. The Prince of Wales also, a constant visitor, and student of the practical preparations in progress. His Royal Highness was there yesterday, and inspected his own pavilion, expressing his satisfaction at the arrangements made. The Princess of Wales, who is attending the opening ceremony in her carriage, should see not on the 12th of May be sufficiently recovered to walk."

SALMON CANNING IN BRITISH COLUMBIA.—The Delta Cannery is the largest in British Columbia. Commencing operations only five years ago, its business has assumed such proportions that it now employs a force of over 400 men, 280 Chin and 140 Indians, and is fishing out its contents of thirty-eight boats and nets, two seines, one steam tug and four scows. The cannery is 160x120 feet square, two stories high, and in some respects the most completely furnished of its kind in the world. It is provided with a boiler sixteen feet long and four feet in diameter, twelve tanks, two retorts of 3,360 gals capacity each, filling and soldering machines, four laquer baths, and every convenience for the rapid and thorough performance of the various operations necessary to the canning of salmon. The water in the tanks is heated to this most excellent article of food. Chinamen, under the supervision of experienced white foremen, are employed for the canning process, and Indians for catching the fish, receiving for their services \$12.00 per month. The cannery is supplied with the daily catch per boat ranges from fifty to three hundred salmon, the fleet sometimes bringing in twelve or fifteen thousand. This season the run has been so extraordinary that the Delta Cannery put up 1,280 cases in a single day, and 6,000 cases in six days. Messrs. Page & Ladner, the managing partners of the firm, showed me their product for the last month, amounting to the enormous quantity of 35,000 cases, or 153,000 pails, of the finest quality. The water in the tanks is lower for the height of over five feet, the largest number ever packed by any one establishment during the same period of time. Two hundred and fifty barrels of salmon, or about 13,000, were also salted within the month. The company ship their product to the coast of California, to the firm of Welch, Ribbet & Co., of Victoria.—Nelson H. Children in "Guide to British Columbia."

THE NEBRASKA COMMISSION.—The Fish Commission of Nebraska has issued reports for 1881 and 1883 in one pamphlet. The hatchery at South Bend Station promises to be the largest and the most complete in the West. The ponds and black bass have been constructed, and also a dwelling for the superintendent. The rainbow trout and whitefish have been introduced in the waters of the State. The Commission has been successful in the acquisition of the necessary literature and probable result of efforts to stock the tributaries of the large streams with this desirable fish—the brook trout. The result of actual experiment shows that the natural elements of the water in nearly all the streams in the State will support this species of fish, but in the thickly settled portions of the State nearly all the streams, especially the smaller ones, have been destroyed for this purpose by the too common practice by the settlers of constructing their cattle yards and hog pens adjacent to and over them, thus rendering the water filthy and destructive to nearly all kinds of fishes, native as well as others. For these reasons and others that may be named, undoubtedly the streams in the northern and western portions of the State, except those of the arid region, are well adapted for cultivating both trout and salmon. Many trout died in the ponds and are believed to have been killed by parasites in the gills, but no specimens were preserved in alcohol and therefore the cause of the loss was not ascertained. The Commission has a considerable showing of work done on the small appropriation allowed.

ROUTES AND NOTES.

CAPE MAY TO ATLANTIC CITY.—A summer note-book. Published by the Passenger Department of the Pennsylvania Railroad Company; full of information about the Jersey coast, including the places, routes, fares, routes, etc., including maps, fishing waters, etc., etc.

A PARADISE FOR GUNNERS AND ANGLERS.—Published by the Passenger Department of the Philadelphia, Wilmington & Baltimore Railroad Company. The "Paradise" is the Delaware and Maryland Peninsula, concerning which the book is full of information. Both of the routes mentioned may be applied to the Pennsylvania and Baltimore Road Company (Philadelphia or New York).

SHORT LAKE, IOWA.—A descriptive sketch. By whom published is not stated, but we presume by the Burlington, Cedar Rapids & Northern Railway (Cedar Rapids, Ia.).

SUMMER RESORTS IN NORTHERN IOWA AND MINNESOTA.—Information for the gunner, angler and the invalid. Published by the St. Louis, Minneapolis and St. Paul Short Lines (St. Louis, Mo.).

DETROIT AND THE PLACERS RESORTS OF NORTHERN MICHIGAN.—A guide to the lakes of the State, and the resorts of the State of Detroit, Lansing & Northern Railroad (Detroit, Mich.).

All the above are sent free on application to the roads publishing them.

to none, as the older boats of odd sizes would in a season or two disappear from the racing course, and be used for cruising only, while no good purpose would be served by perpetuating their models.

THE COMING CANOE SEASON.

THOUGH the continued cold weather has kept back the opening of the canoeing season, there is every indication that there will be more canoeing done this year than ever before. The demand for boats of all sizes ever, and the increasing interest that canoeists are taking in rigging and fitting their own craft is showing good results in the improvement of sails, reefing gear and similar details. The members of the most of the 1882 season have been generally prosperous. The condition of the Canoe Association is in every way gratifying. In the matter of boats the increasing requirements of the more experienced canoeists have set the hullers to work with good results, as some of the later models show, and at Stony Lake this season we may expect the finest exhibition of small pleasure craft ever seen. While cruising is so much in favor as ever, many long voyages being projected, racing is becoming more of a feature, as the clubs increase in membership and in suitable craft, and though the club programs are not yet announced, there is plenty of sport in store for those who delight in this most fascinating form of seamanship.

NEW YORK CANOE CLUB.—The fleet is now in position and the house open and a few of the boats have been out. Mr. Schuyler opened the season with a cruise from Bayonne, N. J., to the C. C. quarters at Eighty-sixth street, and thence down to the club house, with his new canoe Freak, built by Mr. Byles, of Bayonne. She is a very handsome specimen of the modern canoe, 16ft. by 30in. with a broad centerboard of copper and two large hinges. Mr. Newman will sail an Everson canoe of like dimensions, while Mr. Stokes will use one of Ruhlston's, also 16ft. by 30in. beam, with centerboard. This canoe will carry a full complement of about 2000, with a lot of mutton dandy, the mainmast being fitted to lower in a manner devised by the owner. Another new centerboard canoe will also be added to the fleet, 14ft. by 21in. with a good deal of the French in its model, the board being of galvanized iron, twenty-five pounds weight. Her sails will be balance line, 50 and 20ft. Of the old boats the Dot has been much improved, and Mr. John's canoe has had bulwarks changed, a new deck with higher crown added, the pointed harling cockpit now so popular put in place of the elliptical well and the hull last fall, but her entire pricing skipper being now in England there is no telling what he may bring back to take the cup with this season.

THE FRI.—A correspondent on the Pacific writes to us as follows of a phase of the sport that is new to many of our canoeists who are confined to the inland lakes and rivers. "Had a delightful day last week in my canoe, with my new dipper in his, out by the fort, where the tide runs in from the Pacific, making a swell that hid us from each other when it came exactly between us, so that nothing but the peak of the mainmast and the flag on the mast were visible, and this for some time. Mr. St. John's canoe has had bulwarks changed, a new deck with higher crown added, the pointed harling cockpit now so popular put in place of the elliptical well and the hull last fall, but her entire pricing skipper being now in England there is no telling what he may bring back to take the cup with this season.

SOMETHING NEW.—Mr. Tredwell is building a new boat for competition in the races of the Thames Valley Sailing Club, which, as an English boat from the Power will be watched with interest by canoeists. She is 15ft. on waterline, 18ft. 6in. over all, 1ft. beam and 21in. deep, with a smaller midship section to the last, keel, but more freeboard, an overhanging bow and counter stern. She will carry two chine lugs.

SHADOW CANOE.—We shall very shortly publish the lines of a shadow canoe, from which the boat may be built.

Answers to Correspondents.

No Notice Taken of Anonymous Correspondents.

- R. G. C. Haekesaack, N. J.—The new New York game law was unchangeable.
O'Grady St. Simoa's, Ga.—To preserve Demagogues steel gun barrel, use vaseline.
W. L. M. Lynn, Mass.—For plan of Barnegat saek box see our issue of Oct. 6, 1881.
J. L. S. Hackstistova, N. J.—The best quality of muslin. Sample of weight posted to you.
R. E. B. and R. F. G.—For taxidermist's tools apply to Geo. Tlemann & Co., No. 67 Chatham street, New York.
C. B. New York.—For the concentrators apply at the gun stores, for address see our advertising columns.
PHIL.—Please inform me where I can procure carp for stocking a pond? Ans. Write to Prof. S. F. Baird, Washington, D. C.
A. J. McH. Louisville, Ky.—In fishing for bass in small streams throughout Kentucky, use minnows and crayfish for bait.
G. C. W., New York.—Rattles may be used in chokebore guns, provided the ball fits the choke; it is not an altogether safe practice.
G. W. R., Georgetown, D. C.—You do not state the distance at which your targets were made, but if at 40yds. they are very good; above the average.
D. P. G., Charlestown, Mass.—You will find that the shell that fits the chamber will give you better shooting. The shell should not be shorter than the chamber.
D. P. G., Charlestown, Mass.—Four hundred and fifty dollars should put her out of the builder's hands, and her sails and ropes should be covered in forty dollars.
J. S. Lawrence, Mass.—Suppose ten men who shoot at glass balls vary from forty to eighty per cent, how would you handicap them to shoot for a prize? Ans. Handicap from three to five yards.
TWO READERS.—The disputed shot in the target which you submit counts as a bullseye shot just as much as the shot in the center of the bullseye. The rule is that the shot counts if it cuts the edge of the ring.
C. L. W., Hartford, Conn.—We do not know of any house that handles high back canoes. You may, perhaps, secure such a craft by writing to Thomas Nichols, Oldtown, Me. He builds high canoes to order.
F. H. G., Sacket's Harbor, N. J.—With sails laced to booms the foot should be cut straight. The English style of loose-footed sails which are cut with a roach are not laced to booms, but are fastened at the clew and tack only.
F. W. P., New York.—There are several rifles of which the barrels and stocks are well separated. A call at the gun stores which are near you will give an opportunity of examining the several styles and selecting the one that suits.
D. W., Montrose, Minn.—If the Chicago firm lacks enterprise enough to advertise their artificial lures, we advise you to patronize the gentlemen whose wonderful concentration of preposterous words has lately graced our advertising columns.
J. B., Wakefield, Mass.—Will a rifle ball penetrate deeper at 100yds. than at 10yds.? If so, what is the cause of it? Ans. Under certain conditions it will, the greater penetration resulting from the less velocity, which causes less reaction in the object struck.
W. H., M. D., Onneme, Ontario.—Keel sided 5in. and moulded 5in. amidships, tapered to 2in. at ends in the siding, and moulded 7in. aft. and 5in. at fore end. Stem and sturpost sided 3/4in. at head and tapered to 2in. at heel; frames sided 1in., and double moulded 1 1/2in. at heel and 1in. at head; spaced 30in. apart, with a steamed timber 1/4in. at heel, and 1in. at head between end frame; planking, tubed 5/8in.; clump, 1 1/2in. x 4in.; plank, 1 1/2 x 3/4in.; keel bolt, 5/8in. diameter; floor pieces, 1/4 in. of hacknack, 1 1/2in. sided; deck beams, 1 1/2in. deep and 1 1/2in. sided; deck, 3/4in. thick.

DOCK FISHERMAN.—Section 285 of the New York Penal Code reads as follows: "All shooting, hunting, fishing, playing, horse racing, gaming or other public sports, exercises or shows upon the first day of the week, and all races during the same of the day, are prohibited."

HUMBOLT.—1. A heavy gun does not shoot better than a light one, other things being equal, and having the same charge. 2. We have not tested the powder. 3. For snipe use No. 12 shot; for teal Nos. 8s or 10s. 4. For your 13-gauge gun try a load of 8lbs. powder, 1/2 two pink-shots on it, and 3/4oz. to test shot. 5. Very proportionous of powder and shot, and test your gun at a target to determine the best load for it. 5. Humbolt Bay, California, is an excellent region for snipe.

G. H. O., Hudson, New York.—You may obtain quail, prairie chickens and rabbits by leaving your order with Chas. Reiche & Bro., Chatham street, this city. The quail should be liberated in the following manner: The birds are put into cardboard boxes, a peck in each box, and taken at night to the designated place. Here the boxes are put down on the ground in the dark, being open at one end. Some food is spread upon them and they are left. The birds remain quietly in the boxes all night. In the morning they come out, but there is nothing to frighten them, and they begin to feed. At night they come back to the boxes for shelter. In this way they become accustomed to the locality and remain there. Prairie chickens (painted grouse) have been put out in the western part of New Jersey, where, however, the undertaking is still an experiment. There are no reasons why they should not thrive here, provided they have sufficient protection from gunners.

J. H., Cascade, Va.—Two friends are divided on the subject of the difference between the jack and the pike. One contends that the jack has four fins under the throat, while the pike has only two; also the eyes and scales of the jack are distinctly larger than those of the pike. The other insists that they are the same fish at different stages of growth. Which is right? Wherein do the pike, jack and pickerel differ from each other? Ans.—If we were certain just what fishes you referred to we would have no difficulty in answering. Esoc bicetus is called jack in England and Virginia when below ten pounds and pike when exceeding that weight. It is the pike of Canada and the pickerel of New York. Its ventral fins are abdominal, and therefore its pectorals are the only pair "under the throat." The Stizostedion vitreum is called wall-eyed pike, and pike in New York and other parts of its ventral fins are thoracic, and being under the pectorals it has four fins "under its throat." If your jack and pike have no spinous rays in the fins they are probably the same fish at different ages. Popular names are so mixed that we are not at all certain which fishes you refer to.

PUBLISHER'S DEPARTMENT.

WATERPROOF SHELLS.—One of the greatest desiderata in shot cartridges is to have them impervious to water. We frequently have inquiries as to where such are made, and give below some solicited correspondence received by the U. S. Cartridge Co. of Lowell, Mass.: "Fort Wayne, Dec. 7, 1882. The fifteen U. S. Cartridge Company's shot shells that you gave me for trial test, I most conscientiously say are not exceeded by any that I have used, and I believe that I have used nearly every make. I gave the U. S. shells a thorough trial in wet and dry weather. They failed to swell under the same circumstances that I have had other make of shells bulge. I have loaded and discharged each shell three times, and will again reload them for use. I believe and am fully convinced that they are the best shells made, and are all that are obtained for them by the U. S. Cartridge Co. of Lowell, Mass.—J. F." Another correspondent, Mr. Geo. F. Farmer, of the South Shore Shooting Club, at Chicago, states: "I capitalized in nearly five feet of water, and my open shell-box lay for half an hour on the bottom. My U. S. shells were not at all swollen, although somewhat soaked where the paper was bruised in turning the shell. They chambered as well as ever."

"Coming events cast their shadows before," remarked the seer to the young Highland chief. That backache and lumbago of yours may be prophetic of something worse. Prevent them now by using BROWN & CAIRNS' POWDER LASTERA before another day is out. If other plasterers have failed BAINSON'S will not, for it is totally unlike them. All druggists. Price 25 cents.—Ad.

HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS. OR THE CURE OF ALL DISEASES OF HORSES, CATTLE & DOGS, HOGS, AND POULTRY. FOR TWENTY YEARS Humphreys' Homeopathic Veterinary Specifics have been used by Farmers, Stock Breeders, Livery Stable and Truckmen, Horse Railroads, Manufacturers, and all who own and use Horses, Cattle, Hogs, and Poultry. HUMPHREYS' Veterinary Manual. (300 pp) sent free by mail on receipt of price. Pamphlet sent free on application. HUMPHREYS' HOMEOPATHIC MED. CO. 109 Fulton Street, New York.

SECTION BAMBOO RODS. Having been the pioneers in the manufacture and introduction of Section Bamboo Rods, we have always taken great pride in securing and perfecting every improvement in order to maintain our position as the makers of the very best rods. Knowing not only theoretically, but also by long experience, that a properly made rod is the only absolutely perfect rod, we have invariably refused, and still do refuse, to put our name on "Best" round section rods. Our prices for these round rods average only about 30% asked by any other makers, while the rods are widely known to be incomparably superior. Any angular rod can be perfect, we long believed that with proper workmanship and material a really good angular rod could be made. Being much easier and cheaper to make than round rods, we hoped to be able to offer to those anglers who can not afford to pay the price of our "Best" round rods, a hexagonal rod that would be good and serviceable at a moderate price. We are more than satisfied with the success which has attended our efforts, for we are now able to furnish a hexagonal rod that is really worth having, and at a price which is only a trifle in advance of that asked by other makers. Orders received from anglers residing where the dealers keep a full line of our goods will not be filled at any price.

ABBIEY & IMBRIE, Manufacturers of every description of Fine Fishing Tackle, 48 & 50 MAIDEN LANE, NEW YORK.

JAS. F. MARSTERS, 55 Court Street, Brooklyn. MANUFACTURER AND DEALER OF Fine Fishing Tackle. Patent "Perfect" Brass Shells, MANUFACTURED BY KYNOCH & CO., Birmingham, Eng.

WM. MACNAUGHTAN'S SONS, Commission Merchants, 8 HOWARD ST., N. Y. SEND STAMP FOR PRICE LIST. THE SETTER, BY LAVERACK. With colored illustrations. Price, postpaid, \$3.00. FOR SALE BY Forest and Stream Publishing Co.

UNITED STATES MUTUAL ACCIDENT ASSOCIATION. \$5,000 Accident Insurance. \$25 Weekly Indemnity. Membership Fee, \$4. Annual cost about \$11. \$10,000 Insurance, with \$500 Weekly Indemnity, at \$100 per Annum. Rates. Write or call for Circular and Application Blank. EUROPEAN PERMITS WITHOUT EXTRA CHARGE. CHAS. H. FEET, President, (Of Rogers, Best & Co.) JAS. R. PITCHEE, Secretary. 320 & 322 Broadway, N. Y.

These shells are made of extra fine thin platina metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells, and get stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shell. Can be used in a larger than range of shells. Or can be effectively fitted with tool (as represented in cuts) and straighten out to original shape when discharged. The crimping tool also acts as a reducer, an advantage in such cases. The shells are of all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only. (2,000) and crimpers not less than one dozen, by HERMANN BOKER & CO., SOLE AMERICAN AGENTS, 101 & 103 Duane Street, New York. WILLIAM READ & SONS, Boston, Mass., Agents for New England States.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$1 A YEAR. 10 CTS. A COPY. SIX MONTHS, 52.

NEW YORK, MAY 17, 1883.

VOL. XX.—No. 16.
Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$1 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remitt by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C. London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonparel type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications.

- ANSWERS TO CORRESPONDENTS.

These are "the best dogs in the world," and their name is legion; we all know a man who owns one of them, perhaps we have an interest in one of these animals ourselves.

This suggests another point which has been lost sight of in the spicy correspondence referred to. The subject has been treated as if a sportsman's dog were simply a machine to facilitate the capture of game, whereas, much more than this, he is an intelligent companion, upon whom is bestowed a vast amount of affection which he reciprocates. This accounts for the prohibitory price at which he is held; it is dictated not by cupidity, but by praiseworthy sentiment. This feeling is as universal as the ownership and companionship of dogs. There is something radically wrong in the soul of the small boy if he will for gain betray his four-footed friend; we have a deep commiseration for the individual of mature years who, prompted solely by sordid greed, parts with the tried and true companion of his field excursions.

THE RIFLE MATCH TRIALS.

WITH the opening of the formal trial shoots between competitors for places on the American team, the outlook becomes more and more encouraging. Very well sustained scores have been shown by many of the contestants, and although the field is not a very large one to select from, it is quite evident that the committee will have no difficulty in drawing together a body of a dozen shooters which the British team will have hard work to beat. We hear of no complaints thus far, and it seems likely that the men will go on the team because of their ability as shots. With such a team, organization and discipline will be easy. Riflemen respect a brother shot who can stand fairly and squarely up and heat them round for round on the record, and they are willing to step down and out when the record is against them; but no team can be brought into a good working body when it is gathered up by a series of appointments. Rivalry is too large an element in the success which has heretofore been met with by American riflemen to permit it to be placed aside now. With a team picked out as the team of 1883 seems likely to be, there will be no long-continued chorus of grumbling in case of defeat, and only the more hearty congratulations in case a victory should reward the efforts of the visitors.

It will be remembered that in the match of last September the scores of the two teams stood 1,973 points for the British and 1,805 for the Americans, or averages respectively of 164 and 150 points per man, there being twelve men on each team. It will be seen how much above this average the scores are now running for the leading twelve. Bald comparisons of figures are, of course, very misleading, but in the present instance the showing made by the men now practicing at Creechmoor has behind it some real elements of strength. A year ago the preliminary practice was marked by some very unsatisfactory features, which we hoped at the time to see eliminated when the organization of the team was brought about. Instead, however, new elements of discord were introduced, and incompetency at the head produced a natural result in a scattered effort on the part of the men. The lessons of that fiasco have been well learned, and a suitable arm having been carefully prepared, the men were required to use it, and thus make the trial now going on one of men, rather than an exhibition of the experiments which they might be induced to try.

With the next issue of the FOREST AND STREAM it will be pretty well known who are to be on the team, and then some calculations may be made as to their inherent strength as a shooting body. The captain, too, will have been chosen in all likelihood, and then the programme of effort will be mapped out, and the general plan of the campaign decided upon. It is to be a military team. The members will take along only weapons of the military class, except perhaps in a few cases, where some attention will be paid to small-bore practice with a view to entry in the several exacting individual matches on the Wimbledon programme. It is certain that no other team match will be shot than the one for which the men are organized and sent abroad. It will be an event of more than usual importance, for it will be the first time that a body of armed American soldiers have invaded the soil of the mother country. It will be an opportunity worth the seizing for an exchange of courtesies between the American militiaman and the English volunteer. Nearly a half million of men are represented in these two squads who, in a few weeks' time, will face the bullets in the presence of thousands at that well-known common which, for two decades past, has been the central rallying point for all that was valuable in modern rifle practice. The match has

already opened the eyes of many to the inefficiency of our local rifles and military riflemen. The match will, at least, act as a guide toward the better arming of troops, whether regular or volunteer. How generally that guidance will be followed remains to be seen.

THE BURRO AND THE BEAR.

Heels and the Jack I sing, who first on Mariposa hills, etc.

—After Virgil.

TO the layman the formalities of the law are mysterious and awful. The court and its satellites, the counsel for the opposing parties, the spectators, and even the building itself seem all parts of a gigantic and insatiate monster, which devours alike the substance of the well-to-do, the hard-earned earnings of the poor, and the scanty savings of the widow and the orphan. It is never satisfied. It always cries for more. Often it foments quarrels and disputes which might well enough be adjusted in a pleasant and friendly way, without recourse to its terrible process.

It is in the older sections of our country that the law is most to be feared. In newly settled regions and on the frontier, the sense of justice innate in the human heart makes speedy decision in criminal cases, and in those where one individual has wronged another, the rifle or the six-shooter is the sharp arbiter of quarrels. There are none of the proverbial delays, no interminable cross-examinations, no long-winded speeches or proxy charges, no locking up of juries, no appeals or requests for a stay of proceedings; above all, no fees to be paid the court, no retainers to counsel. The settlement is short; there are a few sharp reports, a little whizzing of balls, and the plaintiff or defendant either falls, or limps away, satisfied, or, at least, willing to wait until such a time as he can get the drop on his opponent and make his appeal with better chances of success. In older countries there is a sadder state of things. It takes years to try a simple suit, and usually costs the parties more than the amount in dispute. Besides the wrath that one naturally feels at being deprived of his money, there is the law's choking suspense and anxiety of the delay—that hope

both body and soul. The man who has been wronged by a bear, and who has seen his property destroyed, and his life in danger, will look fondly at them as they walked out from corral to go down to water, and at evening after supper he would sit and smoke his pipe and contemplate them, finding each day a new beauty in some favorite heifer, steer or calf. They were fine cattle, and their owner was justly proud of them. None were sick; none died. They increased, flourished and grew fat. In the winter they fed upon the yellow grass upon the hillside; in spring, when the gentle rains had caused the alfalfa and alfalfa to send up tender shoots, they stood knee deep among the luxuriant and sweet-smelling herbage. But all this was too pleasant to last. A serpent entered Eden—and a grizzly bear Mr. Black's corral. Night after night the fattest and sleekest of the calves were ruthlessly torn from the sides of their helpless dams and hurried away into the fastnesses of the mountains. Day after day their owner saw in the once mild and placid eyes of his herd a stern, hunted look, an expression of appeal which wrung his heart. Mr. Black was in despair, and, determined at any cost to be rid of this fiend of a bear, he published an advertisement offering a reward of \$50 to any person who would kill it.

On Bull Creek in Mariposa county resides a Mr. Opie, who is the possessor of a jackass, which is, no doubt, as dear to his owner as Mr. Black's horned cattle were to him. This burro, like most others, is fond of having his own way, and when confined in stable or corral, and the idea occurs to him that he would prefer to extend his wanderings beyond those limits, he proceeds calmly to kick down the walls of the enclosure and thoughtfully strolls away in search of drier sage brush or more thorny grasswood. Now it happened one night that Mr. Opie's burro, having, as usual, demolished the barriers between himself and freedom, strayed in a meditative frame of mind to the corral in which Mr. Black's cattle were confined. On reaching it he gazed mildly at its occupants, and then gave himself up to a contemplation of the beauty of the scene. The clear stars looked down unwinkingly on the plain; high in the heavens rode the glorious moon. In the distance rose the mountains, bare near their base, but higher up clothed with chapparal and higher

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

DOG SHOWS AND DOG PRICES.

OUR esteemed correspondents who have been discussing the prices paid for dogs appear to have overlooked one important factor in the growing appreciation of canine property, namely, the bench show. The direct result of such an exhibition as that given in the Madison Square Garden, this city, last week, is to stimulate the public interest in dogs, and stimulate the market for them. With the improvement in breeding has come a wider appreciation of the several strains, and a correspondingly greater demand for well-bred animals.

An instance illustrative of this came to our notice the other day. A gentleman, who took no special interest in dogs, and was rather inclined to ridicule his friends who did, was induced by one of those friends to visit the Westminster Bench Show. He entered the Garden indifferent at best; he came out of it an enthusiast, a thoroughgoing one, too. His suddenly acquired fancy was not confined to any one breed; it took in the whole show. This new "dog man" is to-day the happy possessor of a bouncing St. Bernard infant and a cocker spaniel. The spaniel, he maintains, is the only really and truly cocker in America, and in defense of his claim he is prepared at any moment to go off somewhere and establish a new cocker club all by himself.

Our correspondents aforesaid will understand that this gentleman has a long purse; and he is only one of a multitude of visitors to the bench show, who immediately or in the future become buyers, and by keeping up the demand keep up the prices. There are not enough St. Bernards bred to-day to anywhere nearly supply the call for them.

But while celebrated prize winners, blue bloods, and fashionable pets of the hour command prices virtually putting them above the reach of men of moderate means, there are thousands of better dogs which their owners perhaps bought for a song, but would not sell for a fabulous sum.

still with dark pines. Scarcely a sound disturbed the quiet of the night. The long drawn howl of the coyote was silent, but in the *accquia*, the water murmured softly its little song. All this our hero observed and enjoyed; but as the sweet smell of the stacks reached his nostrils he remembered that life was not made for dreaming, and walking to the corral, he leaped against it, and with scarcely an effort, threw down half a dozen lengths of fence. Then he entered and began to eat Mr. Black's hay.

While all this was going on, a grizzly of remarkable size and ferocity was pursuing his way down a cañon toward the corral. He did not stop to contemplate the calm loveliness of the night, but went hurriedly along, for he was hungry and he remembered a particularly large and fat calf that he had twice unsuccessfully tried to catch. This time he vowed he would secure it. The corral reached, he found the fence down, and entering, looked about him. There, beyond the stacks, in the moonlight, reposed most of the cattle, but nearer, and in the shadow, he saw the round buttocks of what he supposed to be the coveted fat calf. Quietly he slipped up behind it, and rose on his hind feet to seize it, when suddenly a pair of heels flew up from the ground. One of these bit Bruin directly upon the chin, breaking his jaw and teeth, and causing him to see 1,500,000 more stars than were at that moment visible in the heavens; the other broke his right foreleg. The patient burro then laid back his ears, and proceeded to further maltreat the unfortunate and astonished bear, and with so much energy did he carry on the assault that in a short time the wretched beast was chewed and kicked into those ursine happy hunting grounds, where, it is to be presumed, the jackass brays not and his long ears are never seen. The bear being dead, the burro went back to the stacks, and, as he munched Mr. Black's hay, meditated on the mutability of affairs upon this mundane sphere, and especially on the uncertainty of life.

The sun rose bright and clear over Bull Creek next morning, and shone upon two individuals who left their respective dwellings at about the same hour. They were Mr. Black, who wished to inspect his cattle, and Mr. Opie, who was anxious to find his jack. In due course they met at Mr. Black's corral. There lay the King of the Mountains dead; there stood the somewhat scratched and torn burro, revolving many things in his mind, and still outing the hay. There could be no question as to what had taken place. The modest and shrinking ass had, single-handed, slain the terror of the district. As was most natural, Mr. Opie forthwith made a demand upon Mr. Black for the \$50 reward, which the latter declined to pay until the owner of the jack should produce a power of attorney or assignment to him of the donkey's claim, and more than this, Mr. Black then and there handed to Mr. Opie a bill for \$25 damages to corral and value of hay eaten. When the owner of the jack received this document, you might have knocked him down with a feather, he was so overwhelmed at the brazen audacity of the claim. He vowed that there was neither faith, truth, nor gratitude in Mr. Black, and hurrying to town, proceeded to bring suit against him for the full amount of the reward. His complaint set forth the facts of the offering of the reward, the killing of the bear, and the further fact that the jackass is his lawful property, and therefore he prays judgment in his favor for \$50 and costs of suit. Mr. Black, in his answer admits the allegations of the complaint, but avers that the reward was offered to any person killing the bear; that the jack is not a person within the meaning of the statute, and that if he were Mr. Opie is not his legal guardian, and in default of a power of attorney or any assignment is not entitled to sue for the recovery of his claim. He further alleges that Mr. Opie, owing the burro, is responsible for the damage done to his corral. Wherefore he prays judgment in his favor for \$25 and his costs in the action.

We are bound to confess that, while our sympathies are wholly with Mr. Opie, we think it extremely doubtful if he can recover the reward for which he sues. Even the lay mind may espay one fatal defect in his complaint, which will, we fear, render his suit hopeless, unless he obtains leave to amend. The complaint should have averred that the jack was a trained animal, and had been taught to kill bears, and that on the particular evening of the slaughter, his owner had said to him "Jack, there will very likely be a bear at Black's corral to-night, just go up and kill him for me;" that pursuant to those directions, the jack had gone to the corral; that the fence had been torn down by the bear, and not by the burro, and that for the value of the hay eaten, he was willing to pay. We opine that had the complaint been framed so as to include these allegations, Mr. Opie would have had a fair chance of success. The court would no doubt hold that should a man send out his hound to catch a fox, and the capture be made, the dog's owner would be the slayer of the animal, and, if a reward had been offered for its capture by any person, no assignment or power of attorney would be required from the hound, any more than one would be asked for from the gun had the animal been shot. So, if a sheep stealer were to send his collie to cut out a hundred animals from a bunch belonging to another, even though the dog's owner did not appear on the scene at all, he would be the thief. Clearly if Mr. Opie had put his jack on the trail of the bear, had followed him with cheers and shouts of encouragement, and been in at the

death, the killing would have been his act and deed. But it is not stated in the complaint that anything of this kind took place. So far as appears, the jack killed the bear of his own motion, and for his own pleasure and satisfaction, just as a greyhound might start out and kill a hare for its amusement, or a setter dog catch a woodcock or a quail. Hence we consider Mr. Opie's case weak.

Another point, hardly less interesting, arises. To whom does the slain bear belong? Evidently the game has been reduced to possession, and by the burro; yet it cannot be his, because the law of the land does not recognize the right of a dumb animal to hold personal—or, for the matter of that, real—property. It does not belong to Mr. Black—although captured on his land—for he had nothing to do with the killing; nor to Mr. Opie—though his burro killed it—for it does not appear that the latter was ordered to catch it, nor was Opie in pursuit at the time. There is a vast opportunity for argument opened up by the present case, and it is a question that we must really turn over to our legal and judicial readers to work out. It is certainly to be hoped that the points at issue may be carried up to the highest courts for settlement, in order that the rights of men who own jackasses accustomed to kill grizzly bears may in future be properly protected.

TRAP-SHOOTING PIGEONS.

PUBLIC attention in this country and abroad has of late been directed more than ever before to the subject of the trap-shooting of pigeons. The practice has been brought to popular notice by the large tournaments, particularly such as have been held in the vicinity of cities where the public press has commented upon them, and by certain bills to prohibit trap-shooting, introduced into the legislative assemblies. In several States these bills have become law.

We are not among the alarmists who frantically declaim that these various anti-trap-shooting movements are portents of nothing less than the downfall of the American republic and the total eclipse in darkest gloom of all our modern civilization. We have faith to believe that our free institutions would survive the shock. Nor do we see in the proposals to abolish pigeon shooting a menace to field sportsmanship; to so construe them is to find an interpretation wholly untenable. Shooting a bird sprung from the trap and shooting a bird flushed in the field are two distinct things, the difference between which is recognized by the public and by sportsmen. Among the latter there is a very wide divergence of opinion respecting the merits of the trap-shooting of pigeons; many who are most enthusiastic in praise and practice of field shooting do not approve of pigeon trap-shooting as it is generally conducted.

This simple fact that the opponents of pigeon shooting are found largely among the rank and file of the great army of field sportsmen, is sufficient to prove how absurd is the silly cry of alarm that efforts to suppress pigeon shooting are covert movements directed against all shooting. If those who follow the practice of pigeon shooting wish to hold their ground against the repeated attacks of a growing public sentiment, it is nothing less than sheer folly to misjudge and misrepresent the true nature of that sentiment. Instead of mistaking it for something which it is not, the wiser course would be to determine exactly what this feeling is and the grounds upon which it is based. These cannot be removed by boisterous buncome of defiance; but the opposition may be allayed by freeing trap-shooting from the cruel practices which often attend it. These are by no means so common nor so numerous as they have been in the past; there has been a change for the better. The barbarous maiming of the birds, which was the chief disgrace of pigeon shooting, is now, so far as we know, approved by no respectable club, whereas formerly much of it passed as reputable and proper. This particular form of cruelty, such as there is left of it, is most often the act of the handler, done without the intention or knowledge of the shooter. In fact, as at present conducted, the trap-shooting of pigeons is attended with far less actual physical suffering of wounded birds than is ordinary field-shooting. How then is the opposition to it to be explained?

POISON IN CANNED GOODS.—Considerable space in the daily press has been devoted recently to the question as to whether canned goods are, or are not, wholesome. Those who believe that they are not assert that the acids in the organic matter contained in the cans acts upon the tin, decomposing it and forming a violent, irritant poison. On the other hand, attention is called to the vast amount of canned goods annually consumed, and the fact that few or no deaths can be traced to this cause. One side shows analyses of canned goods which are evidently poisonous, and the other denies the correctness of such analyses. So the battle rages, now backward, now forward. We shall watch with interest the outcome of the dispute. Canned goods form so important a part of most camping and yachting stores, that it is in the highest degree essential that we should know all about them.

OUR READERS will confer a favor by sending us the names of such of their friends as are not now among the subscribers of the FOREST AND STREAM, but who would presumably be interested in the paper.

The Sportsman Tourist.

THE LOVE OF NATURE.

AN ACROSTIC.

QUIETEST amid earth's manifold delights,
Hill though it be from the unwary eye,
Ever exulting as its joy indices,
Sweet peace bestowing from the earth and sky;
The love of Nature hath an influence holy—
Never denied 'em unto the lowly—
Usurping not, save baser passion's seat,
Teaching all hearts with kinder life to beat.

Heaven sends a calm into the troubled heart—
Into its depths a blessed peace descends,
Like dew upon the bud that meekly bends—
Like midnight silence in the middy mart.

Retire unto the woodland or the shore—
Each wave a symbol of our earthly life—
See! friend in bird or bee, communion more
Exalting than our weak, frail, feeble
Repose upon the hillside, 'neath the pine;
Voices shall soothe thee—aye, a voice divine,
O earth-weary soul, shall whisper "Peace!"
Into thy heart, dispelling every care—
Rest Nature gives, for God is there.

O. W. R.

NIMROD IN THE NORTH.

BY LIEUT. FRED'K SCHWATKA, U. S. ARMY.

VI.—Dogs and Dog-Sledging—Part Two.

A TEAM of dogs means anything from a couple up to as many as can be hitched to a sledge, seal, walrus or carcass of a musk ox, polar bear or reindeer, according to what is to be dragged, for on the hard, marble-like snows of the Arctic winter, any animal with his hair on makes a good enough sled of its own when dragged head foremost, to dispense with that vehicle except for long distances. The manner of hitching these teams varies considerably with the country. In Siberia, the Hudson Bay country and Alaska, they are placed one after the other in double or single files as shown in Figs. 1 and 2. In North Hudson's Bay and the

Arctic Ocean around King William's Land where my travels were cast, I found the dogs hitched with traces of unequal length so as to make a V, the point forward, as shown in Fig. 3, the angle of the V being filled with dogs also. In

Greenland I understand that the harness traces are of equal length and the dogs therefore spread out fan-shape as in Fig. 4. The dog at the point of the V is called the leader

and is generally the most intelligent of the gang, although not necessarily the strongest and the best. It is only necessary that he or she should understand the tones of the voice left, when he wants to halt, go ahead, fast or slow, as all the dogs are regulated by the movements of the leader, and he or she is solely regulated by the driver's voice, sometimes assisted by gently striking the snow near its right or left side to emphasize certain commands.

These vocal commands of the Hudson Bay dog-drivers are the most fearful gibberish and tongue-twisting articulations I have ever heard, and although some Arctic writers have essayed to imitate it in English orthography, I will not attempt it, for I would just as soon try to give my readers the sound of thunder, a hen's cackling, or a wagon on a corduroy road by notes of music as to attempt this. I have never seen a white man that could imitate them well enough so far that the dogs would understand it, and therefore, hardly think it right to essay it so that my readers could. One or two of them are simple enough, however, as our whoa-a! long drawn out, means, steady! as you are! or a sort of sign of vocal encouragements and sounds funny enough at first when you hear it, to see the dogs go right on as if nothing had been said at all. In ordinary tradings a leader is considered to be worth two common dogs, and if he or she be of unusual intelligence, three.

I have already spoken of the feed used in the Arctic for their dogs, in describing walrus hide (koo) and kelp fish that are caught in the natural fish traps by the rise and fall of the tide. Should the carcass of a flensed whale—or one that has had its blubber stripped from it by the walrus—be cast ashore near their village, the dogs will be lucky, indeed, for if it be only of fair size there will always be enough dog food for several months at command. The natives say that when pressed with hunger in the summer months the dogs will devour large quantities of mud from the shores of the fresh water lakes, and thus manage to prevent starvation until something eatable turns up. Early in the spring—that is early for their climate, say June—when the young reindeer fawns are not strong enough for a long run, it is not an uncommon occurrence for a hunting dog to disappear from camp in a thickly supplied reindeer country and to be gone for several days, subsisting off of the young fawns. Parseneuk, a splendid, swift hunting dog of ours, disappeared at one time from us just before we moved to King William's Land, and coming back on th

fourth day, looked as if he had swallowed a hog. The natives always dislike to feed them nearly as long as a day's work, for they are the very largest creatures on top of the coast and require double the amount of usual whipping to get any work out of them.

The whip is just the length of the longest harness trace, so as to just touch the leader, although I should add that he is whipped less than any other dog in the team. The whip is a single long, supple lash of tanned seal (*ookjook*) skin with a very short handle, like that on the western "black-snake" whip. They are the best-trained men with a whip I have ever seen, and can strike out a solitary fore in a perfect moving compact mass of them, and cut him with the lash on any particular ear that they desire. From children up they are constantly using this instrument, and thereby acquire a versatility with it that no white man can ever equal. In some parts of the Arctic the whip is unknown, and the dogs are driven by a small, stout stick, held in the hand when not used, and hurled at any refractory or lazy dog in the team when needed. As the sledge goes by the active driver resumes it to repeat the operation when needed.

It would be useless, I think, to describe the many varieties of sledges to be found in the whole extent of the Arctic, for they vary with nearly every tribe, but I shall confine myself to those few kinds that came under my personal observation. The most primitive and simple sledge of all is one hewed directly out of the ice—bed and runners. One would think this vehicle extremely fragile, and liable to be broken at any moment; but so long as the owner keeps along the level shore ice, its extreme "corpulent" and strong construction renders it a rather serviceable conveyance; besides, it has the advantage of always having ice on the bottoms of its runners, a most necessary adjunct to the sledges of this region of the world. A sledge with ice spread evenly and smoothly over the bone shoe of a sledge can be hauled over the hard snow-drifts of an Arctic winter with ease and the first coat put on this consists of pieces of snow about as big as one's double fist dipped in water to render it slushy and soft, and the native with the open palm of his hand applies it to the runner, rubbing it backward and forward until it forms a level, smooth, and solidly frozen surface of about two feet along the runner and erimps over and binds on the projecting flanges of the bone shoe, as shown in cross section in Fig. B. This, of course, is continued the

wood screws enable them to be fastened securely, and this bone shoe is generally rounded off a trifle on its bearing surface or under side. To "ice" the sledge, it is turned bottom side up and the first coat put on this consists of pieces of snow about as big as one's double fist dipped in water to render it slushy and soft, and the native with the open palm of his hand applies it to the runner, rubbing it backward and forward until it forms a level, smooth, and solidly frozen surface of about two feet along the runner and erimps over and binds on the projecting flanges of the bone shoe, as shown in cross section in Fig. B. This, of course, is continued the

whole length of the runner. This frozen snow is opaque and looks like a mass of ground glass, and when solidly frozen, as it will be even while the man is rubbing it, the process is ready for the second coat or finishing touches, so to speak.

The native now takes his mouth as full of water as it will hold, and sends a gentle spray over the frozen snow on the runners, and this freezes almost as fast as it strikes, the sledge man at the same time rapidly running the palm of his hand backward and forward over the surface to give it a perfect polish. Sometimes he uses a piece of bear skin to save his hand the severe friction, but the last few strokes are always with the open palm of the hand.

The finished sledges and runners are so slippery as one can possibly imagine, and truly I do not think I exaggerate the comparison when I say that it is not much easier to pull a sledge nicely and properly leed over one that is not, as it would be for a horse to pull a truck with the wheels on over one that had them taken off. My largest sledge was one so heavy that it was hard work for any of us men to turn it over so that Toolooah could ice it, and it would have taken a couple and probably three to budge it if the runners were uniced, yet when the leing had been completed, I could take my little finger (and often have done it,) hooked on one of the cross slats, and work this ponderous vehicle backward and forward through the distance I could swing my arm. Several times, without noticing that the snow was a little bit uniced, we have turned the leed sledge over gently to prevent fracturing the glacial shoe, and have been surprised to see it start down the grade by its own weight. They are almost as prone to this as a well-oiled wheel vehicle on rails.

Of course such a valuable, but frail, adjunct to their most important means of transportation must necessarily be a cause for the liveliest solititude and care of the native sledge-man to see that it is not injured in any way so as to compromise its utility. In no place does the superiority of a sledge-man to such good advantage as in his ability to conduct his sledge through a low, rocky portage connecting two lakes or over the top of a ridge where the snow has nearly blown away without stripping thence from his sledge-runners against the many stones that are peeping through the snow in every direction. I have seen my best sledge driver, Toolooah, take his twenty foot sledge through a place for a couple of hundred yards where it would seem impossible to spread one's coat without covering a stone, and yet come out unscathed, but it required the work of a Hercules in hobbling the front of the sledge from one side to the other and watching the rear that it was not thrown against or over a rock. So important is it to keep this leing on the sledge-runner bottoms, that if it is ripped off by any accident the Esquimaux will stop at the first lake or river where they can get water to wet the snow and sprinkle the second coating, though they may have to dig through seven or eight feet of ice to get it.

When one reflects upon the value of this simple accessory

to Arctic sledging, and of the importance of sledging to an expedition that dears to accomplish anything in these regions, and also that this art is solely monopolized by these people, it at once shows the great advantage of having them as allies and the comparative folly of sledge journeys in rough Arctic countries without them. If a rough, stony place interposes itself where the projecting rocks are so numerous that it really becomes impossible to get through, all the persons on the party will take off their rubber coats and spread their hair side up over the stones that the runner would strike in passing by. Late in the spring, when the temperature commences to approach freezing from a much lower standard, the ice will not retain its hold so well on the bone shoes, and when it reaches melting extra precautions have to be taken to protect it. Halting to rest on a warm, sunny day, the sledge is swung around so that one runner is protected by its own shadow, while the other has a number of reindeer cloaks, blankets or anything that nature spreads along over it to get to the sun. The least little bump at these temperatures is very liable to knock off a foot or two, and then the rest is easily sealed off. When it becomes so warm that the ice will no longer retain its hold, the snow on which the sledge runs becomes of a soft consistency that allows the bare bone shoes of the runners to glide over it with comparative ease, and everybody now wants to ride on the sledge, as when walking they are sinking up to the ankles or knees in the heavy snow.

The worst experience I ever had in sledging was on Back's River in December, 1879. This stream is full of rapids which keep open the whole winter, and the rising steam from them (for they lock like huge boiling cauldrons of water in the intense cold of winter) freezes into a fine, gritty, sand-like mass of snow that covers the true snow-drifts with a mass like so much rosin, and that sticks to the sledge-runners with almost as much persistency in any temperature below -50. I once think the thermometer averaged lower than that while we were on the river. But even this was not the worst obstacle, for all the snow that had lodged on the river ice was along the cracks in the ice, nearly all of which seemed to be perpendicular to the axis of the stream. We thus had an alternation of snow and ice every few yards, and often every few feet. The ice from the river would strip that from the sledge, and the snow which was reached it would rest all over it, and additional aid from the members of the party to drag it over. Either ice or snow alone would have allowed us to proceed at a good round gait, but their alternating condition made it the most annoying and laborious work I have ever experienced, and we always felt lucky if the igloos in the morning's camp were out of sight around some bend of the river when we picked out our camp for the evening. At the very first favorable opportunity I abandoned the river and found the hill country between it and Hudson's Bay much better adapted for sledging than even its level bed.

While on the Koojmijok, a branch of the Great Fish River, during the spring so late that the ice would not stay on the runners, we found a great deal of the snow on the river ice mixed with sand, blown from the banks during high winds, and this acted like sandpaper on the bare bone shoes, and was so much more annoying than those shoes to about half their usual thickness and felt a little bit uneasy that they might break under hard knocks, which they did do several times, but never enough to seriously compromise us.

In a great many parts of the Arctic it is impossible to procure the bone from a whale for sledge shoes, and then the wet snow is applied directly to the bottom of the runner, and before its application is mixed with boggy mud full of rot sticks and grass, and the hind end of those shoes to its mixture when it can be obtained is the undigested mass taken from the stomach of a reindeer. Among the Netschilinks, who confine their sledging to the coasts of the Arctic Sea, where it is of the best character, and who kill no whales to furnish them with bone, we find the runners shod with pure ice. "Trenches the length of the runners are dug in the ice, and into these the runners are lowered two or three inches, and the sledges are then dragged over them by the same distance. Water is then poured and allowed to freeze, when the sledge is lifted out shod with a runner of perfectly pure and transparent ice. So transparent is this ice at times that when the sledge is in rapid motion it may produce a peculiar optical delusion, one imagining that the sledge is some three or four inches from the ground, swinging out behind like a kite's tail in its rapid flight. Where not even wood can be procured, the ice sledge already explained is adopted or the skin of a polar bear or musk-ox may be used if it be dragged with the hair pointing backward.

The ratio of width to length in their sledges varies with the different tribes. The Hudson Bay Esquimaux use about the proportions usually seen in boys' sledges used for coasting, although five or six times as large. The Kinneqtoos of Chesterfield Inlet, can be procured, often have sledges of twenty-five to thirty feet in length and only a foot or foot and a half in width, claiming that these go over rough ground much easier than the common kind.

In putting a load on a sledge a pole at the height of a person's breast is often lashed on the fore end of the load so that it will project on both sides a couple of feet, and with a person on either side pushing on this, the sledge is easily controlled.

"How fast can a sledge go?" or "How far can you travel in a day with them?" is an indefinite question, asked nearly as often as the one about the size of the Esquimaux dog, and the reply is about as satisfactory when I say they can travel nearly as fast and fully as far as a horse. If the sledge has a maximum load (say 150 to 200 pounds per dog on salt water ice or half that on inland sledging) the party can make ten to twenty miles a day, and keep it up about the same as a light expedition of footsloggers. With a selected team of ten to fifteen dogs, with only a driver and a light sledge, we could make seventy-five or even a hundred miles a day, especially along the coast. While in the heavy, hummocky ice of Victoria Channel, I only made ten miles, with a fair load, in fourteen hours' hard work; yet I have been told of an incident where life and death hung on the rapidity of action, and forty-five dogs were hitched to a light sledge, with two speakers, drivers weighing on the team from each side, when twelve or thirteen miles were made in less than double as many minutes to rescue a lost sailor from the whaling ships in Repulse Bay.

PENNSYLVANIA.—Jefferson, Pa., May 7.—I have been spending the past week in the country, and by observation I find the quail have wintered well here. I took a stroll to the woodlands on the 4th inst., and in my rambles have seen several pairs, and the welcome notes of Bob White can be heard on all sides.—RAMBLER.

QUIET SPORT.—III.

BY MILLARD.

EARLY on the morning of our third day at Spider Lake, Roy and Glen, with one of the guides, started for another lake about three miles north, intending to remain there a couple of days and then join us again. They carried blankets and edibles, and merrily took the trail.

Ward went back to his first principles of angling, and produced his bag of worms with the remark that now he stood upon his native soil and could tell when he had a fish properly hooked; and would discard the fly for the day, at least. He admired Green's style and its results, but he did not care to learn it too fast. "Go slow and learn to peddle," was his motto, and he would give the hint of another trial on the morrow, so he will leave him at the lake and follow Dick down the outlet. It is a pretty stream, and as General Sherman said of the Rio Grande, so crooked that one cannot tell which side of it he is on. Every rod of it is lovely with its distinct and special characteristics, suggesting innumerable pictures to the artistic eye.

Varied as the tints and forms of the kaleidroscope, at each turn it seemed as if some fantastic water sprite was transposing its look and character. Here its whole surface is heckerd with ripples and foam, each ripple wearing a crown of diamonds and making music sweet as children's laughter. Away it skurries, fretting and chafing and bumping its head against boulders and fallen trees, scraping its sides on the banks until, seemingly exhausted with its headlong race, it quietly hugs the shore and in a deep and darksome pool, black as the ten of spades, which you remember is considerably brighter than the celebrated sea, it vividly reflects the far-away, but close, over-arching, ever-such, and ever-on, and ever with ripple and pool, never-falling spuds adding their tribute to its volume. "There is melody in the fall of the cataraet, and the rush of many waters is sweet to the senses," but "with all thy faults I love thee" quiet.

A few yards below an abutment of fallen trees was one of those quiet pools lying off the eddying waters, a resting place for such trout as were tired from hatching with the strong current. They could just naturally drop into it, as it were, and a trout-stained man would drop into a wayside inn and brace up a wee bit, for trout sometimes grow weary and take a rest.

There's a trout there this blessed moment, and perhaps he is having a sociable chat with the fellow who keeps the place. At any rate he has refused a variety of popular flies; and it is never advisable to waste one's time by too many casts over the same place and fish. It is better to make him aware of your intentions, but mark the spot and come on unobtrusively, and perhaps toward sunset, if you return you may bring him to your creel. Possibly sundry tricks that he has received in the past are not forgotten, and the remembrance of them makes him the more wary; for like a skillful boxer or swordsman he is only biding his time and opportunity to seize a favorable opening when he can deliver his blow and escape the return; and in a careless moment, when Dick's leader is slack and he stretches it to the breaking point, and then suddenly breaks it.

Dick gave utterance to a rather audible "Devil take my carelessness!" as he waded ashore to repair the damage, a mingled look of disgust and disappointment overshadowing the usual serenity of his face.

Some can find solace and comfort in familiar quotations for every disappointment and trouble. Others draw a temporary consolation from their flasks, and others have recourse to their tobacco pouches. Dick had no flask, and for getting any passage touching his present disaster, he turned with a sigh of regret to his briarwood, endeavoring to extinguish his disappointment by lighting his pipe, and adulterating the sweet scented air with the fumes of cut plug.

Fortune not only turned toward him the cold shoulder, but Justice raised the bandage from her eyes, surveyed the scene, gave a very expressive wink as she replaced the hand-dish and said, "Cupful served you right, young man. Next time Miss Goodie Luck offers you her summiest and sweetest favors, do not dally and trifle too long, else she may again change her mind. She is the most capricious of her sex."

By the time a new leader with its east of flies had been adjusted and his pipe finished, Richard was himself again. What did the trilling ulshup amount to? No more than the aching tooth the old wangler had put when Dick was about. Many a man of less sunny temperament would have succumbed to despondency long when Dick would have up and gone home. Dick appreciated the fact that there were as good fish in the sea as ever were caught, and unanimously passing a resolution to be more careful, he waded into the stream with a thickly settled determination that if it were possible to capture any fish he would make the possibility a certainty, and as they began to rise he felt that there he would soon get the enjoyment of an absorbing pleasure that amply compensated him for his previous inattention. So eagerly did they rise among the ripples and the eddies in the pools and quiet reaches, coming from under banks and boulders after the enticing and swindling morsels, that they exhibited a selfishness of which a spoiled child would be ashamed.

It requires an almost fabulous amount of self-control and denial for an angler to reel up a good bag to camp when the fish are in biting humor. The reel may be filled, but the temptation for one more cast, and then another and another, is powerful, and the angler who can resist it is one in a score. The angler should scorn to fish for count, but so many of his angling days are so barren of results, and so comparatively disastrous, that he improves the opportunity when the fish won't let go. But he does it fairly, and every fish he catches is of use to him or his friends. The fingerings he gives back to life and to wisdom; the old and large ones he does not waste. That was the class of anglers to which Dick belonged. He had enough when he could have had more; and then

The angler campward tramped his pleasant way. Dick had hardly reached the shanty when Glen and Roy, with their guides, returned. They had caught what there was of the latter end of the morning fishing, but it had been barren of results. The fish they reported as more seldom than four dollar bills, and as they had none in the concrete, they got the guide to damn them as the obstructive, and could hardly explain the reason of their unexpected return, as they had announced their intention of remaining away a couple of days and had provisioned themselves accordingly; but as Roy and the guide had developed such extraordinary appetites that Glen had, as a matter of self-defense and vomitory protection to consume his share, which resulted in a complete annihilation of the commissariat attached to the expedition, and a speedy retracing of their steps was a matter of course. Supplies for two days were exhausted at one

meal and that only a lunch. Tarrare could hardly have surpassed it in any of his feats of gastronomy. They were hungry, too, when they reached the home camp. The guide said his stomach felt as if his throat were cut, and Roy and Helen responded, among others.

The complaint seemed contagious, for we all felt the insidious approaches of irresistible appetites, whose claims could not be ignored, and the cook was ordered to do his best; and no refinement of palate could be displeased at the spread he offered, barring a few unimportant items. The bread, perhaps, was a trifle too stale, the biscuits might, for some have been rather too heavy, the potatoes might have been baked instead of having been boiled, but the coffee was clear, hot, strong and abundant. The trout came on piping hot. They had changed their spotted dresses of every day wear and for this occasion only appeared in close fitting dresses of golden brown, and they were just as nice as they looked, but their beauty could not protect them.

Then we gathered around that delight of a camper, a roasting fire, and the evening programme was carried out, while the katydids were having their little twilight discussions and the owls were trying to hold the horns off the gibbous moon while the man was away, and drowning out the faint murmuring of the lake and stream. It was an exquisite evening, full of the charms that belong only to forest and stream. A light wind came across the lake, rippling into silvery furrows, and passing on, whispered among the trees and hurried up our faces. Crickets voices struggled with threadbare songs, while the old hills caught up the refrains, and doubling and trebling them, hurled them toward the settlement to annoy the good people there, if they were so unfortunate as to hear.

Natural History.

BIRDS OF NORTHERN OHIO.

BY SEYM. R. INGERSOLL.

[The nomenclature employed is that of the Smithsonian catalogue.]

WOOD THRUSH—*Turdus mustelinus*.—A common summer resident; breeds. Arrives about April 23. Wilson's Thrush—*Turdus fuscescens*.—A summer resident; breeds. Arrives about the 1st of May. Olive-backed Thrush—*Turdus swainsoni*.—Found during spring and fall migration. Hermit Thrush—*Turdus pallasi*.—Not a common summer resident; breeds. Arrives about the middle of April. Robin—*Turdus migratorius*.—An abundant summer resident; breeds. Arrives along the last of February. Mocking-bird—*Mimus polyglottus*.—Rare summer resident. Catbird—*Mimus carolinensis*.—An abundant summer resident; breeds. Arrives about the last of April. Brown Thrush—*Harporhynchus rufus*.—A very common summer resident; breeds. Arrives about the middle of April. Bluebird—*Sialia sialis*.—An abundant summer resident; breeds. Arrives along the 1st of February. Blue-gray Gnatcatcher—*Poocipia cerulea*.—A common summer resident; breeds. Arrives about the middle of April. Ruby-crowned Kinglet—*Regulus calendula*.—Quite common during spring and fall migration. Golden-crowned Kinglet—*Regulus satrapa*.—A common winter visitor. Tufted Titmouse—*Lophophanes bicolor*.—In some parts a common resident; breeds. Black-capped Chickadee—*Parus atricapillus*.—A common winter visitor; a few remain and breed. White-bellied Nuthatch—*Sitta carolinensis*.—A common resident; breeds. Red-bellied Nuthatch—*Sitta canadensis*.—An irregular winter visitor. Brown Creeper—*Certhia familiaris*.—A common resident; breeds. House Wren—*Troglodytes domesticus*.—A common summer resident; breeds. Arrives about the middle of April. Winter Wren—*Anorhynchus troglodytes*, var. *hageni*.—A not common winter visitor. Long-billed Marsh Wren—*Troglodytes palustris*.—Common in some localities; summer resident; breeds. Short-billed Marsh Wren—*Ostothorus sularis*.—Not common summer resident; breeds. Arrives about the 1st of May. Brown Lark, Titlark—*Anthus ludoviciana*.—Found during spring and fall migration. Black and White Creeper—*Mniotilta varia*.—Common during spring and fall migration; a few remain and breed. Worm-eating Warbler—*Helmintophaga cervinorum*.—Found during spring and fall migration. Blue-winged Yellow Warbler—*Helmintophaga pinus*.—Common during migration; few remain and breed. Blue Golden-winged Warbler—*Helmintophaga chrysopetra*.—Not common during migration. Nashville Warbler—*Helmintophaga ruficapilla*.—Common during spring and fall migration. Orange-crowned Warbler—*Helmintophaga celata*.—Rare. Blue Yellow-backed Warbler—*Parula americana*.—Found during spring and fall migration. Cape May Warbler—*Dendroica tigrina*.—Not common during migration; more abundant in the fall. Yellow Warbler—*Dendroica aestiva*.—A common summer resident; breeds. Arrives about the last of April. Black-throated Blue Warbler—*Dendroica caerulescens*.—An abundant spring and fall migrant. Yellow-rumped Warbler—*Dendroica coronata*.—Common during spring and fall migration. Black and Yellow Warbler—*Dendroica maculosa*.—An abundant spring and fall migrant; few remain and breed. Cerulean Warbler—*Dendroica cerulea*.—Found during the spring and fall migration; few breed. Chestnut-sided Warbler—*Dendroica pensilvanica*.—Quite a common spring and fall migrant. Grey-breasted Warbler—*Dendroica castanea*.—Found during spring and fall migration; more abundant in the fall. Black-poll Warbler—*Dendroica striata*.—Migrant; irregular in the spring but common in the fall. Blackburnian Warbler—*Dendroica blackburni*.—Not common spring and fall migrant. Black-throated Green Warbler—*Dendroica virens*.—Quite common during spring and fall migration. Herkland's Warbler—*Dendroica herklandi*.—Very rare; only four or five have ever been found. Pine-creeping Warbler—*Dendroica pinus*.—Not common spring and fall migrant.

Yellow Red-poll Warbler—*Dendroica palmarum*.—Found during spring and fall migration. Prairie Warbler—*Dendroica discolor*.—Rare migrant. Golden-crowned Thrush—*Sialurus curvicaillus*.—Not uncommon summer resident; breeds. Arrives about the 1st of May. Large-billed Water Thrush—*Sialurus nabeola*.—A summer resident in some localities; breeds. Arrives about the 1st of June. Green Black-capped Flycatcher Warbler—*Myiobolus pusillus*.—Occasionally found during spring and fall migration. Kentucky Warbler—*Oporornis formosus*.—Few seen during migration; said to occasionally breed in some localities. Mourning Warbler—*Geothlypis phthaladepha*.—Rather rare spring and fall migrant. Maryland Yellow-throat—*Geothlypis trichas*.—A common summer resident; breeds. Arrives about the 1st of May. Yellow-breasted Chat—*Icteria virens*.—Common summer resident; breeds. Arrives about the 1st of May. Hooded Warbler—*Myiobolus mitratus*.—Common spring and fall migrant; few remain and breed. Canada Flycatcher Warbler—*Myiobolus canadensis*.—A common migrant; more abundant in the spring. Redstart—*Setophaga ruticilla*.—A common summer resident; breeds. Arrives about the last of April. Red-eyed Vireo—*Vireo olivaceus*.—Common summer resident; breeds. Arrives about the 1st of May. Philadelphia Vireo—*Vireo philadelphicus*.—Not common spring and fall migrant. Warbling Vireo—*Vireo gilvus*.—A common summer resident; breeds. Arrives about the 1st of May. Yellow-throated Vireo—*Vireo flavifrons*.—Common during spring and fall migration; few remain and breed. Solitary Vireo—*Vireo solitarius*.—Found during migration; few remain all summer and breed. White-eyed Vireo—*Vireo noveboracensis*.—Not common summer resident; breeds. Arrives about the middle of April. Great Northern Shrike, Butcher-bird—*Lanius borealis*.—An irregular and not common winter visitor. Loggerhead Shrike—*Lanius ludovicianus*.—Not uncommon summer resident; breeds. Arrives about the middle of May. Bohemian Waxwing—*Amphisp garrulus*.—Rare winter visitor. Carolina Waxwing—*Amphisp cedrorum*.—A common resident; breeds. Purple Martin—*Progne subis*.—Summer resident; breeds. Arrives about the last of April. Cliff Swallow, House Swallow—*Petrochelidon lunifrons*.—A very common summer resident; breeds. Arrives about the 1st of May. Barn Swallow—*Iruando erythrogastera*.—An abundant summer resident; breeds. Arrives about the 1st of May. White-bellied Swallow—*Tachycineta bicolor*.—In some localities a common summer resident; breeds. Arrives about the 1st of April. Cowbird Swallow, Sand Martin—*Ocite riparia*.—A rather common summer resident; breeds. Arrives about the last of April. Rough-winged Swallow—*Stelgidopteryx serripennis*.—In some localities a common summer resident; breeds. Scarlet Tanager—*Pyranga rubra*.—Not abundant summer resident; breeds. Arrives about the 1st of May. Pine Grosbeak—*Pipilo erythrophthalmus*.—An occasional winter visitor. Purple Finch—*Carolinus purpureus*.—Found during spring and fall migration. Common Crossbill—*Loxia curvirostris*, var. *americana*.—An irregular winter visitor. White-winged Crossbill—*Loxia leucoptera*.—An occasional winter visitor. Redpoll Linnet—*Aegialitis linaria*.—Not common winter visitor. American Goldfinch, Yellowbird—*Astragalinus tristis*.—An abundant resident; less common in the winter; breeds. Pine Linnet—*Chrysomitris pinus*.—A common winter visitor. Snow Bunting—*Plectrophanes nivalis*.—Not common winter visitor. Orchard Longspur—*Centropus lapponicus*.—An occasional winter visitor. Savannah Sparrow—*Passerculus savanna*.—Common in some localities during migration; few remain and build. Bay-winged Bunting, Grass Finch—*Pooecetes gramineus*.—An abundant summer resident; breeds. Arrives about April 1st. Yellow-winged Sparrow—*Colinus passerinus*.—Not common summer resident; breeds. Arrives about May 1st. Lark Finch—*Chondestes grammacus*.—Not uncommon summer resident; thought by some to breed here. White-crowned Sparrow—*Zonotrichia leucophrys*.—Quite common during spring and fall migration. White-throated Sparrow—*Zonotrichia albicollis*.—A common spring and fall migrant; few breed. Tree sparrow—*Spizella monticola*.—An abundant winter resident. English Sparrow—*Passer domesticus*.—An abundant resident in the cities and towns; breeds. Chipping Sparrow—*Spizella socialis*.—An abundant summer resident; breeds. Arrives about the first of April. Field Sparrow—*Spizella pusilla*.—A common summer resident; breeds. Arrives about the middle of April. Song Sparrow—*Melospiza melodia*.—An abundant summer resident; breeds. Arrives about the first of March. Swamp Sparrow—*Melospiza palustris*.—In some localities a summer resident; breeds. Fox Sparrow—*Passercella iliaca*.—Found during the spring and fall migration. Chewink, Towhee Bunting—*Pipilo erythrophthalmus*.—A common summer resident; breeds. Arrives about the first of April. Cardinal Grosbeak—*Cardinalis virginianus*.—An occasional winter visitor. Rose-breasted Grosbeak—*Goniphaga ludoviciana*.—Not common; summer resident; breeds. Indigo Bunting—*Cyanospiza cyano*.—A common summer resident; breeds. Arrives about the middle of May. Bobolink—*Dolichonyx oryzivorus*.—Summer resident; breeds. Arrives about the middle of May. Cowbird—*Molothrus ater*.—An abundant summer resident; breeds. Arrives about the middle of April. Red-winged Blackbird—*Agelaius phoeniceus*.—An abundant summer resident; breeds. Arrives about March 1st. Meadow Lark—*Sturnella magna*.—An abundant summer resident; breeds. Arrives about the middle of March.

Orchard Oriole—*Icterus spurius*.—Common summer resident; breeds. Arrives about the first of May. Baltimore Oriole—*Icterus baltimore*.—Quite a common summer resident; breeds. Arrives about the last of April. Rusty Blackbird—*Scolecophagus ferrugineus*.—Common during spring and fall migrations. Purple Grackle, Crow Blackbird—*Quiscalus purpureus*.—An abundant summer resident; breeds. Arrives about the first of March. Common Crow—*Corvus americanus*.—Common summer resident; breeds. Arrives about the last of February. Jay—*Cyanurus cristatus*.—An abundant resident; breeds. Shore Lark, Horned Lark—*Eremophila alpestris*.—A common winter visitor; few breed. Kingbird—*Tyrannus carolinensis*.—A quite common summer resident; breeds. Arrives about the first of May. Great Crested Flycatcher—*Myiarchus cinerascens*.—A common summer resident; breeds. Arrives about the middle of May. Pewee—*Sayornis fuscus*.—A common summer resident; breeds. Arrives about the last of March. Wood Pewee—*Contopus virens*.—A quite common summer resident; breeds. Arrives about the middle of April. Canadian Flycatcher—*Empidonax acadicus*.—A common summer resident; breeds. Arrives about the middle of May. Parula Flycatcher—*Empidonax traillii*.—Found during spring and fall migration; not common. Least Flycatcher—*Empidonax minimus*.—Common during spring and fall migration. Ruby-throated Hummingbird—*Trochilus colubris*.—A very common summer resident; breeds. Arrives about May 9. Chimney Swift—*Chaetura pelagica*.—Quite a common summer resident; breeds. Arrives about the last of April. Whip-poor-will, Night Jar—*Antrostomus vociferans*.—A summer resident; breeds. Arrives about the first of May. Night Hawk—*Chordeiles virginianus*.—Common summer resident; breeds. Arrives about the first of May. Hairy Woodpecker—*Picus villosus*.—Common summer resident; breeds. Downy Woodpecker—*Picus pubescens*.—Common resident; breeds. Abundant in the fall and winter. Yellow-bellied Woodpecker—*Sphyrapicus varius*.—Common during spring and fall migration in some localities. Pileated Woodpecker—*Hylotinus pileatus*.—Few still to be found in some localities; breeds. Red-bellied Woodpecker—*Centurus carolinensis*.—Not common resident; breeds; more abundant in the winter. Red-headed Woodpecker—*Melanerpes erythrocephalus*.—An abundant summer resident; breeds. Arrives about April 1. Yellow-shafted Flicker—*Colaptes auratus*.—An abundant summer resident; breeds; a few remain all winter. Belted Kingfisher—*Ceryle alcyon*.—A common summer resident; breeds. Arrives about the first of April. Yellow-billed Cuckoo—*Coccyus erythrophthalmus*.—Summer resident; breeds. Arrives about the middle of May. Black-billed Cuckoo—*Coccyus erythrophthalmus*.—Quite a common summer resident; breeds. Arrives about the middle of May. Long-eared Owl—*Otus vulgaris*.—Resident; common in winter, rare in summer; breeds. Short-eared Owl—*Brachyotus palustris*.—A common resident, more abundant in the winter; breeds. Turkey Owl—*Syrnium nebulosum*.—Resident; more abundant in the winter; breeds. Screech Owl—*Nyctale acadica*.—Not uncommon; breeds. Screech Owl, Mottled Owl—*Scops asio*.—A common resident, but much more common during the winter; breeds. Snowy Owl—*Nyctale scandiaca*.—An irregular winter visitor. Duck Hawk—*Falco campestris*, var. *anatum*.—Found during spring and fall migration; not common. Pigeon Hawk—*Falco columbarius*.—Not common migrant; few remain and breed. Sparrow Hawk—*Falco sparverius*.—A common summer resident; breeds. Arrives about the 1st of April. Fish Hawk—*Pandion haliaetus*.—A summer resident in some localities; breeds. Marsh Hawk—*Circus cyaneus*, var. *hudsonius*.—In some localities a common resident; breeds. Cooper's Hawk—*Accipiter cooperi*.—A common resident; breeds. Sharp-shinned Hawk—*Accipiter fasciatus*.—A common resident; breeds. Bald Hawk, Hen Hawk—*Buteo aquitinus*.—A common resident; more abundant in the winter; breeds. Red-shouldered Hawk—*Buteo lineatus*.—A common resident; breeds. Broad-winged Hawk—*Buteo pennsylvanicus*.—Not common resident, more abundant in the winter. White-headed Eagle, Bald Eagle—*Haliaeetus leucocapillus*.—A few seen during migration; breed in some localities. Turkey Buzzard—*Cathartes aura*.—A common summer resident in some localities; breeds. Passenger Pigeon, Wild Pigeon—*Ectopistes macrurus*.—A spring and fall migrant. Carolina Dove, Mourning Dove—*Zenaidura macroura*.—A common summer resident; breeds. Arrives about the last of April. Ruffed Grouse—*Bonasa umbellus*.—Resident in some localities; breeds. Virginia Partridge, Quail—*Ortyx virginianus*.—A common resident in some localities; breeds. Great Blue Heron—*Ardea herodias*.—In some localities a common summer resident; breeds. Great White Egret, White Heron—*Ardea egretta*.—Summer resident in some parts; breeds. Green Heron—*Ardea virescens*.—A common summer resident; breeds. Arrives about the middle of April. American Bittern—*Botaurus minor*.—Summer resident in some localities; breeds. Least Bittern—*Ardetta exilis*.—Not uncommon summer resident; breeds. Turnstone—*Streptopus interpres*.—A few have been taken along the lake during migration and fall migration. Black-bellied Plover—*Sturnella helvetica*.—A few found during spring and fall migration. Golden Plover—*Charadrius fulvus*, var. *virginicus*.—Not uncommon during spring and fall migration. Killdeer Plover—*Argemone vociferans*.—A common summer resident; breeds. Arrives about the 1st of March. Semipalmated Plover—*Argemone semipalmata*.—Not common migrant; more abundant in the fall. Ring-billed Plover, Ringneck—*Argemone melodia*.—Rather common spring and fall migrant; breeds in some parts.

Woodcock—*Philohela minor*—Summer resident; breeds. Arrives about the 1st of April.

Wilson's Snipe—*Gallinago wilsoni*.—Common during spring and fall migration.

Skill Sandpiper—*Micropalama himantopus*.—A very rare migrant on Lake Erie.

Red-tailed Sandpiper—*Tringa maculata*.—Common during spring and fall migration.

Least Sandpiper—*Tringa minutilla*.—Migrant; not common in spring, but abundant in the fall.

American Dunlin—*Tringa alpina*, var. *umbrinosa*.—A not uncommon spring and fall migrant on Lake Erie.

Semipalmated Sandpiper—*Erereutes pusillus*.—Common during migration.

Sanderling, Ruddy Plover—*Callaris arenaria*.—A common spring and fall migrant.

Marbled Godwit—*Limosa phaeo*.—Rare spring and fall migrant.

Greater Yellow-legs—*Tringa melanoleuca*.—Not uncommon during spring and fall migration.

Yellow-legs—*Tringa flavipes*.—Common during spring and fall migration.

Spotted Sandpiper—*Tringoides macularia*.—Quite common summer resident; breeds. Arrives about the middle of May.

Long-billed Curlew—*Numenius longirostris*.—Occasionally seen during spring and fall migration.

Wilson's Phalarope—*Steganopus wilsoni*.—Few have been taken during spring and fall migration.

Marsh Hen—*Rallus cinganus*.—In some localities a summer resident; breeds in the swamps in the northwestern part of the State.

Parula Rail—*Rallus virginianus*.—Common during spring and fall migration. In some localities it is a summer resident; breeds. Arrives about the 1st of April.

Carolina Rail, Sora Rail—*Porzana carolina*.—In some localities a common summer resident; breeds.

Yellow Rail—*Porzana norboracensis*.—Not common spring and fall migrant.

Florida Gallinule—*Gallinula galeata*.—A common summer resident in the marshes; breeds.

Coot—*Fulica americana*.—A common spring and fall migrant; summer resident in some localities; breeds.

Snow Goose—*Anser hyperboreus*.—An occasional spring and fall migrant.

Canada Goose—*Branta canadensis*.—Common during spring and fall migration.

Mallard Duck—*Anas boschas*.—An abundant spring and fall migrant.

Mallard Duck, Black Mallard—*Anas obscura*.—Common during spring and fall migration.

Pintail, Springtail—*Dafila acuta*.—Quite common during spring and fall migration.

American Widgeon, Balpate. —*Marca americana*.—Common during spring and fall migration.

Shoveler—*Spatula clypeata*.—Common during migration; few breed in some localities.

Blue-winged Teal—*Querquedula discors*.—An abundant spring and fall migrant.

Green-winged Teal—*Querquedula carolinensis*.—Quite common during spring and fall migration.

Wood Duck, Summer Duck—*Aix sponsa*.—Common during migration; some remain all summer; breed. Arrives about the 1st of April.

Little Blackhead—*Melospiza affinis*.—A very common spring and fall migrant.

Cyanus-back Duck—*Fuligula callisneria*.—Common spring and fall migrant on the lake.

Redhead, Pochard—*Melospiza ferina*, var. *americana*.—Common; during spring and fall migrant on the lake.

Buff-headed Duck, Butterball—*Bucephala albeola*.—Quite common during spring and fall migration.

American Sheldrake, Merganser—*Mergus merganser*.—Common during migration; in part summer resident; breeds.

Hooded Merganser—*Mergus cacciatris*.—Common during spring and fall migration.

Florida Cormorant—*Graculus alioptus*, var. *floridanus*.—Occasionally seen during migration.

Great Black-backed Gull—*Larus marinus*.—A rare winter visitor along the lake.

American Herring Gull—*Larus argentatus*.—A common spring and fall migrant on the islands in the lake.

Ring-billed Gull—*Larus delawarensis*.—Found during spring and fall migration.

Bonaparte's Gull—*Larus philadelphia*.—Common during spring and fall migration on Lake Erie.

Wilson's Tern, Common Tern—*Sterna fuscivittatus*.—In some localities a summer resident; breeds; in others only a spring and fall migrant.

Black-throated Grebe—*Phalacrocorax larifornis*.—In some localities a common summer resident; breeds.

Horned Grebe—*Polepeus cornutus*.—Rather common spring and fall migrant.

Thick-billed Grebe—*Polygynus polepeus*.—An abundant spring and fall migrant; in some localities a summer resident; breeds.

Great Northern Diver, Loon—*Columbus torquatus*.—A spring and fall migrant.

Red-throated Diver—*Columbus septentrionalis*.—A spring and fall migrant; not rare on Lake Erie.

make another kind of a noise. My great-grandmother he always hated, and would fly at her and pick her heels, and beat her with his wings, all the feathers on top of his head standing up straight. If everybody was up-stairs he would hunt through every room in the house, whistling all the time. When he found them and they were sitting down he would open himself up their dresses and have his wings stretched out, and fly by them as long as they would let him. He never had his wings clipped. He was called Quock, and would always come when he was called, whether indoors or out. He lived four or five years, and the family moving into another house he was put in the cellar to roost, and the first night the rats killed him. DASH.

THE PANTHER'S LEAP.

I MUST crave permission to add a few words to the very sensible article recently published in FOREST AND STREAM on the panther, catamount, painter, lion, cougar, puma or any other local name he may bear. This fact alone stamps unrivaled character upon an animal found in the length and breadth of both American continents, for, while the African lion or tiger may be competitors in strength, in agility he has no rival living. It is this single quality or ability I wish to consider; the length and power of his spring, whether it be to seize prey or to reach a place of comparative safety when pursued.

A gentleman of truth and candor said this to me: "I was in Canada some years since, beyond the St. Lawrence, in November. The family where I was stopping had just finished the usual slaughter of hogs and a beef for the year's supply, and had hung the beef against a pile of boards or lumber to cool off, or freeze, as is customary. A catamount (the Indian name in New England) smelled the meat from the woods close by and crept out in the night to get a piece. In pulling down the quarter of beef he upset the whole pile of lumber, which came down with a frightful noise, and he made three tremendous leaps from the spot. I saw the tracks in the snow; there was not a mark between them; I did not measure the distance myself, but a man did, and, I believe, correctly. The first jump was up hill, thirty feet, the second, horizontal, to a large rock, fifty-four feet, the third, down hill, seventy-two feet."

A leap of thirty feet perpendicular to the branch of a tree, or a forty-foot plunge after a fatal shot, and falling dead and almost at the hunter's feet, have been repeated until the veracity is not questioned, and after making all possible allowance we must acknowledge there is not a creature living whose leap compares with it.

The question then comes up, how is this superiority over other animals attained? The answer we shall find in a little natural philosophy and a mechanical law in animal economy, since the final conclusion must be that all muscular action, all the functions of life, are strictly mechanical, and that the locomotive is its best representative in existence. Mind, I do not speak of life itself, which, like, the engineer just back, directs and governs all.

The key to the above question we shall find in the coiled wire spring. This spring, pressed down on a base and liberated, leaps ahead further than any other form. The reason is very simple. Every movement of substance must start from a nucleus moved by an outside force. The coiled wire spring, when pressed down from a solid its entire length. When let loose, the first turn jumps from its base, which is the second; the second adds its force to the last, jumping from the third, and so in succession to the last, which adds its force after the whole coil is flying from the outside base of all. And this is precisely the case in the panther's leap. The forelegs and head are shot forward from the shoulder, the powerful muscles of the back straighten the curve of the spinal column from the hips, while the great posterior muscles through the Achilles tendon and over the longest lever in the animal economy, add the last impetus to a body already shooting ahead like an arrow. This serpentine flexibility is beautifully illustrated in the menagerie when the keeper thrusts his stick across the cage and orders *Felis* to jump over it. The head and shoulders rise and graceful curve over the stick, beginning to descend on the opposite side with the last impetus given by the hind feet, and the body alights gently as it rises, seemingly without weight, concussion or the disturbance of a leaf. B. HONSFORD.

SPRINGFIELD, MASS.

THE WAR AGAINST THE ENGLISH SPARROW.—The Academy of Natural Sciences of Philadelphia will discuss at its next meeting the question of the proposed extermination of the English sparrow in Pennsylvania. A bill is now pending in the State Legislature, advocating the extinction of the pest. Mr. B. H. Warren, of the Society, has lately dissected over five hundred of the birds, and has discovered that by a very small portion of them had been feeding on insects, but found gramin, seeds, etc., etc., had been eaten. Mr. Warren has sent his report to the Academy, and it has been referred to Mr. T. B. Gentry, a prominent ornithologist of the Society. Prof. Leidy, President of the Academy, favors the bill for the extinction of the English sparrow, or its being kept within proper bounds, and considers that Mr. Warren's investigations prove the English sparrow to be far from the blessing it was expected they would be. Already, while on his way to the ornithological meeting within the bounds of the city, we expect before long to see it used for trap purposes.—HOMO.

THE TAXIDERMISTS' EXHIBITION.—New York, May 8.—*Editor Forest and Stream:* Your liberal notice of the Taxidermists' Exhibition has just come to my attention, and since I mounted II. H. Warner's Old Frank, I am compelled to make an explanation. Old Frank was eleven years old, and very fat, and furthermore was sick for a year with a tumor. Mr. Warner tried all the known medical skill to cure him, but he died, and he was turned over to my hands to chloroform. His fatness was no fault of mine, and previous to his sickness he was as good and staunch a dog in the field as ever stood on four legs.—T. W. FRANK.

MILLINERS AND SONG BIRDS.—Philadelphia.—*Editor Forest and Stream:* There is again great complaint on the part of those who are interested in the protection of our song and insectivorous birds of the indiscriminate slaughter of all the varieties, under excuse of killing for scientific purposes, which is done by the ornithologists and a place in the millinery stores for the ornamentation of ladies' hats. Our law allows the shooting of birds at any season of the year for strictly scientific purposes; but should not some qualification be made? Again, lads, unable to distinguish

male from female, or young from adult, spend day after day shooting song birds for their collections, when probably not one in twenty is preserved as a specimen. Speaker Layburn, of the Pennsylvania State Senate, has always taken a great interest in the game laws, and is an enthusiastic sportsman. Might not his attention be drawn to the subject?—HOMO.

ARRIVALS AT THE ZOOLOGICAL GARDEN, CINCINNATI, UP TO MAY 1, 1888.—Bred in garden.—One grizzly bear (*Ursus horribilis*), two aquatic (*Ovis tragelaphus*). Received by presentation.—One prairie wolf—(*Canis latrans*), one golden eagle (*Aquila chrysaetos*), one stock (*Falco americanus*), one eared pheasant (*Crossoptilus macularius*), two European pelicans (*Pelecanus aegrotatus*), one white-fronted goose (*Chrocyhalus gambelii*), two West Africa plovers (*Tringa setacea*). Received by purchase.—One Hippopotamus (*H. amphibius*), three mandrills (*Cynocephalus monomus*), one drill (*Cynocephalus leucocatus*), one adult baboon (*C. anubus*), one young mangabey (*Cercopithecus fuliginosus*), one pica-tailed monkey (*Macaque nestoroides*), one moon monkey (*Cercopithecus mona*), one green monkey (*C. callitrichus*), three orang-utans (*Pongo*), one young mangabey (*Cercopithecus fuliginosus*), one spotted cat (*Colonypus poae*), two golden agoutis (*Dasyprocta aguti*), two common pheasants (*Phasianus colchicus*), one barred-tailed pheasant (*P. versicolor*), one red-tailed eucalypt (*E. polygalchus*), one great-billed parakeet (*Tanygastus megalonyx*), four yellow-bellied loathies (*L. luteus*), two all-green parakeets (*Aratinga canicularis*), four red-bellied parakeets (*Aratinga canicularis*), five cut-throat finches (*Anadina fasciata*), four silver bills (*Melanerpes formicivorus*), two saffron finches (*Sayornis flavocephala*), three black-capped tanagers (*Tangara cyathoptera*), one black-capped tanager (*Tangara cyathoptera*), four magpie finches (*Melanerpes formicivorus*), four black-headed finches (*Melanerpes formicivorus*), two paradise whistling birds (*Vireo gilvus*), one whistling sparrow (*Sturnella magna*), one whistling sparrow, four chaffinches (*Fringilla coelebs*), two black-bellied vireos (*Empidonax vireus*), one sulphur-breasted tocan (*Rhamphastos coronatus*).—FRANK J. THOMPSON, Superintendent.

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

BOYHOOD REMINISCENCES.—III.

PIGEONS.

WHAT has become of all the wild pigeons? The vast flocks almost biding the sun as they passed over in their northern flight day after day. Why, I distinctly remember one flock that crossed over Chenango Valley, that was nearly a half hour from their first appearance until the last of the many thousands swept by. The sun was veritably obscured for the time. Many of the old inhabitants of Hamden village will recall that incident, that immense flock of swift moving creatures, stretching from hilltop to hilltop across the entire valley. And innumerable smaller flocks were in the air for days. We see and hear nothing of such numbers now.

These were high times for us boys. S. S. Conant, the able editor of *Harpur's Weekly*, was our next door neighbor, and we hunted in couples, of course. We wore of nearly the same size, he claiming scarcely by only about a half year. Both ministers' sons, and of course impeccable, but he had a grandfather, and he got a gun first. We used to take turns in shots. How well I remember that first real shotgun. Its old beehood stock, single barrel, and no trigger guard. Do you recall it, Still? Do you remember in our turns for shots, after you had killed a robin and it was my turn, and I had a good chance to kill a red squirrel and I held the stock of the gun (all that was left) fast in my right hand. As I sighted upward at the fast moving myriads and brought him down (a big one) after you were waiting so long, how mad you got? But when you knocked over that ruffled grouse running along the path in the maple woods the tables were turned.

But in pigeon time, when the leaves were just budding and all nature bursting out in her sweetest smiles, in what clouds they came. At first high up in the air, then lower, then lower, till they were in the different patches of woods.

What times we used to have! One day I inquired, "Do you remember the old smooth-bore rifle that I borrowed of Dave Hascall? It had once been a grooved rifle and had been bored out for shot. It was a good shooter, but it would not reach the clouds. The birds were flying high, and it was only now and then that we could bring one down. So in order not to strain the gun too much I mounted to the top of a big beech tree and was getting the advantage of some of the others; but these were exciting times, when the air was so full of flying squadrons, and I did not measure my last charge in that tree top with the usual accuracy. For the old bored-out went all to flinders, and I came out of that top with great acceleration. I struck four different limbs in my descent before reaching the ground, or this tale would not now be told; but when I reached mother earth I still held the stock of the old gun (all that was left) fast in my right hand. As I sighted upward at the fast moving myriads when the burst took place, the pieces must have gone directly over my right shoulder and by my head. It was a loud call, but we thought not of the escaped danger, but that our glorious fun had been so ruthlessly cut short. No gun and all those millions passing by. It was a sad day to me. Afterward Lance Beckwith (since a gallant major in the war), another of our boyhood companions, got a rifle. How we used to practice our marks with that rifle, and at how many places we were sitting so silently motionless on the trees, and at the woodchucks in the meadows and on the hillsides. What a place Deacon Pierce's hill meadow among the clover used to be. Just before sundown how we would watch for the rodents to come out to feed on the sweet roots and then by a sharp whistle make the little rascals get up to their hindquarters while we popped them over at thirty, sixty and eighty yards.

Do you remember the serape we came near getting into about Deacon Burchard's horse? Lance and I had started with his rifle after woodchucks. As we passed along near a cornfield on the flats, the corn just then in tassel, Lance, to get his hand in, he said, was practicing on the bobolinks as they for a moment rested on the topmost corn. We thought not of where the rifle ball might reach, or that the stock of the rifle beyond there was a pasture in which was Deacon Burchard's promising colt, a Morgan, which I remember. But when on reaching that part in our journey that promising quon was found in the agonies of death, with a rifle ball through its heart, it did not take Beckwith long to get back home with his rifle and take his shotgun, and when we were suspected (as of course we were), was it not through Thomas L. James (the since Hon. ex-Postmaster-general, then editor of our county paper), that the abill was proved, and we saw us on the way in a different direction, and we were hunting squirrels with a shotgun, and how

A TAME QUAIL.

HAVING read a good deal in your paper about the keeping of quail in confinement, I came to the conclusion I would tell you of a tame one that was in my mother's family before she was married. A friend of the family was in a bird store in Boston, when a live quail was brought in to be tamed, but the proprietor would not accept it, saying that there never was one tamed and he would not attempt it, and would not receive it. It was therefore given to the mother mentioned above, and by him given to my mother, who was very wild, and so he bent itself against the bars of the cage that they gave it its liberty, and in a few days it grew very tame. The bird would sit himself out in the yard, and would fly across the street into some bushes, but at the approach of a team would at once fly back to the house. When my grandmother took down the bread-pan, he knew what it meant as well as she did herself. He would follow every step she took like a dog. She would put it on her foot and give him a push, and slide him away across the floor; but he would be back again in a second, and would not leave her until she gave him a long thin strip of dough, which he would take by the end and commence to swallow. Sometimes the children would chase him and get the dough away from him, when he would commence to yell until he got it back. He would not whistle, but would

could a horse be killed by a shotgun half a mile away? Tom was invaluable to us boys in the alibi business, as the many fertile schemes concocted in that old printing office would bear ample testimony. It is a known fact that country printing offices have proved wonderful schools for starting and developing successful political puppets. How many of our great men owe their success in life to those early trainings? Is it possible that Tom's brilliant career is at all indebted to the characteristic thus early inculcated in that dingy office of making others see things as he would wish them seen? But I digress. Well, Lance, that was a narrow escape for you, and you remembered that fight of rifle balls years after at Bull Run and many a hard-fought battle field; but fewer shots really scared you as those in your boyhood days.

Talk about pigeons, why one spring they were so many, that is, they came in such myriads by platoons, brigades, whole armies, that the students of the University used to stand on the hillside and knock them down with poles as they swept up from the valley below. Pigeon stew, pigeon pot pie, pigeon broils, etc., etc., were the order at the college boarding hall. Such high living was never known in all those days of any University westward, and this particular steward was a good fellow, and his jolly face retorted in proportion. But where are all these birds now? Why we can't even get enough for our trap shooting. Instead of those vast nestings in Sullivan county, N. Y., and Northern Pennsylvania, or even Michigan or Wisconsin, the birds have been driven for a safe retreat while rearing their young away beyond the Mississippi, miles beyond a railroad. The railroads have done it. When they opened up through Central New York, it did not take long for the farmers to cut down their woods; but they had a ready sale, and when the groves with their beech nuts and acorns were gone, the birds soon went to never to return.

I have not visited the scenes of my boyhood for years, but I have heard from there, and I know my heart would be sad. Those glorious old hunting grounds where the grouse drummed in the thick copse, or the gray partridge clattered and whirled, and with a single man limb to limb in that beech wood or maple sugar bush, now are only rotting stumps with cattle and sheep feeding between. Not like gazing upon the face of a dear dead friend in his last narrow box, I want it not. Let my last remembrance of him and of those dear spots of my boyhood be pleasant. I wish not to look upon either, after death and destruction have shown their work. JACOB STAFF.

IN NORTHERN CALIFORNIA.

I STARTED a former letter with the intention of relating the incidents of a hunting trip in the mountains of Northern California, but I wandered from the narrative intended by trying to give a general description of the game, and the nature of the country in the foothills. This time I shall endeavor to describe a long trip in as brief a manner as possible, although I will intimate to start with that I am not a "man of few words." I know you editors always cry, "boil it down," but it is so easy matter for an amateur letter-writer to confuse his thoughts into a few expressive words. We are not all Shakespeares, besides, as has been said by some level-headed writer, "I haven't time to be brief."

Though much may be truthfully said in praise of the "glorious" climate of California, we have to admit that, during the late summer months, the heat is oppressive, the dust is disagreeable (at least in the inland valleys and foothills), and we cast longing eyes toward the snow-capped summits of mountains Shasta and Lassen. Especially do those of us who know the pleasures extolled by Isaac Walton, and are familiar with the use of the rod and rifle, long to leave the dust and heat and seek the cool, pure and exhilarating air of the mountains.

After a great deal of planning and delay in arranging to leave, I set out in company with a friend and an Indian last August upon a three weeks' trip, experiencing varying fortunes and a combination of pleasant and unpleasant incidents. We left Shasta in the evening, preferring to travel by night, as the heat was oppressive during the day; the moon was full and shone brightly all night, and we thought we knew the route. We procured a team and a rather dilapidated spring wagon that had seen hard service and was much the worse for wear. The horses were as unpropitious as the wagon, and the only virtue we found them to possess was that of gentleness; they were so gentle in fact that I am inclined to doubt whether such exceeding docility is a virtue or not. We were obliged to push on the lines and encourage them with the whip continually. In going down hill it was necessary to walk in order to prevent the wagon from reaching the bottom ahead of the horses. However, the poor brutes carried us through our journey safely, and I will make no further derogatory remarks, except that they both had sore necks, and we doctored them both.

We traveled eastward toward Lassen's Buttes, passing through two or three small towns, then into the hills, enjoying the scenery by moonlight, and the fine views of the ammunition and rabbit (or hare), which are a large variety and could be seen in all directions. We did not kill any—didn't expect our desire to—as they are unfit to eat during the summer, being poor and often covered with watery and sometimes wormy lumps.

As is usually the case with strangers on strange routes, we came to a junction of two roads, and, as a matter of course, took the wrong one. We went on for some distance about an hour, and only discovered our mistake when the road narrowed to a mere trail, and from that to the conventional squirrel track which ran up a tree and into a hole. We made a few emphatic and expressive remarks and retraced our way, and by morning reached Cow Creek (at the head of which stream we afterward camped). Here we encamped, rested our horses, tied some more robes on to our precarious vehicle, and took breakfast. Our cooks, before we left home, had provided us with a large basket of ready-prepared provisions, and so long as they lasted we were not obliged to cook, further than to boil our coffee. Enoch's dogged a line for fish, but we were too far down stream for trout, and he only succeeded in landing a turtle, which had swallowed his hook. He left the hook, as we hadn't time to dissect the turtle, and proceeded on our way.

It was tedious traveling now; we were tired and sleepy, very warm, and with a small range nine miles further, however, and arrived at a still much prettier well up in the mountains, where there was an abundance of hay and water.

Here we unhitched and slept in the barn until afternoon,

arising much refreshed and with our pockets full of eggs which the unsophisticated hens must have deposited therein, as we were strictly honest. We took them to the rancher's house and his wife cooked them for us, she apologizing for the smallness of the chickens, but we were well satisfied. We assured her that we were not all inconvenienced, that the hens had taken nothing out of our pockets, had not disturbed us in the least, and begged her not to mention it. We again got started, and, after climbing several steep hills up which we were obliged to walk to lighten our load, we reached the high timber and a comparatively level stretch of road. We shot several gray squirrels and some quail, but the squirrels were so free with their nuts, that we had we desired. On all sides the tall yellow pines, sugar pines and cedars, towered above us, the timber growing so dense that we would travel for miles without being able to see more than a hundred yards in any direction. Then we would come to some high point where we could see for miles up dark canons, where high mountains arose one above another, covered with heavy forests, and the Lassen Buttes in the background white with snow; miles of forest where we know there were herds or herds if we could find them, and bear that we would bag if a good safe opportunity presented itself, while away below we could hear the roaring of the cold mountain stream, and see it, like a strip of silver, stretch far up the cañon, in which we knew the trout in myriads were waiting for some fishhook to swallow. I run short of poetical expression to describe the scenery which is grand anywhere in our mountains, and will continue by saying that we reached our first stopping place in the evening. This was a log cabin in the timber by the roadside, where a man by the name of Edwards lived during the summer. He did not know us so very well, and gave us a hearty welcome. He was a good American, and took us in, let us sleep in his house for a week (we usually froze outdoors the first night, although it was August), and helped us, with our cooking, thereby proving his heart to be infinitely softer than our make of lumber.

We hunted deer for several days with poor success, only killing one. We found plenty of "signs" and numerous beds where they had recently been, but, owing to our unfamiliarity with the range and the density of the timber, we only saw three or four during our stay. I watched two nights at the "lick," an artificial one made by boring augur holes in a log and filling them with salt. Although the lick had only been made a few months before, deer had centered long lines of tracks there, and the mud had become salted, and the ground was dusty with their tracks. One track in particular inspired me with hope and patience, it being undoubtedly that of a mule deer, and was fully three and a half inches long. He had been seen at the lick, and was said to be an extra large deer even for the mule species, which weigh from 200 to 300 pounds, and are said to be a cross between deer and elk. My patience was not rewarded, however, for I saw only the tracks, and the mule deer's tracks were very bright and clear, but the changing shadows cast by the tall trees surrounding the lick, rendered it difficult to define objects, and only a hunter familiar with the ground and night shooting, could have been successful. I watched until two o'clock each night, and frequently heard the dry twigs cracking on all sides, and occasionally heard the shrill snort or whistle of some suspicious buck. I once twice saw moose tracks, which were probably deer, but that was all—all except the mosquitoes; they kept me in continual misery. Losing patience I went to camp, and returning in the morning found numbers of fresh tracks, showing that the cunning animals came into the lick either during the time I was there or after. Subsequently I did not hunt much, but joined Enoch's and the Indian in fishing, and was more successful. The creek was half a mile from camp in a deep cañon, and its banks were so rugged and steep, and there was so much underbrush, that it was necessary in many places to wade in the water to get along. The stream was clear as crystal, very rapid, and so cold as to be almost undrinkable. We tried bugs, flies and grasshoppers for bait, but with little success, and we had begun to think the fishing a hoax, when our Indian brought his sagacity into requisition. We saw him reaching under the water in the eddies, and in a few minutes he came up with a handful of "salmon" flies. These peculiar flies, or rather worms, are found attached to the under side of rocks in the still water along our mountain streams. With the shell on they are the size and shape of a small peanut. The shell is composed of small pebbles and grains of sand finely glued together, completely inclosing the insect, which, when the shell is broken open, is found to be a long, yellow worm, with wings, and greatly resembles a mayfly. They are the "C. H. I." fly, and he was correct. Although the fish would take neither common flies or grasshoppers, they took the salmon flies greedily, and we landed trout as fast as we could bait and cast our lines, the only delay being in obtaining the bait, the coldness of the water rendering that a disagreeable task. The fish were small, from five to ten inches long, with very bright brown and black spots and a red stripe along their sides. We returned to camp with about 200 fish the first day, and thereafter caught as many as we could use, and during our three weeks in the mountains we had trout at our table daily, and the last mesh tested very bit as good as the first. In camp at the cabin we amused ourselves by shooting at squirrels and chipmunks, which fairly swarmed around the place and were very troublesome, as they nibbled everything about camp, including our provisions and clothing. They are a very pretty little animal, and very tame. One was particularly large, and was a large sized rat. Then we played cards, swapped yarns with an occasional traveler, or slept.

A person going into the mountains from the valleys can sleep, and has a desire to sleep about twenty hours of each twenty-four, is hungry all the time, and if he smokes will consume an astonishing quantity of tobacco.

We started with a full supply of peculiar liquor, as a remedy for possible snake bites, but it was not needed the first two or three days. Enoch was so exceedingly fearful of being bitten that whenever he saw a snake he applied the remedy internally, and he finally required a dose every time he saw the track of anything that resembles that of a snake in the road. As a consequence we were in a snake country, minus antidote. We were not bitten, however, and only saw one rattlesnake, which we killed. It was a large one, and if we had had antidote at that time, it would have been less likely and more likely to succeed.

Things of fishing and hacking the energy to hunt where we had met with such poor success, we decided to move still further into the mountains, and headed for Lassen Buttes and Manzanita Lake. Concerning our further wanderings I will speak in a future letter. ESAT.

SHASTA, CALIF., April 8.

THE WISCONSIN DEER LAW.

Editor Forest and Stream:

A game law, which will undoubtedly be of considerable interest to some readers of the FOREST AND STREAM, was passed by our State Legislature during its last session.

In brief, it makes the open season for deer hunting from November 15 to December 15, and prohibits shipments out of the State. We think our legislators have somewhat overdone the matter of protection by cutting off the month of October. Few hunters, and especially those of the "nabob" type, will care to face the cold days and nights of November for the pleasure they would experience in a deer hunt when camping under a canvas tent, and everyone will sorely miss the month of October, the most pleasant month in the whole year for camping.

The open season last year was from September 15 to January 1; thus it will be seen that the open season is two months shorter than heretofore.

The clause prohibiting shipments out of the State is absolutely necessary in order to stop the wholesale slaughter that has been going on for years past. The early opening of the deer season in our State in years past, and the ready sale for saddles in Chicago and other large cities without the State, has tempted many Eastern sportsmen to Wisconsin for their fall sport, and since the northern Michigan (that part which is not included in Wisconsin) has been the principal shipments of venison out of the State, we have been overrun with hunters from all parts of the country, and the slaughter for the past two years has been simply terrible.

We do not wish our brother sportsmen from the East and South to think we are getting "piggyish" or that we rejoice over their loss of the opportunity to ship an occasional saddle to their homes, for such is not the case, but quite the reverse. The law was aimed at the wholesale shipments out of the State and not at the smaller ones, but it is evident that it must allow either wholesale shipments or none at all, and it has wisely chosen the latter.

The wholesale slaughter has by no means been confined to parties resident without the State, and we know of one camp of settlers not a hundred miles from Peshigo River who shipped to Chicago last year between 250 and 300 saddles and about the same number of the muzzles (over to the dogs) and about the same number the fall of '31. This camp has depended upon the killing of deer for their livelihood, and we sincerely hope that the law as it now is will force them to seek other pursuits. Other parties in the northern part of the State have killed and shipped quite extensively, but done so only under the consideration that they might as well indulge in money-making sport as well as to leave the whole to those who make a business of it, and it is safe to say that the majority of them will avail the new law with joy. On the whole the law is a great improvement on that of '31 and '32, regardless of the shortness and lateness of the season, but there is still a chance for improvement. D.

MANTWON, Wis., May 9, 1883.

HUNTING RIFLES.

Editor Forest and Stream:

The strictures of my innocent little article on the hunting rifle by "C. H. I." have given me genuine surprise. I know that they were from any intention to criticize Maj. Merrill. I concluded that under temporary aberration of mind I must have written something very different from what I intended, but a careful perusal of the article in question reassures me. There is not the slightest attempt to criticize or controvert any one of Maj. Merrill's opinions or positions in regard to the muzzle-loading rifle. I admit that my criticisms in respect to the handling of the cartridge being mostly correct, but his is all and perhaps more than Maj. Merrill claims for it, and he, as an officer and a gentleman, had sufficient intelligence to recognize these facts, and know that an answer was not called for. I cheerfully admit his right to be called the Nestor of riflemen; but would suggest, if this classical nomenclature is to obtain, that "C. H. I." be called the Ajax, and he evidently considers me the Achilles, as under no other hypothesis than my supposed invulnerability can I account for the ardor of his attack. "C. H. I." wishes to know "from what standpoint of experience" I write. It can be easily and briefly told. Forty years' practice with the rifle; a score of a little over five hundred deer, with larger game in a smaller proportion, over an extent of country extending from the St. Lawrence to the Pacific Ocean; and I hope I may be forgiven for thinking that my actual experience with the handling of the rifle in the field will compare favorably with almost any one on this coast. If I have not heretofore trusted these statements voluntarily in the faces of the readers of FOREST AND STREAM, it is because that between the choice of being considered a bragart by the gentlemen who contribute to that paper and a jessiming ignoramus by "C. H. I.," I infinitely prefer the latter alternative.

It is true that my experience has not been "superimposed" by a thoroughly exhaustive and scientific research into the fundamental laws which underlie and govern physical science, and although I have a superficial knowledge of the principles of evolution and the atomic theories, I cannot tell at a breath the bulk of gas disengaged by the instantaneous combustion of 60 gr. C. & H. diamond grain, or the chemical formula of the atoms in a .40 cal. bullet, but I have spent with pleasure and profit over twenty years in the Origin of Species, the Mean of Natural Selection, and Draper's Intellectual Development of Europe, and an tolerably familiar with the play from which "C. H. I." fires his quotation at me; I am also pretty thoroughly acquainted with the laws which govern the flight of projectiles, but perhaps this latter qualification has no relation to the subject under discussion in regard to the deer, whose feet scarcely appear to touch the ground.

Vigilance and care in the use of the rifle are not to be taken for granted, and if ever I do, shall not fire at a running, for it is self-evident that if it "goes like a shot" the bullet cannot overtake it.

And then "C. H. I." declares I know very little about cold weather. This is "the most unkindest out of all." After being born and raised away "down East," where the sun is popularly supposed to be pried up with a lever; after passing winter after winter in the illimitable forests of the Adirondacks and the woods of our northern border, to be told that I know nothing of cold weather is nourishing, at least. But does "C. H. I." seriously claim that a butner with gloves, "and warm gloves at that," can open the patch-box in the breech of his rifle, take therefrom a single oiled linen patch, place it on the muzzle of his rifle, and hold upright in the center thereof an elongated bullet, till it can be driven in by the starter? If he does, then his statement is several Merrill had forgotten more than he ever knew is several

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have our publications filled with good fishing localities, and our correspondents favor us with notes of desirable points for angling excursions?

GEORGIA FISHING.

GATHERING tackle, rods, and bait, last week, Capt. Ed. Peabody, our genial and ardent a fisherman as ever wet hook in babbling brook, placid lake, or rushing river, and ourself, took buggy, and sped away to "Douglass" Lake, embowered in green wood shade, two miles east of Bainbridge. Two hours of soft melting April smeltling had sweetly sunned upon old Dame Nature's face, ere we drew rein at our destination.

Unloaded, transferred our fishing gear to the boat, which was to bear not "Caesar and his fortunes," but us, and our luck, over the broad bosom of the lake that tranquilly lay before us, "a thing of beauty," reflecting from its mirrored depths the fresh green leaves of the long branched oaks, densely thumbed and leaved. Many large, literally packed with fruit, rising from its depths cast without interruption a dense shade over its face from one end to the other. We unlock our craft, seize the paddle, and with quiet strokes sped, but noiselessly over the surface. Peabody, on the alert for a good place, sings out, "Garley, there's the place," pointing to where those large oaks tower straight-boughed, high above the water's surface, and with interlacing boughs overhead, form a complete canopy of shade, leaving under a dense shade of oaks, whose branches, with uncut lovely May-haw trees, whose ripe fruit kisses the quiet waters. Quietly I lay the boat alongside an old log on the margin of the tempting spot.

Hooks are baited and cast in for finny prey. Ed gets a bite, a very shy one, that gets away so cautiously that the movement of the float is almost imperceptible. He strikes, and such a strike! Had he hung the fish, the little fellow would have landed about the same as the fish that we have "caught on" anything but worms, and saved himself from utter ruin. Getting the first bite made our friend awful high-minded, and instead of casting into the water, he sent his hook flying into a tree top. There it stuck, and we had to move up the boat to get it. This done, we try again, but get up bites.

Again we cast off, and creep from spot to spot, until we find a hungry crowd of willing, nerve biters, housekeeping under a dense shade of oaks, whose branches, with uncut logs that we find it almost impossible to use our rods. Reader, don't you wish you had been with us, just at this time! I know you do. As fast as one hook went down in the depths, away went a gallant, plucky fighter with bait and hook. A gentle pull, the steel fastens into his greedy jaws, and away he flies, making the line sing through the clear water. A long pull and a strong pull brings him to the boat, and the pretty parrot comes. For one whole hour, with uncut logs, we fly rod and steel, and take in the lively beauties, at the end of which fifty noble specimen of the perch tribute reward our efforts. Proud of our success, and somewhat hungry, we draw in our lines and turn our boat toward shore, where friends await to cook and eat our catch. Turned over to the cooks, they are quickly prepared, and then followed a feast the Gods might envy. O. G. G.

TROUTING IN THE MUSKOKA DISTRICT.

DOUBTLESS many readers of the FOREST AND STREAM have fished for the speckled beauties in the dark and turbulent waters of Muskoka and Parry Sound districts, while many more have contemplated a trip to the wild woods and foaming rivers of Northern Ontario. For the information of those who intend to come and have never made the trip, the best, cheapest and quickest route to reach the Muskoka waters is from Toronto, via Northern Railway to Gravenhurst, then by team a distance of twenty-four miles to Oakley, on the south branch Muskoka, where there is good trout fishing on the river and its many tributaries. Or, go on from Gravenhurst by steamer to Bracebridge, then by stage to Trading Lake, then on by steamer to "Cedar" Narrows, where trout and mosquitoes will make it entertaining for the sportsman. Another route from Bracebridge is by steamer to Port Sydney, at Lake Rosseau, where then by steamer to Huntsville, then by stage to Emsdale, a distance of sixteen miles. Here is where the angler will strike waters of the Maganetanaw River at Kagged Creek, where there is good trout fishing, and further on cast about seven miles by stage the Maganetanaw River at Kearney is navigable for skiffs and canoes without portage to Big Sand Lake, where there is good fishing. Another route is from Gravenhurst by steamer to the head of Lake Rosseau, where "Poulin" Frank keeps tavern. Who is he that has not heard of W. H. Pratt? If there are any lovers of the rod and gun that ever visited the wilds of Muskoka, and never heard or saw mine host of the Rosseau House, they saw but very little of the country. From Rosseau by stage to Maganetanaw village, a distance of thirty-seven miles; from Maganetanaw village by steamer to Binks Falls, a distance of twenty-four miles up the Maganetanaw River. Or, another route from Maganetanaw village, is by stage to Lake Nipissing, distance of thirty-seven miles, and when the sportsman reaches Nipissing he can choose his route and waters for his sport. By coming down the French River to the Georgian Bay, and taking a steamer from the mouth of French River to Collingwood, or Midland, or portaging across in Lakes Talon and Trout, and then into the Maitanaw waters, then down the Ottawa, or hauling the C. P. Railway at Cornwall and Lake Nipissing. Or, from Parry Sound to Collingwood, Penetanguishene, or Midland, by steamer. If any sportsman fails to enjoy himself over any of the routes mentioned, I cannot tell him where to go to find fish and sport. M. C.

PARRY SOUND, Ont., May, 1888.

degrees below the truth. Perhaps by the time that he is old enough to come out of the ranks of "younger riflemen," he will have learned that no experienced still-hunter uses gloves, but heavy y.a.n mittens, knitted so large that they can be removed instantly.

"O. H. I." states that he has only used the '73 Winchester, and the Marlin .40 cal. Where does he get his authority for this statement? If from me, then I have been guilty of a gross falsehood, for I have used the Spencer, Sharps, Evans, Wesson and Ballard, and in giving preference to the Marlin for forest shooting, I did not take single breech-loaders into account, as the rapidly with which the repeaters can be discharged, overshadows the greater force of the best single shot rifle; but on the plains it is a strong point in their favor. In his statement that no hunter of solid experience would take either a Marlin or Winchester deer hunting, if he could get any other, he condemns "at one fell swoop" the thousands of hunters with these arms in their hands, from Maine to California, many of whom have passed the most of their lives in the pursuit of large game. Either his experience has been much greater than he claims, or he has forgotten the caution in criticism which he recommends to me.

Next he says that there are rifles which will bring a deer down to a man where you hit him, and in the next breath declares that he has seen deer literally shot to pieces which afterwards had to be run down. What must be the condition of those which are brought down instantly? This statement that single-loaders never shoot except from the muzzle, may do for those who have never seen them burst at the breach, but not for me. His reasons for the high trajectory of the Winchester, after loftily setting aside my statement, regarding my rifle. Two of them are his "short and high" and "high" caliber. If he will kindly explain how he makes the former to fit the latter without having it "short in proportion to its diameter," which is exactly my statement, he will solve a profound conundrum. The shorter barrel and lighter powder charge do not exist in the 60 gr. Winchester which has also a high trajectory. His reasons for the superiority of the Marlin are, to all intents, the same as the points alluded to in my letter to the W. R. A. Co. His advertisement to read the "V. B. S." still holds, in order to learn the effects of rifle bullets on deer, is good. I expect that some one will next recommend me to read Mr. Steele's "Paddle and Portage" for information in regard to the game resorts of Northern Maine. PENOBSCOT.

JOTTINGS FROM JERSEY.

I HAVE a good excuse for my long silence. I might, of course, plead the close season and no game news, but as Essex county is in this State, and there they kill woodcock on the nest in April, that would not do. To tell the truth about it, I have had the "heat taken out of me." This winter my friend McConnell, of Sea Girt, was riding in a Pullman car, in Florida, and it is a bit of his experience, recounted by him, that has given me the setback. In the car were two "genies" with a full set of sporting tackle. On arrival at a station where there was a news stand, one of them went out and returned with a fresh FOREST AND STREAM, which he immediately began to devour. The stream of contents was first glanced at and read aloud.

"Jottings from Jersey" he roared. "Well, if here isn't another letter from that liar. You remember the one he wrote me about the New Jersey still-hunters, in which he is spinning just such incredible yarns. There is a lot of stuff about sparrow pie and I don't suppose there is a word of truth in it." This is a very mild version of the tirade as McConnell repeats it, but you have no doubt heard enough to sympathize with my determination never to write another line of natural history for publication. To this resolve I should have been faithful, at least until the incident was forgotten. If your issue of May 10 had not changed my mind. When I picked it up and read about seven squirrels inside a blacksnake, a muskrat in a hawk's throat and a chicken in a heron's neck, I felt I was safe. Reading on, I came to the "Partridge Mystery," and assurance became doubly sure. My mind is easy. Write what fact I may I shall never be even remembered as among the dealers in the incredible, while he of Springfield wields his facile pen. Thanks, Horner, for your timely rescue.

The New Jersey Legislature did but little to show its ignorance of the game question, and nothing of real benefit. If repeated the act of 1831, which protected deer for three years, and it is now lawful to kill deer between Oct. 15 and Dec. 1. The nearest approximation to game protection is in the supplement to the cruelty to animals act. Section 24 of the original law excepted from its humane provisions pigeons shot from a trap. This section was amended this year by striking out the word "shooting" pigeons from a trap, and hereafter that cruel sport must stand on its own merits before the suits of the Society for the Prevention of Cruelty to Animals. If we hear of somebody being sent to prison for this business we shall be more proud than ever of Jersey justice.

And that reminds me of the English sparrow. I notice that the Westchester society has ascertained that the little fellow is a fraud as to his insectivorousness and a thief of buds and grain. We are also making "post-mortem dissections" of him in this State, and we find him to be a burglar and a murderer. A day or two since a neighbor took down his martin box and found that the sparrows had killed the young martins, driven off the old ones and taken possession of the whole house.

English snipe tried to be abundant, but it was hard for them to be in fair flight by following between snow squalls. I found some near Monmouth Junction on May 4, and they are probably there yet.

It is the general opinion in Monmouth county that large numbers of quail wintered over, and that they have done well. Rabbits are also reported abundant, and half-grown ones have been seen. A.

A FOX IN A TREE.—Rock Lodge, Fla., May 6.—While in the pine woods west of Indian River, our dog began barking, and we found that he had an animal up a tree. At first we thought it was an opossum, but upon closer examination found it to be a fox. He was about thirty feet up a pine tree; the tree was straight, with no limbs until very near the top. I shot him through the ear and again in the shoulder, and he still held on to the tree. The third shot brought him down. The fox was red, standing on his hind legs, and the size of the red fox of the North. That the fox ran up the tree we think an unusual thing. Is it common for a fox to take a tree for protection?—W. H. R. [It is not common for foxes to take to trees, but we have occasionally known them to do so.]

SEDALIA GUN CLUB.—Sedalia, Mo., May 8.—The Sedalia Gun and Shooting Club met at the Park Hotel May 7. The following officers of the club were chosen by acclamation: Dr. John W. Trader, President; Dr. E. C. Evans, Vice-President; J. C. Parmelee, Secretary; John Montgomery, Treasurer; Frank Houston, Attorney. An executive committee of three, D. K. Smith, John Montgomery and J. C. Parmelee, were appointed, and instructed to secure grounds, balls, clays and traps, and have them ready by Saturday, May 12, for the inauguration of the season. After the business of the evening was disposed of, President Trader invited the club into the dining-room of the Park Hotel, where an elegant banquet was served, after which the members of the Sedalia Gun and Shooting Club departed for their respective homes, with happy anticipations of an early opportunity of trying various of the breech-loaders on the subtle and vacillating hills and chaps. The following are the enrolled members for 1883: S. C. Gold, J. W. Trader, E. C. Evans, J. C. Parmelee, John Montgomery, D. H. Smith, J. Pilkington, A. P. Mowey, J. D. Crawford, J. C. Barber, A. W. Eaton, E. W. Slocum, C. H. Williams, A. W. Nesbitt.

ROSENDALE GUN CLUB.—Rosedale, Wis., May 7.—At the annual meeting of the Rosendale, Wis. Gun Club, on Saturday, May 5, the following officers were elected for the ensuing year: Mr. S. B. Diley, President; Mr. T. K. Gillette, Vice-President; Mr. E. C. Sherwin, Treasurer; Mr. Frank Bowe, Secretary. Executive Committee.—Mr. H. C. Grafman, Mr. S. B. Diley and Mr. T. K. Gillette.—S. B. D.

WELLS BEACH.—Dover, N. H., May 10.—I have just returned from a three weeks' visit to Wells Beach, Me., and found all kinds of sea birds very plenty, and but few gulls there. Just before going to the beach, a friend of mine sent me a bottle of oil for my guns, which I found to be the best thing of the kind I ever used on them. It can be bought of J. P. Lowell & Sons, Boston.—G. A. W.

KYNOCH SHELLS.—Editor Forest and Stream: I was surprised at "F. W. B.'s" remarks regarding the Kynoch shells: I think his gun must be at fault, or there is a great difference in the shells. I have tried one hundred of them, and have reloaded some of them several times, and have not had a misfire or any trouble getting them into the gun.—Px. (Osborne Hollow, N. Y.)

Camp Fire Flickerings.

"That reminds me."

DR. A. and the writer were returning home after a weary row up a very muddy creek after ducks. Dr. A. espied a heron sitting on a dead log about twelve rods off, and gave a yell that he could bring him up. Slipping a heavily loaded shell into his gun, he stands up, so as to get a better sight over the tall reeds, and fires. Result: the heron "wounds his weary way," while your humble servant is left to extricate the Doctor from the multitudinous mud, with the use of an oar as a lever. HENRY.

Something has just reminded me of this anecdote of that good old angler, Dr. Bethune. Among your readers there must be some who remember him.

The Rev. Dr. Bethune, of the Dutch Reformed Church, was not very clerical looking, even in the pulpit, but in his forest and stream togethery he was something wonderful, even for the woods. A worthy woman, who had entertained him, heard that he was a city preacher. She could not make it out, he was so unlike a preacher in dress and address. However, she knew he would tell her the truth, so one day she asked him if he was really a preacher.

"Madam," replied the Doctor, "I am *verbi domini* minister." That was not English, nor was it Pennsylvania Dutch, but there was a "minister" in it, and something that sounded very like "domine." So in default of sufficient information that score, she said, "Well, where do you live anyhow?"

"Do you know where Manayunk is?" said the Doctor.

"No, I don't."

"Well, anyhow, I live about five miles from Manayunk," was the reply. Dr. Bethune lived and ministered in Philadelphia, and Manayunk, about five miles distant, was not then in its corporate limits. GEO. L. NEIDIE.

SCHUYLERVILLE, N. Y.

Answers to Correspondents.

NO NOTICE TAKEN OF ANONYMOUS CORRESPONDENTS.

A. W. B.—Use nothing but soap.

"SMALL"—Please send address to this office.

W. S. H., Camden, N. J.—We have not the address you ask for.

W. A. F., Carroll, Iowa,—Is the teal a duck? Ans. Undoubtedly.

J. P., San Francisco.—We have no knowledge of your inquiry. If you will repeat it, we will give it immediate attention.

E. O. V. W.—Copial varnish No. 2 is best for spars. Decks are usually scrubbed when the yacht is in commission. In the winter they are best coated with common bright varnish. Be careful not to use any oil, or white wash, as the varnish.

Tin, New York.—The autobiography of Davy Crockett was originally published (with excellent illustrations by Porter & Coates, Philadelphia). It has been brought out in the Seaside Library (price 50 cents). Dodd & Ward, New York, published a life of David Crockett, by John S. C. Abbot, which is the "Autobiography" clipped up and patched together again.

BOB STAY.—New list is promised shortly. It will cost \$2.50. Keels of boats should last more than seven years, if kept thoroughly dry during the winter months. If the keel and bottom of a boat is kept on the earth, especially when grass grows in one or two years, they will be found to be rotten. A yacht (raft, open boat) built in the ordinary manner, and not that carries no dead weight, will float for hours after she is upset.

OWEN SOUND, Ont.—I have to report the shooting this week of what I take to be a good species (*Merops streperus*). The following is a description of the bird: Head and upper part of neck shining green, black back and wings, wings black and white, breast and belly of delicate reddish buff color, feet red. Feet and tail, feathers on back of head elongated. Mr. Miller, our sporting jester, sent the bird to Toronto to be set up. He got it from Mr. Young, who shot it on one of the west at the back of the town. Is it a rare bird in these parts? Ans. Not a rare bird.

KINDERHOOK LAKE.

HALF an hour of brisk travel eastward on one of the swift trains of the B. & A. R. R., through pleasant farm lands and villages, and you leave the cars at cool, shady Kinderhook depot. You catch a hasty glimpse of a considerable body of water, picturesquely situated, a moment or two before the train stops, and you rightly conjecture it to be the justly famous Kinderhook Lake, the richest gem in Eastern New York.

The three rival magnates of the three rival establishments for fishermen, tourists and excursion parties, will meet you as soon as you leave your train, confusing you with flowery accounts of the conflicting charms of their several places. Joking aside, you can safely go with either of these, for "whichever" you choose will see to it that you are splendidly entertained and cared for.

For convenience sake, and for the purpose of thoroughly "doing" the lake, it will be with this special occasion to put yourself in charge of "Jorry" Clapper, the gentlemanly proprietor of "The Outlet." A two-minute walk from the depot and you are in sight of his comfortable cottage, cosily nestled down upon the left bank of the handsome stream that empties the lake, flowing from its southwestern extremity.

Once in sight of the dock, with its gaily painted boats and multitudinous fishing paraphernalia, you quicken your steps, hasten across the bridge, and, aided by the ever genial Jorry, select your "kit" and push out into the stream. A few strong pulls and you are through the railroad culvert, gliding up the creek in eager expectancy of entering the lake with every oar-stroke. The birds in the overhanging branches along the shore are unheeded and their songs unheard; the lake is the only consideration of the day, to which everything else must be subjected. Ah! the provoking willow-cowp is passed and you see the lake. Now, once again—a long pull, a strong pull, a pull altogether, and you leave the stream with its narrow bounds and glide into the lovely lake, delighted, transported, enraptured.

Rest on your oars and glance about you. Stretching far away to the north is the extreme limit of the Main Lake; let the eye wander to the east, the eastern shore, lying in the wooded point that shelters Milham's Cove, and still further down, admiring the rough, indented shore skirting Milham's Woods, until the long, high promontory with which Lake House Point terminates cuts off the view. Between you and Lake House Point is another long, narrow peninsula, reaching away to the northward from the mainland to the bounds the southern hills of the lake. This is Racker's Point, and, as you approach, strokes send your light craft skimming around it toward Lake House Point. Suddenly you glance to the southward, and there, coily secreted between the two extended points, a scene of surpassing loveliness awaits you, in that beautiful portion of this irregular body of water, the Round Lake:

"The conversation, and the poet's dream."

Cast your eye to the northwest, and here Paekman's Cove, another surprise, awaits you; a grove on the left and another on the right, add to its beauty. This arm of the lake lies parallel with the upper end of the Main Lake, but is much narrower, and of far less value as a fishing ground. The section of land dividing the cove from the lake proper, is somewhat singularly styled Paekman's Point, though it bears little resemblance to a point. The solitary stream that feeds the lake, flows through the cove, between the hills of Nassau and North Chatham, through cypress pastures, and among sloping hills, entering the Main Lake a little north-west of Milham's Cove. Above this inlet the creek, just described, is joined by a smaller one, a mere rill, that flows from a small pond to the north, bearing the distinguished and somewhat misleading name of Lake Knickerbocker; being a more preceding place for frogs, mosquitoes, and malaria, it hardly deserves so "distinguished" a distinction.

Having crossed the upper end of the Round Lake, you sail to the lower side of the two small islands, sweep around Lake House Point, and drift down the Main Lake toward Trimmer's Dock. Here, also, is a new revelation. You are now about half way down the Main Lake, the two extremes each a mile distant. Above, creeling around the head of the lake, a succession of sloping hills undulate, unevenly, to the north and west. To the south, the low country gradually shuts off, low and flat, into the Hudson Valley. An orchard and meadow border the waters on the south, merging into other farming lands, up the eastern shore, past the Lake Shore House, joining Milham's Grove just across from Lake House Point.

Your boat grates on the beach, you jump out and secure it just in time to enjoy a hearty welcome and handshake from "Bob" Trimmer, the genial proprietor of the Lake House. It is a warm, bright, and sunny noon, and with an accommodating smile, Bob leads you to the dining-room. Here you are! Fresh fish, choice steaks, perfectly broiled and smoking hot, sweet milk, pure and unadulterated, and an endless variety of delicacies from Bob's extensive garden. It is a dinner for a king, but sufficient "regality" to enjoy it with a keen relish is easily assumed.

After dinner you go to your fishing. Bob provides you with that prince of guides, the "down" who rows your craft with steady stroke to the choice fishing grounds, mitigating the wild excitement your sport occasions with timely suggestions, he aids you to capture a reasonable "mess" of the glorious bass and pickerel so abundant in Kinderhook Lake. At length, after a most enjoyable half-day's fishing, the sun goes ruddily down in the west, and, to complete the various enjoyments, John rows you over to the Lake Shore House for supper. Landlord Allen is all attention, and you bid him "good night" in a tone of that "solid satisfaction" that always follows a fine day's sport with a square meal for an epilogue. John is waiting you in the boat, and rows you silently back to Trimmer's in the dim twilight. You take leave of him here, and pull lazily for the head of the lake, to while away the two hours remaining before the train leaves for Albany. Then you float lazily back down the lake. In Milham's Grove flickers the campfire of a party of fishermen; directly opposite, on Paekman's Point, hang the colored lanterns of a camping party from the Capital City.

Just as you stand out between the two camps off Lake House Point, the full moon rises suddenly, brilliantly illuminating the western shores, and leaving the eastern shores in dark shadow. "Lovely as was the scene by daylight, it is infinitely lovelier now; something about it recalls, momentarily, that one line of Scott's on Melrose Abbey:

"Never was scene more sadly fair!"

A party of dancers are on the grounds at Trimmer's—one of the many excursion parties who haunt the lake all summer long.

There is something weird about it; the line from Scott awakens another train of thought; the camps, the dancers flitting about indistinctly in the uncertain light, smatches of song from boats all around you, all mingle together in a strange, airy fancy. It is wonderfully like a bustling in the Scottish Highlands. Then, the Lake House Point, in the soft moonlight, looks, for all the world, like Ellen's Isle, in Loch Katrine. A shadowy glimpse of the Catskills, to the southwest, adds to the resemblance, and, to complete the picture and perfect the scene, a dark boat floats swiftly past, containing a party of musicians. As they disappear in the shade to the left of Lake House Point, they strike up Roderick Dhu's famous nautic song, "Hail to the Chief, who's aye!" You, profane, you suddenly remember that it is nearly ten o'clock. Away romance, poetry, sentiment; pick up your oars and hurry along to Clapper's. With a sigh of commendable regret, you row silently to the mouth of the creek. Near the stream you rest a moment on your oars, and let the boat drift. One more burst of music reaches your ears, faint and almost inaudible; the musicians are playing the closing strains of "Bonnie Dundee." The music stops; now and ere long sing their discordant songs unheeded, and continue to flow down the stream to Clapper's, wishing all sorts of impossible wishes.

Once more you land, and Jorry breaks the spell with a bountiful supply of lemonade and sandwiches. He cheerfully bids you "Go for 'em!" while he packs your fish and other luggage for the journey home. Forgetting your splendid dinner and supper, you imagine yourselves half-finished and greedily devour Jorry's dainty refreshments. Then, alas! you go to the depot and buy your ticket for Albany; the train drives in and whirrs you regretfully back again into the crowded city.

Well, you've had one day's fishing on the lake that enchanted N. P. Willis, the luxurious day-dreamer, and where Matty Van Buren and a host of other famous old "Vans" frequently held high revels in days gone by. You go to bed thinking of the North, among the rest. Back Roderick is just proposing to leave Kinderhook Lake, when all the vision fades; you open your eyes; you are snugly laid away in bed, and the morning sun is shining in upon you. You rise, deeply regretting that it was "all a dream," perform your ablutions and breakfast on the delicious fish you captured yesterday on dearly-loved, never-to-be-forgotten Kinderhook Lake. Oh! that life was an endless holiday!

ALBANY, N. Y., May 7.

H. HUTHER JATTA.

DOES THE MASCALONGE LEAP?

IN the issue of FOREST AND STREAM for April 19, I noticed the rather surprising statement, made by Mr. E. Bruce Phinney, "that from one-half to two-thirds of over five hundred mascalonge caught by himself and friend, 'drew themselves, the instant they were struck, either entirely or partly out of water.'"

I have had some experience fishing in Canadian waters for mascalonge, especially in the same region of which he speaks. During the month of July, 1878, I spent almost every day fishing for bass and mascalonge, and my efforts were handsomely rewarded.

Since reading the article above referred to, I have thought the subject over, but cannot remember of a single instance where the fish leaped from the water upon being struck. Indeed, my experience was exactly opposite, for instead of rising they would invariably go to the bottom, and when they were taken from the water, it seemed as if they came direct from the bottom.

I remember that the difference between the actions of bass and mascalonge, when struck, was a subject of comment between the guide and myself. I could tell almost every time, without seeing the fish, whether I had a bass or mascalonge as soon as the bait was taken. A four-pound bass would afford more sport than an eight-pound mascalonge.

Why is it that the flesh of bass taken from Stony Lake is not so solid as the flesh of those taken from the St. Lawrence River and Great Lakes? The water being considerably warmer, may be one reason. During the coming summer I intend to spend about a month in this region, and will make close observations as to the habits of the mascalonge.

SEBASTIAN, O., May 7.

DR. K.

PENNSYLVANIA NOTES.

THE Pennsylvania Angler's Association has stocked the Perkiomen Creek with rainbow trout, and we are glad to learn that instead of making a promiscuous planting, the head waters, where black-barents are so plentiful, are not stocked, do not exist at all, were chosen, and the lower portions of the stream nearer the Schuylkill were properly passed. This society will do a good work for our portion of the State, and is a live and active organization. It is said that one great cause of the depletion of the Schuylkill River waters of its bass, especially the portion which runs through Fairmount Park, is the netting of the fish at all seasons of the year by the predatory people of Manayunk, Wells of Schuylkill and others, who have been violating the law annually for several years, and it is proposed to appoint a warden whose business it will be to patrol the river and arrest offenders. Would it not be an economical plan to interest some of the railroad "track walkers" and offer them a fee for every case of netting they discover. The railroad track runs close to the Schuylkill River, many miles above Philadelphia, and if the proper officers of the Reading Railroad were seen to have no doubt their consent could be procured to have the employees interested. Gov. Pattison of our State has signed the bill which will allow the Pennsylvania Fish Commission to sell the Marietta Hatchery property and to select waters better adapted, and we hope to soon hear of a new site chosen. Our trout fishermen are now all off on their delayed trips. Your correspondent received a despatch yesterday from Lehigh Valley, reading, "Come up, trout are ripe to be taken! I must stay in Philadelphia this week, and perhaps lose the best of the sport, which is only had in the Lehigh Valley streams the first week or so of the season, and the pleasant weather coming upon us this spring all at once we may expect but a very short season."

PHILADELPHIA, May 11.

Homo.

SOME SOUTH AMERICAN FISHES.

WE were recently favored with a loan of an old work, the property of Mr. Francis Endicott, the title of which is "Cyclope to South America: Describing at Large the Spanish Cities, Towns, Provinces, etc. on that extensive Continent, Interspersed throughout with Reflections on the Genius, Customs, Manners, and Trade of the Inhabitants, together with the Natural History of the Country. And an Account of the Gold and Silver Mines. Undertaken by Command of His Majesty the King of Spain by Don George Juan and Don Antonio de Ulloa, Both Captains in the Spanish Navy, Members of the Royal Societies of London and Berlin, and Corresponding Members of the Royal Academy at Paris." Translated from the original Spanish. Illustrated with Copper Plates. Dublin. Printed for William Whitson, at Mecenas's Head in Bride street, 1758." in two volumes; from which we quote:

Of fish there is a great variety daily brought from the neighboring ports of Chorillos, Callao, and Ancon, the Indian inhabitants of which make fishing their whole business. The most palatable are the corbinas, and the pegey, or sea-king's fish; but those in the greatest quantity, and of some time very palatable, are the anchovies. The corbinas and the king's fish infinitely excel those of Spain; the latter is also remarkable for its size, being generally six or seven Paris inches in length; yet even these are thought to be surpassed by those caught in the Buenos Ayres River. It is a salt water fish but very little different from that caught in the rivers of Spain. The river of Lima affords a sort of anchovy, two or three inches in length, but these should rather be called crayfish. The whole coasts abound with such shoals of anchovies as exceed all comparison, and beside the quantity caught by fishermen, they are the chief food of innumerable flocks of birds, with which all these islands abound, and commonly called guanacos; many of them are indeed alcastraces, a kind of gull, though all comprehended under the general name of guanacos. A little after the appearance of the anchovy they rise from these shoals in such large and thick flights as to totally cover them, and fly toward the sea for an hour or two, without any visible decrease of their number. When at some distance from the land they divide themselves, and begin their fishing in a very entertaining manner. They fly in a circle at a considerable height above the water, and on seeing a fish, they dart down toward their beak foremost and their wings closed, and at the end of the circle they rise from the water in a distance; after which they rise again into the air to catch the fish. Sometimes they remain a considerable time under water, and rise at some distance from the place where they fell, doubtless because the fish has endeavored to escape, thus disputing celerity with them in their own element. **

The islands of Juan Fernandez abound greatly in fish of various kinds, among which are two species not observed in any other part of this vast sea. One is a fish, which, though not absolutely in every particular like that of Newfoundland, the difference is very minute, either with regard to color, form, taste, and even the small scales observable on that fish. They are of different sizes, but the largest three or four feet in length. The other species is a fish resembling the tolo in shape, but much more palatable. From the fore part of each of the two fins on its back grows a kind of triangular spur, a little bent, but containing the back, and terminating in a point. It has a soft, glossy and hardness of a bone. At the root of it is a soft, spongy substance. This spur or bone, for it resembles both, is such a present remedy for the toothache, that the point of it being applied to the part affected, it entirely removes the pain in half an hour. The first account I had of this singular virtue was from a Frenchman, who was my pilot; but as a reason would not persuade me that such a cure after my own experience, to a circumstance seemingly so void of probability, the assertions of the man increased my desire of putting it to the proof, which I did several times, and always with success. I did not fail to communicate a discovery of such great benefit; and accordingly several of my acquaintances, who labored under that execrable pain, made a trial of it, and found from it the same happy effects; and I observed that the particular cure that, after the application of the bone to the part affected, it became insensible to pain, a drowsiness succeeded, and they awaked free from the torture. I observed that the spongy substance at the root, during the operation, became greatly inflated, and softer than in its natural state, which could not be affected solely by the moisture of the mouth, the part put into it being compact, hard, and smooth as ivory.

It is to be remarked that the spongy virtue which extracts the morbid humor, and collects it in the gum. The common length of these anodyne spurs is two inches and a half, of which one moiety, together with the root, is within the body of the fish. Each face of the triangle is about four lines in breadth. The fish is taken in the same plenty as the others. ***

These spurs on these coasts abound in excellent fish, though not in near so great a degree as those near the island of Juan Fernandez. Here are seen, in particular, a great number of whales, which come even into the bay; also a tunny and sea wolves. Among the amphibious creatures here is one known all along these coasts, and even at Callao. It is called *Pajaro Nino*, the bird-child. In its some parts resembles a goose, except that its neck nor its bill is not arched, and is something larger. It has a thick neck, a large head, and a strong, short bill; its legs very small, and its walking is not in an erect position. Its wings are small, scabbled, and nearly resemble the fins of the seal. Its tail is so small as hardly to be distinguished; its wings and whole body are covered with short brown hair, like that of the sea wolves, and generally full of white spots, though some are of other colors; so that upon the whole the bird makes no disagreeable appearance. It lives promiscuously, either in the water or on the land, and is very shy, and is often bit severely, though it is observed never to be the first aggressor. ***

These harbors or roads [Island of Fernando de Noronha] abound in fish of five or six different species; among these are lampreys and moreons, the last of an enormous size, but neither of them palatable. At the bottom of this harbor is taken a fish called cope, from its triangular figure. It has a snout unlike that of a hog, and its whole body is enclosed in one bone resembling iron, within which is a sharp edge, that is, on the two sides of the snout. The upper part of it is covered with green scales, and underneath with white. It has two small fins like other fishes, and its tail, which is horizontal, is also small. On being taken out of the water it immediately emits from its mouth a greenish froth of an insupportable smell, and which continues for a considerable

MEACHAM LAKE, N. Y., May 8.—The ice broke up May 8. Lake clear of ice the 5th. First party out from Malone the 4th. Two of the party caught thirty-one pounds of trout in one hour at the mouth of the inlet, and all hands caught good baskets of trout so far. No salmon trout yet, as we cannot get minnows for bait. The lake is very high to-day; the snow water is still running in, and at the present rate of melting will continue to run in as a matter of course yet. Everything is very backward, which indicates a long season of spring fishing. My land-locked salmon were turned into the lake April 25; the salmon-trout May 2.—A. R. FULLEN.

OWEN SOUND.—Out, May 7.—Trout fishing is here again. So far the weather has been very unpropitious. The streams are very high and turbulent.—AMBER ALE.

Fishculture.

THE McDONALD FISHWAY.—The construction of this fishway has been greatly improved. The later designs greatly strengthened, as well as cheapen, the structure, and at the same time exclude all means for the passage of fish to pass through without clogging the fishway. This is accomplished by a very simple method, and removes the only possible objection to this superior fishway. Col. McDonald, at his own expense, is removing the old iron casings from the one on Bosher's dam on the James River, and is substituting the new pattern. Concerning this fishway on Bosher's dam the last report of the Virginia Fish Commission says: "The construction of it is, in some respects, defective. The introduction of the intermediate iron plates furnish the means for the lodgment of leaves and straw, which soon obstruct the way and interfere with its efficiency. This construction was modified in the Fredericksburg way, so that leaves or small brush material entering the way would pass through it, and it may be necessary to alter the Bosher's fishway in accordance with the same result." We now learn that this has been done, and it makes the McDonald fishway the best and most complete one yet devised.

THE UNITED STATES COMMISSION.—The steamer Look-out has just arrived in Baltimore after her southern trip, and is preparing for a voyage up the Potomac. She has been cruising in the Chesapeake Bay, and has been catching and confining spawning shad, but without success, as the fish were not to be obtained in numbers. In Florida the party under Major Ferguson found a few ripe shad which yielded some millions of eggs, which were hatched and returned to the waters. Down at the Chesapeake they had no new plenty, and the steamer will follow up the fishermen and take the eggs from their fish and hatch them or transport them to the old nursery at Washington. The season in the Chesapeake promises to be a good one.—R.

SALMON IN THE COLUMBIA.—Mr. A. Booth, of Chicago, the pioneer in the salmon-canning business on the Columbia River, is quite certain that salmon are rapidly decreasing in Oregon. He believes that the stock of fish can only be kept up by artificial means. The cost to introduce 5,000,000 young salmon into the Columbia River being \$5,000, Mr. Booth offers to be one of ten to advance funds for this purpose. The yield in good seasons is estimated at \$2,000,000.

THE OHIO COMMISSION.—Toledo, May 13.—The Ohio Fish Commission has just finished planting fifty-five to sixty millions young whitefish, the product of our Ohio hatcheries for the past fall and winter.—D. V. HOWELL, Supt.

PUBLISHERS' DEPARTMENT.

Messrs. JOHN H. DUNN & Co. will sell at auction, Saturday, May 23, the well-known and popular year-book of the Forest and Stream, for the year 1886. The sale can be had at their office, Nos. 25 & 27 Front street, N. Y. Advs.

We call attention to the advertisement of Mr. E. G. Koepig, 573 Broad street, Newark, N. J., in this issue. He has just completed a new illustrated catalogue of fishing tackle etc., which will be mailed free on application.—Advs.

Who smote the marble gods of Greece? Nobody knows. Why are Besson's Currier Rogues' Plasters ahead of all others? Everybody knows. Because they are quick, powerful and sure. Who will ride in a coach when he can travel by rail? Why will you not seek when you can be relieved to-day? For sale everywhere. Price 25 cents.—Advs.

PERHAPS in no other way do accidents happen so frequently as by slips and falls, causing sprains or broken limbs, in the simple act of walking. St. Artistic dispels the illusion that those who do not travel are safe from such accidents. Has a friend or a friend's friend, a member of the Association, 330 & 332 Broadway, New York, offers the protection of a \$5,000 policy, with \$25 per week indemnity, for \$1 member-hip fee. Annual cost of a year's protection, 10 cents. No other plan of application blank. The rich men of America are quick to recognize the value and prudence of accident insurance. As a rule, they carry large amounts in such policies, and are well served. In the event of a fatal or disabling casualty, they represent the value of Government bonds. A \$1,000 dollar policy in The United States Mutual Accident Association, 330 & 332 Broadway, New York, may be had for \$2, and continued at the rate of \$25 per annum.—Advs.

ELECTRIC CALL BELLS FOR YACHTS.—In the building of a yacht the point wherein it is applied; but the American yachtman has also a corresponding interest in the fitting up of his vessel. Being naturally of a practical mind, he makes under-deck a place to live in pleasantly, and from the costly and superfluous decoration to his elegant private stateroom there is every modern appliance tending to solid comfort. Even electricity has been called upon to aid, and now no fit-thing is more common than Longstreet's electric call bells. With them instantaneous communication is received from the cabin to the captain's room, the galley and the fore-cabin. The proprietor of a yacht, or commander of a vessel, will find a stateroom may summon a servant, or if suddenly ill, assistance. The incident may, while under the blankets, order their coffee and toast in the early morning, or their lunch laid on. In the event of a call, the bell is the greatest service, as an alarm may be instantly sent to every part of the yacht, the location of the fire given, and all aboard simultaneously notified of an accident. In the event of a fire, the bell came from the necessity for it, and emanated from the brain of a thorough yachtman. Mr. J. H. Longstreet, the manufacturer of the electric call bells, is a resident of New York City. Mr. Chio, and his apparatus has been designed with special knowledge of the needs of pleasure yachts and those who sail them. His address is Barclay street, New York City. Give him a call.—Advs.

A St. Louis sportsman spent the greater part of last summer at Thompson Junction, Brainerd, Fort Garry, Pembina, Lake of the Woods, and points along the line of the Canadian Pacific Railway. He has returned to St. Louis, and in a letter to us this season, he stated that during his stay in the North, railroad laborers and others made a business of gathering the eggs of water-fowl and shipping them to Duluth and other markets. This notorious traffic was carried on to such an extent that it was necessary to issue orders to the effect that no complaint of by sportsmen. Each nest generally contains about seven eggs. When hatched the proportion is about five males and two females. The sportsman alluded to states that nearly all the birds that were taken by him were males. Ten of thirteen mallards killed on one occasion were males. Of eleven teal bagged at another time but two were females. There is no market for teal, which are very small, but they are used for domestic purposes, and will lay before they are a year old. The mallards are unable to account for his strange experiences and a growing scarcity of water-fowl on any other theory than wholesale robbery of nests and the indiscriminate slaughter of young ducks.—St. Louis Globe-Democrat.

The Kennel.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

FIXTURES.

BNPCH SHOWS.

June 12, 13, 14, and 15, 1886.—Chicago Bench Show, Chicago, Ill. Entries close June 1. Chas. Lincoln, Superintendent.

FIELD TRIALS.

November 19, 1885.—Eastern Field Trials Club, Fifth Annual Trials, at High Point, N. C. Entries for the Derby close May 15 for and Members' Stake, Nov. 17; for the All-Aged Stake, Nov. 1. W. A. Coker, Secretary, Flatbush, Long Island, N. Y.

November 20, 1885.—Club's second Annual Field Trials at Robin's Island, L. I., for members only. Entries close Sept. 1. A. T. Plummer, Secretary, American Kennel Club, Fifth Annual Trials, at Grand Junction, Tenn. D. Bryson, Secretary, Memphis, Tenn.

THE NEW YORK DOG SHOW.

THE SEVENTH ANNUAL BENCH SHOW of the Westminster Kennel Club, which was held at Madison Square Garden last week was much the best that has ever been held in this country, and we are assured by gentlemen who have attended many of the most important shows in England that it would compare favorably with anything that they had seen. Everything connected with the management ran like clockwork, and the club may well feel proud of the success which has attended the exhibition. No one who has been in regular attendance at the shows which have been held by the club can fail to notice the great improvement from year to year in the quality of the animals exhibited. At none of which has this improvement been more apparent than in the collies, which are sufficient evidence of the value of the bench show as an educator of the public. The "Garden" is undoubtedly the best place in the country for holding a large show. The floor which has been laid since the last show was held there is a great improvement as, done away with the dampness, which was very disagreeable.

The arrangements for handling the dogs were complete and nothing was left undone that would conduce to their comfort. They were fed with special diets, and came out at the end of their long confinement looking much better than could be expected. The building was thoroughly disinfected with phenyls, and at all times the air was in very good condition when we take into consideration the number of animals present. Most of the dogs were in excellent health, and the English and Irish setter classes were remarkable for the high quality displayed.

One of the most attractive features of the show was the magnificent display of dogs of various breeds. The collection of collies was also remarkable for the large number and high quality of the entries. The ladies' pets were also a great improvement upon those of former years, and attracted much attention. The judges were very satisfactory, and in general the case. The attendance was very large, many of the best people of New York and vicinity were present, and we are pleased to announce that a handsome balance remains after paying all expenses.

The annual club supper at the Brunswick on Friday evening was, as usual, an elegant affair. The repast was epicurean, and the responses to the many toasts were replete with wit and wisdom. A pleasing feature of the evening was the presentation, in well-kept style, of a pair of collies, of a very handsome gold hedge to Mr. Chas. Lincoln. Mr. Lincoln was taken quite by surprise, but responded in a very happy manner as follows:

Mr. Chairman and Gentlemen—For this distinguished mark of your most highly prized consideration I cannot find words to express my heartfelt thanks. In the words of the immortal bard, I am no orator as Brutus is, but were I Brutus, I would speak as plainly as I could. It is a great gratification for this beautiful badge, which I shall cherish rather as a mark of your kind friendship, than a testimonial to any services it may have been my good fortune to render. That my acts may always be so fortunate as to meet your friendly approval is my constant wish, and only add to my satisfaction and conclusion, my thanks for your past and present kindness.

The bar of the medal bears the letters W. K. C. The usual inscription on the obverse is "The Westminster Kennel Club in the center. Upon the opposite is "From the Managers of the New York Bench Show of 1885 to our esteemed friend and Superintendent, Chas. Lincoln."

Following are our comments upon the dogs; in each class the name of the judge is given.

MASTIFFS.

MR. JAMES WATSON.

There were five in the champion class, all of them magnificent animals. Nevison deservedly won the medal. Gurth, owing to an accident which caused swelling under his jaw, was not entered for competition. We never saw him looking so well. In the bitch class there was one first prize. She is a very good bitch, but was heavy in whelp and shown much too fat. In the open dog class Tilly, who won first, was looking very well. Rover, who won second, is a very fair dog. Cato, who was third, we liked very well. He is of good type and has mastiff character. He is too small or he would have secured a better place. The bitches were perhaps as well placed as was possible. Dolly Varden, who won first, is a very good bitch, and fully deserved the place. Regina, Queen II, and the Scotch bitch, who were placed in the second position, were reversed not much fault could be found. Boedicea, unnoticed, we thought about as good as these, although she was shown in wretched condition. The puppies were a very good lot, and well judged.

ST. BERNARDS.

MR. JAMES WATSON.

Bonivard easily captured the medal in the champion rough-coated dog class. He has improved since we saw him at Pittsburgh. Monk is a grand dog, but was in very bad condition. The prize was properly withheld in the bitch class. His is a good one of the best class. Ervay, who was second, has a good head, but his body is poor. Monarque we liked very well. Marous, who was vice, we liked full as well as any of the class, notwithstanding his bad condition. The others in the bitch class were not so good. The best in the open dog class, notwithstanding his thirteen months old, by Turbo out of Snowflake; he was entered here as twenty-one months old, and by Bruno out of Fan. He is a good dog, and it is a pity that such a mistake should be made. That Harold should have had the place in the bitch class, and that the Scotch open dog class, with the exception of the first prize, was nothing extra, and the second prize was properly withheld. The bitch class was very good, and well judged. The puppies were a very nice lot and also well placed.

BEGGARS.

MR. JAMES WATSON.

The berghand, although a noble-looking dog, is a mongrel, and should never be recognized as a distinct breed. He is cer-

tainly no better than the St. Bernard or mastiff, from which he comes, and consequently is a failure as a distinct breed, and he should be relegated to the miscellaneous class, where he belongs.

NEWFOUNDLANDS.

MR. JAMES WATSON.

This was not a large class, and with the exception of Mayor of Bingley, who was first, there was not a good one in it, although Netop, who got second, has a very good head.

GREYHOUNDS.

MR. JAMES WATSON.
