The greyhounds were very well judged. Don II, who won in the champion dog class, is a very good-looking animal, with a capital head, a fine neck, a good tail, and a good light behind. Spring, the only other in the class, also looks well, except that he is not good in head; he also appears too stiff. Clio, the only entry in the bitch class, was disqualified for her broken leg. In the open dog class, Friday Night was an excellent winner. He is a grand young dog, well balanced, with good chest, shoulders, legs and feet. His stern is also very good. His head is a bit wide and he is a trifle thick-skinned. He was altogether the best one shown, and he rightly awarded the first prize. Dawson was a large dog, thin, and slightly won second, is a fair dog, a bit short forward, with poor feet and heavy stern. Eire, who was vice, lacks bone and has very bad teeth. Doubleshot was in good better condition than the others shown. He has a good head and fair legs; he is weak in chest and hind quarters and has bad feet. The others we did not like. In the bitch class, Fan, who was first, is a very good dog. She is very handsome, with lots of quality, and is well put together, with excellent legs and feet. Her hind quarters are a trifle straight behind. Dorothy, who won second, is also a very good looking bitch, with a good head. She was very well shown. She is also lacking in bone, and is not quite thin enough in neck; her coat is not quite so good as those of Fan, Coquette, who was vice, we liked, and thought that she deserved at least another letter. She has a good head, with the best ears in the class; her stern is also fine. She lacks in size, bone and quality. Her hind quarters are also a fair animal. The others we did not fancy. In the puppy class Honor Bright, who won first, is a very promising puppy. She has a capital head, and if nothing better she will do to show again.

DEERHOUNDS.

MR. JAMES WATSON.

The deerhounds were few and there was not a first-class one in the lot. We thought them properly placed.

POINTERS.

MAJOR J. M. TAYLOR.

We were greatly disappointed in the quality of the pointers. The display was the poorest that has ever been seen at any New York show. The Duke of Devonshire was quite a good dog. He was looking better than when at Pittsburgh. He is rather coarse and leggy, and has not a good tail. Don we preferred for the place. He is a better all-round dog than any other in the class. Foxglove is in beautiful condition, but was all out of condition. Cruxeth was very well shown, except that his coat was not quite right. Tramp was not looking so well as when we saw him last. He is very good, but his tail is not so good as it should be. He was in the bitch class, and was shown in splendid condition. The open dog class was small in numbers and weak in character. Forti and Tally Ho, who were placed first and second, were entitled to their honors. Duke of Bradford, who was awarded the prize, Foxglove in beautiful condition, was a good dog and very well put together. Nan, who won first in the bitch class, is a fine upstanding bitch of more than average quality, and fully deserved the place. Vision, who was second, is a very good dog, but is not so good as Nan, and was ruled out. Lady Gleam, who won third, was not advanced to second place, which was proper, as she is only a fair specimen. In the champion light weight class Bravo was awarded the prize. He was very well shown, and was quite a good dog, and very well put together. Nan, who won first in the bitch class, is a fine upstanding bitch of more than average quality, and fully deserved the place. Vision, who was second, is a very good dog, but is not so good as Nan, and was ruled out. Lady Gleam, who won third, was not advanced to second place, which was proper, as she is only a fair specimen. In the champion light weight class Bravo was awarded the prize. He was very well shown, and was quite a good dog, and very well put together. Nan, who won first in the bitch class, is a fine upstanding bitch of more than average quality, and fully deserved the place. Vision, who was second, is a very good dog, but is not so good as Nan, and was ruled out. Lady Gleam, who won third, was not advanced to second place, which was proper, as she is only a fair specimen. In the champion light weight class Bravo was awarded the prize. He was very well shown, and was quite a good dog, and very well put together. Nan, who won first in the bitch class, is a fine upstanding bitch of more than average quality, and fully deserved the place. Vision, who was second, is a very good dog, but is not so good as Nan, and was ruled out. Lady Gleam, who won third, was not advanced to second place, which was proper, as she is only a fair specimen. In the champion light weight class Bravo was awarded the prize. He was very well shown, and was quite a good dog, and very well put together. Nan, who won first in the bitch class, is a fine upstanding bitch of more than average quality, and fully deserved the place. Vision, who was second, is a very good dog, but is not so good as Nan, and was ruled out. Lady Gleam, who won third, was not advanced to second place, which was proper, as she is only a fair specimen. In the champion light weight class Bravo was awarded the prize. He was very well shown, and was quite a good dog, and very well put together. Nan, who won first in the bitch class, is a fine upstanding bitch of more than average quality, and fully deserved the place. Vision, who was second, is a very good dog, but is not so good as Nan, and was ruled out. Lady Gleam, who won third, was not advanced to second place, which was proper, as she is only a fair specimen. In the champion light weight class Bravo was awarded the prize. He was very well shown, and was quite a good dog, and very well put together. Nan, who won first in the bitch class, is a fine upstanding bitch of more than average quality, and fully deserved the place. Vision, who was second, is a very good dog, but is not so good as Nan, and was ruled out. Lady Gleam, who won third, was not advanced to second place, which was proper, as she is only a fair specimen. In the champion light weight class Bravo was awarded the prize. He was very well shown, and was quite a good dog, and very well put together. Nan, who won first in the bitch class, is a fine upstanding bitch of more than average quality, and fully deserved the place. Vision, who was second, is a very good dog, but is not so good as Nan, and was ruled out. Lady Gleam, who won third, was not advanced to second place, which was proper, as she is only a fair specimen. In the champion light weight class Bravo was awarded the prize. He was very well shown, and was quite a good dog, and very well put together. Nan, who won first in the bitch class, is a fine upstanding bitch of more than average quality, and fully deserved the place. Harrison's Celebrated Fish Hook.

Whereas, it having come to our notice that some unprincipled house, to gain their own unworthy ends, and to attempt to damage our good name, having spread reports to the effect that the manufacturers of the above hooks are defunct, we now take this opportunity of informing the American and British public that such reports are utterly false. The same efficient and workpeople is employed as heretofore, and we challenge the world to produce a fish hook for excellence of temper, beauty and finish in any way to approach ours, which are to be obtained from the most respectable wholesale houses in the trade. Signed, H. HARRISON, H. VAN LEEKEN & CO., Sole manufacturers of Harrison's Celebrated Fish Hooks, P. Oldich, England. (December, 1882.) Manufacturers also of Fishing Tackle of every description. Sewing and Sewing Machine Needles.

AMERICAN Kennel Register.

A monthly record of kennel events for the information and guidance of breeders, exhibitors and owners of all breeds of dogs.

Its leading feature is the "Pedigree Register," of sporting and non-sporting dogs, which makes it the only complete Stand Book issued in America. A register number is given to each dog, and an index will be compiled at the close of each annual volume, thus forming a permanent work of reference. The pedigree registration fee is twenty-five cents. The first two numbers of the Register contained the pedigrees of 188 dogs.

Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs at sale, and deaths.

Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include a record of field trials. The first two numbers of the Register contain prize lists of Washington, Ottawa and Pittsburgh shows.

The publication day is the fifth day of each month; and nothing can be received for publication later than the first day of the month. All matters intended for publication should be in the hands of the editor at the earliest practicable date. Entry blanks for each department will be furnished free on receipt of stamped addressed envelope.

TERMS.—Issued by yearly subscription only. The subscription price is one dollar per year. Make drafts and money orders payable to the Forest and Stream Publishing Company. Address, AMERICAN KENNEL REGISTER, P. O. Box 2,852, New York City.

Rare Opportunity!

Great Sale of Colt Breech-Loading Guns for Summer Holidays.
In order to reduce stock, we will now offer our entire stock of Colt guns, not extension rifles, at retail for sixty days at regular wholesale prices. These guns are all sizes and quantities, from the twist pistol grip, \$35.00 list, to the Laminated steel or Damascus, \$9.00, 28 to 3 in. long, 7/8 to 10 lbs. weight. Among the stock are a few of the celebrated Trap Ear-Killing Guns. These guns are all made of extra quality of barrels, and are made with great care, especially for close and hard shooting, and we have never seen anything yet to excel them at long distances. Price lists sent on application.

	ANSWERS TO CORRESPONDENTS.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

FISHCULTURE.

EVER since fishculture was undertaken in this country there have been doubters as to its utility. Notwithstanding the successes recorded and the great benefits that have been derived from it, these skeptics refuse to be convinced. A few days ago we heard a man say that shad in the Hudson would now be more plenty if none had ever been hatched there. His argument was, that if the fish were left alone they would spawn more freely and the unripe ones captured would ripen and cast their spawn. He was unaware that the eggs taken were from fish which would have gone to market and was really so much saved, and that of eggs cast in the natural manner not one in a thousand hatched.

The same thing has been said about the salmon and the trout. The latest thing that we have noticed is a statement from a professed fishculturist, which has been widely copied, and as it pretends to come from a "United States Fish Commissioner," it seems to have the stamp of authority. The item in question we have seen in the *Cape Ann Advertiser* and the *Belfast, Me., Republican Journal*, both papers devoting much space to fish matters. It says:

"United States Fish Commissioner M. P. Pierce is not a believer in fishculture. He says the Delaware and all the large streams north of it emptying into the Atlantic were natural salmon streams at the time the country was settled, but the clearing off of the forests and tilling of the land has rendered the waters warm and muddy, whereas when frequented by the salmon they were clear and cold. The same is true of the trout streams. To attempt to restock the streams with these fish at a great outlay of money is a mistake. The labor and expenditure are almost a total loss."

In the first place, Mr. Pierce is not a commissioner of fisheries, either of the United States or of any State. He has made some carp ponds and has taken an interest in fishculture to the extent of making speeches before the legislatures of Pennsylvania and New Jersey, in which he has opposed any appropriation being made for the use of the Commissioners. Why he has done this is best known to himself,

although the Commissioners of those States impute selfish motives to him.

His statement that the Delaware, and streams north of it, were salmon streams is also wrong. No stream south of the rivers of Connecticut contained salmon at the discovery of the country; but the Delaware was stocked with a few salmon some years ago, and a few fish have since been taken in it, enough to show that with liberal stocking it can be made to produce salmon.

There is one thing that is certain. Fishculture has too many grand successes to point to in America to fear being discontinued because a few skeptics or disappointed men throw stones at it. The moon is a grand success, and continues to shine, no matter how much barking is done at it.

THE SELECTION OF THE TEAM.

THE theme of all talk in rifle circles and among the outside public as well is the action of the directors of the National Rifle Association in shutting W. M. Farrow from the roll of members of the team of 1883. There is much to be said, pro and con, in regard to the act, but after all the bald fact remains that one of the best marksmen in America, if not the very best all-round shooter we have, has been shut out from a chance of adding his strength to the team, and only because some of those in power have personal spites which they wish to work out in this petty fashion.

The facts of the case are simple, and all the muddle of explanation which may be thrown about them will not change the general impression that a gross act of injustice has been done, and the American motto of fair play and the best man to the front set at naught. Mr. Farrow has been for years a member of the Newport Artillery, an organization of the Rhode Island militia. He competed a year ago at Creedmoor for a place on the team of last year, and at other matches under the control of these same directors has appeared in the uniform of his corps and won prizes. It is nonsense then to claim that he was not well known to the Creedmoor officials as a National Guardsman. Yet he was shut out from leading his valuable aid to retrieve the defeat of 1882 on the flimsy pretext that the directors had not been made officially aware of the fact that he was a member of the citizen soldiery.

The clause under a twisting of which the directors shut off Mr. Farrow is No. 10 of the "Regulations for the Selection and Government of the American Team," which says:

10. Each person entering for the competition at Creedmoor shall be required to produce a certificate from the Adjutant-General of his State, stating that he is and has been since January 1, 1883, a member in good standing of its uniformed National Guard or militia, and is a proper person to represent his State on a team.

Was Mr. Farrow required to produce any such document? No. Instead, this very matter was brought up at the first conference of the embryo team and the committee, held at the club house on the range on the morning of May 14. The fact was then noted that not only Mr. Farrow but several others of the shooters had neglected to provide themselves with such papers, and then and there, with the full knowledge and consent of the committee, this requirement was waived. Had the committee felt inclined to insist upon the display of a certificate, then was the time and that the place, before a shot had been fired. But no. Here was instead a capital chance of playing a sharp trick and profiting by their own questionable device. Mr. Farrow was lulled to the belief that such a palpable, useless precaution was not to be enforced, and when a week's good work had been put in, giving Mr. Farrow the best average of any man in the two dozen picked shots competing, when it became more than ever evident that he was really needed on the team, then it was that the little technicality dodge popped out from behind the fence, and Mr. Farrow became aware of the fact that he was the victim of something very much akin to a conspiracy.

There is talk of securing harmony on the team by the rejection of Mr. Farrow, and it is undoubtedly true that that gentleman in the past has figured in many disputed cases over the interpretation of match rules. He has also a very inconvenient way of looking a gift horse in the mouth, and this is an unpardonable offense to a company of managers, whose five-dollar trinkets appear as twenty-five-dollar trophies on the shooting prize list. In many similar ways, Mr. Farrow has incurred the lively displeasure of many of the rifle magnates, and for this he has been punished when the opportunity offered, though it does appear a great deal like splitting the face by cutting the nose off. It has never yet been shown that Mr. Farrow has ever done anything which was contrary to gentlemanly conduct, and an exercise of an

American independent course of action. He has pushed his way to the very front rank as a marksman by hard and intelligent work. He is to-day thoroughly conversant with the theory and practice of rifle shooting, and his omission from the team is a real loss. There was nothing to show that he was not actuated by the best and most patriotic motives in giving his time and effort to win a place. There is no reason either to fear that he would not have made a good working member of the team, but with some odd scores to settle and a chance to strike down a man who might have carried a particular rifle to the front, he has been sacrificed, and the squad of riflemen go abroad, not as a representative team chosen by a fair and open selection according to merit, but instead a few riflemen who find favor in the eyes of men placed in positions of trust.

There is a very bad air about the whole matter, and its tendency will be to check newcomers from taking an interest in range practice. Merit, it would seem, is not to be recognized, and it is as much a fault, it would seem, to shoot too well, as it is to shoot too poorly. The rejection of the best shot in America from a place on the team may be looked upon with favor by some of the English shots. It certainly is a step toward giving the British team another victory. A year ago it was pretty well understood that the visitors were to win, and some of the private letters sent over by the English managers before the match, would be very interesting reading in this connection. But it certainly cannot be the plan of our so-called American managers to throw another match into the hands of the Wimbledou experts.

It remains to be seen whether the other members of the team will retain their places on a body from which one of their companions has been so rudely pushed. There surely ought to be sufficient regard for fair and honest endeavor to see to it that a snub, and a very emphatic one, is given to such a contemptible little pettifoggery trick as that which cut Mr. Farrow from his hard-won place in the first eight of the American team. No rifeman can in the future tell what trap may be sprung upon him after he has done all the work before the butts which may be required, and a more flimsy curtain to hide behind than the one chosen by the majority of the committee on this international match, it would be difficult to imagine.

There is fault on both sides of the controversy, but no petty fallings on the part of an individual can be for a single instant regarded as offsetting the worse than blunder committed by the directors in their star-chamber proceedings.

FISHING ON SUNDAY.—Mr. Benjamin Vaughan Abbott, who was secretary of the Commissioners on the Code, and who drafted the Sunday sections, is quoted by the *Observer* as saying: "Section 265, on sports, is substantially a transcript of a law which is fifty years old. The effect of section 259 of the code does not seem to me to have been sufficiently considered. It really restricts all punishments for violation of either of the following sections, to cases sufficiently aggravated to be pronounced by a judge and jury 'serious interruptions of the public repose and of religious liberty.'" If Mr. Abbott is correctly reported these may be accepted as the principles upon which the framers of the law intended it to be construed. It will be seen that considerable latitude is allowed to those who choose to "be quiet, and go a-angling." They may fish, but must not make a noise about it and so disturb "the public repose." This reading of the statute, we take it, would not forbid fly-fishing, for the lure which falls upon the water lightly as a feather would not disturb this repose; but concerning bait and line fishing there might be a very nice splitting of hairs, and we are prone to think that the man who *chugs* his bait into the stream would be ruled out. Again it is clearly not permissible to pursue the fugitive herring over the hills, with horse and hound and hunting horn, as at Newport, nor to follow with hue and cry the ancient whitefish, as in certain sections of Canada. Perhaps there was just such a law when the "Complait Angler" was written, and it was to those who thought themselves oppressed by it that Walton left his parting injunction, "Study to be quiet."

THE IDEAL VIEW of the New York and Brooklyn bridge, which is opened to day, would show a tangled skein of fishing lines dangling down into the turbid waters of the East River, with multitudinous monsters ascending. We have seen no statement from the bridge trustees respecting the future angling privileges on the structure. It will now be in order to petition the authorities for permission to fish from the bridge. The only drawback to this scheme is the fact that there are no fish to be caught.

The Sportsman Tourist.

QUIET SPORT.—IV.

BY MILLARD.

ABOUT four miles north, "bearing a little west," lies another and a larger lake, where "solitary and alone" live a quiet couple, Uncle Philo and his wife, whom every visitor is pleased to address as "Anny." The lake affords no sport for the fly, but trolling is good, and many large catches are made in that way. The outlet of the lake, however, offers trout and black flies in generous quantities, and the biggest brawler with rod and reel can catch as many of the latter as the most finished expert.

Dick and Glen sighted the log house of Uncle Philo a few minutes before dinner time. Philo was hard at work following a plow which was pulled in a steady-lyerks fashion on an old black horse which the crows were waiting for. He was breaking, or trying to break up a patch of ground which he had cleared and was going to "put it into faters" if he and the horse ever finished plowing it. It was getting to be a serious question which got broke up first—the land, the horse, or Philo's voice, for the old Rosinante's ears were continually filled with "Git up, ousam ye, ye lazy creeter, git up," which was the extent of Philo's horsey profanity, but repeated so often that the horse rather liked it, and apparently was always waiting for it and trying to hear it.

Anny's call to dinner was a welcome one to all of us. "Was alooking for ye boys. Expected ye on yesterday. Sit down; sit down." Well, anny," says Glen after dinner was over. "You have not forgotten how to prepare a first-class dinner at short notice, and speaking of dinners, Uncle Philo, can you lend me the loan of your razor, for I don't know when I shall have such another chance to slick up." "Sartin, yes, I can make it go. Here it is, but I calculate you'll have ter touch her up a little for you can use it."

"Thank you, Uncle Philo, I'll touch her up a bit this afternoon before I go down the outlet."

After Glen had finished his shave, or scrape, and lounged about the house for an hour or two, he and Dick went down to the falls, over which the surplus waters of the lake plunge before they enter the outlet, and the plunge which the water does, making summer music as it rushes over on the off side and having sport when it strikes below, makes a beautiful pool on the high side and surrounded with immense rocks covered with cushions of moss, while on either shore is a perfect jungle of undergrowth, making it necessary, to fish the pool, to climb one of the aforesaid rocks, a feat which Glen presently accomplishes, though choosing one of the outer ones, where the trout could not see him and from which he opened hostilities, the rod in his hand working with the accuracy of a mathematical instrument.

He was one of Charles Reade's either-hand men, and his car in preparation extended to the minutest detail, so when the battle opened he was ready at every point. He was never headstrong, never letting his zeal outrun his discretion, but patient and undisturbed as a sphynx. He will always manage well enough, and even if the trout escape, he will give no sign of discomfiture, no matter how loudly he may feel for his lost teaching in coolness.

At the second act of the subjective this has done its work, and now, old rod, to business. Humph! two ounces at least, and not an ounce less. Little fellow, you may go home, and please tell the old gentleman there about the nice visit you have had, how sorry you were you couldn't stay longer, and how splendidly you were treated by the pleasant friend you met. Give my compliments to your big sister, and tell her how pleased I should be to see her. Good bye, Splash!

What a retentive memory the two-ounce had for such a youngster, and how he must have embellished the story of his travels as he told it with his fluent tongue, for in a few seconds came another, many times larger and older—one with a great deal of rapid transit about his style; but he was struck at sight, which is the flash of the trout. You may miss him, but if you were to wait long for his chances of escaping, Glen believes, are greater than if he met him the better part of half way. He can let go very prettily.

Every angler has his pet theory regarding the twist of the wrist or turn of the hand, and the proper time to put it in practice, but as Glen says he was taught to strike at sight, it has become second nature with him, and as he can capture rather more than a fair proportion by that method, he is not going to sacrifice it. He is going to break that trout up in business, that's what he is going to do.

That poor trout is a victim of misplaced confidence. Oh, how could Glen do it? He did it with rod and reel, and with silence and celerity. Did it because he loved it, and the trout, bowing to the inevitable, in ten minutes by the watch and chain, was ereled, and slept with us in sections that night. He was a good one. "Sold-made, game; no livered singard, no hot-house product, tame and insipid, that swished like a prize-pigeon for his food to be brought to him, but he was as good as a warrior, and a warrior he had conditioned himself by buffeting the rifts and currents and battling among the eddies for his morning and evening meal."

Into the basket went he, while Glen glew with a quiet glow of satisfaction. One's whole after life might be void of such pleasurable emotions. Even a yes that ends a wooing might be tame in comparison. To one you can always look back with a longing for its repetition. The other—well, we have heard of warriors, but people say if they were to do it over again they wouldn't do it.

Glen was contented when he had landed a dozen that a Christian sportsman need not be ashamed of displaying. In capturing the dozen he had taken some smaller ones, but scrupulously returned them. There was not the slightest particle of the "T. H." in his composition, and he could unblushingly exhibit the contents of his creel if he cared to show the results of his angling skill.

How the black flies had taken hold while Glen was too busy to accord them the reception they merited, and they had improved their opportunity of displaying their infernal tactics on his cleanly shave face.

The black fly season at that particular locality was unprecedentedly active. They all wore spurs, carried red-hot needles, and stuck closer than the scriptural brother. The millions of black flies that stabbled and sucked a hundred years ago are presented to us by descendants worthy to inherit their devilish propensities and proclivities. There has been no degeneration in the stock, for, utterly and hein-

ously depraved, without an apparent redeeming quality, they maintain the old reputation and carry on the business as originally established.

Uncle Philo and Anny were waiting supper when Glen returned.

"Massy, sakes alive! Mr. Glen, but how the pesky flies have lit outo you."

"They did rather manage to get in their work to their good advantage while I was on the rocks below the falls; but that's all right, as it was my fault."

"Your fault?"

"Yes, for I had a bottle of tar and oil but forgot to apply it, so the fault was in a measure my own. Oh, how I have bled an unconsciously suffered, if such a thing be possible, the torments of the damned while handling the rod. Suffered when I had in my pocket the remedy to alleviate the pain, but all forgetful of it in the delights of eating the fly and making the ripples and quiet pools contribute of their treasures to my eye. Put me on a runway watching for deer, and if there is one fly about he will demand and secure my attention so of all the deer within five miles."

"Don't you think, Mister Glen, that giving yourself a nice, clean shave was what drew them to you? Dick ain't scarcely touched."

"That, I think, made no difference."

"Did you find the mazor in good order?"

"Not first-class, but I touched it up on the grind-stone, and finished off on the stove-pipe. I was very careful not to nick the stove. It shaved me, but it pulled terribly hard. I say, Uncle Philo, wouldn't it be a good idea to hire it up with your old black horse, and your ploughing with the two? If your horse can pull as well as your razor, you will have a team that can walk through every stump in your clearing. But Uncle Philo, I am much obliged for the use of it, and Anny, that is what I call a way up supper, one of the kind I firmly believe in putting down."

"So said we all of us."

Before the purple tints in the west had all faded away, the roof of the scarlet Iris Club had joined us, having temporarily broken their usual adquears, and Uncle Philo's cabin was filled with a sociable party.

DAVE'S MEDICAL EXPERIENCE.

IN a former communication* we wrote that poor old Davy W. had paid his last debt—we might almost have written his first and last. He was a rare genius, and his name still "blossoms in the dust" of the Yazoo Valley; at least when there is no overflow upon its fertile fields; for even as we write, through broken barriers the great Father of Rivers, as he sweeps ever southward to the blue Mexican sea, rolls in singing waves over Davy's lonely grave. Small in stature, neither strong nor muscular, and with a somewhat "determined" stoop of the shoulders, he appeared at rather a disadvantage among the stalwart raftsmen of the Swamp. It was only when around the camp-fire, while from black and black "dudeen" the fragrant breath of the Indian weed curled upward to the blinking stars, that Dave towered above his fellows, a veritable Anak in the fields of contemporaneous fiction. Although he was generally the hero of his own story, and so managing in his manner, so self-deprecating his voice, that one never thought of him as a braggart.

His face had perhaps "once been fair," but was when I knew him tamed and weather-beaten. His eyes were yellowish gray in color, with that far-off, dreamy, India-summer look that is always associated with peace and contentment, and so slight was the division which his nose made between an eye and the other, that it almost ran into another. His hair had once been red, and with the exception of a whitish patch on the top of his head, was still of a muddy, fox-tail hue, while his beard was tawny and bristling, and each individual hair stood out fierce and defiant like the spines upon a cactus. It knew no north, no south, no east, no west—a kind of "political beard," as Dave once said of old Sol Frelley's pocket compass—"pointing to every tree in the woods, and there I concluded that Dave would never carry one of these "useless contraptions," as he called them, depending, as many old hunters do, upon the moss and bark upon the trees for guidance, when skies were "ashen and gray."

After Dave had finished the story of his encounter with the "Duteh Yawger," as before related, Ben H. proposed that we should go upon a camp hunt up on "Six-Mile" Bayou. To this Davy, on my implicit assent, and having agreed upon starting the next day, we separated.

Bright and early the next morning saw us assembled at the appointed rendezvous, with our "camp tricks" and a darkey commissary on the roof of an extra mule.

Taking our course along the eastern bank of the Sunflower, we crossed that stream at Callao, the plantation of Col. Harvey L. And here, if it will be permitted me, I would like to make a short digression: Presuming that some of your Northern readers may be ignorant of what were the qualifications requisite for the acquiring of military titles among the planters of the cotton States in ante bellum days—titles so innumerable, that had a modern Napoleon, as No. 1 did when he got Moreau at Eylau, ordered a few shells dropped among us, he would have bagged a "little general" in every pop—I will for the benefit of the future historian state, that they were bestowed in accordance with the number of cotton bales upon which the individual planter stenciled his brand. Be it understood, however, that there were no captains "in those days." The shipper of his five score bales never ranked lower than Major. When the packages of the fleecy staple reached to double that number he was promoted to Colonel, and when he rolled the comfortable figure of 500 out of his gin house, it was "Glad to meet you, General."

If there were "brevets" for the intermediate numbers, the writer knew of none, unless, perhaps, it was "Judge."

Having crossed the river, we continued our course up its western bank, and in a short time struck the Deer Creek trail, following which a few miles brought us to the confluence of "Four-Mile Bayou" and the swift-running Bogue Phuala. Forging the latter stream we soon found ourselves traveling along the bank of a dry bayou, the land upon both sides of which lay in long swelling waves covered with tall grass and a scattering growth of trees, with here and there small islands of cane upon the most elevated points. These lands are subject to annual overflows from the local streams, they remain in all their wild, uncultivated beauty, and are favorite feeding grounds for deer, which could always be found in abundance; until driven to the higher cultivated lands by the past year's disastrous overflow they were foremost and best appreciated by the "gentleman from

Africa." Pitching our camp near a clear pond that slept in depression of the bayou bed, our camp-fire soon shone brightly through the gathering twilight, while around it flitted our sable commissary preparing the evening meal. This dispatched and enjoyed, as such meals always are, we were able to sit in silence watching the white swaths from our lighted pipes as they rose slowly upon the damp night air, each, perhaps—as our sweethearts used to write they were always doing—"following the lead of his wayward fauces."

At length, having doubtless held his game, Ben H. broke the spell with, "I say, Dave, don't it sometimes make your mouth sore for those long-winded yarns you tell to come out of it?"

"O, no," Dave replied; and then very solemnly, as if the question has conjured up some sad memory of the past, he continued, "but if you watter hear it I'll tell you all 'bout one sore mouf I did have wons't."

"Out with it, then," said Ben, "if it won't make your mouth sore danger o' that!"

"O, no sorer o' that; it twan't talkin' as done it that time, no how," said Dave, and, relighting his pipe, he went on, "You see, 'twas while I wase a-lyvin' down at the mouth of 'Murry,' one day Shot Duple he come along the river an' he self down on a log what I wase a-fishin' an' begin a-tellin' me as he'd a-went down ter Ditchal's last Sunday an' a-coched a thousan' peeches outen one hole, an' rarerer one on 'em wus er hit bigger nor er bit littler than tother one."

Here Ben interrupted him with, "And I suppose you believed all such stuff as that?"

"O, no," said Dave, "I didn't exactly believe as to they bein' our same size. But, as I wase a-sayin', there wos t'other I-a-fishin' an' Shot a-talkin', when I looks up the river an' I see er fellow come down in er skiff. 'It's one of them pill-peddlers,' says Shot, 'an' now's yer chance, Dave,' says he, 'for to lay in yer doctor's grub, an' bein' as you's lookin' mighty puny o' late,' says he, 'I think you oughter take in yer eat's ration's an' somethin' extra for Christmas.' Well, sure enough, when that fellow bleded he had his skiff full of all sorts o' powders, an' as a stickin' plasters, an' sich like, right onto about twenty bushels, Shot said, 'Well, what does I do, with Shot a-sayin' all the time, 'Buy this yer, Dave,' an' 'Here's the stuff ter set you up, old feller,' but I lays in a general assortment, ten dollars' worth o' therabouts, an' with what the feller throwed in for good measure makin', as nigh as I can come at it, about er bushel an' er half."

Well, twan't no'er ten days o' two week maybe, I wos taken with cramp in my leg o' somethin', an' think, I wos, old feller, you're lucky this time, you've got plenty o' sick grub in the house. Well, I jest shet my eyes an' I run my little box in the chis' sorder chance like an' up I foted er han' down which were pills all a-iced jest like a weddin' cake. But they didn't seem to understand the business, so the next dive I foted up some kind o' yaller powders, an' I tooked about a three-fluger load on it, but it didn't faze me, then think I things wase gettin' serious, so I pitched in kind o' indiscriminate like, an' in about a week, as sure as you're alive, the whole of that physic jest sild down my waseen."

"That is what makes your eyes look so much like the windows of a drug store," said Ben.

Unheeding the interruption, Dave continued: "Well, by that time my mouf had got so sore that I don't think I could swallow another pill if the suppy hadent a' come out."

"Jes, about that time George Booker, he come along a blovin' up the river, so I runs out on the landin' and I sorter motioned for him to fetch her in, for I couldn't a spoken outen a whisper if I had a wanted to say my prayers. So when George he seed me a workin' my arms he landed her an' I went aboard. An' says I, 'George,' says I, in a whisper, 'I ain't eat a moufful for almost er month,' says he, 'What in the world is the matter, Dave?' says I, 'I god only knows what is the matter,' an' then I ups an' tells him 'bout that pill-peddler, an' how much doctor's grub I'd tooked. 'Oh,' says he, 'you're salivated.' Says I, 'that might a bin his name as far as I knows, but anyways he's about fixed me.' Then George he says how I must go down to Vicksburg an' see er doctor. Well, I puts on er clean shirt an' down I goes, an' when I gets that the first thing I does I goes straight up to old Ben Barkway's medical shop, an' I begin a whisper in him as wher's er doctor. 'Oh,' says he, 'you're salivated, come here an' take er drink o' sellers' pepperin'."

"A drink of what?" said Ben. "I never heard of that brand before."

"O, 'twan't spirits," said Dave; "'twas some kind o' salt an' water stuff."

"O, yes; sellers' pepperin' said Ben. "Go on."

"I'll tell you," says I, "twill make me appear in any better, for I knows I'm lookin' right bad," says I.

"Jest then Doctor Bulver he walks in the sto', and old Ben says he: 'Doctor Bulver, here's one of the biggest cotton planters on Red River hadly salivated, an' I want you to do your level best on him.' Then the Doctor he jest aoids me to come in the back room, an' when we got in that says he: 'Please open your mouf, my friend.' Then he shuek his head, an' says he: 'Yes, yes, pretty bad case. You must a tooked about forty poun's o' hydrargum it, broken down, didn't you?' Says I, 'I god only knows what I didn't took.' Well, then he tells me ter shet my eyes an' lay down that my back on the table, an' then he hollers ter old Ben ter fetch him er pint o' aggyforty, an' the fast thing I knowed he'd a gapped my mouf wide open an' a poured every drop o' that aggyforty down my goozle. Jerusalem, my happy home! er cup o' red hot bilin' lead wouldnt a bin a patchin' to it, an' when I open my eyes the blue blazes wase jest a shootin' outen my mouf about ten feet high, clean up to the ceiling o' the sto'. It jest burnt me out clobberin' a foller log, an' I never heers tell about sore mouves since I drunk that aggyforty, but I thinks about that pill pedder."

"I wish," said Ben H., "we had a pint of that aggyforty to start our fire in the morning."

Dave lifted his eyes inquiringly to the speaker, but if he said anything the water splashed upon his blanket, with his feet on the floor, and his head pillowed upon his saddle, was too far off in the land of dreams to hear him.

TUCKAHOE.

CLEVELAND, O., May 19.—Killed thirteen snipe May 10. Did not weigh them, but were the fattest birds I ever saw. Oil would drip from the hands while dressing them, and when I open my eyes the blue blazes wase jest a shootin' outen my mouf about ten feet high, clean up to the ceiling o' the sto'. It jest burnt me out clobberin' a foller log, an' I never heers tell about sore mouves since I drunk that aggyforty, but I thinks about that pill pedder.

*FOREST AND STREAM APRIL 20, 1898.

Natural History.

NOTES ON THE BIRDS OF ALABAMA.

BY A. M. R.

During the summers of 1880 and 1881 I was afforded excellent opportunities for observing the birds of Alabama, the first season being spent mostly in the north and the second in Montgomery county. I thus had a chance to see something of the avi-fauna of the two extremes, and the following rough notes are the result of my observations. Through the information of friends I have been able to add some remarks on the winter species.

Wood Thrush—Hylocichla ustulata.—Common in the mountains of the north; not common south of Birmingham.

Robin—Turdus migratorius.—Very abundant in winter; rather uncommon during the summer. A nest and four eggs were found in Montgomery in 1879.

Brown Thrush—Harporhynchus rufus.—Common throughout the State. Found breeding in the north during the month of June. Local name sandy muckle-bird.

Mocking-bird—Mimus polyglottus.—Everywhere very abundant. Found breeding in the north in June. A favorite position for the nest is in the thick mock-orange bushes. Three to six eggs form the complement.

Catbird—Galococcyx carolinensis.—Abundant. Found breeding near Birmingham as late as July 1.

Bluebird—Sialia sialis.—Common. Young very abundant in June.

Blue-gray Gnat-Catchers—Poliophtila cornuta.—Common everywhere, but not abundant in the lowlands of the south. Several nests found on Lookout Mountain. The gnat tree is a favorite building site.

Tufted Titmouse—Lophophanes bicolor.—Occasionally met with throughout the State.

Southern Titmouse—Parus atricapillus, var. carolinensis.—First met with on the southern slopes of Lookout Mountain; it was quite abundant, and at that time (June) gregarious; rare in the south. It very much resembles the black capped titmouse.

Blue-headed Nuthatch—Sitta pusilla.—Only one specimen observed during two summers, and think that it is quite rare. The specimen I have referred to was seen near Birmingham.

Carolina Wren—Thryothorus ludovicianus.—Occasionally seen throughout the State; young birds obtained near Montgomery in July.

House Wren—Troglodytes aedon.—Most common in the north, but met with throughout the State; breeds.

Black and White Creeping Warbler—Mniotilta varia.—Everywhere abundant; breeds.

Blue Yellow-backed Warbler—Chloris americana.—Several specimens obtained near Montgomery; none seen elsewhere.

Prothonotary Warbler—Protonotaria citrea.—Sparingly met with in the swamps south of Montgomery.

Tennessee Warbler—Helmintophaga peregrina.—Several males obtained in the extreme north; not seen elsewhere.

Summer Warbler—Dendroica aestiva.—Everywhere common; breeds.

Prairie Warbler—Dendroica discolor.—Extremely abundant throughout the State, frequenting pine woods. A nest and three eggs found in the extreme north in June. It was placed on an older branch overhanging a small stream, and gave the appearance of the summer warbler.

Golden-crowned Thrush—Sturnus auricapillus.—Occasionally seen in the north.

Water Thrush—Sturnus necivus.—Everywhere common, especially in Montgomery county, where it breeds in great numbers in the swamps.

Maryland Yellow-throat—Geothlypis trichas.—One specimen seen a few miles north of Montgomery; nowhere else observed.

Yellow-breasted Chat—Icteria virens.—Everywhere abundant. Near Montgomery nests and eggs were found as late as July 1. Local name, French mocking-bird.

Redstart—Scolecophaga ruticilla.—Rarely met with; one specimen seen in the north.

Scarlet Tanager—Pyrrhula rubra.—Occasionally seen in Montgomery county.

Summer Red Bird—Pyrrhula aestiva.—Everywhere very abundant; in the extreme south they are even more numerous than the cardinal grosbeak. Strange to say, I found no nests, nor could I hear of any, though the young birds, in their varied plumage, were very plentiful in June and July. I frequently noticed these birds darting after flying insects in the manner of the flycatchers.

Barn Swallow—Hirundo erythrogastra.—Everywhere common, nowhere very abundant.

White-bellied Swallow—Pechiprictus bicolor.—Occasionally seen on the Alabama River.

Bank Swallow—Cotyle riparia.—Common; breeds.

Purple Martin—Progne subis.—Most abundant of the family; bred in colonies in bird houses erected for the purpose. Nesting season, May.

Red-eyed Vireo—Vireosylva olivacea.—Occasionally met with throughout the State; only species of the family observed; breeds.

Loggerhead Shrike—Lanius ludovicianus.—Common north and south; a nest and three young birds found near Montgomery in June.

Field Sparrow—Spizella pusilla.—Abundant; eggs collected in the north in June, and near Montgomery as late as July 4.

Whipping Sparrow—Spizella socialis.—Common; breeds.

Song Sparrow—Melospiza melodia.—Abundant; breeds.

Swamp Sparrow—Melospiza palustris.—Common in swamps; breeds.

Yellow Bird—Chrysomitris tristis.—Common.

Snow Bird—Junco hyemalis.—Common in winter; observed during the winter of 1875-76.

Blue Grosbeak—Guiraca caerulea.—Common in the swamps of the south. Nest and young found near Montgomery in June. This is one of the most beautiful of our Southern birds.

Indigo Bird—Cyanospiza cyanea.—Abundant; breeds. This is a most persistent singer, remaining perched on some high branch and enduring with indifference the heat, which has long since driven all other bird life into the shade.

Painted Bunting—Cyanospiza ciris.—Rarely seen.

Cardinal Grosbeak—Cardinalis virginianus.—Everywhere very abundant; many nests found. The eggs of this species

differ greatly, some being of a dark chocolate color and others of a light brown.

Bobolink—Dolichonyx oryzivorus.—Most abundant in the north, but occasionally seen throughout the State. During the winter they are found in vast numbers in the south. Local name, reed bird; breeds.

Cow Bird—Molothrus ater.—Occasionally seen throughout the State; no record of its breeding.

Red-winged Blackbird—Agelaius phoeniceus.—Common in the north; not found in any numbers south of Birmingham; breeds.

Meadow Lark—Sturnella magna.—Uncommon in summer; very plentiful in winter.

Baltimore Oriole—Icterus baltimore.—Occasionally seen; by no means common.

Orchard Oriole—Icterus spurius.—Everywhere abundant; many nests and young found near Montgomery in June. A curious instance of this species nesting in a martin box came under my notice. The young are ground-feeders in summer.

Crow Blackbird—Quiscalus purpuraceus.—Common in the north; rather uncommon in the south; breeds in the north. Found everywhere in the winter.

Crow—Corvus americanus.—Not often seen south of Birmingham; common in the north. Abundant in winter.

Blue Jay—Cyanura cristatus.—Very abundant. Breeds in the pine woods.

Kingbird—Tyrannus carolinensis.—Everywhere common; breeds.

Great Crested Fly-Catcher—Myiarchus crinitus.—Everywhere very abundant. I found it in great numbers in the cypress swamps of the south.

Pewee—Sagorinis fuscus.—Common; breeds.

Wood Pewee—Contopus virens.—Occasionally seen in the north; not observed in Montgomery county, though I was struck numerous eggs collected in the vicinity.

Whippoorwill—Antrostomus vociferans.—Occasionally seen in the thick woods. Breeds near Montgomery.

Night Hawk—Chordeiles virginianus.—Everywhere very abundant; about the last of August they are in fine condition and afford much sport to the hunting community; known throughout the south as the "bull bat" birds.

Chimney Swift—Chaetura pelagica.—Abundant; breeds.

Red-breasted Humming Bird—Trochilus colubris.—Plentiful; breeds. The terror of hawks and owls.

Belted Kingfisher—Ceryle alcyon.—Common; breeds.

Yellow-billed Cuckoo—Coccyzus americanus.—Sparingly met with all through the State. Locally known as the "rain crow;" breeds.

Black-billed Cuckoo—Coccyzus erythrophthalmus.—One specimen, a young male, obtained about fifteen miles south of Montgomery; the only one of the species seen.

Great Ivory-billed Woodpecker—Campylorhynchus principalis.—Common in the mountainous region of the north. Local name, woodcock.

Hairy Woodpecker—Picus villosus.—Several specimens obtained in the north, and it is probably found throughout the State, though I did not notice it in the south. Local name, "sap-sucker."

Downy Woodpecker—Picus pubescens.—Everywhere abundant, especially in the pine woods of the south. Locally known as the "little sap-sucker."

Red-bellied Woodpecker—Centurus carolinus.—One specimen obtained near Birmingham.

Red-headed Woodpecker—Melanerpes erythrocephalus.—Very abundant. A favorite breeding place is in the dead trees in the midst of the cotton fields. I have counted as many as four nests in one of these trees.

Golden-crowned Woodpecker—Colaptes auratus.—Sparingly met with throughout the State; abundant in winter. Local name, "yellow hammer."

Barred Owl—Strixio cinereus.—Common near Montgomery; breeds in the pine woods about the city. I obtained many specimens of this fine bird, one of which I kept alive for some time. It was perfectly blind during the day.

Red Owl—Scops asio.—Common.

Pigeon Hawk—Falco columbarius.—Seen in considerable numbers throughout the State.

Sparrow Hawk—Falco sparverius.—Common; breeds.

Sharp-shinned Hawk—Accipiter fuscus.—Occasionally seen in the north.

Cooper's Hawk—Accipiter cooperi.—Common; breeds.

Bald Eagle—Haliaeetus leucocapillus.—Occasionally found among the mountains of the north; said to breed on Lookout Mountain.

Turkey Buzzard—Bubo virginianus.—Everywhere abundant, acting as scavengers. Instances are reported of their having attacked young lambs and sickly sheep; breeds in great numbers on Lookout Mountain.

Black Vulture—Cathartus atratus.—Often seen, generally in the south; by no means so abundant as the preceding species; breeds.

Carolina Dove—Zenaidura carolinensis.—Abundant. About the last of July the young are in prime condition for the table and are much hunted.

Wild Turkey—Meleagris gallopavo.—Common; breeds.

Ruffed Grouse—Bonasa umbellus.—Found in considerable numbers in the northern mountains. Local name, "pheasant."

Virginia Quail—Ortyx virginianus.—Everywhere very abundant; breeds.

Killdeer—Egialitis vociferans.—Common; breeds.

Spotted Sandpiper—Actinopus macularius.—Common along the banks of streams. Local name "lip up."

Great Blue Heron—Ardea herodias.—This splendid species is very abundant, especially in the south; breeds in the cypress swamps of Montgomery county. Locally known as the "crane."

Little White Egret—Gareta candidissima.—Common in the south; not observed north of Birmingham. Associates with F. carolinensis.

Little Blue Heron—Florida cervina.—Abundant north and south; breeds.

Green Heron—Butorides cirrescens.—Common; breeds.

Night Heron—Nycticorax grisea.—Common; breeds.

Bittern—Botaurus minor.—Not common. One specimen obtained in the south; breeds.

Mallard—Anas boschas.—Occasionally seen; abundant in winter.

Summer Duck—Anas sponsa.—Common; breeds in the swamps of Montgomery county.

Brown Pelican—Pelecanus fuscus.—Rather rare. A fine specimen was shot in the north by a gentleman of my acquaintance.

Least Tern—Sterna hypoleucis.—Two specimens seen in Montgomery county, one of which I obtained and carefully

identified. It was a young male and had probably strayed up from the coast.

Pied-billed Grebe—Podilymbus podiceps.—Common: frequents the ponds throughout the State.

OHIO GEOLOGICAL SURVEY.

THE fourth volume of the Ohio Geological Survey purports to be devoted to the Zoology and Botany of the State, but as a matter of fact includes only the Vertebrates. The report on the mammalia is by A. W. Brayton; that on the birds by Dr. J. M. Wheaton, the reptiles and amphibians are treated by Dr. W. H. Smith, and the fishes by Prof. Jordan. The report on the mammals contains nothing especially new. We are, it is true, occasionally surprised by a statement like the one on page 12: "It is scarcely likely that any [wild cats (Lynx rufus)] remain [in Ohio] to the present time;" but such errors are usually corrected further on in the report. The curious statement that the badger "is very abundant," presumably in Ohio, since the paragraph is not in quotation marks, is to be explained, perhaps, on the ground that the report in fact is largely a compilation from the works of previous writers and contains little or nothing that cannot be found elsewhere.

The report on the birds is a much more satisfactory production. The introduction treats of the topography of the State and its climatic peculiarities, and touches also upon the laws of latitudinal variation, a subject which receives fuller attention further on (Appendix [E]); the nomenclature employed is that of Dr. Conner's "Key to North American Birds," only modifications of more recent discovery. The arrangement of the ordinal groups is also taken from the same work.

A description is given of each species of bird mentioned, its habitat, date of arrival and departure if a migrant, and very full notes on the habits of the species. These notes, too, are written in an extremely pleasant style, and are really delightful reading. It is impossible to allude to any considerable number of the points of interest which come up on this subject. We may, however, notice that the skylark is given as breeding sparingly in the vicinity of Cincinnati. They are said to have been exterminated on Long Island in this State, but Mr. Edmund Orgill, of Brooklyn, believes that a few may still be found there. Dr. Whenton notes nine specimens of Dendroica kirilandi known up to date of writing, and Dr. E. C. Sterling informs us that up to the present year (1883) eleven specimens have come within his observation. The Canada goose (C. canadensis) is an occasional visitor, and the black vulture (C. atrata) has been taken. The extended account of the habits of Ortyx virginianus is extremely interesting. The ruff (Phalaropus pugnax) has once been taken in Ohio. The white pelican (P. trachyrhynchus) occurs occasionally.

In his appendix to his report Dr. Wheaton gives a check list of Ohio birds, adopting the nomenclature of Ridgway's check list (Government Printing Office, 1881). This comprises 292 species with four additional varieties and two introduced species, giving a total of 298 species and varieties; of these six are considered as accidental. This list gives also the dates of the arrivals of migrants, a very useful addition. There is also an excellent bibliography of Ohio ornithology, a paper on the Relation between Latitude and the Pattern of Coloration in Birds, and a Glossary of Technical Terms used in the Report.

The list of reptiles and amphibians includes thirty-six species of the former and twenty-five of the latter. The introduction is interesting and the notes on the species full. Only three venomous reptiles, two rattlesnakes and the copperhead, are found within the State. There are three lizards and thirteen tortoises in the list. The following species are given as rare: Pityophis melanoleucus, Ophiodon colubiger, O. dolivus, Coluber obsoletus, Cychophis aestivus, Diadophis parietalis and Urolythops maculatus.

The report on the fishes by Prof. Jordan is, as might have been expected, in all respects admirable and needs no criticism or comment. One hundred and sixty-three species are enumerated, and of these forty are characteristic of the lake fauna, and sixty-seven of that of the Ohio, the remainder being common to both.

The report abounds in typographical errors, for which there is really no excuse, but very much of the material contained in it is extremely interesting.

DUCK HAWK.—This very beautiful hawk is rather a rare bird. Although it breeds on Talcott Mountain, Conn, and Mounts Tom, Holyoke, and Toly, Mass., I have heard of but one pair breeding in any of the above places, except at Mount Tom. I had that year (1882) a very fine young male, plenty fifty years ago, but being robbed of their eggs, young, and shot, there are now but a few pairs in this section of New England. William Street, on Mount Tom, Mass, had one caged for two years, and, certainly, with his jet black eyes and winsome ways, he was one of the most interesting pets I ever saw. I have watched him for hours, and his every movement was grace itself. Throw him a piece of meat and he would catch it before it could strike the bottom of the cage. Dr. S. G. Moses, of this city, kept three for quite a long time, but they made a feast of one of their number. The pair were presented to Prof. Spencer F. Baird, who prized them highly. These hawks do not build any nests, but lay their eggs on the bare rocks. And they are quite sure to lay their eggs in the places which are most difficult places for man to get at. Before the eggs were sought for, anybody could find their nest. They would fly to it, and keep up a screaming cry, and you were out of sight. The young, which hatched, would make as much noise as a small drum corps. But since their eggs commanded \$4 to \$6 each, they have learned a few points. By visiting their breeding grounds you may see one hawk, but there is a scarcity of this particular species of hawks at once. When the young hatch you they are as still as a Quaker meeting when the spirit does not move. I have known them to be placed in a nest usually in some way, and they were the hawk's eggs. And they got a good view of the beautiful Connecticut Valley for their interest in natural history.

FLICK FLICK (Hartford, Conn., May 15, 1883).

A FAWN AT LARGE.—In the Central Park there is a fawn which the keepers are unable to capture, and which wanders wherever he pleases. He usually comes into company with a flock of penfold and guinea hen, roaming during the day with them about the Park, and at night sleeping under the tree in which they roost. When the fowls are fed he picks up some of the kernels of corn which are thrown to them. He is very tame and will take food from the hands of visitors, but is very suspicious of the keepers or the workmen who have several times tried to catch him in order to return him to the deer paddock.

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such articles?

NOTES OF FLORIDIAN EXPERIENCE.

Editor Forest and Stream:

"N B.—Shooting and fishing unsurpassed." This is the style of life that I've seen for years past attached to every hotel advertisement in Florida, and I confess that it contributed largely toward making up a desire for a Southern trip. I supposed, from report, that quail were so numerous that I could shoot enough in New York to pay my expenses, and that all I wanted every day, and that wild turkeys, deer and bears could be shot by the dozen from the cars. "Lord, how this world is going to live!" exclaimed the renowned "W. S.," and it hasn't recovered from that passion yet. When correspondents begin to tell you the truth you'll begin to know more about Florida than you've learned from them yet.

I have traveled over nearly all the principal routes and have found, on every stopping place, the bagging a few quail involved great trouble and expense, while to get a shot at a deer or turkey one must go to an uncivilized region and live on "hog and hominy," with dirt *ad libitum*, as "crackers" do, which, in fact, is the case nearly everywhere after leaving Jacksonville and Palatka, where Orvis has established his hotel house. If your correspondent had been born and bred among the Digger Indians, any Florida hotel might do for him when crassness and grubs were out of season, but he's unfortunately fastidious and sees no good reason why food should be served up in a dirty and villainous way when it's just as easy and cheap to do it right. It is said that "the devil sends cooks," and it might be added that he also sends hotel-keepers. Not one man in a thousand knows how to keep a hotel, and that a man has secured a license is no proof that he knows how to keep it. When a hotel is advertised for rent, any loon who has the money can take possession of it without any regard to his qualifications, and the public must suffer. At Jacksonville there are four or five good bones, and the Putnam is, as everyone of refined taste knows, the model hotel of the South.

As I was strongly disposed to indulge my youthful passion for shooting, I interviewed every acquaintance who had been to Florida, and came to the conclusion that for good quail shooting the only place in the State was the one left for Ocala, but got left at Waldo, and finding friends and a very well-kept house, I concluded to hang up my hat and send for my baggage—especially as they reported shooting and fishing unsurpassed. I passed two weeks there, and did not regret it, though the shooting and fishing proved a fiction. With a good dog a man may find a few birds almost anywhere, but there is not the same hazing enjoyment in it that one finds in Northern woods. The quail are of a smaller pattern, and do not get up with the noise and vim of our northern birds, and are far inferior all the while. After one or two failures I picked up my "Fox" one day, an hour before dinner, and took a walk just back of an orange grove near the house, and stumbled on an innocent little bevy, but as they failed to notify me of their intention to rise I only got out, but marked them down in a patch of dwarf potatoes and a thick cover of grass, where I found them scattered that I put them up singly and shot down two of the next one selfishly got behind a tree and got off with all his feathers. I then found three snipe and actually shot six times at the wriggling things before I got them safely in my pocket, by which I learned that my youthful skill had led for parts unknown. That ended my Florida shooting. I found that enterprise was a great resort for shooting and fishing, and I've no doubt that early in the winter snipe, quail and duck shooting is very good; but I'd rather have an hour's rough rambling through the Northern woods and fields, and get but half a dozen shots, than to bag a score of birds in Florida.

Ocala is a thriving town, and might be a delightful place for sportsmen if there was a good ho— but no! I won't mention it for fear of hurting some one's feelings, especially a Northern man. When a man gets here he doesn't find turkeys gobbling at him from every bush, and even if he did, the discomforts of the things they call hotels would more than counterbalance the pleasure of shooting and fishing. To get a shot at an item of game, or to catch a fish, one must pay out money.

I have wandered, in an unsatisfactory sort of way, nearly all over the State, and have seen a spot where I cared to stop until I reached St. Augustine, and found a fine, fascinating, quaint old place, and is bound to be the winter Newport of this country. The great obstacle in the way of settling up this place rapidly has been the difficulty of getting here and the atrociously kept ho—; but both these difficulties are about to be removed. A new railroad has just been opened direct from Jacksonville, and the same company will build the splendidly equipped, and well-purplied twenty-car train that will run nearly opposite to the fort, and before another season opens will have a hotel worthy of the beautiful old place, and equal to any at the North; and what is more, there's a fortune in it of no ordinary size. Several efforts have been made to push the city out in that direction, and now that this enterprise is started by a wealthy company properly along will go up with a rush. A general hotel is already being thought up with a view to the winter season, and when the new hotel gets here the old one will be left, at present prices. Everything now is nicely arranged to make St. Augustine by far the most attractive winter resort in Florida, except—the lack of wisdom in her rulers. Nearly half the men who visit Florida have an eye to enjoyment in the way of shooting and fishing, and when they come here and find that they are not permitted to shoot deer or other birds, and that the lawless a mile from the city, they very naturally feel disgusted, and many of them leave for places where they have some liberty; and the city loses thousands a year. Another equally stupid blunder is refusing to allow a newspaper to be sold on Sunday! But the city is undergoing a civilizing change, as Jacksonville did, and the time is not far distant when men will feel ashamed to enact laws that would disgrace a community of sensible old women.

It is astounding to view of the sensible efforts made by Jacksonville and other towns to attract the traveling crowds—that a set of men can be found who will resolutely shut their eyes to the great advantage they possess of making their city by all odds the most attractive point in the State,

and look calmly on while other cities draw the population and the money. But, luckily for those who come here to enjoy themselves, the law does not have any control beyond the city limits, and the shooting and fishing is far better than in any place where I have been, if it is not "unsurpassed."

St. AUGUSTINE, Florida.

[The only reason that our correspondent found the birds plenty about St. Augustine is just because of the much-needed and very proper prohibitory provision of which he complains. Not only this country has there been a more marked instance of the extent of the game laws, which took place in the vicinity of St. Augustine when the rash of Northern visitors first set in there. The gunners spared nothing that had wings. The prohibitory law was enacted as a last resort. We are glad to learn that it has accomplished its purpose.]

IN NORTHERN CALIFORNIA.

[Continued from Page 306.]

TIRING of fishing, and lacking energy to hunt in the dense timber around our first camp, we decided to move still further into the mountains; so we pulled up stakes and headed for Manzanita Lake and Lassen's Buttes. We took an old road, little more than a deer trail at the time, no travel having gone over it for years, but by walking up the steepest of the hills we managed to get through by a short route. Our way lay across a very rough group of small ridges and ravines, which we passed the first day, and then we reached table land, which was settled to some extent by hay ranchers and stock men. We emerged from the timber at one of the prettiest mountain meadows imaginable. It was about three miles long by one wide, very level, and covered with wild grass three or four feet high, and a fine stream ran through it. There was a rail fence enclosing the largest part of it, and a deer track was struck around the fence. We could see where their sharp feet stuck in the ground all along where they jumped over into the field, and out again—probably mornings and evenings.

I wanted to camp at this place, but we concluded to go to the lake. We did not hunt any, only to shoot such small game—squirrels and quail, as we saw from the wagon. As we approached a ranch, two deer were met by the rancher, who said he had just seen three deer cross the stream ahead. I inquired which way they went, and started in the direction indicated, but had gone but about a hundred yards, when, hearing a shout, I looked back and saw a fine spike-buck across the road and stop just ahead of the wagon. Enochs had his rifle in his case and was now struggling excitedly to get it out, but before he could do so the deer started. Instantly Enochs got up and fired, and fell just as he turned, making a splendid shot (though the boys claimed it was an accident), and the buck dropped his tail, but bounded desperately for a short distance. The rancher gave chase, being on horseback, and caught the animal just as it fell, having been shot through the shoulders. Enoch's swore he was about to shoot it through the head if I had not anticipated him.

We reached Manzanita Lake—so called from the dense thickets of manzanita bushes surrounding it—and found it to be a beautiful place indeed; but the surrounding country was open, barren, covered with a lava formation and dense brush, and was poor hunting ground. There was some tall timber around the lake, which was a mile long by about three-quarters wide, clear and very deep. Its inlet was a fine stream flowing directly from the snow on Lassen's Buttes, five miles away. The water was very cold, and to be a mile away from the lake is a curiosity, and must be of recent origin, caused by a sinking of its bed. Numbers of submerged trees may be seen in all positions beneath its surface. Some of the trunks stand erect as they grew, others slope upward in a reclining position, and all of them are white as chalk from the action of the water. We found a pretty good rowboat that had been left on the lake by a hunting party the year before, and we enjoyed many boat rides, gliding over the white, ghostly trunks of the immense trees that could be seen in the clear depths a hundred feet below. On our first attempt to cross the lake we had reached about its middle when we began to realize that we were not making headway. Then the boat began to swivel around like a windvane, and we discovered that we were "snagged," and we were alarmed. The length of the water was the result of our first year's hunt, a half mile from either shore. By shifting our positions, and working the oars we worked off, however, and found we had run the boat about an immense stamp, rotted off six inches below the surface. We kept a lookout at the prow for snags after that, and kept nearer shore. We killed ducks (mallards) enough for our use, but they were not plentiful at the time, although they hatch here in considerable numbers. We shot two or three, and two-thirds grown, still unable to fly, and they were fine eating.

Trout were plentiful in the lake, and of a large variety, weighing from one to four pounds, but we could not induce them to bite, although we tried several kinds of bait. We obtained enough with a spear (a poor one), however, to satisfy us. It was the first spearing by night that I had ever attempted, and a cold bath was the result. During the night did not prove to be the water on account of its deceitful clearness. We had made our camp at the edge of the water, and the night of our arrival, after having built a large fire, and procured a supply of pitch for our torch, Indian Dick and myself rowed around the lake on a spearing expedition. Enoch's rolled up his blankets by the fire and went to sleep. We succeeded in getting several fine fish, which flopped around in the boat and gave the result. During the excitement of the sport over the immense silver trout, everyone had intended to keep the shore, we suddenly found ourselves in deep water. The fire at camp that had heretofore shone across the lake was nowhere to be seen, it having died out, while our supply of pitch in the boat was about exhausted. The night was very dark and we could not see beyond the glare of the torch light, and looking down into the great depths of the water the trout were silver. During the excitement which seemed to spring up to ensnare the boat, our sensations were unpleasant. Dick was first to see a flicker from the wasted fire on the shore, and you may be sure we lost no time in going forward. Upon landing we found that we had rowed directly across the lake, luckily missing the snags.

We found a number of bear tracks in the neighborhood, but did not see any of the animals, perhaps it was because we did not prowl around their haunts, the dense thickets, any more than was convenient.

After tiring of boat rides, fish, and ducks, we concluded to go to the summit of Lassen and then return homeward. Accordingly we set out in the afternoon, going as far as the foot of the mountain and camping in an old log cabin that

had been built by some stock man. Early the next morning we began our climb, and reached the summit after four hours' toil. The ascent was rendered more difficult and more fatiguing by the loose character of the mountain-side, it being composed of loose rocks, and rolling underfoot, and we slipped and fell more frequently than seldom. We reached the top, but unfortunately the atmosphere was smoky and the view greatly obscured. Still we could see for miles over the broken country, trace dense forests stretching in every direction, and see a dozen lakes, some of them mere ponds, others miles in extent. There was a small rock on the summit that had been built by the Government geologist-surveyors. It is said that the United States changed signals with another party on Mt. Diablo, four hundred miles south, by fires at night. We found a tin can containing names, some of whom had probably visited the peak, but as many of them were in the same handwriting, we concluded that each visitor had put down the names of such friends as he called to mind. The lake, as it is, is said, all contain trout, no two containing the same species. In one the fish are said to be a bright red color, and we were told that one contained sardines, but a traveler will sometimes find a liver even in the remote mountains of California. The same man who told us about sardines said he mowed in his younger days a hundred swaths of hay, each swath a mile long, starting at the same place each time. He did it with a scythe, and told it with a sigh and we heard it as a lie. In fact we set him down as a practical liar, for an inexperienced person could have lied like that on short acquaintance to strangers, with guis in their hands, and got away with it.

One side of the peak was almost a precipice—about as steep as the angle of a duck's tail. We heard a crash, and he did it with a scythe, and told it with a sigh and we heard it as a lie. In fact we set him down as a practical liar, for an inexperienced person could have lied like that on short acquaintance to strangers, with guis in their hands, and got away with it.

One side of the peak was almost a precipice—about as steep as the angle of a duck's tail. We heard a crash, and he did it with a scythe, and told it with a sigh and we heard it as a lie. In fact we set him down as a practical liar, for an inexperienced person could have lied like that on short acquaintance to strangers, with guis in their hands, and got away with it.

Next morning we renovated our wagons as best we could, fixed up our horses, and left the lake, going homeward by another route from the one we came from. We crossed a stream near a cattle ranch for two days, caught trout, killed one deer, and were supplied gratis with all the milk and fresh butter we could consume. The second morning we awoke and found a bear track in the dust about a rod from where we slept. We were going away that morning anyway, so it did not make much difference. I don't know how it was—when we started to go we wanted down on a snag, but whenever we found a nice fresh track, or dark thicket that looked promising, we were always tired, or preferred to fish, or if the prospect was very promising, we moved camp.

During the two weeks out we were always hungry, always in good spirits, and slept like logs, though the nights were uncomfortably cold in places. Had a speck of war one day with Dick, on account of his making head after doctoring the sore necks of our horses, without washing his hands. He objected. He said I was too "smart," but we arrived home safely, notwithstanding, and were satisfied with the trip.

SHASTA, CAL.

OWEN SOUND DEER SHOOTING.

"The wild woods, the wild woods,
The wild woods gave me,
The wild woods of Canada,
The boundless and free!"

—Canadian Camp Song.

I HAVE seen so few letters lately from Canadians in FOREST AND STREAM relating to sport in Canada, that I am beginning to think our native sportsmen neglect a duty they owe their American brothers of the rod and gun in not comparing notes from time to time, for mutual improvement. I have seen the outline of my splendid paper, which, by the way, is looked upon by all Canadian sportsmen whom I have met as an authority.

Perhaps some of your readers might not find an account of one of our recent deer hunting forays totally uninteresting, particularly as it occurred in the wilds of the beautiful and picturesque Indian peninsula of Ontario, of which, perhaps, little has been heard.

Our party, on starting out from Owen Sound, consisted of four persons, having for our leader Mr. George Kilhour, of "the Sound," one of the most genial fellows and enthusiastic sportsmen to be found in a day's journey.

It was arranged that we were to start at 4:30 A. M., as our hunting grounds lay several miles to westward of the town. All were on hand promptly at the appointed time, and soon we had our bounds and other needfuls stowed away in the wagon. We rattled along at a good pace, the stillness of the early morning being broken only by occasional wails from the expectant bounds, Truehey and Rattler. On our way to the interior of the peninsula we were joined, as per previous arrangement, by Mr. Johnson and the Manley's *parce de ribs*; the former, of whom I know to us all as "the man with the Doc," being one of the earliest arrivals in the party, and a most ardent sportsman.

We are told in the "Legend of Shephey" that "the Baron called for his boots," and when the Baron called for his boots he meant murder. Similarly, Old Doc called for his gun, and when he called for that he meant—sport. No gun to be found! A neighbor had borrowed the previous evening. Doc looked angry, got into a row, jerked the wagon, and went on his way, and three good-sized grunts, as was his wont when angered, and blankly blank-blanked the servant for lending his blank-blank gun to that blankly-blanked sou of a gun, etc., etc. In fact he used up his whole vocabulary in a manner which left nothing to be desired. There was the devil to pay, and nothing to pay it with! At this juncture we remembered that an extra weapon had been thoughtfully left on the wagon on starting, and it was made lovingly once more.

On arriving near our point of destination it was decided that Manley, Jr. and I should strike off into the woods with the bounds and put up the game, the rest of the party to drive on a bit and up the side lane to a point where they could easily reach the most favorable posts on the runways, and there await further developments.

DUCK BOAT.

No. 1. DECK PLAN. Scale of Feet.

No. 2. Section Through Middle Line. Scale of Feet.

No. 3. Midship Section. Scale of Feet.

A DUCK BOAT.

Editor Forest and Stream:

Enclosed please find three plans of a ducking boat that I have been building. She shows but little above the water, draws but little, and so can be used in shoal water, can easily be transferred to a capital blind by using a little grass, weed, or brush on the deck. She is not easily turned over, and a person can shoot from any position in her, which he cannot do in a canoe. I know this from experience, as I have spent many a day in one both here and in Louisiana.

In the first place, to get frames or ribs I lay out on the floor a cross section both ways of the boat, full size; lay off the ribs or frames a foot apart the whole length, and taking the measure of each one on the horizontal plan gives you the length, and in the perpendicular section the breadth. Then on the ends leave the width of the sides, which in my boat is only 19 1/2 in. Then take a strip of thin stuff, and from a dot that you make for the width on each side of the center spring the strip to the width of sides at each end, top and bottom, and you have the curves for the ribs. Saw out the center as far as the cockpit comes, and you have the forms. Stay them to the floor, and put on the bottom first.

Material for frames and ribs 3/4 in. oak, also for the sides, which, as I said before, are only 1 1/2 in. wide. Screw the sides to the ribs, stem and sternpost with 3/4 in. No. 6 wire brass screws. It is now ready for the bottom. Use 3/4 in. oak stripped to 6 in. in width, and where each joint comes use a batten 3-16 by 1 1/2 in., clenched through about 1 1/2 in. apart with brass escutcheon pins, driving them through on the face of a hammer or piece of iron.

Use plenty of white lead on the battens and on the edge of the sides. I fasten the covering to the ribs and sides with 3/4 in. No. 1 wire screws and escutcheon pins.

For floor to the cockpit I use 3/4 in. pine, and the washboards to cockpit 3/4 in. black walnut worked up and down and screwed to a strip let into the top of the frames, and at the bottom by strips put between the ribs. The midship section (No. 3) shows it in detail.

Amount of material: about 100 ft. of 3-16 in. oak, 20 ft. of 3/4 in. oak, enough 3/4 in. oak for stem, sternpost and keel, 12 ft. of 3/4 in. pine for floor, and enough material for the washboards, which can be black walnut, pine, oak or whatever a person chooses, 1 1/2 gross of 3/4 in. No. 6 wire brass screws, 3 gross of 3/4 in. No. 1 wire brass screws, and 800 of stout brass escutcheon pins 3/4 in. long. This is all that is required but paint.

I shall rig my boat to sail, using two legs of mutton tails, sharp rig, and also to row. The oarlocks will want to be placed on the outside and raised up high enough to clear the washboards, which can be done by a block or an iron, the boat being so wide it can be used with quite a long oar, and by a good oarsman it can be sent along very fast.

I have not weighed my boat yet, but think she will weigh about 40 to 50 lbs. She could be built of cedar to weigh much less, but I wanted mine strong, so I could cart her to the different lakes over the rough roads of this country, and so used oak.

Since writing you I have used my duck boat. She works to a charm. With a few weeds on her deck she is a complete blind. I used the same oarlocks that are fitted to my canoe. The boat draws very little over 3 in. of water. I can change from rowing to the paddle in less than a minute.

WOODCHUCKS IN TREES.—Portland, Me., May 19.—While reading "W. H. R.'s" account of a "Fox in a Tree," in the FOREST AND STREAM, I was reminded of a circumstance that occurred a few years ago while following a brook through a piece of woods in search of trout. I heard a "scratching" sound near by, and upon looking in the direction from whence it came, saw some kind of an animal ascending a small-sized tree that stood on the side of quite a steep hill, only a few rods from where I stood. Going quickly to the tree I discovered a woodchuck perched upon

We had very fair luck, for in less than twenty minutes old Trueboy and Rattler were giving tongue. Trueboy would tackle nothing less than a deer, and foxes might cross his path a dozen times when he was after deer without danger of pursuit.

Kilbourn and his companions could now hear the music and were on the alert. In ten minutes more we heard bang! bang! bang! in quick succession. Making sure that our friends had had at least some sort of success, we pressed on only stopping a moment to breathe, and bang! bang! once more. Heigh! but we are making it interesting for them, sure enough.

My companion sits down on a log. I follow, when my eye is caught by the vision of as noble a pair of antlers as ever graced a stag's head. Great Scott! my gun; where is it? Curse the fates! it's ten feet distant! The case is hopeless, but I seize it and fire; too late! That confounded stag has, for all I know to the contrary, been standing off among those bushes gazing upon me for a full minute; perhaps longer.

We press on, cursing our ill-luck. Kilbourn and the "Doe" are known to be dead shots, and surely after all that banging and blazing must have hit something. We found, upon joining them, that they had stationed themselves where the runway crossed a beaver meadow. Kilbourn had fired somewhat high, owing to the stag having stumbled as it passed him. The Doctor, however, finished the job by sending his ounce of lead through the heart. Old Doe caught him at the moment he cleared a very large fallen tree, just in front of which—perhaps ten or twelve feet—was a log somewhat raised off the ground. Both head and antlers went clear under that log.

The rest of our party had had had luck, two of them having seen a fine large doe, but before they could get within range they lost her, owing to the proximity of some lads who were squirrel shooting, and who blazed away at anything and everything.

After doing justice to a plentiful supply of sandwiches, and drinking success to FOREST AND STREAM in its noble fight for efficient game protection laws, and death to professional poachers and pot-hunters, we returned to Owen Sound.

A word about "the Sound," as we call it. Deer and bears are plentiful within a radius of ten miles; hares and partridge, duck and quail within five miles; speckled trout, salmon trout, pike and doré at our very doors. We will welcome and assist any brother hunters or anglers who may visit us, but only under the condition that they come among us as true sportsmen—i. e., men who will, under all circumstances, give the game a chance for their lives. W. W. OWEN SOUND, Canada.

HUNTING RIFLE SIGHTS.

Editor Forest and Stream:

As you have seen fit to publish my opinions on the rifle, I do not think it out of place to add thereto, as a kind of addendum, some thoughts about the proper sights for the hunting rifle. In the first place, I do not think that the best rifle for wing-shooting, or shooting at game in motion, needs any sights at all. In fact, I believe they are better without any. This may, and I know does, sound to a great many as preposterous; but I can assure all such (and I think I will not have much trouble in proving the assertion) that there are a great many theories accepted as facts that have no scientific value whatever. If we have no eyes, we certainly have no need of gun sights; and if we produce an aberration of vision that interferes with the organic function of the eye, by peeping and squinting, we virtually have no eyes to see straight. I shall not attempt a discussion of this subject at present, but

will simply say that I have made, at a hundred yards, as good a target, with a shotgun, shooting as solid ball gun, as I did with rifle, and I understand that a great many, if not nearly all, of the best guides of Newfoundland use smooth bores, and I have very positive evidence that the Indians of our own mountains and plains use double or single-barrel shotguns with solid ball for buffalo and deer hunting, and will hit and kill about as many as the finest rifles in the field. This, of course, at short range. I make this assertion, then, that for wing-shooting or for shooting at game in rapid motion, the best hunting rifle does not need any sights at all.

But, as no one would have a rifle without sights on it, I will advise, by all means, to select the sight that will come as near as possible to giving you the use of both eyes. The open clover leaf with brass bead, will meet the indication probably as well or better than anything else in use. Our forefathers used a small bead of silver set into the gun barrel near the muzzle, in many instances not to exceed the sixteenth of an inch in height, and never more than an eighth, while for a rear sight a small piece of steel was dovetailed into the barrel about ten inches from the breech, and filed down square to about an eighth of an inch, in the center of which a small notch was made. This brought the eyes on line with the gun barrel, and enabled you to see your gun as well as your game. And I tell you, Mr. Editor, these guns did kill, and kill at long-range distances, too. I put one of these old sighted rifles to my face, yesterday, and I find that the eyes strike the line of sight easily and naturally. You don't have to hunt around for your front sight, then find the notch in the hind sight, and then, probably, take your eye off the gun before you see the game; but everything necessary to good, quick shooting is naturally presented, and the eye at once takes in the whole field. OCCIDENT.

SERRATA, Mo.

A MAINE SHOOTING COUNTRY.—Smyrna, Aroostook County, Maine, May 16, 1883.—Ruined grouse wintered finely. Have never found them more plentiful at this time of year, and the season thus far has been extremely favorable for rearing young broods. In view of the mooted question of red squirrels destroying the eggs and young birds, it is worthy of note that I have met with but few of that species hereabouts this spring during extended tramps. This section has never been worked by outside sportsmen, and offers great inducements, especially for grouse shooting. Most of the region for many miles is traversed by logging roads that in the fall the birds are mostly found, thus making it easy for shooting. Later in the season deer and caribou will afford good sport, as they are fairly plenty in a range of from five to ten miles of this settlement, with some moose at the latter distance. There are no regular guides or hunting camps, so this is no place for "tenderfeet." In this settlement there are six families, some of whom have stout lads who know the country, and whose services could be obtained at a nominal cost, and at one or more of the farmhouses a fairly good home could be found. It is no place here for the market hunters, being too far and difficult for shipping, and besides, the community would not tolerate them.—WARFIELD.

SMBERN.—Answer your correspondent, "Kew," that "I. Task's Magnetic Ointment" is a wonderful remedy for sunburn, insect bites, bruises, and all sorts of inflammatory wounds. I have carried it for ten years and it never failed.—PISCICO.

WRIGHTSVILLE, Pa., May 14.—Farmers in this vicinity find rabbits more numerous in the spring than what they have for a number of years.—RAZOR.

PT-IN-HM SA-POR.

P-T-H S-P.

a limb some fifteen feet from the ground. I tried to disengage him by jarring the tree, but it was too large for me to effect anything in that way, so I picked up a club to throw at him, when I was surprised to see him spring out from his resting place and land some thirty or forty feet down the side of the hill among the leaves and rocks that were thickly scattered over the ground. That he was not dashed in pieces against some one of these was a great wonder; but after rolling over a few times, he regained his feet and scampered away to his hole, which, being too tired to give chase, I left him free to do.—G. L. B. [It is very common for woodchucks to climb trees.]

AUSTRALIAN GOOSE SHOOTING.—Adelaide, South Australia.—*Editor Forest and Stream:* In Spencer's Gulf and about 100 miles from Adelaide there are one or two groups of small islands, which at a certain season of the year the "cecropian geese," commonly called "Cape Barren geese," from the fact of their being first found at that place, congregate to breed. This breed is somewhat smaller than the common goose, and is of a bluish-slate or gray plumage, with black bars on the wings. The legs are strong, dark in color and fringed with red, the feet are webbed, neck slender, bill green with black tip. It is easily domesticated, and proves a decided acquisition to the poultry yard. The flesh is of a dark color and very delicate. Its food principally consists of young grass. The old birds come to the island about the month of June to lay their eggs. When the young are about half grown they can easily be caught, and the old birds at that time afford good sport for the gun. When the young birds are full grown and able to fly swiftly well, they all leave the island and find their way to the inland streams of the mainland, and do not appear on the islands again until the following season.—F. V. S.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

A fine speckled trout that long safely laid fast
In the crevices of the rock, out of reach of the seine,
Being hungry, looked up, and was pleased to spy,
Floating over the water, a green bottle fly.

"Just my luck," said the trout, "I shall soon be the winner
Of a fat, juicy fly for the left of my mouth."
With a wink and a nod, and a tremulous bound,
He sprang for the fly but he hit on the ground.
Just then a man looked for something to eat
But that same speckled trout in his basket for meat.

AN EVENING'S REFLECTIONS.

THE springing grass, and the bursting buds, and the chirp of the robin speak to the heart of the sportsman, telling him the season has come in which to overhaul his fishing gear and see if he is ready for his annual sport, and, what is generally more doubtful, whether he is going to find time to take an outing before long.

I have just laid down a volume of sketches which many of your readers have read (and those who have not have missed a real pleasure), which at the same time pleased and saddened me. It is "Pleasures of Angling," by that veteran sportsman and your late correspondent, George Dawson, who has so lately gone over the river with the great "majority," and will no more delight us with the productions of his facile and graceful pen, nor ever again by wooded lake or streamlet engage in the sport which was so dear to him, and which he so rightfully and in such a true spirit of a sportsman appreciated.

While I never had the pleasure of meeting him in the flesh, yet I breathed through all his writings such a gentle spirit—so like that of dear old Izaak himself that I think every true lover of the craft could but hail him as a brother and feel almost a sense of bereavement at his death.

Now, when Nature with her kindly hand is mantling with the verdure of spring the new-made grave, with what words to those of his comely look he said:

"I sometimes wonder whether, on some pleasant day in May, not long hence, I shall stand on this sunny spot where I have stood during some portion of every season these twenty years, and find in attempting to make my usual cast, that my right hand has forgot its cunning. As old age cools the blood and dims the vision, and checks the elasticity of brain and limb, such thoughts sometimes come to the most buoyant and often cast a shadow across the sunniest landscape. But it is only a shadow. With the thought comes up the vision of another river, brighter, and clearer, and purer than that which flows with such gentle gratefulness at my feet—a pure river of water of life, clear as crystal, proceeding out of the throne of God and of the Lamb." It is a vision which reconciles all thoughtful anglers to the quickening of the new-made graves, which now we know them, shall know them no more forever.—["Pleasures of Angling," p. 231.]

Surely here is the very spirit of a gentle sportsman; one who did not think that to catch fish was all for which a sportsman sought the forest streams.

He sought and found what so many of us have found there, an inspiration from Nature's pleasures, and the pathless woods—a something which will remain with us when age creeps over us with his pulsing touch, golden memories, untainted with any of the alloy which mingles with so many of the pleasures which are found elsewhere.

I am familiar with many of the places of which he so graphically writes, and after many years' experience with rod and reel, hope for many more, but the falling by the way of one after another of the old school is a frequent reminder to us all.

With perceptibly failing eyesight, and a touch of rheumatism, I was the other day looking ruefully at my gun and rods, and remarked to Mrs. Bamboo that it was pretty hard to get so blind that I could not see to shoot, and so rheumatic that I could not cast a fly.

That excellent woman murmured something about a lame knee not preventing a man from fishing, and in sooth, I think myself a good deal better off without my eye-glasses, see a ruffed grouse fifty yards away, distinctly, and that is about

as far as anybody has a chance to see one, generally before he dives over and behind a tree—whether as one of your correspondents says ("Mark West?") you follow him with your second barrel and he falls dead in the next county! But lest I might seem to be dipping into that "ruffed grouse" discussion, which so warmed up your pages last fall, I hasten to drop the subject.

I wish to endorse "Pisces'" views upon the subject of guides as given in his late letter, and to extend my regrets that the " exigencies of the service" will prevent his making his anticipated trip to the woods, as your readers may possibly thereby lose a good letter from him with an account of his experience there.

Speaking of Adirondack guides, I wonder if Jack Sheppard has yet found the key to the camp of which he had charge in June, 1876, and which, as Jim Hines (model guide) was pulling Mrs. Bamboo and myself up through Third Lake, he, meeting us on his way down, tossed to us, at the same time offering us the hospitality of his camp. The key fell about two inches short of Higbee's outstretched palm and disappeared in the placid waters of the lake. We did not stop to look for it just then, but we got into the camp though, thanks to an unfastened window, and by the same token, James soon had us a delicious dinner cooking, composed of venison steaks and a three pound and a half trout which Mrs. B. had caught, and milk and other things from our basket, the memory of which meal, and the voracious appetites with which we devoured it, and the enjoyment with which we subsequently watched Master Bamboo, aged four years, catch his first trout, and prove himself thereby a child of the old Bamboo. All these are parts of the memories of other days.

As is also the trout which I struck in Panther Lake, weighing less than a pound, which towed our boat a hundred yards before I killed him, and which the guide was sure was a three-pounder. And in the afternoon I took from one spot, without moving twenty feet, fifty-three trout, and stopped then only because I had enough. And floating down the Moose River in company with a gentleman now well known as a trout breeder and an officer of your State association, what royal sport we had that afternoon! These are now only memories of the past, but

"Let Fate do her worst—there are moments of joy—
Bright dreams of the past which she cannot destroy,
Which come in the night time of sorrow and care,
And bring back the features which joy used to wear."

Boston, May 13, 1888.

THREE GREENHORNS.

"HAVE you got a pack of cards, O'Neil?"
"No."

"Oh! hang it! let's go back and get them."

"Not much. I wouldn't go back for a dozen packs."

"That the twain wrangled, while the third of the party pliedly listened to the dispute as he urged the horse onward with emphasis.

We were bound for Sneeze Meadows. Owing to business affairs we were unable to start before 5 P. M., on a warm July day, and the long night drive of twenty miles, from Bethel to Grafton Notch, was one of the most pleasant that ever fell to the lot of mortal man. It is a glorious place, the Bear River Valley. On either side, the meadows sloping up to the base of long, undulating hills and mountains, were dotted with hay-cocks, covered with snowy caps, while the road wound in and out among them, and twisted around the base of Mount Saddleback like the track of a weaver's shuttle; and at times we could hear the low rattling mutter of the restless stream, echoing down the impassable gorges of the hills. We had none of us had much experience in roughing it, but we knew enough to travel as light as possible, and had made up our packs before the start.

It was full 9 P. M. ere we reached Grafton. O'Neil was acquainted there, and rousing up a farmer, put up the horse in an empty stall, while the others proposed to try the hay-mow and get some rest on our drive, but "man proposes," etc. If there was one there were thirty grasshoppers to the square inch all over that lot, of all ages and assorted varieties, from the little brown hardshell to the big green, fat and squally ones.

The whole night was one continual squint. Toward morning, however, I dropped off into a nap, the last sound that met my weary ears being the stream, being the sound of an old wheelbarrow that we had turned into a crib, and for which he had developed a decided taste, and the uneasy wriggle of Harry as he scratched a "hopper-down his back and kicked fancifully in the hay.

The morning dawned cold and rainy. With frowzy heads we crawled out from our too attentive hosts, and with a hurried breakfast shouldered our packs and started for a five-mile tramp about a blazed path through the woods.

Well, it wasn't pleasant, and the general vagueness of our directions did not add to its enjoyment, either. But all things must have an end, and about noon, after twice losing the path, we suddenly emerged on the bank of Silver Stream, and then—

We forgot our weariness. Never till then had such a beauty of a stream been darkened by the shadow of our rods. The quality of the water was home in the morning, it led straightaway down through a long ravine, with pool after pool of calm, foam-decked water fairly alive with trout.

Every fall had seven or eight lying there awaiting their chances, and so clear was the water that their magnificent size be distinctly seen, and we could almost count the pink spots upon their sides.

They were not at all shy, either. We counted seven great fallows in the first half an hour, and it was raining and had his best. Putting up our rods, we started for the meadows, which we had been assured were but a little way on. Like the Dutch Governor's foot, that "little way" meant a good deal, but the prospect of having a good haul to sleep in, and the general dampness of things, urged us on to a final effort. Just at dark our efforts were rewarded, and leaving the stream we came out into a broad silt-dotted plain among the hills, where was the barn? Chances were, Harry, a stick on another.

"Say, Harry, don't you want a pack of cards?" That was

the only remark offered by the candidates for a modern Babes in the Wood.

We got a fire somewhere and extemporized a shelter by its light, and after we had secured a senary protection from the rain we felt better. Not much, though. Eerie thoughts are apt to arise; and who has ever forgotten his first night in the woods? Add to this that our only arms was an axe, and that wild cats, and even panthers, had been seen in that region, it can be imagined how our thoughts would turn as we sometimes gazed at our slender stock of fuel. It was a real test of courage for us to go to the stream for water, twenty rods away, and although I did it twice, and was much looked up to for my daring, yet I must confess that it was in fear and trembling. Once during the night we had a terrible fright. "Then shook the earth with the sound of a four-footed trampling," and it wasn't a light one either. Jumped for the axe. Harry got hold of one of my boots. O'Neil stood frantically brandishing the coffee-pot in one hand and a middle-sized jack-knife in the other. The alarming sounds died away in the distance, but they took all desire for sleep away with them. Bitter were the curses heaped upon ourselves, mentally, as we squatted around our spluttering fire, and vowed audibly we "wouldn't go there any more, if the fish that we had killed had any ghosts haunting in that rain they must have been delighted at our misery."

Wet, drabbed, rheumatic, we hailed the early light with heartfelt thanks.

Making a small pyramid of our extra "gnub" at the foot of a tree, we headed for home with all possible dispatch. We stopped not for fishing. We had all we could carry already, and with an eleven-mile tramp up the led on the stream and through the driving woods, we found we had a

We followed a well-marked path down the meadow, and as it grew brighter were started by several large animals rushing out from behind an alder clump, and coming toward us at a tremendous rate, looming up in the thick mist to antediluvian proportions. They turned out to be a dozen or so horses, who welcomed us as the first human beings they had seen for some time.

This explained our midnight fright, and with a hearty laugh we felt cheered already, and were ready to make fun of every mishap. Once I heard a splash, and turning saw the dinner-pail calmly floating down the rapids, and as I looked O'Neil deliberately wheeled around and softly sat down in the white water of a fall, and it was only his quick look and exultant grimace when he saw he was caught that proved that he had not meant to do us any harm. He roared till we nearly dropped as he rose like a spirit of the waters, in solemn and dripping majesty, and stalked shoreward for a private wring.

Again I saw Harry totter and fall with a loud spank on a stone. There was a sharp crack. For a moment my heart stood still, but it was only the lancewood butt of his rod splashing on red to ferule. I stared at him for a moment. He should have come next, but here it came, we had hit the stream, and the rest of the way seemed wonderfully short.

A cup of hot tea at a farmhouse and a warm fire, and we were soon rolling homeward, explaining mutually that there must always be a first time, and vowing that the very next season we would try it again. The last words that I heard before falling asleep in the straw on the bottom of the wagon being, "Say, O'Neil, are you not feeling a lot of colds?" I roared responded, "Harry, my boy, don't you want a pack of cards—d-d-s?"

And, verily, "it is something pleasant to remember hereafter."

VERUS.

ANGLERS' ASSOCIATION OF EASTERN PENNSYLVANIA.

Editor Forest and Stream:

As your paper has manifested a kindly interest in the welfare and prosperity of our anglers' association, a word or two in regard to its present status may probably prove acceptable to some of your readers.

Although comparatively in its infancy, the Anglers' Association of Eastern Pennsylvania has already won tokens of vigorous vitality which promise to result in an organization that will prove both permanent and beneficial. The new headquarters at No. 1,020 Arch street, although not palatial, are snug and comfortable, the only fault to be found with them being their inadequacy for the accommodation of the members who sometimes are in attendance. At each meeting this becomes a serious matter, and for the means of vigorous vitality which promise to result in an organization that will prove both permanent and beneficial. The new headquarters at No. 1,020 Arch street, although not palatial, are snug and comfortable, the only fault to be found with them being their inadequacy for the accommodation of the members who sometimes are in attendance. are furnished with postal cards with printed questions as above, the answers to which they write out. These cards are placed in a rack provided for the purpose, so that members can, at a glance, gain authentic information in regard to any waters they may contemplate visiting.

It is also proposed to establish a museum—literary and general reading room in connection with the association—all of which will be kept open for members' use day and evening. As this will require more money than we have at present command, a vigorous and what promises to be a very successful effort, is being made to increase the membership, which now numbers 150, to at least four times that number.

Arrangements have also been made for monthly lectures or addresses on subjects relevant to the object of the organization. The first was delivered by our president on Saturday evening last, who took advantage of the occasion to defend the angling fraternity generally against the frequent imputations cast upon their veracity when narrating fish stories, and also to impress upon the members the importance of increased efforts in behalf of fish propagation and protection; the prosecution of offenders against the fishing laws, and the formation of a white and black list of boatmen and landlors, the first to contain the names of those landlors who set good tables, provide good beds, and are moderate in their charges, and of boatmen who are competent and obliging; the second to contain the names of landlors and boatmen of opposite characteristics. The speech also took strong ground against the too prevalent practice of anglers, as well as commercial fishermen, of failing to return to the water when alive, fish too small for use. The next address will be delivered by Rev. Wm. Hoyt, D.D., a thorough and very enthusiastic fisherman, who proposes treating us on that occasion to an account of his visit to Yellowstone Park, and the kind of sport he found there.

From this you can perceive that we are doing what we can for legitimate angling, as well as for the promotion of fish culture. W. L. R.

PHILADELPHIA, May 11, 1888.

MILTON THREE PONDS.

FOR the first time, in your issue of May 3, under heading of "Black Bass in New Hampshire," I see mention made of Milton Three Ponds. It is five years ago last September that I got the hint of good bass fishing to be had at Milton. I then lived at Dover, N. H., and at the invitation of a friend who lived at Milton, and who knew the spots in the ponds where the bass were likely to congregate, I accepted. On the cars going there I had the pleasure of becoming acquainted with Fish Commissioner Luther Hayes, who gave me some valuable hints on bass and bass fishing.

I stayed four days, and had a never-to-be-forgotten time, catching from ten to twenty-two bass each day, besides many pickers as well as some large yellow perch, and quite often a horn or bullpout, and large chubs, and never getting time to weary for the want of a bite.

The largest bass I ever got there was 4 1/2 pounds, average weight about 1 1/2 pounds, but as game as bulldozers. It seemed uncertain at times whether it was a bird or a fish that had been hooked, as they fly in the air so often, and with a light rod you get all the fun you want. Regarding the best bait for bass I am uncertain, as they are the most changeable, for after two or three are taken they seem to find out the deception.

My experience runs thus: I will have good luck with the live minnow, sunk deeply; then, all at once, they stop, as if they said, "Enough of minnows, bring along the next thing." So, I put on a small frog, either striped or green, and it will be a rush, and you will get them.

Good boats can be hired at the railroad station for fifty cents per day, and good board at the Phoenix Hotel, kept by Horatio G. Wentworth, at one dollar per day. I would recommend parties going there to take frogs with them, as in all of my five annual visits there I found frog bait scarce. Minnows are plenty in the ponds, and a small seine will get what you want you can use. People say at Milton that landlocked salmon have been put into the ponds, but I never heard of any being caught. About October is the best time to go for a general good time, if you are fond of a shot, as there are many ducks, and many shooters come along about then. There are shore birds called snipe at Milton, but they are, as I think, sandpipers or sandpeeps. Gray squirrels are plenty in the immediate vicinity of the ponds, and rabbits are quite plenty later in the season. Take it all in all, it is a good general place, easy to get to, with cheap boats and board. You can hire a man to row for one dollar and a half per day, and ice and boxes to send your fish away to your friends. Ice costs nothing, boxes can be bought at the grocery store. Any one who can't have a good time at Milton Three Ponds will be hard to please. A. Mac.

RIVER POINT, R. I., May 14.

MUSKOKA LAKES.

I N reply to inquiries by "J. D.," New York, and others, and, as Mr. E. S. Kingsley said, "to add to the general stock" of knowledge on the subject of sport, I would mention the Muskoka Lakes as the acknowledged best place in Canada.

The earliest fishing is to be had through the ice in March and in April. Bass on Lake Simcoe, the most convenient place. Here lake herrings are taken in great quantities, with the minnow as bait, and here, too, the question as to the great whitefish of the lakes taking the bait was settled. Those caught in Barrie Bay average about three pounds, but the herrings are full sized. They run together and are fished for through the ice in from eight to twelve feet of water. The line is usually held in the hand, the rod, for other reasons, being in the way. So soon as the ice goes, which is usually about the seventh of May, begin trolling for bass, pickerel and muskokee. The rod-fishing (trolling may use the term) for bass is simply magnificent in any part of lakes Muskoka, Rosseau or Joseph, and in the smaller adjacent lakes. The bass fishing in the rapids of the Seneca River and at Sparrow Lake is excellent, the more so because they are a small species with hackle can be used. Here I saw Mr. Ed. Harton, of Pittsburgh, land a black bass which tipped the beam at five pounds and a quarter. It was

twenty and a quarter inches long and seven inches wide. Muskokee are caught weighing from three to forty pounds. Trolling for salmon trout begins in the end of May and lasts about three weeks. The Indians begin when the blossom comes on the plum tree. There is late in the fall another interval of three weeks when they will take the spoon. The Indians use for bass, pickerel or muskokee a spoon red inside and bright brass or silver outside, bare hook sometimes, and at other times a hackle of red worsted. For salmon trout they choose a spoon silver inside and dull copper outside, and for hackle use the white hair from the tail of a deer's tail. They always fly a good quarter of an inch from each side of the common spoon-shaped "spoon" to give the swiftly-moving fish a chance of catching the hook. It is strange that in lakes Muskoka and Joseph the lake trout live in deep water close to the bottom. They must therefore be trolled for with a line of over two hundred feet with about two pounds of sinker; but your eight to fifteen pound salmon-trout is a royal fish and worth all the trouble. Keep your gear sharp, and don't let him near the boat.

Splendid brook-trout fishing is to be had on the Maguete-wan and Muskoka rivers. The lakes are reached from Toronto or Hamilton by the Northern & Northwestern Railway, of which Mr. Robert Keer is the general passenger agent. Muskoka Wharf is about one hundred and fifteen miles north of Toronto, and is the point at which the steamers are taken for the various fishing points on the lakes. The return ticket from Toronto to any point on the lakes is only \$3.00. Hotel accommodation is to be had at all landings and towns, and costs from one dollar to one dollar fifty per day.

I am sure there is no better place for sport, and no one will be disappointed. I will gladly give any information in my power. M. MACLEOD.

BROOKTON, Ont.

PICKEREL IN NEW BRUNSWICK.

I HAVE been much interested in the pickered discussion that has been lately going on in your paper. I do not remember when or where I first beheld the lipper-like lines of this fish, but my memory recalls distinctly the first time I ever heard of it. When a boy, I made the acquaintance of a young Southerner who was traveling with a variety troupe. He, finding me very willing to listen to lunting or fishing yarns, delighted me with accounts of pickered fishing, and told me how he had often shot them with a rifle when they were swimming near the surface of the water. He was surprised when I told him that the fish was unknown in this country.

Since then some enterprising person has stocked a tributary of the Upper St. John with them (on the Maine side), and now we have pickered and pickered. In 1876 a few were caught at Eel River, a hundred miles from here, and in 1878 they arrived in our waters in numbers, taking the fishermen by surprise. Most of them are exported annually. Winter does not interrupt the fishing, which is done with nets exclusively. A series of holes, ten feet apart, are cut in the ice, and the net is anchored at one end, and then pulled along beneath the ice by means of a hook till extended its full length.

When the net is overhauled, a long cord is attached to one end, the fastening is slipped, and the net taken out on to one side. The net is then drawn, and the fish are taken out two holes in the ice, last with three tons of weight, and caught in this way in Fosby's Lake, a body of water about twenty acres in extent. The "pickered holes" have become such a nuisance that the Government has enacted a law against leaving them unmarked.

No doubt, the person who planted pickered in the Aroostook (I think it was) did a good turn for those who make a living by catching them, but the Gasconade fishermen and trout anglers mutter against him "curses not loud but deep." The sharp-toothed brutes have among the nets of the former, easily cutting through the slender twine, and the latter say that they have invaded the spawning grounds of the trout, devolving the spawn and small fry. I bear no malice against their disseminator, for I believe I know no plenty of good trout waters that they will never reach; but should he catch them, he will guarantee to furnish him; free of charge, the address of a dozen dollars, but they will like to see him. After he made their acquaintance, I don't believe he would feel like experimenting any more at Ly-sander Hall. "The evil which men do lives after them; the good is oft interred with their bones." The work of this person, whether good or evil, will "endure forever." As to the value of pickered as a food fish, there appears to be great diversity of opinion. I take little stock in a fish diet, but as a bait I consider it a success. I have seen a fallow deer. Many people in this section will not eat them at all. One thing is certain—when tons are exported at five cents a pound, someone must eat them, and by this fact I consider its value clearly established. I know but little of its game qualities, but think it would be a great improvement on the eel, catfish and chub—the fishes to which I was often compelled to flee for amusement when a boy. I feel that the small boy of to-day, with piscatorial inclinations, would find great advantage over his predecessor of fifteen years ago.

No person likes to fish any better than I, and few have less chance to indulge their tastes for this pastime. But I read in FOREST AND STREAM what others are doing, and am content. My entire experience in fly-fishing is covered by a few days on Pallet River—just enough to make me fish for more. My casts would hardly have taken a prize for accuracy, distance, or style, but I managed, in some way, to land five half-pounds, and a few were about half as large. With an angle-worm I am "no slouch," though I have seen people who could beat me even there. I have received an invitation to be one of a party of four which will spend a month on Green River lakes, in Quebec, commencing about the last week in August.

If the multifarious duties of this life, that so encompass me round about, would allow a group for that length of time, I will go. Under the tuition of a lawyer, a druggist, and a quondam Rocky Mountain trader, I have no doubt that I would acquire some knowledge of the "gentle art." One of your correspondents advises bachelors who contemplate a visit to the woods, to get a wife and take her along to cook the fish. He also prescribes a courting ritual, unsurpassed for beauty, but which I fear would not always give satisfaction. For the suitor might find that "you get," as well as "you be" will be with "my pet."

I advise the boys, should they follow the advice, to be very careful in the matter of selection. I have often known "the bonds of matchlock" to end a young man's career as a sportsman, and frequently when another victim migrated from our thinned ranks, have had to exclaim with the poet, "And now farewell, 'tis hard to give thee up," etc.

Once or twice I have attempted to decoy my friends away on an excursion after "changing their condition." Perhaps I made a grievous mistake in not including the lady in the invitation; but when I saw the fairest of forelands take upon itself the appearance of the map, at a track yard at a shunting station, I felt little like repeating the experiment.

"And the mother-in-law, what does she say?" Sh-h-h, don't mention it; many of you have been there yourselves, and know all about it. L. I. FLOWER.

THE FISHERIES EXHIBITION.

BEFORE leaving New York "Uncle Reub" was properly labeled and consigned to friends in London. Among other credentials he bore the following to the genial editor of the Fishing Gazette:

"OFFICE FOREST AND STREAM, }
"NEW YORK, April 4, 1888. }

"R. B. Marston, Esq.,

"DEAR SIR—Permit me to introduce to you Mr. Reuben Wood, who goes to England in charge of the Light fishing tackle of America. Mr. Wood is an accomplished fly-caster and has carried off many prizes. He wants to try the trout, and perhaps the salmon, of England and Scotland, and any favors you may show him will be duly appreciated by both himself and Yours very truly,

"FRED MATHER."

The editor of the Fishing Gazette publishes the above letter, and says: "We have had a long, pleasant angling chat with Mr. Wood, and hope before long to pilot him to one of our best trout streams. He has kindly promised to be present at the Third Fishing Gazette Tournament and show the American split-cane rod as used by American anglers."

The tournament will be held at Mr. Warner's Welsh Harp, Hendon, on the Midland Railway, June 11.

Resolutions.—N. B.—Competitors can use their own rods, reels and lines, but will have to use flies, weights, etc., provided by the management, in order that all may use a similar weight. Limit in length for salmon rods, 20 feet; limit in length for double-handed trout rods, 14 feet 6 inches; limit in length for single-handed trout rod, 12 feet 6 inches; limit in length for Thames and Nottingham competitions, 14 feet. No allowance in points will be made for rods under the above limits. All the competitions, except the fly-casting, float-casting and chess-bait casting, will take place over the grass.

First Competition.—Amateur fly-casting competition with single-handed fly-rod.

Second Competition.—Amateur competition, with single-handed fly-rod, in throwing fly with greatest accuracy and lightness under hushes.

Third Competition.—Amateur fly-casting competition with double-handed trout fly-rod.

Fourth Competition.—Amateur fly-casting with salmon rod.

Fifth Competition.—Amateur competition in casting in the Thames style.

Sixth Competition.—Amateur competition in casting from reel in Nottingham style.

Seventh Competition.—Amateur Competition (open to Thames and Nottingham style) in casting toward a fixed mark. The angler casting the bait nearest to the mark to take first prize; the next best cast made by another angler the second, and the third best cast by another angler to get the third prize.

Eighth Competition.—Professional competition in casting in the Thames style.

Ninth Competition.—Professional competition in casting from reel in Nottingham style.

Tenth Competition.—Competition in throwing the bait with forked stick in the Welsh harp style. Other competitions may be arranged.

THE BEST CAST ON RECORD.—A stout, portly looking gentleman stood in the midst of an attentive group of friends in a Cortland street hotel yesterday afternoon. He was evidently whipping the trout streams of his imagination, for he waved his cane above his head with the rhythmic motion of a conductor of an orchestra. After making several superb casts he evidently hooked a spectre trout and landed him with great applause. Encouraged by his success he began to tell of an unusual capture once made by him, the novelty of which caused the most profound impression. "You know, gentlemen," he said "that the usual method of catching a trout is from the bank of a stream or out of a boat. Once, however, I captured a very big trout while on a train en route to look him up without avail. Men have grown thin digging worms to catch him. He dwells under an old log just beneath the bridge, waiting for the fragments of lunch which fall from the cars. An idea at once occurred to me. I took my rod from its case and put it together, adjusted the reel and tied on a favorite cast, which, by the way, was given to me by Sir Morton Peto when he visited me in this country. I said: 'I'll try the old duffer. Don't stop the train, I am going up to Pike county, in Pennsylvania, fishing, as was my custom for many years.' The conductor of the train was a brother angler and I role with him in the luggage car, chatting over the fish we had taken. The conversation turned to those we had not seen. My friend said: 'General, we will soon come to a narrow stream which the road crosses, where resides an ancient and remarkably wary trout. For thirty-six years I have endeavored to hook him without avail. Men have grown thin digging worms to catch him. He dwells under an old log just beneath the bridge, waiting for the fragments of lunch which fall from the cars. An idea at once occurred to me. I took my rod from its case and put it together, adjusted the reel and tied on a favorite cast, which, by the way, was given to me by Sir Morton Peto when he visited me in this country. TROUT IN MICHIGAN.—The following letter has been received by one of the Michigan Commissioners: Kalamazoo, May 11, 1883.—A. J. Kellogg, Esq.: My Dear Sir—It will be sure, to be glad to hear of you and your vicinity are having some excellent trout fishing. A number of streams in which they were planted three years ago are furnishing a fair supply. Since the 1st of May hundreds have been caught from one brook, and to my certain knowledge they exist in several other streams that have not been fished. And what surprises every one is the fact that they have grown to such size. Quite a number have been taken which weighed over one pound each. I have seen a brook of one the weight of one pound six ounces, another one pound four and one-half ounces, and another one pound and three ounces. Probably most that have been taken weighed from three-quarters of a pound to one pound. The Commissioners have reason to congratulate themselves on the assured success of their efforts, and I trust the Legislature will be disposed to make a liberal appropriation to enable you to carry on the work so auspiciously commenced. Very truly yours, T. S. Cobb.

The Kennel.

November 30, 1883.—Robin's Island Club's second Annual Field Trials at Robin's Island, L. I., to members only. Entries close Sept. 1. T. Flanagan, Secretary.
November 1883.—American Kennel Club, Fifth Annual Trials, at Grand Junction, Tenn. D. Eryson, Secretary, Memphis, Tenn.

TRACHEOTOMY IN A DOG.

Editor Forest and Stream:

The following case of tracheotomy in a dog for supposed laryngeal obstruction may be of interest to your readers. I am not familiar enough with canine surgery and therapeutics to know whether the operation is a new one, or whether it is, in fact, a valuable red Irish secret, something over a year old, while playing on the grass, was suddenly seized with violent coughing and dyspnea, and in a few moments lay almost moribund of asphyxia. He gave no evident symptoms of laryngeal obstruction, and his life was saved at the time only by the prompt action of his master, who, being called, thrust his finger into the larynx as far as possible, without, however, to his knowledge, having it come into contact with any foreign body. He immediately recommenced breathing, and was soon able to stand, though still suffering from severe dyspnea or difficulty in breathing, and still continuing his violent attempts to eject something from the air passages. I was called to see the case at this juncture, and on a laryngeal inspection could detect nothing, except intense congestion of the epiglottoid folds at the entrance to the larynx, nor could I feel any obstruction in the trachea from without. The dog was standing, and, but for his violent coughing, he would have appeared to be in good health, and with characteristic intelligence submitting to be examined without making the slightest resistance. Physical exploration of the chest walls revealed no auscultation the presence of loud rales, or a mucous rattle, or any other abnormal sound, and on resorting to the usual methods in such cases, finding the patient by the hind legs in an inverted position, giving an emetic, etc., I gave the animal an hour's rest, as he seemed to be improving, and was to be unattended danger. During this interval I detected three times considerable quantities of frothy mucus-sanguinolent matter of bright red color, and evidently proceeding from the lungs. The matter contained quite a little grass in blades, and one or two shreds of hair, and was evidently the result of irritation due to irritation by points of grass or other foreign bodies. Expiration was comparatively easy, but upon inspiration something seemed to close down and prevent the ingress of air.

The breathing soon became more labored, and it was found necessary, two or three times, to open the glottis by means of long forceps with sponge attached. The dog began to show evident signs of exhaustion, and I now saw that operative procedure would shortly be called for, and at once dispatched a surgeon to the aid of the animal, and at once proceeded, after a tracheotomy tube. About fifteen minutes later the dog ceased to breathe and became moribund. He was at once thrown upon his back, and an incision 1½ inches in length was made through the skin, just above the cricoid cartilage. This was accomplished by grasping the larynx with the left hand, holding it firmly, thus making the integument over the parts tense. Four rings of the trachea were cut, and as the instrument moved the windpipe the characteristic sucking sound was heard.

Unfortunately, no tube had arrived, nor were toothpicks or goose quills at hand, and it was impossible to keep the opening into the air passages patent; besides this, the animal was now in *articulo mortis*, his heart alone showing by its fluttering pulse that life was not yet gone. At this critical moment the messenger with the tube arrived, and although I pronounced the dog beyond hope, yet I inserted the tube at once, and it had the effect of artificial respiration, and a few drops of whiskey. After ten minutes the animal was breathing naturally through the new opening. All this seemed strongly to confirm the previous diagnosis of oedema glottidis, and the question now arose as to the best means of keeping the animal quiet for the next thirty-six to forty-eight hours, and this was attempted by sewing him securely on his back in bagging and suspending him in this position. This being accomplished, two men were placed on either side of the animal every six hours. The adventitious opening was covered with a large sponge wrung out in a weak carbolic solution, and this was ordered to be changed every hour. About one ounce whiskey was administered hypodermically, and ten grains of Morphine were given by the rectum.

The animal remained quiet until three o'clock A. M., or about nine hours after the morphine had been given, when I was suddenly called to see the patient, the watcher reporting that the dog had begun to breathe, and was now moving restlessly and breathing hard. Examination showed that the tube had slipped from the trachea during his exertions to free himself from his fastenings. The tube was immediately replaced and a few minutes of Magendie administered. The respirations at the pupil indicated no toxic effects from the morphine. At this time there was no breathing whatever from the natural air passages. At eight o'clock in the morning, or about sixteen hours after operating, some breathing through the tube could be detected, and six ounces of whiskey and three ounces of milk, one ounce of whiskey, with twenty drops of laudanum were now administered per rectum.

At noon the dog was breathing quite freely through the air passages. The wheezing and rattling ceased, and the morning's cough and rattling ceased, and regular, eight to ten, Magendie given. Progress good. At 6 P. M. everything had

improved. The breathing through the larynx was strong, and upon closing the tube for a few moments by means of a small sponge, the dog gave no evidence of dyspnea, but breathed contentedly through his nose and mouth. The emesis of milk, whisky and laudanum was repeated, and five minims of Magendie given hypodermically. Everything looked favorably. At 10:30 P. M. I was summoned suddenly by the announcement that the dog had ceased to breathe. I found the brute in a comatose condition, markedly cyanotic and evidently dying of apnoea. He was at once cut loose from his hammock and artificial respiration kept up for over half an hour, while whisky and ammonia were administered hypodermically. At the end of this time the heart had ceased to beat, it being impossible to force more than the smallest quantity of air into the lungs. The animal died just thirty hours after the operation.

An autopsy was held at once, and the following conditions presented themselves: The laryngeal mucous membrane and vocal cords showed evidence of recent intense congestion and inflammation, considerable ecchymosis about the incision into the trachea. Upon slitting up the trachea, a hard foreign body was encountered just at its bifurcation. It proved to

be a large acorn, with a transverse diameter slightly exceeding that of the trachea. It was rather firmly impacted, with its point downward over the entrance to the left bronchus, and completely occluding its caliber. The base of the acorn lay diagonally over the entrance to the right bronchus. The left lung was completely collapsed and carlified, and of dark reddish color. The right lung showed signs of recent collapse, but was of normal color. Neither lung contained any air.

The division of the trachea into the two bronchi was something over eight inches from the lower border of the larynx, lying deeply below and behind the episternal notch, and beneath the thick masses of the neck. The conditions at the time of operation seem to have been as follows: The lining membrane of the larynx was the seat of an acute inflammation or oedema glottidis, brought on by the passage through it of this large body, increased doubtless by the various manipulations by forceps and fingers to which it had been subjected. Undoubtedly the acorn had, by the violent inspiratory efforts, been forced down to its final resting place, the bifurcation of the trachea, the moment it had passed through, or possibly it had pushed through the unyielding walls of the larynx. It must have completely occluded the left bronchus from the beginning, but resting diagonally (as per diagram), had allowed the air to enter and make its exit from the right lung. The deep breath which the watcher stated the dog had taken just previous to his collapse, must have sucked the base of the acorn over the entrance to the right bronchus, thus occluding them both. Local inflammation around the acorn aided in narrowing the caliber of the trachea at this point.

The fact of the operation giving relief at once from the asphyxia, was almost proof positive that the obstruction was laryngeal and not below, and hence exploration of the chest for physical signs, except in a superficial manner, at first, was overlooked. Had this been done, the absence of all sounds on the left side might have raised suspicions. In all probability no operative procedure could have saved the dog's life, even had a complete diagnosis been made. How so large a body passed, with difficulty, over the tip of my index finger through the larynx. The animal was in the habit of playing with a small rubber ball, throwing it into the air and catching it, and while thus engaged with an acorn the accident must have happened. The operation in itself is a simple one, and in all cases where the obstruction is laryngeal, would be called for, and I am satisfied, with proper care, he highly successful.

New York, May 10, 1883.

MORRIS GRINNELL, M.D.

THE GORDON STANDARD.

MR. DIXON'S letter in your last issue on Gordon standard is very pleasing to me, and I thank him for its character, and I trust that our united efforts may be crowned with success. Mr. Dixon says I ignored stern in my standard. I would not do so, as I have an eye for an eye, and I would not give general appearance. A setter with a teapot tail ought to be very heavily penalized; in fact, I should disqualify him on spot bench, but at the same time I think this point should be considered in the general make-up of the dog.

When I saw him in New York last year, I considered the best of the Gordon setters by long odds, yet I did not consider him my style. I would suggest that a committee be formed of the prominent breeders of the Gordon setters in America, and that they should take into consideration the standards now before the public—i. e., Stonehenge's, Vero Shaw's, Malcolm's, Dixon's, and my foible effort—and by doing so I think a correct and useful standard would be framed, that all bench show managers would consider it their duty to have used, and at the same time breeders and the public would reap the benefit of it.

This is the only true mode. As it stands at present, exhibitors who do not use it are sure that the old Stonehenge standard will not exhibit under the late productions and vice versa, those holders with the later views will not exhibit under the

older ones, so that bench show managers are placed in a difficulty.

This is the only true mode of proceeding (a paper war only can be a success), if you have any other way, and I am quite sure it will commend itself to all sportsmen as the proper way out of the difficulty which at present surrounds the Gordon setter. J. S. NYVES.

CANINE TENACITY OF LIFE.

BY G. D. ALEXANDER.

THE first year of the surrender in the late civil war found the old planters of the Arkansas in most destitute circumstances. They had lost their lands and all they had chase them—credit was dead as a hammer. Shortly after I had returned from Marshall, Texas, to begin life anew, and prepare for a crop in the fall of 1865, a heavy snow fell. It was a godsend to many a poor planter who was unable to track his wild hogs to their beds, and lay in a supply of meat for the impoverished family. It commenced snowing about bedtime, and I lay awake a greater part of the night, planning with my nephew, Samuel Woodman Alexander, who had recently arrived from Lynchburg, Va., to have my grand wild hog hunt the next day. My pack of hounds would run any animal I wanted them to pursue, from the cotton-tail hare to the biped man. The difficulty in the way was to get them on a hog track before striking that of a deer, bear or wildcat.

By morning the snow was fully three inches deep. The ground was dry and frozen before it commenced falling, and as there was no wind during the night, every tree, shrub and cornstalk was covered. It was just such a snow as I had seen and before sunrise I was in the saddle on a gentle mule, and accompanied by my nephew and two freedmen, I started to a big canebrake where the wild hogs were certain to have bedded in this deep snow.

It was not over a quarter of a mile from the house to the rear of the field, where there was a gate through which I could pass out into the forest, a large body of heavily timbered land densely covered with cane, and extending for some miles to the plantation. Along the edge of the cane was a wagon road used for hauling cord wood, that extended about a mile along the fence, and then diverged at right angles until it struck a pretty bayou, down which it lead until about a mile and a bayou disappeared into the woods. Fortunately, just as I passed through the gate, I discovered tracks of two hogs, indicating from their great size that they were several years old. My nephew dismounted, shaved the tracks to my favorite hounds, and they broke open on the ground, and I wanted her to run, and by a little coaxing I got the entire pack in full pursuit. The hogs had fed along the road as far as it extended by the field, and then continued in the wood to the bayou. After following the bayou for several miles, and my hounds had crossed the bayou, I was confident they had made for the canebrake. Being minus my left arm, which I had left on the banks of the Potomac during the late unpleasantness, it was not so easy for me to ride through the dense woods as I kept up with my pack of hounds directed by my nephew, who was a superb shot with both pistol and rifle, having served the entire four years of the war as a member of Manford's First Cavalry Regiment of Virginia, to follow the pack and keep up with them, and to take the hounds in hand with him, and with him I was as good as I could be to the place where I knew the hogs would be found.

Sau obeyed orders, and half an hour's ride brought me in hearing of the dogs, that were then baying the hogs in this big canebrake. He had stopped to wait for me to come up, as he did not understand me as directing him to shoot the hogs before I should arrive. I instructed him to give me time to ride to the opposite side of the place where the dogs and hogs were fighting. The two freedmen were posted on the flanks, and I wanted my nephew to shoot the hogs, and I went to go into where the hogs had bedded, and shoot them if possible.

One of my grand bitches on this occasion refused to run the hounds, and she had followed behind my nephew, and was different to the fierce struggle that was going on. The place which they had selected for their lair was one most admirable for their defense. Two large cottonwood trees had been blown down in some storm during the year, and had fallen one across the other. In this crack the logs had made their bed. The trees were not less than five feet in diameter, and under the upper tree was the bed. All around was as dense a canebrake as I ever got into. The hogs proved to be very old hogs, and the old wood was the most dangerous. It was simply impossible for the dogs to do anything with these hogs. They were as impenetrably fortified against the dogs as they held a position. The dogs were fully conscious of the danger and kept at a respectful distance, some on the logs, some in front and some behind the logs. One of the disagreeable points of a hog hunt in the deep snow is the constant falling of masses of snow from the trees, and this was the case here. It was a very great nuisance, and I had to be very careful to keep a muzzle-loader from getting wet and failing to fire.

The actions of my bitch, Venus, had puzzled me not a little in her efforts to attack the hogs, and I saw the rest of the pack. I have often thought she must have had a spiritual warning that some great mishap was going to take place, and it had thrown a damper over her buoyant spirit. At any rate she stuck to the heels of my mule, and it proved the worst thing that could have happened.

I had reached the point I desired and the signal was given. It was some little time before the sharp report of Sam's rifle was heard, and then followed his loud shout, "Look out! He is coming!"

In a moment I heard the cane popping as if a huge bear was bursting through it and coming direct to where I was seated on my mule. The dogs were in full cry; the boar was "howling" as if in great terror, and gnashing his great tusks with direful audibility. My mule was in a great state of alarm, and I could neither turn myself in the saddle nor move the mule. I heard Venus give one whine, and at that instant I felt the shudder of the mule. Turning as well as I could to the right, I endeavored to get away from the relic of the cane. Her entrails were dragging and the bamboo had caught them, thus preventing her going any further. Here was a dilemma—my mule badly cut, my bitch, one of the best I had, mortally wounded, as I supposed, and the boar, dogs, freedmen and Sam out of the hunt, and I was obliged to get away from the relic of the cane. To leave the poor bitch in that condition would never do. I was fully three miles from home, and in this dense canebrake. An old hunter has many resources under such circumstances, and I was not accustomed to the woods would not think of applying.

I unloosed the entrails from the bamboo, put them back into her belly, and then wrapped my handkerchief around the body covering the wound, and made up the rest of the relic of the cane, and I cut my mule and my hand and my mule, and then tightened the knot with a stick. I determined to

when, though she did not at once make her mark as the crack of her rig, she sailed so inconspicuously well that no one was surprised to see her lead the list of winning yachts in 1878, winning two Queen's Cups that year and on the next, and netting in twenty-three races, from 1874 to 1878, the handsome sum of \$1,000. Her dimensions are: Length, 32 ft.; beam, 17 ft.; draft, 4 ft. 10 in. HALIFAX, N. S.

THE GRAYLING.

Editor Forest and Stream: I agree with you about Grayling, but I think that you have omitted one probability, and that is he has living gone by the head when pressed by the wind. I remember when I saw her in the yard that her hull was the longest and finest I have ever seen. The cabin that Fishers had ever been guilty of, and I couldn't help thinking of all the disagreeable experiences when sailing free in cutboats of approximately this size, sitting almost overboard to keep the stern down, letting the whole sail go forward of the mast to save a capsize, etc. I do not want that sort of ship in my pond. M. STON LITTLE CURE.

THAT TWISTER.

Editor Forest and Stream: We were out in a 24ft. keel yacht during the "trouble." There was no small as reported in the accounts of Grayling's capsize, but a strange unusual freshening of wind out of a dead calm. With a clear sky to windward (west), in ten minutes we had a single reef breeze gradually changing to north-west. We got a halloo jib on the yacht, her topsail was up, and not knowing whether the fresh breeze would continue to increase, we stowed mizzen, but almost immediately fresh it, not finding anything to cause alarm. The boat's deck never touched the water, and the boat was never "let up." Criticus.

KNICKERBOCKER YACHT CLUB.—Editor Forest and Stream: The annual opening regatta of this club will take place on Wednesday, May 31, 1888. All yachts enrolled in the club will be considered as entered for this regatta and will be classed as follows: First class, cabin sloopy-yachts; second class, open jib and mainmast yachts over 20 ft. in length; third class, open jib and mainmast yachts under 20 ft.; fourth class, cat-rigged yachts over 24 ft.; fifth class, cat-rigged yachts under 24 ft.; and over 20 ft., sixth class, cat-rigged yachts under 20 ft. This class to open jib and mainmast yachts under 20 ft. The course for seventh class will be to mid around Fort Schuyler buoy. All other classes to and around Gangway buoy and return. The first gun to start at 11 A. M.; third gun, for sixth class to start, at 11:30 A. M.; fourth gun, for fourth and fifth classes to start, at 11:45 A. M.; fifth gun, for second and third classes to start, at 11:55 A. M.; sixth gun, for first class to start, at 12:05 P. M. All yachts not having crossed the line within five minutes after the firing of the starting gun for their class, will be timed as having started at the expiration of said five minutes. All signals will be given from leeward in windward. A pennant will be held to the boat making the best time over the course. This includes catamarans. For further details see regatta program. The committee is composed of A. Lichtenhan, J. L. Burt, and J. B. Burt.

AN EXPLANATION.—Editor Forest and Stream: Proceeding upon what appeared to me strong evidence of partiality in the Herald's account of the Grayling's recent capsize, interested motives were here to be perceived in my letter last week. I have since been reliably informed that no interested motives existed and that between the owner and reporter no cause for such motives had passed. Forfeiting these assurances to my own interpretation, it is and to be regretted that the report in the Herald should have been carried upon its face an implication creating an erroneous impression. It affords me pleasure to absolve the writer in the Herald on the best of evidence from journalistic insincerity in the case. F. KUMHARDT

WE WILL.—Editor Forest and Stream: So many assertions have been made that a cutter can be capsize as easily as a sloop, that I am sick of it. I hope you will take in hand some of these fellows who write without experience or understanding.—X.

OSWEGO, N. Y.—The first cruise of the Oswego Y. C. will take place on the 26th and 27th inst. Fairhaven is the port which all the yachts will make for, where the orders to be observed on their return voyage will be given.

Answers to Correspondents.

H. T. W., Northbridge, Mass.—I have no pool, say 800 feet long, in which I keep spring trout. At each end there is a square space 100x100, and these are connected by a diaphanous wire. The pools are fed by springs entirely and the banks and bottom are of this kind, as the place is a reclaimed swamp. The pools are open, being in the middle of a meadow. The trout are in there two or three years, but they do not seem to grow any, and this spring they are very thin. What can I give them for food, for the lack of food is the trouble. I have tried about a quart of corn meal, but it does not seem to do any good, but as soon as the weather gets warmer these will not be obtainable. I dislike giving liver as I hear that liver destroys the delicate trout flavor. Would it be a good idea to put in a few thousands of small river "shiners" about an inch or two long, which I can easily obtain? I want very much to have them grow as I am trying to get them large enough so I can stock a pond covering about an acre and a half. Ans. Your trout are, as you say, in need of food. We would advise feeding liver, clams, or other food readily obtainable. They will fall on it and stock your larger pool with them. Your shiners will make good food, but take care to kill them first or they will increase in the pond.

SAN FRANCISCO SUMMERS.—What is the lightest and most complete outfit for a walking tour, camping out at night? There are two of us. Ans. So much depends upon the circumstances of time, locality, your own physical condition, etc., that an answer is difficult. Clothing should be as light as weather will allow, and if you can send a change of underclothing by express to some point where you will need it, this is better than carrying it. Wear soft felt hat, low shoes with gaiter tops. Sleep at ranch or hotel in preference to camping out at night; but if you must camp, take a strip of canvas (each) 2ft. by 3ft., with buttons and buttonholes along the edge; these are joined together to form a shelter tent. You will need a blanket apiece. We assume that you will be within reach of the settlements, where you can procure your meals. Miscellaneous: Stout stick, drinking cup, flask of tea, pocket compass, pocket magnifying glass, good pocket knife, string, etc., as your fancy dictates. Be careful not to burden yourself with unnecessary luggage.

ISLANDS.—Will you please inform me what sort of fly-fishing can be derived from the small lakes of Central Michigan, say mid-way between Detroit and Chicago. I am compelled to spend my summer round about there mostly for business, and I should very much like to know if there is any chance of casting a quiet fly now and then with my favorable relatives; I am not a b-o-g or a pot-hunter, and our two moderate sized fish will be ample returns for a day's labor (I) with rod and reel. Ans. The lakes of Central Michigan contain a few black bass, perch, and sunfish, but not in any numbers. The lakes are small and are well fished. If you go north to Houghton's and Higgin's lakes in Roscommon county you will find black bass in good numbers and of good size. As you are moderate in your desires try the south part of Livingston county. There are some trout about Niles.

ISSUES.—North Middletown, Ky.—What time between the 25th inst. and the 1st of July next would be the best time to go black bass fishing, if the time is favorable would be the best for accommodation, reasonable prices and good fishing. St. Clair Falls near Detroit, or the Thousand Islands and that vicinity on the St. Lawrence. I can spare two weeks from home within the time mentioned, and wish to enjoy it without hunting up a place. Ans. Probably the latter would be the most convenient and reasonable for you. The last half of June would be best.

B. B. B., New York.—I am informed that a setter bitch named Biddy took a prize in a dog show held at the Madison Square Garden a few years ago. Is this correct? In what class was she entered, and what prize did she take? Do you know her pedigree? Ans. Biddy was v.b.c. at New York in 1877. She was entered in the class for imported and Irish setter bitch puppies. She was bred by Erin out of Fan. Erin was by Knight's Star out of the Duke of Buccleuch's Peggy. Fan was by Pierce's Shamrock out of Jess. This is the only Biddy that has been placed at any of the New York shows. She was owned by the St. Louis Kennel Club, and won first at St. Louis and champion at Boston in 1878.

D. M., Oswego, N. Y.—Will you please advise me what I should do to have my bitch Bran Berkeley entered in the Irish setter registry of America? Ans. We know of no special Irish setter register. The American Kennel Club published in 1879 the first volume of their Stud Book; entries for the second volume closed many months ago, but the book has not yet appeared; we are unable to learn when it will be published. Your entry would be of course good in the third volume, which we presume will follow the second in the course. Meanwhile, the entry you have made in the American Kennel Register will answer every purpose.

H. E., Erie, Pa.—The reel is a center action multiplying reel with an adjustable click. It is a good reel. Address the party you name. 2. Probably mangle; your description is rather vague. Try the following and write us again in ten days if it does not effect a cure: Wash him thoroughly with strong soft soap suds, using warm water, then apply the following, rubbing it well in: Sublimed sulphur one dram, balsam of Peru one dram, lard two ounces. Apply this for three successive days, and on the fourth repeat the ointment.

W. B. N., Bridgeton, N. J.—Inclosed in this mail you will find a small snake of a kind rarely seen in this neighborhood. Will you be so kind as to give a description and name of variety in your next number? It was picked up near but not in the water. Ans. The specimen is a young ring snake, *Diadophis punctulatus*, a harmless and beautiful species found in the woods. It is figured in Vol. I. of "The Natural History of New York," Vol. I. "Reptiles and Fishes," pl. 14, fig. 29 and a short account of it is given on p. 39 of the text.

Riverside, Cal.—A small species of owl is very common here which inhabits spruce firs, though it occasionally digs its own holes. They are about seven or eight inches in length. Are they burrowing owls (*Otus vociferans*) or California pigmy owls (*Holoceryx*)? Ans. The burrowing owl.

L., Gloucester.—Please advise me where I can procure a few carp to stock a small pond. Ans. Write to Prof. S. F. Baird, Washington, D. C., or to E. C. Blackford, Fulton Market, New York. You cannot get them before October, but write now.

H. E., Palmyra, N. Y.—The original shooting was "class-shooting," i. e. the shells to be shot off in the same manner, whether the prize was divided into two or not. You should have such things clearly understood beforehand.

A. R. H., Palmyra, N. Y.—Permits from a natural history society to kill birds for scientific purposes are not required in New York State, the very proper provision for such permits having failed to pass the Legislature.

J. W. T., Wallingford, Conn.—You will not find any "good hunting" in New England in July, as it is then the close season on all game. For Maine angling resorts see recent numbers of this journal.

SECRETARY.—In a class-shooting match for three prizes, four competitors, A, B and C, tie for first; D, takes second; who takes third? Ans. It reverts to the four contestants in equal shares.

J. A. W., New York.—For wild rice apply to Chas. Gilchrist, Port Hope, Ont.; R. & W. Valentine, Janesville, Wis., or Hiram Sibley, Rochester, New York.

A. N., Minnesota.—Mr. George A. Phelan, author of the sketches published under the pseudonym "A. Mule," died last October. See our issue of Oct. 12.

W. E. P., Bridgeport, Conn.—Write to the Middlesex County Association for the protection of Game and Fish, Middletown, Conn. A READER wishes location for good trout fishing and woodcock shooting combined in Pennsylvania.

A. S., New York.—The best Adirondack map is Stoddard's. We can supply it.

F. C. DeV., New York.—Write to Kennedy Smith, Enstis, Me.

HUMPHREY'S HOMEOPATHIC VETERINARY SPECIFICS

FOR THE CURE OF ALL DISEASES OF HORSE, CATTLE, SHEEP, HOGS, PIGS, ETC. For Twenty Years Humphrey's Veterinary Specifics have been used by Farmers, Stock-raisers, Hunters, and Sportsmen, and have proved themselves Menageries and others with perfect success. LIST OF SPECIFICS: A. A. Cures all Inflammation, Milk Fever, Spinal Meningitis, Hog Cholera, 75c. B. Cures all Fevers, 75c. C. Cures all Coughs, 75c. D. Cures all Diarrhoeas, 75c. E. Reliable Testimony

Hop Bitters Co.,

Philadelphia, Pa., Sept. 6, 1882.

I am seventy-four years old, have lived thirty-four years in Philadelphia, and well-known among terms. I have been troubled twelve years with a white swelling on my right foot, and getting worse every year, and very painful, and breaking out in hot weather. I consulted several doctors and they told me it was incurable and I would have to take it with me in the grave. Some time ago I lost my appetite, was cosine, had headache and fever—in fact was very sick. I saw in the *Gorman Democrat* that Hop Bitters was what I needed. I got a bottle, took it one week and was as well again as ever, and to my greatest surprise right from the first my swelling went down gradually, and I taking another bottle got entirely well of it. The wife of my neighbor had two such swellings on her legs and three bottles cured her. I think this is a great triumph for your bitters.

JOHN STOLL,
No. 1 Young's Alley, above Willow st.

Stippshill, Ind., Nov. 13, 1881.

Dear Sirs—I have read so much about Hop Bitters, and always had a belief in its efficacy, that I got a bottle, took it one week and was as well again as ever, and to my greatest surprise right from the first my swelling went down gradually, and I taking another bottle got entirely well of it. The wife of my neighbor had two such swellings on her legs and three bottles cured her. I think this is a great triumph for your bitters.

LUCY VAIL.

Beat the World.

Rockville, Conn., March 6, 1882.

Hop Bitters Co.,

I have been taking your Hop Bitters for several weeks, and they beat the world.

L. S. LEWIS, Lewis' Axles Machine.

Leontonia, Pa., April 13, 1882.

Hop Bitters Co.,

I have not been well for three years, tried almost every kind of patent medicine and no less than seven doctors, one of Elmira, N. Y., none have done me any good. I finally tried your Hop Bitters and found them just the thing. I have praised them so highly there is a great number here who use them with great benefit and satisfaction.

Very respectfully yours,
R. HENR.

GENTLEMEN:—The "Hop Bitters" meet with large sales and give general satisfaction, one case in particular you should know of. Mr. John H. Green, 728 Spring Garden street, Phila., Pa., has been suffering from kidney affection, which superinduced rheumatism. He tried physicians and remedies in vain. He was obliged to take morphine to induce sleep; his trouble was so great. Reading your advertisement in the *Christian at Work*, he was prevailed upon by one of his daughters to try it. Three bottles affected a cure, and now he is an enthusiast for "Hop Bitters." He is one of the oldest residents in the locality named, and known as a gentleman of unusual probity.

HENRY TORREN,
672 North 10th street, Philadelphia, Pa.

Office Jelloway Mutual Aid Association,
Jelloway, O., Feb. 18, 1882.

Hop Bitter Manufacturing Co.,

I have been using your Hop Bitters and find them what you recommended them to be for kidney disease, viz.: superior to all others.

J. L. HILDEBRAND.

Vertigo, Dizziness and Blindness.

Office *Utica Morning Herald*,
Utica, Feb. 18, 1882.

I have been troubled with vertigo since last July, and have suffered greatly every night after any considerable exertion from dizziness and blindness. I tried two bottles of Hop Bitters, and since then have been entirely relieved.

Respectfully yours,
J. J. FLANNAN.

Hop Bitters Co.,

June 15, 1881.

I have been suffering five years past with neuralgia, liver complaint, dyspepsia and kidney complaint, and I have doctored with fourteen different doctors who did me no good. At last I tried Hop Bitters, and after I used a few bottles I received a great benefit from them, and if I had used Hop Bitters regularly I would have been well before. I know them to be the best medicine in the world for nervous diseases of all kinds.

JAMES COONTS,
Beclington, Barner County, W. Va.

Wicked for Clergymen.

"I believe it to be all wrong and even wicked for clergymen or other public men to be led into giving testimonials to quack doctors or patent medicines, but when a really meritorious article composed of valuable remedies known to all, and that all physicians use and trust in daily, we should freely commend it. I therefore cheerfully and heartily commend Hop Bitters for the good they have done me and my friends, firmly believing they have no equal for family use. I will not be without them."

REV. B. R.—Washington, D. C.

A good Baptist clergyman of Bergen, N. J., a

strong temperance man, suffered with kidney trouble, neuralgia and dizziness almost to blindness over two years after he was advised that Hop Bitters would cure him, because he was afraid of and prejudiced against the word "bitters." Since his cure he says none need fear but trust in Hop Bitters.

My wife and daughter were made healthy by the use of Hop Bitters, and I recommend them to my people.—Methodist Clergyman, Mexico, N. Y.

I had severe attacks of gravel and kidney trouble; was unable to get any medicine or doctor to cure me until I used Hop Bitters, and they cured me in a short time.—A distinguished lawyer and temperance orator of Wayne County, N. Y.

MANN'S Trolling Spoons.

Sixty varieties manufactured, suitable for trolling for all kinds of fish that will take an artificial bait. Our Perfect Revolving Spoon is undoubtedly the best general spoon for taking fish ever offered to the public.

AMERICAN Kennel Register.

A monthly record of kennel events for the information and guidance of breeders, exhibitors and owners of all breeds of dogs.

Its leading feature is the "Pedigree Register," of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is given to each dog, and an index will be compiled at the close of each annual volume, thus forming a permanent work of reference. The pedigree registration fee is twenty-five cents. The first two numbers of the Register contained the pedigrees of 188 dogs.

Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs at sale, and deaths.

Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include a record of field trials. The first two numbers of the Register contain prize lists of Washington, Ottawa and Pittsburgh shows.

The publication day is the fifth day of each month; and nothing can be received for publication later than the first day of the month. All matters intended for publication should be in the hands of the editor at the earliest practicable date. Entry blanks for each department will be furnished free on receipt of stamped addressed envelope.

TERMS.—Issued by yearly subscription only. The subscription price is one dollar per year. Make drafts and money orders payable to the Forest and Stream Publishing Company. Address, AMERICAN KENNEL REGISTER, P. O. Box 2,832, New York City.

ANGLING TALKS: BEING THE Winter Talks on Summer Pastimes

Contributed to the FOREST AND STREAM

By GEORGE DAWSON.

CONTENTS:

Simple Wise Men, About Bass, About Grayling, A Memory, Reminiscences, Odds and Ends, About some Distinguished Anglers of our Time, About Salmon Fishing, Salmon and Sea Trout Haunts and Habits, Several Relevant Topics, Angling Mishaps.

Extract from the Preface:

"The 'Talks' attracted wide attention at the time of their publication in the angling columns of the FOREST AND STREAM, and were received with very cordial appreciation. It is thought that their collection into the present more permanent form will prove acceptable. These 'Talks' are brimful of manly, wholesome sentiment; there is in them all not a particle of cant. Their sincerity and overflowing spirit at once win the reader, and he perceives shares the author's enthusiasm. The effect is magical, like that of the mimic players in Xenophon's *Memorabilia*; he who reads, if he be an angler, must go a-fishing; and if he be not, straightway then must he become one."

Limp Cloth, 78 Pages, sent postpaid on receipt of price, 50 Cents.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

DECORATION DAY.

YESTERDAY the green turf on a million graves was made more beautiful by the tender offerings of loving hearts to the memory of the dead of long ago. In village, in town and in mighty city, all over country, in the North and the South, the East and the West, the loveliest flowers of spring were scattered over the graves of those who have gone before, but whose memory cannot die.

To the white-haired father on this day comes up as vividly as ever the recollection of his bright-faced boy, who went from his home at the first call of battle and who never returned. The widow still mourning the stalwart husband, whose duty to her and the children kept him chafing at home until the struggle had assumed such mighty proportions that he could no longer hesitate. Then he went, and was never again seen alive. The mother whose sole support was torn from her by the conflict; the sister who gave up her darling brother, on this day suffer again the pain of their bereavement.

The flowers which have been scattered over the graves of the hne and the gray have not yet faded. Still fair and fragrant they fitly symbolize the sad, sweet recollections of those who, after twenty years, sorrow for their dead, yet not as those without hope.

Bitter and savage was the struggle, terrible the meeting of opposing forces during the long years of the war, and deep the animosities engendered by the conflict. The whole fabric of the nation was shaken to its foundations, the best of its citizens on both sides yielded up their lives. But the fury of the battle is long past and forgotten, and peace and prosperity smile over our whole land. The mourners of the North and the South mingle their tears and their offerings on this Decoration Day, and the survivors of the struggle on either side clasp hands in strong friendship and good feeling, for the heart-burning and the bitter sectional hatreds of former times have passed away to return no more forever.

THE BOY AND THE ANGLE.

NOT solely for the scientific angler with his eight-ounce rod, silken line and flies cunningly fashioned to resemble to living thing, are all and the chiefest delights of the gentle pastime. There is one of humble estate in the brotherhood of the angler who makes no pretensions to skill, and uses the most unorthodox and coarsest tackle, to whom it yields supremest enjoyment. He never casts a fly, and knows no "green drake" but him of the duck pond, no "doctor" but the village practitioner who gives him an occasional nauseous dose, no "professor" but the "deestriet" school-master, and if he ever heard of a split bamboo, thinks a split pole must be a poor stick to catch fish with. He wants no reel to wind in his fish with, but "yanks" them out and lands them high and dry and safe from return to the flood, easting them the length of pole and line behind him. This is, of course, our young and unsophisticated friend, the boy of the country, he who remains a boy till he has grown big enough to go a-fishing, and perhaps never becomes a young gentleman, but keeps a boy's heart within him, and a boy's ways until he becomes a man. He does not always wear a torn hat, nor always trowsers in which he feels most at ease if sitting down when big girls are about, nor does he always go barefoot from spring till fall, though he likes to give his naked soles a taste of the soil for a few days when he has seen the necessary seventeen buttresses.

Furthermore, we do not claim for him, nor does he for himself, that he can catch more fish than the scientific angler; but how he loves to go a-fishin', and how he enjoys it all, from the preparative beginning to the very end! What happiness is his in the cutting of the pole in the always-pleasant woods, where many a sapling is critically scanned and many a one laid low before the right and fore-ordained one is found; and in the buying of the ten-cent line and half dozen beautiful blue fish-hooks, selected with much deliberation from the tempting array in the showcase of the country store. How continually he is full of anticipation of sport from the moment he begins digging his bait; each big worm uncerthed and going into the leaky coffee-pot promises a fish, and as he hurries across the fields to the stream he cannot stop even to look for a bird's nest, though sparrow, bobolink and meadow lark start from almost at his feet. Nor hardly can he halt to disentangle his hook and line from the fence or bush they are soon to catch in, for he knows the fish are waiting for him. Then out of breath beside the stream he impales a lively worm, spits on it, not so much for luck as in deference to time-honored usage, gets his line straight out behind him, and sends it with a whizz and a resounding "plung" of the two-ounce sinker far out into the waters, and waits for a bite with what patience a boy can muster. Presently perhaps the expected thrill runs up his angle to his hands and through all his nerves, the tip of the pole nods, then bows low to the flood, and by no "turn of the wrist," but by main strength and by one and the same motion he hooks his victim and tears it from its watery hold. So swiftly has it made its curved flight over his head, unseen but as a dissolving streak, that he knows not till he has rushed to where it is kicking the grass whether his prize is a green-and-golden barred perch, a gaudy-mottled pumpkinseed, a silvery shiner or an ugly but toothsome bullpup, gritting his wide jaws when his horns do him no good, though they may yet do his captor a mischief.

Whatever it may be, he glloats over it as much as any man over his well-fought trot or bass, and straightway runs to cut a forked wand whereon to string it, and takes care that it be long enough to hold many another. If the fish do not bite he sets his pole in a crotched stick and lets it fish for itself while he explores the shore and catches a "mud tarle," "almost" kills a "mush rat" or scares himself with a big water snake.

Returning to his pole, perhaps he finds the tip under water and tugs out a writhing eel, the wild fun and horror, and the abominable, all-pervading sliminess of whose final eaptive makes memorable the hour and the day thereof. Perhaps a hungry and not too fastidious pickerel or picker-pere or bass may gorge the worm-indeed hook and be hauled ashore, and then the measure of the boy's glory is filled and the capacity of his trousers to contain him tried to the utmost.

Though he goes home with a beggarly account of small fry dangling at the end of his withe, he is unabashed, if not proud, and hopeful for another day. But if it is strung so full that his arms ache with lugging it, what pride fills his heart as he displays his fish! Till they are eaten and digested he ceases to be a "no-account boy." He cleans them and enjoys it. Every scale is a cent, bright from the mint, and he catches each fish over again as he takes it up. He

recognizes his worms in their maws. When they are cooked, whoever tasted fish so good?

The boy is no more a contemplative angler than he is a gentle one, and he does not of choice go fishing alone. He would rather go with the renowned old fisherman of the neighborhood and learn something of the mysteries of his art, but that worthy does not overmuch desire the companionship of youthful anglers. So performe the young fisherman goes with another boy and has some one to "holter" to, compare notes with, and enter into rivalry with, and he can say with truth, when he gets home, "Me and Jim ketched twenty" though he forgets to add that Jim caught nineteen of them. Wherefore not? Do not his biggers and hettters brag of scores which would not have been made if their guides and oarsmen had not fished?

Alack, for the bygone days! When May comes with south winds and soft skies and the green fields are dotted with the gold of dandelions and patched with the blue of violets, and the bobolinks are riotous with song over them, who would not be a boy again just for one day to go a-fishing?

STEAM YACHTING.

IN unsympathetic quarters the query is often heard, "What are steam yachts good for, anyway?" Such an interrogation would hardly have been made more than once had a little thought been bestowed upon the subject. Though different in some features from the sister branch of the sport, it does not follow that yachting under steam is in anywise inferior to sailing, either in respect to enjoyment or to the opportunities offered for instruction to the mind and healthful exercise to the body. To be sure, the greater certainty of movement under steam, the precision upon which one can count in all that relates to time, removes from steam yachting that charming element of uncertainty which contributes so much to the romance of the more Bohemian-like cruise under canvas. If steaming eliminates speculation upon time and the weather, it is none the less exacting and enticing in other respects. Navigation, such as keeping the vessel's reckoning, skillful pilotage, a knowledge of seamanship in the event of accident to the machinery, all afford field enough for thought, and, supplemented with an investigation of the "power behind the throne," a world of study for the busy brain and nimble activity, for nerve and muscle in quantity unostiated. Indeed, the speed of the steamer demands from the controlling mind a sharpened intelligence, quick decision, a head capable of thinking more than one thought at a time, prepared in an instant to meet an unexpected situation with just the right move in remedy. Thought must flash and work as if by instinct, for time to reflect and evolve from one's inner consciousness is too precious for such waste when slashing along at fifteen, eighteen or twenty knots to the hour. On the bridge watch has to be kept more searching and strict than in the cockpit of the yacht under sail. Emergencies occur not with gear and sails perhaps, but equally as serious, may far more dangerous or sudden in their consequences, in the boiler and engine room below. Pumps cease to act, valves leak, tubes blow out, grate bars choke, bearings heat, keys work loose, and a hundred and one other troubles occur familiar to all who have had motive power in charge. The engine room is not one whit more free from mishaps or accidents than the spars and gear of a sailing craft, and to meet onward complications in a steamer requires even greater knowledge and experience of head and deftness of hand. In management and care the steamer stands exponent of a higher branch of learning and skill than the simpler demands of fore and aft rigs and smooth water sailing aspire to. Though the steamer disdains without risk nearly all weather prognostications, and shows a thoughtless front to sea and wind, her speed and motive agent involve the assumption of cares and responsibilities at least as great and serious as all those trials and tribulations peculiar to the sailing yacht.

It will be said that owners keep clear of the engine room, care nothing about machinery and delegate all attention it requires to a person employed for the purpose. That asking a man of business, carrying stocks and tape measures in his head, and dressed in faultless fashion, to delve into the sooty, greasy depths of fire-room or engine space for instruction or pleasure, is expecting that oil and water should mix. In some cases it is, in others it is not. There are those who own large sailing yachts, yet know nothing and care less about their rig and navigation. But there are likewise industrious Corinthians and persons of ambition who seek to master the intricacies of working a vessel to the best of their abilities

and opportunities, nor are they frightened at the idea of work or the tar and the shakings. It is within reason to suppose a similar class of earnest enthusiasts will be found who seek advancement in all there is about them, and who in time will as learnedly discuss "lap and lead," "cut-offs and expansions," "high and low pressure," "crank and disc motion" as we now hear bold Corinthians taking issue upon "luffing out or squaring away," "keels or boards," "cutter rigs or sloops," and the knotty formulas of "time allowance."

With steam all around us, steam whisking us up and down town, from floor to attic, from city to country town, steam in the kitchen turning the spit, steam in the sewing room whirling the sewing machine needle, and steam twirling the peanni roaster in the street, it would be strange indeed were gentlemen of leisure and means to pass by slightly the universal agency which has contributed so much to life's ease and comfort, and perhaps been the means of their own professional success. We need but look to older nations for an answer. There are in British waters vast fleets of yachts, from the yawl and launch up to stately sea-going vessels, driven by steam applied to screw or paddle. Among the owners of such yachts the number who comprehend and control the working of the machinery is growing apace, and a large class of amateur marine mechanics has sprung into existence.

Steam yachting and all that the term includes is not what many presume, a problem fully solved and in a quiescent *status quo*. There are the same issues in existence which animate circles devoted to the sail. Engines and boilers and systems and tools of propulsion of a rival kind there are innumerable. The question of model itself is perfectly unsettled. Type is still in the first throes of embryotic stages. Shall she be high speed, cruiser or auxiliary? Shall she be long, narrow and shoal? Shall she have a working rig or be content with poles, twin screws or single? And as for wheels and driving power, their theory and practice, their adaptability to various waters, these things of themselves open up a vast, and as yet unworked, mine for deep study and acquisition as well as for experiment and practice.

From America will ultimately hail the largest fleet of steam yachts in the world. The certainty of movement of such vessels recommends them to men pressed for time. Our vast network of rivers in the interior, the great distance to be traversed from point to point, all will insist upon the rapid multiplication of the small nucleus of steam yachts now afloat. For all this, there need be no fear that the sailing yacht will be driven to the wall. There is ample room in the world for both classes. Cheapness in first cost, economy in running and love for a sailor's life will keep the fleet under canvas from extinction for all time. The man of steam will be drawn from other ranks, and with his vessel will add one more to the yachting navy without a single sail being withdrawn on this account.

The recent formation in this city of a club, especially devoted to steam yachts, bears out what has been written above. It is the first step toward securing that recognition which has been denied by the self-engrossed community of amateur sailors through groundless fear of rivalry, and a failure to concede to steam yachts the importance they are entitled to.

SUPPORT THE TEAM.

NOW that the indignation, naturally felt at the action of the Rifle Association directors in the rejection from the team of one of the best shots in America, has in some measure subsided, the entire effort of all who wish well to American arms should be directed to strengthening the squad of National Guardsmen who in a few weeks will set sail for the English range. The honor of the country has to be sustained by the men now giving their time and effort daily at Creedmoor to gain that thorough control of hand and eye which shall enable them successfully to meet the English experts. The men are doing good work; they already show scores far beyond what was recorded a year ago at the same stage of preparation, and the prospect is that without any more than merely holding their own they will be able to make a strong fight with the picked British team.

The National Guard of the entire country owe it to themselves to see to it that the team of 1883 goes abroad in a manner befitting its representative character. The men on the team are not men of wealth. They are young men who love the innocent excitement of the rifle match, and having shown their ability to excel in one branch of the soldier's duty, it should be the proud and pleasant duty of every other member of their body to lend aid and assistance in getting them the victory. This can be done through a generous subscription to the fund now raising for the expenses of the team. These will necessarily be heavy, for a jaunt over the ocean for so large a group of men is not a trifling matter. Though it will be a short visit, it cannot be a flying one. After the novel experience of a sea trip, the men will need a few days for rest and quiet to steady their nerves and refresh their bodies. Then there will be some days' drill at Wimbledon to get acquainted with the ground over which the match is to be shot. During all the time the men look for their support to the body of their fellow citizens who will share in the honor which a victory will bring.

The board have placed their estimate of expenses at a

moderate figure. It is thought that \$6,000 will carry the team out and home again, and but a small percentage of this sum has already been secured. Every cent of it should be in the hands of the committee before the date of sailing. It will add much to the confidence with which the men will start if they know that their friends and well-wishers have been thoughtful in this respect. The *meu deservit* support for the good work thus far, and as everybody feels like adding a trifle to a successful cause, they may feel assured that in all likelihood they will be doing so by sending a subscription to the American Team Fund.

BLACK BASS.

ON the first day of June the black bass season opens about New York. It is an open secret that to many it practically opens at Greenwood Lake on Decoration Day, two days before. This being a legal holiday, many persons go to the lake, and the people about it wink at the transgression, because the visitors leave substantial mementoes of their visit, which is regarded as a full equivalent. This practice is wrong and it should be stopped, or the law should be changed, making the opening of the season on the holiday. There is no doubt about the early season being the best. The fish seem livelier and even gamier than later in the greater heat of summer, with its greater excess of vegetation in the water. It is in the beginning of the season that the bass take the fly with more certainty than at any other time, and this alone is reason enough to many to make them anxious to go early to the lakes.

About New York there are not many good places for black bass. A few are taken in the Croton reservoir, but not enough to make it an object to fish for them, they are usually captured by those who are fishing for perch. The most accessible places for good fishing are: Greenwood Lake, lying partly in New York and partly in New Jersey, fifty miles distant from the city, and reached by the New York & Greenwood Lake R. R., with ferries at West Twenty-third and Chambers streets. This lake is one of the best black bass lakes in this part of the country, notwithstanding the great yearly drain upon it and the number of anglers that visit it. Several good hotels are on it, and the scenery is fine. Lake Hopatcong is reached by the Morris and Essex R. R., ferries at Barclay and Christopher streets, trains for the lake connecting at Drakesville, distance about sixty miles. This lake furnishes some black bass and many pickerel. It is quite a pretty lake and has hotels. From Hopatcong station passengers go some three miles by canal before entering the lake. Swartswood Lake, near Newton, N. J., sixty-seven miles from the city, is reached by the Sussex branch of the Del., Lac. & W. R. R., ferries foot of Barclay and Christopher streets. This lake also abounds with pickerel and perch and the fishing is often good. The rivers readily accessible from New York where the fishing is more or less good are: The Delaware from Port Jervis to within twenty-five miles of Philadelphia, and there are also black bass in the Raritan River.

Fly-fishing, where and when the fish will take the fly, is by far the highest of all fishing, but the black bass is a notional fish, full of queer conceits about a diet of flies, or perhaps only regards them as dessert, to be taken in moderation, or not at all, according as his digestive organs may incline him. Certain it is that the black bass cannot be depended on to rise to the fly with anything like the certainty that we calculate on the rising of trout. Even trout refuse to rise at certain, or uncertain, times, but the black bass is always uncertain. For fly-fishing use trout tackle with larger and more gaudy flies, and allow the latter to sink and troll them after a cast. For casting or trolling the minnow, a shorter rod, about eight feet, of some stiffness, and a multiplying reel are used. Still-fishing from an anchored boat is done with rods of all kinds, but we prefer a trout rod if we are forced to practice this method by reason of the refusal of the bass to take the fly. Baits include frogs, helgramites or dobsons, worms, minnows, crawfish, grubs, grasshoppers, etc. Skittering a frog which, after being humanely killed, is hooked through the jaws, is good sport, and is done by standing in a boat while a man rows it slowly near the likely spots, and casting the frog on one side and jumping it along the surface two or three times and then casting it to the other side. This often raises large fish, and there is an amount of exercise attending it that lazy still fishing does not bring. In doing this we prefer to stand in the bow of the boat, although most men take the stern. We prefer the bow because we then work water which has not been disturbed by the oars. Trolling with spoons or minnow gaugs is a favorite with some. It requires no skill and is a murderous practice as well as a lazy one. If bait is used it will save much time, expense and disappointment to carry it, for it is often scarce at the fishing grounds.

Concerning the comparative gameness of the two species of black bass, we agree with Dr. Henshall, and, in defiance of popular opinion, claim as many qualities for the high-mouth as are possessed by his brother with the smaller opening in his countenance. The big-mouth, when under two pounds weight, makes a splendid fight, although he has been cried down, and it is fashionable to echo the cry. We look forward to the day when a fair judgment, irrespective of prejudice, will be rendered by intelligent anglers on this question of comparative gameness, always making allowances for the weight of fish. We believe that the proper fighting weight of a black bass is from a pound and a half to two pounds, if

he is in good condition, and that when he exceeds these weights his game qualities decline in proportion, and he is tired out in less time, always allowing light tackle to be used instead of hickory poles and main strength, which gives the smaller fish no chance to display his science and his pluck. Take the black bass all in all, they are the gamiest fish that the angler finds in fresh waters, except the brook trout, and there are anglers who do not except even them.

ENGLISH AND AMERICAN TROUT.—We would like a fair discussion as to the comparative merits of the English trout (*Salmo fario*) and *Salvelinus fontinalis*. Those interested in the subject may read Mr. Chambers's remarks on American trout in our review of "Fish and Fisheries," in our fish-cultural columns.

The Sportsman Tourist.

THE WHISTLE OF THE ELK.

BY H. P. UFFORD.

JUST who was responsible for the position in which we found ourselves, was "one of them things no feller could find out." Ignotus charged it upon John, John shifted the burden to The Rhymer, while The Rhymer in turn laid it upon the shoulders of Ignotus. Whether that John was in hopes of discovering the mythical Dead Man's Gulch, where "solid nuggets of pure gold as large as walnuts or as sappins lay" "thick as autumn leaves in Vallambrosa," or that The Rhymer was fired with a wild desire to scale heights repented to be hereto inaccessible to the white man's foot, or that Ignotus was led by the hope of finding and securing a specimen of that hunter's will of the whisp, the mountain bison—certain it was, that the sun, descending behind Dos Hermanos, seemed to wink derisively at our little party, as exhausted with the fatigues of mountain climbing, we huddled together for the night on a rocky shelf on the side of one of the steepest peaks of the steepest group of the San Juan range, "the Needles." What there was in our surroundings to induce anyone to tempt the perils of the break-neck climb hither would have been hard to tell. Above and below, before and behind, on the right hand and on the left, a monotonous and unvarying of stone was varied only by a uniform monotony of rock. Trachyte, granite, or quartzite—black, brown or gray—cliff, talus, boulder or slide-rock—rent by the earthquake, pulverized by the thunder-bolt, or polished by the sliding avalanche, rusty with stain of iron, or ashen with the sickly gray of the lichen—everywhere it was rock, rock, rock, that met our view, crunched on the worn detritus at the base of one jagged cliff, and facing across twenty yards of black basalt, another, no less rent and torn—on the one side, the gorge above choked with jagged boulders, heaped together in elemental confusion; and on the other, the gorge below breaking off to the nether world by a Devil's Staircase of shattered porphyritic steps—our only bed the angular slide-rock, and our sole linally the shriek of the wind as it swept through the pass; still, Gallo-like, we "carried on none of the things." A new experimenter always pays for itself, even though its price be tears, and woe, and blood; and it was worth while once in a lifetime to see nature in her most savage mood. Stripped of all her virginal beauty and grace she stood revealed before us that night, cold, pitiless and cruel; a detestable goddess whose breath was the hurricane, the glance of her eyes sharp thunderbolts, and in the touch of her bloodless hand the chill of death. Little recked we, however, we had laughed in her face ere now, and were not children of a younger world to grovel on our faces before her because she chose for once in a way to show us the virago side of her character. "Nature never did betray the heart that loved her," and we felt no fear of her, on whose lap we had so often laid our tired heads and been lulled to sleep, like weary children by the crooning music of her voice. So we kicked the ashes out of our pipes, smoothed out a place among the rocks as best we could, wrapped our blankets around us and soon forgot our pains and aches in the gentle caresses of sleep.

Next morning, after a breakfast of dry bread and jerked beef, we swung to the left, flanking the cliff under which we had slept, and after merrily a few hours of painful climbing, emerged by the crest of an upland meadow, thickly set with clumps of spruce and alder and watered by a little stream, which, taking its rise in the peaks to our left, poured its waters into the gulch up which we had struggled the day before. Deer signs were plenty, and while following one of the freshest of the trails, intent on fresh meat for dinner, The Rhymer suddenly stopped, as though petrified.

"Hello!" he shouted to Ignotus, "who in thunder's got cattle up here on this mesa?"

"Cattle? What do you mean?"

"Why, here are the tracks of a drove of steers—three-year olds at least."

"Pshaw! you're crazy! No steer in the world could climb up here."

"Can't help that. Here are the tracks; come and see for yourself."

Over came Ignotus.

"Bull elk, by gracious! and whoopers, too. Let's see; one, two, three, four—eleven of 'em by Saint Patrick! The biggest drove I ever saw."

"You haven't seen them yet."

"No, but I will to-morrow morning. If we don't have elk steak for breakfast it'll be sorry."

"Why not go for them now?"

"Too late; they're gone up on the peaks. How's the moon? Did you notice her this morning?"

"Yes; she was about four hours high at sun-up."

"Good; we'll catch 'em as they come down about daylight. Not a cow or a calf among 'em. Tell you what, my boy, it's going to take fine-haired work to get one of those smoke or twenty miles, if the wind was right. Queer, too; the less they're hunted the more the snail scares them; after a while they seem to get used to it, and don't mind it,

Now, tobacco smoke they don't mind a bit, while a black-tail hates it like pizen."

The rest of the day was spent in studying the lay of the land, and in planning the morrow's campaign. It was decided that Ignotus and The Rhymer should essay the capture, while John would "keep camp" in their absence, as the exertions of the last two days, joined to the exposure of the night before, had brought him a visit from his old friend, "the mountain goat."

The moon was only fairly above the horizon when the pair stole carefully from their blankets and started for the peaks, looming dimly in the distance. The morning was phenomenal—neither clear nor cloudy, light nor dark. There was no perceptible mist, yet all things had a lazy, uncertain look. The shadows cast by the trees were as clear and pitchy-black as though produced by the electric arc, yet the moon shone full and pale and wan. There was no sign of hoar-frost on the grass, yet the stinging air felt damp and raw. The stars glittered like sparks of fire, yet the sky was sodden and gray. Everything was incongruous and contradictory, as though Chaos was just departing, and the New Earth had not yet been born.

As the hunters threaded their way silently through the alder groves, or crossed the mesa from one woody island to another, they seemed to themselves like shades of the departed, flitting around the place which had been their accustomed haunt in life. They were not wholly wild and weak, but neither felt bold enough to break the uncanny stillness. The sense of something mysterious, of a vague intangible "one-knows-not-what," a feeling that "it is the unexpected which always happens," seemed to weigh down and oppress them. Weak ghosts of sounds quavered around them, yet if one turned to listen, they ceased, and nothing was heard but silence; the silence of the Cosmos, which, maddened at its own dumbness, flung itself upon the ear with a muffled, pulsating roar, wherein were mingled the plunge of the surf upon the shore, the moan of the wind in the bending tree-tops, and the low reverberation of the dying thunder-peal. Ghosts of things there seemed to be, as well as ghosts of sounds; spectral forms vanished behind the somber spruce boles; white wraiths floated over the mesa, fading away as soon as looked at; intangible something which eluded sight, and dimly, dimly pressed upon the mind and on every side of the soul faintly felt, though all unmet; so that it was with a sigh of relief that they finally reached the throat of the mesa, where it narrowed to enter the peaks, forming a *cul-de-sac* through which the hunter instinct of Ignotus told him the elk would most likely pass on their way to the pasture below. But, led by their suspicious nature, they might vary their usual routine, and cross over the "rookie continent" or "chick-back," which formed one side of the throat, so The Rhymer was left there that he might have a double chance, while Ignotus went further up, following a trail so broad that it might have been a cow-path or a New England hillside.

Cuddling down between two boulders, with his back to the cliff, yet so situated that he could watch both the pass above and the rounded sheep-back before him. The Rhymer proceeded to make himself comfortable while he kept the rounded water hole in his line of vision behind and on the well with the line of the rocks behind and around him, that he had no fear of being seen by the wary eye of "him-that-walks-with-a-tree-on-his-head," as the fanciful red man calls the antlered elk. The place and the hour were productive of fancy. Around were the everlasting hills, and above stretched the gray arch of the eternal skies. The uncanny feeling was gone from the air, and in its place was a soothing, mellow "em whistle" condurion matched with a sense of preparation—an expectation of something about to happen, but something wonderful, and not terrible; majestic, but not awful. Nature was preparing herself for the working of a miracle—none the less marvellous because it is repeated over and over again—the miracle of the birth of a new day.

Struck by the marvel, Jupiter started for a moment on the top of Dos Herrones, and Orion shifting his hand on his sword-hilt, shaded his eyes to see what was to take place on his sister, Terra. But infinity cannot stand still, and they wheeled onward again in their planetary march, while a thrill of vague unrest stirred the bosom of the earth-goddess, as she waited for the first kiss of her coming lover, the Sun.

And then, from the sky above, from the air around, from the ether trim and some distant star, from every where, and from nowhere, comes a low, distant, plaintive note, rising, swelling, falling, echoing from rock to crag, and dying away in the pass below.

"O hawk! O heart! how shrill and clear, And shriller, clearer, farther going; How faint and far, from cliff and snow, The horns of Eblaunt faintly blowing!"

Nature bonds her ear to listen, as it comes again, like the low drawn strain of an Æolian harp, or the first doubtful note blown by the great god Pan from the reed he bent by the river. Once, twice, thrice it comes, borne on pulsating ether waves, echoing, echoing from cliff to cliff, note and echo so blended that the ear cannot separate the one from the other. In its evanescent strain are suggestions of all supernal music heard since the world began; the glad cry that broke from the lips of Mennoen's statue when touched by the first sunbeams of the dawn; King Olaf's wailing cry of wild, heart-broken wail that went shuddering through the vineyards and olive groves of the Mediterranean isles, announcing to a heathen world that the old pagan gods were dead, and the new Christ was come; the angelic sadness of that seraph strain that held the sin-worn Lancelot mute, as, before his rapturized sight, slow swam the Holy Grail; or the wild, defiant outburst of Scandinavian Thorr, challenging the new faith to battle, while King Olaf still went sailing, sailing up through Drontheim Florid.

With half closed eyes and parted lips, The Rhymer holds his breath to listen. When the last sweet echo has died away, he comes back to earth again, opens his eyes, and lo! on the crest of the rounded hill opposite him, outlined upon the sky and thrown into high relief by the faint pink glow behind, he sees, through the gray haze of the morning, the grand admittance of a mighty head, crowned by branching antlers, an arrow's flight from the tip to the tip.

Silently and spectrally, while he gazes, another giant head takes shape and form out of the curling mist, and another, and another, each materializing slowly and each more life-like than its predecessor, till the whole background of the sky is crossed and recrossed by the huge palmate horns, beneath which a vivid fancy almost distinguishes shapeless bulks which might well be taken for white, though those giant heads belong here. Here, he thinks, is a capital illustration of the way in which so many ghost stories take their rise.

Given a fantastic imagination prone to play tricks upon its more matter-of-fact brother, Common Sense, and surroundings a little out of the commonplace beat of every-day life, and what more natural than that the subjective should dominate over, or even usurp the throne of, the objective, and the afferent idealional be merged into the efferent sensational? By one who has not, like himself, been accustomed to the practice of cool, mental analysis, and has thus learned to recognize intuitively the line which separates illusion from fact, these ghostly shapes would be taken for real, instead of, as they truly are, mere phantasms of the brain, projected upon a background of fog and sky. In fact, the method of their appearance is proof of their unreal character. If they were solid flesh and blood, the tips of the horns would first be seen rising gradually over the crest of the hill, till the whole head came into view, as the white top of a ship appears over the curve of the sea, before the vessel herself swims into the watcher's ken. Instead of which the whole head comes into view at once; just as a dim, shadowy outline, then gathering form and shape as the actinic rays of fancy impinge upon the sensitive plate of the mental camera. As The Rhymer dreamily contemplates these eidola of the mind, and lazily smiles to think how a less keen psychologist than he might be duped by these airy visions, a long beam of light from the rising sun behind flashes over his head, breaks upon the slope opposite, the gray mist vanishes as by magic, and—by the spear of Nimrod! what he has taken for the idle stuff of dreams proves to be the veritable drove of elk for whose coming he has been waiting! Motionless they stand, within fair rifle shot—twenty-three of them, the largest drove of full grown elk he had ever, or for that matter, has ever seen. All noble, majestic fellows, too; not a runt or an ignoble head among them. So magnificent were the look, so free and wild, and in such perfect keeping with the scene, that for a moment there flashed through The Rhymer's head the insane idea of letting them go scot free; but the next moment the hunter's instinct of slaughter, or, it may be, the ganglionic nerve centers of the stomach, prevails, and the Sharps .44 rises slowly to the shoulder, steadies a moment, there is a pressure upon the trigger, a tongue of flame, followed by smoke, leaps out, the silence of the dawn is shattered by a detonation of sound which clashes and clangs from cliff to cliff, there is a rush of feet, forms, and a clatter of hoofs, and when the smoke has drifted away down the pass, the opposite slope is as devoid of life as when it first met The Rhymer's eye two hours before. As devoid of life, but its smooth outline is now broken by a shapeless russet bulk, and a thin red stream is slowly staining the brown shingle and scattered clumps of moss. Death must have been instantaneous, for the elk lies simply sunk upon its knees, and except that the head has fallen to one side, so that the antlers touch the ground, he looks as though he might be quietly sleeping. With lunatic inconsistency The Rhymer, who would have heartily cursed his luck had he missed his aim, feels a sensation of half regret because he did not. In a few moments, Ignotus having heard the shot, appears, picking his way down the pass, and in five minutes more he and The Rhymer are busily at work "graing up" their quarry.

"I heard 'em whistle," says Ignotus, holding his bloody knife between his teeth, while both hands tug at the tough hide, "and I knew from the direction they weren't coming my way, so I thought you'd be apt to get 'em. Rather early for 'em to be running, though; last year's calves are hardly weaned."

"Heard 'em whistle!" says the wild uncle which had filled The Rhymer's soul was nothing but the amorous call of a four-legged hee to his hairy love.

To this day Ignotus has not found out why The Rhymer, after gazing at him for a moment with a look of blank disgust, softly murmured, "Oh! that one were here to write me down an ass!"

Natural History.

BIRDS OF NORTHERN OHIO.

ADDITIONS.

CLEVELAND, O., May 31, 1883.

Editor Forest and Stream.

Having collected birds in this locality for about twenty years, I feel called upon to offer some comments on the list of "Birds of Northern Ohio" from my friend Mr. Ingersoll, which appeared in last FOREST AND STREAM, as well as to make a number of additions to his list.

Golden-crowned Kinglet—*Regulus satrapa*.—Very seldom visits us in winter, but is a common spring and fall migrant. Red-bellied Nuthatch—*Sitta canadensis*.—I have never seen it in winter, but it nearly always visits us in spring and fall, and at times in great abundance.

Brown Creeper—*Certhia familiaris*.—Is not a common resident, but in spring and fall and mild winters it is abundant.

Worm-eating Warbler—*H. virens*.—Rare migrant. I think less than a dozen have been noted in this locality.

Orange-crowned Warbler—*H. celata*.—Not rare during fall migration.

Kirtland Warbler—*D. kirtlandi*.—There are now eleven specimens recorded, six of which were taken within five miles of Cleveland, and two of which I shot.

Snow Bunting—*P. nivalis*.—An abundant winter visitor.

Hairy Woodpecker—*P. villosus*.—Common resident.

I will now add to the list:

Gray-checked Thrush—*Turdus carolinensis*, var. *ulmiei*.—Not uncommon migrant.

Great Carolina Wren—*Troglodytes ludovicianus*.—Rare summer resident.

Prothonotary Warbler—*Protonotaria citrea*.—I know of but one instance of its capture here.

Tennessee Warbler—*Helminthophaga peregrina*.—Rare migrant.

White-browed Yellow-throated Warbler—*Dendroica dominica*, var. *albifrons*.—Not uncommon on river bottoms, especially among sycamores.

Water Thrush—*Sturnus nactus*.—Not uncommon migrant. Connecticut Warbler—*Oporornis agilis*.—For the last two or three seasons I have found this warbler in considerable numbers for a "rare" one, having taken from six to twelve each year.

Lincoln's Finch—*Melospiza lincolni*.—Irregular spring and fall migrant.

Snowbird—*Junco hyemalis*.—Abundant in colder months.

Black-throated Bunting—*Pipilo americanus*.—Summer

resident; seemingly rare some seasons, and sometimes abundant.

Yellow-bellied Flycatcher—*Empidonax flaviventris*.—Rare migrant.

Great Horned Owl—*Bubo virginianus*.—Common resident.

Goshawk—*Astur atricapillus*.—Rare winter visitor.

Rough-legged Hawk—*Archibuteo lagopus*.—Not uncommon during cold months.

Golden Eagle—*Aquila chrysaetos*.—Rare.

Wild Turkey—*Meleagris gallopavo*, var. *americana*.—Formerly abundant here, but now extinct, except in heavily wooded counties.

Avocet—*Recurvirostra americana*.—Rare; have never seen but two specimens, both from vicinity of Sandusky Bay.

Stilt—*Himantopus nigricollis*.—Rare.

Northern Phalarope—*Lobipes hyperboreus*.—Rare migrant.

Red-throated Loon—*Phalaropus fulicarius*.—Rare migrant.

Red-rumped Snipe—*Macropodus griseus*.—Rare.

White-rumped Sandpiper—*Tringa fuscolinis*.—Rare migrant.

Red-breasted Sandpiper—*Tringa canutus*.—Rare migrant.

Willet—*Totanus semipalmatus*.—Rare migrant.

Solitary Sandpiper—*Totanus solitarius*.—Common summer resident.

Bartramian Sandpiper, Upland Plover—*Actitis bartramia*.—Common summer resident.

Wood Tit—*Turdus leucolator*.—I know of but a single specimen from this locality.

Night Heron—*Nycticorax grisea*, var. *viridis*.—Rare summer resident.

Whistling Swan—*Cygnus americanus*.—Not uncommon migrant.

Blue Goose—*Anser carolinensis*.—Rare.

Indiana's Goose—*Buteo calurus*, var. *hutchinsoni*.—Rare; given on authority of R. K. Winslow.

Gadwall—*Chaulelasmus streperus*.—Not common migrant.

Greater Blackhead—*Fuligula marila*.—Not common migrant.

Golden-eye—*Bucephala clangula*.—Spring and fall migrant; have seen them in cracks in ice on lake in mid-winter.

Long-tailed Duck—*Harelda glacialis*.—Not rare during cold months; abundant at lower end of Lake Erie.

American Black Scoter—*Brema americana*.—Rare winter visitor.

Violet Scoter—*Brema fissa*.—Rare; have only seen them in fall and winter.

Ruddy Duck—*Erisutora rubida*.—Not uncommon migrant.

Red-breasted Merganser—*Mergus serrator*.—Rare migrant.

White Pelican—*Pelecanus erythrorhynchos*.—Rare migrant.

American Jaeger—*Speotytoctes pomatorhinus*.—Very rare; I know of but two specimens secured here, both of which are in my collection.

White-winged Gull—*Larus leucopterus*.—Rare winter visitor. Given on authority of R. K. Winslow.

Kittawake Gull—*Larus tridactylus*.—Very rare visitor. Given on above authority; have never seen a specimen.

Black-throated Diver—*Columbus arcticus*.—Accidental visitor; have only seen one specimen, which was shot on Sandusky Bay.

These additions to the list published, are made from actual capture or possession of species mentioned, with four (4) exceptions, of which three are given above on authority of R. K. Winslow, and prothonotary warbler, which Dr. J. P. Kirtland showed me, giving location of its capture, etc. The list, as amended, is practically complete.

H. E. CHUBB.

"NEW ENGLAND BIRD LIFE."

VOLUME II.*

IT has become rather the fashion of late years in this country to publish works on ornithology in an incomplete form. The appearance of the first part or volume of some admirable work would excite high hopes in the minds of those interested in the subject, but time would pass on, and the desire to behold the completed work remain unsatisfied. We can think at this moment of half a dozen works which are known only by their fragments. The most glaring instance of the kind is the case of Baird, Brown and Ridgway's "North American Birds," of which we know only the land birds, but there are not wanting others in which the disappointment has been almost equally great. It is very gratifying, therefore, to be able to announce the completion of "New England Bird Life," the first volume of which was noticed in these columns (FOREST AND STREAM, Vol. xvii., p. 267, Nov. 3, 1881) soon after its appearance. At that time we expressed our views on the value of the work and its usefulness to the public, and a perusal of the concluding part shows that it is no less important than its predecessor. Indeed, in some respects it is much more so, for it treats in part of the water birds, a group—if we may use that term—which for many years has been sadly neglected. For, with the exception of what is said of them in the "Birds of the Northwest," nothing systematic has been written on this important division of our birds since the days of Audubon.

To treat the birds of New England from the Pyramide down to the end of the list in a single volume of 400 pages is a task that few men, either as authors or editors, would care to undertake, but Dr. Coues has succeeded marvelously well in giving the important facts with regard to each species. As may be imagined, there is no expansion of the biographical notes. Each bird is treated with the utmost conciseness, and yet the references, which enable the reader to look the subject up for himself, are never omitted. Notwithstanding this conciseness, one would know even if Dr. Coues's name did not appear on the title page, that he had a hand in the authorship of the work, for it abounds in those happy turns of expression and telling phrases for which he is so justly renowned. It is therefore delightful reading, and judged from a scientific standpoint, it is as excellent as we should expect a work of Dr. Coues to be. The importance of having put together in compact shape so that they can be readily got at the scattered mass of notes and records, which during the past years have been gathered by the large and ever-increasing number of New England collectors, can scarcely be over-estimated, and those who are accustomed to much turning over of books in their search for such records and notes, will appreciate what has been done for them in this respect by Dr. Coues and Mr. Stearns. It will be an agreeable task, did our

* New England Bird Life (Being a Manual) of New England Ornithology; revised and edited from the manuscript of W. Brewster, a member of the Nuttall Ornithological Club, etc. (By Elliott Coues) (under the Academy, etc., Part II.) Non-scientific Birds of prey Game and Water Birds Boston Lee & Shepard, Publishers; New York, Charles T. Dillingham; 1883.

space permit it, to notice in detail the contents of the present volume, but we must content ourselves with referring the omniscient to his pages, assuring him that he will find each one of them full of interest.

HABITS OF THE PANTHER.

I WAS much interested, as I presume many others were also, in the carefully written, and, as I believe, generally accurate account of the cougar, or panther (*Felis concolor*) by Mr. Livingston Stone, in one of the recent numbers of the FOREST AND STREAM. As a man who has written so rare and formidable a work is usually read with avidity by those at all interested in the fast disappearing denizens of our forests and mountains, I am tempted to add a few items of my own observation upon the habits and characteristics of this great cat, more especially as my experience in one or two minor points differs somewhat from the conclusions of Mr. Stone.

Seldom found very abundantly in any portion of our country, when compared with other wild animals of equal size, and still more rarely killed, unless by poison, the panther is nevertheless usually the first animal who disappears before the advance of civilization. They are extinct in most localities long before the deer or bears have suffered any serious diminution in numbers. Upon many portions of this coast, however, panthers are still frequently met with. It has always been a perplexing matter to my mind why the pioneers, many of whom were well acquainted with the animal as found in the Eastern forests, and knowing it there as the cougar or panther, should have straightway set about calling the same animal which they found here the California or mountain lion. Certainly in appearance the two panthers are so nearly alike that no one would dream, upon comparing them, of regarding them as distinct species.

As to their local name, the ignorance of the Eastern animal prevents me from comparing them in that particular. Only upon one point I can speak, and on that so far as my knowledge extends, and also from the assertions of many old hunters and trappers who were perfectly familiar with them. The panther of the West coast never indulges, for his own entertainment, in those fierce, cat-like screams with which his Eastern brother occasionally makes the night hideous and lonely. I have heard of the latter's savage yell as far west as the Raton Mountains on the Santa Fe trail, but although I have hunted and camped for weeks and months at a time all through the Sierra Nevada coast and Cascade ranges, from Washington Territory and Oregon in the north to the Mexican line of San Diego in the south, in many parts of which the panthers were so abundant that their fresh tracks could be seen everywhere, I have always listened in vain there for their characteristic cry.

The more I learned of them in their native haunts the more skeptical I became in regard to their ever willingly attacking a man. I have known them on several occasions to follow persons a short distance, and I have seen wolves do the same thing, especially when I have been picking in freshly killed meat, but I do not believe that in either case they meditated an attack. In one instance, in the Cascades near the Hood, I knew a panther to jump at a man as he lay at night in his blankets, but as soon as the man partly arose and shouted for assistance the animal bounded into the brush and disappeared. In talking it over we all came to the conclusion that the panther had seen the man move under his blankets and had mistaken him for some less formidable antagonist, and that when the deception was revealed to him he threw up the job at once. As for those stories we read occasionally about their chasing a man on horseback for several miles, in which the writer assures his readers that he only escaped being devoured by being providentially mounted upon the fastest horse in all that section of the country, they appear so absurd to all hunters acquainted with the animal in question that they are looked upon at once as extracts from "Dashing Dick of the Wild West," in the dime novel.

That the panther will run from and tree before the smallest yelping cur that can be induced to follow his trail is true, but I am satisfied that instinct in some mysterious manner warns them of the hunter behind the dog, and that it is the latter only which they hold in fear. This I have demonstrated to my own satisfaction, and have had it corroborated also by others. Upon one occasion I followed a panther trail that was being chased by a settler's dog in the dense fir, oak and spruce forest through which the Chascanine River, in Oregon, runs, and although the plucky little cur treed him at least a dozen times, I did not succeed in obtaining the slightest glimpse of the brute, and after chasing him from early dawn until late in the afternoon through the most terrific wilderness of almost impenetrable thickets, immense fallen trees and giant ferns, I found myself so completely winded up that I was forced to relinquish the pursuit from sheer fatigue.

In this instance the panther must have paid but little attention to the dog after he treed, but put in the time listening for my approach, and as soon as that was ascertained he would jump at once to the ground, continue his flight for perhaps half a mile or more, when he would again take to a tree and the same thing would be repeated. Two or three times, where the ground was particularly favorable, I was near enough to hear him as he left the tree, which he seemed to do just as readily as if there had been no dog there.

In regard to their manner of climbing, they ascend the immense trees near the mouth of the Columbia, which are frequently 300 feet high, and 60, 80 or even 100 feet to the first limb, precisely as a cat would climb them, and when wounded, will sometimes go far up the trunk, where they are found in a well-grown forest, where from the sign it was evident that two or more of them had been gatholing and like kittens scurrying around in the grass, and then bounding against the trunk of a tree, at a point at least ten feet from the ground they had ascended apparently on the run, tearing off great pieces of bark, and leaving claw marks a foot long on each side.

Although in some localities spend the day in lying upon the limb of a tree, I think they always prefer rocky ledges and caverns for that purpose, where such are accessible. In San Diego, near the Arizona line, the rugged, rocky ranges furnish admirable retreats for panthers, there usually called mountain lions; and although not so abundant, that are, I think, more frequently shot than they are further north, for reasons that will soon be explained. Like all of the cat tribe, they are much to be warmed, and upon days when it is rather cool in the shade, they frequently come out of their lairs in the middle of the day and lie upon the rocks near by to bask and drowse in the warm sun, and as the ranges there are generally very sparsely timbered, they are occasionally discovered by hunters, when the

chances of getting within shot are better than under almost any other circumstances. But for all that, they are animals that are seldom shot, and very few abundant they may be, and their disappearing so rapidly before the march of civilization is a mystery that I can only solve by the conclusion that, being such a large and entirely carnivorous animal, they are immediately affected by the least thinning out of the large game, and are driven by hunger to seek places where the rifle has not begun its deadly work, unless, as they seem to have done on the McCleod River, they turn their attention to the stocks of the cattle.

Many of them are poisoned by the sheep and cattle men of the southern counties when their visits to the flocks or herds become too frequent, and I have often seen their hides nailed to the walls of the lonely cabins of the stockmen there, and, upon inquiry, were found to have been poisoned in at least three cases out of four.

I entirely agree with Mr. Stone in the belief that a panther would be no match for a grizzly. It is not possible that their superior night sight might sometimes make them more than a match for a black bear, but I can only conceive of their being able to kill a grizzly by fastening upon him in a position where the bear was unable to inflict any injury upon them, as a single, well-directed blow from the paw of a full-grown grizzly will crush in the ribs of an ox, and would, I fancy, leave but little light in any panther.

With a single incident to illustrate the idea that it is the hunter and not the dog the panther fears, I will close this already lengthy article. In the summer of 1868 I was in Port Gamble, on Puget Sound. A trail leading to Port Madison, eight or ten miles distant, was the only land route open in any direction, and that ran through an unbroken forest the entire distance. One of the workmen at the saw mill at Gamble was returning along the trail from Madison one afternoon, having with him a favorite little dog, who was trotting along a few yards in advance, when a panther bounded suddenly from the brush, and snatching up the dog, disappeared with the quickness of thought on the other side of the way. The man stated that it was so quickly done that he seemed to "see the dog without stopping in a flying leap across the trail."

FORKED DEER.

SAN FRANCISCO, May 15.

CARDINAL GROSEBEAK IN LOCKPORT, N. Y.—While collecting specimens last Saturday, my son shot a male cardinal grosbeak and female rose-breasted grosbeak. There is no doubt that the cardinal was a wild bird, as it showed no signs of being caged. This is the first I have known to have been taken so far north, and I think it is a rare occurrence.—J. L. D. (Lockport, May 17, 1883).

FLORIDA GALLINULE IN NIAGARA COUNTY.—On May 8 my son received a Florida gallinule to be mounted which was shot at Wilson, on Lake Ontario. Is it unusual for this species to be found so far north and inland?—J. L. D. (Lockport, May 17). [The Florida gallinule frequently breeds in Central New York. See FOREST AND STREAM, Vol. vi., p. 52, and elsewhere.]

A BLACK EAGLE.—Richmond, Va., May 24.—On the 19th inst. there was shot at Dutch Gap, this State, a splendid specimen of the black eagle, measuring six feet from tip of wing and three feet from beak to tip of tail. It has been preserved and mounted by W. E. Pusey, a taxidermist of this city.—J. H. T.

Camp Fire Flickerings.

"That reminds me."

"THAT reminds me" of how Mae shot ducks on a little pond a few miles back of Nyack last fall. Mae and a friend had just got down into the pond when they saw a flock of some five or six ducks sitting in the bushes a short distance from where they appeared to have taken notice of their boat. It did not take these mighty hunters long to lay their plans for the battle, which were to fire two barrels on the "sit" and two when they arose. They both fired, but no ducks flew up, but there was a great amount of splashing. Of course they thought they had knocked the whole flock out and they commenced to shoot the cripples. Just as they had picked up their first two, they were startled by loud cries from the bank, and on looking up saw the vision of a six-foot German woman, who was running about the bank crying out excitedly about her duck. But here we must draw the curtain, for mere shame sake, and I need only add that they paid a dollar or two and did not get the ducks either. Mae has not shot much since that trip.

NIAGARA.

Here is a story of the Newfoundland seal fishery which illustrates the "luck" of the business. There are many steamships engaged in the business off the Newfoundland coast. They engage the fishermen to work on shares. The fisherman is to get one seal out of every three captured. This looks to be a fine thing for the fisherman, but it is not. The fisherman is charged storage for his seal, he has to pay a share for the boat he uses, for in many cases the fishermen are poor and cannot provide their own "kit." Then he has to pay four or five pounds for the loan of a gun. There is still another way in which money is made out of the fisherman. He has to pay ten cents for every shot-hole he makes in the pot when killing the seal. There is a good story told about this charge for holes. A fisherman one day shot a seal, making twelve shot-holes in his pelt. He took the skin to the company, and was told that it was worth \$1.10. When he came to settle up he found that he had been charged \$1.20 for the holes in the skin, and that he was indebted to the company to the extent of ten cents by the transaction.

H. S. S.

I met Richard Roe the other day and asked him if he had had any snipe shooting this spring. "Oh, yes, all I wanted, but if there is any bird I can't hit it's a snipe. Had all the shooting I wanted though. There was one snipe out our way and I have hunted him all spring, until some darned fool came along the other day and killed him."

CLEVELAND, Ohio.

Ward had been hunting for nearly two hours, but without success. His old muzzie loader would not go off. After snapping about twenty eels he saw water in the tube and soon drew out a large tobacco quid.

W. K. P.

ATHENS, Pa., May 24.

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such notices?

AN ADIRONDACK EVENING.

THE deer was walking along in the sand. Now he stopped and lifted his head into the air, now walked on again. Noiselessly the canoe ran toward him. I could not tell that it was moving, or could I hear the least sound from the paddle, which sunk deep into the water, was passing quickly to and fro. I well knew the skill of him that held it, and that on me alone depended our success.

Nearer and nearer we glided. The deer had not seen us yet. It was dusk. The last hues of the sunset were fading in the west, and darkness was fast settling over the lake. The boat was not yet plain from the shore, but I could clearly see the outline of the deer. He stopped and raised his head again. He saw the canoe now. Intently he watched us. Still nearer we went. He did not move yet. A few rods more. He jumped back. It was a broadside. I raised the rifle and pulled. He staggered an instant, then plunged into the woods. Hank saw the canoe flying toward the spot. There were the footprints where he had jumped, sank deep into the sand; and there was something else—yes, it was blood. More on the grass, a drop on a birch leaf, more on a fallen tree. A little further, and there the deer lay dead, with a bullet through his side.

"By Jove, Hank, look at those horns."
"Yes, Professor, he's a big gun."

It was quite dark when we reached the pines. There was no time to build a hut, but the night bird fair to be a clear one; so after dressing and hanging up the buck we prepared to sleep. Just as they rested their heads on the point, a tub-basin of clear, sparkling water, glittering sand, and a bottom, bright moss hanging thickly upon its sides, and a little stream flowing to the lake. The water was cold and delicious. The soil through which it rose impregnated it with mineral properties. This was our beverage; the flesh of the deer our food. When we rolled ourselves in our blankets at the foot of a lofty pine we were in no mood to sleep. We were just as restless when the sparks rose over the camp, the sparks rose high among the trees, then taking a blazing brand, I set fire to an old dead trunk that stood alone upon the point. It had been a lofty pine once, but the lightning had shattered it, the wind had wrested away its branches one by one, and the old trunk had been left standing there to be the camp-fire of two hunters, and a royal camp-fire it was, the flames rising high into the air, and the sparks flying over the lake, where the fire was lighted far around. Long after Hank had fallen into slumber I lay there in reverie. The sky was clear and studded with stars. Here and there, through the openwork canopy of pines, I could see them.

How silent and peaceful the lake was as it rested there in the bosom of the wilderness just as it rested centuries before, just as it rested when Columbus discovered America. It looked to me as it looked to the Hurons years ago, as it would have looked to Hendrick Hudson had he penetrated to its solitude, or to Burgoyne when his army was marching to its grave near by. Might it not have been the same when Troy fell? When Romulus laid low the walls of Rome? When Cæsar was murdered? When Paul preached at Corinth?

Thus I mused as I gazed, out upon the beautiful sheet of water, illumined with weird distinctness by the burning pine. I imagined it a lake of old Thessaly or Greek Aegædia; the woods an I-beams around the haunts of satyrs and nymphs, and the noble Raquette near by the home of some old river god. Diana might have basked here and bathed in its secluded waters. I fancied I saw I. Draydons come out of their cave, and glide away through the forest, and I heard the hoarse laughter of the satyrs, and then, out of a little crystal spring, rose a nymph of fairy grace who danced away over the mosses.

There appeared to me to be a new beauty in that old mythology of the ancient world, that idolatry which peopled every mountain top, every winding stream and crystal fount, every forest glen with gods and goddesses, and fairies, and sprites, and marvel that the beautiful imagery and noble humanities were so deeply rooted in the Grecian heart. It was the worship of God in nature—a worship instinctive to man. That old form of it has long since passed away. I stood in imagination upon the Athenian Acropolis, and saw the ruins of the Parthenion. In the calm beauty of the Grecian night, the moon poured a flood of golden light over the broken columns, and the white faces of the pediment statues seemed to move, the dull, cold lips to speak, and all to say: "Great Jupiter is dead."

I gazed out upon the mountain lake again, and there, in the deep silence of the Adirondack night, the water, the trees, the hills, aye, the stars far above, spoke to me and said, "Jehovah endureth forever."

A QUEBEC HUNTING GROUND.

THAT part of the Laurentian range in the Province of Quebec, which is situated directly north of the ancient city of Three Rivers, is one of great interest to the sportsman. There are several lines of communication; one by taking the railway from Three Rivers to the falls, and another by driving directly in a barouche from Louiseville, Yamachiche or Pointe du Lac, which places can be reached from Montreal in three hours by the North Shore Railway, or by driving direct from Three Rivers, passing by the St. Maurice Forges. This latter place enjoys the distinction of being the first place in Canada where iron ore was smelted, this having occurred in 1757.

As the drive through this beautiful district is very interesting to the student of geology—many traces of the glacial period are to be seen. The roads are excellent, except in the immediate vicinity of the villages above mentioned, where the clayey nature of the soil causes them to be somewhat heavy in wet weather. A drive of twenty-five miles brings the sportsman to the base of the Laurentides, and in close proximity to the lakes. Here the forest is thick, and close to the water, of course, he found useless, and recourse must be had to the canoe and to walking.

The lakes are innumerable and are swarming with trout; others are filled with bass, mascalonge, pickerel, etc., many of the lakes have never been fished at all, and brook trout are caught weighing six pounds, while the "lakers" or lake trout attain a weight of twenty. For about three weeks in

built to my order. I found upon trial that I could do better shooting with other brands and felt it to be my privilege to use them. I am now using a 35-90 Winchester, and, notwithstanding the company's advice and the dealers' "pledges," I feel it to be my privilege to use such ammunition as I find gives me best results. The fact that our breech-loaders admit the use of ammunition that can be prepared by most people who use them is one of the strong points in their favor.

I have enjoyed good opportunities to observe and compare the work of muzzle-loaders and breech-loaders on game, and as "a specimen brick" would briefly state the results of two trips after deer by parties from this section. During the first trip five of our party used muzzle-loaders and five used breech-loaders. During the second trip four of our party used muzzle-loaders and four used breech-loaders. Time of each trip about three weeks. I think the aggregate of skill on the side of those using the muzzle-loaders at least equal to that on the other side. For every deer killed by a muzzle-loader during those trips, five were killed by the breech-loaders. I killed with a breech-loader on these trips, ten deer, five of these I shot dead, two were wounded, and three were missed at the first fire. Of the latter four would have escaped had I been using a muzzle-loader.

It cannot be claimed that the failure of the muzzle-loaders on these occasions was owing to luck or lack of opportunity. I have a vivid recollection of the side of those using the muzzle-loaders of our party after he had sat behind some rocks and snapped a number of caps upon a fine muzzle-loader that refused to go, with four deer in full view peacefully chewing their ends within six rods of him. (Ed Maj. Merrill been a member of our party and had attempted to champion the muzzle-loader around our camp fire the evening after this fiasco, he would certainly have cited himself to the danger of being "blown up" by the most dangerous sort of an "explosive." The close of our hunt furnishes a fine opportunity for those wishing to secure first-class muzzle-loaders at a bargain. But my intention was to propose a match only. I am quite anxious to bring this about and will agree to use factory ammunition if there is any hitch upon that point.

GASSEVOORT, May 21.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

AN ANGLER'S REST.

IN MEMORIAM LORENZO PIOTTY.

"After Life's fever he sleeps well."

Whose name alone has come to the back-slip

And to the mountain breeze

Scattered her favors far and wide,

Attuned her voices clear;

But a void in all their seems—

As we wander, roid in hand,

We miss the ever kindly gleams

Of his eye and grasp of hand.

A "quiet eye" and true he bore.

Fair mirror of his heart;

He loved the dotted meadow more

By far, than busy mart,

And mountain pine and hemlock seem

To sigh in sad refrain.

As they shade the labelling brooklet's gleam,

"He ne'er will cease again!"

The May fly (o'er the silted "deep")

Whose name alone has come to the back-slip

Now tempts the hasty trout to leap

Till its brief life is past.

The glowing coals, the camp-fire glows

With ever welcome grace,

But, from his new and long repose,

He comes not to his place

No huntsman's horn, no angler's glee

Can rouse him from his sleep,

But, in our stricken hearts, may we

His "memory green" ye keep!

A-field, or by the stream, he left

No "blaze" of shame, or grief,

Save a name unquelled and dear.

One craft's Bayard indeed!

Time's silent stream on, ever on,

Unheeded by him flows—

Is he not in that brooklet's own

Through "seasons" free and "close."

We sign the cross upon his grave,

With rod of true Iarlan,

And, as we fish, on him we crave

Perpetual light may shine.

O. W. R.

QUIET SPORT.—V.

BY MILLARD.

CAME the rain which we expected from the confident prognostics of the guide Rufe. He knew it from the position of the knees and from the unusually bright color of the full moon. He was more certain of it from the unusually dull color of the waning moon. He said that the moon sometimes reminded him of men he had known, who were brightest when they were fullest, and might dull and dim at other times—but at any rate came the rain.

A low and distant rum in the early morning and a southing among the rocks were the first forerunners, a bright flash, and then came the thunder with its multiplied echoes in quick succession; a wild burst from the northwest, and the storm was here.

"Shut up your doors 'tis a wild night."

Though it was to be a day indoors, surely we could find some consolation in the fact that we were well housed for the present, and not obliged to chance a shanty which, in spite of all our precautions, might leak.

Uncle Phil's library was soon exhausted; whist and casino proved a bore; the morning wore away; noon-time came; still the rain came down, drizzle, drizzle, drizzle, and we longed to get once more into the stilling under the big eaves, among the wild flowers and wilder birds and fishes. But at last the clouds broke away, and the sun showed his face in the west, giving promise of a bright morrow.

Dick during the day had rigged up a trolling outfit, and with Ward took a few spins across the lake and landed several large lake trout, which proved an acceptable addition to Ann's store. We were well pleased with the novelty of trolling, which to him was a new method of fishing. He had lost a lake trout which had captured his

trul, and afterward he had fastened on to and landed the same fish. He knew it to be the same, for it bore the marks of a recent skirmish.

"Such things are of frequent occurrence," said Roy. "Many an angler has caught trout or other varieties of fish and found old hooks embedded in their jaws. I was fishing for weekfish with an old partner of mine, Ed. Hulse, in August, '78, off Curtis's place, in Jamaica Bay. Now, Ed. rarely let a fish go away after hooking it, and if one did break loose his escape might always be attributed to some weak spot in line or leader. On this occasion he had hooked a weakfish and he reeled him well up toward the boat, when the fish broke loose, carrying with it hook and about six inches of the leader.

"The accident was forgotten until sometime during the summer of '79, when fishing off Forked River, in Barnegat Bay, Ed. hooked a fish that I do not think he ever landed here. But she was a beauty; long, broad-shouldered, and how she glistened with gold and silver as she came out of the water into the sunlight.

"How do you know it was the same fish he lost in Jamaica Bay a year before?"

"Ed. took this one home not suspecting in the least that he had ever met her ladyship before, but when the servant came to clean the table she said, 'Mister, I think I know seed the loakes of this. Faith, it's full o' little hooks. Begorra, I've pricked me fingers in a dozen places, bad cess to it.' Ed. examined the fish and I'm a sinner if he did not find several hundred small hooks, and every one of them was stamped E. H."

"Of course you are a sinner in my estimation," said Ward, consequently I'm not compelled to believe your fish-hook story. Still you will not doubt that I might not come to believe in it as earnestly as you do in your politics. It reminds me of the Scotchman who, being unable to write, obtained the services of a friend as an amanuensis. After dictating the local news and inquiring after friends and relatives he said, 'Tell Rob I caught a salmon this morning that weighed thirty-nine pounds.' The scribe, looking up, said, 'Why, Andy, you've caught a salmon of that weight in your life, much less this morning, for you have not yet a line this blessed day.' Archie answered, 'Matters a don; per' er don,' and down it went, and I have but little doubt that when Rob and Archie met Archie told the story of his fight with that salmon, and Rob wished he had been there to see, but I am willing to make all due allowance for exaggeration so far as fishing is concerned."

"At joking aside, I am ready to admit that the angler may sometimes give a rosacule hue to his achievements, but it is never beyond what he truly feels and believes, for fish stories to the contrary, the angler has no more license to draw the long bow than has the lover of any other sport; nor does he, though he may be an enthusiast."

"You surely don't wish me to understand, after your fish-hook story, that the best of anglers don't stretch the truth and frequently brag it?"

"What I mean to say, and do say, is that you nor I would not vary from the truth were we talking of business in town or sport in country. We would not be justified in either. There are enough dissemblers, to use a mild term, without our assistance. Angling is a gentlemanly recreation, requiring an imbore love of the exercise, masculine and sensible. To many it is a struggle for existence and becomes fishing, while to others it is a display of skill, finesse and slaughter, and a proving that they are theoretical and practical hogs, who would never give a hint of any information they might acquire which would help their best friend to capture a fish which they themselves might otherwise catch."

"You will admit in your heart all quietly to yourself that the majority of anglers are rather disposed to tell big stories; that they are lazy and shiftless, and all that sort of thing, won't you?"

"I'll admit nothing of the kind, not even to myself. Perhaps fellows who go fishing are too often what you describe, but the angler is a different person. The day has passed for him to bear the reputation of being lazy and shiftless. The class of men who have gradually come to the front as votaries and experts with the swaying rod has worked a self-renewal and change in the estimation people hold of the sport. You know the saying, 'Tis not all of fishing to catch fish.' There are other reasons that prompt him to go to lake and stream. Some, I know, go for a grand spree. Theirs are familiar faces in pool rooms and at bars, where they will 'back' dice with graceful turns of the wrist, and win or lose, swallow its consequences with a smile; but little or no joy have they for the melody of running waters, the cold lake, the beauty of the dawn, the prairie or the mountain, nor for any of the sights and sounds that gladden the eye and ear of angler or hunter."

The ideal sportsman is modest and reticent, except perhaps when among the genial enthusiasts about the rod and reel. "His may be a heart that every hour runs idle, yet never once his gone astray." His lendings are to everything good in thought, in speech and action. His best loved sport is unalloyed by any debasing tendencies. It involves a healthy body, a calm mind and steady nerves.

With him there is no spirit of rivalry, and if there were, still there would be no jealousy, no taking advantage in any manner, no boasting of his achievements as an angler. He modestly keeps his score to himself if he is a good one, and does not engage in the display of self-interest and blameworthy of the flies. Ill humor can never be numbered among his foibles, nor can it be said of him "he sucks in melancholy as a weasel sucks eggs." He is an optimist, always cheerful, and gives his companions the benefit of it.

A little boy was asked if his papa feared the Lord. His answer was "Yes, I think he does, for every Sunday morning when he goes out he takes his dog and gun along." Our sportsman would accede to a similar reply, "I am always willing to devote one day in the week to thinking and thinking, and that day he keeps sacred."

He is appreciative of the beauties of nature. When the horizon gleams with the coming of the new day, and the west is radiant with all the colors of the sky above the sunset, when the lake is illumined with the silvery sheen of the moon, or at mid-day when tree and cloud and passing bird are pictured on it as a spring picture, or at twilight when the moon, or autumn revels in her gorgeous hues, he sees in nature something richer than anything in the world of art.

The untiring warbling of the larks, the music of the dancing waters rising in a thousand liquid notes, the golden buttercups, the shy forget-me-nots, the daisies and violets, the sunshine broken into fragments as it comes stealing and peering through the leaves, are to him sources of inestimable pleasure, and he pays his willing tribute to divine goodness.

ON THE BARTIBOGUE RIVER.

THE Bartibogue is one of those famous streams which empty into the lower Miramichi. Over the Tabusintac, chief of all New Brunswick trout rivers, the Bartibogue has once decided advantage in its greater accessibility. It is within a few hours' drive of the towns of Chatham and Newcastle. In the last of May or early in June sea trout come in from the gulf and work their way down grand stages up most of the smaller rivers draining the Miramichi basin. Not all these streams, however, do they look upon with equal favor; there are several of special beauty which they never condescend to visit. But the Bartibogue is one for which they show a marked partiality, and as it is a delightfully unobstructed stream, and affords easy wading almost everywhere, and with a few well-run trout is generally initiated by a trip to its sunny valley.

It is a profitable as well as honorable distinction to be the first in the field, for the earliest fish are among the finest, and are least discriminating in the matter of flies. Their favorite for the first few days is a large red and tawny fly with white wings. Later in the season, under the influence of fresh water and civilization, they begin to evince more individuality and shrewdness in their tastes, becoming much like any other trout.

Ambitions, therefore, of being the earliest to greet the new arrivals, on the 27th of last May a party of three, the writer included, left Chatham at daybreak for the banks of the Bartibogue. We represented three professions whom difficulties are never known to daunt—we were an editor, a politician and a pedagogue—so that success of some sort would attend our efforts, and we were fortunate in our wading. One day, of some ten miles through the white and misty morning, which was fast breaking to blue and promising a day more clear than we desired, brought us at last to a narrow, green lane leading a tortuous mile or two through marshy grounds to the river. By the bank we unharnessed and tethered our horse, intending to make a day of it in this vicinity. The spot was wading, and the best on the stream for spring fishing, "a mile above" head of tide, and we confidently anticipated a day of successful sport.

The editor and the politician, whom for brevity we may designate Ed. and Pol., promptly got their lacewoods together and went to work with characteristic alacrity; while I sat splicing my pet greenheart with great deliberation, in no haste to wield it on new waters. My friends were habitually easy-going, and I was no exception. I saw that my generousity we have experienced, when friends of mine, we value, we approach with open cordiality, but for my own part I confess to a feeling of reserve, I am loath to make too ready advances, when coming in contact with strange waters. However, Pol. had scarcely made a cast ere he struck a half-pounder, and landed it. It was not a sea trout, but an ordinary brown, and, as it turned out, a solitary wanderer, but a noteworthy awakened my energies, and I rushed into the fray. There was another rise at Pol's feet, and he began insolently jeering at the Editor and the Pedagogue; but it was only a chub this time, and we crowded over his prompt humiliation. How thoroughly every square inch of this famous pool was whipped, Ed. climbed into his monstrous rubber trousers the was a fastidious man, after the manner of his kind, and a dreaded wetting his feet, and he was not content to do this, but he was to proceed in all directions, but in vain. Not another rise blessed our vision. Then the eyes of Ed. and the Pedagogue were opened to the dreadful fact, that for the first time on record this pool had gone back on its reputation, and we made a move for fresh fields. But the Politician could not realize it. He had never heard of such a thing as going back on the reputation of a pool, and he was to proceed in all directions, but in vain. Not another rise blessed our vision. Then the eyes of Ed. and the Pedagogue were opened to the dreadful fact, that for the first time on record this pool had gone back on its reputation, and we made a move for fresh fields. But the Politician could not realize it. He had never heard of such a thing as going back on the reputation of a pool, and he was to proceed in all directions, but in vain. cestasy. He threw himself prostrate on the turf, and I, grasping his design with a pedagogue's swift intuition, rushed up and seized him by the feet. As I gently raised his heels the waters found their exit. He crawled laboriously out of the now tenacious garments, and we resumed our march.

On reaching the pool by whose borders we had left the Politician, we at once perceived that his faith in these trusted waters had undergone the rudest kind of shock. Not one other fish, trout, or club or red-fin even, had patronized his moat since he had put on a "retroactive snapper" for the lunch hook, which he found not to have done himself down on the young sward, where we found him spearing beetles with a pin. This cruel occupation had served to beguile his hour of vacancy, but we felt called upon to read him two severe homilies upon it. He should rather have sought, near at hand, the gracious shade of the hudding alders, there to breathe his somewhat prosaic-colored hair with the tender ferns and addest-tongue. But this pretty pastoral opportunity had all gone upon him. Alas! the dust from our crumpled anticipations will rather blind the best of us.

However, it was still left us at least to dine like heroes. After having faced this duty bravely, the sky once more looked bright for us; we again inhaled with some sensations of pleasure the fresh spring-scented breeze. We even laughed, and attempted a feeble pun. But this last was a rash experiment, and the gloom again fell. We arose, and fled to our carriage in precipitous shame. A half hour more and we had reached the head of tide, and adjourned to the waterside to have a cast for bass.

Here a slender spit of sand and gravel runs out some distance into the stream. At the extremity thereof Pol. stationed himself, Ed. and the Pedagogue standing to either side. The tide was full, the surface just ruffled by a light breeze, and the sky was darkening up with threats of a thunder-shower. The Editor and the Politician threw up the accepted bass-fly, a starting incongruity of green and scarlet, with flaunting white gossamer wings. For myself, as the modern pedagogue has an ineradicable leaning to independent research and experiment, I resolved to tempt the bass with a big red hackle, with a light yellow on for drop. As my flies touched the water the thunder growled above us, and the first big drops pattered down on the gleaming level. Instantly there was a rush along the water's surface, and a goodly number of red hackles. His play was soon over, and he called him in I heard the same welcome sounds in the neighborhood of my companions. These bass rise a yard or so distant, and rush upon the flies impetuously, their dorsal cleaving the surface instead of rising from beneath or leaping at and striking down the victim. As I lovingly examined my prize ere consigning him to the basket, I judged him something over two pounds; then I saw the Politician waving aloft another of like development. At the same time we heard Ed. ejaculate: "By the ghost of my great-grandma, we've hit it!" and he landed a small sea trout. He had hooked a bass, too, on his tall fly, but his drop had been taken by the trout; and during the struggles of the latter the bass had made good its escape, thanks to the tenderness of its mouth.

By this time we were in the midst of a heavy thunder storm, but paid it little attention, having none to spare from the accepted bass-fly, a starting incongruity of green and scarlet, with flaunting white gossamer wings. For myself, as the modern pedagogue has an ineradicable leaning to independent research and experiment, I resolved to tempt the bass with a big red hackle, with a light yellow on for drop. As my flies touched the water the thunder growled above us, and the first big drops pattered down on the gleaming level. Instantly there was a rush along the water's surface, and a goodly number of red hackles. His play was soon over, and he called him in I heard the same welcome sounds in the neighborhood of my companions. These bass rise a yard or so distant, and rush upon the flies impetuously, their dorsal cleaving the surface instead of rising from beneath or leaping at and striking down the victim. As I lovingly examined my prize ere consigning him to the basket, I judged him something over two pounds; then I saw the Politician waving aloft another of like development. At the same time we heard Ed. ejaculate: "By the ghost of my great-grandma, we've hit it!" and he landed a small sea trout. He had hooked a bass, too, on his tall fly, but his drop had been taken by the trout; and during the struggles of the latter the bass had made good its escape, thanks to the tenderness of its mouth.

CHARLES G. D. ROBERTS,

NEW BRUNSWICK.

would be larceny in another to take it. So, if I shoot down a wild bird the bird is immediately mine, and it will be larceny for another to take it. If I entrap a bird in a cage I have this qualified property, which is protected by the law, and yet if the bird escapes or I turn it loose it belongs to any one who can entrap or shoot it.

From these principles it would seem to follow that in the "fish" question put by your correspondent the passer-by who took the fish from the hook was guilty of larceny.

G. D. T.

ATHENS, Ga.
[The only weak point in this conclusion would appear to be the tenacity of the claim of possession by the man whose hook was down. Every angler knows from an experience more or less bitter that there's many a slip betwixt the hooking and the creeling; and the pivotal consideration is then to determine just the point when the law would adjudge that an angler had acquired "possession" of the hooked fish. We confess that we never at all seriously seized the question of the prize until we had it safe in the basket. For a case in point see the story by "Verax" in our issue of May 10.]

WITH HACKLES AND GENTLES.

"When the southwest wind blows,
And the clouds, as they pass,
Are varying the shade
And the wide-swinging grass;
When the rippling waves hurry
Across the deep pool—
Ah! this is the time
To be steady and cool.
Then wave your rod deftly,
Your flies must not whittle,
But fall on the streamlet
Like down of the thistle.

NATURE is much good advice in the above—in fact, a gentle cast of the fly and a cool head and steady hand after "striking" the fish is the *sine qua non* in trout fishing. "Whipping" a stream is an ill term for an angler to use; it is the crude practice of a novice to use his rod like a whipstock and his fly like a "snapper." In the true angler's outfit and in his surroundings there is a suggestion of wariness, of gentleness and of consummate skill. See his well-balanced rod, his fine and modest-lined line, his ready reel and tidy fly! See, also, the clear stream, the "daisy-dotted meadow" and the hudding hedger. In yonder "deep" what lusty trout may await his deft cast, and what trial of skill and fine tackle may succeed. No sport is more in sympathy with Nature—if I may use the term—than is angling; full of gentle, graceful, subtle action, with no "hue and cry" with the visible struggle of the victim, till he is in hand or gaffed, and receives the merciful stroke at the hands of his victor, whom he has fought against so nobly.

How differently we feel in fishing a new and (to us) untried water than we do when we cast upon a familiar stream. If "alone and unattended" we make ready and start upon a "voyage of discovery," measuring distances and depths with "practical eye, now and then with a fish, perchance, but, on the whole, rather 'restless and unsatisfied, but there may be a better 'stretch' or 'pool' beyond. The chances are that our attention is distracted by strange and beautiful bits of scenery, and that we grow uneasy in the "division of the mind," and our reel remains light in consequence thereof. Nonetheless we try the temper of the trout, we have upon a "braw" rise and, ultimately, a bonnie fish, see many new beauties, and, at last, after a return, decide where to concentrate our angling energies at our next coming. All this is very pleasant and, as our next meal does not depend upon our catch, satisfactory.

Heavy creels are not always more so, and "this reminds me that 'once upon a time' I went a-fishing and had a stiff ten-mile tramp to the chosen water, and the like (it seemed quite double the distance) to return. With a full reel I started, and for some time I did not get a rise. Ever long another sense was ministered unto, and I soon found that my hip bore a weight of 'flat, stale and unprofitable' fish—corruption had begun its work and ended it by the wayside, where my day's catch I speedily dumped. The heat and a rascally "blue-bottle" had fouled the fish, and I tramped on with "lowered crest" and a reel still heavy with cynipines. It then, and for long after, seemed "hard lines," but at this point, in the disposure of the "outing," rather than the discomfort and the disappointment are "to the fore," and memory recalls many joys connected therewith. I was taught a lesson thereby, and have never fished on a hot day since without taking precautionary measures to preserve my catch sweet and sound. It does not pay to tramp far and fish long in mid-summer in this climate.

Of all fishing give me the "merrie May" fishing and its perfect accompaniment, the lush grass, singing birds and flowers. Hot suns have not burned the fair face of nature, the streams run clear and full, and the lovely epheura dances over the water in its short-lived gladness and abandon.

"The fly that is born with the sinking sun,
To die ere the midnight hour,
May have deeper joy, ere his course be run,
Than man in his pride and power;
And the insect's moments be spared the four,
And the anxious doubts of one three-score years."

May and October are the two perfect months for out-door life in this country, especially where the rigors of winter and the tropical heats of summer seem to wage war against perfection and comfort. What fair and blessed memories are associated with a May morn's walk to a pleasant water, the midday lunch, pipe, Walton and stick, followed by a few casts on our homeward way, the arrival and welcome in the gloaming, and an evening spent in social joys and angling talk! History may repeat itself, but some joys can never be real again—they have become ethereal, and memory is their wardian!

A few days since I tried a new water and "caught nothing"—like the Apostolic fisherman—but I had rare pleasure. The stream was to be below, with wide, moistened reaches for throwing the fly, with swirling rapids and tree and cliff-shaded pools. I was "too early" for that stream, and for the trout therein, but not a moment too early to catch a deal of joy. Trout, trout, trout, seemed to be writ upon bank and stream and every ripple, and I only longed to be there in "leafy June" to try my luck again. I may or may not fish there again, but it will be pleasant to recall the "likely" places, and to imagine a pound fish at the end of

my line. Had I caught several from being I should have been glad, but as I did not, I am far from being sad.

Thus it is with angling (and with any legitimate sport that comes us as useful amid the refining, restful influences of nature). We carry to the meads a light heart and return thence with a glad one. We have looked about us, we have breathed, we have caught and kept some of nature's smiles and goodwill, and the fish we have not caught we, or some worthy brother, may yet bring to creel. We have had an outing and are the better, wiser and happier for it.

"The linnet's note, the blackbird's song
That sound the tangled brakes among;
The gushing streams, the rustling breeze,
The warbling lark, the hum of bees—
All sounds and sights I heard and saw,
Deep, sympathetic strains they gave;
And oft on fancy's wing I stray,
And throw the fly and catch the prey."

O. W. R.

SOME MAINE ANGLING RESORTS.—In Somerset county, Me., many towns are situated away from the railroads, and good fishing for trout and pickerel can be enjoyed at a small expense. A great many of the trout streams, whose waters are ice-cold, being fed by springs, are running through this mountainous country. Board can be secured at about three dollars per week, or less, with the usual "country comforts." Moose Pond, situated in the town of Harmony, Hartland and Athens, Me., is a fine sheet of water abounding with white perch, yellow perch, pickerel and bullheads, or horned ponies. Higgins Stream, which empties into this pond, is a splendid trout stream and is not fished to death. One point of this stream is the wonderful Kettle Falls, so named on account of the kettle-formed holes worn in the ledge, some of which will not hold more than two quarts of water. It will hold up to ten, and there are hundreds of them. The water comes down the inclined ledge and rushes around these "kettles," and here you may always catch trout. Several other streams in this immediate vicinity are good trout waters, and there are plenty of woods. The fare from Boston is about five dollars. Should any of you correspondents want to know more about this section I will endeavor to enlighten them.—FRANK FLICK (Hartford, Conn., May 35).

Oxford, May 28.—In reply to your request for angling and hunting resorts, would recommend Thompson's Pond; a pond famous for its black bass, pickerel and trout fishing. No better fishing can be obtained this side of Rangleway than here; we are within forty or forty-five miles of the lake—south—and in the fall gorge are quite plenty, foxes and rabbits (the great Northern hare) innumerable. One of our enthusiastic fishermen, Geo. H. Jones, in company with A. E. Frost, of Lewiston, Me., has just returned from Rangleway with a hundred pound of trout, the largest weighing five pounds.—STYLAN DALE.

NORMAN'S INVITATION.—Chicago, May 22.—To "Old Hickory," "Knotts" and the "Scribe," take warning: We presume you are overhauling your fishing tackle and preparing the weapons of war for another camping trip on Intermediate and Central lakes. Before we lies a communication from Central Lake, from the Dominic Noyes. He says: "It is the largest fish I ever saw; while swimming I should say it was between four and five feet long." This item did not do much for the big muscadel that dragged some of the crowd around the lake for about two hours and then almost spilled them into the drink when hauling him into the boat. He's waiting for the champion — to come up and tackle him, to give them a run around the lake. One of these big fish, weighing thirty-two pounds, was caught just before the ice run out of Torch Lake. But have mercy on the heads! "Don't tie them up to a post like a dog and let them die of a broken heart." Kill your fish, and above all give us the results of another camping trip in FOREST AND STREAM, so we can laugh over them in our camp a few miles from you. If you see the broad folds of the stars and stripes floating from some tall sapling, and an irrepressible youngster around camp at the mouth of Torch River, almost opposite Spencer Creek, during the month of August, give us a call and receive the greetings of the ladies and the grasp of a NORMAN.

WHITEFISH TAKE BAIT.—St. Joe, Mich., May 26.—Do whitefish take baited hook? They do, and I know of hundreds of others of this place who will say the same. We catch, every spring and fall when the water gets cold, from our piers a great many, not one as a rare thing. We generally catch them while fishing for ciscoes and perch. They are generally caught with small minnow, but I have sometimes with a small piece of perch belly. We let the bait lie on the bottom and move slowly along. Your correspondent, Mr. O'Brien, says he don't know of an instance of one being caught on a hook. That reminds me of the Irishman who stole a pig: The plaintiff proved by three witnesses that the accused was seen to take the pig, and the Irishman brought half a dozen witnesses that did not see him. Your correspondent appears to think that he has something whitefish never take bait. He has asked those who fish with nets and they say they don't take the hook. I know they do, for I have caught them. I can send Mr. O'Brien a hundred affidavits from this place. One man told me he had caught in one day all he could carry, say fifteen or more. Others two, three or more in a day. From examination of their tanks I think cut worms would do good bait. Does your correspondent think any kind of fish is going to take bait pitched up in a net and struggling to escape all the time?—W. B. RANSON.

BELLEVEILLE, Ontario, May 25.—Black bass and pickerel (pike-perch) are now to be taken here with the fly. During the winter the only trout stream within thirty miles of this city was ravaged by a number of poachers, who, however, have found that they were more greedy than wise. Over-seen Wilkins set wind of the affair and on the 14th inst. several of the transgressors were brought before a magistrate's court at Strling. The following was the result of the cases tried: A. McWilliams, fine and costs, \$48.80; A. G. Scott, fine and costs, \$23; David Seely, fine and costs, \$56; Andy Siddle, fine and costs, \$47.90; John Houston, fine and costs, \$47.90. The Fishery Department will be asked to restock the stream, there being a large number of speckled trout fry at the Newcastle hatchery.—R. S. B.

SALMON FISHING.—The undersigned has some salmon fishing upon two of the best rivers in Canada at his disposal. Address at once "Smada," this office.—Adz.

DID HE STEAL THE PICKEREL?

Editor Forest and Stream:

Blackstone says (Vol. I., Book II., page 390): "Animals are divided into such as are *domitile* and such as are *ferre nature*. In tame animals or those belonging to the *domitile* class (such as horses, sheep and the like) a man may have an absolute property (or title) just as in inanimate objects. But in animals *ferre nature* a man can have no absolute property. He may have a qualified, limited or special property."

Chancellor Kent in his "Commentaries" (Vol. II., page 347), says: "A man may have property in chattel, personal, either absolute or qualified." Animals *ferre nature*, so long as they are reclaimed by the art and power of man, are also the subjects of a qualified property, but when they are abandoned or escape and return to their natural liberty and ferocity, the property in them ceases. While this qualified property in them continues, they are as much under the protection of the law as any other property, and every evasion of it is redressed in the same manner.

Blackstone again (same page): "These animals, *ferre nature* are no longer the property of a man than while they continue in his keeping or actual possession * * * * * The law extends this possession further than the mere manual possession. While they continue my qualified or dependent property they are under the protection of the law as if they were absolutely mine, and an action would lie against anyone that detains or destroys them. It is also as much felony at common law to steal such of them as are fit for food as it is to steal tame animals."

These principles of the common law are of force in all States. Therefore when I catch a fish on a hook the fish is mine "by the art and power of man;" and, unless the fish escapes and regains his liberty by his own exertions or by my consent, I have such a qualified property in him that it

MR. HOWARD HARTLEY'S LEMON AND WHITE ENGLISH SETTER DOG "ROYAL RANGER."
Winner of First Prize in Open Class at New York, 1882.

ROYAL RANGER.

OUR illustration this week is of the English setter dog, the Royal Ranger, winner first in the open class at the recent show of the Westminster Kennel Club. He is owned by Mr. Howard Hartley, of Pittsburgh, Pa., who imported him a short time ago. His sire, Royal, is by Rollick (Roll II.—Belie) out of Flame (Pittington's Belle—Currie), and his dam, Novel, is by Blue Prince II. (Blue Prince—Cora) out of Flame (Roll—Countess). He is a dog of good size and great beauty, with plenty of bone and muscle. He has appeared in public but once before, winning second at Pittsburgh in April.

EASTERN FIELD TRIALS DERBY.

THOSE intending to enter their dogs in the Eastern Field Trials Derby, should bear in mind that the entries close on July 1. We expect to see a larger field of starters for this event than has yet appeared at any previous Derby. The prizes offered are well worth the winning, but the honors achieved by those who win them are generally of far greater value. Even the beaten ones who acquit themselves well, receive from the public a meed of praise that is never bestowed upon the stay-at-homes. Breeders are aware of this, and many of them will send the pick of their kennels to display their quality, and judging from the number of entries already received, we shall undoubtedly see a High Point the most notable gathering of youngsters that has ever been seen in this country. In addition to the liberal prizes offered, the president, Mr. Elliot Smith, will give a valuable cup to the breeder of the winner.

THE FAR-FAMED DOG OF THIBET.

IT is a century since Warren Hastings, whose predilection for rare animals and desire to acclimatize them served to occupy and amuse the leisure of his later years, endeavored in vain to obtain specimens of the far-famed dog of Thibet, and we are not aware that any other person has been subsequently more successful in introducing the breed into this country. Owing, however, to the kindness of Count Szechenyi, a Hungarian nobleman, an account of whose interesting travels in the Far East was published some two years ago, the Prince of Wales (says the *Times*) has become the possessor of a male and female of the race, and will probably, with all his wonted liberality, afford the public an opportunity of seeing them in Regent's Park during the ensuing season.

Count Szechenyi had heard so many reports in China—where, however, they are almost as great strangers as with us—of the size and beauty of these dogs, that he was very anxious to become personally acquainted with them, and on the first opportunity, which presented itself at Bataung, the frontier town of China on the route to Lassa, he purchased three, at a very considerable price it is understood. He found that they were fully deserving of their reputation in looks, courage and sagacity. In some respects they are said to resemble the handsomest specimens of the Newfoundland breed, but have a head very much larger, to which, moreover, an air of imposing dignity, if not fierceness, is added by a thick, shaggy mane, which grows forward so as to encircle the face like a collar. Their formidable aspect is still further enhanced in their native mountains by artificial means; for the shepherds and herdsmen who employ, and are very proud of, these useful yet dreaded animals, often fasten round their necks or like wreaths made of the bristly hair of the yak, and painted red—a species of decoration which gives them a still more lionlike appearance than that which they owe to nature.

Indeed, some drawings we have seen of them strongly recall to mind the king of beasts as imaged in heraldic devices—e. g., in the arms of the Duke of Argyll. The color of their coat varies from black to light brown, the former predominating. The people of Thibet find them invaluable either to guard their flocks or as house watchdogs. In the latter capacity they display the utmost fierceness and hostility to intruders on their master's property, and would be truly dangerous if not tied up by strong chains during the day; even when thus secured their furious barkings and mad efforts to escape startle the passing traveler, and warn him to give them a wide berth. It is curious that the rapid movement or wagging of the tail is with them a manifestation of anger, and not of friendliness, as it is with their European cousins. As guardians of the sheep and yak caravans, implicit reliance is placed on them; they preserve peace and order among their subjects as effectually as Eastern despots of the better sort, and, perhaps, after the same fashion—viz., by short strife

and heavy tolls; at any rate, they gallantly defend them when attacked by man or beast.

The two individuals who are about to visit our shores bring with them a good charter for docility; at least they soon became attached to their Hungarian, as it is to be hoped they will be to their English master. Their names are Chandu and Zama. The fate and character of the third dog of this interesting group were different from those of his companions. Like a true follower of the Lamas, he was a declared enemy of Europeans, and would accept no overtures of amity from them. Count Szechenyi, who strove to propitiate him by feeding him with his own hand, was repeatedly bitten, and on one occasion very severely. His antipathy was, however, not confined to the white faces of the foreign devils, for a poor Chinese old woman, whom he encountered in the streets of Buda, was so maltreated by him that she died almost immediately. This wanton act filled up the measure of the irreclaimable brute's iniquities, and was at once avenged by a bullet from his master's revolver.—*Live Stock Journal*.

CURRENT DOG STORIES.

Much excitement was caused in an English opera house the other night, during the performance of "Uncle Tom's Cabin." Mr. Charles Herrmann, who took the character of George Harris, has three bloodhounds, with which he is supposed to struggle on the stage. Unfortunately the dogs were brought unloading cocoanuts on the wharf, and in the excitement they lost their temper, turned on their master and bit him severely. Had not assistance been at hand, Mr. Herrmann would have been seriously injured. After having his wounds dressed he continued the performance.—*Evening Post*. In a Brooklyn theatre last Wednesday night, the play being the same, the "bloodhounds" had a big fight on the stage.

At the Union street wharf yesterday there was an exhibition of canine depravity that was as amusing as it was remarkable. The dog in question was an experienced thief, and entered into the work of thieving with all the zest of an experienced hand. On the occasion in question a schooner was unloading cocoanuts on the wharf, and, as usual, a crowd of boys were on hand to pick up whatever they could. As it was hard for them to sequester any of the nuts without detection, the natural or acquired depravity of the dog in question was made use of, and he was made the agent through whom a good supply of said nuts was secured. A boy would step up to the pile of nuts, and would apparently accidentally kick one a few feet. At once the dog would seize it, and a big cocoanut and a small dog rapidly vanished up the wharf and around the corner. Being relieved of his burden by a boy in the conspiracy, the dog would come back, and, when a good nut was selected, would take it away, to have it added to the heap stolen. This continued for some time, and was enjoyed by some who saw the affair.—*San Francisco Bulletin*.

An engraving of Woolner's bust of Tennyson, used as a frontispiece and two beautiful full-page pictures of Thornycroft's masterpieces are among the illustrations to Edmund W. Gosse's "Living English Sculptors," in the *June Century*. The writer tells the following anecdote of the dog in the statue of "Artemis": "In 1884, Mr. Thornycroft made another great stride forward with his 'Artemis,' a statue of heroic size, which has since been placed in marble in Eaton Hall, the seat of the Duke of Westminster. We give an engraving of this figure seen from the front. The goddess advances through the forest, and suddenly arrests her steps as she sees the quarry in front of her; with a dignified action she lays her hand over her shoulder and takes an arrow from the quiver, which rests on her left. The other hand, with her bow in it, passes behind her back and is drawn up almost her right hip by her hand, which has strayed on the wrong side. This dog has been much admired, and a little anecdote concerning it, which has not been recorded, may be worth telling. The sculptor had arrived at the point when he wanted a bound as a model, and he could find none that suited him. On the very day when a dog was to have been finally fixed upon, there came to the studio door a very beautiful deerhound, without any collar or mark of ownership, which seemed to have suffered much privation, and which absolutely refused to go away. The model was exactly what Mr. Thornycroft wanted, and while every effort was made to find the dog's master the charming creature sat for her portrait. Nobody claimed her, and she became the pet of the household; but the effects of

ing himself of all prejudice in favor of any fancy of his own and trying to stick as close to a recognized standard as possible; in other words, by both exhibitor and judge being entirely reasonable and unbiassed, and as that is getting pretty close to the millennium I guess I had better stop. W. WADE. PITTSBURGH, Pa., May 31.

"DOGS NEVER REASON."

IN FOREST AND STREAM of May 10 there is a brief article under this caption, by "The Old Doctor." Duke's disposition of the chain would seem to indicate an exercise of the reasoning faculty. The proposition may not have taken the form of a syllogism in Duke's brain, but it was syllogistic in the highest degree. A human being could scarcely have done better. All dogs may not reason; not all men reason, but some do, and the same may be said of dogs. In company with a friend I was duck shooting on one of the marshes in Minnesota. We stationed ourselves about thirty rods apart and began business in a very lively manner. In less than half an hour I had killed a dozen mallards, and my pointer dog, Charley, had placed them at my feet. My friend, who was a novice at the business, had fired a number of shots without any effect. He insisted that he had made a number of "penionsers," but they managed to get away. He finally condemned his gun, and expressed himself as completely discouraged. Just then I dropped a brace of mallards within thirty feet of my blind, and Charley, picking up one of the birds, passed a few seconds, and then proceeded to deliver it to my friend. He returned and made the same disposition of the other bird. This act had a most exhilarating effect upon my friend, and he renewed his efforts with great enthusiasm. The results, however, were very unsatisfactory. Meanwhile Charley continued to divide the dead birds between us, and, to our great surprise, we found at the close of our evening's shooting that the division had been made with mathematical accuracy. And now, if anyone suggests to my friend that "dogs do not reason" he will insist that there is at least one exception to that rule, and more than this, he firmly believes that Charley can count. T. BRANTFORD, OHI.

THE GORDON STANDARD.

Editor *Forest and Stream*: Dr. J. S. Niven's standard in your issue of April 12 allows five points for color. I think color is a great point in the Gordon; a rich, glossy black, and a rich mahogany tan, without mixture of either color, gives a beautiful harmony, and I allow ten points for color and feather. The head is another very important thing. The skull should be high at the occipital, at the same time broad and well proportioned. The head should show no thickness below the eyes. Nose, $4\frac{1}{2}$ in. long and square. Lips quite pendulous. Ears hang low and well feathered. Eyes large and round; color, dark brown. Neck large, not throaty, and well placed in the shoulders. Shoulders large and rising above the back. Chest wide and deep. Ribs round and well sprung. Back and loin very large and muscular. Distance between ribs and stifles short, dog gait. Quarters muscular and heavy. Feet well haired and round. Height 25 in. at the shoulder. Tail spike-like, with heavy feather. Fore legs straight, with large hock. Hind legs long and well crooked for speed. Shoulder rise $\frac{1}{2}$ in. above the hips. Weight 55 to 60 lbs. for dogs, and 45 to 50 for bitches. The color should be free from white. With an intellect and a pedigree showing Gordon breeding for years back, makes up my idea for a Gordon setter. Below is my standard:

Head, ears, muzzle and eyes.....	20
Neck.....	5
Body, ribs and height.....	10
Shoulders and weight.....	10
Loins and length of back.....	10
Quarters and stifles.....	15
Feet and legs.....	10
Color and feather.....	10
Coat and style.....	10
Total.....	100

C. T. BROWNELL. NEW BEDFORD, MASS.

"AMERICAN KENNEL REGISTER."—The entries for the June number of the *American Kennel Register* will close tomorrow, June 1. Plans are sent upon receipt of stamped and addressed envelope.

Slaron Island, is receiving her jigger work. The little cutter, 14ft. loadline, for a Providence gentleman, is also being fitted. In Boston the heavy cutter, Huron, has been launched, and Melusid and Buttery are well along.

There are building in such numbers that our esteemed contemporaries have found it "suitable" to the conditions" to promulgate among their three or four readers with some gravity the advice to build more than one cutter, and that they be of the same type, and hereafter receive their graceful sanction as cuts, but would be relegated to the tribe of sloops. Well, their declaration was quite true, and it is not a matter of course to build the lines to less than the orthodox 2 1/2 to 3 beams of the sloop. Three cutters have also been built on the lakes, of which particulars will appear, and our for diluvial waters.

NEW YORK Y. C.

REPORT OF THE MEASUREMENT COMMITTEE.

THE report of the committee appointed for the purpose of devising some system acceptable to all clubs and fair to all classes of yachts, opens with introductory remarks which in honor to those made by the Sea and Yacht committee, which will be found printed in full elsewhere. We extract from the report so far as those portions having direct bearing upon the subject, reserving a review of the new propositions for a special article.

They came to the conclusion that any system that taxed either breadth, depth or hull, such by itself, would favor or foster an opportunity, and should therefore be rejected. That length alone would lead to produce to an undesirable extent some of the foregoing evils.

That it would be impracticable to directly modify length by any one of the elements as the reason for the recommendation. That hull, beam or depth, with outside ballast, or a combination of the last two, with either or both modified, or in other words, "power" or ability to carry sail was the most important element, and should find direct expression in the sail plan or area of sail, which could therefore be used as the modifying factor of length without singling out any of the best construction elements, or limiting the discretion of the designer in his particular fancy for form or type—and that, as an expression of this power, only such sails as are or inarily carried when sailing to windward, and in general, all that would be used. And your committee have therefore come to the conclusion that length in some form modified by sail area in some form, should be the principle adopted, and the correctness of this decision has been acquiesced in by most of the representatives of the clubs we have been in communication with, either in person at many of our meetings, or by letter. It is to be regretted that the committee has not reached its conclusions, the Yacht Racing Association of Great Britain has taken up the subject, and has advised the adoption of a few simple principles, the most important of which are, that the area of the sail should be directly some one or more of the elements, as herein stated, and allowing other elements to go free.

That the area of option should be the most important element to appear as a more important factor than to the extent they have declared to recommend, and a consideration of the working of the rule would indicate that the general rule would be to allow, in any type of boat, but in the introduction of sail area, as a factor in a rule of measurement for time allowance, they were desirous of not being too much restricted in the scope they could take, in accordance with the custom of the club, heretofore, to leave out of consideration altogether.

It has been found that in yachts of normal type, the square root of the sail area expressed in square feet is about equal to the length on waterline, and, therefore, as comparable with the latter, would indicate a departure from the ordinary type, with a hull of the same diminished sail area—in other words a heavily rigged vessel would be taxed, the ordinary type to go free, and the snugly rigged boat be benefited.

It was accepted as a fact that overhang had a value, varying according to the shape of boat, but that it would be difficult, or almost impossible, to formulate a general rule, and that it should be shared equitably, and that to tax any portion of it as a part of the whole of it, would be to give the same importance to it as to the body of the boat, and it was therefore decided to add to the rule, that the importance to outweigh considerations of simplicity in measurement, and freedom to the owner or designer in carrying out ideas as to finish or ornamentation, and that the overhang should be practically ignored.

Stated in a formula, the foregoing is—add twice the length to the square root of the sail area, and divide the sum by 1.75, the divisor being merely used to approximate the figures to the actual length, so as to facilitate the use of the ordinary tables for time allowance, and to avoid the figures of the tables, and to conform to the usual practice; the result being entitled "Measurement for Time Allowance."

It was decided that it would be impracticable and objectionable, for obvious reasons, to obtain an area of sail by taking actual sail measurements, which are ever varying—and your committee, therefore, came to the conclusion that, for the purpose of ascertaining area, certain simplified measurements on the spars only be taken, in manner as follows:

A perpendicular line to be taken along the after-side of the mainmast from the under-side of the gaff-topsail block, or shroud to the topmast to the upper side of boom, when resting on the saddle or on the lowest part of gooseneck, the distance of which point from the deck or lower side of the hull, to the point of contact of the gaff with the other points used in measurements.

A base line to be taken from the heel of the point of contact of the jibstay or lower part of the mainmast to the point of contact of the jibstay or lower part of the mainmast, in a straight line to the end of the mainboom, with one-quarter (1/4) of the length of gaff, measured from after-side of mast to end, and after-rod.

To obtain area from the above measurements, the formula for obtaining the area in square feet of a triangle is to be followed, namely, base multiplied by the perpendicular and divided by two.

The length to be measured from the forward side of stem at the water-line to the water-line at stern wherever topped. This measurement to be taken when the yacht is afloat, and in her ordinary trim, and by the crew, if possible, or by a third party, the measurer, at the time of taking his measurement, to affix a distinctive mark at each point. To the square root of the length of the stem, and the result is the measurement for time allowance.

The time allowance table is based on the accepted rule that relative speeds vary as the square roots of relative lengths, and that, as these relative speeds are only developed in strong winds and under the most favorable circumstances, and that the committee, therefore, constitute an equitable table for use in the average weather in a rich race are sailed.

This table being made for one mile can easily be adapted to courses of any length.

Your committee, as a consequence of the adoption of the system they are reporting to the club, and to make it consistent with one of the objects which they have had in view, recommend the abolition of the distinction between fore-and-aft and center-board which now exists, and a reclassification as follows:

- SCHOONERS. Class 1. To comprise all those whose measurement for time allowance length is 10ft. and over. Class 2. All those of less than 10ft., and not under 8ft. Class 3. All those of less than 8ft. STOODS. Class 1. All of 5ft. and over. Class 2. All those less than 5ft., and not under 4ft. Class 3. All under 4ft.

Your committee, in closing their report, cannot help adding that they are confident that the adoption of the principles they recommend, by all or most of the prominent clubs, will result in a complete triumph, and that the result will be to foster and give it an impetus, the importance and extent of which can hardly be realized now, and the initiating and carrying out of which could be accomplished only by the efforts of the club, which was accomplished, and to remain a re-letter page in its annals.

All of which is respectfully submitted.

Wm. C. SMITH, ANSON PHILIPS STOKES, CHARLES W. LAMARIS LITTLE, J. COMMITTEE. CHAS. L. LEWIS, T. FREDERIC TAPP.

New York, May 9, 1883. The proposed allowance is based upon the assumption that speed can be obtained in proportion to the square roots of the lengths of vessels.

L represent the length of the larger boat, and l the length of the smaller boat. The speed of the larger boat is to the speed of the smaller boat as the square root of the length of the larger boat is to the square root of the length of the smaller boat.

The table is based upon the time taken to sail one mile. Therefore the formula would become:

Time / L is to Time / l as sqrt(L) is to sqrt(l)

The time taken as a basis is one hour, or 3,600 seconds, but it has been found in practice that this would make the allowance too large.

and four-tenths of 3,600 seconds, which is 1,440 seconds, has been taken, and the formula becomes:

Allowance = 1/40 * L - 1/40 * l

The result multiplied by the length of course will give the allowance in seconds.

RULES FOR ASCERTAINING ALLOWANCES.

To find the time one yacht allows another: Subtract the "time opposite the length of larger yacht from the time opposite the length of smaller yacht, and the result will be the allowance in seconds. To find the time for fractions of ft: What time will a yacht 48ft. long allow one 46ft. 6in. long?

Time opposite 48ft. 85.00 sec. Time opposite 47ft. 83.73 sec. Difference 1.27 sec.

One-half of difference—1.27 would be time for 6in.6375 sec. Aid time opposite 47ft. 83.73 sec. Time for 46ft. 6in. 84.3675 sec.

From this time subtract time opposite 48ft. 81.52 sec. Time 48ft. will allow 46ft. 6in. for one mile, 3.8475 sec. Multiply by length of course, 40 miles

—Allowance in seconds, 153.60 sec. Divide by 60—Allowance in minutes and seconds, 2 min. 33.60 sec.

TABLE SHOWING ALLOWANCES UNDER VARIOUS SYSTEMS OF MEASUREMENT.

SEAWANAKA Y. C.

REPORT OF COMMITTEE ON MEASUREMENT.

In compliance with the resolution passed at the last meeting of this club that the committee then appointed by the Commodore confer with the committees from other clubs with a view to adopting a common system of measurement, your committee has the honor to report that it has attended a number of meetings of the New York Y. C. at some of which representatives of the Atlantic and Larchmont clubs have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred.

This meeting will readily see that it is not to be expected that the different clubs, whose representatives have thus met together, or otherwise communicated with each other, should as the result of these communications, be ready at this time to take definite action on this matter; or that their representatives should be able to announce any definite plan of measurement to be adopted by them. Such action as is here indicated can only be looked for after meetings have been held of the clubs interested, and after ample opportunity has been had for the subject to be discussed between the members.

Your committee is, however, impressed with the conviction that conferences of the kind now mentioned, if it were possible, would afford for comparisons of experience, thought and suggestion; and afford the best opportunity for discussing the principles which ought to govern time allowance, and give opportunity for the

rid of misunderstandings, and for arriving at similarity or even uniformly of view on most matters involved in the subject.

Your committee therefore, before referring directly to the more important practical result of its labors, would discontinue the impression which should be entertained by any of the members of its work, as far as this applies to the agreement of other clubs which can be correctly given by any announcement that can now be made.

The result of its work and discussions must rather be looked forward to, and your committee will find satisfaction in the immediate present, if by their action they have made a common agreement between important clubs more easily practicable in the future. It is to be regretted that the arrangements for the meeting of different clubs met together, there has been a great deal of effort, but a fair and candid temper and disposition has commonly prevailed, and the representatives of the various clubs have been in a measure worked practically as one committee. The suggestions and information furnished being treated as common property, the result being a general agreement in principle, and a common understanding, easily understood and adjustable, either for the purpose of a joint race, or because the experience of either club may show it to be desirable.

In the opinion of a part of your committee, sail area is allowed to be represented by too large a factor in the present formula, and should be reduced. In the opinion of one member of the committee, this cannot be safely assumed from such facts as there has been experience of, and in the absence of other reasons the rule might in the opinion of the member of the committee be conservatively and prudently left to bear the light of another season's experience, as far as this factor is involved.

In the opinion of the committee, however, concurred in this: That the purpose of this committee, to provide or agree to a rule which should conform itself to this club, and also be acceptable to others, was mainly directed from the fact that the square root of the area of sail area, to increase or lessen the main factor, would be seen at once.

The committee agree that a measurement, which should take into account sail area and length, but which should be expressed in a modified or differential length rather than in tons, would best suit the purpose in view. Such a method of dealing with the subject would admit of the water in most common use, that which has as its base the length of water-line, and which is related to the square root of the area of sail area, to increase or lessen the main factor, would be seen at once.

In the last report read before this club on time allowance, allowance was made to the fact that the length of water-line of the average yacht, multiplied by itself, would correspond very closely with the area of the square root of the area of sail area. It is to be regretted, it, of course, follows that in the ordinary yacht the square root of the sail area is equal to the W. L. In the yacht with a light rig it is commonly different from the yacht with a snug rig it is sometimes less than the W. L. length.

Your committee recommend as a formula for measurement length, which is equal to the square root of sail area, and the sum divided by two.

The reasons for using sail area are so well understood in the club that they need not be repeated. It is to be regretted that the modification length may, however, be a very simple illustration. Take as the normal boat for comparison, one 50ft. long, carrying 3,500 ft. of square root of her area of sail area, and which has a water-line of 40 ft. The application of the rule to her would have no modifying effect on her length whatever. If, however, her sails were reduced to 2,000 ft. of square root of her area, and her water-line, which sum, added to 50 and divided by 2, leaves 51ft., or an addition of one foot to her original length, as a tax for her large sail area, and her large beam and ballast, which means to it a normal quantity, would be deducted from her actual measurement for racing.

If, on the other hand, her sail area is 3,300, the square root of that being 57.4, if, or less than amount which is below a normal quantity, would be deducted from her actual measurement for racing.

The existing rule was adopted by the committee then charged with the work of devising a mode of measurement, some misgivings were entertained by members of that committee who were desirous to receive ready recourse to a method of measurement of accuracy and conveniently measuring so elastic a material as canvas, which is necessarily subject to variation, and may increase or decrease in length, and in width, and in weight.

To this part of the subject your committee and those who met with them have been most anxious to attend, and it is to be regretted that the first conclusion at which it has arrived, that spars need not be measured as is usual in the following manner:

The perpendicular to be taken from the heel of the side of the mainmast from the under side of the gaff-topsail block or shroud to the upper side of boom when resting on the saddle, or on the lowest part of gooseneck, the distance of which point from the deck or lower side of the hull, to the point of contact of the gaff with the other points used in measurement.

The base line to be taken from the heel of the point of contact of the jibstay or lower part of the mainmast to the point of contact of the jibstay or lower part of the mainmast, in a straight line to the end of the mainboom, with one-quarter (1/4) of the length of gaff, measured from after-side of mast to end, and after-rod.

To obtain the area from the above figures, the usual formula for obtaining the area of a triangle is to be used, namely, multiply base by perpendicular and divide by two.

Length to be measured from the forward side of stem at the water line, to the water line at stern, wherever topped. This measurement to be taken when the yacht is afloat, and in her ordinary trim, and by the crew (if aboard) amidship.

The measurer, at the time of taking his measurements, to affix a distinctive mark at each point.

To the square root of the area as ascertained add the length as ascertained, and divide by two.

The result of the measurement for time allowance.

Any change in these measurements to be reported by the owner (as customary) to the measurer.

It will be seen that whereas the present way of measuring sails requires that they be hoisted, regardless of wind, weather and convenience, the mode of measurement here recommended is one that can be used with such sails as are decked down, and that they are present one, and not subject to change excepting with a change of spars.

The change from a tonnage measurement to one of length made necessary a new time table of allowances.

As was noticed in the last report made to the club on this subject, an opportunity for speed with different vessels vary as the square root of their respective lengths. An allowance table formulated on this principle would, however, be much too liberal toward small yachts, if used for the practical purpose of yacht racing in ordinary weather, as it presupposes the full development of that power and speed in larger vessels, which only occurs in strong winds.

In the last printed report of the club on this subject, figures are given in a table, and also a table in the diagram, both of which show the quantities being reduced 50 per cent. This deduction still left the allowance larger to small yachts than to large yachts, and the result was also larger than any table in use by prominent clubs heretofore.

The table of allowances which your committee have to propose to you, obtained in the same way as the illustrated curve just referred to, but still further reduced, that is, 40 per cent. instead of 50 per cent. of the allowances which were determined by the table just referred to, as does the square root of length in different vessels.

In conclusion, your committee would submit, that by the formula proposed, the result of the measurement for time allowance, which is based upon an equal footing, if the report is accepted, and it should in the after experience of the club, appear desirable to change the relative importance of the factors, such change could be made by simply to involve the labor and discussion which have attended past conferences.

Your committee further hope that with an allowance table adapted to length alone, and with a method of combining with length sail area in any desired proportion, and with its modifying influence so arranged as to be applicable to all classes of yachts, and to all classes of races, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested in the subject of measurement, and with whom the secretary of the committee of the New York Y. C. has conferred, a common system of measurement may be adopted, and that by means of other conferences of the kind in which your committee have been present, and at which various communications have been read from officers of other clubs interested

THE SEASON NOW OPENING.

THE process made within the last few years in American yacht building promises to be exemplified with great force in the coming and cruising of the present season. The rapidity with which cherished prejudices of the past have been supplanted by modern ideas is not less striking than the progress of the latter.

As the recognized expert of the sport in this country, we feel bound to congratulate the community upon the readiness with which the new ideas are being accepted, and the rapidity with which the old and the lessons of recent developments taken to heart in good earnest. The revolution from light draft, flat bottom, shoal keel and excessive sail has not been accomplished without much hard work, but still in far less time than the most sanguine could expect.

It is the pride of Forest and Stream to know that its pages are filled with the results of the progress of the sport, and that its pages are filled with the results of the progress of the sport, and that its pages are filled with the results of the progress of the sport.

The former cherishes flat bottom, shallow hull, beam, centerboard, light draft and a simple one. Still we build modern yachts whose speed rests mainly in sparring without regard to a vessel's capacity to carry the rig, or shall we turn the lessons of recent years to account and demand from moderns something whether of our admiration in the way of vessels, speed, sea and windward accommodations.

The answer from the public is not difficult to divine. It is to have the best of both worlds, and to have the best of both worlds, and to have the best of both worlds, and to have the best of both worlds.

In regard to rig, the fierce opposition to double jibs has waned in its approach, and many are now turning to see through the prism the wisest will listen to tonight else. Cutlers have become as plentiful as blueberries and fresh material is steadily being added.

It is in regard to the use of the keel that the most interesting changes are being made. The keel is being built on the principle of the keel, and the keel is being built on the principle of the keel.

boats or less to the lead line, the artificial restraint of length measurement is to be held accountable. This is the condition of yacht building in the East at the opening of the season.

What the sport in New York City is doing is quite as favorable, still far from discouraging. The keel is not in the majority, beam and light displacement are still much venerated, and the strongest opposition to the new ideas is still to be seen.

The number of keels figuring in Olesen's new Annual for '88, hailing from New York, is larger than ever before. The New York Y. C., the Seawanhauk Corinthian Y. C. and the Atlantic C. all show more on their list than ever before, and more keels were laid in the Greenpoint, Bay Ridge and Staten Island yards than ever recorded in any vessel or pleasure.

NOTES FROM BELLEVILLE, ONT.—Work on the new twelve-tonner Iolanthe, at Cuthbert's yard, goes briskly on, and the prospect is that she will be finished within the week.

NEW KEEL.—Lako Hall, of East Boston, has a fine keel yacht ready for launching. Built for Albert Hall, of Chicago, she is to name Perry II, is 35ft. 3in. over all, 32ft. 5in. on loadline, 14ft. 6in. beam, 4 in. draught and 14ft. draft.

NEW STEAMERS.—John Bosch & Son, of Chester, are building two steam yachts, to be named, for W. E. Conner, of New York, and another for G. C. Scott. They are to be seagoing yachts with high freeboard, dash decks, schooner rigging, showing 4,200-hp. of power in lower sails.

OPEN BOATS.—The Pollons have finished two open boats for afternoon sailing, designed by A. Cary Smith. They are in many respects superior to the usual style of such boats.

GANANOQUE REGATTA.—The races sailed May 24 brought out a good lot of starters. In class under twelve tons, Laura, Capt. Abbie, of Kingston, Fearless of Gananoque, and Eclipse of Chilton, Course 30 miles. Time, one minute 27.6 seconds.

THE STEAM YACHT CLUB.—The new steam yacht club organized under the auspices of Jay Gould, Geo. C. Scott, W. E. Conner, Jesse R. Grant, Wm. B. Dowd, W. P. Clyde, Alfred de Cordova, J. H. Houston, Frank R. Lawrence and others has been given the title "American Yacht Club." Initiation fee has been fixed at \$100.

QUINCY Y. C.—Opened the season May 29 off Great Hill. Strong S. W. blow kept many at home. Two cash prizes in each class. Queen Mithras, 31ft. 8in., W. L. Phony, 24ft. sail-over among the big ones. In second class, Thistle, 21ft. 10in., S. A. Freeman, won in 1:09.10, beating Noodle, Water Witch, Druid, Diadem, David Crockett and Plover. The second prize was taken second.

STRANGER.—This steam yacht, belonging to the estate of the late Geo. A. Osgood, was sold at auction, as announced, to Mr. Frank Osgood for \$20,000, said to be below value. She was built by Wm. Cramp & Sons, Philadelphia, iron hull, 185ft. over all; 165ft. loadline, 23ft. 8in. beam, 14ft. depth of hold, 10ft. 5in. water; compound inverted engines, cylinders 34 and 44in. diameter, 24in. stroke. Two boilers, 10ft. 6in. by 11ft.

NEW CUTLER.—J. W. Lawlor has finished a very smart cutter, for which she plans are supplying the sails. The cutter is 35ft. long, 19ft. 5in. over all; 15ft. 10in. beam, 21ft. 2in. gaff, 14ft. 10in. overboard rig, jib 13ft. on foot, 34 1/2ft. on luff, foremast 9ft. on foot, luff of square beam 10ft. 10in. by 11ft.

WAKE.—Boston yachts are becoming appreciated in New York for their fine lines and superior sailing. Length on loadline 25ft., beam 13 1/2ft., draft 5ft. 8in.

GRACE.—This Boston sloop, James Donovan, S. B. Y. C., is overhauled and will receive 1,000 pounds iron on the keel. Keels and outboard will be all the go in Eastern waters. No one thinks of building anything else.

SEAWANNAH Y. C.—Has adopted the revised measurement at last meeting, May 24. Formula now reads loadline length plus square root of sail area, the whole divided by two. Report is printed in this issue.

IRON KEELS.—The Boston sloop Atlantic has received a shoe of 2,500 lbs.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. }
SIX MONTHS, \$2.

NEW YORK, JUNE 7, 1883.

VOL. XX.—No. 19.
Nos. 29 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annua subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Sanson Low, Marston, Seale and Rivington, 185 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications,

--	---

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

THE NEW YORK FISH COMMISSION.

THE Governor of New York has vetoed the item in the supply bill which gave the Commissioners of Fisheries three thousand dollars additional to carry on the work at Cold Spring Harbor, Long Island, on the ground that their regular appropriation was sufficient for all purposes. We do not know from what source the Governor drew his information, nor how correct his conclusions may be; but we do know that the proposed work on Long Island is a much-needed one, and is a step in advance in the good cause. The station has only been in operation five months, and has not only a commendable exhibit of work done in the way of hatching and distributing, but also of much in the way of permanent improvements in such things as troughs, rearing-pools and fixtures for hatching fresh-water fishes generally.

Although the public recognizes the fact that a hatchery for the salmonidae and other fluvial fishes is a necessity in the southeastern portion of the State, the facts are that the proximity to the salt water renders the Cold Spring station one of almost unlimited possibilities, especially as it is unique in this respect, and has therefore the assistance of the United States Fish Commission, with its extensive connections at home and abroad. There has been no hatchery established for salt-water fishes in America, nor in any other land, and the New York Fish Commission took the lead in trying to establish one, and they only asked for a very small sum to start the work; therefore the Governor's action in this matter is much to be regretted. The springs at this station are so elevated that they have been used to turn mills, and would easily pump salt water to a height of twenty feet or more, where it could be used for hatching codfish, and all other

fishes which are available, as at high tide the salt water comes to within a hundred yards of the old mill which is now used as a hatchery.

The United States Commission has hatched codfish to a limited extent, but has worked with the disadvantage of having no hatchery near salt water. Some were hatched at Gloucester, Mass., and turned into the harbor there, and have since been taken near the docks, where no deep-sea cod were ever seen before; and others have also been hatched in the old Arsenal at Washington, in artificial sea water. No doubt new cod grounds could be created about Long Island Sound and New York city, as well as on the south side of Long Island, by large plantings of the fish, for food is plenty there, and eggs by the tens of millions can be obtained from the live fish brought to Fulton Market. These facts show reason enough to have the work continued, and it is to be hoped that it will not be abandoned, even though the Governor did not approve of a special appropriation for this purpose. Pisciculture is a progressive industry, and its hold on the people is now so strong that it is in no danger of being turned back on account of a temporary impediment.

OBSTACLES IN RIFLE PRACTICE.

WITH the opening of the present month, shooting will begin on many ranges under official orders from various commanders in the ranks of the National Guard. A number of States have made arrangements for the practice of the men, and considerable time and effort will be expended in securing records of the proficiency, or the want of it, on the part of the troops. Each State seems to have devised a special system of ball practice, and the result is that it is entirely impossible to make any precise comparisons. The Regular Army, too, has a system, and this seems to be a shifting one, so that during a decade past we have seen a half dozen schemes devised for securing a short cut to good marksmanship without the tedious detail of careful range practice.

With a general observance of some one plan of practice, it would be possible to so show up the failings of some of our organizations, that a feeling of emulation would spring up and good results follow; at present there is too much striking about in the dark, and the general public are left in a state of uncertainty, whether or not this banging of rifles, which goes on through each summer on our State ranges, really amounts to anything.

It was the strong point made by the advocates of rifle practice when it was introduced in the National Guard that it was then entirely possible for a member to go through a full term of service and yet never have occasion to fire off a gun. Is it quite certain, then, that this cannot be done to-day? That there are not now members of the Guard who have not had any practical experience with the rifle in the field before the targets? There are certainly many who do not go near the ranges. That this is so, may in some very rare instances be due to unavoidable obstacles, but it is too true that the army methods are sadly at fault. There is not and never has been enough aiming drill in the squad rooms. Without this, work out of doors is worse than useless, and with it the field records are sure to stand out in excellent prominence.

Progress has been made and perhaps a fair result has been secured for the amount of effort put forth thus far in the cultivation of military marksmanship. Still, there is danger that a great deal of waste labor may be expended simply because each worker in the field does not know what other directors of practice are doing. In New York changes of administration have led to changes in the personnel of the Inspector-General's office, and then naturally comes a different way of putting the Guard through its course of training. There are no definite principles guiding. There is no standard set toward which the men are expected to approach, and the result is that there is no end of the work and no way of telling how much the men have profited by it.

It would be unfair to conclude that because but twenty-nine men fitted themselves to shoot in the preliminary camp petitions for places on the American International team, that the interest on the subject among guardsmen is at a low ebb, or that there is not a general ability to shoot well. It is one thing to shoot for pleasure, or even in fulfillment of one's duty as a member of the Guard, and quite another to undertake the responsibilities of a place on a representative team. Neither is it just to gauge the interest or want of it by the fact that Creedmoor is not crowded by competitors at the fall meetings. Time and distance prevent any such

gathering. It would be worth the while of the Board of Directors here to arrange a programme of matches to be shot on the several local ranges throughout the country, making the conditions so simple that they could be easily understood and generally complied with.

This city is able to furnish a team of any sort of shooters, and over the several States they would find many responses to a well-put invitation for a test of ability. Such matches at a quick hand are going on almost every week now in an off-hand way, and all that is required is for some central body to undertake the labor of directing and managing them. This can be well done from this point, and perhaps through such a series of shoots something could be done toward breaking down the barriers of localism and place-pride which now play so prominent a part in keeping riflemen from knowing more of each other, and enjoying their sport in its best feature—that of generous rivalry.

THE ROD WAS SPARED.

AT the recent dinner to the foreign representatives to the International Fisheries Exhibition, at Fishmongers' Hall, London, in reply to a toast, Mr. James Russell Lowell, the American Minister, said that—

"He had always been jealous of the exercises, the undue exercise, of arbitrary power, and he must confess that he knew of no exercise of arbitrary power more cruel to its victim than that which brought him to his feet when he was at rest what to say. He was in that position, but he could not help thinking there was a sort of retributive justice in it; for it happened to him several years ago, as president at the annual festival of the University of which he was a member, the magnificent satisfaction with which he used to rise and to say that they were honored with the presence of a very distinguished gentleman, (laughter) and then he paused and saw a slender pass through the assembly every one of course laughing himself to be the distinguished gentleman meant, the average of distinguished gentlemen in America being very high. (Renewed laughter.) They had never heard of a fish speaking, it was true. There was a tradition of St. Anthony at Padua preaching to the fishes, but now the fishes had been brought to preach to us and to instruct us. If he could only make the speech which was sure to come to his mind as he was going down the stairs when they were all going away, he should have a deal to say to them; but as it was, he thanked His Royal Highness for the kindness with which he had proposed the health of the representatives of foreign countries. The kindness he met with in this country convinced him that he represented less a foreign country than most of the ministers for foreign States there, and that he rather represented the eldest daughter of England. (Cheers.) He believed that some of the exhibits sent from his country would not be found inferior in interest to those in other departments. He held in his hand a rod, one of the exhibits from America, weighing only four ounces and a half, warranted to land a fish weighing five pounds. He wrote a great fisher, but he had exceedingly pathetic associations with the American rod. (Laughter.) He once bought one which cost him \$18, and he took it to a river and had his cast, and at last succeeded in hooking a silver trout, and brought it home in triumph, when he was told that he had caught the most valuable fish in the world, as, seeing that it measured about six inches it had cost him \$3 an inch. (Laughter.)

It is evident from this that Mr. Lowell took to fishing too late in life. A boy, or man, who never went fishing until he could amass wealth enough to buy an eighteen-dollar rod, will never become, as Mr. Lowell puts it, a great fisher. This is not the only instance on record where the rod was spared and the child spoiled, *sic* Solomon. A father who brings up his boys in ways which they do not depart from, buys his sons rods and lincs at an early age, or he gives them currency of the realm sufficient for an outfit, and they forego the rod and buy cheap lines and hooks, and apply the remainder of the cash to the purchase of other necessities of boyhood, as marbles, balls, etc. A boy whose angling education had not been neglected, would never figure up that his first six-inch trout had cost three dollars an inch, because the rod had been bought for eighteen dollars. He would have swapped his fine rod for a sled, a terrier pup, and a quart or two of marbles to boot, and have gone into the swamp and cut him an alder switch for a rod and been happy. It is very evident that the American Minister to the Court of St. James has been entrapped by our English friends, who are born anglers; into talking about things that he is not familiar with, in order to lead him on to the question of the Halifax Award and the Fisheries Treaty of Washington.

We suggest to them that if they want to know about the commercial fisheries, or the ichthyology of America, that they ask Prof. Goods or Capt. Collins. If they seek to penetrate the mysteries of fishculture they may inquire of Mr. Earle, while Reuben Wood will tell them how the de-lu-sive fly is palmed off on the unsuspecting trout as some thing which is desirable as a lunch. We have never heard much of Solomon as an angler, but his maxim, "Spare the rod and spoil the child," shows that he thought that a boy would be ruined if he did not go fishing. We fear that the rod was spared in the case of Mr. Lowell.

Many sad incidents of death by drowning will occur to the minds of all of my readers; nevertheless, I may relate the unhappy fate of two young men with whom I was acquainted. These unhappy victims to the inability to swim were out on a hunting excursion, and when crossing a small pond in their canoe they were upset, and both perished miserably. They both wore belts heavily laden with cartridges, and these probably kept them from coming to the surface when once immersed, and also destroyed all chance of grasping the canoe and making a struggle for life. The man of the country where this accident occurred is a fisher, and they might have hung to the canoe until exhausted, and no help could have reached them. The water was not over seven feet deep, and should rapidly. Now, a good swimmer could undoubtedly have saved himself, either by swimming into shallow water, encumbered with his belts, or he could have held his breath under water long enough to allow of his taking off his belts. The first thought of a good swimmer on finding himself down into the water, is to secure a full breath before going under, and to hold his breath while under. But the man who cannot swim is flurried, and of course utterly at a loss to know what to do. He is helpless, suffocated, sacrificed. The good swimmer is, under ordinary circumstances, as safe on the water as he is on land. The person who cannot swim is, under the same conditions, in imminent and constant danger of death. In contrast to the sad event just mentioned, is the experience of a person of my acquaintance who is a good swimmer. He was returning from a hunting excursion, when by some mishap his bark canoe upset, and he and all his utensils were thrown into the river. He was not very far from shore, and after swimming to land with his canoe, he undressed, and returning to the spot, dived and recovered his gun and all the other articles of value, and reached home none the worse for his accident. A person who could not swim, if in the same position, had been drowned. As before stated, I am not at all in advising all who go upon the water to learn to swim, I merely reiterate the advice of hundreds of writers, but I know personally many who cannot swim, and I am aware that there are hundreds of young men in every large city who are ignorant of that useful art. To all such I say, let not this summer pass and leave you in criminal inability to exercise powers which have in mercy and pity been given to mankind by a wise Providence. E. M. BARTO.

NEW BRUNSWICK.

SUMMER SPORTS IN CANADA.

AS now is the time when the summer sporting and camping trips are generally laid out, I give herewith a short list of what are in my opinion the best places to visit.

Beginning on Lake Ontario, to first come to the Thousand Islands, which are, however, so well known that little need be said. For old sportsmen the Islands are of course too much frequented, but there is still plenty of good bass fishing, and many a pleasant day may be spent there.

Rice Lake and the region and lakes thereabout are next in order, and as in the former case, are old camping out places, and are generally well known to the sporting world.

Next is the Erie and Ontario region. One of the best and Poindexter are still able to give a first-class day's fishing and shooting, but the best points are all under lease, and well guarded from the outside world.

I omitted to mention while talking of the Lake Ontario region, that for parties wishing a pleasant camping place with moderately good fishing, and where the modern necessities of life are all handy, the mouth of the Niagara River is one of the best fishing grounds. Next in order comes the fishing and shooting grounds of the River and Lake St. Clair, called "the Flats." The River St. Clair, where it enters the lake of the same name, passes for some miles through a vast swamp of reeds or rice, which swamp is intersected by shallow channels in all directions. Owing to the wet nature of the ground in the vicinity it is not the best camping ground in the world, but if one can only get a foothold in plenty of good fishing and duck shooting, it may be found. Parts of the flats have been leased by clubs who have erected club houses at different points.

We now come to Lake Huron, the shore of which for the first one hundred and fifty miles is, like the other lakes, devoid of interest to the sportsman, except in a small way at the mouths of the rivers.

My idea of a camping ground is a place where one can get out of civilization, and if such a thing be possible) without having to travel too far and undergo too much hardship in doing so—a place where one can get good fishing and shooting, good clear water to bathe in, where the wild fruits of the season are to be found, and above all, a place picturesque enough in itself to leave in one's mind pleasant reminiscences of the sight as well as the sports enjoyed there.

With the exception of the first place mentioned above (the Thousand Islands), the region I have traveled over does not to my knowledge contain one spot combining all, or nearly all, the above advantages; shooting and fishing being abundant, but the character of the land, generally reedy and swampy, precludes the quieter pleasures of camping out.

One hundred and forty miles northward from where Lake Huron enters the St. Clair River, and about twenty miles above Southampton (or as it was formerly and more properly called, Chagoy), on the east line, there is a tract of straight shore apparently with a few openings, which I have seen from the foot of Lake Ontario, and again assumes the character it wears at the Thousand Islands.

From Chieft's Point, some fifteen miles above Langean, the coast line to Cape Hurd, some sixty miles distant, is cut up with bays and coves in all directions, and the Fishing Islands run along it for some twenty miles. The shore is low, rocky and covered with cedar. There is a plenty of bass, pike, and pickerel fishing in the bottoms of the bays, and capital trolling ground inside the islands for both sail and row boats. Also good duck, bear and deer shooting in the fall.

This region, however, lacks two of the main requisites for a complete camping ground, namely, picturesque and a supply of wild fruits. From Langean to Cape Hurd one can take a boat every three miles. At the mouth of the bay, the entrance to the greatest and grandest of all fresh water bays—the Georgian Bay. This bay contains within itself all the requisites of a perfect camping ground that I have mentioned, and, as far as my experience goes, is the only place that does so.

The scenery as one enters the bay from Lake Huron by the Cape Hurd channel, is fit introduction to strangers. The top of the Flowering Cove Island, Bear's Rump and the other islands of the group is really grand. Just around

the cape is Tober Mornay, the finest natural harbor on the lakes; nearly a mile long and a quarter of a mile broad, with a deep water all over, with banks of rock to which a vessel eae tie and ride as if at a dock.

The fishing in this neighborhood is good. Bass in large quantities and pike and pickerel in the bays and coves, and tip-top trolling for salmon trout on the shoals, as many as ten or twelve beauties ranging in size to twenty pounders being sometimes taken in one afternoon.

However, one must fish out still farther to the famous "North Shore." Talk about "The Thousand Islands," why for a stretch of 200 miles from Collingwood to the Bruce mines at the entrance of the St. Mary's River, the islands on the coast are simply innumerable. A man once started to count them, but when he got to seven thousand had to give the contract up as hopeless. One can take a steamer at Milland City drawing ten feet of water and journey by a protected passage inside the islands for 100 miles or more and then only get a glimpse of the beauties of this region. The islands around here are all rock and very picturesque indeed. On almost every island one can turn around after partaking of the substantial of a meal and pick a cupful of wild raspberries, strawberries, huckleberries, currants, blackberries, and in the fall cranberries *adlib.* without moving from your camping ground. You are within reach of the finest bass, pike and pickerel fishing to be had on the continent, and it is a pleasure to see the fish that are taken. However, these fish, like the salmon trout, generally prefer deep water in the hot weather. An occasional marsh at the bottom of some of the bays makes duck shooting prime. Bears are also to be met with, and plenty of deer on the mainland.

This region is very easy of access, the Northern from Toronto or Hamilton landing you at Heneauquisheche, and the Midland from Toronto or Port Hope taking you to "Midland City," both places being at the southern end, and of the "north shore" chain of islands. Guides and boats can be procured at either place for moderate sums, say one man and a 25-foot sloop for \$1.50 or \$2.00 per day, and in an hour or two you can be camped in a spot where you can live for a month without seeing anyone, except perhaps a solitary Indian in search of game.

I spent a month in the Muskoka region canoeing and portaging, and I cannot speak too highly of the trout fishing and deer shooting in the early spring and winter, but the difficulty and expense of reaching the good grounds makes it beyond the reach of ordinary camping parties, especially as in pleasant camping weather deer shooting is out of season, and the trout fish too low to be tempted with the fly.

I spent parts of one or two seasons on Lake Superior, but as that region is so far ahead of the present wants of the campers-out, I will say anything more than that fishing and shooting of all kinds are good.

For the past few years or so I have generally made one of a small party camping out or fishing for a month or two. We generally used sailboats, from twenty to thirty feet long to convey ourselves and stores, but as this necessitated pitching tents and a great deal of trouble loading and unloading the boats, we determined to get a boat large enough to hold us all comfortably and safely.

For this purpose I purchased and had fitted out anew the class "A" schooner yacht Explorer. This large yacht is some 60 feet over all, 16 feet beam, and 6 feet depth of hold, has a forecabin for the crew and a large poop cabin with six bunks, and there is room for thirty more large berts below decks. She carries foresail, mainsail, staysail, jib, jibtop sail, and main and foregigtop sails, and has a large rotary yawl capable of carrying fourteen or fifteen people. She will be used for cruising in the north or six weeks cruising in the season, and as they are few wealthy men will during the balance of the season, be open for charter to any party desiring her on any of the lakes (American or Canadian sides) at a charge of \$1 per diem each. She can call for parties at any port desired. E. LEWIS.

GODERICH, CANADA.

Natural History.

A NATURALIST IN WASHINGTON TERRITORY.

TO the ardent sportsman or more patient naturalist, Washington Territory presents the field of adventure and study unequalled in this country, perhaps in the world. Her magnificent rivers and grand old forests, her mountain peaks and beautiful valleys, are a source of wonder and admiration to whoever beholds them. It was my privilege to make one of a party to explore this wonderful region during the summer of '82, and the pleasure I derived from it forms one of the pleasantest recollections of my life, while the many rare birds and eggs which I obtained, and the curious habits noted of those of little is known, has well repaid me for many hardships and privations.

About forty miles north of the Columbia River there empties into the Pacific a large body of water known as "Gray's Harbor." It is a fine bay, being about twenty miles long and fifteen broad, and with the numerous large rivers that empty into it, drains a wide section of country. It was through this section that I spent nearly a year collecting.

The channel of the harbor is broad and deep, and dividing several miles from its entrance, forms the north and south channels, the whole center, as well as the sides, being immense flats covered by the tides. These flats are the chosen resort of thousands of aquatic birds, and gulls, terns, pelicans, cormorants and hosts of smaller birds literally cover the sands, and when disturbed rise in a perfect cloud, their shrill cries being audible for miles. Here they have congregated from time immemorial to rear their young among the adjoining rocks and marshes, undisturbed by sportsman or collector.

One afternoon after a long walk over these flats in search of new specimens, but without success, I crossed the south channel in my *bontia* (Indian canoe) and landed on the main shore. Slitting down on an old log to rest I heard a peculiar whistle, and turning around, observed half a dozen birds, which had evidently just arrived on the sand, and immediately recognized them as the somewhat rare black turnstone (*Sterna melanogaster*), not a single specimen of which I had as yet obtained. They did not seem to notice me, and I watched their graceful movements and the curious way they would scrutinize the pieces of kelp and shells that lined the beach, and then, if everything seemed satisfactory, turn them over. Woe to the unfortunate insect that had concealed itself there, for it was gobbled up in "the twink-

ling of an eye." While thus busily engaged, a large hawk came sailing past, and frightened them before I could secure my gun from the canoe. To say that I was disappointed would be feebly express my feelings, and as I watched them gradually fade from my sight, I determined to follow at all hazards, so I shoved the canoe in again, and after a hard paddle of about two miles, landed on the flat once more. Hundreds of birds were to be seen in every direction, but no turnstones, so I started down the edge of the water dragging my canoe and then me, I soon discovered the objects of my search quietly feeding among a large flock of red-breasted snipe, but they had no notion of letting me get within shot, my repeated efforts to do so only causing them to fly greater distances.

The tide had now turned, and was fast creeping up over the flat, and having ceased to drag my canoe, it was now almost out of sight. At extreme high tides the water, I knew would reach a depth of six or eight feet, and whatever I was to do must be done quickly, so I tried coarse shot at long range, and had the satisfaction of seeing one bird left struggling on the sand. I hastened forward to secure my prize, but before I could reach it a large gull (*L. occidentalis*) suddenly swooped down and seizing the still struggling bird in its bill, flew off with it in triumph. I recovered sufficiently from astonishment to send a parting shot after it, but without effect.

The habits of this variety of *L. argentatus* are somewhat peculiar. If undisturbed they will sit or circle around for hours near our camp, and the moment we would leave they would gather by the dozens, and amid a perfect chorus of screams, would carry off bread, crackers, and even large pieces of meat. Although I had specimens ready to be skinned, and others drying in the air, they never seemed to molest them, and I could not account for it at that time. I have since lost many a valuable specimen in this way. I have also seen these birds pursuing the smaller species of *Limicola*, and especially the surf-bird (*Aphriza virgata*), with the persistence of the pigeon hawk, never for a moment slackening their speed, until the frightened bird fell an easy prey to their rapacity, and was carried off in their bill.

I now took a hasty retreat, and received a thorough wetting before I could secure my canoe, which was now anchored several hundred feet from the shore, and returned to camp with the having secured one very slim specimen.

In conversation with the Indians of this section (Chinooks) they have told me of some very large birds that at long intervals of time visited the harbor. From the closest questioning I concluded that they could be no less than the great wandering albatross (*D. exulans*), the occurrence of which on our coast has been considered as doubtful. I always kept the closest watch for these birds, and one day in September, after a protracted storm, I observed a pair. They were accompanied by Bonaparte's gulls, four birds that quickly arrested my attention; their peculiar manner of flight immediately proclaimed them as albatrosses, and from their great expanse of wing they could be nothing less than *D. exulans*. Lastly seizing my gun and shell belt, I rushed to the beach and was quickly paddling my light canoe in their direction. They were fully a mile from me, and notwithstanding my utmost efforts to get within shot, they were out of range before I could get within effective range. I returned disconsolate, not being fully satisfied as to their identity.

Some weeks after this, while walking on the ocean beach, I discovered a large bird partially buried in the sand. It was very much decomposed, and I had some difficulty in getting it stretched out on the beach. There could be no question in regard to its identity, it was a *D. exulans* of large size, and was accompanied by a very slim specimen. Whether it had met its death on or near our coast, or drifted from some southern sea, I could only conjecture. It was too far gone for a specimen, so I contented myself with securing the skull, which is now in my possession. These are the only instances of its coming under my observation, but I am now satisfied that it does occasionally visit our coasts.

The interesting birds of this section are one of its most interesting features. You see them everywhere, in the open glades of the forest, or its darker recesses, out on the bare sands of the ocean beach, and even far out to sea, the whir of their wings is heard, or their tiny forms are seen for an instant as they dart away. The rufous-backed (*Stelaphurus rufus*), and the caliope (*Stellula caliope*), are the most abundant, although we occasionally secured specimens of several other varieties, and numerous nests and eggs. The nest of the latter is a very curious species in a tiny and different form all that have ever come under my observation in being made entirely of bright green moss. It is almost invariably placed at the extreme end of some low branching tree or sapling, and so perfectly does it correspond with the leaves, that it is almost impossible to discover it. These little birds have all the pugnacity of our Eastern representative of the group, and attack birds of our times their size, driving them away by the use of violence of their attack.

I will close this article by a short account of the habits of the brown pelican (*Pelecanus fusces*), which were a source of much amusement to us. They frequented the harbor in great numbers. Every morning we would see them in companies of from twenty-five to one hundred coming in from the ocean, and at dusk as regularly returning again. One company of about twenty invariably alighted on a point of sand about a mile distant from our camp, where their singular and curious habits were observed during the day. Concealing ourselves one morning before their arrival in a convenient thicket, we watched them without being ourselves seen. They were all young birds with a single exception, and he was a white-headed old chap who evidently prided himself not a little on his looks. They arranged themselves in a row with the regularity of soldiers, and then the old fellow walked up and down in front of them and then, facing the row, thrust his head at their head. They all marched into the water and swam off to commence their regular avocations of fishing. Here again it was laughable to watch them. They would sail along a few feet above the water, each bird being attended by about a dozen white-headed gulls (*L. belcherii*). The moment the fish was seen, down would go the pondorous head, and the bird, with wings half closed, would strike the water with a splash that could be heard for a long distance. This was the opportunity for which the gulls had been waiting, and the moment the poor bird came to the surface, they surrounded him like a swarm of bees, alighting on his back, flapping their wings in his face and otherwise so troubling him that he was frequently unable to elevate his head, without doing what a pelican cannot swallow, and in self-defense would drop the fish, which was immediately carried off by his persecutors.

KALAKALA.

WHEN THE BIRDS RETURN.

Editor Forest and Stream:

It may interest some of the many readers of your natural history columns to know just when our friends, the birds, return to their nesting haunts, or pause with us on their way further northward. The following list has been taken with care, and is reliable for this locality. In most cases one bird only would be noticed the first day, the following on the variety would not be uncommon.

Table listing bird species and their return dates. Includes: Robin—Merula migratoria (March 3), Purple Grackle—Quiscalus purpuraceus (March 10), Phoebe Bird—Sayornis fuscus (March 10), Red-winged Blackbird—Agelaius phoeniceus (March 10), Woodcock—Philohela minor (March 11), Fox Sparrow—Passercula iliaca (March 11), Cowbird—Molothrus ater (March 11), Wilson's Snipe—Gallinago wilsoni (April 2), Night Heron—Nycticorax grisea nana (April 5), Blue Heron—Ardea herodias (April 6), Yellow-shafted Flicker—Colaptes auratus (April 6), Mourning Dove—Zenaidura macroura (April 6), Yellow-rump Warbler—Dendrea coronata (April 8), Chipping Sparrow—Spizella monticola (April 8), Great-crowned Flycatcher—Myiarchus cinerascens (April 9), Fox Sparrow—Passercula iliaca (April 9), White-bellied Swallow—Tachycineta thalassina (April 13), Grass Finch—Poocetes gramineus (April 13), Savannah Sparrow—Passerculus sandwichensis (April 14), Hermit Thrush—Hylocichla ustulata pallasi (April 14), Redpoll Warbler—Dendrea palmarum (April 15), Chickadee—Parus atricapillus (April 15), Black and White Creeper—Monticola saxatilis (April 21), Brown Thrasher—Harpophaga rufus (April 21), Swamp Sparrow—Melospiza palustris (April 23), Pine-cropping Warbler—Dendrea picus (April 24), House Wren—Troglodytes aedon (April 25), Black-throated Green Warbler—Dendrea citreus (April 27), Blue-headed Vireo—Laniroica solitaria (April 28), Spotted Sandpiper—Actitis macularia (April 28), Barn Swallow—Hirundo erythrogastra (April 28), Chimney Swift—Chattura pelagica (April 28), Kingbird—Tyrannus carolinensis (May 1), Wood Thrush—Hylocichla ustulata (May 2), Golden-crowned Thrush—Sialurus auropallidus (May 2), Warbling Vireo—Vireosylva gilva (May 4), Yellow-breasted Chat—Icteria virens (May 7), Blue Yellow-backed Cuckoo—Caprimulgus vociferans (May 7), Baltimore Oriole—Icterus galbula (May 7), Catbird—Galeoscoptes carolinensis (May 7), Indigo Bird—Passerina cyanea (May 7), Oriole Bird—Icterus spurius (May 8), Chestnut-sided Warbler—Dendrea pennsylvanica (May 8), Yellow-throated Vireo—Laniroica flavifrons (May 8), Whippoorwill—Caprimulgus vociferans (May 8), Black-throated Blue Warbler—Dendrea caerulea (May 8), Summer Warbler—Dendrea aestiva (May 9), Nashville Warbler—Helmintophaga ruficapilla (May 9), Maryland Yellowthroat—Geothlypis trichas (May 9), American Redstart—Setophaga ruticilla (May 9), White-eyed Vireo—Vireo noveboracensis (May 9), Rose-breasted Grosbeak—Zamelodia ludoviciana (May 9), Wilson's Thrush—Turdus pinus (May 9), Least Flycatcher—Empidonax minimus (May 9), Solitary Sandpiper—Kythophtilus solitarius (May 9), Blackburnian Warbler—Dendrea blackburnii (May 9), Caudian Flycatching Warbler—Myiobites canadensis (May 10), Boholink—Dolichonyx oryzivorus (May 10), Green Heron—Butorides virescens (May 10), Blackpoll Warbler—Dendrea striata (May 11), Black and Yellow Warbler—Dendrea narubata (May 11), Ruby-throated Hummingbird—Trochilus colubris (May 12), Black-billed Cuckoo—Coccyzus erythrophthalmus (May 12), Blue-winged Yellow Warbler—Helmintophaga cyanus (May 13), Scarlet Tanager—Tyrannus carolinensis (May 14), Black-capped Yellow Warbler—Myiobites pusillus (May 17), Red-eyed Vireo—Vireosylva olivacea (May 20), Yellow-winged Sparrow—Colinus passerarius (May 21), Worm-eating Warbler—Helmintothorus vermiformis (May 23), Mourning Warbler—Geothlypis philadelphia (May 27), Green Heron—Butorides virescens (May 27), Kingfisher—Alcedo capilla (May 27), Old Turkey.

Table listing bird species and their return dates. Includes: Crows, Robins and Bluebirds (Feb'y 16), Song Sparrows (Feb'y 16), Purple Grackle (March 13), Meadow Lark (March 25), Carolina Dove (March 25), Kingbird (April 3), Chipping Sparrow (April 3), Red-winged Blackbird (April 5), Red-headed Woodpecker, Golden-winged Woodpecker (April 7), Yellow-bellied Woodpecker, Downy Woodpecker and Cowbird (April 8), Coot, Bittern, Carolina Rail (April 8), Grass Finch (April 9), Kingfisher, Virginia Rail and Snipe (April 9), Loggerhead Shrike (April 12), Towhee Bunting (April 17), Brown Thrush (April 18), Barn Swallow, Sparrow Hawk (April 20), Wood Thrush, House Wren (April 24), Looon, Night Heron (April 26), Yellow Warbler, Wood Pewee, White-bellied Swallow, Bank Swallow (April 30), Cliff Swallow, Chimney Swift, Spotted Sandpiper (May 1), Warbling Vireo, Kingbird (May 2), White-crowned Sparrow, Baltimore Oriole, White-throated Sparrow, Yellow-rumped Warbler and Catbird (May 3), Purple Martin (May 3), Redstart, Maryland Yellowthroat, Cerulean Warbler, Orchard Oriole (May 4), Great Blue Heron, Green Heron (May 6)

Table listing bird species and their return dates. Includes: Golden-crowned Thrush, Scarlet Tanager (April 9), Bay-breasted Warbler, Chestnut-sided Warbler and Indigo Bird (April 10), Great-crowned Flycatcher, Black and Yellow Warbler (April 11), Boholink (April 12), Rose-breasted Grosbeak, Cape May Warbler, Blue Yellow-backed Warbler, Blackpoll Warbler, Black-throated Blue Warbler and Black-throated Green Warbler (April 15), Blackburnian Warbler, Wilson's Thrush, Blue-gray Gnatcatcher, Hooded Warbler, Canada Flycatching Warbler, Warbler, Black and White Creeping Warbler, Blue-winged Yellow Warbler (April 17), Yellow-breasted Chat, Whippoorwill (April 18), Red-eyed Vireo, Yellow-throated Vireo and Acadian Flycatcher (April 19), Pewee, Solitary Vireo (April 20), Black-billed Cuckoo (April 26), CLEVELAND, OHIO. S. R. I.

WINTER AND SPRING NOTES, 1882-83.

DEC. 9, 1882.—Took a misty grackle in good plumage. It was found in a thick, bushy swamp; a spring and fall migrant. Dec. 12.—Saw a robin feeding on some poke weed berries growing along the edge of a piece of woods. Has been seen several times since in the same vicinity. Dec. 13.—Saw eight or ten yellow rump warblers among the cedars. They became quite numerous in a few days in the open woods and cedar thickets, until about Jan. 5, 1883, when they disappeared. Saw two song sparrows in a swampy thicket. This is a summer resident. Dec. 20.—Saw a small flock of meadow larks in the field. The ground is covered with snow. Jan. 1, 1883.—Pile grosbeaks here. Saw twelve or fifteen among the cedar and spruce trees, all in the gray plumage. A few are seen nearly every winter here. During the winter of 1871-2 they were very numerous. Jan. 12.—Saw three bluebirds among the cedars. Jan. 14.—Saw a golden-winged woodpecker. Jan. 15.—A helmed kingfisher shot at Mill Hollow, Pamechan River, Middletown, across the Connecticut River. A summer resident. Jan. 30.—Pine finch; shot one from among a flock of goldfinches and lesser redpoll finches; the first and only one taken here. Feb. 5.—Saw a herring gull flying up the Connecticut River. A few usually seen about the river in fall and spring. Feb. 9.—Saw an immense flock of lesser redpoll linnets, numbering thousands; also a very large flock of Arctic snow buntings on the meadows. Feb. 20.—A long-eared owl shot. Several barred owls have been taken in this vicinity during the winter. March 2.—Took great Carolina wren, of which you have published an account in the FOREST AND STREAM. Saw a flock of robins and two fox sparrows. New arrivals. March 4.—A great horned owl's nest found at Gilead, Conn., containing two fresh eggs. March 13.—Saw crow blackbirds and redwing blackbirds. New arrivals. March 25.—Several rusty grackles in the swamps. March 26.—Saw three pewees. April 1.—Large numbers of fox sparrows in the woods and swamps; more numerous than I have ever seen them before. Purple finches and cedar birds, which are usually quite numerous here during March, have not yet put in an appearance. Several flocks of wild ducks about the river. A pair of hooded mergansers, male and female, shot March 18. CHARLES H. NEFF, Portland, Connecticut.

[The field notes given above were received long since, but have been mislaid, and only recently come to light. We regret the delay in their publication.]

THE ENGLISH SPARROW.

Editor Forest and Stream: It is with much satisfaction that we have noted the progress of the war made for the extermination of that great nuisance, the English sparrow. That war has made its way so extremely obnoxious wherever he has been introduced, that it has become positively evident that he must be got rid of, and that very soon, or he will in time drive every one of our small insectivorous native birds from our cities, villages, and thickly settled agricultural sections. And what have we in the place of our native birds? The meanest little "devil" of the feathered species that was ever created. For the English sparrow is not an insect eater, that we can discover, neither has he a song note or beautiful plumage. But he is ever ready to devour the grain of the farmer, feed upon crumbs about homes, and feast upon the offal around barns and in streets. Hence his readiness to make his home wherever there is the most of this kind of food to be had. After having satiated his gluttonous appetite he will gather by the thousands upon horsestables, the dust of streets, for hours, thus idling away valuable time that our native birds industriously devote to the work of insect hunting. He is a pugnacious little animal, ready for the combat at any moment, not only with other species of birds, but among his own family. There seems to be no god in him, and we cannot see why ornithologists, or any one else, could have the heart to defend this bird in the present war. It is glad to see those who have made bird science a study taking sides against this miserable pest, and hope the legislatures of the different States will soon follow the lead and take measures to have the English sparrow exterminated from the whole country. Here in Titusville, five years ago, the shade trees and shrubbery along the streets and about grounds, were the homes of the native wildwood songsters, and the air was filled with melodious music and evening with their sweet-voiced notes. Some of these summer visitors were the beautiful plumaged birds from the sunny South, who strayed North, it seemed, to make us glad with their presence; now they are all gone. Seldom one appears since the advent of the sparrow, except a few robins, a family of which is raising a young brood in the branches of a tree a few feet from our window. We do not know of the nest of another native bird in the immediate vicinity. Humming birds used to be plentiful here a few years ago, but they, too, have taken fright and left the English "pirate" to have full possession. What has been the experience here with this bird, seems to hold good over the country wherever his habits have been

noted. Hence, where there is so much evidence against, and none for, the culprit, there is certain reason for taking vigorous action in its matter. E. C. BELL, TITUSVILLE, PA., May 23, 1883.

HANGED BY THE NECK.—Onondaga Hill, May 22, 1883. —On the 17th day of June, 1880, directly after dinner, I went out onto the front stoop of our house, and laid down on my back looking up into the trees and sky, quietly thinking and listening to the birds above me. Suddenly I discovered a cedar bird suspended by well, I have reason to believe that these two robins were the executioners. Snipe have not been very plenty here this spring. I have heard of a couple of good bugs being made, one of thirty-five snipe, another one of ten only. I saw some of them; four of them called a robin in size each. At a place on Seneca River called Mud Lock, over forty ducks and one wild goose were fed in one day. The place is only about eight miles northwest of Syracuse, N. Y. The flock of twenty-five or thirty I captured twelve and had four sent to me to mount; also nine scarlet tanagers and a few rose-breasted grosbeaks.—GREEN WING.

WOOD DUCKS IN THE BARNYARD.—Saratoga, N. Y., June 2.—In conversation this morning with Mr. D. A. Bullard, one of Schuylerville's solid citizens, the following unusual circumstance was elicited which may be of interest to your readers. A few weeks since some boys passing through one of Mr. Bullard's orchard observed a wood duck fly from a tree. A duck in an apple tree was to them unheard of, and they reported the fact to Mr. Bullard, farm manager. He made an investigation and found in the decayed trunk, eight or ten feet from the ground, a nest containing eleven eggs. These were removed and placed under a hen, which in due time came promptly from the nest with eleven brownish-black ducklings. The little aborigines are exceedingly lively and shy, darting to places of concealment with the rapidity of a mouse, on the approach of a living thing. They regard the voice of the hen as that of a loving parent, and when in turn displays the usual solitude when they bathe in the vessel placed for their convenience near the coop where the foster mother is confined. It is the intention of the gentleman mentioned to make an intelligent attempt to rear and domesticate them, with a view to matrimonial alliances with their civilized relatives.—S.

A HERON CHOKED TO DEATH.—A large blue heron was found dead a few weeks since, and upon post mortem examination it was found that his love for fishing and his greed for food had caused his untimely demise. He had probably read some of the recent articles in FOREST AND STREAM relative to the expansive capabilities of the throats of snakes, cranes, etc., and thought all things possible. It seems that the heron had tackled a shad fully twelve inches in length, and had succeeded in swallowing almost half of the fish, head foremost, when it refused to be "put down," and becoming wedged fast in the throat of the bird, caused its death. "The fish prevented the disgorging of the delicate morsel. So, there he lay, a victim of scientific research and misplaced confidence. Fact! Moral!—Be very careful what you write in FOREST AND STREAM, as all sportsmen and "fishermen" read it, and being "naturally credulous," may injure themselves by experiments.—A. F. R. (Belvidere, N. C., May 29).

A BEAR'S WINTER SLEEP.—Mr. James Hopper, of Edwardsburg, is the happy possessor of a year-old bear, for which he has snug quarters prepared in the shed. On the 6th of last December, his bear had no doubt feeling drowsy, retired to his quarters, and much to the surprise of his owner, refused to be coaxed out again, even upon savory dishes, placed at the door of his box, had not the slightest effect upon him. Weeks passed into months, and still he remained in a state of lethargy, until people began to look forward to the 17th of March, when all well-recalled bears are supposed to come forth and look for food. He had retired for the old story, he came not forth, and it was not until the 28th of the month that he succumbed to poke his brown nose out and partake of a little milk, and not until the 9th of April that he may be said to have partaken of a square meal. His long fast does not seem to have disagreed with him, as he looks just as well as ever.—Prescott (Out.) Messenger.

THE PINE GROSBEAK'S SUMMER HOME.—I found pine grosbeaks at Second Connecticut Lake, May 24, in pairs. The song of one male I distinguished from a medley of songsters at least 300 yards away. He was perched upon a dry tree on the Carhart Bog at head of lake.—N. U.

Camp Fire Flickerings.

"That reminds me." DIAMOND PONDS, ten miles east of this village, are yielding some fine catches of trout, as usual with all tributaries of the Androscoggin. A camp will soon be completed there for the accommodation of sportsmen, under the auspices of Martin Noye, a new hand but a royal fellow. Last week, while in temporary quarters across the lake, he was aroused by a call from the terminus of the road, as one half awake would imagine. His loud "hello" in reply aroused one of the guests inside, who quickly recognized the voice of Bibbo and exclaimed, "Come in, Mart, and let him go around if he can't swim." A few deer had been seen on shore at the lower end of the pond. Mart, anxious to show the attractions of the locality to one of his guests, discovered, as he fondly imagined, the form of a deer partly visible through the brush, and while trying to draw attention to it the fog lifted, and it alighted in the top of a convenient tree, as before. COLERBROOK, N. H. NED NORRIS.

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication any reliable account, as it may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such notices?

CONCERNING BEARS.

BILL asked me for a ride the other evening, and got into my cutter. It was a wild night, and the road was long, and as we drove slowly through the drifting snow, Bill lighted a cigar and congratulated himself on the fact that the wind was in our backs.

Under the influence of the weed he became communicative, and it is always a pleasure to me to find him in this mood, when I have time to listen, for he is a man of wide acquaintance in his way, and is no ordinary character.

Bill does not call himself a hunter; but there are few beasts of the forest which he has not seen and slain. He knows the country, much of it intimately, from Denver, Colorado, to the outlet of the Great Slave Lake; has wintered on Lake Nipissing (in old muzzle-loading days), and starred in the Grand Brule. The Dog-rib Indians nearly took his scalp, but he gave them cause to remember his rifle and the way in which he carries a scar or two to remind him of their polite attentions.

"Bill," said I, "you've killed bears?" Of course, I knew he had, but I wished to draw him out.

"Yes," said Bill, "I have."
"How many?"
"I killed seventeen one fall."

"How many altogether?"
"Ten forty."

"Did you ever know a bear to kill and eat a man?"
"N-o, I never did."
"Ever have any trouble killing 'em?"

"No. I never had what you might call a fight with one. The worst racket I ever had was with a wild stag. He shook me up so's I thought I'd never get over it."

"How was that?"
"Why, it was a rousin' big buck. Jim W—'s got the horns now. You see, he was fallin' in love. I shot the doe with one barl, and him with the other, and thought he was all right, but when I stepped over a log to look for him in the brush, he lit on me so quick I couldn't use my gun. He knocked it out of my hand, and then my knife, some way, and I grabbed his horns. I thought he'd never stop yankin' me round."

"How did you get clear of him?"
"I took his horns a witness and dislocated his neck."

"That was a lucky twist."
"Yes. I had another time with a buck up on the 'Six Mile' a good deal like that, but I managed to get out a Smith & Wesson revolver I carried then, and shot him."

"Did you ever know a bear to chase a man?"
"Yes, I did—once o' your own neighbors, Bill D. Mc and my wife, and four or five others, was down to his house that night, and he began scratchin' in a brush fence about twenty rod off, and thought it was a brachyester Johnson had, and wanted to drive it away, and he got right up to it before he see what it was. The bear chased him clean up to the house, and he was white as a sheet when he came in."

"Do you believe a she bear, when she has cubs, will tackle a man?"
"No, I don't; not if he stands and faces her. I can give you an instance with a witness, Henry D. He was the man that come to the tree first when he heard me whistlin'. I'd been putting up a little warehouse for a man in Kinnoin and was going home just at night, with my adze and a basket of tools. When I got to the bridge I saw two porcupines, as I supposed, and started for 'em. They run up a tree and then I saw what they were, especially as they begun to squeal. When I heard the old bear coming through the brush and had a mind to run, but I thought I might as well make a good fight as a bad retreat, and I dropped my basket and clinched my adze. The old bear came clanging up within ten or twelve feet of me and capered and snorted round, and growled and snarled fearful. Then I begun whistling, and after a while Henry heard me and came where I could talk to him, and I told him what was up, and that if he'd stay there and keep the cubs up the tree, I'd go and get my gun. He said he wouldn't stay there for a hundred dollars, and about that time my wife—my famy, joined Henry's—heard the whistling and the racket and let loose a big Spanish hound I had. Henry'd set on his bulldog before, but the bear took after him and back he went to the house."

"My hound came up full chisel, and meant business, and it wasn't long till he drove the bear up a tree."

"Well, the short of it was that I stayed by my tree till I got my gun, shot the cubs, and then went and got the old bear."

I spoke of an instance within my own knowledge where two men, seeing a bear near a small wood, went up to it and killed it with axes, and found that it was very old and perfectly blind.

The fattest bear I ever killed," said Bill, "was blind as a bat. My Wilson had a field o' corn that they was workin' in, and one night I went out to watch for 'em. I stayed to the house and talked with the old man till it got to be so late that I told him if I stayed much longer the neighbors 'nd think I was after sparkin' some of his daughters, and I put out for the field. There was a stand part way down, where I'd watched before, and though it was dark I knew what row of corn to follow to take me right to it. Before I had got half way across the field I saw in the dim light something like a log right in the row, and I stopped. I know'd that there was no log there when I seen the place before, but there it was, and it lay perfectly still. Then I moved up a little nearer, and I had one of those old English muskets, with two or three balls in it, and I took aim in the darkness and onbitted. The thing hardly stirred. I see I'd killed something, and went back to the house for a lantern. It was an old gray bear and blind as could be, and he'd been in the cornfield, I suppose, all summer, and died with the cob he was eatin' in his mouth. He was fat."

"You hadn't much trouble with him."
"No, not much. I never had what you might really call 'trouble' with 'em. I once thought I was in for it, though, and no mistake."

I was in Lower Canada. I'd been following a track in the early snow, and it seemed as if they—there was two of 'em, an old one and a cub—didn't know where they was goin'. I believe they did though, all the same. They

trailed me round—or I did them—hither and yon through a big swamp of several hundred acres. At last they took a better track toward night, and I followed 'till I came to a ledge with a hole near the bottom. It wasn't very large, and went down into the ground, or rock, and after looking the place over, I took a piece of a large dry poplar tree, and dropped it in for a plug. I thought I heard a growling, but I went on and built a fire about twelve feet from the hole. Then I took out the plug, lay down on the other side the hole where I could see the hole, and waited.

"It got dark, and I began to feel sleepy. At last I saw the head of a small bear pop up. He just took out look and settled back. Pretty soon he looked out again, and the third or fourth time he climbed out. I drew a head on him, and knocked him over. Then I waited. In about two hours I see another head. That was a yearling, and when he finally came out, I shot him. Then I waited, and it got pretty well toward morning when I heard a growling. I guess I must have been asleep, for the bear was half way out of the hole before I saw her. I jerked up my gun and let loose, and back she tumbled into the hole. Then I thought I had 'em all, and I tried to get the old one out, but couldn't do it. Then I got a torch and slid down into the hole. It branched off level, and I walked on through a sort o' cave, about eight or ten feet high, till I came near the end.

"I'd set my torch down against a side of the cave, and I was lookin' round when I heard a growl and up, on a sort of shelf to one side, I see the head of an old rouser. I up my gun and fired, the torch went out, and I dropped gun, axe and all, and scrambled out of that hole, as quick's I could, I tell ye. I thought I was called for. I plugged up the hole again and started for home. I looked up a chum o' mine and we went back, and after listening awhile, went into the hole. I'd blowed that bear's head all off. We got 'em out and managed to get 'em home after a while. There was lots o' people went to see the place that fall, and the next year but one there was two more bears killed in the same hole."

MICHIGAN.

HUNTING RIFLE SIGHTS.

Editor Forest and Stream:

I was much interested in a communication from "Occident" which appeared in the FOREST AND STREAM last week. It seems to prefer the old-fashioned open sights for hunting purposes. I agree with him to a certain extent as regards using a muzzle sight only—the same as a shotgun. I have made some very good shots with a rifle using a muzzle sight only. The old-fashioned notch and bead I have discarded entirely, and I think that "Occident" would do the same if his experience were like mine. Last year I commenced using a Lyman rear sight; the more I use it the better I like it, and I think that if "Occident" will try one of them in conjunction with almost any front sight (I prefer the Beach) he will soon change his opinion about the best kind of rifle sights for hunting purposes, and especially for shooting moving objects.

But when aiming with a Lyman sight be sure and keep both eyes open. Don't go to "peeping and squinting" with one eye shut and the other nearly so. Don't try to use the large aperture for a peep sight, for it is not intended to be used for any such purpose; but keep both eyes open, throw up your rifle, and you will find that the eyes strike the line of sight easily and naturally. You don't have to hunt around for your front sight, then find the notch in your hind sight, and then probably take your eyes off the gun before you can see the game; but everything accessory to good, quick shooting is naturally presented, and the eye at once takes in the whole field.

I now have two of the Lyman sights in use, and I prefer them to any sight that I ever used or saw. I have both eyes open, and naturally. You don't have to squint with your eyes (one of them closed) when you certainly have no need of gun sights, and if we produce an aberration of vision that interferes with the organic functions of the eye by peeping and squinting, we naturally have no eyes to see straight."

IRON RAMROD.

SOMERVILLE, MASS.

BAY BIRD SHOOTING ON THE CHESAPEAKE.

I HAVE BEEN putting my breech-loaders, and notably my Greener trap gun No. 10, to a severe test during the last two weeks, for I never in my life saw so many birds, especially ducks, and naturally. You don't have to squint with your eyes (one of them closed) when you certainly have no need of gun sights, and if we produce an aberration of vision that interferes with the organic functions of the eye by peeping and squinting, we naturally have no eyes to see straight."

May 16, 1893.—Stopped at the Illegia Hotel, Old Point.

May 17.—Started for the Chesapeake shore on the steamer Northampton. The wind was blowing high, the bay was rough, and the passengers as a general thing yielded up their breakfasts. Reached Chestertown, a pretentious village of many streets and avenues, but no houses; hired a darkey, a mule, and an antiquated spring wagon to carry me to Ketchum's. The animal was in the last stages of goneness, and I believed if the mule could cheat the buzzards I would make the trip sure. Reached Ketchum's in about five hours—a little grocery and a one-horse oyster and clam steamer built on piles in the bay. Captain Ketchum is a retired merchantman sailor, gun in manner, but accommodating and kind. George Hutchings carried me over to Smith Island.

May 18.—Set the decoys on the mainland shore. Much to my surprise the robin snipe have not made their appearance, but the curlew and calico-buck snipe are in abundance and stool well. Result, forty-one birds.

May 19.—Went with ox cart four miles up beach of Smith Island to Mud Hole, where E. Cobb, of Cobb's Island, killed two hundred birds in one day last week, but then Cobb is a pot-hunter, and shoots for the New York market, and he has the thing down fine, his decoys are life-like and numerous, his patience untiring and he can whistle every bird to him for a mile around. Did not have Cobb's luck by a long sight, the spoils only amounted to thirty-two birds. No sign of the robin snipe. It is terribly hot, face and hands scarlet and burning.

May 19.—Woke up this morning and upon going to the looking-glass started back with feeling akin to the unfortunates who gazed at the prophet of Kohassan's countenance unveiled—skin coming off in flakes off face—nose, already large, now of double size, cheeks puffed out, eyes bloodshot, hands out and sore shoulder, bruised and black from kicking of the gun. Some would not call this fun, yet as the Cockney would say, "Wat's the odds, long as you're 'appy." A stiff wind blowing and the birds flashing by on the

pinions of the wind. Shot until evening and the score was seventy-one birds, all killed singly and on the wing. Still no sign of the robin snipe, which have invariably hitherto stopped here on their migrations about the first of May. The old inhabitants say their absence is something unaccountable.

May 20.—Sunday, a day of grateful rest and ease. It has been the custom from time immemorial, both in verse, song and story, for the courted swain to express his desire to fly to a desert isle with his fair one and live in the light of her smile evermore. It is a beautiful sentiment, but I would recommend the love-sick youth and the lushful maiden to stay for a week at some lighthouse, where the moaning of the surf sounds a requiem in one's ears.

May 21.—Again at the blinds; birds more plentiful than ever. Only stayed a couple of hours. Spoils, twenty-one. No sign still of the robin snipe.

May 22.—It is a wonder to me that some of the votaries of the rod and gun do not erect a club house on some of the uninhabited islands scattered round here, where the gunning is fine, the fish plentiful, and where one is free from mosquitoes. I know of one gem of an island in this vicinity.

May 24.—At the blinds at sunrise, and the like of the curlew I never saw before. They came from every point of the compass and in flocks. Such an exciting time don't come often. I had shot both barrels into a whirling, quivering mass, and when in a frenzy of haste tried to unlock the barrels I found they would not open. I separated the barrel from the stock and with a rod tried to force out the shell, which was a brass No. 10 with Berdan primer. In vain—the shell was stuck fast. I rammed and rammed until the rod shivered, and one half stuck in the barrel. And there I was with an empty gun, and the curlew, calico-bucks, black breast and yellow-legs, fresh from their slumbers and drowsiness, were gliding and hovering over the decoys in hundreds, and I was in a quandary as to what to do. I had never in my life, but never one more aggravating and more trying. There I sat—I could not do anything else—the nearest house was two miles distant, and by the time I could walk there and get a ramrod the birds would be scattered to their feeding grounds. I became silent at last, for words were inadequate.

Break, break, break.

On thy cold gray stones, oh sea;

And I would that my tongue could utter

The thoughts that arise in me.

May 25.—The tide ran being exactly right, did not go hunting. The greatest case on the island is George Hitchcock's, he has many a most excellent set fancy. The blunders say that when George wants oysters he goes to a bed and tells some of his cotangent lies, and as he proceeds the oysters' mouths open wide in astonishment and then George helps himself with a fork—and old Joe Millerism—but it shows how rustic tradition hand it down.

May 26.—Last shooting day. Killed twenty-six calico backs in about two hours.

Sunday, 27.—Walking along the beach this evening found the robin snipe had arrived—they come all at once—to-morrow they will be in millions, and I have to go home to-morrow. Just my luck.

CHASSER.

OFF THE VIRGINIA CAPES, MAY 28.

FLORIDIAN EXPERIENCE.

Editor Forest and Stream:

"I hate the man who can travel from Dan to Beersheba and cry all is barren!" So wrote Sterne a hundred years ago, and the race of grumblers is not yet extinct. We meet them in cars and steamboats, and they utter their complaints in the newspapers. Especially do they abound among tourists returning from Florida. One class goes there for health and amusement, and being of vacant minds, with no resources within themselves, they pass through a region full of novelties and see nothing except the poor food, the mosquitoes and the fleas. All these inconveniences are met with in the Northern States, and many of them in European traveling; but to hear these people talk, and to read their indignant letters to the newspapers, one would suppose that fried beefsteak and salted bread were unknown in New England and the West, and that the mosquito and the flea were peculiar to Florida.

Often have we met with these unhappy people and listened to their complaints. "Florida is all a swamp." "Nothing can grow in Florida, it is nothing but sand." "I've been all over it and I know." "Where have you been?" "Oh, I've been to Enterprise, staid one night at the Brock House; then I went to the Old man's, and after that to St. Augustine. I don't think it's all alike. I wouldn't give a hundred dollars for a whole county."

Then there is another class who try to pass for sportsmen. They go loaded with guns, dogs and rods. They take the great traveled routes and are surprised not to flush quail in the streets of Jacksonville, that they see no deer or turkeys about the Putnam House, in Palatka, except on Orvis's table, or find no bears in Enterprise or Sanford, except in the hotel office, perhaps.

I have seen them fishing in the St. John, Black Creek and Lake Munroe. Having no boatman who knows the waters, they come home with a few catfish or perch, swearing that there are no fish in Florida, and that the whole thing is a fraud.

The tourist who has an eye for natural scenery, or who has a special pursuit in every land, will always find matters of interest in every land, and the real sportsman, who knows where to look for game and fish, and how to kill it when found, who goes into the wilderness properly equipped with guides, or to the remote lakes and rivers, or to the seashore with skillful boatmen, will find sport in Florida, and that of the best. But neither North or South will every day bring success. No one but the creature known as the "trout hog" expects or wishes to commit constant slaughter.

S. C. C.

MARIETTA, GA.

Editor Forest and Stream:

I see in your issue of May 24 a letter on sport in Florida. Having spent this year some weeks wandering there in March and April, I am able to corroborate much that "Orlymum" says with regard to the badness of the general run of the Floridian hotels, and I think most people who visit Florida for winged game shooting are likely to be more or less disappointed; but on the other hand I think he is too sweeping in his condemnation of the sport to be found there.

The greater part of the Gulf Coast is still almost a terra incognita to the sportsman and the tourist, and to anyone who does not mind a moderate amount of roughing it, and

who wishes to try his luck at cod, with an occasional shot at a geator or a turkey. I can confidently recommend the Hammock, where he will find a most comfortable house, kept by Mrs. C. Wingate. I found it more of a home than an hotel, and the charges most moderate, \$12 per week. It has none of the pretentiousness of the large hotels, but I am certain that no one, after spending there some weeks, as I did, will regret having done so, and they will, I am sure, say that they found every comfort, though perhaps not all the luxuries of the larger establishments.

There is a keen hunter, Albert, whose services are always at the disposal of the guests of the house, and a sportsman must be indeed unlucky who goes out without starting some deer (one day we jumped no less than eleven), and it will be his own fault if he does not have venison every day for dinner. There is excellent black bass and sheephead fishing in the lovely stream the Wociva, which runs close to the house.

Gulf Hammock is nine miles from Old Creek station (where there is a post-office), on the Fernandina & Cedar Keys Railway, or it can be reached by boat, being about twenty miles from Cedar Keys, should anyone prefer that means of locomotion to the nine miles' ride in a wagon.

BOSTON, MASS.

VIATOR.

Editor Forest and Stream:

From an experience of many years in sporting, I think Indian River, Florida, one of the best and most interesting places for hunting and fishing I ever visited. A few miles back of the western shore is the most extensive cypress swamp in all Florida, in which can be found all the larger game of Florida, and one has only to build a fire and burn some flesh or fish some quail abundant, that the scent may waft out into the air, to entice out panther, bear and wolf. I found deer and turkey more plentiful there than in any other part of the State, and on the strip of land between the river and the Atlantic, quail were plenty. The river abounds in fish of great variety, and oysters and turtle, while ducks, sea-fowl and wading birds are found in countless numbers. As the winds are usually either east or west, the river is seldom rough, and a good light boat is like a ready team requiring but little care, and really hitched at the door. It is impossible to try to describe the beautiful scenery, the views, the ever new and wonderful varying points of interest, the variety of birds that seem to start up as one sails along by the grassy points and woody inlets of the west coast. The want of a hotel has so far been a barrier to sportsmen's visits. But that want will be in a measure supplied or filled by the Florida Sportsman's Association, for as a member one finds a home and is nicely cared for, and four or six members can at any time take one of the portable houses, and shift their camp to any point desired.

In your issue of May 24, "Didymus" says he supposed when he went to Florida he could shoot all the wild turkeys, deer and bear from the cars. Well, that is the opinion of about one half the "city sportsmen" that start for distant points South or West. But wild game is seldom found on the beaten paths of well-travelled tourists, and the excellent sportsman that expects to find gangs of wild turkeys looking into the car windows, or droves of deer pie-necking on railroad tracks, will be sadly disappointed. I deny that there are no good hotels in Florida where game and fish abound. I would say visit Homosassa, sit at Jones's table, and in the morning or evening try the deer or wild turkey in the adjoining hammock on either side; or in a boat at his door, try either red or black water fowling, and the excellent field that abound there, and when tiring of that, try the ducks and sea-fowl to your heart's content; then go down twenty miles below Bay Port, and stopping at Mrs. Garrison's, try the river fish or ducks, and the hammock for deer, or continue down to Tampa, stopping a while at Clear Water Harbor, and then honestly confess you were mistaken; and that there are no good hotels, no excellent sportsmen, no excellent fields, clean beer and obliging hotel keepers in Florida. Did "Didymus" expect to have wild turkeys gobbling at him from every bush at Ocala? Ocala is the shire town of Marion county, in a pine land district, largely agricultural, quite a business place, with steam mills and cotton gins, hardly a place to expect much game. Having spent eight winters in Florida, I am rather disposed to contradict the statements of "Didymus" as I have visited all the counties of the State and most every large town, and venture to assert that my shooting and fishing experience exceeds his by at least fifty per cent.

PUTNAM, CONN., May 28.

W.

ONCE MORE "THE SCREED."

Editor Forest and Stream:

"Still must I hear?" those other fellows bawled, and I not sing? Why can't I have a "sly" at the old "Screed," as well as the rest?

It was rather "briery," not a doubt of it; but the sportsman, who ten years hence shall take the trouble to re-read it, will be likely to say it was well written, and in excellent style.

The value of a dog is more difficult to fix than that of almost any other piece of property. I have never dealt in them, though I once accepted an offer of \$50, for one which cost me \$17, three days before. I would not give fifty cents for his counterpart to-day. Nevertheless, I have owned and broken a good many, and although dogs which are really good, and thoroughly well-trained, are not ever plentiful, I think the value of such animals are often fictitious. Many will continue to pay the fancy prices, but fewer can afford them.

I did not understand "Nessmuk" to class Prang's ebromo among works of high art, but rather to take the position held by the late Mrs. L. M. Child, who "believed in" them, as enabling persons of moderate means to adorn their homes with pictures, when expensive paintings would be out of the question.

"Picket" hasn't it all on his side in the matter of Damascus barrels, either. I have thought that such a firm as Quentin Matsys and Benvenuto Cellini (artists and artisans) would have made, might do something quite creditable in that line, should they choose to attempt it.

I do not know "Nessmuk," but I will bet my best whinhammer against a common dog, that if he had plenty of money, and found a dog, or anything else which suited him, he would buy it without much regard to the price.

Some publisher ought to bring out a volume entitled, "Nessmuk, his Screed (and neg. docs.)," which should contain the original production and the various comments which it has elicited. Wouldn't it sell?

P. S.—"The game must go."

THE KYNOCH SHELLS.—If we may trust the evidence printed on the other side of the water in regard to the Kynoch shells, their invention marks an epoch in the use of the breech-loader, not less important than the adoption of choke-boring for long-distance shooting. The merits claimed for these shells, or as they are called in England, "eases," are that they give harder shooting and more even spread of the shot than is obtainable from the ordinary paper shells. Besides these important matters, they do not bulge, and always slip in out of the chamber without difficulty. Water does not affect them, and they can be many times re-loaded, while they are no heavier than the ordinary shells now in use. In his recently published work, the "Modern Sportsman's Gun and Rifle," Mr. Walsh devotes some space to the consideration of the Kynoch shells, and reaches the conclusion that it brings twenty or thirty more pellets to the target, and that all of those reaching it do so with equal force. This is a very serious loss to the shooter, and he actually tested the matter, there is a very serious loss to the ordinary turned down cartridge, from the fact that two or three layers of the shot usually become misshapen or upset in the discharge, and so fly wild and fail to reach the target, or even if they do so, strike it with such slight force that they fail to penetrate to any depth. This state of things is said not to take place with these new shells, and as evidence of this Mr. Walsh says: "I have myself lately seen 298 pellets out of 306 (which number constitutes the above charge 14 ounce) put on a 40-inch plate with a very full choke." Notwithstanding the excellent results attained in England, very little appears to have been done with them in this country, and we regard it as somewhat extraordinary that so little apparent interest has been manifested in America on a subject which would appear to be of the highest importance to all who use the shotgun. The somewhat greater cost of the Kynoch shells may have something to do with the apathy that has been shown in the matter, but notwithstanding this, we hope ere long to bear the views of our correspondents on this subject.

THE TOLLESTON CLUB CASE.—The Tolleston Gun Club case has finally been decided in these courts, and the club has scored a signal victory. THE FOREST AND STREAM contains full particulars of this celebrated case, but a brief recapitulation will be made for the sake of deciding the case after relating the following history of the controversy: "The defendant, E. S. Alexander, attempted to prevent the members of the Tolleston Club from passing over his land in going from the club house to the shooting grounds on the Little Calumet River. The club, which was organized in 1871 as a voluntary organization, though steps were at that time being taken to incorporate the club, has a lease on the defendant's land to the river from their club house so as to have access to the shooting grounds, at big expense. To this canal the defendant fully assented at that time, and was also a member of the club. He executed a lease to the club for the ground used for the canal, providing, however, that this lease should terminate whenever the club should cease to exist as then organized. Of course the defendant claimed that the incorporation of the club would annul the lease under the terms stated." The court in rendering a decision held that the lease should be construed in the light of the circumstances under which it was made and with reference to the intention and purpose of the parties at that time, and after reviewing the evidence the court found that the instrument was really executed in view of the incorporation of the club and intended to operate as a grant or easement to the club after incorporation; and also held that inasmuch as the club had been accustomed from the first to use the bank of the canal as a foot path, and Alexander knew and assented to this, and even agreed with the club upon the location of a plank walk lead for this purpose, such walk was covered by the lease. The court therefore awarded to the club a decree perpetually enjoining the defendant from obstructing the canal or foot path or interfering with the use thereof by the club members. Thus ended the great Tolleston Club case.—(Chicago, June 2).

PHILADELPHIA NOTES.—June 2.—A large flight of shore birds reached the near New Jersey coasts during the past week, and many of all the late migrating varieties can be seen in our markets. The stay will be short, and even at this writing have passed northward. They are a full week late this year. I would advise all readers of FOREST AND STREAM who will shoot "between seasons" to try the Sinepuxent shores for the first time in August for curlew and willet, and stay at the Sinepuxent House, a new and comfortable place, run by J. Miller, at Ocean City, and engage bay-window Powell and his outfit. I have heard this week, from the best authority, that the shooting is good there in August. A large number of night herons, or "quaks," have taken up their quarters in a wood near Bellefonte, Pa., this spring, as a nesting place. The unusual number of the birds has astonished the Bellefontaines. At one time a clump of wood a mile from the Delaware shore, between Chester and Lepperville, Pa., was the breeding place of flocks of both the blue heron and the night heron. This was within the writer's recollection; but the birds have long since deserted the place. Tracey, the canine artist, is displaying a number of his dog portraits in Earle & Sous' windows, in our city. They are attracting much attention. It is the first time many of our sportsmen have had the opportunity of admiring Mr. November's "Gun Shooting" and portraits of Crockett and Seneca. There is now a furor among the poultry and pigeon dealers of our city to have all varieties of dogs for sale in their stock rooms. I took a general run among them to-day, and found some very fair dogs offered; but alas! at one place I discovered evident signs of distemper among the poor animals, and the keeper, a mere lad, unaware that his whole stock of puppies would soon suffer, and totally ignorant that the malady was cropping out.—HOMO.

INDIANA.—Fairland, May 29.—The winter was unusually favorable for the protection of our game. There was little or no snow, the favorite time for the boy with the old musket to pot them in the snow. It gave them good protection also from their natural enemies, owls, hawks and woodcocks. Their chyrons were all hearty, and nurses in all directions, now that the birds are paired and are nesting. Woodcock have come in goodly numbers, and the absence of heavy spring floods and the favorable weather in early May render it probable that the supply will be abundant. We are expecting better quail shooting this fall than for five years past, should the weather continue favorable.—C. W. W.

MINNESOTA.—Pillsbury, May 28.—Ducks are nesting here in unusual numbers; also pigeons.—J. F. LOCKE.

DAVY CROCKETT.—Editor Forest and Stream: I was much interested in your article on Col. Crockett, and was glad to see the cut of the rifle. I had not the pleasure, when a boy, of reading his autobiography, have never seen it, in fact—but I remember well that during my early years I was annually issued in Massachusetts a volume entitled "Crockett's Almanac." This was embellished with all sorts of extravagant illustrations, representing the gallant Colonel in the act of performing various extraordinary feats. There was also associated with him his particular friend, "Ben Hardin." I do not, if I remember rightly, and I have often wondered if there was any original in this counterfeit. Perhaps Colonel Bob Crockett will oblige me by settling this point in his next communication to THE FOREST AND STREAM. I am very glad that the rifle is still preserved in the family, a fitting memorial of their distinguished ancestor.—X.

RAIL BREEDING ON THE DELAWARE RIVER SHORES.—An ebony-colored gather of sweet flag root or ephimus tells the writer that many rail birds have settled down to breed in the marshes near Oldman's Creek, which empties into the Delaware opposite Marcus Hook. In old times this would have been nothing strange, the marshes all along our river were regular breeding grounds, but of late years their numbers have grown very visibly less.—HOMO.

NORTH CAROLINA.—Smithfield, N. C., June 22.—Wild mules on Neuse River rifeeping and squirrel shooting fine; kill a dozen any afternoon.—C. L. P.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

WACCAMAW LAKE.

"And in the visions of romantic youth,

What endless hours of bliss are yet to flow."

—Gentiana of Wyoming.

INDICATED in one of my recent communications to THE FOREST AND STREAM that I had intended to much pleasure in a contemplated trip to Waccamaw Lake, where I expected to meet my friends, Hon. A. S. M. and J. J. D., to enjoy the hospitality of Col. H. B. S., who lives upon his banks, and indulge in the delights of fishing and all others "thereunto belonging or in anywise appertaining." Soon after the gentlemen, whom I have named, and myself had made the arrangement referred to, I wrote to another friend, Hon. A. S. M., the genial Chairman of the Committee on Indian Affairs during the Forty-sixth Congress, urging him to join us, and thus afford a reunion of four persons who had sat at the same table day after day in the dining hall of the Metropolitan Hotel, three of whom discussed "affairs of State," while the other sat and listened with respectful attention to their utterances. He answered with commendable promptness, assenting to my purpose to be one of the party. Matters being thus arranged, I confidently expected that all would meet, until a few days before the time appointed, when I had a letter from J. J. D. expressing his regret that business avocations would prevent his participation in the pleasures anticipated, and his wishes that the others should have full fruition of whatever could be had. So at midnight on Wednesday, the 15th of May, I took the cars for Wilmington, where we were to remain for the day, and then board the train at 9:30 P. M. for Flemington, the station at the lake. We met our friend H. B. S., who told us that he would take a freight accommodation at an earlier hour, meet us on our arrival, and escort us to what we must regard as our home during our stay. He did not fail to do this, and in compliance with my much pleasure in checking the depot at Wilmington in full time to get tickets and check our baggage, we waited patiently for the arrival of the train from Weldon, after which we would start promptly for our destination. It came at a seasonable hour, and I soon saw the portly form of my friend A. S. M., but failed to see the others who were expected. Making the needed arrangements we entered the cars, and I eleven minutes before we received welcome news from the conductor of our arrival at Flemington.

So soon as we left the cars, we were greeted by our friends H. B. S. and H. B. S., Jr., and welcomed to all the hospitalities of their elegant residence. After chatting a short while with our hosts and Judge M., of Wilmington, we were assigned to our quarters, and soon were enjoying the pleasures of an excellent bed, which invited us to sleep. At five o'clock and I were in bed sleeping well, from information which came to us the next morning, we had grave doubts whether the same good fortune befel our congressional comrade. He and Judge M. were schoolfellows at the old Caldwell Institute, at Greensboro, and had not seen each other for twenty years. After they retired to their room, I learned that they discussed all things, from the dawn of creation down to the present time, and when they came in a state of physical exhaustion, they swooned away into the land of dreams. When we met them the next day, they were discussing the character of Charles the Bold, Duke of Burgundy, and the Earl of Oxford, and on their separation, after the fish was over, they had gotten down to the battle of New Orleans, concluding to leave the subsequent history of the country as a subject for conversation at their next encounter.

After partaking of an excellent breakfast, we walked down to the lake, where we met our old friend, K. K. C., of Bladen, who had come over to join us in our piscatorial sport, and enliven us with the sallies of his quiet humor. Pretty soon, Lewis, the colored commissary of our host, made his appearance, bearing a large basket, in which was stowed away a lot of prepared provisions, in case of an emergency. These "emergencies" often occur in fishing and hunting frolics, and it is safe always to make the needed preparations, and not rely exclusively upon what you expect to get as the result of angling or venatorial skill. Rods and tackle and bait had been provided, and after a short while Capt. Bish announced that the yacht was ready to take us across the lake to the point where its waters are discharged into the river. [In-ch—got. I had the worst case of the discrepancy between the spelling and pronunciation.]

BASS TROLLING IN FLORIDA.

MY Southern trip last winter was one of such interest and pleasure, that I am already beginning to think of the coming winter, when it can be repeated, and enjoyed even more fully, though the knowledge gained from experience during the first trip.

Although acquainted with the sport afforded by the Adirondacks, the Lake George region, and the smaller lakes of Wisconsin and Indiana during the summer months, the novelty of trolling for black bass and of gathering violets in the month of January, with the thermometer at 80° in the shade, does not wear off with me in one trip only.

Leaving Chicago city on a Tuesday night, in a through Pullman sleeper, we reached Louisville next day noon, and from there had a pleasant ride to Montgomery, Ala. During this part of the journey we made social advances, compared notes, and became acquainted with our fellow travelers, fifteen in number, and all with through tickets for Jacksonville, some going for health, and some for pleasure.

Due in Montgomery on Thursday morning, we arrived behind time, and somewhat anxious in regard to connections, as our sleeper was to be detached there and taken on by the local trains through Georgia for Albany, Thomas's company Waycross. Finding that our coach was left on a side track, we learned, after inquiry, that the outgoing train had been gone about five minutes. We had seen it as it pulled out from the station, but had not then realized that it was so "near and yet so far."

Looking up some of the officials of the Louisville & Nashville Railroad (and finding them, by the way, to be gentlemen in every sense of the word), we received their regrets that they could not control the action of connecting roads. Learning that no coal had been ordered before the following morning, we made ourselves comfortable—explored the town and retired to our berths in the sleeper after a day pleasantly spent. Friday morning we were attached to the train for Albany, and started on time, and just in time to see, coming into the depot, the train from the North, with its sleeper full of passengers, who were left over there for twenty-four hours, as we had been.

Reaching Albany on Saturday morning, our experience of being left was repeated, and from the car windows we saw our train, that was to be, going rapidly away, over a bridge not a hundred yards distant, and including the shrill whistles from our engineer whose run ended at this place. There being no help for it, we accepted the situation, and visited the town half a mile from the little station house.

On Saturday we found the streets of the town alive with the colored men and women from all the surrounding farms who had come in on foot, on horseback, and in carts drawn by mules, and by oxen, single and in pairs. It was a periodical event, and they had all come in to visit, and to buy provisions, clothing, and needed supplies for future use. After twenty-five hours' delay, we left Albany on Saturday afternoon, not sorry that, through the peculiar, behind the age management of Georgia railroads, we had been given the opportunity of seeing much more of the country and people than we could have seen otherwise. We reached Jacksonville on Sunday morning, and as our little company had become well acquainted and formed pleasant friendships during our five days' journey of about eleven hundred miles, it was with regret that we separated here after plauing to meet again later on, at St. Augustine and points on the St. John's River.

The winter, whose trip was for pleasure, including black bass and alligators, was not a bad one, for the first steamers, which starts every day during the season for the upper St. Johns, and reached Enterprise in the time. Having engaged a rowboat and its owner, who was a quiet, intelligent colored man, answering to the goodly name of Israel, we prepared for an early morning start. After breakfast, ordered over night by the host of that excellent hotel, the Brook House, and carrying an ample lunch in the boat, Israel took the oars and rowed us down the lake (conco) to the mouth of the St. Johns, flowing in from the south. The fishing began here, for there was none in the lake, and using two rods, one a nine-foot bass rod and the other a longer, heavier one, which had done good service over many other waters. Forty yards of line were run off the reels, and then began the expectant waiting, so pleasant and familiar to every fisherman.

The waiting is not a long one—for one reel sings as the running line revolves it—and soon the landing net in the hand of our fisherman, and the four-pound pickerel. This is a beginning, but we hope for better things. Trolling now in shallow water, one line in the channel of the narrow stream, and one near the edge of rushes showing above the water, I reel in all but twenty yards of line and find, by experience, that the longer lines needed in northern waters, where the fish are more wary and shy, are not needed here, where the bass will quite frequently take the bait very near the bottom.

Using two rods, one line is always in the water, and when a strike is felt upon either the other is laid down for the time, or until the fish is landed, and though there is the risk of tangled lines in the rush and efforts of the fish to escape, I willingly take this risk for the sake of increased sport. Landing on a small island, our lunch is eaten under the shade of the palmettos, a little rifle practice indulged in with a heron, a duck or one of the myriad "blue peters" in the distance for a target, and then over nearly the same water by which we came, we slowly troll along homeward. Occasionally a splash and a commotion in the water near by, and a glimpse of a disappearing form, tells us of an alligator disturbing in his afternoon nap, but each one plunges out of sight before I can lay down the rods and grasp the rifle in the bottom of the boat. The hotter the day gets, the better does this ugly reptile enjoy its beat, the sooner does he sleep on his bank or log, and the better chance does he then give for our silently approaching near enough for a shot; but it is a sport of itself, and cannot be connected with that of fishing. Meeting a friend in a boat, homeward bound, he shows a seven foot long alligator, which a ball in the head from his fifty-one-calibre Winchester has so effectually quieted. But the skin can with safety be removed and taken North as a trophy.

The experience of one day is like that of another—full of sport as one can wish, and by each night my basket is filled, the usual catch being eighteen to twenty-five in number, and running from three to six pounds weight each, of large-mouth black bass, with generally one or more pickerel. One day's sport affords me a week's work, certainly worthy of mention here. It consisted of twenty-two black bass, of which one weighed twelve pounds, one weighed ten pounds, four were of six pounds each, and the rest of the

number were smaller, averaging about three pounds each. None of these had received a dose of shot to increase their weight, as is sometimes done in that section of country. The best of good times must come to an end, and with regret the Brook House is left behind and the journey northward begun, stopping at Palatka for a steamer through the Oklawaha to the Silver Springs, then on to St. Augustine, Jacksonville, and Thomsville. After spending a little time at the more northern spots on the river, the steamer, if the road, home is reached. Often the thoughts go pleasantly back to the land of sandy soil, crooked rivers, oranges and last, but not least, its black bass which, though not having all the gaminess of the same fish in Northern and colder waters, yet do not fail to furnish excellent sport to the lover of the rod and line.

D. L. WHITTIER.
CHICAGO, MAY 28, 1883.

BLACK BASS IN LAKE ERIE.

THE following account from the Dayton (O.) Journal shows that bass are plentiful in Lake Erie, and that if the fish are forbidden to be taken in Ohio waters, the citizens of that State must find them in paying numbers in Canada. Point au Pelee is near the mouth of the Detroit River, just east of Pigeon Bay. The correspondent says:

"The morning of the 23d opened with clouds, through whose gray and misty pall glimpses of a brighter sky were seen, and by noon the sun, a long hidden visitor, came back to cheer the hearts and make the earth to gladden greenly and bring the lost roads to possibility again. All day long the Dayton anglers, tired of their forced rest, were out the waters, and came back with a total catch for ten rods of 283 fine black bass, the persuasive Commodore and his mate, Mr. Thompson, heading the list with 70 fish.

"The wonderfully vigorous old gentleman, Mr. V. Winters, went, however, one better, having alone caught 36. In fact the water was not fully settled after the gale.

"At noon the American Eagle came in with a party of fourteen distinguished gentlemen—Robt. L. Lincoln, Secretary of War; Gen. Phil Sheridan, Gen. Anson Stager, Gen. Tompkins, of Boston; Messrs. McGinnis and Elliot, of New York; Messrs. Ryerson, Seeliger, Sprague and Draue, Chicago; Mr. Mills and Mr. Marshall, Sandusky; Mr. Marshall Field, Chicago; and W. Chisholm, of Cleveland, O.

"In the afternoon, with a 3:30 start, these gentlemen caught 163 bass, and both parties are out fishing for dear life to-day, and the record of May 24, 1883 (birthday of our gracious queen) will, I doubt not, be 'fishfully' celebrated on the reefs of Pelee.

"The Steinhoff runs regularly, and it is quite a comfort to be able to reach the world on every side—to Detroit one day, the next to Sandusky and the South. Up to this date for five days fishing, the Dayton party had caught exactly 1,094 black bass, no pickerel counted, and only the actual count. The respective scores are as follows:—V. Winters, 164; Schulz and Bickham, 262; N. and B. Morey, 174; Best and Greulich, 300; Thompson and Cooper, 158; King, 65, or in round figures, 1,100 black bass!"—PELEE.

Following is the score of Thursday: Cooper and Thompson, 70; Schulz and Bickham, 64; Winters, 36; King, 23; Best and Greulich, 45; N. Morey and son, 45; total, 283.

In a letter to his son, Mr. E. F. Cooper, (Commodore Cooper) writes that from cold, steady weather the party were for two or three days diligent in getting the docks and the log fire, but with the first huff of the storm, all hands took to the water. Mr. Thompson sent a barrel of bass home yesterday.

Mr. Greulich returned to Dayton last evening, and was bearer of dispatches. The rest of the party will continue fishing at least until next week.

The Register says: The Steinhoff arrived from Point au Pelee last evening with a cargo with a large load of fish. The bulk of the cargo was consigned to Albany, N. Y. There were, however, several boxes of black bass caught by the sportsmen.

A TRIP TO LAKE LAKE.

THERE is probably no place in this State of any size so conveniently located to the North Woods as our beautiful city, and I doubt very much if you can find a place where there is as much fishing talked, and where there is so much talk there must be some sport, for it is not all of fishing to fish. I have often read in FOREST AND STREAM how such and such a one has looked up his favorite rod, reels, etc., and is preparing for a day out on the water. I am going to make my own rods, lents, etc., and keep them in order the year around. I find it affords me great pleasure during my spare time to devote myself to my outfit, in fact I think it quite a study to keep posted on angling, and I think more and more of your very interesting paper every copy I read. In the closet out of my office I keep everything ready for a start, even in mid-winter, if necessary—some have the fever worse than others, you know. It is a long time from September until April, and this year it was May the 15th before we dare venture out for a day.

On that night myself and Billy O., a fellow that loves the streams and lake as much as myself, started for a trip of four days up the West Canada Creek. Leaving home at six o'clock P. M. night soon set in, but with light hearts, a good horse, fair rods, and a full moon, we were making good time for Morehouseville, fifty miles distant. With plenty to eat and smoke we passed the time very pleasantly, and enjoyed the drive as much as any part of the trip, reaching our destination at 3 A. M. The next morning, without a wink of sleep, we were after those little beauties. You know that he who has sport nowadays must work for it. A sleep of two hours at guide Remondan, and an early breakfast well stored away, we were soon on a tramp up Mad Tom Mountain, all the way to the top, a distance of three miles. With plenty to eat and a beautiful sheet of water, but at the present time, no property, and therefore no fishing for us. We took the liberty to put our canvas boat together and crossed, but we were severely reprimanded by Mr. Matson, the owner of the lake, for daring to trespass on his land.

Taking the trail for Indian River and tramping for a mile, the most of the way in the snow up to our knees, we came to Sugar Lake, a little body of water, but well filled with trout. After being there a few moments we saw our guide appear on the other side of the lake, just returning from a trip to Twin Rock Lake. Our calculations proved correct, and by giving him the old hoop he knew us, although it had been several months since we had seen him. Sending him down to the house after the remainder of our traps we went to fishing and had fair luck for the first day. The next day was Sunday and the question arose, how to get around that. I guess most fishermen will now and then not give it away. Three days of fishing and then we started

Soon we were under full canvas and "walking the water like a thug of life," to use an expression which is entirely original. In due time the prow of our craft was raking across the sand of the shore, and we took the plank to enable us to get to the shady ground, where we expected to eat our noonday meal. If we were to enjoy fish we knew full well that we must catch them, and so, rigging up, we were soon engaged in a vigorous struggle for something to eat. Fortunately for us, the darkness had taken more than a dozen fine ones of the variety called here "raller bellies," and these, with a few others, the product of our own luck, gave us an abundant supply for our dinner. The wind was from the north and unseasonably cool, and besides kept the lake in too much agitation for successful angling. To speak in plain English, the fish would not bite. Old Kinchen K. and Old Billy Pierce, who have been frequent visitors to the lake for the last forty-five years, and have caught thousands and thousands, could do nothing, and after several hours of patient effort rolled up their lines and yielded to the inevitable. The fates or the winds, or some other equally potent power, were against us, and but for the providence of our host, we should have had but a spare dinner that day. It is true, "the visiting statesmen" had a royal feast of killed fish, but then the "gentlemen in waiting" had content themselves with less tempting, though equally excellent, fare. We include myself among the "visiting statesmen," but "Othello's occupation's gone" went to the lake to indulge in the luxury of fish, and nothing else would have met the demands of our appetites.

It is but just that I should remark that no offense is meant to any one by the words "visiting statesmen," which I have used. At one time they had a certain political significance, but I meant that they should express no idea, except that in our nation there was one or more who had occupied, and even now occupy, a respectable position in the country, and is known to intelligent men all over the United States and their Territories. In all my correspondence with the FOREST AND STREAM, whatever may be my views upon questions at issue before the country, I endeavor to maintain the status of an old darkey whom I saw many years ago at a cotton landing on the Mississippi River. It was just after a Presidential election that he was coming, he was then engaged in discussing, in a friendly way, certain points which had been raised during the campaign, which had just closed. When the boat landed, several of us went to the bank to get a good look at the plantation, and a little variety besides. The subject of politics was resumed on shore, and after some conversation had passed, one of the gentlemen asked the darkey what were his views upon public affairs—in other words, what were his politics. He promptly answered: "Massa, I don't know nothing 'bout them things. It belongs to the Agriculturist." With this digression, I resume "the thread of my discourse."

If possible, we had less success the following day. On our return home the wind had veered round to the southwest, and we anticipated "a glorious morrow." But next morning it had resumed its former course, and our old friend K. K., regarding it as ominous, ill luck, latched up his horse, and we might have thought it was a bad omen. The Swamp, a distance of about seven miles from the lake. (Recall, whose tastes do not run on the pleasures of water, much preferring those of land, being utterly disgusted, took a seat with K. K., so as to enable him to reach home that night by the E. C. Railway, on the line of which our friend lives. But we were halted to give it up; and so soon as we could get all things ready, spread sail, to the haven of our hopes, but about twenty minutes, we east anchor and took to our boats, hoping to get enough for dinner. Our prudent friend, Short, whose hospitalities we were enjoying, knowing full well what "dishman's luck" sometimes is, not only carried along some prepared victuals, as he did the day before, but had engaged the services of a piscatorial son of Ham to secure us a supply of fish, so that if we failed, we should still have the victuals we desired. It was well that he was so thoughtful, for any two of us could easily have eaten all we caught. The darkey had secured a respectable bunch, and that, supplemented by what we could add, gave us an abundance. I can offer no better evidence of the quality of the fish than the fact that Judge M. managed, by great effort, to dispose of four of them, while Gen. S. showed equal prandial capacity; your correspondent, of course, fully maintaining his reputation in that department of human industry.

I have visited this beautiful sheet of water on frequent occasions, and never but once had such a destruction of my hopes. At that particular time I reached the lake during what we know here as "the long season of May," and it rained so much that I did not even get a chance to "try my luck," though I stayed three or four days. When the weather is favorable, a good sport can always be had by those who are acquainted with the places where the fish congregate, or who are able to procure the services of a guide who is. But it is just like all other places of which I have ever seen or heard—if you fail to hit the right time, you are subjected to disappointment. We missed it. Although we got but few fish, those which we did get were delicious, and the open-hearted and hauled hospitality of our host, his genial son, and every pleasant lady who graces the coffee court of the table with unobtrusive charm, made our visit one long to be remembered. Indeed, in thinking over the kindness shown us, I feel somewhat as Burns expresses himself in the closing stanza of the "Lament of James, Earl of Glencairn":

"The bridegroom may forget the bride
Was made his wedded wife yestern;
The monarch may forget the minister,
That on his head an hour has been;
The mother may forget the child;
That smiles so sweetly on her knee,
But I'll remember thee, Glencairn,
And all that thou dost do for me."

The following morning at an early hour we bade our kind friends farewell, took the train for Wilmington, where we arrived in good time and on condition to enjoy the breakfast which we found at the Parrell House. Owing to the schedule, we were obliged to remain at this place until 7 P. M.; but we spent the time pleasantly in "receiving" such friends as close to call on us and enjoying their conversation. At the appointed hour we took the cars, and at half-past two A. M. the following morning were luxuriating upon the couches at my friend's family breakfast, and the banks of Pelee. My friend accompanied me, and did not think it prudent to give for a few days, when he went to gladden the hearts of the "loved ones at home."

WELLS.

for home with forty pounds of fine trout, the largest weighing 14 lbs., pretty good catch after all. We were perfectly satisfied, and, eating a good supper at Theodore's, we were ready to start for home on Tuesday night at 10 P. M. with rather a heavy load, for it rained all day Monday. But with a strong horse and stomachs well filled we were on our way as happy as two clams in high water. Bill sang and once in a while I joined in on the chorus, and the night passed on, and the old horse jogged along and reached home about 4 A. M., just in time to see the boys getting out with the morning papers, and we regretted that we were too late to have any of the fish stories in that edition. H.

Utica, N. Y., May 27.

ANGLING IN PIKE COUNTY.

SO much has been said of late about the backward season all over the country for anglers, that I thought I would devote Decoration Day to testing the truth of such a disappointing statement. I had intended to make up a party of four rods, but two of my friends were on jury duty, and had to drop out. That enthusiastic sportsman, Mr. L. Howard, of Brooklyn, came up to time all beaming with smiles and laden down with two fine fly-rods.

There were very gloomy predictions when we arrived at Milford, and old Jake Sehorn shook his ten-story white hat dubiously when we told him that we were here to kill one hundred fine trout or try in the attempt. Jake said it could not be done with fly, and enjoining Pete Hanse would have to snare them with mosquito netting. Even our good-natured host, Frank Crissman, was afraid we were on a fool's errand, but promised to fix things up to the Queen's taste.

We made an early start on Decoration Day for the Pinney farm, with two rods and coachman, red his and black gnat flies. The Sawkill Creek was low, and the woods were pretty full of lumber. We managed to fill our creels with fifty fine trout, one-third turning the scale at over a quarter of a pound.

Our luck astonished Frank Crissman and Jake Schorr to such an extent that we determined to give the Sawkill two days' more investigation, and so secured the services of that genial young sportsman, George Pinney, who agreed to pick out all the favorite holes both on the meadow and in the brook below Gannon's farm. We put in five hours of solid work, from 6:30 A. M. to 11:30 A. M. and brought back 175 trout, 120 of which were fit to be shipped to New York the same night. Among them were five one-pound fish, fifteen half-pound and thirty that tipped the scale at four ounces.

We gave the Sawkill a paring two hours' visit this morning and secured 100 speckled beauties that made a good twelve-pound mess. We attribute our good fortune to chasing our flies to a smaller size, using cow dung, grizzly kings, queen of the water and royal coachman. The water we waded through is still chilly, but with one or two more warm days will make the trout more lively, so that, I think, on any good opening day, after a shower, large masses of fish could easily be secured. In this mouth, unless the indefatigable colored sportsman, Jim Peggary, who sleeps on the banks all night, has whipped the streams to sell to strangers and what are known down here as New York city folks. A. H. MUIR.

Milford, Pike County, Pa., June 1.

SEBAGO LAKE-LOCKED SALMON.

Editor Forest and Stream:

Seeing a little slip in the *Maine News* that J. Hamilton, the superintendent of the Portland & Ogdensburg Railroad Company, had landed a fifteen-pound lake-locked salmon while fishing on Sebago Lake, Maine, I wrote him in order to ascertain the particulars, at the same time congratulating him on the capture of so large a fish and expressing hope that the strength he could easily be secured. His mouth, unless the indefatigable colored sportsman, Jim Peggary, who sleeps on the banks all night, has whipped the streams to sell to strangers and what are known down here as New York city folks. A. H. MUIR.

"Portland, Me., May 26, 1883. Dear Sir—Your kind favor of yesterday is at hand. The salmon was a beauty; thirty and a half inches long and nine inches deep; weighed, after being out of the water three days, fifteen and a half pounds; was in fine condition. I did not use much strength in the capture, I had only a very light rigging, single leader, oiled split line and an eight and a half split bamboo rod; but I did have solid enjoyment for a half hour; had it all to myself, as I was alone in the boat. I caught on the next morning of five pounds' weight and another of two and a half; and as I could only spend two days, think my luck quite fair."

The lake-locked salmon of Sebago Lake are of a larger size than all other lakes in Maine. So far as I have learned, none have been taken with a fly. I have tried that method to my satisfaction, and I learn that one of the former fish commissioners tried the fly two days without success. The smelt (a native of the lake) is the principal, if not the sole bait used. The smelt run up the Songo and Crooked rivers during the last of April to spawn, the salmon as well as speckled trout following them up for food. I may say here that the smelt, during their spawning season, are so numerous that they are dipped up by the net and peddled through the towns adjoining the lake.

The lake-locked salmon run up the same rivers during September to spawn. Some of the inhabitants along the banks and in the vicinity of these streams are also there with torch and spear to give the salmon a bloody reception. This, I have learned, has been their invariable custom for many years to a certain extent. These night catches have amounted to tons during some falls, some of the fish scaling as high as twenty pounds, the fifteen pound salmon being quite common.

I am credibly informed that quite a number of individuals were detected during the past fall in this illegal fishing and indicted, a few tried and convicted. The remaining indictments are to try over the parties for their good behavior, as it were, in the future.

I have no doubt that these spears enjoy this sport (?) with its certain results (aside from the penalties of the law) with as much zest as the visitor at the lake does by taking (the fish trolling with the smelt on his finetackle and light rod; hence the difficulty in breaking it up). The question of spearing is not, and can not be argued by those who indulge in this exterminating practice. They are fully aware of the penalties attached to it and its depopling results. The excitement of this fishing one year and the penalty following may, through a fancied revenge (on the innocent salmon), induce a few to keep their spears bright through use.

It is generally understood, whether truthfully or not, that the Commissioners have from time to time authorized the

dipping up of the small fry of salmon and taken them to Rangeley and other lakes without attempting to keep up a supply at Sebago. This practice has made the inhabitants about the lake somewhat angry, and they therefore justify to some extent their own spearing.

The Commissioners should in some way meet these spears half way in this business elsewhere than in the courts. Sheriff observed laws are but poorly kept. The lake should be replenished with its own kind as well as with the Grand Lake fly-taking salmon. Then let the inhabitants understand that it is for their own interest more than for that of the strangers to do only the fishing in its proper season. With a well-stocked lake, the Commissioners need there would be multitudes of strangers to be provided with boats, bait, board and teams, dispensing money in liberal amounts.

This lake is next in size to Moosehead, with deep, pure water, is the principal feeder of Presumpscot River; supplies the city of Portland with water, and is but about seventeen miles from Portland by Portland & Ogdensburg R. R.

Inasmuch as it is optional with the Fish Commissioners upon which lakes in Maine they will bestow their favors, the Rangeley has received many favors from the board, which are greatly appreciated by all the frequenters of those enchanting and enticing waters. Were there as many influential men to solicit the attention of the Commissioners to Sebago Lake as at Rangeley, and with such liberality, these Sebago waters would soon be comparatively as rich in fish. It would afford more pleasure by far to a greater number of ardent anglers than at Rangeley. It would quench the spears without the aid of the law. It is not known generally what action the Commissioners will take in this matter, but it is hoped, so long as they have already undertaken to break up spearing by means of the law, that their good work of replenishing this delightful lake is already determined. Be it as it may, there should be considerable effort on the part of Maine, particularly the southwestern portion of its inhabitants, beginning with the Governor, who resides but seven or eight miles from it, as well as the anglers from all portions of the State, to induce the Commissioners to do the liberal thing for Sebago, and for its first business to replenish it, then I think the "spears will be beaten into pruning hooks." WINGATE.

Boston, Mass.

"FISH DAY" AT WORCESTER.

SINCE the formation of the Worcester Sportsman's Club, nearly two years ago, the annual hunt and game dinner has been the grand social event of the year; and when at the annual dinner last fall Capt. C. A. Allen in his speech suggested that the club might have a "fish day" with the same pleasurable results, the members quickly "caught on," for they saw at once that the project meant two grand dinners a year instead of one. In the previous letter I mentioned that the captains were chosen and the whole matter left in the hands of a committee consisting of Captains Allen and Bennett and Secretary Hartwell, Thursday, May 31, was selected as the day for the fishing, the dinner to be served on the evening of the following day.

It proved to be the best trout day of the season here in Worcester county, and those members who fished near home, as a rule, did the best. Messrs. Colby and Porter, however, made the big catch of the party somewhere in New Hampshire. Capt. Allen made the next best also in New Hampshire. Quite a large party went to Vermont and did not to nothing, while A. Houghton fished near home and caught the best string brought in from Worcester county. Nearly all the members fished for trout, though there were three fine strings of perch and a few pickerel, these three being the only kinds that caught.

There was a large party present at the Bay State House, Thursday evening, to witness the count, which was to close at 10 o'clock, those members who could not get there to report by telegraph before that hour. One splendid string was lost to Capt. Allen because the party could not reach a telegraph station. The count resulted in a victory for Capt. O. A. Bennett, who scored 107 fish as follows: Colby, 23; Porter, 23; R. L. Golbert, 3 P. Davenport and H. E. Smith, 17 trout, 2 pickerel, 130 points; A. B. F. Kinney, 26 perch, 6 C. Sumner, 16 points, fish not reported; Colby and Porter, 540 points, fish not reported; A. H. Perry, 64 points, fish not reported; total, 845.

Capt. Allen's side—C. A. Allen, 19 trout, 131 points; T. Smith, 9 trout, 53 points; J. A. Titus, 10 trout, 50 points; Charles Hartwell, 56 points, fish not reported; A. W. Joslyn, 23 perch, 6 points; total, 296.

The dinner, which was served at the Bay State House Friday evening, was the best in the history of the club, which is saying a great deal. The members, with the invited guests, assembled in the parlors and spent an hour socially before marching to the dining hall at 9 o'clock. K.

WORCESTER, June 4, 1883.

From another account we take the following: The dinner was served in the main dining-room, which never before presented a more attractive appearance. The hall was decorated with flags and implements used by sportsmen. Over the side-board was a glory of flags, faced with a network of fishing-rods; at the rear was another glory of flags suspended by ribbons; over the tables hung glass balls, clay pigeons and fishing-rods.

MENU.

- Oysters Served on Clay Pigeons.
- Cucumbers, Sliced Tomatoes, Lettuce.
- Boiled Kennebec Salmon & a Hollandaise Sauce.
- Boiled Turbot a la Bay State.
- Boiled Striped Bass, Anchovy Sauce.
- Entrée
- Mayonnaise of Lobster. Brook Trout in Aspic. Frites of Cucumbers.
- Mayonnaise of Columbia River Salmon. Fried Brook Trout with Salt Pork.
- Fried Butter Fish in Crumbs. Fried Tautog, Cape Ann Style.
- Fried Pickerel, Hunter Style. Fried Perch in Batter.
- Boiled Connecticut River Shad, Butter Sauce.
- Broiled Lake Trout, a la Maitre d'Hotel.
- Broiled Fresh Mackerel, Hollandaise Sauce.
- Baked Bluefish, Stuffed, Genoise Sauce.
- Baked Chicken, Hollandaise Sauce Supreme.
- Baked Baked Black Bass, White Sauce.
- Vegetables.
- Strawberries and Cream.
- Ices. Fruit.
- Charlotte Russe. Coffee. Assorted Cake.

Hon. Charles B. Pratt presided at the table. At each plate was a button-hole bouquet with a glass ball as a holder,

This, with pictorial menu and the clay pigeons for oysters, was a very unique feature of the arrangement.

At the President's table were Hon. Charles B. Pratt, His Honor Mayor Hilthroth, Hon. T. C. Bates, J. N. Frye, of Boston, President of the Massachusetts Rifle Association; R. T. Noble, President of the Malden Sportsman's Club; and Secretary of the Massachusetts Glass Ball Association; Alderman John R. Thayer, Col. W. S. B. Hopkins, Dr. Albert Wood and President Parker, of the Common Council.

After the dinner there were short speeches. The first was by Mayor Hilthroth, who said for some time he had been trying to find out on which side he was, but he was satisfied that he was on the winning side. He was not a fisherman like those present, but he could catch them when they came on the table. Senator Bates was full of anecdotes at the expense of his twin, the president of the evening; his stories of experiences at the State House amused the boys. Next came Gen. A. B. Sprague; his pairing off and the results were stated as only the General, the new arrivals. Alderman Thayer made reference to the good work the club was doing to elevate the standard of sportsmen. He thought it would be an advantage if the business men would spend more time with the rod and the gun. Col. Hopkins said he always had a liking for sporting; he was not a success with the gun, but he took to fishing in his early days. He closed his remarks, like all the others, with a story.

Remarks were also made by Col. J. A. Titus, O. O. Parker, D. M. Earle, O. A. Bennett, C. A. Allen, Dr. Raymond, president of the club, L. G. White, E. S. Knowles, H. P. Verry, Charles S. Barton, also by Dr. Albert Wood, who in very complimentary terms referred to the arrangement of the tables, and the unique manner the hall was decorated, as well as the remarkable bill of fare. He then referred to the results stated as only the General, the new arrivals. Item is overworked, the men are breaking down at 35 and 40. To avert this, out-door sports should be encouraged; more half days should be given up to recreation, to visiting the field with the rod or the gun. Near the close of the evening remarks were made by Mr. Noble of Malden; he closed with the following sentiment:

"The Worcester Sportsman's Club—An honor to the city and the Association. We find its members always and thoroughly "White" men, which is a "Goodell" more than can be said of some organizations. We wish there were "Moore" like them. With "Hartwell" pleased, they are cordial to their "Newcomb"—ers, each one pronouncing himself a "Mann," or, as I might say a "Holman" in every respect. "Strong" men there are among them, who for the sake of the trap will "shoot" and "hold" a "Coley" and on a "Davy" when they are on their traps, will lay "Lo" to their competitors with a "Sweet"-ness that is refreshing. In a nutshell, they are "Verry" good fellows, although caught "Cutting" up now and then. Never out of temper "Norcross," invariably "Hatch"-ing up something for a "Wright" good time; winning a "Garland" now and then to add to their wealth of laurels. With a "Simpson" the faithful care for them and their guests always. "Eager" for a minute at the traps, and when "Holden" about night it's a "Coley" day when they get left.

THE UNITED STATES DISPLAY AT LONDON.

[From the London Morning Post, May 29.]

IN order to convey a definite idea of the importance of the United States department in the International Fisheries Exhibition it will, perhaps, be as well to make use of the following few statistics of the actual condition of the fishery industries in the Grand Transatlantic Republic, kindly supplied by the American Commissioner, Mr. G. Brown Goode. In 1880 the number of persons employed in the fishery industries of the United States was 132,427 of whom 101,684 were fishermen, and the remainder shoremen. The fleet of fishing boats was 6,605, augmented (since 1882) to 7,126, and 44,804 boats, now about 47,000, the capital invested being actually about \$40,900,000. The value of the fisheries of the sea, great rivers, and lakes, was placed in 1880 at \$43,946,053, and that of the minor inland waters at \$1,500,000, in all \$45,446,053. In 1882 the value of the fisheries was greater than in 1880, and prices both at first hand and at wholesale were higher, so that a fair estimate at wholesale market rates would place their value at the present time rather above than below the value of \$100,000,000.

These figures will at once prove that the pisciculture trades of a country which extends from the Gulf of Mexico to the Arctic regions, and which contains numerous inland seas are even in their actual (by no means fully developed) condition gigantic. In 1880 the Government of the United States liberally assisted private enterprise, and by its contribution contrived to make the American display in the Berlin Fisheries Exhibition the principal feature of this highly successful enterprise. The Government then voted a sum equivalent to the cost of the exhibition, and in 1882 the present exhibition caused Congress first to vote a special grant of \$10,000, and then a second of \$2,500. The number of exhibitors amount to 250, and the amount of material forwarded equals, if it does not actually exceed, that of the British department. Hence, we may safely declare that this section, after our own, is the most important in the building, and it is at the same time the most important in reality, by its valuable and dignified. It is not a mere collection of cases containing miscellaneous articles, often only vaguely connected with the subject of the exhibition, i.e., fishery industries, but it is a complete and thoroughly well-thought-out and designed collection of all manner of objects illustrative of the vast marine and fresh-water fisheries of the United States. It is mainly due to the industry of our individuals that this department has been so remarkably complete an achievement—Professor Baird, United States Commissioner of Fish and Fisheries, Mr. G. Brown Goode, Mr. R. E. Earl, and Captain J. W. Collins. These gentlemen and several others connected with them have labored almost incessantly for three years past to form this collection, which is certainly worthy of their persevering hard work and of their country's reputation for enterprise. The proportion of the first and most striking feature in the department is a complete pictorial representation of almost every phase of the fisherman's life, represented by a series of from 600 to 700 large photographs, charcoal drawings, pen and ink sketches, and oil and water-color pictures arranged around the rooms in consecutive order. These are supplemented by a number of casts of men and fish, and by models of various vessels, fishermen's cottages, and other objects of interest. It is to be hoped that the visitor both needs a guide or guide book in order to understand all that he beholds. There is,

for instance, a curious and most eccentric looking fishing craft, our country cousin is at a loss to make out what it is intended for. If he will take the trouble to look above he will see a photograph of this little vessel in progress of building, then a second showing its launch, yet a third illustrating its purpose when out at sea, and, finally, a series of others showing what is done with it until it returns to shore again. Perhaps it is necessary, in order better to convey to the spectators the *raison d'être* of this particular boat, to have a model of a fisherman rowing or sailing it out to sea, and lo! there he is, admirably executed in painted wood as large as life, and in the identical costume he habitually wears when in the exercise of his daily vocations. Let us study, for instance, the not over creditable history of the youthful American herring, who at an early stage in his career figures in the European markets under false pretenses as a sardine. There are about twenty photographs showing how he and his companions in involuntary imposture are caught by the million off the coast of New England, and how he is "dressed" in boiling oil, done up in tin cases, and sent on his final ton of the world, with only one extenuating circumstance in his favor, and that is, that even in Nantes it would be difficult to detect his true origin, his taste being identical with that of the Crolese sardine, although if he had been taken up to the strait he would have assumed the proportions of a "farmouth hider."

In connection with the exhibits of American sardines is a series of wooden models, showing how the fish is cured and tinned for exportation, and also views of the beautiful residences of the capitalists who are making large fortunes by the industry.

In addition to the photographs, pictures and models of man, are also series of casts of the most remarkable fish caught in the American seas, notably curious being those illustrating the gigantic "devil fish," or *lemons*, rendered famous by Victor Hugo's marvelous but, by no means exaggerated description of the monster in "Les Travailleurs de la Mer." One of these, the exact size of life, could not only attack and soon destroy a man, but render himself highly obnoxious to a large-sized shark. Of course the American oyster, valued principally for its edible qualities, is exhibited in a most marked manner, and really is, one of the chief products of the country. Its important character is shown by numerous canned specimens, and also by plaster casts showing the most incredible size to which the translucent mollusc grows. Some of the bivalves, though worthless for food, are, nevertheless, extremely valuable for the beauty and quantity of the deposit of mother-of-pearl which lines their shells. The utilization of this material is shown by a collection of mother pearls, necklaces, etc., and by one large cross surmounted by a shell, made out of the exquisite shells found in Florida. In this connection may be mentioned the various objects manufactured from the ivory of the whale and walrus, and the superb display of artistic articles sent by Messrs. Tiffany & Co., of New York, made out of alligator hide, tortoise-shell, and fish skins, mounted in ivory, bronze, and silver in a manner at once so remarkable and so artistic as to attract universal admiration.

In order to render the department still more complete there is a certain case which will amuse as well as instruct. It contains nearly all that Jack loves most dearly. There is his not-to-much-thumbed Bible, his well-used pipe, his thread and needles, and his buttons, his "lucky" cents and shillings, and his library of "The Fisherman's Own Book," "The Cruise of the Rocket," and sundry of Marryat's works. A few things are arranged according to, and his improvised dinner board, and there is a genuine bundle of his "love letters," not forgetting his rather soiled rack of playing cards. In that case the visitor can study for himself all poor Jack's simple wants and domestic ambitions.

In order the better to explain the completeness with which the several fisheries are represented, the cod fishery will illustrate as well as anything else the thoroughness of the display. The geographical distribution of the cod, as well as the favorite localities of its capture, are first of all shown on a series of large maps. Then the biology and embryology is explained. The fishery of the cod is next illustrated, with models of vessels and boats employed, with actual apparatus, trawls, handlines, etc., of every conceivable kind, while the methods of the fisheries, the passage to and from the banks, the process of cleaning and curing the fish at sea, the dangers encountered—fogged, all the incidents in the codfisherman's life are graphically illustrated by large pictures. After this come the numerous methods of curing the fish for market. For instance, a schooner lands on a Gloucester wharf her cargo of hundreds of quintals of salt codfish, which are dried, skinned, boned and pulverized, and then converted into the famous "Alden's evaporated codfish," an article of food which this exhibition will soon, probably, as greatly popularize in England as it is already in America. The same species is graphically illustrated, and those who have tasted it declare that it is without question the cheapest and best relish of its kind they have ever eaten, and the same can be said of the "boneless cod," which is delicious and known all over the interior of America, as it will doubtless be long in England.

There is also a vast collection of boat and vessel fittings, such as scum boat gear, blocks (of which a Boston firm makes a grand display), grines, davits, canvas, covers, anchors, etc. The welfare of the fishermen has not been overlooked, and the interest gains its culminating point when contemplating the collection of life-boats, fog-signals, fog-horns and other articles intended to secure the greater safety of vessels at sea. Captain Collins's most effective fog-alarm occasionally emits a by no means dulcet, but at the same time a most far-sounding howl, which certainly startles the ladies. For it is to be heard, at an incredible distance at sea as well as on shore. The exhibition of objects which are made in the United States Life Saving Service and Lighthouse Board, displayed at the extreme end of the department, is as complete as possible, and includes the original Francis patent life-car, which was first used on January 12, 1850, and was the means of rescuing 200 men, women and children from the wrecked British vessel *Ayrshire*. This collection is also admirably illustrated by oil sketches and life-sized cut models. Close by it is a case which will doubtless attract ladies, since it contains an assortment of the richest sea otter and seal furs yet seen in England, and exhibited by the Alaska Seal Fur Company.

Salmon breeding and other fishculture are illustrated by a complete and historical series of the apparatus used in the preparation of fish from a comparatively early age down to the time when they are ready for the gradual progress from the beginning of fishculture in America to the present day. A series of tables has been also provided with the most improved modern appliances for hatching fish eggs. This apparatus may be classed under three heads—"closed,"

the "trough," which requires running water, and the "floating" apparatus, the latter being a hatching box placed in a small lake. There is a large water tank, the water in which is forced through the fish-hatching appliances by means of a gas engine, so that the actual work of hatching can be carried on and studied in the presence of the visitor. Another feature is the group of models of experts in the act of pouring the eggs into the hatching boxes. One of these represents the "spawn-taker," kneeling on one knee, clasping under his arm a fine female salmon, from which he is pressing the eggs with his thumb and forefinger. There are also photographs of all the American fish which have been propagated by fishculture in America, as explaining the development of the egg and the growth of the fish in the egg from day to day, followed by others explanatory of the size and condition of the fish after it has been hatched.

Other photographs illustrate the method employed in the United States of transporting young fish to various parts of that immense country. A great variety of novelties in the way of tinned, dried, and otherwise preserved fish of all kinds is shown, and among other things of interest should be mentioned Le Page's fish glue, an adhesive which can be used for mending glass, china, and furniture, and which is said to be the strongest ever discovered. It certainly is much stronger and cleaner than either gum or any of the better known cements.

In connection with the United States Department is the U. S. Fish Commission steamer *Albatross*, of about 1,000 tons, a model of which is shown, and which will arrive in the Thames towards the middle of June. She is designed especially for deep-sea research, and is fitted with all kinds of fishing and dragging apparatus, so that she can capture anything that swims from the surface to the bottom. She is under command of Captain Tamer, and forms a part of the exhibits, to which the American Commissioners intend to extend special invitation.

SPORT IN COLORADO.—Gunnison County.—Starting out from our cabin one beautiful morning in June, with my shotgun strapped to my back and my fishing rod in my hand, I thought I would follow up Maroon Creek, which is in Gunnison county, and have some fine sport with the trout, with which the waters of such sport I did have! Hardly a cast but I would hook some speckled beauty which they would take almost any bait. I tried two or three different colored flies, grasshoppers, and even a piece of red flannel. It did not seem to make any difference whatever with them as to what they wanted for breakfast, so you can imagine the sport I had. After following up the creek for about two miles, I came across a large drift pile. A huge pine tree had fallen and laid across the creek from bank to bank, and driftwood coming down the creek had caught and formed a sort of waterfall, and there is where I caught some beauties; one was one of the finest specimens of salmon-trout I have ever seen. It measured 18½ inches, and was a deep red color. It seemed almost a shame to cut him for he was such a beauty. About twenty yards above the drift pile a large pine tree extended across and I thought I would try a cast there; so walking out on the tree, I was just about to cast when I heard a rattle of stones and sticks, and looking up the side of the ravine saw a wildcat coming down, apparently to get a drink. He trotted out on the drift pile and just as he reached the middle of the pile I let him have both barrels of my shotgun, nothing but No. 6 shot, but too me for, for the recoil of the gun kicked me over into the creek and I got the nice rolling over and wetting I have ever had. I got out all right, though, for it was only about three feet deep. After this I looked up the creek and saw the cause of all this trouble, but Mister Wildcat had gone far away and left nothing but a few blood drops. I had enough for that morning, so, picking up my string of trout, I went back to my cabin and soon had a fine mess of fried trout.—PAUL SCOTT.

THE BERTRAND ISLAND CLUB.—A number of well known gentlemen in New York City, interested in shooting and angling have recently purchased Bertrand's Island, in Lake Hopatcong, New Jersey, where they propose to build a club house. In addition to the island, which contains about twenty-three acres, a tract of shore land has also been secured. At present the membership will be restricted to fifteen, and the organization will be known as the Bertrand Island Club. It will be governed by rules similar to those of the West Jersey Game and Protective Association, and henceforth angling out of season in the waters of the lake will be prohibited. The Club proposes to restock the lake with black bass and other game fishes. During the summer the club house will be kept open for the benefit of single members; but a number of the married clubmen propose to lease small plots of ground from the club and build cottages. The members are George B. Post, president; G. W. Campbell, Jr., vice president; J. Heron Crossman, treasurer; C. F. W. Nicholas, secretary, and Messrs. N. Martin, J. F. Cox, James Kent, Jr., J. A. Risley, B. K. Jameson, Frank Jenkins, Henry L. Pierson, Jr., and E. S. Benwick.

WHITEFISH TAKE THE HOOK.—BLACK BASS.—I have seen a good many articles of late upon taking whitefish with bait, etc., but have not notice of a single instance of one being taken with spoon by trolling. Once, some seven or eight years ago, I was fishing for pickerel with a spoon on Lake Cayuga, N. Y., and caught a whitefish weighing over four pounds. It was not hooked, but caught with the hook well in its mouth. Was this not a rare occurrence? First-rate black bass fishing can be had in Niagara, at the mouth of the Niagara River. No fly-fishing, they are taken with chub and by trolling. Good flies, boats, etc. Good fly-fishing can be had later in the season at the same place for white or silver bass, which are very game, bite fast, and are taken in good numbers, as many as sixty to eighty are taken in an evening.—NIAOGARA.

PENNSYLVANIA.—Philadelphia.—Hundreds were fishing yesterday along the Schuylkill for black bass, it being the legal opening day of the season. Up the river, near Pottsville, anglers outnumbered the fish. On the train from Reading in the early morning there was a large delegation, which was joined at Pottstown by a contingent from the latter place. All went for Yankeo Dam at Limerick, or Pawling's Bridge, both considered the best places in the upper Schuylkill for bass fishing. The catch, I learn, was good. For the season, the season is backward this spring for every line of sport, and it will not be until late in the winter before the writer is tempted to join his rod for bass.—HOMO.

A WORD ABOUT GEORGE DAWSON.—June 2, 1898.—I do not believe in having time drag on my hands because there are no books or papers in camp. I am no book worm, but give me a hammock, a shady spot, such books as these for the first two or three days after getting into the woods, and I am happy. I think Dawson's works the purest of the kind ever written. They touch the keynote of kindred souls. They are pitched high, and must elevate the mind of the careful reader. They are deeply reverential, and will purify many a thinking mind.—NORMAN.

MINNESOTA.—Pillsbury, May 28.—Fishing in all the many lakes throughout this section is now excellent. Bass, wall-eyed pike and pickerel are to be had in abundance. I will gladly provide the best quarters possible, i. e., farm home accommodations, for any brethren of the angle who may wish to try our waters.—J. P. LOCKE.

LARGE SHAD.—A shad weighing eight pounds was on Mr. Blackford's slabs last Saturday. It came from the Connecticut River.

Fishculture.

"MISDIRECTED FISHCULTURE" AGAIN.

Editor Forest and Stream:

In your editorial comments upon my rejoinder published last week, you express the opinion that I do not do me justice, and that I have been "interrupting progress in fishculture," whether intentionally or through mistaken notions we [you] cannot say. Now, Mr. Editor, if you will state the particular facts upon which you base the opinion that I am an "obstructionist" in this matter, I will be glad to judge whether I am playing that rôle or whether you are doing me injustice by what I consider very wild assertions.

In the first place, you have received a copy of my humble note to you expressing my opinion on the subject of fishculture, and you have expressed your own opinion on the same quite sharply (without offense, however), and the presumption is that you must have read it. If so, you found on page 6 a reference to Dr. Garlick and his operations of 1883, which I thought it well to refer to, as your article has been confined to the construction of "some carp ponds and making speeches before the Legislatures of Pennsylvania and New Jersey."

Next, as I said before, the files of the FOREST AND STREAM for eight years past will afford some evidence upon the subject. And further, my letter files contain a somewhat prized accumulation of personal communications from the editorial department of the FOREST AND STREAM for eight years past, containing comments strangely at variance with those now emanating from same source. I know, by a little experience, that facts are sometimes developed which necessitate an editorial change of front. I, at this moment, recall a case in your own experience of this kind; also another, involving Mr. Editor, do not hesitate to fire out your facts which will prove me to be the fishcultural sinner portrayed in both your late editorials upon the subject. It is possible that I am rendering myself obnoxious to the charge of "egotism" by asserting that I am perhaps sufficiently quoted as an author to render it desirable for the public to know whether I am now, or have been during the past quarter of a century or more, obstructing legitimate, practical and intelligent fishculture, or whether the other side of the question is the one who are apparently endeavoring to vent a little pent-up jealousy through the medium of FOREST AND STREAM.

If the mild expression, on a few occasions only, of my individual opinion, in the FOREST AND STREAM, in connection with the State appropriations intelligently in your name, is sufficient basis for your assertion that I have "been very hostile" to the Commission, then I will plead guilty to that count in your indictment. Certainly have not antagonized them in other respects, and I do not care upon that point to insist. You certainly do not quote me correctly as to what I said in your office concerning my remarks before the Pennsylvania Legislature. After having referred to some of the misdirected efforts of our fishculturists and Fish Commissioners, I was asked by one of the members of the Legislature, in connection with the question, if I could recommend an appropriation for the Fish Commission. I replied that if I were to answer the question, either affirmatively or negatively, that no qualification, my reply would be highly misinterpreted. I do not, in my opinion the Legislature should grant a liberal appropriation for fishculture, but under proper conditions; that I had a high opinion of the Fish Commission, who ranked far above the other side of the State Commission, and could not conscientiously recommend an appropriation to be expended as heretofore; that most of the previous experiments were failures, that although these experiments were justified under the high water mark, there was no justification for further expenditures by the State in the same direction. I then recommended a consolidation of the Fish Commission with the State Board of Agriculture, as stated in my last communication. This is the substance of what I said briefly in your office, and in your editorial. I do not care to repeat to the Commission of New Jersey. I replied that I only knew Mr. Jenkins of Camden, that I was not aware that he had any experience in fishculture, that he was an authority on planked fish, but that, although, in my own experience, the public prosecutor, would be likely to make it hard for willing violators of the fish laws, and would be one of the most valuable Commissioners who had held the office in New Jersey.

And now in regard to your assertion that the carp "is a poor table fare," etc. I have conversed with over twenty persons who have tested their table qualities, and most of these parties were epicures. All except one extolled their table qualities, and this one's test was of a specimen taken from a filthy pond. I have never least bit of evidence of any kind that has had any other evidence of its wonderful success in numerous ponds constructed by me for several of the leading business men of Pennsylvania, New Jersey and Delaware. Nor do I think that the carp is a poor table fare. On the other hand, I am enthusiastically in favor of continued, well-directed, intelligent experimental work, such as most of that performed by the United States Fish Commission; but not constant repetition of exploded follies. By exposing the latter, I am aware that I am doing violence to the carp, but I do not think the FOREST AND STREAM is justified in its course of constant repetition of these follies, and I am not so stupid that I cannot understand the "true inwardness" of the petty antagonism which, like one of the snappish enemies of the carp, is thus indulging in the same old story. I do not think the FOREST AND STREAM is justified in its course of constant proper investigation, which would surely change its trend.

By reference to your editorial leader I find that I have not replied to you, denied that the Delaware was an original source of the carp, and that I do not care to repeat your assertion that it will me to prove mine, though I cannot furnish as direct proof as might be required in a court of law. For several years past numerous reliable Pennsylvania newspapers have published the following well-documented records of Pennsylvania make repeated reference to the abundance of salmon in the Delaware. An aged Quaker gentleman, recently deceased, whose grandparents were resident in Philadelphia in 1760, in a letter recently heard of in their day. The late Thaddeus Norris assured me in 1870 that he had no doubt of the Delaware being an original salmon stream, and well known to him as an industrious and reliable investigator of all matters relating to river fishes of

GLENCHO KENNEL'S RED IRISH SETTER BITCH "TRIX."
WINNER OF FIRST IN OPEN CLASS, NEW YORK, 1888.

America. Mr. Norris attributed their disappearance to continued fishing out of season.

I am now becoming an old man. While a mere boy I watched from the bank of a tiny green mountain brook the curious operations of a pair of trout over a bed of gravel, but could not imagine what they were up to. Doctors Garlick and Ackley were the first to enlighten me, years later. From that moment my investigations practically commenced. I have from time to time since, had opportunities of studying the New England trout streams, now practically barren. After patient investigations I have come to the conclusion that the depletion of the larger portion of our trout and salmon streams is, in the main, due to the clearing off of the forests and the tilting of the soil contiguous thereto, rendering them warm and muddy, and while these conditions exist I believe it useless to spend time and money in repeated attempts to restock them with members of the salmon family. If this constitutes me a crank, young men may see in the situation some reason for endeavoring to read me out of the fishculture ranks.

MILTON P. FERICE.
117 MARKET STREET, Philadelphia.

We repeat that we had no intention to belittle Mr. Pattee's efforts in behalf of fishculture. The question about which we wrote is with that gentleman was his reported statement that fishculture in the United States had not been successful. We believe that it has been. The matter under discussion has assumed the shape of a local dispute between Mr. Pattee and the former New Jersey Fish Commission, as to the manner in which the latter have expended the State appropriations for fishculture, and this point we may leave for them to settle among themselves. We believe that evidence is lacking to show that the Delaware was an original salmon stream, and this view is supported by the best authorities in the country.]

FISHING BY ELECTRICITY.—According to a correspondent of the Philadelphia Press, the electrical apparatus of Prof. Baird's expedition is very complete. The search light is one of the most novel of the wonderful inventions of the nineteenth century. It consists of three Edison electric lights of sixteen-candle power each inclosed in a hermetically sealed glass case, which is surrounded by a glass globe, and capable of resisting the pressure of the water at a great depth. It is proposed to sink the lamp and illuminate the sea by turning on the light. This, it is expected, will attract the fish, and a net ten feet in diameter at its mouth, placed below the light, will draw at the proper time, and the unknown fish of the lower waters will be caught. "It is an improvement," said one of the officers of the ship, "on the method of the Indian, who searched the rivers at night time with a burning pine knot in the bow of his canoe, and a spear in his hand, but the idea is really stolen from him." Paymaster Read has the most perfect arrangements for his work. He will be able to photograph fish and shells, as soon as they are taken out of the water, by a vertical camera. This is necessary, as in some cases the air changes the form of some of the curiosities of the sea. The sea water will be brought to the surface from any depth desired for analysis. During the trip of the Albatross from Wilmington an arc light has been first successfully operated on an Edison circuit, and an invention has been completed for lighting the surface of the sea, which will be worked for signaling and for the prosecution of all kinds of work at night.

THE FISHCULTURAL ASSOCIATION.—As we go to press the American Fishculture Association is in session in the room of the Farmer's Club, Cooper Institute, New York. The meeting will continue through Thursday, beginning at 11 A. M. As usual we will give a full report of the proceedings.

PUBLISHERS' DEPARTMENT.

Roundabout roads are out of favor. Short cuts are popular and practical. Besson's Carbine Powders Plaster is in this respect and in all others in advance of the times. It is fast superseding all other external remedies. It does not postpone; it acts to-day. It is commended by eminent physicians. It never fails to afford immediate relief. Price 25 cents. Word "Capsicle" cut in middle of the plaster.—*Advt.*

The good qualities of Greenwood's Improved Outlook are demonstrated by the constant and increasing demand for them in city and town, and by the universal favor they receive from boatmen, experience and understanding, also in their adoption by some boat clubs to the exclusion of all others, and again by the many testimonials of their superiority received from purchasers everywhere.

The Kennel.
To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

EXHIBITORS.

BENCH SHOWS.
June 12, 13, 14 and 15, 1888.—Chicago Bench Show, Chicago, Ill. Entries close June 1. Chas. Lincoln, Superintendent.

FIELD TRIALS.

November 19, 1888.—Eastern Field Trials Club, Fifth Annual Trials, at High Point, N. C. Entries for the Derby close July 1; for the Mowbray's Stake, Nov. 17; for the All-Aged Stake, Nov. 1. W. A. Coster, Secretary, Flatbush, Long Island, N. Y.
November 20, 1888.—Robin's Island Club's second Annual Field Trials at Robin's Island, L. I., for members only. Entries close Sept. 1. A. T. Plummer, Secretary.
December, 1888.—National American Kennel Club, Fifth Annual Trials, at Grand Junction, Tenn. D. Eryson, Secretary, Memphis, Tenn.

THE DOGS AT THE NEW YORK SHOW.

Editor Forest and Stream:
I have just finished reading Mr. Stuart Taylor's letter about the last New York show, and I feel inclined to reply to it in a few words. I entirely agree with him when he says, "There are a great many disagreeable people in this world, and the more I see and hear of this class of human beings, the better I love dogs." And it is because I do love dogs, the dogs of the present day and the very ones which Mr. Mason says "are degenerating into worthless curs" that I feel constrained to break a lance in their behalf. Mr. Taylor remarks that his standpoint may be too critical, I consider him most hypercritical—not of the managers, but where dogs and dog shows and judging is concerned. I thought so when his former letter to FOREST AND STREAM appeared, in which he said that he had attended one of our former shows and also one of the large English shows (Crystal Palace, I think it was), and, in his opinion the dogs at both places were a poor lot. Now, I am sure that his suspicion that he may be too critical is well founded.

Of all the pointers and English setters there was not one who was right in stern; in fact, they were all "faulty to a peculiar degree" as regards their "tails!" I wonder if Mr. Taylor thinks it best to improve upon nature, as was done in the case of the "tails" of two of his dogs, viz., the little bull-terriers Pogus and Kittie. It would seem unreasonable that out of one hundred pointers and nearly two hundred setters nature should not have seen fit to bestow at least one "stail" good enough for one rest of the dog! Says Mr. Taylor: "If any lover of the pointer will point out one to me that was on exhibition that is not faulty to a peculiar degree in stern, I will make him a present of any one of my dogs he may select." I am as much lover of the pointer as anyone, and I believe I could select pointers which were on exhibition and whose tails were all right. But I doubt if I could satisfy Mr. Taylor, and as I do not want any of his dogs I shall not make the attempt. I had only one dog at the show this year, and I know his "tail" would offend Mr. Taylor. In the ring he carries it somewhat after the manner of the foxhound, which the "excellent sportsman" confounds with the pointer, but in the field never found cause to complain of the graceful and efficient carriage of this same stern.

I do not pretend to know all classes of dogs as well as Mr. Taylor, but I do think I have a fair knowledge of pointers and setters. I take issue with anyone, be he English or American, who belittles our sporting dogs. I have had the pleasure of attending nearly all the large shows in this country, but I have never been in England when the large shows were open; so I can only speak from hearsay about the foreign dog shows. In 1880 Mr. Hugh Defauld told me that he had no idea that our dogs, particularly the sporting classes, were so good as he found them to be, and he told me that we could beat them in the very class of dogs which they particularly affect in England, viz., the English setter. This year Mr. Herbert Inman came to me and said that he had gone critically among the dogs, and that our show was better on the whole than the great English shows which he had attended last winter. This gentleman had just returned from England and is a judge of dogs.

I know we are not far behind our English cousins in sport-

ing dogs, as is too often said by some English dog dealers, who would be our teachers and counsellors and guides for a consideration! Let us do what Mr. Stuart Taylor suggests, "improve the dog as we improve the horse, by careful breeding and judicious selection," but do not let us be discouraged because our dogs and dog shows do not meet the approval of such men as Messrs. Mason and Graham.

ROBT. C. CORNELL.

NEW YORK.
Editor Forest and Stream:
Mr. Stuart Taylor says in his "Notes on the New York Dog Show": "I saw no English setter there I would give one hundred dollars for in current coin. Show me just one out of all that got grouped in the examining ring that did not carry right royally a defiant curling flag," etc. He also wanted one shown with a good chest, substance and bone, etc.

Now I trust that Mr. Taylor will accept my refutation of these sweeping charges in the spirit that prompts me to answer, as I will neither cur nor do I court any controversy, but I need not say this to Mr. Taylor, in good faith and kindly spirit, in justice to my dog; that if he will take the trouble to visit me the fourth house on Linden Boulevard, Flatbush, Long Island (street cars run every five minutes), I will tender him a most courteous, hospitable and delicately reception to my home, and take the utmost pleasure in proving to him that he did not scrutinize so carefully, nor is his sight so keen as he thought. For I have an orange and white field trial setter, three years old, full of as good useful substance, bone, sinew, perfect chest, and that he carries a tail "according to Hovle" always, and this same dog faced Major Taylor. This is no bid for his best dog. I don't want him. I only ask him not to conceal my dog because found in company inquired to his taste and fancy.

I agree with him in some things, but in regard to my dog I fear his wholesale slaughter has been indiscriminate. There is need for one to hold the end of my dog's tail. He has ample courage to do the same unaided. In conclusion let me add, I have others of this same type, fast staunch, and enduring—just such dogs as fill the eye, and good as ever greeted the gaze of practical sportsmen. WASHINGTON A. COSTER.

Editor Forest and Stream:
A few remarks seem to me called for by Col. Taylor's last letter:

1. As to breadth of shoulders in setters and pointers. I inquired if there were any later and better authorities on this subject than Stonehenge and Lidstone, whom I quoted as favoring narrow shoulders. In reply, Col. Taylor cites only Laverack, whose views on this point now are, I believe, generally conceded to have been wrong. The idea that breadth of shoulders greater, say, than Flat's, is essential to endurance and stamina is one that has very few adherents among the men who have given most intelligent attention to the subject. Col. Taylor ingeniously advances as an argument the fact that a narrow and shallow chest is undesirable in a man. So it is in a dog, and no one denies it. But I never heard that broad shoulders improved a man's chances in a long race or a short one. Depth of chest, thickness fore and aft, is pretty essential to good wind in a man. The analogy between man and the dog is not perfect, but so far as it goes, it is altogether against the Colonel. For use in harness broad-shouldered dogs are probably the best, although I do not wish to be supposed to speak as an expert on this point.

2. As to the color of setters. Col. Taylor wrote that the setters at the New York show of 1882 were "wretchedly colored." Now, the preponderating color having been shown to be blue-black or black and white, with or without tan, he merely says it does not look like liver. It is not necessary to pardon for doubting it being disliked by Col. Taylor is the same thing as being wretched.

3. As to liver being a "setter color." Here, also, the Colonel has toned down his original statement. He first said he remembered the time when it was regarded as exclusively confined to pointers and "everlastingly condemned" in a setter. Now he says it was regarded as "almost a bluish and not desirable." But even this last statement is too strong. The worst that should be said of liver is that for setters it is not so desirable as some other colors, principally, I think, because of its liability to fade. Faded liver is certainly a very ugly color, but it is my impression, although I do not know the fact, that a good deal of liver is as durable as any other color, and it is certainly handsome. To my mind it is absurd to regard it as a sign of impure breeding; while for utility in the field it is

GLENCHO KENNEL'S RED IRISH SETTER DOG "GLENCHO." WINNER OF FIRST PRIZE IN OPEN CLASS, PITTSBURGH, 1883.

unobjectionable. I should like to know just when it was everlaughly condemned. Was it during the career of Pride of the Border? Or before the existence of bench shows in America?

After what Col. Taylor has recently published in FOREST AND STREAM, I think he ought, in fairness, to show us, say at the next bench show in New York, what a setter or pointer should be. I should say he would be willing to take some trouble and incur considerable expense for the purpose. I for one shall look for his entry with some curiosity.

I am conscious that I have written in a more personal vein than I usually care to indulge in. I have done so because I consider that when a man writes in such a lofty strain of criticism as Col. Taylor, everyone else has a perfect right to examine and question his qualifications as a critic and to expose, if they can, his inconsistencies. It is hardly necessary to say that I concur in some of his ideas, especially about the tail-holding and setting up the dogs to look as wooden as possible. That kind of performance has often afforded me amusement, and I should be sorry, therefore, to have abolished. Pitzer, New York, June 2, 1883.

CHICAGO BENCH SHOW.

[From our Regular Chicago Correspondent.]

THE International Bench Show to be held here at Battery D Armory, June 12 to 15, inclusive, is attracting great attention over the country, and being under the management of Mr. Charles Lincoln, there is little doubt as to its great success. The judges selected are well qualified for the position, and it is considered very fortunate that such a selection has been made.

Some information was gathered by your correspondent as to entries, though the official closing is not until June 4. There will be about 1,000 dogs entered in the seventy-four classes. The secretary has heard from the East, and a special car will leave New York on Saturday evening with twenty-five dogs of the fox-terriers, Yorkshire terriers, pugs, bull-terriers and bulldogs, all first-prize winners. A great entry will be a wild Mexican dog, weighing only one pound and one ounce, by T. S. Peabody, of Chihuahua, Mexico, and it arrives here next week in charge of a guard, who never leaves him. This is the second time that one of these dogs has been exhibited in the United States. The other time was three years ago in New York, when a Mexican lady exhibited him. Another great entry is the celebrated pointer Bang Bang, entered by the Westminster Kennel Club for the first time in this country. He is now on his way across the waters. Every one will want to see him. The champion mastiff, Nevison, winner of thirty-three first prizes and cups, and the champion St. Bernard, Bonivard, both world champions will be exhibited. It is announced that the great and the beautiful champion Rake, will be exhibited. The Hornell Kennel Club will enter a number of spaniels. Mr. J. H. Whitman, of this city, will enter some famous dogs, and all in all, the promises for a grand and interesting show will be a large number of toys, poodles and pugs exhibited.

The building in which the show will be held is spacious and easy of access, and without doubt will be well filled each day with admiring crowds.

CHICAGO DOG SHOW.

At a meeting of the local committee of Chicago passenger agents, representing the following railroad companies: Baltimore & Ohio, Chicago & Grand Trunk, Lake Shore, Michigan Central, Pittsburgh, Ft. Wayne & Chicago, Pittsburgh & St. Louis, the following circular has been issued: "Circular No. 45, Chicago Dog Show. To be held June 12th to 15th inclusive. Decided to carry dogs free, at owner's risk, when crated and accompanied by owner or caretakers."

The express companies have agreed to return dogs free if the same have prepaid their usual rates to the show.

CHAS. LINCOLN, Supt. Arrangements have been made for special baggage car which will leave Jersey City depot of Pennsylvania Railroad 6 P. M., Saturday, and go through to Chicago without transfer, arriving there about 8 A. M., Monday, thus giving the dogs a rest before the show opens. An experienced dog man will accompany the car to take care of the animals, and ample food and water will be provided. Those who desire to avail themselves of this opportunity must apply to Mr. W. T. Dunnell, Room 5, 160 Broadway, before 4 P. M. Friday.

GLENCHO AND TRIX.

WE give this week cuts of the red Irish setters, Glencho and Trix, owned by the Glencho Kennel, Peekskill, N. Y. Glencho is a capital specimen of the Irish dog, with out few faults. He made his bow to the public at Pittsburgh last April, where he easily captured first in the open class. He is not quite two years old and not yet fully matured. He is by champion Elcho out of champion Norsean. Trix is one of the best formed Irish bitches that we have ever seen. Her first appearance was at the New York show last month, where she won first in the open class. Soon after her arrival at the show she was purchased for the Glencho Kennel by Mr. Wm. K. Lentz, of Seville, Fla., who was offered a large advance upon the price paid, but wisely refused to part with her. She is three years old, and is also by Elcho and out of Pire Fly. Both are said to be excellent fielders, and their owners may well feel proud of them. The cuts are from sketches by Harry Tallman, and are capital likenesses.

THE SAN FRANCISCO DOG SHOW.

Editor Forest and Stream: At your request I send you a few notes about the Dog Show of the Pacific Coast Kennel Club, held at San Francisco last week. To show your readers that I am thoroughly competent to perform the task, I will state, on possess, that I had the honor of assisting the judges at Watertown, in 1875, or at least one of them (I picked up his hat). I also had the supreme pleasure of howling at Chicago early the next year when the judges placed such weeds as Adam's Rock and old Leicester over my favorite, the beautiful Paris. I had my revenge, though, when Elcho beat Erin and Rufus. Here I rest my case, as the fact that I selected Elcho for premier honors upon his first appearance, when taken in connection with his since brilliant career, is proof "strong as holy writ" that as a reporter of dog shows I am *au fait*.

The show was held in Union Hall, on Howard street, commencing on Friday, April 27, and closing Wednesday, May 3. I was unable to be present until Monday, which was perhaps fortunate for me, as according to all accounts things were badly mixed during the first two days. Indeed, I thought that considerable more straightening out might with benefit have been applied to affairs all through the show. There were said to be about three hundred dogs present, which is perhaps a fair estimate. The catalogue was a "delusion and a snare," as many dogs entered were not to be found; but to balance this there were quite a number shown that were not down in the list; and worse than this, not a few of the dogs were entered in wrong classes. The building is not large enough for such a show, and the space allowed the spectators was at times uncomfortably crowded.

The dogs were upon the whole a fair lot, much better than I expected to see. The English setters were, as a class, the best of the show. The judging was upon the whole as satisfactory as could well be expected, although there was considerable growing by some of the "outs," but in most cases a glance at their exhibits would plainly show the error in judgment could not be charged against the gentlemen who made the awards. Take it as a whole, the show was fairly successful. Let us hope that it is the precursor of a series of meetings that will prove to be both a benefit and an honor to the sportsmen of the Pacific slope. I fully intended to give a learned dissertation upon the comparative merits of the dogs exhibited, but I find upon looking over my notes that owing to the lamentable ignorance displayed in classifying them, some of my winners were transferred to other classes, and I will therefore refrain from comments. *Verbum sap.* Following is a list of the awards:

FOXHOUNDS.

Dogs: 1st, Prof. E. P. Heald (imported Tracky); 2d, withheld. High com., J. M. Bassford (Np). Bitches: 1st, withheld; 2d, J. M. Bassford (Judy). Very high com., Fritch & Martin (Julia) and J. M. Bassford (Track).

GREYHOUNDS.

Dogs: 1st, J. J. Murphy (Stoneval Jackson); 2d, T. J. Cronin (Oshopee). Very high com., W. Lane (Julian). Bitches: 1st, Robert Lyson (Young Minnetta); 2d, John Dugan (Lily Newark). Very high com., T. White (Tyr); Jas. Henderson (Gypsy).

PUPPIES.

1st, J. E. Carroll (Master Paragon).

DEERHOUNDS.

SCOTCH.

Dogs: 1st, Capt. A. J. Hutchinson (Sheik).

SETTERS.

Dogs: 1st, H. D. Bartlett (Rob Roy); 2d, J. C. Nealon (Dlek). Very high com., D. E. Goodman (Bob). High com., J. de Vault (Bill). Bitches: 1st, E. H. Farmer (Queen); 2d, T. R. Jacobs (Fannie). Very high com., J. de Vault (Beauty); M. D. Goodman (Daisy G.). Puppies: 1st, E. H. Farmer (Marcks); 2d, John de Vault (Royal Duke). Very high com., H. D. Bartlett (California Rose). High com., R. W. Martin (Jim Budd); K. W. Martin (Bess); H. A. Mayhew (Mars).

LLEWELLYN.

Dogs: 1st, H. M. Briggs (Race, Jr.); 2d, R. W. Hills (Nemo). High com., Samuel Ustian (Ben). High com., Geo. Kanerer (Flush). Bitches: 1st, H. C. Chipman (Beatrice); 2d, H. M. Briggs (Fern). Very high com., Frank G. Abell (Red Bess). High com., Wm. Hearst (Kate H.).

IRISH.

Dogs: 1st, Dr. H. C. Davis (Duke); 2d, F. A. Tafts (Dorr). High com., J. S. Van Doren (Paisy). Bitches: 1st, C. Krumback (Nellie); 2d, T. J. O'Keefe and S. L. Abbott (Noggy). Puppies: 1st, E. N. Underwood (Fannie); 2d, W. W. Morrison (Professor).

POINTERS.

Dogs: 1st, G. W. Bassford (Razer Boy); 2d, prize withheld. Very high com., R. E. Bell (Jack). Com., Dr. H. C. Davis (Hes). Bitches: 1st, G. W. Bassford (Gracie Bow); 2d, G. W. Bassford (Josie Bow). Puppies: 1st, Geo. H. Peabody (Victor Bow); 2d, H. A. Bassford (Bluffe Bow). Very high com., J. M. Bassford (Keno Bow); Gen. G. B. Crosby (Bow, Jr.).

SPANIELS.

No award. KING CHARLES. Dogs or Bitches: 1st, Albert Miller (Dash); 2d, A. W. Havens (Roger). High com., C. A. Story (Beau).

ENGLISH WATER.

Dogs: 1st, R. C. Johnson (Janius); 2d, J. F. Hoffmann (Sam). Bitches: 1st, John N. Korner (Nigger); 2d, Wm. Dotal (Nell). Puppies: 1st, Miss V. Rutler (Kidulo-a-Wink).

ENGLISH RETRIEVERS.

Dogs: 1st, C. A. Tullio (Curley); 2d, E. H. Fritch (Bob). Bitches: 1st, John N. Korner (Nigger); 2d, Wm. Dotal (Nell). Very high com., James Lawler (Juno).

NEWFOUNDLANDS.

Dogs: 1st, John Gufflet (Dovefoot); 2d, J. E. Slenkey (El Monte). Very high com., S. Stahr (Dick). Bitches: 1st, Wm. Cawley (Flora).

ST. BERNARDS.

Dogs: 1st, M. L. S. Ancona (Lion); 2d, H. M. Norton (Jack). Very high com., W. H. J. Mathews (Poon).

GREAT DANES.

Dogs or Bitches: 1st, A. B. Sprackels (Dianna); 2d, O. Tolle (Baton). Puppies: 1st, O. Tolle (Major).

MASTIFFS.

Dogs or Bitches: 1st, James Henderson (Juno); 2d, W. F. Pettigrew (Spot). Puppies: 1st, Thomas F. McNamara (Queen).

COLLIES.

Dogs: 1st, J. McNab (Max). Bitches: 1st, J. Cullingham (Gypsy).

DALMATIANS.

Dogs: 1st, Dr. E. H. Woolsey (Spot). Very high com., Dr. E. H. Woolsey (Speck). Bitches: 1st, A. J. Kelly (N-His Dotzoe); 2d, H. B. Sloonin (Ruby).

BULLDOGS.

Dogs: 1st, F. W. Sharon (Tiger); 2d, W. I. S. Hgley (Bull). Bitches: 1st, A. B. Trueman (Sally McElhattan).

TEBRIERS.

Dogs or Bitches: 1st, W. M. Beger (Sabbath); 2d, Samuel Ambler and J. H. D'Arcy (Nell). Very high com., F. Hoagler (Lion).

KYNOCH'S
Patent "Perfect" Brass Shells,
MANUFACTURED BY
KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the cheaper makes. Cost only about half as much. Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool (as represented in cuts) and straighten out to original shape when discharged. The crimping tool also acts as a rotator, an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (\$2,000) and crimpers not less than one dozen, by

AMERICAN Kennel Register.
A monthly record of kennel events for the information and guidance of breeders, exhibitors and owners of all breeds of dogs.
Its leading feature is the "Pedigree Register," of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is given to each dog, and an index will be compiled at the close of each annual volume, thus forming a permanent work of reference. The pedigree registration fee is twenty-five cents. The first two numbers of the Register contained the pedigrees of 138 dogs.
Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs at sale, and deaths.
Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include a record of field trials. The first two numbers of the Register contain prize lists of Washington, Ottawa and Pittsburgh shows.
The publication day is the fifth day of each month; and nothing can be received for publication later than the first day of the month. All matters intended for publication should be in the hands of the editor at the earliest practicable date. Entry blanks for each department will be furnished free on receipt of stamped address envelope.
TERMS:—Issued by yearly subscription only. The subscription price is one dollar per year. Make drafts and money orders payable to the Forest and Stream Publishing Company. Address, **AMERICAN KENNEL REGISTER, P. O. Box 2,323, New York City.**

"O. C. PATENT PERFECTION."
Multiplying Reel, Center Action, Depressed Balance Handle, Safety Band, Adjustable Click.

The cut shows the position of the index when Reel is used in (a) casting; (b) as a Multiplying Click. By pressing the index to the right the Click is removed, and thus it can be used as a free-running Multi-plying Reel. It is the Reel for black bass, is simple, durable, and in every way desirable.
TO SPORTSMEN!
These reels are for sale by the trade generally, therefore please apply to a dealer in your place. If you are unable to procure them, please advise me and I will mail, registered, on receipt of following prices:

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, JUNE 14, 1883.

VOL. XX.—No. 20.
Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newscasters throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

THE TEAM QUESTION.

BEFORE the issue of another number of the FOREST AND STREAM, the American team will have sailed for the British shores. They will go accompanied, we are sure, with the best wishes of every American citizen, and we hope with enough of the coin of the republic to make their jaunt a pleasant one and enable them to fitly discharge the duty of representing the American National Guardsmen on foreign ranges.

With the history of the make-up of that team our readers are familiar. It is a squad which fairly represents to-day the best available shooting material in the ranks of our citizen soldiers. It is not easy to secure a dozen or more men who are willing and ready to make such a trip as that undertaken by the American team, and especially when these men must be experts in a very difficult art.

The National Guard of the country does not make a very creditable showing in this matter. After months of notice, we find but twenty-nine men appearing to contest for places on the team, and of these several were shooting merely for a record. The fact is, that marksmanship has not yet become a part of the Guard system here. While the public and the men in uniforms will flock from near and far to witness a contest in the manual of arms, or to see a picked company strut up and down a paved plaza in the evolutions of the squad drill, but a man here and there can be found who has a well-founded knowledge of ball practice, and who can put that knowledge into play. Aside from the beggarly show which the Guard of the whole country makes when compared with the whole male adult population, there is wanting in the Guard, as at present organized, that conception of a soldier's duty which gives to rifle shooting an important place.

But the team as organized is a strong one. A glance over the records made during the weeks of preparation and drill at Creedmoor, will show to the experienced reader that the men come very near to the maximum which may reasonably be expected of a military breech-loader. A year ago the

British team, which visited America, and had such an easy victory, were not as competent as the men now leaving our shores. That is, judged by the records made by them in practice and in the match. There were certain points in which the English team showed great strength. Individually they were far in advance of the men who composed the American team, and we cannot hope to equal them in that respect until we too have secured such an immense field of choice as is shown in the ranks of the British Volunteers. This year will find a system of team management and discipline, which will mean a great many points on the American score.

Public opinion in regard to the team has been largely modified by the action of the Board of Directors. A great deal of childish wrangling and foolish exhibition of petty spite on the part of the "has-beens," has served to bring the whole matter into much dispute. There should not have been from the start anything concealed or done in an underhand fashion. There was such a star-chamber proceeding, and while the popular verdict would, in all probability, have sustained the directors had they declared their opinion that the rejected marksman was an undesirable person to place on a team, there is no doubt that the N. R. A. management has lost much in popular confidence by the far from manly fashion in which Mr. Farrow's case was disposed of. This is a matter which, so far as the present team is concerned, has passed into a "by-gone," and unpleasant things of that sort are always best when forgotten.

The work of the team is before it, and for that work it is fully competent. Col. Howard may not be statuesque, but he has managed to show that he has a quiet working method, and if the men are acting in good faith on the ammunition question, he ought to know just what he can rely on from each man. This is something which the captain of the last team never did know. Should defeat come to the Americans, it will simply be that chance of conflict which may at times send the best equipped and most competent adversary to the wall. It will not be from that utter disparity between the opposing forces which marked the match of 1882.

The pressing need now of the team is a substantial financial backing. The entire National Guard of the country will be disgraced if the team is sent abroad poorly equipped, and the civilian citizen will share in that disgrace. From our knowledge of the management of the team we feel safe in vouching for the economical expenditure of all funds raised for this purpose. There has been much sacrifice of time, labor and money by the men on the team, far more than may ever be known to the world at large; but every man who will feel a thrill of pleasure in the victory of the team should do something toward bringing such a result about and this can be done in a measure by liberal subscriptions.

FISICULTURE IN ENGLAND.

IT is only within the past two or three years that a few of the more advanced fishculturists of England have taken to reading the reports of what has been done in the United States and in Germany, and have candidly told their fellow workers that England was far, very far behind those countries. It is exceedingly hard for Englishmen to believe that their land is not up to the standard in all things, and when Mr. Arthur Chambers, President of the English Fisicultural Association, and Mr. R. B. Marston, editor of the *Fishing Gazette*, both publicly stated that their country was far in the rear in this matter, it created some surprise. The fact is, that for years there have been some efforts in this direction, but they have been the work of individuals, who realized the necessity of increasing the stock of fishes, but who lacked the financial support of the government. Mr. Francis Francis early started the good work of salmon breeding, and of sending the eggs to Australia, and he was followed by Mr. Buckland, who, however, seemed to be ignorant of what had been done abroad, and therefore groped in the dark to a great extent. To illustrate this, he packed salmon eggs for Australia on the day they were taken and, of course, lost them, where if he had taken the pains to read American reports, he would have learned a fact known for years previous by all intelligent fishculturists, that the egg does not bear long transportation well until the embryo is visible to the unassisted eye.

These facts have been called up by the following extract from a report on the International Fisheries Exhibition in the London *Field*, which says of the American display:

In pisciculture there is a large and varied show of models and other apparatus. Many of the models appear to be rather needlessly complicated, though exceedingly ingenious. There were plans

of batcheries, trays, carriers, hatching boxes in various forms and of varied ingenuity. The same may be said of a large collection of models of fish passes and salmon ladders. They are ingenious beyond all doubt; but many of them are, we fear, too ingenious to be practicable. In these matters there are certain broad principles to be observed: if these be recognized the work is easy; but if they be not, all the ingenuity in the world will not replace them. Among the most interesting things in the American exhibit is a large and fine series of black and white pictures of all manner of piscicultural operations. The United States have done well, and although they make a fine exhibition.

If there is anything in which the fishculturists of America excel it is in their apparatus which is designed to accomplish the greatest results in the least space and with the minimum of labor. There have been implements devised which are needlessly complicated, and these are possibly shown with the Government collection, but they are not those which are in common use, or which will be found in the models of the best batcheries. Of the salmon ladders which the *Field* fears are "too ingenious to be practical" there are some which exceed by far any in use in Europe. For instance, the McDonald fishway may appear to be complicated, but its principle, which is different from any other, is simple enough when seen at work, and a fishway up which a man can row or pole a boat is certainly a practical one. The "broad principles" in the construction of fishways, a diminished speed of water down an incline as short as possible. The device which accomplishes this in the best and cheapest manner, need not fear to be called ingenious.

There are some excellent private fishcultural establishments in England which sell eggs and fry at high prices, such as obtained in America ten years ago, but beyond stocking the waters of some of the nobility, not much has been done. The proposition to hatch what in England are termed "coarse fish," such as pike, and the cyprinoids of the rivers, has received much favor, and if the new Association carries it out, it will afford both food and sport for those who do not own vast parks with lakes and streams, which are of use only to the owners. We believe that the day will come, and come soon, when England will work up to the present high standard of fishculture on the Continent and in America, and those who plainly tell the people that they are behind other countries in breeding fish are the best friends of the cause. If the new Fisicultural Association can work up popular interest in this question and obtain government recognition and financial aid, we expect to see a body of progressive fishculturists spring up in that land that will make their mark on this industry, provided that some person whose only claim to distinction is a long title is not put at the head of it.

England has several earnest workers in this field besides the gentlemen named. Mr. Charles W. Harding has been experimenting with the breeding of mussels and oysters in Norfolk; Mr. Charles C. Capel, of Fooks Kra, Kent, has a hatchery for *Salmonidae* which is well known on this side of the water, and there are others who are earnest, capable men, who should long ago have had charge of government works to provide fish for the million, instead of for the few wealthy persons who plant them merely for sport.

Fisiculture in England has been mainly a toy for the rich to play with, and hence there has not been that stimulus to devise space-saving and labor-saving apparatus, which will turn out millions of fish into the public waters at the least expense. It has never had the slightest aid from the Government, notwithstanding the fact that thousands are engaged in the coast fisheries, and that the people consume vast quantities of fish. The salmon rivers of Great Britain are kept from exhaustion by protection alone, but with a plentiful yearly stocking would produce many more fish than at present. The Fisheries Exhibition, now in progress in London, should open the eyes of the Members of Parliament to these facts.

THE REPORTS RECEIVED from the various fishing localities, far and near, would seem to indicate that the prospects for the sport this summer are unusually good. The season opened very late in all localities, and those who tried the overfished streams near the cities, as soon as the law was off, returned disappointed, with empty creels and drooping rods. We are inclined to believe, however, that this is to be a good fish year, and that the same old frosts and storms, which annually destroy the peach, the corn, the wheat and the ice crop, have this year left the trout and the bass harvest unharmed.

DR. JAMES A. HENSSELL will publish in illustrated book form the two series of "Florida Sketches," contributed to this journal. The entertaining material contained in those papers was ample for a successful volume; and our readers will welcome them in the new form.

HOW TO BUY A DOG.

A SAD-EYED, low-voiced correspondent, who writes to us from Western New York, and who signs himself "Victim," asks our advice. He complains that when people write to us, and ask us where they can buy a dog, we always refer to our advertisers, and asks what guarantee the inquirer has that the dog he purchases will be as represented, and what is to prevent him from being victimized, as our correspondent has been. He suggests that a person may advertise a number of pups with a pedigree as long as one's arm, for sale at a certain price, but what can a one do after raising one of these pups, and finding that he has a curly-tailed pointer or setter?

We will try to answer our correspondent's questions. We refer inquirers to our advertisers, because they are the only people we know who have dogs for sale. A man should not buy a dog without seeing it, or, if it is a young puppy, seeing its parents. Moreover, it is by no means certain that all the puppies of two excellent dogs will be as good as their parents. On the contrary, it almost always happens that one or two of a litter will have a tendency to revert to some ancestor which had faulty characteristics, and one can never be sure what he has got in buying a puppy. Pedigrees are excellent things in their way, but they are not by any means every thing, and the most splendidly bred dog in the world may fail to show the good points of his sire and dam. People in this country at present are rather given to buying pedigrees and not dogs. Of course they make the purchase in the hope of getting dogs, but they are too often disappointed. Any one who has had much experience with dogs, of whatever breed, should know that in buying a puppy he is taking a great many chances of being disappointed, and the man who has not time to breed and break his own dogs, will save money, time, and an infinite deal of wear and tear of mind by purchasing an old well-broken dog. We may repeat here some remarks printed in these columns nearly two years ago, which will give our readers our views on the very important subject of buying dogs:

In all transactions between buyer and seller, only the strict rules of business should obtain.

What should we think of a merchant who, seeing an advertisement of goods by a stranger, should send his check for the amount demanded without first satisfying himself that the advertiser was thoroughly responsible? How do you suppose his balance sheet would average on such ventures? We know that many men, who are considered sound upon most subjects, are entirely dumb when anyone says dog in their presence, and are easily persuaded to overstep the bounds of prudence in their eagerness to secure some canine paragon, whose perfections are glowingly described in a speciously worded advertisement. There are also many men of stolid habits and quiet lives, who, feeling the need of relaxation, naturally turn to the sports of the field and, all untaught to the ways of business, and guileless of the wiles of a wicked world, confidently comply with the request of some unscrupulous scoundrel to "send the money," and "hold, and to let, that men better." Perhaps an idea of what is proper in the matter would induce them to make inquiry as to the reliability of the advertiser, but an innate feeling of diffidence, that leads them to scrupulously avoid wounding the feelings or giving offense to their fellow men, restrains them and they become the dupes of designing knaves, who knew full well that beyond a letter or two of mild reproach they are safe from any attempt at recovery of their ill-gotten gains; and, emboldened by success, they continue their similar operations as long as they can find victims. So great are the dangers that attend such purchases, and to so great an extent have these dishonest dealers practiced their tricks, that in justice to honest dealers, summary measures should be at once adopted, to put an end to their career. This can easily be accomplished if every one wishing to purchase will take the ordinary precautions that should be observed in any business transaction.

No honest dealer will object to the closest scrutiny regarding the animal he may offer for sale, nor to the fullest inquiry as to his own reliability and responsibility, and no fear of a possibility of wounding any one's sensibilities should deter would-be purchasers from fully satisfying themselves in these respects, or perfect immunity from becoming the victims of fraud.

Before purchasing a dog it is, if possible, very important that you should see him at actual work in the field or game, in order that you may know how he does his work, and learn just how he has been handled. When this is not practicable, you should receive from his owner minute instructions as to all different words, signs and whistles used, as well as a full description of any peculiarities that he may possess, either natural or acquired. You will also find it greatly to your advantage to become well acquainted with him before taking him into the field, particularly if he is young, or has not had experience.

That the complaints of purchasers, who think that they have been cheated, are sometimes unjust or perhaps entirely without the pale of reason, we are well aware. It is often the case that persons who buy a dog are woefully ignorant of everything pertaining to canine management, and because their purchases will not in a faultless manner execute their commands—which probably are enunciated in language which the poor animal has never heard in his life—they at once pronounce him worthless, and seizing their pen, they write us pages of vilification and abuse of the seller, who very likely is entirely honest and has sent them an animal which is just as represented by him.

Every one who has had much experience with dogs should know that, no matter how perfectly trained a dog may be, in the hands of a stranger, he may never so expert a handler, with perhaps the advantage of having witnessed the manner in which his former owner worked him, the animal will not acquit himself nearly so well as when under the eye of his accustomed master. This to one of slight experience is a prolific source of disappointment, and as first impressions are generally the most indelible, often ends in discarding a really worthy animal, whose only fault is that he cannot at once "off with the old love and on with the new."

It is an occasion of regret among Canadians that Mr. J. U. Gregory, of Quebec, could not have gone to London in charge of the Canadian fishery exhibit, his important official duties detaining him in Quebec. It was due in a very large measure to Mr. Gregory's energetic services that Canada's display is so large and complete.

The Sportsman Tourist.

MAJOR JIM O.

JIM O. was a warbler of a different feather from slouchy old Davy W. Dave might be likened to that solitary bird with ventriloquist "kolk" that boys call rain-crow. His manner was that of a trained canary, and he sang the far-off hush-a-by-baby sound, like the rhythmic beatings of a steamer's paddles on a still summer night. While on the other hand, Jim O. seemed to be a cross between a blue jay and a guinea fowl, with all the pert impudence of the one, and the incessant cackle of the other. I think, too, he might be classed among game birds, for there is little doubt but that he would "lie to a dog." In truth, when indulging in his favorite amusement he was never handicapped, whether by either time, place or subject. "No put up Utica" evoked Jim's powers. He could lie in one State as well as in another, and all over the Union whenever the occasion demanded it. Quick in his motions, self-assured in manner and glib of tongue was Major Jim. There was, in truth, no flattery in Major Jim's talk. The words came out of his mouth like stones from a hand-cannon. Sometimes they seemed to come out in "ready-made" sentences—to come out from both corners of his mouth at once, and then run together like a flock of flying geese. Yet Jim was no goose. He had a mother wit that made up in a great measure for his lack of education, and an assurance that fitted him over every difficulty. To many of his associates he was a prodigy of learning, and they listened with open-mouthed wonder to his long Latin quotations, whose meanings neither speaker nor audience had the remotest idea.

My first meeting with the Major was wholly accidental. It was a beautiful day in October, and the sun, hanging low in the western sky,

Shot shafts of gold
O'er shining river and darkened wood

and shone with mellow radiance upon our camp at Brushy Lake. Besides the writer, our party counted as follows: Lucien R., a young planter, Ben H., my old neighbor, and old Steve Slaughter. A word about old Steve. He was one of those unfortunate captives left by that defunct institution, who were "freedmen" by the name, but who were the property of their old masters and buy-outs. A genuine African, with a genuine Afro-American dialect. His grizzled beard, his woebegone look, and shambling walk, with his spical collar carried at an angle of forty degrees with the plane of the horizon, generally led the casual observer to think him old and decrepit. Yet such was not the case, for although he boasted of having "lived ten thousand for nowt" a hundred year, he had at the time of which we write scarcely passed the half-way station on man's allotted pilgrimage. Polite and obliging, brim full of humor, a good singer, with a rich, mellow voice, and a laugh of whose "music" no combination of the letters of our alphabet can give the least idea, Steve, with his half dozen many curs, was always welcomed whenever we went on a "bar" hunt, which was our present business.

The letter to enable the reader to form a mental picture of Steve, let me state that he was a *recomber* of more than ordinary merit, and had a habit before speaking of always doffing his weather-beaten chapeau and placing it under his left arm, and accompanying his recital with a continual bobbing up and down of his head. He was an old Muscovy drake when talking of his "plum" and "plum" and "plum" peculiarly. He invariably began his replies and interlarded his stories with the words "Yes, my master," and contrary to the habit of his race, and to his own usage generally, he always gave the vowel in these words the flat sound which it has in the word fate, or more correctly the prolonged sound which we hear in the good-morning "ma-a" of an angry goat.

On the occasion of which we write, Steve, armed and equipped with a greasy haversack and an old army musket, and lurching as he came through the woods the bugle note of a callophe, had followed Ben and myself into camp, to which we had just returned after an unsuccessful drive. Just as Steve reached our camp a stranger, doubtless led by Steve's song, was seen approaching, riding upon a mule. We were not long to learn who our new visitor was. Riding up, he addressed our party generally: "Glad to meet you, gentlemen. Glad to strike you, sirs. Out hunting stry stock; heard that old darkey's racket and followed him in, you see."

He then went on to inform us that he was Major Jim O., that he had lately moved on to the Bryndake plantation, etc., ending by a request that we should give him a place in our party. Having completely lost his bearings, and having no idea of the way home. We invited him to get down from off his mule, and suggested to him that Lucien R., who had not as yet returned to camp, would soon be in, and intending to return home after an old strike dog that had been accidentally left behind, would put him in the Cold Lake road, and thus enable him to reach Bryndake. He had previously met Lucien R., and they had agreed to go together. Introducing myself and Ben H., and not forgetting old Steve who, doffing his beaver and making a low bow, said, "I see glad to see you, Mister Major." I pointed our visitor to a seat on a convenient log. He had hardly taken his seat before, as Steve remarked after he had gone, "he give tongue like a young dog on a wet rail."

"Really glad to see you, Col. Glad I met you, sir. Hear you're from the old Dominion—a native of the grand old State myself, sir. Born on the shores of the classic James, educated at her noble university, sir."

"Ah," I broke in as he paused to draw breath, "I had the honor of being expelled from that noble institution myself, I suppose, Major, you were a student what time old Gess sat in the canine chair."

"Ah, they say I was," he answered. Never could remember names, sir—never could. Old Gess or old Reckon or something of that sort. I'm just like old Joe Fisher, sir—lived down in Warren county, five miles from Vicksburg, all his life, sir—never went to town but he had to ask somebody the name of the place, sir. Forgot his own name once, sir. Couldn't draw on his merchant—niggers liked to starved to death, sir."

The conversation which may be called a one-sided affair, then drifted into other channels, and in the meantime, while Major Jim, like an old maid at a watering place, was fast getting over his bashfulness, Lucien R. was seen approaching camp. "What luck, Mr. R.?" asked the Major, as he came near, for, as was before mentioned, they were acquainted.

"None at all, Major," he answered. "They say that old

Zack Lukins killed seven bear one day last week, and it seems that the others, if any are left, have vamoosed the ranch."

"That's so," said the Major. "B'ars will leave when you make it too hot for 'em, sir. Why, sir, when I was doin' business for old Judge Snides, down in Madison parish—plantation by the name of the river—Mississippi River you know—one night I was sittin' on my gallery smokin', sir—moon comin' up over the trees on t'other side the river—stars shinin' bright—not er cloud in the sky, and everything jest as still as er dead mule, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could stand it no longer, sir, I jest jumps up on my feet and I says, 'Old comin' up, sir. God, old, old, comin' up, sir. Well, first thing I knowed I heerd a kinder noise way 'er cross the river, and it sonned rater low like at first, and then it kept gittin' louder and louder, and when I could

more for a watch-dog than anything else. After going twelve miles up the valley we reached the Santa Ynez Mountains, and began the ascent. We lightened the load for the mules by getting out and walking up the steep places. Wild cherry or plum trees grew abundantly by the roadside, and their sweet fruit was very refreshing. When plentifully marked of this fruit sometimes intoxicates a person. The day being warm, we toiled slowly up the mountain. Several times we came upon the trail of a huge rattler or other snake, which lazily dragged itself across the dusty road, and after two hours hard climbing, we reached the summit. The view alone well repaid us for the exertion. Range upon range of brush and timber covered mountains stretched before us for miles. Three thousand feet above, and far beyond the canyon, the road in the distance now disappears nor reappears further on, until it is lost to sight in the distance. Fifteen miles away is the grand Pacific, its various currents plainly visible; some of dazzling brightness from the sun shining upon them, and others of a deep blue color. In the air above are a number of vultures that would measure from eight to ten feet across the wings, lazily wheeling about in large circles. Everything is quiet. Even the birds are silent from the heat. A cool and refreshing breeze pervades the scene. One almost imagines he could live forever on nothing but climate and this enchanting view. But we are soon roughly aroused from our reverie by the voice of Frank telling us to "come on, and not keep us waiting all day!" We reluctantly leave the spot, and getting in the wagon begin the descent. On making a sharp curve we rai over a rattlesnake, and it being only crippled, we couldn't resist the temptation to go and get his earthly career, thus adding his nice rattles to our collection, the largest of which consists of fourteen rattles and a button.

We ate our lunch in a shady recess near the road, where a cold spring of pure water bubbles up, and by two o'clock reached the foot of the mountain. About five o'clock we came to the ranch of Mr. Cyrus Marshall and decided to camp there for the night. Mr. M. being an indelicate but we were somewhat surprised to see himself and wife dressed in the most refined and elegant style and good looking on the front porch, but, we found out later, they were keeping Mouday for Sunday, and were horrified when we informed them of their mistake.

We were on the road by daylight the next morning, and camped about eighteen miles up the Santa Ynez River at a beautiful spot. We were kept awake that night by the coyotes, and it being moonlight we endeavored to get a shot at them, but were unsuccessful. Before the sun had risen Jim and I went out and got the traps, and set out two companions to their stumblers, hastily rigged our fish tackle, and stole down to the river a few feet away. The river is not more than thirty yards wide at any place, but it is very clear and contains lots of trout. We made a cast and immediately felt a tug, and then a rush, and presently landed a fine one that would weigh a pound and a half. In a few minutes twenty-three were in our creel, averaging a pound and a half in weight, and had a very good number of them were in the frying pan. The savory odor greeted the nostrils of Jim and Frank on awakening, caused them to den their clothes in haste. After a breakfast of fried trout, camp biscuit and coffee with condensed milk, we made our plans for the day. We were all going to hunt. Jim started out one way and Frank another, while we spent a few minutes to fix up things around camp. Just before leaving we turned to look across the river and saw a large coyote trailing along. He was about a hundred yards away, and taking good aim we blazed away. A little pop of dust raised beyond him, and the fact was made apparent that we were not Dr. Carver or some other famous shot. We concluded not to shoot again, for when we got ready the coyote was about half a mile away. When he heard the shot he started, and all that could be seen of him was a grayish streak.

Before we had fairly started from camp we heard Frank fire six or seven shots in rapid succession, and soon he came running to camp after Dave to help him in capturing two bucks he had wounded. Dave took the track of the one that had gone toward the river, but after going half a mile lost the track, and appeared much at fault. We assisted him, and finally he found it again and soon came upon the deer. He was vigorous and two year-old buck, with one hind leg broken, but he was well rested, and the fight was truly exciting. The deer would strike most forcibly with his fore feet, but the dog would watch his chance, and seize him by the throat, choking him down, when, losing his hold from exhaustion, the fight would begin again with renewed fury. But it was evident that the dog would prove the victor, and calling him off we shot the deer through the head. After trying in vain to drag him to camp, we huffed Dave and he returned to the trail, and in arriving at the spot where it was shot we put Dave on the track, and in a few minutes we saw him ascending the ridge to the west of us. We followed, and a long and toilsome trip it was. Dave occasionally returned to us to see that everything was right, and then would take up the trail again. We continued on over mountains and across cañon for at least six miles, when we heard Dave baying. We increased our pace to a run, but found that he had come upon a three or four year-old buck, with all one leg broken. Everything showed that the battle had been severe, but Dave had conquered, and the deer was now at his mercy. After resting about twenty minutes we pushed the buck with our feet, when he jumped up straight nearly six feet and started down the mountain, bounding over brush and rocks at a rapid rate, but by the time he had gone two hundred yards Dave had him again, and he was soon dispatched. We had followed the deer fully six miles, and were now five miles from camp, as tired and footsore as can well be imagined. We hung the buck and lugged back to camp, gave Dave an early dinner and washed him in the river, he being covered with blood from his recent encounters. Jim returned with a few quail as the result of his skill.

The next day we found a bee tree near camp and Jim rode one of the mules eight miles to borrow an axe to cut the tree down, as we were not in possession to do the same of our own. Mr. Moore, the proprietor of the ranch, was camped. The name of the ranch was Tequempis (Ta-ka-pis) a Spanish word, the meaning of which I do not know. On Jim returning with the axe we proceeded to cut the tree, and although it was no easy task, secured about ten gallons of honey clear as crystal, and left a great deal beside. Every article of material was filled, and for some time it was about the sweetest article we had ever well imagine. On the following day, we moved our camp a few miles on. After while driving at a sharp trot we came upon a young buck feeding by the roadside. He didn't seem to see us until we

were opposite him, and we were so near that we could almost of quite touch him with the whip. He ran about two hundred yards and stopped, looking at us, as if wondering who we were. He had probably never seen the like before. As we had plenty of fresh meat we didn't bother him. Going on a few miles further we came upon a hunter's cabin. The occupant had not seen the face of a white man for three months and was overjoyed to see us, and gave us the privilege of using anything of his that we cared to. He was a fine specimen of a backwoodsman, standing full six feet, straight as an arrow and a fine shot. Surrounded by his dogs, horses and chickens he leads a secluded life. He had about thirty deer skins, and pressed us to accept all the "jerkey" we wanted. He informed us that he came from New Orleans in 1860, and since then had led the life of a hunter and trapper. His prejudice against the breed-keeper is so strong that he would not allow one the space it took up, and so he uses the muzzle-loader entirely, hardly looking at our Winchester.

We pushed on two or three miles further and camped. Not having any fish for supper, Jim and the writer went to the river and saw in one pool what we estimated to be at least a thousand trout, and in the shallow water we caught enough with our hands for two or three meals. Nice, large ones, too. We killed a rattlesnake that day that measured four feet in length and twelve inches in circumference. It was the largest we had ever seen and had eleven rattles. The next morning we saw three deer feeding on the mountain about four hundred yards away, while we were eating breakfast. Frank took his rifle, and by making a detour succeeded in bringing one down. I went to his assistance, while Jim went after a couple of coyotes he saw some distance away. When I reached Frank saw water, that he had killed one of the largest bucks I had ever seen. The bullet went in one ear and came out the other, killing the deer instantly. Frank declared that he had killed it at fully 275 yards. We disputed the matter with him, until we stepped the distance off and it was just 133 paces. With difficulty we dragged the deer down the mountain and then went to camp and hitched the mules to the wagon to bring the deer to camp, but he was so large that we could not lift him into the wagon, even after the entrails were removed, and we were not very weak, either. By cutting the head off we finally got him into the wagon by very hard lifting, and started for the camp. If Nast could have seen us tugging away at that deer he might have enriched Horner's with a cartoon that would have added to his fame. After returning to camp it was hard work to hang him high enough to dress, but after much trouble succeeded in doing so. He was undoubtedly the largest deer we ever saw, and his wide branching antlers probably grew the walls of Frank's ranch at the present moment. Jim returned after we had accomplished all the hard work, minus a coyote, but with a lynx he had killed. Its color was white and yellow, and it was eighteen inches tall and twenty-nine inches long. We saw a large bear track that day that measured nine by fourteen inches. Its large size was caused probably by the hind foot stepping in the track made by the front foot.

No hours were seen by us on that trip, though numerous tracks were noticed. The writer killed only one deer, and that was a small one. We killed a great many quail, they being very plentiful, some flocks that I have seen numbering thousands. When a flock of that size take wing the noise made resembles distant thunder. In some places farmers have to guard their young grain from their depredations. We saw many deer that we did not shoot at, because we had plenty of fresh meat. One herd contained thirteen, all grown ones. Although we saw no bears on this trip, we did on others, and in the future may describe how we were treed by an old chufout.

FALLS CITY, Neb.

FROM A SPORTSMAN'S NOTEBOOK.

NEVER could understand why all compass needles are not of such form as to designate, at a glance, the north pole.

Most of the pocket compasses have the needle pointed alike at both ends, one end being polished, and the other, the north, left blue.

Suspecting a fellow, having failed to notice this difference, should become lost, and "compass" turned around, "what use would the compass be to him? Of course, no old hunter would be caught in any such foolish scheme, but the tenderfoot might. If the f. were a scientific man, or one who happened to remember all the points in the natural philosophy of his school-days, he could easily prove to himself which was the north pole of the needle as follows: Set the compass on a level spot on the ground, hold the gun nearly vertical, and the muzzle of the end of the needle outside the case of the compass, would point to the ground, and violently repelled; this is the north pole. In the Southern Hemisphere he would have similar effects with the south pole, or blank end of the needle. Any mass of iron, set on end, would answer the same purpose as the rifle barrel. This effect is supposed to be due, partially, to the "magnetic moment" of the iron, and also to the natural polarity due to the earth's influence, a subject of prolonged study by Sir W. S. Harris, who published a report for the use of iron ships.

Last Sunday I watched the movements of a crow-blackbird in my door yard. He was only about twenty feet from me, and by using an opera glass I could see everything plainly. He would hop around and tip his head to one side and peck steadily for a moment at the sod, then with a few picks he would bring out an angle worm. This he would put his foot on and pull in two, and swallow the parts. Finally he found what appeared to be a May bug. This he pulled to pieces, but I could not tell whether he swallowed any of it or not, but he kept what appeared to be the legs or thighs, and, perhaps, some other parts in his mouth. Then he found more worms and would lay down the pieces of bug until he had eaten the worm. This he repeated several times, always picking up the pieces of bug, which he finally flew away with. I suppose these were tidbits for his young.

Talking about fishing, I did some funny work one time. It was during the war. I was on the Gulf, bound for South-west Pass, mouths of the Mississippi, from Brazos de Santiago. The little schooner was sailing along very slowly, when we noticed some large fish acting very strangely. One was much larger than the rest. I should think, as I remember it, some five or six feet long. This one kept directly under the boat, except when she came out to chase away five or six smaller ones, perhaps thirty inches long. She

would drive them further than we could see in the beautiful clear water, but returned to false station under the boat, to be soon followed by the smaller ones, which would linger just under and alongside the rail. We had a dolphin line over the stern, with a rag attached to the large hook. I took this hook and bound it to the end of a pole, with the stout cord still attached to the hook, and carried up the pole as a means of safety. With this rig I sat on the rail midships, and by divers jerks and reaches finally hooked one of the fish near the tail. With the help of the captain I succeeded in hauling him aboard.

These fish were called by the captain of the schooner "albicore," as near as I can remember, and he said he never saw one caught, and laughed at the idea of my attempting it. After one was caught he took a lively interest in the matter, found an old spear-head in the hold, which we soaked out to the same pole, and succeeded in spearing another fish, when the rest suddenly disappeared.

That day we had a fish dinner. I was hungry; had been living for some days on army rations, broom smothered in onions, which I detest. My mouth waters as I write of it. I have "fed" at some high-toned tables, with all the adjuncts of sauces, but no fish ever tasted half as good. This isn't much of a fish story, compared with your "Jottings from Jersey," but the statements are cold facts.

Would like to know whether I have the correct name for this fish; he was dark blue, I think, on the back and light beneath.

We afterward speared a dolphin, the "King of the Sea." It was the most beautiful fish I ever saw, the "magnificent" sides of the "speckled beauties" being way off in comparison. I remember that the top part of the dolphin's head struck me at the time as being of the most perfect lines for clearing the water; that is from the mouth up. Turn him on his back and the top of his head would make a model for the prow of a clipper. Am I right or is my memory at fault?

In cooking the dolphin the old superstition of putting a piece of silver in the pan with the fish was followed, and as the silver was not discolored we ate the fish.

Speaking of explosives, the *Scientific American* quotes from the *Loudon Observer*: "An explosive is a body of unusual chemical composition, which, when its chemical equilibrium is disturbed, violently expands in bulk. A Gun cotton may be held in the hand and burnt, but if a detonator be attached to it, and it be clapped between the palms of the hands, it will blow a man to pieces. * * * Chloride and nitrogen will explode with terrific violence if the bottle containing it be tapped with a feather. * * * Explosives may be roughly divided into combinations which are purely chemical and those that are chemical and quasi-mechanical. Nitro-glycerine is purely chemical. All purely chemical compounds decompose spontaneously and group themselves into sub-combinations of a treacherous nature. * * * Nitro-glycerine can be carried about safely, but it kept for any length of time it passes through interred changes which render it unsafe."

I suppose black powder to be a simple mechanical mixture, and if kept dry can be kept for centuries unchanged. Does it about wood powder? Probably the boys had better use it if at all of fresh manufacture, and before it may have "grouped itself into combinations of a treacherous nature." It is pretty powder to use, for many occasions, and it is to be hoped it is as safe as it is declared to be by the manufacturers.

CLEVELAND, Ohio.

Natural History.

ANOMALIES IN BIRD-LIFE.

I HAVE spent most of the present spring at Northford, Conn., a little village just above the mouth of the Long Island Sound, just above Northford. On Thursday morning, April 26, as I was walking there near Farm River, a man named Dunkle told me he had just seen a "white robin." Thinking he possibly was mistaken, I hurried on in pursuit of the curiosity. I found that Dunkle was right; it was a genuine red-breasted robin (*Turdus migratorius*) and as tame as a chicken. It permitted me to come within five or six feet of it, and even my nearer approach occasioned it no serious start. Its head and breast had the usual color and markings of a male robin, but every other portion of it was perfectly snow white. Flight, size, "chirrup," everything, except the strange coloring, proved unmistakably that it was a robin.

This and several similar instances already narrated lead me to suspect that some species of birds occasionally cohabit with other species. Many ornithologists will smile at this, while others, perhaps, will think it over and consider that it is not altogether impossible. When it is once considered that, with the exception of a mere handful of scientists, the habits and peculiarities of birds are not generally observed, and that new facts are constantly coming to light, equally as strange as my theory, those deeply interested in things ornithological certainly must concede that what I have said is worthy of a second thought. In support of my theory one instance has come under my personal observation which I must give now for the consideration of others. A Baltimore oriole (*Icterus baltimorensis*) nested in my door-yard last summer that differed from all other orioles that I ever saw or heard of, in this respect: after singing its own sweet song it would rattle off the whole halcyon jargon of song, common to the catbird (*Icterus carolinensis*), even to the spiteful cat yawl that gives the catbird its common name. (Orpheus Hutton, decision, or other absurdity may be argued, but they know better; the bird was near my study windows all summer long, and I saw and heard it every day. It is possible, and barely possible, that the oriole had learned to imitate the catbird's song, but I doubt it. It would be no more absurd to argue that a eagle might, under certain circumstances, learn the coo of the dove. Scientists accept the term hybrid, or mongrel, in describing monstrosities in the quadruped kingdom, and I am at a loss to understand why they reject its appli- cation to birds. It is possible that thorough investigation may some day succeed in ascertaining the pretty theories that now exist respecting "bird-vice."

NORVILLE, N. Y., May 11, 1883.

[That hybrids between different closely allied species do occasionally occur among birds is well established, but that such occurrences are rare is very certain, and that such hybrids are fertile *inter se* and produce young like themselves

LEW VANDERBILT.

has never been shown to be the case, or even to be likely. The subject has been pretty thoroughly investigated by our best ornithologists, and the above conclusions are those which have been reached.

SEBAGO SALMON.

A SALMON of thirty inches length, nine inches depth, and a weight of fifteen and a half pounds, three days after capture, was taken with rod and line at Sebago Lake May 5, 1883, by Jonas Hamilton, Esq., of this city. It was an active male fish in good condition and gave good sport to its sport captor. This is the largest salmon of record as taken within recent years in Sebago waters by rod and line.

Although the salmon (*Salmo salar*) is popularly regarded as a salt water or "sea" fish, yet its home is in fresh water, and even those of our rivers that annually visit the ocean are in the habit of spending the greater portion of each year in the rivers frequented by them.

The Sebago or lake salmon is of the species (*S. salar*), accustomed to remain in fresh water continuously without visiting the ocean. The name "land-locked," so often used to distinguish individuals of the lake or fresh water variety from the "sea salmon," is absolutely a misnomer, as the fish are in no instance "locked" within the land or in inland waters, but have easy access to the ocean. The habits and food of the salmon of Sebago Lake are almost identical with those of the salmon of the Kennebec and Penobscot rivers in Maine. In the districts of the pure waters of this lake a cool retreat is found, where there is an abundance of smelts, the favorite and most common food of the salmon in Maine. In April, or just as soon as the smelts begin to ascend the streams, the salmon are found following them. In the larger rivers many salmon remain throughout the summer and until obliged to seek suitable spawning places in the autumn, although many of them probably return to the tidal portion of the rivers or to the estuaries for food and cooler water during the summer months. The streams tributary to Sebago Lake are small and shallow, and after the spring "run" of smelts is over and all have returned to the lake, no salmon, except stragglers, are found in the streams, as both the salmon and the smelts return to the lake, their "inland sea," to pass the summer months. In autumn, all the salmon that are found in the pure waters and gravelly beds of the upper portion of the streams, there to deposit their eggs. At one of the breeding places of the Sebago salmon a poacher killed a fish weighing twenty-four pounds in the autumn of 1883. This was the largest salmon of record as ever taken in Sebago waters, and the fact of this capture was made public by the detection and conviction of the poacher who killed the fish at its breeding place.

It is impossible to absolutely determine whether a salmon killed at its breeding place in autumn has ever been to the ocean; and I have seen salmon taken in the spring from the mouth of the principal streams tributary to Sebago Lake that were precisely similar to the ordinary kelts taken sometimes in spring in tidal rivers. In spring the lake salmon, or those living constantly in fresh water, can usually be readily distinguished from salmon that have been in salt water.

The salmon of our lakes are scientifically distinguished by a varietal name (*Salmo salar sebago*), but as the term "land-locked" is neither euphonious nor of correct application in its generally accepted meaning, I would suggest to sportsmen and others the brief and expressive terms "lake salmon" and "sea salmon" whereby to distinguish the two varieties. It perhaps hardly seems necessary to add the above list of facts, generally well known to ichthyologists but less so to sportsmen, a mention of the fact that the varietal name *sebago* was adopted because in Sebago Lake are found the largest fish known to be of the fresh water variety. Similar fish in other waters, in Maine and Canada, do not commonly exceed a weight of five pounds each. EVERETT SMITH.

PORTLAND, Me.

It is impossible to absolutely determine whether a salmon killed at its breeding place in autumn has ever been to the ocean; and I have seen salmon taken in the spring from the mouth of the principal streams tributary to Sebago Lake that were precisely similar to the ordinary kelts taken sometimes in spring in tidal rivers. In spring the lake salmon, or those living constantly in fresh water, can usually be readily distinguished from salmon that have been in salt water.

BIRD LIFE IN THE CENTRAL PARK.

"There is a deal of quiet enjoyment, in this world of ours, if one keeps eyes and ears quiet."

HERE we are quietly seated. The incessant chatter and noisy fussing of the English sparrows is all around us, and to the casual observer it would appear as though there were no other members of the feathered tribe to be seen beside these persistent little fiends, who always thrust themselves into such noisy prominence. But wait. Quietly but rapidly a pair of robins are putting the finishing touches on a neat summer-nest they have built in the willow overhead. Another pair are slowly completing the construction of their new quarters they will, we trust, succeed in rearing a brood of little choristers, to swell the music of nature, despite the thieving efforts of the purple grackles, those black egg-sucking ogres. Even as we speak four or five of the latter swoop down and flutter into and among the bending twigs of the bushes that fringe the opposite bank, and presently we see them stalking sedately along among the bushes at the water's edge, veritable destructive canibals. Now and again their harsh grating cry comes over the water, as if the villains were sharpening their teeth and enjoying in prospect the feasts of nestlings they are sure to have before the season is over.

What is that shy, dusky fellow flitting his tail and making the little flowers on that bank tremble and quiver in response to his nervous movement as he thills up and down from the grass to the hush above? Oh, you sneer, do you, because I say catbird? He is preparing to take a bath; remain quiet until he has finished and perhaps you may hear something which will surprise you. There he goes, all damp and fuzzy, up, up, among the drooping boughs of that spruce.

Here is a summer yellowbird in the grass, his canary coat, streaked with little brown dashes, is in due order this morning. Look that way through the branches, there is an oriole clinging to that willow; Oh, you sneer, do you, because he balances himself there directly over his nest. His subdued colors proclaim him to be the orchard or garden oriole, as he is called. Why should he chatter so? Now he is off, and his swinging perch is bending under the fairy form of Lord Baltimore himself, who, resplendent in orange and jet, glances like a live coal in among the tender green leaves. His arrival is no doubt the cause of the more humble cousin's hurried departure.

Here is a little chap, demurely poking along in the grass, now running down to the water, now back again, as though afraid of wetting his feet. What a pretty contrast his modest gray coat and white vest make with the dark green of his surroundings. He seems thoroughly at home, and is enjoying himself in his own way, as he snoops in the soft

and on the margin for grubs. You hardly recognize in him the "beetle snipe" of our boyhood. I shouldn't wonder if his little red coated spouse were snugly sitting in a nest somewhere near by.

Hark! do you hear that subdued warble now swelling out in a clear ringing note, now modulated and dying in a soft ripple? The notes come swelling out from that dark spruce. Look up there and tell me what you see. Can't find him? Look up toward the top and close in to the trunk. Ah! yest! that fluffly little ball of dusky feathers is our catbird of an hour ago. You would acknowledge that he could perform in that way? Well, there are hundreds of others who share your ignorance and cannot believe him capable of anything better than chee! chee! chee!

So close in shore here come a pair of wood ducks. How proud the drake is of his sweet little wife, and what a pretty picture of domestic content they present as they paddle industriously by.

It may have surprised you to learn that all these sunny pictures of nature are copies from the gallery located right in the heart of this city, and the originals may be seen by anyone who will turn his steps to Central Park and quietly use his powers of observation. There are many secluded nooks where all and more than I have thus briefly mentioned may be enjoyed by anyone not too oblivious of all that is lovely in nature.

[Our correspondent has called attention to a matter of great interest and one which will be new to many of our city readers. No less than one hundred and thirty species of wild native birds have been observed within the limits of the Central Park, and of these many make it their summer home. During the migrations, no doubt, a host of the tiny warblers, which would escape the eye of any but a naturalist, stop there for rest and food, and in the late autumn not a few ducks alight in the reservoir or on the ponds. Several species of herons, one or more of rail, the coot, and a number of gulls have been observed about the water. The presence of the squirrels does much to interfere with the permanent stay of many of the smaller birds, while the prowling cats and the packs of wild dogs which infest the shrubbery at night would probably make it impossible for quail or partridge to successfully rear their young. We have heard quail whistling here in the spring, but have never seen any young birds. It is interesting to note that the common brown rabbit is extremely abundant in the Park, though it might be supposed that they would be especially exposed to the attacks of night-hunting carnivores. It would certainly be a delightful state of things if the Park could be made a preserve where many of our wild birds and animals could be viewed at home. And we may reasonably look forward to a day when this shall be the case. In the meantime let everyone who goes there keep his eyes open.]

DESCRIPTION OF A MERMAN.

SOME days ago in reading a collection of quaint documents written by the first visitors to Newfoundland, I came upon one entitled "Captaine Richard Whitbovnes discovere an discovery of Newfoundlndm, unprinted at London, 1623," which interested me so much that I procured an extract which I believed would prove interesting to the readers of FOREST AND STREAM. The Captain has related many wonderful things of what he saw upon the new-found land, and among other marvels relates:

"Now also I will not omit to relate something of a strange creature which I first saw there in the yeere 1610, in a woman's entry, which she said that she saw in the harbor of St. Johns, which very swiftly came swimming towards me, looking cheerfully on my face, as it had been a woman; by the face, eyes, nose, mouth, chin, ears, ucker & forehead it seemed to be so beautiful, and in those parts so well proportioned, having round about the head many blue streakes resembling haire, yet I beheld it long, and another of my company also yet behaving, that was not then far from me, and he said I comming so swiftly towards mee; at which I stepped backe; for it was come within the length of a long pipe, supposing it would have sprung ahand to mee, because I had often seene huge whales to spring a great height above the water, as divers other great fishes doe; and so might this strange creature doe to mee if I had stood still where I was, as I verily believe it did such a party, which I sawe as it went from me, it did theroutop dive a little under the water and swam towards the place where a little before I hauded, & it did often looke backe towards mee; whereby I beheld the shoulders & backe down to the middle to be so square, white & smooth as the backe of a man; and from the middle to the hinder part it was poynting in proportion something like a broad hooked arrow; howe it was in this part from the neck & shoulders, he said I did seee it discease, he came shortly after to a boat in the same harbor (wherein one William Hawkbridge then my servaunt man) was that hath been since a captaine in a ship to the East Indies, & is lately there so employed again; & the same creature did put both his hands upon the side of the boat: whereat they were afraid, and one of themstrucke it a full blow on the head, whereby it fell off in the harbor, when they lay by the shore the men in them for feare fled to land and beheld it. This (I suppose) was a mermaid or mareninn. Now because divers have writ much of mermaids, I have presumed to relate what is most certaine of such a strange creature that was thus then seen at New-found-land, whether it were a mermaid or no I leave it for others to judge; and so referre you to the persons that sawe it, and the several letters following which have been lately sent from the New-found-land, which I doubt not but that they will also give you some satisfaction of what I have written of that country whereby to bring you the more in love to the imbracing of a plantation in that country which may be well styled a sister land: which God grant to blesse and prosper."

What this strange creature could have been I cannot venture to say. But in my opinion that it was a seal, as I have frequently shot seal in the harbor of St. Johns, but that these animals are shy, and will scarcely permit a boat to get within forty yards of them. J. E. COLLINS.

TORONTO, Canada.

A FALSE ALARM.—The daily papers of last week announced, with something of a flourish of trumpets, that a young sea cow had been captured in the surf off the beach at Spring Lake, N. J., and had been sent to the Zoological Gardens at Philadelphia. The animal turns out to have been neither more nor less than a small specimen of the common seal (*Phoca vitulina*). It is quite remarkable to find this species so far south at this season of the year, though in winter they are not specially uncommon along the coast.

MORE ABOUT THE "STICKFISH."

Editor Forest and Stream:

I notice in yours of the 3d of May an interesting letter on the "stickfish" *Halipterus haka*. Stated by Mr. J. C. Hughes. I can add a few facts in regard to it, which may be of interest to him and to your other readers. This animal belongs to that group of polyps generally called "sea pens," on account of the endostome which supports the soft polyptidum, or external fleshy mass to which numbers of the individual polyps are attached or form a part. Most of the kinds are much smaller, and reach six to ten inches in length, though there is one found in the depths of the North Atlantic, which has the polyps grouped in a rosette at the tip (instead of being set like the vanes of a feather, as in the *Halipterus*), which reaches nearly as large a size. They are both deep-water animals, and the west coast species certainly normally lives erect in the mud, above that part and the bulb are buried in the mud, the latter acting as an anchor. The smaller species occasionally swim in the water by simultaneous rhythmic contractions and expansions of the bulb and polyps. I have seen one in the very act in the Santa Barbara Channel, Cal. It is quite possible that if accidentally detached from its anchorage, the *Halipterus* may be able to progress slowly in the water, but probably not as well as itself again. The smaller and more fleshy species must be more adapted to active exertion than one of such elongated and slender form.

The "stickfish" is found as far west and north as the cod-fishing grounds in the Shumagin Islands, Alaska, where, in 1880, I obtained a bundle of the rods from a generous fisherman, who told me there were certain banks where they were so thickly set on the bottom, that no fishing could be done there. They probably are in the mud, the latter being the more favorable, from Puget Sound to the extreme end of the Aleutian Islands, throughout the extent of the Oregonian fauna. But as this region is little known and the deep waters are almost wholly unexplored, they have not come to light elsewhere than in Bursard Inlet and the Shumagins.

The sub-genus *Ferrillia* of Stearns is not thought by naturalists to differ essentially from *Halipterus*, beside which I believe the name *Ferrillia* has been used before for a coral or other anthozoan.

Wm. H. Dall.

United States National Museum, Washington, D. C., June 3, 1883.

WHAT WAS IT.—Le Roy, Minn.—Editor Forest and Stream: Having taken much interest in those articles on the rattlesnake bite and antidote, I will relate a circumstance that occurred in my neighborhood some nine or ten years ago there came into the neighborhood two young men that professed to be snake-charmers, having with them several snakes, which they would handle with as much ease as they would a kitten. My friend having an idea that the poison fangs were extracted, thought to try them with a boua file Minnesota rather than had been to a dentist, and shortly the opportunity came to do so. I slipped around the neck of the snake was taken from the house and thrown upon the ground. One of the men took up the snake, and in doing so was bitten on the hand. He dropped the snake and started for his satchel, which contained a grayish white powder, which he applied around but not on the bite, and also touched his tongue to the same. He then continued to handle the snake. The bile seemed to have no more effect on him than a mosquito fly bite. He claimed that he obtained the above powder from an Indian chief in Missouri, and called it *teubeah*. The boys tried to obtain some of the magic powder, but could not get any. Can some one of your many readers tell what the antidote was?—SMITH EXE. [Among the Pawnees in old times in Nebraska we have several times seen horses cured that were bitten by rattlesnakes. The Indians said that of the remedy was a plant that could be consumed in the prairie, but we never succeeded in inducing them to point it out to us, and have never been able to learn what it was.]

"DO RAIL CARRY THEIR EGGS?"—Last Monday evening, I found the nest and eggs of a sore rail. After seeing the bird walk away from, and pass within ten feet of me, not being prepared to take the eggs, I left them and went for them the next evening, but was disappointed in finding nothing but the nest, which was partly submerged in water. It having rained for twelve hours during the day, I went to the ground over and finding no tracks, I came to the conclusion that the bird had removed the eggs. On Saturday evening I tried the swamp—which is about three by eight rods in extent—again, prepared to make a thorough search. I found the bird on the opposite side, and shot it, and after half an hour's search, found another nest about two rods from the first one, and about eight inches above the water, containing the same four eggs. Never having seen any rail eggs before, I examined them very closely the first time and noticed a peculiar x-shaped marking on one of them—which I had no difficulty in recognizing when I found them the second time. If any of your readers have had a similar experience, I wish they would make it known in your columns.—J. L. L. (Lockport, N. Y., June 4, 1893).

NIGHT SONG OF THE CUCKOO.—A cuckoo that has envied our shrubbery and fruit trees with its peculiar song for the last week, awakened the echoes of a startling night on the 5th inst., at 11:50 o'clock P. M. His voice appeared to me a little subdued and softened, not quite so full and strong as in the daytime. It is common for the American cuckoo to sing at night.—E. S. HOLMES (Grand Rapids, Mich., June 6).

MAY ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—Purchased.—Two weavers (*Coturnix fiber cordis*), two gray siskinets (*Parus palmarum*), two blue jays (*Cyanus cyanocephalus*), two bluebirds (*Sialia sialis*), two house wrens (*Troglodytes aedon*), two chipping sparrows (*Spizella chipping*), two meadow larks (*Melospiza cinerea*), two common nuthatches (*Sitta carolinensis*), one black-headed vireo (*Vireo flavifrons*), one brown capucin (*Cebus felleus*), five elephant seals (*Morichionus angustirostris*), one turkey vulture (*Cathartes aura*), two blue-winged parrots (*Cyanocitta stelleri*), one green chinch (*Carpodacus elegans*), two blue jays (*Cyanus cristallus*), and two unadorned grass parakeets (*Melospiza undulata*). Presented.—Two ring-necked pheasants (*Gallus gallus*), two rosebreast Grosbeaks (*Agelaius phoeniceus*), one white-fronted goose (*Anser albifrons gambeli*), one snow goose (*Anser hyperborea*), two diamond rattlesnakes (*Crotalus adamanteus*), two water moccasins (*Aligatoron piscivorus*), one hog-nosed snake (*Liopeltis phyllorhina*), one diamond rattlesnake (*Crotalus oreganus*), three black snakes (*Discophora constrictor*, and three alligators (*Alligator mississippiensis*). Born.—Five prairie voles (*Citellus talpoides*), six prairie dogs (*Cynomys ludovicianus*), and two mallard ducks (*Anas boschas*).

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes on private game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

A DEER HUNT NEAR MONROE, LA.

BY G. D. A.

SEVEN miles above Monroe, on the east side of the beautiful Ouachita River, is one of the most noted, pleasant and successful places for deer shooting in the State of Louisiana. I mean in late-bellian days—but it is at this time I am unable to say. In addition to deer, no better ground could be found for indulging in the delightful amusement of hunting wild turkeys or chasing woodcock. The lake and river abounded in barfish—or striped bass—trout, and every variety of perch usually found in Southern waters. It is called the "Horseshoe," being a peninsula formed by a large lake in the form of a horse shoe, the heels of the shoe reaching into fifty yards of the river, and not over two hundred yards apart. The interior of the Shoe was a long, rather narrow body of land, pretty high in spots, and covered with dense long fisting-pole cane. Parallel with the banks of the lake were several sloughs filled with water in winter, but dry in summer. Many water oaks and persimmon trees grew in these sloughs, the acorns attracting the ducks and the ripe persimmons the deer, which are especially fond of this fruit. The Shoe was a long and wide lake, deep in places, and with high banks generally on both sides. At the time in which this hunt, to which our article is devoted, came off, this lake abounded in alligators; in fact, they were so numerous that the deer would not take the water unless absolutely compelled in order to escape the dogs and hunters, and no dog would cross it often than once or twice if not caught by the alligators, being so badly frightened that they never ventured upon the land side. It was not very wide across the Shoe, but there was a sufficient body of land to offer a strong attraction for the deer, on the same side of the river on which the lake was, to go there and lie during the day, and even a stronger one to the deer frequenting the pine flats that bordered the river on the west side. Those deer would swim the river at the point between the heels of the Shoe, and thus were safe from the hunters that pursued them on the land side. At night they swam back and fed on the hills and pine flats.

Often as many as twenty to fifty deer would lie in the Horseshoe at a time. It only afforded hunting for one day. The plan of the hunters of Monroe was to send up a party of servants with the dogs in yaws, to go by water, and land at the mouth or rather head of the Shoe, while they rode by land and generally arrived some time before night, so as to occupy the whole heel and keep the deer inside until next day.

Mr. Charles W. Phillips, of the old firm of Williams, Phillips & Co., had arrived from New Orleans on his way to visit his plantation on the De Siard Island, on which island was this Horseshoe. His friends, consisting of James McEnery—the eldest brother of the Gov. McEnery, Tom Scarborough, Joe Masou, Henry Dinkrave, his half brother, John Ludeling, subsequently the Chief Justice of the State, and your humble servant, met and agreed to give Mr. Phillips a hunt at the Horseshoe; to go up one afternoon, camp that night and return the next day.

A more lively, jovly set never went hunting, prepared to enjoy themselves no matter what turned up. All were successful hunters except Mr. Ludeling, who, I think, had never taken so long a hunt before, and I am certain had never killed a deer until on this occasion. The three yaws were sent up the river with the hounds, and supplied with all the line liquors, wines, cards and good things that the eating and drinking saloon of Charlie Austin (who was then living, but a short time afterward was basely murdered) could supply.

The hunters took their guns and rode on horseback to the appointed place. Strict orders had been given to the servants that rowed the yaws, to make no noise until they had got into the boat, and to be certain to keep the yaws bound, should they reach the rendezvous before us. My shotgun had been sent on the yawl, and I bore my rifle, intending to have a turkey hunt, or a still-hunt the next morning at daylight.

There were seven of us, four have been gathered to their fathers, and three survive. In those days, fine wines, liquors and card-playing, (whist and euchre), were the fashion, and must be done to get the good things and the cigars, that one could get then in perfection. I never drank, nor did I play cards, but as to cigars, one could always get on my good side, if I had one, by offering me a genuine old black Cuba-Principe.

We reached the ground in advance of the negroes, kindled fires along the 300 yards between the heels of the Shoe, and had a merry time before the arrival of the yaws. After that time, ten or twelve men, with their dogs, were sent out and each secured himself to have a good time generally. We congratulated ourselves on being the first camping party of the season, since we could find no signs to indicate that any one had been in to disturb the deer. My particular hunting friend, Henry Dinkrave, gave me directions how to take a stroll outside of the lake, in order to learn the bearings of the woods, so as to have the still-hunt the next morning. I took my rifle and went out in one of his directions, and during a part of the hunters rigged their fishing poles, and during my absence had succeeded in catching more bar, or striped, bass than we all could eat. I returned by sundown, having learned all I desired about the surroundings and the game. I found a long piece of ground on the lake, from which the cane had been burned, leaving it clear of undergrowth, and on this piece were plenty of signs of deer and turkeys. The ground under the water was covered with acorns, on which the deer fed at night. I saw several fresh and large "scrapes" made by the bucks, and I was confident of finding one there the next morning.

It had been agreed, too, that no one should fire a gun before morning, for fear of frightening the deer inside of the Horse Shoe. Mr. Dinkrave had taken a walk along the high bank between the heels, and reported finding a great deal of sign of deer. Sammie was every one's favorite and drinkable set of successful hunts that had been witnessed in the State. After the heartiest supper I ever ate, and one I really enjoyed, I laid down in my blanket to watch the party earnestly engaged in playing euchre. "I'll bet a hundred dollars," said Phillips, putting a small trumpet on Scarborough's

ace of diamonds, "that I kill the first and biggest buck to-morrow."

"Take that bet," replied each, "that you don't."

"Bring that basket of champagne here," said McEnery, speaking to his servant; "I'm getting awful dry."

The old already had an open cask, and how much good old Brandy whisky I do not know.

"I'll bet fifty dollars that Ludeling kills a deer," said Scarborough.

"I'll take it," said Dinkrave, "for he never shot at one in his life."

"Don't you bet, Tom, for I really never shot at one," said Ludeling.

Before lying down I had got Mr. Dinkrave to promise to wake me up before light the next morning. I knew they were going to play and drink all night. So, after watching them for some time, I turned over to go to sleep, but I heard, before I went off into the land of Nod, Mr. Mason offer to bet a large sum "that if a deer was killed that Col. A. would be the one to kill it," and another sum that I "would kill one on my still-hunt in the morning," both of which bets Mr. Phillips took, and then called for the fish and oysters and coffee.

I heard no more, until nearly daylight. I felt someone pulling and shaking, and recognized the heavy speech of Henry Dinkrave, "Get up (hie) Col. A. (hie), if you want to go still-hunting (hie), here's a cup of hot coffee." In a moment I was up, drank the coffee and started, telling Henry if I shot and blew my horn, to come to me, with a horse. Unfortunately I omitted to take with me any matches. I had lighted a cigar when I started, and had a pocket full of matches. It was the dark of the moon in October, and it would only be visible a short time before day-break. A more favorable time for finding the deer could not be chosen, besides, the ground was damp, it having rained the day before we left Monroe.

It was about a half a mile to the "burn" I had found the evening before. There was good walking along the edge of the water of the lake, and all I had to do, after getting to the burn, was to softly creep up the high bank and peer over to see if I could see a deer. In the first and second time I did so nothing was seen, but the third (by the way, is not the number three a lucky one?) I was rewarded by seeing a massive head with a wide pair of antlers appearing above a large prostrate cottonwood tree. The buck neither saw nor smelt me. I had discovered the omission of having no matches, and I could not afford to lose my lighted cigar. Creeping back, I hid the cigar in a place where I would have no difficulty in finding it, took up my rifle and the triggers, and then stepped over the bank. The deer had not moved his position. Never did I take more deliberate aim. It was true, it was barely light enough to see the sights; but then the deer was not over forty yards from me, and I could make allowance for that distance. Not the least excitement about me, the heart beat all right, the nerves were steady from the cup of strong coffee, and the stock and barrels of the rifle were held as steady as if in a vice. I thought the eyes were not very strongly for a deer that had been shot at, I quietly stepped down, and getting my cigar, which was alive, loaded my rifle and cautiously went up the bank and peeped over again. There was that huge buck still in sight and whistling and snorting, but further off, not less than 150 yards. Putting down the cigar on the top of the bank, I raised the rifle and fired with a rising aim as it came to the shoulder. The deer presented a beautiful broadside shot. I aimed for the heart, and oh! how glad I was when I saw him spring from the ground and then pitch over on his head. My esteemed young friend, Joe Masou, had won his bet. First giving the cigar a few long whiffs, I seized my horn and blew three long blasts as heartily as I ever did on any occasion. I had to blow a good many times before Dinkrave, with Tom Scarborough and James McEnery, came to my assistance with two horses. Hearing the shot, Henry Dinkrave insisted on taking two, as he asserted he was confident I had killed two deer, predicated on the premises that I did not miss when I had a fair shot.

When the three arrived I am very certain three weaker-kneed hunters never assembled around a big deer with the intention of putting him on a horse's back. They were not drunk, but in the most agreeable state of "tightness," in the best of humors with themselves and everybody else, and so merry, out of it whole night's carousal, they did not collectively possess the strength to get up and out to the deer's head off and take out the entrails in order to render it easy to put him on the horse. This Tom Scarborough and Dinkrave objected to, as they wanted to take him just as he was to Charlie's for a show, and to wiu a champagne supper on his weight. It was the most awkward squad I ever saw undertake to get a big buck on a horse. When not under the influence of such a night's frolic, I have seen Henry Dinkrave take such a deer, and put him behind a rider as easily as I would a small doe. Now, all three failed to do it, until after many an effort, my part being that of holding the horse and keeping him steady. Finally they succeeded and we started back. When we got opposite to where I first shot at the deer, looking over the big log, I asked Tom Scarborough to ride to it and look to see if there was not a dead deer there, telling them what a pretty shot I had and how steady I was to have missed that deer. I had a ride.

"Hold, Scarborough," said Henry, "I'll wager an oyster supper to-night for the crowd there is a dead deer behind that log."

"I'll take a half interest in it," said McEnery.

"And I won't risk a cent," said Tom.

"Well, I'll give the supper if there is one," said I.

Mr. Scarborough rode out to it, and then shouted for us to come and see the biggest and fattest buck I ever saw. Sure enough, I had made a center shot, and struck him precisely where I aimed. The second deer must have been either lying down, or, if standing by the side of this one, was concealed by his greater size. The sudden death of his

companion, and not seeing any one, caused him to net as he did, and lead to his own death.

"Now we are in a fix," said Mr. Henry Dinkrave. "Let us all blow our horns and get the others to come. If we had as much trouble to get that buck on the horse, what will you do with this one?"

The proposition was agreed to, the horns blown, and not being answered at the camp, I proposed to ride to it, and get the rest, for if either of the others should go, they would consider it only a ruse to get them to come. This was agreed to. I had not gone fifty yards before Dinkrave shouted, "Be sure to lunge the negroes and the demi-john."

The camp was reached. The rest informed of the success and wants, and taking one negro man, we all started back.

I shall never forget Charlie Phillips' hearty oah of admiration, (and he could swear with more emphasis than any one I ever heard) when he examined that buck.

Dinkrave proposed that I should drive for them, as I had my share of the sport, and it was unanimously resolved that I should not be allowed to take my Greener launch and barrel shotgun, as Henry remarked, "it would be the nearest accident to get a shot with it, and he did I propose I should have another chance that day. With the aid of the negro man, who was quite sober, the buck was lashed on the saddle and we went back. Mr. Joe Masou telling Mr. Phillips he would have enough champagne not to drink at his expense for a couple of months. Breakfast was ready when we got back to camp. I had a vigorous appetite and laid in a goodly supply of eatables, and had a lunch put up, as I expected to make repeated drives in the Horseshoe until all the deer were driven out, and it would be time to return to Monroe.

Mounting my horse, and securing my rifle, with partial instructions from Dinkrave how to drive, I blew my horn and dashed into the drive. The hounds struck a trail wiu sixty yards of camp, where the deer had been as far as a drop of the second bottom, and seeing our camp-fires I tried to venture down. The dogs started, and I bounded down the heels of the Horseshoe before the dogs jumped deer. In ten minutes began the skirmish firing, standers had been posted about forty yards apart, from north end of the heel to the south, a distance, as before mentioned, of some two hundred yards. The one at the outer stand being Phillips, and at the lowest stand was placed Ludeling, the other four gentlemen respectively filling the intermediate distances. I had been agreed upon to shoot at the deer as soon as it bounded down the bank, and if possible not suffer one to escape across the river, which ran some ten or fifteen yards behind their backs.

The deer that came out proved to be a solitary fine buck. He came direct to Mr. Phillips's stand, who emptied both barrels and did no damage. The buck turned parallel with the standers, giving each a double shot. After running the gauntlet of Phillips, next Scarborough let him have both barrels, and Dinkrave, who occupied the best stand, next the dogs' report. From McEnery's gun followed, and still no flagging of the terror-stricken animal. Then boomed the barrels of Joe Masou without a halt, when the last shot had to be made by Mr. Ludeling. Adjusting his gold glasses to take a better sight, as the deer passed broadside about twenty-five yards, mechanically he shut both eyes after seeing which way the animal was running, pressed both triggers at once, and then came a tremendous report, a double shot, and he had, for the first time, had with him the loads from Ludeling's gun and replaced them with double charges of powder and shot. Down went that unfortunate deer as dead a shot as ever was made, only one shot striking, and down went Mr. Ludeling on his back.

The dogs ceased running after the last shot, and I came out as fast as possible to ascertain the luck, fully expecting to find not less than a half dozen dead deer after twelve successive heavy gun shots.

All were in a merry glee and bent upon giving Ludeling a good hooding, according to hunters' usages, as this was his first deer; while he was contending most strenuously in arguing he had gotten enough by that joke of Masou's, as his face and shoulders would not get over it for a month of Sundays.

Toddies and cigars were distributed, and I went back into the drive, to stand seven several other days besides this one. In a very little while the dogs started again. The deer were rather afraid to go out at the same place, and doubled around the whole drive a time or two before they made the leap down the fatal bank. Five double shots were fired, and when I came out again I found four more had been killed. Phillips, Scarborough, McEnery and Masou each bagging a deer—three pretty good-sized bucks and one stout doe. Dinkrave did not get a shot.

It came out this time I saw quite a number of deer clashing back, with no dogs after them. This I told the hunters, and advised them to keep a sharp lookout, as I felt sanguine of running out quite a herd of deer the next time. Taking the dogs back under the bank of the lake until I reached the center of the Shoe, I rode up the bank and the pack burst into full cry. I had been very quiet in driving, but hallooing to the dogs, and endeavoring to get a shot myself. The game was so thick that, though I had my deer came within twenty or thirty steps, yet I could not get a shot with a rifle. The herd of deer made a straight run for the standers, not doubling any. Again came the hooms of all the guns, everyone getting in both barrels. Dinkrave killed two fine bucks, Phillips killed a doe, McEnery bagged one, and the other gentlemen all had a hand in killing a fawn of one summer.

To my great joy I heard the whole pack coming back, and straight to me. I was riding up a persimmon slough that was open sufficient to get a shot. Quickly I discovered the horns of two bucks lounding over the bushes, and just about to get into the head of the slough, where I had stopped my horse. I was waiting for them to come as near as possible before shooting. The hounds being so close upon me I knew I would have no opportunity to get a standing shot, and if I got one at all it would be running by in the bushes or among the persimmon saplings. Just when they had gotten to the place I wanted to fire, a breeze blew from me to the deer, and instantly the foremost sprang into the high cane, and as the other attempted the same movement I pulled down on him, and was so fortunate as to break his back. This was the smaller of the two. The dogs hit it for a while, until I succeeded in cutting his throat, when all my efforts were unavailing to keep him from following the deer. I then heard him strike in the bushes, and I did not wish the dogs to follow for fear of the alligators. Deer and dogs all crossed without being attacked, and I sent myself on the bank to blow my horn, with a

hope of getting them to come back. I blew until my mouth was sore, and then I turned my attention to shooting alligators. I had shot nearly all my rifle balls away before I heard or saw a dog returning, without killing, as far as I could discover, a single alligator, often getting practice shots at them as they swam in, but, back and forth, along the lake. It must have been two o'clock in the afternoon when I saw one of our best dogs come to the water's edge, get a good drink, and then commence howling. I blew my horn and rode along the lake, with the hope that he would follow my course on the opposite side, and not attempt to cross. Instead of that he plunged into the water and began swimming across to me. One of the alligators that I had seen, and at which I had shot over a dozen times, kept the middle of the lake. He discovered the dog swimming, and as if conscious of his power to catch him, acted like the cat that lets the mouse run as if he did not intend to spring upon it. He swam back and forth, apparently without any intention of pursuing the dog, and seemed to be eyeing me more than he did the poor fellow. The dog had gotten over half ways when the listlessness of the alligator gave way to the most powerful efforts to catch his prey. So great and so swift was his velocity in swimming, that the waves rolled far ahead of him, striking the shore where I was and running a few inches up on the sandbar. The hound had discovered he was pursued, his efforts to escape redoubled and he gave from time to time, quick, mournful howls. I kept my rifle ready to shoot at the last moment, with the hope of making a successful shot and saving his life. On came the dog, on followed his deadly pursuer, the distance between them lessening each stroke of the great paws of the alligator which kept its body entirely sunk out of sight, with nothing but the great frog eyes visible above the water, which rolled in waves so high as sometimes to hide those eyes. I shouted and gave all the encouragement I could to the dog, hoping an alligator would be killed but I was determined to have a sup on that poor dog, and I vowed to prevent it if possible. The dog had gotten in some twenty-five yards of the bank, the mouth of the alligator nearly close enough to seize him. A few more strokes of those great paddle feet, and he was up with him, but the heavy waves sunk the dog, the rifle was passed to the shoulder, the forerunner ready to touch the spring-trigger, the alligator raised his whole head out of the water, struck the dog, with the hope of making the couical ball, forty to the pound, crashed through one eye of that alligator and burst through the brain, coming out near the center of the head. He sprang clear out of the water with the whole body, not less than twelve feet long, and down he came on his back, resting in the throes of death for a few moments on the surface, and then sank out of sight, the last seen being the four great paddle feet, with the long claws stretched out like the hands of a drowning negro. The dog was saved. I felt happier over that shot than any shot I had made at any time of my life previous to this.

Three long blasts of the horn brought in twenty minutes Mr. Scarborough and Mr. Dinkrave. The nice shot and the exciting chase were related, the buck I had killed was tied behind my saddle and we returned to camp.

While waiting for the dogs to return, I had eaten my lunch, and smoked up every cigar, and now I was as hungry as hunters generally get, and nearly dead for a smoke. After a tremendous dinner, enough for three men, I was ready to rehearse the comeliness and join in getting ready to return. The deer were put into two yaws, with some negroes to row back to Monroe, the horses and dogs sent by land under care of some two or three negroes, and we seven whites got into the banks by torchlight, and started down the river, a better pleased set of hunters never before landing at that old picturesque and most hospitable city.

It was getting dark as we rowed up to the landing opposite the saloon of Charlie Austin. Coming in under a good chorus of a hunter's song, everybody was out on the bank watching for us, and when we got past, fat, fine deer, thirteen in all, were carried up the banks by torchlight, and deposited before Charlie's door, many beds were made as to weight, and everybody that wanted a toddy or a glass of wine, or a cigar, was invited to participate, and thus ended one of the most delightful and successful camp-outs that the oldest inhabitant had ever known to have taken place at the "Horeshoe."
MINNESOTA.

THE MINNESOTA LAW.

THE text of the Minnesota game law passed at the last session of the Legislature and approved March 5, 1883, is as follows:

Section 1. No person shall kill, or pursue with intent to kill, any woodcock, snipe, quail, or any other game bird, after the third (3d) day of said month, and during the months of August, September and October; nor any prairie hen or chicken, nor any white-breasted or sharp-tailed grouse or prairie chickens, save only between the 15th day of August and the 1st day of October in any year, nor any quail or partridge, nor any ruffed grouse or pheasant, save only during the months of October, November and December, nor any other game bird, save only between the 1st day of September and the fifteenth (15th) day of May succeeding in any year. Any person or persons offending against any provisions of this act shall be punished by a fine of not less than five (\$5) dollars nor more than fifty (\$50) dollars and by the forfeiture of any and all of the above named game birds, found in his or their possession, and by the forfeiture of any gun or guns and sporting implements and any dog or dogs, in his or their possession, together with the costs of prosecution, or both, in the discretion of the court.

Section 2. Section two (2) of the said chapter be, and hereby is, amended by striking out the word "November" when the same occurs therein, and inserting in lieu thereof the word "December."

Section 3. That section five (5) of said act be amended to read as follows:

Section 5. No person or corporation, or any employee of such corporation, shall, at any time or in any manner, export or carry out or cause to be exported or carried out, or have in possession for the purpose of carrying out, or attempt in any way to carry out of the limits of this State of the birds mentioned in section one (1) of this act, or any of the animals or part of animal mentioned in section two (2) thereof, or any person or corporation offending against any provisions of this act shall be punished by a fine not exceeding one hundred (\$100) dollars, nor less than five dollars (\$5), or by imprisonment

in the county jail not exceeding three months; and provided further, that for the purposes thereof, the transportation or attempted transportation, or having in possession thereof as aforesaid of each bird or animal or distinct part thereof, shall be and constitute a distinct and separate offense.

Section 3. This act shall take effect and be in force from and after its passage.

THE NEW SPORTING POWDER.

BY H. CHOLMONDELEY-PENNELL.

IT is not a little singular in this age of chemical discovery and in regard to an article of such universal demand as gunpowder, that it should be still possible to say with accuracy that until quite recently no powder, or substitute for powder, has been invented which is not only not imperfect but which is not open to one or more fatal objections. Such, however, is literally the fact. Of all the cottons, felts, compounds and what-not that have from time to time been introduced with flourish of trumpet to the public notice—two only—common black powder and Schultze or Wood powder—remain for practical purposes in existence; and they are both open to objections which, unless I am much mistaken, will very shortly consign them to the category of the "things that have been."

We all know, alas! and only too familiarly, on both sides of the Atlantic, the vice of our old friend Curtis and Harvey, *et hoc genus omne*; when they smoke, how they recoil, how they foul—the (coagulated dirtiness accumulating, moreover, with every additional shot)—in fine, how well they merit their original sobriquet of "villainous saltpetre;" while the faults of their rivals, the Schultze, or Wood powder, though (unfortunately, perhaps) not lying so much on the surface, are only too well known to those who have had any experience of their effects. That such an especially rare heavy charge must be used, as in pigeon shooting, manifest themselves in what may be described as their regular irregularity, no two issues being apparently alike in strength, and in the extreme inequality of shooting which is the natural consequence. But this is not the only, nor even in my judgment, the most formidable drawback to Schultze powder, the chief being to the detriment of invariably by different amounts of pressure, or as was lately suggested by the editor of the *London Field*, to the large admixture of dust, which possibly gets into the cap, it is certainly the fact that while on the one hand it will happen, and not infrequently in my experience, that there seems to be an almost total absence of explosive force, it is occasionally developed in such a startling and inexplicable manner as to result in split cartridge-rims, ghastly gas-blasts blown back and barrels, or, as sometimes happens in the more serious class of accidents, a complete carrying away of wood and iron, after which the shooter may be only too thankful if his head is left on his shoulders. An illustration of this sort of escape occurred within my own small range of acquaintances only during the last month or two; and several of such accidents I have witnessed. I remember when Lord Ronald's bird was killed, and the gunner, who did not we all feared the worst. I recollect, also, seeing the gun of a well-known pigeon-shot of his day broken right into two pieces, the barrels after the accident remaining in one hand, and the stock absolutely divorced from its partners, in the other; and I am satisfied from the extraordinary recoil which I have experienced over and over again in my use of these two different kinds of powder, that the same must we all feared the worst. I recollect, also, seeing the gun of a well-known pigeon-shot of his day broken right into two pieces, the barrels after the accident remaining in one hand, and the stock absolutely divorced from its partners, in the other; and I am satisfied from the extraordinary recoil which I have experienced over and over again in my use of these two different kinds of powder, that the same must we all feared the worst. I recollect, also, seeing the gun of a well-known pigeon-shot of his day broken right into two pieces, the barrels after the accident remaining in one hand, and the stock absolutely divorced from its partners, in the other; and I am satisfied from the extraordinary recoil which I have experienced over and over again in my use of these two different kinds of powder, that the same must we all feared the worst.

Of course, there are strong reasons which prevent these accidents, as a rule, from coming before the public—such as, for example, the direct and personal interest of the gunner for the moment in the use of the *corpus delicti*, &c., and besides, the world is getting so terribly "mealy-mouthed" where trade and other "vested" interests are concerned that few people nowadays venture to call a spade a spade. I can have no hesitation, however, in telling plainly what I believe to be unvarnished truth without circumlocution or beating about the bush. Probably, however, I have said enough and added facts sufficient to show that my strictures are not unfounded, and that despite its many advantages over black powder, which have of late years caused its very general use among sportsmen, Schultze powder has its faults, and those such serious faults that nothing but the very great practical inconveniences of black powder have caused it to be so long tolerated. It has been, in short, in vulgar parlance, "Hobson's choice."

The new E. C. powder, which takes its name from the Explosives Company, by whom it was patented and brought out, is, so far as my judgment and experiments go, entirely free from the defects of both the black powder and the Schultze powder. It belongs to what is technically termed the nitro-compound class of explosives, in which the oxygen required to produce the explosion is present in the form of nitric acid in combination with some organic substance, while in ordinary black powder the oxygen is united with a mineral substance, commonly potash. In both compounds the nitric acid is converted into gas at the moment of ignition, its oxygen uniting with the carbon and hydrogen present. In the E. C. powder, the nitric acid molecules being in "chemical combination" with the carbon and hydrogen, combustion is so complete as to almost entirely do away with the after-smoke; whereas in the case of black powder, the carbon and sulphur being only "mechanically" mixed with the nitrate, combine but imperfectly with its oxygen, the unconsumed particles mixed with the solid products of the explosion issuing from the barrel in the form of smoke. Again, the fouling produced by black powder is cumulative, the recoil, of course increasing in proportion to the obstruction created in the barrel; whereas with the E. C. powder the recoil is reduced to a minimum, the very slight "kick" or "deposit" which is left being removed by the wads at each fresh discharge. The grain of the new powder is hard, spherical, and free from dust, so that it readily admits of being accurately measured and equally compressed where desirable, and its explosive force is always in exact accordance with its chemical constitution, a perfect regularity, and equality in the strength of each issue can be insured. It is unmanufactured, or, at any rate, issued, in two separate grades, one that is of a light yellow color, which are of a light pinkish shade, and that for rifles, of which the color is yellow and the grains considerably larger.

While the drawbacks inherent in black and Schultze powder are thus entirely obviated, the advantages of each

are combined and improved upon. In pattern and penetration alike, as has been shown by recent carefully conducted and independent experiments,* the E. C. powder is superior to both its rivals. This is fully confirmed by the "practical" tests which I have applied myself, as chronometer in the London *Field* and elsewhere. As in every really scientific experiment, however, complete success depends primarily upon the requisite conditions being complied with, and I recommend any one wishing to try the E. C. powder to adopt the following rules in loading their cartridges:

Charge.—The best game charge for 12-bore gun with 14 ounces of shot is from forty-five or forty-six to forty-eight grains of powder. For heavier charges of shot the powder should be increased proportionately. A very good charge for pigeon shooting or heavy work is fifty or fifty-three grains of powder and 14 ounces of shot—which is the largest charge that can be conveniently got into a 24in. case, without some mechanical means of compressing the powder.

Wadding.—Wads are very important in order to get perfect regularity of pattern and penetration, and I find the following give the best results. Over the powder a common (gray) cloth wad; then a felt, and over the shot again a common (gray) cloth wad. The wads should all fit the cartridge closely. The felt wad especially should fit tightly. With 24in. cases an extra 1/4" felt wad should be added over the first felt wad, to fill up the space.

Pressure.—A heavy pressure is essential; and in the absence of a machine adapted to the purpose, which I have no doubt would give still better results, I get the best pressure that can be obtained by hand. The shot should fill the cartridge-case (filled as to powder, and with the first cloth wad inserted in front of me on the loading-table, and, holding the rammer with both hands, apply the full weight of my body, giving at the same two or three heavy lunges or downward jerks. I repeat the same pressure on the second, or felt wad. The pressure of one hand and arm on the other side of the cartridge-case will not do.

Cartridge-cases.—Up to the present moment none of the cases I have tried give such good results, either in regular shooting, pattern, or penetration, as on these manufactured by Messrs. Eley & Co., expressly for this powder, and which have a specially constructed cap, anvil, and flash-hole.

A gentleman is now in America endeavoring to get up a company to develop the E. C. Powder Company's powder here in this country, and I am expecting to be almost more popular than in the Old Country.

RANSLER POLO CLUB, St. James Street, London.

THE OUACHITA SPORTSMEN'S CLUB.

PERMIT me to call your favorable attention to the recent organization of the "Ouachita (pronounced Washita) Sportsmen's Club," of this place. The following are the names of the members:

Dr. T. Y. Ahy, President; W. C. Williams, Vice-President; M. N. Coe, Secretary and Treasurer; W. A. Bracey, J. S. Boatner, C. J. Boatner, T. G. Dabney, F. Y. Dalney, Austin, J. G. Hudson, J. G. Hudson, J. G. Hudson, J. G. Hudson, M. J. Hilton, M. J. Liddell, J. E. McGuire, R. Richardson, Wm. Sandell, L. W. Stubbs, E. H. Hills.

(Limited to twenty-four members.)
The object of this association is to promote skill in shooting by practice and competition with other clubs. The preservation of game, and stocking our rivers with game fish. Procuring the enactment of proper game laws, the improvement of the manners and habits of the members, and the enforcement of such observance among others. The recreation of its members by encouraging healthful field sports and target practice, the preservation and cultivation of fraternal relations and good feeling toward all other similar associations, and the co-operation with other clubs in the furtherance of these objects.

Monroe is a very pretty town, situated on the east bank of the Ouachita, and very pretty river. This stream is about one thousand feet wide, and navigable, except at low water, for the largest steamboats. The water is always clear, which is unusual in alluvial countries, and when high enough to bathe the lower branches of the luxuriant trees that fringe its banks, and wash the green grassy slopes, it presents a beautiful picture. At low water it affords a sport to the anglers. It abounds in bass and striped bass, the former called trout here, and the latter bar fish; also white perch, the finest of our fresh water table fish, but not very game, as well as several other varieties of perch, locally known as sun perch, goggle eye, etc. Monroe has a population of about 3,000. It is almost perfectly level, having a gentle slope, sufficient for drainage, away from the river bank, a characteristic of alluvial formations. It is of Spanish origin, having been settled before the cession of Louisiana to the United States.

It is on the extreme western margin of the great Mississippi Delta, and is nearly on the 32d parallel of latitude, being on the great southern transcontinental railroad route. It is connected with Vicksburg on the Mississippi River, by a line of railroad, and with New Orleans and Pacific, which is also under construction westward to Red River, and will be completed this year, thus supplying the only missing link in the chain of communication between the Atlantic and Pacific seaboard, on this parallel of latitude.

This country abounds in a great variety of game. In the fall and winter, the numerous lakes and bayous literally swarm with ducks. Snipe and woodcock are plentiful in the low ground, but locally exterminated the non-migratory game, such as deer, bear, partridges (mis-called quail in the North), and wild turkeys, all of which were more or less abundant before. The squirrels are still very plenty everywhere. West of here, the country extending from the Ouachita to Red River, about one hundred miles wide, is upland for the most part, and in many localities deer and turkey are very numerous.

On three different "drives" during last winter, a party, of which I was one, "jumped" five deer each time, within five miles of Monroe, but failed in every instance to bag a deer, and I have no doubt that the same would have been the case had we not been so fortunate.

* "Experiments on Velocity, Time of Flight, etc., of Small Shot" By Robert McCord, published in the *Report of the Royal Small Arms Factory, Enfield Lock*. Published in the *London Field* of February 3, 1883.

probably owing to the fact that I have always been considered a Jonah on a deer hunt.

One day last winter two sportsmen, belonging to a New Orleans club, bagged 320 ducks in Lake Bistacneau, west of here, most of them being single shots. You will perceive that there is abundant material about here to excite the lively interest of sportsmen. The completion of the railroad from Shreveport, which will be accomplished early next winter, will open up an extensive game country, heretofore inaccessible to outsiders.

MONROE, LA., June 7.

THE SLAUGHTER OF THE INNOCENTS.

THE subject of protecting our small birds is, we are glad to see, occupying each year a larger share of the public attention. A correspondent sends us the following clipping, taken from an Easthampton (Mass.) paper, which expresses the views of every right-minded man upon the subject:

"Bird shooting should cease. Every man who owns a gun should not be allowed to destroy the songsters under the thin pretense of scientific purposes. It is too easy to get a permit, and they often fall into the hands of men who have as little idea of science as they have respect for the lives of the feathered beauties. A man who takes sufficient interest in natural history to be allowed to shoot birds for scientific purposes will have too great a love and reverence for them to kill common varieties in nesting time. The Legislature has made stringent laws to protect the birds, but it has left a top-hole which, by the leniency of the permit-granting powers (the presidents of colleges and incorporated natural history societies), has undone the whole business. If a local party has found the law standing in the way of his pleasure, all that has been necessary was to write to President Seelye of Amherst College, and a permit to shoot birds has been immediately forthcoming. Such a license ought not to be granted unless the applicant is a known scientist, or until he shows recommendations sufficient to satisfy the grantor, never that he is a safe person to be entrusted with a gun. It is a matter of importance that we should protect our birds, and public sentiment should be aroused to such an extent that bird shooting in nesting time for any purpose would not be tolerated, and that it would be properly restricted at all seasons."

Our correspondent says: The above from our local paper is particularly interesting to a few sportsmen here, who, with some friends at New Orleans are endeavoring to stock this season with quail obtained from Tennessee. To look from an office window and see one of those incompoops going past, with a gun on his shoulder and a permit in his pocket, and feel that he is as likely to shoot the quail, which we have been to so much trouble and expense to obtain, as he is a jay or a crow, is not a particularly pleasant sensation to the writer; but, to repeat the words of the great Tweed, "What are you going to do about it?" Of course, if we could know that they shoot the birds the law prohibits, we would make it expensive for them, but that is hard evidence to obtain. I hope the FOREST AND STREAM will take up this subject, as it is one that needs looking after. EASTHAMPTON, MASS., June 8, 1883.

A MINNESOTA GROWL.—Leroy, Minn.—In your issue of March 20 the poor old market-shooter tells very many more truths than the majority of sportsmen are willing to admit. Now, I am not a market-shooter, but I do dislike to see those that claim to be gentlemen and true sportsmen make such hogs of themselves by slaughtering the game the moment the law is on their cannon. I do not believe in doctoring laws all the time and not living up to them. One year ago Minnesota extended the close season of pinnated grouse from August 15 to September 1, and what did we gain by it? Nothing. By the last week of July every man and boy that could procure a gun, even to the law-makers themselves, was out in quest of snipe. Each one had agreed not to give the other a way. Now let me see where the gun comes in to the sportsman that quietly waits until the law is off and then goes out to find the game all killed, or what little is left so wild, that he cannot get within rifle range of it. Such is the general complaint all over the northern part of our State. I now learn that the season opens August 15, which will give universal satisfaction. Our legislators have also shortened the open season for deer, which, in my humble opinion, is all wrong, for it will be practically the same as our other law did. I maintain that the laws, as they stand, were good enough, if they could be properly enforced, and if not enforced, of what use are any of them? I was talking with a friend from Chicago county a few days ago, and learned that the natives shoot deer whenever found, from August 1 till the last of winter.—SHARP EYE.

PHILADELPHIA NOTES.—June 7.—The flight of shore birds, robin, snipe, bullhead plover, dowitchers and calico-backs, which arrived on our New Jersey coast during the past week, immediately preceded, as was expected, the present "warm spell." Let it be noticed each season—these latter weather-makers have their position in the year in advance of a real touch of summer weather. How much better would it be, if they are to be killed and eaten at all, to have them pass on their nesting grounds unmolested in the spring and shot on their return in August, when there are more young birds in the flocks, and they would be certainly a more palatable dish if one can abide them in any condition, which the writer confesses he cannot. It is so with the brant on the same coast. A snipe would do much better and make finer sport. Woodcock have hatched plentifully in the swampy marsh bordering the New Jersey creeks which flow into the Delaware River, and broods have been seen two thirds grown. Some have been already killed; two pair by a farmer's son, who "shoots straight," knows the law, but says, "As the birds were bred on his place, they are his at any season."—Hoxo.

TO WASH A SNIPER!!!—San Francisco, May 31.—In your issue of May 24, "Scaipe Scaipe" spoke of washing snipe. Can you conceive of doing anything to that delicious bird that would more effectually spoil its flavor? Wipe it, "Scaipe," wipe it! Wash a snipe! A wail!!!—Quon.

INDIANA.—Hanover, June 7.—The prospects for a good quail crop are excellent, the birds having wintered splendidly. Rabbits, squirrels and quail are our principal game. Any one coming here after October 15 could have fine quail shooting and also some woodcock shooting.—F. J. B.

WERE THEY RUFFED GROUSE?—I am 75½ years old, commenced shooting when 7½, and have hunted and shot every year since. About thirty-six years ago I killed my first bird on the wing and was so elated I was willing to give up my rifle for a "scatter gun," and since then have "killed my thousands" and have hunted with some of the best wing-shots where ruffed grouse (or partridge) were plenty and scarce. I once knew of fifteen being bagged in a day, never more, and I think six or seven the most I have ever known killed "consecutively." I wish to ask S. L. Wilson, Shelby, Linn county, Missouri, if he is correct in his statement in your paper of May 31, 1883. Were not his ruffed grouse pinnated grouse, of which he says he had often killed fourteen and sixteen consecutively, and had bagged thirty-two in a day, and once nineteen without missing a shot?—LEVI STROUDES (North Bloomfield, O.).

LEFT-HANDED SHOOTING.—In reply to "Snapshot's" inquiry in FOREST AND STREAM of May 31, I think a solution to the phenomenon may be found in the supposition that when shooting from the right shoulder with both eyes open, we insensibly use the right eye more than the left, and years of practice confirm the habit, so that when we shift to the left shoulder, although our left eye is over the rib, we are really looking at the object with the right eye, which is out of line, and hence the aberration complained of.—R. K. B.

MINNESOTA.—Leroy, May 7.—Game notes are scarce, but I learn that pinnated grouse have wintered nicely. Quail and pheasants (ruffed grouse) have, I fear, many of them succumbed to the deep snows and cold weather. Still, we hear the familiar druu quite often, and know that they are not all gone. Ducks have been very plentiful this spring and in very good condition.—SHARP EYE.

THREE-CLIMBING FOXES.—The common foxes of California invariably ascend trees if pursued. If chased by dogs they climb the first tree they approach, and are frequently seen in trees when undisturbed. Have known them to take to tall pines and ascend for thirty feet before reaching a limb.—ESAU (Shasta, Cal., May 31).

NEW JERSEY.—Toms River, June 7.—Quail are very plentiful here at present. While out walking recently I saw eight pair within an hour, and found a nest with thirteen eggs in it. But as there is a good supply of hawks, they will be taken care of.—T.

QUAIL PROSPECTS.—New Harmony Ind., June 6.—The woods and meadows of Southern Indiana are alive with quail this season, and we aim to make the pot-hunter quail too.—A. D. (Secretary, Rod and Gun Club).

PENNSYLVANIA.—Waynesburgh, June 9.—Quail are rather plenty, and if the weather for nesting is at all favorable, we look for good fall shooting.—RAMBLER.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Editor of FOREST AND STREAM, and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESOLVES.—We shall be glad to have for publication notices of good fishing localities. Will our correspondents favor us with notes of desirable points for angling excursions?

THE NATIONAL ROD AND REEL ASSOCIATION.

A MEETING of the National Rod and Reel Association was held in the Metropolitan Hotel, New York, on the evening of Wednesday, June 6, at 6 P. M., President Endicott in the chair. The secretary read the minutes of last meeting, which were approved. Letters of regret at not being able to attend were read from Messrs. W. C. Harris, Hon. James Geddes, and James L. Vailinton.

Mr. James Benkart was made chairman of the committee of arrangements for the coming tournament, but the other names which had been selected by the president had been temporarily mislaid.

Mr. Mather stated that he had been informed by Mr. Benkart that the members of the South Side Sportsman's Club of Long Island would renew their very liberal offer of prizes amounting to one hundred dollars in cash this year, and he thought that rules governing the tournament should be thoroughly revised in the light of last year's experience.

Mr. Endicott favored drawing the lines between amateurs and professionals very closely. It had been complained that last year the amateur class had been filled by persons connected with the manufacture of rods, and that the prizes had been carried off by them. Many gentlemen came to the tournament with rods to cast, but were deterred by finding that "trained amateurs" had entered, and that under the rules these exports could not be declared. This, however, can and will be arranged differently this year. Even the makers of rods objected to having rods given by them as prizes go to rival makers instead of the amateur anglers, as they hoped. He would recommend that all prizes given by the trade should go to the amateur class, from which all who handle fishing tackle as a business should be declared. At the same time he favored the giving of liberal cash prizes to the "professional class," as we could not afford to pass them by without having their presence. The extreme length of line cast by these gentlemen was an attraction and showed what could be done by practice.

Mr. Benkart said that the tournament would not be a success unless the amateurs thoroughly understood that their classes were strictly for themselves, and that they were not expected to compete with those who by constant practice in testing rods had attained an excellence that ordinary fishing does not give.

Mr. Mitchell inquired if such rules would apply to the bass casting, or if there would be changes or modifications. The president answered that he thought the same rules should apply, although last year the amateurs in bass casting beat the professionals, but that all this would be left to the committee.

Mr. Van Brunt asked if the tournament would be held in the same place as last year.

Mr. Endicott thought not. There was a prospect of getting a lake lower down than Harlem Mere, and he thought

that the Park Commissioners would have no objections, as the Chief of Police had given such a favorable report of the conduct of the audience at the last meeting.

Mr. Mather hoped that the platform would be lower than last year. The elevation of three feet above the water had been criticised in England, and had been made use of to account for the extraordinary length of the casts. He did not believe that it had much to do with the cast, but it would be well to remove all chance for cavil.

Mr. Endicott thought that six inches or a foot above the water would be sufficient, but as he had said before, these matters would all be left to the committee.

With a vote of thanks to Mr. Henry Chair, proprietor of the Metropolitan Hotel, the meeting adjourned. Several new members afterward joined.

BASS SLAYERS.

Editor Forest and Stream:

I clipped the following from the Mail of May 29. The Mail is a daily paper published in Toronto, Canada.

"Messrs. W. C. Matthews, H. W. Nelson, Townsends, Budge Dwight, and J. Kilgour returned on Saturday from a trip north after black bass. The party had a phenomenal success, taking 526 bass in two days' fishing, the bass averaging about two pounds. The best fish weighed five pounds one ounce."

The above gentlemen are, I presume, "sport-men," but wherein lies the sport slaughtering so many bass in so short a time? It is far beyond my ken. If the publication of their wholesale destruction is intended as a beacon to call others to the north of Toronto, where such innocents may be caught on their spawning beds, then the work of the fish and game protective clubs has been in vain. Our close seasons for bass does not suit every year in Canada, this year especially, and in the district referred to, the Grand Muskoka District, the season is exceptionally late, as it is here, where our close season does not reach far enough into the summer. We leave to every true sportsman his own conscientiousness as to whether he should defile the object of our clubs by a willful destruction of fish in a season when, had they but thought, the fish could not yet have spawned, and the extraordinary catch referred to no doubt can be explained for that reason.

We have good fishing in many parts of Canada, and it has improved greatly since the protective clubs have educated the people up to the proper seasons for killing. We had hoped to have heard better reports from Toronto, and we are again to believe the practice general.

Bass and muscalonge are only beginning to take in this season. Our trouting is exceptionally late this year, and parties for our lakes back of here are only preparing. When some of their catches are reported I will drop you a line.

MONTRÉAL, June 4, 1883.

RANGELEY LAKE.

"THE ICE went out on the sixteenth." Our good friend Page, of the Elmwood, at Phillips, sent us a telegram, of which the above is a copy. We marshaled our forces and on the morning of the 19th left Boston in a special Pullman car by the Eastern Railroad, a jolly party of fourteen, and with minds and bodies somewhat wearied by the whirl of active business, we sought all the comfort, rest and recreation which the angler always enjoys in his allotted season of ten days among these beautiful Rangeley Lakes surrounded by these grand old mountains and bordered by the primeval forests. The thought that, for a few days you may dream only of your poor wives and children enjoying themselves so at home while you are having such hard work in the wilderness is rather depressing, but you brace up with the determination that this time the largest trout of the trip shall drop gracefully into your landing net, and your guide shall carry the first money of the pool.

All goes well to Portland, where the baggage is shifted to the Maine Central Railroad. This carefully watched process over, our good enterer, R., calls all hands to lunch. Farmington is duly reached, thence by the tiny two-foot gauge up the beautiful Sandy River. Old Blue Mountain rears his majestic head and the train rolls up to the depot, where, greeted by lads and lassies, we leave our baby engine and the obliging officers of the road. Page is there with a four-wheeled, and in a jiffy we land the Elmwood. The next morning we divide our party in three portions of six and two fours and make the drive to Esty's. Here we walked down the carry to the inlet, where the Molly Clunkamunk waits, to take us to the Mountain View, our headquarters for the trip at the lower end of the lake. Each one of our party had secured the best guide in the whole region and we were happy.

With song and story we glide over the charming lake, and are duly greeted by Kimball, of the Mountain View. He is flanked by his neighbor, Cal Penock.

The next morning opens finely; rods are a-peak, reels examined; leaders, swivels, sinkers and hooks are adjusted. One, two, three, up to twelve, boats start out. "Man proposes, God disposes"; and at the close of the day we return all weary, some elated, with their catch and others depressed.

"The fisherman's luck." "Water is too cold." "I told you so."

"I lost a five-pounder; had him alongside; tore out; just my luck; always lose a five-pounder—never landed one yet!"

With varying fortunes we visited from day to day the "Eddy," the quick water below the dam, the Cupshape, and the "Big Edge." A portion goes down with Fred Parker and pass the night at his cheery camp at Bemis. The sunset view from his camp is a thing of beauty.

To sum up our experience: The largest trout caught was 7½ lbs., second 5½, third 5½, fourth 4½, fifth 3½, with sizes ranging from three down to one pound by the score. Smallest catch by any boat any day, when not actually white-washed, one. Largest catch, any boat, thirty-five. In fact we caught all we should.

Now we are packed, baggage and fish, ready and willing to "go out." Strong mentally and physically, ready to do battle with the outside world, and meeting others coming in, as eager as we were ten days ago, to be pleased or disappointed as we severally may have been, and with the same old stories to tell.

And so year by year we go and return, stronger and better for our communion with nature. Reader go thou and do likewise.

By the way, the BULL MOOSE, RANGELEY LAKE, May 29.

him some training on woodcock. At the first fire of a gun the dog made for another part of the country, and we never saw or heard of him again. When we packed up our things, we couldn't find the dog's chain or the collar it was fastened to, and we started on without it. I was walking out of the woods behind the wagon. We hadn't gone more than a hundred yards away from camp, when I heard a noise behind me. I looked back. There was that mink, snapping at my heels. He had the dog's collar around his neck, and when I turned around, he raised up on his hind feet and held the chain up to me with his fore paws. That mink was so blame grateful to me that he wanted me to take him home with me. It touched me to the heart. I took him in, but, poor fellow, the trap had injured him so badly that he died of lockjaw."

PHILADELPHIA FISH NOTES.

BLUEFISH appeared simultaneously on the different points of the New Jersey coast this week. Every inlet of any importance was thronged with them, but, as is generally the case, Barnegat showed larger fish than Little Egg Harbor Inlet. The bluefish at the former place ran from three to five pounds in weight, and at the latter I told they were smaller. The writer last week (June 2), anxious to learn the exact condition of the bluefish, went to the Schuylkill and at the same time wishing to give a beginner his first lesson in fly-casting, took a boat at Flat Rock Dam and rowed up the river as far as Conshohocken, and on the route passed a number of anglers and found quite a number of fish had been taken during the day. Those a mile or so above Shawmont were quite large.

While casting along the shore for snuff for practice, I saw a Mr. Sellize, of Philadelphia, take a bass, weighing three and a half pounds, and having left his landing net on shore, manage his boat with one hand, rowing in for the net, while with the other he played the fish, and finally hoisted him, a very masterly feat to witness, I assure you. Mr. Sellize had several other bass he had taken during the day, and tells me all the fish he secures in the Schuylkill are from the river above the dam at Manayunk, about the locality I saw him, above Shawmont, and that the residents about the place do not know how to take the large ones, and hence rarely catch fish.

The last "haul" of the season with the big seine was made at Gloucester, yesterday, and it was stated by the captain of the smack which brought the final catch of ninety-five shad and a quantity of herring to Dock street wharf fish market, that the Gloucester shad fishing had been "cut off" for the season, although it does not end by law until June 10.

The take has been so poor this year, especially recently, that it was determined to wind up on the 6th. The highest catch was on the 14th of May, when 1,400 shad were secured, on the 8th of May, 1,200 were taken, and on the 15th of May, 950 were brought in. The lowest number caught any one day was 51. The season has been a very poor one both in quantity and quality.

Two small whales (black fish) were stranded last week on Peck's Beach, N. J., and the natives are trying out the blubber and a half pound, and having left the locality for a time. Could this have affected the late move in petroleum?

The rock bass should by all means be planted in the Eastern Pennsylvania streams, near Philadelphia, by the Anglers' Association of Philadelphia. It is not so palatable a fish for the table as the black bass, but he will take the fly more readily than his larger cousin, and is a game little fellow no one need wish to lose. He will rise where the black bass will not make good sport for in weight and no doubt many streams could be found where he would thrive. Are they not easily procured?
Jesse T.

PERSISTENT POACHING.—We are informed by Mr. S. V. Brayton, one of the New York State game protectors, that on the 28th of May he took from the Mohawk River two pike nets belonging to a Mr. Wolf, a deputy sheriff of Waterford. As one net was in Albany county, and the other in Saratoga county, Mr. Brayton began an action against Mr. Wolf in each county. He says that Mr. Wolf has defied the law for three years, and has now begun an action against him (Brayton) for destroying his nets, and the latter has been summoned to appear at Saratoga on the 10th inst. Mr. Wolf is a man of some means, and his deputy sheriff it costs him nothing for counsel, and therefore the latter has an advantage over him, he having to give bail, which would trouble him. There is no protective association in either county, and he therefore asks for assistance.

THE ROCHESTER WEST SIDE CLUB.—The West Side Fishing Club, of Rochester, N. Y., held a meeting at the Bay View House on Thursday, June 7. Much successful fishing was done by some of the members during the day, and at the club dinner there was a full attendance. After the banquet the following officers were elected: President—Fritz Ziegler; Vice-Presidents—J. Bauer, Joseph Fleckenstein, Joel Gerling, H. MacGregor, John Seape, Philo Baker, and Christian James Cassidy; J. Fleckenstein, S. S. Brewer; Recording Secretary—Charles Bernhardt; Corresponding Secretary—Frank R. Swain; Treasurer—John A. Felsing; Master of Ceremonies—Charles R. Pimegan; Committee of Arrangements—Joseph Haungs, L. Stadler, L. P. Steimes, H. Berdel, C. Mackley, J. Schreiner, A. Haangs, W. Bishop, George Mumbach.

WEAKFISH AND STRIPED BASS.—Oceanic, North Shrewsbury River, June 5.—The weakfish are just commencing to bite. I took the first two this afternoon with crab bait. The New York Herald of Monday stated that only two ripe striped bass had ever been taken. Thirteen years ago I purchased a thirty-pound ripe female. This was in March. I am quite positive that this fish spawns in the spring. I think the habits of this species of fish could be studied by the Maryland Fish Commissioners, as the hauls of rock are at times very large at the mouth of the Bush River, Maryland.—W.D.

MASSACHUSETTS GAME LAWS.—The Massachusetts Fish and Game Protective Association have issued in neat and convenient form a pamphlet containing the laws of the State for the present year. The little pamphlet is so small that it can almost be carried in the vest pocket, and its general distribution through the State will do much to help on the objects of the Association.

SALMON FISHING.—The undersigned has done salmon fishing upon two of his best rivers. All lands at his disposal. Address at once "Salmon," this office.—Ad.

HARD TO CATCH IN TEXAS.—The turpans are never eaten here, they are so active that one is seldom caught; are made of fiddle strings, we think. As soon as they strike the bait and get fast they commence leaping high in the air, shaking their heads as a terrier does a rat until entirely free from the hook and line. Although fishing in this bay during the summer months for many years, and having had them taken my tackle almost every time, I have never yet caught one.—CARONKAWAY (Galveston, Tex.).

LAND-LOCKED SALMON IN NEW HAMPSHIRE.—On May 18, Mr. B. F. Tappan, son of Attorney-General Tappan, of New Hampshire, took, on Snake Lake, N. H., a land-locked salmon weighing 64 lbs. This was one fish of Mr. Samuel Webber's plant of 1877.

BLACK BASS IN LAKE ERIE.—Erie, Pa., May 28.—The black bass season has been at its height here for the past week, and is still excellent. One man has caught from ten to forty nearly every morning for the past week or two.—C. H.

BLACK BASS.—In the July *Century* will be an illustrated article on "Black Bass Fishing," by Dr. J. A. Henshall. The name of this writer is a sufficient guarantee that the sketch will be of a high character.

NEW JERSEY.—Oceanic, June 8.—9 P. M. The first small bluefish of this season are coming up the channel, but full fed, only caught one. 5 P. M. Just caught first bass (striped) trolling.—W.D.

Fishculture.

THE AMERICAN FISHCULTURAL ASSOCIATION.

SYNOPSIS OF PROCEEDINGS.

The annual meeting of the Association was held in the Farmer's Club rooms of the Cooper Institute, on Wednesday and Thursday, June 6 and 7, President Page in the chair. On opening the President said:

"A year has rolled round since our last meeting, and there are indeed many things to be glad of in the progress made. It can be said with truth that, since the beginning of fishculture in the United States, there is no other branch of industry that has made such progress. It has spread from Maine to California, and from Minnesota to Texas, until nearly every State and Territory has its fish Commission, and most of them have an appropriation to work with. These funds have been put in the hands of Commissioners, who give their time and energies to the work, and but few receive any compensation for it other than the knowledge that they are doing good to their fellow men. It will be needless for me to go into detail in this matter, for I see before me men who have for years carried on the work in its broadest form for the National Government, and who are familiar not only with the work which they have been engaged in, but are also familiar with the whole literature of the subject, and know what fishcultivists in other lands have done. I might, however, be permitted to refer to the efforts in stocking waters heretofore made, to which has been added what is known as the American game fish. In the West and in the South it is found in the creels of the angler and on the slabs in the Markets. They are now so abundant in the States and Territories that it is difficult to say they were unknown a few years ago, that they can be bought in the markets at a price within the reach of the poor man. Coming recently from the interior, I had an opportunity of examining the markets in St. Joseph, Mo., and found among the marketmen frequent acknowledgments of the work of fishcultivists, and of the teachings of this Association, and a thorough knowledge of the fact that, if the bass are protected in the spawning season, they become the commonest and most plentiful everywhere, and tend to lower the price of other fishes. We who live on the shad rivers, mark the manner in which the supply is kept up, in spite of the increasing demands of a growing population. Col. McDonald, who has been the constant attendant in the process of hatching at Mr. Blackford's Fulton Market, which he brought on from Washington to show the process. After they are hatched, they will be taken charge of by Mr. Mather, of the New York Fish Commission, and deposited in the Hudson near Albany, where Prof. Henshall has secured one million a fortnight ago. Pardon me for relating a bit of my personal experience abroad. Happening in London at the inception of the plans of the Fisheries Exhibition, now in progress there, I had the honor to be invited to make a paper at that time it was not known that our Government would make a display, and by request, as there was only three days before the passage of the yearly appropriation bill, I cabled to Senator Frye, of Maine, on the subject, and also sent a duplicate message to the President, who was very ready to oblige. The bill, being in the balance, yet in two days an appropriation was introduced into both Houses, and was signed by the President. Our exhibit at London is a most creditable one, and is generally well received, and has met with success favorably. Another fact: Making the acquaintance of Sir James Maitland, of Sterling, near Edinburgh, I found that within seven years he had achieved great results in fishculture. He has hatched and reared 1,000 eggs, all alone, without the assistance from any of his men, and has made the process cost sixty thousand dollars, and he has made fishculture so successful in Scotland. Up to April, of this year, he has sold ten thousand dollars' worth of young trout and salmon, and his example has been largely followed in England, Ireland and Scotland."

The Secretary then read the report of last meeting, and the following new members were proposed: W. H. Schieffelin, Prof. D. B. Fish, and Mr. J. H. Lott, eggs, all alone, without the assistance from any of his men, and has made the process cost sixty thousand dollars, and he has made fishculture so successful in Scotland. Up to April, of this year, he has sold ten thousand dollars' worth of young trout and salmon, and his example has been largely followed in England, Ireland and Scotland."

Mr. Blackford read a valuable paper, entitled "Facts Regarding Food of Fishes, and their Spawning Seasons on the Atlantic Coast," of which the following is a summary: The season of the spawning of striped bass, sheephead, and bluefish had for several years been the subject of investigation by the association. During the past summer the Senate Sub-Committee on Foreign Relations visited several fishing points on the coast to obtain evidence from fishermen, dealers, and others as to the habits of the fishes. The report was also as to the fact that this fish formed one of the principal articles of food for the bass, bluefish, and other valuable food fishes. No accurate information, however, could be obtained upon which to base any reliable conclusion for the protection of salt water fishes. Mr. Blackford, at the suggestion of Prof. S. F. Baird, some time ago undertook the task of examining the viscera of all the important fishes that passed through his market. He secured the assistance of Prof. H. J. Rice, who prepared a general table of the contents of the stomachs examined had in their stomachs from one to seven fishes in various stages of digestion; they were always, eels, flounders, menhaden, and in one instance one of its own species. In a small bass he found a large quantity of small fish, including small shrimps and a few fish scales. In sea bass remains of small fish were found, and in Bluefish (crab). Bluefish were found crammed with small bluefish, weakfish, butter-

fish, kingfish, menhaden, and other small fish. In conclusion, Mr. Blackford stated that they were not prepared to draw conclusions from these examinations, because the time in which they had been conducted was so short. Another year's work would have more of a value.

Mr. Fred Mather read a paper on "Smelt; their Habits and Plans for their Destruction." He declared this fish to be a pest to fishcultivists. It was a voracious feeder and produced nothing but waste. It was no food for fishes, as its numerous spines made it a thorny mouthful. It ate worms, flies and insects, and thus became a formidable competitor to young, valuable fish, and it also devoured young shad. The smelt made its nest near the shore, and June was its spawning season. Dynamite was first suggested as the best substance to destroy this fish, but Mr. Mather thought that they could be more easily destroyed by dropping small alumps of quick-lime into their nests.

The following paper by S. M. Johnson, of Boston, on "Legislation for the Protection of Lobsters," was briefly as follows:

The true sportsman angler, when he carefully releases the fingerling trout and returns it to the stream, intuitively recognizes the true economy of fishculture, which an application of this same law to lobsters great good might be done. By returning to the grounds all that are immature, and placing the limit so as to allow time for reproduction, a constant and increasing supply would be insured, and finally Mr. Johnson thinks, can be accomplished in no other way. The merits of this plan seem to be very generally understood, but the great difficulty in determining what good has been or may be accomplished arises from the fact that the laws of the different States are not uniform, and moreover, they are often disregarded altogether, so that no satisfactory knowledge of the benefit derived is possible until these difficulties are removed.

It was suggested that all traps or pots be so constructed that the lobsters or sticks shall be sufficiently far apart to allow all small lobsters to escape, and that a funnel hoop shall be used of not less than five and a half or six inches in diameter. The disposal of the spawn-bearing lobsters is an important question, and is worthy of careful and serious consideration. The opinion is that if the limit is large enough, a sufficient quantity would be included in the number returned to the grounds to provide for breeding necessities. The plan of having a closed season is frequently advanced.

The essay closed with a regret that lobsters are becoming every year scarcer and scarcer, and the hope that legislation would soon end this difficulty.

The Association passed a resolution at the conclusion of the reading of the paper, that legislation be urged to make provision for the preservation of lobsters, as suggested in Mr. Johnson's paper.

A recess was then taken and in the afternoon a very careful reading of the paper on "The Distribution of the Rock Bass," by Dr. J. A. Henshall, was read, and elicited much discussion. The original habitat of this fish ranged from Virginia to Florida, and from Canada and the Red River of the North to Louisiana and East Mexico; it embraced the whole of North America south of the British possessions, and east of the Rocky Mountains except the waters flowing into the Atlantic in New England and the Middle States. Of the two species, the large-mouthed bass had the widest distribution. The small-mouthed bass had a somewhat more restricted range, not extending east or south of the Alleghany mountains. The habitat of the black bass had been extended by transportation and by means of artificial canals. It had also been successfully introduced into waters where it had never before existed, occupying a wider range than any other fish in the world. The black bass was in a manner omnivorous. Crawfish and minnows were the principal food of the adult fish, and in addition to this they fed upon insects, larvae, frogs, etc. Mr. Entomologist protested against the practice of catching the bass into trout streams, where it would be sure to devour that game fish.

"An interesting paper entitled "Food Fish and Fish Food," by Dr. Henshall, was then read, in which he advocated planting food for the fish when they were placed in ponds or streams.

SECOND DAY.

Col. McDonald read a paper on "The History of the Experimental and the Development of the Automatic Hatching Jar." He traced the work of practical fishcultivists from its inception to the present time, and showed the various forms through which the hatching of fish eggs has passed. He demonstrated on the blackboard the different experiments which had been tried by himself in the order of success, and the loss of eggs and to provide for the separation of the dead from the living eggs. The separation of the dead from live eggs, he said, was formerly done by picking out the dead eggs, and the result was a loss of many eggs, and a great deal of time. The syphon had been used, but this system did not prove satisfactory. Noticing that the specific gravity of dead eggs was less than that of live ones, Col. McDonald has introduced a method of separating the dead from the live eggs, and also the young shad when hatched. This jar in shape resembles the glass flasks that are seen on the shelves in apothecaries' stores, but with a rounded bottom. The water in the middle of the jar is raised up to the bottom of the jar. Another tube passes about one-third of the way down. The jar is half filled with shad eggs, and the water is forced through the long center tube, causing a gradual revolution of the eggs. The water, being healthy, immediately fall again to the bottom, while the dead eggs are thrown up and forced by the current through the other tube into another jar.

Mr. Fred Mather read a paper called "The Transportation of the Water Culture Jar," in which he advocated ending them packed as fish eggs are.

A paper of great interest, by Dr. T. Garlick, on "The Beginning of Fishculture in the United States," was then read. It was a very interesting paper, and was particularly well listened to with great attention. He drew diagrams on the blackboard and illustrated the principles of the construction of the new fishway. Among other things he said: It is a well attested fact that the river fisheries of the Atlantic States have steadily diminished in value and importance, and the causes, probably, have concurred in producing this decrease. First, the capture of the greater portion of the run each year may not have been sufficient to maintain production under natural conditions. Second, the question of obstructions in the rivers has, in some cases, entirely cut off the run of fish from their spawning grounds. The remedy for this condition of things is to be found, first, in such legislation as will remove all existing and prohibitive destructive modes of fishing; second, in compensating the value of the natural supply by artificial propagation and planting; third, in extending the area of breeding and feeding by overcoming natural obstructions by means of fishways. Fishways are various devices of artificial construction, the object of which is to otherwise be impossible to them. A fishway to be effective must fulfill certain conditions. First, it must be accessible; that is, the foot of a fishway must be so located that the fish will readily enter it. Second, it must be such that a sufficient volume of water to attract the fish. Third, the water must be discharged with such velocity that the fish may readily enter and swim up it. In what is known as the stop fishway or pool-and-fall fishway, the water is brought down from its elevated position by a series of short, vertical, rectangular weirs of such a size in comparison with the volume of water entering them as to bring it practically to rest after each drop, and in this way to deliver the whole volume at the bottom with sufficient force to attract them. It has in dropping from one pool to the next.

IN THE MATTER OF LEWIS.

Editor Forest and Stream: Oblige me very much by publishing the enclosed letter from Mr. Wade. He has acted in a very frank and handsome manner...

It is truly strange, and to me incomprehensible, that when one writes earnestly and truthfully, and for the best interest of our country, one should be called a chameleon. However, the gentle spray which has been dashed upon him don't start him from his firm base.

W. WADE, 7 EAST THIRTY-SIXTH STREET, New York.

Mr. Wade's letter is as follows: PITTSBURGH, June 9, 1888.

Col. Stuart Taylor: MY DEAR SIR—Yours of the 5th is duly received. I am much pleased that my explanation is satisfactory. I could not rest easy until I had endeavored to make amends to you...

W. WADE.

EASTERN FIELD TRIALS CLUB MEETING. At a meeting of this association, held on Wednesday, June 6, at 3 o'clock P. M., at No. 59 Wall street, this city, it was voted to extend the time for entering an entry for dogs coming from foreign countries to August 1. The following gentlemen were then elected to membership: Mr. B. P. Wilson, Mr. J. Worth and Mr. Howard Hartley, all of Pittsburgh, Pa.; Mr. William Johnson, of North Carolina; Mr. Edward Dexter, of Boston, Mass.; Mr. Fred E. Perkins, of Providence, R. I. The meeting then adjourned.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kenel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of each animal: 1. Color. 2. Name and residence of owner. 3. Breed. 4. Age or sex. 5. Date of birth, of breeding or of death. All names must be plainly written, communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

See instructions at head of this column. Foyot, Parhall, Finance and Frolic. By Mr. Robert Blackwood, Minneapolis, Minn., for black and tan Gordon setter dogs, whelped March 27, 1888 (Major—Young Flora).

NAMES CHANGED.

See instructions at head of this column. Pointy to Finest Fun. Pointer bitch, 5 yrs. old, by Faust, out of Minnetonka (Shot—Countess Royal), owned by Mr. S. E. Riley, Rosedale, Wis.

BRED.

See instructions at head of this column. Nell—Singsby. Mr. J. Coleman Drayton's (New York) greyhound bitch Nell (Tippecanoe—Cleitran Glib) to his Singsby (Rapid—Sally) May 25. Coquette—Singsby. Mr. J. Coleman Drayton's (New York) greyhound bitch Coquette (Den—Fam) to his Singsby (Rapid—Fruitie) Girl, May 29. Josie—Nip. Mr. Leroy F. Patterson's (Bainbridge, Ga.) pointer bitch Josie (Nip—Casper) to her Nip (Casper) June 10. Lark—Robin Aldair. Mr. Geo. H. Whitehead's (Trenton, N. J.) collie bitch Lark (A.K.K. 7), to Mr. Thomas H. Terry's champion Robin Aldair, June 4.

WHELPS.

See instructions at head of this column. Young Flora. Mr. Robert Blackwood's (Minneapolis, Minn.) imported black and tan Gordon setter bitch Young Flora, March 27, 1888 (Major—Young Flora). Valfrey. Mr. Robert Blackwood's (Minneapolis, Minn.) black and tan Gordon setter bitch Valfrey, June 3, two (one dog), by his Major (Major—Young Flora). Cornelia. Mr. L. Shuster, Jr.'s (Philadelphia, Pa.) English setter bitch Cornelia (Leicester—Dirt), May 24, six (three dogs) by champion Tom (Pinder—Floss). Gossamie. Mr. L. Shuster, Jr.'s (Philadelphia, Pa.) English setter bitch Gossamie (Thunder—Peers), June 2, two (one dog), by Mr. P. Bryson's Gladiator. Gretchen. Mr. Leroy F. Patterson's (Bainbridge, Ga.) English setter bitch Gretchen (McLeod of Dura—Brenda), June 8, nine (four dogs), by Roy (Pinder—Floss). Countess Belle. Mr. Edward Lohman's (New York) imported English setter bitch Countess Belle, May 7, seven (four dogs), by Mr. E. A. Herzog's Duke. May David. Mr. J. A. Rockwood's (West Medford, Mass.) black and tan Tweed setter bitch May David (Druid—Nelson) June 2, five (one dog), by his Nelson (Nelson—Floss). Nellie. Mr. W. E. Bassett's (Jersey City, N. J.) English setter bitch Nellie (Elmo—Floss) May 24, nine (seven dogs), by Jack (Tom O'More—Floss). One dog and one bitch since dead. Vir. Mr. H. Drain's (Baltimore, Md.) Irish setter bitch Vir, June 8, seven (five dogs), by Thos. Hudgins's Supp.

SALES.

See instructions at head of this column. Elcho II. Red Irish setter dog, 5 yrs old (Elcho—Rose), by Mr. Adolph Nelson (Brooklyn, N. Y.) to Mr. P. Russ (Harrisburg, Pa.). Phantor—Finnie whelp. Byron foxhound, by Mr. Thos. Goode Tucker (South Grafton, N. C.) to Mr. E. D. Shippington (Arrow Rock, Mo.) and one blue to Mr. C. Newell (Ashburnham, Mass.). Phantor—Ench whelp. Black and white Byron foxhound, by Mr. Thos. Goode Tucker (South Grafton, N. C.) to Mr. E. D. Shippington (Arrow Rock, Mo.). Phantor—Kelpie whelp. Blue Byron foxhounds, by Mr. Thos. Goode Tucker (South Grafton, N. C.) to Mr. E. D. Shippington (Arrow Rock, Mo.) and one to Mr. C. Newell (Ashburnham, Mass.). Phantor—Black and tan Gordon setter dog and bitch, whelped March 27, 1888 (Major—Young Flora), by Mr. Robert Blackwood (Minneapolis, Minn.) to Mr. J. E. Duchanin (Montreal, Canada). Phantor—Black and tan Gordon setter dog and bitch, whelped March 27, 1888 (Major—Young Flora), by Mr. Robert Blackwood (Minneapolis, Minn.) to Mr. L. A. Boyer (Montreal, Canada). Phantor—Black and tan Gordon setter bitch, whelped March 27, 1888 (Major—Young Flora), by Mr. Robert Blackwood (Minneapolis, Minn.) to Mr. James Cox (Montreal, Canada). Phantor—Black and tan Gordon setter dog and bitch, whelped March 27, 1888 (Major—Young Flora), by Mr. Robert Blackwood (Minneapolis, Minn.) to Mr. John McCaven, Jr. (Montreal, Canada). Phantor—Ench whelp. Black and tan Gordon setter dog, whelped March 1, 1879 (Dash III., Orial), by Mr. John Reynolds (Fall River, Mass.) to Mr. J. J. Scullin, same place. Kuckelcocker—Rose whelp. Liver and white pointer dog puppy, whelped Dec. 5, 1882 (champion Kuckelcocker—Rose), by Geo. L. Whins (Jersey City, N. J.) to Mortimer Milk, same place.

PRESENTATIONS.

See instructions at head of this column. Finance. Black and tan Gordon setter dog, whelped March 27, 1888 (Major—Young Flora), by Mr. Robert Blackwood (Minneapolis, Minn.) to Mr. H. McNickin (Winnipeg, Manitoba). Phantor. Black and tan Gordon setter dog, whelped March 27, 1888 (Major—Young Flora), by Mr. Robert Blackwood (Minneapolis, Minn.) to Mr. W. J. McLenn (Montreal, Canada).

KENNEL MANAGEMENT.

No Notice Taken on Anonymous Correspondents.

F. E. Independent Hill—You forgot to give your name and address for each dog. E. S. F. Albany, N. Y.—The pointer bitch Louy Frances was by Boss out of my dog, Supp. C. A. Lawrence, Mass.—Ans. 1. Yes. 2. We fail to comprehend your meaning, write more fully. C. H. E. Boston, Mass.—Marble's Grouse is by Wakefield's Jack out of Conslaud's Nell. Tipton's Lou was imported by Mr. H. N. Munn. Pedigree not reported. Remyer, Boston, Mass.—Give two grains of finely powdered arsenic for each pound of dog weights. Give out empty stomach and follow in two hours with a dose of castor oil. C. H. Erie, Pa.—In using any preparation of mercury upon a dog great care should be taken, as it is a poison and very liable to produce bad effects. If you are obliged to use it with vegetables, give it in small quantities for mange. It should be diluted with three parts water. J. A. C. Newburyport, Mass.—You do not state whether your dog has had distemper or not. The itching you describe is often a sign of distemper, and should be treated accordingly. The decaying of his teeth is probably caused by a disordered stomach. Change to meats, and wash his teeth with a stiff brush on his teeth twice daily, with a solution of one grain of chloride of zinc in one ounce of water.

Rifle and Trap Shooting. RANGE AND GALLERY. THE AMERICAN TEAM.

MATTERS have been very lively in the preparation for the match in England. The team which has been selected by the managers has been very valuable and most discreetly jealous. The shooting men, or such of them as reported for practice, had three days' work at Creedmoor, on Wednesday, Thursday, and again on Thursday, when, with an unusually wind, the scores ran: 700 500 600 800 500 1,000. T. J. Dolan 35 35 30 31 33 32 186. M. W. Bell 35 35 35 31 33 30 183. F. J. Rathbun 31 33 30 31 33 30 179. G. Joiner 30 33 31 29 27 25 178. W. J. Smith 29 33 32 32 30 27 172. W. L. Cash 28 32 32 30 29 25 171. J. M. Pollard 31 30 33 28 26 23 170. A. H. Van Heusen 30 29 30 29 27 23 168. T. W. Griffith 31 28 28 27 27 23 167. S. J. Scott 30 33 29 28 25 22 167. F. Stuart 28 29 28 27 26 23 164. J. H. Brown 33 32 30 29 30 14 155. J. Smith 29 27 27 27 27 27 144. C. W. Himman 31 27 21 31 32 11 148.

On the day following the men were again on the range, and with a large attendance. The marksmen took advantage of the favorable condition of the weather and piled up high scores. The wind, as usual, was a little troublesome, but not enough to interfere with good shooting. The teams showed the 800, 600 and 1,000 yards only, as Captain Howard, under whose direction the match took place, they required more practice at the long ranges than at the shorter distances, at which they are very proficient. The following is a summary of the shooting: 800yds. 600yds. 1,000yds. Total. W. J. Smith 35 31 24 91. F. J. Rathbun 34 29 26 89. T. J. Dolan 25 27 31 83. J. H. Brown 31 31 24 86. W. L. Cash 28 25 28 81. J. W. Griffith 28 25 28 81. J. M. Pollard 31 34 30 95. A. H. Van Heusen 30 23 27 80. C. W. Himman 33 29 18 80. F. Stuart 28 29 27 84. G. Joiner 30 23 25 83. W. Scott 30 23 21 75.

On Monday the team met for range drill. The weather during the morning hours was fine, although it was too warm for comfort. Shortly after 1 o'clock the sky became overcast with heavy clouds, and before the afternoon commenced there was a shower of shelter a terrific thunder storm burst upon them. The storm abated after raging for half an hour, and the drenched men resumed their shooting with undiminished interest. The conditions were fair at the first two ranges, but at the latter were very trying, a strong and choppy wind blowing from the east over the range.

The following is a summary of the shooting: 800yds. 600yds. 1,000yds. Total. F. J. Rathbun 27 33 30 90. T. J. Dolan 27 33 28 88. J. L. Faulding 30 31 25 86. S. J. Scott 30 31 25 86. F. Stuart 28 29 27 84. J. H. Van Heusen 30 29 26 85. J. W. Griffith 28 25 28 81. J. M. Pollard 31 34 30 95. A. H. Van Heusen 30 23 27 80. C. W. Himman 33 29 18 80. F. Stuart 28 29 27 84. G. Joiner 30 23 25 83. W. Scott 30 23 21 75.

The team concluded its practice at Creedmoor on Wednesday of this week. It will sail for England on the Alaska on Tuesday, the 19th inst. The match will be held at Wimbledon on Wednesday, the 20th and 21st of July. Fourteen only of the sixteen men now shooting will be taken across the water, and the interesting question now remains as to who will constitute the two unfortunate who will be "shot off." This question will be determined by a summing up of the records made in practice.

The men were doing such good work the directors were making a great commotion in the newspapers. The hubbub of the meeting on Tuesday the 6th had done much to bring discredit upon the match. Nothing has yet been resolved. Of course, the directors had not been very liberal and this exhibition of a dog-in-the-manger spirit cut them off entirely. With the intent of stirring them up they had directed E. Karsened of the Finance committee to announce saying: "I deem it my duty to notify you in order that you may notify the directors of any probabilities now or here that the international team will go to Wimbledon. A special meeting of the Board of Directors has been called for next Tuesday afternoon at 3:30, to discuss the matter of my committee's address. The acting president on the 23rd ult. no subscriptions have been obtained by those outside of the committee, and our labors fail to reach the necessary amount. Nothing has yet been resolved. Of course, the directors had not been very liberal and this exhibition of a dog-in-the-manger spirit cut them off entirely. With the intent of stirring them up they had directed E. Karsened of the Finance committee to announce saying: "I deem it my duty to notify you in order that you may notify the directors of any probabilities now or here that the international team will go to Wimbledon. A special meeting of the Board of Directors has been called for next Tuesday afternoon at 3:30, to discuss the matter of my committee's

cooling off, as the change from the heat and exertion of paddling to sailing or swimming may be very harmful. If suitable ground is at hand a race of the stumpler and lighter boats over land and water is always amusing, starting on shore. Carrying to the water, launching and paddling, then landing, and over some obstacle and paddle to the beach.

Canoes to carry four are sometimes used in England for racing only, but the expense of a boat and difficulty of training specialist crews make them unsuitable, except for large clubs. The association rules are explicit as to the details of racing, and will serve as a guide to those in charge of the races. The regatta committee should be organized in good time on the day of the race, with mark flags, timing watch, entry lists, time slips ruled for keeping records, horn or pistol for signaling, and a committee of one or two men to read and report for himself. One member will be appointed to look after visitors, and if reporters are present to give them accurate information, one with an assistant or two, to attend to the boats, giving clear for the use of contestants; while one will have charge of starting flags, timing, etc., with the assistance of a time-keeper, to whom each start should be agreed on in case the wind fails, or it is necessary to conclude the race unexpectedly. In the event of fouling and protests, the regatta committee must endeavor to decide fairly according to the rules, and their decision should be cheerfully accepted by all. During the season a long-distance race in cruising trim, occupying an entire day, would be best late in the fall, as all are in proper condition for a long pull after the cruising season, and it would be a fitting conclusion of the season's races.

AMERICAN ASSOCIATION'S CAMP.—A meeting of the general committee to make arrangements for the camp of the American Canoe Association, at Stony Lake, next August, was held in the Post-office Block, Peterboro', on Tuesday evening. The reports of the various sub-committees showed that the work entrusted to them is progressing satisfactorily. There seems to be every probability of a large influx of the brethren of the paddle and the oar from other parts of Canada and the United States. We feel sure that they will not regret a visit to our beautiful waters, and that many will return here subsequently for a holiday trip.—Peterboro' Advertiser.

A NEW CANOE.—Mr. C. W. Smith, of Lansingburg, N. Y., has patented a new method of building south-skin canoes, in which strips of hardwood one-half inch square are used for the ribs, and the various sides, instead of having one round and one hollow side to avoid beveling, is laid in place and fastened with wooden shoe pegs to the two preceding strips. After the hull is completed and the deck when it is ready for rubbing down and varnishing, the inside being smoothed down and painted, making a hull that is light, strong and perfectly smooth.

PETERBORO C. C.—A party from this club ran the rapids of the Trent River on May 24, making the distance from Campbellford to Trent in 27 minutes, with only a stoppage of an hour and a half for lunch and several shorter ones.

A MAINE CRUISE.—Dr. Neidé and Mr. Frank Hubbard, of Boston, will start shortly on a cruise up the Kennebec and Dead rivers and down the Chaudière to the St. Lawrence, following Arnold's route to Canada in 1775.

TORONTO C. C.—The Toronto Y. C. have arranged a race for small yachts, sailboats, and also the canoes of the Toronto C. C.

A. C. A.—We have received from Commodore Edwards the new rules as finally adopted by the Executive Committee.

Answers to Correspondents.

No Notice Taken of Anonymous Correspondents.

J. C. C., Eagle Pass, Tex.—Write to Hartley & Graham for the ammunition.

Victoria, Buffalo.—We know nothing either in favor of or against the person or stock referred to.

W. Sheldon, Ia.—Can you furnish me with Norris's "American Fishculture," and at what price? Ans. Yes, price \$1.50 and 10 cents for postage.

G. W., Boston, Mass.—You neglect to give any details of bore of your gun, but if you can find the shells to fit the execution should be first-class.

W. Corning, N. Y.—Where and at what price can I get the best work on the life and writings of Isaac Walton? Ans. Get Beddome's edition by John Wiley & Sons, New York. Price, \$6.

OLD READER and WARWICK and many other inquirers will understand that their questions are not answered because no names are signed to the communications. See line at head of this column.

RAMBLER, Waynesburgh, Pa.—We should certainly recommend your taking some of the Kynochs, and giving them a fair trial. Let us know the result. We know of no tests such as you ask about.

L. F., Red Hook, N. Y.—Will you kindly inform me who owns and where is the Irish terrier dog Barryown, imported by Mr. William Graham, of Belfast, some months since. Ans. Mr. C. H. Mason, Yonkers, N. Y.

J. L. T., Baltimore, Md.—No gun on back in your State except that in the waters of eastern branch of Potomac and its tributaries in Prince George county the season is August 15 to May 15. In Virginia the season is from May 1 to July 1.

A. B., Huntington, Ind.—1. Where did the ferret originally come from? Where is its native country? 2. Do you know of any breeder of the ferret near this State? If so, please give me his address. Ans. 1. Africa. 2. We know of none. See advertising columns.

W. L.—I send you by this mail a shell. I have never seen anything like it in my river. Will you please inform me what it is the shell of. Ans. It is the mantle shell of the minute shrimp, *Squilla gwynna*, and is not uncommon in the salt waters of New York and New Jersey. We have seen specimens that were eight inches long.

W. St. Paul, Minn.—1. For ducks use Nos. 4 and 6 shot. 2. In 16-bore gun for ducks use 34s, to 31s, powder, and 3/4oz. to 1oz. shot. Experiment until you get the proper charge for your particular gun. 3. The necessary number of decoys depends upon where you are shooting, the more of them the better, from twelve to fifty.

J. W. M., Silverton, O.—1. The last book includes all the important matter of the former books by same author. 2. Can you give plan for construction of the best fish ladder to enable trout and other small fish to pass dams on small streams? Ans. Write to the Maryland Fishery Company, Lock Box 285, Washington, D. C.

H. R. T.—How are guns gauged, or to put it more plainly, what is the diameter of the different gauges? Ans. The following are the diameters of the different gauges in thousandths of an inch: No. 9, .28; No. 10, .27; No. 11, .25; No. 12, .23; No. 13, .21; No. 14, .19; No. 15, .17; No. 16, .15; No. 17, .14; No. 18, .13; No. 19, .12; No. 20, .11.

W. F. H., Allentown, Pa.—Would not the raising of what is called the casimere coat be a new and profitable business in the south-western part of this country? Where and at what cost could they be brought? Would two hundred dollars be enough to start on? Ans. 1. The experiment has been tried in California, Nevada and we believe, Arizona, but we have not heard that it was so successful. 2. To induce any great amount of capital to be invested, 2. Doubt-

ful if they could be obtained in any numbers in this country. 3. No. For fuller information on this subject, address *Breeders' Gazette*, Chicago, Ill.

W. J., New York.—I have studied carefully your advertisements, hoping to learn where I can have a dog clipped for the summer. Failing to find the information I seek I venture to write and ask you to inform me through your journal. Ans. We presume that any one who makes a business of clipping horses will perform the same service for your dog.

H. F.,—and Ergo fishing: A bet B that he (A) will catch the largest fish. A catches a fish that weighs five pounds and eight ounces. B catches one weighing four pounds and twelve ounces. B's guide catches a fish weighing five pounds and nine ounces. Ans. A has caught the largest fish at the time. Who wins the bet? Ans. A has caught the largest fish, he wins. The terms did not include the guide, nor any persons except the two contracting parties.

W. K. M., Salem, Pa. 1. Do you know where I can get the genuine Indian moccasins the shoe worn by the American Indian? 2. Do you know of any individual or firm who deals in or buys bullfrogs? 3. What is meant by the term choke-bore, and do choke-bore guns possess superior shooting powers over regular bore guns? Ans. 1. Philadelphia. 3. A gun bored so as to throw the shot closer together than the ordinary cylinders. Superior at long distances because the empty spaces between the pellets of shot are smaller.

J. H. G., Detroit, Mich.—Please tell me where or whom I could get shells for my gun, either rifle or shot shell. The piece is an old rifle. It was originally a breech-loader, and used in the civil war, but was bought from the Government and changed into a breech-loader by the fishermen for their special use during the Fenian excitement. No dealer here has shells small enough to fit. Ans. The bore of the Enfield was .477. If your rifle is of so small caliber as you imply, it cannot be an Enfield. Ascertain the exact size of cartridge for which it is chambered, and apply to some of the New York dealers.

B. J. M., N. Y.—Can you give me any information with reference to either the Muskoka Lake region in Canada, or the northern Michigan lakes, for good shooting and fishing during August. Ans. As to the Michigan lakes for fishing see *FOREST AND STREAM*, "Camps of the Anglers," vol. xvii, pp. 26, 28, 30, 43, 45, 55, and 64. There is said to be good fishing for brook trout and bass near Charlevoix, eighteen miles south from Petoskey. In fact you can hardly go wrong in looking for the State. For information about the Muskoka district see *FOREST AND STREAM*, vol. xx, pp. 207, 327 and 362. You will love no shooting, as it is illegal to kill any game except wood-

TRU, Tom's River, N. J.—1. What size was should be used in No. 12 brass shells to insure the best shooting. 2. Also what size was should be used in No. 12 paper shells (choke-bore gun)? 3. What shall I use to keep my gun barrels from rusting on the outside, and not injure them? 4. Do you know where I can get a book or pamphlet on loading? 5. What size shot do Boscovius and Carver use in their pigeon matches? Ans. No. 10 was in brass and No. 11 in paper. 6. By watching them and keeping dry, scarcely any oil is required, but if needed any good animal machine oil will do. 7. Green's "The Gun and its Development," price \$7.50, or Duggal's "Shooting," price \$3. 4. Nos. 6, 7 or 8, according to circumstances.

PUBLISHER'S DEPARTMENT.

There is a tradition handed down from time immemorial that a lady can never write a letter without a postscript. If the latter is heeded, an *Restorook* pen No. 335 will answer the purpose admirably.—*Adv.*

Wrecks and failures are visible everywhere. Causes: Ignorance, want of skill, and carelessness. Put Boscovius's Cement Plasters stand at the head of external remedies, like a lighthouse on a stormy coast. They act thoroughly, scientifically, and begin their work as soon as applied. All other counterfeits are time and temper. Per, and cost. Word "Capitino" cut in center of each plaster.—*Adv.*

THE MILD PAIN CURES. DR. J. C. HUMPHREY'S OMBOPATHIC SPECIFICS.

In use 30 years.—Each number the special preparation for the cure of the following diseases. Simple to read. Sure. Medicines for the people. LARGEST ASSORTMENT OF MEDICINES. Price reduced. 1. Humphrey, 109 Fulton Street, New York.

"THE FAIRY" MINNOW. This is by far the best artificial minnow ever made. It is a great improvement on the "Phantom," which has long been considered the best of all minnows. When put into the water it almost immediately becomes as soft as velvet and as tough as leather, besides having the exact appearance of a real minnow, even in the matter of wings. Our Phantom has been imitated, and so, no doubt, will this be. Anglers will find our name on every box containing one of these minnows, and our well-known trade mark on the card to which each minnow is attached. The above minnow is No. 7. The following are the various sizes we keep in stock. Nos. Inches Long - 2 5/8, 3 1/8, 4 1/8, 5 1/8. Orders received from anglers residing where the dealers keep a full line of our goods will not be filled at any price. ABBEY & IMBRIE, Manufacturers of every description of Fine Fishing Tackle, 48 & 50 MAIDEN LANE, NEW YORK.

JAS. F. MARSTERS, 55 Court Street, Brooklyn. MANUFACTURER AND DEALER OF Fine Fishing Tackle. First Quality Goods at lower prices than any other house in America. Brass Multiplying Reels with Balance Handles, first quality and line finish, 75¢, \$1.00, 1.50¢, \$1.25, \$1.50, \$2.00, \$2.50, \$3.00, \$4.00, \$5.00, \$6.00, \$8.00. Any of the above Reels, \$1.25. 25 cts. extra, nickel plated, 50 cts. extra. Brass Clink Reels, 50 cts., 70 cts., 90 cts., \$1.00, \$1.25, \$1.50, \$2.00, \$2.50, \$3.00, \$4.00, \$5.00, \$6.00, \$8.00. Also, 25 cts. extra. Hooks, 25 cts., 50 cts., 75 cts., 1.00, 1.25, 1.50, 2.00, 2.50, 3.00, 4.00, 5.00, 6.00, 8.00, 10.00. Single and Double Hooks, 25 cts., 50 cts., 75 cts., 1.00, 1.25, 1.50, 2.00, 2.50, 3.00, 4.00, 5.00, 6.00, 8.00, 10.00. Waxed Leaders, 3 length, 5 cts.; triple twisted, 3 length, 10 cts. Per Doz. 50 cts. per doz. Black Bass Flies, \$1.00 per doz. Trout and Black Bass Flies, 50 cts. per doz. \$1.25 to \$3.00. Trout and Black Bass Flies, \$1.25 to \$3.00. Also, forty-eight different styles of rods for all kinds of fishing. Samples of books, leaders, etc., sent by mail on receipt of price in money or stamp. Send stamp for catalogue. Established 20 years. Open Evenings. J. F. MARSTERS, 55 Court St., Brooklyn.

APPLETON & LITCHFIELD, -SUCCESSOR TO- PROUTY & APPLETON, (Mr. Prouty was for many years at the head of the Fishing Tackle Department of the late house of Bradford & Ahlberg.) Importers and Dealers in Fine Fishing Tackle, RODS, REELS, LINES and HOOKS of every description. Communications by mail will receive prompt attention. APPLETON & LITCHFIELD, 304 Washington St., Boston, Mass.

KYNCH'S Patent "Perfect" Brass Shells, MANUFACTURED BY KYNCH & CO., Birmingham, Eng. These shells are made of extra fine thin phable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be re-loaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells. They shoot straight and true, and are nearly two gauges larger. Load same as any brass shells, using wads six two sizes larger than gauge of shells. Or can be effectively crimped with tool as represented in cuts, and strung out to original shape when discharged. The crimping tool also acts as a reducer, an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsman's club or to original shape when discharged. Only for sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by HERMANN BOKER & CO., SOLE AMERICAN AGENTS, 101 & 103 Duane Street, New York. WILLIAM READ & SONS, Boston, Mass., Agents for New England State

AMERICAN Kennel Register.

A monthly record of kennel events for the information and guidance of breeders, exhibitors and owners of all breeds of dogs.

Its leading feature is the "Pedigree Register," of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is given to each dog, and an index will be compiled at the close of each annual volume, thus forming a permanent work of reference. The pedigree registration fee is twenty-five cents. The first two numbers of the Register contained the pedigrees of 138 dogs.

Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs at sale, and deaths.

Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include a record of field trials. The first two numbers of the Register contain prize lists of Washington, Ottawa and Pittsburgh shows.

The publication day is the fifth day of each month; and nothing can be received for publication later than the first day of the month. All matters intended for publication should be in the hands of the editor at the earliest practicable date. Entry blanks for each department will be furnished free on receipt of stamped addressed envelope.

TERMS.—Issued by yearly subscription only. The subscription price is one dollar per year. Make drafts and money orders payable to the Forest and Stream Publishing Company. Address, AMERICAN KENNEL REGISTER, P. O. Box 2,832, New York City.

ANSWERS TO CORRESPONDENTS.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects than is contained in all other American publications put together.

GAME SLAUGHTER IN THE WEST.

INFORMATION from authentic sources makes it appear that the Game Protective Association of Wyoming is not doing the good work that we had hoped to see performed by it, and which the list of its officers and the tone of its inaugural address to the citizens of the Territory, warranted the public in expecting. In two essential particulars complaint is made that there is a failure to take necessary steps to punish violators of the law.

Some years ago the rapid decrease of the beaver within the Territory induced the passage of a law protecting these animals for a term of years, and forbidding their capture under severe penalties. For two or three years this statute was well observed, but during the past winter it has been openly violated, and the Wyoming newspapers have at frequent intervals contained local items like the following:

"John Smith has been trapping on the Labonté and neighboring creeks, and has brought in forty beaver as the result of his season's work."

"Peter Jones killed two beaver last week near the head of Rock Creek. Beaver are scarce there now, and Pete was lucky to get these."

Items such as these have had sufficient currency in the press to have attracted the notice of the officers of the association, and it would seem that by a little effort some one of the numerous law-breakers might have been brought to book and punished. A single conviction would have put an end at least to the open violation of the law, and would have greatly increased the respect in which the society is held by the public. The protection of the beaver is not less important than that of game animals, and we hope that the recurrence of another trapping season will find the officers of the Wyoming Association so far on the alert, that any open violation of the wise act in regard to this great rodent will receive prompt punishment.

During the past winter not a little elk skinning has gone on in the Territory. The law forbidding the sale of hides

has been evaded by transporting the skins by wagon down to Fort Collins, Col., where they are readily sold. It is true that the elk and the blacktail deer and the antelope are not slaughtered in anything like such numbers as they used to be a few years ago, but this is the result more of the scarcity of the game than of any respect felt by the skin hunters for life or law, or any apparent efforts on the part of the Wyoming Association to stop the butchery. We have no desire to be hypercritical nor to belittle the difficulties of enforcing the law in a country where the conditions obtain which are found in Wyoming, but we do wish to see the fast disappearing game of the Rocky Mountains protected from the skin hunter. We know (few men better) that it is simply impossible to prevent the slaughter, except by closing the markets, but the wagons which carry the butchers' spoils to Fort Collins pass through or close to Laramie City, and so the traffic ought to be detected and stopped. If, as was at one time hoped would be done, the stock men all over the Territory would take hold of this matter of game preservation in earnest, they could, in a very short space of time, make the butchers and illegal trappers feel that their shameful business was a dangerous business as well.

If anything is to be done for the game it must be done speedily, for each year shows more plainly than the preceding one that the big game of this continent is doomed. Only in the Yellowstone National Park, if the United States officials do their duty, has it any hope of surviving the ruthless persecution to which it is constantly subjected.

ONE OF THE FOOLS.—A correspondent writes to us that, misled by the glowing but false representations of a contemporary, he forwarded some time ago the fee for membership in a certain Western hunting club, and received from the officers promises of information and assistance in a proposed expedition to one of the Territories. Since the receipt of the acknowledgment of his money, he has had no further advice from this so-called club, and he now asks whether there is any means by which he can secure the return of his fee or in any way obtain satisfaction. We presume not. This is evidently a case of the "fool and his money soon parted," and we confess we have no sympathy with the fool. A man who has not intelligence enough to use ordinary prudence in dealing with strangers, deserves to be plundered.

It is from the ranks of this class of simpletons that the unfortunates are drawn who become the prey of the "bucco steersmen" and "sawdust men," and those, scarcely less silly people who answer catch-penny swindling advertisements under the impression that while all the world beside will be duped, they will be dealt fairly with. How anybody outside of the walls of an idiot asylum can be imposed upon by the shallow devices of these sharpers is very mysterious, and yet the rascals, if we may trust the frequent exposures of their practices by the newspapers, make a fat living off the world at large. It may be set down as a true principle, that in the long run all attempts to get something for nothing will prove failures. All things have their price and are worth what they will bring, and any effort to obtain them without rendering an equivalent, whether it be in money, in labor, or in marketable goods, is a clear violation of the most self-evident principles of political economy.

THE ANNOUNCEMENT of the capture of a hooded seal on the New Jersey coast, and its exhibition alive for nine days at the Zoological Garden in Philadelphia, will be a matter of great interest to many of our readers. Mr. Brown gives in another column some valuable notes on the subject, though the death of the captive precluded any lengthened observation of the habits of the species in captivity. The hooded seal is known among sealers as the most ferocious and difficult to capture of the species commonly found on the North Atlantic coast, and the Philadelphia specimen, even though so young, appears to have shown the usual temper of its race. We learn from Dr. C. H. Merriam, whose name is familiar to all our readers, that during a recent cruise which he took on a sealer along the Newfoundland coast, and among the ice fields off Labrador, he found this species quite abundant. He secured during the cruise 120 specimens of seals, most of them *Cystophora cristata*. Mr. Brown is to be congratulated on having secured for his collection so uncommon a species of seal. And the bringing together of the hooded seal and the sea elephant—two rare and closely related forms, yet from such widely separated localities—was a piece of great good fortune. We shall look with interest for Professor Chapman's paper on the anatomy of the present specimen.

THE WIND-GAUGE QUESTION.

THE wind-gauge question is the one drawback upon the prospects of the American team, so far as its preliminary practice is concerned. It was thought that the Wimbledon rules might be construed into keeping the American team men from practice during the Wimbledon meeting, but the discussion at the spring meeting of the members of the British Rifle Association further showed that the rifle-men of the visiting team using the screw wind-gauge had little prospect of admission into the many matches at the great meeting.

The speaker, at that meeting, who urged that the utmost liberty should be given the American team, was silenced by the remark that as the Americans had not made a formal demand for the use of the screw wind-gauge, therefore it was evident that it was a matter in which they had no interest, and that it was a matter of utter indifference whether or not the rule prohibiting the use of such wind-gauges was enforced at Wimbledon.

The speaker should have remembered that it would hardly have been courteous for the visitors to look ahead in this way. It is known to the British Council precisely what sort of weapon the Americans have prepared for the match, and it is known that they will wish to practice with these arms as much as possible upon the very range and at the very firing points from which the final match is to be fought. If such privilege is not accorded them, they will go into the match handicapped to a certain extent, and certain very invidious comparisons will be made with the treatment which the British team received a year ago. At that time Creed-moor was thrown open fully and freely to the visitors. They fired over the same ground which was to be used in the final match, and no restriction of any kind was placed upon their use of the range.

The American team in England would like the privilege of getting all the shooting possible over the Wimbledon ranges during the fortnight of the general competitions. It will not do to say that the pool targets are open to the general marksmen on the range. The exercise at the pool targets generally consists in standing for an hour or more in line, and then hurrying through a few shots, so that the value of the shooting, so far as making any acquaintance with the range is concerned, is about nothing.

If the full value of the fortnight's stay at Wimbledon is to be gained by the Americans, it must be by the right to enter without hindrance all the several military breech-loader matches. In this way, too, the English rifleman may learn something from the methods of the Americans, and there certainly will be cultivated a good fellowship between the Guardsmen of the two countries, which is after all no small part of the permanent benefits of an international match.

We beg our English friends to dislodge their minds of the idea that the American team are indifferent over the fact that the Wimbledon programme, as it seems to be arranged at present, shuts them out of many of the most valuable practice matches, and if this exclusion is kept up, it will do much to weaken our present faith that the match is to be one of a fair field and no favor.

THE MEN who sailed on Tuesday in the steamer Alaska to compete with the best rifle shots of Great Britain, went off in good health and spirits, accompanied by the cordial good wishes of a large throng of spectators. Although no predictions can as yet be made as to the probable results of the contest in which they are to engage, it seems certain that the prospects for victory are far better than they were at this time last year. We have every confidence that the men will do their best, and the arm with which they are equipped has shown that it can do most accurate work. With which ever side the victory may rest, it seems likely that the scores on both sides will be very satisfactory.

PLENTY OF BIRDS.—Private advices from several of the Western States speak most encouragingly of the prospect for the fall shooting. It is rather too early yet to predicate much upon such reports, for a great many things may happen in the two months that intervene before even the prairie chicken shooting opens. Still it is satisfactory to learn that in many sections the birds wintered well and have had favorable nesting seasons.

GAME PROTECTOR NEEDED.—The need of a game protector for New York city, and one for Long Island, is every day more apparent. Will not the State executive help the sportsmen to protect the game and fish?

THE ICHTHYOPHAGOUS CLUB.

THIS famous club will have its fourth annual dinner at the Manhattan Beach Hotel on Tuesday, June 20. The invitations, requesting members to assemble at the time and place named at 6:30 P. M., have been issued. These say that the club will meet "to discuss the qualities of many rare and excellent fishes, as well as of some less prized but not less toothsome mollusks, reptiles, and denizens of the deep, interspersed with such due admixture of familiar flesh and fowl as may sustain the strength of the least adventurous, and satisfy the yearnings of the most fastidious."

We fear that this indicates a backing down of the club from the high ground it has occupied, as it certainly intimates that it is about to make concessions to popular prejudice by introducing into its feast a "due admixture of familiar flesh." The club has claimed to be a medium for introducing to the public certain inhabitants of the water, as well as "denizens of the deep," which may prove to be wholesome food, but against which there has existed an ill-founded prejudice because of a lack of beauty in either their countenances or in their general appearance. In this good work they have had the moral support of those who look beyond the surface of that vague science called political economy. The club has introduced to public notice the despised skate, which is now occasionally sold in the markets, but which was long tabooed for no good reason. The skate is largely eaten in Europe, but not being in fashion here, our poorest people would not touch it because it had the reputation of being unclean, and, as consequence, tons upon tons of this very good fish are thrown away every week, while thousands of people in New York are in want of a dinner.

The new departure of the Club is to be regretted because the average man will decline water snakes, snails, angle-worms, and shark's liver, when the menu contains "familiar flesh and fowl," and so the usefulness of the club may be greatly impaired. We hold that a member of the Ichthyophagous Club is bound to sink all inherited prejudice, and eat every living thing which the waters produce, even including those vague and possibly horrible things described as "denizens of the deep." To this end each member should insist that there be no "familiar" dishes, and that every other member and guest should eat of every dish that is served, in order that the public may know what is good and wholesome. If by any chance a few of the members should die from the effects of some poisonous monster's flesh, then those members' names should be inscribed upon the roll of honor, and pass into history as those who have died to benefit their fellow men. Certainly no one can accuse those brave men, who have unhesitatingly swallowed hellbender steaks and fried sea-snails, washed down with octopus soup, of being afraid to carry on the war against prejudice through any fear of personal harm. We certainly do not; we know too well the stuff that they are made of, to suspect that the proposed concession is at all dictated by personal considerations, and feel sure that had they been among the grounders of Frederick the Great, when their comrades hesitated before a charge which looked hopeless, and their king rode in front and asked: "What! do you fellows want to live forever?" they would, with one voice, have answered: "No."

Reading between the lines of this invitation, we see only a desire to please the new members, and perhaps to cheer them on by devouring the mysterious "denizens" before them, while they (the new members) content themselves with "civilized" food until they can sew their combined courage to the sticking point, and gradually arrive at the point when all pre-conceived notions as to what is edible have vanished, and the effect of an early education which was filled with prejudice, is partly or wholly gone. All have heard of the honor that is due to him who makes two blades of grass grow where but one vegetated before, but we think that an equal amount of merit should attach to those who teach us how to use what the earth or the waters provide, especially such things as are thrown aside as not fit to eat, when no one has tried them to find out whether they are or not. The fact that our grandfathers did not eat certain things is no reason at all why we should not test them, and a broiled "toad-fish" may be equal to any other fish, for all that the fisherman, who catch and throw them away, may know. The fishermen of Connecticut will not eat sturgeon, the royal dish of England, and yet they eat lampreys which the New Yorker turns up his nose at. Neither of these persons have tasted the fishes in question, nor would they do so unless under compulsion.

It might be well for the Ichthyophagi to consider the propriety of having different degrees among the memberships, and to mark these degrees by divisions at the table. For instance, a new member sits at the foot of the table, and notes are taken of the dishes of which he partakes. If he goes through with the muskrat stew and the toad-fish, he is admitted to a higher seat at the next feast, when, if he devours his water snakes and fried angle worms with gusto, he is promoted to be a brother in full standing. We are glad to learn that the old custom of the club of holding a new member on the floor and inserting repulsive "denizens of the deep" one after another down his oesophagus with a pump, has been abandoned. This course only produced nausea in the strongest stomachs, and in several fatal cases the coroners strongly condemned the practice. That was one extreme, the new departure of pandering to prejudice is another. The true method of inducing the novice to eat of the unusual viands lies between the two.

Those of our readers who would like to unite with this body of philanthropists, may have an opportunity of joining the martyrs to nightmare and dyspepsia by addressing the officers of the club, which are, as given on our invitation, as follows: President, John Board. Executive Committee—Engene G. Blackford, Robert B. Roosevelt, Fred Mather, Charles R. Miller and Barnet Phillips. We hope that all who propose attending this fourth annual dinner will notify us where we may find suitable data for an obituary notice, as we already have on file complete ones of the older members in the readiness for any emergency.

FOOD AND SPAWNING OF STRIPED BASS.—In the proceedings of the American Fish-cultural Association, in another column, will be found some notes on the food of the striped bass, by Prof. H. J. Rice, and also some account of the successful hatching of the fish, by Mr. S. P. Worth. The bass has been hatched in very limited numbers, just enough to experiment with, for years, but the fish-culturists have found where they spawn, so that they can be obtained in quantities. Mr. Worth is the first to obtain the eggs in large numbers.

JUNE WOODCOOK.—A correspondent writes us that at the Manhattan Beach Hotel, at Coney Island, John Breslin proprietor, he saw a few days ago twelve woodcock—small young birds. Will Governor Cleveland give Long Island a game protector?

The Sportsman Tourist.

SPORT IN CALLAO BAY.

IT may be of interest to some of my fellow-readers of FOREST AND STREAM to hear a little of life, from a rod and gun standpoint, in this quarter of the globe; and on that supposition I give you a few bits of experience from the lives of a friend and myself, who are in temporary exile in this dreary spot, and who are forced to devise all sorts of expedients to prod dull time along.

On account of the present military occupation of this unfortunate country by the Chileans, which precludes all possibility of getting into the interior, my experience has been confined entirely to the coast, and, indeed, to a very limited extent of that. From all accounts the upper plateaus of the mountains, fifty or seventy-two miles inland, abound in game of great variety, and, barring the rarest atmosphere, it is easily bagged. Properly speaking there is no game at this point on the coast, unless an occasional flock of bay birds, with a stray curlew or two, may be so denominated. But to my yarn which, though it has little to do with game, does deal to a slight extent with fishing line and rifle.

To premise I will state that our present home is on board the United States steamer —, at this time lying at anchor, close under the lee of the island of San Lorenzo, some four miles southwest of Callao. I make this reckless statement with a full realization that it will be apt to blast my reputation for veracity among those acquainted with the present state of our navy; but, if necessary, I can produce affidavits to prove the fact, and so I will condemn me without previously investigating the case.

Having stretched your imaginations sufficiently to grasp this fact, please consider us in strict quarantine, greedily willing to receive anything in the fresh fish line capable of being eaten, and you have our exact status.

The Doctor and I, being the only officers on board who were fond of fishing, nobly sacrificed ourselves on the altars of our respective duties, and volunteered to daily sallies forth with hook and line, in search of what the sea might yield us. For a fishing ground we chose an old launch, anchored near the island shore, in some three fathoms of water, and thither, with hand lines (neither love nor money will purchase a rod in Lima or Callao), we daily repaired and caught large quantities of fish, called by the natives "cabrilla." They are a fine food fish, weighing from one to three pounds each, and outwardly much resembling the ordinary fresh-water perch. We also caught mackerel, eels and various other fish, mostly useless for table purposes. Every day white fishing, we lost several hooks and parts of lines, which were carried off by some immense fish, whose movements, when hooked, were as uncontrollable with our light tackle as would have been those of a locomotive. After a few days this naturally grew a little monotonous, and we determined to try and get a glimpse of the creature that was apparently amusing himself so highly at our expense. We, accordingly, each procured a large eel-line, to which we fastened three heavy hooks, and half a pound of lead. These machines we leaved with a good-sized mackerel, and let the bait lie close to the bottom alongside the launch. We took the precaution, luckily, to coil down about 100 yards of each line in the launch free for running.

The second day of the trial of this device, just as we were winding up our light lines for the day, and when the bottom of the launch was well covered with flapping fish and squirming eels, the Doctor's big line started over the side for Callao at about fifteen knots an hour. He made a wild grab for it, missed it, fell down in the bottom of the launch, recovered himself, spit out a couple of stray eels, and a good kind of strong language, and finally got hold of his machine. He had here since wished that he had fallen down again, for that line was probably the worst thing he ever got hold of. The Doctor is not of a prevaricating disposition, and when he took firm hold of that line and excitedly shouted, "I have got him," he doubtless thought he was telling the truth; but it was but another version of that old, old story of the man and the bear, and he only kept up communication with the terminus of the line long enough to get two of his fingers cut well in toward the bone. He let go, remarking with a good deal of unnecessary force, "The d—n beast can go — Cotopaxi." Whether or no the occupant of the far end of the line heard this expression, I cannot say, but I presume it did, for it immediately stopped, doubtless to give the remark due consideration, and to cogitate upon the feasibility of taking up the liberal course of travel, opened up for it by the Doctor's quaintly worded remark.

The sudden stoppage of the line caused us both to think that our game had escaped, but a cautious pull satisfied us

that his flag was still there, and, as it showed no signs of immediately renewing the fight, we prepared to do a little work on our end of the line. The fish was on the Doctor's tackle and the place of honor belonged to him; accordingly, having duly fortified his hands with a pair of gloves and some old junk, he declared himself ready to begin offensive operations. Fearing our customer would foul the anchorage of the launch, we got into a small boat alongside, the Doctor handling the line very gingerly during the transfer operation. When all was ready I took the oars and rowed gently in the direction in which the line trended, the Doctor meanwhile taking in the slack of the line and coiling it carefully down in the bow. When he had got in about seventy-five yards he found it about up and down. He then braced himself for another trial, and, with a light yarn brake, for cutting my fingers," and gave a yank on the line that would have fairly staggered a bull. It was sufficient. The fish evidently thought a young earthquake had generated right under it, and accordingly started for a cooler clime, but in making calculations it forgot to take into consideration the new ties it had so recently formed, and was forced to stand upon the order of its going. The Doctor had his blood up at the time, and the fight began, our fish came to the fifty pounds pressure. Even with this strain on the beast and if all its own way for a long time, and towed the boat backward and forward like a cork. When the brute tired of this kind of fighting it began sulking. It would lie on the bottom and would not stir more than a few feet, jerk and pull the line as we would. Whenever it did move the Doctor worried it as much as possible, and finally, some forty minutes after the battle began, our fish came to the surface about twenty feet from the boat. As soon as it broke water our curiosity was appeased, and we saw that our line-breaking, hook-stealing friend was one of the ray tribe. We thought it had given up, but it was apparently satisfying its curiosity also, for as soon as it saw the two objects it was fast to it made a desperate rush for liberty. That was the end of his last effort of fight, and, though extremely violent, did not continue long. It came to the surface again and again, and we shortly had it close alongside the boat. I told the Doctor to keep a taut line on, while I took a knife, with a ten-inch blade, and prepared to give the beast a death-blow through the brain. Our scheme of annihilation was very well planned, but "the best laid schemes o' mice an' men gang aft agley," and when I, with my trusty knife, was ready to give the fatal blow, the brute, with a tremendous splash, moved off a yard or two, and I ranned that knife countless fathoms down into the bright blue waters of Callao Bay. I stretched my temper further than I did my arm, but, although I shortly regained my usual sweet disposition, my right arm is still several inches in excess of its normal length. You can, perhaps, imagine the blissful satisfaction I experienced when, shortly after the day's mishap, I succeeded in putting that knife (with my left hand) into a fatal spot in our quarry.

The Doctor thought my accident very funny, and did not get over his hilarity till he had been surveying his captive. Then the overwhelming knowledge of his own puissant prowess so overcame him, that he would not deign to notice so insignificant an individual as myself. I felt my own inferiority, and humbly begged his pardon for the blow from the water, by means of a crane, and deposited on a small hand-car, whence it was removed to the scales at the smelting works adjacent, and found to weigh 81 1/2 pounds. The Doctor, whose fishing experience had heretofore been mainly confined to trying how far he could throw a three-quarter-pound bass through the cerulean atmosphere of a clear day, means to try to make a record. He has quite overcome by the weight of his own laurels, and fully realized that, unless I wished to everlastingly forfeit his regard, I must catch a fish weighing well up in the double figures. So the following day I girded up my loins and sallied forth to redeem my lost position. The Doctor endeavored to accompany me, but the expedition was a barren failure, and my greater good fortune led me to make the day succeeding that, however, fickle fortune smiled upon me, and I succeeded in hooking two rays. The first one got the line foul of the buoy anchorage before I could get him under control, and soon broke away. Shortly after I hooked another, and after about an hour's hard work, much similar to that described before, I landed the largest fish, by over a hundred pounds, that it has ever been my good fortune to capture. The fish was a fine specimen of the genus: From tip of nose to tip of tail, six feet two inches; from the extremity of one enormously developed pectoral fin to the extremity of the other, five feet eight and one-half inches; weight, 136 pounds. Its large bulging eyes, uncouth rhomboidal shape, and long flexible tail, gave it anything but a fish-like appearance, and made up a *total ensemble* that was extremely peculiar. The fish I have been speaking of gave a single spike at the base of the tail, and from the limited means at my command for obtaining such information, I concluded them to be *Raja trigloca*.

If any of my readers wish to get information as to the edible properties of this fish, I refer them to Col. H., of the Island. He, burning to make a discovery in gastronomy that would pleasantly astonish his fellow gourmands, had a steak cut from one of the fish, and served it to me the following morning as the first course at a breakfast for two of my friends. His guests were not hunting for discoveries in that line, and, after being helped, they patiently waited for the Colonel's verdict on the newly discovered delicacy before bestowing their meed of praise upon his deserving head. He took a generous mouthful upon his fork, placed it where he thought it was going to do the most good, and, with an ecstatic smile, began his hasty way at it. He had scarcely taken a few mouthfuls, and soon died away entirely. Then his face assumed a sickly green color, and remarking, "I am not overfond of rich pastry for breakfast," he left the room amid the roars of his guests. The new discovery was afterward tried upon a dog, but he, less reckless than the Colonel, would not even deign to put a bit of it in his mouth.

A short distance off the southern end of San Lorenzo there lies a small, barren, uninhabited island called Bugan, and from the limited means at my command for obtaining such information, I concluded them to be *Raja trigloca*.

A short distance off the southern end of San Lorenzo there lies a small, barren, uninhabited island called Bugan, and from the limited means at my command for obtaining such information, I concluded them to be *Raja trigloca*.

This we resolved to take advantage of, and a few days since we made up a party of six, suitably armed, took possession of the ship's sailing launch, and got under way for our proposed fishing ground. As we intended to be gone most of the day we carried a loaf of bread, to stave off all danger of water famine, and the Doctor thoughtfully compounded a few mild prescriptions, in suitably labeled bottles, that gaunt hunger might be lulled should he attack our jolly crew.

After a pleasant sail of a couple of hours we dropped anchor behind an out-putting point that completely hid us from the land. We had a bag of bait, and had a couple of lines on hand. We got the small boat (which we had towed alongside, and made preparations to land. Here arose an obstacle, which we had completely overlooked, viz., a difficulty in landing. There was a pretty heavy sea running, and a single beach to disembark on. The water, however, was deep close in shore, so there was no greater danger than that of getting a partial ducking, while jumping from boat to beach. We had made elaborate preparations to land, and this consideration to take a long, and a half, was soon in the small boat, and two blue-jackets at the oars, rowing briskly toward the shore. We approached the beach stern to, and when at the proper distance, the first man, inwardly commending his soul to his maker, made a wild jump for it. Much to his own surprise he reached it, and succeeded in scrambling up over the loose stones without wetting a hair. The second man foolishly tried to get out between the same two bays, and got beautifully scalded as high up as his knees for his untoward haste. Of course he got well laughed at, and I being left in the boat, called into exercise the Nestor-like sapience for which I am noted, and concluded to show that young man how to land dry-shod. Carefully balancing my fiery-like form in the stern sheets, I assumed an attitude of unobtrusive grace, and at the critical moment stepped lightly from the boat. My foot, with but slight noise, struck the sand, and I was up, with my hands on my hips, and when it struck the noble stones on the bottom. I assumed the latest disposition, and was sauntering leisurely ashore, when old Neptune, doubtless thinking I was not going to fetch, kindly sent another roller to help me. This coming as high as my armpits, was of material assistance in carrying me to my goal. I got above high water mark as soon as consistent with my dignity, and by a new system of drainage, there and then, I formed an up and salt lake of very respectable size. In the meantime the balance of the party had got ashore, along with more or less water, and we started over the hill for our prey. From its crest we discovered about a hundred sea lions on a strip of beach a little to our left, and exercising due care, we all, in about ten minutes, got safely ensconced behind a large flat rock, within a few yards of the nearest lions, and they utterly unaware of our presence. There we were spread over quite a long beach and in all sorts of positions, most of us with our backs to the sea. For a long time we watched them in their fancied security, great hulking fellows from seven to ten feet long, and then, each picking out a victim, we drew bead, in a good deal of excitement, and cut loose. After the first discharge it was touch and go with us as fast as we could load and fire, until the beasts got into the sea, but I don't think there were many effective shots after the first round, as everyone was pretty highly excited. This impression was made almost certainly afterward; I found that two of the party had been firing at an elevation of 200 yards, when their targets could not possibly have been more than thirty yards distant. Among the sea lions the first discharge seemed to produce nothing but astonishment, for they merely reared up on their flippers and looked at us, perhaps wondering what we were making such a devil of a row about. In the subsequent part of the day we were anxious to try to shoot some, and they lumbered into the sea, one over the other, in the unbecoming confusion. When we ceased firing we found four dead ones and two others so badly wounded that they were unable to reach the water. These we soon dispatched, and then hastily went down to the next beach, where we repeated our previous tactics and succeeded in killing three more. After this we perched ourselves on a huge rock, and kept up our ammunition in tabling snags, pots and things at them in the water. They seemed to be highly endowed with curiosity, and would rear their large heads out of the water and gaze intently at us for at least half a minute before going down again, thus affording a fair target for a reasonably quick shot.

On the morning after our expedition, men were sent down to our shooting rounds to collect the skins and blubber from the dead animals. The blubber was taken up on the beach. The blubber from these, dried out by a very slow process, yielded an average of about sixty pounds of oil to each animal, and I, from this data, judge their weight to range from 700 to 1,000 pounds each. The skins have been sent to Lima to be tanned, and I await with considerable curiosity the appearance of the resulting leather.

There is a Peruvian law against killing these animals, as they are the main source of food for the Indians, and since the Chilean occupation, this law, for obvious reasons, has not been enforced. They destroy an almost incalculable amount of valuable food fish every year, and we feel no compunctions about hunting them, as we consider they do far more harm than good.

I have heard a good deal about killing seals by hitting them on the nose with a cudgel. That this is true is a fact altogether too well established to be doubted; but if anyone has an idea that these sea lions can be gathered in in that way, and is foolish enough to experiment on that idea, he would soon become convinced of his mistake. Opportunities are not wanting, just here, for adventurous spirits to try this means of killing them, but they are never taken advantage of. It is my candid opinion, that the remains of any person, who gets between a herd of large sea lions and the water, will be lying in a gummy sack.

I have tried the cudgel act on an ordinary walrus once, and it had about as much effect as if I had pounded a bag of sand with a toothpick.

I hear that the Oroya railroad is about to be opened up and that trains will soon be running up into the mountains. If this be true, and quarantine does not prevent, I shall soon go up with a few friends on a shooting expedition. If we go I will give you some of our experiences in the highest altitudes.

DEATH OF THE "BROWN STUD."

SOUTH of Boise City, Idaho, there is a great tract of lava country bounded by the Snake River, which is only fit for pasturage. This vast expanse is seventy-five miles one way and from twenty to thirty the other way. No living streams or springs intervene, and in summer heat it is impossible even for stock to live in some parts of it. For ten or twelve years we have seen the home of a number of wild horses, roving in bands of ten to twenty, five or six to twenty or thirty. Each band is led by a stallion, and he guards them like the most watchful sentinel. Snuffing the danger, away he gallops to some elevation, where in a moment he spies the intruder, and back he gallops to his band to lead them in an opposite direction. Many horses each year were lost, and only a short time elapses before the same are all wild alike. This year these bands have been

broken up and most of them captured in a great corral. This corral has wings spreading out to catch the animals as they were chased down by their pursuing pursuers.

To the Damstien brothers, of Boise City, belongs the credit of doing this. It involved great expense and took an iron will, endurance and good plans to accomplish. Among all these horses there was one noted for his surprising swiftness and nobleness of bearing. A hundred dollars had been offered for his capture, and when the different bands, numbering altogether 125, had been run down and captured, it was thought that by having twenty horses or more for relays stationed at points where the chase could be plainly seen, the noble animal would have to give up. Accordingly on the 26th of May a party started out from a dry camp twelve miles from any good water, to find and chase down the "brown stud," as he was called. And no one ever supposed that his blood would redder the larrikin's noose that night. He was sighted with his hand near Dorsey Butte, and, after a most exciting run of about seventy miles in four hours and a half, mostly over a lava country, rough and broken with fissures and naked masses, with high sage brush everywhere reaching to the knees, he was captured. Nine of the best saddle-horses took him by relays, one of these, a celebrated horse called Portland, himself of great power and activity. This horse alone gave the stud a breathless chase of twenty miles on one circle. When tired, panting, but bright and noble to the last, the brown stud reached one of his old watering places, pausing as if for some lake farewell, he staggered and dropped struggling mightily against death. The terrible convulsions of the noble horse brought pity to the hearts of his captors. Everyone brought water in their hats to the horse and tried every remedy in vain. He had run his last race. Captured with him was a fine, fast, iron-gray gelding, which always ran with the stud and scemed his inseparable companion. As a usual thing, the stallion will not allow a gelding in the band. This was an exception. He never allowed the iron gray to camp, but he never rallied; toward night the look of death came over him, and in the morning he, too, was dead. The color of the stud was dark brown. He was six years old and weighed 1,000 pounds.

A CAPTIVE HOODED SEAL.

Editor Forest and Stream:
Some days since you wrote me inquiring as to the identity of a seal which was captured on the 3d of June, near Spring Lake, New Jersey, and forwarded to the Zoological Garden. At the time of my reply, I was able to refer it only to the common species of the North Atlantic (*Phoca vitulina*), and it was some doubt of the correctness of the identification. It was quite different externally from any I had ever seen, and yet might well have been taken for one of the dark, unspotted individuals of that species. Any close examination was made impossible by its vicious bites and struggles when handled. It was in poor condition when received, steadily refused food, and died on the ninth day after arrival, when its incisor dentition ($\frac{3-2}{3-2}$), the large development of claws on hind feet, with other details, proved it to be a young female hooded seal (*Cystophora cristata*). Although a few specimens of this seal have been seen on our shores, even as far south as the Chesapeake, yet its occurrence is sufficiently rare to be worthy of note, and at this season of the year it may be inferred that a considerable part, at least, of the voyage was performed on an iceberg or floe.

The short life of the animal gave little chance to observe peculiarities of habit, the only ones observed being its extremely savage disposition, to a degree far greater than I have ever seen in the common seal, and its habit of floating in the water with the axis of the body almost perpendicular instead of horizontally, as with most other seals. Both of these habits I find to be mentioned by those who have observed the animal under similar circumstances.

It is much to be regretted that the specimen did not live, as its presence in the same pond with specimens of three other North American seals, the common seal (*Phoca vitulina*), the California elephant seal (*Moschophoca angustirostris*), and Gillespie's hair seal (*Zalophium californianum*), would have offered a rare opportunity for studying the moral differences of these species.

It is curious to observe that the habit of floating perpendicularly, above referred to, is shared by it with the seal-elephant which it resembles in dentition, and quite strikingly in internal anatomy, the two genera forming a group quite apart in subordinate characters from the other *Phocinae*.

ARTHUR ERWIN BROWN,
ZOOLOGICAL GARDEN, PHILADELPHIA, JUNE 14.

THE SWALLOW.

OUR swallow is a cheerful, untiring little fellow. Never a meadow at sunset, without some members of his immediate family darting across, over and back, with doubles, and twists, and swift glides, all combining to make up a most erratic though graceful flight.

Now high in the air when the minute insects seek the upper strata, he dashes through their midst, gathering his food, and rolling in his scales of health, as testified by his intermittent bursts of joyful rattle. Meeting a friend in his airy flight, they career off in company, giving utterance to a continued though not strikingly melodious warble, as they take long stretches together with outspread wings, until a fresh impulse sends them back again to spread dismay among the insect rattle.

All this is carried on amid the most rapid changes of light and shade in the sky, over the western sky, until twilight steals on; then our little singer and we are left alone with our thoughts. We stand in imagination in the doorway of the old barn, and memory sends a flood of yellow sunshine around us, lighting up the old building as in the past. The farm hands are in at dinner, and, save the comfortable sound of munching, coming from the stalls under the mow, all is quiet repose. We step again into the silo and hear the busy buzz of that same old blue bottle fly we used so often to see, as he quietly stretched his wings and revelled in the full glare of the midday sun. What are we here for? To stone the swallows' nests! Would we do it now? No sir! But at that time we were boys! The hay which crammed the barn last autumn, has been fed to the stock, and the great cavernous mow shows its ribs of

poles as we look up, with here and there a wispy hanging straight down, or fastened on dusty spider webs, swaying to a gentle movement of the air. Our volleys of stones whiz through the air, and great swarms of mud and rubble all around the little mud house, so cozily resting on the lowest peg that pins the rafters. As the harmless missiles bounce down among the cattle, causing a momentary panic, we hear the warning slam of the blind door on the kitchen stoop, and scamper out through the back door into the current bushes, as Tom charges down on the other side, in a vain effort to catch us, until, enough of this, the dust we made in those days is still visible in my eyes, and I have lost track of the swallows for a moment.

I have an old saying in mind, "When the swallows fly low, look out for a thunder storm." True on the borders of the woods, or on the lawn, where the insects which form its food instinctively seek the shelter of the shrubbery on the approach of a storm, which then subtle nature warns them is not far away. There the swallows follow them, darting round and gathering them in by scores, but not so invariably the case on the meadows, where they will follow the grazing cattle, flying low and catching the myriad insects disturbed by them in feeding. Here you may see all the family congregated—swallows, swifts and martins, all tumbling around as they gather their food in a regular jumble of uncontrollable fun and good spirits, and on a bright day with no trace of storm in the sky. A pair of swallows were building under our front porch at one time, but owing to the interference of some dozen English sparrows, had hard work to carry on their labor. Noticing their distress I championed them, and by careful watching enabled them to carry the work to a successful issue. The eggs were laid, and the little couple happy in their wedded life, before I thought it wise to relax my watchfulness. Thinking then safe, I omitted for a day or two any supervision, and the sparrows, with a vindictiveness that never sleeps, took the opportunity to nest the inmates, and kick out the eggs. Not content with destroying their happy home, they had installed one of their number in the broken nest, and there he sat, a feathered "dog in the manger," greeting with open beak and savage chirrup, the fluttering approaches of the distressed swallows. With my Floret I slew him where he sat, and his rotting carcass still held possession of the deserted nest a week afterward.

During the month of October the swallows gather in flocks, and especially near the salt marshes, and the telegraph wires spanning the Diker meadows near Bath, L. I. are black with their little forms, while thousands more are continually hovering near, trying in vain for a resting place, so closely are they clustered together. After days of excited debate, each individual lending his voice to swell the general twitter, off they go, and only a solitary loiterer now and then reverts our search in their accustomed haunts, as he fits by with a lonely trill.

The "Indian has a happy hunting ground in store for him," and I often wonder if our hereafter will not be peopled with the fairy forms of nature's feathered darlings! This world would indeed be dreary without them.

L'HONOREL,
NEW YORK.

A CURIOUS INCIDENT.—My house on the seaside fronts the water. The Chesapeake Bay is about five miles distant in the west, and the Sound about two miles in the east, and the Atlantic Ocean twelve miles off in the same direction. One of the rooms in the second story fronting the west, had a pane of glass broken out, and it was not put in because hawks would silt in the trees in the lawn, and if a door was opened they would leave, so we silted them through the door for storm protection. In the fall of the year, through a storm from the southwest, the room spoken of was blown out much, and all the ladies of the family being absent it was not entered by any one for more than a month. Something took me in there one day and I saw sitting upon the mantel a bird. I found that it was dead, almost a skeleton as far as flesh was concerned, and dried up. It was a stormy petrel. How did it get there? I can only suppose that during the storm it was blown in from the bay to the sea, it had accidentally flown into the room, through the broken pane, and not being able to find its way out had starved to death. It is very seldom that one of them is seen in the bay, and I have seen only one inside, and that was at Great Egg Harbor, New Jersey, many years ago. The curlew and bay snipe were scarce here this spring. The spring shooting tells upon them and the gulls are so persistently egged that they too are not as abundant as usual.—Old POPE (Johnston, Va., June 9).

THE ENGLISH SPARROW.—I notice with pleasure E. C. Bell's letter regarding this nuisance. Their constant chattering is enough to drive any birds away that are not deaf, for their song is about as melodious as a fishmonger's trumpet or the warbling of a laying hen. We should crush out this too prevalent bird. Around our parks people have erected for their use boxes and fine houses. If the same attention was displayed in attending to the comfort of our native songsters, I think the parks would be increased. Inverse conditions in numbers each year, we shall rue the day we ever invited them to our shores. They were imported, at least some of them, for the purpose of looking after the interest of canker worms, when the orchards in this vicinity were stripped of their foliage, but it is evident that they did not hanker for the diet that is prepared for them. One cedar bird will do more toward destroying canker worms than the food of it. If any of our native songsters should be made scarce, a good number of birds, such as sparrows, would encourage the parties to eat these sparrows. I will guarantee that a supply of birds will be furnished the eaters at no expense to them. Or suppose some Yankee should see a chance for a "canning factory," have them put "boneless sparrows" or "evaporated," we do not care which way they are served.—FRICK FLICK (Hartford, Conn., June 16).

FOR THE FIRST TIME.—The five elephant seals, or, as they are more commonly called, sea elephants (*Moschophoca angustirostris*), now on exhibition at the Philadelphia Zoological Gardens, are the first that have ever been shown alive. These great seals are so much sought after for the oil which they yield that they have become very scarce and their skins and skeletons are very rare in museums. They are practically extinct on the Pacific coast of the United States and are found in numbers only in the Antarctic seas.

GREAT HORNED OWL.—Bay Ridge, L. I., June 12.—Took a fine specimen of the great horned owl this A. M. Is not this unusual for this time and locality?—DICK. [They stay with us the year round but are not often seen in summer.]

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

THE CAMP.

IT was the close of a hot dusty day toward the middle of August. That a party of adventurers lighted their campfire on Elizabeth Point, on the eastern shore of Thirteenth Pond, a small lake just beyond the hither bounds of the great northern wilds.

A group of four, all of middle age, men whose harsh hands gave token of daily toil, though they had left their cares and labors, turning their backs for a season upon the harvest field and the workshop, they had come hither for rest.

Their mission here was to give respite to muscles, long taxed, to divert minds from a constant unvarying round of cares. The location and arrangement of their camp showed that they were no novices at least in this branch of woodcraft, for their tent was pitched on a little timbered promontory commanding a view of the whole western shore of the lake, some three miles in extent, a rough and jagged mountain line coming down abruptly to the water's edge, indented here and there with sharp gaps between peaks that loomed darkly against the evening sky, and threw their black shadows now quite across the lake at their feet. An army tent set with front toward the landing, formed an awning under which boxes of provisions and utensils were arranged for convenient use, four stakes supported the large square cover of one of the boxes for a table, towels hung from a line overhead, a bar of soap lay in a notch cut in the side of a convenient tree, and by the side of a huge log upon whose trunk one or two of the party were sitting, a pile of coals which, fanned by the little gusts of wind now and then whistling up from the lake, threw out a genial warmth quite pleasant in the somewhat chilly evening, which in these forest wilds often succeeds even a hot day.

They had evidently finished their supper, for the tin plates and cups were neatly washed, arranged bottoms up on the table, and, save a kettle steaming on the fire, a frying pan, coffee pot, and tea-kettle, but from the table, driven in trees conveniently near, no other utensils of cookery were to be seen, but a covered box adjacent to the table and now used as a seat, is strongly suspected of being the corner cupboard of this forest kitchen. The party sat some time in silence, looking dreamily at the decaying fire, or watching as the darkening shadows close over woods and lake, till the sharp outlines of the opposite peaks become only the dark background of a dim, uncertain picture, growing more indistinct even under the eye of the observer.

But now an awful of dry branches thrown upon the fire sends up an inverted shower of sparks among the overhanging leaves, and soon a bright and ethery blaze brings out in clear relief the figure of him who is evidently the chief cook of the party, as now stirring into great activity the crackling pile, or kicking back some stragling brand, he smiles fitly with a knowing nod of the kettle on the fire, peers for a moment into its steamy depths, replaces the cover, and turns his back to the fire with the remark:

"Well, boys, there's the foundation of our breakfast, anyhow, provided we can't do better, but I'm bound to try again to coax those stupid trout to bite in the morning."

An instant's pause—a deprecating glance at the dull smoky sky and, "It's up hill business, this confounded dry weather tonight." The speaker, Vulcan, Knight of the Hammer, spare, muscular, square-shouldered, above the median height, with a forehead and phreological development combined with a quick decided movement that proclaimed him at a glance a master of whatever he undertook, now stood facing the others with the question, "R, did you notice how much below the mark along the rocks the water has fallen?"

He addressed a farmerlike-looking person, who smiled familiarly, looking up for a moment from a breech-loading rifle which he was cleaning, and then with some casual remarks, resumed his work.

Seated on the box previously mentioned, with elbows on the table and his head resting on both hands in an attitude of deep meditation, was perhaps the most remarkable man of the party. Slightly round-shouldered, but with a chest both broad and deep, fully six feet in height, with massive limbs, somewhat unathletic in manner, and person, his strongly marked features and the accompanying head made up an organization that Fowler would, unthought, have pronounced one of great power.

Here was a man of signal ability, and one who, upon occasion, could reef off yarus or swear oaths which his great prototype in morals and creed, perchance in person, glorious old barbaric Ethna Allen, might have equalled but certainly never surpassed.

As was his wont when thinking lurdest, oblivious to all surroundings, with ever and anon a monotonous whistle or humming so much of melody as might be dictated by an ear claimed equally by heavenly tones of Sweden's Jenny or discordant screech of Taunton engine, "The Battery" was roaming deep in unknown lore, but whether of Newton, Euclid, or Blackstone the historian sayeth not.

An animated conversation ensued between the two at the fire, who were soon joined by the fourth and last of the party.

Taller than any of the others, the listless manner and languid step proclaimed the invalid. Gaunt, lean, dyspeptic and cross, Paul Devereux scented but a sorry companion in a hunting camp.

Various topics were discussed—the procuring of a guide, prospects of getting deer, the locality and distance of other lakes, hopes of a better success, and though the evening was well advanced and the party evidently tired with the labor of bringing in their "traps" and arranging camp, there was no indication of a desire for sleep.

It was plain that the party was not yet complete, and that they were expecting an addition of some sort, for their plans were not definite, and a letterer could have heard occasionally an expression like, "We'll see about that when he comes" or "He knows the ground better than we do," etc. Conversation at last began to fail, the seat by the table was empty, but a pair of enormous long-legged boots projecting into the freight at the front of the tent, and a steady rumbling snore of wondrous depth and power, starting a shade below double B flat, and rising a semitone or so under the fullest pressure, neither of which could by any

possibility have pertained to anyone, but "The Battery," accounted for the vacancy.

As conversation waned, the numerous sounds of the wilderness became audible, the chirp of the tree frog and cricket, the weary note of the circling night hawk and distant cry of the loon, the whole family of owls, each with a different note all served to fill the vast space otherwise left to total silence.

The fire had burned low, till just enough of light remained to render visible the thin wavering spire of smoke that wound up among trees, when a faint ticking as of oars in the rowlocks came up from toward the foot of the lake, at first scarce audible, but regular, and becoming gradually more distinct. "Coming from Bennett's Landing," says one. "Yes, but who is looking about on the lake open's night as this?" "Why, it's darker than the Stygian Pool, and none too smooth at that."

"They are not steering toward us anyhow," said Paul, who was intently listening.

"How do you know?"

"Listen to the stroke and the echo, that boat is in the bay below Shanty Point, across the lake and a good half mile from here."

The rowing now ceased a moment, and was again renewed, not, however, with the light, one-handed movement of a boat at landing, but with a full sweep and a double stroke, as if the rower looked or listened a while and then pulled ahead.

It was decided to strike a light, and a few dry pine branches soon sent up a blaze that could hardly fail to be visible from that part of the lake under which the boat proceeded. A few moments passed, and a distant, faint haloo came across the water.

Vulcan bounded to his feet, "O. B. for a thousand," and an answering yell rang through the woods, over the waters, and was echoed back from the mountains beyond. Another haloo and its answer, and the oar-strokes rang quick and clear again.

"I thought I knew that yell, only he was a little out of breath. Well, I don't wonder at it, if he has pulled up from Bennett's Landing against the wind. Mind you, it blows out on the lake."

A lighted lantern was by this time down at the landing, and as the light streamed across the dark waters a whoop came back that left no doubt as to the comer.

"What in creation brought you here? I was looking for you on Shanty Point."

"All right, I'm here bare as a fallow."

"Oh, ho, it is, eh? But this ain't good camping ground."

"Wait till you see."

As the boat touched the shore, out jumped a wiry little fellow, and with a mimic bow, "How are you all? happy to see you, how's your friends, wives and babies? wasn't looking for company this evening, hey? hope I don't intrude, brought my knitting work you see. And he heaved a stack of logs, and began scrambling up the bank toward the fire without stopping to look for the path, or waiting for the lantern to lead the way, all the while rattling his jokes, questions and comments, never waiting or caring for any answer either. Arrived at the fire he pitched his pack under the table and plumped down on the log with—

"Hain't got no deer, no, nor trout either. I'll bet it, couldn't do nothing this come, no matter though, we'll have 'em, stacks of 'em. I'll show you how," and immediately began a discourse on hunting, fishing, and woodcraft in general, and of this locality in particular, telling of at least forty places on this lake where one could not fail of catching trout at any time, of more sure places for deer than the whole party could visit in a week, and interlarding the whole with seemingly no end of anecdotes of hunting adventures of his own, in fact from the time his feet touched land, becoming the life of the party. During the latter part of this performance Paul had sat cross-legged on the log with his back against a tree, taking little or no part in the conversation but regarding the speaker, at first with an air of total indifference, to which succeeded a half quizzical smile as he listened, vastly amused in spite of himself at the animated stories and quaint jokes of O. B., who but for Vulcan, several times essayed to fling a fire-brand at him, as the little rascal declared "just to walk the poor devil."

"Had a cracking shower at the Port yesterday; rain any here?"

"Not a drop."

"Pity, can't catch no trout till it rains, that's certain. Say, I drove my mare from the Port up since ten o'clock this forenoon, and not a wet hair when I got to Bennett's. What do you think of that?"

"That's nothing." This answer came from "The Battery."

"Oh, but I had a load in my buggy, myself and baggage, a bag of oats for my horse—by George, I forgot my corn or we'd have a roast—I had a sack of green corn, and blankets and so on; a load, I tell you. It's more than any of your old ricks of bones can do."

"This much of a hostile demonstration would draw the fire of that 'Battery' at any time, and with a short pause it came."

"Ho—buggy? that straddle-bug concern I kicked across the canal by Vulcan's shop the other day, and you stuck on top of it like a flea on a 'granther graybeard.' It's a pity if a horse couldn't make seventy or eighty miles in a day."

The little one roared with laughter, lying back over the log and kicking up his heels till his head nearly touched the ground, and then came back with a brisk snap on "The Battery" knee, sprang to his feet, and started on a tour of exploration around the tent, exclaiming, "Let's see how you got it anyhow," pitching headlong over three guy ropes in succession without the least ruffling his temper, or stopping the string of comments rattling from his tongue, which seemed to run just as well when down as up, he soon emerged into light from the tent for an examination of its contents, with the remark, "Pretty well, pretty well after all, most as well as I could have done if myself," to which "The Battery," by the fire, rolled up his eyes in geometrical astonishment, with a sub-bass growl of, "Thunder, hear him go it, forgot his corn, he hain't got none, too darned lazy to pack it down to the boat, I suppose, anyhow." The subject of the remark having finished his survey of the outside row, literally dove into the tent for an examination of its contents, and came out of nothing so much as a vigorous terrier in hot pursuit of a rat, he proclaimed the name and quality of each article, hauling out to the light whatever he could not determine by other means, whether it be gun, fishing tackle, wearing apparel, catables or what not, and keeping up a while a running fire of remarks for the edification of the company. Suddenly, however, the bubbling cess-pot and the astonishment of all, even the irrepressible member no longer wagged

For an instant all were at fault, but the silence was broken by Vulcan with, "Come out of that I say! come out of that, or I'll—"

What the threat might have been we shall never know, for the Knight seized a blazing brand and made a furious rush for the tent. As the light began to play about the entrance, there came a sound as of opening the valve of a suction pipe under a heavy pressure, and the curtain being lifted showed the occupant seated flat on the ground by a box of 'stores' tugging at his boot-straps as if trying to force the bottom out, and muttering in a strangely altered voice about "wet feet" and "that plaguy boat," "dry socks," etc.

Vulcan, however, was incoercible, and proceeded to examine his treasures, under a package of Dr. Whitehead's famous "specific," which, in his zeal for the welfare of the party, the worthy doctor had with his own hands prepared and with oerks securely tied and safely packed for the journey, committed to Vulcan's charge with many and full directions for use, was found in a had condition, strings broken and contents partly gone. Upon interrogation the accused stoutly denied all knowledge of the matter, declaring that the suspicious sounds must have been produced by pulling off his wet boots.

The lateness of the hour compelled the party to seek that sleep which was to prepare them for the morrow's sport, leaving the question undecided.

The curtain was buttoned, down, and wrapped in blankets spread above the beds of soft and fragrant evergreen boughs, the hunters forgot in dreamless sleep the labors of the day, its mishaps and its jokes, so also their anticipations of the future.

And now, though the pen of Paul hath even become rusty by reason of long disuse, the readers of FOREST AND STREAM may rest in the assurance that if the fates be propitious, they shall certainly, in due time, hear of the days that followed.

PAUL DEVEREUX.

FLORIDIAN EXPERIENCE.

I HAVE just read with regret "Didymus's" seathing article in FOREST AND STREAM of May 24 on Florida, and the deceptive nature of the accounts of hunting to be had there. Without wishing to cast reflections on the writer's veracity or the sincerity of his opinions, I still do most severely condemn the article in which he admits that persons will go into this State. I am not at present a resident of Florida, but from November, 1880, to February, 1882, I spent my time on Indian River, and conversed with gentlemen who had hunted the coast from St. Augustine to Tampa. From my own experience, and from the remarks of these sportsmen, I have formed an entirely different opinion of the sport and accommodations obtainable by genuine lovers of the lake and gun. It is to be regretted that persons will go into a new country and expect such a style of sport and bring as "Didymus" was looking for, and particularly is it to be regretted and repented, when such persons, not finding everything as easy and comfortable as at home, write for publication articles condemning at one sweep hotels, game, and the country at large. "Didymus" is not to understand that I am taking sides against him in his description of Florida. I am not at present a resident of Florida, but from November, 1880, to February, 1882, I spent my time on Indian River, and conversed with gentlemen who had hunted the coast from St. Augustine to Tampa. From my own experience, and from the remarks of these sportsmen, I have formed an entirely different opinion of the sport and accommodations obtainable by genuine lovers of the lake and gun. It is to be regretted that persons will go into a new country and expect such a style of sport and bring as "Didymus" was looking for, and particularly is it to be regretted and repented, when such persons, not finding everything as easy and comfortable as at home, write for publication articles condemning at one sweep hotels, game, and the country at large. "Didymus" is not to understand that I am taking sides against him in his description of Florida. I am not at present a resident of Florida, but from November, 1880, to February, 1882, I spent my time on Indian River, and conversed with gentlemen who had hunted the coast from St. Augustine to Tampa. From my own experience, and from the remarks of these sportsmen, I have formed an entirely different opinion of the sport and accommodations obtainable by genuine lovers of the lake and gun. It is to be regretted that persons will go into a new country and expect such a style of sport and bring as "Didymus" was looking for, and particularly is it to be regretted and repented, when such persons, not finding everything as easy and comfortable as at home, write for publication articles condemning at one sweep hotels, game, and the country at large. "Didymus" is not to understand that I am taking sides against him in his description of Florida. I am not at present a resident of Florida, but from November, 1880, to February, 1882, I spent my time on Indian River, and conversed with gentlemen who had

a moulter. Look at Mineo, who was given first in the bitch class. She is a Leonora—not a good one—with a split nose.

NEWFOUNDLANDS.

JAMES MORTIMER.

Mayor of Bingley was in his usual good form and easily captured first. Pete, who won second, is a fine young dog of good size with plenty of bone. His coat is much too curly. Cesar, who was entered in this class, was transferred to the St. Bernards; he is a very good dog, but he is not a setter. He is a bluish-gray nondescript with brown spots, and should have been shown in the miscellaneous class.

GREYHOUNDS.

JAMES F. KIRK.

Friday Night was an easy winner in the dog class. He was looking well, but was not quite so well shown as at New York. You Know, who won second, is a very fair dog. He has a good back, legs and feet. He is not quite up to the mark in head, and is a trifle heavy in shoulder. His eye is also a little full. Lady, who won first in the bitch class, is rather a good one, were her ears right she would be a beauty. Tony, who won second, is also a fair looking animal.

DEERHOUNDS.

JAMES F. KIRK.

Oscar, who won first, is a very well formed animal of great beauty. He is of good size with plenty of bone and substance. He is a little too heavy in head, but he is not so much as the harsh; it is also like that of his aesthetic namesake, too long. There is also a decided feather on his tail, which detracts somewhat from his otherwise thoroughbred appearance. Lord Agincourt notwithstanding his title, has a fair smattering on his tail, but that shows a decided tendency toward assuming the form of those in whose veins the royal blood so long the pride and boast of "Scotland's favored Isle."

ENGLISH SETTERS.

JOHN W. MUNSON.

In the champion dog class Royal Ranger had a walk over, Plantagenet, the only other entry, being absent, as were all of Mr. Goodsell's entries. Royal Ranger well deserved his honors. He was looking in good form, and was given first by Mr. Moore, who has had him in charge, is deserving of great credit for the excellent condition in which he was shown. In the bitch class Dido II. also had it all her own way. The little lady was looking better than when she was at New York. She was greatly admired for her beauty, and was given first in the open dog class Laverack Chief was deservedly placed first. He is a capital animal, of medium size, with lots of quality. He was not in good condition owing to want of time to prepare him. Should he have been in good form it will take a very good one to beat him. Snow Flake, who won second, is a very handsome dog with a capital coat. He is pure white, with the exception of a few lemon ticks on his ears. Belvidis, who was vice, fully deserved the ribbon. He was looking very much better than when at New York. He has a capital body with good legs and feet. Laucelot, who was also vice, is a big, upstanding dog and looks like a workman. He also liked Prince Rake for the three letters. He is also a big dog, but a very good one. Count Derby, who was he, deserved the place. He is of medium size and well put together. Count Blythe, who was commended, should have been given another letter. He is a very fair animal of Laverack type. In the bitch class, Gladys, who won first, was a very good bitch, and except that she was a little too fat, she was shown in elegant condition. This, we imagine, carried her through, as Queen Alice, who was second, was her superior in nearly every respect. Queen Alice, who was third, was also a very good one. Queen Alice is a very sweet head, and except that her lip is not quite so well arched as we like, she is very near perfect. Mr. Howard Hartley, of Pittsburgh, liked her so well that he paid \$100 for her under her very close guard, both on account of her breeding and good looks. Jessica, who was given vice reserve, although only thirteen months old, fully deserved the honor. She is by Count Noble out of Sandborn's Nellie, and is the best Nellie puppy that we have seen. Mr. Sandborn, who bred her, offered a long time for her, but could not prevail upon his owner to part with her. She is said to possess very good field qualities, and will run in the field trials at High Point next November. Nobby, who was vice, we thought was a very good one. He is by Count Noble, and is a very good one. Princess Draco II, Zara, Lill and Fannie, unmentioned, were all worthy of mention. In the dog puppy class there was not much to choose between Post Boy, who won first, and Chicago, who was second. Both are very good ones, and very promising. Mr. E. H. Thompson, of St. Paul, Minn., claimed them both at the catalogue price. They make a beautiful brace. Duke Gladstone, who was vice, is also quite a promising puppy. Aside from these there was nothing worth mentioning in the class. The only first in the bitch class, was entitled to the place, although had Comtesse Daisy, who was placed second, been as old as she, their positions might have been reversed. The English setter classes, although not so well shown as at New York, were of good quality. The bitches in the open class were a very good lot.

BLACK AND TAN OR GOLDEN SETTERS.

JOHN W. MUNSON.

In the champion class the judge stated that he failed to find one that conformed to the standard, but that he thought they were advertised to be judged, and consequently he should judge them according to the points as laid down by Stonehouse. Argus, who was awarded the prize, is a very good dog and deserves the honor. There were four in the class, all good ones, and all were very well shown. In the open dog class King Dan was the only one that approached the standard. He is a very fair animal. Moss, who won second, is rather large and heavily made. In the bitch class Young Flora, who won first, is a very good one of the proper type. Gracie, who was placed second, is also a fair specimen. The others were not worthy of mention. There was but one puppy shown, quite a pretty one, but too young to show.

HUSH SETTERS.

JOHN W. MUNSON.

There were no entries in the champion classes. In the open dog class first was awarded to Brush, a very good animal. He has a typical head, is very well made up, and of good color. Irish Kork, who was second, is also a nice dog. He was shown in a very good condition. Earl, who was vice reserve, is also quite a good one. Elcho II, who was vice, we do not like. He has a good head but is a little too lathy; we liked Derby, who was he, better, and should have changed their position. In the bitch class, who was first, was a very sweet bitch, and fully deserved the place. She was in beautiful condition, as were all of the Emporia Kennel's dogs. Queen, who won second, was also liked. There was not much to choose between her and Thornton's Dancer, who was vice reserve. The puppies, with the exception of Fawn in the bitch class, were only a fair lot. We thought they were well placed. Fawn is very handsome, and good enough to show again. In the dog puppy class there were very good all through, but the best and most uniform set of heads that we remember to have seen at any previous show.

POINTERS.

JOHN W. MUNSON.

There was but one entry in the champion classes, and he was absent. In the open dog class Chancellor won first. He is quite a good dog and was very well shown. Tim, who was

placed second, is also a capital animal. We liked Cavalier, who was vice reserve, full as well for the place. Although he is a bit high on the leg, we have seen these legs do most excellent work. He has improved since we saw him last, and makes a beautiful dog. We liked Don, who was vice, although he is a bit lathy. In the bitch class, Dove, who won first, is a very fair bitch. She is just a trifle snipy and is a little snippy in the neck, but otherwise she is good. Maggie, who was second, is also a very fair animal. She had capital legs and feet. Her ears are not quite right, and she was shown much too fat. Devonshire Lass, who was vice reserve, was also very fat and heavy in whelp. Rose, who won vice, has a good body, legs and feet. She was in head and has a coarse tail. There were only two puppies shown. Both were good, with not much to choose between them. The quality of the pointers shown was good. We were disappointed in their numbers, as we had expected to see a grand exhibit.

SPANIELS.

JAMES F. KIRK.

The champion Irish water spaniel class was divided and an extra class was made for those who had already won a champion prize. This we think to be wrong and very liable to lead to confusion, as there can be but one champion in a class at the same show. Mike, who was given the extra prize, is a capital dog of very good form. His coat was in very bad condition, but otherwise he was good. In the champion class Count Bendigo was awarded the prize. He is a grand dog and was in the best of condition, except that his coat was ragged and faded owing to a hard season's work. Dan O'Connor is a very well built dog, but his coat was in wretched condition. He has a very nice face of white on each ear, which is decidedly objectionable. In the open dog class, Storm, a rattling good one, won first. Mr. Gardner, who owns the second prize winner, protested Storm, on the ground that he had been shown in the open dog class, and had lost the root of his tail. Mr. Kirk, after a careful examination, announced that the protest was not sustained. Storm has a light tan marking around the neck, but the blemish is not a disqualification, as the coat is very good. In the bitch class, Tim O'Morkin, who won second, is well made dog, but he is feathered on his legs like a setter. In the bitch class Swan was placed first. She is a capital specimen, strong and well made with a capital head, but in wretched coat. Queenston, who was second, is a very good dog, and has a good coat and proper feather. Her topknot is first class. Cricket, who was vice reserve, is also very good. The others that were noticed were very fair animals, but not in good condition. In the water spaniel class, we saw the largest in number, and the best in quality that we have ever seen together. Nearly all of them were of good form but were lacking in condition.

FIELD SPANIELS.

Benedict was alone in the champion class. He was in good form and added one more ribbon to his large collection. In the open class, Hornell Dash, quite a nice looking one, was placed first, and Hornell Gaudin was awarded second. She was in very good condition. Mr. Kirk, having so frequently judged at shows, has thus been precluded from exhibiting heretofore, but by special request he was induced to bring some of his favorites to Chicago. Being an enthusiastic student of scientific breeding, he has imported some very fine spaniels of guaranteed pedigree, with the object of improving the spaniels of America to a position of usefulness as well as retain for them their beauty and affectionate character. Toronto, who was vice reserve in this class, is a very handsome chestnut liver dog of great power and substance for his size. Although he is of good length he is not the excessively long back of the clumber. His feet are very good, and his ears are not too long. He has a handsome head and long heavily feathered ears add much to his attractiveness. In the champion cocker class Lass of Breda was given the pride of place. She has improved greatly since we saw her at Chicago, and is now in the best of condition. She was in beautiful condition and is one of the best that we have seen. Hornell Dandy, her only competitor, is also a first-class animal. Both were purchased by Mr. F. S. Waters, of Chicago, who paid \$300 for Lass of Breda, and \$300 for Dandy. They are very good dogs, and their owners will feel proud of them. In the open class, for "other than black," Nellie was alone. She has improved since the New York show, where she won the American Cocker Spaniel Club prize. In the class for "black and white," Frank, who was placed first, is a capital dog; but his early coat spoils his appearance. Flora, who won second, is also quite a good bitch. Mr. Kirk's Negress, whose long list of winnings on the show were in England, which is recently published, and the fame of her pedigree and famous as an animal of rare quality, with a perfect head, and the longest ears we have ever seen on a spaniel. She was shown a trifle short of coat and feather, but otherwise in splendid condition. Toronto, who was vice reserve, is a beautiful, wiry, active little black bitch, of the old-fashioned cocker stamp, with a true, flat cocker coat and plenty of feather. She has a beautiful expressive eye. She is a trifle short, and round in the skull, but has a good face and a very good tail. Her legs are very well whelp, was not exhibited. There was only one entry in the puppy class; Bertie, quite a nice one. The spaniels, although small in numbers, were as good in quality as the country can produce.

FOXHOUNDS.

JAMES F. KIRK.

There were only two foxhounds shown. Both were good, but of different types. Forester II, who was placed first, is a fine racing looking dog, with a capital head, neck and shoulders. He is a little light in build and a trifle off in legs and feet. Waterman, who was second, is one of the true type, with a grand, open face and a beautiful, wiry, active coat and tail. He has a short neck, and is too thick through the shoulders; he is also a trifle out at elbows, and is rather weak in hind quarters. They were placed perhaps as well as was possible.

BEAGLES.

JAMES F. KIRK.

There were only four beagles shown. Rattler, who won first in the dog class, is rightly named. He is a bit light in bone, but all over a beagle, and a good one. He was in capital condition, as were all of the dogs shown by Dan O'Shany, who takes great pride in his dogs. He is a very good one, who was second, is also quite a good specimen, with the same fault as Rattler. He is also light in ear. Music II, who was the only entry in the bitch class, we liked about as well as any. She has a sweet head, and is very well built.

DACHSHUNDE.

JAMES F. KIRK.

Gratchen, who won first, is a rare good bitch, and except that she is a trifle heavy in the hind quarters, she is a very good one, who was placed second, is quite a fair specimen, and a bit too small and too straight legs.

FOX-TERRIERS.

JAMES MORTIMER.

There were no entries in the champion dog class and only one in the bitch class, Topsy, a very good little one. She is a trifle light in bone and was a little off in coat. One of her eyes has a film over the sight caused by a scratch from a wildcat nearly twice her height, which she was fighting with. She prosecuted struggle in which she displayed game qualities of the highest order. In the open dog class first was won by

Fuenei, a very good one indeed. He is a trifle thick in skull, which is about all that can be said against him. Barney, who won second, has a good body, legs and feet. He is too thick in skull, carries his tail too high, and his eye is very blue, is only a fair specimen. He is leggy and light in bone and coat. Dash, who was c, is quite a fair dog, but with too much black for the show bench. Nora, who won first in the bitch class, is quite a nice bitch, with a lovely head and well carried ears. She has rather open feet and lacks a little in bone. Beauty, who was placed second, is also very good except that she is a little weak in jaw and has too full an eye. In the puppy class there were five that were very fair, with not much to choose between them.

COLLIES.

JAMES MORTIMER.

In the champion dog class Robin Adair had a walk over. He was in capital condition except that his top coat is not yet grown. Zulu Princess was also alone in the bitch class. She was looking her best and made many friends. Phillip, first in the open dog class, is a fair dog with a good coat. Glen, who won second, was the only other entry. He has a good coat. His skull is a bit heavy, and he is too straight in the shoulder, and a little long-gaited. There were no entries in the bitch class. In the puppy class Daisy, who was given first, was the best of a bad lot.

BULLDOGS.

JAMES MORTIMER.

Romulus was an easy winner. He was in good form. The second prize was withheld, as the only dog to show against Romulus was a very poor specimen with a split nose.

TERRIERS.

JAMES MORTIMER.

In the bull-terrier dog class, Spring was the only one to face the judge. He was in capital form and well deserved his prize. Young Bill was afflicted with an abscess on his jaw and was withdrawn.

In the black and tan class there were only three to show up. Topsy, quite a good one, was placed first, with Wallace second. He is also good but too large. The only entry in the Bantle Dinnout class was absent. There was a very good dog in the same class, but it was not shown. It is a very good specimen of the old style. Jersey, who was second, we liked full as well as Dart. He is of good form, hard as nails and has the most punishing set of ivory that we ever saw in a dog of his size. Anna, who was vice reserve, is also good all over, except that he is too tall in the hind quarters, but for this fault he was as good as any. The Skyes were very good, and the prizes were properly withheld. There were three very good ones in the hard-haired Scotch class; we thought them well placed. The same may be said of the Yorkshire class. In the class for Irish terriers, Garrywood was properly placed first, but had Erin II, who is but eight months old, been a year older, he would have made a good fight for the place. He is a nasty, game-looking little dog of good type and will be heard from again. The Yorkshires were a good class without a poor one in the lot. They were as well placed perhaps as was possible, although we should have been better suited with Tot, who was vice reserve, for second place.

PGGS.

JAMES MORTIMER.

With the exception of Sanjo, who won in the champion class, and Mr. Mortimer's Joe, who was on exhibition only, there was not a good one in the lot. The first prize in the dog class was withheld, as the only dog to show against the best was a very poor one, but the best were only fair. The puppies were very poor and the prize was withheld.

TOY TERRIERS.

JAMES MORTIMER.

The toys were all very good with not much to choose between Flora, who was awarded first, and Minnie, who was given an extra first prize of \$5; had her ears not been cut she would probably have won first as she is a handsome little animal.

TOY SPANIELS.

JAMES F. KIRK.

The class for King Charles, Blenheim and Japanese spaniels had two entries, but as neither of them could fill the bill the class was changed to toy spaniels, and as they were about equal in beauty they were given equal first.

POODLES.

JAMES MORTIMER.

Captain was the only poodle for competition. He is a very good specimen. He is a black and white and is a first-class retriever. His owner gratified the audience by showing off some of his accomplishments, in the performance of which he displayed great intelligence. His owner informed us that it was not so easy to guess his breed with the Irish water spaniel, with the expectation of getting some good retrievers.

MISCELLANEOUS.

JAMES F. KIRK AND JAMES MORTIMER.

This class, as is usually the case, contained a truly miscellaneous lot. First was given to Gipsy, a fair harrier in capital condition; and second to Hornet II, a fair white English terrier. He has a good body, legs and feet, but is a little weak in the head and has a poor tail. All of the others were commended with fine ribbons, but we failed to learn how much honor they conferred. Chihuahua, the Mexican dog, is quite a pretty little pet, and is highly prized by his owner. Miro, entered as a Lapland deerhound, was so fat that no correct idea of his form could be had. His coat is very like a mastiff's, only shorter and finer, and if our ideas of the climate of Lapland are correct, he would at least need a lap-robe, if not an overcoat, to make his stay in his native land comfortable or prolonged. Snow, a white dog, like the St. Bernard and Newfoundland, we greatly admired. He is of noble build and has a beautiful seal-brown coat. Dragoon, the celebrated Irish wolfhound, greatly disappointed us. We expected to see something nearer the type of this grand breed. He is quite too small, although he has a fair power and ability. He resembles the Great Dane in make-up, and is said to be a useful animal for hunting large game. Nearly opposite the stalls of this class was a very handsome collection of spaniels belonging to Mr. J. H. Waters, of Chicago. There were seven of them in an open stall, and beauties they were. They were constantly surrounded by a throng of admirers, whose praises and caresses were insisted.

SPECIAL PRIZES.

Several special prizes were offered too late for publication in the catalogue. No entry was required, all dogs being eligible to compete. Following is the list of prizes and the winners: Class A.—gentlemanly dog of any breed. Won by Mr. A. C. Waddell's Laverack Chief. Class B.—Dr. Wm. Jarvis, Claremont, N. H., offers a silver cup for the best Irish setter. Won by Mr. J. A. Sprague's Brush. Class C.—Mr. C. H. Mason, Yonkers, N. Y., offers a silver cup for the best sporting dog in the show. Won by Mr. Howard Hartley's Royal Breeze. Class D.—Chicago, Ill., offers \$100 to let her complete, believing that the different breeds should not be pitted against each other. Class D.—Mr. C. H. Mason, Yonkers, N. Y., offers a silver cup for the best St. Bernard dog. Won by Mr. E. D. Sturges's Bismarck. Class E.—Mr. F. S. Waters, Chicago, Ill., offers \$10 cash for

the best cocker spaniel dog under 38 lbs. Won by the Hornell Spaniel Club's Hornell Dandy.

Class F.—Mixed Bloods.—W. & Webber offer a silver cup for the best Irish water spaniel exhibited from Milwaukee, Wis. Won by Mr. A. J. Cooper's Storm.

Class G.—Mr. J. D. Aloft, Milwaukee, Wis., offers \$10 cash for the best brace of beagles. Won by Mr. D. O'Shea's Rattler and Mutt.

Class H.—Mr. J. D. Aloft, Milwaukee, Wis., offers \$10 cash for the best greyhound. Won by Mr. C. H. Mason's Friday Night.

Class I.—Mr. J. D. Aloft, Milwaukee, Wis., offers \$5 cash for the best pug. Won by Mr. C. H. Mason's Sambo.

Class J.—Mr. J. D. Aloft, Milwaukee, Wis., offers \$10 cash for the best kennel of Irish setters. Won by the Emporia Kennel Club with Irish York, Karl, Irish Comber, Irish Duck, Irish Faith, Irish Rock and Irish Biddy.

Class K.—Dr. Wm. Jarvis, Claremont, N. H., offers a silver cup for the best Irish setter puppy. Won by Mr. S. L. I. Woodbury's Pawn.

Class L.—The managers of the show offer a silver medal for the best collie. Won by Mr. Thomas H. Terry's Zulu Princess.

Following is a complete list of the

AWARDS.

Class 1. Mastiffs, Dogs.—1st, Mrs. Mason's Navion, fawn, 3 yrs., Girth—Imo; 2d, Chas. H. Mason's Girth, fawn, 3 yrs.; 3rd, 2 yrs.; 4th, Capt. R. D. Dullwinkle's Nelson (formerly Mercha) grindle, 3 yrs.; 5th, G. Greenwood, High com., Mrs. Henry Kisteman's Rover, 2 yrs., full pedigree.

Class 2. Mastiffs, Bitches.—1st, withheld; 2d, Wm. Wade's Diana H., imported, dark fawn, 2 mos.; Wyn's Taurus H.—Miss Hesketh's Rance, com., Paul Merker's Major, black, 3 yrs., Rover—Nette.

ST. BERNARDS.

Class 3. Rough-coated St. Bernard Dogs.—1st, Mrs. Henry Kisteman's Marco, reddish, 1½ yrs., full pedigree; 2d, David Stephenson's Ivy, orange, tawny and white, 3 yrs.; 3rd, Mrs. H. C. Smith's Haweka's Spot, orange, tawny and white, 3 yrs.; 4th, bred from imported stock, com.; Jas. A. Metcchie's Cesar, orange, tawny and black pug, 3 yrs.

Class 4. Rough-coated St. Bernard Bitches.—1st, Mrs. Henry Kisteman's Mince, fawn, 2½ yrs., full pedigree; 2d, Mrs. H. C. Smith's Snow, white, 2 yrs.; 3d, Mrs. H. C. Smith's E. B. Shum's Bishop, orange, tawny and white, 3 yrs.; 4th, Brannell—Koscan.

Class 5. Smooth-coated St. Bernard Bitches. No entries.

NEWFOUNDLANDS.

Class 7. Newfoundland Dogs.—1st, Chas. H. Mason's Mayor of Bingley, black, 3 yrs., Sam—Fly; 2d, S. R. Ireland's Pete, black, 3 mos.; 3rd, very high com., Paul Merker's Major, black, 3 yrs.; 4th, Rover—Nette.

GREYHOUNDS.

Class 8. Greyhounds, Dogs.—1st, Mrs. Mason's Friday Night, black, 1 mos.; Master's Prince—Sally; 2d, Carl Young's You Know, fawn, 3 yrs.; 3rd, 4 mos.; by Manie's imported dog out of Gersbert's imported bitch, High com.; Harry L. Goodman's Rat, fawn, 4 yrs.

Class 9. Greyhounds, Bitches.—1st, Dr. Edwin Warren Sawyer's Lady, fawn, 3 yrs.; 2d, G. G. Gerritt's Tony, light fawn, 2½ yrs.; Cash—Zulu.

DEERHOUNDS.

Class 10. Deerhounds, Dogs or Bitches.—1st, Dr. Van Hurnard's Oscar, blue gray, 3 yrs.; 2d, H. Moran; 3d, Jas. B. McKay; 4th, Lord Achanloo, brindle gray, 3 yrs.; imported Brim—Imported Bark.

ENGLISH SETTERS.

Class 11. Champion English Setters, Dogs.—1st, Geo. W. Moore's Royal Kauger, lemon bellon, 2 yrs.; Royal—Shortnose's Novel.

Class 12. Champion English Setters, Bitches.—1st, W. B. Slatton's Dido H., black, white and tan, 2 yrs.; 2d, 1 yr.; 3d, 1 yr.; 4th, 1 yr.; 5th, 1 yr.; 6th, 1 yr.; 7th, 1 yr.; 8th, 1 yr.; 9th, 1 yr.; 10th, 1 yr.; 11th, 1 yr.; 12th, 1 yr.; 13th, 1 yr.; 14th, 1 yr.; 15th, 1 yr.; 16th, 1 yr.; 17th, 1 yr.; 18th, 1 yr.; 19th, 1 yr.; 20th, 1 yr.; 21st, 1 yr.; 22nd, 1 yr.; 23rd, 1 yr.; 24th, 1 yr.; 25th, 1 yr.; 26th, 1 yr.; 27th, 1 yr.; 28th, 1 yr.; 29th, 1 yr.; 30th, 1 yr.; 31st, 1 yr.; 32nd, 1 yr.; 33rd, 1 yr.; 34th, 1 yr.; 35th, 1 yr.; 36th, 1 yr.; 37th, 1 yr.; 38th, 1 yr.; 39th, 1 yr.; 40th, 1 yr.; 41st, 1 yr.; 42nd, 1 yr.; 43rd, 1 yr.; 44th, 1 yr.; 45th, 1 yr.; 46th, 1 yr.; 47th, 1 yr.; 48th, 1 yr.; 49th, 1 yr.; 50th, 1 yr.; 51st, 1 yr.; 52nd, 1 yr.; 53rd, 1 yr.; 54th, 1 yr.; 55th, 1 yr.; 56th, 1 yr.; 57th, 1 yr.; 58th, 1 yr.; 59th, 1 yr.; 60th, 1 yr.; 61st, 1 yr.; 62nd, 1 yr.; 63rd, 1 yr.; 64th, 1 yr.; 65th, 1 yr.; 66th, 1 yr.; 67th, 1 yr.; 68th, 1 yr.; 69th, 1 yr.; 70th, 1 yr.; 71st, 1 yr.; 72nd, 1 yr.; 73rd, 1 yr.; 74th, 1 yr.; 75th, 1 yr.; 76th, 1 yr.; 77th, 1 yr.; 78th, 1 yr.; 79th, 1 yr.; 80th, 1 yr.; 81st, 1 yr.; 82nd, 1 yr.; 83rd, 1 yr.; 84th, 1 yr.; 85th, 1 yr.; 86th, 1 yr.; 87th, 1 yr.; 88th, 1 yr.; 89th, 1 yr.; 90th, 1 yr.; 91st, 1 yr.; 92nd, 1 yr.; 93rd, 1 yr.; 94th, 1 yr.; 95th, 1 yr.; 96th, 1 yr.; 97th, 1 yr.; 98th, 1 yr.; 99th, 1 yr.; 100th, 1 yr.; 101st, 1 yr.; 102nd, 1 yr.; 103rd, 1 yr.; 104th, 1 yr.; 105th, 1 yr.; 106th, 1 yr.; 107th, 1 yr.; 108th, 1 yr.; 109th, 1 yr.; 110th, 1 yr.; 111th, 1 yr.; 112th, 1 yr.; 113th, 1 yr.; 114th, 1 yr.; 115th, 1 yr.; 116th, 1 yr.; 117th, 1 yr.; 118th, 1 yr.; 119th, 1 yr.; 120th, 1 yr.; 121st, 1 yr.; 122nd, 1 yr.; 123rd, 1 yr.; 124th, 1 yr.; 125th, 1 yr.; 126th, 1 yr.; 127th, 1 yr.; 128th, 1 yr.; 129th, 1 yr.; 130th, 1 yr.; 131st, 1 yr.; 132nd, 1 yr.; 133rd, 1 yr.; 134th, 1 yr.; 135th, 1 yr.; 136th, 1 yr.; 137th, 1 yr.; 138th, 1 yr.; 139th, 1 yr.; 140th, 1 yr.; 141st, 1 yr.; 142nd, 1 yr.; 143rd, 1 yr.; 144th, 1 yr.; 145th, 1 yr.; 146th, 1 yr.; 147th, 1 yr.; 148th, 1 yr.; 149th, 1 yr.; 150th, 1 yr.; 151st, 1 yr.; 152nd, 1 yr.; 153rd, 1 yr.; 154th, 1 yr.; 155th, 1 yr.; 156th, 1 yr.; 157th, 1 yr.; 158th, 1 yr.; 159th, 1 yr.; 160th, 1 yr.; 161st, 1 yr.; 162nd, 1 yr.; 163rd, 1 yr.; 164th, 1 yr.; 165th, 1 yr.; 166th, 1 yr.; 167th, 1 yr.; 168th, 1 yr.; 169th, 1 yr.; 170th, 1 yr.; 171st, 1 yr.; 172nd, 1 yr.; 173rd, 1 yr.; 174th, 1 yr.; 175th, 1 yr.; 176th, 1 yr.; 177th, 1 yr.; 178th, 1 yr.; 179th, 1 yr.; 180th, 1 yr.; 181st, 1 yr.; 182nd, 1 yr.; 183rd, 1 yr.; 184th, 1 yr.; 185th, 1 yr.; 186th, 1 yr.; 187th, 1 yr.; 188th, 1 yr.; 189th, 1 yr.; 190th, 1 yr.; 191st, 1 yr.; 192nd, 1 yr.; 193rd, 1 yr.; 194th, 1 yr.; 195th, 1 yr.; 196th, 1 yr.; 197th, 1 yr.; 198th, 1 yr.; 199th, 1 yr.; 200th, 1 yr.; 201st, 1 yr.; 202nd, 1 yr.; 203rd, 1 yr.; 204th, 1 yr.; 205th, 1 yr.; 206th, 1 yr.; 207th, 1 yr.; 208th, 1 yr.; 209th, 1 yr.; 210th, 1 yr.; 211st, 1 yr.; 212nd, 1 yr.; 213th, 1 yr.; 214th, 1 yr.; 215th, 1 yr.; 216th, 1 yr.; 217th, 1 yr.; 218th, 1 yr.; 219th, 1 yr.; 220th, 1 yr.; 221st, 1 yr.; 222nd, 1 yr.; 223rd, 1 yr.; 224th, 1 yr.; 225th, 1 yr.; 226th, 1 yr.; 227th, 1 yr.; 228th, 1 yr.; 229th, 1 yr.; 230th, 1 yr.; 231st, 1 yr.; 232nd, 1 yr.; 233rd, 1 yr.; 234th, 1 yr.; 235th, 1 yr.; 236th, 1 yr.; 237th, 1 yr.; 238th, 1 yr.; 239th, 1 yr.; 240th, 1 yr.; 241st, 1 yr.; 242nd, 1 yr.; 243rd, 1 yr.; 244th, 1 yr.; 245th, 1 yr.; 246th, 1 yr.; 247th, 1 yr.; 248th, 1 yr.; 249th, 1 yr.; 250th, 1 yr.; 251st, 1 yr.; 252nd, 1 yr.; 253rd, 1 yr.; 254th, 1 yr.; 255th, 1 yr.; 256th, 1 yr.; 257th, 1 yr.; 258th, 1 yr.; 259th, 1 yr.; 260th, 1 yr.; 261st, 1 yr.; 262nd, 1 yr.; 263rd, 1 yr.; 264th, 1 yr.; 265th, 1 yr.; 266th, 1 yr.; 267th, 1 yr.; 268th, 1 yr.; 269th, 1 yr.; 270th, 1 yr.; 271st, 1 yr.; 272nd, 1 yr.; 273rd, 1 yr.; 274th, 1 yr.; 275th, 1 yr.; 276th, 1 yr.; 277th, 1 yr.; 278th, 1 yr.; 279th, 1 yr.; 280th, 1 yr.; 281st, 1 yr.; 282nd, 1 yr.; 283rd, 1 yr.; 284th, 1 yr.; 285th, 1 yr.; 286th, 1 yr.; 287th, 1 yr.; 288th, 1 yr.; 289th, 1 yr.; 290th, 1 yr.; 291st, 1 yr.; 292nd, 1 yr.; 293rd, 1 yr.; 294th, 1 yr.; 295th, 1 yr.; 296th, 1 yr.; 297th, 1 yr.; 298th, 1 yr.; 299th, 1 yr.; 300th, 1 yr.; 301st, 1 yr.; 302nd, 1 yr.; 303rd, 1 yr.; 304th, 1 yr.; 305th, 1 yr.; 306th, 1 yr.; 307th, 1 yr.; 308th, 1 yr.; 309th, 1 yr.; 310th, 1 yr.; 311st, 1 yr.; 312nd, 1 yr.; 313th, 1 yr.; 314th, 1 yr.; 315th, 1 yr.; 316th, 1 yr.; 317th, 1 yr.; 318th, 1 yr.; 319th, 1 yr.; 320th, 1 yr.; 321st, 1 yr.; 322nd, 1 yr.; 323rd, 1 yr.; 324th, 1 yr.; 325th, 1 yr.; 326th, 1 yr.; 327th, 1 yr.; 328th, 1 yr.; 329th, 1 yr.; 330th, 1 yr.; 331st, 1 yr.; 332nd, 1 yr.; 333rd, 1 yr.; 334th, 1 yr.; 335th, 1 yr.; 336th, 1 yr.; 337th, 1 yr.; 338th, 1 yr.; 339th, 1 yr.; 340th, 1 yr.; 341st, 1 yr.; 342nd, 1 yr.; 343rd, 1 yr.; 344th, 1 yr.; 345th, 1 yr.; 346th, 1 yr.; 347th, 1 yr.; 348th, 1 yr.; 349th, 1 yr.; 350th, 1 yr.; 351st, 1 yr.; 352nd, 1 yr.; 353rd, 1 yr.; 354th, 1 yr.; 355th, 1 yr.; 356th, 1 yr.; 357th, 1 yr.; 358th, 1 yr.; 359th, 1 yr.; 360th, 1 yr.; 361st, 1 yr.; 362nd, 1 yr.; 363rd, 1 yr.; 364th, 1 yr.; 365th, 1 yr.; 366th, 1 yr.; 367th, 1 yr.; 368th, 1 yr.; 369th, 1 yr.; 370th, 1 yr.; 371st, 1 yr.; 372nd, 1 yr.; 373rd, 1 yr.; 374th, 1 yr.; 375th, 1 yr.; 376th, 1 yr.; 377th, 1 yr.; 378th, 1 yr.; 379th, 1 yr.; 380th, 1 yr.; 381st, 1 yr.; 382nd, 1 yr.; 383rd, 1 yr.; 384th, 1 yr.; 385th, 1 yr.; 386th, 1 yr.; 387th, 1 yr.; 388th, 1 yr.; 389th, 1 yr.; 390th, 1 yr.; 391st, 1 yr.; 392nd, 1 yr.; 393rd, 1 yr.; 394th, 1 yr.; 395th, 1 yr.; 396th, 1 yr.; 397th, 1 yr.; 398th, 1 yr.; 399th, 1 yr.; 400th, 1 yr.; 401st, 1 yr.; 402nd, 1 yr.; 403rd, 1 yr.; 404th, 1 yr.; 405th, 1 yr.; 406th, 1 yr.; 407th, 1 yr.; 408th, 1 yr.; 409th, 1 yr.; Class 13. English Setters, Dogs.—1st, Thomas G. Davey's Post Boy, black, white and tan, 1 mo.; 2d, E. McCracken's Chicago Boy, blue belt, 1 mo.; 3d, E. McCracken's Very High Com.; 4th, E. McCracken's Dec 1st, black, white and tan, 1 mo.; 5th, champion Gladstone—Lavalette, 1 mo.; 6th, English Setter Puppies, Bitches.—1st, F. L. McCracken's Charlie Girl, 1 mo.; 2d, E. McCracken's Daisy, 1 mo.; 3d, C. E. Willard's Comets, Daisy, blue belt, 4 mos.; Count Derby—Daisy.

BLACK AND TAN OR GORDON SETTERS.

Class 17. Champion Black and Tan or Gordon Setters.—1st, Dr. J. S. Niven's Argus, black and tan, 2½ yrs.; Blossom—Moll.

10,00 yards this would have caused a difference of elevation at P. M. of about 10 P. M. of 30 yards or 30 inches in height on the target. The variation occurring between P. M. and P. M. would have produced a fall of 29 inches on the target. In the above instance the relative humidity was not stated. It has been assumed at 65 per cent, as in the case of the other trials.

The 50-grain bullet and service charge are taken to illustrate the effect of the above variations because I have not been able to ascertain the exact initial velocity of the ammunition actually used at Creedmoor in the match.

[EXTRACTS FROM LETTERS OF S. HENRY HALFOUD.]

WISTOW, LEICESTER, ENG., Oct. 30, 1882.

I think the best thing that I can do will be to send you along with my cards a small memorandum which Mr. Metford used to point in his sporting books.

"I do not know the real angles of the rifles you used to make your calculations with, but you will see in Mr. Metford's paper, the angles of the rifles from which most of my experiments have been made I have also shot much with Sharps' and Remington's rifles with practically the same speed and weight of projectile, and they agree with Mr. Metford's rifles in wind deflections as they naturally should from having the same speed, form and weight of projectile. I have also used a 391-grain bullet at very high speed, giving an angle of 2° at 1,000 yards, but from its lightness it is deflected as 10° to 2° compared with a 500-grain bullet. [The ratio of deflections in this instance is in the inverse ratio of the weights.—E. L. Z.]

The general angle of the rifles I have used with match charges of 12-grain Hazard or of Curtis & Harvey No. 6—(as 10-grain Hazard) is 2° 15' with the thermometer at 50° Fahrenheit. On any card you will see that a wind which would give 30" deflection if square across, would require 2° 15' H. from 75 to 500 yards. A 49-grain bullet requires 8° rise for head wind, a 570 only requires 3°. Mass tells me I may mention that all our sighting is in degrees and minutes of angle, and the wind gauge is also out in minutes. We find it the easiest way of working. The rifles are all shot for zero at 135 yds. here the scales cut, so that I can take up any of Mr. Metford's rifles and expect to get the same result as well as with a rifle with which I am well acquainted."

"I find the effect of temperature on angle is that, say from freezing night to 90° Fahrenheit, I can get 1/2" difference in angle by lowering of 1/2" of angle. There is, too, some queer difference in winter and summer of angle, not entirely due to temperature, and I find that angles range from 1/2" to 1 1/2" in winter. We find it the easiest way of working. The rifles are all shot for zero at 135 yds. here the scales cut, so that I can take up any of Mr. Metford's rifles and expect to get the same result as well as with a rifle with which I am well acquainted."

I see you have taken great pains with your tables. Ours are based on 200 yards range, and I have a table with a 100-grain bullet gauge and with a spinning gauge; also a pocket spring gauge with a chronometer spring set to grains weight on outer of disk. I never use, or have used, a scale, but I use only in minutes. We find it the easiest way of working. The rifles are all shot for zero at 135 yds. here the scales cut, so that I can take up any of Mr. Metford's rifles and expect to get the same result as well as with a rifle with which I am well acquainted."

WISTOW, LEICESTER, ENG., Dec. 3, 1883.

It is almost impossible to lay down a law or make a table that will suit more than two sorts of small game conditions. I have practiced 100 yds. you will suit bullets from 540 to 570 grs. in weight. A 50-grain bullet will require the head wind to be nearly double when shot at 100 yds. as compared with a 500-grain bullet required more elevation for head winds, so I think one must be satisfied with getting practical results, for I don't see how one can lay down a law.

And as to side wind, I think I do it, you, but am not sure, that a 50-grain bullet with an angle of 2° at 1,000 yds. requires 10° to 17° over match bullets of 500-grain weight.

You are quite welcome to make any use of my letters if you think them of sufficient interest.

As to water, I never summer, they are not due to difference of barometer, for I noted that point.

American riflemen are very frightened at changes of light. For my own part I am not. I have noticed a difference in the wind, it is never not to take a fuller or finer sight, and with a match rifle I never been changed of light. I have set carefully a theodolite and levelled it for day and night, and the variations are almost in direct due to refraction.

Graduations, 3"-5", roughly for every 10 yds., is very easy to see and easy to calculate. I have these spaces on my military rifle, and one can set sights very accurately with it.

Some years since Mr. Metford made me take up some half-inch caliber rifle weighing 11 lbs. for 2,000 yds., with telescopic sights and did very good work with them. I could reckon on hitting 12", by 12", but it was felt that two sorts of small game conditions. I have practiced 100 yds. you will suit bullets from 540 to 570 grs. in weight. A 50-grain bullet will require the head wind to be nearly double when shot at 100 yds. as compared with a 500-grain bullet required more elevation for head winds, so I think one must be satisfied with getting practical results, for I don't see how one can lay down a law.

I send you a copy of Mr. Metford's paper on trajectory in *Spirit of the Rifle*, 1878. I have also written a book on "Rifles and Marksmanship" by *Spirit of the Times*.

WISTOW, LEICESTER, ENG., May 30, 1883.

"I am sending you a table of trajectory for 2,000 yds., and will send you a copy of some of the tables I have made on the angles by absolute shooting on Metford's formula."

Note.—This last extract is given to show that the experiment of very long-range rifle firing, dropped a few years since, is being resumed, and the time may not be distant when competitors will take place at distances of 2,000 to 3,000 yds. In the succeeding paper I will endeavor to show that the increase of elevation in air over that required in vacuum, for a given range, is directly proportional to the square of the range, and that the increase of grains of weight of air for each minute of this increase of elevation over that required in vacuum is in the inverse ratio to the squares of the ranges.

"It is desirable to have uniformity of the graduations of the sights on the guns to be used. The 'drop' of sight by the members of the team may assuredly benefit by the experience of those who have fired before them, and that the captain of the team may more easily direct or advise as to the 'drop' of sight."

"Since writing the above, the initial velocities of the Remington rifle using 550-grain bullet and 40 grains of powder, were measured at Frankford Arsenal. Between each measurement a thermometer was inserted in the cartridge, and the 'drop' of sight was noted for the next day. The following table shows the mean of results:

Number of Rounds.	Mean Temperature of Barrel.	Mean Velocity.
4	92.25°	1308.3
6	95.50°	1310.0
8	98.75°	1312.0
11	115.00°	1318.6

It will be seen that the velocities increase with the rise of temperature. This appeared to be very curious, and the barrel was cooled by passing water through the barrel. The ensuing results are given in the first line of table. Furthermore, it was noticed that the 'drop' of sight was comparatively low, and within narrow limits than when the barrel became hot. The 'drop' of sight was not so much affected by the wind, and does not appear to be due to reduction of velocity by fanning, as, in these experiments, the rifle was not cleaned before completing the shot. The 'drop' of sight was not so much affected by the wind, and does not appear to be due to reduction of velocity by fanning, as, in these experiments, the rifle was not cleaned before completing the shot. The 'drop' of sight was not so much affected by the wind, and does not appear to be due to reduction of velocity by fanning, as, in these experiments, the rifle was not cleaned before completing the shot.

NEWARK, N. J.—At the meeting of the Newark Rifle Association on Wednesday evening last, at the range of the Essex, it was decided to hold an annual target shoot, to be held on the 21st of June. The committee from each association was appointed, and a special meeting will be called by the president later to make final arrangements. The shooting will probably take place at the Newark range.

THE SWISS TRIFLE.—The Swiss Federal Rifle Tournament will take place this year at Lugano, on the lake of that name, from the 25th to 29th of July. Emilio Cessi, the president, sends a most cordial invitation for American riflemen to participate in the matches.

CREEDMOOR.—During the remainder of the month of June, on each Saturday the range will be open for gunners to qualify in their several rifle matches on the 100, 200, 300, 400, 500, 600, 700, 800, 900, 1,000, 1,100, 1,200, 1,300, 1,400, 1,500, 1,600, 1,700, 1,800, 1,900, 2,000, 2,100, 2,200, 2,300, 2,400, 2,500, 2,600, 2,700, 2,800, 2,900, 3,000, 3,100, 3,200, 3,300, 3,400, 3,500, 3,600, 3,700, 3,800, 3,900, 4,000, 4,100, 4,200, 4,300, 4,400, 4,500, 4,600, 4,700, 4,800, 4,900, 5,000, 5,100, 5,200, 5,300, 5,400, 5,500, 5,600, 5,700, 5,800, 5,900, 6,000, 6,100, 6,200, 6,300, 6,400, 6,500, 6,600, 6,700, 6,800, 6,900, 7,000, 7,100, 7,200, 7,300, 7,400, 7,500, 7,600, 7,700, 7,800, 7,900, 8,000, 8,100, 8,200, 8,300, 8,400, 8,500, 8,600, 8,700, 8,800, 8,900, 9,000, 9,100, 9,200, 9,300, 9,400, 9,500, 9,600, 9,700, 9,800, 9,900, 10,000, 10,100, 10,200, 10,300, 10,400, 10,500, 10,600, 10,700, 10,800, 10,900, 11,000, 11,100, 11,200, 11,300, 11,400, 11,500, 11,600, 11,700, 11,800, 11,900, 12,000, 12,100, 12,200, 12,300, 12,400, 12,500, 12,600, 12,700, 12,800, 12,900, 13,000, 13,100, 13,200, 13,300, 13,400, 13,500, 13,600, 13,700, 13,800, 13,900, 14,000, 14,100, 14,200, 14,300, 14,400, 14,500, 14,600, 14,700, 14,800, 14,900, 15,000, 15,100, 15,200, 15,300, 15,400, 15,500, 15,600, 15,700, 15,800, 15,900, 16,000, 16,100, 16,200, 16,300, 16,400, 16,500, 16,600, 16,700, 16,800, 16,900, 17,000, 17,100, 17,200, 17,300, 17,400, 17,500, 17,600, 17,700, 17,800, 17,900, 18,000, 18,100, 18,200, 18,300, 18,400, 18,500, 18,600, 18,700, 18,800, 18,900, 19,000, 19,100, 19,200, 19,300, 19,400, 19,500, 19,600, 19,700, 19,800, 19,900, 20,000, 20,100, 20,200, 20,300, 20,400, 20,500, 20,600, 20,700, 20,800, 20,900, 21,000, 21,100, 21,200, 21,300, 21,400, 21,500, 21,600, 21,700, 21,800, 21,900, 22,000, 22,100, 22,200, 22,300, 22,400, 22,500, 22,600, 22,700, 22,800, 22,900, 23,000, 23,100, 23,200, 23,300, 23,400, 23,500, 23,600, 23,700, 23,800, 23,900, 24,000, 24,100, 24,200, 24,300, 24,400, 24,500, 24,600, 24,700, 24,800, 24,900, 25,000, 25,100, 25,200, 25,300, 25,400, 25,500, 25,600, 25,700, 25,800, 25,900, 26,000, 26,100, 26,200, 26,300, 26,400, 26,500, 26,600, 26,700, 26,800, 26,900, 27,000, 27,100, 27,200, 27,300, 27,400, 27,500, 27,600, 27,700, 27,800, 27,900, 28,000, 28,100, 28,200, 28,300, 28,400, 28,500, 28,600, 28,700, 28,800, 28,900, 29,000, 29,100, 29,200, 29,300, 29,400, 29,500, 29,600, 29,700, 29,800, 29,900, 30,000, 30,100, 30,200, 30,300, 30,400, 30,500, 30,600, 30,700, 30,800, 30,900, 31,000, 31,100, 31,200, 31,300, 31,400, 31,500, 31,600, 31,700, 31,800, 31,900, 32,000, 32,100, 32,200, 32,300, 32,400, 32,500, 32,600, 32,700, 32,800, 32,900, 33,000, 33,100, 33,200, 33,300, 33,400, 33,500, 33,600, 33,700, 33,800, 33,900, 34,000, 34,100, 34,200, 34,300, 34,400, 34,500, 34,600, 34,700, 34,800, 34,900, 35,000, 35,100, 35,200, 35,300, 35,400, 35,500, 35,600, 35,700, 35,800, 35,900, 36,000, 36,100, 36,200, 36,300, 36,400, 36,500, 36,600, 36,700, 36,800, 36,900, 37,000, 37,100, 37,200, 37,300, 37,400, 37,500, 37,600, 37,700, 37,800, 37,900, 38,000, 38,100, 38,200, 38,300, 38,400, 38,500, 38,600, 38,700, 38,800, 38,900, 39,000, 39,100, 39,200, 39,300, 39,400, 39,500, 39,600, 39,700, 39,800, 39,900, 40,000, 40,100, 40,200, 40,300, 40,400, 40,500, 40,600, 40,700, 40,800, 40,900, 41,000, 41,100, 41,200, 41,300, 41,400, 41,500, 41,600, 41,700, 41,800, 41,900, 42,000, 42,100, 42,200, 42,300, 42,400, 42,500, 42,600, 42,700, 42,800, 42,900, 43,000, 43,100, 43,200, 43,300, 43,400, 43,500, 43,600, 43,700, 43,800, 43,900, 44,000, 44,100, 44,200, 44,300, 44,400, 44,500, 44,600, 44,700, 44,800, 44,900, 45,000, 45,100, 45,200, 45,300, 45,400, 45,500, 45,600, 45,700, 45,800, 45,900, 46,000, 46,100, 46,200, 46,300, 46,400, 46,500, 46,600, 46,700, 46,800, 46,900, 47,000, 47,100, 47,200, 47,300, 47,400, 47,500, 47,600, 47,700, 47,800, 47,900, 48,000, 48,100, 48,200, 48,300, 48,400, 48,500, 48,600, 48,700, 48,800, 48,900, 49,000, 49,100, 49,200, 49,300, 49,400, 49,500, 49,600, 49,700, 49,800, 49,900, 50,000, 50,100, 50,200, 50,300, 50,400, 50,500, 50,600, 50,700, 50,800, 50,900, 51,000, 51,100, 51,200, 51,300, 51,400, 51,500, 51,600, 51,700, 51,800, 51,900, 52,000, 52,100, 52,200, 52,300, 52,400, 52,500, 52,600, 52,700, 52,800, 52,900, 53,000, 53,100, 53,200, 53,300, 53,400, 53,500, 53,600, 53,700, 53,800, 53,900, 54,000, 54,100, 54,200, 54,300, 54,400, 54,500, 54,600, 54,700, 54,800, 54,900, 55,000, 55,100, 55,200, 55,300, 55,400, 55,500, 55,600, 55,700, 55,800, 55,900, 56,000, 56,100, 56,200, 56,300, 56,400, 56,500, 56,600, 56,700, 56,800, 56,900, 57,000, 57,100, 57,200, 57,300, 57,400, 57,500, 57,600, 57,700, 57,800, 57,900, 58,000, 58,100, 58,200, 58,300, 58,400, 58,500, 58,600, 58,700, 58,800, 58,900, 59,000, 59,100, 59,200, 59,300, 59,400, 59,500, 59,600, 59,700, 59,800, 59,900, 60,000, 60,100, 60,200, 60,300, 60,400, 60,500, 60,600, 60,700, 60,800, 60,900, 61,000, 61,100, 61,200, 61,300, 61,400, 61,500, 61,600, 61,700, 61,800, 61,900, 62,000, 62,100, 62,200, 62,300, 62,400, 62,500, 62,600, 62,700, 62,800, 62,900, 63,000, 63,100, 63,200, 63,300, 63,400, 63,500, 63,600, 63,700, 63,800, 63,900, 64,000, 64,100, 64,200, 64,300, 64,400, 64,500, 64,600, 64,700, 64,800, 64,900, 65,000, 65,100, 65,200, 65,300, 65,400, 65,500, 65,600, 65,700, 65,800, 65,900, 66,000, 66,100, 66,200, 66,300, 66,400, 66,500, 66,600, 66,700, 66,800, 66,900, 67,000, 67,100, 67,200, 67,300, 67,400, 67,500, 67,600, 67,700, 67,800, 67,900, 68,000, 68,100, 68,200, 68,300, 68,400, 68,500, 68,600, 68,700, 68,800, 68,900, 69,000, 69,100, 69,200, 69,300, 69,400, 69,500, 69,600, 69,700, 69,800, 69,900, 70,000, 70,100, 70,200, 70,300, 70,400, 70,500, 70,600, 70,700, 70,800, 70,900, 71,000, 71,100, 71,200, 71,300, 71,400, 71,500, 71,600, 71,700, 71,800, 71,900, 72,000, 72,100, 72,200, 72,300, 72,400, 72,500, 72,600, 72,700, 72,800, 72,900, 73,000, 73,100, 73,200, 73,300, 73,400, 73,500, 73,600, 73,700, 73,800, 73,900, 74,000, 74,100, 74,200, 74,300, 74,400, 74,500, 74,600, 74,700, 74,800, 74,900, 75,000, 75,100, 75,200, 75,300, 75,400, 75,500, 75,600, 75,700, 75,800, 75,900, 76,000, 76,100, 76,200, 76,300, 76,400, 76,500, 76,600, 76,700, 76,800, 76,900, 77,000, 77,100, 77,200, 77,300, 77,400, 77,500, 77,600, 77,700, 77,800, 77,900, 78,000, 78,100, 78,200, 78,300, 78,400, 78,500, 78,600, 78,700, 78,800, 78,900, 79,000, 79,100, 79,200, 79,300, 79,400, 79,500, 79,600, 79,700, 79,800, 79,900, 80,000, 80,100, 80,200, 80,300, 80,400, 80,500, 80,600, 80,700, 80,800, 80,900, 81,000, 81,100, 81,200, 81,300, 81,400, 81,500, 81,600, 81,700, 81,800, 81,900, 82,000, 82,100, 82,200, 82,300, 82,400, 82,500, 82,600, 82,700, 82,800, 82,900, 83,000, 83,100, 83,200, 83,300, 83,400, 83,500, 83,600, 83,700, 83,800, 83,900, 84,000, 84,100, 84,200, 84,300, 84,400, 84,500, 84,600, 84,700, 84,800, 84,900, 85,000, 85,100, 85,200, 85,300, 85,400, 85,500, 85,600, 85,700, 85,800, 85,900, 86,000, 86,100, 86,200, 86,300, 86,400, 86,500, 86,600, 86,700, 86,800, 86,900, 87,000, 87,100, 87,200, 87,300, 87,400, 87,500, 87,600, 87,700, 87,800, 87,900, 88,000, 88,100, 88,200, 88,300, 88,400, 88,500, 88,600, 88,700, 88,800, 88,900, 89,000, 89,100, 89,200, 89,300, 89,400, 89,500, 89,600, 89,700, 89,800, 89,900, 90,000, 90,100, 90,200, 90,300, 90,400, 90,500, 90,600, 90,700, 90,800, 90,900, 91,000, 91,100, 91,200, 91,300, 91,400, 91,500, 91,600, 91,700, 91,800, STEAM LAUNCH MACHINERY.

THE increasing use of steam as a motive power for yachts and launches renders information concerning existing practice of great value in giving those contemplating investment a review of the field as it is now occupied in finding them in their selection. Continuing the series of articles on this subject we produce this week illustrations and data of considerable interest to those interested in launches, side wheel and stern wheel boats.

The Little Giant Vertical, an example of which is shown in the accompanying cuts, is built by the Snyder Engine Company of this city, to be run in connection with boilers of their own design. It is suitable for screw launches of the smaller size. Simplicity, compactness and durability are the chief points kept in view. All working parts are easy of access and provision is made for taking up the wear of all parts. The stroke is short, the crank counter-balanced, and the frame is strong with good spread to the standards, so as to make the engine especially adapted to high speed and pressure. Cylinder heads and steam chest cover are turned and bright finished, the cylinder is encased in polished brass, the crank shaft, piston and connection rods are of steel, link and rods being highly polished. The link blocks, fastenings, packing nuts, etc., are of polished brass. The engine is furnished with brass cylinder lubricator and oil cups, and hand wheel for turning off center. Reversing levers are not required on these small engine, the link and handle being sufficient. In the following tables, of great use to the student, the horse power is calculated for a pressure of fifty to sixty pounds and four hundred revolutions for the small engines and two hundred for the larger style, where this is exceeded in practice the power of course becomes greater.

Size of Cylinder in Inches.		Horse Power.	Approximate Weight in Lbs.	Height from floor to top of cylinder in inches.	Size of Boat for which suitable, Length, Feet.	Beam, Feet.
Diameter.	Stroke.					
2 1/2	1 1/2	1 1/2 to 4	22	13	12 to 15	...
2 3/4	1 3/4	1 3/4 to 4	30	15	15 to 18	...
2 3/8	1 1/2	1 1/2 to 3	30	17 to 20
3 1/4	1 3/4	1 3/4 to 4	40	20 to 25
4	1 3/4	4 to 5	125	28	25 to 30	...
4 1/2	2	5 to 10	200	30 to 35
5	2	5 to 8	250	35	30 to 35	...
6	2	8 to 12	400	47	35 to 38	7 to 7 1/2
6 1/2	2	10 to 14	500	58	40 to 43	8 to 9
8	2 1/2	12 to 18	800	70	45 to 50	9 to 10 1/2
10	3	20 to 27	1200	76	55 to 60	10 to 12
12	3	25 to 35	1600	80	65 to 75	12 to 15

For boats above thirty feet in length the larger style of engine with reversing lever is the most appropriate. It is known as the Snyder Vertical Marine Engine. Their frame is strong and graceful, the crankshaft is in finished steel; finished forged connecting-rod with heavy brasses; jacketed cylinder and forged cylinder and steam-chest heads. Two solid bearings for the crankshaft which, with the crosshead slides, are cast in one with the frame. A plain slide valve is used. The pump is at the base of the engine, run by an eccentric. The engine is noiseless in its working. For driving side wheels or stern wheels an arrangement is adopted shown in the large cut. Fastenings can be coupled to the crankshaft as required, or the shaft can be extended out to the boat's side to admit of tying on cranks and long connecting-rods to drive one wheel over the stern as in the steamers of the Western and Southern rivers. The plan of the engines are bolted to a cast iron bedplate, the plan of

which is also to be found among the illustrations. The cranks are coupled together at right angles to one another, so that the machinery can always be started. The reversing lever operates the links of both engines and will steam can be cut off at one-sixth to seven-eighths stroke. A spur wheel is shown in the cut in case gearing up to higher speed is wanted. Engineer's data as follows:

Size of Cylinder in Inches.	H. P.	Approximate Weight Lbs.	Bed Pl.		H ^o C ^o Crk in. Slits	Dia. of Boiler in.	Size of Boat for which suitable Length, ft. Beam, ft.		
			L.	D.					
2 1/2	1 1/2	2 to 3	250	30	22	7	14	20 to 22 1/2	4 to 5
3 1/4	1 3/4	4 to 5	325	35	26	8	14	25 to 30	5 to 6
3 3/8	1 3/4	4 to 8	375	38	28	8 1/2	14	30 to 37 1/2	7
4	2	9 to 12	525	46	35	10	2	40 to 60	7 to 10
4 1/2	2	12 to 16	850	63	45	12	2 1/2	50 to 75	8 to 12

^o Height of center of shaft from floor, inches.

In respect to boilers, we give sections of two kinds of verticals. In one the heat passes up through tubes surrounded by water, in the other the water circulates through tubes, around which the heat rises. The best quality of iron or steel is used to enable a safe working pressure of one hundred pounds to be carried if required. Space is economized and the weight kept as low as possible by the arrangement of fire and heating surfaces adopted. The Vertical Tubular is adapted to yachts and launches up to 90 ft. in length. They are built of lance iron or steel, having a tensile strength of 50,000 to 70,000 lbs., and are inspected and tested up to 200 lbs. per square inch. The cut of the tubular boiler shows the manner in which the water circulates. Handholes are cut near top and bottom of the furnace, to remove mud or sediment from crown sheet and water leg. The water is carried high above the furnace, and danger from low water lessened through a safety plug as fitted. The outer shell is nowhere exposed to the action of the fire. Ash pan, grates, smoke-box, spring safety valve, atom gauge, water gauge, gauge cocks, blow off cocks, feed check, feed globe valve, steam stop valve and whistle are the principal fittings which go with the boiler.

Dimensions of Boilers.		Size of Bed-plate to be driven. (Verticals)	Size of Boat for which suitable. (Approximate.)
Diam. of Boiler.	Height of Boiler.		
24	42	1 1/2	24 x 4 1/2
26	45	1 1/2	28 x 4 1/2
28	48	2	32 x 4 1/2
30	45	2	4 x 4 1/2
33	48	2	4 1/2 x 4 1/2
36	48	2	4 1/2 x 4 1/2
40	48	2	4 1/2 x 4 1/2
44	66	2	6 x 6
46	70	2	6 x 6
48	82	2	8 x 8
50	82	2	8 x 8
54	82	2	10 x 10
		2	12 x 12

The water tube boiler will be easily understood with these explanations. A is the dome top or smoke box; B the steam space; C the water space; D the furnace; and E the ash pit. Number 1 is the main shell of 5-16 lap-welded wrought iron, withstanding a pressure of twelve hundred pounds to the square inch. No. 2 is the stay-rod also acting as boiler flue. No. 3 is the fusible safety plug. It consists of a plug threaded on the outside to screw into iron of the boiler, with a hole in and through the center. This hole is filled up with an alloy which will melt out as soon as the water gets dangerously low and leaves the plug uncovered and unprotected from the full effect of the fire, and as it melts, the steam escapes into the furnace of the boiler, putting out the fire and giving the alarm. No. 4, crown sheet of wrought iron. No. 5, top cap, the flanges of which support the sides of the boiler. No. 6, side tubes for circulation of the water, increasing the heating surface. No. 7, outer casing on which the inner boiler is suspended. The weight of a twenty-inch boiler of this kind is 200 lbs., contains twenty-eight tubes and drives a cylinder 24 x 24. A boiler thirty inches diameter will weigh 850 lbs., contains eighty tubes and is suitable for cylinder 4 1/2 x 5.

For small launches, two-headed propeller wheels are preferred by the company. The pitch of a twenty-inch wheel is thirteen inches, that of a twenty-four wheel is twelve inches; that of a thirty-two-inch wheel is fifty inches and that of a forty-eight-inch wheel is sixty inches.

The cost of boilers and engines is something most people will be anxious to know in forming an estimate. The engine and pump for a launch fifteen to eighteen feet long will cost about sixty dollars; one for a launch thirty to thirty-five feet long will cost one hundred and fifty, and the engine for a yacht say sixty feet long will cost about five hundred and fifty dollars. The cost of corresponding boilers will be about a hundred and fifty, three hundred and fifty and five hundred and fifty dollars, all the fittings included.

FORTUNA.—The trial spin of Mr. H. S. Hovey's new schooner down the Bay June 19, was very satisfactory in all respects. She proved herself extremely handy, working like a top, headstays requiring no hauling in coming about. She carries her water almost on mainships, with just enough water to keep her well in hand at all times. "There is not the slightest show of gripping. Heels to about 15° and at that reaches her 'stickiest' point. She seems to set fast, though actual trial with others can best determine her capability in this respect. She will require no changes or alterations of any kind.

EXHIBITS.—Concerning the season's exhibits prospects seem to be rather better than the average, especially among yachts of small tonnage. *Land and Water* says: "So far as racing is concerned, Vivienne won't be entered, and it seems during the summer, as the ordinary yearly regatta will be supplemented with the amateur matches of the Royal Thames on the river, and there will be important regattas at Ascot and Amersham, besides various other matches and regattas round the coast."

YALE Y. C.—The spring tuck of the club was sailed June 7, in a blustering wind with rain squalls. One lost her side, Clarence passed some gear, and Hilda got in trouble with her spinaker. Classes for sloops under 30 ft., cuts over 23 ft., and cuts under 23 ft., Course ten races. Vivienne won in class A, in 1:29:12, beating Hilda and Clarence. Ripple won in class B, in 1:34:39, beating Fearless. Hovey won in class C, in 1:41:35, beating Frolic, Yale and Yale.

AMONGST.—This steamer, Mr. James Gordon Bennet, is now under the shears at the yard of Day, Sumner & Co., Northam, Eng., for new and larger spars, cleaning bottom, etc. Later in the year she is to be given iron deck plating, alterations to the bows, and a thorough overhauling.

DEATH TRAPS.—The yacht *Habe*, bound from Burlington to House's Point, captured in a squall June 9, of Colchester Point, Lake Champlain, Captain and crew were drowned.

PRICES OF FISHING TACKLE

BEST GOODS. LOWEST PRICES.

At KIFFE'S, 318 Fulton St., Brooklyn, N. Y.

Kiffe's Celebrated Hooks snelled on gut, Limerick, Kirby Limerick, Sprout, Carlisle, Chestertown, Kinsey, Aberdeen and other Hooks. Single gut, 12 cts. per doz.; double gut, 20 cts. per doz.; treble gut, 30 cts. per doz. Gut Leaders, single, 1 yard, 5 cts. each; 2 yards, 10 cts. each; 3 yards, 15 cts. each. Double Twisted Gut Leaders, 3 length, 5 cts. each; 4 length, 10 cts. each; 5 length, 15 cts. each. First Quality Braided Linn Lines, 150ft., 30 cts. each. First Quality Twisted Linn Lines, 300ft., 9, 12, 15, 18 or 21 ft. and, \$1.00 each. First Quality Brass Multiplying Reels with balance handle, 25 yards, \$1.00; 40 yards, \$1.25; 60 yards, \$1.50; 80 yards, \$1.75; 100 yards, \$2.00; 120 yards, \$2.25; 140 yards, \$2.50; 160 yards, \$2.75; 180 yards, \$3.00. Between Fulton Ferry and City Hall. OPEN EVENINGS. SEND FOR PRICE LIST.

AMERICAN

Kennel Register.

A monthly record of kennel events for the information and guidance of breeders, exhibitors and owners of all breeds of dogs.

Its leading feature is the "Pedigree Register," of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is given to each dog, and an index will be compiled at the close of each annual volume, thus forming a permanent work of reference. The pedigree registration fee is twenty-five cents. The first two numbers of the Register contained the pedigrees of 138 dogs.

Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs at sale, and deaths.

Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include a record of field trials. The first two numbers of the Register contain prize lists of Washington, Ottawa and Pittsburgh shows.

The publication day is the fifth day of each month; and nothing can be received for publication later than the first day of the month. All matters intended for publication should be in the hands of the editor at the earliest practicable date. Entry blanks for each department will be furnished free on receipt of stamped addressed envelope.

TERMS.—Issued by yearly subscription only. The subscription price is one dollar per year. Make drafts and money orders payable to the Forest and Stream Publishing Company. Address, AMERICAN KENNEL REGISTER, P. O. Box 2,832, New York City.

UPTHEGROVE & McLELLAN, VALPARAISO, IND. HOLABIRD SHOOTING SUITS

Of Waterproof Duck, Irish Fustian and Corduroy, Unequaled in Convenience, Style, or Workmanship. WRITE FOR CIRCULAR.

THIS

Is our Skeleton Coat or Game Bag; weighs but 15 ounces, has seven pockets and game pockets. It is of light material, dead grass color, and will hold the game of a successful day without losing a hair or feather. It can be worn over or under an ordinary coat. We will mail it to you for \$2.00. Send breast measure.

B. F. NICHOLS & CO., BOSTON, MASS.

Manufacturers of

HEXAGONAL SPLIT BAMBOO FISHING RODS, REMOVED TO 153 MILK STREET.

We are obliged to have more room in our factory and greater facilities for manufacturing our goods to meet the increasing demand. We have received the highest award and silver medal at the Massachusetts Charitable Mechanics' Association Fair for our superior goods. Send for catalogue.

"O. C. PATENT PERFECTION."

Multiplying Reel, Center Action, Depressed Balance Handle, Safety Band, Adjustable Click.

The cut shows the position of the index when Reel is used (in fly casting) as a Multiplying Click. By pressing the index to the right, the Click is removed, and thus it can be used as a free-running Multiplying Reel. It is the Reel for black bass, is simple, durable, and in every way desirable.

TO SPORTSMEN!

These reels are for sale by the trade generally, therefore please apply to a dealer in your place. If you are unable to procure them, please advise me and I will mail, registered, on receipt of following prices:

Send for illustrated circular. Address S. HEMMENWAY, 60 South St., Opp Wall St. Ferry House, Factory, 39 South St., Cor. Old Slip, N. Y. City.

30 DAYS' TRIAL FREE! We send free on 30 days' trial Dr. Dye's Electro-Voltaic Belts and other Electric Appliances TO MEN suffering from Nervous Debility, Lost Vitality and Kindred Troubles. Also for Rheumatism, Liver and Kidney Troubles, and many other diseases. Speedy cure guaranteed. Illustrated pamphlets free. Address VOLTAIC BELT CO., Marshall, Mich.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. SIX MONTHS, \$2.

NEW YORK, JUNE 28, 1883.

VOL. XX—No. 22.
{ Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C. London, England. Subscription agents for Great Britain—Messrs. Sanson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, unpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted.

"Misdirected Fishculture."	ANSWERS TO CORRESPONDENTS.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

THE SCREW WIND-GAUGE.

It seems that the worst anticipations of the gentlemen of the American team are to be realized, and that there is to be no chance for the men using the screw wind-gauge to shoot over the ranges during the Wimbledon meeting as contestants in the several M. B. L. matches.

The Council of the National Rifle Association of Great Britain has had the matter under consideration, and in a letter written by Sir Henry St. John Halford, he acts as the mouthpiece of his associates. The letter bears the appearance of an apology for the action of the Council, and an apology certainly is needed. It has been decided not to alter the old Wimbledon rule, which declares that a rear sight set by a screw is not a military sight, and that those of the American rifles having that attachment are to be barred out from the many Wimbledon matches.

The *Volunteer Service Gazette* has ably seconded the efforts of a large body of the English shooters who wish to see the antiquated rule abolished, and urge that this permission be now given the American team, in order to show at once a gentlemanly courtesy to a visiting body, and also to show such unpractical apologists as the council members that a screw wind-gauge is not only an excellent range device, but may be made so simple as to be serviceable in the field. Our esteemed contemporary has taken a wide view of the situation, looking at it from the American as well as the English standpoint, and very properly refuses to be convinced by the letter of Sir Henry Halford, which is not only misleading in its review of the history of this wind-gauge discussion, but erroneous in the conclusions which it draws.

The screw wind-gauge to-day is not a mere range device to secure higher scores. It is in use on the Springfield rifles now coming from the armory in Massachusetts, and in con-

tradition to the opinion of the British N. R. A. Council that it is "an addition to a rifle which they do not consider practicable for a military arm on service," may be brought to the opinion of marksmen here that in any form of carbine or rifle the screw may be and is made so ready of adjustment that it is not one whit behind the slide in rapidity of manipulation, while it is far more exact and reliable.

Sir Henry, in his somewhat remarkable letter says: "There will be no difficulty in their unshipping their screw adjustment, so that their rifles will come under our rules for our M. B. L. competitions, leaving their sights precisely like ours. They, as well as I, believe that the screw adjustment gives a certain advantage to those using them, as the slide can be moved more certainly by it, and with greater accuracy, and I have no doubt they will gain by it in the match as we shall not use it. We have yielded this advantage to them at their earnest solicitation, because we beat them last year, and not because we think it a matter of no importance; but we do not think they would be justified in putting our own men at a further disadvantage in the All-Comers' matches, for it is our duty to see that they are fairly dealt by."

It is indeed a display of more than usual conservatism that the British riflemen, having conceded to the Americans the use of a screw wind-gauge, should not adopt the same themselves. It is the coming improvement which must be made in any military rifle which hopes to hold its own. It is nonsense to suppose that the old open sight, even when given a pretense of improvement by any such clumsy arrangement as a sliding sight bar, is to continue in use when such important modifications and improvements are made in other parts and features of the rifle. Sir Henry ought to know this, and any skirmish match, such as the Dryden match at Creedmoor last year, where the men fired at random distances while in advance and retreat up and down the range, ought to convince the veteran marksman that the competitor using the screw-gauge is not at all handicapped as against the one using a slide-gauge. This is as near a semblance of real warfare as we can get, and it ought to settle the question as far as it can be determined by range experiments.

Sir Henry reverts to his favorite match rifle, and bewails the improvements made in small-bore weapons, as they have made the highest possible so easily attainable that there is no longer much competition when a marksman of judgment, armed with one of these latest weapons of precision, enters a match.

If the object is to keep in a liberal factor of uncertainty, then let the how and arrow be revived for match purposes, and the match rifle laid aside as too mathematically correct.

While we for a moment wish to reduce the M. B. L. to a mere target tieker instead of a service weapon, we respectfully urge that the screw-gauge has been proven fit for field work, and that while the improvement is sure to come, there is no better time than the present to introduce it upon the Wimbledon range.

THE GREELEY RESCUE EXPEDITION.

THE expedition for the relief of Lieutenant Greeley is to leave New Foundland early next month. The rescuing party is to consist mainly of officers and enlisted men of the United States Army, and the only members who are familiar with Arctic life are three "hard ice men" to be taken from St. Johns. The steamship Proteus has been chartered for the occasion, and the orders to the expedition direct that every effort shall be made to reach Lieutenant Greeley by ship, but if this cannot be done, the winter is to be passed at Life Boat Cove or Littleton Island. After the winter has set in, attempts will be made to proceed northward by means of sledges. The instructions announce that the provisions of the Greeley party will be exhausted this autumn, although at the time of its departure and subsequently, it was stated that it was vitualated for three years.

Two naturalists, Messrs. H. G. Dresel and A. A. Ackerman, accompany the expedition on board the United States steamer Yantie, which goes as a tender to the Proteus. Both gentlemen are ensigns in the navy, and have for the past eight months been acting as assistants in the United States National Museum at Washington, Mr. Dresel working on fishes, and Mr. Ackerman on mineralogy. Their equipment is mainly for the collection of marine fish and invertebrates.

It seems unfortunate, in view of the probable difficulty of reaching the Greeley party, that a selection had not been made of men better qualified for the work than the present party appear to be. If the views set forth in these columns as to the personnel of Arctic expeditions had been adopted, we cannot but think that this relief party would set out with much brighter prospects of success.

THE ENGLISH ANGLING TOURNAMENT.

IN another column we give a full account of the last tournament at the Welsh Harp. From our report it will be seen that Mr. Reuben Wood gave a good account of himself, casting eighty-two and a half feet in the trout contest, and one hundred and eight in the salmon casting, taking both first prizes.

We had hoped to see accounts of this contest in the daily papers of New York the morning after it occurred, but so far they have not had a word of this international match, although we know that the secretary of the National Rod and Reel Association informed the agent of the New York Associated Press on the 9th that the contest would come off two days afterward. Had it been a base ball match or a game of marbles, or other interesting event, we would have seen it flashed across by cable in quick time. It really seems as if the great dailies are not aware of the interest taken by the angling public in these events, nor of the extent of that public. The fact that anglers are quiet gentlemen seems to hide the other fact that they are numerous.

It has been said that these tournaments are useless as tests of angling skill. This may be so, to some extent, but they are very useful in exhibiting excellence in all that they claim to do, which is in casting the fly, not in the capture of fish. It is barely possible that a man might learn to cast a fly who never saw a fish taken, and would therefore be ignorant of fishing. We have never heard of such a man, and do not believe he exists. The tournament is an excellent school for those who wish to learn the art of fly-casting, which is a most beautiful one, and the time will come when our daily papers may even rank it as high as a dog fight and give the details.

The *Fishing Gazette* Tournament, just held near London, was more fortunate in the matter of weather than last year, and it seems to have gone off smoothly, and to the satisfaction of all. Certainly it went to the satisfaction of Mr. Wood and the American delegation, and from a perusal of our correspondence on the subject it appears that the competitors were pleased also. The only complaint that "Uncle Reuben" has made is in a private letter to one of the FOREST AND STREAM staff, where he says that they nearly kill him with kindness over there, and that if he should eat and drink all that he is invited to, he would either have to be hooped or burst.

We hope to see some of our English anglers on this side of the water next October at the tournament of the National Rod and Reel Association. We can assure them of a cordial reception at a good time.

RACING WEEK.

THE fact that a very large number of the most important yacht races about New York have taken place within the past week, obliges us to devote much more space than usual to this sport. It is in some respects unfortunate that so many of the important regattas come together, but there are other, and perhaps equally good, reasons why June is above all others the month for racing. It is important that FOREST AND STREAM, which is the yachtsman's journal of America, should give to its readers accounts of these races which shall be more intelligent than the hastily written reports in the daily papers, and at the same time be something more than a mere record of courses and times; and for this reason we have treated these important events very fully. It may be said, however, that occasions like the present only come once or twice a year, and that we are not often obliged to allow any one department to so far overrun its usual limits.

The widespread and rapidly increasing popularity of yachting is of comparatively recent growth, and is in part attributable to the interest which is now taken in canoeing, for the canoe is often the primer of the yachtsman. The canoeist who has cruised for two or three years and has thus learned something of the delights of a life on the water, feels an ambition to own a larger vessel, and is likely to become a Corinthian and obtain a single-handed cutter, and from this his development is rapid and only limited by the depth of his pocket. We rejoice to see the sport taking the high rank it does, for it is one which cultivates some of the highest qualities of both mind and body.

HIGH POINT QUAIL.—Advices from High Point, N. C., give us the pleasing intelligence that quail have done wonderfully well there during the past winter, and promise to be extremely abundant during the coming season. A part of this abundance is attributed to the non-shipping act of that State.

Natural History.

MORNING IN COUNTRY AND CITY.

silly enough to believe that he could find good shooting and fishing in the streets and gutters of cities, towns and villages. "Didymus" admits that he "wandered in an unwise-factory way nearly all over the State," and there are such wanderers to be found everywhere. From his own statements, it is evidently quite unnecessary to make him a fisher of men, while not hunting and *not dead* "sportsmen" have been shooting at every living thing clothed with feathers for the last eighteen years. It is evident that he is not a sportsman or a competent judge, for he states that he "actually shot six times at three wriggling snipe before he got them in his pocket." He refers to fishing at Ocala, and unless he fished in a rain-water barrel for wigglers, he could not find fishing within six miles of that place. He refers to Ocala, "he doesn't find turkeys gophling at him from every brush." Such a statement is, to say the least, silly, if it did not convey the idea that such statement had been published by some interested party. Every winter, samples of "sportsmen" like "D." visit the State, and are disappointed, and misrepresent it because they cannot shoot deer, quail and turkeys in the public streets, and capture fish in every river and lake. Game and fish exist in endless quantities in certain portions of Florida, but sportsmen must visit the localities where they exist.

From the tenor of "D.'s" communication it is evident that he is interested in a "hotel" enterprise in St. Augustine, or has "land" to sell near the "Port," and used your columns to advertise his wares. The whole communication "smells of the shop." "D." asserts "that fishing and shooting in the neighborhood of St. Augustine is far better than in any place I have ever been." This statement is evidence that he has not visited the best "shooting and fishing places" in the State, and that he is ignorant. Any person residing in St. Augustine would have informed "D." that Matanzas, Halifax, and Indian River inlets, far exceed the neighborhood of St. Augustine for fishing. If he had inquired of any sportsman where he should go to make a bag or kill a deer, he would have been directed to Diego Pines. He complains of some sportsmen (sic) being prevented from shooting in the neighborhood of St. Augustine. This is a wise provision, for some "sportsmen" cannot distinguish the difference between a tame duck and a mallard, or an old hen from a pheasant, and some of them are so careless with the use of firearms, that to protect the lives of residents protective laws are necessary.

To me it is evident that "D." has not visited the "unsportsmanlike" fishing parts of Florida, and that he has used your columns to benefit a hotel in Florida. If "D." like Dr. Ferber, Dr. Heushall, or Ward, of Grayling, Mich., will follow in my tracks, eat loose from hotels, "hog and hominy," and leave his "fastidiousness" in a first-class hotel, he will tell a different story, and apologize to your readers for occupying valuable space with mere twaddle, and a puff regarding a hotel in embryo, and lots to sell near the "Port."

AT. PRESSCO.

JACKSONVILLE, FLA., JUNE 11, 1888.

Editor Forest and Stream:

Please allow me a word in defense of what I said about the local laws of St. Augustine. This question, like most of the two papers on this subject, is entirely unnecessary, more explicit in my statements. The prohibitory law which you commend, if I understand it, has nothing to do with the "extermination" that you speak of "when the rush of Northern visitors first set in," but was a very recent enactment, and instigated by a man irritable of bitter prejudices, who is affected by the sight of a gun as a mad dog is by a stick. This man enjoys the use of a gun as a child enjoys a stick, and a stick with a worm at its end, and a— etc., etc., but he will not interfere with your enjoyment if it happens to be something that he approves of. If the prohibitory law had been sensibly framed it would meet even my approval, but as it stands, it certainly does not.

To prohibit shooting within a radius of half a mile from the City Hall would be very well, but the city limits are close to the city proper on one side, while on the other they include the marshes nearly to the ocean, and extend a great distance above the city. On these vast tracts of marsh lands there are a great many birds, but as it is difficult to get at them there is no danger of extermination. That idea came from the fact that, while there was no law to prevent it, every boy who could carry a gun was constantly popping at the birds on the flats almost within a stone's throw of the City Hall, and when they found it too hot for them and left for unmolested feeding grounds; they were not exterminated.

That the privilege of shooting plover on the marshes a mile or more above the city can do anything more in the way of extermination than the same privilege would in any other place I fail to see. Consideration for the birds had nothing to do with the enactment of this law. If the "city fathers" care anything for the birds why is there not a law to prevent the infamous business of robbing birds' nests? This wholesale "slaughter of the innocents" is universal here, not the slightest effort is made to stop it. A mocking-bird is lucky if she can find a place for her nest that these impudent, annoying little rascals cannot reach. But the singing birds are not the only sufferers, for the depredations of these little devils extend out into the marshes. One, at least, of the rail tribe (a large bird) breeds here in great numbers.

A few weeks ago a man surprised a small gang of these exterminators near his fence; one was carrying an old bird which they had killed with a stick while on the nest, and another had the eggs in his hat. They roamed and steal wherever they choose, and the only law they have to fear is a cross dog.

NEW YORK, JUNE 15.

Our correspondents appear to have taken too seriously some things which "Didymus" wrote in jocular mood. He is not a grenshorn, nor, as one writer unkindly suggests, a "dude," but a gentleman who has traveled extensively, and as a sportsman can probably hold his gun as "dead on" as the next man. His praises of old St. Augustine appear too lavish, they are at least pardonable, and it is not necessary to scribble them to any sordid motives. It is one of the most beautiful cities of Florida citizens to exalt some particular point in the State, and in comparison with it to decry all other localities as in some respect or other inferior. The State has been sufficiently vindicated by those who have replied to "Didymus," and this discussion carried as far as can be useful. To prolong it would probably not affect next winter's Florida travel. When "Didymus" knows more about St. Augustine he will agree with us about the wisdom of the law referred to.]

Oh, the beauties and delights of rural surroundings. The cheerful awakening from sound, healthful slumber. For instance, the time is about 4 A. M. or a little before. Dick, the game-cock, having gone to roost at sundown, suddenly awakens to a sense of his responsibility as boss of the entire premises, and sends out a clarion note that may be heard one mile away. Nine female geese and one old gander at once respond, with outstretched necks and voices shrill and deep. Three guinea hens, with their Brigham, take up the cry. The old peacock gets on his wings, sails up to the peak of the barn, and lets down the bottom of his lungs. A flock of ducks start up suddenly and waddle off to the creek, with most noisy quacking. Four milk-eyed, deer-faced Alderney cows commence a musical howling from the paddock on the flat by the creek; four fawn-like calves answer with responsive bleating from the calf pasture above.

It is not yet 5 A. M., and the thrush, the robin, the song sparrow, the Phoebe-bird, the cardinal, the peewee, the chickin, the bluejay and the vireo are making the whole house very musical.

How about the awakening of a summer morning in New York? I am not so certain. I have tried both sides. I prefer the donkey engine to the guinea hen; the steam whistle to the peacock. The rattle and roar of the waking city is hardly more disturbing to nerves than the racket of a farmyard. I know something better.

"I know something better. O'erhance the verdant banks of Otter, Where wood-ducks build among the vines, That bend above the crystal water, 'Tis there the bluejay makes her nest, In thickest shade of water beeches; The fish-bawk, statusque in rest, Keeps guard o'er glassy pools and reaches."

Well, I am "going through the Wilderness." The Sairey Gamp meets me at Booneville the first week in July. The Sairey weighs 140 pounds. I noticed since I commenced writing light canoes in FOREST AND STREAM, several makers have discovered that the "one" will carry a light canoe and his duffle. Have they ever seen it done? They placed a few 10-pound cones in the hands of skilled canoeists for lone, independent cruises in the North Woods and other glorious lake-dotted forests? Am I to meet one of them here and there, go into camp with him, divide the last ounce of provisions, and then paddle in company with him over the blessed clear waters, and over the islands, outlets, etc.? I guess not. There is no 11 or 12-pound cedar canoe afloat in this section with 150 lbs. in her. I think a 16-pound canoe would be safer and more comfortable. All the same, she is bound to go through. Maybe she will do better than her maker thinks. Possibly he has builded better than he knew. There is a possibility that I may turn out to be an old gray-headed expert in light canoeing. Maybe I have been there. Perhaps I have paddled a kayak, the most ticklish boat that ever floated a man. And I may get drowned. I shall certainly take in some duckings.

NESMUK.

EDIBLE CRABS OF THE UNITED STATES.

AN interesting, though brief, article in the catalogue of marine invertebrata sent to the London Fisheries Exhibition, Mr. Richard Rathum, of the U. S. National Museum, gives a list of the principal edible crabs of the United States, and the methods by which they are taken. He says: Over twenty species of crabs belonging to the coasts of the United States are now regarded as of greater or less practical importance to mankind. The most valuable of these are the blue crab (*Callinectes hastatus*), lady crab (*Platyonichus ocellatus*), stone crab (*Menippe mercenarius*), and rock crabs (*Cancer irroratus* and *borealis*), of the East coast, and the common crab, rock crab, and red crab (*Cancer magister*, *antennarius*, *productus*), of the Pacific coast. The remaining species are utilized simply as bait, or to a slight extent only as food.

The blue crab is the common edible crab of the Atlantic coast, and ranges from Massachusetts Bay to the Gulf of Mexico. The season for its fishery is of variable duration on different parts of the coast. At New York it lasts from May to October, while in Florida it begins as early as March and continues until December, or, if the weather be mild, through the year. This crab is eaten in both the hard and soft shell condition, but is greatly preferred and commands a much higher price, when in the latter state. This is contrary to what holds true with all of the other species of crabs upon our coast, as well as the lobster, which are only eaten when hard-shell. However, soft-shell crabs are seldom taken in marketable quantities except on the New Jersey coast, whence New York derives the greater part of its supplies. The crab fishery for New Jersey alone amounted to over \$100,000 in 1880. The blue crab also forms an excellent bait.

Several different appliances are used in the capture of blue crabs, the most common being the ordinary scoop or dipnet, also called crab net. For attracting the crabs from depths not easily reached by means of the dipnet, the fishermen resort to baited lines, without hooks, which are used singly or made up into trawls. In a small boat, each fisherman is furnished several single lines, which are hauled up at short intervals, the crabs being secured in a dipnet as they approach the surface. The crab-trawl, or trot-line, measures 250 to 700 feet in length, and has small lateral lines arranged at short distances apart. There are several methods of setting it. One is to anchor each end by means of weights, and another to attach the ends to long poles, which are driven into the bottom. A man in a skiff rows continuously from end to end, hauling in the net and lines and taking the crabs as in the first instance. On the Louisiana coast the trot-lines are stretched along the beaches, the lateral lines being thrown out into the water and hauled in at regular intervals. Seines, hoop-nets, lotted with meat, and chain tows are also occasionally employed for catching crabs. As the soft crabs remain in a semi-normal condition, and will not take the bait, they are secured almost entirely by means of scoop-nets from the beaches, or in the hands. Floating enses are extensively employed in some localities for keeping the hard crabs until they shall have cast their shells and become soft. Crabs are generally shipped to market in boxes, baskets or barrels, with or without packing. Some boxes are usually preferred for the soft crabs, which are packed in

very snugly in order that they may stand transportation without injury, and so that the moisture will not run too freely from the gills. The crab catchers consist largely of women and children, especially in the Southern States.

In 1880, there were three crab canneries in the United States, two being located at Hampton, Virginia, and one at Oxford, Maryland. Only hard crabs are used in the supplies coming mainly from the neighborhood of the canneries. The process of canning crabs is somewhat similar to that for lobsters, as practiced on the New England coast. The crabs are boiled or steamed, after which the meats are removed from the hard parts and packed in one and two pound tins, the shells or carapaces being cleaned and sold with the meats, to serve as holders in making deviled crabs. The refuse is used as a manure.

The crab fisheries of the eastern coast of the United States, in 1880, amounted to \$328,000 (fishermen's prices), of which the greater part belonged to New Jersey, Delaware, Maryland and Virginia. South of Virginia, on the Atlantic coast, the crab fishery is of but slight importance at present; on the Gulf coast it amounts to about \$10,000 annually, and is mainly confined to Louisiana.

The rock and Jonah crabs (*Cancer irroratus* and *borealis*) are eaten only to a slight extent, probably for the reason that their range is co-extensive with that of the lobster, which is much more favorably regarded as an article of food. *Cancer irroratus* is caught at the mouth of Boston Harbor in small quantities, to supply the Boston markets, and both species are taken for the Newport market, in Narraganset Bay. They are also used as bait for several species of fish.

The stone crab (*Menippe mercenarius*) is very much esteemed for eating, but nowhere occurs in sufficient abundance to supply more than a limited demand. The shell of this crab is thick and heavy, and the claws proportionately large, furnishing a generous supply of meat. The stone crab lives in holes in the mud, which it excavates, and in cracks between rocks, and is, therefore, somewhat difficult to capture. In taking them from their holes, which are sometimes very deep, the crabber thrusts down his arm, and seizing the occupant by the elbow of the nearest claw, draws him quickly out, allowing him to fall upon the ground, where he is better able to secure him without injury to himself. The crab offers stout resistance, and is sometimes taken out piecemeal. The crabber occasionally resorts to digging out his prey. This species is rarely shipped away from the seaport towns where it is taken, and is, therefore, seldom seen in the larger markets, excepting at Charleston, S. C., in the vicinity of which it is abundant. On some parts of the Florida coast it furnishes the inhabitants with a considerable share of food at certain seasons.

The lady crab (*Platyonichus ocellatus*) is occasionally taken for food on the Atlantic coast, in the same manner as the blue crab, but is rarely seen in the markets. In the Gulf of Mexico, and especially on the Louisiana coast, it is an important article of fishery, and large quantities are shipped to New Orleans every season. On the New England coast it is used as bait.

Six species of crabs are regarded as edible on the Pacific coast of the United States—the common market crab (*Cancer magister*), rock crab (*Cancer antennarius*), red crab (*Cancer productus*), kelp crab (*Epilattus productus*), yellow shore crab (*Paralona orgonensis*), and the purple crab (*Hemigrapsus oregonensis*). Only the *Cancer magister* is now extensively used as food, although the other two species of the same genus are said to be equally good as regards flavor. The *magister* is, however, the most abundant species in those localities and depths which are most frequented by the fishermen, and also averages somewhat larger in size. It is captured mainly on the sandy beaches of San Francisco Bay, by means of seines and crab nets, baited with fish and offal. The principal market is San Francisco. The season continues more or less throughout the year, but the summer catch is much larger than the winter. The red and rock crabs are most abundant on the rocky shores of the northern side of the Golden Gate, where but little fishing is done. The *Cancers* are not, apparently, caught elsewhere for food on the Pacific coast. The yellow and purple shore crabs are eaten by the Chinese, who spit them upon wires and cook them over open fires. The kelp crabs are used by the natives of the northwest coast. A large "red rock crab" (*Echthrococcus setimimus*), living about the Farallone Islands, off San Francisco, is occasionally brought to the markets of that city as a curiosity, and sometimes brings a high price as ten dollars each. Species of *Chionectes* and *Lithodes* are eaten by the natives of Alaska.

ALBINO ROBINS.—About half a mile from this place there keeps a white robin, the bird is entirely white with the exception of few wing feathers, and one or two feathers in the tail. That this bird is a robin is certain; its flight and "chirrup" proves that. It is very tame, allowing a person to advance within a few feet of it. This is its second appearance in this locality, last year there were more dark feathers in its plumage than now. It is evidently a male. Another instance. Early this spring I noticed a robin with more than its usual allowance of white in its plumage. I shot the bird, and found the tail to be entirely white, the breast was nearly white, there were several white spots on the wings, back and head. This bird was also a male. In this case, and in the preceding one, other robins were making war upon their unnatural brothers. Now, was this a freak of nature, or were these birds hybrids? The white bird can be seen almost any time, and the one I shot I have mounted.—H. B. GLASCO, N. Y. June 18.

AMATEUR PHOTOGRAPH EXCHANGE.—Sherbrooke, Quebec, Canada.—Editor Forest and Stream: One of the most valued items of my camp kit during the past three years has been a photographic outfit. I have been thinking that an exchange of views with other sportsmen would be very agreeable. I have a dozen or more that I think would be of interest to lovers of the wildwood, and which I would be glad to send to any of your readers who have copies of their own work to spare.—JOS. G. WALTON.

A LARGE CAT.—A wildcat weighing thirty-five pounds was recently caught and brought into Nashville by Reuben Cain, of Clatsop county. It was a superb specimen of the species, and should have been secured for one of the zoological collections in the North. Reuben said: "He was regular hell in harness, and most er got off, but for Nanny, my wife. She's more nor any teu cats in Tennessee."—J. D. H.

animal. In like manner I cannot believe that the muzzle-loader is the best rifle, because it is a little more accurate and has a slightly flatter trajectory. My little hunting rifle is a "Irrecci-loaded from the muzzle" (sometimes), or a "muzzle-loader loaded from the breech," but not a gun through the barrel of which daylight cannot be made to shine without several minutes' work with a huge fraction of a blacksmith's set of tools. L. I. FLOWER.

CAMBRIDGE, N. B.

SENSIBLE VIRGINIANS.

THERE were a good many sportsmen here this week. As I write, a large sloop has just filled anchor, and has headed for the Virginia capes with some twenty-five of the Baltimore Sporting Club on board. She is bound for a month's cruise. Another sloop from Suffolk, Virginia, with some twenty-five of the gun and rod, has put in an appearance, and will leave to-morrow for Hog and Monacan islands. The Richmond, Va., Club will commence their annual cruise the first of next week, as also will the Norfolk Sporting Club. It is no wonder that the ladies wander disconsolately alone at the watering places, for this custom of the Virginians of leasing a vessel and spending their mid-summer holiday in a snug party afloat, has grown steadily in favor, and now represents the men as represented at the springs by headless boys, or by those effeminate young men who avoid the sun and wind, as if it bore on its beams and breeze the pestilence itself.

Besides, the Virginians find it not only more enjoyable, but cheaper. Twenty-five young men clubbing together can, upon paying a sum of twenty-five dollars apiece, rent a sloop, provision it, and enjoy a delightful, free Bohemian life for a month, and not a vessel that would cost half that amount to go to the springs, and they would not have half the enjoyment either. This place is the rendezvous of all of the clubs, and they stop going and returning. The rough-looking sailor grub of the day is changed into a gorgeous butterfly at night, with full dress suit, who circles in the "mazy," as Mr. Dick Swiveller expresses it.

The fishing is unusually fine this summer, and trout, sheephead and hogfish are caught in great quantities close to the hotel. There are a party of five returning from a fishing excursion over across the Rip Raps, who had averaged eight fish to the line, all of good size, too.

Sportsmen just from Cobb's Island and vicinity, report the robin snipe as having disappeared, but that the curlew, willet and yellow-leg snipe are arriving in good quantities, and the sport is fair.

OLD POINT COMFORT, Va., June 22.

MY FIRST WOODCOCK.

IN after years the matron mused smilingly on her first hunt; the station on his first speech; the mother on her first child. Delicious memories, all of them, and happy are they to whom they can come unalloyed with sorrow. In my own heart lingers one fond memory that, perhaps, lacks the sweetness of the first, the fervor of the second, the beautiful frenzy of the third: yet to me it is as thrilling as any or all of these, for it takes me back to that happiest day of my boyhood when I shot my first woodcock.

That prince of sportsmen and gentlemen, Prof. Beach, who has just returned to his northern Columbia colony, N. Y., near the rugged hills of Green River, that region long immortalized by William Cullen Bryant, did everything together. My boyish enthusiasm and wild love for nature pleased him as much as his wonderful culture and genius charmed me; from our earliest meeting there was a tender and mysterious bond of sympathy between us, that made us the most congenial of companions, until the premature end of his sad and unhappy life.

One perfect morning early in September, a day of vastly more moment to me than that which witnessed the victory at Marathon, or even the later episode of the Charter Oak, we, Prof. Beach and I, arose bright and early, breakfasted, and went off over the hills together after woodcock. He was armed with his light, trusty shotgun, I with an antiquated "rover," about as well calculated for efficiency as a fowling-piece was the formidable saumon made by one Krupp, or some other jackpaws with an equally heathenish name.

We tramped through swamp and swale nearly all the forenoon, each burning about the same quantity of powder, though with vastly different results—he had half a score of handsome woodcock, and I—nothing, alas! but one wretched blue Jay that I had shot (and I blush to record it) sitting stock still. A burning shame!

The Professor made numerous puns about my proficent shooting and deficient hitting, for I made it a matter of religion to blaze furiously away at whatever crossed the range of my vision, in dignified disregard of all considerations of distance or other disadvantage. I had long since abandoned all hope of ever hitting anything smaller than the woods, or the Professor's retriever, yet "try again" was the motto emblazoned on my escutcheon, and I swore inwardly with a wild sort of a deacon's oath that I would try until at least one genuine game bird perished.

When, as a reward to my pertinacity, success finally came; of the three, the Professor, the bird and your humble servant, I was the most surprised.

Late in the afternoon, when fatigue and failure had made me despondent, his capacity for producing smoke and wild, each discharge, put the combined efforts of a whole battery to shame. I attributed the silence of the Professor's gun to the fog of smoke which enveloped the whole clump from mine. But I was mistaken.

"You've got him!" yelled the Professor, "Got what?" I demanded.

"Why, the woodcock; that's what you fired at, wasn't it?"

Great essence of smoke! I surely must have frightened it to death. I didn't see it when I fired, or anything else for that matter, and certainly couldn't have hit it. I had emptied my gun from mere force of habit, into space, with no other intention than such a disposal of its contents. However, it was hit and severely, too, for when we dressed it the next day, its unfortunate skin completely resembled a horse-radish grater.

Years have passed since then; long, weary years; but I think I live that day over again, in memory, far oftener than any other day of my life. LEW VANDERPOEL.

HUNTING RIFLE SIGHTS.

FOR the benefit of those that may be interested I enclose herewith a rough sketch of a hunting rifle sight that I have found to be very effective, with the following description:

I have always had them forged from solid steel, the upper part standing at an angle with the bar (which has dovetails into the barrel), and leaning to the rear, so as to prevent any chance for light to reflect back into the eye, as it might do if this part were vertical.

This upper part is first made solid, and then drilled out accurately with a $\frac{1}{8}$ or $\frac{3}{16}$ inch drill, according to the gun

and the size of "horns" required, and a fine slit is sawed through accurately on top and in the middle, separating the metal into the two horns, and a fine notch is cut in the bottom of the circle, vertically under this slit, for the sight notch. This "notch" may be of any form, according to the fancy of the shooter.

The "horns" are now filed up to shape as shown in the sketch, their rear face being left a dead flat, and their front faces being beveled off toward the inside, so as to bring them down to almost a knife-edge on the edges on the orifice. This prevents any chance for light to reflect back from the edges of this orifice and strike into the eye.

Directly in front of the slot or notch a deep hole is drilled, and this carries the notch always to be in shadow, with no light to glimmer on its edges and blur the sight.

Now, the horns and orifice between them give quite a field of view, and (if the gun fits the man) the front sight is seen instantly on the gun being brought to the face, and but a slight movement is necessary to bring the front head accurately into the rear notch, and still have the game in the field of view. The line through the fine slit on top of the horns and the hole gives a vertical line by which to hold the gun level, and also a line on which to take a coarser sight, as the game is further off, and there being no raising sight to foot with and so lose time, the sight is almost instantaneous.

By experiment with a graduated peep sight and one of these rear sights, I found exactly how coarse a sight to take over the fixed rear sight up to 500 yards. At 500 yards I had only to sight in the top slit between the horns and hence the bottom notch, and I could, therefore (after I had learned from the use of the peep sight at fixed targets), take my sight fine or coarse at once, according as I judged the game to be far or near.

It is my experience that adjustable rear sights are a "delusion and a snare" for ordinary hunting. They may be all very well at times when game is quiet and knows nothing of the hunter's proximity, and he then has time to accurately judge the distance and set his sights accordingly; but under ordinary circumstances this is almost impossible, and I have known the game to be lost by the loss of time in adjusting sights. With a fixed rear sight (as nearly point blank as may be), the hunter knows he must "allow for distance" by a finer or coarser sight, and he can soon learn how much to allow and do it almost instinctively, and the temptation to adjust sights is not there to disconcert the shooting.

I have always used a "silver bead" front sight with this rear sight, and have made it the rule to get both down as close to the barrel as possible, and still see them both clearly and quickly over the breech mechanism; by this the deviation caused by the piece not being held level is reduced to a minimum, and the sights are both made better able to stand rough usage.

After aligning the rear sight accurately, it is fastened in permanently and a reference mark made on sight and barrel for future use, should the sight have to be removed or become deranged by accident.

I have never shot without a rear sight, but I know it is done in some of the armies of Europe at distances over 100 yards and at long ranges. The soldier is taught to sight over the horns of his left hand laid over the barrel and bent to greater or less height according to the distance; this might or might not answer for hunting purposes, according to the amount of skill acquired by the shooter. I never have tried it, preferring the fine or coarse sight through the buck-horn sight herein described.

Nothing original is claimed for this sight. It used to be very common on the Pacific coast and in Arizona, but as I never have seen one on sale or advertised as made by gunsmiths, it is sent as of possible value and interest to brother sportsmen in the East. C. D.

FORT McKINNEY, Wyoming.

INFORMATION WANTED.—While on a trip across Lake Umbagog two years ago, I was informed that the lower end of the lake had been scooped down to wild rice by a New York sportsman's club. I have since made inquiries as to the fact, but can get no information. Can you tell me anything in regard to it? I am contemplating a duck and grouse shooting trip this fall and thought of going to Umbagog or the Bangskeys. Will you or some of your many readers advise me as to the best point to strike, also the best month in the fall to go?—G. N. K. (Lancaster, N. H., June 19).

KYNOCH SHELLS.

Editor Forest and Stream:

Being a student in connection with your issue of 21st inst. by "D." of Mallowwood, Wisconsin, I know Kynoch shells it is apparent to me, as doubtless it will be to many other sportsmen who have not only thoroughly tested, but habitually use the "Perfect" shells, that "D.'s" trouble was caused by the simple fact that his guns are not correctly chambered. With paper or thick brass shells, this fault would not matter so much, but the "Perfects" being thin and pliable, they of course swell to fit, and if the chamber is slightly larger at the muzzle the shells will naturally be difficult to extract. When they first appeared I was prejudiced against them, notwithstanding their high repute with English sportsmen, and was first prompted to try them from motives of curiosity. I was, however, so agreeably surprised at the result, that I now use no others, and find they work well in every respect, and have so many advantages over both paper and the thick brass, that to my mind there can be little doubt they will soon be the rage here, as from perusal of the English sporting papers I judge them to be abroad. H. V. L.

WEST HOBOKEN, N. J., June 22.

Editor Forest and Stream:

As a matter of course, all readers of your interesting and instructive journal feel in duty bound to inspect and test whatever of implements or apparatus are found advertised therein, more especially when favorably noticed by the editor.

Being something of a connoisseur in fine breech-loading shotguns, you will readily see how easy and natural it was for me, as soon as I saw the advertisement of the Kynoch patent "perfect" brass shell, to begin at once to consider the "ways and means" whereby a supply of the aforesaid "perfect" might be "reduced to possession" for the purpose of inspection and trial. An opportunity soon presented itself, and I became the fortunate possessor of twenty-five of the coveted article, and having loaded them with three drams Hazard's duck-shooting No. 3 grain, and one and one-eighth ounces No. 10, I repaired to our range for the purpose of testing them on our weekly glass ball shoot. A friend of mine, Mr. E. P. W., prepared the same number in like number (the shells were 12 gauge). At the conclusion of our shoot we were surprised to find that the shells on four of our entire number had burst or broken off at the point where the reinforced body of the shell met, or about one-quarter of an inch from the head.

I reloaded what remained unimpaired, and at the conclusion of the second trial found as many more ruined in the same manner. I then determined to consign the remainder to the section of the back yard.

I enclose a shell that you may get the better understand the matter and see exactly how it is done. These shells were tried in my Parker, in Mr. W.'s Fox, and in guns of other manufacture, and in all cases fitted the chamber nicely, with the exception of being a trifle close in the Fox, and they in fact went a little close in all, so that it could not be due to any misfit in chambering. Taking into consideration these facts, we concluded, Mr. Editor, that the Kynoch is very nearly on a par with the best of the situation in no. Now I believe a nice, light, durable shell is "consummation devoutly to be wished," and the field appears to be open to some smart, enterprising Yankee for the exercise of his ingenuity, and whoever first brings out a light, durable shell will undoubtedly reap a rich and well-deserved harvest of thanks. The metallic shell now in common use is far too heavy, no doubt about it, and must soon be replaced by something lighter and nearer, and the sooner the better.

VINAILIAYEN, Me., June 20.

MEDICUS II.

INCIDENTS OF A JERSEY QUAIL HUNT.

DEPARTED this life, June 3, 1881, Nellie, in the twelfth year of her age, lamented by her own and his family, and acknowledged, by all who knew her, to be one of the best red Irish setter bitches in the house or field, that this country or any other ever knew. This should be the epitaph placed over the head of one of the most remarkable dogs in the field. She professed no tricks, but when she was sent to retrieve a bird, or to "back" of the situation, no instructions necessary as to where and how to hunt either quail, pheasant, woodcock or snipe, for she was equally good in hunting all. She was what some of the inexperienced would call a "winder." To make this explicit, I will illustrate. Some dogs hunt with their noses close to the ground (these are called "trailers"), in order to strike the scent of a covey, as they break from the brush to feed, in the first place, and then to follow up the bird.

Nellie was too high-minded for this, and would jump into a ten-acre field, throw her head up in the wind, sniff once or twice, and if the birds were out she would go to them without further ceremony, and slay there until you came up, if she had to wait for a week. When on a point, you could lay a cane from the end of her nose to the tip of her tail—straight as an arrow, and as stiff as a poker she stood.

She was nearly on one occasion when shooting in the fall at Cape May, some years ago, with Nellie for my "right bower," and several other of the canine specie to help fill the bill. My companion was Charles Clark. The dogs after ranging over two or three fields and finding nothing, at last brought up to a high rail fence, dividing the field we were in from the adjoining farm. Nell, the fleetest-footed of all, sprang on the top rail, and the moment she got there came to a point, looking back and forth to keep from going, while the other dogs sprang over without winding, and flushed a covey of about twenty-five quail. Never in my experience had I seen such a point, so ridiculous it appeared to me that I forgot to shoot, while Charlie got one with each barrel, which Nell retrieved one after the other in fine style.

We marked the rest of the covey, which flew and scattered in all directions (down there) a "blue bed" or "Landing grass." Nell found and pointed about two-thirds of the birds we killed out of that bunch, and we went on seeking for another. Before the day was over she came to disgrace in the following manner: About two o'clock in the afternoon the dogs drew up on a covey in the middle of a stubble field, backing nicely, and as they rose, we cut five from the number with the first two barrels, and got a single one with a third, returning back and forth to keep from going in the edge of a little swamp. Nell started at my command to retrieve this one, which she found, and came capering up to me with the bird in her mouth, sat down on her haunches, looked up in my face with expressive eyes, as if to say, "haven't I done it?" and as I reached out my hand to take the bird, she opened her mouth, and—and the bird flew off

and settled in the thickest part of the swamp. She looked foolish, but that was the last crippled bird that ever got away from her, because ever after she would pinch them enough to be sure that they would not get off after her trouble in retrieving.

We bagged forty-nine birds that day, and I went back to the city entirely satisfied with the day's sport. One more illustration of this bitch's wonderful sagacity and I will close. About three years ago, she had a hater of fine red jays. Among the hater one, Ned, at an early age began to show great promise. In the back part of the yard where the kennel was built, and in one of the stalls could be seen Nellie with her family. Master Ned, full of curiosity, was roaming around the yard looking and sniffing for stray pieces of garbage, and while thus engaged a sparrow lit in the yard and began to make a breakfast of the scattered crumbs.

The moment Ned saw the bird—the first in his life—he began with cat-like tread and little tail straightened out to approach the sparrow, which was entirely unconscious of the danger that threatened, being busy with his meal. Ned keeps up his alternate crawling and standing, and at last pounces upon the luckless sparrow, and with great triumph hears it to his mother in the kennel. As he came tumbling in, she took him by the nape of the neck and shook him until the air was filled with his dismal howls, and then put him out and he dropped the sparrow. The only way I could interpret this action of Ned was, that he was like that of a mother whose child has been guilty of some misdemeanor, and to whom she desired to give a moral lesson that would be lasting in its effect. By shaking Master Ned, she desired him to know this was not the kind of game that a scion of a noble house should bother with—a bird not worthy of notice. Ned at this time is a first-class bird, but not to be compared to the bird that I am now writing of. I could relate innumerable instances of the sagacity and affection of this beloved and faithful dog. Kind and affectionate to children, she was a terror to beggars.

Never brought prominently before the sporting public, yet she had sufficient "pints" to carry off the first premium in the bench shows in which she was entered, to wit: Centennial Dog Show and the Philadelphia Kennel Club Show.

CAMDEN, N. J.

J. S. M.

CONNECTICUT RAIL LAW.—We are indebted to the courtesy of Dr. J. W. Alsop, of Middletown, Conn., for the following, which comprise all the game legislation of Connecticut for the year. Chapter XLIII, approved March 28, reads: "Section 1. It shall be unlawful for any person to hunt, kill, destroy, attempt to destroy, or use any gun, rifle, or other weapon, in the counties of New Haven, Fairfield and Litchfield, between the first day of January and the twentieth day of August; and every person so offending shall be fined not more than twenty-five dollars for each offense. Section 2. The provisions of chapter one hundred and twenty-one of the public acts of 1882 (page 201) shall not apply to the counties of New Haven, Fairfield and Litchfield." This, it will be seen, allows rail shooting in August in the counties named. Elsewhere the open season remains as before, from September 12 to January 1. The other law, approved May 3, relates to game-wardens, and is as follows: "Section 1. The selectmen of every town shall appoint two or more persons to be game-wardens, who shall assist in detecting and prosecuting offenses against the game laws, and shall be paid the same fees allowed to grand jurors in criminal cases. Section 2. Game-wardens shall hold their offices for the term of two years from date of their appointment, and shall have the same powers as other officers to arrest for the violation of any law relating to game." The effort to open summer woodcock shooting was defeated. Dr. Alsop was chairman of the Senate Committee on Agriculture to which the game bills are referred, and to his careful attention Connecticut sportsmen owe very much for the excellence of the present law.

TENNESSEE NOTES.—The almost to the day, the noisy pair (or a pair) of woodpeckers have arrived to take possession of their breeding place on the wood pile in the corner alongside of my bedroom. Every year for the past five I have mentioned their arrival to the readers of the FOREST AND STREAM, because their constancy of purpose, and untiring energy, have served as a valuable lesson to me. How many times the actual visitors have changed, or more properly, which generation of the original pair are now by me, is a mystery, but I am sure, and am sure, that of the skilled matter, they arrive, and seem to know the exact place to stop at. One year a company of bluebirds had taken possession of the nest, and the woodpeckers had a long and desperate fight before driving them away, but so effectually were they eluded, that they never tried it again. From various sources I learn that the nesting and hatching of quail has been unprecedentedly large this spring, and, having accident, there will be great quantities of them next season. I noticed while out driving a few days ago, that there are myriads of doves this season. The "Nimrods" around Nashville prefer this to any class of shooting they can get. The birds are strong fly very fast and are hard to hit. No dog is used in hunting them, though their habits are such that when their watering place is discovered, they will go every day despite any amount of shooting at them. Sportsmen by the million infest the regions, and even near the city a capital day's shooting could be had after them.—J. D. H., (Nashville, Tenn., June 16).

THE NEW YORK ASSOCIATION INCORPORATED.—Articles of incorporation of the New York Association for the Protection of Game were filed last week. The objects of the corporation are to advocate the passage of suitable laws for the preservation of game and certain varieties of fish, to enforce such laws and other existing game laws, and to promote a healthy public opinion in relation thereto and in relation to the same. The incorporators are Robert B. Roosevelt, Benjamin L. Ludington, Charles E. Whitehead, John W. Green, John W. Balfour, Chas. E. Strong, Royal Phelps, Paul E. Thebaud, Stephen A. Main, Alfred Wagstaff, Wm. M. Fless, John H. Rhoades, Clinton Gilbert, J. Nelson Tappan, James Reynal, Thomas N. Cuthbert, H. C. Falmesest, Henry J. Scudder, Henry T. Carey, James Curpley, Townsend Cox and Roland Redmond.

SPRING CHICKEN GUN CLUB.—Permit me to call your attention to the organization of the Spring Chicken Gun Club, of Beaver Falls, Pa. The following are the names of the members: J. F. Kurtz, President; H. W. Baird, Secretary and Treasurer; W. H. Criss, D. B. Wilkinson, Bay E. Surks, Ernest Mayer, J. A. Tatro, Joseph Otto, S. R. Patter-

son, H. C. Patterson, Ed. Hutebison; honorary members, Jas. M. Fessenden and Mr. Smith. Limited to fourteen members. The object of the club is to promote skill in the use of the shotgun and the rifle, the preservation of game and game fish, the recreation of its members by encouraging healthful field and target practice; the cultivation of fraternal and good feeling toward all other such organizations. The club has secured a very desirable ground from H. T. and J. Reeves, of this place. The ground is just outside of the borough limits, at the upper end of town, and we anticipate a very pleasant time every two weeks during the summer. The regular day will be on Wednesdays afternoons.—Bad Shot (Beaver Falls, Pa., June 18).

NEW METHOD OF GAME DESTRUCTION.—While in Dakota last fall I found it was customary to rob game birds and ducks' nests. In a local paper I saw an item about one man who had secured over 5,000 duck eggs from Ranney's Lake, one of the small lakes with which that country abounds. I stopped at one farmhouse where the woman said her two small children had brought in sixty-eight prairie chicken eggs in one day, and she had cooked the fresh ones. I did what I could to try and educate them differently. Some attention should be paid to it this season or we shall miss our usual fall and spring sport.—M. (Hastings, La., June 19).

PHILADELPHIA NOTES.—There is a dearth of shooting news in our city, owing, of course, to its being an inter-season. It seems impossible to entirely break up the illegal killing of woodcock before July, and we every now and then hear of their being shot before the broods have separated, while yet we must confess the birds were nearly grown. The only way out of the difficulty is to do away with all summer shooting of woodcock, and we feel the majority of this morning wish that it will be best for all.—HOMO (Philadelphia, June 22).

GAME PROTECTOR IN NEW YORK.—State Game Protector J. S. Collett is at No. 391 Fifth street, Brooklyn, where he may be seen or written to in reference to any violation of the game laws in this vicinity.

BURLINGTON, IOWA, JUNE 18.—The outlook for next season seems very promising, as we are having continual rains, and an unusual number of ducks are breeding on the islands and lowlands opposite this place.—W.

QUAIL.—Moscow, June 18.—The quail in this vicinity are doing well, many young ones are now to be seen. The rabbits and squirrels are plentiful, and the prospects for fall hunting are good.—G. G. J.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

IMPROVED BLACK BASS TACKLE.

BY DR. J. A. HENSHALL.

IT is a source of great pleasure and gratification to the angler at the present day to note the march of improvement in the manufacture of fine fishing tackle, and to observe the commendable enterprise manifested by the manufacturers in producing light, elegant and suitable implements of the craft. In deed, the skill, study, ingenuity and good taste employed in this branch of the art is scarcely excelled in any other; all of which is highly gratifying, for it would seem to imply that the love and practice of angling has taken deep root, and that fine fishing and scientific angling are in a healthy state of growth and development. Especially have black bass anglers cause to rejoice in this matter, for in no other direction has this progressive feature been so marked as in the production of improved implements for black bass fishing during the last five years. Among some of the recent improvements in tools and tackle, designed more especially for black bass fishing, I take great pleasure in describing several which I have lately had the opportunity of examining and testing.

While the tapered, enamelled silk line is all that can be wished for fly-fishing, the lines heretofore furnished for bait fishing are open to several objections. In my "Book of the Black Bass," in reference to this matter, I said: "The perfect line for black bass bait-fishing is yet in the future. The best manufactured at present is the smallest size (letter G, or No. 5) hard-braided raw silk line, and it is very much to be regretted that the caller and snappers, and closely braided, and as firm and hard as the twisted, or laid Japanese grass line, it would be all that could be desired for a bait line. I have great hopes that a line of this description will soon be made, as I have invited the attention of Henry Hall & Sons to this subject.

"A bait line for casting the minnow should, in the first place, be composed of the very best material, and in this case, it is raw silk. It should be of very small caliber, the smallest that can be made consistent with strength, and the raw silk fulfills this condition better than any other material. It should be very hard, compact and closely braided. These conditions secure a line that renders freely and easily, is quite elastic, and at the same time absorbs but little water, and will not kink or snarl in casting. The line should, moreover, be fitted some suitable color, to render it as nearly invisible as possible, for it must be remembered that we cannot use a gut leader in casting a minnow."

The Henry Hall & Sons Company, of Highland Mills, N. Y., recently sent me two lines, one raw silk, the other boiled or dressed silk, marked size "H," or No. 6, saying: "We think this line is something new what you speak of in your book; but we will be better satisfied when you thoroughly test it and report. We are not quite ready to put this line on the market, but after hearing from you (if report is favorable) will put it in hand at once."

I have thoroughly tested both these lines, and find them the best yet made for the purpose. They are round, hard, and very closely braided, absorb but little water, and consequently render very freely in casting. They will be liked with delight by the bait-fisher as a very welcome desideratum. They seem to contain the same amount of stock as

the "G" line, but being more closely braided the caliber is reduced, while the strength remains the same. The raw silk line sustained a strain of 8 pounds, and the dressed silk 6 1/2 pounds, which is at least three times the strength actually required with a pliant rod. I have often caught bass averaging three pounds with a line that would not sustain a pound dead weight.

The dressed silk line is a quaker drab or light chocolate color, and is very light, weighing not quite 2 grains to the yard, 300 feet weighing 185 grains. It is of the same caliber as the No. 1 sea grass line, and fully as strong. The raw silk line is a trifle larger in caliber, though not so large as the "G" line, or sea grass No. 2, but as strong as either. It weighs about 2 1/2 grains to the yard, or about 225 grains to 100 yards, and is white, mottled with green, the usual color of raw silk lines. It is to be hoped that the company will soon put these lines in the hands of dealers who will promptly bring them to the notice of anglers by their usual custom of advertising in FOREST AND STREAM.

Abney & Imbrie's new compensating device, as applied to their multiplying black bass reels, is a very desirable feature, causing the spool to revolve as swiftly and noiselessly as though running on jewels; and as the bearings become worn, they can be adjusted and compensated by the device mentioned. This consists of conical recesses in the ends of the shaft, or axis of the spool, into which are fitted the conical ends of screw-pivots, which are tapped through the center of each outside plate, or disk. The heads of these pivots are covered by caps in the usual manner, by removing which, the pivots can be served in or out, adjusting their conical points, perfectly, to the conical recesses of the shaft. By this compensating device the reel can be made to run smoothly always, thus avoiding the wobbling, unsteady and noisy working of the spool in ordinary reels after they become worn. This improvement leaves nothing more to be desired in this respect in this class of reels.

This compensating principle I know to be a good one, and is the same in effect as one applied to reels more than thirty years ago by Mr. Snyder, now dead, formerly a watch-maker of Paris, Ky., and a contemporary of Mr. Meek, of Frankfort, Ky. The reels of both of these makers were built upon the same plan, but Mr. Snyder constructed his spool shaft with beveled, or conical, ends, fitting into corresponding conical recesses in the frame, by means of Abney & Imbrie's method, but subserving the same purpose. I have lately examined one of Snyder's reels that has been in constant use for more than thirty years, which, by virtue of the compensating device, runs as smoothly to-day as when first made. From this fact it follows that Abney & Imbrie are to be congratulated for making a happy hit. I have also recently examined and tested a black bass reel of a new superior shape, made by the same mechanic (a member of the Kentucky Fish Commission), fitted with Snyder's compensating device and an automatic thumb for casting (invented by myself), which works admirably in every way.

The new and novel treble multiplying reel and automatic drag, made by Wm. Mills & Son, is the best reel yet devised for fly-fishing for black bass. As they truly say: "It has no equal in this class, and is a real multiplier in value as a multiplier." The reel, in shape, approaches very nearly the ordinary click reel, but more particularly the Leonard reel. It is quite light, a 40-yard reel weighing but little more than four ounces, and is made entirely of metal, oxide and nickel-plate. The handle is firmly affixed to a revolving disk, which is the best plan in a click reel, the handle revolving through the center of the frame, instead of being cast into it from the outside, as in the new principle, as applied to the gearing of reels, which consists of an epicycloidal wheel at the outer rim, and a large cog-wheel affixed to the axis of the spool; between these two wheels is geared a small pinion, attached to the inner surface of the revolving disk; one revolution of the latter causes the pinion of the outer wheel to revolve three times by the spool in casting. It multiplies the force of the hand, in the most powerful multiplying principle yet devised for reels.

The automatic drag of this reel is also a novel feature. The central pinion is countersunk at its center, to admit a coiled watch spring with a ratchet or pawl on its free extremity, which engages with shallow cogs, or cams, on the end of the revolving disk, and causes the drag to revolve as the spool is cast. It is retarded somewhat by this ratchet-wheel, the same as a click; but in reeling up the line the ratchet-wheel, or pawl and cams, are inoperative, and the line is reeled rapidly and without hindrance.

Wm. Mills & Son have also patented a new landing-net which is a very compact and convenient tool, and, I think, the most portable of the kind, and is made of fine mesh, which is made of flexible material of brass or nickel—when released from its socket at the end of the handle, can be straightened and inserted in the hollow bamboo handle. The net can be carried in the creel or pocket.

When we add to these various implements the light and elegant rods, Sprout and O'Shannessy hooks, invisible leaders and neatly fitted flies which are now the pride of any first-class angler, the angler of the present day has much to be thankful for.

BLACK BASS FISHING.

I AM fearful of being misunderstood by some reader of THE FOREST AND STREAM, when I tell my brother sportsmen of one of the finest bass fishing grounds in this State. I do not wish to be thought a hotel runner, nor agent for any railroad or omnibus line. My desire is simply to give a few directions whereby sportsmen can reach good fishing grounds easily and conveniently.

The place of which I speak is situated in the town of Mexico, in Oswego county, and is called "Mexico Point," and is one of the finest bass fishing grounds between Cape Vincent and Oswego. At this place is found the natural home of the Oswego and black bass. A bar runs out for four or five miles parallel with the lake shore, and one-fourth of a mile from it. On this bar bass have been taken during the entire open season for the last three or four years. They are now taken by the minnow or small spoon, the former being the best bait, and the latter the best fly. The season opens in the month of August they take the fly readily.

Sportsmen can reach Mexico from Rome or Oswego via the R. W. & O. R. R., or from Syracuse via the S. N. R. R. I understand that a bus will be at the depot here ready to convey all passengers to the lake, distant four miles. At least a conveyance can be obtained. There are two hotels at the Point, the Lake View, kept by Mr. Will Wright and the Point Hotel, kept by Mr. J. C. Hancock. At the Lake View will be found all modern conveniences, good boats and oarsmen. I will add that the Little Salmon River flows

into the lake just between the hotels, and good trolling for pike and pickerel can be had here when it is too rough to go outside.

Mexico, N. Y., June 14.

Parties who wish to have moderately good black bass fishing, either fly or minnow, can find it on Goose Creek, near Clear (which is, I'm sorry to state, not the case now), in Loudon county, Va. One who examines the map will find this tributary of the Potomac within easy access of Washington by rail, sizable enough to hold many and large fish, and small enough to be fished at many points with the fly by wading. As this stream empties into the Potomac, one has a choice between two good things. Boats are used, not on the Potomac, and may be taken up Goose Creek for about a mile before coming to a dam. One may find excellent accommodations at Lent's Dam, not far from the railroad. Mr. Lent has taken once, and I suppose would do so again, a pair, brace or couple (whichever is right) of anglers to stay a night or two.

I know from the gentlemen so entertained that they were pleased with their host and his treatment of them. Mr. Lent's house is within thirty or forty yards of the stream, and admirably adapted to fish-like warfare. Mr. L. and his son-in-law are so fond of fishing themselves that they take a personal interest in the angler's success, and cheerfully do all they can to assist him. They have a large dip net, to catch minnows for bait, at their sawmill, and can procure branch minnows from parties living on Sycolon, a tributary of Goose Creek not far off. Mr. L. and his son-in-law constitute a perfect contradiction to the idea that persons from the city of the rod are lazy, as they have successfully made a clearing and built their houses and mill in one of the rockiest parts of the country, and are now cultivating land which seemed to be covered at first with rocks tumbled in confusion down the sloping country near the creek. A clear cold spring (nicely enclosed in hydraulic cement) bubbles up through an opening in the kitchen floor and within a foot or two of the stove, so that a person may dip water from the spring to fill a vessel on the stove without moving the feet. A room adjoining has a trough cemented in the same way, which serves as a dairy for milk, butter, and even fish can be kept alive ready for transportation at the close of a trip. Everything about the house is as neat as a new pin, and Mr. L. and his family are genuinely hospitable and kind, as indeed folk fond of angling generally are. I hope it is not necessary to say that I have no earthly interest in this matter, except that I have made pleasant acquaintances at Lent's Dam among the people of the forest and the stream, the artistic fly and the bending rod.

In one particular this place is deficient, viz., in a first-class host. There are good boats on the creek at other points. Leesburg is about three miles off. Two Baltimore gentlemen have lately tried this stream, and I can procure their address. THOMAS WILLIAMSON.

THE ENGLISH TOURNAMENT.

THE Fishing Gazette International Anglers' Tournament, in aid of the Anglers' Benevolent Society, took place at the Welsh Harp, Heudon, on Monday, June 11. The day opened with a cold northeast wind and rain, and it threatened rain all day, and this detracted somewhat from the attendance. The presence in London of so many persons from foreign lands who are interested in fish matters brought out many strangers. A correspondent of the Fishing Gazette writes:

Toward evening the sun shone out beautifully, and a group of the visitors was taken in the ground by Mr. R. W. Goodden, photographer, of Putney. The first competition was the amateur fly-casting competition, with single-handed fly-rod. The competitors were Messrs. Murphy, Mallock, Baker, R. B. Marston, and Rowba Wood. This was a very pretty competition and resulted in the victory of the stars and stripes. Mr. Wood, throwing 27 1/2 yards, though he was closely run by Mr. Mallock, who was only half a yard behind him. In the second competition, an amateur competition with single-handed fly-rod, in throwing fly with greatest accuracy and lightness under bushes, the Englishmen had their revenge. Mr. Mallock, of Perth, proving the winner. Mr. R. B. Marston, the editor of the Fishing Gazette, being second, and Mr. Baker third. For the third competition, for amateur fly-casting, with double-handed trout fly-rod, several prizes were given. Mr. Mallock made some splendid casts, being our American friend, Mr. Wood, though he certainly threw a splendid cast. Mr. Parker, of the Gresham Anglers, made some capital throws. For the fourth competition, Messrs. Wood and Mallock again contested, and Mr. Wood won with a grand cast of thirty-six yards, his friendly competitor only being one yard behind him. For the fifth competition, which was for an amateur contest in casting in the Thames style, three prizes were given, and great excitement prevailed. Messrs. Powell, Palmer, Coburn, Grandfield, Chambers, Hobden, Lewis, Adis, Simpson and Da Costa competed, and Mr. Powell won, Mr. Simpson being second, and Mr. Adis third. The sixth competition was for amateur casting from the reel in Nottingham style. Messrs. Slater, Martin, Gregory and Holden competed. Mr. Slater won, but Mr. Holden was only half a yard behind, with Mr. Martin third. The seventh competition was an amateur contest, open to Thames and Nottingham style, at casting at a fixed mark, the angler casting the bait nearest to the mark to take first prize, the next best angler the second, and the third best cast the third. For the eighth competition, Messrs. Slater, Simpson, Chambers, Powell, Lewis, Noris, Deane, Deane, and Holden competed, and after an exciting contest Mr. Powell won, Mr. Slater second, and Mr. Chambers third. The excitement now grew intense, and for the eighth contest three of the Wilders (well known on the Thames), Ted Andrews (of Maidenhead), and Bob Plummer (of Monkey Island) competed. Mr. Andrews won with a cast of fifty-four yards, Wilder being second with a cast of forty-five yards, and very clever that was considered. The eighth competition was that joined in professionally, and the contestants were the three Wilders (well known on the Thames), Ted Andrews of Maidenhead, and Plummer, Jr., being the most successful, rightly from knowledge of the vicinity, and the posted of empty beer barrels and planks, and had moored in front of the store. From this the competitors threw their lines with more or less vigor into the lake. The majority of the contests, however, took place upon dry land, the ground being staked out in lines for the pur-

pose, the site chosen being the center of the inclosure usually occupied as a shooting ground. A word as to the weather will not be out of place especially as this gathering has generally been associated with rain and cold winds. The committee, probably, going on the principle that a good fruit year comes once in every three, looked forward to a glorious time this season, as they had been sadly disappointed at previous meetings. Happily the rain which threatened to help, though the day was cloudy and cool. The number of visitors was larger than at any similar gathering, though the attendance was by no means as large as it should have been, considering the charitable object for which the meeting was promoted. The attendance, however, by no means represented the whole of the profit which will accrue to the society from the tournament, as a very large number of persons who did not attend had bought tickets.

The first competition was for fly-casting with the single-handed rod, which was won by Mr. Wood, who threw 27 1/2 yards, Mr. Mallock, an expert Scotchman, being second 27 yards, and Mr. Baker third, with 25. Mr. Kenner Wood, who took at Syracuse, New York State, is at present staying in England in connection with the Fisheries Exhibition, where he has charge of an American collection of rods and lines, etc. He is the champion fly-fisher of the States, and president of the Onondaga Fishing Club. Mr. Wood is over sixty years of age, but as active as a young man at twenty. He has a lot of prize trophies, but the one he values most is a beautiful gold badge given him by the members of his club before he left for England.

Cast-rod contests are much more common in America than in England, and Mr. Wood has generally figured to good purpose in these for the last twenty years, and he has been champion for twelve. His style of fishing is neat, skillful and clean, and he is a consummate master of the difficult art of getting his fly on to the water before his line—a feat in which so many amateurs fail. Mr. Wood used split bamboo cane rods—implements in the manufacture of which Americans excel. The split or glued rods are marvelous examples of Yankee ingenuity. They have gradually been improved until they are now as near perfection as it would be possible to get a rod. They are made in hexagon form, the strips being leveled so as to fit each other with the greatest nicety. The glue, however, with which they are "fixed up" is a trade secret, known only to about three men, as is also the varnish. Both are perfectly impervious to wet, and it is impossible to get the best made rods apart, or to injure them except by ill-usage. They are tough enough to hold any fish, and yet so flexible that it is possible almost to make them crack like a coach-whip.

But to resume our narrative. Mr. Mallock was first in the second contest for "throwing the fly with double-handed rod" with the greatest accuracy and lightness under bushes. Mr. Marston second, and Mr. Baker third. The said bushes were another triumph of Welsh Harp ingenuity, and were certainly worthy of a stage manager. A contest of double-handed fly-rods followed, and in this Mr. Mallock and Mr. Wood ran a very close race, the American champion being beaten by just half a yard, the winner managing to throw his fly thirty-five yards. Mr. Mallock used a splendid greenheart rod, and certainly made his line travel in extraordinary fashion, but he would have to select his pool if he were to fish for the lonely salmon in similar fashion. He certainly would run the risk of hauling up a tree or two by the roots, to say nothing of clearing off the "wee, moosey daisy" heads behind him. Mr. Reuben Wood beat his friendly rival in the next contest (for salmon-rods), as he managed to throw a cast fifty by Mrs. Williams, of Great Queen Street, no less than thirty-six yards, the Scotch representative failing to get beyond his original distance of thirty-five yards.

- RULES.
I.—Competitors are at liberty to use their own rods, lines and waders, except where otherwise specified, and subject to the under-mentioned regulations.
II.—No rod shall exceed the following lengths:
Single-handed fly competitions..... 12 ft. 6 in.
Double-handed fly competitions..... 16 0
Salmon fly competitions..... 20 0
Thames style bait competitions..... 14 0
Nottingham style bait competitions..... 14 0
III.—No rod shall exceed the following lengths:
Distance in length of rods. The term rod shall be understood to mean a bona fide fishing rod.
IV.—Each competitor shall use the artificial baits and flies for casting provided by the management.
V.—Competitors shall draw lots to determine the order in which they shall cast, and must be ready to commence when called upon by the time-keeper.
VI.—In each competition five minutes will be allowed for casting; the judges, however, may allow further time, if they consider it necessary, for repairs.
VII.—The fly competitions will take place on the water, and each competitor will be required to cast from the same position, either on the lake or on the bank (according to the wind), as may be decided by the judges.
VIII.—The bait castings will take place on the grass, and competitor will be required to stand on the selected ground, which will be reported by the time-keeper.
IX.—In no case will three prizes be awarded in any competition unless there are at least four competitors.
X.—The decision of the judges to be final in all cases.

We are enabled to give the following score through favor of Mr. R. B. Marston, of the Fishing Gazette. Judges: Messrs. Bates, Crumple and C. Hatfield.

Table with columns for competition name, competitor name, and distance in yards. Includes categories like 'Amateur fly-casting with single-handed fly-rod', 'Amateur competition with double-handed trout fly-rod', and 'Professional competition in casting in the Thames style'.

Table with columns for prize level (First, Second, Third) and amount in yards. Includes categories like 'Amateur competition in casting in the Thames style' and 'Professional competition in casting from reel in Nottingham style'.

[FROM OUR OWN CORRESPONDENTS]
THE GREAT INTERNATIONAL FISHERIES EXHIBITION, SOUTH KENSINGTON, LONDON, JUNE 14, 1888.

Editor Forest and Stream:
The enclosed clipping will give the principal details of the Anglers' Tournament, on Monday, 11th inst. It occurred at Welsh Harp, a beautiful village about ten miles from the center of London. The United States was represented by Mr. Reuben Wood, who covered himself with glory, carrying away three prizes (two first and one second). He might have won others had he entered for competition. To cheer him on several of our party were on the ground, including Prof. Good, Capt. Collins, Mr. Hausmann and myself.

Contests I, II, III, and IV, were from a raft on the shore of the pond; other contests in an enclosure on the level turf. In the first contest there were five competitors. Mr. Wood used a split bamboo rod 11 ft. 6 in. long, an E line (water-proof enamel silk), and an automatic reel. He threw 27 1/2 yards. Mr. P. H. Mallock, of Perth, Scotland, threw 27 yards with a hickory rod 11 ft. 9 in. long and a waterproof silk line. Second contest was with same rod and lines, won by Mr. Mallock.

In the third contest Mr. Wood and Mr. Mallock both used the same rod, a 16-ft. greenheart. The latter gentleman won by three-quarters of a yard, throwing 35 yards to 34 1/2 by Mr. Wood.

The fourth contest was a fine one between Wood and Mallock. Wood used an 18-ft. split bamboo fly-rod, called line B, and an automatic reel. Mr. Mallock a greenheart rod 18 ft. long and a heavy silk line, B size. Wood made 36 yards, Mallock 35.

The other contests were not international, but entirely between Englishmen. You probably know the difference between the Thames and Nottingham style of casting, the latter being from the reel, same as the Guttyhunk method, while in the former style the line is coiled or thrown on the ground before casting.

These styles of fishing are for trout and pike, the rods being generally of solid cane 10ft. 6in. long, and very fine lines of flax or hair. In the Nottingham style, the Nottingham reel is used, running with scarcely a particle of friction. Throughout the contest there was a wind from behind, blowing quite fresh at times. A. HOWARD CLAIRE.

LONDON, JUNE 12.

Editor Forest and Stream:
The Tournament came off yesterday, and I will try to give you a little account of it.

When I first arrived in London, I took my letter of introduction to Mr. Marston, and found him a genial gentleman, who has done everything in his power to make it pleasant for me, so much so that I do not see how all the obligations I am under to him can ever be discharged. I went to Hungerford with him to fish for trout, and had a good time, but let me tell you the fishing is very different from ours. Here they use very small flies, and exceedingly fine drawn gut leaders, and have to dry the fly every time they cast. If the fly is not dry when it strikes the water it is no use. This makes it laborious, and you must carry dry flies and gut leaders, and then they go for him; if none rises near they walk along the bank and watch for a break above, or below, and then cast about two feet ahead of the fish, and let the dry fly float down over it, and it must go just to the spot or it is useless. There are plenty of trout in the stream that we visited, but if one takes two or three braces of them in a day's fishing, he has done well.

You will see by the reports that I took two first prizes, one with a single-handed trout rod, and one with a salmon rod. I came out second in a double-handed trout match, which is, as you well know, a style not in use on our side of the herding pond. In this style they swing their fly back and forth through the air to dry the fly. I entered more to fill the class than in the expectation of winning, for there were two prizes and only one entry at first, a third coming in after. Mallock, who won first in this match, is from Scotland, and is a cordial gentleman. He offered me his two-handed rod and urged me to come in. I was glad to see him win in this contest, for he is a clever angler and casts a neat fly.

All through the fly-casting we had a strong wind at our backs, or our record would have been better in all the classes. These anglers are jolly fellows, and have made it very pleasant for me. The prizes are to be given out at Rosebery Hall, Clerkwell road, on Friday, June 22, at 9 P. M. This means, I think, a big dinner and a pleasant time. REUBEN WOOD.

ANGLING AT PLEASANT POND.

THE morning of May 1, a friend and I left our "head and board" at 8:30 A. M., and after an appetizing tramp of six miles reached one of our favorite fishing grounds, where the lively trout hold forth. We at once joined our rods, and baited up with the lowly worm or a piece of clump, for as this brook runs through an almost impassible swamp, it was no use attempting to use the fly. Our luck this season was not near as good as it was the first time last year. The snow water had not yet let out of the brook in a few places, so it did not seem to have any life about them, and would take hold more like a sucker than our fighting friend. Our catch was twenty this year, as compared with seventy last year.

May 24, being a holiday, Dick, Albert, and myself made up our minds to go to Ayr, a small village fifteen miles from here. We made our start at 5 A. M., and took, I think, the coldest drive I ever had in summer. We arrived at our destination at seven o'clock, and after putting our horses up immediately left for "Cock's" creek. It is not five minutes walk from the village, and being quite a large stream, we were enabled to use our rods full length. We once at commenced fishing, just below the old dam at the mill, and working up the stream for half a mile, we got into the thick swamp, and after fishing for about ten minutes in it, we had to stop on account of the mosquitoes. I believe they had already been waiting for some time, and after putting our flies on I found as we had a good square meal. The next time I go, I will be prepared for them. Going down stream we only caught three or four, and arriving at the mill we inspected our catch, sixty-two being the total for the three of

MR. BAYARD THAYER'S LEMON AND WHITE POINTER BITCH "RUE."
Winner of Champion Prize, New York, 1888.

Muzzle square-cut and lips slightly dependent. Neck strong and set on higher than foxhounds. Breast wide and shoulders strong. Body round and rather short, with wide, strong loin; thighs thick and muscular; legs strong, with plenty of bone; stern shorter than foxhounds', and carried slightly curved above line of back. Coat should not be fine or very short. Any Color allowed foxhounds or harriers is admissible. Height from twelve to fifteen inches, and from fifteen to twenty pounds weight preferred.

SCALE OF POINTS.

Head.....	20
Neck.....	5
Legs.....	10
Feet.....	10
Shoulders.....	15
Back.....	10
Loins.....	10
Hind-quarters.....	15
Stern.....	5
Total.....	100

Speed is not desirable in beagles, and a strong compact form adapted for endurance is, in my judgment, what is required.

I was much interested in an article by Gen. F. A. Bond regarding a certain pack of beagles running down thirteen rabbits one day, and fully agree with the General that beagles of correct type cannot, under ordinary conditions, run down rabbits; at least I never had any that could, and having the largest beagle kennel in the world, have been able to put as many into the field as any one, and my pack have never yet caught an unwounded rabbit. Holes and stone walls are too common in this section for puss to allow herself to be run down before retreating to them; and the great sport in hunting with beagles is that they run so slow that game is not compelled to take to earth and gives the hunter an opportunity to obtain a shot.

N. ELMORE.
GRANBY, CONN.

DOGS AT THE NEW YORK SHOW.

Editor Forest and Stream:
Perhaps Col. Stuart Taylor will explain why he does not quote from Mr. Dalziel's letter entitled "Babylon?" If there is anything in it inconsistent with his statement to Mr. Cornell (and I may add that he made a similar remark to me) I fail to see it. His letter is a pleasant, chatty one, with very little in it about dogs, and not one word derogatory of the quality of those exhibited here. He makes but one reference to our shows, which is as follows: "The Westminster Kennel Club are also the promoters and responsible for the great international dog shows held in New York, which, speaking of the one held this year, was superior in some of its features to any I have judged at or seen in Europe."

Perhaps your readers can find in this brief extract good reason for the eminent critic's failure to quote. Col. Taylor attitudinizes as the generous, public-spirited lover of the dog, who only seeks by his criticisms to spur his fellow countrymen into more successful rivalry with foreign breeders. The spirit is a worthy one, but I protest against his method. Wholesale denunciation will not attain that end, and is not deserved. It is such statements as the following which I object to. I quote from Col. Taylor's letter in your issue of 31st ult.: "Now, seriously speaking, Mr. Editor, a poorer lot of dogs of the many breeds exhibited it seems to me it were hard to get together, unless we took nondescripts." Whatever of justice there may be in his objections when he particularizes is neutralized by such sweeping charges.

ELLIOR SMITH,
NEW YORK.

Editor Forest and Stream:
Your valued issue of June 21, at hand, and I have just read the highly practical and sensible letter of Col. Stuart Taylor. Your correspondent treats his subject so ably that he leaves very little for any one else to say, except to endorse all the views set forth by him. One subject alone is capable of being enlarged upon. Col. Taylor says: "Let our breeders and our judges stand by, hard and fast, a type of dog pronounced good, and award laurels accordingly; there is too

much change from bench show to bench show in the prize winners, even under the same judge."

He has hit the right nail on the head. Is it not a patent fact that the same dog exhibited under different judges very rarely is allowed by both to score the same honors? Where do our judges get their ideas of type from? And further, where are breeders to get their ideas of type from? Each week we see controversies over certain dogs, some praising, some condemning them. Cannot something be done to remedy this kind of breeding from two types? Witness the trouble over the breed of cocker spaniels. The fox-terrier silver, was under one judge at Ottawa awarded second prize, and was no doubt considered a pretty good specimen. Now at Chicago he is passed over with a vhc., and the remarks made on him are: "Is only a fair specimen, is tery and light in bone and coat." It should have been added that he was broad-chested and had a snipy muzzle. Now, sir, where is the one definite type in this one of many instances? Cannot our judges unite in judging each breed of dogs from a definite, accepted standard and type of each breed? Or better still, cannot we have at each show a judge for setters and pointers, a judge for spaniels, and one for terriers, and so on? Let us hear from others on this subject, for many feel as I do.

FERRIER.

Editor Forest and Stream:
I think Messrs. Cornell, Coster and Pickett's letters in answer to Col. Stuart Taylor's criticisms of our late show were uncalled for. They ought to be very grateful that at last one gentleman has been discovered who has such a thorough knowledge of dogs. A judge who himself tells us that he knows as much about pugs, mastiffs, etc., as of setters, pointers, and all other dogs, is indeed a rarity, and I sincerely hope that the Westminster Kennel Club will let Col. Taylor judge, in future, all the dogs at the show, and do away with having so many judges.

BOSS.
NEW YORK.

SOME STAUNCH POINTS.

TALKING about dogs, I wish to say a few words about the staunchest, and in most other respects the best, dog I ever knew. His name is Joseph E. Johnston. He is a large white setter, which I acquired with him after the way to Mississippi. He called the dog Tramp, in commemoration of this event, before the term had acquired its present unpleasant notoriety. Tramp was a magnificent dog, with a splendid "flag," carried erect and waving as he would gallop all over a hundred-acre field, while the sportsman need only sit on the fence and direct him by a wave of the arm, for which he occasionally paused and looked. His predominant white color made him easily visible among the brown weeds and cotton stalks, and that, by the way, is a great advantage.

Joe Johnston is the son and exact image of Tramp. All the pedigree known of Tramp is that embodied in the pedigree of the Right Rev. Bishop A., who, while he is a sound churchman and an able and worthy divine, does not consider the healthful exercise of bird shooting beneath the dignity of the cloth, and derogatory thereto, was shooting with my friend Skipwith, the owner of Joe. Joe was at a stand on a covey, on ground a little elevated. As Bishop A. approached, an old bird got up, at which he fired, and sent some thirty No. 8 shot into Joe's side, at less than thirty yards. Joe quickly turned his head and looked very reproachfully at the Bishop, then, "without saying a word," as the miner said about his cat, Tom Quartz, he resumed his point until the birds were flushed. When the shot was fired, the white hair flew from Joe in a small cloud. He was taken home, the shot picked out by a physician, and in a couple of weeks he recovered.

In the other instance, Joe was going at a gallop, and jumped through a barbed wire fence. When he struck the ground on

the other side he came to a stand on a covey, a few feet off. Skipwith came up and flushed the birds, but noticed that Joe was standing over a pool of blood, perhaps a pint. On examination he found a gash four inches long, and quite deep, in Joe's abdomen, made by the barbed wire. Yet he stood perfectly staunch, without a whimper. He was carried home and the wound sewed up, and it was several weeks before he recovered.

Your "mink" man can beat me on flights of fancy, but what I have related about Joe are facts. OUAUCHITA.
MONROE, LOUISIANA.

[Almost everyone who has been much in the field with good dogs can recall interesting exhibitions of this kind; and as the subject is a most entertaining one, we hope that some of these points may be described in the FOREST AND STREAM.]

RUE.

THE pointer bitch Rue, whose likeness we give this week, is undoubtedly the best specimen of the small pointer that has been produced in this country, if not in the world. She was bred by Mr. Edmund Orgill of Brooklyn, N. Y. She was whelped August 12, 1879. Her sire, Snapshot, was imported in 1877, and to his long list of winnings in England, he added a number of important and well won victories here. Her dam, Ruhv, was litter sister to Mr. Orgill's well-known Rush. The breeding of Rue, it will be seen, is of the best and she is fairly entitled to her good looks. We are informed by those who have seen her at work that she is an excellent fielder, with a capital nose, very speedy and has lots of style. She was purchased by her present owner, Mr. Bayard Thayer of Boston, Mass., at the recent New York show, at the largest price—one thousand dollars—ever paid for a pointer bred in this country. We understand that it is the intention of her owner to run her at the field trials next fall. Rue was first shown in New York in 1880 when she was given vhc. in the puppy class, and first at Atlanta, Ga. At the New York show this year, she won in the champion class and, with Rush, Random, Rowell and Romp II., in the best kennel of small-pointers. She also won the same year, first at London, Oct., and first at Atlanta, Ga. At the New York show this year, she won in the champion class and, with Rush, Random, Rowell and Romp II., in the best kennel of small-pointers. She also won the prize for the best pointer at the same show. The cut is from a sketch by Harry Tallman.

BOXER IS POISONED.—I can now sympathize with others who have been compelled to deal with that miserable form of a sneak thief who has not the courage to say a word in open light, but vents his cowardly meanness on a dumb animal. Just one week after his return from the Pittsburgh show, my beagle dog Boxer II. was poisoned. A short time before, the same fate befell my pointer dog Dick. I considered Boxer a good specimen of the English beagle and had shown him but twice—last June at Cleveland, where he took first, and this year at Pittsburgh, where he took second; one of his pups, Lill II., taking first at same time. Besides being a prize winner, he was an untiring hunter. Some of his pups at five months old would give tongue on trail, which in my opinion was something extraordinary, and think it shows about the right kind of material. I have grown suspicious as to the identity of the sneak, and hope to gain a little more proof when I will try to make it hot for him.—J. M. BRIGGOLD, Canal Fulton, Ohio, June 12.

ERIN AND BIDDY'S PEDIGREE.—*Editor Forest and Stream:* For the benefit of the parties making inquiries of Biddy (30 N. A. K. C. S. B.) and Erin (6, 120 E. K. C. S. B.) I send you a full pedigree of the first and one of Erin's son, Erin II., which I hope will help to furnish the desired information. I think by closer comparison of the English and American stud books you will see the pedigree of old Erin is the same in both. Champion Biddy's pedigree you made out as by Erin out of Fan. It should be by Erin (6, 120 E. K. C. S. B.) and out of Whitford's Erin, imported (899 N. A. K. C. S. B.) (later St. Louis Kennel Club's). Biddy and Erin II. were bred by the St. Louis Kennel Club and they were sold by that club to Mr. J. B. C. Lucas, of this city, who still owns them and takes them on his annual shooting trips to Minnesota. They were thoroughly broken by C. B. Whitford. I don't think "G. W. G." will find out anything more of the pedigree of Duke of Buccleuch's

WENONAH, CUTTER, WINNING N. Y. Y. C. MATCH, JUNE 21.

NEW YORK Y. C.—JUNE 21.

It was a "luck race," and it was not. It was luck to a great extent to get out to the Lightship and half way to the Jersey beach, where the majority of the yachts bunched and took a fresh departure together for the last quarter stretch home. It was no race at all, inasmuch as it was soldiers' business all round without as much as a "turn," excepting one short board to the westward for a higher position coming out along the West Bank made by Mischieff, and a little later by Vixen. Not that this was really required for lack of close windiness, but the slackening of the breeze and a little more easings to some of the streaks had sagged these two sloops as well as many others making up the rear somewhat to leeward of the leaders, who had run out with about all they wanted for a time. This was of course a great disappointment. A close haul to the Spit with an outside S. S. W. wind, a drift out past the Hook with spinnakers hanging limp, a lot of unexpectably dispersed easings and airs waiting (then out to the Spit, a tolerable turn, a jam on the wind for a long and short leg working back to the Hook, a calm about half way in, and a fresh and smart breeze from S. S. E., finally striking in all along the line, making a free sheet clear to the finish, all this was not likely to produce a hard to hand tussle with rewards bestowed according to merit. In fact but for the bunching near the Jersey beach and the magnificent run home, the race would hardly be worth recording, except as a tedious and unsatisfactory hulk and drift. Three-quarters of the match is a story of make with occasional interesting brushes, but the last quarter made omeads for previous shortcomings, and the race in to the line with the magnificent spectacle at the finish will not quickly be forgotten.

The fleet was probably the finest, and it certainly was the fastest, ever collected in the history of American yachting. Had there been a fair share of windward work it would likewise have been the most absorbing encounter fought in our waters. But the club did all it could, old Froh, failed them, and so we must accept the open field for much speculation which this match was intended to aid in closing. The day was of more than national importance. Such a weighty fraction have deep yachts already become in our leading clubs that races assume an international coloring when sloop and cutter meet. This phase is likely to pass before long, when really American cutters shall have filled the places of the present vessels from S. W. heading in to the beach. The true course in was nearly V. N. W. The rear guard rounding the Lightship in straggled order was on the point of following suit when the wind pettered and a dark squall to the southward brought a newly born breeze from that quarter, taking the leaders aback and causing them to square away quickly for a free run up along the shore edging in all the time to the head up Sandy Hook buoy for a neat turn. They had, however, made so much southing while high on the old wind, that the yachts rounding the Lightship last found themselves suddenly jumped to the one or two tags of their own.

The two batches were all at once put about equally distant from Sandy Hook, and a general rush for that cape was undertaken, scarcely a hundred yards in a cluster some distance below and making a grand company hunt along the beach, affording really a second start for the day and the beginning of the race in earnest. As the lot ran up Sandy Hook and spinnakers filled to tension and in rapid succession hauled around the black cap, a choice bit of racing was witnessed, glorious enough to make one forget the tedious annoyances earlier in the morning, and what seemed to promise only a wretched failure was rounded off to a close as brilliant and imposing as was full of instruction. If any satisfaction can be derived from snatching up a dash in a crowd, our observations may be given to the following effect: Among the schooners, Montauk seemed able to fully hold her own with Crusader and others, but got left by the wind coming up the beach outside, while others holding a rounder drove down on her, blanketing her, and holding their way, shot by

before Montauk could pull herself together for the new state of affairs. She never recovered what she lost. Crusader was admirably toiled, and in her excellent form this year will keep Montauk moving when the latter's tonnage does not stand her in steady besides. Crusader has a grand fitting suit and a perfectly gorgeous array of bills. Grayling, the new candidate, made a fearfully bad start, which, considering the professional talent aboard, was quite unaccountable. Her skipper pulled a deal better than he knew, for this late start put her well to the fore in the lead. She had modestly been closing up the rear clear out to the Lightship, and being one of the last to turn had gone least to the southward when the new breeze struck in from that direction. She found herself in luck, having less distance to travel home than the rest, which she put to best account by turning up in the middle of the hook coming up the beach. Once she had the true wind with the rest, she failed to accomplish anything worth notice, being in fact easily held by Crusader. But, if Grayling gave no evidence of more than ordinary speed, we are inclined to consider her best lay down wind, and of this game she had to her fill nearly all day. So far as her early appearance at the finish is concerned it was a stroke of luck, pure and simple, due to her being at the tail of the fleet while rounding the Lightship, and at the tail she would have remained but for the sudden shift in the wind. Fortuna was brand new and stiff, and being one of the last ones off, struck into the doldrums outside the Narrows and fared poorly for wind all day, missing what there was by a few lengths upon several occasions. She likewise had a crowd to keep at bay when casing around the Spit and was blanketed and covered without mercy, and snapping her spinnaker boom in jibing a short ways out of the Hook. This schooner received, however, a good deal of admiration for her fine appearance, and the spectators seemed to be aware that it was too light for her kind. It was luck principally that seemed to be dealt against her all over the course. In rapid alternations moved off with great ease, and was a good fourth in her class at the Spit, after which she lay becalmed and failed to catch the airs sending others along further to the southward. She was left in the lurch after trimming flat around the outer mark and while the rest wereavoring homeward at a seven to eight knots an hour rate, she rolled helplessly to the long swell without steering way for five minutes, slowly falling away last in the fleet to the new breeze.

As for the sloops, they are all so familiar that relative merits are pretty well understood, but among the cutters it is more difficult to make a fair judgment, and to such good effect that she likewise landed her maiden piece of silverware, winning victory from the fastest fleet in America. Grace in company with Montauk had a big lift down the West Bank by a streak of wind which sent the two along toiling, putting a long lot of water between themselves and the rack. It was the limit, and as a down wind vessel she will not be dangerous. But she made amends during other portions of the race, for she did not monopolize all the luck there was going. Julia was never fairly in the hunt, and as a down wind vessel she will not be dangerous. Her reputation in the past, upon which so much store is laid in some quarters, is more of a myth than anything else, and the chances are she has been greatly overrated right along. She never had anything of her size to sail with in history, and then we know from improvements in rig, etc., found possible within the last two or three years, that the yachts she met were probably fearfully deficient in respect to equipment. Fanny, on the other hand, was something of an eye opener. All knew Grace as a steamboat with spinnaker out, but when they saw Fanny get away rather badly with the old favorite, there was something to talk about. Fanny, her entries, looks to be the dearest down wind we can muster. She is likewise smart on a wind but just how smart remains to be seen. Bischoff had a big share of the bad luck running, but pulled through a good fourth at the Lightship. Thus trimming in for the short-lived windward work, she seemed to sag to leeward and fall to point with the rest. The question is, who had the helm at the time, for the boat could certainly do better. Hilgard and Whiskey fell victims to the great America trister and are now repairing damages. As for the cutters, Bedouin and Wenonah, they sailed a game race through all the vicissitudes of fickle fortune, and came out nobly at the finish. Bedouin made a good start, kept Grace down the West Bank, till the wind fell and the latter got the duke already spoken of above. Then Bedouin drifted into the calm hulk outside, while Grace, easily edging to the seaward, found a gusty breeze, and kept the sea mark, and Bedouin fell among the ruck coming up, but after

some very fair sailing crossed fourth. What she may do on the wind remains to be seen, but we are convinced that with a racing rig Bedouin would be by odds the fastest single decker with a free sheet in America. Considering that she has 46, less hoist than her racing sail plan calls for, her record last Thursday deserves commendation. A stiff breeze and a windward boom will be her play. Wenonah performed wonders, and wrong words of admiration from even the most hardened believer in old time dogmas. In contemplating her doings, we skip the first portion of the race as too lucky, and pick up her record from the Lightship in. She gave close chase to Panis on the wind for a while, being eighth boat in the line. As the new breeze backed them all a round to a free sheet with booms to starboard, she was to leeward of the Hook, emerged with a lead of the whole fleet, Fanny, Grace and the two big sloops. As she span up to the finish, going through clear without a bubble, a vast deal of tooting from the spectators assembled announced the victory over America's fastest flyers by nothing more than a cruising cutter! slower over a forty-mile course than a clipper of genuine racing proportions.

The smaller yachts were much bothered through the earlier part of the race by blanketing from the big schooners. As they could not clear out from under their lee in the light winds, they were mercifully eluded at times. Vixen, in her new form, did not quite seem the old boat, but she scored, nevertheless, in her class, beating Panis, which is something to brag of, after much misfortune. Oriva sailed a thoroughly good race, but lost to the wind and made the outer mark in company with the last, leading her class home, however. The difference in actual speed between her and Vixen was less than three minutes, or ten minutes with allowances applied. For all yachting purposes, except racing, this difference must be considered pretty nominal, of no practical account. Now, no one looking for safety, accommodations, heavy, cool cabins, handiness, sea-going ability, and such sterling qualities, but who would select Oriva and pass by Vixen. If Oriva loses to the latter by only a few minutes in six hours racing, the exchange she offers in other respects so much more than compensates, that our choice is with Oriva every time as the more desirable style of the two.

The race again demonstrated how badly we are off for a good course in New York. The one sailed from time immemorial round the Spit and Lightship is too much of a triangle, and in the southerly winds of June supplies too little turning, which is, after all, the chief attraction and the best test of good qualities. For this match the dreftious were as follows: From an imaginary line between committee steamer and flag-rod of Stopneton, to and around buoys 10 and the 5/8 spindle on Southwest Spit, leaving black buoys on starboard hand, thence out to the Sandy Hook Lightship, passing outside of the black cap buoy, 2 or 3 miles, the Lightship to be turned from the northward and westward, then returning over same course and finishing at the between judges' boat and buoy No. 15, between the Narrows, classes for schooners, ketches and centerboards over Spit, and under Spit, and for sloops and cutters over Spit, and from 45 to 50 ft., according to new line and sail area measurements. For the guests of the club the large steamer Columbia had been chartered. Mr. John H. Bird, of the regatta committee, being in charge, while Mr. J. Frosterie was accompanied the racers aboard the tug Luckenbach. A vast fleet of "outside" yachts got under way and kept along under the lee of the contestants, or underfoot to work their way through the narrow channel as a show, while a dozen steam yachts and half a dozen sail yachts accompanied on speculation bent screws and paddled out to sea, offering several thousand persons an excellent view of the great annual track. Among the steam yachts should be noted the Orienta, a smart looking Herreshoff production with two coil boilers, and the No. 100, that being the swiftest member of the latest high speed turned out by the Bristol firm. Both of these were very fast, the No. 100 toying with the Strauger and Corsair, and speeding

Canoing.

FIXTURES.

- May 21.—Toronto Canoe and Skiff Races.
- May 29.—American Canoe Association Meeting at Stony Lake.
- Aug. 21, 22, 23.—American Canoe Association Regatta at Stony Lake.
- Aug. 24.—American Canoe Association Meeting at Stony Lake.

COMMODORE OR CAPTAIN.—That able and accomplished writer on matters canoeical, ex-Commodore Allen, has lately devoted much time and careful study to the statistics of the canoe fleet, and especially to the subject of commodores. By an interesting and carefully detailed description, he has shown the higher mathematics of the "ometry," and most of the "ologies," which space compels us to omit. He proves conclusively that the number of commodores in present existence in America is eighteen hundred and seventy-three, a most formidable total. As figures, especially the Commodore's figures, never lie, this result must be accepted as correct, but it is to be hoped that his further researches into the subject will suggest some cure for the evil. That it is an evil is the opinion of many old canoeists, and the desirability of changing for some less pretentious title is generally admitted. The Philadelphia Canoe Club, newly established, has started with the title of captain for their commanding officer, a much more suitable term than commodore, and the idea is worthy of imitation by other clubs. It is ridiculous to apply such a term to the commander of a "squadron" of two or three canoes. The days of gilt buttons and gold lace are fast passing away among boating men. If the high sounding titles of commodore, vice-commodore and rear-commodore go with them they will be missed. Just what use the two latter were to a canoe club has never been ascertained, and their places would be better filled by "mate." The commanding officer of the association should retain his title of commodore, while the club officers will appear to much better advantage among boating men as simple captains. Which of the clubs will be first to make the change?

NOVA SCOTIA WATERS.—The writer, having just returned from a flying trip through the Maritime Provinces unfortunately without a fishing net, is unable to remark that Nova Scotia is a veritable paradise for canoeists, the country everywhere being cut up by picturesque lakes and rivers. Yarmouth county is especially favored with the Tusket lakes and river. Starting at Westport, Nova Scotia, one may cruise through this chain to the sea. Trout abound and salmon are frequently caught; no lease or fee necessary for the latter, either. A fine cruise across the province can be made from a point within ten miles of Annapolis, via Sandy Fishers, Fairy and Rossington lakes and connecting streams to Liverpool. A Halifax canoeist known to the writer, and who has been in the province, is indebted for courtesies) has announced his intention of "doing" this trip the present month. Halifax, by the way, has several canoeists, and his intention of visiting the province, and his intention of "doing" this trip may also be had on the Bras D'Or lakes in Cape Breton.—SUNSHINE CITY.

WHAT SAYS THE MAGALLOWAY.—Editor Forest and Stream: My friends lack arguments to discourage my proposed attempt to descend the Magalloway River from Farmhouse Lake to Errol Island in a 25 ft cedar canoe, alone, next July or August. Will some of your many admirers, who are so busy over the route help them out, and at the same time give me some information as to canoe, outfit, etc. Never mind how big the canoe is, but get the canoe to Errol. I will be sure of it. The fact that my friends want are the reasonable risks in order to form some sort of basis of a proper program for an individual insurance policy, as "Nessmuk's" friends have done for him. His "in home" is so. If you know any nice young "feller" who wants to go, tell him to speak out.—MAGALLOWAY.

SAN FRANCISCO C. C.—We have received a copy of the new constitution and by-laws of the San Francisco C. C. in the form of a very neat little pamphlet. There are also given three signal codes, one in French, one in German, and one in English. The codes are for the paddle, and one in which various motions of the arms are used to

distinguish a canoeist when on shore from possible enemies in the shape of sarcastic small boys or warlike hoodlums who may be lurking in ambush.

STONY LAKE.—The Commissariat Committee have adopted as their first resolution the rule enforced at Lorna Island: "The sale and open use of intoxicating liquors is prohibited. A firm of grocers will open a store at the island, and supply groceries, canned goods, bread, butter, milk, etc. They will have hot tea and coffee always ready, but will not furnish meals. The free distribution of leaf to campers is also in their hands."

NEW YORK C. C.—The annual regatta will take place off the club house, New Brighton, S. I., at 3 P. M., Saturday, June 30, and will be open to all canoeists. There will be a senior and a junior sailing race; the latter for a prize and also for the Junior Trophy, single and double paddling races, and an upset race. The club-house may be reached by boats from South Ferry either to Tompkinsville or New Brighton.

Answers to Correspondents.

No Notice Taken of Anonymous Correspondents.

RATS.—For letters apply to Mr. C. H. Van Vleeten, Victor, N. Y. They cost about \$7 per pair.

J. C. V., Warwick, N. Y.—Train oil is whale oil. You can probably get it of your local druggist.

MANHATTAN, Morrisania, N. J.—Rose is by imported ringer and out of the breed. She is full sister to champion Red River.

A. A. W., Kansas City.—The N. A. K. C. Stud Book contains some of the pedigrees. Write to D. Bryson, Memphis, Tenn.

G. K., Boston, Mass.—Write to E. S. Harris, 147 Broadway, he may be able to supply you. The rifle is no longer manufactured, the company having failed.

C. W. W., Fairland, Ind.—Can the E. C. powder be obtained of New York dealers at this time? Ans. We know of no place in the United States where it is to be had.

F. M. P., New York.—The New Jersey woodcock law is uniform throughout the State. The open season are from July 1 to August 1, and from October 1 to December 16.

H. D. C., Midland Park, N. J.—The address of the New Jersey Game and Fish Protective Society's secretary is W. L. Forre, Plainfield, New Jersey. The membership fee is \$2.

W. E. B., Ironton, Ohio.—What is the difference in measurement at breast and muzzle of a duck and a quail? Ans. The difference is in the method of firing. There is no fixed rule.

C. McC., Norwich, Conn.—Cones and Stenrus' "New England Bird List" what you want. Two volumes, price \$5. Manton's "Terrestrial without a Teacher" is a handy little book; price fifty cents. We can furnish both.

G. R. S., Dumont, Cal.—Your bird was probably a harlequin duck (*Harlequin duck*), a species which breeds in the northern Rocky Mountains and on both coasts, but is only of accidental occurrence in your section.

W. F. Marion, Ohio.—At what place and at what time will I be likely to get the best bluefish? Ans. Barrelet, N. J., Long Branch, N. J., Sandy Hook, N. J., or Fire Island. For the latter place go to Babylon, L. I. Any time from now until October.

H. E. H., Boston, Mass.—In New Brunswick, Nova Scotia and Prince Edward's Island, the non-resident is required to take out a license, which costs, we believe, \$30. There is a similar law in the Province of Quebec, but we believe that it is seldom enforced.

C. R. H. W., Canada.—It will be some months, we presume, before Dr. Heisehal's book will be published, and a due notice will be given of its appearance. B. There are two pamphlets on the carp, one by Milton F. Peirce, 117 Market street, Philadelphia, Pa., and the other by Geo. Finley, Pittsburgh, Pa. The fish has been exten-

sively introduced in the Western and Southern States. They require warm water to grow rapidly.

Douglas, Schenectady, N. Y.—The black cocker spaniel Zulu is about three years old. He is by imported Bolo and out of imported Louie. He is owned by Mr. George Macbeth, London, Ont. His windings are: First, London, Ont., 1881, and champion at Cleveland, 1882.

F. L. D., Boston, Mass.—We have no other address of Massachusetts Fish and Game Protective Association than 408 Washington street, Boston, Call at store of Mr. John Fottler, who is the president, or upon Mr. L. S. Tobey, Jr., the secretary; or address the society at Boston.

W. P. S., New York.—If a person shoots a dog maliciously, what remedy has the owner under the laws of the State of New York? Ans. The remedy that he would have were the animal a horse; i. e., resort to law for the collection of damages. In this State as in several others, a dog has been held by the courts to be personal property.

E. F., Newark, N. J.—You can find a good camping place on Greenwood Lake, below the railroad station, almost anywhere. There is a small island there that seems a good place. Black bass can be taken by bait, troll, and sometimes with the fly. Pickrel are not very plenty, but can occasionally be taken by trolling a minnow or a spoon.

A. J., Higginpat, N. J.—Will you please inform one of your patrons by mail whether a reel is placed on top or under the rod when used before the band, and if a fly-rod can be used with the line running along the top of it, instead of on the under side? Ans. We cannot reply by mail. Yes. Different anglers use the reel in all the ways named, according to individual preference.

P. A. B., Philadelphia.—Can you oblige me by giving information about the habits of the frog and the method employed in catching it? Ans. The frog catches insects, snails and small frogs. It is not clear that it takes many fish. They are taken by shooting, striking them with a stick, and by a hook baited with a piece of red flannel, or a hare hook swung near their noses.

J. Port Lyon, Cal.—I have skinned three female Nuttall whippoorwills (*Phalaenoptilus nuttallii*) this spring, and they all have the throat-bar and tips of tail feathers white. Is this normal? In all the rest of the goatsuckers (*Caprimulgus*) I have seen, the colors of the throat-bar and tips of tail feathers are either tawny or fulvous in the female. Ans. Very unusual, we think. We have never heard of a similar case.

A. M. R., Pittsburg.—Would you in form me where I could find a fisher? Ans. I have been told by some anglers that there are small islands of 50 miles, if possible? Ans. There are no lakes within the distance you mention, and most of the streams are foul with the trash and refuse of the city of Pittsburg. There are some catfish, etc., in the Ohio River, but nothing that we would call good fishing.

E. S., Sparta Center, Mich.—How can I carry rifle cartridges with paper patched bullets for hunting so as to keep dry and free from dust and wear, still have them handy to get at? Ans. What style of box would you advise for carrying four, or one that will hold in the storm? Ans. I do not know of anything better than some one of the numerous cartridge belts. 2. An ordinary army wall tent tent by tent.

Schreiber, Grant's Mills, N. Y.—The loafers catch all the trout in the streams of this vicinity. Is there a law in force whereby farmers can protect the streams running through their lands? Ans. You can protect the streams by enforcing the trespass law, which provides: \$10. Any person who shall knowingly trespass upon cultivated or enclosed lands for the purpose of shooting or hunting any game protected by this act, or shall take any fish from private ponds or streams not stocked in whole or in part by the State, or after notice has been given by the owner thereof as provided in the following section, shall be liable to such owner or occupant, in addition to the actual damages sustained, in exemplary damages to an amount not exceeding \$25. If the notice referred to in the preceding section shall be given by erecting sign boards, at least one foot square, upon every fifty acres of land upon the limits thereof, or upon the shores or bank of any lake, stream or pond, or in at least two conspicuous places on the premises; such notices to have appended thereto the name of the owner or occupant, and any person who shall fear down or in any way deface or injure such sign-board, shall be liable to a penalty of \$25.

HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS
 OR THE CURE OF ALL DISEASES OF HORSES, CATTLE, SHEEP, DOGS, HOGS, AND PIGS.
 FOR TWENTY YEARS Humphreys' Homeopathic Veterinary Specifics have been used by Farmers, Stock Raisers, Livery Stable and Farriers, Horse Railroads, Manufacturers, and all who keep Horses, Cattle, Sheep, Dogs, Hogs, and Pigs. They are the only medicine that will cure all the diseases of these animals, and are the only medicine that will cure all the diseases of these animals, and are the only medicine that will cure all the diseases of these animals.

HUMPHREYS' NERVOUS DEBILITY SPECIFIC
 Vital Weakness and Prostration from overwork or indolence. This Specific No. 28, is the most successful remedy for Nervous Debility, and is fully known. Price \$1 per bottle, or 5 bottles for \$4.50. Sent free by mail on receipt of price, 50 cents. Samples sent free on receipt of price, 50 cents. HUMPHREYS' HOMEOPATHIC MED. CO., 109 Fulton Street, New York.

JAS. F. MARSTERS, 55 Court Street, Brooklyn.
 MANUFACTURER AND DEALER OF **Fine Fishing Tackle.**
 First Quality Goods at lower prices than any other house in America.
 Brass Multiplying Reels with Balance Handles, first quality and fine finish, 75c., \$1.00, 19c., \$1.25, 19c., \$1.50, 24c., \$1.75, 30c., \$2.00, 45c., \$2.25, 60c., \$2.50. AMERICAN Kennel Register.

A monthly record of kennel events for the information and guidance of breeders, exhibitors and owners of all breeds of dogs.

Its leading feature is the "Pedigree Register," of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is given to each dog, and an index will be compiled at the close of each annual volume, thus forming a permanent work of reference. The pedigree registration fee is twenty-five cents. The first two numbers of the Register contained the pedigrees of 138 dogs.

Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs at sale, and deaths.

Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include a record of field trials. The first two numbers of the Register contain prize lists of Washington, Ottawa and Pittsburgh shows.

The publication day is the fifth day of each month; and nothing can be received for publication later than the first day of the month. All matters intended for publication should be in the hands of the editor at the earliest practicable date. Entry-blanks for each department will be furnished free on receipt of stamped addressed envelope.

TERMS.—Issued by yearly subscription only. The subscription price is one dollar per year. Make drafts and money orders payable to the Forest and Stream Publishing Company. Address, AMERICAN KENNEL REGISTER, P. O. Box 2,352, New York City.

UPTHEGROVE & McLELLAN, VALPARAISO, IND. HOLABIRD SHOOTING SUITS

THIS

Is our Skeleton Coat or Game Bag; weighs but 15 ounces, has seven pockets and game pockets. It is of light material, dead grass color, and will hold the game of a successful day without losing a hair or feather. It can be worn over or under an ordinary coat. We will mail it to you for \$4.00. Send haste measure.

B. F. NICHOLS & CO., BOSTON, MASS.. Manufacturers of HEXAGONAL SPLIT BAMBOO FISHING ROD. REMOVED TO 153 MILK STREET.

We are obliged to have more room in our factory and greater facilities for manufacturing our good to meet the increasing demand. We have received the highest award and silver medal at the Massachusetts Charitable Mechanics' Association Fair for our superior goods. Send for catalogue.

AIR GUNS.

If you are going into the country this summer do not fail to take one of our air guns with you and have a grand time.

We manufacture a full assortment of Air Guns. Every family should have one. You can entertain yourself and company at all times, indoors and out, besides teaching your trespassing cats and dogs, kill rats and small game, or start a shooting gallery and make money with them. Our guns are extremely simple in construction, well made and handsomely finished; easily operated and shoot with force and accuracy; to get out of order. All first-class gun-dealers sell them. We also manufacture Nickel-Plated Net Picks and Cracks, Star Rods, Foot Ladders, etc. Circulars sent upon application. Address
H. M. QUACKENBUSH, Herkimer, N. Y.
Testimonials Change Weekly.

H. M. Quackenbush: Your air gun is the best arm for elementary target practice I ever saw. Very truly yours,
Edward S. Farnow, U. S. Army,
Instructor of Military Tactics at the U. S. Academy.

CLAY PIGEON COMPANY
133 5TH ST. CINCINNATI, O.

[Extract from FOREST AND STREAM, July 7 1881, p. 44.]

This flight so nearly resembles the actual motion of birds that the Clay Pigeons afford excellent practice for what shooting. We commend all sportsmen to test its merits.

WOOD'S IMPROVED TOBACCOPOP!

The greatest known antidote in the world for Mosquitoes, Black Flies and Grats.

No enjoyment can be had in the Adirondacks without this wonderful preparation. For sale by all Sporting and Fishing Tackle Houses in the United States. Price, 25 cents per box; postage paid, 30 cents.

Manufactured only by
R. WOOD, Syracuse, N. Y.

A Skin of Beauty is a Joy Forever.
DR. T. FELIX GOURAUD'S
Oriental Cream, or Magical Beautifier.

PURIFIES as well as Beautifies the Skin.
Removes Tan, Pimples, Freckles, Blemishes and every blemish on the face and complexion. It has stood the test of 30 years, and is so harmless we taste it to be sure the preparation is properly made. Accept no counterfeit of similar name. The only genuine is Dr. L. A. Sayre, said to a lady of the best (in a patient): "As you totes will use this I recomend 'Gouraud's Cream' as the best hair of oil the skin preparations." One bottle will last 6 months, using it every day. Also Remedy for removing superfluous hair without injury to the skin.
Mme. M. B. T. GOURAUD, Sole Proprietor, 43 Bond Street, N. Y.

For sale by all Druggists and Fancy Goods Dealers throughout the U. S., Canada and Europe. Also found in N. Y. City, by Messrs. J. B. Rose, E. H. Elrich, B. Ridley, and other fancy goods dealers. Beware of base imitations. \$1.00 reward for arrest and proof of anyone selling the same.

How I Became a Crack Shot,

—BY—
W. MILTON FARROW.
Price \$1.00, postpaid.
For sale by Forest and Stream Pub. Co.

Two Beautiful Illustrated Books PADDLE AND PORTAGE AND Canoe and Camera

BY THOMAS SEDGWICK STEELE, of Hartford, Conn.
122 exquisite illustrations of life in the woods, with map in each copy.
The humorous as well as the serious side of camp life is vividly represented, while Mr. Steele's well-known artistic perceptions, and a most fastidious love of nature, has made the work all that could be desired.
SEVEN EDITIONS of these works sold. Most popular books in the market. Cloth. Price \$1.50 each.

A NEW MAINE MAP.
The headwaters of the

Aroostook, Penobscot and St. John Rivers.
Compiled by THOMAS SEDGWICK STEELE.
The chart is 20x30 inches, printed on Government survey paper and mounted on cloth. Sent postpaid on receipt of price, \$1.

FOREST AND STREAM PUBLISHING CO.
30 Park Row, New York.

Silk Worm Gut.

F. LATASA, 35 Broadway, calls the attention of the trade and dealers in fishing tackle to his extensive assortment of Valencia Silk Worm Gut in all grades, long and extra long, and from Extra Heavy Salmon Gut to Extra Fine.
For price list address
F. LATASA
33 Broadway, New York.

Oil-Tanned Moccasins.

For Hunting, Fishing, Canoeing, &c. They are easy to the feet, and very durable. Made to order in a variety of styles and warranted the genuine article. Send for price list. MARTIN HUTCHINGS, Dover, N. H., P. O. Box 308.
READFORD & ANTHONY, Boston; HENRY C. SCOTTES, New York; F. CHAS. EICHEL, Philadelphia, Agents.

Shields' American Improved Gt Leader or Casting Line.

All fly fishers will readily see the advantage there is in using them. The easiest way to apply a fly or to remove it without impairing the strength or durability of the leaders. Lengths, 3, 6, and 9 feet, made of superior silk worm gut in all varieties. Fine trout, salmon and bass flies, and waterproof silk lines.
JOHN SHIELDS,
Box 221, Brookline, Mass.

MANN'S Trolling Spoons.

PERFECT REVOLVING
Sixty varieties manufactured, suitable for trolling for all kinds of fish that will take an artificial bait. Our Perfect Revolving Spoon is undoubtedly the best general spoon for taking fish ever offered to the public.
Three sizes made—No. 30 for bass, pickerel, or any fish under five pounds weight; No. 21 for large fish; No. 22 excellent for deep water fishing.

BEWARE OF IMITATIONS.
None genuine except with JOHN H. MANN'S name stamped on every spoon.
For sale by ABBEY & IVHLE, and JOHN P. MOORE'S SONS, New York; DAME, STODDARD & KENDALL, Boston, Mass.; In Chicago and Detroit by the principal dealers in Sporting Goods.

JOHN H. MANN & CO., SYRACUSE, N. Y.

SPORTSMENS TENTS.

Tents of all kinds for Sportsmen, Naturalists and Photographers, also for Camp Meetings. Fancy Tents for families made to order. Drawings of all kinds for dwellings, boats, etc.; also Yacht and Boat Sails, Flags and Banners of all kinds made to order. All work done in best manner and at very low figures. Send for Illustrated circular. Address S. HEMMENWAY, 60 South St., Opp. Wall St. Ferry House, Factory, 39 South St., Cor. Old Slip, N. Y. City.

30 DAYS' TRIAL FREE!

We send free on 30 days' trial Dr. Dye's Electro-Voltaic Belt and other Electric Appliances TO MEN suffering from Nervous Debility, Lost Vitality and Kidney Troubles. Also for Rheumatism, Liver and Kidney Troubles, and many other diseases. Speedy cures guaranteed. Illustrated pamphlets free. Address
VOLTAIC BELT CO., Marshall, Mich.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. SIX MONTHS, \$2.

NEW YORK, JULY 3, 1883.

VOL. XX.—No. 23.
Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsvendors throughout the United States and Canada. On sale by the American Exchange, 410 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications,

THE ABSURDITY OF THE FOURTH.

JUST about this season, over a good section of the country, hundreds of thousands of very patriotic and very foolish persons are inviting death by the firearm method. Somewhere at some time some one reached the absurd conclusion that the correct way of celebrating the holiday of our National Independence was to raise as much noise as possible. Unluckily his view has been adopted by the millions of his fellow-citizens, and now year after year there is a repetition of the catalogue of deaths and mangleings.

There is something so utterly ridiculous in using a firearm entirely for the noise which accompanies its going off, that it is surprising no concerted effort has been made by the arm manufacturing companies to discourage this application of their wares. In place of doing this, however, and for the sake of the profit which follows the sale of the pesky little things, we see several large concerns giving up their time and labor in large measure to turning out thousands upon thousands of contrivances which have the name and appearance of firearms, but which in the essential points of accuracy and safety are utterly unworthy of the name.

There is a clear, sharp defining line between a pistol proper, one which has a value as an arm of precision, and these cheap little counterfeits. And there is ample room for the operation of a salutary law which should come in to repress the making and vending of the dangerous toys.

There are plenty of noise-provoking contrivances which may be manufactured to meet the wishes of those who insist upon expressing their feelings by means of a racket, but there is no reason why so excellent a thing as a firearm should be debased into such flimsy pretences as we see hawked at every street corner. It would indeed be an important item in our strength as a commonwealth if every American citizen were familiar with firearms, had a just appreciation of their powers and their dangers, but there is a right and wrong way of securing that excellent result, and one of the worst ways is to put a make-shift of a weapon into the hands of every boy who can beg, borrow or steal the dime or two necessary to secure the toy.

BENCH SHOWS.

THE bench shows that have been held this year have been uniformly successful both in the number and quality of the animals exhibited, and also from a pecuniary standpoint. This shows a healthy state of affairs, and should encourage all who have an interest in the welfare and improvement of man's best friend to renewed efforts in speeding on the good work until every lover of the dog throughout the length and breadth of the land shall become possessed of the knowledge that will enable him to intelligently pass upon the merits and demerits of his favorite breed.

That the bench show has been a great educator of the public in this respect, no one who has been a regular attendant can deny. That still greater good will be accomplished in the future we have every reason to believe. Although the bench show is comparatively of recent introduction in this country, it has already become a permanent institution, and we trust that the day is not far distant that will see not only our larger shows greatly increased in number, but that in every city, village and hamlet in the land, we shall see local shows where friend and neighbor will meet in friendly rivalry, to decide upon the respective merits of their favorites.

This plan is extensively practiced in England, and contributes in no small degree to the success of the larger shows, both in the increased number of entries, and in the improved quality of the animals exhibited. The owner of the village champion, ambitious for higher honors, "seeks other worlds to conquer," and sends his favorite to a larger meeting, and so continues until he encounters defeat or achieves a well won victory that brings to him not only fame and honor, but pounds, shillings and pence as well. That this plan is eminently practicable and feasible it needs no argument to prove, nor of necessity need it entail a dollar of expense upon its promoters, at least so far as the smaller shows are concerned, as the honor of owning the "best of his kind" in the vicinity should be ample recompense for the small amount of trouble entailed. We trust that our readers will give this subject the careful consideration its importance demands, and that we shall soon be called upon to chronicle the inauguration of a series of local shows all over the country, that in a short time will accomplish the much-to-be-desired result, the filling of the benches at our important shows with representatives of the best of their breed from all sections of the country.

THE TOY PISTOL is doomed; State laws and city ordinances have been enacted for the suppression of the pernicious agent of death, and parents and police are united to squelch the nuisance. This is all as it should be; the sooner the sham pistol is banished the better for the thumbs and eyes of the patriotic small boy. But it is very foolish for parents to indulge, as they often do, in an insane horror of all firearms. A boy ought to be taught to handle a shotgun or a rifle just as soon as he is old enough and strong enough to do so. He will be all the more ready for it. Gunpowder smoke is healthier than cigarette smoke, and the associations and influences of the one are better than those of the other.

THE SUNFISH.—In a paper read before the Fishcultural Association and printed elsewhere, Mr. Fred Mather recommends the destruction of the sunfish. From any such proposition the FOREST AND STREAM most emphatically dissents. The sunfish was our earliest friend among the fishes; we hooked him long before our vaulting ambition dreamed of trout or bass, and when salmon was a term unknown to our vocabulary. The fishculturists may wage their campaign against the sunfish, but they will find little sympathy in their nefarious efforts outside of their own fry-entail circle.

THE CLAY PIGEONS were "slaughtered" yesterday beyond count. This target is growing in favor, having very largely supplanted glass balls, over which it possesses many very decided merits. We understand that the enterprising Ligowsky firm are about to perfect the manufacture of a cheaper trap, so that the five-trap style of shooting will be within the means of all. This is by far the most beautiful form of practice with the "birds," and promises to be very popular.

SEND IN THE NAMES.—We should be glad to receive from our readers all over the country the names of their friends who may be interested in any of the departments of outdoor recreation of which the FOREST AND STREAM treats, and who do not now take the paper.

SALMON IN THE MERRIMAC.—We learn from Mr. Samuel Webber, late Fish Commissioner of New Hampshire, that the salmon have at last made their appearance in the Merrimac River at Manchester, and one "guessel" at from eight pounds to ten pounds has actually been seen passing the Fishway at Amoskeag Falls. This proves the prediction which, it will be remembered, Mr. Webber made, that we should see a score of smaller fish, from the plant of 1879, this year. The season is later by two weeks than last year, but the salmon are on their way up now. Ten were seen in one day in the fishway at Lawrence, Mass. What is of more especial interest to sportsmen, however, is the fact that a salmon weighing ten and a half pounds was taken last week in the Merrimac, at Concord, with the artificial fly in a legitimate manner. We have always believed that one was taken three years since by a bass fisher, but owing to the fact that the prohibitory law was then in force, we could never prove the fact; but this catch of last week proves that the salmon bred from Penobscot stock will take the fly in the Merrimac. We note the following change in the New Hampshire Fish Commission, viz., the appointment of Elliot B. Hodge, of Plymouth, Superintendent of the Hatchery, as Fish Commissioner, in place of A. H. Powers, resigned. The Commission now stands: Colonel George Riddle, Manchester, Chairman; E. B. Hoëge, Plymouth, Superintendent of Hatchery; Luther Hayes, South Milton.

THE "AMERICAN KENNEL REGISTER."—The anxiety with which the monthly issue of the Register is looked for by its already large circle of readers, is a fair measure of the high esteem in which it is held by the owners of well-bred dogs. We regret, however, to see a tendency among those who have animals to be registered to hold back their entries until the last moment, and then just at the first of the month to send in their blanks in a lump. This course, while apparently serving no good purpose for anyone, puts the publishers of the Register to serious inconvenience, and has in one or two cases caused a delay of several days in the issue of the periodical. Whether the tardiness in sending in entries has any real reason or not, we cannot allow it to interfere with the date of issue of the Register. To examine the pedigrees, correct the mistakes which the owners make, and prepare the material for the printer, involves much labor and time.

OCCASIONALLY we receive questions from correspondents who ask us to decide for them wagers, and sometimes decisions are requested in games of cards. In the past we have good-naturedly answered some inquiries of this description, but as they are entirely out of our line, we shall no longer do so. THE FOREST AND STREAM does not hold stakes nor decide bets, nor does it profess to be an authority on games of chance. There are many journals which give attention to these matters, however, and we recommend those of our readers, who may be unable to decide such questions in any other way, to apply to them. Questions pertaining to matters within our own scope will, as they have always done, receive attention, but those which have to do with betting or cards will seek the seclusion which a waste basket grants.

AMATEUR PHOTOGRAPHIC EXCHANGE.—The amateur photographic outfits are now in general use by sportsmen, and large numbers of picturesque views are secured by them on pleasure tours. We have been greatly entertained in examining many such pictures which have been sent to this office from our friends. They are delightful suggestions of the pleasures of camp and cruise. It has been suggested that an exchange of such views would be welcome to many amateur photographers, who might thus add to their own collections the pictures of others. We think the suggestion an admirable one.

AMERICANS MUST LOOK TO EUROPE for "sporting novel-ties." The latest is a kangaroo hunt, provided for the huntsmen of Vienna by an Englishman, who has transported to the Prater thirty of the Australian marsupials. We learn from our esteemed contemporary, the Allgemeine Sport Zeitung, of that city, that great expectations have been raised among the Viennese, who are eagerly awaiting the chase of the novel game.

THE FIRST BOYHOOD EXPLOIT with rod or gun is always a theme of pleasant recollection. The pages of FOREST AND STREAM contain many accounts by the graybeards of their first successful hunt or fish long ago. "It seems but yesterday that I caught my first trout," said Henry Ward Beecher the other evening, upon the celebration of his seventieth birthday.

you, my marster, dat ole fool nigger he des riz up on his foots, an' open his mouf elean baek ter his ears, an' den, sur, he bar back his head, and he des farly howl."

Here Steve, imitating old Lawyer, sprang upon his feet, threw baek his head, and sang a portion of "Mars Garrett's hime chune," as follows:

"Hens and chikens gone to roos,
De hawk flew down an' he bit dat goose,
An' he bit dat goose in de middle er de baek
An' he mard dat goose go quack, quack, quack."

"Bless yer soul, my master," he continued, when he had ended his singing, "dat yarker town nigger, w'er des firy foot onten his hooves. He didn know w'at ter do, sur. He fuss look like he w'antter jump outen de baek winder. Den he des tun 'roun' an' he gits hime mid in de face, an' he des ups wid dat rod merrocker hime bock, an' he draw baeks, an' he truck Ole Lawyer kerslap right atwix his eyes, sur. He des farly knocked dat ole nigger somerset clean ober Mars Garrett an' Mars Shep. But bless yer, 'fore you knode it, sur, dat ole nigger des riz on his foots ergin, an' he made er lunge at dat preacher nigger, an' he lit elean ober dat white fikes house. An' presenly here come ole mars an' ole miss tarin' down de pall ter de church house. An' ole marster he euss, an' he say, 'What de debil's got inter you niggers you can't go ter hebin' doot fightin' er de road?' Den dat yarker town preacher nigger what look like he bin wraslin' wid er bumbee nigger, he pint at Ole Lawyer, an' he say ter ole marster, how dat big mouf nigger ober der wer siglin' corn-shuckin' songs, an' sackerlin' de mouf services. Den ole marster git red in de face like he do ole 'lection' dat er den, sur, he euss ter de sweet it des drop ofen de eend er his nose. Den he call dat yarker house gal bring him his cow white, an' sur, he des literly wode dat ole fool Lawyer cleau out, sur. He did fur er fark, my marster. Den ole mars tun roum' an' he shuck his fis' at Mars Garrett, an' he say, 'Dis some er your dan's foolisness, my young feller.' But Mars Garrett he never say nothin', he des come up close w'at he w'at he say to me, 'Der Steve, you kin make up er muif har rowe dat pulpit ter make yer a good matris; Ole Lawyer he owe you somthin', anyhow, for larnin' him doot buterful hime chune lass night.' Den he laff an' he say, 'But diden dat dam town nigger hav' er happy time uv it dis mornin'.' But ole 'miss' she come roum' dar w'at we wer, an' she whisper to Mars Garrett he better be gittin' way from dar 'fore his par get rested. An' Mars Garrett say how er ole 'miss' tood leup de ole Gunner ofen his trail twel de scent git eole, he leve he will. But bless yer, ole marster he tone cleau gin out. Me an' big Andy had ter tuck an' tote him up ter de white fokes house. He so lusteder by dat ole nigger dat it laid him up wid de bud fur nose fo' matris. Yas, my marster, laid him up in de bud fur nose fo' matris, sur. Mars Garrett he want me larn Ole Lawyer one yuther dem w'at he call hime chune song, w'at I knode, 'bout

"Adan an' Eve day eum er tree,
An' Eve wer stung by er numble bee;
O carry de nigger ter Mary.'
But bless yer soul, dis here nigger never larn dat ole fool yarrather hime chune sure as you're horn."
MISSISSIPPI. TUCKAHOE.

THE DOCTOR AND THE GRIZZLY.

A HOT WEATHER YARN.

TO hunt wild beasts and brave them in their lair, to conquer and destroy them, has been the ambition of heroes, modern and ancient. Man brooks no rival in the animal kingdom, but disputes with the fierce denizens of the forest supremacy in the wide domain of Nature.

The question may well be asked, whether man is not more savage and blood-thirsty than the beasts themselves, seeing that they slay their fellow-creatures from the mere love of slaughter, while they slay but to appease their hunger. To destroy would seem to be natural to man; nor has civilization altered his nature in this particular. Civilized and enlightened society sends forth the tiger hunters to India and the lion slayers to Africa.

Coupled with this destructive trait, there is in most of us the love of adventure, which must be gratified even though we thereby pay the price of our lives. There is an excitement about danger that fires us on, whether to the "nambunt, deadly breach" or to the tiger's jaws.

The writer is not ashamed to confess to the same love of the chase that animated the demi-god Heracles, alike with "the Chaotic Huntress of the silver bow." And there are times when my soul, revelling from the sordid affairs of daily life, seeks to free itself from society and its trammels, and find relief in the chase.

It was while in such a mood, not long since, that word came to me that a man had been killed by a bear while "prospecting" in the San Antonio Cañon—one of the many cañons which have their source in the coast range of Southern California. It had long been my ambition to kill a grizzly bear, and it seemed now was the opportunity to gratify that desire, and, at the same time, to avenge the death of a human being.

I immediately set about ascertaining the locality as nearly as possible of the fatal encounter, and sought a companion for the perilous journey, not that I expected him to kill the bear, but because I wished to have a truthful witness of my own exploits. Doctor Blank, an enthusiastic sportsman and an experienced mountaineer, gladly agreed to accompany me. The weapon I carried was a Winchester rifle, .45 caliber, 60 grains of powder to the cartridge. It was one presented me by a friend—my companion in many a hunt elsewhere. The Doctor was armed with a weapon similar to my own.

On the morning of April 9, we set out on foot from the mouth of the cañon, packing our blankets and provisions on our backs. Our route lay up the cañon, and we trudged along merrily enough, the Doctor relieving the march with some of his best songs.

The ascent for the first few miles was easy; after that, the walls of the cañon narrowed in, confining us to the bed of the stream, here filled with huge boulders, over which we clambered with difficulty.

At noon we halted at a point where there is a beautiful

meadow, in the midst of which gush out the springs that feed the stream of the cañon. The Doctor had brought along his rod, line and flies, and it was not long before he had caught trout enough for a meal for two men, hungry though they might be. I lingered long at this romantic spot, and soon reluctantly took to the march over a wilder and more rugged trail. Night found us some twenty miles from the mouth of the cañon. The topography here changes from a gorge to an elevated plateau or bench on the mountain side, intersected in places by ravines, and, for the most part covered with brush, with here and there a meadow to be seen. This was the place we sought; it was near here that the poor miner had met his fate. We camped for the night by a little stream, and building a big fire, sat down to our meal. After it was over we lay down, rolled in our blankets, our guns loaded and at our right hands.

It had been a long time since I had slept on, and the novelty of the situation kept me awake for some hours, though I was. At last I dropped off to sleep, to be awakened shortly after by the unearthly scream of a mountain lion. We both leaped to our feet at once and seized our guns, awaiting to be attacked, but we could see nothing of him, so we lay down again. The bear, however, kept us so near that this midnight marauder, however, kept us from again sleeping. Shortly before day we heard the brush crashing, as though some heavy animal were making his way through it. This noise I supposed was made by a bear, as I know that the mountain lion moves stealthily, and a deer would not make such a noise. The Doctor was of the same opinion, and knowing my anxiety to kill a bear, he very generously moved so as to give me the best opportunity to get a shot, placing me between himself and the place of the noise. So the animal passed on without disturbing us; we kept very quiet, as we were not eager for a night encounter with a bear. It is dangerous enough in the day time.

At dawn we were up and eating our meal. Just so soon as it was light enough to see objects at a distance of fifty yards, we buckled on our cartridge belts, took up our guns, and started off. I noticed, at the time, that the Doctor carried a small case in his last pocket. Being so, I was curious to know what the case contained, I inquired of him what it was. He handed it to me, and on the outside I read:

DR. BLANK'S
DOUBLE ACTION LIFE-PRESERVING PILLS.
Caliber .45, 60 grains.

I returned them to him with a smile, and asked him why he brought such stuff into camp with him. "I am never without them," was his answer.

Little did I dream of the important part they were to play in my subsequent experience. But I anticipate. We went in the direction taken by the animal we had heard making a noise in the brush; and soon struck the trail of a large grizzly. It was evident that he had not long passed; so we followed it up the valley, and along the margin of a little trickling stream, with patches of clover growing along its banks. On the roots of this clover he had been feeding. There had probably gone about a mile from our camp, and were just turning an angle in the valley, when we suddenly caught sight of the largest grizzly it has been my fortune to see. He was tearing up the roots of the clover not more than fifty yards from us. His left side was to us. I saw the Doctor turn pale with excitement. Whispering to him to stiffen his left ear, I rested my rifle on that prominent part of his person, and taking dead aim for the bear's breast, fired. At the report of the gun the Doctor, stunned by the explosion, I suppose, fell as though he had been shot. Not so with the bear, however, for starting up with a snort, he looked around. I fired again, but shot wild, and then saw the bear start for us, with hair on end and growling fearfully.

I have looked into the cannon's mouth when the foe was at the breach, and have seen the advancing wall of hostile bayonets at the charge—all this without flinching, if not without fear; but never have I held anything so close to my spirit me with terror as that bear. Shall I confess it that fear took possession of me, even so that I dropped my gun and ran?

Yes, I fled ignominiously and left my poor, helpless comrade to his fate. Yea, more, I entertained the base and selfish hope that the beast would eat him, become disgusted with human food, and so escape. Some fifty yards below where I had fired there was a scrub oak tree, some twelve feet high, and for this tree I ran as fast as my legs would carry me, and swung myself into its branches none too soon. The bear clutched at my feet as I drew up. I climbed to the top, and looked trembling down. The bear seized the tree in his grasp and endeavored to tear it up by the roots; but it was rooted in the rocks, and was too much for even his mighty strength.

I bent my forehead against the trunk of the tree, and I know he could not climb the tree. On looking at him closely I could see the hole in his left side where the bullet had entered and on the other side where it had passed out. It must have torn his heart to pieces. The blood was flowing from the wound and the bloody froth was on his lips. Surely he must soon die, I thought. But he showed no sign of failing vitality, and I soon came to believe that a bear may live without a heart. I saw plainly now that I should have shot him through the head or else through the spine. But it was too late to rectify the mistake; my gun was on the ground.

The bear would not leave the tree, but kept looking up at me. After awhile he took a large boulder in his paws, and laid it at the root of the tree, and then another and another. At first I was puzzled to know what he meant, but soon the terrible truth dawned on my mind that he was heaping stones there that he might stand them and reach me. The thought was enough to make me start, and for a moment I thought of leaping over him to the ground and taking my chances in running. But I knew he would overtake me. Then I thought of the Doctor, and turned my eyes toward the place where he had fallen. He was not there. I shouted his name, and saw him thrust his head out from a crevice in the rocks close by where I had left him. How he managed to squeeze his body into so small a space is a mystery to me.

"Get your gun and shoot the bear," I screamed to him. "Are you going to stand still and see this brute eat me?"

He did not answer, but crept out cautiously to where his rifle lay, and ran quickly back to his retreat. I saw him aim, and then saw the flash of the gun—and one of my hot-heels flew off. I implored him to aim with more care next time, and to shoot at the bear, not at me. I waited with much impatience until he had reloaded, and then the bullet sung a dirge; by my ear, at the time it was passed. Then I asked him to desist, for fear that he might commit murder and that I would be the victim.

Slowly but surely the bear was piling up the rocks at the base of the tree, and must soon reach me. What hope was left to me now? Preposterous as it may seem, I, for a moment, thought of leaping into his cavernous throat when he reached up, but the fear of being caught between his teeth in passing prevented so foolish a step.

The bear reared up again, and had to draw up my feet to prevent his reaching them. I looked into his hideous eyes and they seemed to burn with the fires of hell. I gazed until I began to believe that he was the "Great Beast" himself come to claim me for his own.

For a while hope deserted me and I sat in a kind of stupor, from which I was aroused by a thought that flashed across my mind. At last I said to myself, I should tell the Doctor. "Draw the bullet from a cartridge, quickly, and replace with one of your pills!" Load your gun with it."

"All right," came the response. "Now run out," I said, "and attract the attention of the bear."

In another moment he came out yelling and cawing about. This was more than the bear could resist, and he rushed for the Doctor, who fled to his retreat, followed by the bear.

"When he opens his mouth, fire straight down his throat," I yelled.

I heard a shot, saw the bear stagger back, then rear up and place his paws on his abdomen, howling all the while as if in pain. Then he started to flee, but fell into convulsions horrible to behold, tearing up the earth in his death struggle. Gradually his movements ceased. His limbs stiffened. He was dead.

Then the Doctor emerged from his crevice in the rocks, and rushed up to the bear's carcass and kicked it and leaped upon it, yelling all the while like a devil.

I descended from my perch, and going up to the Doctor, embraced him, and thanked him from the bottom of my heart. I told him that he was the dearest, stoutest—with a pill—had ever seen. And I promised to use my influence in having him appointed physician to the county hospital, provided by the use of his pills, he could do the county great service in causing the permanent disappearance from earthly scenes of those rambling wrecks of poverty and disease who are a burden to the community.

We stripped the hide from the bear, the Doctor claiming it as his trophy, but generously allowing me to keep the claws. The hunt was ended, for we agreed that we had had adventure enough to last for a while. We retraced our steps homeward with light hearts.

That I am now alive to participate in the events above narrated, I attribute to "Doctor Blank's Double Action, Life-Preserving Pills, calibre .45, 60 grains."

If any one should doubt the truth of this story, the Doctor is ready to verify it by affidavit. Or, if such person is ready to wager any money against the efficacy of the above-named pills, let him bring on his bear, and I will undertake that the Doctor will make a dead bear of him with one pill in five minutes. Truly yours,
EL GOZONELA.

LOS ANGELES, CAL.

Natural History.

THE SWAMP ROBIN.

Turdus swainsonii.

AMONG the many bright visitors at the bath (see "Bath-tub for the Birds" FOREST AND STREAM last June) is one whose graceful form is always a welcome sight to me. His quiet dress is in marked contrast with that of some of his friends, but there is a dignity of carriage, a certain self-respect, about the swamp robin, which lends an indescribable charm to his manners, and gives him an air of aristocratic elegance, utterly wanting in many of his more richly dressed though less noble neighbors. He approaches in a fearless, frank way that wins your heart at once! Dropping into the grass from the tree above, he comes directly to the water, never hesitating for a moment until reaching the tank; he will perch on its edge, and with head knowingly cocked to one side, survey the fussy little clumpy, noisily fluttering just below, and making the spray fly from her wings as she washes. Seemingly not in the least hurrying, he awaits the finish of her noisy performance with an air of such supreme superiority that chirp is riled, and with tail erect, feathers bristling, and wings trailing, she rushes up the little steps leading from the bath, and darts at him in the most insulting manner; but with unruffled temper he gracefully jumps right over her head, and running into the water, calmly begins his toilet. The manner in which this feat is accomplished is indicative of such utter contempt for chirpy, that she is completely paralyzed, and with a spiteful little shriek, she hustles off like an irritable little old woman from the scene of her discomfiture.

His method of bathing is different from most of his fellows; none of the noisy wriggling that characterizes many of our visitors, especially the smaller varieties of warblers, etc. He stands in about two inches in depth of water, and with one or two energetic shakes, his feathers are loosened sufficiently to give the water free access to all parts of his little body; then, deliberately squawking, he thoroughly soaks his breast and under parts for a second or so. The next move is to duck his shapely head well under once or twice, accompanying this with a dash of the wings that sends the water pouring over his back and down between his shoulders.

Two or three plunges satisfy him, and now he trots out and stands again, all dripping, on the edge, with his wings half extended, to let the air pass under, his bright eyes sparkling with the additional dash lent by his refreshing bath.

His rufous coat is a perfect fit, and his speckled shirt front runs into a snow white waistcoat, reaching down to the most delicate flesh-colored hose inclosing his slender legs. See him thins, and you will, with me, pronounce his attire to be the very perfection of taste in dress.

He will use us for the present, now, and mount high among the hothouses to where his mate is keeping house in a snug cottage, built on the branch of a beech; there he will rearrange his dampened plumage, standing, perchance, on the rounding arch of a sturdy limb in full sight of his little lady, as she broods over her household, and blinks at him in admiration from the nest. Here, amid the dark green of the leaves, and the cool gray of the beech bark that covers the branches and overlapping twigs, the whole group forms a picture perfect in the harmony of its colors, on which I never tire of looking.

During the heat of noontide he seeks the silent shade, and

here he hops about in the grass or on the damp, moist earth, daintily picking here and there as he gathers his food.

His song is rarely heard during the day if the weather be hot, but after a shower toward sunset, when the yellow rays light up the diamond drops clinging to every leaf and blade of grass, his full, rich notes ring out above the songing of the breeze in the treetops. There are none of our songsters whose notes appeal so strongly to one's inner nature, so much as this creature, and so full, more especially in that our thoughts, it may be, are tinged with sadness as we listen. The refreshing air brings to us the faint, sweet perfume of the night-blooming jessamine, and still the dear little fellow sings on into the twilight, sometimes, indeed, until the firefly lamps are lighted. Dick.

A PERIL OF THE SEA.

IN the European seas, and extending into those of the tropics, we find a family of swordfishes (*Xiphiidae*), which are well known to attack whales when they meet with them, and occasionally vessels, which they would appear to mistake for their gigantic opponents. These fishes attach to a vessel, and so kill, more especially in that our twenty feet or more in length. Their bodies are compressed, their fins large to afford great propulsive powers, while the upper jaw is prolonged into a long, sword-like process, an evident organ of offense. There are two genera—*Xiphias*, destitute of ventral fins, absent from the seas of India, and *Isiophorus*, which possesses ventral fins, and which not only infests the open seas of tropical Asia, but likewise is not uncommon along the coast, more especially in that our months of the year. I have observed that they arrive off Madras about October, continuing until March. There may be two ways in which the foundering of a ship is occasioned when pierced by these creatures—either a leak may be at once set up, or else the perforating snout may act as a plug, not permitting any leak until decomposition has set in or the salt water has softened the bows.

In 1874 the *Columba*, a new and small steamer, was nearly lost, owing to an injury inflicted by a swordfish. The vessel was on her course from Bombay to Calcutta, when, without any apparent cause, she began to make water, while all attempts to discover the cause of the leak were futile, until, after the removal of a large part of the cargo, the lightened ship rose in the water, and a piece of the snout of a swordfish was observed. This piece pierced the copper and timbers, the latter being perforated at ten or twelve inches below, breaking off by the copper, probably from the impossibility of withdrawing it. The sword had not merely pierced the ship, but split the plank for a considerable distance on each side of the point of contact. In this instance there could have been no doubt that a leak had occurred, while an examination of the ship demonstrated that it had been entirely due to the injury inflicted by one of these fishes.

The ship *Royal George*, of about 500 tons burden, experienced a dreadful hurricane in the Bay of Bengal. So furious was the tempest, that, in addition to the loss of the main and mizen masts, the bowsprit was found broken off close to the hull of the vessel. Its diameter was twenty-three inches, and, on examining its base, the snout of a swordfish was found protruding from the hole in the surface. A similar occurrence took place in 1833, and the perforated planks, with the imbedded sword, was presented to the Asiatic Society of Bengal, and are now in the Calcutta Museum.

The British Museum possesses a specimen of planks from a ship's side, in which may be seen the sword of one of these fishes, which has penetrated six inches into the timber. In the museum of the Royal College of Surgeons is the section of the bow of a South Sea whaler, which has been penetrated through 13½ inches of solid timber by the snout of a swordfish, which latter is 12 in. long and 3 in. in circumference. When *L. M. S. Leopard* was repaired in 1735, after her return from the coast of Guinea, it was found that a swordfish had pierced its outer sheathing, one inch in thickness, near a three-inch plank, and finally 4½ in. further into a solid beam.

The foregoing facts seem to me sufficient to demonstrate that in numerous instances swordfishes have attacked vessels and occasioned leaks. The reason why they should act thus leads us to inquire what can be the common use of such a weapon to a fish which merely possesses small teeth in its jaws? The ancients asserted that it transfixes fish with its snout for the purposes of prey. A practice which has been compared by one writer to skewering larks—but without being able to obtain its prey. We have likewise been informed that the proper use of this sword-like projection is to turn up the sand, etc., to hunt for minute sea creatures on which it lives. If this long process is intended simply for digging up sand, it seems curious why it should have been so rigid, for a softer, wider, and more luctile organ, such as exists in the snout of the sturgeon, would be better suited for such a purpose. I, therefore, would suggest, first, that the rostrum is not intended for turning up the sand; secondly, that it is intended entirely for offensive purposes, or to obtain food; and lastly, that these fishes do not solely live upon "minute sea creatures," although, doubtless, they occasionally devour eels, cepia, etc.

In the Indian Ocean the swordfishes live in the open sea, only approaching the shores at certain seasons. It concurs there is great difficulty in ascertaining among the pelagic fishes whether they are surface-swimmers, or reside occasionally in the greater depths, or even at the bottom. It is generally believed that the inhabitants of the ocean live within a certain definite bathymetrical or vertical zone; and, if such be admitted, the anatomy of the swordfish must lead to the belief that it is a more or less surface-swimmer when in mid-ocean, to whom an apparatus for digging up sand would hardly be useful in ascertaining its food. It possesses a large bladder, having thin walls, and which is not provided with any pneumatic duct or safety valve, by which the gas in this organ could escape were it to be suddenly distended. If, in short, this fish lived at the bottom of the sea, and employed itself in digging up the sand searching for food, the result must be as follows: Were it to rise suddenly to the surface in pursuit of mackerel or tunny or similar forms, its bladder would be subject to great pressure, owing to the sudden expansion of the contained gas, which would necessarily ensue on the pressure of superincumbent water being decreased; then, having no safety valve, this organ would burst. Consequently, as the swordfish could not be a resident in the depths of the sea, one is led to inquire what does it feed upon? *Coniferiformis* us (that a European form (*Xiphioides*), which I examined on the evening of February 15, 1867, when I saw a swordfish (*Isiophorus gladius*) nine feet

in length, being carried by two fishermen toward their huts; for, although this fish is unremarkable, their families consume it. Its long back fin was of a bright Prussian blue, covered with large dark spots; hence its native name *Mylmen* or "peacock-fish." I purchased the example found inside it a full-sized Indian mackerel (*Scomber vateropidibus*), two large half-heads (*Hemiramphus*), and numerous small fish, at once testing the nature of its usual diet; in short, it is a voracious feeder, eating merely small forms, would scarcely seem to account for the necessity of its being provided with an elongated, sword-like snout, which, added to the great rapidity of its movements, would render it a truly formidable opponent. *Belouin* tells us that shoals of tunnies (*Thynnus thynnus*), in the Mediterranean, are as much alarmed at the presence of a swordfish as a flock of sheep are at the sight of a wolf. It pursues them with great pertinacity and transfixes them with its snout. In *Bancroft's "Rural Sports"* we read that "in the Severn, near Worcester, a man bathing was struck, and absolutely received his death wound from a swordfish. The fish was caught immediately afterward, so that the fact was ascertained beyond a doubt."

It is thus evident that the swordfish eats other fish; that it can kill them, as, for instance, the tunny, by transfixion; and it has been known to kill man, as happened in the case being. A step further takes us to the fact that it will attack even whales, and, as it eats fish, we may fairly conclude that hunger induces them to do so for the purpose of obtaining food. *Capt. Crow*, on a voyage to Menel, tells us that one morning during a calm, when near the Hebrides, all hands were called up at 3 A. M. to witness a battle between several of the fish termed thrashers or fox sharks (*Alopias vulpes*) and some swordfishes on the one side, and an enormous whale on the other. As soon as the whale's back appeared above the water the thrashers, springing several yards to their, desecrated with great violence upon the object of their rancor, and inflicted upon him the most severe blows with their long tails, the sounds of which resembled the reports of muskets fired at a distance. The swordfish in turn attacked the whale, and transfixed him with its sword; and, thus beset on all sides and wounded, the water around him was dyed with blood. *Conch* was of opinion that as the swordfish has no teeth to tear the flesh, and he supposed it only could swallow its food whole, it must have been gratifying its appetite with blood. He tells us how in August, 1861, near Westra, one of the most northern of the Orkneys, an individual of the smaller species of whale, termed the "bering loch," was attacked by a swordfish; and when thus compelled to leap out of the water, which it did to the height of six feet, it was observed that the sword had been thrust into the whale's body behind the pectoral fins. Its leaps continued, and then it was perceived that a thrasher was assailing it on the sides.

Dr. Jerome Smith, in his "History of the Fishes of Massachusetts," states that one calm, sunny day during the previous summer (1832), he was walking upon a beach, with a little skill, he was suddenly roused from his seat by the plunge of a swordfish, thrusting his long spear, more than three feet, up through the bottom of his slender bark, but the pilot broke it off with the butt of his oar before the marine assassin had time to withdraw it.

Irrespective of using this organ to obtain food, it is evidently occasionally employed when fighting with another fish. The *Vestminster Museum* I was shown the cast of one of these fishes, nine feet long, captured near the town in 1873. On its left side, opposite the hind edge of its first anal fin, existed a large cicatrix, evidently due to a wound which had nearly transixed the fish, there being a spot on the opposite side showing to where the injury had extended. The appearance of the wound seemed to show that it had been inflicted by another of the same family, perhaps fighting during the breeding season.

Lastly, I would advert to the case of the ship *Dreadnought*, which, in 1868, while on her voyage from Ceylon to London, suddenly sprang leak, and upon an examination being made, a round hole, about one inch in diameter, was found in the copper sheathing of the vessel. Those who had insured the ship claimed £5,000 on the ground that the injury had been inflicted by one of these fish, while the insurance company contended that some other cause had been at work. After a protracted trial the jury returned as a verdict that the damage had been caused "by contact with some substance other than water, and that probably it was caused by a swordfish."

Although these fish are taken off the Madras coast in the large seine nets, say at an angle of about 30 degrees, in the Mediterranean, they are speared with a swordfish; and the method of capture appears to have remained unchanged for centuries. A man ascends one of the cliffs which overhang the sea, and as soon as he spies the fish, gives notice, either by his voice or by signs, of the course it takes. Another individual in the boat climbs the mast, and on seeing the fish directs the rowers to it. As soon as he considers that they have got within reach, he descends, and taking in his hand a harpoon to which a cord is attached, strikes it into the fish, sometimes from a considerable distance. After struggling for some time the exhausted animal is dragged into the boat, the whole process somewhat resembling a whale fishery on a miniature scale. The superstitious Sicilian fishermen have an unintelligible chant, employing which they believe essential to success. The clamor of the rowers, the noise of the oars, and the vicinity of the boat; and were a single word of Italian to be spoken, their belief is that it would drive into the sea and be no more.—*Francis Day in London Field.*

A BIRD BATH TRY.—Many of our readers will remember the pleasant account of the "Bird Tank" given in *FOREST AND STREAM* over a year ago by our correspondent "Dick." We have again been assured by that gentleman of its utility to those who are interested in ornithology, for it proves a very great attraction to the birds, which visit it all hours of the day to bathe and drink. As an instance of the number of visitors to it, we are told that during one of the hot days in the early part of June the constant splashing and drinking of the birds lowered the water in the tank, which is two feet square, nearly two inches. Of course evaporation played some part in this, but not much, for the tank is not directly exposed to the sun's rays.

POISON OF THE GILA MONSTER.—It has been generally believed, and stated by writers, that the bite of the "Gila Monster" (*Heterodon nasicornis*), was extremely painful, and that the bite was deadly, and some recent experiments made by Drs. Mitchell and Reicher, indicate that the natives were right

and the scientific men wrong. This lizard is usually sluggish in its habits, and only bites when provoked, but this bite is poisonous and may be fatal. In his experiments, Dr. Mitchell induced the reptile to bite the edge of a saucer, and when the saliva began to flow it was caught in a watch glass. This saliva gives an alkaline reaction, thus differing from most venomous reptiles, which is acid. A very small quantity of the saliva, when injected into a pigeon, caused it in less than three minutes to walk with a tottering gait, and in less than nine minutes it was dead. The *Heterodon* sometimes attains a length of three feet, but the individual upon which these experiments were made, was only fourteen inches long.

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of game and game resorts as will be of help to the readers of *FOREST AND STREAM*. Will not our correspondents favor us with such advice?

WILD BOAR HUNTING IN JAMAICA.

ON a cattle pen and pimento plantation in the Ocho Rios (eight rivers) district of the Parish of St. Andrew, Island of Jamaica, resides a Mr. L., who possesses a fine breed of bull-terriers, much prized by their owner for their indomitable pluck. Being well trained they are invaluable while hunting the wild boars that are frequently met with in the woods, providing good sport for those who indulge in the pursuit of game, which is attended with some risk, and is especially flavored with excitement when the hunter spends a fortnight with this gentleman, renowned for his hospitality. I met two young Englishmen who had lately arrived. Several points of a sporting nature were discussed one evening after dinner, and the prospect of a boar hunt was eagerly entered into by the party. The headman (a Maroon) was summoned by the proprietor, and instructions given for him to get ready on the following morning to take us to the spot in the woods where good sport was likely to be obtained.

Early next morning after a hasty breakfast, the three of us mounted and made a start, the Maroon and two other natives leading the way, cutlass in hand, and with a rope each coiled over their neck and shoulders. Having ridden for an hour or more, a fine track made at the foot of a limestone mountain, and the guides and the Maroon, carrying half a dozen lancewood spears, and splitting them into rough spears ten feet long by two and a half inches wide, and with their cutlasses and clasp knives tapered the spears to a sharp point. The lancewood being light and flexible, but at the same time a hard and tough wood, is admirably adapted for the use they put it to in "pig sticking." The horses were hitched to the party, and the Maroon, who had proceeded up the hill, gave for a distance of a mile or more when, on arrival at a level piece of tableland, final instructions were given to the two Maroons by their "boss" (Maroon No. 1). They separated, taking different points of the wood, while the dogs, led by a coolie boy, were swivelled in a loose manner by the collars on their necks. The three terriers were loaded, and all the party were ready to start on the approach of a boar. The excitement shown by the four hunters increased so that they were as anxious as we were for the boar.

The Maroon suddenly assumed a most ludicrous position, kneeling down and laying his woolly pate on the ground, with ear inclined to mother earth. Suddenly he sprang up and took shelter behind a limestone rock, bidding us do likewise with the boy and dogs, and to hang on long to wait for the boar's rustling in the bush, and a most extraordinary thing on within twenty feet of our hiding place. Our rifles were all leveled at him, and although the balls hit they did not in any way affect the animal's progress. The Maroon, seeing this, rushed out and with good aim sent one of the lancewood spears into the boar's jaw. The dogs were let off from their tether, and the excitement of the chase continued for him to tread upon the party proceeded up the hill, giving the grunting of the boar, and the shouts of the Maroons at the prospect of soon securing their prize, was enough to unstring one's nerves. Down the ravine the beast started, one terrier securely fastened on the back of his neck, while the other three were making a good hold on the flanks. Another and yet another lancewood spear spins through the air and strikes the boar, and the boar, having recovered his footing, had hold of the last flank. The boar, undeterred with pain, frantically rushed on over rocks and tree roots, stumps and thick undergrowth, at times quite lost to view, and making it risky on the dog's account to fire.

In a short while the wood was cleared, and with the spear still sticking in his jaw, and the dogs still holding fast, the boar passed a shallow brook and took an open common. No time was lost in mounting the horses, and my two friends and self galloped as hard as the stock could go, and were just in time to prevent the animal from getting into a thorn up coffee piece, so dense with overgrowth of tropical vegetation, that we would in all probability have been unable to secure him. This surprised he retraced his steps, still dragging the dogs, which still maintained their hold. From the thicket we came on him from the rear, and the Maroons having so far followed us, they attacked from the fore. Two well-directed bullets hitting between the ear and the jaw caused the brute to fall, and in rolling over he nearly squashed two of the pups. Another spear through the throat settled the matter for the boar. Then out with our knives and with great dexterity the boar was severed. There was distinctly to be seen the spots on his body where bullets had hit, but no further impression. Round about the jaw and mouth hung masses of thick froth mixed with blood, which was pretty well distributed on the dogs. One of the terriers was lost, having been ripped by the boar, and the other three were one mass of cuts, bruises, and blood. In spite of their condition, some idea of its greater or different weight, when compared to the animal, and they were apparently thoroughly indifferent to their share of injury sustained during the encounter.

Preparation was at once made for conveying the booty home. After being dressed, the Maroons hung it on lancewood spears, and supported on their shoulders it was carried down for safety. The animal was considered as large as any dog I have seen. Some idea of its size may be gathered by the standard at 350 pounds. The meat is of a very fine flavor, attributable, no doubt, to the fruit and wild berries these animals live on. The flesh is sometimes boiled or fried fresh

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favour us with notes of desirable points for angling excursions?

ANGLING AT BEAR LAKE.

ON the morning of the 12th of June, our party of five landed at our annual fishing ground on Bear Lake, in Clearlevoix county, Michigan. On our way up we agreed upon a prize, which should go to the one taking the largest fish during our stay. At noon of the first day, when we came into camp, it was discovered that the prize belonged, for the first time being, to Sam, who brought in a black bass weighing three pounds. During the afternoon the water landed a five-pound pickerel, which enabled him to win the prize for about an hour, when an unceremonious yell from the other boat attracted our attention just in time to see the leap for life made by the largest pickerel I ever saw on a hook and line. My brother Will was master of ceremonies, and had the proud satisfaction of taking the fish into camp, as well as carrying home the prize award.

It is about this capture, which I consider a notable one under the circumstances, that I wish to write. The tackle used was a nine-ounce split-bamboo rod; a small silk line; a 5-0 Carlisle-Kirby hook with gimp snell and a live minnow for bait. The fight lasted nearly two hours, with the chances all the time in favor of the fish. During the first hour he had things all his own way, and towed the boat around about as he pleased. He tried all the devices known to his art to get rid of the tie that bound him, but the hook was placed just where he could not loosen it. He would rise to the surface and shake himself with his terrible jaws wide open, and then make a bee-line for the bottom of the lake at a rate of speed that burnt the fingers as the line passed through them, and threatened many times to empty the reel of its 400 feet of line. Fortunately the old fellow would change his course just in time.

Perhaps most of the honor is due to Mr. C. J. Wooden, whose knowledge of the peculiar handling of the boat kept the fish in deep water where he wanted to fight. When tired out Wooden steered him into shallow water, and stepping out of the boat, in water up to his waist, after a few passes got his thumb and finger in the victor's eyes, and carried him ashore without the aid of gaff-hook or net, and without a scratch. He weighed 29 1/2 lbs., measured 44 inches long, 30 inches around, and from what I could learn, was the largest fish ever taken in Bear Lake. He is now in the hands of Prof. Vail, of the Academy of Science, who pronounces him a very fine specimen of Northern pike.

CHICAGO, Ill., June 25.

L. B. B.

THE SHRINKING OF THE TROUT.

IN your issue of May 24, 1883, received by me this month, your suggestion that those who have fish tickets to sell would do well to send them in, struck me as an opening for a fish fact that occurred while I was stationed in New Mexico, at Santa Fé, as an officer in the army, about the year 1865 or '66—some slides by in such a slippery way that one cannot fix dates accurately, nor would one wish to who is on the other side of the hill and can only look back over it in memory—but I will vouch for the accuracy of the story, which should be a warning to all who place a line string of fish in a side pool to keep them fresh, a process pretty well known to anglers as a softening process.

About the time of which I speak, New Mexico was the home of many sporting men, I mean fishers of men, and not fishermen, and better, more law-abiding and true-hearted fellows never lived; as well as dangerous as a grizzly bear when aroused, but with a true love for the fish that was honest, brave or beautiful among their own people; leaving the sidewalk when a party of American ladies passed over it and remaining in the street, with their hats in their hands until they had left their immediate neighborhood; ready to fight for them at a moment's notice, and use freely the pistols which hung in their belts at all hours, day or night; true gamblers in their instincts to win, while they sat at their game; and in the end, a poor, oppressed and poor, of whom there were many in that country at that time. Of this class of men I would now tell a fishing story that was given to me by one of the actors, the night after their return from the mountains.

The Rio Chiquito (little river), which runs through the city of Santa Fé, is a sprawling mountain stream, which, for the greater part of the time is but a few feet wide and running through a channel cut for itself in the middle of the sand bed or arroyo some eighty or one hundred yards wide, that indicates the real width of the stream when the deluging rains of the mountain send it down as a torrent, with a rush and burst of water three or four feet high, rolling the great boulders in its mighty flow, so that the noise of their grinding can be heard for miles. At such times, of course, there is no fishing, but the process tears out great holes in the river bed, that during the time of the up-tide are fairly well stocked with the trout, mountain brook. None of them are very large, but many may be caught that can be called good pan fish; and for the capture of a mess of these one of the sportsmen, Tom Stevens by name, started up the stream one morning, armed cap-a-pie, as an angler. The way was rough, the bushes were low and troublesome, the clamber over the rocks and fallen timber was tiresome; but Tom's luck was good. He arrived within a mile or two of the head of the Chiquito with quite a goodly number of fine fish strung on a willow stick. Their weight, added to that of the pole, began to be somewhat of a burden to him. Here, some yards from the edge of the stream, he found a pool which the rain water had formed in a depression of the rocks, and to this pool he consigned his string that they might be kept cool and fresh until his return from the further shore of the head of the river.

Some time after Stevens returned from Santa Fé, and without his knowledge, Joe Cummings, a brother sportsman, was seized with a desire to fish the same stream, and knowing that Stevens had gone some time before, he borrowed a rod, and was soon tramping over the same trail that the first angler had taken. His luck as to numbers was good, but as to size, his fish did not attain what could be dignified

above that of fingerlings, still he cast and caught until he arrived at Stevens's pool, where he espied the string in the water. Full of fun, and ready for a joke at any time and upon any one, he quietly pulled out the willow, and stripping off the spotted beauties, he replaced them, fish for fish, with his own diminutive ones, and put the string back in the pool; and then, knowing that it could not be long before Stevens would return, he concealed himself and Stevens's fish behind a huge moss-covered rock and awaited the appearance of his "pard."

The crashing of lashes soon announced his approach, then his head and shoulders were seen at a little distance, struggling through the undergrowth, and then, with a sigh of relief, he saw himself through the lift of open space, and bent his steps toward the pool to recover his fish, Cummings, from behind his rock, watching him, his eyes beaming with fun, and awaiting the denouement. Stevens stopped and stooped over the clear water and stretched out his hand for the willow, but caught sight of the trout just as he did so, when he resumed his perpendicularity with a jerk, as a knife blade flies to its open position, gazed intently at the fish, and then slowly bending his body until his hands rested on his knees, he looked long and intently, with his eyes fairly popping out of their sockets. After a long-drawn, sonorous sigh, he said, "Well, you have shruken the — of any fish that I ever saw."

The attitude, the wonder and the exclamation were too much for Cummings; he fairly howled with laughter, when Stevens took the joke and "took after" him simultaneously, and then there was a foot race about that clearing. Of course, ended in the capture of Cummings, who was so convulsed with laughter that there was but little speed left in him. A compromise was effected, and Cummings's flask being reasonably full and Stevens's empty, they were soon laughing together over the exchange of the trout; but Stevens made Cummings promise that he would not let the joke out. It was too good, however, to keep, and champagne, paid for by Stevens, notwithstanding the mortification of several fellows, but night in Santa Fé who had not looked for anything better than the wheat whisky of the country.

W. H. B.

THE INTERNATIONAL TOURNAMENT.

OF the fly-casting tournament, the London Fishing Gazette says: "But that the affair was a most interesting and successful one will not, we think, be questioned by anyone who was present; and of the hundreds who took up their places to view the commencement the majority remained until after seven o'clock, and many until past nine, when the proceedings were cut short by darkness. Undoubtedly the most interesting event was the casting of Mr. Rumber Wood, which was watched with the greatest interest. It will be seen that Mr. Wood took first prize in both the single-handed fly-rod competition and the salmon fly-casting competition, though in both competitions he was very closely pressed by Mr. Mallock of Perth.

"The wind was most trying to the fly-casters, now coming in a steady, strong gust, and then, after a rest, chopping and eddying in two ways, so that it was very difficult to fly low for them. The chief difference in the American and English casting seems to be more in the rods and lines than in the method of using them. Mr. Wood used a powerful 'casting' split-cane rod and a very heavy winch line—a much heavier winch line, in fact, than is used for anything but salmon fly-fishing in this country. Later on, Mr. Wood very kindly gave an exhibition of his skill with the 5oz. soft-wood tackle ever used in the States. He says that a heavy winch line must be used to get the proper angle on the split-cane rod. The fly-casting this time took place from a platform raised about two feet from the water, and not from a punt, as was the case last time."

One of our London correspondents says, in a private letter: "You will see by the papers that Mr. Wood's victory is laid to the superiority of American rods and lines. This may be true to some extent, and no doubt will please Mr. Wood as well, as he has charge of the arrangements in the American Department of the Fisheries Exhibition, and this judgment will no doubt result in giving the first prizes to American rods. Mr. Wood has offered to take part in a friendly cast with any one in England and to use their rods and lines, either with single-handed trout rods or salmon rods. Mr. Mallock, who came nearest to Mr. Wood, whipped the ground behind him so that his flies were much damaged, a thing that Mr. Wood did not do."

We thoroughly believe in the value of these tournaments as a means of demonstrating the best methods of handling the rod, and therefore we gave the reports of the last one in full in our last issue, and will continue to give such comments as our correspondents may send, or we may find in English journals.

BLOOMING GROVE PARK.

THE Blooming Grove Park Association has been improving its grounds for the past two years, and is now proposing to establish a hatchery for trout. The new club house is finished, and both complete and commodious, and is well attended. We recently paid a visit to the park, and drove over to Lake Laura and took some bass. This lake is singular in being shallow in parts and yet free from vegetation, the bare rocks looking as clean as if washed by surf. The bass are plentiful in this lake, but as a rule are not very large. They take the fly readily, perhaps because food is scarce, which may account for their small size. In Lake Giles, where the club house is, the bass are large and well fed, but will not take either fly or bait, although they can be plainly seen at times. This is thought to be on account of food being so plenty, and if so, the fish will eventually increase until food becomes scarcer when they will gladly accept a bait, even if a line be attached to it. With a hatchery there the trout streams should be brought up to their former standard in a few years.

The breeding park contains some deer and others will be purchased; some fawns were dropped this spring and will be turned out. Bears are frequent, and we saw where one had opened an ant-hill in the road, on the way to Lake Laura. The woods abound in game of many kinds, and the club is on a sound financial basis. Some years ago it seemed as if this organization was in a feeble state; but its membership is now

like other ancient appliances, has become succeeded by a firearm but because more correct in principle. I purpose to abstain from any comment, except that which reads this letter, upon the spirit of the letters you have so kindly published from various correspondents in their criticisms of each other. Let us all acknowledge the right of each to his honest convictions, and not consume time or space in useless quarrels. I respect what I consider the mistaken views of the muzzled loaders, whether I agree with all that is said by the breech-loaders or not, and I certainly am entitled, and so are all the others, to a proper respect for the views expressed by us, mistaken as they may be, in favour of our hobby. As to "revolvers," let us all assume that each is a gentleman, and that the sanction of publication in your columns is "credentialed" enough that the views expressed are honestly believed and honestly intended, and that, unless in some other way, such as all striving to benefit ourselves by a friendly exchange of rival ideas.

"Unless a man finds out and remembers why he misses he will never know the value of a work." "The Gun and its Development," which I have not had time to read, is a gem, and why our rival guns do not work, and how and why we differ as to their rival merits, we will never vitiate of us he convinced but that each one is right in his own way.

W. WOODS. I should refer all interested to the chapter on B. L. Rides, p. 126 to 135, and the following chapter on "Penetration of Rifle Bullets," pp. 145, in which we may see "The Gun and its Development," which I have not had time to read, is a gem, and why our rival guns do not work, and how and why we differ as to their rival merits, we will never vitiate of us he convinced but that each one is right in his own way.

Camp Fire Flickerings.

"That reminds me." THE dusky dick, in dusky lean. With his malarial cousins by the stream; And the airy pinto sails the sky With outstretched neck and watchful eye; The green-wing teal, with lightning dart; Flies close to the water's face afloat; The blue-wing mooves at reckless pace, Nor sees the shooter's blinding glare; The widgeon, with more wary care, Swells the procession, pair by pair. "Why don't you shoot?" "It was a sin." "Oughter killed him too dead to skin." My pard is right, but the gun won't go. The shells are scattered, the crows begin to flow; And as I break the gun on the side of the boat, Says my pard: "Ef you hit me in the nose again like that, I'll kick you out of the boat, ef I don't um a goal." MR. FRANKLIN.

Rev. J. J. Pearce, D. D., of Pennsylvania, is an eminent minister of the gospel, a successful politician (he has been a member of Congress), a true sportsman, and a noble specimen of a man.

While on a visit to friends in Iowa a few years ago he expressed a great desire to have a chicken hunt, and to be able to say on his return that he had dined on the noble bird of the prairie. A hunt was organized and he put himself at its head, and after a hard day's work and many miles travel the noble bird, in the shape of a half dozen birds. These were given to the wife of one of the party to be prepared for supper, and the Elder was invited. Supper time came; there were pies, cakes, preserves, meats of every kind and variety, but no prairie chicken. The Elder was puzzled as well as disappointed. The woman being interviewed about it afterward, said that she had been better advised than to set the likes of a prairie chicken before a nice gentleman like Mr. Pearce.

A young man in one of the rural towns in southern New York was passionately fond of athletic sports, and also had a love for natural history. He spent most of his time in running foot races, playing baseball, and in shooting and moose hunting or stung birds. One day a boy, friend, just from college, said to him: "Spencer, I understand that you are becoming quite an athlete?" To which Spencer replied, "Yes, I do stifle a good many birds nowadays." QUILLS.

Answers to Correspondents.

No Notice Taken of Anonymous Correspondents.

MAC, Harrisville, Mich.—The address is No. 408 Bleeker street, New York.

J. P., San Francisco.—A reply was sent by mail advising the purchase.

G. B. W., Conway, Mass.—The party is a gamsmith in Chocomaug, Wyoming.

W. W. We have written for the law. 2. Do not know where you will find the decoys.

F. B. B., Geneseo, N. Y.—The New York law forbids sailing for ducks, also use of decoy more than twenty rods from the shore.

G. W. T., Waterbury, Conn.—There may be such a law in reference to the trees on State lands. Write to Verplanck Colvin, superintendent Adirondack Survey, Albany, N. Y.

J. B. A., Fort Orange, Volusia County.—The sharpie is a flat-bottomed launch, with about 2 to 3 feet to the sides. The chine (as it is called by barge builders) or bilge is, therefore, nearly square to the bottom. From the midship section aft, the bottom turns up to the transom, which is heightened in height by the depth lines upon the boat. The transome in shape is a reduced midship section, reduced in breadth enough to give the boat the same taper at her deck level as she has at the water line. The transome can be rounded off on the lower part outside in the same fashion as a rowboat. The plank next the keel rubs into the deadwood from the midship section aft, the setting of the transome. From the midship-section forward is given both at the sheer line height and to the chine, the rake of the stem and the extra fullness of the stem feet below. For depth, some of them of the transome are made as much as six feet broad in their cabins, while (as set forth by Mr. Roosevelt in our issue of April 5) they draw but 6 inches. The transome is a three-cornered sail, with the transome ribs set, the sail area being regulated mainly by the depth of the boat. A spinnaker is a three-cornered sail, with the transome ribs set, the sail area being regulated mainly by the depth of the boat, and to windward if running with the wind abaft the beam.

PUBLICATIONS RECEIVED.

GUIDE TO THE MYSKRA LAKES. Published gratuitously by the Northern and Northwestern Railway, Toronto. THOSE PRETTY ST. GEORGE GIRLS. A society novel. Philadelphia: T. B. Peterson & Bros. LIFE AND ADVENTURES OF LEWIS WETZEL, the renowned Virginia hunter and scout. By R. C. V. Meyers, Esq., Philadelphia: Jno. E. Potter & Co. full, and of good men. Some years ago it bought some thousands of acres in the wilds of Pike county, Pa., and now it has over 800 acres under fence as a breeding park for deer.

SMALL FRY.

Editor Forest and Stream:

In your issue of June 7, a correspondent gives a glowing and enthusiastic recital of his wonderful prowess as a trout killer. I should scarcely have noticed the rhapsodical effusion, if the writer had not been so overcome by blind infatuation as to use the expression "speckled beauties," that terrible *bite noir* to sportsmen, which he introduces with heart-sickening recklessness, and utter disregard for the finer feelings and tender sensibilities of your readers. I supposed it was a principle well settled and fully understood, throughout the length and breadth of the territory which constitutes the geographical distribution of FOREST AND STREAM, that if any man should assume to himself the garb and semblance of sportsman, and had the hardihood to force that nauseous phrase upon the stomachs of your innocent and unsuspecting readers, he would, with common consent, be indignantly ejected from the fraternity, and be metaphorically drawn and quartered, for the warning and edification of posterity. The correspondent and his companions devoted five hours to the heroic exploit of killing one hundred and seventy-five trout, of which five were one-pound fish, fifteen half-pounders, and thirty-four-ounce specimens, leaving a hundred and twenty-five which weighed less than four ounces. That a moderately sized trout is so sure, on the poor little innocents, is a reminder of a story told me by an attaché at a traveling dramatic company, a musician named Reynolds. He said he was fishing a trout stream in Massachusetts, and he had been engaged for several hours, when a farmer accosted him and asked, "What luck?" "Oh," replied Reynolds, "I have caught twenty trout." "Where are they?" asked the man. "I have them here in my vest," said Reynolds. "How did you catch them?" asked the farmer. "That's a secret of mine," said Reynolds, "but I don't mind telling you, only don't give it away. I put a big grasshopper on my hook, and whenever a trout comes along the grasshopper swallows him. When he got full I took him off and put him in my pocket."

The sort of fish which constituted the bulk of Mr. Mure's catch are such as we commonly catch here when we drag with a mosquito larva for bait.

A few days ago a friend of mine, Bob Osborne, caught in Bayou Danchiff, near the crossing of the Vicksburg, Shreveport and Pacific Railroad, one hundred and forty-seven pounds of fish with a single rod, most of them being black bass and white perch. His fish ranged from one to two and a half pounds. One of the perch weighed five pounds, a very unusual weight for this fish. Let Mr. Mure and his companions try our Southern waters. We will give him a hearty reception and good sport, but let him eschew "speckled beauties" in his future ebullitions of enthusiasm.

OCUCHITA.

FISHING AND LYING.

Editor Forest and Stream:

It is a singular fact that these two accomplishments usually go hand in hand throughout the world, and doubtless accounts for the remark attributed to the blackfish, to wit, "I don't mind being hooked so much, but it worries me to think what lies will be told about my size and weight. For nearly two thousand years this propensity has been indulged by piscatorial sportsmen, and it is worthy of comment that in pursuit of that branch of moral culture the lower animals have generally been selected for illustration. We are all familiar with the boy's story of the thousand cats which he saw on his father's woodpile, and which on investigation was reduced to "our cat and another one."

The periodical appearance of that fish known as "the great American snake" which is seen everywhere and anon hovering about our coast, seemingly in doubt whether to swallow an Atlantic steamer or pull Long Island away from its moorings, is faithfully reported to the world by the press.

One of these "fish stories" has lately been hooked up out of Lake Michigan or elsewhere by a Chicago editor, and the editorial organs east of that moral city have scooped it into their own columns, with an exaggeration which would astonish the blackfish spoken of had not the frying pan destroyed his powers of appreciation.

The science of "fishculture," as represented by this tale, can hardly be expected to go much further, for what was a mere little "killy fish" at Chicago has become a right whale on reaching the seaboard. But, without further preface, let the story be briefly given.

The writer is charged with having said that our worthy President Arthur is not fit to be the Chief Magistrate of this great republic, although a gentleman and a scholar, because "he goes a-fishing." Now, to deny such a silly story would be as silly as the story itself, and reminds the undersigned of the prudent remark of an old lady, who lived near where he was born, in reply to the assurance of her son that his gun was not loaded, to wit, that she had heard of guns that would go off without lock, stock or barrel!"

HENRY BERGH.

LARGE CAVALLE, OR POMPANO.—Mr. George Gilbert, of Pilot Town, Fla., recently sent to a friend in Jacksonville a cavalle weighing 49 lbs. and measuring 3 ft 8 in. The name of cavalle, or cavalle, for Dr. Gill spells it both ways, is apparently a name for different fishes of the family *Carangidae*. Gill gives it as a South Carolinian name for the fish known as pompano on the southern coast and in New York. In his "Catalogue of Fishes of the East Coast of North America" he records three pompanos—the *Trachygnathus carolinus* (the one we have referred to), the *T. glaucus* or smooth pompano, and the *T. ovalis* or short pompano. Within the past three years we have recorded the capture of large specimens of *T. glaucus*, weighing from eighteen to twenty-four pounds. A fish whose habitat is the west coast of Africa about the Canary Islands and in the same latitude as Florida. It has been suspected to be merely the adult form of our common pompano or cavalle. If so then our fish is not full grown, and in common on our coast only in its early life. Our valued correspondent, Dr. Kenworthy has been charged with drawing the long hook in saying that he has caught one of these fish in the Cape Lossahatchie River, Florida, which weighed sixteen pounds, a fact that we do not doubt.

BLACK BASS IN LAKE ONTARIO.—The Oswego, N. Y., *Pollackian* says: "Just now, not only the people of this city but of the whole country along the south shore of Lake Ontario, are having the rarest sort of sport in angling for black bass. It may be that this is an exceptional year—though we doubt it—and that the bass have come to this shore in unusual numbers, about which, also, we are dubious; but of one thing we are certain, and that is that some of the finest sport which is to be had in the world will be had by the fishers on the lake. In a general way, and of a verity, it may be said that the whole south shore of Lake Ontario, from Pulteycville to Cape Vincent, is one series of black bass fishing grounds. Of course there is much of this shore—the sandy and gravelly portions—which is not haunted by the black bass. But, wherever there are broken rock bottoms, if from five to fifteen feet in depth, there the fisherman may safely throw out his lines, and there he will get the most satisfactory results. The city of Oswego seems to be most favorably situated with reference to the noted black bass haunts. Lewis's Bluff, some six miles up the lake, is one of the best points on the whole shore, and it can be easily reached either by boat or carriage; by the former in an hour and a half, and by the latter in an hour, over a delightful route. Coming rear from Lewis's Bluff, and about half way to the city, the fishermen run upon Ford's shoals, and a better place for an afternoon and evening's sport is not to be found. These shoals cover considerable ground and there are days when the well equipped fisherman can have sport which he will not fail to remember with pleasure. Good baits, ormsen, luncheon and minnows can be had at Lewis's Bluff. Coming down the lake and passing east of the city, the angler will find many a fishing spot of points of land, all of which indicate rock bottoms and deep beds. In any of these, if his lines are out, he will soon "have trouble." Four miles down there are large areas of bass bottoms from which fabulous numbers of the game trout have been taken this season, and of unusual size. Continuing east, wostrike Pleasant Point, one of the notable fishing grounds of this shore. Here Capt. Sam Nichols has a comfortable tackle shop, and a most generous and liberal hospitality. The point is convenient to many famous ledges, and it is much favored by parties from the city and surrounding towns for its pleasant scenery, as well as for its notable bass beds. Three miles further east is Mexico Point, one of the loveliest spots on the south shore. Here is Mr. W. H. Wright's hotel. Just now, and probably until the latter part of July, the trolled, live minnow is the "killing" bait. In our own mind, the most wonderful execution now. Very large bass are taken with minnows—still fishing—but this is no sport for an angler. If you would have sport next to fly-casting, do this: Take a fly-rod—say from ten to fourteen ounces in weight, with a good reel, and from seventy-five to one hundred feet of oiled silk line. Put on a twelve-foot leader and three flies—two large and clumsy chumps of feathers such as some tongue are necessary, put on the minnow, and the end of a three quarter ounce sinker on the line about two feet above the leader; troll slowly over the ledges in the vicinity of any of the points named above, and if you are an angler, you will have fun, the like of which you have not had. We know a man—a Mr. Loomis of Syracuse—who within the last week, with this kind of rod and skilled manipulation, killed in one day near Mexico Point, one hundred and thirty-two black bass that weighed two hundred and sixty-eight pounds—and it wasn't much of a day for bass, either."

A BLACK STATUE.—Capt. J. W. Collins, of the staff of the U. S. Fish Commission, now at the International Fisheries Exhibition in London, tells the following story of how one of our colored brethren came out ahead of an Indian from Canada in the way of posing like a tobaccoist's sign. Capt. Collins says: "We have among our exhibits (at the London International Fisheries Exposition) several fine models of fisherman. One of these had been placed near the display of whaling implements, and another close by the main entrance to our section, being the broad aisle between the United States and Canada, down which passed the royal procession. A short time before noon the Indian brought over by the Canadians took up his position on their side of the aisle, and, as the king and his legions, etc., he made quite a sensation on his first appearance. He was outdone by 'Mr. Lo,' a North Carolina turkey, who has been employed as a laborer in our department, acting under instructions, dressed himself cap-in-hand, in a suit of oil clothes, and took up his position, or in hand, opposite the 'noble red man' from New Brunswick. Standing as erect and immovable as a royal horse guard on duty, and scarcely distinguishable from the cast of a negro, near by, he became, as soon as the opening ceremonies were over, the center of attraction for a large crowd which gathered round, and by all the arts and devices which are usually resorted to on such occasions, tried to bring a smile to the stolid and statuesque colored individual. But he displayed a most remarkable control over his features. Though he was pinched and pushed, and his wings were forced to creak, he was an emblem of the between his fingers, not a muscle quivered, and scarcely the wink of an eyelash told the gaping crowd that he was different from the plaster cast. Some of the people were deceived into the belief that he was a cast. One lady exclaimed: 'Well, I do declare, these Yankees are very clever people; they are sure to get ahead of all the rest of the world. No one could tell but what that colored man was a better actor than I have ever tried to make myself.' To make the darkey show some sign of motion, broke out with: 'That beats the horse grand all to pieces. I never saw anything like it.' It is needless to say that this caused the crowd much amusement during the entire afternoon. The Indian was forgotten, and after showing his approval of the negro's solidity by an 'ngt,' left the scene, probably retiring to smoke his calumet outside of the buildings, where no prohibiting notice stared him in the face."

BLACK BASS IN THE POMPANO.—Dr. W. S. Hoke, of Philadelphia, with his brother and party of friends from Chambersburg, Pa., will go into camp at Falling Waters, on the Potomac River, for the purpose of black bass fishing. The lake, at this point on the river are large and sport is anticipated. I shall have daily accounts of the catch from the camp.—HOMO.

THE CARP AS A GAME FISH. A correspondent of the *London Fishing Gazette* writes of carp fishing at Wimbleton Lake, and says: "We clever anglers cease to try and pull out of the Wimbleton Lake carp weighing from 4 lbs. to 20 lbs. without a reel? You will scarcely believe it possible, but many of these so-called carp fishers visiting this lake never think of using a reel. The consequence is, as 'L. B. Esq.' says, 'the breaks away, as compared to the captures, are most alarming.' I shall not forget to give a few lines to these same gentlemen contradicted in a future issue. In answering a question, I ventured to suggest, in the most polite manner, what the result would be in the case of hooking a fish of 5, 6, or 7 lbs. In reply, he observed: 'It appears to me you know very little about carp fishing. With a rod like this, I could play a carp 5 or 6 lbs. as easily as playing a roach of 3 or 6 oz.' I should no more think of using the said rod for taking carp, Mr. Editor, than a butcher's pole. The rod used for club or barbed fishing in the Trent is what I should use. Unless I am very much mistaken, I said: 'You would not even have the chance of playing him.' 'Why not?' 'Why not?' because he would be gone before you could say 'Jack Robinson.' I here left him, and within ten minutes my yard so he was literally smashed all to ribbons by a perfect 'fisher.' The keeper afterward informed me that this very individual was broken up no less than three times in one day."

Two or three years ago the Erie Game and Fish Association secured a large number of German carp minnows, which were placed in the bay here in the greatest variety and abundance of the already excellent stock on our fishing grounds. Scarcely anything has been heard of them since they were placed in the water and their fate was a matter of conjecture for some time. It was not known whether the little fellows could manage to escape the hungry maws of the carp, whose voracious appetite would glory in such delicate food as the little minnows. The success of this spring's fishing season shows that the experiment has proved a success, and that a number of the German carp have become full-grown, and are biting well, but of course it cannot be known yet whether the supply be large or small. From time to time small German carp have been captured occasionally, but this spring quite a number have been taken in an afternoon. It is not probable that any large black bass will be the attraction of hauling in a fish of light and as excellent eating. Mr. Fuchslocher was out yesterday with a friend, and during the afternoon they captured two big fellows weighing about five pounds each. Mr. Fuchslocher says that the carp die game and fight desperately for life, so that the sport of hauling them in is fully equal to that of a good struggle for a lively black bass. With a disposition not to be caught, it can be said that the carp somewhat resembles a whitefish, but are more of a silver-gray in color, and as soon as their favorite haunts are well established they will be sought out with great avidity.—Erie (Pa.) Observer.

THE JORDAN.—To those who have visited the Jordan River it is unnecessary to say anything in praise of it as a trout stream. Few fishermen are ignorant of its qualities, but to those who are not acquainted with it, we say come and try it, and like others who have done the same, go away satisfied that it is one of the finest streams in the Northwest. We refer those wishing an extended description of its beauties to the little booklet, "The Jordan River, Game Resorts of Northern Michigan," issued and distributed gratuitously by the passenger department of the Detroit, Lansing & Northern Railroad. Excellent catches are reported already, and sportsmen are turning their steps toward the Jordan in large numbers. First-class accommodations may be had at the old hostelry, Webster's, three miles up the river, and guides and boats may be procured at Charlevoix. The various ways of reaching Charlevoix are pretty well known to shooting men. Lake steamers may be taken from Buffalo, Detroit, Cleveland and Chicago direct to Charlevoix, or by rail via Detroit, Lansing & Northern, or Grand Rapids & Indiana to Boyne Falls, thence by narrow-gauge railroad to Boyne City, thence by steamer on Pine Lake to Charlevoix. Refreshed by food and rest, and invigorated by the northern air, the fisherman can (having proper guide and boat) take the most enjoyable of the elegant passenger steamers, Char Bell or Gazelle, for the river, or can procure a rig direct to the liveliest stable at hand and drive through the forest direct to Webster's.—H. L. 1.

A LARGE ALLIGATOR GAR.—MORROE, LA., June 26.—Your correspondent "Fehinus" writes a very facile pen and sends you a very interesting report of a very large fish he ran him down on the weight of his fish. This morning Bill Hanna caught an alligator gar in the river at this place, which I think is the largest fish I have ever seen a record of as having been taken with hook and line. Bill procured a cotton line "about the size of a lead pencil," and had three ordinary catfish hooks lashed together with wire, so as to form a kind of "bob." Armed with this tackle he went down to the dock of a local boat, and, having tied to the post with the gar, which assemble there in great numbers to feed on the fish offal which is thrown into the river. Bill put a chunk of catfish on his hook for bait, and tossed it into the water. He very soon had a bite, and then the fun began. The line was some hundred and fifty feet long. For some time it looked doubtful to the spectators whether the fish was coming to the surface, but he went on for some time, but he succeeded in getting the fish near enough to feed on the fish offal to enable the fisherman to brain him with an axe. The gar was hauled up to our office on a dory, where, having procured a small block and fall, he was hoisted up to a limb of a tree and weighed in the presence of a large number of deeply interested spectators. He weighed one hundred and seventy-six pounds, and measured six feet ten and a half inches in length.—OCUCHITA.

WHITEFISH TAKE THE HOOK.—Editor Forest and Stream: Do whitefish bite or take the baited hook? Yes, they do. Many years ago I was storm-bounded forty-eight hours at Copper Harbor (old Port Wilkins, Lake Superior). One person was found there, a tried fisherman, who had taken a fish with the gar, which assemble there in great numbers to feed on the fish offal which is thrown into the river. Bill put a chunk of catfish on his hook for bait, and tossed it into the water. He very soon had a bite, and then the fun began. The line was some hundred and fifty feet long. For some time it looked doubtful to the spectators whether the fish was coming to the surface, but he went on for some time, but he succeeded in getting the fish near enough to feed on the fish offal to enable the fisherman to brain him with an axe. The gar was hauled up to our office on a dory, where, having procured a small block and fall, he was hoisted up to a limb of a tree and weighed in the presence of a large number of deeply interested spectators. He weighed one hundred and seventy-six pounds, and measured six feet ten and a half inches in length.—OCUCHITA.

PROTECTION IN GREAT SOUTH BAY.—The *South Side Signal*, of Babylon, L. I., says: "The South Side Association for the Preservation of Fish and Game has gone to work in earnest to break up the drift netting of fish in Fire Island Inlet. Several parties have been arrested under that portion of the game law that prohibits the hauling of nets at night, and the setting of drift nets in the channels. As a consequence the bay is fairly alive with bluefish, and those engaged in legal netting are reaping a rich harvest. On Monday morning last George Saunins, in company with Scott Millard, took over 5,000 bluefish from their nets. The fish average about 2 1/2 pounds each, and the entire catch will probably return about \$600. All the other net fishermen did nearly as well. So much for giving the fish a chance to come up into the bay. We learn that no less than thirty men who were fishing with 'dry nets' were arrested last week. They were punished with from three days' imprisonment to fifty dollars fine. It has long been a matter of surprise to anglers that the hotels and others permitted such open violations of the law as has been done for the past ten years or more on this valuable fishing ground. Pound nets have been set in Fire Island channel contrary to law and to the destruction of fishing in this great natural fishing ground. It is time that something was done, and we hope that the association will continue the good work."

COLORADO TROUTING.—Denver, Col., June 29.—The riflemen are doing very little shooting here, as the extension of the city limits compelled them to leave their old range, and they have not as yet decided on a new one. The fishing season opens here the first of July, and Postmaster Fishers and Lawyer France are going to Middle Park about the 15th on their annual trouting expedition. Tourists coming to Colorado for fishing and shooting, will do well to call on John P. Lower, the veteran dealer in sportsman's goods, for information where to go, and if they stand in need of an outfit, John can supply it. He is every inch a gentleman, and what he don't know about the game resorts of this State wouldn't fall a very large look.—**THAT OFFICE BOY.**

BLACK BASS IN LAKE ERIE.—Erie, Pa., June 30.—The fishing for black bass has been good all spring, but of late has fallen off somewhat, and parties have been going over to Long Point, Canada, twenty-eight miles distant, and returning nearly every time loaded. I believe the bass taken here represent the first crop of returned black bass. Fishers and Lawyer France are going to Middle Park about the 15th on their annual trouting expedition. Tourists coming to Colorado for fishing and shooting, will do well to call on John P. Lower, the veteran dealer in sportsman's goods, for information where to go, and if they stand in need of an outfit, John can supply it. He is every inch a gentleman, and what he don't know about the game resorts of this State wouldn't fall a very large look.—**THAT OFFICE BOY.**

BLACK BASS IN LAKE ERIE.—Erie, Pa., June 30.—The fishing for black bass has been good all spring, but of late has fallen off somewhat, and parties have been going over to Long Point, Canada, twenty-eight miles distant, and returning nearly every time loaded. I believe the bass taken here represent the first crop of returned black bass. Fishers and Lawyer France are going to Middle Park about the 15th on their annual trouting expedition. Tourists coming to Colorado for fishing and shooting, will do well to call on John P. Lower, the veteran dealer in sportsman's goods, for information where to go, and if they stand in need of an outfit, John can supply it. He is every inch a gentleman, and what he don't know about the game resorts of this State wouldn't fall a very large look.—**THAT OFFICE BOY.**

FISHING WITH THE FLY.—We have received proofs of plates on flies to illustrate the following book, "Fishing With the Fly," by Mr. C. F. Orvis, assisted by Mr. A. N. Cheney. We have before announced the fact that such a book, with articles on different kinds of fish by well-known writers, was in progress. The plates are exceedingly fine and give promise of a valuable work. It will probably be issued in the course of a month.

BLACK BASS IN THE SCHUYLKILL.—Bass fishing in the Schuylkill about Reading is not good. At this point the fish take all but early in the season better than in the months of July and August. Residents state that from the middle of July until September few will be taken there. The heavy rains of this week have rendered the waters so muddy that little can be done until they become clear.—**HOMO.**

LAKE HEBRON.—Monson, Me., June 30.—The Piscataquis Game and Fish Protective Society of Monson, Me., purchased 50,000 brook trout fry of the M. Kineo hatching works, and they were turned into Lake Hebron on the 28th inst. The fry have been doing well, and are in part now in Lake Hebron this spring, weighing from two to four and three-quarter pounds.—**J. F. SPRAGUE.**

WINCHENDON, MASS.—Mr. E. S. Merrill's party have returned from the Canada woods report having had excellent success in taking trout, both as to numbers and size, and that several of the finest specimens were taken. One of the and another of twenty-five pounds the last taken by Mr. Myron W. Whitney, of Boston.

SALMON ON THE RESTIGOUCHE.—We understand that the salmon are running in large quantities on the Restigouche, and that several large fish have shipped from Campbellton since June 1. This is good news, and will in part make amends for the unsatisfactory fishing of the past two years.

MICHIGAN.—Linden.—Good fishing in this part of Michigan for bass, pickerel, etc. Linden is on D. G. H. & M. R. R., fifty-five miles west of Detroit. Anyone coming here can get accommodated with boats, etc.—**WM. H. G.**

SHEEPSHEAD AT BARNEGAT.—June 30.—Sheepshead fishing at Barnegat was never better. Thomas M. Dickson, of Philadelphia, on June 29, between 9 A. M. and noon, took twelve, weighing 108 lbs.—**HOMO.**

LARGE TROUT.—George H. Comstock, of Ivoryton, Conn., last fall caught with a fly in the Kennebec River, below the dam, in one day, twelve trout, weighing forty pounds and one ounce.—**P. F.**

Fishculture.

CALIFORNIA SALMON BRED IN CAPTIVITY
We give below a translation of an extremely interesting paper by MM. Ravert-Wattel and Bartet, on the successful hatching of eggs obtained from salmon in the Trocadero Aquarium, Paris.
On the 15th of October, 1878, the aquarium of the Trocadero received from the National Society of Acclimatization ten thousand eggs of the California salmon (*Oncorhynchus quin-*), part of a shipment made by Mr. Spencer F. Baird, United States Commissioner of Fisheries. These eggs, in which the embryos were already well advanced, soon hatched. The fry were very vigorous and their development rapid, at least from the time (January 1, 1879) when the aquarium having been handed over to the Municipal Government, and given in charge of an engineer of the service of the parks and walks in the city of Paris, care was regularly given to the different fish which occupied the tanks.
The young salmon, liberally fed upon the chopped-up flesh of the whitefish, attained in one year the weight of 250 grammes. At this time almost all lost the dorsal fin. Life to assume the beautiful silver reflections of the smolts, but they did not show the restlessness which is usually observed in the

common salmon of the same age when kept in captivity. They endured their confinement perfectly well, and their losses were relatively insignificant.
Two years later, the young salmon had become very beautiful fish, some of them weighing two kilograms. In October, 1881, several individuals gave evident signs of spawn. Artificial fertilization was attempted, but the eggs taken appeared to be badly developed, and gave no result. Then all, or nearly all males and females, which had appeared ready to spawn, died.

The following year, 1882, again in the month of October, these fish once more manifested a desire to spawn, and on the 24th of October seven individuals were taken, one of which an attempt was made to fertilize by the milk of a trout, as ripe male salmon were lacking at the time. The operation was unsuccessful. But a few days later individuals of both sexes were ready to spawn, it was possible to take and fertilize in the space of five weeks nearly 30,000 eggs.

Unfortunately the lack of a sufficient number of hatching troughs necessitated the keeping of the eggs for several days in a space too confined. And besides the work of repairing the troughs, which for the aquarium, permitted for a while only the use of unfiltered water. It is to these two causes that we must attribute the failure of the greater number of the eggs, which, looking very healthy, almost all perished as they ought to hatch. About 1,500 very vigorous fry were raised, and these, in perfect health. They are enough to demonstrate the possibility of rearing and breeding the California salmon under entirely exceptional conditions of captivity. The fact appears still more interesting, because we are dealing with a foreign species, which is essentially migratory, and which has thus adapted itself at once to a new climate and to a complete change in its habits. The acquisition of the species would seem therefore easily to be brought about, and it would be especially useful in considering the restocking of those waters in which fish flow into the Mediterranean, in which the common salmon is unknown and probably would not succeed, while the California salmon, which shows itself in America down to the thirty-fifth parallel of latitude (and is found in California south of the *Salmo salar*), could apparently be acclimatized in the Rhone, the Aude, and the Herault.

*The individuals which had spawned soon died.

THE AMERICAN FISHCULTURAL ASSOCIATION.
[PROCEEDINGS CONTINUED.]
SUNFISH: THEIR HABITS AND EXTERMINATION.

BY FRED MATHER.
A PEST which the fish-culturist who has large ponds often has to contend with is the little fish, or fishes, for there are several species, which are popularly called sunfish, pondfish, pumpkinseed, etc. These are the *Cyprinus carpio*, *Catostomus commersoni*, and are closely related to the black bass, both in structure and habits, an intermediate link being found in the "red eyes," "rock bass," and the "white-mouth" of the South. Within the district east of the Mississippi and north of North Carolina, Prof. Jordan, in his "Manual of the Vertebrates," enumerates eleven genera and twenty-six species of sunfishes, and this region would be several millions of dollars richer, if they were not so numerous.

The sunfish is among the first of the scaly acquaintances made by the boyish angler in his Saturday trips to the mill-pond; and although there is a feeling of sentiment in favor of a fish that is connected with early angling, and on whose account I was once fined, and whose name is pronounced by a stern parent to account for absences from school, I now look upon the little fish as a great nuisance. Sentiment has no place in the struggle to produce food, and the sunfish consumes a vast amount of food, which is wasted by its being furnished to other and better fishes to any extent, for its strong spines, which are erected when in danger, make it a thorny mouthful. Even when these spines are trimmed off it is the poorest of baits, and it is well to know the fish by sight and to be on its guard when it is introduced into a pond, and thus learn that the individual before them has been disarmed. There are comparatively large species, which in some waters grow to a quarter of a pound in weight, but take the fish as they run in the ponds, they seldom reach two ounces.

The food of the sunfish is worms, flies, crustaceans, fish eggs, and small fish, especially those which have soft fins, for they do not resist the sunfish's jaws. Consequently they are formidable competitors for the food of the young fish, and the fish, even if they did not devour them, but when their predatory habits are added to their consumption of other food, and their voracity is also known, they at once become regarded as among the most injurious foes of the fish-culturist.

My attention was strongly called to this fish this spring. Near the hatchery at Cold Spring Harbor, Long Island, of which I have had charge this year, are the mill ponds belonging to the Messrs. Jordan, by which the water for the hatchery was leased for a nominal sum to the New York Fish Commission. I had some young land-locked salmon, and Mr. Townsend Jones wished to try some of them in the lower pond, which is deep and cold, but in contact with sunfish. I recommended placing the fish in the upper pond where the water is shallow, plentiful, and where the spring streams would afford food and protection to the fry, until large enough to run down into the two lower ponds. Mr. Jones (eared they would interfere with the eggs) consented to my suggestion, and placed in each some in each pond. In the lower pond, where the sunfish are most plentiful, we placed 3,500 young land-locked salmon, of an inch or more in length, by setting them out in the springs bordering the pond. We watched them, and saw the sunfish waiting for those which went down into deeper water, but could not see that any were caught. The next day Mr. Jones captured a sunfish which had thirty-five young salmon in its stomach, just one per cent. of the plant. At this rate it would eat up the entire stock of sunfish in the course of the next day, and we estimated that there were tens of thousands of sunfish in the large pond.

About the middle of May, in this vicinity, the sunfish makes his nest near the shore, and builds it of stones and mud, about twelve or fifteen inches in diameter in the gravel. The male and female occupy the nest and fight off all intruders. In the pond mentioned there is a spot near the flume where a space twenty-five feet long by fifteen wide contains two hundred nests, lying as thickly as it is possible for eggs to lie. On the first day of June I noticed that they were spawning, the female slowly turning around in the nest, and the male going around outside of her. They would come together and lie upon their sides, and the male would frequently come to the surface, and by motion of his tails turn round on a point of which her dorsal fin was the pivot. I imagine to think that all the eggs are not laid at one time, but that altogether each female deposits from ten to ten hundred eggs in the season. There are probably ten thousand such nests in Mr. Jones's pond, as they can be seen all along the shores in from two to four feet of water, seldom deeper than five feet.

In the course of my fish-culture life, I have been applied to many times by persons who wish to know how to value a fish, to know how to get rid of sunfish. They have often asked if explosion would not be effective, and I have told them that it would, but it would also kill every other living thing in the water, and would be a great loss to the fish-culturist. Such valuable fish-food as insect, larva and crustacean, and that the remedy was as bad as the disease. All that then suggested itself was persistent netting, and this entails much watching the nests, it occurred to me that the young of all could be effectually killed off by rowing around the ponds and

dropping a piece of quikline as large as a robin's egg upon each nest, perhaps through a tube, which would deliver it exactly. This plan would not interfere with the waters in the pond, nor with the fish, and it would be a great deal better than the original stock did out would appear to be effectual. I have recommended this plan to Mr. Jones, and, if it meets terms, will assist him in carrying it out.

LOBSTERS.

Mr. PHILLIPS.—I have here a paper on lobster culture, by Mr. S. M. Johnson, of the firm of Johnson & Young, the large lobster dealers of Warren Bridge, Boston, but think it best to preface it by some extracts from a report on the Collection of Economic Crustaceans, Worms, Echinoderms, and Sponges, sent to the Great International Fish Exhibition at London, by Mr. Richard Rathbun, Curator of the Department of Marine Invertebrates in the United States National Museum. The report says:

"The lobster is by far the most important crustacean occurring upon the coasts of the United States, and gives rise to an extremely valuable fishery. It is confined to the Atlantic side of the continent, and ranges from Delaware, in the south, to Labrador, in the north. The most southern fishery is a small one in the neighborhood of Atlantic City and Long Branch, New Jersey. Lobsters were once moderately abundant in New York Bay, and were taken there for market, but the pollution of the waters of the bay by numerous factories and other causes have combined to destroy the species. At numerous places through Long Island Sound, lobsters are sufficiently plentiful to permit of limited fisheries, which are mainly confined to supplying the local demand. Further east, on the southern New England coast, in the region of Block Island, Montauk Point, the Nantucket Islands, and Martha's Vineyard, they become much more abundant and afford a very profitable fishery, extending through the spring, summer, and early fall. The entire coast line of Massachusetts abounds with lobsters, and the Maine coast has the largest supply of them, but overfishing has nearly depleted some of the shallow water areas, which were once prolific, as at Provincetown. The sandy shores of New Hampshire furnish only a moderate supply of lobsters. Lobsters are very much more abundant on the Maine coast than anywhere else in the world, and the yearly fishery exceeds in quantity and value those of all the other States combined. This State is, in fact, the main source of supply for all the principal markets in the United States. The fishery continues all the year, but is most active during the spring, summer, and fall, and especially from April 1 to August 1, when the canneries are open.

"The lobster fishery, as a distinct industry, commenced on the Massachusetts coast about the beginning of the present century, and on the Maine coast about 1840. It has rapidly developed to the present time. At first, lobsters were frequently found, during the summer, in some favorable spots along the coast, but they were not taken in large numbers until the late '40s, when they were taken in great numbers on the coast, where they could be gaffed out from under the protection of overhanging rocks and seaweeds. They rarely occur in such situations now, and the fishery is mainly carried on in depths of from five fathoms to 20 or 30 fathoms, but sometimes in depths of 40 to 60 fathoms. On the coast of Nova Scotia, lobsters are about as common as on the Maine coast, but further to the north they become less abundant again. They have been taken on some of the outlying fishing banks, such as the Grand Bank, but are not fished for at any great distance from land.

"The lobster fishery is regularly carried on by means of wooden framework traps, or pots, generally constructed of the same material as the fish traps, and of a somewhat conical or oval shape, being flat below, rounded at the sides, and above, and with a net-work or wooden funnel-entrance at each end, or at one end only. The ordinary size is four feet long, and one to three feet wide, and high, with two funnels; the funnels with one funnel, and the other with two funnels are occasionally used, as are also rectangular-shaped pots. The old style of lobster pot, employed when lobsters were more abundant and the fishery less important, consisted of a wooden hoop, of circular or oval form, with a net-work of diameter, carrying a net which sagged but little, and furnished above with a cross-loop arrangement, or with twine leaders, to which the line for lowering it, as well as the bait, was fastened. The old style of pot, now almost entirely disappeared from the coast, as it required constant attention, and only a few could be tended by each fisherman. The lath or cylinder pots are built in the center with hoop or refuse fish, which are fastened on an upright, spearlike holder, and are lowered by means of a rope attached to the end of the pot. The number of pots used by each fisherman varies in different localities, ranging all the way from 8 or 10 to 100. The average number used by each fisherman is about 25. The pots are fastened singly or attached together in trawls, the character of the bottom, abundance of lobsters, and custom regulating this matter. When set trawl-fashion, the pots can be handled much more easily than otherwise, and this method is generally resorted to on the coast of Maine. The pots are fastened to the bottom not too tight. The pots are fastened together in strings of 10 or a dozen to 50 or 60, at distances apart of 15 to 20 fathoms, and have a long buoy line at each end, which is fastened to the bottom, and is usually of iron line, beginning at one end, and marks the ends with kegs or small wooden buoys. After remaining down a sufficient length of time, generally twenty-four hours, he proceeds to examine the pots, and hauls them up, one by one, or a few together, and it to the other. The general arrangement of the trawl is not, therefore, disturbed; but the pots, after they have been examined, fall back again into nearly the same places which they previously occupied. In setting the pots singly, each has a buoy line and buoy, and the fishery line and buoy, and succession from one to the other. Where lobsters are much scattered, this is the preferable way of setting the pots, as they are shifted slightly every time they are hauled, and the fishery line and buoy are not disturbed. The trawl is probably the one most universally employed along the entire coast. It is customary to visit the pots early every morning, or otherwise, when the tides serve best.

"The principal lobster markets are Portland, Boston, and New York. Three-fourths of all the lobsters disposed of to the fresh trade are carried by well-manned or railroads to one or other of these three centers, where they are sold locally or distributed through the country, either alive or cooked. The principal market for live lobsters is Portland, where large cars, in which a considerable stock can be stored awaiting orders. Lobsters are in season during the entire year, but are much more abundant in the markets, and much more expensive, during the winter and spring months, than in the early fall. For most lobster fishermen the season is of short duration, lasting only about two, three, or four months, after which time, and until the next season, they engage in other fisheries, but generally in the former state. Their season's stock seldom exceeds a few hundred dollars.

"The canning of lobsters in the United States is entirely confined to the coast of Maine; and most of the provincial canneries are controlled by American capital. Without its canning interests, the Maine lobster trade would be of little value, and its prestige, as the majority of the lobsters canned are below the regulation size established by custom for the fresh markets. The market-makers will seldom buy lobsters measuring less than three inches in length, and the minimum size under this size are sold to the canneries. The canning industry was first started about 1840, at Eastport, Me., but several years elapsed before it was successfully introduced. In 1850 there were reported to be three canneries in Maine, with a total capital of \$200,000, remaining open during the season, and giving employment to about 650 factory hands and

THE TERROR—Concerning the *Margorie*, the *Wood's* correspondent writes from Harwich, England, as follows: "Mr. James Ashbury's schooner, the *Cambria*, which went to America some ten years ago, must be pretty well known to most American yachtsmen. She was at first the crack English yacht, but things have wonderfully changed here since then, and the *Miranda*, which was built in 1876, proved herself so much faster that the *Cambria*, after a few matches with her, gave up racing altogether. The *Miranda* sailed in to-day's race, meeting the *Margorie* for the first time, by which yacht she was beaten, as described, by six minutes and thirty seconds, without any allowance. The *Miranda*, after numerous contests, was found last enough to give the *Cambria* from twelve to fifteen minutes in anything like a fair breeze over the usual English course for this class, say six miles. Now if the *Miranda* can beat the *Cambria* in fifteen minutes and the *Margorie*, according to a fair and honest performance to-day over a course in which there was a large proportion of running and reaching, can beat the *Miranda* six minutes and a half, the *Margorie* is accordingly some twenty minutes faster over a sixty-mile course than the *Cambria* was when she sailed in America.

THE NEWS ABROAD—The victory of the keel cutter *Wenonah* over the centerboard sloops of the New York Y. C. in the annual regatta of that club on the 21st inst., shows that the America's cup is at the mercy of the English yachtsmen, whenever they choose to try it. It will one of their best racing cutters, the *Wenonah* was built last year from a design by John Harvey, a famous English naval architect, and is of the following dimensions: Length over all, 100 ft.; draft of water 10 ft. Her sails were made in England, and she was sailed by an English skipper and crew. The *Wenonah's* dimensions are scarcely up to the standard of modern English racers, and as she sailed her first race on the occasion, there are probably at least a dozen well-seasoned cutters in England that could have given her a beating over a 50-mile course.—*Belle-vue Intelligence*.

NEW SLOOP—John Munro is building a deep sloop for Mr. John Dimond, of Brooklyn. Over 145 ft.; water line 32 1/2; beam, 14 1/2 ft.; depth, 5 ft. Mr. Dimond was a great admirer of the skimming fish, and lost no opportunity to proclaim his faith. We are glad to find his new sloop with 2 1/2 depth in place of the old orthodox 4 ft.

QUINCY Y. C.—Third race was sailed off Great Hill, June 27, in easterly wind with light fog. J.oker, Oso, Coffin, won in second class in 1:10:42 and Danforth, Jr., Adams, and in third class in 1:52:41 corrected time. Prizes were pennants, presented by Sigourney Butler. Next race second championship match, fixed for 8 P. M., July 12.

KINCHEEBUCKER Y. C.—Pennant matches for club yachts are to be sailed once a month, July August and October. Pennants become property of yachts winning most races. First class comprises all cabin sloops, second class open yachts over 24 ft., third class open yachts under 24 ft., fourth class cat-rigged yachts over 24 ft., fifth class cat-rigged boats under 24 ft. and over 30 ft., sixth class, cat-rigged yachts under 30 ft. Course for first class from Fort Morris club house around Tom buoy and return. For others around Port Schuyler buoy. Start prompt at 2 P. M.

RIVET—The iron cutter *Rivet*, formerly of Kingston, Ont., will join Royal Canadian squadron this year. She was built by Simons, of Glasgow, in 1876, and sent out in sections to the lakes. She has now been bought by Hon. Edward Blake, and has been thoroughly overhauled and received her ballast. *Rivet* is 100 ft. over all, and 30 ft. beam, so it will be seen she has quite modern proportions and certainly was ahead of her times when first built. She sailed for Niagara with the Toronto squadron, June 30.

BEVERLY Y. C.—Club book for the year shows 122 members and 109 yachts, being a larger proportion of yachts to members than any other club in America. The fleet is made up of four keel and four centerboard schooners, six keel and fifteen centerboard sloops, eleven cutters, two yawls, one helms, fifty-eight entombs, and one steamer. There are four keels among the catboats. Seventy-third race on Saturday. Classes over 21 ft and under 17 ft.

PHOTOS—We have received from Rockwood, the photographer, No. 17 Union Square, a fine assortment of instantaneous photographs taken during the recent great races. They represent individual vessels and interesting groups. Among them we note some of the schooner *Grayling*, *Albatross*, *Tidal Wave*, *Montauk*, cutters *Red Onin* and *Peter*, sloops *Rover*, *Fanny*, *Rover*. The photos are well executed and handsomely mounted.

TORONTO Y. C.—The squadron sailed for Niagara June 24, and attended a hop in the evening. Yachts in the dock were: *Chatter* (Huntrevere, Geo. Nicol, M. C. Brown, C. Marriott, Saulters, H. Armstrong, W. Law, H. Parsons; cutter *Rivet*, Capt. E. H. Blake, V. Armstrong, N. Moffatt and H. Norton; sloop *Gypsy*, Capt. Townsend, G. M. Sutherland, A. Boulbee, R. Agnew and F. Dunbar; sloop *Mischief*, F. Parkinson, D. Murray, F. Thomas; sloop *Kestrel*, C. Townsend, J. George and A. Campbell.

SALEM BAY Y. C.—Prizes in recent race have been awarded to *Nirvana* in first class sloops, and to *Conus* in third class; rest failed to make the course.

KEEL CAT—Lawley & Son, South Boston, have built a keel cat for Geo. Payne. Over all 100 ft., on water line 10 ft., iron on keel 500 pounds.

NEW JERSEY Y. C.—Will arrange a match open to all yachts under 35 ft., for Sept. 15. Regular club course, around Robin's Reef and buoy 13 in lower bay. Fixed ballast, limited crews. Classes for cat-rigged yachts over and under 20 ft. Prizes, champion pennant and \$25 in each class.

JEFFERYS Y. C.—Second championship match was sailed off Jaffrey Point, East Boston, June 30, in light easterly wind. Course, 6 miles. Only two starters. Lizzie S. Porter, Jr., won in 1:29:32, corrected time, beating Judith, E. T. Piceau, by 3m. 15s.

CHICAGO Y. C.—Sixty members are off on the annual cruise to Milwaukee. The fleet comprises schooners *Idler* and *Countess*; sloops *Coria*, *Wasp*, *Nordon*, *Arlet*, *Port Zephyr* and *Beatrice*; cutters *Larons*, *O. K.* and *Staine*, and steamer *Hunter*.

HULL Y. C.—Has placed large mooring for visiting yachts, and they are instructed not to occupy those of other vessels away from a safe. The club has issued to members a twenty-page pamphlet giving fixtures and rules for the season.

ROYAL CANADIAN Y. C.—Schooner *Orion*, cutters *Albatross*, *Alben* and *Verre*, and other yachts of the club, are off on the annual cruise. *Orion* is first port of call, then *Charlott* and home, occupying three days.

BOSTON CITY REGATTA—Judges for the public races are M. J. Riley, chairman; C. F. Loring, Wm. Morris, Louis M. Clarke and Geo. A. Palmer. A full report appears in our next issue.

JERSEY CITY Y. C.—A match has been fixed for July 10, open to cats for cup offered by Vice-Com. F. C. Browner *Archer*. Course twice around Robin's Reef Buoy.

EOLUS—The exact amount of lead ballast on under-side of keel of schooner *Eolus*, Mr. Miles Wood, N. Y. Y. C., is thirteen tons.

WANDERER—This schooner has been sold to Mr. Wild, of Boston, and is being overhauled before departure.

VALKYR—is having a new racing fit by Sawyer, of South Street.

"When cleanliness, prompt action and general therapeutic results are desired, Benson's CAPSICUM PASTES are masters of the situation. They easily excel all other external remedies." So writes an eminent western physician. For local rheumatism, torpid liver, sciatica and bronchitis they have made a brilliant record. Beware of imitations. "Capsic" cut in each. All druggists. Price 25 cents.—*Ad.*

"HAMPHREY'S" HOMEOPATHIC REMEDY SPECIFICS

FOR THE CURE OF ALL DISEASES OF HORSES, CATTLE, SHEEP, AND DOGS.

For Twenty Years Hamphrey's Veterinary Specifics have been used by Farmers, Stock-Breeders, Horse & Cattle Raisers, and Hipnotists, Menstruaries and others with perfect success.

LIST OF SPECIFICS.

A. A. Cures Fever and Inflammation, Milk Fever, Spinal Meningitis, Hog Cholera, 75c.
B. Cures Foundry, Spury, and other Fevers, 75c.
C. Cures Diarrhoea, Small Distempers, 75c.
D. Cures Croup, Hoarse, and other Affections, 75c.
E. Cures Croup, Hoarse, and other Affections, 75c.
F. Cures Colic or Gripes, Bellyache, 75c.
G. Cures Thrush, and other Affections, 75c.
H. Cures all Urinary Diseases, 75c.
I. Cures all Diseases of the Digestion, 75c.
J. Cures all Diseases of the Digestion, 75c.
K. Cures all Diseases of the Digestion, 75c.

200 bottles of Hamphrey's Veterinary Manual, 50 p. 75c. 10 bottles of Medicine and Mediator, 75c. \$8.00

These Veterinary Cases are sent free to any Veterinarian on receipt of the price, or any order for Veterinary Medicine to the amount of \$4 or more.

Hamphrey's Veterinary Manual (200 pp.) sent free to readers on receipt of a postage stamp.

75c Pamphlets sent free on application.

HAMPREY'S HOMEOPATHIC MED. CO.
109 Fulton Street, New York.

"MIST COLOR" LEADERS.

Being consumers of nearly three-fourths of the total amount of silk worm gut imported in this country, and having in Murcia, Spain, increased our facilities for the manufacture of silk worm gut, we are enabled to secure a selection of material for our leaders beyond what even we have ever had. The leader being one of the most important articles in an angler's outfit, we have long given particular attention not only to the material in which it is composed, but also to the manner of making or tying it. All of our leaders have a place every three feet, made quadruple by looping, so that the flies can be easily adjusted and will not wear the leader unnecessarily. All of our leaders are "Mist Color." Every envelope contains one dozen leaders; has our name and trade mark on it; states the length and quality of the leaders in it.

Orders received from persons residing in cities in which the dealers keep a full line of our goods in stock will not be filled at any price.

ABBEY & IMBRIE,
Manufacturers of every description of
Fine Fishing Tackle,
48 & 50 MAIDEN LANE, AND 33 & 35 LIBERTY STREET, NEW YORK.

J. F. MARSTERS,
55 Court Street, Brooklyn.
MANUFACTURER AND DEALER OF
Fine Fishing Tackle.

First Quality Goods at lower prices than any other house in America.

1000 Multiplying Reels with Balance Handles, first quality and line finish, 75ft., \$1.00; 130ft., \$1.25; 180ft., \$1.50; 240ft., \$1.75; 300ft., \$2.00; 450ft., \$2.25; 600ft., \$2.50. Any of the above Reels with Drags, 25 cts. each; metal drags, 50 cts. each. Lengths, 20 cts.; 30 cts.; 40 cts.; 50 cts.; 60 cts.; 80 cts.; 100 cts.; 150 cts. Nickel plated, 50 cts. extra. Marsters' celebrated Hooks made on Long, Clark, Kirby, Limerick, Speck, Curdie, Chesterown, O'Shaughnessy, Kinsey, Aberdeen, Suck Bent, and all other hooks, 25 cts. per doz. Double Twist Leaders, 10 cts. per doz.; treble, 30 cts. per doz.; put up one-half dozen in package. Single Gut Trout and Black Bass Leaders, 10 cts. per doz.; 20 cts. per doz. Double Twist Leaders, 3 length, 5 cts.; 10 cts. per doz.; 14 length, 10 cts. per doz.; 20 cts. per doz. Black Bass Fly Rods, 10ft. long, \$1.50 to \$2.00. Established 30 years. Open Evenings. **J. F. MARSTERS, 55 Court St., Brooklyn.**

KYNOCH'S
Patent "Perfect" Brass Shells,
MANUFACTURED BY
KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weight about the same as the thicker shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool (as represented in cut) and straighten out to original shape when discharged. The crimping tool also acts as a reducer, an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

We will mail it to you for \$2.00. Send dress measure.

AMERICAN Kennel Register.

A monthly record of kennel events for the information and guidance of breeders, exhibitors and owners of all breeds of dogs.

Its leading feature is the "Pedigree Register," of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is given to each dog, and an index will be compiled at the close of each annual volume, thus forming a permanent work of reference. The pedigree registration fee is twenty-five cents. The first two numbers of the Register contained the pedigrees of 138 dogs.

Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs at sale, and deaths.

Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include a record of field trials. The first two numbers of the Register contain prize lists of Washington, Ottawa and Pittsburgh shows.

The publication day is the fifth day of each month; and nothing can be received for publication later than the first day of the month. All matters intended for publication should be in the hands of the editor at the earliest practicable date. Entry blanks for each department will be furnished free on receipt of stamped addressed envelope.

TERMS.—Issued by yearly subscription only. The subscription price is one dollar per year. Make drafts and money orders payable to the Forest and Stream Publishing Company. Address, AMERICAN KENNEL REGISTER, P. O. Box 2,832, New York City.

	ANSWERS TO CORRESPONDENTS.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

TEN YEARS.—With the issue of July 26, the FOREST AND STREAM will have completed its first ten years of publication.

JAPANESE PHEASANTS IN CALIFORNIA.

IN our issue of November 3, 1881, was published a letter from Lieut. W. W. Folger, of the Navy, then stationed at Shanghai, in which letter he told us of Consul-General Denny's willingness to procure Japanese pheasants for importation into this country. An appeal was made to sportsmen's associations to avail themselves of this kind offer by making provision for receiving and caring for the birds. Whether because discouraged by the fruitless migratory quail importation or from a lack of public spirit, game societies appear to have given no attention to the subject, save the California State Sportsmen's Association.

Something over a year ago that society received from Japan nine pheasants—they being all the survivors of a lot of seventy-five birds shipped. The pheasants were put in charge of a gentleman at San Mateo, and carefully provided for in a house specially constructed for them. We learn from the *Pacific Life* that the birds have thrived. Eighteen young have been hatched and are now a month old, and sixty eggs were, at the time of writing, yet to be heard from. The association appears to have demonstrated that it is practicable to breed the birds in this country, and although it is as yet too early to predict the final outcome of their enterprise, it appears highly probable that the pheasant can be successfully acclimated.

The so-called English pheasant has been introduced on this side of the continent, one instance being that of Mr. Lorillard's farm in New Jersey, where the bird furnishes sport after the regular English style.

If the individuals and clubs, who have a great deal to say and little to do in protecting game, would direct their intelli-

gent efforts to following these two examples of public and private enterprise, they would accomplish much more than can ever be attained by violent denunciations of "pot-hunters" and "monopolists." Our State associations have abundant means and every opportunity to increase the supply of native game and to introduce foreign game, if they could only be induced to give some attention to the matter. If these societies had begun ten years ago, to labor in a systematic way for this increase, they would have had a great deal to show for it to-day. The next best thing is to begin now.

THE BOTTLE JOKE.

ONE of the harmless institutions of the day is a Funny Paragraphers' You-Tickle-Me-And-I'll-Tickle-You Association. The membership is composed of the professionally funny men of a half dozen professionally funny papers. The duties of the members are simple; each is bound by a east-iron oath to copy the jokes manufactured by the others, and there his obligations end. Each member of the order makes an annual pilgrimage to the offices of the rest; on which occasions Brother Bill devotes a half column of gush to lauding the visiting Brother Bob's brain, and Brother Bob in return pays in kind by communicating to his own paper an equal number of lines about Brother Bill's capacious intellect. Thus each practices the golden rule and blows hard the other's horn, even as he would that the other should blow his horn.

A staple topic for these paragraphers and mutual admirations at this season of the year is angling. They generally let themselves loose on the topic of the city angler and the "barefoot boy;" or they try a big "fish story;" or (and for some not wholly ecient reason this is their favorite theme) they find their inspiration in the "whisky bottle." It would be an interesting subject of inquiry to determine which of these themes is the most venerable as a joke, or in the paragraphers' hands most dismal. The grandson of the original "barefoot boy" was killed by a British bullet at Teon-deroga; the greatest "fish story" extant is some thousands of years old; and the whisky joke was current in Ireland when Raleigh and Spenser were fighting the Spanish invaders there, and was even then thought by connoisseurs to be considerably mellowed by age.

The latest distillation of this spirituous joke is a product of Iowa. We find it credited by the other funny paragraphers to "Bob" Burdette, and it is therefore of the Burlington *Hawkeye* brand. It reads:

Did we not go fishing it would not be summer. Conversely, if it were not summer we would not go fishing.

"We are going fishing next week," said Mr. Oldboy, "and I want to be sure we've got all our things together."

"Gotta tent?" asked his partner.
"Yes, I've got a tent."
"And a boat?"
"Yes; that's engaged."
"Whisky?"
"Lots of it."
"Some pilot license?"
"Yes, a whole box."
"Five or six dozen of beer?"
"Yes."
"Cigars?"
"Hundreds of 'em."
"Plenty of whisky?"
"Yes."
"Hain and canned meats?"
"Yes."
"A good lot of beer?"
"Yes."
"You'll want some ice."
"I have that, and I have lots of canned goods, plenty of beer and cigars, no end of whisky and bread, and everything I can possibly think of, and yet it seems to me I've left something out."
"Got your tackle, haven't you?"
"By George!" shouted Mr. Oldboy, "you've hit it. That's just it—fish hooks and lures, we'll need some of them, won't we? I knew I had forgotten something."

I do not know why it is, but for some reason nearly every fishing party carries with it a lot of hooks and lines which are only good to tangle up and catch in the drooping branches of the whispering trees.

Now, as we have said, these paragraphers and their little jokes, even their whisky jokes, are for the most part harmless. So is a drop of water. But it is the iteration that tells. The drop of water when it falls at regular intervals upon the head of the victim becomes the most refined torture and drives the sufferer into a maniacal frenzy. The angler's whisky is passed around so frequently and so persistently by the funny men that respectable gentlemen, who go into the woods for recreation, are losing their patience. They are tired of having the bottle continually fired at their heads by these muddled prnsters. We know some anglers—very worthy, law-abiding citizens they are, too—who would like nothing better than to impale one of these stand-

erous jokers on their hook, souse him into a cool stream of pure trout water and "play" him there until the whisky should be well washed out of his gigantic brain aforesaid. Again it has been plotted to invite him out on a shooting trip, when on a preconcerted signal all hands should accidentally fill him full of No. 8 shot. Less heroic than the water cure or the administering of leaden pills, and not so provocative of black lies in the bereaved funny paper, is the method proposed by others, namely to entice the whisky joker into the forest and there compel him to inhale the odor of balsam hongs and the woody fragrance until the fumes of the still are evaporated; but, however differing in methods proposed, one and all are agreed that the angler's whisky joke fiend should be squealed, even if it be necessary to disrupt and disband the whole mutual-tickling half dozen of them.

The funny men are behind the times; this is the year of grace 1883, not 1388. If they ever go angling themselves they ought to know, as we now beg leave to tell them, that it is not all of fishing, nor indeed any part of it whatever, to get gloriously drunk. An angling trip is not, nowadays at least, an excuse to swill whisky or beer. The professional and business men, clerks, artisans and mechanics who annually by hundreds and thousands go into the woods with fly-rod or bait-hook do not go there to guzzle freshwater. These dimly humorous imputations that anglers think more of their jugs and legs than of their tackle are standing insults—none the less obnoxious because flat, stale and unprofitable—to all pleasure tourists who in the God-made forests, as at home, are gentlemen and men, not beasts.

When the FOREST AND STREAM's machinery becomes so nicely adjusted that its editors can "get away" for a fortnight in the woods, nothing would please us better than to take along a trio of the whisky paragraphers to show them how to angle successfully without swilling demijohns of grog. Nor would it be an altogether thankless task to teach the paragrapher how to shoot without loading himself to the muzzle with rum.

And yet the community as a rule understands these things, better than does the funny man. There is no need then of enlightening him save for his own individual benefit and that of his professional brethren; and the beauty of it is that if we can convert one "Brother Bob" or "Brother Bill" he will, on his annual mutual-admiration tour among his fellows, help to convert them also, until the whole lump shall be leavened.

HENRY BERGH AND ANGLING.—The story about Mr. Henry Bergh's objection to President Arthur because of the latter's angling proclivities turns out to be a fiction, or in short, a lie, concocted by the fertile brain of that mischievous being, a "New York correspondent." The denial from Mr. Bergh, with its good-natured but nevertheless telling sarcasm, published in our last issue, has sufficiently vindicated that gentleman from the silly fabrications of the said gossip-loving penny-a-liner. Mr. Bergh might have gone further had he thought it worth while, and have corrected the distorted personal portrait of himself as drawn by the same imaginative and more or less slanderous correspondent, who in all probability never heard Mr. Bergh say anything about angling or anything else, nor in short, ever saw him.

A SUMMER HOME FOR PETS.—When city people leave their homes for a summer in the country or by the seaside it sometimes becomes a perplexing problem how they shall provide for their house pets during this absence. In response to the "long felt want" of a caravanseray where owners may leave their dogs and cats and birds, Miss Ellen M. Gifford, of Boston, has established a "home" for the purpose in that city. The weekly rates of entertainment are seventy-five cents for small dogs, fifty cents for cats and thirty-five cents for birds. The institution ought to be a paying one. We shall probably now hear less about the heartlessness of Boston people who leave their cats to die.

ANGLING INCIDENTS.—A man out West in casting his hook caught it in one of his eyes, which was ruined. A man who was fishing from a Hoboken dock lost his hat overboard; according to one account he was drowned in trying to recover it; another says a bystander was the unfortunate victim; if both accounts are true, both men were drowned. A fisherman near the Highlands, the other day, fished up the body of a drowned man. These cheerful notes might be multiplied, were the catalogue pertinent; but we have no desire to dampen the ardor of any enthusiastic angler.

THE WIMBLEDON TEAM

THE American team are now on the Wimbledon Common, and within a fortnight the match will have become an *fait accompli*. The reports so far from the other side show that the men are in good condition, and the few scores made on several occasions show that the men have caught the secret of the air, light, etc., and are able to roll the records close to the highest possible.

The fears that the team of visitors were to sit by, a mere idle squad, during the Wimbledon meeting, are not to be realized, if the meagre telegrams received speak aright. In place of allowing the rule prohibiting screw wind-gauges on the rear sight of military breech-loaders to be set aside in favor of the American shooters, and others like them, who prefer a modern to an ancient style of firearm, the Council have issued to the team complimentary score tickets to the several M. B. L. matches.

This may accomplish all that the riflemen and their friends here wished on behalf of the team—a chance to practice freely and fully during the fortnight of the Wimbledon meeting, and if so, then the team will go into the match as fully prepared for the struggle as it was possible for them to be under the circumstances. Still, it had been better if this concession or courtesy had been granted earlier in the season, and the vast amount of uncertainty which surrounded the reception of the team abroad had been avoided. It is but a roundabout way at best of reaching a good result, and it would have been far better had the Council turned fairly about on the screw gauge question and confessed by an amendment to the rule that the screw is a part of a serviceable weapon and that in using it the American team is not guilty of employing a mere device for securing higher scores, fit only for range use, but not to be recommended for those who desire only a soldier's weapon.

The work of the team will be watched with interest during the next few days. Already members have been the center of a great deal of attention on the part of their fellow-marksmen in Great Britain. Pêtes and dinners of various sorts are talked of, but to all the reply is made that a previous engagement will prevent acceptance until after the match has been fought. No date has been fixed for the return of the team, but win or lose, Col. Howard is determined to keep his men in good condition until after the meeting of the teams at the end of next week. He has placed them in lodgings away from the temptations of Wimbledon camp, and when the afternoon for the opening range comes, we hope to hear that the men stepped to the shooting point with every factor of possible error as far as may be carefully removed.

THE OLD "BEAR MARKET."—The Washington Market, in this city, is to be rebuilt; and *apropos* of the change the *Evening Post* gives some interesting particulars of its early history. At the time of its establishment, it was too far away from the thickly settled parts of the town to prosper, and the dealers who had taken stands there soon deserted them. "In this uncommercial condition of the new market a fortuitous event occurred. One day a great fat bear came out of the New Jersey woods and started to swim the Hudson for a visit to New York. When near the shore on this side he was observed by a young butcher named Jacob Finck, who had kept his almost deserted stand. Collecting a few assistants, Finck boarded a small boat and prepared to receive Bruin in proper form. After a hard contest the butcher slew the bear and bore his carcass in triumph to his market stall. The fame of the encounter spread through the city; people came from all parts to see the dead beast, and the butcher improved the occasion to let it be known that the carcass was to be dressed and offered for sale, in parcels to suit, from his hocks. The meat was readily and profitably disposed of, and the place where it was sold came quickly to be known, in the absence of any other name, as the market where the bear's meat was sold. Finck, with true business sagacity, procured other bears from any source they could be obtained, which he sold exclusively from this market, and it thereby acquired the permanent name of the Bear Market," which it held until, after the Revolution, its patriotic dealers gave it the name it now retains.

"SLATHERS" is the only word that will express it, and it is therefore just the term used by an Oregon paper to signify the amount of game in that favored land. For the sake of certain titled gentlemen from abroad, who with extensive armaments of express rifles, explosive bullets and bombshells, are scouring the Western game countries, we repeat the wild tale which comes to us of a valley near the headwaters of an Oregon River, where the "cougars have for years herded deer, one or two keeping watch at the mouth to prevent the deer from escaping. Whenever a cougar of the band gets hungry he walks into the little valley, like a butcher into a corral, and picks out the fattest deer he sees, and dines off his carcass. When the herd of deer grows small the cougars hold a "rodeo," and collect a few score more and drive them into the valley. Now all a man has to do is to kill off the cougars, and then go for the deer, and there is just fun alive." If the artillery trains of the gore-thirsty band alluded to could only be diverted from the antelope and buffalo to the cougars, it were a consummation on the attainment of which true sportsmen might fall upon each other's necks and weep for joy.

"THE WILD WEST."—Messrs. Carver and Bogardus have turned philanthropists, and are now "starring" for the benefit of the small boy who goes to the circus, and his grandfather who goes to take care of him. The aggregation of wonders under their canvas is something to make the proprietors of the "only greatest show on earth" green with envy. Here is a list in cold type of the attractions, the show being under the direction of "Buffalo Bill, the World-famed Prince of the Plains; the Hero of Thousand Thrilling Scenes; the Most Romantic Character in American History; and Dr. W. F. Carver, known as the 'Evil Spirit of the Plains,' whose appalling Skill with the Rifle has won for him a place among the Remarkable Productions of the Century." "One Hundred Indian Horses; a Herd of Wild Buffalo; a Herd of Mountain Elk; a Herd of Wild Texas Steers; a Camp of Sixty Indians; a Company of Famous Scouts; a Band of Genuine Cowboys; a Group of Genuine Mexicans; the Original Deadwood Stage Coach; Bogardus, the American Shotgun Champion; Major North, the White Chief of the Pawnees; Tom Wilson, Hero of the Deadwood Massacre; Buck Taylor, the Cowboy King; Jim Lawson, the Wonderful Lassoist; the Chiefs Standing Buffalo and Little Sitting Bull; John Nelson and his Indian Family; the Comical Mexican Burros; the Only Baby Buffalo in Captivity; the Squaw and her Pappoose; the Lonely Wagon Train; the Phantom of the Prairies."

A REQUEST FOR WORDS.—The Century Company of this city are preparing an American edition of the Imperial Dictionary, which they propose to make the most complete work of the kind in existence. The editor of this journal, having undertaken the revision of the terms relating to angling, shooting, and kindred topics, would be grateful for the co-operation of those persons who may favor him with terms in local use.

THE GREELEY RELIEF EXPEDITION.—At four o'clock P. M. on Friday, June 29, the vessels for the relief of the Greeley party left St. Johns, N. F., for Lady Franklin Bay or the nearest accessible point to it. The Proteus was the first to start and was soon followed by the Yantic. The wind was fair for them from the southwest, and the squadron moved off under most favorable circumstances.

THE DENVER MINING EXPOSITION will be opened July 17. Visitors to Colorado this summer may combine a visit to the exposition with a visit to the trout bonanza streams of the mountains.

THE FOURTH OF JULY, as will be learned from our rifle and trap news columns, was a great day for targets and clay pigeons.

The Sportsman Courier.

ON THE VIRGINIA SHORE.

JUST a little to the southward of a line between Old Point and Cape Henry, about six miles from the former and twelve from the latter, with both in sight on a clear day, there is a very pleasant resort for the summer stayers in Norfolk, Portsmouth and vicinity. Reached by a half-hour's pleasant ride in open excursion cars, it gives as we emerge from the woodland a good view of the ocean, and with the wind in any of the quadrants, north of west or east, a breath of its salt air, a very welcome breath to succeed those impregnated with the many odors due to combinations of great quantities of Africans, truck, imperfect drainage and sewerage, hot sun, chloride of lime and other disinfectants which are liberally used in the main streets, and I wish I could say the back alleys, also.

The resort is appropriately named Ocean View, and every evening that the thunder storms do not prevent, the place is crowded from 6 to 8 P. M., or later, as there is our later train.

Ocean View has several advantages over its rival, Old Point. People can go and return several times per day at an expense of not necessarily over thirty cents; while, except upon occasional occasions, a trip to Old Point includes supper, lodging and breakfast at Higgin's, when croakers do duty for sport, at one dollar per meal, said croakers being a drug in the market at five cents per dozen, the spots ranging from twenty-five to seventy-five cents; and the spots are served up as "hogfish," which are quoted at treble price. Thus a trip to Old Point is nearly ten times as expensive, and Ocean View reaps the harvest of people of moderate means, or who prefer sleeping at home to temporary lodging at a hotel.

Old Point has the Fortress, the military band and the gay uniforms, and is a most delightful resort. But Ocean View is not without its charms; the beach is clean, bathing facilities excellent—better than at Old Point, if the beach and surf are considered.

There is a comfortable hotel, with spacious verandas facing the sea, a band stand, a dancing pavilion, restaurant, bar, and good attendance. Last but not least to me, there is good fishing very near by; and if the hotel, which furnishes boats and hostmen, would but recognize the fact that as the good fishing depends upon the right tide (last of ebb and young flood), and that this phenomenon is bound to occur very often during the extreme heat of the day, and that when this is the case the most ardent fishermen will think a dozen times before he will hire a boat once—and that the more he thinks the less chance there is of his hiring one at all—and that (to put it briefly) a boat without an awning is at such times a delusion and a snare, a pain producer and a joy destroyer—and would in consequence proceed to fit out said boats in more comfortable shape, then this letter is not written in vain, and "mine host" Kennedy will gather in increased store of stacks, and hire a thousand yards from the beach there are many rocky patches, and here and there the sub-

merged timbers of wrecks or casks, furnish resort for the sheephead, while over the rocks must swim a countless host of fish of many varieties.

Leaving Norfolk on an evening at 5:30 with a companion, I left the beach at 6:15, and at 8 P. M., again landed to catch the 8:20 train up, and a preliminary saundwich. During the interval we had, besides the row to and from the fishing patch, caught six or seven dozen fish, ranging from six ounces up to a two-pounder; and I lost a good bit of my line; once a good-sized bluefish, which scooted off with the fifty yards on my reel, and then without raising continued to scort regardless of my feelings; and again when I hitched out to what at first I supposed to be a rock, but which while I was worrying at it, coolly got under way and shifted berth about six or eight yards in a slow deliberate style, that pronounced its character to William Henry (our boatman) as a turtle.

These two fish I didn't catch, and, as usual, in such matters, they were the biggest of our day's work.

We did catch croakers, "black wills" (a sort of perch), perch, spot, trout, roundhead, bluefish and hogfish. Only two of the latter, for it is comparatively rare, and to this fact more than to any inherent virtue, owes its proud prominence in price, for I'll defy any man, not thoroughly familiar with the Virginia fish, to tell which is which, when brought in contact with a well-cured plaster full of spots and hogfish. I cannot, and I've tried a dozen times, guessing wrong quite as often as right. So, although not quite the fair thing to sell two-cent spot for a ten-cent hogfish, it's not quite so bad as to try to pass off croakers as either. The croaker is to a fisherman here what the chub is to a trout fisherman, or the emmer to a tawogier, and has hardly a marketable value. Of our fish, at least three-quarters were croakers.

They are a very fair table fish, and when slightly cured can hardly be distinguished from the best plentiful, and I like them better than either the roundhead or trout, especially as material for a chowder.

I wonder if the coming process would not prove a very good way of preparing trout, bass, or other fresh-water fish? Instead of allowing them to open, remove the back bone; sprinkle a little salt; expose to sun, inside up, for about fifteen to twenty minutes, and it is good for two days.

Our bluefish were about half-pounders; the spots ranged from six to eight ounces; croakers ditto; trout and roundheads up to two pounds. After a little practice we could tell pretty well the fish that was biting by his method. Generally all were the spot and bluefish, but a minnow (twice) the croakers hit savagely, pulled for a while, were very hard and were quite gauzy; the trout were lively, but not so much so; when occasionally we felt a slight nibble, and on pulling in a heavy dead weight, it meant ear, of which "little red fish that walks backward" we got lots.

The bluefish was the gamiest of all. He didn't wait as did all the others for the bait to wearily reach bottom; anywhere from the surface to a yard under he would bite.

The "trout" puzzles me. In general appearance it strongly resembles a real trout, both in shape and markings. But lacking the second dorsal, peculiar to the salmon family, it is evidently not a member.

The few spots where sheephead can be procured are reserved for those who are willing to tip the boatmen, who depend largely upon said tips for their income; and those of them who fall fairly the duties expected of them tully earn their money.

The boats are owned and rented by the hotel, and a ticket costing fifty cents entitles a person to boat, man, gear and bait.

I don't know how much can be gotten for the fifty cents; parties of which I have been one have always fished liberally; and we had all the fishing we wanted.

The baits used are peeler crabs, soft crabs, clams and hard crabs, valuable in the order given. One is much surer of good fishing by taking one's own gear, and carrying down a few peeler crabs or clams; the former are hard to get, the latter abundant and cheap. Unless you carry your own rod and gear, that provided may not suit, as it is of the coarsest sort.

Take it all in all, a run down to Ocean View pays.

PISCICO.

JULY, 1888.

[We presume that the "trout" is the fish known as weakfish in New York. There are two species, the Southern form is black spotted.]

A STORY OF WAR TIMES.

SEEING nothing of late from our old army friends who were the "blue and gray" in our late family differences, I give you the outlines of a stirring incident that took place while the writer was stationed at Goodrich's Landing, La., during the summer of 1863.

While the siege of Vicksburg was progressing, and in fact at its termination, the darkies, in pairs, in squads and in droves, poured into our camp for protection, and formed a motley crowd of men, women and children several thousands in number. The able-bodied young men were enlisted into the several negro regiments then forming at that place. All these people had to be fed from our post commissary on the regular army rations, and the food told with little effect on these helpless creatures, who had been accustomed to nothing but corn meal and fat bacon; they were prostrated by hundreds and died by scores daily. The fatality was not confined to "Africa," as we designated the contraband camp, but invaded the colored regiments, until the hospital was full and the levee in front of the quartermaster's depot one vast graveyard, alarming in the extreme. By Bruce, our medical purveyor, and his able assistants, had exhausted their skill to lessen the fearful death rate, but had utterly failed; not for the want of skill on their part, but owing to their want of knowledge of the Southern negro, and his former mode of life.

About the first of September the matter became so serious that the General called a council of his staff and field officers to get their views, and if possible to devise some change for the better.

After a two hours' highly scientific discussion by the medical staff on the causes, effects and cures of acute and chronic dysentery, which was amusing in the extreme, considering their lack of practical success in arresting its fatal effects; and the General, observing a broad grin on my features, remarked, "Well, Quartermaster, you have said nothing; you are silent."

He remarked, "Why, Bruce, this is not a question of medicine; it is one of diet. Return to plantation fare, and my word for it all will be well. Corn and bacou are the things

to feed the colored regiments on Stop your rations of flour and fresh meat and you will have no use for drugs."

This settled the problem, the council was dismissed, and all returned to routine duty.

"The chief of our living Sergeant Charles Hatten, our chief of land transportation, some instructions, when an orderly rode up, handing me the following order:

"HEADQUARTERS, 8th REG'T, ETC.

"The quartermaster will procure by foraging, and deliver daily to the post commissary, forty wagon loads of corn and one wagon load of flour and Gen. Grant's troops as he may deem necessary for protection and fatigue duty."

"J. P. HAWKINS, BRIG. GEN'L."

I read it and handed it to Charley. It was a surprise to both of us, for at that time the whole country between the post and the Tensas was ruled by Harrison's cavalry, a reckless, daring set of men, led by their brave, enterprising colonel, who was always watching for a brush with our men.

While discussing the merits of the order, and the probability of carrying it into effect, an old darkey who lived on an abandoned plantation five or six miles northwest of camp, came shuffling in, hat in hand, with his usual salutation: "Morning, Massa Cap'n." Forgetting the order for a moment, I queried, "Any deer or turkey in the cane-brake, Nels?" "No deer, but some turkey, saw them last evening west of the place." This news stirred up the huntsman in me, and turning to Hatten I said: "Charley, let's have a hunt, and perhaps we will find some corn on the trip. It was soon settled that we two should start early next morning, and we went about our preparations, brushed up our Sharps carbines, that we had trusted to close shooting, each taking a package of ten cartridges, and providing one day's rations cooked ready.

Long before the sun rose on the following morning we were far beyond the vedettes, cantering on our way to Nelson's place. We found the old man up; he pointed out the clump of woods where he had seen the turkeys, and we went about our preparations, brushed up our Sharps carbines, that we had trusted to close shooting, each taking a package of ten cartridges, and providing one day's rations cooked ready. Long before the sun rose on the following morning we were far beyond the vedettes, cantering on our way to Nelson's place. We found the old man up; he pointed out the clump of woods where he had seen the turkeys, and we went about our preparations, brushed up our Sharps carbines, that we had trusted to close shooting, each taking a package of ten cartridges, and providing one day's rations cooked ready.

The hunt being over, we took reckoning, judging we were ten or twelve miles from camp, in the midst of an unknown country, and two rounds of ammunition in our pockets. On examination we found we had been hunting domestic turkeys, which had reverted to a wild state. The country being abandoned, the plantation animals left alone, took to the woods, and we came to approach.

Discovering the plantation buildings a mile distant, we walked toward them leading our horses, and eating a check as we went. We advanced to the residence without hesitation, hitching to the horse rack, we tried the front gate, which was fastened—lalled fast. The yard in front of the house was a thicket of rose-hibiscus, flowers, vines, lilies, a hundred different kinds of animals, all in full bloom, filling the air with a perfume so delicious that it filled our intoxicated senses; while the walks and paths were choked up with tall, coarse weeds, showing that no fostering care had been bestowed on the garden that season. Springing over the gate, we mounted the steps, found the door locked, and windows barred by shutters. Going to the back door, to our surprise we found it unlocked. Entering we found every room finely furnished, showing taste, luxury and refinement, as they had fitted out the quarters. Beds, chairs, settees, oil paintings on the walls; a piano, flanked by a stand of select music, stood silent on one side. Opening the shutters we surveyed the scene. In one corner stood a stack of *De Bow's Review*, while on the luxuriant sofa, face down, lay one of the last numbers open as if just read.

I opened the piano and touched the silent keys; the sweetest sound started me sitting down. I sang "Auld Lang Syne," which awakened sweet and tender memories of scenes long past in dear old Scotland. Then I played "Home, Sweet Home." How sad, now touching the thoughts started into life by his heart-searching notes. Then I sang to its hold accompaniment, Campbell's "Soldier's Dream." The last notes had scarcely died away when I sprang up, closed the beautiful instrument, shut the blinds, and told Charley we were taking in every note of the music. "This will not do," Harrison may be about." We passed through the hall, and seeing a door ajar, entered. It was a young lady's bedroom, with a large dowry bed covered with dust, a wardrobe, with a number of dresses and garments on the hooks, and a dressing stand. We both felt that we were trespassing, and withdrew, closed the door, and left all as we found it, silent, sad, alone; bearing every mark of the imprint of war's fearful and gloomy reign.

Mounting our horses, we passed on to the quarters. There we found everything in disorder, showing plainly that the flight had been made in haste, without thought as to the mode of departure. Passing on to the ginhouse and stables, we found plows, cultivators, hoes, baskets and tools scattered about in the greatest confusion, and to our surprise and pleasure, every building full to the top of corn in the shock, stored, packed and piled in every corner; also a quantity of mill pens, full to their tops. Thus we had found turkey and corn, and as the boy says, "felt good."

I dismounted, handed my bridle to Charley, and examined the corn, found it all sound and in the best of order, and had returned to my horse and placed my foot in the stirrup, when Charley said, "What is that over in the stock

bed? I have been watching it but cannot make it out." I had mounted while he was speaking, and looking in the direction pointed out noticed a horse pass an open space in the tall cornstalks, and close after it a man leading a second horse.

"Charley, we are trapped," was my answer; and wheeling my horse to the left passing round the stables, I saw a road flanked on both sides by broad ditches, running, as I supposed, east toward the river. At this moment a shot rang out, clear and sharp, and to my dismay about fifty men mounted their horses, half on our right, half on our left, forming a line of men, and drawing in on our road before us. The two troopers that we saw were on our right and considerably in advance of their followers, while those on the left were closer together, and about two hundred yards from the road. No time for thought; I touched Black Tom with the spur; he knew its meaning and fairly flew over the hard road, while the two troopers on our right were closing in on us, and threatening to bar our way. When within about one hundred yards of us, coming tearing through the dead dry cornstalks, we saw them raise their guns, the leader emptying two barrels at us. The report was followed by a shower of spent buckshot, which maddened our horses but did no damage. The second one, dropping his bridle to shoot, relieving his horse from the pressure of the hit, it staggered and fell, throwing the rider in a half circle over its head, when both barrels were discharged in the field. Charley was by my side in a moment, and said, "I will have to kill that fellow." Without answering I fired at him, but missed. Charley then stopped his horse, fired, and the dead animal that was preparing to spring the ditch in front of us, reared and fell down on its brink, and at the same time disabling his rider. When he fell Charley pulled off his hat, waved it over his head, and yelled at the top of his voice, in which I joined most heartily.

Now it was a race, with fifty shotgunners behind us to push forward our pursuers. The race was first, only on our dismount. Our horses were good, and we kept up for four or five miles, during which time we had passed through a skirt of timber.

We gradually slackened our pace, chatting and laughing at our narrow escape, and rejoicing at the fact that we each had one cartridge left, when, without the least warning, "crack" and "zip" came a bullet right between us and very close. We touched our horses with the spur at the same instant, and looked at each other, and then at the man who had fired. "No, sir," said Charley, "that is no shotgun." Glancing over my shoulder, I saw two new, fresh troopers coming after us at the top of their speed, gaining at every leap, the leader, an officer, about forty yards in advance of his comrades, and about a hundred from us, shooting with deliberation at short intervals; while the whole troop was scattered along the road to the woods.

"Charley, they will get us," I said. "No, sir," was his answer; he drew rein, wheeled, fired, and was answered by a shot that shattered the pommel of his saddle. My turn had come; our safety depended on my shot, which was our last. Staking all in my nerve, I drew rein, jumped from the saddle, dropped on one knee, took deliberate aim and fired. The noble horse gave two or three convulsive springs, then reared up and fell back on the brave fellow that rode him. I was riveted to the spot, and was still sitting when Charley returned with my horse which had gone some distance. He said, "Mount, Cap," quick, they will be on us." We were soon on the way again, and finding that the chase had ended slackened our pace and reached camp in safety. And we had our turkeys.

This story would be incomplete without its sequel. The next day the officer of the day led up to my quarters a handsome bay horse bearing a young lady. She wished to see Ferguson knowing of me being outside of the lines but myself and Hatten, sent her to me. She dismounted, entered the office, and being furnished a seat, I asked her kindly, "Madame, what can I do for you?" She blushed; tried to say something; failed; blushed again; and finally unwrapped a beautiful bouquet of flowers, handed them to me as a peace offering, and having gained her composure, said: "I have come to ask a great favor of you, sir. My husband, who is a doctor, and a great carrier of the cap, that wounded Willie yesterday. He sent me to you for help. There is no physician to dress his wounds, and I ask as a favor that you send one with me to take care of him a few days." My visitor proved to be the wife of the brave fellow who came so near capturing us. Charley's shot had struck him in the thigh, while my last shot had been planted square in his horse's breast. The fall had broken his arm and bruised him elsewhere; and he lay in a bed in the cap. In the midst of the Tensas, and his brave young wife, during the time in his den, had ridden some fifteen miles to the Yankee camp to procure a surgeon to dress her husband's wounds.

It is needless to add that when the request was made known to Gen. Hawkins it was cheerfully granted. A surgeon with the necessary appliances was sent to the wounded man's relief, and after a few days' absence returned and reported that the daring fellow was out of things.

CAPE GIRARDEAU, MO.

CAPE ROCK.

A SEAFARING REMINISCENCE.

BY FRANK H. CONVERSE.

THAT sailors are naturally superstitious, goes without saying. And this is not so much to be wondered at when one takes into consideration the fact that the ignorant and unlettered condition of many of them, and the strange and mysterious nature of certain sea phenomena which they are constantly encountering.

A singular, and, I must confess, inexplicable, illustration of this came into my experience when I was quite a youngster, making my second or third voyage before the mast, in a very old ship called the William and Mary. I had left the ship Tomawanda, known to many Philadelphiaans, in Southampton, and with the other crew, we had made our way on board the William and Mary, receiving fifty dollars (wages were low in those days) for the "run" to New York.

The William and Mary was a small, full-rigged ship, whose antiquated appearance indicated that she must have been built during the past century. Her masts, sails, spars and rigging were of modern make, while her hull was strangely old-fashioned. The stern, however, was high and overhanging, and the cabin in a mast-bate below, though the carrying-deck was partly concealed by the many coats of coal-tar which had been liberally applied, voyage after voyage. Her beam was full one-third the out-rig length of the box-like deck, with its shouder-high bulwarks, and the bows were as bluff and swelling as those of a Dutch galleon.

The captain, Robert Thumber, was an Englishman from somewhere about Deal. I remember rightly. His two officers belonged in the south of England. They were all quiet men, not given to bullying or blustering, and as the crew was a very good one (for in those days the merchant service was not made up of the mixed foreign element composing our present-day crews) the voyage proceeded without any incident worthy of notice, until the little event that I am about to relate.

By the time we got up with Hatteras, the wind, which had been for the most part from the south and south-east, hauled round into the north-west, and began to blow as it only ever did that stormy epoch in the month of February and March. Being crank, and very deep with her heavy cargo, the William and Mary was not a very marked success on a wind—indeed, I am inclined to think that she made nearly as much leeway as headway, for the thirty-six hours that the nor'wester lasted.

It was in the middle watch, the second night of the gale, and blowing harder than ever. Under three-reefed topsails, fore-staysail, and reefed spanker, the old ship with her yards braced sharp against the backstays, was staggering along through, into, and under, a tremendous cross sea, nearly as fast as one could whip a crab through a barrel of soft tar—to use a sailor's simile. As she luffed up against the tremendous billows, or sank into the great abysses that yawned beneath her keel, sea after sea broke over her continuously, keeping the vessel so full of water, that Captain Thumber had the cockpit stationary in the slings of the fore-yard, and called the rest of the watch up in the gangway on the lee side of the quarter, for it was almost impossible to stay on the main deck, without danger of being washed overboard. I remember my watchmates, as being rather out of the ordinary run of common sailors generally found on shipboard. Two, besides myself, were Americans. One of these was a middle-aged man only known to us as Tom. Not many years previous he was Captain Thomas B. F., at one time master of the ship Amethyst, built in Boston, in 1829—a ship which when commanded by Captain Jakey Howes, once made the passage between Liverpool and New York in sixteen days. Later, the Red Jacket made a like passage in thirteen days, one hour, and twenty-five minutes, and if I remember correctly, the formerly famous clipper ship Dreadnaught, is said to have done almost as well. The other was a young man, formerly a Harvard graduate, with a wild streak penetrating his Boston blue blood. He had in the ten years of his seafaring life visited almost every navigable port in the world, and it was his laughing boast, that during this time, he had also sailed under nearly every flag that floats from a ship's peak halyards—even having once made a voyage in a Chinese junk, from Whampoa to Melbourne, Australia. If I mistake not, this erratic sailor is now the oldest captain of one of the largest ocean steamers afloat.

These two were crunched under the lee of the after-house, while my third watchmate—a tall, reserved Russian, nicknamed "Silent Peter," by reason of his peculiar reticence not only regarding himself, but in general conversation— took refuge by my side in the partial shelter of the long boat which was secured on the top of the house. Now, among sailors, for some reason whose origin I do not mean to consider, a Russian or a Russian Finn, is looked upon as the possessor of certain powers closely verging upon the supernatural—all comprehended under the generic title of "wizarlity." Forecastle Jack asserts that some of them can at will bring good or bad luck to a ship; that they have the gift of second sight, and can also see phantoms of their drowned shipmates. So I was not so very much surprised, when Peter, who had hardly spoken since we took our seat on the house, suddenly asked—

"See Harry, believe you of the supernatural, what do you peoples call the ghost?"

"As I never saw anything of the kind, I can't say I do. Seeing is believing, you know," I answered carelessly.

"Um"—retorted Peter, who not only spoke English quite fluently, but two other languages besides—"well, look you. You may at me laugh," he continued with an earnestness which impressed me strangely, "but last night when from eight o'clock till I did see one strange thing. You know how it was dark?"

I nodded without speaking.

"For all the dark," Peter went on, "I see plainer than you now, a strange dress man who belongs not to the ship, stand for one, two hour in the weather gangway here, hold of the topmast backstay."

"A stowaway, perhaps," I suggested, more for the sake of an answer than because I really believed anything of the kind.

"The stowaway shall not be a man thirty-three or four year old, dress in old-fashion soldier-coat and top-boot with light breeches," returned Peter with a quiet shake of the head. "He had to him a face that was some thin," continued the speaker slowly, as though recalling the features of the mysterious stranger, "but you would see him as one of a character determined. His hair was long, of color black, and tied at the back of his head with black ribbon, as in the times old. How I see him so plain," Peter went on after a little. "All round him was kind of light, like when you rub the match on your finger in the dark."

Of course, I affected to laugh at the whole thing as an idle fancy, though secretly, Peter's singular communication, told in a quiet matter-of-fact way, had really made quite an impression upon me. As may be imagined from his quaint, yet correct use of language, which I have given almost verbatim, Harry was a man of more than ordinary education. He seemed less reserved with myself than with the others, and I had gathered from fragmentary bits of his half confidences, that at some time in his life, he had been an officer in the Russian navy. This much, together with the fact that he had a twin sister in New York, who was the wife of a wealthy fur dealer on Broadway, was all I did know of him. Such anomalies as this singular shipmate, however, are not infrequently met at sea. There are few safer places for a man who wishes to lose sight of his past life and present identity, than a ship's forecastle.

Peter said but little in reply to my rather flippanant comments upon his narration, until the striking of four bells called him to relieve the watch.

"No one shall know what may to him happen," he quietly obtained, and prepared to obey the summons, "and should it come to me any time, tell my sister that will come aboard in New York, there is the letter for her in my chest." And before I could answer this singular request he had left my side.

Two hours later, while we were slowing the mizzen top-sail in one of the fiercest nor-west squalls of sleet and hail

that I ever experienced, Peter lost his hold and fell, striking head first on the rail beneath and going overboard. The blow itself must have stunned, if not killed him outright, and with the terrible sea then running, it would have been worse than madness to have lowered the clumsy old tub which we called a long-boat.

So the waves and storm sounded their requiem over the drowned sailor, and the old ship went wallowing on. Next day the gale abated; the wind came round to the southward and eastward and blew us fairly into port in rather less than a week. As usual, the crew all left, bag and baggage, directly the ship was made fast. Disliking the surroundings of a sailor's boarding-house, I had obtained permission to remain on board until next day, when I was intending to start for home. After supper Captain Thurber went ashore, and a little later both officers, leaving only the colored steward and myself in charge. As I stood leaning idly over the rail, a private carriage drawn by two stylish black horses drove rapidly down on the pier, from which a groom assisted a tall, slender lady in deep mourning. As she approached the vessel's side and threw back a heavy cape veil, I could not repress a slight exclamation of astonishment, for though far more delicate, her features were almost perfect copies of those of the "my drowned shipmate," and I at once knew that this must be the twin sister Iliida of whom he had once spoken.

"You had a sailor—Peter Androvitch—on board," she remarked in tones singularly like those of her brother, but speaking in quick, agitated tones.

"We had," I began hesitatingly, but the lady interrupted me.

"Yes, I know; he was drowned the night of this day week; he told me himself," she answered in a tone of reproached emotion, and as I stared at her in open-mouthed amazement she stepped on board and entered the dingy fore-cabin. She remained there a moment or two, and when she came out I saw that she held a letter in her hand.

"His chest and the things in it you may have, sailor," she said, and I saw that her eyes were full of tears. But before I could stammer my thanks she had entered her carriage and was driven away.

The entire affair seemed so curious that when Captain Thurber came aboard I told him the whole story, and even his usually phlegmatic nature seemed to be somewhat stirred, particularly when I narrated that part of it relating to the singular appearance which Peter had described to me. "It is strange, Harry," he said after I had finished, "and I'll tell you that you are the strangest of all. This old ship, built a little more than a century ago, is the one that carried General Wolfe and his staff from Portsmouth, England, at the time when the British troops were sent over to conquer Canada. And the description Peter gave of the apparition, or whatever it was, closely resembles an old steel engraving of General Wolfe himself that hangs in my father's house in Sherburne."

I gave the story exactly as it occurred, without the slightest embellishment, nor do I offer any comment upon it. The main facts are copied from an old pocket diary, and I have written them out in detail as merely illustrative of the time-honored and well-worn quotation:

"There be more things in heaven and earth
Than thy philosophy dreams of, Horatio."

Natural History.

THE COMMANDER ISLANDS.

FROM the advance-sheets of the proceedings of the United States National Museum just issued, we learn some details of the natural history of this group of islands, situated between Alaska and Kamtschatka, and of which Bering Island is the most important. This group has a great historical, as well as zoological, interest, for it is here that the explorer Bering met his death.

Mr. Leonard Stejneger, who is known to many of our readers as an ornithologist and naturalist, has spent some time among the Commander Islands, studying the zoology of the group, and as might be supposed, when the geographical position of the region is considered, he has found this study full of interest.

Bering Island, which was the first of the group to which he devoted much time, is the last of the Aleutian chain of islands, and is only about one hundred miles from the nearest cape of Kamtschatka, and about twice that distance from Attu, the northernmost Aleutian Islands. The character of the fauna of the island is, as has been supposed, paleartic, agreeing more or less closely with that of Kamtschatka. This is due in part to the greater proximity to the coast of Asia, and also to the fact that the prevailing winds and currents are from the westward, and visitors are thus more easily carried from that direction. Stejneger concludes, from several facts of a geological and geological nature, that these islands during the period previous to which they received their present fauna, were wholly covered by the sea, and that therefore the present inhabitants are immigrants from two continents, those from the west coming more easily and regularly, while those from America are accidental visitors, for our continent contributes but very little to the fauna of these islands. The notes from which we quote are contained in a letter to Prof. Brewer P. Baird, Secretary of the Smithsonian Institute, and we make copious extracts from them, for they are to the zoologist very delightful reading.

As announced in my letter from San Francisco, the steamer Alexander started on the 5th of April at noon. The wind was very unfavorable, most of the time blowing from the west, and very often with a force of forty miles or more. Up to the 24th my observations were twice only a direction of wind from a different quarter. As we were compelled to make about one thousand miles under sail, our progress was necessarily slow, so that on the 23d of April we found ourselves only in longitude 145° west, and latitude 50° 35' north, about 500 miles southwest from Sitka, and as many miles southeast from Kodiak. On the 30th of April we passed the Aleutian chain between Seagan and Anila, in fog and mist, and Bering Sea received us with a veritable hurricane from the east-northeast. After having stopped at the village of Copper Island the anchor was dropped in the morning of the 7th of May at Gavan, the harbor of Bering Island, where I landed with as much of my baggage as could be taken on shore before the cargo had been discharged in Petropavlski. For long I was comfortably lodged and began my work.

At first I was much confined to my station on account of

the meteorological observations. Not until the obliging agent of the Alaska Commercial Company, Mr. G. Chernick, had been instructed how to take and record these observations, could I think of making longer excursions. Many thanks are due to him for his kind assistance. Thus I was unable to cross the northern part of the island, consisting chiefly of flat swamps and tundras, of lakes, a moderately high range of mountains of interesting table mountains of about the same height, while the southern, mountainous and larger, two-thirds of the island remained a complete terra incognita to me. I therefore planned an expedition with the purpose of exploring the secrets of this region, the more as it was especially there that Steller had made his observations. But I had to wait until the sailing season was over, for all hands now were occupied in this, their chief, and one may safely say, only work.

Meanwhile I resolved to go to Petropavlski on the 16th of June to establish a meteorological station, and to hire and train an observer. Besides, it was my desire to study as much of the natural history of Kamtschatka as the surroundings and the limited time would permit.

The season was unfavorable, as the vegetation was already so luxuriant as to make it difficult to move outside of the roads, and the mosquitoes were so numerous as to make it extremely painful to lay in wait for birds or to creep around searching for spiders, beetles and snails. However, if the stay was not very profitable to the collection, it was not entirely without results, for I gained a great deal of valuable experience which will be of use to me during my proposed visit to Kamtschatka next year. What rendered my sojourn there so especially profitable and instructive was the daily intercourse with the experienced and meritorious explorers of Eastern Asia, Dr. Benedict Dybowski, who, of course, better than anyone else, could give me all desirable information. On the 15th of July I found myself again on Bering Island.

The following weeks were occupied chiefly by observations on the rocky, about 15 miles distant from the village, and culminated in the departure of the expedition toward the South before the middle of August.

Every one suggested that the most practicable way would be to go around the island in a boat, as traveling overland with dogs would be difficult and expensive, and, on the other hand, several places of interest would be inaccessible by this route, which, besides, would offer little or no opportunity for carrying a necessary outfit and the objects of our collection. In all directions on the island the prospect of finding a skeleton of a sea-cow at any one of these places, seldom or never visited by the natives, was a very probable one, and as such a skeleton alone would be enough to load a boat even larger than ours, I resolved to hire six Aleuts, to man the boat of Mr. Grebnitzky, kindly placed at my disposal, Mr. Osche, in the service of the Alaska Company, who during a sojourn of several years had traversed the island in all directions on his hunting expeditions, and had thereby gained an extensive knowledge of the island and its products, joined the expedition as a volunteer; an assistance the more valuable, as without it I should hardly have been able to realize my intention.

The special object of the expedition was to study the general natural history of the southern part of the island, to collect specimens of all kinds, as far as circumstances would permit, but especially to search for remains of the sea-cow. I also proposed to survey the island for further explorations, and to collect material for a more correct and detailed map than the one in existence. Besides I wished to identify the places mentioned by Steller in his narrative, in order to compare his description with the localities as they present themselves to-day, and to restore the original names. I also desired to visit the spots where Bering's vessel was wrecked, where the ill-fated expedition wintered, and where Steller made his observations on the sea-cow.

The "circumnavigation" took place between August 21 and the 1st of September. It was attended by all the disagreeable consequences of fog and rain, of wind and surf, and the few skins which could be obtained under these circumstances were almost spoiled at our return. The personal inconvenience was not less, for the heavy fog, blowing along an open coast without harbors or anything like a shelter; of being kept wet by continuous fogs and rains; of sleeping under an old sail, are serious; but no naturalist would ever count them should the result of his work be in inverse proportion to his troubles.

Unfortunately, I cannot so report, because the animal life, contrary to my expectations, was so rich and varied, and the species that in the northern part of the island were common to individuals was considerably larger. In fact, the only addition to my list of birds observed on the island was a single species, *Rissa brevirostris* Braud, a species strangely limited in its distribution on the island.

I inspected a large colony of *Rissa kotzebui* Bp., situated on the western shore, about 18 miles from Cape Manat, the southwestern point of the island, where thousands and thousands of this black-legged kittiwake were now feeding their almost full-grown young ones. Among them a single red-legged bird, quite lonely, and apparently without any young, had placed itself on a narrow shelf of the rocky wall. It was the first and the only one that I saw, and I was fortunate enough to shoot it. *R. kotzebui* was observed in countless numbers along the western shore; but as soon as we had doubled Cape Manat we met as large, or still larger, flocks of *R. brevirostris*, among which not a single black-legged individual could be detected. I minutely surveyed a breeding colony on this side, and the result was the same, not a single black-legged one was seen. And thus the red-legged form completely excluded the other along the eastern shore, except at Cape Tonkoj, where the coast trends towards the northwest. Here on the cape a large flock of kittiwakes was sitting on the ground, so that I could see that only the legs of the other race could be seen; they were all red. I shot, however, and of the ten lying on the ground, seven were red-legged, and three belonged to the black-legged species. The young of *Rissa brevirostris* also has dark legs, but I need not expressly state that I did not make any mistake in this respect.

On the other side of the last mentioned cape the old acquaintance reappeared as exclusively as along the western shore. Thus the genus *Rissa* occupies the whole shore line of the island, of which *kotzebui*, however, has usurped nine-tenths, leaving to *brevirostris*, as an exclusive possession, but one-tenth, or about twelve miles.

We found, however, another animal, which I much regretted not to have been able to skin and to carry with me. But as it was a *Balaenoptera*, fifty to sixty feet long, I was compelled to leave it where I met it, spending a day on the spot in order to take the necessary measurements, and to make such investigations as the far-advanced decomposition of the

carcass would allow, as a matter of course. * * * But now as to the sea-cow. We found the remains of one, and I will here give an extract from my journal concerning this event.

August 27, 1882, Cape Tolstoj.—Mr. Osche went out hunting, while I was occupied in searching for fossils. From the extreme point of the cape I took some bearings of the other capes visible from here, and was just looking over my collection of stones when I was returned to me with the cheerful intelligence that he had found what he thought to be a skeleton of a sea-cow. Immediately we seized the spades and set out for the place. Having removed some spades full of soil, I soon became convinced that his supposition was right, but at the same time it was evident that the skeleton was in such a bad state of preservation that it would hardly be of any use. It was sometimes a sand bank twelve feet high, about equally distant from the base and from the top of the shore, close to a rivulet, which here had cut its bed through the bank and carried away the whole caudal portion of the skeleton. The distance from the sea was 500 feet in a straight line, and the height above high tide not less than 10 or 12 feet. The head of the skeleton pointed toward the west. It was long, horizontally to the back, slightly bent toward the left; most of the bones were in their natural position. The top of the sand bank was covered with thick sod, and both above and below the skeleton the bank consisted of moist and rather fine sand, of the same kind daily washed up on the beach and deposited in horizontal and alternating blue and brown layers, the latter color greatly predominating. The color of the other capes visible from here, and was just looking over my collection of stones when I was returned to me with the cheerful intelligence that he had found what he thought to be a skeleton of a sea-cow. Immediately we seized the spades and set out for the place. Having removed some spades full of soil, I soon became convinced that his supposition was right, but at the same time it was evident that the skeleton was in such a bad state of preservation that it would hardly be of any use. Having removed some spades full of soil, I soon became convinced that his supposition was right, but at the same time it was evident that the skeleton was in such a bad state of preservation that it would hardly be of any use. It was sometimes a sand bank twelve feet high, about equally distant from the base and from the top of the shore, close to a rivulet, which here had cut its bed through the bank and carried away the whole caudal portion of the skeleton. The distance from the sea was 500 feet in a straight line, and the height above high tide not less than 10 or 12 feet. The head of the skeleton pointed toward the west. It was long, horizontally to the back, slightly bent toward the left; most of the bones were in their natural position. The top of the sand bank was covered with thick sod, and both above and below the skeleton the bank consisted of moist and rather fine sand, of the same kind daily washed up on the beach and deposited in horizontal and alternating blue and brown layers, the latter color greatly predominating. The color of the other capes visible from here, and was just looking over my collection of stones when I was returned to me with the cheerful intelligence that he had found what he thought to be a skeleton of a sea-cow. Immediately we seized the spades and set out for the place. Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

NOTES FROM CAPE COD.

I HAVE been down here since the first of April, and have never before seen bay birds as scarce as they have been this spring. I will try to show how some of the shore birds have decreased of late years. We will begin with the golden plover, one of the bandsomest and largest of the plover family. My uncle is a close observer of birds, and has been a sportsman many years. He says, "When I was a boy and went to school, the golden plover would come and alight in the fields around the schoolhouse in large flocks, and were so tame that we could walk within a few yards of them before they would fly." That was twenty-five years ago and no person shot plover there then. Let us go there now when there is, not a flight, but the arrival of a small band. You will see a number of sportsmen lying in wait for them, and they are fortunate if they shoot a dozen each. If they decrease in the next twenty-five years, as fast as they have in the last, which they surely will, unless a law is made to prohibit shooting them for a number of years, the whole year round, they will become an extinct species only to be seen in museums and colleges.

The black-bellied plover has also rapidly diminished within the last few years. On one marsh, where they were quite abundant in the spring migrations several seasons ago, only a few dozen stopped this spring. The reason they did not stop is not because they were shot there in springs before, for only one man has quailed there at all, and he has not lately. It is simply because they have decreased with such rapidity that there is no great number to stop.

A few turnstone or chicken plover stayed with us a short time this spring, and I succeeded in obtaining several good specimens. While I was setting them up an old man, (that has lived here all his life, happened to be in the room.) He looked at the birds a few moments, and they said, "I have seen great many of them during my days." He called them rock birds and said, when a young man, he and a companion with a stick and lantern used to kill as many as they could carry home. He also said, the first bird that was heard in the spring was the killdeer plover, and they were plentiful, but for the last five years he had not heard a single one. And bobolinks, until lately, were seen in small numbers on the reeds in the brooks here. This year I have not seen or heard a one.

The yellow-leg and humiliate are getting scarcer and scarcer every year, and this spring the winter yellow-legs were very scarce.

Thirty years ago the sickle-billed curlew was quite common, but they are rarely seen here now.

The ranks of these smaller shore birds, such as the ring-neck and piping plover, peep and least peep, are growing smaller and smaller, and ten years hence will be as scarce as golden plover and curlew.

Within the last day or two a few peeps and ring-necks have made their appearance. We expect brown-backs by the twelfth.

Quail are quite plentiful here, notwithstanding one hundred were shot within an area of a few miles this last fall. Even as I write I hear them calling in the fields near by. I saw bevcys as late as the first of June. Have not seen any young quail yet, but have seen two fine bevcys of ruffed grouse.

EAST BREWSTER, MASS., July 5, 1883.

CRISTEYER.

KYNCOCH SHELLS.

Editor Forest and Stream:
I have used one hundred of the Kynoch shells in four different breech-loaders. When the advertisement first appeared in FOREST AND STREAM I thought they would be an expensive shell, so went to New York for one hundred, and the guns I have used them in are the Fox, James, semi-hammerless and Field; the last two are single guns. Out of the one hundred, using them the first time there were only two or three misfires, but after being recapped about one-half of what were used in the Fox gun failed to go. I at first laid it to the primer, but tried two kinds with the same result, but I soon saw what the trouble was. The head of the shell was so soft that when the plunger struck the cap the cap would not resist the blow but would drive away so far as to be out of reach of the plunger and that, being the large-headed kind, could not follow it up, hence the misfire. In the James they seldom missed, as the plunger was different, but I can not use them in it as the chambers are not perfect, and they can't be used in a gun imperfectly chambered. In the Field they failed to go after being recapped, as this gun also has a large-headed plunger. In the semi-hammerless they work to a charm. This gun has a long firing-pin that follows up the cap, and they very rarely miss, and being made by the same makers as the Fox is perfectly chambered, so the shells do not expand. Unlike "Medicins II," I have not had one burst. I have fired some of them half a dozen times.

In regard to loading, I do not like the mode they give of scooping the shells, as it is apt to cause annoyance when one is in a hurry to get them into the gun. I made a stick with a small groove similar to the one advertised, but discarded it. My mode is to recap them with a Remington recapper, and if the head of the shell is pressed in to put it on a bench or table and drive it out again. Then I use the Parker loader with No. 10 wads in 12-gauge shells. This seems to hold the shot in nicely, but unless one uses this kind of loader the shot will expand and the shells will not be so tight for use. They can be used in almost any shape, but when fired they are as perfect as ever. I think the makers will miss it if they do not make the head of these shells a little more solid. It looks rather bad to have a man go to a glass ball match and have about one-half of his shells misfire. C. B.

NEW HAMPTON, N. Y.

Editor Forest and Stream:

I have read with much interest the several communications in regard to the Kynoch shells.

I procured two hundred of them; have used all once, and some second and third time. I load with number of wad hat corresponds with that of shell. Make three dents just over and above wad with the loader. They work well and

stood the severe test of duck and snipe shooting to my entire satisfaction. I had none to split or crack the gun, and no misfires. The complaint of misfires, I think, comes from defective locks or faulty firing pins. They are open, however, to the same objection as the heavy brass shells, namely, one must save them. When they can be made cheap enough to throw away, they will, indeed, be "perfect."

I am now trying the star brass wads. I have used sixty shells loaded with them at target and glass balls. They do not make any change in pattern or penetration, and do not scratch the bore, and they are the same as those with a shell in the other barrel, to test their holding properties. No very great loosening was noticed until the fifth shot, when the wad came entirely loose.

Whether they will stand the rough usage of field work or not, remains to be tested. From above experience I very much doubt their doing so. I of course used the brass wads in paper shells.

We will have plenty of quails this season. Their merry whistle can be heard in every stubble.

Bass fishing has proven an entire failure this season, the first time for many years.

BRAZIL, Ind., June, 1883.

Editor Forest and Stream:

In your issue of June 28, "H. V. L." Hoboken, N. J., advances the idea that the difficulty I experienced with the Kynoch shells was due to imperfect chambers. I think not, for this reason: I have used Winchester's shot shells for over two years, firing from some of them probably over fifty shots, and to-day I can extract them from the gun with my fingers, without any effort whatever, and I believe that if there were imperfections in the chambers such as he mentions, the brass shells I have used would have expanded so as to be greatly injured. I have seen others experience great difficulty in extracting their brass shells from their guns after long usage, but happily I have not been troubled in this manner, and I come to the conclusion that my gun must be slightly smaller at the innermost end of the chambers. I am not one to condemn, especially implements pertaining to the gun, unless facts warrant it, and I was as pleased as a boy with a new top when I read of the merits claimed for the Kynoch shells, but upon giving them a trial I was greatly disappointed. I neglected, in my previous communication, to mention the gun and charge used, and will do so now: The gun is a Calabrigo, 10-gauge, double breech-loader, with all the modern improvements. I used 4 drs. Hazard ducking powder (Dixou gauge), with two pink-edge No. 8 wads on top, 12 oz. No. 5 shot and one pink-edge wad, just such charges as I always use for ducks. The sample shells I use were slightly defaced when received by me, but not apparently as much as crimping would render them. I have ordered a new sample, and hope to be able to make a more favorable report. I should say that the breaking of these shells as reported by "Medicins II," in your issue of June 28, was due to the shells being too small for the chambers, and the butt being of heavier metal than the rest of the shells, it would not expand as readily and caused them to break apart. I consider this a subject of vast importance to sportsmen, and am pleased to see the reports coming in, and I hope, if the difficulty we experience in them is due to improper loading or a faulty gun, we want to know it, and if in the "Kynoch Perfect," ditto, D.

MANTOWOC, Wis.

Editor Forest and Stream:

I notice in your issue of June 31, a short article from "D" on his experience with the "Kynoch perfect" brass shells. I have been experimenting to a limited extent with these shells also. While the results were not as satisfactory as I could wish, yet they are not as bad as those of "D." My experiments were with a W. & C. Scott & Son No. 12 gun, weight 8 pounds, choke bore. Shells loaded with 3 3/4 and 4 drams Hazard No. 4 powder, 14oz. shot, 8 of each charge being fired. In two instances with 3 drams powder the shells cracked, one at the base and one about middle of shell. With the 3 3/4 and 4 dram charges the shells stood fine. I had no trouble in extracting empty shells after each discharge, and the pattern and penetration was probably some better than with paper shells under the same circumstances.

Another party has also been experimenting with about the same results as myself, having fired twenty charges of 3 drams Hazard No. 4 powder and 14oz. shot, with one burst shell at base. He uses a Jaicus gun, 12-gauge, and 8 pounds weight, and experienced considerable difficulty in extracting on account of expansion. The shells fit my gun nicely, and I think I could detect the least expansion.

While very serious drawback in crimping or cutting shot, when the shells work perfect, and loaded shells are easily extracted, but when reloaded the crimpers binds so it is in many cases impossible to extract the shells without removing the wooden head and driving them out with a stick; this I attribute to the shells not being put in crimpers in same position as first crimped and not to expansion of the shell. I hope to hear from others on this subject, who have had a more varied experience and can present the matter to the advantage. J. L. P.

KANSAS CITY, Iowa.

Editor Forest and Stream:

As soon as the Kynoch shell was for sale, I procured several, and have tested them thoroughly, and in my gun they are certainly a failure. I have forwarded to your address, a Kynoch shell that I have fired several times and also two patterns, one made with the Kynoch shell, the other with a Winchester brass shell. You cannot fail to notice the great difference between the two. The one made with the Winchester recording 224 No. 8 shot in a 30 inch circle at 40 yds., while the one made with the Kynoch only records 214 (the shot circle did not continue so far), and the Winchester I send you is the best I can make with a Kynoch shell. On the other hand, with a Winchester or Parker brass shell or a Winchester, U. M. Co., Lowell, or Eley paper shell, I can average about 320 No. 8 shot, in a 30-inch circle at 40 yds. Why the difference?

I have loaded in every conceivable manner, and the best result you have before you.

With Winchester brass shell, at 40 yds., I use 3 drs. of powder, 2 Eley pink wads, 14 oz. shot, and one Eley or cardboard wad over shot, without crimping. My gun is a 12-gauge, 28-inch barrel, Colt, and with brass shells I use No. 10 wads, with paper shells No. 12. My Winchester and Parker brass shells are the same length as the Kynoch. As the Kynoch is so much thinner than the Winchester, I tried a larger wad, and varied the quantity of powder and shot, but the result was no better, always a poor pattern,

The penetration was about the same as the other shells. The shell that I send you seems to be perfect yet, with no splitting, etc., that others have complained of. Now, where lies the trouble? It must be with the Kynoch shell, somewhere. I think that I have given them a fair, honest, trial, and the result is certainly not very satisfactory. A. T. S. [If there is an abrupt shoulder in the gun used by A. T. S. it may be that the shot driven out of the thin Kynoch shell against it are jammed out of shape and so fly wild.]

Editor Forest and Stream:

I have noticed several articles in late numbers of FOREST AND STREAM in regard to "Kynoch Perfect Shell." I had a sample package sent me, and my experiments have been conducted with only two shells, 12-gauge. I fired several shots from these shells, and in every case, pattern and penetration were both better than those made with paper shells. Charge used was 3/4 drs. powder and 1oz. shot. The gun was a heavy 12-gauge, full choke in both barrels. I could find no difference in shells after a number of shots had been fired, and considered the tests satisfactory. Although closed with the fingers, the charge was held tight in shell in left barrel when right barrel was fired. I shall use these shells this fall, and think them superior to paper shells. FAIRFIELD.

WALLACEVILLE, S. C.

DECEPTIVE ADVERTISEMENTS.—It is very amusing to read some of the advertisements for seaside resorts which are intended to draw the sportsman. The following is a sample: "Back of the island and along the sandy channels which cut off Atlantic City from the mainland are illimitable reedy meadows, fed with the salt sea, and a bonie for numberless snipe, plover and reed birds. About the middle of this month the snipe-shooting season will begin, and the half dozen varieties of the noble game will pipe sweet music to the sportsman's ears." Now the reed bird is never found near salt water, and the reed upon which he feeds is a fresh water plant. "The several varieties of noble game" are found on the Atlantic City meadows in numbers only during the spring migration. All that will be found at Atlantic City by the middle of July will be peeps or ox-eyes. The note of a clapper rail or mud-hen will be heard often enough, but the bird will not be seen until September storm tides drive him to show himself, and then he will be potted in the water. Better it is for the sportsman to read up his weekly FOREST AND STREAM, select his grounds from the notes cut therefrom, than to be influenced by flaming advertisements written by those who are out of the cloth.—HONO. [Our correspondent is in error when he states that the reed bird is never found near salt water. We have frequently seen and killed them among the beach-plant bushes between the salt meadows and the beach.]

A FELINE RETRIEVER.—Cooper's Point, July 3, 1883.—I have a cat, I call him Jerry, a name perpetuated from the great grandire, the original boathouse pet. Every fall he takes his six weeks' trip with me to the Delaware Bay on a duck shoot, and no one enjoys oysters, fish, and birds more than he. He is my constant companion, whether tramping the marsh, or lying behind the blinds. He is the best swimmer I ever saw, man or beast; answers to a dog call, and retrieves my birds when crippled on the marsh, and on one occasion brought a dead hawk duck to land from outside of the decoys on the bay shore in quite a tumble of a sea. I could write pages and yet not do Jerry justice. A brute of an hostler at the hotel near the Delaware Bay, and was pelting it with stones while it was struggling for life. Jerry was taking his usual afternoon siesta in the boathouse, and heard the cry of distress. In a moment he was in the water, and despite the stones thrown by the heat-bish hostler and feudish boys, he caught the drowning kittie by the nape of the neck, and brought it triumphantly to shore, depositing it in his own cosy cot. I promise you this kittie while the world will be recognized by a good many who read this. How the brute often puts man to shame.—R. G. W.

WOODCOCK IN PENNSYLVANIA.—Philadelphia, July 6.—There has been so much rain during the last week, our woodcock shooters have found the birds very much scattered and it is necessary to start them in a possible bag. During the two first opening days of the season, no good shooting has been had, however, in the neighborhood of Burlington and Bordetown, N. J. All the woodcock killed in the cripples near these places were birds bred there. I learned that two gentlemen who worked these cripples last week brought in twenty. The weather now is sweltering hot and but few will venture into the river side fields while it continues so. Two pairs of woodcock were killed on the morning of the 5th of July, on Darby Creek near Potts; my informant stated to me he knew of the old birds settling there early in the spring to breed, and he expected to find at least six, but bagged all he saw.—HONO.

STAR WADS.—Editor Forest and Stream:—Herewith I give you my experience with the star wad, as requested in your issue of the 21st ult. Loaded tin shells, put star wad over pastebore wad on top of shot, and after firing nine out of the right barrel, I found that the shot in left barrel did not start. With the star wad necessary to start the shot the shell or to crimp it, thereby much time and labor is saved; now add the advantage gained by filling the chamber of the gun up to the shoulder, thereby giving a better pattern, also the saving of the shell, and I think we have something that fills a need long felt. Trusting that we will hear from others in regard to the star wad in your next issue.—ROBT. W. HOPKINS (Secretary Anquehonsu Guu Club, Steata Island).

WOODCOCK IN WOODLAND CEMETERY.—Philadelphia.—On the evening of July 6, two woodcock were seen to fly across Woodland avenue, West Philadelphia, then over the road into the cemetery. At the lower end of these grounds, near to the Blockly Almshouse enclosure, there is an excellent feeding place which remains wet the summer through; the birds doubtless were attracted thither. Years ago we knew of two woodcock breeding there, but of course more secure retreats have been chosen by the birds.—HONO.

TENNESSEE.—Nashville, July 6.—Squirrels are reported abundant, and a number are offered for every morning at the market houses, though the weather has been too hot and wet for the town Nimrods to go abroad after the sport. Commodore Wallman and Bob Grubbs killed a few doves and a brace of summer ducks the other day, but both are as yet out of season.—J. D. II.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

THE SECRETS OF ANGLING.*

THIS quaint and charming old poem has been faithfully and literally translated from the original edition, and we therefore have it as it was written, instead of the modernized edition of After, which has long been the only accessible one. The latter took great liberties with the original, both in punctuation, orthography, and syntax, and consequently robbed the book of its principal charms. The original edition had on its title page the following: "Secrets of Angling. Teaching the Choicest Tooles Baytes and Seasons, for the taking of any Fish, in Pond or River; practised and familiarly opened in three Bookes. By J. D. Esquire. Printed at London for Roger Jackson, and are to be sold at his shop neere Conduit, 1613." This appears on the title before the reprint.

The first Booke containeth these 3, Heads. The Antiquity of Angling, with the art of Fishing, and of Fish in general. The lawfulness, pleasure and profit thereof, with all Objections answered, against it. To know the season, and times to promise the Tooles, and how to choose the best, and the manner how to make them fit to take each severall Fish.

The second Booke, Containeth The Anglers Experience, how to use his Tooles and Baytes, to make profit by his game. What Fish is not taken with the Angle, and what is; and which is best for health. In what waters and Rivers to finde each Fish.

The third Booke containeth, The 12 virtues and qualities which ought to be in every Angler. What weather, seasons, and times of the yeere is best and worst; and what hours of the day is best for sport. To know each Fishes hunt and the times to take them.

Also, an obscure secret of an approved Bait, tending thereto.

We have read this volume with great pleasure, and commend it to all lovers of angling. It is so full of gems that it is difficult to select a few for illustration. In the "First Booke" we read:

You *Anglers* that in the Springs and Waters sweet,
Your dwelling have, of Fery Hill and Dale,
And oft amidst the Meadowes greene doe meet
To sport and play, and hear the *Nightingale*.
And in the Ethers first doe wash your feet,
While *Prognosters* tell her wofull tale:
Such ayde and power unto my verses lend,
As may suffice this little work to end.

Even two hundred and seventy years ago it was known that an angler should be properly dressed for his work, for we are told:

And let thy garments tusslet be or gray,
Of colour dark, and hardest to desrey.
That with the Raine or weather will away,
And least offend the fearful fishes eye.
For neither Skarlet nor rich cloth of ray
Nor colours dyt in fresh *Asyrian* dye,
Nor tender silkes, of Purple, Paule, or Golde,
Will serve so well to keepe off wet or cold.

The obscure secret of an approved bait we will give, not only to refresh the memories of the older anglers, who may have forgotten it, but also to inform a generation who may not have seen it, of the most perfect thing ever discovered to attract fish to the hook. The ingredients may be difficult to obtain in some places, but the author assures his readers that if they understand it it is perfect.

Wouldst thou catch Fish?
Then Herbet's wish:
Take this receipt,
To annoynt thy Bayte.

Thou that desire'st to fish with Line and Hooke,
Be it in pond, in River, or in Brooke,
To blisse thy bait, and make the Fish to bite;
Loe, here's a menues, if thou canst hit it right,
Take Gum of life, fine beat, and laid in soake.
In Oyle, well drawn from that which kills the Oake.
Fish where thou wilt, thou shalt have sport thy fill.
When twenty faine, thou shalt be sure to kill.

Probation.
It's perfect and good,
If well understood,
Else not to be told,
For Sinner or Golde. —B. R.

The work is neatly printed and gives us the first opportunity to read the author as he wrote, and Mr. Westbrook deserves thanks for preserving this book from extinction, or, what is as bad, the devastating hand of the "improver."

MOSSBUNKERS OR MENHADEN.

FISHERMEN in the north are complaining about the wholesale destruction of mossbunkers, as bluefish and other fish are driven from the coast as a consequence of a lack of food. With us the opposite is the case, for in the lower St. Johns fishing is seriously injured as a result of too many bunkers. Food is so plenty that the fish will not take a hook. On the food tide bunkers enter the stream in immense quantities; in fact it is a continuous stream of mossbunkers for about four hours of the food and five hours of the ebb tide. The supply is continuous from June until the latter part of November.

Land, labor and firewood are cheap, and as the fish can be captured in immense quantities, it might prove advantageous for your bunker fishermen to investigate the subject. Steamers would be unnecessary, as there is an almost unlimited demand for fertilizers in the State and vice is cheap.

An excellent market would be found in Jacksonville, Fla., and in Savannah, Macon, Augusta and Atlanta, Ga., for the

edible fish caught. In this market the wholesale price paid by dealers for sea trout, small sheephead and whiting, is fifteen cents per string. If the bunker men wished to indulge in the capture of larger and oily fish they could net along the tarpon and porpoise waters. Near Milk Point is a small bay with sandy bottom where porpoise do most congregate during the copulating season, and if a net could be constructed to hold them tons could be captured at a hunt. Will some bunker man visit the lower river and investigate the resources of the St. Johns regarding the manufacture of oil and fish gmano? A. P. FRISCO.

JACKSONVILLE, Fla., June 7.

FISHING NEAR NEW YORK.

THE fishing season near the city has been an average one thus far, both in fresh and salt waters. The height of the season is from June to July in fresh waters, and from July until cold weather in the salt waters near New York. There is not a place in the country from which such a variety of fishing, and such excellent sport also, can be had as New York city. There are many places where more fish of any one or two species can be taken, and where larger fish may be captured, but take it all in all New York city is the best center for variety angling.

In the fresh-water fishes there are the trout streams of Long Island, the Catskills, New Jersey, Connecticut and Rhode Island, all within a few hours' reach, while the salt-water rounds are only from fifteen to thirty hours distant. The black bass fishing is not of the best, the fish being absent from such waters as have not been stocked with them, for it is not a native of this region. Still the New Jersey lakes and the Delaware River and its branches afford some sport. Pike are not found near the city, but small pickereel are plentiful in the waters most esteemed by anglers.

The salt waters outside the harbor and up and down the coast swarm with gamy bluefish, often reaching ten pounds in weight, while the noble striped bass is taken about Staten Island up to three or four pounds, and from Montauk Point to Newport of the largest size. Weakfish, kingfish and other species are more or less plentiful, and are sought by anglers of all degrees of skill and with all grades of tackle. From the best to the poorest, the fish are taken in the bay in small boats and with shadler crab and clam "twigs," at every indication of a bite, and haul their prey in hand over board, and often come back with large strings. The "Fishing Banks," just outside Sandy Hook, are visited by steamers which advertise for passengers, promising from four to six hours fishing, "bait and lines provided," and carrying a motley crowd loaded with lunch-baskets, returning with the party well submerged and usually seasick, with more or less porpoise, toadfish, sculpin, and an occasional weakfish or other game. The Long Island Railroad takes the angler to Great South Bay, where the fishing is often excellent, and now promises to be better since war on the illegal netters has been declared.

In the brackish waters of New York and Newark bays and the Kills, small bass, weakfish, perch, blackfish, flounders, sea bass and eels are taken both from boats and off the bridges. This kind of fishing is not as good as formerly, on account of the pollution of the waters by the refuse products of petroleum which are dumped into them, and which have banished the lobsters and disgusted the crabs. But all which enticed to live cleanly have left for rivers, swamps and a motley crowd loaded with lunch-baskets, fishing, especially behind the light-house at Bergen Point, and off the long bridge from the Point to Elizabethport. Near the junction of the Passaic and Hackensack rivers small striped bass are taken, and up these rivers are found catfish and eels in abundance for such as care to take them. Further up the Passaic some black bass are found, after the fashion of the best grounds lying between Two Bridges and Little Falls.

With this variety all who love to fish, whether the scientific angler or humble brother of the hand-line and worm, can surely find sport suited to their tastes and their purses, and fish of all sizes, from the ponderous drum to the little sunfish, and from the royal striped bass to the slimy eel and the growling catfish. If we have omitted the Hudson River, not only the good fishing places, it is better known, no fishing worth the name in it near the city. The Hudson seems to be the poorest angling river in the United States. It still produces shad, eels and a few insignificant fishes, but nothing that the angler cares for—at least in any quantity. Even the sturgeon, which were once so plenty, have nearly disappeared.

COOS, NEW HAMPSHIRE.—A recent communication of mine in the FOREST AND STREAM regarding the fishing in this vicinity having brought me a "heap" of letters replete with inquiries, I take the same medium, with your consent, to reply. Coos, N. H., is the address of the village of North Stratford, N. H., the most northerly railroad station in the State, on the Grand Trunk Railroad, where it crosses the Connecticut River into Vermont. It has two regular Boston mails, and two regular Montreal ails, daily. There is a first-class hotel called the Percy House near the depot, with which is connected a livery, and the roads in all directions are unsurpassed. The trout waters in the immediate vicinity are Nulhegan River and its branches, Paul Smith's brook, the good fishing brook, Bear Brook, King's hall Brook, West Pond, Turtle Pond, Natch Pond, unknown Pond, South America Pond, North Pond and a score of other resorts, with pickereel and perch fishing in as many more places. I nearly forgot to mention Maidstone Lake, eight miles distant, with a first-class road, where the fishing this summer has been unsurpassed. Very recently three men, after about two hours fishing, caught about 300 fish, averaging over eighteen pounds. The absence of small fish is remarked, and had they been present in the usual number, the catch would have been up to or above the usual run.

PENOBSCOT SALMON.—The run of salmon in the Penobscot River has been a small one this year. Comparatively few have been caught, but the individuals have been of good size, averaging over eighteen pounds. The absence of small fish is remarked, and had they been present in the usual number, the catch would have been up to or above the usual run.

QUEBEC, CANADA, July 5.—Through the enforcement of the Quebec laws the fishery at St. Amand, near Brookville, respectively from this city, which had been almost completely "fished out," are now teeming with trout, and the latter lake well stocked with bass.—H. H. Y.

ANTELOPE IN TEXAS.—Martin County, June 25.—Antelope are quite plenty in this section. I saw about sixty or seventy head this morning while traveling eight miles. They were within two miles of the railroad. Good sport can be had here in the winter season. Last winter while hunting here I often saw as many as 300 to 700 in a bunch. During a "norther" they will drift down on the plains as far as the railroad, and I have seen their trails along the side of the road as plain as if three or four thousand sheep had been driven along. Being afraid of the track they would not cross it, and seldom do so except when they see other antelope on the opposite side, or when the leader takes a notion to cross, then the rest of the bunch will follow.—W. A. W.

THE "EJECTOR HAMMERLESS."—Among the notable improvements in the manufacture of fine guns is the ejecting mechanism recently added by Mr. W. W. Greener to his hammerless guns. By an ingenious device, which is exceedingly simple and we should judge durable, the fired shells are ejected when the gun is opened; or if but one shell has been fired that is ejected, and the other simply extracted. We have recently tested the working of the ejector and found it to be as excellent in practice as in theory. In some of our English exchanges we find reports from those who have used the ejector hammerless, and the experiences there detailed appear to bear out in the fullest degree the advantages made by the manufacturer in regard to the gun's durability.

DUTCHESS COUNTY ASSOCIATION.—Poughkeepsie, N. Y., July 9.—We organized on Saturday an association to be called the Dutchess County Association for the Protection of Game and Fish. The following officers were chosen: W. S. Johnson, President; James H. Dudley, Vice-President; Peter B. Hoyt, Secretary; James Lenox Banks, Corresponding Secretary; Edward L. Morse, Treasurer; P. E. Ackert, Counsel.

Camp Fire Flickerings.

"That reminds me."

FOR two or more very long hours had we sat in a boat on the unruddered bosom of Maidstone Lake, our bats within a yard of the bottom, seven feet below us, "bobbing" for a bite. Three expectant fishermen, whose beaming countenances, radiant with hope, might craze with mirth the most stolid "byp" that ever darkened a community—Prof. S. of Bangor, Capt. B. of Lancaster, and yours truly. Suddenly Prof. S. jumps to his feet: "I've got a bite."

"Yank, then," from both his companions. He did yank. Two more hours of weary "bobbing," during which the beaming countenances changed to a somber hue, then a blue, then a bronisec color, without lilt, but expressive. "I've got sick of this 'let's go home.' Enough." We slowly wound in on our lines. As the Prof.'s hook came from the water a quarter pound trout was seen impaled upon it, hooked through the brain, dead. Again his varying phiz changed to an expression of astonishment indescribable, and he made his companions scream with laughter as he slowly ascended. "What made my bait grow like that?" We assured him it was a peculiar property of the water, and that was enough. Coos.

In FOREST AND STREAM of May 24, the writer of "Notes on the Birds of Alabama," states that the local name of the ivory-billed woodpecker is "woodcock."

It is a fact, also, that to many dwellers in our land of cane-brakes and cotton fields, the true woodcock, *Phibohela minor*, although at certain seasons quite numerous, is almost a *Phibohela incognita*. The only bird that they recognize by the name "woodcock" is the aforesaid Ivory-bill. Thereby hangs a tale.

One day, in a country cross road, the writer was relating a story of what time he had hunted woodcock under the shadow of Muskonekong and along the swales of Waynes yanda, where the foot prints of poor Herbert (Frank Forester) had scarcely been obliterated by the changing seasons, when John B. remarked that the woodcock was certainly the best of birds when properly served. His words attracted the attention of an individual who stood near us, an overseer on a neighboring plantation, whom we will call H. This person, believing that C. had reference to the aforesaid ivory-bill, volunteered the remark that he "didn't know them durned things were fit to eat."

"O yes," said B., who saw an opening for a practical joke, in which he was never averse to indulge. "O yes, the finest bird that flies when properly cooked. You just kill some and try them. He and you'd agree with me, I'm certain." Nothing more was said on the subject at that time.

About a week afterward we three happened to meet at the same place again, when B. asked H. if he had tried any woodcock.

"D—n your woodcock!" said H. "I killed a whole dozen and had 'em cooked, and I had as live-ent so much fried alligator."

"What?" said B. "I don't expect you cooked 'em rightly."

"I cooked 'em like everybody cooks birds," said H. "There you made a great mistake," said B. "But tell us exactly how you did cook 'em."

"Why," said H., "I just picked 'em, and dressed 'em, and I think the old darkey said she parboiled 'em, but it didn't do 'em a bit of good. They ate like they were a hundred years old."

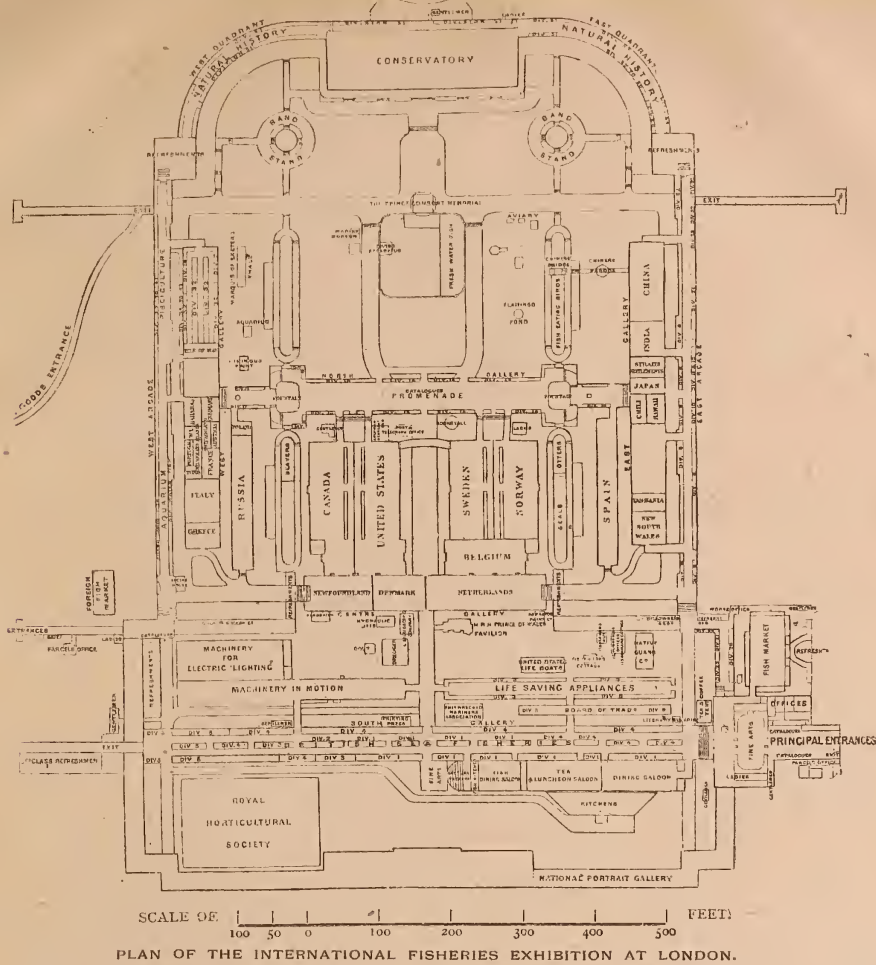

"I thought," said B., "you must have made some mistake in cooking 'em."

"Well, how the devil do you cook 'em?" said H.

"Well," said B., "in the first place you ought not to have picked 'em, and in the second place you ought not to have dressed 'em. As you've got to do when you cook woodcock is to tie a string around their necks and hang them up before a pretty hot fire—not too hot, though, nor so near as to scorch the feathers. Some people," he continued, "like 'em basted with salt and pepper; but they are good enough for me just dry so."

"The devil you say?" muttered H., as he turned away, and he'll have mine cooked that way next time, and—have you not got 'em?"

But according to the ivory-bill in H.'s *culina* was ever served up according to B.'s recipe, I do not know, as H. never seemed disposed to talk woodcock afterward. TUCKAHOE.

PLAN OF THE INTERNATIONAL FISHERIES EXHIBITION AT LONDON.

BASS AT ST. CLAIR FLATS.—Buffalo, N. Y. June 30.—One two months ago I saw an article in FOREST AND STREAM from "Deep Troller" speaking of black bass fishing at St. Clair Flats. He has evidently "been there" and thoroughly enjoyed the sport, but even then does not extol it highly enough. Last season I saw a black bass (not a "large-mouth" bass) that was caught there, and he weighed 7 1/2 lbs. This is a fact that can be easily demonstrated. The fishing there now is good, but not as good as it will be in July and August. One afternoon last week, I caught thirty-nine black bass, averaging three pounds each, on light tackle. Pickeral are also biting well on a troll, and from this time out any one that enjoys perch fishing can have his fill. They are almost too plenty; can be caught two at a time, and will average over one-half pound. They abound where there is little or no current, and very light tackle can be used. The fishing grounds are about thirty miles above Detroit, and two steamers run from there daily. Joe Bedore keeps a first-rate house for hunters or fishermen to stop at, has good boats, and can furnish first-rate boatmen if desired. Among the best of these are George W. Cole, (in fact the best I have ever met) who, as a hunter or an oarsman, cannot be excelled, and has lived all his life on the Flats. James Slocum, at Star Island, also has quite a large hotel. The steamers from Detroit stop at his and Bedore's docks. Any one going to the Flats should not fail to visit the Bassett Channel. There I have had the best black bass fishing I have ever known, and it is very easy of access from Bedore's house. I shall go again in July or August, and would be very glad to meet any of my brother fishermen there and then. There is "room for all," and more than enough fish to go round. P. S.—Joe Bedore has a big ice-house well filled.—LIGHT TACKLE.

SALMON IN THE RESTIGOUCHE.—The fishing in the Restigouche River is better this season than for the past three years. Many salmon have been taken, and the sizes run large. We were lately shown a letter from Mr. William Blair Lord to Harry Pritchard, dated Fraser's Hotel, Matapedia, Province of Quebec, July 4, in which he says: "I send you by express a salmon I killed to-day. I would have sent you one sooner, but I have relatives and others who have prior claims on me. Besides, for two weeks, while the logs were running thickest, I caught just enough to send to my brother and sister. I have had very good sport below the club grounds. My largest fish was 36 lbs., and my whole catch averaged over 30 lbs. I have caught 4, 3, 3, 2, 2, on different days. The four weighed 99 lbs., good for one day. I hope the fish will reach you in good order, and that you will enjoy eating it."

WEAKFISH AT BARNEGAT.—L. M. Auerbacher, of this city, with three friends, caught over 500 weakfish on Barnegat Bay, one day last week. Largest fish 3 lbs., average about 1 1/2 lbs. The small fish were returned to the waters as fast as taken. Party started from Parker's Hotel, Forked River.

PHILADELPHIA NOTES.—The Schuylkill River still continues muddy; the water is gradually clearing, however, but the heavy rains have rendered it more than usually turbid in the last ten days. Its tributaries are much clearer, and at this writing are in prime fishing order for bass. Bass fishing about Shawmont has been poor since the heavy rain-fall. The catch since the opening day, June 1, this year, taking it as a whole, will exceed that of any season for three or four years. We may expect a falling off during the hot weather. Weakfish, seabass, blackfish, etc., continue to bite well all along the New Jersey coast. Many sheephead are taken, the fish measuring large. From Fish Warden Ore's report to the Fish Commissioners of New Jersey, of the value of the fish caught in the Delaware, in Camden county, I take the following, which is very interesting: "The shad catch be values at \$20,700; herring, \$725; sturgeon, \$500; and catfish, perch, black bass, etc., \$240, making a total of \$23,455. In trout run near Clemington, N. J., a trout was caught weighing one and a half pounds. The report asks that all herring nets and small meshes should strictly be prohibited after June 10, as thousands of small shad are destroyed by them. The retail price of shad on an average was thirty cents; herring seventy-five cents a hundred, and other fish averaged eight cents a pound, except sturgeon, which brought one dollar each."—HOMO.

NEW BRUNSWICK SALMON RIVERS.—Frederick, June 20.—The sale of fishing leases on the migranted water grants, on the following rivers took place to-day, at the Crown Land office, at noon: Restigouche River, from Toad Brook to Almon grant, at Indian Brook, upset price, A. L. Light, Toronto, Ont., \$825; from Almon grant, at Indian Brook, to Tracey Brook, upset price, A. A. Mason, New York, \$500; from Tracey Brook to mouth of Kedgwick, upset price, H. R. Ranney, St. John, \$600. The river Kedgwick from its mouth up to Quebec boundary, upset price, H. N. Habersham, Savannah, Georgia, \$510. Nepisquit River, from its mouth to Indian Reservoir, upset price, J. W. Nicholson, St. John, \$360. Upsalquitch River, from the mouth to Great Falls, no bid; from the Great Falls upward, upset price, H. N. Habersham, Savannah, Georgia, \$210. Main North West Miramichi, from the head of the tide up, no bid. Patopedis, from its mouth up to Quebec boundary, no bid. Jacquet River, upset price, H. R. Ranney, St. John, \$130. Total \$3,435.

SALMON IN THE MERRIMAC.—Manchester, N. H., July 2.—Some small boys were observed pounding with clubs a large fish in a small pool on the Amoskeag Falls this morning. On being asked what they had, replied they did not know, but guessed that they had killed a young whale. Investigation proved it to be a salmon of twenty-one pounds weight.—H.

GRAVENHURST, Canada, July 5.—Owing to the beastly quantity of rain up here the fishing is rather poor, but just as soon as the weather settles we expect to have grand times.—C.

A BOOK BY THE LATE LORENZO PROUTY.—A memorial of the late Lorenzo Prouty will be published in a week by Cupples, Upham & Co., Boston. It is a book on "Fish their Habits, Haunts and the best methods of taking them," together with descriptions of trips made by Mr. Prouty in the woods of Maine and Nova Scotia. The work was in part written by Mr. Prouty himself, and in part compiled from his journal by his widow.

BLACK BASS.—A very interesting paper on the distribution of the black bass, by Dr. James A. Henshall, read before the American Fishcultural Association, will be found in another column. By the way, we presume most of our readers have seen Dr. Henshall's excellent paper on black bass fishing in the July Century, to which we called attention some time ago.

Fishculture.

THE AMERICAN FISHCULTURAL ASSOCIATION.
[PROCEEDINGS CONTINUED]
ON THE DISTRIBUTION OF THE BLACK BASS.
BY DR. J. A. HENSHALL.

IN this brief paper the writer intends merely to give the facts as they exist, relative to the distribution of the black bass species, without attempting to draw any conclusions therefrom from the laws which govern the geographical distribution of fresh-water fishes, or to offer any theory concerning the same. A study of the habitat of the black bass, however, will, no doubt, aid the biologist very materially in solving the problem of the distribution of animals.

The geographical distribution of the black bass is remarkable for its extent; the original habitat of one or other of the two species ranging from Virginia to Florida, and from Canada and the Red River on the north to Louisiana and East Mexico. In other words, it might be stated that the original geographical range of this representative American fish embraced the whole of North America, south of the British possessions and east of the Rocky Mountains, except the waters flowing into the Atlantic in New England and the Middle States, thus far exceeding any other fish of America in its distribution. Of the two species, the large-mouthed bass had the widest distribution occurring all through the vast scope of territory mentioned above. The small-mouthed bass had a somewhat limited range in comparison, not extending east or south beyond the Alleghany Mountains, though occurring everywhere else with the large-mouthed species.

At the present day the habitat of the black bass has been extended by transportation, and by means of artificial canals, so that it may be said to inhabit every State of the Union. It has also been successfully introduced into England, Scotland and Germany, thus occupying a wider range than any fresh-water fish in the world.

The fact that the original habitat of the black bass does not embrace New England and the Pacific slope is not remarkable, for the characteristically American forms of fishes, as has been observed by Prof. Jordan, are, generally speaking, rare or absent in the waters of those sections. This fact was

noticed by Prof. Louis Agassiz, who called New England "a zoological island," on account of its faunal peculiarities as compared with those of the rest of the continent. Thus, about a hundred genera of fresh-water fishes now known to occur in the waters east of the Mississippi River, only about one-fourth occur in New England, and of these all except a half-dozen genera are represented by but a single species. I do not mean that the same species occur in the waters of the Pacific slope. Almost any stream of any extent of the Ohio or Mississippi basins will furnish double the number of genera and species as the entire waters of either of the named sections. The same is true of the fishes. "In the little White River at Indianapolis, seventy species, representing forty-eight genera, are known to occur—twice as many as inhabit all the rivers of New England."

The distribution of fishes does not seem to be much affected by geological formations, climatic influences, or the character of waters; for although one or both species may have been absent originally in certain localities, they readily adapt themselves to the waters of these sections when transported, and rapidly increase.

Originally both species were at home among the primordial rock of the zoic period of Lake Champlain, Northern Wisconsin, and along the Appalachian chain in the Carolinas and Northern Georgia. They flourished amid the paleozoic rocks of the Great Lakes region and the Mississippi Valley, and in the coal measures of the Ohio, Illinois and Missouri river basins. While in the marine tertiary formations of the same period, they were abundant on the slopes of the Southern States, the large-mouthed bass alone occurs. Thus, while the small-mouthed bass seems to be restricted naturally to the older formations, the large-mouthed bass roams at his sweet will over the entire range of metamorphic and stratified rocks and glacial drift, down to the recently formed coral reefs of the peninsula of Florida.

Climatic influences do not seem to affect the distribution of the large-mouthed bass in any degree, in the United States. One of the small-mouthed bass is found in a small extent. The original habitat of the species extended through twenty-five degrees of latitude and thirty degrees of longitude, the small-mouthed bass alone not occurring in the extreme test degrees of Northern latitude. The large-mouthed bass extends to the longitude of this range. Thus, while the small-mouthed bass is naturally restricted to cold and temperate waters, the large-mouthed bass bids defiance alike to the ice-bound streams of Canada and the sunny streams of Florida. He flashes his bright armor under the firs and birches of the St. Lawrence basin, and erects his spiny crest in the grateful shade of the palms and live oaks of the southern peninsula. To him it is given

"To bathe in fiery floods, or to reside
In thrilling regions of thick-ribbed ice."

The character of waters has but little influence upon the distribution of the species, less upon the large-mouthed bass than upon his small-mouthed congener. If the water is reasonably pure, both species will thrive just as well in turbid waters as in the small-mouthed bass naturally seeks cooler and clearer waters. Thus, while he is found in the headwaters of certain rivers flowing into the Atlantic (notably those of the Allegheny region of the Carolinas, Georgia, Alabama, and Florida), he is also found in the lower portions of the streams. (There are several rivers in Hernando county, on the Gulf coast of Florida, that burst out from the base of a sandy ridge running parallel to the coast, and which are from one to two miles long, and are large springs fifty or sixty feet deep, and of half an acre in extent. Their waters are remarkably clear and cool, with a strong current until tide water is reached; and I have no doubt but that small-mouthed bass are abundant in them.) In the upper portions of the streams if introduced into them, as the conditions all seem favorable, and the large-mouthed bass is very abundant in them.)

As we approach freshwater the small-mouthed bass disappears. The large-mouthed bass, however, true to his cosmopolitan nature, descends the streams to their mouths, where he seems to be as much at home in the brackish waters of the estuaries as in the pure and crystal rapids of the highlands.

The black bass being in a manner omnivorous, is probably not restricted in its range to any great extent by the supply of any one article of his food; though it would be affected, of course, by any sudden scarcity of its food. Crayfish and minnows are the principal food of adult black bass, and these are more or less plentiful throughout the waters of the United States. In addition to these they feed upon insects, larvae, frogs, and tadpoles. I have analyzed the contents of the food of fishes, ascertained that the food of young bass, when less than an inch in length, consisted entirely of minute crustacea (*Zalostreva*). When from one to four inches long they feed almost wholly upon insects, while the larger bass, when six to eight inches in length, feed upon the same principal diet of adult bass, the small-mouthed species showing an especial fondness for the former. The great prevalence of crayfish in rocky streams may throw some light upon the preference of small-mouthed bass to such waters.

I wish to say a word in this connection in reference to objections heretofore urged before this Association against the introduction of the black bass into eastern waters, upon the theory that the presence of the bass would prevent the increase of shad or salmon. The objections are not valid or founded on fact, for the black bass preys on a diet of crayfish, when he can get it, varying it with minnows, insects, larvae and frogs, and in eastern waters he would not object to young eels, blue pickering, pike-perch and garfish are almost entirely piscivorous in their habits, which might be expected from the character of their teeth, and their fins have no doubt been changed to the black bass. But while the bass will take the eel, pickering, or salmon, he will not when hungry, he will not make them special objects of pursuit, like the canine-toothed fishes above named.

The failure to restock such streams, if any such failure exists, must be attributed to other causes than the presence of the black bass, prominent among which is the unrelenting pursuit of the young fry by the predatory fishes mentioned. They are only exceeded in their destructiveness by the genus *homo*, with his insatiable gill-net, and his voracious nets, which prevent the return of the shad or salmon during the breeding season; and should a few run the gamut and succeed in depositing their spawn in the upper reaches of the rivers, the eels, hulleheads and suckers take their share of the young fry. All of which are true, and do not make a case for the bass, but in your just and righteous indignation do not make a scape-goat of so good a fellow as the black bass.

In Western waters where the bass exists with the usual varieties of fishes, there is no reason to believe that the bass is the cause of their decrease in the numbers of either. If any species suffers it is always the black bass on account of over-fishing, spearing, etc. I know of isolated lakes in Wisconsin where the black bass has co-existed with the cisco for many years, and has not only not diminished in number, but on the contrary, without a decrease of the latter fish. If then the bass cannot "get away with" the cisco in confined waters, how can he "clean out" the shad or salmon in large flowing streams? Moreover, I know of small streams in the West where the black bass and crayfish, into which brook trout were introduced to the discomfiture of the former fish, for the trout increased while the numbers of the bass have been reduced to a few. If the trout, or the rainbow trout will not thrive, do not hesitate to aid in the further distribution of the black bass by introducing that desirable species. It is easily done, and success is already assured. You have only to look at the Potomac, the Susque-

hanna, the Delaware and many other streams for evidence of its rapid increase.

The black bass is excelled by no other fish that swims for gainness, and among fresh-water species by but one, the white-fish, for the table. And furthermore, he will not eat the spawn of his mate, or that of his fellow anglers. His voracity for the crayfish and minnow he prefers them, and they are easily procured. On them he will wax and grow fat, increase and multiply. The run who alleges that he depopulates the streams of valuable food fishes, or asserts that he kills the shad, has never looked into the mouth of the bass with his eyes open.

MR. ENDICOTT—I have listened with great attention to the interesting paper by Dr. Henshall, and I feel constrained to take issue with him on the subject of introducing the black apostle of the black bass, and he therefore defends him against all charges of bad habits. It is a deplorable fact that the introduction of black bass into some of the Adirondack waters, notably in Herkondo Lake, has resulted in the thinning out of the trout, so that angling for bass is all that can be looked for with any certainty of sport. There is no doubt of the value of the bass in all waters that are not uninhabited by trout, but the latter is so far the superior of the two species that it is vandalism to place bass in trout streams or lakes. In regard to large shad rivers I can agree with Dr. Henshall, for those rivers contain other predatory fish which may be kept in check by the bass, for it is well known that in many waters the bass lays the eggs of the other predators. The learned Doctor, living far from trout streams, and having caught the bass for years and learned to love them, does not seem to place as high a value upon the trout as we do, for he evidently considers the trout as the superior of the two species. This is an assumption which I cannot assent to, nor will trout anglers generally. Years ago while fishing in the Adirondacks for trout I was annoyed by the continued rise and capture of small black bass, and turned to my companion and said: "The trout must go, for the black bass is more fatal to them than the smeltish are."

COL. McDONALD—I agree with Mr. Endicott concerning black bass in trout waters, but do not think they have any bad effect in shad rivers.

MR. ENDICOTT—I regard the black bass as the bluish of fresh waters, and Professor Baird has characterized the bluish as more voracious than the shad. The bluish is a more voracious fish than the shad. Col. McDonald: The black bass is of great value to some rivers. I sent to the Holston River for bass to stock New River, Virginia, and the bass were so lively that they jumped the seine, but we caught some, and it was a great gain. They increased and made the water so full of bass that hundreds now go to fish. The black bass are worth five dollars per pound to the people who keep hotels and boats, for they get that, on an average, indirectly from the anglers, and others who resort to the river.

MR. MATHER—I do not think that Dr. Henshall has advocated the placing of black bass in trout waters. He is very enthusiastic on the bass as a game fish, and personally may prefer it to trout, but he is too well informed not to know that trout anglers do not agree with him. I know of a gentleman in this city who has taken trout for years, and only fished for black bass for a limited time, who prefers the bass. For myself I prefer trout fishing, but think very little of either trout or black bass for the table. For me a fresh codfish is far ahead of them. I would never put black bass in good trout waters, but our large rivers are not trout waters, and the bass there will prove the most valuable of fishes to the angler.

THE NEW HAMPSHIRE COMMISSION.—Plymouth, July 3.—*Editor Forest and Stream:* There has been hatched and distributed from the joint hatchery here the past winter and spring, 425,000 *Salmo salar*, 204,000 whitefish, 125,000 haddock salmon (*Salmo sebago*), 150,000 brook trout. One hundred thousand of the *Salmo salar* eggs were taken from fish caught in the Pemigewasset River during the season of '82. The fish are taken in positive lots, as placed in reservoirs kept running, and after being relieved of their eggs, are returned to the river. The spring run of salmon are late this season. Two were taken this morning, which are the first that have reached here. They are reported plenty in the lower part of the river.—H.

If you can extract the oil with petrol or other substance, you can then use a white cement. For blue-stained, neutralize and all pains affections. What you will find La Page's Russian cement a good article.
- W. F. S., Woonsocket, N. H.—Has there been caught in the waters of Maine brook trout since the 22d of June? Ans. 2. In the Mt. Kineo House a truthful record of a brook trout taken in that vicinity weighing 14½ lbs. 3. Has there been caught a larger brook trout in the town from Rangeley Lakes, in 1877, by G. S. Page, weighing 15½ lbs.? Ans. 1. We have no knowledge of such a trout. 2. Not that we know of. 3. The trout caught by Mr. Page weighed 16½ lbs. Some specimens are fresh, and it is claimed that it was a well-developed, or over. Prof. Baird has a cast of a trout which weighed about 15½ lbs, and which came from the Rangeleys, but who took it we do not know.

PUBLISHER'S DEPARTMENT.

TROUT PONS.—We call attention to advertisement of trout pond property for sale or exchange in this week's issue.
Like a beam from the sun BENSON'S LACONIC POROUS PLASTERS go straight to the point, and produce a permanent and lasting cure. All other external remedies are sluggish and weak in comparison. BENSON'S are the latest product of the most careful study and experience of the world. For rheumatism, neuralgia, and all pains affections. All druggists. Price 25 cents.—*Adv.*
Last week's issue of FOREST AND STREAM was a most excellent one, though this might be said of every number published. FOREST AND STREAM has been the best of all our papers, and is the only one that is worth columns each, and contains more first-class reading than any paper in America on the same topic. In its line FOREST AND STREAM has no competitors. We are glad to see that you are sending us so many readable letters on fishing, hunting and kindred subjects, as from all parts of the country. The editorials are always bright and sparkling.—*Ashtand (Ky.) Independent, June 28.*

THE DOGS AT THE NEW YORK SHOW.

Editor Forest and Stream:
By the way, one very pertinent question that no one has asked is, and one Mr. S. Taylor to ponder is: When he was laughing so heartily of "tail-holding," and quoting all the Englishmen he ever heard of, why does he not tell how his friend, Mr. Chas. Mason, held Friday Night (greyhound) up by collar and chain till his front feet barely touched, so his hind legs would spread well in the judging ring. Is that the natural position that Englishmen and anguished Americans are all the while talking of?
If, there really is no power that would enable us to see our own faults, then so be it. But it could hardly be expected when Gurth's "legginess" is made a point in his favor by "adding to his magnificent height."

I am not seeking a controversy, but having read Mr. Taylor's letter in FOREST AND STREAM, have wondered at his meaning at times.

He says the dogs at the New York show this spring were a "wretched lot." Well, the best dogs in the country were there, and almost every one who has seen them will say so. What? Dogs are born, not made to order, and because they are not born to suit Mr. Taylor he "thinks and thinks and thinks."

There are indeed a "great many disagreeable people in this world," and it is greatly to be feared that Mr. Taylor's papers are apt to confirm, all who have read them, in that opinion.

O. P. L.

PROVIDENCE, R. I., July 3, 1888.

Editor Forest and Stream:

Col. Stuart Taylor, in his criticisms on the dogs and judges of the late New York show, has succeeded in bringing himself into disrepute, and almost every one who has seen them will advertise his dogs and kennel free. I think he has succeeded beyond his utmost expectation; and Mr. Mason ought to pay him in part, as from what I can gather from their very numerous letters they are not only ones who can possibly benefit. It is a little late in the day to try and improve the knowledge and character of one of the judges who has given such general satisfaction to both the public and exhibitors—I refer to Mr. Kirk, who is in every way a very clever man, which he facilitates was fully indorsed by the press, and for the most part by the exhibitors. For myself, I have shown under Mr. Kirk three times, and have been set upon by him as well as won under his judgment. Yet I do not at all think that he does his part. Col. Stuart Taylor's dogs, he was in the least unkind, although these dogs, as the Colonel admits, are not faultless, and besides he admits that they were faked, even the paragon Mayor or Bingley is admitted faulty, both before and behind, as he has long since under his eye, and a suspicious lump at the end of his tail, which gave his owner, Mr. Mason, a very considerable deal of trouble in England, but has so far been passed over in this country.

Col. Taylor is too sweeping in his judgment of American dogs. I have also seen many of the largest shows in Great Britain, and I freely admit that in non-sporting dogs they are the best of us by a long way. I do not think that he does his part. Col. TRAINING BEAGLES.

I HAVE never seen a beagle except the one I have owned since last February. Let me tell you how I came to get him. I own a gun and I like to hunt. As a strictly local sequence I like to get a pointer, but Bob White is a *rara avis* within ten miles of Chelmsford, and I can't afford one of the enjoyable trips so often described in the columns of this paper. I want a beagle, and I want one such game as happened to be within the circle of a few miles about my home. I live in a village; have a small yard, and neighbors near by. I wanted one that would not worry over rather close quarters, and keep the neighbors and my own family awake o' nights by his howling. The common grey rabbit flourishes hereabouts, and I am one who thinks there is nothing so good as a rabbit. It is melancholy to see a beagle to itself, and may a merry day have I put in after one little long-eared, long-legged, furry friend.
For several seasons I have hunted in company with a friend who lives just out of the village, and he has a bound. That dog is a most interesting specimen of the canine race. A great, gaunt, long-legged, hollow-sided, cadaverous individual, sticking out all over in "points" and knuckles. It is melancholy to see a beagle to itself, and may a merry day have I put in after one little long-eared, long-legged, furry friend.

MAGGIE, CUTTER, 39.64 ft. CORRECTED LENGTH.

BOSTON CITY REGATTA.—JULY 4.

THE racing for the municipal prizes was not what it ought to have been, for two reasons. First, there was too little windward work, the courses being round about, and second, the courses were too short. This last is a common complaint in American yachting, and takes from the records much of its meaning. In the Boston races, for example, Shadow was outlacked at the start, and for want of distance, was unable to make up what she certainly is capable of doing with time enough, she was beaten by a whole crowd of miscellaneous craft, decidedly not her equal on any point of sailing. Of what account can a result be, achieved really without even giving the opportunity for competition? The courses might all, with propriety, have been doubled in length, and there is no reason why a city regatta should degenerate into baby's play any more than regular club matches. But beyond the fun a dash, or scramble affairs, the Boston city regatta does not deserve the dignity of being classed as racing. First class was not open so much to this objection, and really Maggie and Hesper made the best race of the day. Siran dropped in at the finish just in time to squeeze the prize from the cutter's grasp by allowance. But she was so much smaller than the other two, that finding just enough wind for herself, and not quite enough for the others, she profited by the state of the weather and won by dispensation from Providence rather than on her merits. As she has been handled by Maggie upon previous occasions, the truth of our remarks will be conceded.

Had the course been longer, it would have given the big ones more chance to shake their smaller sister, which they came very near doing as it was. Hesper and Maggie made fine sport all day. The cutter got a little the best in her class, and down wind held Hesper, but the length without regard to her area, which is considerably smaller than the plans supplied to sloops of like length. With the new measurement rules in force, Maggie would have won with ample spars. Racing between her and Hesper was always so close, however, that the day is generally decided upon seamanship, or the faintest semblance of luck. In second class, things got topsy turvy, owing to shadow following the big ones too far under the Spectacle Island, while her class got fresh streaks making hoards down the West Way. Of course the crack sloop picked them up one by one as she got after them, but the course was too short, and she finished long down in the list astern of some very ordinary boats.

The "eye opener" of the day was decidedly the cutter Vayu, new from Lawley & Son's yard, a fast craft, and as yet only a dark horse. In her class she won a smartly sailed race, strictly upon merit. Starting down Thompson's Island shore, with lots of yachts in the lead, she showed so well to windward in the fore leeward down channel until a course could be laid for the turning beacon, that she weathered on the majority. She was third to round and second to finish, taking first prize on time from the respectable Lillie. She was stiff as a church, and went through very clean, considering her beam. Altogether, we were much impressed with her excellent performance. Being, besides, a yacht of more accommodation, with non ballast oil, absolutely safe, flush deck and smart in appearance, we think it quite certain that others of her kind will be built this winter. The schooners were an odd lot, rather cheap looking in equipment and aloft. Vanitas is a hold little craft, however, a cut above the rest, but what a pity such small schooners are not rigged as yawls. They would be equally handy, faster and more economical to commission. Third class made a big bunch clear down, and only straggled toward the close. Queen Ma and Sealbird proved the attraction, and for once Sealbird gave in by a few seconds and captured second money instead of her usual first. The catboat class was so numerous and sailed away to itself that we could not follow their movements. We should recommend a modification of courses for next year to facilitate recording the happenings during the race, for with nothing but the times at the finish, the table is left in the dark altogether on the merits of the contestants. But for our character of a special steamer, we should have seen no more of the race than the judges aboard the tug at anchor at the line.

Courses for first class out Broad Sound, passing Graves and Hardings to starboard, thence retracing by main ship channel—distance, four miles. Course for second class down West Way, to and around Point Allerton buoy, thence retracing through the main ship channel—14 miles. The third class went to and around flagstaff of Old Harbor point, thence to Buoy 7 off the fort, thence around Spectacle Island to lower end of the fort, thence to the light, thence round the buoy—four miles. The fourth class went to and around flagstaff of Old Harbor point, thence to Buoy 7 off the fort, thence around Spectacle Island to lower end of the fort, thence to the light, thence round the buoy—four miles. The fifth class went to and around flagstaff of Old Harbor point, thence to Buoy 7 off the fort, thence around Spectacle Island to lower end of the fort, thence to the light, thence round the buoy—four miles. The sixth class went to and around flagstaff of Old Harbor point, thence to Buoy 7 off the fort, thence around Spectacle Island to lower end of the fort, thence to the light, thence round the buoy—four miles. The seventh class went to and around flagstaff of Old Harbor point, thence to Buoy 7 off the fort, thence around Spectacle Island to lower end of the fort, thence to the light, thence round the buoy—four miles. The eighth class went to and around flagstaff of Old Harbor point, thence to Buoy 7 off the fort, thence around Spectacle Island to lower end of the fort, thence to the light, thence round the buoy—four miles. The ninth class went to and around flagstaff of Old Harbor point, thence to Buoy 7 off the fort, thence around Spectacle Island to lower end of the fort, thence to the light, thence round the buoy—four miles. The tenth class went to and around flagstaff of Old Harbor point, thence to Buoy 7 off the fort, thence around Spectacle Island to lower end of the fort, thence to the light, thence round the buoy—four miles.

still as any yacht in the fleet, Laying occasionally bending to a strong pull more than the rest. Schooners and sloops of the other classes followed in crowd so fast, in each other's wake, that it was impossible to catch their doings in a steamer of consumptive engine-power. Maggie continued to lead Hesper by a few lengths on the close had home through main channel. Wind having veered to the westward, they were obliged to make a couple of tacks coming across the West Way and under Spectacle Island to fetch to windward of the markboat at the finish. This was the prettiest and closest work imaginable. The couple tacked in to Spectacle, the cutter having weathered Hesper and Hesper footing on her a trifle. When high enough for finish, Hesper was first around on port tack again, crossing under Maggie's stern, then the cutter hove aboard and led by two lengths along Thompson's Island. The sloop tried for the other one's weather, and Maggie could not help it, for want of water to tuff out. So Hesper crawled up and threatened to hanker Maggie and show the way across the line. Almost abreast they came tearing up the beach, when half mile below the finish the cutter ran from under Hesper's lee and led over the line by a length. All by herself Siran came along five minutes later, when by profound opening it was discovered that Maggie had not captured the big prize, but that little Siran was the winner by a minute and more upon headline time allowance. A sort of slip between the cup and the cutter.

Prizes go to the following:
 First class—First prize, \$50, Syren.
 Second class centerboard sloops—First prize, \$40, Maggie; second \$25, Nimbas.
 Second class keel sloops—First prize, \$40, Vayu; second, \$25, Lillie.
 Second class schooners—First prize, \$25, Vanitas; second, \$20, Bessie.
 Third class centerboard sloops—First prize, \$10, Queen Mab; second, \$25, Sealbird; third, \$10, Lizzie; fourth, \$10, J. S. Poyen, Jr.; fifth, \$5, Josie.
 Third class keel sloops—First prize, \$10, Fairy; fifth, \$5, Josie.
 Fourth class centerboard sloops—First prize, \$25, Bis; second, \$20, Nobe; third, \$15, Flora Lee; fourth, \$10, Lillie; fifth, \$5, Josie.
 Fourth class keels—First prize, \$25, Nonpareil; second, \$20, Charlotie; third, \$15, Vesper; for fourth and fifth prizes the Hard Times and Meester艇. Money, \$15, to be divided between the two.

Summary and official times as follows:

Withdrawn.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR, 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, JULY 19, 1883.

VOL. XX.—No. 25.
Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsmen throughout the United States and Canada. On sale by the American Exchange, 419 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Initial pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications,

Forest and Stream Publishing Co.
Nos. 39 AND 40 PARK ROW, NEW YORK CITY.

	ANSWERS TO CORRESPONDENTS.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

ON THE EVE OF THE MATCH.

TOMORROW and the following day are the dates set for the match between the American and British teams at Wimbledon. Each team has been most carefully selected, and the two dozen men will embrace the pick of the thousands of civilian marksmen on both sides of the Atlantic. The match promises, at this writing, to be a close one, for since the arrival of the American marksmen in England they have been very diligent in their range work and the scores have been such as to lead Colonel Howard to express his opinion that the team under him is in good form and able to do its best on the match days.

There certainly is little difference in the excellence of the weapons employed. If the Americans have not been able to make rifles in every respect equal to the English arms the odds are so little in favor of the British arm that they are hardly worth considering in anything but a careful bench test. The British riflemen are individually vastly superior to the Americans in experience over many ranges and under every possible condition of wind and weather, so that taking such a measuring unit as the average of each man's shooting for a time past the British aggregate might run the higher, but if Col. Howard's assertion that his men are working in good tria means anything, we understand that the men are in a condition to help each other in every way during the progress of the match. In this way, and in this way only, is the match to be won. That the men help each other is not of itself a warranty of a victory, but it is very certain that, taken from first to last, the individual members of the American team are not the equals of the British shooters, and only by a well organized system of co-operation can the Americans successfully cope with the home team.

While the match and its results is in itself of comparatively trifling importance, yet in its consequences, direct and remote, it is an event of more than passing moment. It would be a thing of vast value if the American public could

understand just what the Volunteer movement in England amounts to. It can be studied to advantage by the authorities of every State, and the people of the United States would not regret the time and money spent in building up such a reservoir of passive power in case misfortune ever required the throwing of a body of armed men into the field. With such a force of semi-trained civilians to pick from there would not be that scrambling about for available men which has marked the formation of every American team thus far. But entirely apart from team formation, the possession by the United States of such a body of men would be a wonderfully effectual guarantee of peace and safety from invasion, and if the present match will in any way lead to the bringing into existence of such a body, it will be worth all the expenditure of time and money which it has cost.

THE SPORTSMAN AS A GULL.

ATTENTION has frequently been called, in the pages of this journal, to one of the growing abuses of the time, the luring of sportsmen by hotel proprietors into regions where there is neither game nor fish. The summer resort landlord and the farmer, who takes "city boarders," both put forth their mendacious and alluring advertisements of "good fishing in the vicinity," and "game abundant," when, as a matter of fact, there may be no fish, save minnows, within ten miles, and the only game is the mal-odorous skunk or the burrowing woodchuck. Many sportsmen, misled by these lies, make long and expensive journeys, only to find themselves most abominably sold.

We know of no sufficient course of action to remedy this evil. It is little satisfactory to "show up" the unscrupulous "hosts;" that does not give one back the wasted money and time. A very good rule is to write personally to the advertisers of these rare fishing and shooting resorts, and obtain from them in writing an explicit statement of the case. It is often the case that a man will lie in an advertisement to the general public, when he will hesitate to put the same deceptive statements on paper in black and white, over his own signature, for which he may be held to a personal accountability by the victim of his greed. The sportsman tourist is wise in his day and generation who thus provides himself with the documentary evidence which, in the event of disappointment, may serve its useful purpose in fixing the blame where it belongs.

FORESTRY.

IN another column we give a report of a meeting held to organize a society to preserve the Adirondack forests. It is an organization much needed, and one which will commend itself to all who love our-door life, as well as to those who look upon it from the utilitarian point of preserving a great water supply for our aquatic highways. In parts of Europe forestry is a science, and officers are appointed by the governments to supervise the forests; and only judicious thinning of young trees and the cutting of those which have attained their growth is allowed, and we understand that this law applies to tracts of woodland owned by individuals, the theory being that the individual will pass away, but the forest must remain forever. Such laws would be unpopular to many here, but they would work well for the people at large. A man who can only live a hundred years at most is allowed to buy a tract of land in the great water producing region of the State and for his own pecuniary benefit render it forever sterile.

The State was too anxious to sell Adirondack lands at an early day, in order to get some one to pay taxes on them. Lands were sold in great tracts at a price often less than five cents per acre; the timber was cut off, and then the lands were allowed to be sold for taxes and finally came back to the State. In consequence of this there are isolated tracts of State land scattered all through the wilderness; and in some cases the State has an individual third interest in lands on which the other two owners can cut the trees, but from which the State derives nothing. These State lands are regarded as free plunder by some lumbermen, and a sort of squatter sovereignty has been established in some cases where lumbering and bark-peeling have been carried on freely.

The new association deserves the support of all interested, and we hope that names of new members will flow in to the secretary from all who love the woods. His address is, Mr. Verplanck Colvin, Superintendent Adirondack Survey, Albany, N. Y. A meeting for further organization and action will be held this fall, when all who are likely to take an interest in it will be out of the woods.

GREAT SOUTH BAY.—The waters of the Great South Bay of Long Island were formerly celebrated for their fine fishing. Hundreds of anglers went daily from New York and other places to capture bluefish, weakfish and other fishes in its waters. For years the people living near it received much money from the angling strangers who came to fish; and they waxed fat from summer boarders, boat and horse hire, bait, etc. But they also allowed netters to take the fish, in open violation of the law, and failed to support those who protested against it. Mr. Roosevelt, of the New York Fish Commission, was one of those who protested some years ago, and the netters convicted him that he was in error by boring holes in his yacht and other arguments of a like character. Now the fishing is ruined, and the angler who goes there not knowing this fact soon leaves for Barnegat Bay, or other good locality, and the hotel keepers are in mourning. True, a society has been formed to correct the evil, but they are late, and it will take them years to repair the mischief which has been steadily exhausting the fisheries for the last decade. It seems to us that the Long Island Railroad, which has derived its share of benefits from the traveling anglers, should help this new association to preserve the fisheries of this great natural feeding and breeding ground.

AMERICAN WOOD POWDER.—In reply to several inquirers respecting our opinion of the powder manufactured by the American Wood Powder Co. of this city, we repeat what we have said before. The manufacturers of the powder, when they first brought it out, stated that they had succeeded in overcoming, by the process of manufacture, the objection we urged against the Dittmar powder, namely, its liability to detonate. The strength of their claims could be tested only by a chemical analysis of the powder. This we at once instituted, putting samples of the powder into the hands of an eminent chemist for that purpose. Circumstances have delayed his reporting to us. Pending this report we must decline to give advice in the matter. We prefer to treat such important subjects thoroughly, believing that the interests of all concerned—particularly those of the consumer—demand intelligent consideration instead of a hasty and therefore premature passing of judgment.

THE U. S. FISH COMMISSION.—Prof. Baird is now at Wood's Holl for the summer, where the scientific portion of the commission is at work on sea-dredging and general marine investigation. The menhaden investigation by the Senate committee, consisting of Senator Lapham, of New York, Senator J. F. Morgan, of Alabama, and Senator Call, of Florida, is at Cape May. Col. McDonald, one of the brightest and best fish culturists that this country has produced, is with the committee, representing the commission. The question is a very vital one, and one that anglers take a great interest in. We will look for the report with much anticipation.

RAINBOW.—Speckled beauties—trout. Crimson beauties—snappers. Green beauties—bullfrogs. Brown beauties—woodcock. White beauties—polar bears. Blue beauties—disappointed belles. Red beauties—Irish setters. Black beauties—crows. Liver and white beauties—pointers. Crushed strawberry beauties—sunburnt anglers. Rusty beauties—gun barrels. Yaller beauties—Ki-yis. "White, black, and read all over" beauties—FOREST AND STREAM pages.

THE GAME PROSPECTS for the approaching shooting season are very satisfactory. The birds are recovering from the decimation wrought by the severe winter weather of 1881-2, and where they have been fairly well protected from illegal shooting will afford good sport in the fall months.

LOGIC IS LOGIC.—"That Office Boy" says that a man who will kill game out of season will not scruple to kill his fellow man as well. This is, we must confess, a pretty severe statement, but the suggestive point is that out in Colorado the "Boy" has found facts to sustain his proposition.

THE G. A. R.—Target practice, carefully conducted, is getting to be a feature of the many G. A. R. picnics held. The "old uns" show considerable skill with the improved weapons of to-day, and always manage to boast of much more than they accomplish.

WILL CORRESPONDENTS PLEASE OBLIGE us by directing their communications to the Forest and Stream Publishing Co., and not to individuals. The annoyance caused by non-compliance with this request is constant.

The Sportsman Tourist.

CAMP HENDERSON.

A SONG to the jolly old camp.
The scene of full many a lark;
Alone fit the grave-wood wood,
The five flickers wailed in the dark.
The coffee-pot sings in the coals,
Above fits a shadowy owl,
A frog hawks croaks in the pool,
A chorus to the wolf's distant howl.

Some venison cooks on a spit,
The deep skillet savors of eels;
Hark! 'yonder come' B'naius and John,
The fruits of the land in their creels.
With zest the attack is begun;
We eat as if famished for weeks,
The forest resounding with fun.
Sweet hemlocks we strew by the fire;
On these our tired limbs find repose;
With blankets drawn o'er us we sleep
The slumber true weariness knows,
Mosquitoes and punkies may swarm,
And grandmas may prate of the damp;
We'll laugh all such terrors to scorn
And sing to the jolly old camp.

LEW VANDERPOEL.

WESTERN NORTH CAROLINA.

NO tourist can pass through the mountains of North Carolina without being impressed with the magnificence of the climate and scenery, and made sensible of the justice of the boast of its inhabitants, that it is the "Switzerland of America." I shall not attempt to describe any of the lovely spots which have called forth enthusiastic admiration. Those who desire to obtain accurate information of the climate, scenery and physical attractions of Western North Carolina, may consult the book entitled, "The Land of the Sky," and to the sketches on the subject in *Harper's Magazine*, by "Porte Crayon."

It is my design, by this article, simply to invite attention to this locality as a game resort. There are localities off from the beaten tracks, such as Watauga county, which it is difficult for the tourist to reach, but which, it is said, present to the lover of nature and sport, attractions not to be found elsewhere east of the Western North Carolina Railroad which connects with the Richmond and Danville system at Salisbury, and with the East Tennessee, Georgia and Virginia systems of railroads at Morristown. The drawback consists in the exorbitant charges which a sojourner at the Warm Springs is sure to find on his bill. Niagara is no worse. But if satisfactory arrangements in this regard can be made with the hotel proprietors, the sportsman will, in all other respects, be charmed. Accustomed to Miss Gentry and the servants, like the colored servants generally found at public places all over the South, are excellent. It is the greatest mistake in the world to suppose that white servants are superior to colored servants found in the South. When, in this great republic, a white person becomes a menial, it seems to degrade him in his own estimation, as it certainly does in the opinion of others. He even resents the idea of being called a servant, but insists that he only is. The colored citizen upon the contrary, when he becomes a servant does not object to being called one, provided you do not call him a "nigger." The latter term he regards as the greatest insult. And so far from being lowered in his own, or the estimation of his fellows, by going into service, the reverse is true. If his employment be one where he has some authority, confidence or trust reposed in him, he feels elevated, and seldom receives faintness. There are no more thorough aristocrats than are frequently met with among the colored menials of the South.

Upon inquiry I was informed that Tom Coulter was regarded as the great authority upon all questions relating to the chase in the neighborhood of the Springs. Tom is a colored man, and resides in Green county, Tennessee, about nine miles from the Springs. He rode over into Tennessee to see him, and fortunately found him. Like most of his race, he is polite and accommodating, and has far more than ordinary intelligence. He was formerly a slave, and is now fifty-three years of age, and lives with his family on a comfortable little mountain farm, which he has bought and paid for since the war. He keeps a pack of hounds, and from and after the 15th of July of each year, having secured his crops, he stays at the Springs during the season to hunt with his guide and guests. There is not a foot of ground in a radius of thirty miles around his house with which Tom is not familiar, and notwithstanding his age, he can tramp over the mountains following his dogs from daybreak and until dark, and always keep within hearing. He exhibited a number of trophies of the chase, and gave me a full account of all game, and the haunts of the same, in the neighborhood.

Bears are numerous, but owing to the lofty and precipitous mountains and the dense growth by which they are covered, it is almost impossible to catch them or bring them to lay with dogs. Started near the Springs, they often make for the Black Mountains, the highest mountains east of the Rockies—Mount Mitchell being higher than Mount Washington in New Hampshire—a distance of over thirty miles. But large numbers of bears are caught in traps and pens. Tom himself has caught since the war twenty-three bears in pens. These are built of hewed locust logs, about four feet deep, four feet wide and seven feet long, with a door of the same hard and heavy material, so constructed as to fall when the bear enters and takes the bait. If any other materials are used except the best locust, the bear will be certain to cut out. These pens are much better than steel traps.

Bears are a good many deer in the neighboring mountains, but there are more in the groups known as "Cow-Bell" and "Spring" mountains than in any other. When started on the north side of the French Broad River, the deer generally run through Courtland's farm, and cross the river at certain

points between two and four miles below the springs. Hunters taking stands along the river at these places are almost sure to obtain a shot if vigilant. There are now on the mountains embraced in the Courtland's farm a herd of fine bucks. The does have fawns at this season. They fawn about the last of June, and by the fifteenth of July the fawns are able to shift for themselves. The laws of North Carolina afford the poor deer no protection whatever, as I am informed. Tennessee has game laws, but they give the game no protection near the North Carolina line for obvious reasons.

Within a few hours' ride from the Springs is the Clifty-fork range of mountains in Cocke county, Tennessee. This is a famous bear region. It is on the northwest side of the French Broad River, and covered with dense thickets of laurel and briars, affording to bruin an almost inaccessible retreat.

Brush Creek Mountains and flats, nine miles west of the Springs, is a favorite resort for deer. When started in these mountains they almost invariably cross the river at the mouth of Brush Creek, which is therefore an excellent stand. Four miles above the Springs is Walnut Mountain, upon which there are a great many deer. When started they cross Laurel Creek at two points, from which they may be easily killed. Laurel Creek is a large and beautiful stream emptying in the French Broad four miles west of the Springs. Many fine streams flow into and forming the Laurel are filled with trout, which, though small, seldom exceed ten inches in length, afford excellent sport.

On the south side of the river, and emptying into it at the springs, is a large clear stream called Spring Creek, which takes its rise in the Bluff Mountain range, some ten miles from the Springs. On the head waters of this stream and of Big Creek, which rises in the same locality, there are well stocked and plentiful. It is the only locality I know of in these mountains where wolves are found. Not long ago five were killed in one day by a party of huntsmen; and on another occasion four bears were killed in one day on this range.

Since the railroad has been built along the river, the deer and other game have been driven further back into the interior, but are still to be seen in the mountains.

Wild turkeys, pheasants, ruffed grouse and partridges are abundant. Occasionally eagles may be seen. They build in the inaccessible cliffs near the rivers and creeks. Of course, there is other small game, such as rabbits, squirrels, etc.

Owing to the splendid warm baths at the Springs, which are favorable to the sportsman afflicted with rheumatism, no more delightful place can be found by the coast of the Mississippi, during the autumn and winter months, provided he can obtain board on reasonable terms. From November until January is the time to come here to hunt, when the deciduous trees have shed their leaves, and the mountain air is crisp and bracing.

The sportsman tourist, by going only two miles from the hotel, may get into the hunt, and enjoy the loveliest scenery in the South. White tents and catamounts are numerous, and are often killed.

The tributaries of the Laurel are the only streams near the Springs in which trout are now found; but black bass, redhorse, cats and other fish abound in the French Broad and all of its large tributaries. Gray and red foxes are found in such numbers as to afford excellent sport. Tom Coulter and Mr. Sarveyor have each a pack of hounds, and are always ready and willing to lend their services to the sportsman. Indeed, every one about the Springs is polite and accommodating, and outside of the hotel, charges are reasonable enough. Like most men of his habits, Tom Coulter is good-natured and amiable, and delights in all kinds of hunting, whether for rabbits or for bears, and has at his tongue's end any number of incidents connected with his sporting experience wherewith to beguile away a tedious hour.

I had the good fortune to meet at the Springs Col. Thomas Steele and his son, of Little Rock, Ark. All readers of the FOREST AND STREAM are probably familiar with his name, as I have often seen it mentioned in connection with his hunting tours in the Rocky Mountains. He is a large planter and an enthusiastic sportsman, and having removed to Arkansas in 1858, remembers the first time he was out on a sportsman's paradise. Scarcely a season passes that he does not go on a camp hunt in the Rockies. Having, therefore, such varied experiences as a sportsman, and being a gentleman of fine sense and attractive though plain conversational powers, it may be readily imagined what a treat it is to sit and listen to his relation of his sporting adventures, especially when given in his quiet and original style. We have long been acquainted with the gentleman who has some here in the mountains. I trust he will be inspired thereby to give us soon another of his entertaining letters. I desire here to return my thanks for the kind invitation extended by him to me and others of the fraternity, through the medium of the FOREST AND STREAM, to visit his home in Roekingham. Not only from some of his numerous kinsfolk (for he belongs to a family having probably a more extensive connection than any other in the South) but also from others I had earned of the hospitality to be met with under his roof, and I hope at no very distant day to be able to find time to accept his invitation.

M.
July 7, 1883.

THE ADIRONDACK GUIDES.

I AM no fighter—would rather walk round a block of iron wrong way to avoid a hand-saw than a man's blood, even from my wife. But there are times when I will make a stand for my friends, and show fight in their behalf when, were the case my own, it would probably pass unnoticed.

Now then for the provocation, which is in the following paragraph from a late number of *The Mail and Express*: "Adirondack tourists are already on the march, and the guides have all come to the front with customary rapidity. Tourists are most fortunate who do not have to do with the guides."

You know that I have done a little traveling and camping in the Adirondacks—and your fishing editor has done a little of the same. Now, I know (excuse me for going in front, for it's my fight) and you know, that without the aid and assistance of these much-maligned guides, the Adirondacks to many would be an impossibility. There are some who can go off into the wilderness, make up their horses, boatmen and cooks of themselves, can put up with any or no shelter, can digest food cooked poorly or well; can do many things that the guides do for us, and feel all the better for it. Wouldn't I be a proud man if I could do it and live? But I know that's too much for me, and not only for me, but for the

great majority of those who visit and enjoy the grand old North Woods, and are the gainers thereby.

What are we to do when this terrible army of guides fester the woods, and, with their almost closed eyes upon us, we enter their territory? beat a retreat, and go somewhere else, simply because of these miserable, mean, scurrilous intentions hung out in this style? or, will we be mainly enough to do as the Children of Israel when Moses, acting under Divine instruction, issued his marching orders, "Go forward!" I have been in the care and keeping of several different guides in the woods that I have led, and my acquaintance among them, especially at the Brown's Trap Region, is pretty extensive, and I do not know of one solitary guide with whom I would not share my blanket in any part of the wilderness, and feel just as safe in person and property as I would in the house of any friend in New York city.

They work for pay. So do we all of us, only they give a great deal more work for the money than any class of men I know of. There is an intelligent service—they require brains, and good ones, too. Every emergency of crisis they must be prepared for, and I've seen some of them get caught in tight places, but never knew one to fall or flinch; true as steel, and faithful as true, they do not deserve these slurs and stabs in the dark.

I know that around some of the lakes where large numbers of fashionable people gather, in the large hotels, there exist a class of "hotel guides," who are not to be named in the same breath with the genuine guides. These men, or boys, are brought in from the settlements and farms on the borders of the wilderness, and are employed by the hotels at a certain sum per day for the busy season. The hotel hires them out to the guests, and often the latter are sadly taken in. They may get some one to row the boat for them, but they have no guide; he knows nothing about what the hotel or game is, and the sportsman, with his woodcraft, and is often simply a lazy, good-for-nothing beat, whose only ambition is to get through his day's work and bleed his patron of all his spare change. "From all such deliver us." They are not guides!

In your issue of May 3, which I read in the woods, your correspondent, "Piscoe," relates his grievances in this line at the expense of my good friend Rod Perrie, of the Blue House, and then tells Mr. Perrie as I do, it would be very difficult to convince me that the story is as stated by "Piscoe." And yet I don't want to say, or even believe, that he would make a false statement, but will suppose that he got a bad bargain, felt very much aggrieved, down on everybody, and had to "boil over or bust." Mr. Perrie's statement is briefly told. "Piscoe" came to him at a season when all the guides were engaged, every man of them. He was so informed, and then told of a fact that he could get who was able to row a boat, but knew nothing about guiding, and, it being Hobson's choice, he had to take him or none. He was disappointed in his bargain, as he might have expected, but he would have been wiser and happier if he had passed it by without getting into print.

So much for the guides, and it's all gratis on my part. I love the honest faithful fellows for their merits, and could not hold my peace.

I went into Brown's Trap via Boonville, early in June, and spent a pleasant three weeks there with my son, and then turned back to my daily round of work, better, fresher, and abler for my toil—brain clear, blood purified, liver cleansed, iron infused into my system and "set up" in good shape, warranted to run. Changes have occurred since my last visit; George A. May, the genial landlord of the Hibbert House, Boonville, has sold out to George H. Beck, who promises to do his best for the sportsmen and visitors to Brown's Trap who may give him a call. Death has made another change; Bart Halliday, one of the old time guides, died late in May and was buried at Boonville. He was well known, respected, and much sought after by sportsmen. He has dropped his paddle and gone over his last "carry," and now he rests from his labors.

One other change, and I don't like it, a steambath has been put upon the Fulton Chain of Lakes. To be sure it is "only a little one," and very slow at that, but, without wishing John Meeker any injury in person or purse, I shall not express my regrets if he finds it profitable to give up the job. The Adirondack boat is good enough for me yet, notwithstanding my little tilt with "Nessumk" last year—he is well, and his little boat is still afloat, you can apply that scripture to either or both of us.

J. R. J.

IN BOSSIER PARISH.

BY GEO. D. ALEXANDER.

ON Friday, June 30, 1883, in company with my esteemed young friend, J. H. Mercer, I set out on a memorable excursion to the Bayou of the Gluck's Bayou, some eighteen miles southwest of Minden; having prepared myself with everything necessary to enjoy several days of sport in both hunting and fishing.

As we drove over the bridge across the bayou, Mr. Mercer remarked, "The water is in fine condition for catching perch, and just right for using a good troll for black bass, a mile beyond the bridge." It was at this place, Mr. Mercer unfortunately, was on Red River visiting her sister, but he expected her to return before I should leave. Now he would have to do the honors of the house and act the part of the bachelor.

At his store, near by, I met my old friends Dan Cole and Mr. Bodenheimer; out old in the seizure of years, for both are denizens, you see, of the bayou. One of our most formidable sportsmen, Mr. Sugden, was there also, who joined us the next day in fishing.

Early the next morning we were up, rigging poles, propping bait, and saddling horses, though our spirits were considerably dampened by fears that the heavy rain which fell during the night would have muddied the water and destroyed the prospects of a very successful fish.

However, Mr. Mercer it was in the case, he would return to the store, get some freedmen and his seine, and, by going down to the mouth of the bayou, where it empties into Lake Bisteneau, we should not be disappointed in having as many perch and bass as we desired to eat. On getting to the bayou, we found it just muddied sufficient to prevent the bass from striking the trolls, yet not preventing black perch and the goggle-eye from doing their work, several were taken, but not a bass would strike. In huge disgust I laid those aside and tried the minnows. It was as unsuccessful as the trolls. Then I gave it up as a bad job, and turned my attention to fishing with red worms and sawyers for perch, which Mr. Sugden was rapidly pulling out and filling his sack.

Mr. Mercer did the same. An hour's sport had filled our

sacks, and we returned to the house to have them prepared for dinner. His cook, who, by the way, is splendid in browning a fish just to suit my palate, and baking a corn dodger, which, next to an ash cake, I love above all sorts of bread, had cooked the fish to suit me to a T, and I did enjoy my dinner. Mr. Mercer has the largest quantity of cattle of anyone in Bossier Parish, among them some of the best milk cows, and no acid to fine butter and good milk. How I did enjoy these after being cooped up in a town for a year!

That evening a big chill caught me, and I could not accompany Cole and Sugden to go higher up the bayou, where they thought the water would be clear and the chances good for catching bass and goggle-eyes. They returned in time for having the fish cooked for supper, with a large number of each kind, reporting the fishing as superb. It being almost impossible to let the troll strike the water before a fine fat bass of some two or three pounds striking it. Goggle-eye bit as fast as the hook could be baited and thrown in the water.

This was all pleasant to them, but poor me! I had shaken the bed nearly down with a chill, and when they brought the fish into my room to show me, I was burning up with fever.

Sunday, July 1.—I got up, dressed, and felt better, but staid in-doors all day.

Mr. Mercer said, as it was now lawful to hunt deer, we would go hunting early Monday morning.

Monday Morning, July 2.—Ate a hearty breakfast by sunrise, and then mounting Don, Mr. Mercer's fine saddle mare, with him, Cole and two freedmen, proceeded to our stands about a mile and a half from the store. The deer had been coming every night into his cotton field just before the house, and then laid up during the day in a large piece of woods nearly surrounded by fields. Cole drove. He had two good hounds. I went with Carey Porter, a freedman, to show me my stand, while Mercer and Adam Turner, a freedman, went to stands beyond ours. Carey had barely time to place me at the proper place, before I heard the full and bounding direct to my stand. In a few minutes I caught the outline of a deer's ears as he sprang into the path some seventy-five yards from me, and stopped, but behind some pine trees, and at the same instant, a plagued red ear bounded across the path between the deer and myself. It was done so quickly that I was in doubt whether it was a dog or a fawn, until in a moment it returned direct to the little deer and drove it back into the drive. The two hounds came out, ran across the path, and in a circuit coming up to me, and just then I heard the ear open a few times, not less than a quarter of a mile out of the drive, taking the deer, as I thought, to Mr. Mercer. The ear was running it so close that the animal took a thick, and though passing quick near Mr. Mercer, he did not see it, and then left on quick time for Red River bottom.

To say I was mad would not express my feelings. I was furious, and I declared I would kill that dog as sure as I should lay eyes on him in the drive.

Cole blew back the hounds, and went to stands inside of the same drive. Mercer told me this same ear had kept him over twenty times from killing deer, just as he did me, that he belonged to a worthy freedman who lived not far from his store, and when the dog heard the horn of the driver, he would come to him or the drive, and act just as he did this morning.

They took me to a stand and then went on to one further down the road, the freedmen being left at the stands I and Carey Porter had filled.

Not thirty minutes passed before I heard Cole hallooing very lustily to his dogs, and then they broke into full cry. Soon he blew his horn many times and succeeded in getting the dogs back to him. He was blowing, shouting, and making as much noise as the first locomotive makes on coming to a station. We were for the first time, when two heavy shots in rapid succession broke the stillness, and then came an indistinct cry of a dog as pain, and next the war of both dogs for half a minute. Then all ceased, and the three long blasts of the horn notified me that a deer was killed, and I should ride up.

Cole was not over a quarter of a mile from me, when he shot, and as I came up both of the freedmen and Mercer rode up. I saw a beautiful fat young maiden doe lying dead with her hind legs broken in several places, and several shot piercing both horns. He had made a call, and shot as the deer got up before him. Very thick bushes, and he only caught a glimpse of it as he shot.

He rather evaded a reply to my asking him "did he kill it with the first or second shot?" He was in fine spirits, more lively than usual. It was not over half a mile to the house, and while going along back home he informed me, "that red coat with his new and red, and second shot being at the ear that ran in before him as the deer came up."

We had not been absent two hours from the store. The milk and liver being favorite parts of a deer with me, Mr. Mercer sent them to the cook, to have them prepared in the best manner, and did I not enjoy them? It had been eleven months since I had eaten any venison, and this was it, Mr. Mercer's.

Soon after dinner I was taken with a regular old fashion ague and chill. I have rarely suffered as much before, with one as I did with this. Nevertheless I managed to eat a double portion of the delightful venison. The cook had stewed the ribs until they were thoroughly done. I ate an enormous quantity for a sick man.

The next day I laid up all day, swallowed not less than forty grains of quinine, sweated myself nearly to death, and rose the next, bright and refreshed, ready for another hunt.

It was now one of the finest specimens of a bear of the negro by him. He got several freedmen to accompany me. Among them were Carey Porter and Henry Johnson. This last was one of the best negroes, Mercer said, he ever knew. He certainly had one of the most pleasant and honest faces I ever saw. Mercer told me, "he would believe him as quickly as any white man in the country, and he would credit him as fast as any one the amount he asked for."

He was one of the finest specimens of a bear of the negro I have seen, about six feet two inches tall, black as a crow, well proportioned, and having a face that one does not tire in looking at. Honesty, fidelity and bravery were stamped on every lineament. He was the body servant to young Jack Hodges, an older brother of my son-in-law, Lawson K. Hodges, and had accompanied his young master at the opening of the war to the field of Manssas.

There young Hodges was killed, and when it was known that Henry, the negro, was near, he was very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased.

He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased.

He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased.

He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased.

He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased.

He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased.

He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased.

He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased.

He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased.

He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased.

He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased.

He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased.

He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased.

He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased.

He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased. He and Henry, the negro, were very much pleased.

lifting him gently in his great arms, he bore the body back to camp. He could get no coffin to place the body in, but as he told me, "he borrowed a saw, and he stole some planks from a quarter-master, and made himself a rude coffin in which he placed the body, and then digging a grave, he buried by himself the loved form of him whom he loved as a brother, and then he made his way back to his old master's home, near which place, on the same land, he now lives. He owns his own farm, has a good gun, plenty of horses and cattle and hogs, makes good crops, and owes no man a dollar.

Who will denie that a negro is not faithful, and to be greatly praised under such circumstances?

But to return to our hunt. He made three drives in succession without getting a start. "Ordinarily," Cole said, "he could start twenty deer in the woods we hunted!" It was getting excessively hot, and we went to a spring to get some water. While there, I was struck with a quaint remark of Carey Porter. Said he, after swallowing nearly a gallon of water, "It is too hot for white folks, too hot for hounds, but is just right for niggers."

How true is this in such a latitude and at such a season of the year!

In no part have I seen the freedmen so well off as in this Bossier Point, and I am certain I have never seen a more quiet, orderly and respectful body of colored people. All are doing well. You never hear of any fights and quarrels. And I am certain that even in slave times one would not have found the negroes more respectful and law-abiding.

After cooling at the spring, we proceeded to beat across an old field, before taking another drive.

Cole was riding a little in advance of me, to my left. Henry Johnson was in the center, but in advance of me. We were passing a little cluster of sumac bushes, when I saw Henry lower himself on the neck of his horse to look at something, and then exclaim: "Daris a deer, shoot him."

Up bounded a beautiful fawn, and then it stopped a moment and ran on my right. I could not shoot, but rode a step or two to give Cole a chance to shoot, when he flew both barrels from the left shoulder, but did no damage. The terrified little creature ran some forty yards and stopped. By this time I had turned Don to the left, which gave me a beautiful chance to shoot; and as I brought down the heavy Moore & Son gun, weighing some eight pounds, the mare's head went up and down quicker than a die-dapper duck.

The gun was so hard on trigger that I could not keep it on the deer, and I fired at random, only frightening the beautiful little terrified creature. It bounded off unharmed, and I was glad of it.

The hounds ran it for a mile or more and then lost it. On returning home, Henry told us "he could not be happy unless he told the truth about this little deer, and that was, he was so excited he forgot he had a gun, and wanted us to shoot it."

This ended our hunt. I did not have a chill, and I did, indeed, enjoy the eating of the deer we killed the day before.

After our railroad is completed, the hunter who loves both fishing and hunting, will find much to be desired by going down into Bossier Point. And should he be so fortunate as to make the acquaintance of this most hospitable and genial gentleman, William Mercer, he will never regret a sojourn at his residence.

The next day I returned to Minden, to find all my fine chickens dead with cholera or some other fatal disease, and my fine bitch, Princess Louise, the gift of Mr. J. O. Donner, of Brooklyn, so wild, that she would not come to me, and had left home to take up with a neighbor.

residents such species which at present are known only as temporary or casual intruders.

The occurrence of species peculiar to the islands (and I have no doubt the final revision of the material collected by me will make known several new ones) will not invalidate what I have stated above with regard to the want of indigenous animals and plants. Their origin is due merely to variety in connection with isolation and time.

As to the plants I shall here very briefly, as I am not a botanist. I limit myself to the remark that I find the general character of the flora very much like that of the treeless regions of Northern Europe, the most discrepant features being the splendid *Rhododendrons* (*Kauntschotium* and *chrysanthum*) and the Saranna lily (*Prilitharia saranna*). Still closer, of course is the resemblance to the plants of Kauntschotka, especially to those in greater altitudes. The plants of both islands are, I think, identical, but the manner of their immigration very likely has caused the occurrence of some species in one island which are absent in the other. Thus I have from Copper Island a very small but conspicuous *Viola* with yellow flowers (much resembling the yellow variety of *V. tricolor*), a plant which I found also in Petropaulski, but not here on Bering Island.

The islands are completely destitute of trees, unless one might say that to form soil the stubs of *Salix*, *Sorbus* and *Betula*, from six to eight feet high, some of which obtain a proportionately great thickness close to the ground. Thus, for instance, I have a section of a birch with a diameter of two inches.

The vegetation, especially in the valleys, is very luxuriant in most places of a man's height or more. This exuberance is especially due to the rich soil in connection with the extreme moisture, for the temperature during the three months, during which the plants have now been growing, was not high. My observations show a mean of 45° F. for June, 48° 2 for July, and 54° for August. The minimum temperatures for the same months are 31° 3, 39° 4 and 44° 6, respectively. In higher latitudes the length of the day and the intensity of the light produce the same effect, but as we live here in latitude 55°, under a sky generally overcast, we do not find the same conditions as we should think.

Of land and fresh-water invertebrates I have collected only some specimens of worms, mollusks, and arthropods. The worms are represented only by a species of *Lumbricus* and by two *Hirudines*.

The mollusks are more numerous, including one bivalve and two or three pond snails, seven land snails, and one slug. Among the land snails there are several extremely small *Littoræ*, scarcely larger than a pin's head, some of which I suspect to be new. They are surely not the young of the larger kinds, of which I possess young ones also of the same size, except a medium-sized *Littoræ*, and with the same exception they are not very numerous.

Of myriapods I have found only a few species, while the spiders have yielded a richer harvest.

As a rule the winged insects seem to be more numerous, with regard to both individuals and species, which is also the case with the *Arthropoda*, the diptera, the mosquitoes and other insects which are very numerous, and which in such large numbers as in Kamtschatka, where the furious attacks of their legions sometimes prohibited me from securing a bird I had shot, and usually a valuable one, even here on the island they seriously interfere with the duties of a collecting naturalist. The diurnal lepidoptera seem to be very scarce. I have seen only a single one, early in the spring, on the 21st of May; it was a butterfly, much like, if not identical with *Vanesa arctica* L., but unfortunately the chase was unsuccessful. My lookout for some species of *Argynnis*, *Erebia* or *Tieris* has been completely in vain. The *Noctuidæ* are not very numerous either, while the *Geometridæ* and *Microlepidoptera* are more common.

The beetles are not numerous, including up to date only one or two *Carabonidæ*, one or two *Elatridæ*, one *Stilpæ*, some *Staphylinidæ*, *Dytiscidæ*, *Gyrinidæ*, *Carabidæ*, and a *Curculionidæ*, which I have seen at only a single place, although it is a conspicuous species.

Of crustaceans the fresh-water ponds have yielded a *Branchiopoda*, some *Gammaridæ*, one *Daphnia*, and one or two other almost microscopic species, which, I think, belong to *Cyclops*.

I can hardly write anything about the fishes inhabiting the rivers and lakes. It will be better to postpone this topic until next year, and I shall limit myself to a mere enumeration of the species observed by me up to date, viz., *Gasterosteus aculeatus* L., *G. calligaster* (Pall.), *Salmo edwardsi* (Pall.), (called *Golez* by the natives here), *Oncorhynchus lyacodon* (Pall.), (Russian *Krasnaja Riba*), *O. sanyuiniolentis* (Pall.), (Russian, *Kisidzh*), *O. prostratus* (Pall.), (Russian, *Gorbuscha*), and the "Balderskii" of the natives, which I have not yet been able to make out. "Sik" is the Russian name of *Gorbuscha*, but I do not believe that it belongs to that genus, as the mouth extends beyond the eye. Probably it is the same species called *Corygonus* by Nordenskjöld (Vega Expedition, American edition, page 618), as I do not know any other one to which to refer this name; the three other species of which he speaks are *Callarias*, *lyacodon*, and *prostratus*.

In my next report I hope to be able to add another Salmonid to the list of the species known (as I suspect the case) to the islands of the species of such a size.

Batrachians and reptiles are wanting altogether on the island, as might be expected. Dr. Dybowski and I have been searching very eagerly for a *Salomonatritia*, as we suspected the "Krygani," of which the natives told us, to be such an animal. It turned out, however, to be a large *Dytiscidæ*.

The ornithologist starting for Bering Island will probably prepare himself beforehand for hunting and collecting two large, rare, and interesting birds, viz., *Agelaius phoeniceus* (Pall.) and *Phalaropus perspicillatus* Pall., as Pallas, on Steller's authority, gives Bering Island as their habitat, where they occurred in abundance. You will not be more disappointed than I am in learning that there is no hope whatever of getting a specimen of the latter, and very little of obtaining any of the former from Bering Island.

It is not to be doubted that the *Phalaropus perspicillatus* does not occur on the islands at present. The next time, however, remember very well the time when it was plentiful on the rocks, especially on the outlying islet Are Kamea. About thirty years ago, they say, the last ones were seen, and the reason they give why this bird has become exterminated here on the island is that it was killed in great numbers for food. They unanimously assert that it has not been seen since, and they only laughed when I offered a very high reward for a specimen.

When Pallas gives Bering Island as the habitat of

Natural History.

THE COMMANDER ISLANDS.

[CONTINUED.]

I AM unable to send you at present a full description of the islands, as my sojourn here has scarcely exceeded three months. The following pages will contain merely some disconnected sketches of those things I consider to be new or of special interest. You will see, besides, that they are, with a few exceptions, all of the species occurring here, of course, has been the main object of my studies and observations. The collections of marine animals are as yet insignificant.

My stay here has as yet been too short, of course, to allow of exhaustive generalizations with regard to the zoological relations of the islands, the more as I have been able to identify with certainty only a small portion of the animals which I have collected. But I feel compelled, as it has been supposed to be. Such being the case, you will not find it surprising that the faunal character of the island agrees more or less with that of Kamtschatka. * * *

The islands during the period previous to which they received their present fauna and flora were totally covered by the sea, and that since that time they have not been connected with the mainland on either side. From this it would follow that the species occurring here are not true indigenes. They evidently immigrated, especially and more regularly from the west, from Asia, by means of prevailing winds, currents, and the driftwood carried by these, and more accidentally from the east, from America. That the inhabitants, more independent of those circumstances, likewise show nearer relationship to the Asiatic fauna is partly due to the shorter distance, this being only 100 miles from the nearest cape of Kamtschatka, Cape Kronotski (which by the Russian man-of-war Vestnik, this year has been found to be situated twenty miles more to the westward than given in the charts), while the nearest island of the Aleutian chain, Attu, is twice as far off; and partly to the effort of the Asiatic fauna to extend beyond its own limits. It is a well-known fact that the Asiatic fauna is in a continuous and comparatively rapid motion toward the west, especially in northern Europe. But it seems to me that a similar movement takes place in the eastern part of Asia, only in an opposite direction, the proof of which I find in the not inconsiderable number of exclusively palaearctic forms in Alaska, especially among the birds. I here enumerate only *Cyanocitta*, *Scolecida*, *Phylloscopus*, *Pyrrhula*, *Perisoreus*, *Obolops*, *Cab. c.*

It is true that the zoogeographical regions overlap each other, but their boundaries are, for the most part, well defined, and contributes but very little to the fauna of the eastern part of that ere long we will detect still more Asiatic forms in Alaska, and that hereafter it will be necessary to register as

gest names for representatives of the New York Association at the meeting of the National Forestry Association at St. Paul, in August, was adopted. The meeting then adjourned subject to the call of the chairman. The Senate committee subsequently held an executive meeting for the purpose of discussing the best method of examining lands in the Adirondack region.

A BIRD BATH.—Your notice in the last issue of FOREST AND STREAM, of the fondness of birds for a bath in hot weather, reminds me of a scene very familiar to me during my rambles in search of specimens through the cedar groves of Bermuda, during the hot weather of the island summer. The peculiar formation of the group affords in several places depressions of the earth's surface, which have evidently once been the floors of so many small caverns, now minus their roofs. These miniature tanks after rainfalls fill to the brim, and being water tight retain the liquid for several days, if in a shady spot. To these welcome baths the gradually-plumaged cardinal grosbeak (*Cardinalis virginianus*), locally termed "red bird," lies during the hottest period of the day, and one of the prettiest ornithological sights I have ever beheld, was that of a small flock of males, in full serelet livery, performing their ablutions in one of the fairy pools situated in the midst of the dense *Lantana* scrub in some retired part of the island. They were very tame, and the least high and stooping down, flapped their wings violently enough to send the spray to a considerable distance. Having well wetted the feathers, they would hop on to the elevated rim of the tank and as violently vibrate their wings again, rubbing their whole bodies with their beaks, and soon drying the whole plumage. Then up into the branches of a neighborly cedar, and with a loud "faw, twe, twe," they were off to their daily routine. The only other birds of the other common resident birds of the island, of which there are only four—blackbird (*Melospiza carolinensis*), bluebird (*Sialia sialis*), chick of the village (*Troglodytes aedon*), and ground dove (*Chamaepelia passerina*) indulging in a bath, and this induces me to believe that the *Tringidae* are of all other land birds, perhaps, the greatest lovers of a bath.—J. MATTHEW JONES (Fern Lodge, Nova Scotia).

LOCKED DEER HORNS.—South Bend, Ark., July 10.—An old trapper found near here about three months since, a curiosity in the way of two pair of massive deer horns that were locked together by fighting, and in such a manner that it is impossible to pull them apart. He stated to me that he supposed the two bucks had been dead probably three or four months. The four horns, and the two pairs of their frames, that they must have been tremendous big deer. They will be in the Arkansas exhibit at the Louisville Exposition.—E. T. B. [We have a pair of such locked horns in this office.]

RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—Received by purchase—Two gray squirrels (*Sciurus carolinensis*), five hawks (*Castor fiber canadensis*), one tamarina antelope (*Tamandua latirostris*), two cassowaries (*Cassuaris casuarus*), six manatees (*Trichechus manatus*), one Peruvian thicknee (*Edentomys superciliosus*), one Cuban parrot (*Chrysotis leucophthalmus*), one diamond rattlesnake (*Crotalus adamanteus*), one red fox (*Vulpes fulva*), one woodchuck (*Marmota monax*), one white rabbit (*Lepus sylvaticus*), one otter (*Lontra canadensis*), one robin (*Turdus migratorius*), three yellow-headed woodpeckers (*Colaptes auratus*), one fish hawk (*Pandion haliaetus*), one osprey (*Pandion carolinensis*), one barn owl (*Syrinx flamma americana*), two banded rattlesnakes (*Crotalus horridus*), one water snake (*Protophylopsis natrix*), one water snake (*Protophylopsis natrix*), one blue snake (*Basiliscus constrictor*), one pine snake (*Pituophis melanoleucus*), Bora—Seven Virginia deer (*Cervus virginianus*), one Oryx (*Oryx capensis*), one water buffalo (*Bubalus bubalis*), one llama, two hoppers (*Castor fiber canadensis*), nine valley quail (*Lophortyx californicus*), four pea fowls (*Pavo cristata*), and three mallard ducks (*Anas boschas*).

Answers to Correspondents.

SALEM, N. J.—Can you let me know what you bait with to catch carp in a pond. Ans. See reply to "R. M."

A. SICK, New York.—What is the best bait for black bass? Ans. The best is a minnow, or a chub, or a dirlip, minnows, frogs.
W. W. New York.—Please inform me of the best and nearest fishing place to Sing Sing, N. Y. either salt or fresh water. Ans. There is a little fishery in the Tappan Zee, or Tappan Bay, as that part of the Hudson opposite Sing Sing is now called, but it is not reliable. The best and nearest salt water fishing is New York Bay, or Long Island.
T. F. M., New York.—I am desirous of stocking a small lake in Westchester county, N. Y. with bass. Can you tell me whether I could, by addressing Mr. Seth Green, secure that end? What is Mr. Green's address, and what charges, if any, are made by him in sending trout to the above address in Westchester Co. N. Y. directly to him.
Ans. I. We cannot say whether there are fish there or not. Try trout, or brook trout, or golden spoon, or cut grass, or cut two or two more pounds of lead two feet above the spoon, row slowly. Try also trolling with a minnow gear in the same way. 2. The guns are so heavy and so awkward and so dangerous that your decision must depend upon your individual choice.
J. B., Augusta, Ga.—Will you please inform me if a small hand machine for making fishing lines can be prevented and from whom? Ans. We do not know of such a machine. Fishing lines are now made by machinery in large establishments. The makers deal entirely with houses in the wholesale fishing tackle trade and do not advertise, consequently they are unknown.
R. M.—1. What is the best way to kill trout when caught? 2. Are Green Goby and yellow perch and white perch, all good eating? And put the second joint of the forefinger in the mouth, and the thumb on the back of the head, and bend upward until the neck is broken; 3. Can a knife be used in the same way? 4. Can you give me a recipe? They are taken with boiled peas, a paste made with mashed potato and dough, and also with the worm.
Ans. 1. As you have considered the strongest, most durable, and in fact most desirable, a twisted or a braided line? supposing both to be of the same thickness, or diameter. 2. Which is the best? 3. Can you give me a recipe? 4. Can you give me a recipe? 5. Can you give me a recipe? 6. Can you give me a recipe? 7. Can you give me a recipe? 8. Can you give me a recipe? 9. even bringing up their boats to trap, snare, and sell quails (called "colin," when you don't want them to know what you mean), taking them to market with only a pinched head, or broken neck, when a simple punch with an awl, or a jab with a fork would enable them to swear they shot them, about as much risk as a party of sportsmen would incur by inserted in the hole would satisfy any petit jurymen of modern times.

You will see the expediency of educating the farmer and his family up to the standard, so that he may be led to divide with you occasionally when you cannot, consistently, provide your own table with the luxury of game in season, or any other time.

REVISION OF THE TARIFF.

While some may doubt the policy of mixing our affairs with political questions to any great extent, I would ask your careful but cautious attention to the protection of game, which, by a moderately elastic construction may come within the "tariff for revenue" side of the case. Game, if properly protected (from observation) can be made to produce revenue at all seasons of the year. Your wise consideration of this fact is respectfully suggested. Trout, grayling, and other protected game fishes will come under this head. You must not consider that I recommend any interference with game, as understood by another branch of the sporting fraternity. I allude to poker, both straight, draw and trunk, keno, faro, croquet, polo, tennis, charades and base ball. The various varieties of pool properly belong to the Fish Commissioners, who would carp at any officious intermeddling in that channel. The influence of these classes of game upon revenue is so uncertain, that I advise you to be very careful to look over your hands the second time previous to risking money upon their value. I may, however, be allowed to hint, as my individual opinion, the policy of reforming the rules now in vogue as to the Jack pot, so called, which is a destructive modern invention, and gives capital an undue advantage over labor, induces and encourages stakes, causes localities to demand so high exorbitant prices supply that production is stimulated to such extent that decks are overloaded, holds are full in flush times, when many rash speculations are made, resulting in disaster in the call. I may safely leave these matters to your mature judgment, trusting you will deal fairly with them when it comes your turn.

IN CONCLUSION.

Thinking you, who are still awake, for kind indulgence and the deep interest you seem to manifest in my remarks, and that you will not disturb them by falling into slumber, nor attract the attention of the police, by an enthusiastic applause, I beg to close by tendering my heartfelt gratitude to you all, for the honors so often conferred upon me, only asking you to attend my funeral in a body should I die before a quorum shall be present.

A. H. HERBSTON, President E. S. G. P. Club.

EAST SAGINAW, Mich., Jan. 7, 1883.

STAR WADS.

Editor Forest and Stream:

Under the above heading in your issue of June 21, one of your correspondents asks for some information from those who have used them. My experience has not yet been very extensive, but as far as it goes is decidedly in favor of the star wad. They have held their place firmly in place in every shell in which I have used them, whether in new paper shells or in those which I have unloaded.

My gun is a W. & C. Scott Damascus barrel, 22-gauge, choked to 14 at the muzzle, and I do not find that there has been the least injury done to the barrels. I am convinced that these wads cause the gun to shoot closer than when a cartridge is crimped. As evidence of this fact, I was shooting clay pigeons on the fourth of July, and found that I must get directly on the object or I would miss it; and then, as a further test, after others had shot and missed several, I shot, and broke them at least 50 to 60 yds. distance; all of the time I was using 3 drms. of Dupont No. 2 powder, and 14oz. No. 8 shot. The metal of which these wads are made is so soft that it would appear impossible to injure the barrels of a gun, and yet they do hold the paper wad down very perfectly. J. H. T.

New York.

GAME IN COLORADO.

THE game in Colorado is fast decreasing, owing to the non-enforcement of a not very stringent game law. Your correspondent interviewed one of the oldest and best-informed sportsmen in the State. He said that within the last fifteen years buffalo could be found within a few minutes' ride of Denver in numbers of thousands, and antelope could be seen in the outskirts of the city. In fact, about six years ago one wandered into the city during a blinding snow storm. Some four years ago, during the month of January, when the antelope made their appearance, after a severe snow storm, hunting for food, 285 were killed by stag hounds, near the exposition grounds. This was during the close season. It is only a few years ago that the black-tail deer could be found within two hours' ride of Denver; and also that famous animal the Rocky Mountain sheep could be found in large numbers in the neighborhood of Bear Creek and Clear Creek Cañon, while the cinnamon, black and grizzly bears were abundant enough to satisfy the most bloodthirsty tourist.

With the advent of the railroads into the mountains all this was changed: not the employes of the railroad companies, from their contracts to the land, but the game that was their property and slaughtered indiscriminately, in season and out. In places where the railroads do not reach, the stockmen and desperadoes kill the game, blow up the fish with dynamite, and in many cases kill deer in the close season for their hides only. Even the well-to-do stock raisers, men who would consider it an insult if you accused them of breaking down the mountain game, have been in the close season justifying themselves by a clause in the game law which allows a man to kill game for his own use only. Buffalo cannot now be found within 600 miles of here, while only fifteen years ago there could be seen thousands of them. This may sound exaggerated, but it is a bare fact and can be proven.

The Legislature here is not competent to enact a suitable game law, and unless the people will elect men that can appreciate the value of the game and fish to Colorado, things will get worse instead of better. It is a well-known fact that Eastern and foreign sportsmen have contributed in no small degree to the welfare of Colorado, and if the game is protected, she will lose one of her greatest attractions to tourists. Wealthy men come here in search of health, rec-

reation and good hunting; and in many cases have located here and greatly increased the prosperity of this State. If the game be exterminated, the attraction for the moneyed tourist is gone, and Wyoming or Montana will reap the benefits that Colorado can and should have. There are in this city of Denver men who, if they would, could do a great deal to stop this illegal killing of game, and if they can only be persuaded to set the ball rolling, will find plenty of supporters in the other towns throughout the State.

In Grand county some prominent men who have openly violated the game laws only a few days ago, shot each other, which proves, in this State at least, that a man who will break the game laws will commit murder.

When the citizens of Colorado awoke to the fact that she is fast losing one of her greatest attractions, then they will enact and enforce a law that will protect the game and fish, but unless they do this very soon it will be too late.

THAT OFFICE BOY.

DENVER, Colorado, July, 1888.

A REVOLVER STORY.—Editor Forest and Stream: Your readers have undoubtedly all heard of the traditional lunatic, who, during the heat of an engagement, loaded six charges of powder and shot in his musket, one above another, in order to get six successive whacks at the enemy without stopping to reload; also, of the fellow who goes hunting one year in the summer time and always manages to ram two big charges down one barrel of his gun at a critical moment, when he sees a red squirrel smiling at him from the opposite side of a tree limb. What I want to chronicle is a newly-discovered method of compound loading, which certainly beats both the foregoing by a vast majority. Last summer my brother Walter, accompanied by several other boys, went down the Ohio River a few miles from town, and while in a grove tried target shooting with a 7-shot, 22-caliber revolver. Strange to relate, after each discharge no bullet marks could be found anywhere. At length, when the shooter tried to cock the revolver for the sixth shot, he found the concern would not work. In the investigation which followed a remarkable discovery was made in the barrel. There were six tightly together, one behind the other, were the five lost bullets, jammed into one mass, with the tail end of the fifth bullet projecting into the cylinder and clogging its action. The cylinder was found to have been put into the revolver out of a true line with the barrel, and the bullets, moreover, being rather too large and tight for the weapon, they had lodged, one upon the other, in the barrel, and, as a result, the way is why the tool didn't blow up. As the inventor would say, "The facts in this case are entirely true."—W. (Kentucky).

WESTERN NEWS.—Mexico, N. Y., July 9.—I fear that the fall shooting in this vicinity will be a failure; at least will afford but little sport to local sportsmen. In talking with a gentleman yesterday (who always keeps his eyes open) he said we would have a few woodcock as he had seen one or two broods in his rambles. Big and Little Sandy ponds have been mentioned in your paper frequently, and, in need say nothing of them. Oswego sportsmen could, in part, if not entirely, all the duck shooting at both ponds. The ruffed grouse is no longer seen in this locality, I don't suppose there are twenty-five birds in the county. In my early boyhood I used to find a coivey in almost every piece of woods. Now there are none. "The parasito or worm and not the hunter that has destroyed our best game bird. The bass fishing is good, and continues good, though I understand that the best fishing is found at Captain Sam Nichols', up the lake and nearer to Oswego.—J. W. S.

THE CHARMS OF FLORIDA.—There are hundreds of your readers, who like the writer, have spent winters delightful and pleasant to remember among the lakes, the woods and marshes of Florida. Go there from the snow and ice, the slush, wind and rain of our northern winters; camp (not in the hotels nor among the "crackers," but) in your own tent under the pines; sail in your own boat; leave the lines of tourists' travel; go anywhere in South Florida and good sport with rod or gun can be had for those who seek it patiently and do not expect too much. As for the climate, it can restore weak lungs I know from experience. I also know that in the southern end of the Peninsula it is usually dry, delightful weather from January to April. For fishing, where can it be equalled? Of game there is enough, except for those who wish to slay their thousands in a day, and all from the deck of a steamer.—G.

REED BIRDS AT THE SEASIDE.—In stating that the reed bird was never found near salt water, I only intended to convey the idea that the bird was not abundant in such localities, or in numbers that would warrant their being sought for, and thus criticized the article referred to. They are plentiful in season, and in the best condition for the table only when they are feeding on the seeds of the Fresh-water reed, and then are not scarce. I have killed them in May for mounting in bobolink plumage near the seaside. Those shot, as stated, among beach plum bushes near the salt meadows could not have been in prime condition. Your correspondent has killed wild pigeons on the beach that skirts the New Jersey coast, but would not advise such grounds to be selected by the sportsmen. He has also seen a horse fly over the river.—Homo.

TEXAS PRairie CHICKENS.—Indiana, Tex., July 9.—Have had nice showers these last few days, and look forward to good prairie chicken and plover shooting on the 1st of August, when the season opens.—G. A.

PRAIRIE CHICKENS IN MINNESOTA.—Sauk Centre, July 10.—Fresque prospects are good for prairie chickens, as it is a dry season and has not been bad by flooding the marshes for any length of time.—Dell.

"BATES'S TRAVELS IN MINNISCOTA."—The editor of this journal wishes to procure a copy of Bates's "Travels in Minniscota," and will thank any reader who may direct him where the book can be found, or who may send to him the full title page.

A son of Mr. Henry Christison, living a few miles west of Winchester, Ill., met with a painful accident a short time ago which will cause him the loss of one of his eyes. While engaged in the usual work of a farmer, he was struck in the eye by a stone, which struck him in the eye, sinking in the pupil beyond the beard of the hook, making it necessary to have a surgical operation performed.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

A DAY'S SPORT AT CEDAR STUMP.

ON June 25, 1888, two veteran anglers might have been seen at Middle Dam Cañon, on the Rangley Lake, making preparations for a trip some distance away. Any one knowing the country and the men well would have said, "There is business ahead," and as the bunkboard was driven up in front of the camp, Judge P. and the Scribe stepped aboard, with lunch basket, landing net, and two good fly-rods. As the horses started down the road toward Cedar Stump Landing, the boys in camp being under the impression that they were up, and soon one remarked, "That means trout, for those two old coons know what they are about, and I have noticed a mischievous look about their eyes for the last half hour."

Three and one-half miles ride, and we left the bunkboard and walked down the old trail a half mile to Cedar Stump Landing. As we parted the alders and stepped out on to the rocks by the riverside we looked down the water level to the still water below the rapids. The trout could be seen breaking water in a half dozen places at a time, but entirely out of our reach.

"A boat, my kingdom for a boat" broke forth from the lips of the Scribe, but no boat was to be had, and the next day he does not intend to fish the "spring hole" and the rapids. Carefully creeping out on the rocks to understand what was up, and soon one remarked, "That means trout, for those two old coons know what they are about, and I have noticed a mischievous look about their eyes for the last half hour."

"I say, Judge, this looks like business—both fast to large fish at once."

"Yes, Mr. Scribe, we've struck it this time."

"We can't work our fish up near the top," said he to them, and "Chubs, by thunder," when the Judge unlocks two chubs weighing nearly two pounds each, and they were whacked on to the rocks in a way that indicated great displeasure. About this time the Scribe's face took on such long dimensions that it is not necessary to say that he had duplicated the Judge's catch of chubs. We kept at work, however, until the kind of game was well cleared out, and when we concluded to wade back to the rocks, we saw the water in the pools quiet down, then try again; for we were sure there were trout in them, and large ones at that. Ten minutes' rest and the Judge decides to go up stream some six or eight rods to a nice looking pool, while the Scribe leisurely walks about two-thirds the way across the river, clearing the flies for long east toward the "spring hole."

"The time, and the flies came dancing in, and the Scribe spotted intended." "Great Scott! what a trout he is two feet long if an inch!" but he just missed the stretcher fly and was gone like a flash. At that instant a cry is heard from the Judge, above the roar of the waters, "Come with the landing net," but the temptation was too strong, and the Scribe made another cast.

"You people fishermen! Ye penurious stay-at-homes! Ye gingerly fellows that are afraid of a little tar and oil and a few mosquitoes, and ye who dig and delve from year to year, and will not take an outing and bask in the golden sunlight, and wander through the majestic forests and by the peary streams. To you I do not address myself. It would be casting pearls before swine, but to the man who can swing the fly-rod and who understands the gentle art, and loves the woods and hills, and hears the shore water register as his gliding notes float through the green valleys and from the mountain sides, to you I would say: The ecstasy of the next moment cannot be described, but you, and you only, can understand it well.

The sun had struggled through a rift in the clouds, which gave the rippling water a bright golden tinge, through which the form of a trout was seen within a moment. The fish of a rainbow as he plowed upward and upward through the rushing water, and with a splash that would have given an amateur the "buck fever," closed his huge jaws over the light-winged "Montreal." A strike, a "twang" from the line, and a rush of sixty feet down stream, when the old and tried ten-ounce split-bamboo says, "Whoa!" and I find that the form of a trout, an eighteen-inch one, four or five pounds, and a stubborn fighter to the last. But I will not weary Forest and Stream's readers with a repetition of the playing and netting of a trout when it has been done so many times before. Suffice it to say, that I had forgotten the Judge, who had towed his two-pound trout ashore and saved him, and now stood by my side, and, as he gently slipped the net under my trout, quietly remarked: "I saw the whole business, and was well pleased."

After a short rest we struck out again, and in a half hour, we added to our catch two more trout weighing three pounds each. At this juncture the Judge concluded to cross the river and fish down toward the still water. I was busy eating for a large fish that would rise but would not take any fly I had in my book, when I heard a tremendous splash across the river. I glanced across and, O horror of horrors, no algae to be seen, but only a hat, struck into the water, which finally makes its way to the shore and slowly rises from the water with something in the shape of a man under it, and both disappear in the woods. I never allow myself to laugh at other's misfortunes, but this thing was so sudden, so unexpected, although I was told by a near relative of the Judge, that if he got excited he was liable to fall in, and I had seen him, and I will not wear Forest and Stream's readers with a repetition of the playing and netting of a trout when it has been done so many times before. Suffice it to say, that I had forgotten the Judge, who had towed his two-pound trout ashore and saved him, and now stood by my side, and, as he gently slipped the net under my trout, quietly remarked: "I saw the whole business, and was well pleased."

One o'clock P. M. found us both together, with clothes dried, dinner eaten, ready and eager for the fray. I said to the Judge: "There is a large trout left at the spring hole, and by going well up the stream and making long casts, I guess you can raise him."

In less than ten minutes he was fast to his fish, up and down the river, across the current, over and around the rocks, at times nearly a hundred feet away, the Judge played with his fish. After twenty minutes fight his troutship was forced to the top of the water with the fight nearly all out of him, his great, broad, red sides showing him to be a big fish. I stepped in just below the Judge to net his trout, but the first movement of the net towards him, started him down stream with the speed of a race-horse, and carrying the line directly across, and as he headed up stream nearly around my legs, but by lively stepping he was fisherman and towed up stream to shallow water, where I slipped the net under him, and the Judge scores his first five-pound trout in a rapid river. Imagine a well-built, broad-shouldered man of 67 years of age, with a large drab hat, with broad brim turned down all around, and another man of 55 years of age, who hopes to fish for many years, with light wool hat turned down behind and up in front, with net in one hand holding the noble fish, and the other extended to grasp the hand and congratulate his older friend on his success, and you have our picture about as near as I can make it.

After taking two more good sized trout we decided to walk back to camp. As we passed South Lodge Pool we whipped that a few minutes and added enough trout to our string to make up plump twenty-five pounds weight of fish, every one taken with a fly, and seven of the largest pulled the scales down to the twenty-one pound net. But I am a trifle, four miles. It seemed to me that it was the heaviest string of trout that ever took into camp. The day's tramp, the netting and tugging home the fish was "solid business," but I venture to say no two sportsmen in the Maine woods make a better catch of trout that day, or sleep a sweeter, sounder night's sleep than did the Judge and the Scribe, the night after they "interviewed" the big trout at Cedar Stump Landing. SCRAE.

PENNA., Conn., July 12.

SOME ADIRONDACK RESORTS.

YOU solicit correspondence from fishing localities, and as I happen to be one of those fellows that "Dixons" tells about—that occasionally hurry forward at a double-quick trot to publish anything they know—I am very glad that I am able to inform your readers where good sport can be had, as well as also a good hotel, and where they can find aylvan landscape without a thoroughbred cow watching the fisherman cast his fly, and where you can risk a dose of shot by two balls of fire without being embarrassed with a lawsuit for having cruelly murdered somebody's thirty-year-old horse. Where is this enchanted and much-talked-for region? Let me whisper it gently—Franklin county is the place—and the greater part of it lies in the most primeval part of the Adirondacks, where lakes, ponds and streams are too numerous to mention, but each of which abound with trout. Some of the lakes have well-appointed hotels near their shores, good meals, guides, boats can be had very reasonably. Those who wish the better sport of camping out, can find lakes where they will be alone in their solitude, and they can imagine themselves monarchs of all they survey: the fine back on the shore inclusive, provided you can bag him.

To reach this part of the mountains it is best to come by way of Malone, which is on the Ogdensburg & Lake Champlain Railway. It is a place of 8,000 inhabitants, and one of the liveliest places in the State. A drive of ten miles will take you to the mountains, or fifteen miles north, to the St. Lawrence River. At both the river and in the lakes and ponds, the fishing is the best known for years, and from present outlook, deer promise to be plenty for fall shooting. Those of your readers, therefore, who are yearning for a dose in some vast wilderness, where he can soothe his tired brain and expand his aching limb, will say: "Come over into Macedonia and help us—catch trout!" F. S. C.

N. B.—Artists will find the usual number of pretty girls, each with a stern father, to fall in love with. MALONE, Franklin county, N. Y.

BLACK BASS IN THE MOHAWK.

AS a constant reader of your valuable journal, I find many good things, and much valuable information in it. My especial interest, however, is in the columns devoted to angling, and it amuses me (while it appears a little singular) that the only persons who write of their experiences among the many tribes, are those who have both the leisure and means to pursue the sport, either in the streams of the Adirondacks, the granite hills of Maine, or the balmy atmosphere of Florida. None seem to dare to eulogize the cause of the historical Mohawk; so sweetly sung about years ago, or tell of the royal sport to be had within our very borders.

So it occurred to me just now, while reading the Ponceas article, that I should be less than grateful if I failed to speak for that noble stream where I've spent once in a while a day. I always go when I can, and been well repaid by lots of fun black bass fishing. And I was reminded when I sat down to write, how on one bright Monday morning I seemed to have an insatiable desire for a day's fishing. I well knew that a brother-in-law, a royal good fellow, would be sure to be at his favorite grounds, Fort Ferry, a point about eight miles from Troy, N. Y., so I would be sure to get company. This only served to increase my desire. By the way, the fish would come up—"Business, my boy, before pleasure." So I bustled around, did up my chores about the barn, went into the house to change my clothes preparatory to going to my office, when it occurred to me that possibly there was nothing needing my special attention; if so, I could hook up my horse, put my baskets and rods in the wagon, and in about a half an hour be at the Ferry, and keep Frank company. I didn't change, but ran down to my office like a boy, poked my head inside of the door and said: "Anything needing my attention?" My assistant looked up with a smile on his face, (he knows my falling) and "no," came out. "Well, I won't be here to-day." Back to the house, looked up and was off. Pony was feeling good, and in an hour I was on my way to the Ferry, my horse put away in farmer Sharp's barn, and I set out to the bank.

I soon espied him, hallooed to him to come ashore and take me in his boat with him. Up anchor and ashore he came. "What luck?" "Poor, 'tain't a good day." "Well, well"

try it." So off we put back to his old anchorage. Soon had my rods (we both used two rods, and at it we went. "Frank, they are here, I feel 'em, and I've got him!" And so I had. A good fight he made. I kept cool as possible, for I knew he was a good one, and a single leader and snell would not hold a whale. But I had faith, to which I added work, and soon swung the beauty alongside, too tired to make any fuss, and quietly lifted him into the boat. "My boy! a good four-pounder!" says my companion, "he's a beauty!" I say, "I've got him, and I've got him, the heaviest weighing not less than a pound. On my arrival home I found a call that obliged me to go down street at once. On my return I asked, "Who cleaned those fish?" My wife responded, "I." "Did you weigh the large one?" "Yes, and he weighed a trifle over three pounds and a half after he was cleaned and his head taken off." So you see he was full four pounds and over. And this within ten miles of Albany. We don't say much about such things here, but we have the fun all the same. Just as I was about to start a four-pound black bass at the end of a nine-ounce rod is the cause of fun, and a kid I'd go many a mile to have.

ALBANY, N. Y.

PIGEONIX.

GOOD BLACK BASS FISHING.

BLACK bass fishing has a charm for the angler beyond any other sport in this part of the country. One as enthusiastic as myself cannot hold himself contented till the law allows them to be taken in this State or in Pennsylvania.

When the balmy air of May comes and a gentle shower bedews the earth, when the angle-worms begin to air themselves by lamp-light and the oriole chirps his sweetest notes, the fever seizes me. Gentle reader, have you ever had it? Well, it is a purely nervous disease, originating in the brain, and is partly hereditary and the other half acquired.

It comes on strongest when we have the most to do and cannot possibly get away from home; thus, the trouble is tenfold intensified. A prominent symptom is the blues; then comes pouting, distaste for work or study, in fact, one has no taste for food, and lastly a fit of insanity comes on, and nothing short of stopping everything else and taking the rod and a flies cures the disease.

When you have reached the haven of your joy, the rod is stung and the oarsman pulls you to the bass grounds; then a three-pounder strikes the leader like a lead ball of thunder. Soon the glassy eye begins to tear, the back stiffens, and the muscles grow tense; then "Richard is himself again," the disease is cured.

Some sportsmen go to one place and some to another. Now listen while I tell you where I go. For five consecutive years I have spent one or two weeks in Wyalusing, Bradford county, Pa. There is the best bass and pike fishing in the section of the United States. This sounds large, but I think it is so or I would not go out on the beautiful Susquehanna, less than a mile from the hotel, in the early morning and capture forty or fifty black bass, and get home to eat; all of them tearing fighters, weighing from 1 1/2 to 4 1/2 pounds each. Now and then I have hooked well-eyed pike weighing from three to eighteen pounds each.

A party of four with me last summer caught fourteen pike besides great numbers of black bass in one day. The fly-fishing and trolling is good, the bait-fishing excellent. The first day I went out, three or four years ago, I took forty-two very large ones; they were a back load for two landlors.

There is every facility there for comfort—good hotel accommodations at one dollar per day, good living at reasonable rates, good boats, and any quantity of bait at a low figure. The bait that kills the most fish are minnows, the second best clippers or helgramites, also called doberies. Quail are abundant there; also woodcock, partridge, and black and gray squirrels.

Go the last of July and stay till the middle of August, and you will be well paid. *Those who wish to go can do so via Lake Valley Railroad. The air is salubrious and the scenery grand. M. M. B. SCRUGOISE, N. Y.

THE FISHERIES EXHIBITION.

FISHING was a far earlier mode of supporting human life than agriculture. However far back in the stream of terrestrial events we may suppose it allowable to carry the date of man's appearance on the scene, still he must have been preceded by fish. The rivers, lakes, and seas, when he first looked upon them, must have been peopled very much as they are at this day. There was as great a variety of species, and probably much the same infinitude of individuals in some of those species. And as a savage population must be always sparse, and in any locality few in number, his unimproved state was worth cultivating. The suitable form had to be evolved or created by long processes of observation and selection. This is why we know nothing of the parentage of wheat, barley, oats, rice, beans, or maize; and why the tropical breadfruit, plantain, banana, and sugar-cane have lost the power of producing seed, and so of reproducing themselves; this must have been a result of long ages of human selection. Nothing of the kind had to be done for fish. There it was as fit for human food as the first day that man stood on the river bank, or the sea shore, as it is at this day. Agriculture also required implements to clear and stir the ground, and to gather in the crops with; and these implements we know were the result of a long series of discoveries, improvements and advances. Primeval man, therefore, as we now read his history, could not have lived by, or known anything of, agriculture. Nor could he have lived by wild fruits, fish, and game, not continuous throughout the year. They have their season, and that is brief only. He must have lived by hunting and fishing; and of the two fishing would be the most continuous and unvarying throughout the changing seasons; the most valuable of all qualities for those ill-supplied times. It would not be more difficult to hook, and spear, and net, and trap and fish, and to gather mollusks from the rocks and sandbars, than to learn to till, sow, and reap. Our immediate comparison, however, is with agriculture; and we may be sure that not in it were the foundations of society

laid, but in hunting and fishing; and that of these two, as the great founders at first had possession of the forest and of the plain against intruding man, fishing was the main primeval occupation, and means of subsistence.

Vigil notes that it was their wants that sharpened the wits of mankind (*curis acens moribus cohibet*). There is no inquiry more interesting, or indeed that we are more concerned in, than that of how the human mind has grown to be what it is in ourselves. The fishing, which was an initial, and a very long stage in man's career, has had much to do with the growth of the industry of mankind, and with the ends, and the patience required in the fisherman, when he had to go without food if he could not catch fish, was one of the earliest, most general, and most powerful stimulants of his mental development. He had to elaborate the idea of the hook and line, and of the net, while as yet there were no materials for them except for the hook, wad and bone, or for the net but the intestines of animals, strips of leather, and some very poor vegetable fibres. To work out the conception of these instruments with nothing to start from, except a knowledge of the existence of the fish, and to put them into form with no other materials than those just mentioned, required much observation and thought. Here was the first human training that mind received. The habits of the fish had to be carefully noted, and the instruments nicely adjusted to the conditions under which they had to be used; no other mental quality, or early pursuit drew out and established was that of patience, both patience in waiting, and patience under exposure to heat, and cold, and wet.

After a time a further step was taken; there arose in the mind the thought of pursuing the fish on their own element, at a distance from the bank, or the shore. This must have been first attempted on a log of wood, then on two or more logs fitted and tied together, which would be a kind of raft; then on a burnt-out, or dug-out, trunk, which would be a canoe. We are thinking, by the aid of what may still be observed of the ingenuity of savages, and by the light that can be derived from prehistoric archeology, of what were the attempts of the primeval savage to extend the area of his fishing, in times prior to the possession of iron tools. Some, instead of using the trunk of the tree, may, like the North American Indians, have used its bark; others, like the Eskimos, may have constructed rafts of hides; others of the skins of seals, like the Eskimo boat of walrus hide. Fruitful germ. It was not commerce that set man afloat on the waters. We are looking back into times long antecedent to the first beginnings of commerce. When in a very distant future the time for commerce shall have come, the vessels and the men to navigate them it will require, will be ready for it. It will not have to invent the one, or to train the other. The fishing craft, step by step elaborated, and the knowledge of how to manage them, vessels slowly accumulated by the fishermen of the antecedent periods, will be the machinery of transport for nascent commerce. Its first essays, therefore, were made in undecked vessels, drawn up on the beach at night and in bad weather. Between them and the ocean shipping of our day the distance is great, the steps are many. The first step, however, of all was taken by the primeval fisherman. His log and his dug-out have been the starting point in him. He originated what at the time was a new art, as the conditions of their times required and permitted, only enlarged.

In looking on the early stages of the art and early industry of fishing, as far as we may recover its history from what may be found in caves and shell-mounds, we see everywhere all over the earth that, however much men may have differed in the conditions of their lives, and in their climatic and other surroundings, they hit upon the same contrivances for capturing their early prey. Everywhere there was an adaptation of the idea of the hook and line, and of the net which would allow the water to pass but not the fish. Among all tribes of men in all latitudes these were the primitive ideas and practices. Then came the contrivances for floating and moving on the water under the canoe. Since those days many devices have been invented, and have been made; command has been acquired over many new materials. The primitive ideas and practices, however, have not been departed from. The hook and line, and the net are still the universal implements of the fisherman. This sameness, however, in the apparatus among all people, which in the Exhibition is almost wearisome, has its interest and instruction. It shows the identity of mind, and as mind is almost mind, the identity of the race. All, under the most diverse circumstances, hit upon the same ideas, and followed the same fashion. The iteration in gallery after gallery of nets and hooks, and of hooks and nets, goes some way toward establishing unity as against plurality of origin in mankind.

It is also interesting, and somewhat of a corrective to modern pride, to see that the devices adopted by our earliest and rudest ancestors in this matter, have throughout all times been maintained, and are still practiced by ourselves. We have not worked out anything better than their original thought. Just so has it been with many other matters of primary importance. It was our prehistoric ancestors who subdued to the use of man the ox, the sheep, the pig, the horse, the dog. We are still benefited by their thought, their inexhaustible patience and their success. In this matter we have added nothing. So with the plants they selected and improved by cultivation, and the arts of spinning and weaving. In all these master arts of life we are only doing to-day what was done before even traditional history begins. Some of these processes we can carry on with greater ease and rapidly. This is all we can claim. For the idea of the thing, for thinking out how it was to be done, we are indebted to our remote unknown predecessors. We are as much indebted to them for all these contrivances, as we are to the sea and the shore.

It would have very much added to the interest and instructiveness of the Exhibition, if a page had been put in circulation on which were tabulated the estimated magnitude and value of the fisheries of the different countries of the world, and the number of hands they severally employ. Some particulars of this kind we will endeavor to extract from the notices contained in the Official Catalogue, adding as we go along such comments as may seem to be of any use or interest. Professor Leone Levi, on page 102, tells us that the fishermen of the United Kingdom number 120,000 men, and that the value of the fish they capture is £11,000,000. By these 120,000 men he means those actually engaged in fishing, for he says that with their dependants, by which I suppose he means women and children, they give a population of 400,000. To these, when we add the population of the fishing industry of the country, must be added all the people engaged in building and equipping

their boats, and in providing them with salt, barrels, etc., and in transporting and distributing the fish. This may be some way toward doubling the numbers already given for each barrel, clothing, etc., as it is necessary for fishermen as their boats and nets, and as the people who supply them with these necessities are as dependent on the fish taken as the fishermen themselves, they too must be added to our total of those who are maintained by our fisheries. This will in all give about 1,000,000 souls, or three per cent of the population of the United Kingdom. Of this calculation, however, only the 1,300,000 men and boys are ascertained by enumeration. This is about as many as the effectives of the British army, and nearly three times the number of the seamen in the British navy.

How Professor Leone Levi obtained the £11,000,000 he gives as the value of the fish taken in the British and Irish fisheries, he does not tell us. When in Scotland last year I was told that the take of the previous year had been sold for £2,350,000. Of this £2,000,000 had been taken at the fishing towns on the Aberdeenshire coast, which is a sum greater than the assessed rental of the whole county. Those of us whose memories go back to the days of old Smithfield Market will recollect that it used then to be said that more money was paid for fish at Billingsgate than for cattle and sheep at Smithfield. But this was before London had grown to its present size, and at present Billingsgate buys in a greater degree than it is now the fish market for the whole country.

It would be interesting to know the rank of the different fish in the order of value. I suppose the herring, the poor man's fish, would rank first. The Scotch sometimes export more than 1,000,000 barrels in a year. To this we must add what are reserved for home consumption, and to the whole of the English herring fishery the produce of which, as fresh herrings, bladders and red herrings, is, I suppose, mainly consumed in this country. Possibly the fish that would occupy the second place would not be cod or mackerel, but the sole, which is in season all the year, is a general favorite, and is seen in every fish shop in every town almost without fail every day, excepting when a combination of bad weather and low water has put an end to its most expensive fish, salmon and turbot, would, I suppose, in their respective aggregates, on account of the relative smallness of their supply, fall below cod.

To the fish already mentioned a great many other names must be added to complete the list of our common sorts—whiting, smelt, pollack, eels, halibut, skate, sprats, john dories, plicards, gurnets, haddock, ling, hake, red and garfish, not to mention trout and other freshwater fish. In Yarrell's work on English fish 221 species are figured and described. Far the greater part of these are gastronomically and economically useless. But the number shows how well adapted the seas which surround us are to fish life.

While endeavoring to form an estimate of our fisheries, we must not omit our mollusks and crustaceans—lobsters, shrimps, prawns, cockles, periwinkles, pippins, mussels, crabs, oysters. Most of these are taken in surprising quantities, but in none probably does the supply reach the demand. I do not know how many Norwegian lobsters are added yearly to the produce of our own coasts, but fifty years ago Yarrell mentioned that we took 1,000,000 of them annually from the Dutch, who had caught them on the coast of Norway. One would like to know what the supply of shrimps reaches. This is the fish which the poor woman, who after a day's or week's hard work, thinks some little addition to her tea table allowable, generally indulges herself in a pint of shrimps. Last year we took 2,650,500 pounds of shrimps from the Dutch.

The supply of oysters has long been deplorably deficient, and there appears no probability of our ever again being able to obtain what we were once able to get. Some sixteen years after a visit to the United States, during which I had seen how apparently inexhaustible is the abundance of this mollusk along their Eastern and Southern coasts, I suggested that we might draw upon them for supplementing our falling supply. Three years ago we paid them £70,000 for fresh oysters. But this source of supply is not to be depended on, for in the United States the people are so well supplied that the production increases so each year—the yearly addition being now about 2,000,000 souls—that they may themselves, before many years have passed, consume all that their coasts can yield.

Our opposite neighbors, the French and Dutch, the Danes, the Norwegians, and Swedes, in the matter of fisheries participate in our advantages, but not to an equal extent, for though they more or less fish in the same waters as ourselves, yet, as we have already seen, they have a one-sided, and an eastern coast, in addition to a western. They have a one-sided, we a four-sided fishing ground. Still they make a great deal of their sentient advantages.

The French are very successful fishermen. Boulogne, as many of us know, is great in fishing. It need not fear comparison with Yarmouth, Grimsby, Whitby, Scarborough, or Fluy. Unfortunately the French are not so successful in putting in an appearance at South Kensington. Since their great catastrophe they have shown great backwardness in coming forward in such matters as exhibitions, or indeed in any way, with the exception just now of filibustering in the China seas, and round about Africa, in places where they suppose—but in defiance of the possibilities of the coveted regions—that they will be able to establish profitable colonies. Their oyster fisheries are worth to them more than any other export commodity, and are highly profitable. In 1881 they supported 50,875 fishermen, who had 22,123 vessels, of an aggregate capacity of 150,000 tons. To these their report adds 55,485 riparian, men, women and children, who have to assist in the fishing operations from the shore. The produce of their fishing for 1880 was valued at 87,000,000 francs. In 1881 it was somewhat less through a falling off in the take of sardeles. Their oyster fishing is worth 18,000,000 francs a year.

The amphibious Dutch are bad to beat on land or water, but particularly on the water. Two or three centuries ago, they were the boldest, most ingenious, and most successful fishermen in the world. Amsterdam, their great trading port, was said to have been built on herring bones. For their export of salt herrings, and the wealth it brought them they were indebted to one Wilhelm Benckelzoon, a native of Beverwijk. When he discovered was a method of so salting the herring that they might be packed in barrels for exportation, for of course it was not to him first of all men that the idea of salting herrings occurred. Three centuries before his day the herring fisheries of the Baltic are mentioned, and in some way or other their produce must have been salted; and in 1290 dried herrings, which must have been

previously salted, are mentioned among the articles used in victualing a vessel sent from Yarmouth to Norway. What the name of Benckelzoon himself appears to have been the happy idea, not to dry them, but to pickle them in moist salt, and so pack them in bulk in barrels, with the certainty that they would remain unspoiled. This was a speedily effected and cheap process, and the result was a much cheaper and much better article. The great man died A. D. 1449, and was buried in his native town of Beverwijk, and a grateful country decreed a statue to his memory. The century after that the biggest port of the world had seen since the days of the Roman Caesars, the great Emperor Charles V., having capacity enough to understand how much pickled herrings had done for the Netherlands, went on a pilgrimage to this tomb at Beverwijk. But we cannot suppose that he went so far in his thoughts as to compare the effects Benckelzoon's discovery had had upon his country with the effects his own ambition, high politics and wars had had upon Europe; or that he asked himself which of the two, the herring emperor or the emperor, had been the greatest benefactor to mankind?

The Dutch now take in the North Sea somewhat over 200,000,000 herring annually. These are salted and barreled according to old Benckelzoon's receipt. They also take about 50,000,000 a year in the Zuider Zee. These, for the most part, are sold in bulk to foreign buyers, and are significant compared with those of the Scotch herring fishery, the export of which is 1,000,000 barrels or at least 709,000,000 fish. The Dutch have also a very large anchovy fishery in the Zuider Zee, which employs 1,200 boats, and in a good year gives 70,000 baskets of 3,500 fish each, or 250,000,000 anchovies. We pay them very large sums for fish taken by them in the North Sea, and they value us as a means of protection, and so of high duties on foreign fish, and before the days of packing fish in ice and carrying it so packed to market in steamers, we paid them, on Yarrell's authority, £80,000 a year for turbot, and £15,000 for the lobsters that were to accompany it to the table. The Dutch have also a very large cod fishery. A great part of what they take on the Dogger Bank is sold fresh. Of salted codfish Germany and Belgium took from 1880 to 1890 about 2,000,000 cwt. The Belgians are their numbers, large consumers of fish. It is sold annually to the amount of about £170,000 in the market of Ostend. More than half of this is taken by Belgian fishermen. The rest is bought, chiefly from French and English boats. We may suppose that Antwerp also does something considerable in the fishing business. A great deal, too, of fish is imported by rail from Holland.

The fisheries of Denmark proper are worth about £250,000 annually. The most important of the fish taken in the Danish waters are the eels of the two Belts and of the Sound. Germany is the chief customer for Danish fish. The cod fishery of Iceland is worth about 4,000,000, and the herring about 1,300,000 crows, that is together about £350,000 a year.

We have now reached the fisheries of Norway, which possess a higher historic interest than any of Holland. In Norway a far more considerable proportion of the population is employed in fishing than in any other country in Europe. As far back as we know anything about the matter, it never was otherwise. There never was a time known to history when its people did not obtain a large proportion of their sustenance from the sea. Nature had given them little on land, but in the sea more than she had given to any other people. She had also given them the habitable forms for building their vessels, and, at the same time, a coast which, with its innumerable fjords, was the most convenient in the world for fishing. It would have been strange if, at some time or other, something had not come of this combination of advantages; and something did come of it which has left its mark on the world. These advantages it was that a thousand years ago made them a such estimable sea-rovers. If the Norsemen had not been a people of hardy and venturesome fishermen, discontented with their own *terra firma*, they would not have settled in France; William of Normandy would not have brought the language of France and his Norman barons here; the language in which Shakespeare thought would not have been created; the English would not be what they are, nor would the people of the United States be what they are, as we have already seen. The Exhibition brings before us fish, fishing, and fishermen; and now we are carried back to a point in the history of our subject which invests it with profound interest. It was the fish, the fishing, and the fishermen of Norway which, at a peculiar juncture in the course of human affairs, originated and set in motion a series of events which formed the English race and their descendants, and which possess and make the life of the world. The forests of dreary Norway and the shoals of codfish that peopled its waters created the Norse sea-rovers. In him was the fountain-head of a stream of events which has already had more effect on the world than the conquests and laws of Rome; and the effects of which, through our descendants, will continue to expand till they are felt by the whole human race.

The exhibit seen by Mr. Brassy of the reproduction of a Viking vessel, which was lately found in a sepulchral mound in Norway, one of the most interesting objects in the Exhibition, and one, too, that is most closely connected with its purpose. We are afraid, however, that the vast majority of visitors as they stand by it will not feel so much emotion as they will think they ought to feel while looking at the exhibit, and that they will be disappointed when they speak to the mind of nothing beyond barbarian vanity, the cruel sufferings of myriads of harmless birds, and an enormous amount of misplaced human labor.

The present fish population of Norway, though it is in these days, compared with what are now the resources of other nations, relatively powerless, yet is in itself something considerable. The last census returned by the Government in 1870 or 1871 put the whole population, while 50,000 men, or 7 per cent. more of the population, are employed in the shipping business; that is, if the two be combined, 18 per cent; and if to these we add those dependent on them, we reach to half the population. Of these 80,000 fishermen, 26,309 are employed in the great Lofoten cod fishery in 6,800 open boats resembling the Viking vessel just mentioned. These boats are on an average of only 26,000 lbs. in weight, and in time must come when, vast as is this quantity of fish, none of it will be salted, but the whole of it packed in ice, and so carried by steamers and railways to the inland markets of Europe. Norway has the fish which all would be glad to get. She has also the ice for preserving it. The steamboats and railways for distributing it already exist. Nothing is required but the capital for providing the machinery for packing, the machinery for existing means of transport and for distribution, and the mind capable of

seeing what is required, and how it is to be done. On the other side of the Atlantic a single season would suffice for setting on foot the necessary arrangements in complete and successful operation. It is not to be done in the Old World, to time to feel and act as if the seas and national boundaries which separated us from one another centuries ago, were still as prohibitive as ever of intercourse and interchange.

In the northern cod fisheries, between the Lofoten Island and the North Cape, 14,000 men are employed in 4,000 vessels. In the southern fisheries, between Cape Stat and Tromsø, 2,000 vessels employ 10,000 men. To these three main branches of the cod fishery must be added some small deep-sea fisheries. These export together yearly 75,000,000 fish dried and salted, which if sold fresh would equal 375,000 tons. Norway is able to supply every family in Europe (supposing the number of families to be 60,000,000, each containing five souls) with thirty pounds of fresh fish annually. The export of pickled herrings is about 600,000 barrels a year.

The value of the Swedish fisheries does not reach £500,000 a year.

Germany has some advantages for fishing in both the extent and the variety of its water area. It has access to the North Sea, and possesses the whole of the southern shore of the Baltic. From its numerous large rivers, and the vast number of smaller streams, it derives a most abundant supply of fish. It derives very considerable supplies of many species of the salmon and carp tribes. But the most remarkable fact connected with its fisheries is their inadequacy to meet the demands of so large an inland population. Germany has, therefore, in these days of cheap and rapid transport, become a larger importer of foreign fish than any other country. Stimulated by its shortness of the home supply, the Germans have of late given much attention to fish breeding, and to legislation which aims at increasing the supply. Notwithstanding, however, all this, we find the city of Berlin exporting annually thirty millions of eel-fish, chiefly to Belgium and France; not at all because they are not appreciated at Berlin, but because the Berliners are unable to pay for them the price obtainable elsewhere. The introductory notice of the exhibition in the catalogue of the German part of Germany contributes to the Exhibition—makes mention of "prehistoric discoveries, which have brought to light surprising facts, which show how closely connected with the dawn of civilization was the practice of fishing." It goes on to tell us that "in historic times fishing was a highly important factor in the economy of the nation; and that it was to a great extent the source from which the Hausatic League derived its origin."

The facts connected with the fisheries of Italy that are most worthy of notice are the variety of fish captured, for the Mediterranean species outnumber those of the coasts of western Europe; the smallness of the money value of the capture (£1,600,000), compared with the number of men engaged in the fisheries (60,000); and the inadequacy of the supply for the exports amount to £260,000. The most valuable product of the Italian seas is coral. After that come the anchovy, the tunny, and the sardine.

The fisheries of Spain are no exception to the general paralysis which has in that country overtaken every description of effort and of industry. All kinds of deep fisheries have been abandoned. But even the small take of their inshore fisheries is more than the Spaniards themselves require, for they export fish to the value of about £30,000 a year.

The most interesting and satisfactorily executed introductory notice in the official catalogue is that of the United States Commissioner. It is everywhere quite intelligible. It gives all one wants to know, and states the grounds of its calculations. For instance, it distinguishes—and nowhere else do we find this distinction—between fish now received for his purposes by the fisherman and the wholesale market rates. We find that in 1880 the first price, that received by the fishermen, was nearly £9,000,000, but that last year, a great advance having been made in the meantime both in the amount of fish taken and in the prices, the wholesale market price must have been about £20,000,000. In the excellence and fish—there is an error in the original notice in their apparatus and implements, in the size of the vessels employed in the extent of water fished over, and in the value of the fish taken, our kindred on the other side of the Atlantic already stand at the head of this industry. This fact is highly significant when we recall the dearth of labor in the United States, and that all the hands that can be had are required for the pressing work of reclamation and rearing of cattle, and the raising of corn, and the raising of cotton. Nature, however, has not bestowed on any other country such a field for fisheries as on them. It is indeed a field that embraces the two great oceans; they both are open to American enterprise from the Arctic to the Antarctic zone, in both of which the hardy and adventurous fishermen of New England pursue the whale and the seal. Their own coasts on the east in Florida, and in the west in California and New Mexico all but touch the northern limit. Their vast lakes, their mighty rivers, their enormous extent of coast give them 1,500 species of fish. But all these advantages would run to waste in the hands of a dull and lazy race. They have all along taken to fishing, and succeeded in it, because they came of a good fishing stock. The first settlers of New England came chiefly from Norfolk and Devonshire, and their chief motive in the selection of the spot chosen for their first settlement. It was because they saw that that part of the coast possessed peculiar advantages for the prosecution of fisheries. This was in the year 1620. A hundred and fifty years later New England was employing 1,455 men and 665 vessels in the Newfoundland fisheries; a great venture, and one that has commensurate success. It is not to be forgotten that the effort to increase and to find them in possession of absolutely the largest fishing industry in the world.

The greatest contrast in the Exhibition is that between the fisheries of the youngest nation in the world, at which we have just been looking, and those of the most ancient. In the exhibits of the United States every appliance is characterized by its purpose, and the effort to do it to the best advantage is completely as thought and material now available allow. In China the ruling idea is to do everything as cheaply as possible, and as much as possible in the way that was found to be the cheapest some thousands of years ago, and all the while to have very scant consideration for the human agent. The fishing boat is generally the only home of the fisherman and of the family; they live on as little as fish, and the effort to do it all the day is as simple as is compatible with taking enough fish to support the family.

There is nothing in the twenty-three acres the Exhibition

covers, or in the six hundred pages of its catalogue, more suggestive than this contrast between the exhibits of China and those of the United States. They represent two very opposite views of human life, and two very opposite methods of dealing with nature and of extorting from her the means of subsistence. Will the people who have grown to 800,000,000 already—an expansion no other people have ever reached, an homogeneous population equal to the aggregate of all the nations of Europe—who are able and ready to work as hard as any other people, who can labor in every climate, and are content with any form of government, will they at last burst the invisible bonds which have hitherto kept them within their own boundaries, and which there now appears in them some disposition to burst, and overflow other parts of the world, and displace existing populations by getting possession of the means of living, through their ability to work harder than their living upon less? Or to look at the question from the other side, will the most progressive people in the world, who take it for granted that what those who have gone before them did is no more than the starting-point from which they themselves are to advance; who, without shrinking from manual labor, labor with the brain as no other people ever did, in order not merely to live, but to live well; who regard the whole world as the field for their activity; and who look at the life of the people of the past, and of nature, may be subdued to human purposes and the materials of nature turned to the best account, as so many problems which they are called upon to solve, will they be henned in, beaten, and displaced by the Chinaman?

It has been said if a Chinese Napoleon were to arise he would cut out very ugly work for the rest of the world. That apprehension, however, we may summarily dismiss, because the future can only grow out of the past, and China during its thousand years of existence, and out of the hundreds of millions of people, has produced no Napoleons. The contrast just dwelt upon seems to meet satisfactorily the apprehensions on this subject with which some minds are at present troubled. Who can doubt that fifty years hence the Chinaman with the same appliances as he sets before us in this Exhibition, will be capturing about the same amount of fish he captures at this day, and which is probably the highest his kind of capture has ever reached, not two or three thousand years ago? This interesting and instructive Exhibition shows, among many other things, that the history and present condition of the fisheries of all people, together with the amounts of enterprise and hardihood displayed severally by their fishermen, constitutes a very fair measure of the character of the people themselves.—F. Barlow Zieck in Macmillan's Magazine.

TIM POND AND THE SEVEN PONDS.—I send you extracts from letters just received from the Maine resorts named: "July 3, 1883.—Smith is getting lots of letters from new parties referring to advertisement in FOREST AND STREAM. Several cabins are engaged by sportsmen for themselves, their ladies and children to board at Tim Pond for the next few months. There has been more sport here this season than up to this time last year. The prospect is for a very large increase through the season. Gen. F. C. Barlow, of New York, with two sons, are now having splendid trouting at Big Island Pond. I saw in Gen. Barlow's boat fifteen or twenty trout averaging about one pound each. Mr. Henderson weighed two of them, one weighed two pounds seven ounces, the other two pounds five ounces. The latter was found at Smith's, a gentleman from South America who has been at Seven Ponds the last twenty-five days, came into camp last night from L. Pond, bringing the best string of fish I have ever seen from that pond. A man from Boston went to Tim Pond yesterday, and was having grand fun when I left. He saw several broods of young partridges in the woods this spring, but cannot yet tell how numerous they will be the coming season, but the law that prohibits killing them for the market will save thousands per year for sportsmen and the home tables. I saw a bear in the road between Smith's house and Tim Pond recently; he looked at the buckboard team a moment, then made good time for the cover of the forest." "The law protecting trout in this State is a great help to fish in these ponds as well as all others. Formerly there were more trout caught out than in season. Not so now, and partly due to fish law. Five years ago, all the sea trout were quite as fine now as then. I hope when you come you will have your usual good luck."—J. W. T. (New Britain, Conn., July 11).

NOTES FROM THE SUSQUEHANNA.—Athens, Pa., July 9.—*Editor Forest and Stream:* In your many mentions of bait for black bass, I have not noticed hilledhead mentioned. This is the principle bait for those who fish for big bass use a hilledhead from two to four inches long. When fishing with these you are not troubled by the biting of small fish. They are found under loose stones in the riff, and are caught by stunning or by dip net. Hook them through the lips. E. W. Davies, our enterprising fishing tackle man, offers a fine rod as a prize to any of his customers catching the largest black bass with hook and line during the season, the bass to be weighed by him. We have had little or no fishing here yet, as the river has been too muddy or muddy. But early in the spring quite a few yellow heads were taken by trolling. Monday evening, July 9, a fish club was organized to protect the fish, which are disappearing yearly because of pot fishing and seine drawing. J. S. Williston, President; E. W. Davies, Secretary and Treasurer; R. Jolly, Fish Warden, besides others appointed to act as wardens. A reward of twenty-five dollars is offered to any one who will give information that will lead to the conviction of parties who draw seines in the county of Bradford.—W. K. P.

PICKEREL TAKE THE FLY.—A well-known angler of New York in a private letter to us wrote as follows: "Last week I took advantage of leisure to run down to Southampton, Long Island, where another gentleman and I caught fifty-nine pickerel" (on the fly), casting, not trolling, and they were large-mouthed bass. The pickerel were far more game than the bass, and reminded me of the festive trout in action. The pond where we caught them is surrounded with overhanging bushes, which explains to me the readiness with which we caught them in casting the fly. When I saw what we were about I put on some "old sockers" I bought several years ago, and had had aside as useless. They were so many years old, picked up, and they were very little, having had the wood badly yellow and red; wings, mostly red and black. Did you ever?"

CAMPBELLTON, NEW BRUNSWICK, July 9.—Salmon and trout have so far been scarce in the Jacques River, but in the Restigouche waters both the net-fishermen and fly-fishers report the catch of salmon to be the largest known for years, and during the first part of June trout fishing at the head of the tide in Bay Chaleur was good, but now at this date little or no sport is to be had there. The writer and Mr. Richard Parker, of Campbellton, have just returned from some lakes back some twelve miles to the wilderness from here, where they had had good trout fishing and a portion of the trout taken there were the most beautiful specimens of *S. fontinalis* imaginable. With the exception of a narrow, dark-mottled strip along their back, the general color was a pale yellow, with four rows on each side of the fish of large deep gold spots, and running through and among these larger spots were two rows of smaller spots of the deepest crimson. I several times had two of these trout that would weigh about 12 lbs. each on my flies at the same time, and they presented, while darting through the water, their colors, which shone with a bright metallic lustre, to the best possible advantage, and formed the most attractive pictures that I ever saw. Moose, caribou and bear signs were numerous in the vicinity of those lakes. I also saw a leuc ruffed grouse that had a large family of chicks. A part of them were, at least, three or four weeks old, and the others not over two or three days old. With the exception of the few days that trout are running in the river, trout sea-trout fishing is not as good in this section as in the lakes north of the St. Lawrence River, or even in some portions of Maine and the Adirondacks, while the expense is greater, with nothing of the comforts that you get in the last-named places. Here at the hotels, badly cooked food and dirty sheets are the rule without hardly an exception.—STANLEAD.

BLACK BASS TACKLE.—Mammoth, N. Y.—I have read with pleasure and profit Dr. Henshull's article on "Improved Black Bass Tackle," in a recent number of FOREST AND STREAM. I have seen the reels he refers to, and they are certainly improved in the right direction. The Doctor's clear and evidently impartial manner in setting forth the good points of these reels is to be commended. The black bass being, in a manner, my specialty, I feel much interest in everything pertaining to improvements in the "tackle" by means of which this game fish is caught. There are other reels and fishing appliances which I should be glad to see the Doctor treat in the same practical way, showing their defects as well as their good points. In regard to the new line, I have made up my mind to give a trial to the Doctor's description, and which, for aught I know, may have been made to meet the requirements called for by Dr. H. in his "Book of the Black Bass," and which has been for sale by Messrs. Wm. Mills & Son for about a year past. It is numbered H., is a very hard braided, very strong (lifting nine pounds or more), and is in all respects the best black bass line I have yet seen. It may have been made by the parties Dr. H. mentions, at all events, it seems to be identical with it, and deserves all the praise the Doctor bestows upon it. Articles like the Doctor's last are very useful to such readers of FOREST AND STREAM as are not well posted in regard to fishing tackle, and who are not quite willing to trust implicitly to the highly drawn descriptions found in many of the catalogues.—PETRA.

REUBEN WOOD IN ENGLAND.—New York, July 10.—The following extract from a private letter just received from my friend Henry Wright, Esq., confidential secretary of the Duke of Sutherland, will be read with interest by the numerous friends of the angling fly-caster of the world, Reuben Wood, Esq. of Sutherland, Geo. S. Sargeant and PAGE. "Stafford House, St. James, London, June 28, 1883. My dear Mr. Page: * * * What a pity you cannot be at the Fisheries Exhibition here. There never was so complete and extensive a show, and probably never will be again. Although I have been several times, I was so hurried that I was unable to study anything closely. I met your friend Reuben Wood, a beautiful, genial, cheery gentleman, who showed me some beautiful rods, and a new reel, which would be very convenient for trout fishing, but I am afraid would not enable one to kill a heavy fish, otherwise it would be a great advantage when a fish was running toward you to be able to run up the slack more rapidly than by the usual plan of hand winding. A few weeks ago I was at Dunrobin, Sutherlandshire, Scotland, and killed two salmon on my single-handed trout rod, and I fear I could not have done that with the spring reel I am going to Trentham, Staffordshire, to-morrow, and on my return I mean to have another "palaver" with Mr. Wood on the subject. Yours very truly, HENRY WRIGHT."

THE BIG CAT OF THE KAW.—North Carolina.—*Editor Forest and Stream:* "Ouachita's" big "gar" beats me by just eleven pounds. While in Lawrence, Kas., in 1878, I saw a catfish taken from the Kaw River, at the dam of the Douglas Company's mills, which weighed 165 pounds. Some of your readers probably will remember the incident. This monster cat was caught with tackle similar to that described by "Ouachita," and he retained the weight of the burly "sons of Ham" to land the fish, and I well remember that after a pole had been run through its gills, and shouldered by the proud possessors of the prize, the tail of the fish trailed on the sidewalk as it was being carried up street. "This was the largest fish I have ever seen taken with hook and line, though some of the "forty-niners" can tell of larger fish having been taken from the Missouri and its tributaries."—A. F. R.

PRINCE EDWARD ISLAND.—Charlottetown, P. E. I., June 30.—*Editor Forest and Stream:* The long continued rains have kept the waters well up in the small rivers of this island, which has made trout fishing the best known here for years. Mine host Davis has just returned from the "Morrell" with fifty pounds of trout in a thirty-five-pound creel, and the basket was not full either. After much discussion and a war of words the catch was placed on the scales, and showed thirty and one-quarter pounds, which may be set down as the usual difference between a fisherman's guess and the actual fact. The catch of salmon here this season has so far been a small one. The movements of *S. salar* have been very erratic, a great scarcity in some sections, while in others an overabundance.—STANLEAD.

SHEEPSHEAD AT CAPE MAY.—July 12.—The sheepshead fishing at Cape May Point continues to be very good. Mr. Campbell, of Philadelphia, has taken no many days since taken twenty-five fish during one forenoon.—HOMO.

VERMONT, TROUT STREAMS.—East Berkshire, Vt., July 14.—I am living on the Mississippi Railroad, twenty-two miles from St. Albans and within five miles of plenty of trout fishing. There are several brooks where plenty of trout are caught, viz., Wade Brook, Mill Brook, Hamlet Clark Brook, Jay Brook, and several others that I do not think have any names; and besides these is Trout River. A short time ago I fished on Wade and Jay Brooks, at the junction where Wade Brook runs into Jay Brook, and took out eight or seven fine trout that were raised on a short after, at several different places, I having divided them among my friends. It is a fine place for a sportsman to spend a few days, as there is plenty of fishing, with good hotels near by. Plenty of partridges can be shot there after the first of September, as they are very plenty this year and with but few hunters. Till I commenced taking your valuable paper I did not know anything about angling, other than going to the brooks, yawking out all I could and going home. But, thanks to your paper, I now fish with a 16-coned, 104-foot fly-rod, with a multiplying reel and forty yards of very fine grass line, and am getting good sport without caring so much about the number of fish as I do the size of them. I learn something from your paper every week, and it is getting to be a friend that I do not care to be without.—SIR SNAPE.

BLACK BASS FISHING IN THE BRANDYWINE.—Bass fishing in this stream has been unusually good of late, and some fine strings have been caught. Mr. John Ingram, a tobacconist, of West Chester, Pa., offers as a premium for the largest black bass taken during the season of 1883 a jointed bamboo bait rod of superior workmanship. There are a number of competitors for its possession. The largest bass reported measured twenty inches, and weighed one and one-half pounds. The west branch affords excellent fishing. The bait employed most successfully is the tadpole, although some of the smaller fish are caught with the varied taste of the black bass of the Brandywine. At times all the above allurements are persistently refused, while the common earthworm is eagerly sought. I can recall a circumstance which happened a few years ago in this section of the Brandywine. One of our local fishermen had all the known bass bait and a great deal of patience without avail. As he was in the act of unjoining his rod, he espied a small field mouse. In a fit of desperation he killed it, attached it to the hook and made another cast. In an instant the cork was out of sight, and after much persuasion he landed a three-pound bass. So much for bait.—OCCASIONAL.

BLACK BASS IN OHIO.—Newcastle, Pa.—Fishing here this year seems to be a failure on account of rain. It has rained almost three days a week since fishing began, keeping the water muddy. I am told in the fall there is good fishing to be had for "salmon," but as I have just moved here I cannot tell you very much about it. After frost they are the best of all I am told. I shall try her the other day. I will write and let you know. The English sparrow is good for something after all. I was walking on the main street when I saw one chase a seventeen-year locust, which he caught and proceeded to tear to pieces. First the wings and then the head came off. I could not tell what use he made of the body as he flew to the top of some houses with it. By the fly, did any of the anglers of FOREST AND STREAM ever see a locust for bait? Will it be better than the other day I saw several drop on the water, and they had no sooner touched than they were taken by the fish, but I could not tell what kind of fish they were. There were four or five fine bass caught at the old railroad bridge over the Neshaunk yesterday. I am told, that would pull the scales at three and one-half pounds.—CHAB APPLE.

BLACK BASS IN SENECA LAKE.—Elmira, N. Y.—I have never seen anything about this magnificent sheet of water and black bass in the *FOREST AND STREAM*. The fishing does not take place in Seneca Lake until about the 15th of September for black bass, and then they will take the hook until very cold weather. The law in regard to that lake is the same as in other lakes as to black bass, but for some reason or another they will not take the hook until about the 15th of September. A great many fish at night for these fish in the summer, using pieces of pork, white rags, shad, lobsters, etc., for bait, and they have much better success than the day fishermen. One person keeps the boat moving just enough to keep the hook of his "pard" from getting fast to the stones in the bottom of the lake, and they will fish in this manner all night some nights, and will be rewarded by a handsome string of these black beauties.—G.

POACHING NEAR ALBANY.—Nassau, Reinselers Co., N. Y., July 16.—There is a pond about one mile from the town of Nassau, which was stocked with black bass of the small month species, several years ago. I can remember the time when one could go up to the pond of a morning, and take a nice mess of pickered or black bass; but now that is a thing of the past. And why? Because there are certain unscrupulous persons, living on the borders of the pond, who keep the fish as soon as the ice is out in the spring by netting. Now what I want to know is, could I inform a game constable, without letting the party be the wiser as to who gave the information?—C. J. Y. A. [If you inform your nearest game protector he can work up the case on his own responsibility, and you need not appear in it.]

THE KINGFISHERS.—That jolly party of anglers known as "the Kingfishers," whose camp life has been so delightfully portrayed in our pages, is now in the woods of North Carolina. They left their fishing for Cheboygan, where they took wagon to camp, some twenty-three miles. They will remain for three weeks, and the big bass are welcoming them with outstretched jaws and empty stomachs, while the maselalongs are whetting their incisors to sever their lines. There is a hint that a grayling stream, said to be unknown save to a few "old mossbacks," will be visited, and we are promised an account of their joys and tribulations when they get out of the woods.

FLORIDA.—Jacksonville, July 11.—Colonel J. E. Hart is fishing at Fort George and stopping with the general George Gilbert, of Pilot Town. Yesterday Colonel Hart, with rod and reel, caught four bass of an aggregate weight of 110 pounds. He lost seven beside these and several lengths of line. Good time? Of course he is having a good time. Couldn't you be having a good time if you were catching fish like that?

MR. C. H. MASON'S GREYHOUND DOG "FRIDAY NIGHT."

The Kennel.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

FIXTURES.

BENCH SHOWS.

Oct. 2, 3, 4 and 5, London Bench Show, London, Canada. Entries close Sept. 19. Charles Lincoln, superintendent; John Puddicombe, secretary; C. A. Stone, assistant secretary.

FIELD TRIALS.

November 19, 1883.—Eastern Field Trial Club, Fifth Annual Trials, at High Point, N. C. Entries for the Derby close July 1; for the Members' Stake, Nov. 17; for the All-Aged Stake, Nov. 1. W. A. Coster, Secretary, Flatbush, Long Island, N. Y.

November 20, 1883.—Robin's Island Club's second Annual Field Trials at Robin's Island, L. I., for members only. Entries close Sept. 1. A. T. Plummer, Secretary.

December, 1883.—National American Kennel Club, Fifth Annual Trials, at Grand Junction, Tenn. D. Eryson, Secretary, Memphis, Tenn.

THE BEAGLE CLUB.

LIKE our friend "Brian" I am pleased to note that the admirers of the beagle are beginning to give us their views, but that alone will never establish a beagle club as long as this effort is not vigorously prosecuted. I fear there are a great many among us like our friend "Dorkin," whose minds are filled with doubt instead of being confident of success. Of course if we intend following the example of the cocker men we had better "leave well enough alone." I agree with "Dorkin," and I hope all others do, that the forming of a standard should be left to a small, competent committee, and in my humble opinion three better men than he has named could not be selected. His confidence in friend Elmore, I have no doubt, is shared by all who ever came in contact with that gentleman. If these gentlemen—Dr. Tveddell, Gen. Rowett and N. Elmore—will together decide upon a standard, I have no doubt that all real lovers of the beagle will abide by their decision. If so, then there will be no chance for the bickering and controversies such as "Dorkin" predicts.

Why should not success be ours? Are the lovers of the "little hounds," whose idleness, courage, devotion, intelligence and affection entitle them to the rank of our best friend, not energetic and strong enough to organize and maintain a club for their benefit?

Now, Mr. Editor, let me beg of you to take this matter in hand, appoint the necessary committees, etc. Hoping you will aid us, we thank you for the interest shown in our cause on previous occasions.

RAZOR.

WRIGHTSVILLE, Pa., July 13, 1883.

LONDON (ONTARIO) DOG SHOW.

THE third International dog show, which has been fixed to take place on the 2d, 3d, 4th and 5th, October next, during the week of the Great Western Fair, promises to be a great success.

The committee will soon issue a very liberal premium list, besides a large number of special prizes have already been contributed.

The Fair Association have generously placed at the disposal of the committee a large and commodious building for the purpose of holding the show, which is admirably suitable for a show of this kind, being both well lighted and ventilated, besides the exercising ground is unlimited.

It is the desire of the committee to make this show in character what it is in name—International—and cordially invite all owners of dogs from the United States to make exhibits, and to those visiting the show, their time will be endeavored to be made as pleasant as possible.

The judges appointed are Mr. John W. Munson, of St. Louis, for setters and pointers, and Mr. James Mortimer, of New York City, for all other classes.

The entries will close on September 19, and the premium lists will be ready for distribution by August 1, copies of which will be sent you for distribution.

CHAS. LINCOLN, Supt.

FRIDAY NIGHT.

FRIDAY NIGHT is a black greyhound dog with some white on chest and feet. He is 18 months old, and is by Master's Prince out of Mr. J. H. Salter's Sally, both well known in the coursing field. He is owned by Mr. C. H. Mason. He was imported last spring, and shown in public at the recent New York show, where he won first in the open class, and the Lotz-Hawson challenge gold medal. He also won first at Chicago last month. Friday Night is of medium size, very well balanced, with a racy appearance that takes the eye at once. He is an elegant easy mover, and is said to be very fast. The cut is from a sketch by Harry Tallman, and is an excellent likeness.

THE ULMER OR GREAT DANE.

SINCE the non-sporting dogs have become fashionable, your enterprising journal has given not only true delineations of the most important breeds, but also some very faithful woodcuts. I think with Mr. Adcock, of London, and many others who have had occasion to study this breed, that the great Dane, or, as the Germans call him, the German dog, has a right to rank with the English mastiff and St. Bernard, not only in nobleness of appearance and carriage, but as regards intelligence and affection. In England he is being more to be appreciated, and ranks highly in Germany, at Aix, and in Prussia.

At the recent conference in London, for the purpose of organizing a Great Dane club, a deputation was sent to Vienna, there to meet the German recognized authorities and adopt a set of rules, and get the correct points, etc., of the breed.

Through a private letter received by me recently from an enthusiastic breeder and fancier of the great German dog, Prince Albert Solms of Braunfels, Prussia, I received a copy of the recognized standard, taken verbatim from the German National Stud Book, as follows:

THE GERMAN DOG.

By accepting this name, the usual denominations Danish dog or Ulmer dog, have to be dropped.

1. *General appearance.*—The German dog is not so heavy and clumsy as the mastiff or bulldog, and at the same time his form is not so slender as the greyhound. His appearance should be exactly the middle between the two. He is large, of powerful build and elegant figure. He has a proud step and haughty attitude, with head carried high. The tail is generally bent downward or horizontal, and only slightly curved.

2. *Head.*—The head is moderately long, and more high and compressed at the sides than broad and flat. The forehead, in profile, seems to be only a little higher than the bridge of the nose and gradually rising toward the back. Seen from the front the forehead is not remarkably broader than the muzzle, which is very well developed. The muscles at the angle of the mouth are also well developed. Nose large, with the bridge a little curved. The lips are nearly straight, docked in front, and on the sides somewhat projecting. The lower jaw is neither long nor short. The eyes are small, round, with a sharp expression, the brows well developed; ears middling large, set high on the head, if cut they are pointed.

3. *Neck.*—The neck is long, powerful and slightly arched, gradually increasing in size from head to shoulders without much throatings.

4. *Chest.*—The chest should be broad and deep with the ribs well sprung. Belly small.

5. *Back and Loins.*—The back is long and straight with loin well arched. Croup short and handsomely sloping to set on of tail.

6. *Tail.*—The tail should not be too long, hardly reaching the hock. It is broad at the root and tapering to the end and slightly curved.

7. *Forelegs.*—The forelegs should be diagonal to the shoulders and perfectly straight and strong, with the upper arm muscular.

8. *Hindlegs.*—The thighs are muscular, with the lower leg strong and long and bent like a greyhound's.

10. *Feet.*—The feet are round, turning neither out nor in; toes closed and well arched, nails strong and curved.

11. *Coat.*—The hair is very short, fine and thick, with no long hair upon the under side of the tail.

12. *Color.*—A—Like flames. Ground color, golden brown, yellow, slate, iron color, or ash gray, but always with black, irregular cross lines of one color. B—Yellow, slate, ash gray, silver gray, or entirely of these colors, with a darker shade around the eyes, mouth or on the back, further entirely black. The yellow color alone is not fancied, nor are white spots. The nose is always black, with dark eyes and udder. C—Spotted or tiger dogs. Ground color, white or silver gray, with black or gray irregular spots.

The above exact translation was kindly rendered by Mr. Louis Solms, of the Austrian Consulate, this city, an accomplished linguist.

Prince Solms also sends me a large photograph of the champion German dog, Dr. Cester's Leo. He stands thirty-two inches at shoulder, and is straight and graceful as any terrier; weighs 160 lbs. This dog is worthy of a place in our kennels, although he has been much abused and distrusted under the name of "Siberian bloodhound," etc.

Any further information on this subject will be gladly given if in my power.

E. P. HODGES.

PITTSBURGH, Pa.

THE BELFAST SHOW.

Editor Forest and Stream:

I send you marked catalogue of our recent Belfast show. There was nothing new shown that was especially ace except Rex, the first prize pointer, a really good liver and white. He beat the celebrated Red Irish Garygoewai, as well as the black spaniel champion Zulu, for the challenge cup for the best sporting dog in the show. I understand that his owner claimed him at the catalogue price (£50). This I consider a very low figure for him. With the exception of the Irish terrier and red Irish setter classes, which were good, there was nothing worth mention.

Following is a list of the awards in the pointer and setter classes:

POINTERS.—1st and Newry challenge cup, D. Richardson Coates's Rex, 3 yrs, 5 mos. (Col. Campbell's Oscar—Rathmore Belle); 2d, G. Arthur Coates's Boucove V, little brother to Rex; 3d, Adam Clarke's Bravo II, 2 yrs. (Bravo—Juno, High con., E. J. B. Buckle's Garuna II, 2 yrs. (Shot—Bellmaid).

SETTERS.—Crampton—James J. Giltrap's red Irish dog Garygoewai, 3 yrs, 8 mos. (Belmonton Belle).

IRISH SETTERS.—1st, R. A. Wilson's Boz, 4 yrs. (Red Rocket—Dora); 2d, T. M. Hilliard's King Richard II (Count—Uster Queen); 3d, James J. Giltrap's Lady Palmerston II, 3 yrs. (Gos. Palmerston—Lizzie). Very high con., Edward Higgins's Red Queen, 3 yrs (Rock—Clay); Wm. Elliott's Blarney, 3 yrs. (Brace—Stella); John Budy's Ross, 3 yrs. (Brace—Kate); Thos. Erwin's Red Anna, 3 yrs. (Gos. (Red Grouse II—Peggy II). High con., Edward Higgins's Rathmore, age and pedigree not given; G. St. G. Tyrer's Frog, 2 mos (Ferry—Billy); A. P. Nuttal's Rebou and Lou VII, 3 yrs. (Grouse II—Colleen Hill). Com., T. B. French's Parnell, 3 mos. (Roger's Palmerston—Quail); Wm. J. Smyth's Parnell II, 3 yrs. (Shot—Chloe); Thos. Erwin's Red Dash, 3 yrs. (Red Rock—Sappo); Thos. Kirk's Colleen Bawn, 3 yrs. (Brace—Stella).

SETTERS—ANY OTHER BREEDS.—1st, Joseph Boyle's Conna Walker, 3 yrs. (Rock—Dream); 2d, R. Chappann's Dye III, 3 yrs. (Dye—Kate); 3d, R. Chapman's Heather Jock, 10 mos. (Harry—Banger—Bell). Com., Thos. Kirk's Star, 3 yrs. (Shot—Luna). G. BELFAST, June 25.

BANG BANG.

THE pointer dog Bang Bang, recently purchased in England by Mr. G. De Forest Grant, for the Westminster Kennel Club, arrived last week on the steamship Erin. We like his appearance very much. He is an orange and white of medium size, very well put together, with capital legs and feet. He has no weak points, but is good all over, and we have no doubt will prove a valuable acquisition to the club as well as the breeders of this vicinity. It is the intention of the club to run him at the Field Trials next fall. The liver and white pointer bitch Moonstone, owned by Mr. Grant, also came in the same steamer. She is half sister to Bang Bang, of medium size, well built, and looks a worker. She will be bred to Senation.

FLYING STARTS.—Starting to one gun with time taken from the gun later practiced by the Boston, Eastern, Hull and Beverly Y. C., and also by the Boston City Regatta authorities as well as by some of the smaller clubs. As yachtmen become accustomed to this smart way of starting it seems to be growing in popularity.

UTOWANA.—The new steam yacht building at Chester, Pa., for Mr. W. E. Connor, was launched Tuesday. She is 138ft. over all, 12ft. 6in. loadline, 28ft. 6in. beam, 11ft. 7½in. hold, with 874, 2in. draft. Compound inverted engines, 100-hp cylinders 18in. and 25in. x 34in. stroke. Horizontal tubular boiler 12x11ft.

NEW MEASUREMENT.—The sail area and length rule has now been adopted by the three principal clubs in the country, the New York, Eastern and Southern Yacht Clubs. Beverly will also sail the open race for first class under the rule, and several other clubs are about to adopt the new system.

BOSTON CITY REGATTA.—In fourth class Meteor and Hard Times made a dead heat of 1½ to 20 minutes. They will divide the prize money for first and second yachts.

ARLINGTON Y. C.—This Baltimore club, the only one of that city, leaves August 4 for an extended cruise down Chesapeake Bay. Fleet to be gone two weeks.

VALKYR.—This compromise cutter is at the yard of Pollans, Brooklyn, receiving a new racing outfit, larger spars, 6ft more gaff and 6ft. more bowsprit. With this rig she will, no doubt, give a good account of herself. We should like to see her shed the honra and bid 8 or 10n. lead underneath the reel.

OFF CRUISING.—There has never been a time when so many of our yachts were away on cruises as at present. It is supposed that they go early this year so as to get back for the great regattas of the Beverly and Hull yacht clubs, August 18 and September 1.—Boston Courier.

FINE CUTTER.—D. J. Lawlor has just finished for Lynn owners in very handsome trim a cutter. She has been named Otter. Over all 24ft., beam 7ft. Outside iron 2,100lbs. Same huller has also finished the Cypress, 25x27. This yacht is varnished instead of painted.

IRON LACQUEL.—Three pounds asphaltum, half pound shellac, one gallon turpentine. Varnish for iron work may be made by dissolving in two pounds of tar oil, one-half pound asphaltum, and one-half pound powdered resin. Mix hot and apply cold.

LARCHMONT MATCH.—In the race, July 4, the protest between Fanny and Oracle was decided in favor of the Fanny. She takes Corner cup, subject to conditions, also regular cash prize of the club.

OPEN BOAT RACE.—The owners of the open boats, Mistake, Snoozer, Susie S. and others met at John Sawyer's loft, 83 South street, last Friday, and settled upon a sweepstakes race for Monday, August 27, entrance money per boat \$100.

ARROW.—This sloop, recently bought by W. P. Douglass, N. Y. Y. C., has been overhauling in Mumm's yard, Fifty-fifth street, South Brooklyn, and will go into commission in time to join the cruise of the New York Y. C.

DREADNAUGHT.—Mr. A. W. Nickerson will cruise to the eastward from Boston in the schooner Dreadnaught. She has been newly coppered and received a new fit of sails from Wilson's Sons, of Port Jefferson.

HULL Y. C.—Cruise to New Bedford and other ports will be undertaken July 28. The fleet will meet the Atlantic Y. C. in New Bedford.

CRUISING.—Sloop Mystery, N. Y. Y. C., Mr. W. B. Parsons, arrived at Halifax, July 17, and will remain a few days.

NYFFA.—Mr. J. L. Wall has changed the name of his keel sloop Glean to Nyffa.

NORNA.—This schooner left Halifax for New York Thursday, July 13.

KYNOCH'S
Patent "Perfect" Brass Shells,
MANUFACTURED BY
KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauges of shells. Or can be effectively crimped with tool (as represented in cuts) and straighten out to original shape when discharged. The crimping tool also acts as a reducer, an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in cases lots only, (2,000), and crimpers not less than one dozen, by

DOG TRAINING;
—BY—
S. T. HAMMOND, KENNEL EDITOR OF FOREST AND STREAM.
FOR SALE AT THIS OFFICE PRICE \$1.00.

AMERICAN Kennel Register.

A monthly record of kennel events for the information and guidance of breeders, exhibitors and owners of all breeds of dogs.

Its leading feature is the "Pedigree Register," of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is given to each dog, and an index will be compiled at the close of each annual volume, thus forming a permanent work of reference. The pedigree registration fee is twenty-five cents. The first two numbers of the Register contained the pedigrees of 138 dogs.

Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs at sale, and deaths.

Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include a record of field trials. The first two numbers of the Register contain prize lists of Washington, Ottawa and Pittsburgh shows.

The publication day is the fifth day of each month; and nothing can be received for publication later than the first day of the month. All matters intended for publication should be in the hands of the editor at the earliest practicable date. Entry blanks for each department will be furnished free on receipt of stamped addressed envelope.

TERMS:—Issued by yearly subscription only. The subscription price is one dollar per year. Make drafts and money orders payable to the Forest and Stream Publishing Company. Address, AMERICAN KENNEL REGISTER, P. O. Box 2,832, New York City.

The Parker Trap Gun.

We are now prepared to supply the Parker "Trap Gun," for which we are sole agents. These guns have top lever, extension rib, rebounding locks, large strikers and pistol grip. They are simply superb. The Parker Trap Gun should not be confounded with the regular Parker top lever guns, which, although excellent guns, differ materially from the Trap. Every genuine Parker Trap Gun has the rubber butt plate with a flying pigeon beautifully embossed upon it, as shown in the above cut.

We have a small remnant of Webley's heavy ducking gun, mostly 10-bore, of various qualities, at about half price. Address: **H. & D. FOLSOM, 15 Murray Street, New York.** P. O. Box 1114.

THE FOX GUN.

Secure one at once at our **REDUCED PRICES**, which will continue only for a short time.

Harrison's Celebrated Fish Hook.

Whereas, It having come to our notice that some unprincipled houses to gain their own unworthy ends, and to attempt to damage our good name, having spread reports to the effect that the manufacturers of the above hooks are defunct, we now take this opportunity of informing the American and British public that such reports are utterly false. The same efficient staff of workmen is employed as heretofore, and we challenge the world to produce a fish hook for excellence of temper, beauty and finish in any way to approach ours, which are to be obtained from the most respectable wholesale houses in the trade.
Signad, R. HARRISON, BAKELER & CO., Sole manufacturers of Harrison's Celebrated Fish Hooks, Redditch, England. (December, 1882.)
Manufacturers also of Fishing Tackle of every description. Sewing and Sewing Machine Needles.

THE FISHERMANS AUTOMATIC REEL.

Mr. Reuben Wood took three prizes at the great English fly-casting tournament at the Welsh Harp, Hendon, England, June 11, 1883, using the Automatic Reel, and says he will use no other, his life is too short to use the crank reel.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. SIX MONTHS, \$2.

NEW YORK, JULY 26, 1883.

VOL. XX.—No. 26.
Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newscasters throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

With its compact type and its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

TEN YEARS.

WITH this issue the FOREST AND STREAM completes the first ten years of publication. Next week, that being the paper's eleventh birthday, we shall review some of the many changes which have taken place in those years. The number will be an interesting one, containing contributions, congratulatory and otherwise, from many familiar pens, among them those of Al Fresco, Awabsoose, Balsam, Nathaniel H. Bishop, Didiyams, John Deau Catou, Cecil Clay, Elliott Cones, Forked Deer, Theodatus Garlick, J. A. Henshall, Hix, H. P. U., Jack, Jacobstaff, K. (of Worcester), Kingfisher, M. (of Boston), Maj. H. W. Merrill, Wm. B. Mershon, Nessmuk, Penobscot, Piscico, Podgers, Reigolds, Robt. B. Roosevelt, S., Von W., Corp. Lot Warfield, Wawayanda, Yell—thirty-one, with others yet to be heard from.

DEFEAT OF THE TEAM.

THE American team has suffered a defeat, and for the second time the English military shooters have established their superiority in a formal match test. It can hardly be said that this outcome of the competition is a surprise. A year ago defeat was certain for the American team, this year there was a chance of victory for the visitors, though the probabilities were against them, and after a good fight, with some very encouraging features about it, Colonel Howard and his men came home to impress upon American riflemen that, though much has been done for the development of rifle practice and the improvement of small arms in this country, yet our advance has been irregular, and that in certain very essential lines of the art and science of rifle shooting we are still behind our British friends.

To the story of the match we give ample space in our rifle columns. There it is told how a tempest of rain and wind came down upon the common while the match was in progress, how these squalls and showers were broken by floods of bright sunlight, how the wind came from various quarters of the horizon, and in such a quick succession of changes that it appeared to the bewildered Americans as if the cave of

the winds had opened on all sides. It was, in fact, such a day as Creedmoor never has and Wimbledon but seldom. The Britishers were somewhat used to such conditions of sky and air, and so the sooner caught their bearings in the skirmish of the elements, and managed to get out of the match in advance of the strange team.

There has been talk of inferior rifles in the hands of the American marksmen, and the cable dispatches, reflecting the opinion of the English ranges, have placed special stress upon this feature. It appears to us to be not well founded, for had there been a change of weapon, and the Metfords of the English team placed in American hands, and *vice versa*, we doubt not that the victory would still have been to the team whose members were best able to catch the real strength of that rush of crosswinds, and who could best fix their elevations for the dark, moisture-laden atmosphere. No doubt the American rifles placed the bullets just where they were aimed, but had judgment was shown in estimating the meteorological conditions and in formulating their influence in so many points on wind-gauge and elevation.

The match passed off in good shape so far as freedom from any misunderstandings were concerned. It was, so far as the wire informs us, a fair fight for the American militiamen not against their very friendly antagonists, the English team, but against that very uncertain and treacherous foe, the fickle weather. We are not informed upon what basis Col. Howard made his selection of the final shooting twelve, but no doubt there were good and sufficient reasons for making such choice as he did. It is not likely that any other arrangement of the men would have brought about any different result. The strength of the American squad was fairly set forth in the twelve men who went to the firing points.

The match in its results is full of encouragement to the N. R. A. and to American rifle interests generally. As compared with the results of last year we have been able to show a positive advance. The lesson of last year has not been thrown away, and to-day we have a fund of information, of experience and practical knowledge on the points of the military breech-loader as known at Wimbledon, where two years or more ago we were entirely ignorant. At the lower and more distinctively military service ranges the Americans proved that they were in rifles and ability not a whit behind their expert adversaries, but rather superior, yet the difference was slight, hardly more than the general luck of battle would leave between two well trained and evenly matched contestants. We have, indeed, in two years produced a gun which will shoot round after round without cleaving, and we have secured a body of men able to use that weapon with fine precision under all the conditions of weather to which we are accustomed here. The match days brought Colonel Howard and his men face to face with new conditions, to meet which they had no data in their score-books, and consequently they could only flounder about, making such efforts to reach the target as their general knowledge of rifle shooting suggested. The Englishmen may well note this significant fact, that our men are rapidly closing up the gap between our neglect for years and their two decades of most thorough and careful practice at Wimbledon and its many subsidiary ranges. There are even in misty, muggy England days when the sun shines out so clear and bright that our boys might imagine themselves at home at Creedmoor, or Bennings, or Brinton, or Walnut Hill, and then perhaps the figures of the totals may tell a different story.

It is, perhaps, too early yet to speak of the match in a critical way. The scores would seem to show that there was a lack of team system at the extreme range among the members of the defeated side, but until mail advices bring more full particulars, it would be well to leave this point of the match without discussion. There was the usual chapter of accidents, such as planting good shots on the wrong target, but these accidents did not change the final result. The Americans were whipped, not by any fluke or unaccountable slip-up, but fairly and squarely because they were over-matched in pitting their brief experience against the shooting drill which has been going on for so long a time abroad. They struck more weather to the square inch at Wimbledon, than Creedmoor ever dreamed of having.

There is no talk yet of another match. This is right. Let us first get our team home, learn from them exactly what is to be done for improvement, and then during the winter there is ample time for such correspondence as may lead to a continuation of the series of competitions, but with conditions so fully drawn that no misunderstanding may creep in. The defeated ones deserve a hearty welcome home. While they may not have accomplished all that was hoped, they

have surely done all that could be reasonably expected of them. They encountered tremendous odds with a natural consequence.

We present to our readers not only a full account of the match, but a series of diagrams showing where each shot fired struck the target slab. The New York *Herald*, with its accustomed enterprise, gave its readers early representations of the targets in fac simile, and before the last shot had been fired on the English range the public in New York were looking at the targets made in the earlier part of the match. Our diagrams give the shots numbered in their order of hitting, reproducing, in fact, the record of each marksman's score book.

There is but one little gleam of consolation, and that is in the fact that while we are whipped in the International match, our old friends, the Irish small-bore men, seized the occasion to once more enjoy a victory in the Elcho Shield match.

SEEING THE YELLOWSTONE PARK.

THE completion of the Northern Pacific Railroad to Bozeman, has opened the National Park to the world—Men of all professions are hastening thither, urged on by the natural ambition to be among the first of the general public to behold those natural wonders, of which so much has been written since their discovery, and which, during the progress of the fight against the attempt of a stock company to capture the Park last winter, were again brought prominently before the people. The projectors of the scheme for seizing the Park have inaugurated a great excursion thither; another made up of prominent Northern Pacific people is in contemplation, and a host of smaller parties will scatter themselves about over the Park, and enjoy its beauties.

More important than any of these, from the standpoint of the friends of the Park, and so of the people, is the party which is to enter the Park from the south. This will be under the command of Gen. P. H. Sheridan, and will include among its members President Arthur, Secretary Lincoln, Senator George G. Vest, Surrogate Rollins of this city, and Governor J. Schuyler Crosby of Montana. Early in August they will leave Green River Station on the U. P. R. R., and proceed thence to Ft. Washakie, where they will take their pack train and go into the Park, and through it northward to Livingston, Montana, whence the Northern Pacific R. R. will bear them eastward once more.

No doubt they will have a good time, will catch a lot of fish, and, without the boundaries of the Park, kill some game. But the important point of the excursion will be that members of the Government, whose influence should be strongest in shaping legislation on this important subject, will be able to see for themselves a part of the needs of the Nation in respect to the Yellowstone Park. It is impossible, of course, in a hasty trip across such a wide area, to appreciate all that is required in the way of provision for the protection of the Park and its interesting features, whether organic or inorganic, but intelligent men cannot fail to acquire much useful knowledge, especially when they go accompanied by one who is so familiar with a considerable portion of the reservation as is Gen. Sheridan.

We have urged this subject on Congress because we know that it is something that ought to be done, and because the longer it is delayed the more difficult it will be to accomplish it, and the more it will cost. Those who oppose it are as a rule men who are quite ignorant of the subject, while all who are most familiar with the Park and its capabilities are agreed that it is a matter which demands the prompt attention of Congress. This year a greater number than ever before will feel its importance and be able to speak intelligently on the subject.

We believe that the importance of enlarging the Park will at once impress itself upon these visitors, and we trust that the need of such enlargement will be so clearly seen, that a recommendation concerning it may form a part of the next message of the President to Congress. This extension of the Park's boundaries should be made both on the east and the south. On both sides there are wonders which should be preserved to the people at large, and the setting aside of these additional tracts can be done now without interference with the rights of any citizen. There are a few cattle men within the region referred to, but their claims can be bought out for a few thousand dollars, an expense which should not be considered when the importance to the country at large is realized.

We hope most earnestly that within a year the boundaries of the Park may be so extended as to include the territory lying east of it to the 106th meridian, and on the south to lat. 45° 30'. We should then have a park in which every

American might take a just pride, and one which by beauty and interest is unparalleled. The wonderful lakes and mountains to the south of the Park, Jackson's Hole, the Tetons and a hundred other beautiful spots should be saved, and so too should the heads of the Stinking Water and a dozen other streams, each of which could pit forward its special claim for protection from the touch of civilization's hand.

The gentlemen who are about to visit the Park are incurring responsibilities in the matter which we are glad to see them assume, for we are confident that this pleasure-trip will, next winter, in Washington, bear abundant fruit.

NEW YORK GAME PROTECTORS.

AS our readers are aware, from our reports of the progress of the Game Protector bill in the Legislature of New York last winter, the Governor of the State was empowered to appoint sixteen new protectors in place of the eight which held office last year. A clause in the new bill placed these men entirely under orders of the Fish Commissioners of the State, from whom they are to receive instructions and to whom they are to report in writing every month. Without the proper certificate from the Fish Commission the game protectors can receive no pay.

The men appointed are all new ones, except John Liberty, of Essex county, and Geo. M. Schwartz, of Monroe county, and we hope that they will do their duties well. We have been importuned to make recommendations for this office, or to endorse them, but have steadily declined to do so, not caring to become responsible for the performance of the duty in the case of any individual. We are therefore free to applaud or condemn, as the work done may seem good or bad.

The protectors are appointed for certain districts this year, and not for the State at large, as last year. How this will work, unless they have full powers all over the State, we do not know. For instance, Oneida Lake, which lies wholly in Oswego county, where the Onondaga Chub fishes a great deal, lies in the ninth district, and the protector of that district lives nearly forty miles east of it, while the protector of the tenth district, a man whom the chub indorses, lives within six miles of the lake, which is infested with poachers whom he has fought for years. If a protector has powers outside his district this will work well, but if he has not, then in this instance a mistake has been made. The appointments are:

- First District—Kings, Queens, Suffolk, and Richmond Counties—George A. Whitaker, Southampton.
 - Second District—New York county—Joseph H. Godwin, Jr., King's Bridge, New York city.
 - Third District—Westchester, Putnam, Dutchess, Columbia, Ulster, Greene, Rockland, and Orange—Matthew Kennedy, Hudson, to take effect August 1.
 - Fourth District—Sullivan, Delaware, Schoharie, and Otsego—Francisco Wood, Schenectady.
 - Fifth District—Albany, Schenectady, Saratoga, Rensselaer, Washington, and Warren—Seymour C. Armstrong, Weavertown, Warren county.
 - Sixth District—Essex, Clinton, and Franklin—John Liberty, Elizabethtown, Essex county.
 - Seventh District—St. Lawrence and Jefferson—Albert M. Griffin, Pine, St. Lawrence county.
 - Eighth District—Fulton, Hamilton, Montgomery, and Herkimer—Thomas Bradley, Rockwood, Fulton county.
 - Ninth District—Oneida, Lewis, and Oswego—Nathan C. Phelps, Remsen, Oneida county.
 - Tenth District—Broome, Chemung, Cortland, Madison, Tioga, and Onondaga—William H. Lindsley, Canastota, Madison county.
 - Eleventh District—Cayuga, Wayne, Ontario, Yates, Schuyler, Tompkins, Chenung, and Seneca—Aaron M. Parish, Reading, Schuyler county.
 - Twelfth District—Monroe, Orleans, Livingston, Genesee, Steuben, Wyoming, and Allegany—George M. Schwartz, Rochester.
 - Thirteenth District—Chautauque, Cattaraugus, Erie, and Niagara—Stephen A. Roberts, Buffalo.
- Mr. Lindsley, of the tenth district, has for some years been a town game constable, and has acted with Mr. Dodge, a former State game protector, and has been repeatedly shot at by the persistent poachers of Oneida Lake. He has built a steamboat for the express purpose of clearing this lake of nets, on the promise of being appointed a State officer for the protection of fish and game in a region which was supposed would be in his district. Knowing these facts we hope that the Fish Commission will extend his authority over Oneida Lake.

THE CENTURY MAGAZINE is rendering good service to field sportsmanship in America by its admirable sketches of shooting and fishing. The engravings in the July number accompanying Dr. Henshall's paper on the black bass were not only artistic but excellent in their faithfulness to nature; and the same may be said of the beautiful illustrations, in the August number, of Prof. Alfred M. Mayer's excellent description of "Bob White, the Game Bird of America." The engravings and the letter-press combine to make a very charming study of this favorite bird. It is an open secret that the Century Co. will soon publish, in book form, a collection of their magazine articles on field sports.

The Sportsman Tourist.

DRIFTING FOR SHAD.

"WHAT are you going to do to-night? Will you come out with me for shad?"

Such was the compound question which my friend James, the impetuous, hurled at me as I came up the wharf after having a cooling dip in the noble St. John.

"Well, nothing particularly; and, yes, I should like to go, very much!"

It is a curious fact, that while game birds and animals retreat before the advancing white tide of civilization, fish are more constant to hereditary haunts, and inhabit their ancient waters until driven therefrom by the defilement of the stream, or actually decimated by the imprudent angler. But, while the defilement of streams drives away some fishes, others, such as the eel, thrive on the garbage and refuse of cities. This is scarcely an example of "the survival of the fittest." Of course, the different elements in which beasts and fish live account somewhat for the coyness of the first, and the friendly constancy of the latter. As the land becomes settled the animals have to retire to more secluded haunts, but the fish, living in an element whose domain cannot be so thoroughly invaded by man, are exempt from the necessity of heaving an unqualified retreat. But while this is true, I hold that the fish, of its nature, is far tamer than is the beast of its. While our forests and plains for miles round any considerable center of civilization are entirely deserted by their old time frequenters, our rivers and streams are still well stocked with the descendants of the primitive occupants, untroubled by the thunder of saddle wheels, the gliding, dark hulks of commerce, or the panting saw mills, which, like wrathful giants, hurl the spoils of depleted forests upon the uncomplaining tide. This is that in the St. John River, at Fredericton, the capital of a populous Province, we still find the perch, chub, smelt, pickerel, shad, eusk, gizzard, huss, salmon, sturgeon, and many other fishes, and, what is a striking feature of the scene, the honor of the little, unobtrusive, speckled beauty, the rainbow-hued trout. But let us drift back to our drifting.

"Yes, Jim," I replied to the hydrant-headed interrogatory, "I should like very much to go." And so we went down behind the wharf where the boat lay ready to receive us, and where the entangling net hung over its saddle where it had been drying for the sun. After Jim had placed the net and a mysterious little basket on board, we seized the oars and pulled for our destination about a mile above the city, and almost abreast of that aristocratic mansion, Government House. Think of it! drifting for shad within a stone-throw of the gubernatorial residence! Is it possible that the humble shad is growing aristocratic? No, I scarcely think so. He is a Conservative, such a good Conservative that he will ever be a Liberal, and he will retain to his dying day the unaffected manners, the godly customs, and the glorious liberties of his centennial forefathers. He frequents these waters merely because he has ever done so, and he cares not whether caste or cottage, court or crib, stands on the banks of the placid river.

The St. John at Fredericton is not far from a mile wide, and this evening its broad, unrippled surface, which reaches far westward under a gleaming current, bears many boats bent on errands similar to ours. Each boat confines itself to a certain locality—its own domain, as it were—the same spot where perhaps for years and years the fisherman has cast his net, and the desertion of which he firmly believes would be attended with disastrous results. He knows the old ground, just where the snags lie, and these he can locate as correctly as if they were visible to the eye. Perhaps he has spent many hours in removing snags or bushes from the bed of his favorite drifting ground; and when many boats are out all good fishermen will respect his claim. At times, when but few boats are out drifting, a fisherman will desert his usual ground, if the fish are coy, and casting his net in waters new, make a long sweep of the river, his distances being curtailed only by the locality of his home, and the necessity of his dipping into the current to rowing back. But when he has dipped into strange waters, he is in danger of having his net caught in snags or obstacles of the locality of which he may be ignorant. There are spots in the river here where no boat is ever seen to drift, not because there are snags lying darkly concealed to lead the net, but because, as the fishermen aver, the shad never run there. From some peculiarity in the locality, some formation of the bed of the river, or other cause, these fish are known to pass through those places in numbers sufficient to repay the trouble of casting the net.

Here, off Government House, James, and his father before him, have fished for years; here the shad, from some cause best known to themselves, run within well-defined limits, which said limits are well known to the honest James; and here the net may drift slowly, noiselessly as a shadow, without let or hindrance of any snags or ledges, dangers of the deep. There is one large sunken log at the lower end of James's territory, but this monster is spotted. By the producing of many carefully studied lines springing from well-known corners, chimneys and trees in the distance, and from closer but less accurate points on the shore, by an instinct which would guide my friend's course when these landmarks were invisible, this monster is spotted. His fate is as well known to me as carefully as to James, if he were a floating torpedo, ready, on impact, to blow us and all other little fishes, sky high, and transform us into veritable flying fishes.

Here, off Government House, James casts his net carefully into the water, while I row the boat athwart the tide, "going out" or "holding on," "up stream" or "down stream," as James commands, and as the proper extending of the net requires. Our new venture ends from the start, as we are in a straight line of bobbing fishes, thirty or forty yards across the current. James sits in the stern with his hand on the rope. He says he can tell by the motion of the net, which he feels in the rope, when a fish is entangled, even in the uttermost meshes.

We float quietly down, talking in but subdued tones, and when near the end of our run, James hauls in the net. Only eight, but they are all large, and as carefully as I could so while James overhauls the net, I row up to our usual starting point. Again the net is cast; again we drift over the accustomed ground, and again eagerly and in great expectation is the net hauled in. Fifteen this time! That's better! And still we feel that other nets on the river this evening must be accomplishing more work than is ours. We will try one more cast.

It is getting to be quite cold, and when I make an obser-

vation to that effect, James produces his mysterious basket and takes therefrom a small flask, which he hands to me. "What is it?" I inquire.

"It is one gill of Jamaica, one gill of water, and some lemon-juice."

"Good! a little of that will keep out the cold. Good haul, James!"

James has also some sandwiches, and pulling to shore, we make fast to a raft and enjoy our collation.

James is a great talker, and many and wonderful are the tales which he has related, both when out fishing, and also at divers other times and places. He is a firm believer in the powers of the mineral rod, and he hints darkly at having tested his capabilities on the Fresh-water, near the city, in search of hidden treasures supposed to have been buried in the dark ages by darker dyed pirates. The old French frigate which lies deeply imbedded in the sand, keel up, in its eternal dock-yard at the bottom of the river, opposite the city, has ever been a source of curiosity and regret to James. If he could only raise that hulk, what vast treasures he would discover! Why did no one ever make the attempt?

Another sunken vessel lying in the Nashwaakiss in, as he says, a hole so deep that no one can find bottom, is also matter of wonderment and anxiety on James's part. He is ever promising himself that some day he will, &c., but treasures and vessels remain undisturbed, and I cannot compel myself to hope that the deserving James will ever be enriched by such phantom wealth. Having finished our lunch, we pulled again to our starting point, and, casting the net drifted slowly down, and patiently awaited the result of this, our last venture for the night.

"How many?"

"Eleven."

"Not bad at all!"

And now we start back to our place at the wharf whence we came. As we proceed down river we meet or overtake other boats still plying their trade, and make inquiries as to their luck. When one lone fisherman acknowledges having secured a smaller number than fell to our share, we immediately become possessed of the idea that we are great fishermen; but our exultation is short-lived, for the next man we greet informs us that he has caught forty-five! We pass away silently, and forbear making inquiries of any other boats. Arriving at our landing we hung the net on its rack, and James placed it in a wheelbarrow for transportation homeward, I accepting six, which left twenty-eight at James's disposal. Probably he sold about twenty of them next day, at ten cents each. As we said good-night, I could not help thinking that casting the net for the treasures of the deep is somewhat more profitable than shadowing mineral rods over the country in search of the errand-y treasures buried in unknown ages by pirate princes. I did not say so, however, for I would not offend James for the world. It was two o'clock when I got home, and placing my shad in a tub of fresh water I left them to await the tender offices of the cook.

ERATO.

FREDRINGTON, New Brunswick.

COBB'S ISLAND.

DOUBTLESS many of your readers are now casting about them for a pleasant summer trip, and are anxious to find a place where good fishing and shooting can be had, and where a millionaire's pocketbook is not required to pay expenses. I have just returned from such a place—Cobb's Island—and have had most excellent sport.

On Friday last, with a friend, we shot over stools eighty grayback snipe, and would have killed more had we been in practice. This bird is now returning from the north, and within a week or ten days myriads of them will be found at the place mentioned. The fishing for weakfish or sea trout is superb, the writer and his friend having taken over 100 lbs. in one tide, and only desisted from very weariness. As an apology for catching so many, I would add that we fished for a boat's crew of thirteen persons. Any person going to Cobb's for fishing should take with him an ordinary rod and reel, with a fairly large braided silk line, as found in the fishing is an abomination, and does not afford half the sport nor fun.

As to the comforts of the hotel I cannot speak, as I did not live there, but the guests appeared fairly satisfied. The snuff bathing is good, and any one fond of the labor of hauling in sharks can have as much of that kind of sport as they want.

To reach Cobb's Island take the boats from Baltimore or Washington to Old Beach, and the steamer "Northampton" to Cherryston, then by sailboat to destination.

COSMOPOLITAN.

WASHINGTON, D. C., July 21.

Camp Fire Flickerings.

"That reminds me."

IN your paper of July 5, "Quaichin" tells of the attack of the dramatic company catching the twenty trout through the medium of the large grasshopper. "That reminds me," says the writer, "of the time I spent fishing in the Spring River, Me., some time ago. We had met with very good luck, capturing a number of channel catfish, white bass and perch, when one of the 'natives' came along. He was quite talkative, and related his experience in fishing."

Among the many stories he told was one wherein he had caught what he termed the "hellfish." He said he had been fishing in the headwaters of Spring River about two weeks ago. The fishing was doing very indifferently, success, when at last (he had about concluded to give it up) he had a "powerful bite." He worked for nearly an hour and landed the "hellfish," and as he expressed it—"Stranger, you may not believe me, but as soon as that ar fish was out of water, the fish—an! I never see the like—commenced to flop and jump out of the water to follow him, an' with the help of my oldest boy, we just took a pole an' an old net, and with us, at caught near two bar' of fish." We concluded that that was a large "fish story." He explained by saying that fish always selected one of their number as a leader, and followed it, just as cattle, horses and sheep will follow one of their number to which a bell is attached.

SHAWONDASIE.

KANSAS.

In next to last line of "Me-hi-ables" story in issue July 5, "boat" read "bed," as he wrote it.

Natural History.

HOW TO KILL THE ENGLISH SPARROW.

Editor Forest and Stream:

I agree with your correspondent, "Uomo," in regard to the dangers attending the use of the gun or of poison for exterminating this nuisance. I have been much annoyed lately by sparrows that occupy a martin-house on my neighbor's premises. The martins left it in disgust a few years since, for all our birds keep aloof from the filthy house-sparrow. If the house had been my property I should have removed it long ago. The sparrows likewise had tramped their rubbish upon forsaken birds' nests, defacing the trees and making something like a nest for their own offspring. I encouraged the boys in the neighborhood to destroy all these lumps of rubbish, but this did not seem to diminish the sparrows or their demoniacal chirping.

Our Massachusetts Legislature had repealed the ridiculous law that protected these pests, and the inhabitants were now at liberty to use the common sense in the treatment of these birds. But while thousands are anxious to exterminate them (if possible from the face of the earth), all were averse to using poison or the gun. I would not like to use either, though in winter, when our summer granivorous birds are absent, poison might be used with safety.

Being confined to the house by illness during the month of May, and amusing myself by listening to the singing birds that were numerous around my house, I was greatly annoyed by the demoniacal chirping of the sparrows, which often for an hour would render it impossible to hear the sylvan concert. While watching a man outside who was using the hose to wash the windows of an adjoining house a happy thought, as it seemed to me, entered my mind. I thought how quickly every sparrow in the martin-house might be destroyed by directing a stream of water into their filthy apartment, after they had receded to rest and drooping their heads. The same thought might be used to drive them from every place they had appropriated. But this method of destroying them could be used only in certain neighborhoods.

Now, Mr. Editor, I ask leave to suggest a method by which the sparrows, however numerous, might be exterminated from my town in less than a week. This would be done by the use of a steam fire-engine. Let every town that is in earnest appreciate an engine as a means of saving a man's life, and use it for this work. The drowning of the sparrows with cold water would be momentary, and there is indeed no cruelty at all in the act. The engine could be used most effectually in the winter, when a stream of water, by immediately freezing, would destroy the birds almost as quick as lightning.

WILSON FLAGG.

NORFOLK CAMBRIDGE, July 19.

THE ROBIN.

Turdus Migratorius.

SEE him throw out his chest and rear back! Oh, he is a grand fellow—a grand fellow in himself, with his more modest mien; but after all, his is a pardonable pride. Possessed of such a well-knit figure, fine head and erect carriage, who can blame him if he exhibits a trifling conceit. His is a familiar figure on our lawns, now hopping quickly along and now running swiftly, pausing after each dash, and rearing up to look around. See him as he makes another swift run of a few feet, then bends eagerly forward, appearing to listen intently. Suddenly he dashes his bill down, with a snap, and the grasses, we see him drag a long comb of worm from out the grass roots. I have never been able to determine with any satisfaction to myself whether it is his sense of hearing or sight which guides him to his food; his attitude of intense attention for a moment before darting on his prey, would seem to indicate that the former was the case, but again, he may be only watching intently, as it is possible that the squirming of the worm, as he pushes his way to the surface, may cause a tremor among the blades of grass, not visible to our coarser vision, but easily perceptible to our little lynx-eyed friend. At all events, there is a moment's pause each time before the final lunge, which almost invariably results in a capture. If the tender morsel happens to be an extra large one, it is amusing to see him "freshen his grip," as it were, and back off, until stretched to its utmost, out comes the worm, and its wriggling length appears for an instant only, as redrestreat unceremoniously gulps him down.

Our friend is fond of living near us, and builds almost anywhere, in maple, elm, spruce, on the lawn, in the orchard, or in fact, in the most convenient spot he may chance upon. The location, however, once selected for his nest, he will often occupy year after year. High or low seems to make little difference. As to materials for his nest, he is not over particular. Though formed chiefly of wisps of hay, and dry grasses, its make-up will often contain bits of paper, string, hair, and always a quantity of mud, seemingly intended to give it stability. The interior is carefully lined with soft warm fibers of bark, hair, and grass, and great attention is paid to this part of the work. His temper, I am sorry to say, is not altogether as lovely as his appearance. When a family jar occurs among the feathered inhabitants his acidity, although they may not be of his own kind, you will see him streak off for the scene of the rumpus, to mingle his angry notes in the general roar. He is a kind husband though, and ever on the alert to protect his family. His shrill cry of distress will summon all his companions within hearing, and their united efforts will often disconcert and drive away feline intruders, say nothing of crows, blackbirds and other egg-sucking, nest-destroying vermin. He is a happy bird, although they may not be of his own kind, he is supremely happy and will join with the sparrows in missing such a din about the poor thing's ears as to put it ignominiously to flight. A good singer, he is at his best during the breeding season, and it is a surprise to many, who are familiar only with his ordinary monotonous cry of bob! bob! bob! to hear him launch into such an ecstasy of song, often insisting that he cannot be the performer. He is capable of a great deal in the musical line at this season, however. At the bath he is inclined to domineer over others who may be in possession on his arrival, and I have noticed with interest that the English sparrow moves off at once on his appearing, or is forced to leave often in spite of noisy expostulation. He will wash in company, provided he is not crowded, but if this happens he at once leaves the board.

In the autumn his whole nature changes; congregating in large flocks, he becomes exceedingly shy, and difficult to approach, and at this season is a favorite object of pursuit with the swarms of pot-hunters who infest our neighbor-

hood. A great deal has been said in regard to his destruction of fruit. True, he will eat the cherry, and by-the-by, he is a connoisseur as regards the cherry, and we boys always succed to select those that bore his mark as being the most luscious. He affects the strawberry also to some extent, and occasionally varies his menu with a fine grape or two, but the damage he does is light, compared to that inflicted by others, the imported nuisance for instance. It may be that he causes wholesale destruction in some sections, as is written of him, but I cannot believe of it, nor am I rather inclined to think that if pains were taken to carefully observe, the greater part of the sins of which the pretty fellow is accused, would be brought home to "some other man." In the mean time until the documents are produced, I shall stand for "Bob" against all comers.

WILKOT.

["Wilnot" is the signature adopted by our contributor who under the nom de plume "Dick" has so often had a place in our columns. For the many "good things" sent in the past, our readers will please transfer the credit to the new name.]

THE BLACK RACER.

Editor Forest and Stream:

I'm surprised. Do you know who doubts and unbelievers go when they leave New York for good? Here I've had the oversight of a snake twenty years, for it off myself have referred to it I don't know how many times, and one of you say that his existence is doubted, or rather that he did exist before I killed him, or that there ever was another like him. I am surprised. I only wish Woodman was alive to set forth his merits to you as he did to me, and then see if you had doubts. "Don't know Woodman?" Why, he's the one that (did not give the first unearthly screech when the city of Springfield was born, but he did the crying that invariably follows birth, for two years beautifully. I wish you could have seen him march down Main street, swinging a ponderous bell as though the championship of America rested on his shoulders, and as he would bring up at the corner of Court square, with the dignity of a judge deposit the bell on his left arm, and, with feet well braced, open on the subject in hand. It was not necessary to repeat his message, for the whole city heard it. Laterly, however, his voice produced some fearful results. One Sabbath morning while engaged in his usual barber-ous occupation, and in the most difficult part of it, "two dogs" attempted to settle a little unpleasantness on the doorstep. Opening the door under the excitement of the interruption, he "histed the gate clear up" with a "get-a-e-o-n-i" exceeding even his usual powers. One dog disappeared over the fence and was not seen afterward; the other made a desperate leap for the street, but fell dead at the gate, undoubtedly struck while crossing the line of some note in that "music of the spheres." This conclusion was reached after full discussion over the remains.

But there was earnestness in his description of the black racer. There was, to him, terror in the name, and this, perhaps, not to be wondered at, for he was not swift of foot, and the idea of being choked in the racer's coil was among the possibilities at least. "One of my neighbors," said he, "was riding over a hill, when he was cut across his back by a heavy whip, and hollered, 'Oh, he looked all round, but could see nothing and drove along. Soon he received another blow and again hollered, 'Oh, it was a black racer, hid in the hay, that had struck him.' Another case he related where the snake "clicked" his tail like a whip lash round the legs of some children, hurting them awfully, and that one big snake was chased by men on horses clear to the city of Hones on the Boston road, where they lost the track entirely, having been distanced out of sight by the snake.

But to return. It is hardly safe for parlor naturalists to ignore tradition. Few structures are without a base, and the wildest exaggerations in describing phenomena in organic life invariably have some parts on which to build. The Indian tradition of the mastodon which grazed one of our earliest schools, is to me, an unsolved mystery. I will in an hour, the skeleton entire, stood before me, and I walked between the forelegs of one, my head not touching the breast bone. And in like manner, after the accumulated tradition of the black racer, it was hardly proper for Goodrich and other writers to ignore his existence, because there must have been something from which to build it. Now he stands out as one of the things that are, and although almost extinct in New England, no reasonable person can deny his existence.

The common *Coluber* of the United States is seldom even six feet in length, black above, while the whole belly is slaty blue. Constrictor is to me a mistaken title. I have seen them in all ways and places for nearly half a century, and I never kill one, but give chase, stepping on the tail to see them turn upon me, striking with open mouth, seizing my clothing and shaking it like a puppy. I have never been able to induce an attempt at the Constrictor qualities represented. I have seen them ascend a tree of thick branches with all the celerity of a squirrel."

"The black racer (*C. cerberus*) is slimmer built and from eight to twelve feet in length. Glossy black above, the belly a mottled brown. The throat and two-thirds of the eye circuit white as polished ivory, while large blotches of white extend four feet down the belly, disappearing in a broken line in the middle, at first slight, and on short acquaintance it is the most saucy impudent snake I have seen, and ready to follow anything that will run. One man said this: "The snake moved out from an old fence directly in front of me, head two feet high, white throat and belly, thrusting out a long fiery tongue. Then, to get a better view probably, he came several feet nearer, and evidently with 'come now, start yourself' in his eye. Of course I showed coat-tails across the field, with my snakeclub close behind. In a twinkling he was a stake on the right side of the fence, and the snake stopped just beyond reach of the club. After regaining the breath which was most gone, I demonstrated at the snake who retreated across the field and I after him. Making a stroke at him which he dodged, my club broke and fell from my hand. He instantly turned upon me, and without stopping to think I took to my heels across the field a third time, the snake close behind. Here I cried 'quits,' got over the fence and left him in possession of the field."

Another man said a racer chased him whose head was as high as his own, and that he barely escaped with his life. Another said his companion, while hunting, chive down the hillside with a racer at his heels, calling for help at every jump, having lost both hat and gun in his flight. And yet another, "I was sauntering along, staff in hand, when I heard a 'quits' coming from the woods, and the racer was with 'colors flying loose.' There's a snake after me, was

all she could utter. As she shot past me, I stepped in front of the snake, who instantly stopped. Slooping a little to get a horizontal stroke and cut his head off. I struck, but his head wasn't there. Quick as a flash he dodged my blow, then turned and disappeared in the brush and bushes."

I could repeat these stories indefinitely. They come from men of candor and veracity; are what they saw and what they did; so that, making all possible allowances for fright and exaggeration, I feel that it is hardly necessary to exhibit my own opinions to substantiate the truth of the tales which, in all serpentine qualities, stands alone and at the head of his genus. Impudent, saucy, rolisome, but harmless, is my story of his life till a better one is told.

B. HORSFORD.

P. S.—I am happy to announce that after twenty years' research I received to-day another *Cerrop*, not as large as the first, but bearing all the characteristics before described.

SPRINGFIELD, MASS.

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication notices of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

SOME EXPERIMENTS IN VISION.

I HAVE pursued my experiments, as "I. H. T." suggests, with results as follows so far as my eyes are concerned:

If I bring the left edge of an object close at hand on a line with the right edge of an object at a distance, the right eye being closed at the time, and the open right eye, the first object does move over and obscures, though it does not hide, the distant object; the distant object is seen dimly, and apparently as if through the near object, while other objects at a distance that were hidden by the near object when the right eye was closed, become visible when the right eye is opened.

If the right edge of the near object is brought in line with the right edge of the distant object, the right eye shut, when the right eye is opened the near object again apparently moves over to the left, and the distant object becomes visible; but by looking intently with both eyes open, the head being steady, the same appearance of seeing the distant object through the near one becomes evident, though not so clearly marked as in the first case.

That we see with both eyes, when both are opened, can be easily shown by trying to hide some distant object, as a flag-pole, by some near object set as the vertical bar in a window sash. With either eye shut the head can be moved so as to bring the distant object; with both eyes open the distant object will be seen in all positions of the head that keeps the orbits of the eyes on a horizontal line; looking intently it will appear as though there were two near objects, the distant object being seen all the time, and a position can be found when it will appear as though the distant object was seen between the two near objects.

The moon was used as a distant object, and a veranda post as the near object in verifying the above, so far as the near object's moving over to the left, and the moon and a flat ruler wide enough to cover her disk, when held at arm's length, for the last experiment. The ruler was used for this, as the veranda post hid the moon even with both eyes open, on account of its width. The ruler, held at arm's length, and held in the middle, the two images occupying the positions shown when first one eye and then the other was closed; by closing first one eye and then the other, the ruler can be given such a position that the moon can be seen exactly midway between the two images, and the image in position for the right eye (for my eye) was found to be much the stronger.

I have used the microscope, telescope, transit, &c., and have never shown the unaided eye, nor does its being open bother me in the least. The most singular one, however, is that familiar to all who use the jeweler's eye-glass; by the will power alone it is possible to see with either the eye looking through the glass and be blind for the time being with the other, or to see with the eye not occupied by the glass and to be blind with the one so occupied. Time and time again have I so used my eyes, seeing through the glass when at work that needed it and seeing absolutely nothing with the other; but what a tool was needed, instantly changing to vision with this eye and looking for the tool, perhaps and more than probably not changing the position of the head while so doing, so as not to lose the position of the work through the glass when it became necessary to look at it again.

In shooting a rifle at targets I always close one eye, although I can see the sights plainly with both eyes open. In sharp rifle shooting never stop to think whether I shut one eye or not, and in shooting with a shotgun I keep both eyes open—with me, being a right-eyed and right-handed individual, I have no trouble; but I can readily see how a right-handed, left-eyed man, or vice versa, would be troubled to shoot well until he had accustomed himself to the circumstances by practice.

I will not trouble on your patience longer, as I only intend to give you "Snapshot" by the results of my observations. I thank "I. H. T." for his suggestion, however, which has led me to confirm my idea by further observations. C. D. WYOMING, July 16.

A PERTINENT INQUIRY.—"The Rev. G. A. Cleveland, of Gloucester, Mass., in a letter to the *Cape Ann Advertiser*, says 'I have been a great deal troubled by the results of some of my experiments with one of your tricks. On my coming near the flock the male partridge would rush toward me with feathers stuck out like a frill, wings flapping, and making a terrible fuss in every possible way. After a time, though, I found that this was only a trick. While my attention was being drawn to the bluster before me, the female with smooth feathers and drooped head was hurrying off with her head to the ground safely.' After what has been accomplished there were no longer any partridges in sight, male or female." A Hartford correspondent, "W. H. K.," who sends us the above clipping, suggests the pertinent inquiry, at what season of the year was Mr. Cleveland "hunting partridges before now?" Will that gentleman have the courtesy to tell us? And if, as we presume may sometimes have happened, the shooter succeeded in being wiled by the head to the ground, what was his contribution to natural history, what became of the brood?

FIR AND SALAD.

LET any one who wishes to enjoy this dangerous sport, where there is no scarcity of the raw material, and of a pretty savage quality, too, come to Washington Territory, if he does not get all he wants of it, the failure will not be for lack of opportunity.

Extending from Gray's Harbor north to Puget Sound, a distance of about eighty miles, is a tract of country entirely uninhabited, and of which but little is known. On the Surveyor-General's map it is marked as innoxious, unfit for cultivation, and unsurveyed. It was on the borders of this wild region we picked up our camp, and in the summer of 1891, from an old trapper we had learned that the report of the country was incorrect, and although somewhat rolling, there were a number of fine prairies, and not far from the headwaters of the Humpulips River, there was a large lake with a prairie several miles long adjoining it. He stated that some years before, while prospecting, his "pard" and he had discovered it, and building themselves a cabin, had had no provisions enough for the rainy season set in to last them six months. Here they passed the winter and returned in the spring laden down with furs. The lake abounded in fish and wild fowl, while large herds of elk were frequently seen on the adjoining prairie. Bears and cougars were very numerous, and seemed to have very little fear of them. All this delighted us extremely, and we determined, should opportunity offer, to explore the promised land for ourselves. Our camp was located on a narrow strip of sand that extended some distance out into the bay, and covered with a stunted growth of pine. Between us and the heavy timber was a flat about a mile in width, which was covered with water at high tide. Here we had built ourselves a cabin, from which we made our daily excursions in search of new specimens.

One rainy afternoon, as we were returning from a long tramp, and as we were about the cabin, some one exclaimed, "What's that?" and to our surprise we saw a bear sitting in front of the door. He was a little fellow, and seemed very curious to know what kind of beings we were, for he raised himself up on his hunches and eyed us suspiciously. Our first impulse was to "howl him over," and I raised my gun to do so, when some one suggested to "catch him alive." This met with approval, and we started to do so, but he got down, we started for him, and he immediately took to his heels, and then followed one of the most exciting chases I ever remember. Around the cabin he went, the whole camp following, shooting at the top of our lungs. Then he dodged behind a pile of driftwood; and driven from there, back to the cabin he went. By this time we were pretty well winded, our heavy rubber boots and clumsy "Cape Ann" suits having proved too much for us, and notwithstanding our utmost efforts he had succeeded in keeping just out of our reach, and at last headed across the flat for the heavy timber.

I prided myself not a little on my running (having won several medals on the cinders at Mott Haven); and to have a little cub get away from me in that style was not to be allowed without an additional effort on my part, so continuing the chase alone. As long as the sand was firm I could hold my own; but I soon gave into the mud and one of my boots came partially off, bringing me to a sudden stop. Sitting down in the mud, I drew them off and also my waterproof coat and pants. The change was a decided improvement, and I then gained on the bear very rapidly. A small creek ran through the center of the flat, and, having reached it, the game seemed undecided as to whether to extend myself to the woods, and I got within a few yards of him when he scrambled into the creek and swam across. I floundered after, and on reaching the other side I had the greatest difficulty in getting out, often sinking up to my waist in the soft mud. But it did not seem to trouble him in the least; and by the time I had reached the hard sand he was fully 200 yards ahead. I now strained every nerve to overtake him; but it was in vain, and I was obliged to content myself with the mud, and I was not without twenty-five feet behind him when he disappeared in the salal brush. I dared go no further, for if his respected mamma had discovered me, she would have made a meal of me without remorse on my part, for I had not even a club to defend myself with, and, moreover, was so exhausted that I could not have run a hundred yards to save my life. Covered with mud and slime, with my feet bleeding from numerous cuts, I limped back to camp, where I received with shouts of laughter at my dilapidated condition.

Salal and salmon berries were now getting ripe, and the bears, descending from the mountains in large numbers, became decidedly familiar, their tracks being frequently seen around our cabin in the morning, and an occasional animal was seen along the edge of the timber, but we could not obtain a shot, owing to the almost impenetrable character of the new growth. In these were forests, where the silence of the grave reigns, giant fir and spruces, frequently nine feet in diameter, tower a hundred feet without a limb, and generally beneath these giants is a dense growth of vine, maple and alder, and still lower the salal brush. It is almost impossible to make any headway through these thickets, and so thoroughly does this dense mass of vegetation shut out the light that even at midday it puzzled me to read the print.

One of our party, wandering off one day alone, met with an adventure that came near being the end of him. On entering an open glade in the forest he came suddenly on an immense bear devouring a deer. The bear was not more than ten yards off, and our trembling collector having come after small birds was not prepared for such a monster. Hastily looking over his shoulder he found to his horror that he had neglected to bring any buckshot; nothing larger than No. 3 could be found. The bear immediately rose to its haunches and began to growl savagely; then dropping on all fours walked leisurely toward him. This was too much for our now thoroughly frightened collector, who incontinently fled, leaving the bear master of the situation, and disappeared as fast as his legs could carry him. Arriving at camp he prepared to return to the forest, but he could not find his way, and of course he was not to be found. We waited patiently until ten o'clock that night, but finding that he did not return, we built a trap of logs in the shape of a letter V, and putting the remains of the deer in it, we attached a string to it and the trigger of a gun heavily charged with buckshot, and returned to camp. All hands turned out early the following morning, and busily despatching our breakfast, returned to the trap. We found the logs scattered in every direction; and to our delight the bear was stretched out stark and stiff, with a hole in his breast large enough to put one's hand in. He was an immense creature, and although we had no means of definitely determining his weight, it required the united strength

of four of us to get him hoisted over the limb of a tree. He certainly could not have weighed less than 500 pounds, and was in prime condition, the fat on his hams measuring nearly three inches in depth.

We now procured the services of a half-breed hunter and his dog, and whenever a bear made his appearance the dogs would be immediately put on the trail, and they generally succeeded in tracing him, when a shot from a rifle usually settled the business.

The dogs also occasionally tread a cougar in this way. Just here is concerned a subject that has been of considerable interest to me, and which I have not been able definitely to settle. In conversations with numerous trappers and Indians, I found that they universally agree as to the existence of an animal differing from the cougar (*Felis concolor*), which they call the panther. They describe it as nearly the same color, but longer and more slender, with the head elongated, the chest narrower, and legs somewhat longer. It is much rarer than the cougar, and only an occasional one is killed. I offered a considerable sum for the capture of one of the animals, but could only succeed in procuring a skull of one that was killed some time before. It differed essentially from that of the cougar. Our Indian guide showed us the track of one of these animals and explained the difference between it and the track of the cougar. We then had a large steel trap made which weighed nearly fifty pounds, to which we attached a log of about 100 pounds weight. Placing it near where the tracks were seen, we baited it and left it. The result was a very large bear, who, notwithstanding the great weight, dragged it fully half a mile, and only stopped when the log got entangled in some trees. We caught several others in this way but no cougars.

Our supplies were very low, and the Indians we had engaged to procure more not having arrived, two of our party were detailed to get them at the nearest place, a sawmill situated on the opposite side of the bay and about fifteen miles off. Our navigation at this point is extremely dangerous in this bay, but we had a chance by the blowing of the wind in the right direction, we thought we could safely venture. In order to be safe, should we experience rough weather, we took a heavy salmon boat instead of our light kamin. This nearly cost us our lives. Everything went lovely for a while, and we skimmed over the water at a fine pace, but suddenly there came up one of those sudden squalls for which this coast is famous, and we were blown to the wind, and with a very heavy sea, and jerking the sheet from our hand, and only with the greatest difficulty was it secured and the sail lowered. We shipped a heavy sea which filled the boat nearly half full of water. Going with the tide running at the rate of six miles an hour, it did not seem to make much difference whether the sail was set or not, we fairly flew. We had now lost the channel, and narrowly escaped being dashed to pieces on a sunken rock, of which there were dozens to be seen in all directions, and as if to add to our danger, a heavy mist came in from the sea, shutting out the shore line entirely. Heading her the best we knew for the nearest point of land, we soon had the satisfaction of seeing the dark timber line appear, and a moment after we struck a snag, smashing in the bow of the boat. Jumping overboard we dragged it on shore and then sought for assistance, but with only ropes and a coil of rope, and a few tin cans, we had no help for it; camp we must. Dragging the sail on shore, we made a bed of it; and collecting a large supply of wood we laid down wet and supperless. During the night we were disturbed by some animal that came prowling around us; and as our only weapons consisted of a small hatchet and a revolver, we did not feel any great desire to secure the animal, and it was not until the morning that we saw the sound set off, and we were not further disturbed. In the morning the intruder proved to have been a large bear, the tracks being plainly visible in the soft earth.

Our real danger now commenced. The tide of the previous night, being an unusually high one, had driven our boat far up on the beach, fully 100 feet from the present water line. It was so heavy that it was impossible to move and only ropes and a coil of rope, and a few tin cans, we had no help for it; camp we must. Dragging the sail on shore, we gave up and betrough ourselves of breakfast. It was a scanty affair, consisting of a few salmon and salal berries. Not a drop of fresh water could we find, although we searched for a half a mile on either side. My "pard" considered himself quite a shot with a revolver, and, as squirrels were very abundant, I meekly suggested that now was the time to try our aim, and I was completely right. They were walking up within ten feet of a squirrel, he blazed away, but the little animal only ran away a few feet and chattered at him, as if very indignant at such treatment. He tried another shot with the like result, and on my suggesting that they might be blank cartridges, he desisted entirely. Returning to the beach we collected some drift-logs, and making a kind of roadway, using the boom for a roller, we succeeded in getting the boat about, and then retired and slept until morning. About noon the next day we arrived at the sawmill with our throats so parched from thirst that we could hardly speak. Securing our supplies, we engaged the mill steamer to take us back to camp, hiring an Indian to bring back our boat.

Having exhausted the game in the neighborhood of our camp, we packed our traps for the boat and returned to the Humpulips River for the like the trapper had told us about, but after going about five miles we came to a bad "drift." It was upward of half a mile long and utterly impassable; as the boats were too heavy to make a portage we had to abandon the expedition and return to the harbor. At some future time I will send you some of our experiences in the new camp. Since writing the above I have learned that the Government has made an appropriation for clearing this river, and ere another year has passed this fertile region will be open for settlement.

RISE LAKE.—Port Hope, Ont., July 18.—So far as I can yet judge the shooting prospects on Rise Lake for this autumn are good. A great many ducks which breed so far south as this are with us, more, I think, than usual. The fall shooting is always more or less uncertain, but should be good this year, judging from the number of fall ducks which visited Rise Lake this spring on their way north. The fishing is simply magnificent, not only a larger number of fish but fellows of greater weight than usual having been already captured. The rice crop is a very large one, and I have made arrangements which will insure my having a very large quantity on hand.—CHARLES GRANTHIST.

VIRGINIA GAME.—Staunton, Va., July 16.—The prospect for quail and ruffed grouse in our country is good. The birds are fast recovering from the destructive winter of 1890-91, and in another year we will again be blessed with plenty of them.—JACK.

THE REPORTS OF SHOTGUNS.

NOT many days since, as a Mr. Cole, one of the members of the Board of Supervisors, was returning to his home in the country from Victoria, B. C., he saw a number of men, some one concealed near the roadside fired a load of buckshot into his body with such terrible and fatal effect that the man was dead when he fell from his horse to the ground. Several persons along the road and in the vicinity of the tragedy heard the report of the gun, and a young lady saw the dead man a minute or two after the shot was fired. The next day an inquest was held, and I have seen the deposition of the witnesses before the coroner taken on that occasion. Nearly every one who heard the report of the gun swore that they knew it was a Doctor Cook's gun which had been fired, as they were used to the sound of his gun and could distinguish it from any other.

This line of testimony struck me as a shade peculiar, if not a little careless. I have been thinking the matter over and I don't think I could go so far as to identify any gun from merely hearing the report of it. It seems to me impossible for the report of any gun to be uniform. There are so many conditions that may vary the sound, such as the charge, the distance, the topography of the country, the direction and velocity of the wind, the density of the timber in the vicinity, and perhaps even the direction the gun may be pointed at the time of discharge.

I have always thought my brother has a gun with a more peculiar report than that of any other gun I ever heard. I would say, as a guess, that I have heard him fire it no less than three thousand times, at distances ranging from twenty inches from my ear, to two miles or more away—in the woods, in the water, on sandbars, in the willows, in calm, in storm, in snatching a log in snow, and in all sorts of places, and generally when I was listening for its music and could about locate him in my mind if out of sight; and yet I could not go before a jury and say upon oath that I knew a certain shot was fired from his gun unless I saw it with my own eyes. I know that often in hunting with him I have mistaken the report of other guns for his, and have failed to shoot at other places at other times when he had fired within my hearing, especially if in a different direction from what I supposed him to be at the time.

Imagination was, perhaps, a large factor in the case cited above. The witnesses were mostly colored people. Dr. Cook probably did more shooting in that vicinity than any other man, and as it developed on the investigation that a feud existed between him and the deceased, and he had been seen with a gun in his hand before the man was shot, and not far from the scene of it, suspicion naturally fell upon him, and it was easy for an imaginative person to think the report was similar to all reports of the Doctor's gun on other occasions. I would say, at a hazard, that such testimony should be set aside as utterly worthless.

BURR H. POLK.

LACONIA, NEBRASKA, July, 1893.

KYNCOCH SHELLS.—Manitowoc, Wis., July 17.—*Editor Forest and Stream:* I tried a new sample of the Kynoch shells yesterday and met with the same difficulty as before, viz., "too numbesstiecke," and I don't know but that I shall have to agree with H. V. L., "that there are some imperfections in the chambers of the shells, and that they are not adapted to my gun, so I cannot use them." To sum up this whole matter, my version is that if the chambers of the gun are adapted to the Kynoch shells, it is policy to use them; but this sportsmen will never know until they give them a personal trial. Crimping should be done by grooving the shells and not by bending them in at the end with the fingers, as that will give them a tendency to burst. The shells of the gun if bent in at the end, while they go in readily when grooved in three or four places. I made no better patterns with the Kynoch than I did with paper shells.—D.

Editor Forest and Stream: I have used the Kynoch shells this season for glass ball and target shooting. I shoot a 12-gauge Colt gun. Have loaded shells with 4drs. black powder, two pink-edge wads, 1oz. of shot and one cardboard wad. The shells do not chamber close; never burst; and retain their shape, giving pattern and penetration equal to best brass shells.—WINNIFROGEE, (Laconia, N. H.)

WORK FOR THE GAME PROTECTOR.—As far as I can judge there is no protection for even song birds here. Reckless shooting may be heard any day, Sundays excepted, and "after us the deluge." There are some who are shooting for taxidermist in town. Quail never have been as plentiful and bold as they are since the five-year law was up. They can be heard calling everywhere. Yesterday a pair flew up right in front of the house, but I see no reason why the above-mentioned young men should respect them or any other bird, game or song. The law here seems to be a dead letter, and has been for years. And I know no better bird-ridge quail or woodcock country if only the birds are given a chance. There was something of a fight of large snipe going east last Friday and Saturday. I have only seen one English sparrow since I have been down. They do not seem to thrive down here. The robin is the commonest song bird we have, and meadow larks spend the winter here; but the farmers protect nothing; they go on the principle "after us the deluge." There is a splendid opportunity for you "philanthropy."—T. C. M. (Easthampton, L. I.) [The above communication is respectfully referred to Mr. G. A. Whittaker, of Southampton, L. I., who is the game protector for the counties of Kings, Queens and Suffolk.]

TENNESSEE NOTES.—Nashville, July 23.—Bob Miller, of the *Banner* staff, shouldered his shotgun and started out for his traps and ammunition belt for a few days after squirrels in Alabama. Bob is a dandy editor, and said to be a first class shot. He ought to have a good time, as he is one of the best of fellows, and if he does have, everybody near him will be made lappy. Squirrels are very numerous throughout the wooded districts, and as this is the season when they are in their fattest, forms squirrel pie-cakes, pies and stews are the luxury enjoyed by the killers. If you I could surprise you all with a red-hot pot of "Tennessee squirrel stew," and if you did not fancy yourselves in the promised land, then I would be very much mistaken. Doves will afford excellent shooting in about two more weeks.—J. D. H.

RUFFED GROUSE IN NEW HAMPSHIRE.—Enfield, N. H., July 24.—In reply to your inquiry for good sporting localities, I would say that ruffed grouse are very plenty about here, and would afford good sport for any one who "shoots on the wing. Gray squirrels are also very plenty among the oaks in this vicinity. Black bass fishing is very fair, nothing extra.—P.

OHIO GAME NOTES.—Steubenville, O., July.—We have quite a number of gentlemen here who are alive to the enjoyment of sports in the forest and stream. It is true, game is not very plenty in this locality. Squirrels are being killed in fair numbers around the wheat fields, and I am happy to say that Bob Whites are whistling all around us again. I saw a brood of little fellows last week just large enough to fly, and had the exquisite pleasure of putting a load of No. 7 shot in a hawk which was doing his best to destroy them. With a little care we will have plenty of birds here again. Rabbits were never so plenty. The boys are training their dogs with the expectation of fine sport this fall. I have three good dogs, and about October we will make the fur fly.—A. E. M.

IOWA PRAIRIE CHICKEN.—Decorah, July 18.—I must send you a few lines again this year, in regard to the prospects of the coming shooting season. From all accounts I have them, I think we are likely to have some good chicken shooting; we have had some very heavy rains, but fortunately the young birds were strong enough to stand them before they came, and if the birds are only left alone (which I fear is dubious) until the season opens, there will be some good sport in this vicinity. There seems to be a nice lot of quail, which I am surprised at, owing to our having had so severe a winter. Pheasants are almost as good as a bird of the past in this part of the world, why I cannot say.—J. L.

NORTH CAROLINA GAME.—Belvidere, N. C.—Have never seen old quail more abundant than at this time. Should the heavy rains not destroy the young, we will have excellent hunting next autumn. Our law protects them until Oct. 1. Decidedly a better time than any other year, and as we have protection for them from Jan. 1 to Aug. 1, they will probably get a rest.—A. F. R.

TELEGRAPH STRIKERS.—Our Philadelphia correspondent reports July 21: Two or three dead woodcock have lately been picked up under the telegraph wires near Norristown, one last evening by some children of the town. Examination proved them to be telegraph strikers, but the blows in every case were disastrous and ended in dissolution.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

CHANNEL BASS.

Editor Forest and Stream:

On several occasions I have referred to the royal sport in store for fishermen if they would visit Mayport, near the mouth of St. John's River. In the past our fishermen have been in the habit of capturing these fish with a hand line, and I have repeatedly pointed out to several of my friends the sport to be secured in the capture of these noble fighters with rod and reel. About two weeks since Col. H. S. and H. made their first essay in rod and reel fishing for large bass. S. hooked a large one, and after playing him for some time he coaxed him to the side of the boat. The fish disliked the appearance of the excited face of S., gave a flirt with his tail, ran under the boat, and in an instant the rod was converted into match wood. H. (an eminent civil engineer from Gotham), who had earnestly discussed with me the antics and gambics of the "lordly salmon," and ridiculed bass fishing, hooked a big fellow. The bass started on a two-forty gait, and H. thumbed his reel until the cuticle disappeared; and as a *dejeuner* resorted he compressed the line against the rod with his finger, but the pressure lasted but for a moment, for blood followed the line. H. let him run, and as soon as the last coil left the reel, the line parted and the fish departed. Col. H. hooked one which the boatman estimated at fifty pounds, and after a fight of one hour and a half the snood was cut in twain.

Col. H. made a second attempt, and he called on me this morning in raptures over his success. Owing to the breaking of his line and the hook tearing out he lost two large fish. He weighed his fish, and in order that I may not be accused of "drawing the long bow," I append a printed statement from to-day's *Evening Herald*, regarding my friend's second attempt at bass fishing:

"Our genial and popular fellow citizen, Col. J. E. Hart, is distinguishing himself as a disciple of old Luak Walton, and bids fair to make as complete a success of himself in the delightful sport of fishing as he has made of his big grain elevator at the foot of Liberty street. He came up from the bar this morning, where he has been spending the last few days, bringing with him a twenty-five-pound channel bass, the weight of the rod and reel. Saturday he caught four of these beauties in about an hour's time, the largest weighing thirty-five and the other three twenty-five pounds each; and the rod and reel did it all."

The time has not arrived for the main run of these fish; but from the middle of August to the middle of September they will enter the river in quantity. In many years' fishing in the neighborhood of Mayport, the smallest one I captured weighed 19 lbs. On one occasion I caught a single four captured between daylight and 7:20 A. M. eleven that averaged 45 lbs. My memory may fail me with regard to the fighting and staying qualities of the striped bass, but in my opinion channel bass are their equals. It is to be regretted that none of your Northern fishermen who are devotees of the rod and reel, and who can enjoy the capture of fish worthy of their steel, do not visit this section in the early part of September. If bass ranging from 25 to 50 lbs. are considered unworthy of their daily notice, in the way of variety they can hook on to from five to eight feet of grased lightning—a tarpon.

The voyage from New York to Savannah in August and September is a pleasant one; time about fifty five hours. From Savannah to Jacksonville by train six hours, and from Jacksonville to Mayport by steamer less than three hours. At Mayport Boatmen's Office a good table where board can be obtained at \$10 per week. The temperature is no higher than in the North, the nights are cool, insect pests are not so bad as on the Jersey coast, the healthiness of the

locality is beyond question, and the sea bathing is A1. Fishing is done from a boat; and to those who can enjoy right royal sport we will say try channel bass fishing. Even friend "Didymus" might find something to interest him.

JACKSONVILLE, Fla., July 10, 1888. AL. FRESCO.

OSSEIPEE PARK.

BY G. W. R.

I.—THE HEART OF THE OSSEIPEES.

"The cedar and the mountain pine,
The willow on the fountain's brim,
The tulip and the opuntia,
In reverence bend to Him.

The song birds pour the sweetest lays,
From tower and tree and middle air;
The rushing river murmurs praise—
All Nature worships there!"

ON the northern shore of Lake Winnepesaukee rise and extend from east to west the range of mountains called the Osseipees. The highest peak, Mount Shaw, (named in honor of the owner of Osseipee Park) is 3,000 feet above the level of the sea, and from the observatory on its top (forty-five feet higher than the mountain's crest) an exceptionally fine view may be had in every direction, and the finest, anywhere obtainable, of the White and Franconia ranges.

The park is, *par excellence*, a natural one, and the desire and purpose of the owner is to keep it so; to preserve and foster its pristine beauty, and the hand of art (not always a soft or deft one, and associated with natural scenery) is only used to make accessible the rare loveliness of Nature's handiwork so lavishly spread throughout this lordly domain of 400 acres. The Hall, situated on a plateau on the mountain side, surrounded by a lawn of about seven acres, is 800 feet above the level of the lake, and for elegance of design and finish is a model. It is thoroughly built and not thrown together hastily, and for the short "season," but is comfortable for long sojourn in the fall, when the mountains and meadows are ablaze with glory. It is well supplied with fire-places, and in their construction the useful and beautiful have joined hands, and the result is pleasant to more than one sense. I am sure that every sportsman will recall to mind the comfort of stretching before a blazing fire on the hearth after a hard day's tramp over the hills and by browsing stream. With or without "accessories," a wood-fire is a rare good thing of a rainy day or a chilly gloaming. Every modern convenience, and, thank God! several good, old-fashioned ones, are to be found within the Hall, so that pleasure and comfort are not wholly dependent upon the state of the weather. Aside from the extensive and incomparable views to be had from the Hall and from the observatory on Crow's Nest—a height near the lawn—there is a marvel of beauty in the shape of a brook running through the domain, the falls and cascades and rapids of which are notable for peerless and peaceful beauty and picturesqueness. The Park is reached via Center Harbor, thence by trolley-coach to Moultonborough Corner, where the Park carriage will meet expected guests. For the present season only a dozen guests can be comfortably accommodated at a time, as the Hall was erected for its owner's summer occupancy and not for a hotel. The whole property is owned by Mr. B. F. Shaw, of the Shaw Stocking Company of Lowell, and is fitted and managed very like an Englishman's lodge in the Scottish Highlands, which it resembles more than any other American ever brought to my notice. It is a place designed and eminently fitted for the cultured taste, for the refined and for those who love the beauty and peace of nature rather than the fashion and worry of "society," as found at most country resorts. It has been called "the most beautiful place in New England," and I think it cannot be denied. For good and sufficient reasons shooting and fishing, within the domain, are strictly forbidden, but even the most ardent sportsman must forget, or hold in abeyance, his favorite pastime within the confines of this beautiful and peaceful spot—lung, as it were, between earth and heaven and deluged with "loveliness devoid of art."

Those who love Nature, rest, freedom from turmoil and a free enjoyment of all creature comforts, will find here the name of reasonable desire, and a revelation of wonderful beauty and magnificence.

I purpose to note some ramblings and views taken hereabouts, yet though written about the place can never be fully described. Of it may it be truly writ—

"And in some calm, sequestered spot,
While listening to thy choral strain,
Past griefs shall be awhile forgot
And pleasures bloom again."

THE HALL, JULY 17, 1888.

THE COMING TOURNAMENT.

IN accordance with a resolution passed at the last meeting of the National Rod and Reel Association, President Endicott has appointed the following gentlemen as a committee of arrangements for the tournament to take place next October:

- Chairman, Mr. James Benkart, President South Side Club, Long Island.
- Fraucis Endicott, President National Rod and Reel Association, *ex officio*.
- Eugene G. Blackford, Commissioner of Fisheries, New York.
- Samuel M. Blatchford, Squibnotch Club.
- Dr. E. Bradley, President Bloomingdale Park Association, Pennsylvania.
- Marlin B. Brown, Waywanda Club.
- D. W. Cross, Andouh Club, Ohio.
- Chas. B. Everts, American Piscicultural Association.
- Hon. James Goides, Onondaga Club, Syracuse.
- Wm. C. Harris, New York.
- Dr. James A. Henshall, Cynthiaiana, Ky.
- Dr. C. J. Kenworthy, Jacksonville, Fla.
- Robert B. Lawrence, Union Club, New York.
- William Blair Lord, Washington, D. C.
- Hon. Henry P. McGowan, Cuyahunk Club.
- Thatcher Magoun, Jr., Boston.
- Fred Mather, Adirondack Club.
- Prof. A. M. Mayer, Stevens Institute, Hoboken.
- Barnet Phillips, American Piscicultural Association.
- Hon. R. B. Roosevelt, President Game and Fish Protective Society, New York.
- James L. Vallotton, President Pasque Island Club.
- C. Van Bruut, Willememoc Club.
- R. Van Vleck, Ichthyophagous Club.

Edward Weston, President Greenwood Lake Association.
Locke W. Winchester, President Restigouche Salmon Club.
Louis B. Wright, Westminister Kennel Club.
Rev. Henry L. Ziegenfuss, Poughkeepsie, N. Y.
The committee will be divided into sub-committees on grounds, rules for the different contests, etc.

BLACK BASS IN TROUT WATERS.

BY DR. J. A. HENSHALL.

IN the discussion following the reading of my paper "On the Distribution of the Black Bass" at the last meeting of the American Piscicultural Association, and published in FOREST AND STREAM of July 13, I am placed in a false position in regard to the introduction of black bass into trout waters, which I hasten to correct. I am utterly opposed to the introduction of black bass into waters in which there is the remotest chance for the brook trout or rainbow trout to thrive. I yield to no one in love and admiration for the brook trout. I was perfectly familiar with him before I ever saw a black bass, but I am not so blinded by prejudice but that I can spare that love with the black bass, which for several reasons is destined to become the favorite game fish of America. "My offending hath this extent, no more." Let us look this thing squarely in the face. I do not wish to disturb any one's preference, but I do want to disburse the minds of anglers of all prejudice in the matter. The brook trout must go. It has already gone from many streams, and is fast disappearing from others. It is sad to contemplate the extinction of the "anglers' pride" in public waters, but the stern fact remains that in this utilitarian age its days are numbered and its fate irrevocably sealed. As the red man disappears before the tread of the white man, the "living arrow" of the mountain streams goes with him.

The trout is essentially a creature of the pine forests. Its natural home is in waters shaded by pine, balsam, spruce and hemlock, where the cold mountain brooks retain their low temperature, and the air is redolent with balsamic fragrance; where the natural food of the trout is produced in the greatest abundance, and where its breeding grounds are undisturbed.

But the iron has entered its soul. As the buffalo disappears before the iron horse, the brook trout vanishes before the axe of the lumberman. As the giants of the forest are laid low, and the rank and file decimated, and the wooden walls of the streams battered down, the hot, fiery sun leaps through the breaches, disclosing the most secret recesses of forest and stream to the bright glare of mid-day. The moisture of the earth is dissipated, the mosses and ferns become shriveled and dry, the withergreen and partridge berry, the ground pine and trailing arbutus struggle feebly for existence; the waters decrease in size and increase in temperature, the conditions of the food supply and of the breeding grounds of the brook trout are changed; it deteriorates in size and numbers and vitality, until finally, in accordance with the immutable laws of nature and the great principle of the "survival of the fittest," only the fittest remain. This is the point of view, but the fittest to survive the changes and mutations consequent on the march of civilization, disappears altogether.

Much has been said about the "trout hog" in connection with the decrease of the trout. But while he deserves all the odium and contempt heaped upon him by the honest angler, the result would be the same were the trout allowed undisturbed and peaceful possession of the streams, so far as the fish-hook is concerned, while the axe of the lumberman continues to ring its death knell.

Let us, then, cherish and foster and protect the crimson-spotted favorite of our youthful days as long as possible in public waters, and introduce the rainbow trout, or the Dolly Varden, or some of the Pacific black-spotted trout when he has disappeared; and when all these succumb, then, and not till then, introduce the black bass. But let us give these coming of the brook trout a fair trial first, and without prejudice. There are plenty of lakes, ponds and large streams in the Eastern States into which the bass can be introduced without interfering with trout waters, and this is what I meant by saying, "If, then, there are waters in which the brook trout or rainbow trout will not thrive, do not hesitate to aid in the further distribution of the black bass by introducing that desirable species."

For many years the brook trout will be artificially cultivated, and the supply thus kept up in preserved waters by wealthy angling clubs; but by the alterations of the natural conditions of their existence they will gradually decrease in size and quality, until finally they will either cease to be or degenerate to such a degree as to forfeit even this precarious protection.

I must dissent from Mr. Endicott's statement that the black bass is the bluish fish of fresh waters. The black bass is voraciously an all-games fish—but not more so than the brook trout. The character of a fish's teeth determines the nature of its food and the manner of its feeding. The bluish fish has the most formidable array of teeth of any fish of its size—compressed, lancet-shaped, covered with enamel, and exceedingly strong and sharp, in fact, miniature shark teeth—while the black bass has soft, small, brush-like teeth, incapable of wounding, and intended only for holding its prey, which is swallowed whole. The brook trout has longer, stronger and sharper teeth than the bass, and a large, long mouth, capable of swallowing a bigger fish than a black bass of equal weight. The mouth of the bass is very wide, for the purpose of taking in crawfish with their long and aggressive claws, and not, as supposed by some, for the swallowing of large fishes. The black bass gets the best of other game fishes, not by devouring the fins themselves, but by devouring their food. For this reason, more than any other, they should not be introduced into the same waters with brook trout. The pike or pickerel is the bluish fish of fresh waters, and in dental capacity and destructive possibilities is not far behind him.

I regret the placing of black bass in Raquette Lake fully as much as Mr. Endicott, and although the trout were said to be nearly extinct, not by devouring the fins themselves, but by devouring their food. For this reason, more than any other, they should not be introduced into the same waters with brook trout. The pike or pickerel is the bluish fish of fresh waters, and in dental capacity and destructive possibilities is not far behind him.

I thank Mr. Endicott very heartily for the statement that he was annoyed by the continued rise and capture of black bass when fishing for trout in that lake. Perhaps this statement from one who calls the black bass the bluish fish of fresh waters, will tend to convince some of the doubting ones that the black bass will rise to the sky.

CYNTHIANA, KY., July, 1888.

OUR ICHTHYOPHAGOUS DINNER.

THE TEXAS correspondent, "N. A. T.," who sat through all the courses of the last Ichthyophagous Club next to Mr. F. Eudicot, president of the National Rod and Reel Association, and still lives, we are happy to say, writes an account of the feast to the *Galveston News*. We are sorry to see that at the close of "N. A. T.'s" letter he casts a doubt on the record of the club, as given by the New York *Sun*. The *Sun* is nothing if not correct, and its smoke stories are received by the naturalists of all countries as valuable additions to our knowledge of reptiles, while its fishing trouts, backed, as they are, by the name of the learned Amos Cunningham, will go down to a posterity which will marvel at the former wealth of the fisheries of America. With this bit of preamble we give the following extracts from the letter of Mr. Taylor:

"I managed to get down a little of all on the menu, but found the horse-shoe crab wretchedly poor eating. It took at least a half-pint of champagne to wash down a piece no bigger than the end of one's finger. As someone remarked, it tasted like the pith of dried elderberry bushes. I have no idea that the ichthyophagous will ever succeed in introducing the horse-shoe crab into the article of food. I have the same opinion of the fresh-water mussel, which tastes just like green moss. The alligator steak was good; at least it could be worried down without an extra supply of wine. The fillets of sea-cow were splendid, rich, tender, and carrying a mild flavor of banana. The animal is the manatee of the peninsula of Florida, and had never been tried as food before, so far as anyone knew. It is a fine success, and it is to be hoped that somebody will start a manatee ranch in the swamps of that State."

"The following are the names of the members and guests, with the 'fish record' of each as given by the *Sun*, for no man could be admitted without a 'fish record':"

Table with 2 columns: NAMES and CAUGHT. Lists names of members and their respective fish catches, such as John Fido, John Fido, John Fido, etc.

"Now, if this fish record, as given to other gentlemen, is no more correct than that given to me, then I must say that the whole thing is a romance. I never caught a 'buffalo fish' in the Rio Grande, nor did I ever catch one of that sort of fish anywhere except in the fish markets at so much a pound."

Our correspondent is the first one that we have heard dispute the angling record of the members as given by the *Sun*. He denies the buffalo fish, and this, we fear, will tend to throw a doubt on what has been considered a truthful record. The club will be pained to learn that some papers have intimated that their members are prepared to make a spirit of fun, than as learned scientific seances, as all who have attended them know them to be.

A DAY WITH THE TROUT.

I DID NOT arrive in season for the best fishing. It is only in the large spring-holes that one now meets with success. One such place I got of and have recently enjoyed to the very utmost. But though I have often tried it, this is the first success. It must be struck at just the right time, and the time varies with the season. As the water of the stream grows too warm they seep here, and very soon thereafter the otter and mink assemble to the feast, and it is then that the trout are taken with much expedition.

Monday morning, the 4th inst., found me, with my guide, picking our way over leath and log, through windfalls, brush and over boulders, under a burning sun, each sacking a heavy load of grub and camp duff. About twelve o'clock we reached the stream, and soon had the birch in the water. At one o'clock we arrived at the pool, laid the canoe alongside the low bank and set it in place with the paddles. My rod was already in the water with much expedition, that I unhooked from the reel-bar the stretcher, a golden pheasant, and let it fall, with the dropper, a Jennie Lind, lightly into the pool. In a flash a two-pounder struck, and as I sent home the barb, another, his fellow, was hooked and both landed. It was well I had previously soaked my leader, or one, or both, were lost.

I would fill a page of your paper to tell of the rise, strike and landing of all the trout, to require the pen of a Davy Crockett or a Primo to do them justice. Every cast landed one or more, and of the 137, the limit of my catch, thirty pair were landed. I quit at four o'clock P. M., having fished just three hours. I had improvised a fish ear from a packing case. That was full to repletion; still the trout seemed to suffer no diminution in numbers, and if possible the sport would be better as the sun set, for I had killed enough, and more than I would have done were it not that they would soon fall a prey to their furred enemies. Bobby, my guide, could not care for them as they were reeled in. The most he could do was to pass them from my hand to the car. I never saw trout take flies so deep in the mud, and as a consequence, being without finger-stalls, fingers and thumbs were badly lacerated.

One beautiful picture presented itself and should be reproduced on canvas, only it would appear too extravagant for belief. I had hooked a large fish on the stretcher, and while reeling it in with the dropper a foot or more above the water, when four trout, apparently of a size and of about three-fourths pound weight, leaped simultaneously straight up all in a bunch and nearly their length out of the water to reach the fly. It was simply beautiful.

It was a tedious job towing the deeply-laden and square-ended ear, and we had barely time to cut wood and put camp to rights for the night, kill and dress the fish, before it was dark. As I lay on the fragrant boughs drawing water from my pipe, the problem of how to save and utilize my beautiful fish presented itself, and before I slept it was solved. I had laid them on a large pine tree that lay prone beside the camp, to drain and cool off. At one o'clock I awoke, arose and turned them over, finding them doing well in the cool night air. I slept no more, not even lying down again, so preoccupied was my mind with its pleasures. Long here and there I went to sleep, in order to be ready with cool grass in a hamper, with the remainder string on two forked branches. All this was done in the morning by the bright light of the camp-fire.

Bobbly enjoyed the sleep of youth and innocence, so I got breakfast ready which was eaten in the first flush of dawn. We considered the fish, leaving all else for another party to fetch out. It was a heavy load to sack out and we had many miles to go before 9 o'clock, in order to hit the Boston express. We were in time to flag the train. All aboard then, for a sixteen miles ride to a station where a box and ice were obtained, and time enough to pack the fifty fish and start them on the way to dear friends in Boston, whom I trust enjoyed as much pleasure in receiving them as I did in—[I was about to add taking, but as that could not be possible.] I will say seeing. The remainder were eaten at the home camp and given to settlers on the line.

CAMP, LOT WARFIELD, NEW BRUNSWICK, July 19.

NEW HAMPSHIRE TROUT STREAMS.

I HAVE just returned from a two weeks' outing at and in the vicinity of Deer Falls, N. H., where I have had my first class sport, having caught over 500 trout. This place is ninety-nine miles from Portland, and is reached via the Grand Trunk R. R. Fare from Boston for round trip via Portland steamer is \$7.80. The Cascade House, Mr. H. F. Marston, proprietor, is a well-kept hotel, and the charges are \$1 per day. There are many good trout brooks within easy distance. The best are Blackstrap, Chickwally, Silver Stream, Chaudron, Adams, and Jernico brooks. There is excellent pickerel fishing in the Androscoggin River, which is but a rod or two from the hotel.

This river was formerly filled with trout, but the chemicals from a wood-pulp mill situated on the river at this place, have killed them nearly all. About half a mile below the hotel on the river, are the famous Berlin Falls. The scenery in this vicinity is very fine. Mr. Washington and the Sun Hotel, also Mr. Adams, claim a jerked brook. The pizza of the hotel. A friend and myself caught 174 lbs. of trout in one day's fishing from Chickwally Brook, and on another day 25 lbs. from Blackstrap. My friend also took over 200 trout in one day from Horn Brook. The trout run good size, many weighing from 6 to 9 ounces, and some more.

On my return home I brought twenty-two trout weighing about 8 lbs. From what I saw while there I should think the outlook for fall hunting was good. Partridges and rabbits are abundant. I saw deer tracks several times along Chickwally Brook. An old hunter named Blodgett has trapped and killed four bears this season, and during my stay he caught a fifth, which escaped by gnawing off its paw and leaving it in the trap. We also saw three foxes.

E. M. W. SPRINGFIELD, Mass., July 23.

COLUMBIA RIVER SALMON FISHERIES.—The salmon fishing season on the Lower Columbia River is at its height. The run, which was very light early in the season, is now all that could be desired, so far as numbers are concerned, but the fish are somewhat smaller than the average of former years. The falling off in size is so considerable that many canners were compelled to sell. Without much reason to hope for an advance, most of the packers are holding off, and it is estimated that not more than one-sixth of the season's pack has been sold up to this date. But one ship load has been dispatched to a foreign port, but there has been a steady series of shipments to San Francisco, where a considerable part of the pack is now warehoused ready for shipment to Liverpool. Few packers who have sufficient capital to take advantage of the market will make money; most of them will come out even on the season's work, and a few who are compelled to operate in a hand-to-mouth way, it is thought, will fall a little behind. If the effect of the year's misfortunes shall be to stop the building of canneries it will be well. The business is already overdone on the Columbia River.—Portland Oregonian, July 10.

THE FINN FISH.—Fall River, Mass., July 19.—A fish of which the skeleton enclosed is a fine specimen, was caught yesterday at Seacoast Point. Its color is a bright golden yellow, not unlike the yellow mackerel we sent you about four years since. No fisherman or any other man can give us any information as to the name or family this species belong to. In some respects it resembles the sea surgeon family. If you can help us out of this safely it will oblige your Fall River readers of the FOREST AND STREAM. P. A. [The fish is not very rare upon our coasts at this season. Your sketch was a very good one, and enabled us to recognize at a glance that the fish was the "orange file fish" (*Monacanthus tomentosus* DeKay). It is of the family Balistidae, a peculiarity of which is the trigger-like dorsal spine, which can be set as though incapable of being lowered and yet may be depressed at the will of the fish, in order to cause the pectoral spines of the eel fish.]

GOOSE FISHING.—The editor of one of our Arkansas exchanges, in an issue just at hand, craves "the indulgence of readers this week. The type is not set as it should be: *The Coupositos trape gous in arnuiffshexcusosou*." We should think so.

TWO FISHING TRIPS.—Nashua, N. H., July 9.—Reading in your issue of July 7 an article on fishing in Canada, it reminds me of my own trip. Last month (June) I went on my own, about 25 miles, and the landlord, Mr. Smith, and myself started at about 6 o'clock A. M., and an hour's drive brought us to a friend's farm, where I flows a nice trout brook. We asked permission to fish in the brook, which was given with the understanding that we were not to tell where we fished, and we caught eighty trout in about four hours' fishing, some of them half-pounders. I took my catch to Nashua to let them see, not hear, what I had done. I had a very fine day, and a couple of friends were going to Lenoxville, Canada, on a fishing excursion, one of them a hotel proprietor of an amusement, and the other a conductor on B. L. & H. R. R. Saturday 8:23 P. M. finds them all wily tucked into a car, rods and basket of flies, a tin full of anglerworms, so if they can't fish with the fly they can with the worm. They start off well for a three-day trip, and the next day is a nice day to fish here, at home, so we suppose, of course, it must be with them, but, alas! the second day in the morning we look out, and lo! who do we see but our fishermen friends returning with not a single fish. Some one said: "Well! Jess didn't do the best, and only went twenty-five miles, and you went four hundred and fifty miles and not a fish." "Well," says Mr. J. G., the landlord, and "Well," says Mr. D. C., the merchant, "the water there was so high that we tried but could not get any where near the brook, so we did not drop a line, but all tired out riding on the night express on the B. L. & H. R. R., and we have had enough of Canada fishing."—JESS.

THE ENGLISH ANGLING TOURNAMENT.—The prizes won in the Tournament at Hendon were presented to the winners by Mrs. R. R. Marston, at Foresters' Hall, on June 29. After the distribution Mr. Murphy proposed a hearty vote of thanks to Mrs. Marston for her kindness in presenting the prizes, which was greatly appreciated, and also to Mr. Marston, who had introduced the interesting character of this country, Mr. Marston replied, and then proposed a vote of thanks to Mr. Bates, who really had almost the sole management of the Tournament arrangements, and had succeeded most admirably. Mr. Bates, in replying, so ably described the objects of the Anglers' Benevolent Society that he at once secured a handsome donation to the funds from Mr. Healey, who was present. Mr. Marston proposed, and Mr. Marston seconded, a hearty vote of thanks to Mr. Wood for the interest he had taken in the Tournament—we should be glad to see him every year, even if he always carried off the best prizes, as he was doing to-night. (Hear, hear.) Mr. Wood briefly replied, expressing himself much gratified with the kind reception English anglers had given him—in fact, he felt "quite at home" over here, and he was delighted if he had been in any way able to aid so excellent a society as the Anglers' Benevolent. They had nothing of the kind in America. He would not detain them longer, as he felt much more in his element when playing a big black bass than addressing a meeting. (Laughter.)—Fishing Gazette.

A FISHWAY FOR THE SUSQUEHANNA.—Harrisburg, Pa.—In your issue of July 19 you notice that Professor Baird has approved and adopted the "McDonald fishway" for the Great Falls of the Potomac. We regard this fishway, to be put in at the expense of the general government. If so, there are a million of people here in Pennsylvania who would pray and preach to have one erected at the Columbia Dam (I feel like putting an "n" to that word) on the Susquehanna. Our Fishy Commissioners have tried several times to do something beyond their ken, and have wasted several appropriations in attempting to put a fishway in that dam, and have so far succeeded as to put all our fish to go down to Maryland, but not one to come back. The Susquehanna and its tributaries were good shaft streams before the dams were built. Now, none get above the dam at Columbia except at intervals, such as a break in the dam or unusual high water. A good practical fishway at Columbia would fill the upper streams with anadromous fish and bring joy and happiness to the angler's foot, and create a market for millions of our people. With a view to having the question agitated, I ask you to insert the foregoing.—KEOKU.

TOWNSEND'S INLET FISHING.—It is scarcely worth while just now to point out any particular ground as the best for fishing. All along the New Jersey coast, from Barnegat to Cape May, reports come that fine catches of all the varieties are being made. Weakfish are so plentiful at some points, the haymen cannot dispose of them at any price at the summer months, and they are taken in their markets. Shrewsbury, however, never go a begging no matter how numerous they are, and at both Barnegat City and Beach Haven, the entire catch of the season is contracted for by hotels at a fixed price before the fish begin to arrive. Barnegat is always the choice when bluefish squidding is desired, and I believe the waters of this inlet are conceded to be the best for this kind of sport on the New Jersey coast; although the writer has found Little Egg Harbor inlet to be provided with bluefish enough to satisfy a very greedy fisherman. It has long been my desire instead of squidding for bluefish to be able to fish for them with a lass rod and light tackle. Has it been done, and can it be done, if so, cannot some one rise and explain?—HOMO.

PHILADELPHIA NOTES, July 21.—The Schuylkill River has been so high and turbid that fishing has not been at all good during the week. I speak of the water as I noticed it to-day going to Norristown, Pa., seventeen miles from the city. It may be clearer further up stream, and no doubt the streams flowing into the Schuylkill are in better angling condition. Inquiries made coincided with the opinions formed on my way up. I noticed, while passing on the Schuylkill, a boat pitched up on the New Jersey coast, where the Shawmut, evidently that of a fishing party which had settled down for a week's vacation; camp utensils hung on the trees, and the reflection of the sun on their bright surfaces and other indications, plainly visible from your correspondent's point of observation, told of the order and cleanliness of the temporary home of the angler. Without knowing whose camp it was, I will venture to guess it was that of the Seizeze party, and would ask that a short account be given for FOREST AND STREAM of the catch made during their stay on the island.—HOMO.

NEW BRUNSWICK.—St. John.—In Telegraph Lake, near the head of Milkish, and in portions of the parishes of Westfield and Kingston, excellent fishing is afforded by many of the lakes and streams, and the locality is easily accessible by way of the steamer Enterprise.

THE LARGEST BLACK BASS.—After we went to press last week a monster black bass of the small-mouth species was brought to New York and shown at Mr. Blackford's, in Fulton Market. We believe it to be the largest fish of this species on record, and therefore its capture can claim to be "a high hook" on this fish. Black bass is not so plentiful in any of the lakes of Western New York, nor in any waters which are the natural habitat of the fish, but in Lake Ronkonkomo on Long Island, where he was introduced only a few years ago. Its captor was Mr. Herbert Seymour, of Brooklyn, and as the fish weighed seven pounds, plump, on Mr. Blackford's scales twenty-four hours after it was caught; we do not doubt its claim to be an eight-pounder. Black and diagonal stripes are prominent in the small-mouth. Lake Ronkonkomo was stocked some four or five years ago with both the large and small-mouth black bass, but no authentic records of captures have been made.

THE CANADIAN SALMON RUN.—New York, July 13.—Contrary to general expectation, the present season has furnished an extra run of salmon in Provincial waters, and of very fine quality. This coming after some three years of unusual deficiency, may be a study for those who give attention to the habits of these migratory beauties. Leaving home with a party made up of four for a few days sport, the remaining eighteen days and the four and a half miles. The total catch was 197 fish, weighing 4,391 pounds, averaging over twenty-two pounds. The uniformity of size, weight and condition was remarkable. The score of the rods in numerical order stood: 77, 56, 39, 25—197. Heaviest fish, thirty-three pounds.—AN OLD HAND.

Fishculture.

THE NEW YORK FISH COMMISSION.

[The Rochester Post-Express, of July 18, gives the results of the shipments of fry from the State Hatchery at Munford in detail, as taken from the order books of Mr. Monroe A. Green. From these orders there were shipped, in all, 1,423,000 lake trout, 614,000 brook trout, 1,406 California mountain trout, 151,000 rainbow trout, and 30,000 hybrids, which were three-fourths brook and one-fourth lake trout.

It is pleasant to state that the prospects now are very encouraging for the erection of new hatching houses and buildings at the State hatcheries, Munford, and that the present buildings, which are a disgrace to the great State of New York, are to be removed or destroyed entirely, and the grounds are to be enlarged, graded and otherwise improved. The increasing business of the hatcheries demand these improvements, and at once. Seven or eight years ago the hatcheries were established with a small stock of fish. Through the energies of those in charge it has successfully grown to its present mammoth proportions and stands at the head of the fisheries and hatcheries of the world. With the improvements completed the supply to the waters of the State of fish will be increased in a year a hundredfold. State Commissioner E. M. Smith is determined that these matters shall receive immediate attention.

There are a number of enemies of fish which destroy thousands annually along Spruce Creek and in the waters of the hatcheries, viz.: snakes, blue herons and kingfishers. Monroe A. Green wages a relentless war upon them, but they will multiply and increase in spite of his efforts. His experience in throwing a line or fly and catching snakes is well illustrated in the following incident. One day he was in a boat, with a light rod, fine line, with a tiny hook without a barb, he would make a cast, with a strong wind blowing, dropping the hook just over the head of a snake, just showing out of the water, fifty feet feet away, and in a twinkling of an eye the reptile would be on his way to the boat with the hook in the back of his head. The fly was thrown with as much precision as the majority of men would send a rifle ball.

AMERICAN FISHCULTURAL ASSOCIATION.

[PROCEEDINGS CONTINUED.]

Second Day.

HISTORY OF THE EXPERIMENTS LEADING TO THE DEVELOPMENT OF THE AUTOMATIC FISH HATCHING JAR.

BY M. McDONALD.

THE work of practical pisciculture was, until a comparatively recent period, confined for the most part to the hatching of different species of the Salmonidae. The incubation of the eggs was at first effected in troughs having the bottom covered with a layer of gravel, upon which the eggs were placed, and over which a current of fresh water was allowed to flow.

In succession followed the "grill system" of M. Coste and the different devices of movable trays, now in common use for handling this class of eggs. In all these various methods the separation of the dead eggs from the live ones is effected by means of hand-picking. The necessity for the separation, although not as urgent in the case of the eggs of the Salmonidae as in that of the whitefish, and the attendant scale imprecations in much shorter periods of time, still entails a vast amount of labor in connection with the hatching operations. Although the ingenuity of our pisciculturists has greatly improved the forms of hatching apparatus for these heavy eggs, yet up to a comparatively recent period no effectual means of separation other than the above indicated has been found practicable. The U. S. Fish Commission, in the development of its work, had presented to it the necessity of dealing with the eggs of the whitefish, and the attendant scale imprecations in the history of fishculture. Millions of eggs were to be hatched where pisciculturists formerly handled only thousands, and the old methods of hand-picking were soon found to be impracticable.

In all of the forms of apparatus for bulk hatching heretofore devised, no adequate means is employed for the separation of the dead eggs from the living, all, as they come from the fish, the unimpregnated as well as the impregnated, are placed in the apparatus and remain together.

In the case of the whitefish, and more especially in the case of the shad eggs, which run through their period of incubation in a much shorter time, fungus rapidly develops among the dead eggs, contaminates each of the living, and large numbers of them, which would otherwise reach the period of hatching, are destroyed. The percentage of loss produced in this way is always considerable, and in many cases leads to the entire loss of the eggs undergoing incubation. The attention of pisciculturists is early directed to the serious losses thus arising, and various experiments have been made with a view of effecting the separation of the dead from the living eggs.

In 1875 Mr. F. N. Clark, the superintendent of the United States Hatchery, at Northville, Mich., attempted to effect the separation by introducing a gate into one side of the Bell and Mather case, through which the shells and fish and dead eggs would go out, the impregnated remaining. The device, so far as it served for the collection of the young fish, was quite successful; but it was not found capable of doing the work for which it was first planned by Mr. Clark, and was abandoned.

Similar experiments, looking to the same result, were made by him with the Chase jar—the form of apparatus employed for the whitefish work at the Northville station. The result of these experiments, however, led Mr. Clark to the conclusion that an automatic or self-picking arrangement for effecting the complete separation of the dead from the live eggs was not practicable, and a paper to that effect was written and published by him in Vol. I., Bulletin of the United States Fish Commission. The present method employed by him for the separation of the dead whitefish eggs is to siphon off the dead eggs and such live eggs as are necessarily drawn over with them, and to transfer them to what he terms "hospital jars," the live eggs thus drawn being left to take their chances with the dead.

This mode of treatment undoubtedly has served to diminish materially the percentage of loss in the eggs thus treated by him, as in this way, by the sacrifice of a small proportion of the eggs he secures the very complete separation of all elements of contamination and disease from the great bulk of them.

In the spring of 1881, being in charge of a shad-hatching station on the Potomac River, and in position to observe closely the performance of the hatching apparatus in use, the question of the separation of the dead from the living eggs was taken up systematically with a view of devising a form of apparatus which would accomplish the purpose and which would be of such shape as to be of easy and convenient use in practice. Knowing that there was an apparent difference in the specific gravity of the living and the dead eggs I determined to see if I could not avail myself of this difference to effect the separation. The first form of apparatus employed is represented in Fig. 1,* on the blackboard.

In the use of this apparatus I found that a fair separation could be effected, but to accomplish this required perfect stability of the vessel and careful manipulation. When the barges were lying quietly on the water and there was no tide swell in the river the separation went on quietly, the dead eggs being continually thrown off from the mass of living eggs and swept by the current over into the exit trough and carried off from the apparatus. The slightest oscillation, however, of the jar, produced by waves, would have the orderly movements of the eggs and required continual watchfulness on the part of the attendant to prevent considerable losses of live eggs. A second form of apparatus looking to the accomplishment of the same result was devised.

The result with these forms of apparatus were not satisfactory in developing a method which could be conveniently applied in practice, yet they pointed the way to it. Later in the Spring, near the close of the hatching season, the suggestion of Professor Baird and in conjunction with Professor Hyder, we instituted in the basement of the Smithsonian Institution a series of experiments to determine the limit of healthful retardation of development that we could effect by lowering the temperature of the water employed. In order to subject the eggs conveniently to the action of the current of cold water they were placed in small, two-ounce laboratory flasks closely corked. Through the center of the cork was passed a glass tube which descended to within a short distance of the bottom of the flask and through which the current of water was admitted to the apparatus.

An exit tube, the lower extremity of which extends a short distance below the surface of the water, provided for the escape of the water. While this form of apparatus had been devised by me in connection with the experiments on retardation above referred to, I had no sooner fixed upon the apparatus than I felt at once I had arrived at the solution of the question of automatic separation of the dead from the live eggs. An eight-ounce wide mouth glass jar, such as is used in the National Museum for holding alcoholic specimens was fitted up as indicated.

In this were placed 6,000 shad eggs, and a current of water turned on and regulated. The movement of the current established a regular rolling motion on the eggs, which brought each in succession to the surface. The dead eggs remained there, forming as they were freed from the mass of the living, a separate layer on the surface. By sliding down the exit tube to a suitable distance, I found that the dead eggs were feeling the influence of the escaping current, were by degrees drifted under the lower end of the tube, lifted by the

*This consists essentially of an oblong trough with wooden ends and sloping glass sides, glass tubing used in order to be able to observe the automatic separation of the dead from the live eggs. The trough rests upon a rectangular box made of boards, which serves as a firm base for the support of the trough and as a chamber for the water. The water enters the trough through a hole in the center of the box forming the base of the apparatus through the supply pipe passes to the trough proper through a slot extending to the whole length of the trough. The water is regulated by a valve, which by means of the set rods can be pushed down so as to cut off the flow of water entirely. By setting the valve to have the water enter the trough through a hole about 1-32 of an inch, the water enters the hatching trough in thin sheets which are directed up the glass sides of trough. The effect of this is to give the eggs a constant movement from the outside to the center. The water flows over the edges of the central trough, and escapes from the apparatus at the end. The dead eggs in this position are lifted by the current of water, and the current current may be so regulated that the former will be swept out by the escaping water.

current, and swept out, leaving an absolutely clean mass of live eggs.

The use of eggs was successfully hatched, and at the period of hatching not a dead egg was found in the bottle; nor do I think a live egg was lost in the whole course of the experiment.

The first experiments had been framed solely with reference to the assumed slight difference in the specific gravity of the living and the dead eggs. Attentive study of the movement of the eggs in the jar showed a still more potent influence for separation than the difference in the specific gravity. It is that there is a slight difference in the surface of the egg, hardly appreciable. The more important difference, and that upon which the success of the apparatus depends, is the close adhesion which exists between the living eggs; the effect being that the live eggs cling to each other, and always in contact, even when they reach the surface, are by this adhesion carried around in the regular sequence of movement. On the other hand the dead eggs having once reached the surface, their adhesion to the underlying layer of eggs is not so strong; consequently when they once reach the surface of the mass, they remain there until they are carried off by the exit tube.

Several experiments made with different lots of eggs gave uniformly the same satisfactory results.

In May, 1881, the apparatus was exhibited before a meeting of the Biological Society, held in the basement of the Smithsonian Institution. These experiments were so decisive, that I did not hesitate to recommend and urge the adoption of the new method in the work of the U. S. Fish Commission.

In the spring of 1882, it was determined to convert the old armory building into what is now known as the central hatchery and distributing station. Prof. S. F. Baird was engaged by the government to superintend the construction of the form of hatching apparatus by authorizing me to equip the station with them. The working form of apparatus not having been then even designed on paper, it was not possible to prepare the drawings and to have the jar complete and ready for use in time for the shad hatching season. An improvised form was devised in which cork stoppers were substituted for the screw cap, and metal tops employed in the form now fixed upon. Ten tables suitably planned to receive the jars were constructed, and the pipes for the distribution of water supply to the tables were introduced, and the station equipped with 300 of the jars. Each having a capacity of sixty to seventy thousand shad eggs, gave a total hatching capacity of 21,000,000 to 30,000,000 shad eggs during the entire shad hatching season. This was, of course, in excess of any possible production to be looked for; but in the organization of a shad hatching station it is necessary to provide for the new hatchery in the event of a failure to hatch during an interval of a few days of each other. The form of hatching apparatus used during the season is figured in FOREST AND STREAM of Oct. 26, 1882 (and here reprinted).

An arrangement of a hatching apparatus for the collection of the young fish as they hatch in appropriate receivers or aquaria was also devised. The present form of apparatus and the work contemplated in the first design, but only completed recently, is shown at Mr. Blackford's.

The method was described where a set of jars fitted up, one for the hatching of the eggs, the other for the collection of the young fish.

The jar consists essentially of a cylindrical glass vessel with hemispherical bottom. These are not blown, but pressed, in order to have the jar perfectly round, and to have the bottom which depends to some extent the perfect working of the jar. The glass foot which is shown in the improvised form has been omitted in the form now in use, the jar being supported upon a central tube which is supported by a central disk. The jar is adapted to prevent the distortion of the bottom of the jar, which would necessarily result from the attachment of a single foot to it.

The top of the jar is cast with thread to receive a screw cap, which fits on the bottom and the top surfaces are ground so that the plane of each shall be perpendicular to the axis of the jar and so that when the jar is resting upon its feet its axis shall be perfectly vertical.

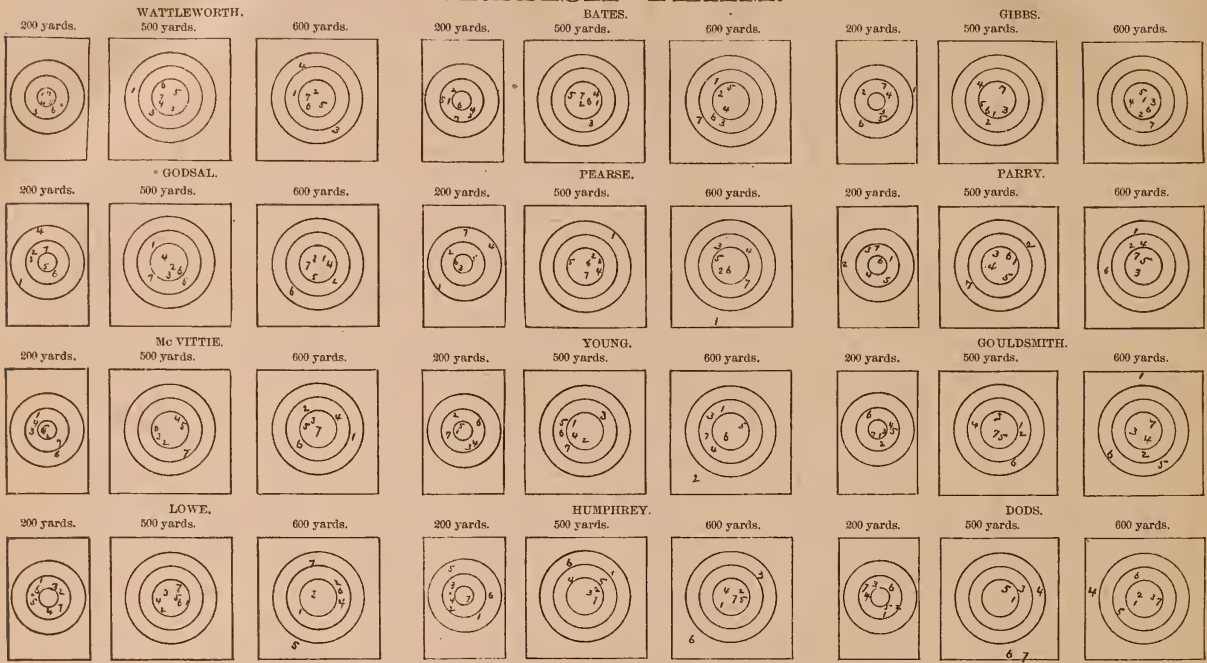

In these respects the important considerations to secure the proper working. The top of the jar is closed by a metallic disk perforated with two 1/2-inch holes, one perfectly central, which admits the tube that introduces the water into the jar, the other equally distant from the center, which carries the edge of the plate. A groove in the inner surface of the metallic disk carries a rubber collar, and when the plate is in place the tightening of the metallic screw cap, as in a fruit jar, seals the opening hermetically. Both the inlet and outlet tubes are supported by a central tube which is supported by a central disk. By pushing the tube down so as to be almost in contact with the bottom of the jar we make a relatively small quantity of water do the work of a large quantity in producing motion. In the case of the present apparatus, the water enters the jar by a pipe of water is needed and not a great deal of motion, we may secure this by increasing the feed and raising the lower end of the central or supply tube, so that the delivery of the water from it will be under less pressure. This central tube is connected by a rubber pipe with the petcock which furnishes a supply of water under a constant head.

The exit tube serves a double purpose. First, as an outlet for the water, and secondly, at our pleasure to remove the young fish from the water and to transfer them to the aquaria, stated intervals—once in twenty-four hours—by loosening the screw of the stuffing box so that the tube will slide readily, pushing it down until the dead eggs nearest to the lower end are seen to begin to swing in and out, and then to remove the jars for a few minutes the layer of dead eggs is swept off entirely. They may be allowed to pass off in the waste, or, better, collected by screens and fed to the fish in the aquaria, thus serving the double purpose of preventing the fouling of the system, and furnishing a very important advantage for many varieties of fish. While the period of hatching approaches, instead of allowing the water from the hatching jars to pass directly into the sinks, it is necessary to conduct the water into a collecting trough, which enters the aquaria, and is connected with the hatching jar. Indeed, it is the hatching jar with some special arrangements to adapt it to its new purpose. The water passes from the hatching jar through the rubber tube into the eccentric opening of the petcock, and then into the trough, where the mesh of the wire cage of the outlet of the frame, over which is drawn a bag made of cheap cotton, the texture of which is such as to permit the water to strain through, but the meshes of which are so fine that the surface of the water will not hold the young fry against it, as would be the case if a wire screen were used.

The surface of this strainer should be as large as is convenient, and is adjusted to the center of the aquaria. The petcock is positioned so that the end of the tube is as nearly convenient to the center of the wire cage, the object of this being to make the draw of the water equal in all directions. The water is allowed to pass out of the petcock into the collecting trough, and the young fish, if they are whitefish, or shad, or trout, as they burst the shell, begin to swim around vigorously in the hatching jar, drifting with the current. They pass into the exit tube and are carried over into the receiver, in which

AMERICAN TEAM.

AN OFFICIAL OPINION.

THE NATIONAL RIFLE ASSOCIATION OF AMERICA,
OFFICE, No. 112 WILLIAM STREET,
NEW YORK, July 23, 1883.

To the Editor of the Forest and Stream:
It is not a difficult task for non-experts to offer critical observations about the inferiority of our American team. Unmerited reflections from those ignorant of facts are pardonable, while those who are familiar with rifle practice regard our defeat from a very different line of rational argument.

The National Rifle Association does not assume to become an apologist for inexperienced sharpshooters, but when amateurs attempt to mislead or misjudge the situation it becomes a pleasant duty to defend and instate the American team in its proper position.

The impression that these contests are shot under similar conditions and with similar rifles as in those matches which made American riflemen famous through consecutive victories does not seem to have escaped the attention of our countrymen. The truth is that it was impossible to induce our English friends to meet us, as of yore, with our fine sighted and scientifically adjusted weapons, that superinduced the most accurate marksmanship; and I repeat my former assertion that, with our fine rifles, America stands first and foremost, and it would be an exceedingly difficult undertaking to win the laurels that remain accredited to the United States.

British sharpshooters, under the enthusiastic direction of that whole-souled, genial rifleman, Sir Henry Halford, smarting under

repeated defeats, were extremely anxious to introduce a match that would enable Great Britain to win. After considerable correspondence the National Rifle Association concluded the terms and conditions, which were in every particular to their advantage. Instead of using the rifle with which our previous victories had been won, we agreed to use a strict military weapon, with open front and primitive rear sights—appliances which Americans have long since discarded as unprogressive and considered practically obsolete. The distances were divided into two stages—200, 500 and 600 yards—the regular military distances, where we can hold our own with any country, even with inferior military arms; the second stage was arranged at 800, 900 and 1,000 yards—distances where, it is safe to state, we never had any experience or practice. We expected to be beaten and never disguised our opinions; it was only a question of how many points, defeat naturally taking place at the long ranges.

In the first competition our team were armed with inferior military rifles, the English weapon being quite equal to our fine sporting rifles, admitted by Sir Henry Halford and his team. On completion of the match our team were beaten under favorable conditions at all the distances, and submitted to it like soldiers and philosophers.

The greatest gain made by our British friends was at the long ranges, where twenty years' practice enabled them to become expert and masters of all the atmospheric conditions, including shooting in a rain storm. What had we to show against such experience? Three months' practice! Is it a wonder that we were beaten 170 points with such a combination of advantages? In addition to the enumerated

forces, as a matter of fact Great Britain has over 500 qualified marksmen in the first class to select fourteen men from; it was with the greatest difficulty that we could secure forty men to enter for competition for places on the team.

What did the first defeat accomplish for the return match? Our answer is, one of the objects of the match. It led to the production of a superior military rifle and another season of practice, thus giving us one and a half years' experience to our competitors twenty at the longer ranges. Interested partisans have made an attack on the Brown rifle, with which more than one-half of the team were armed in the return match, and attribute the defeat to its use. Let the public draw their own conclusions from the following statement: The majority of the men in our team who used the other rifle are at the bottom of the list, so defeat cannot fall on the Brown rifle. Too much praise cannot be offered to Mr. Brown for his indefatigable attempts to produce a military arm equal to the English, calculated to assist in winning the Wimbledon competition; therefore, any attempt to involve it in our defeat is unjust and actuated by other than sound motives.

To the general facts connected with the match we can add nothing until the captain of the team, Colonel G. E. P. Howard, makes his report. To state that the results of the shooting by our team at 200, 500, 600 and 800 yds., with a lead at the latter distance of twenty-four points, was an unqualified surprise to every National Guardsman, and even to the British Volunteers, is simply to substantiate the truth. We had a perfect right to indulge

[CONTINUED ON PAGE 514.]

SECOND STAGE TARGETS.

BRITISH TEAM.

AMERICAN TEAM.

ILEEN.

THE new cutter now building by Piegrass, at Greenpoint, for Mr. Padelford, promises to be the handsomest and best built work of the kind ever turned out in America. The design is one of Mr. John Harvey's best and is of extraordinary fairness and so well schemed out and fully digested in its many details that we look for a most creditable record, should her owner put his new vessel to a test in the private matches this fall. Although planned in direct opposition to the prejudices and nonsensical dogmas of the fast dying school of old-fashioned light displacement hobbies, the extreme proportions of the Ileen are not untried, Mr. Harvey having previously put similar principles through thorough and satisfactory tests in his long practical experience in yacht building. We look forward with confidence to a complete realization of the intentions of both designer and owner so far as the planning of the yacht is concerned. That she will be the handsomest, smartest and best built and fitted vessel ever floated from a yard in America needs no assertion on our part, as a visit to the yard will afford ocular demonstration in confirmation. The chief dimensions of the Ileen are as follows:

Length over all	78ft.
Length on loadline	65.5ft.
Beam extreme	11.5ft.
Depth, top beams to top keelson	11.5ft.
Least freeboard to covering board	3.6ft.
Hulwarks	1.4ft.
Greatest draft of water	11ft.
Displacement	30 tons.
Lead on keel	30.5 tons.
Lead on keelson	12.5 tons.
Total ballast	44 tons.
Mast, deck to lower cap.	44.6ft.
Masthead	3ft.
Mast housed	11ft.
Mast above deck	53.6ft.
Topmast, Bd to pith	34.4ft.
Topmast, pith to shoulder	1ft.
Topmast, pole	5.3ft.
Bowsprit outboard	3.4ft.
Bowsprit housed	13ft.
Boom	58.6ft.
Gaff	37.6ft.
Hole of mainmast	35ft.
Topsail yard	55.6ft.
Spinnaker boom	60ft.
Diameter of mast at deck	15 1/2 in.
Diameter of bowsprit at stem	9 1/2 in.
Diameter of boom	11 1/2 in.
Diameter of gaff	7 1/2 in.
Diameter of topmast	7 1/2 in.
Spread of crossrees	18ft.
Area mainsail	3,358sq. ft.
Area foresail	438sq. ft.
Area jib	638sq. ft.
Area large lower sails	3,485sq. ft.
Trysail gaff, length	14ft.
Trysail on foot	3ft.

In construction the Ileen is without a peer in America, and far ahead of usual customs in material, fastenings and accuracy of work. She is building under the immediate superintendence of Mr. Harvey, which is a guarantee that she will sail alike on both decks, and that the drawings will be accurately reproduced "in the flesh." The plan followed is a very superior one, similar to that which has given such satisfaction in Bodoin, and made Wenonah the craft of our single-stickers. Lightness, with great strength, long life and a dry hold, are secured by Harvey's double-skin plan to a greater degree than any other work put in practice. The method consists essentially of a stout backbone and a light frame, with two sheathings of plank wrought in the greatest lengths obtainable over the frame, the seams the inner and outer skins overlapping, giving a surface to chaulk against, and with a coating of white lead between the skins, rendering a leak impossible. Mechanics will at once appreciate the enormous addition to strength thus gained. The two skins being thoroughly clinch-fastened with copper, and all huts and seams giving great shift to one another, virtually makes the hull a unit in construction throughout, whereas the usual method of building with heavy frame of short pieces and single thickness of plank, is, by comparison, a bungling job, unmechanical in origin, and weak as well as leaky, aptly characterized as a bundle of sticks thrown together. Lightness and roominess of hull are secured in the Ileen, as well as the saving going to increased ballast and accommodation.

The keel proper is of selected white oak, 4ft. wide and 8in. deep. It is a "built" keel, composed of three pieces in width, so securely bolted together as to make the whole stronger than a large and more or less faintly balk, even could one be obtained to dress to the requirements of the keel. The lead keel is 12in. deep, 3ft. wide, across the beam, and 34ft. long. It is bolted up to the wood with 1 1/2 in. copper, spaced 30in. apart, the bolts being driven diagonally to support the whole while the lead better than if driven in the middle line only. The lead was cast separately and allowed to cool before being placed, so as to obviate all risk of splitting the wood lead by the contraction of the metal. The rocker to keel is moderate, as is also the round-up to forefoot, and but little is taken off the heel, the Harvey bowsprit differing from other recent designs in not having so extravagant cut-up at the ends. The stem is 7 1/2 in. sided, and the stern post 12in. at the head and 4in. at heel. Apron and knee forward and filling for deadwood aft with a long keel over all. The framing consists of regular sets of double timbers spaced 3ft. with two steam bent timbers between, giving a general spacing of 20in. All have double floors, which are 3in. sided each. The two floors of the regular frames lay close together with long and short runs on alternate sides of the middle line. To their heads the heels of the first futtocks of the double frames butt. The steamed frames, however, run down between two 3in. floors, the heels being nipped by the beads of the floors, all being bolted through. These bent timbers are 3in., the first futtocks are 3 1/2 in., second and third futtocks 3in. Owing to the easy form of the lower most of the frames are in one piece from head to heel, which in itself adds greatly to the strength of the yacht. The steamed framing of course runs from covering board to keel each side. A main keelson is worked clear fore and aft in one length over the floors, the bolts of the lead and keel fastenings generally going up through the keelson, making a keelson which can never be holed or broken by the weight hung to it, and giving the hull perfect rigidity, preventing working in a seaway with the nuisance of opening seams as in yachts of ordinary construction. The keelson is of oak, 3in. square, leadwood and bow fastenings are of 7 1/2 in. Muntz's metal. There are besides sister keelsons 5 1/2 in. square, also worked, one length fore and aft, and floor-head strakes, 3 1/2 x 8 1/2 in. The counter timbing is 4in. sided, and the quarter timbers are hewn out solid cedar. Clamps are 2 1/2 x 3 1/2, tapering in thickness to 1in. at the ends. An oak shelf is laid above these for the reception of the beam ends and is 5 1/2 in. square. In ordinary practice this shelf is generally omitted, and the bearings of the beams seriously reduced. This fault is here made up in some cases, where builders are mechanics enough and possess some conscience, by resorting to a cumbersome system of kneeing, which in the end is more expensive and not as effective. The beams of the Ileen are 3 1/2 and 4in. sided. To prevent any possible distortion of the sheer by the pull of the rigging, a most excellent, simple and inexpensive expedient is resorted to. It is a continuation upon the crude state of yacht building of America that something similar has not come into practice aboard our wide yachts, which are inherently weak structures, owing to their round and flat floor and the enormous rig requires to drive them. In the Ileen a bar-iron strap is worked across a number of frames in the shape of an inverted arch, the ends reaching down to take two bolts through first futtock heads, and the crown passing up under the clamps. This iron strap is 2 1/2 x 3 1/2 in. It is easily made and fastened in place at trifling cost, yet it would be in many cases the direct cause of preventing the sides being pulled up in wake of the rigging, thereby saving a material loss in market value to the boat in old age. Another similar band is worked over the frames in wake of the backstays for a like purpose. These inverted arches are indicated in the accompanying profile by the dotted circles. For tying the yacht's ends there are three large hooks in the bow and two aft. There are eight hanging knees of wood, and the principal cabin beams have also iron knees with four bolts clenched through frame and plank and also through the beams. Seven iron pillars serve as a vessel tie. They run from deck to keelson, and being located alongside the bulkheads do not interfere with the cabin arrangements, the inside sheathing of planks is 3in. Georgia pine. The outer sheathing is all 1 1/2 in. best oak, so put on as to lap seams with the inner skin. A layer of white lead is applied between the two. These skins are fastened together by eight 3/4 in. copper bolts, clinched through between each frame. All butts and floor head strake are also through fastened in each frame with 3/4 in. copper. The fastening of the yacht throughout is all copper, clench work, no spikes or iron being permitted in such first-class work. The deck will be exceedingly handsome. Along the center will be a wide piece of thick plank of Spanish cedar. The plank proper is 2 1/2 x 3 1/2 in. thick and will be sprung with a taper fore and aft to the yacht's side, butting into the cedar strake amidsips. Eight feet from the stern the fore and aft plank will be stepped upward to plank sprung to the round of the archboard. All deck fittings are to be of teak. They include a fore scuttle 2 1/2 x 3 1/2 ft., galley skylight 2.0 x 2.2 ft., main skylight, 4.5 x 4 ft., companion hatch, 3.0 x 4.0 ft., after cabin

A CRUISE ON THE MOKEUMNE.

FIRST PAPER.

F. AND I had been making cruises for the last two years, but unfortunately they were most all made in my dining-room, with our legs "under the mahogany" (for I possess one of those relics of a bygone time, a mahogany dining table), and consequently we never got very far.

To the average spectator a full-rigged ship is a construction of considerable magnitude, but if one wants to know how large a ship really is, let him paddle alongside of one in a canoe, the immensity of the subject will then strike him with commensurate force.

Total fall from Rice Lake to Bay of Quinte, at Trenton... 365 feet.
From Port Perry to Foot Seaugo Lake... 19 1/2 miles
Seaugo River to Lindsay, slack current... 9
Cobocouk to mouth of Gull River... 3

Mouth of river to Rosedale, foot of Balsam Lake... 4 miles
Rosedale to Cameron's Lake, Lock... 1
Head of Cameron's Lake to Fenelon Falls... 4 1/2
Fenelon Falls to Bobseygon... 15 1/2

and that he takes a sort of fatherly interest in all his productions, so as a sort of tortoise here, I asked him if in his peregrinations he had seen aught of her. He said: "My spirits sank, but he heard that the harge was discharging at Folson street. My spirits rose again, but then it was a decidedly long pull to Folson street, against the tide and getting late, and no certainty at that. "Nothing venture, nothing win," thought I, and if I don't find her, I'll have a booming tide to come home with. Settling myself to business I worked my way along, hugging the wharves and looking for eddies, thinking all the time what a jolly place this would be for canoeing, if the wind did not blow hurricanes all summer, and the tide did not tear and churn so among the piles, until the dismantled shed falling to pieces over Folson street wharf, where in the old times the Constitution, the Golden Age, the Golden Gate, the John L. Stephens, the Moses Taylor, and a lot more "naval triumphs" that are classed now, were wont to make things lively, have in sight. There, sure enough, hidden away in the shadow of her overgrown consort, lay the object

of my search, and mine host just in the act of locking the pilot-house to go ashore. A halloo acquainted him with my propinquity, and in a few minutes I was safely alongside. How he stared and laughed at my ill-fitted craft and my business-like air and costume, but he helped me haul the Folly on deck and stow all the movables in the pilot-house that the ever-present and acquisitive wharf rat might not run off with them.

WILL BROOKS, Canoe Folly, S. F. C. C.
KENNEBEC AND MEGAN TIC.—Vessels, Neide and Hubbard have returned from their cruise up the Kennebec and Dead rivers, Chain Falls and Lake Megantic, and report many portages over dams and low lands, the longest one six miles. Plenty of mosquitoes and black flies made life in the wilderness lively if not interesting. Game is plentiful about the Chain Falls and Lake Megantic, few caribou but many moose and deer, and trout in all the streams. The trip down the Chaudiere was abandoned, owing to the low water. Dr. Neide will go to Stony Lake about August 1.

'THE IMBRIE' BLACK BASS REEL, PATENT COMPENSATING ACTION.

By which more than one-half the friction (necessary to all other reels) is obviated. Multiplies twice and his adjustable click.
WE MAKE FOUR SIZES OF THIS REEL:
No. 1... 30yds. No. 3... 100yds.
No. 2... 150yds. No. 4... 80yds.

Orders received from persons residing in cities in which the dealers keep a full line of our goods will not be filled at any price.

None Genuine without the name of 'ABBIE & IMBRIE, N. Y.'

JAS. F. MARSTERS,
 55 Court Street, Brooklyn.
 MANUFACTURER AND DEALER OF
Fine Fishing Tackle.

First Quality Goods at lower prices than any other house in America.
 Brass Multiplying Reels with Balance Handles, first quality and fine finish, 75ft., \$1.00; 120ft., \$1.25; 180ft., \$1.50; 240ft., \$1.75; 300ft., \$2.00; 400ft., \$2.35; 600ft., \$2.50. Any of the above Reels with Drums, 25 cts. extra; nickel plated, 50 cts. extra. Brass Click Reels, 20 cts.; 30 cts.; 40 cts.; 50 cts.; 60 cts.; 70 cts.; 80 cts.; 90 cts.; 100 cts. extra. Marster's celebrated Hooks spelled on gut, Limerick, Kirby Limerick, Sprout, Carlisle, Chestertown, O'Shaughnessy, Kinsey, Aberdeen, Sneak Bent, and all other hooks, Single gut, 12 cts. per doz.; double, 20 cts. per doz.; treble, 30 cts. per doz.; put up one-half dozen in a package. Single Gut Trout and Black Bass Leaders, 1yd., 5 cts.; 2yds., 10 cts.; 3yds., 15 cts. Double Twisted Leaders, 3 length, 5 cts.; treble twisted, 3 length, 10 cts. Trout Flies, 60 cts. per doz. Black Bass Flies, \$1.00 per doz. Trout and Black Bass Bait Rods, 6ft. long, \$1.25 to \$2.00. Trout and Black Bass Fly Rods, 10ft. long, \$1.50 to \$2.00. Also forty-eight different styles of rods for all kinds of fishing. Samples of hooks, leaders, etc., sent by mail on receipt of price in money or stamp. Encd stamp for catalogue.
 Established 20 years. Open Evenings. **J. F. MARSTERS, 55 Court St., Brooklyn.**

Shields' American Improved Gut Leader or Casting Line.

All fly fishers will readily see the advantage there is in using them. The easiest way to apply a fly or to remove it without impairing the strength or durability of the leaders. Lengths, 3, 6, and 9 feet, made of superior silk worm gut in all varieties. Fine trout, salmon and bass flies, and waterproof silk lines.
JOHN SHIELDS,
 Brookline, Mass.
 Box 221.

REVISED EDITION.—AMERICAN KENNEL AND SPORTING FIELD, by Aurold Burgess. Price \$3.00.
 This very popular book has been entirely rewritten, greatly enlarged, and brought up to the times in all that relates to the broad field which it covers. It is profusely illustrated with cuts of the most celebrated dogs and sporting scenes, treats thoroughly of breeding, breaking (including "Force in Retrieving"), kennel management, selection of dogs, and all that relates to kennel and field work, making it the most comprehensive and useful book of the kind before the public.
 For sale by **ORANGE JUDD CO.** or **C. T. BILLINGHAM,** New York, or **D. S. HOLMES,** 30 Fourth St., E. D. Brooklyn.

How I Became a Crack Shot,

HERMANN H. KIFFE, 318 Fulton Street, Brooklyn, N. Y.
 Between Fulton Ferry and City Hall. OPEN EVENINGS.

AMERICAN
Kennel Register.

A monthly record of kennel events for the information and guidance of breeders, exhibitors and owners of all breeds of dogs.
 Its leading feature is the "Pedigree Register," of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is given to each dog, and an index will be compiled at the close of each annual volume, thus forming a permanent work of reference. The pedigree registration fee is twenty-five cents. The first two numbers of the Register contained the pedigrees of 138 dogs.
 Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs at sale, and deaths.
 Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include a record of field trials. The first two numbers of the Register contain prize lists of Washington, Ottawa and Pittsburgh shows.
 The publication day is the fifth day of each month; and nothing can be received for publication later than the first day of the month. All matters intended for publication should be in the hands of the editor at the earliest practicable date. Entry blanks for each department will be furnished free on receipt of stamped addressed envelope.
TERMS:—Issued by yearly subscription only. The subscription price is one dollar per year. Make drafts and money orders payable to the Forest and Stream Publishing Company. Address, **AMERICAN KENNEL REGISTER, P. O. Box 2,832, New York City.**

THE FOLLETT PATENT
Trout and Bass Reel
 The Lightest, Cheapest and Most Durable Metal Reel ever offered to the Anglers of this Country.
 SUITABLE FOR TROUT, BLACK BASS AND PICKEREL FISHING.
PRICE, \$1.50 EACH.
 LIBERAL DISCOUNT TO THE TRADE.

W. & J. M. AIKENHEAD,
 65 Front St., Rochester, N. Y.

KYNOCH'S
 Patent "Perfect" Brass Shells,

MANUFACTURED BY
KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced bases, are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool as represented in cuts and straighten out to original shape when discharged. The crimping tool also acts as a reducer, an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by
