FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. SIX MONTHS, \$2.

NEW YORK, FEBRUARY 1, 1883.

VOL. XX.—No. 1. (Nos. 39 & 40 PARK ROW, NEW YORK.)

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months to a club of three annual subscribers, three copies for \$10; five copies for \$14. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newscasters throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications, Forest and Stream Publishing Co. New York City.

Nos. 39 and 40 Park Row.

- ANSWERS TO CORRESPONDENTS.

Such a law as that proposed would be pernicious in the extreme. We cannot believe that it will be enacted by the Legislature. It would be a step backward, a sacrifice of the public good to the grasping greed of a few selfish men.

The proposition of these Maine petitioners is a very fair illustration of the unscrupulous, every-man-for-himself spirit that to a lamentable degree inspires the game legislation of this country. There is hardly a game law on the statute books to-day that has not been put there after a desperate conflict with such selfish and improvident clamors for present gain; or else contains on its face some special clause or exception in favor of this class, and in total disregard of the rights and interests of the community at large.

This condition of affairs will continue just so long as the sportsmen of a State are content to leave game legislation in the hands of any and every man who cares to tinker at it for his own private ends. There ought to be in every State in this Union a live society of sportsmen, representing the whole State, and working together to secure a law framed for the common good.

ARCTIC EXPLORATION.

IN his very entertaining paper to-day Lieut. Schwatka illustrates the point, made by a correspondent of this journal last June, that the Arctic exploration of the future must be conducted on different principles from that which has proved so disastrous in the past. The successful Arctic explorer must be, first, a successful sportsman, able to avail himself of the game resources of the country. Lieut. Schwatka's experience demonstrated very clearly and conclusively the practicability of living on the country. He and the members of his party used their rifles, and with them secured a constant supply of food. They have established a precedent, some modification of which must be adopted by future Arctic explorers, if they are to do any more than add new names to the long and melancholy list of those who have perished in the futile Arctic search.

The situation of a trained hunter in such a country, adapting himself to the habits of life of the native dwellers there, self-reliant and capable of winning a subsistence by his skill with the rifle, is in decided contrast to that of the shipwrecked seaman wholly ignorant of the ways of game and inexperienced and incapable in its capture. We commend the account of Lieut. Schwatka's hunting in the North to the consideration of future Arctic explorers.

THE TARIFF ON FIRE-ARMS.

THE present import duty on shotguns is thirty-five per cent. ad valorem. The Tariff Commission recommended an ad valorem duty of twenty-five per cent., and the Senate last Monday agreed to retain the present rate of thirty-five per cent. ad valorem, with ten per cent. on barrels in the rough. But the Tariff Bill now before the House of Representatives provides that the tax on fire-arms shall be as follows: "All sporting breech-loading shotguns, with plain or twist barrels, of iron or steel, five dollars each; with laminated iron and steel or stub twist barrels, fifteen dollars each; with Damascus or other fancy barrels, twenty-five dollars each; all other shotguns, and all other fire-arms not provided for in this act, thirty-five per centum ad valorem."

The increase of duty here called for on the cheapest grade of imported guns would be 900 per cent. With this we have no fault to find; if Congress could put an absolutely prohibitory tax on such guns it would admirably serve the interests of society. It is also patent that were the tariff amended according to the provisions of this bill, the price of expensive guns would be lessened just in proportion as the uniform duty of twenty-five dollars is less than the thirty-five per cent. on their cost in the foreign market. It is with neither of these extremes, however, that we are especially concerned, but rather with the arms of moderate price, the guns most in demand by the class of men who constitute the majority of sportsmen.

The proposed duty would materially increase the cost of such guns, and the burden of the tax would fall upon those who are least fitted to bear it. In fact, if this bill is put through, so great will be the discrimination against this grade of arms, that the imported goods specified will be driven out of the market, and the manufacture will be virtually in control of American makers. No such protection as that contemplated by this bill is necessary. There is ample profit in the manufacture of shotguns in this country with the foreign competition as it is at present. We can conceive of no good to result from the cutting off of that healthful competition.

RELIEF FOR THE FOWL.—The seizure and destruction of two of the big swivel guns, which have long been known to be in use at Spesutia Island, will be a severe blow to the poachers. The capture and fine of two of the ringleaders of the gang will not be without effect in intimidating the outlaws, but that is a small matter compared with the taking of the guns. These murderous weapons are not easily obtained, and it will require time and money to replace them. Unfortunately, only a portion of the armament appears to have been secured, but so far as it went, the raid on the outlaws is a most encouraging sign of the interest taken in their rights by the owners of ducking shores in Maryland. A constant system of espionage and harassing of these and other lawless individuals in the winter feeding grounds of our fowl could not fail to work great good to the shooting all along the coast. Nothing is more destructive of fowl shooting than the use of lights and these big guns, and we hope that the day is not far distant when an advanced public sentiment will prevent the use of such engines in any waters in the land. The authorities, or, better still, the sportsmen of some of the Southern States, should look also after the duck traps which are being used in some Southern waters. These traps should be destroyed, and the owners, whether white or black, should be promptly clapped in jail.

BIG GAME.—The average American understands the value of advertising; he scruples at nothing that will bring his scheme and his goods before the public. In a recent police parade in this city the ranks of blue-coated officers marched bravely through the streets to the music of the band, and close upon the rear of the last column followed a wagon setting forth the charms of a cat show in a dime museum. This shrewd genius successfully used the police force of a great city to advertise his cats. When Dr. Carver went abroad, his manager's first step was to have the marksman exhibit his skill in the presence of the Prince of Wales, that with dignity in exactly the same manner that the cat showman used the police. And now the Associated Press dispatches from abroad state: "The London *Army and Navy Gazette* says: 'We understand that the Prince of Wales, at the urgent request of the Princess of Wales, is bestirring himself to put down the cruel sport of pigeon shooting. The ladies have formed a ring, and intend boycotting Hurlingham until the Gun Club discards the pretty dove and adopts the terra-cotta pigeon, a new invention which is being brought out under the patronage of the Prince of Wales, and can be seen at work at the Knealagh Club grounds.' There is no cat in that meal-bag, only a clay pigeon."

ON TUESDAY LAST a hearing was given by the Committee on Agriculture of the Massachusetts State Legislature to those who advocate the offering of a bounty for the destruction of English sparrows. No friends of the sparrow appeared, to raise a voice in his defense, while, on the other hand, a considerable mass of testimony was given against the bird. It was stated that the species is causing great and increasing damage to the crops, and that it is particularly destructive to apples, nearly one-half of last year's promised yield having been destroyed by it. It does not destroy insects injurious to vegetation, while it drives away our native insectivorous birds, which would, if left to themselves, do good service in this way. If the bird should ever become numerous in the West, it would do a vast amount of damage to the crops of grain. From all points of view, therefore, it is to be condemned. These arguments, with all of which the readers of FOREST AND STREAM are familiar, are advanced to induce the Legislature to take steps to abate what has become both in our large cities and our lesser towns a real nuisance.

THE YELLOWSTONE PARK.—We print in another column a very few of the numerous remarks, editorial and personal, which have been called out by the recent fight on the Yellowstone Park grab. The only hope of the engineers of this project was to have railroaded it through with such silence and celerity that the grant would have been confirmed to them before the matter could have been subjected to any scrutiny by the people or their representatives, and this they did not quite succeed in doing. As soon as the true import of the job was understood by the people, there was but one sentiment expressed in regard to the matter, and the general condemnation which it received quite frightened the projectors of the scheme from their original position. The whole matter may safely be left in such good hands as those of Senator Vest and Secretary Teller.

PROPOSED MAINE SUMMER SHOOTING.

THE present open season for deer, caribou and moose in the State of Maine is from October first to January first. There has been presented to the Maine Legislature a petition to so amend the law as to make the open season for killing this game begin July first, thus extending the time by the addition of three months.

It is needless to say that this change is not wanted by the sportsmen of the State, but by the hotel and steamboat men and the guides. It is alleged in the petition that the time is now so short as to seriously "discourage" and "inconvenience" visiting sportsmen, who, provided the discouragements and inconveniences are not removed, will be obliged to seek other fields of slaughter and renown. It is further alleged that with this change no special harm can come to the deer. This is beautiful logic; a summer shooting season is wanted so that visiting sportsmen may shoot more deer, and yet the deer are not to suffer therefrom. It is the reasoning of greedy men, who have regard for nothing save stuffing their own pockets with the proceeds of untime game slaughter. They know very well—no one else better—that deer shooting in June and July means death to the mother doe and death by lingering starvation for the fawns. This is not the kind of shooting that respectable sportsmen ask for; it is not the kind they would tolerate; it is sought and defended only by the class of greenroons and butchers who like to fire into a deer in the water while their "guide" holds the victim for them—and by these same guides, who have an eye for the almighty dollar and nothing else.

Maine has a rich store of wealth in her native game supply. Her recent wise and provident action in securing better care of this resource by the appointment of game wardens, and the way in which these officers have set about their task, have been among the encouraging signs of the times. The State has made a good beginning. It only remains for her to pursue the same course, without regard to the selfish and improvident demands of summer shooting petitioners.

HUNTING WITHOUT A GUN—II.

LET your gun hang on its own hooks; and go you to the wooded hill, from behind which you first saw the sun rise, over whose length and breadth you have hunted every fall and winter since you began to carry a gun. You know every ridge and hollow so well that if you were led to any part of it blindfolded you could tell where you were after you had looked about a minute. Let yourself drift about in these familiar woods some autumn day in search of nothing, and the chances are that you will find many things you never saw before.

You are not hurried. There is time for your nostrils to drink all the subtle odors of the woods, the mingled perfumes of flowers, fruitage and decay. You hear the voices in voices, the sounds beyond the environment of silence, outside sounds of civilization and industry piercing but not breaking the stillness of the woods. From the moss and mold at your feet to the frayed horizon that closely encompasses you, there is enough to keep your eyes busy for a day and then leave a world unexplored.

I have known fox-hunters, who year after year have ranged all the woods for ten miles about them, and who never yet saw the biggest woodpecker that lives in them, the pileated. They have heard him calling them more than once to come and see what a brave woodchopper he is, how he can make the chips fly and the woods echo to his strokes. But they had come hunting foxes, not woodpeckers, and had no time to turn out of their way to visit him, and he was too great a personage in woodpecker circles to come to them. If they desire his acquaintance, they must come to where he is doing business. Then he will show them his work. What a barkpecker he is. Wilson says that he has "seen him separate the greatest part of the bark from a large dead pine for twenty or thirty feet, in less than a quarter of an hour." With hammer and chisel in one, he can cover the roots of a tree with his iron shivers and cut a doorway to his home almost large enough for a coon's passage. He will show them his aerial paces as he hops from tree to tree, exhibiting then the white feathers of his wings, and his crest has not faded a whit since Hiawatha first dyed it. Though seldom seen he does not desert us, with the golden-winged and red-headed, but stays all the year round, and by the few country folks who see him is called woodcock, a name which fits him better than it does the borer of bogs, who by ancient usage bears it.

I wonder how many times in my hunting with a gun I had crushed the walking fern with my knees, and torn it up with my nails, as I scaled the ledge before I ever saw it. There are not a score of people of my acquaintance—hunters and woods-hunters of all sorts—who know that it grows here at all, far less that it is almost common. Having got the secret of its hiding, one finds it on almost every northward and westward-facing ledge from the rocky shores of Champlain to the backbone of Vermont, not everywhere, but here and there a patch of it, looping its small fronds along a shelf of the ancient mossy walls.

I am ashamed when I remember that I waited till I was a big boy for a lady to come all the way from Pennsylvania to show me the arbutus, growing almost as common as wintergreen and prince's pine on our rocky hills. How dull my senses were never to have caught the fragrant trail of its blossoms in the May woods, and to have followed it up till I found them blushing among their own rusty leaves and the last year's dead ones of their tall neighbors. Every one who cares for it knows where it grows now, and people come in troops to rob the woods of it for the decoration of churches at Easter. They might better leave it in these first temples. In the choppings, where the thin soil is heretofore the shade of the trees, I find its leaves withering as if scorched by fire, but like a girdled apple tree, every spring is full of blossom, it dies with its crown on.

Till the coming of the fair Pennsylvanian, it had blossomed for me only in books, and grew as far off as the *Victoria regia*. As for finding it here, I should sooner have thought of hunting for seals in the lake, for there had been two or three of them killed in its waters or on its ice.

Though I hardly expect to find a seal or a *Victoria regia* within the limits of our State, there is no telling what fortune there is in store for me. If one stays beneath the star he was born under, watching and waiting, it may, at last, prove a lucky one. R. E. R.

GENERAL GHANT DECLINES.—There has been a strong feeling among certain of the directors of the National Rifle Association that some strength would be gained for the organization by the use of Gen. Grant's name as president. The proffer of the position was made him but promptly declined. The nominating committee are now casting about for another available candidate.

SWIVEL GUNS.—A correspondent tells us that one member of the Committee on Game Laws, at Albany, is a professed advocate of the use of the swivel gun for duck shooting on the Hudson River. This is one very good reason why the Albany game law bills should be closely watched.

SPRING SHOOTING.—The advocates of the abolition of spring shooting are increasing in number and influence. The matter is one well worthy of agitation. We should like to hear from those who can add anything to the discussion of the subject.

The Sportsman Tourist.

NIMROD IN THE NORTH.

BY LIEUT. FRED'K SCHWATKA, U. S. Army.
III.—The Rifle and the Reindeer—Part One.

OF all the animals with which my party came in contact on my Arctic expedition, there are none with which I can claim such a close personal acquaintance as the Arctic deer. Before we started on our sledge journey in the spring of 1879—that is from the time we had landed among the Esquimaux, my own party and hired hunters had killed between three and four hundred. On the sledge trip we secured five hundred and twenty-two, and after our return to Hudson's Bay, many animals were added to this already enormous score. On the sledge trip, probably three-fourths of our subsistence (including the month's supply of civilized food taken along) was derived from the reindeer, whose habits were taken advantage of as much as possible by following them to the north in the spring, and keeping them with us on their southward migration as we returned on the same course during the autumn months and winter.

Shortly after arrival in North Hudson's Bay, in the early part of August, 1878, Colonel Gilder became our pioneer in inland hunting and camping. The loneliness of the place after the Esquimaux had left the vicinity of our camp upon their annual autumn reindeer hunts, and a desire to kill some of the many reindeer reported so thick north of our halibut, induced him to return in that direction with two young Inuit boys that he brought us the first deer meat to sell, or rather trade, for powder, caps and balls. The little party started about noon on the 25th of August, and Colonel Gilder returned home late at night on Sept. 1, during a heavy storm of snow, very hungry and very tired. He had been living for the last three or four days on native diet—raw reindeer meat and wild berries—having judiciously shared his civilized provisions so generously with his native countrymen that he brought us the first spirit of a Nimrod, would give him an early opportunity to kill his coveted reindeer, which he could return in triumph to Arctic Rome. But, alas for hopes based on Esquimaux generosity. A few scattered reindeer were seen, but it was a wild foot race, with every man for himself, in which the unpracticed Caucasian stood a poor chance in the contest over razor-edged toes that he met with wet, spongy moss, and other equally severe impediments.

The cold snap at the end of October commenced to bring in the scattered inland hunters to erect their winter quarters of snow and ice houses, and our little camp so long nearly deserted, began to assume a very lively aspect. A summation of the autumn's hunting showed that between 400 and 500 reindeer had been killed by all the natives that would make their quarters of the country, but were worthless, owing to the want of anxiety in regard to a winter's supply of the very best of all Arctic meat, and a plentiful supply of reindeer skins for winter clothing and bedding. And these latter were of the very best quality, for the reindeer skins secured in the month of October are superior to those taken later in the year, the hair being less liable to come out, and not so heavy as to render the clothing impliable. After January the reindeer skins of this section of the country, including from January to the readiness with which the hair comes out; and are thrown away by the native hunter, they having no use for the skins whatever, except so far as they hold a useful amount of fur on them. During this part of the winter they are fed to the dogs, should the latter be hungry enough to want them, and probably one in five or ten thousand is tamed of its hair and made into their *ka-look-likes* or drums for singing and religious uses, that winter, so that we were obliged to buy it, I think, from the summer cat, as the loss of that of the winter does not commence until spring and lasts nearly through the summer. In short, I think the reindeer sheds twice annually, the lengths of both periods being much longer than in the temperate regions, and almost overlapping each other. About the middle of August, when all the winter hair has shed, the short summer coat is in its prime, and from that time made all the native hunters, and that which is worn with the hair toward the body. From the middle of September until the first or middle of October, the skins are valuable for outside clothing (worn hair side out) and for bedding, and after this date they steadily deteriorate, but are still used to place beneath the bed until January, when the hair readily pulls out and they are no longer saved. At all times the skins of one and two years are equally highly prized, as they make an exceedingly fine, soft suit of underclothing, especially for their children, to whom this people are fondly attached, and who always receive the best at their disposal.

When the white man has become entirely "at home" in this clothing and accustomed to life in the native *igloos*, or snowhouses, the matter of temperature and how to secure it, may be deemed of inferior importance, and the *igloo* or snow-hut has been told of so often by previous Arctic travelers that it would be a superfluous burden on your time to describe it here. The utility of the *igloo* and reindeer clothing can not be exaggerated. Habituated as my party of four white men were, during our two winters in these desolate zones, to a constant life in these simple habitations, and the many comforts securing therefrom, I often marvel how white men could stand the distresses and hardships and dangers of a spring tent life on the many expeditions wherein tents were used. I have read so often of their sufferings while living in this manner and dressed in clothing made from the furs of the temperate zone, under circumstances that to my party would have absolutely been pleasure and of discomforts when even housed in ships, and the perils they risked in short daily journeys from these arctic districts, that I can scarcely believe that the natives could do so. When, under the same circumstances, my party was prosecuting a sledge journey, with no discomfort, 400 to 500 miles from its depot, with no provisions except such game as was killed from day to day, the conviction becomes twofold that the accessories of *igloos* and reindeer clothing are essential to a well-managed Arctic sledge journey. With their help the subject of the intensity of cold, strange as it may seem, becomes of secondary importance, and if it was not for the long dark night which accompanies the season of these depressions of temperature, a winter sledge journey could be carried forward in any part of the Arctic appropriate for it with no small chance of success.

And now a word in regard to this Esquimaux reindeer clothing. The native has two suits of it, an outer one with

the hair turned outward, and an inner one with the hair turned toward the body. This is true of the coat, pants and stockings. With the exception that the inner suit is generally finer and softer fur, being made from fawn skins or doe skins, secured earlier in the season, there is no essential difference in the two suits; in fact, by reversing either, it may be used as a substitute for the other.

On the latter part of December, I made a short sledge journey due north about thirty miles, so far as I could get through the high hills known to exist between Hudson's Bay and Wager River. I took only Toooloah's family and a Netschikull young man, Mitkolliull, and expected to be gone a couple of weeks, leaving December 28, in a severe snowstorm, which lasted four days. We pushed out, however, on our sledge journey, January 1 being the first fine day we had, and a rare New Year's treat it was, after so much dreary, dismal weather. Hoping that the day was prophetic of the coming year, I pushed on with light heart, but after all only succeeded in making some ten miles, owing to our having seen reindeer, which it is impossible to prevent an Esquimaux from attempting to kill after they have once laid eyes upon them. Thus an hour or two were lost, and when the day is but a couple of hours in length this becomes of importance. Toooloah's young man, the reindeer, the night before, the night of his former *igloo*, built while reindeer hunting, and where he had *cached* some four or five carcasses of reindeer. The Esquimaux *cache*, or meat cache, is built of loose, heavy stones, before the snow becomes deep or solid by freezing, and of that material afterward, with the addition of plenty of water to form a protecting cover of ice to prevent the depredations of wolves and wolverines, preventing anything smothering through, and also killing the scent which allures them to the place.

On the 8th of January, having satisfied myself that I could find a practicable route by this way to the Wager River, I started homeward, but feeling somewhat disappointed that I had seen no recent sign of musk-oxen, reported by the natives to be abundant in this locality. Their large carcasses, compared with that of the reindeer, makes them a more reliable and profitable source of large carcasses. On the 10th of January, the reindeer, and this was a very important item in my forthcoming sledge expedition.

I reached home on the 13th, the coldest weather I experienced on the trip being on the 13th, when about two hours before sunrise, the thermometer indicated —53° F. That day I made a journey of twenty-five miles, riding most of the way on the sledge, and at no time during that day did I feel more comfortable than I did on the 13th, when the thermometer —50° F., and I might here say that I really enjoyed the whole trip. I attribute this almost wholly to the Esquimaux reindeer clothing and constant living in a snow *igloo* like the natives, where the temperature is never above freezing and generally ten to fifteen degrees below that point. I do not believe—and my belief is confirmed by the written accounts of others—that any Arctic voyagers, housed in warm ships as they are, and in the usual Arctic winter, could stand such a journey without more or less material discomfort.

Once only did I learn the lesson of caution. I took off my right mitten in attempting to get a shot at a passing reindeer, the wind blowing stiffly in my face, and the thermometer —37° F., when the persistent refusal of the frozen gamecock to work for me, after I had waited for some minutes, I then intended. When I attempted to use it again, it seemed paralyzed, and looking at it, I noticed that the skin was as white as marble. Toooloah, who was beside me, noticed it at the same time, and with an Inuit exclamation of surprise, hastily doling both his mittens, grasped it between his warm hands, and then held it against his warmer body under his *coo-ke-tah*, or Esquimaux coat. I soon resumed its use, and although I felt for some time as if I was holding on to a hornet's nest, I experienced no more serious results than a couple of ugly looking blisters where the iron of the gun had come in contact with the bare hand. The reindeer escaped.

As the reindeer clothing is the warmest in the Arctic, so it makes the warmest bedding, two large skins made into a long collar-like bag or sack, the hair side in, being a sufficient protection in the coldest weather when in a properly constructed *igloo*. When the first severe cold came at Hudson's Bay, I was sleeping under a blanket and two fine buffalo robes, which I found as the thermometer sank below —30 to —40° F. to be inadequate to secure comfort, until I procured a reindeer sleeping bag, weighing not half as much after which cold nights were no longer dreaded. The robe of the American bison seems under the least provocation to become damp, and the furs of the reindeer, when once constructed as I explained in this manner, it is difficult to dry it and restore it to its former pliability in the low temperature of an *igloo*. The furs of the beaver and muskrat I found to be equally unsuitable in our mode of life, and I believe that all the other furs of the temperate zone would have shared the same opinion if tested in the same practical way.

I have said in my former articles that we started on our main sledge journey of the expedition with the prospect of a small herd of reindeer, although none were secured, owing to the barking of the dogs, but next day we were more fortunate, Toooloah killing two and Joe Eberling one out of a small band. All through the month of April our larder was constantly replenished by a fair supply of reindeer, which allowed us to save our civilized provisions and giving them a chance to rot away in the snow until the spring season as the natives did, as we assumed, so that the latter would not be forced to use us as a repulsive novelty. Our breakfast consisted mainly of boiled reindeer meat, some three or four pounds to each adult, followed by the heavy soup which was thus derived, thickened by a few crumbs of hard bread. Our suppers were the same, prefaced, however, by a good, generous supply of frozen reindeer meat, which we ate while we were waiting for the snow under the protection of the heavy *coo-ke-tah* hatchet into chunks about the size of the three fingers and then generally mashed by the back of the hatchet to convert it into brashy shreds before being chewed. The first effect upon taking this into the mouth is to chill one through, often making the teeth chatter, but the reaction is rapid, and followed by a genial warmth all over the body, especially if a generous supply of the frozen reindeer tallow (*loot-oo*) has been eaten. It can be said to be one method of cooking, and reindeer meat thus eaten tastes not unlike compressed corned beef made by the saltiness of that article. No attempt was ever made by us to salt it, although we had that necessary condiment along with us. One can soon accustom themselves to it without this when eating frozen meat, reserving it for the cooked in the pot. Seal and walrus meat tastes much saltier

than the roinder, besides the natives often cook the former in the salt sea water in whole or in part, and in this manner derive all that is necessary to supply them, and a quantity which is much less than that used by the cooks of civilization.

[To be concluded.]

LONG LAKE LOITERINGS.

HEARTILY concur with all Mr. Mather has said in regard to the shooting of deer in the Adirondacks before September 1. I can conceive of no more heartless action than the killing of a doe during the months when her young depend on her for life.

I have listened to the feeble bleat of a young and motherless fawn at midnight, in the still North Woods, my heart full of sympathy for the helpless little creature I could not aid. I have inwardly cursed the mighty "sport" who could do such an inglorious deed as to murder—for murder it is—the mother of the little innocent, and years ago resolved that no act of mine should be the cause of such pitiful misery.

It has been said that one's features are to a certain extent evolved from interior processes. A man who thinks viciously will look vile. A photograph of the man who shoots the mothers of young fawns would betray the face of a snake. Whoever shoots deer in the months of June, July or August, knows that he is liable to do the wicked things referred to; and the only way to keep clear of it is not to shoot deer at all during those months. A hunter, that no business in the world during that time, and July certainly, if he goes to fish, let that satisfy him. Even by September 1 venison is none too good. What must it be during the months named?

Some of the guides will not allow their patrons to kill deer out of season, but the majority of them give the matter no concern as long as they please those whose money they get. While at Long Lake last season, I had the pleasure of hearing a jury announce a verdict against a fellow who was shooting deer out of season. It was a flagrant violation of the law, and as there were several unimpeachable witnesses—two ladies among them—it was a clear case. A purse was made up on the spot that more than half paid his fine, and why? Because there were many in that crowd who felt guilty, knowing that they had either killed deer themselves out of season, or knew of those who had, and so, to ease their conscience, chipped in and helped. The man said that all who contributed were guilty, but some were, and some was no secret in the place.

That transaction revealed too much altogether; it revealed a brotherhood of law-breakers. There was one man—a guide—there, however, who showed his spirit as well as his principles, and savagely denounced the hypocritical sympathy manifested for the accused. He gave the true state of the case when he asserted, "that those guides who were guilty of similar acts, or who knew of those who were, and did not complain of them, were the worst enemies of the profession, and deserved the ultimate consequences—no employment on account of the extermination of the game." There are men at Long Lake, however—some of them in a judicial capacity—who are clear-headed on this subject, and if they have proper encouragement, will do much to execute the law.

Since I have referred to Long Lake, I will speak of other matters there. Most of the old readers of FOREST AND STREAM have some idea of the place doubtless, while hundreds of others have called there at least. The village is about four miles from the head of the lake, and has two or three hotels and a little church. Yes, and Lysander Hall—the man who stocked, or helped stock that lake with pickered. Now I am aware that Hall has had much more than his share of criticism. He says he picked the fish there, or, at least, helped do it, and the result has been, that they have afforded hundreds of visitors capital sport for years. The fish well cooked, fresh from the clear waters of the lake, are capital eating. Never have I tasted a more delicious fish than one that Mrs. Sabbath stuffed and baked one day two years ago, when an attack of the sick-headache rendered me unable to do anything. The dinner made of that five-pounder (taken by my better-half), made me feel so happy, that my disposition was improved for time and I, hope, for eternity, and I have loved Lysan Hall ever since, and hereby extend my hand in recognition of his valuable services to fish-loving humanity. I have fairly enjoyed hearing him swear, when he put on the gloves and went for his defamers, Mr. Dawson among the number. This was in the winter of 1871, and I was there, but as well as an enthusiast, but at the time Hall put the pickered in that lake, the speckled trout had almost disappeared. So, gentlemen, "let up on" Hall—all your choicest adjectives were exhausted long since—and go for Seth Green, who has introduced fish into some of the waters of the Adirondacks that will root out the trout faster than Hall's pickered ever did. Trout may still be had near Long Lake in fair quantities, but as "trout hogs" are not all dead, we may expect to see them exterminated ere long. Last season one of these pests took from Fishing Brook, five miles out toward Newcomb, about three hundred in a day, and said that the "sport" of catching these fingerlings amply paid him for his trip from New York. For a consideration invalids who cannot tramp far may obtain permission (this is a supposition only), of lawyer, farmer, blacksmith, merchant, parson and gentleman, Robert Shaw, to fish in his private pond near the lake.

I said before commencing this digression, that Long Lake had three hotels, Mr. Helms keeps a neat and comfortable house, the Kellogg place a short distance from the lake.

Mrs. Kellogg has a new house at the landing, which will accommodate fifty persons, and the post-office is here. The charges are moderate, and the place is very pleasant.

Last year Mrs. Dornburg & Butcher erected a spacious hotel on one of the most prominent points on the lake, near the village, which will accommodate two hundred guests. The house is built in modern style, four stories high, with French roof, and the rooms are large and pleasant. One of the grandest views in the entire wilderness is had from this house. Looking down the lake, that beautiful sheet of water extends for a dozen miles, while grand old Seward, and other lofty peaks, form an imposing background. One must watch with never-fading interest, the cloud shadows chase one another along the immense slopes of those ranges, forgetting meanwhile the petty cares that crowd our poor lives in slavish routine down the course of time.

The magnificent outlook from almost every part of this house must of itself attract many visitors. Its interior is first-class, with spacious dining room, large parlors, ample office, and all the adjuncts that make up an attractive and

comfortable house. I am no prophet if the tide of travel does not set thitherward, as it is one of the easiest places to reach in the wilderness. From Newcomb to the end of the Adirondack Railroad—the distance is a few miles further than to Blue Mountain Lake; but the road being less hilly, and as good as the other, the journey of forty miles is easily made. If there was a good road between Long and Blue Mountain Lakes, the tide of travel between the two points would be very great—the distance being but nine or ten miles. An extension of the telegraph line from the latter point would largely contribute to the result. The long journey via the Raquette, through lakes and carries, would then be avoided, to the relief of invalid tourists.

Game may be found in as great a supply in the vicinity of Long Lake as elsewhere, as was amply proved last year. The writer was camped during the month of September, only seven miles out, and had all the venison that any white man ought to kill in that time. Three deer were shot directly in front of the camp, that came in from some quarter not known to us.

While I agree with Mr. Mather, that hounding deer into a lake, and then dispatching them with a bludgeon, or shooting them from a boat, is not the most sportsmanlike method of capturing them, yet at that season it is about the only way they can be had. Later, after the snow has covered the ground, deer may of course be had by stalking; but most camps would see little venison if their capture depended on that manner of hunting. Even back or night hunting in June and July, and August if it were like (although not so many are taken in that way during that month), and on the use of dogs the rest of the season.

On an account would I favor their slaughter in the way it is commonly done, by killing them while close at hand in the water. Let us shoot at them like men while they are off at fair range, and give them a chance for their lives. The only objection to this would be the inability to aim them, so they would escape and die in the woods.

Last year our party killed them at varying distances, from four feet to forty rods, but I never shoot at one unless the chances are in his favor at a fair range. I will not, however, agree to do "Nessmuk" says he will—confine himself to a muzzle-loading rifle—and shoot but once, and if not killed, let them go. "Nessmuk" would draw the thing a little finer if he would dispense with a rifle and use a bow and arrow, which would also be lighter for that purpose. I will be proper, and will sink before the fall coat is full grown, and that fact makes it necessary to kill them while closest hand if they are to be killed in the lake. The fairer way is to let them gain the shore, and shoot as they are in the act of springing out of the water. We don't always get them, but who cares, there are more left and we have more fun hunting them. I had a favorite stand on a certain rock last year, and when the poor things came to the opposite side of the lake (which was the North Woods in), took careful aim with a twenty-inch Maynard, and let slide. Killed one at that distance and missed two. One bright morning I came a fine buck just opposite, when I threw up the rear sight for forty rods, but for some cause did not fire, but waited until he was reaching the shore not four rods from the spot where we stood. I then blazed away, supposing, of course, that a fresh pair of antlers would adorn the opposite side of the lake, but the deer was not there, and I had disappeared from my observation forever. Shot over, of course, with the forty-rod sight up, but felt a little stricken, all the same. Shouldn't have cared so much about it had not "the partner of my toils" saluted me with, "Humph! should think you had shot away lead enough to do better than that. Oh dear! I could do better myself." I think so might.

Bears abound in the vicinity of Long Lake, and one morning while the guests and I breakfasted at Kellogg's we heard the cry, "A bear! a bear!" a real wild bear! Up we all jumped, and on reaching the door, sure enough there was a shaggy black fellow over on the lake shore sixty rods away. Hearing the commotion, he reared upright, and disappeared in the woods. Dogs were put on trail, while three valiant sportsmen manned a boat and sped down the lake, landed and made for the mountain side where Bruin was supposed to be. He was not there, but the party retraced their way to the house, happy in the consciousness of having periled their lives for the safety of the people of that squattered hamlet.

A bear was killed in sight of the hotel thusly: Two men were coming up the lake, and saw the animal swimming; so, having no weapons, they drove him ashore and placed a lot of stones in the water. Then they pulled him until he again took to the water, when he got into the boat and fired the stones until he "kerfundermud."

A guide in search of lost dogs near by encountered a bear and shot him, when another showed himself, which he also killed. A third appeared, which was dispatched, when the man discovered that he had but two cartridges left, and fearing that more might be mousing around there, decamped as fast as his long legs would carry him. Ren Towne, while watching for deer on Slim Pond, killed a bear, or thought he did, until convinced to the contrary. There was some mystery about the affair, as Ren avers that he shot him four times in vital parts, and that the bear lay stone dead on the shore. The writer certainly heard him pumping that Winchester as fast as mortal man could, but never was able to account for the absence of the bear on visiting the spot with his guide.

A fine deer was shot in front of the house as it was going up the lake out of the new house.

From the foregoing it is expected that the readers of FOREST AND STREAM will understand that this writer and sojourner in this vale of tears is interested in the prosperity of the before-mentioned place known as Long Lake. I am, for, like many others, I have been elsewhere, and got—no, not fleeced—but got no game, no fish, no deer, no bear, and no panicles. Here we have all these without city prices. I have investigated the building lots, no real estate, and no insurance companies at that thriving place, and have no axe to grind—only a little hatchet. Here lives Uncle Mitchell S. battis, known to thousands all over the Union as a good guide, hunter and friend.

"That reminds me." There is a little church here, and Mitchell, as everybody calls him, has always taken a great interest in it. So good friends, when you ferry over Sunday, don't forget that this little church needs the aid of its friends. A dollar bill looks well in the bottom of a felt hat as it goes around the church in the hands of our friend. Besides, you will have the reputation of being rich, and it can't be got cheaper. Rev. John Todd, who used to come here to hunt and fish thirty years ago, gave the society a good boost, made friends of all the guides, and is held in everlasting veneration in that quarter, and has in all proba-

bility been given a good berth over on the side of the main forty. He did missionary work, and got his fishing and hunting long before people commenced to blab about the locality, consequently he had a good time. The people of Long Lake are in a fair way to become indebted to another habitué of the wilderness—Mrs. E. W. Crosby, of Albany, N. Y.—who has been laboring for two years to raise the necessary funds to establish a free library for the guides.

She has already about half of the amount that will be required to carry out the project, and its early completion is anticipated. There are many intelligent people there who will patronize the enterprise for themselves and families, whose means do not enable them to procure all the books they would like. Any contribution of books or money may be sent to her, and will be promptly acknowledged. The old-school people there do not care for the latest phase of thought, and a clergyman who attempts to give it them will hardly be appreciated. Style and tone, and all the fixings, may be had on the Raquette every summer, but here, religion makes no parade—is dispensed under no particular garb. Last season one of the big guns of Boston conducted the service on a Sunday, and as he was fresh from the woods, and at peace with himself and all the world, was in no mood to give 'em hell, and he didn't. He referred to man's relations to his Maker, and to his spiritual nature, after the method of treatment of such subjects among cultured and well read people, and the sermon was not a success. My guide more than intimated that if that was religion he didn't want any. The scattering of pearls does not always pay, even if they are picked up in the city that has had the benefit of the brains of Phillips, Brooks, Dr. Duryea, Theodore Parker, Emerson, Paine's Hall and Murray. TUNNIS.

RIVERFON, Conn., Jan. 22, 1883.

AROUND THE COAST OF FLORIDA.

BY DR. J. A. HENSHALL. Second Paper.

SAILING out of San Sebastian River into Indian River, a break in the coast line opposite can be seen, which is the beginning of an attempt by the settlers in the vicinity to cut an inlet to the sea. Four or five miles below the mouth of San Sebastian we came to Pelican Island, an outlying island of some eight miles in extent, forming Indian River Narrows. For two years the pelicans had ceased breeding on this island, owing to their being continually harassed and wantonly and mercilessly shot by Northern tourists. This year they were again nesting and we paid them a quite visit.

On our approach the pelicans hovered uneasily around, while a rookery of egrets, cormorants and man-of-war hawks on a small mangrove island adjacent was the scene of great excitement and commotion. We anchored the schooner several hundred yards away and landed in the small boats. The dead and stunted mangrove trees and the ground of the entire island, of an acre or two, were literally covered by the nests of brown pelicans. Those on the mangroves were rude, flat affairs formed of sticks, those on the ground often consisted of but a handful or two of grass or rushes, while many eggs were lying on the ground. In some nests I found a single egg, a newly-hatched, naked, purplish-red pelican, and one four times the size sparsely covered with a yellowish-white down. This occurred so often as to attract my particular attention. There were usually two or three eggs or young in a nest. The young pelicans kept up a continual screaming and screeching as we approached them, darting out their long bills and opening their mouths, uttering a cry that sounded very like "gag-gag-gag." Some of the, however, were incapable of sound or motion, being literally "too full for utterance." It was very comical to see them sitting solemnly in their nakedness, their bills elevated vertically, with the tail of a fish sticking out and pointing heavenward. Pulling out some of these fish I found them sometimes twice the length of the young bird, bill and all, the lower or head-half of the fish being entirely digested. And thus they sat for hours in a state of perfect bliss and contentment. The pelicans were very tame, being literally "too full for utterance." It was very comical to see them sitting solemnly in their nakedness, their bills elevated vertically, with the tail of a fish sticking out and pointing heavenward. And thus they sat for hours in a state of perfect bliss and contentment. The pelicans were very tame, being literally "too full

large bird, nearly as big as a goose, but flies and swims gracefully and swiftly. It, like the pelican, is remarkably so for the pugnacity of its body. Like the pelican, also, it has a gular sac, though a small one.

About ten miles below the Narrows, and nearly opposite Fort Capron, we entered Gardiner's Cut, at the entrance to which was the furthest camp of Arthur Park and Jim Russell, and a mile further on we anchored in Pinkham's Cove, near the sea beach, and just above Indian River Inlet. After a ramble on the beach, where we saw half a dozen immense blackfish stranded, we gathered several barrels of oysters, fished to our heart's content, and shot a number of eury and bay snipe. Toward evening we were driven away by the sandflies. Making sail we crossed the inlet and entered the Fort Pierce Cut. Here we encountered a school of porpoises and a number of large tarpon (*Megalops atlanticus*), the latter from six to eight feet in length. As they rolled out on the surface their bright armor of silver scales, as large as silver dollars, shone resplendent in the slanting rays of the setting sun. Jack was trolling and expressed a great desire to hook one, but it was well enough he didn't, for he might as well have been fast to a steam tug. We crossed over to Fort Pierce, on the mainland, four miles below Fort Capron, and dropped the anchor about dark. After a stroll on the beach, where we saw half a dozen blackfish, but the Rambler did it like a duck.

We went ashore at Fort Pierce to chat with Ben Hogg, who keeps a store at that place. Ben has a monopoly of the Indian trade in Southeast Florida, and buys their deer hides, gator teeth and beeswax. A party of Indians from the Everglades were then hunting back in the flat woods, their canoes being drawn up on the shore in front of the store. Ben has a good, snug, sloop in which he runs his occasional trips to Jacksonville, which he does at the inlet opposite leaving his guide wife and barn to tend store in his absence.

A few miles below Fort Pierce we stopped at Hermann's Grove for a supply of sour oranges for culinary purposes, sour orange juice and soda being superior to baking powders in the construction of the mysterious but gustatory flapjack. The old grove was originally founded by planting sweet orange on sour or wild stocks, but the trees having been burnt down to the sour stumps, the new growth, of course, produces only wild, or sour and bitter-sweet oranges. Below this, and about seven miles above the mouth of St. Lucie River, Mr. Richards has built a large house and has quite a clearing planted to oranges and pineapples. Nearly opposite, on the east shore, can be seen the hamak once owned by "Old Cuba." Four or five years ago a young man and his wife, from Philadelphia, who had bought a piece of land without seeing it, and found it to be located on the bald top of Mt. Pisgah.

The wind being favorable, we sailed up the south fork some four miles, being altogether about twelve miles from the mouth. Here we moored the schooner for a camp of several days, and had fine sport, there being an abundance of deer, turkey and quail.

One morning I entered a clump of bushes near a spruce-pine thicket, where I had seen some turkeys the day before, and began calling, or "keouking," with the intention of enticing some old gobbler within range. Just outside of the clump of shrubbery was a large bare space of white sand, which I had examined carefully for deer or turkey tracks before concealing myself. After a half-hour's fruitless endeavor I came out of my ambush, and saw a large panther, and the fresh track of a large panther, who had approached within six feet of where I was concealed. He evidently mistook my efforts at "keouking" for the complainings or agonizing cries of some turkey in sore distress, and thought to make a meal of it, but seeing me, he beat a hasty retreat, for his tracks led to and fro between the thicket and my hiding place.

One day I had perforated and blown some pelican eggs, and left them in a shallow box on deck to dry, when all hands went hunting. We returned after a few hours with a fine buck and some turkey. As I stepped aboard I noticed that one of the eggs was missing. Going toward the stern I found it on a coil of rope, and on picking it up, a fisher-er, sitting on a limb of a pine tree to which the bowline was made fast, uttered a hoarse and mischievous "eaw, eaw, eaw," seeming to say "you are a fool."

"Ah, you black rascal; you found it too light for sneaking and dropped it, didn't you?" said I, shaking my fist at him. "Caw, eaw, eaw," he laughed derisively, as he flew away. The fisherers are comical fellows, but very impudent and audacious. Some thirty-five years ago, when Squire Charley Moore of Lake Worth was a younger man, he was engaged in wrecking on the Florida coast. He and his comrades endeavored to render aid to a vessel wrecked on the coast of Lake Worth, which was separated from the ocean by a narrow timbered ridge, some two hundred yards wide, known as the "haulover." Anything of value found on the beach was conveyed across the haulover to the lake, where it was safe from observation, as the existence of a lake twenty miles long would not be suspected from the beach-side.

The fisher was hopped around the camp like a barnyard turkey, picking up and eating of everything that fell from the table of the wreckers. There was one crew that had lost a leg in some manner, who was made an especial pet on account of his misfortune, and in consequence became quite tame, feeding royally at the bounty of his friends, and to the great envy of his sable companions. But he was a great rogue. Like Silas Wegg, he slumped his way into the affections of his patron, at first amusing them by his grotesque antics and hoarse croaking, and like the double-baited Silas, insisting on double rations for "mellowing the voice." He became very familiar, hopping over the feet of the men for the tid-bits dropped to him; but his familiarity, as usual, bred contempt, and, like Silas again, he became aggressive and exacting, snatching food from hands that fain would have caressed him. As it was about the time of the Mexi-

can war, the wreckers, naturally, named him "Santa Anna." Whenever they returned to their camp on Lake Worth on Santa Anna and his companions were to be on hand. On one occasion they repaired to the lake after an unusually lucky expedition down the coast, but Santa Anna failed to put in an appearance on the first day; the other crews were there, but kept a respectful distance as was their wont. The second day came and passed, but with no appearance of Santa Anna. Then the men lamented him for a few days. But the next day, while at dinner, beheld the repentant Santa! He hopped about on his one leg in a very stiff, awkward and painful manner, and wild and seemed unusually sly and humble.

"He has been sick," said the men, "and has not quite recovered his strength."

"He don't look like himself, at all," said Charley, "he is thinner, and not so sleek and noisy; but he'll be all right in a few days. I once had a parrot that acted just that way, when sick."

"He's got a wonderful appetite for a sick bird!" said one of the men, as Santa gobbed the fragments of bread, bacon, fish, vinegar and sweet potatoes; for the men, in their youth, had heard of the fatted calf, and were very lavish with their grub, which they bestowed with eulogistic hands on the returned prodigal. But there is a limit to which the prodigal can go, and Santa hit it very early, and with success. Santa was filled to repletion. He made several ineffectual attempts to take flight, but his one poor leg was not sufficient or strong enough to give his overloaded body the upward boost required to enable his wings to come into play. He was weighed down with prog, like Mark Twain's jumping frog, with that.

"Poor Santa!" said the men, "he is very weak, quite ill." But while *debut* the "Poor Santa" was seen in the distance a second leg, which had been artfully drawn up and concealed, and then, by the combined effort of two good legs, and a quick preliminary squawk, accompanied by a hurried but contumelious "eaw, eaw!" he bounded upward with an "initial velocity" that would have gladdened the heart of a rifleman.

Each man looked at his neighbor, wistfully and expectantly, but silence reigned supreme. No one felt equal to the task. No one could do the subject justice. Alas! Santa Anna was dead, indeed; but worse than all, their hospitality imposed upon, and their affections outraged by the duplicity and usurpation of an infamous, dissembling and fraudulent fisher-er.

The black bass fishing of the St. Lucie cannot be surpassed in any place in Florida, or for that matter, in the United States. Their numbers are legion and their size monstrous; we caught them from two to fourteen pounds, the catch usually averaging five pounds. The boys, especially Buck, never seemed to tire of the exciting sport, of course throwing most of them back as soon as caught, when they were ready to bite again; for it was ent and come again with these voracious and gony large-mouthed bass; gony, indeed, as those of any other waters, though on account of the general sluggish current of these rivers they are sooner landed. Fish in fresh water seem to be endowed with more vigorous and lasting fighting powers, but which is really to be attributed to the force of the current, which aids them materially in their opposing and staying qualities.

At night the favorite sport of the boys was shark-fishing; and even at this remote camp, though fully twelve miles from the sea, they were able to catch several. On one occasion they looked and landed an immense soft-shelled turtle (*Trionyx chelyde*), whose carapace was nearly three feet long; he made a good pot of soup, and furnished some palatable steaks.

With a favorable wind we left St. Lucie camp and proceeded down the river, seeing several more manatees or sea-cows in the main stream, with one of which we had an exciting race for a short distance, as we swam a few yards behind, but was forced to make for the grassy bottom as the bow of the schooner touched him. They swim very swiftly for so unwieldy an animal, but make much fuss about it, leaving a wake as large as a steaming. Sailing down Indian River we soon came to Jupiter Narrows, near the head of which is a closed inlet, Gilbert's Bar; there was some talk of reopening the inlet, but the project was abandoned. The bay which we emerged into is known as the Sound, as the lower ten miles of Indian River is called. Here the boys had a surfeit of trolling for eruvale. At Coneh Bar, midway between the Narrows and Jupiter, we sighted the lower of Jupiter light, which we reached in another hour.

At Jupiter we found several parties of tourists; among others, Major Macrea and some of Philadelphia; Dr. Sweet and Dr. Badell, of Mass.; W. E. Spencer, of Iowa; Dr. Kellogg, of Pittsburg; Messrs. Mass and Clark, of Maine. Dr. Sweet had a whaling harpoon in his boat, and had some famous sport harpooning sharks and swish. Mr. James Armour is still chief keeper of Jupiter light, his assistants being Messrs. Spencer and Carlisle. He was very courteous during our sojourn, and twice he and Mr. Carlisle hunted with us their hounds, but the Indians had made the deer wild; turkeys, however, were plentiful enough. Mr. Armour had two boys associated with his life while we were there: a rife in the hands of an inexperienced person was accidentally discharged, the bullet just missing him; and in the afternoon, while descending from the dome of the lantern (a hundred feet from the ground) on an iron ladder which rested on the railing of the balcony surrounding the lantern, the rail broke as he set his foot on it. A less cool-headed man than Mr. Armour would have been hurled two hundred feet to the ground, but his cool impetuosity and level-headedness.

The boys had many a fierce contest with the large sharks and sawfish at Jupiter, catching many white and blue sharks from six to twelve feet long. Their shark fishing is always practiced at night, they being engaged in other sports and adventures during the day. These sharks are formidable man-eaters, and very plentiful enough. They are known by their large, and which, being encased in cartilaginous sockets, can be erected or depressed at will. With one snap they can take off the leg of a man as clean as the sickle of a mower can decapitate a quail. While the boys were playing a small shark, I have seen a larger one sever it completely in twain at one bite; and I have seen a piece as large as a shark's jaws taken out of the body of a man as clean as if it were a quail, and the man with a sharp knife. When it is considered how tough and myriofid is the skin or shagreen of a shark, the power of his jaws and the sharpness of his teeth can be imagined.

One night the boys tackled a foe worthy of their steel in a huge jewfish, or black grouper (*Epinephelus nigricans*). It took all hands to land it, and, as in the case of the sharks, a rife ball through the head to quiet it. The next morning

Mr. Armour weighed it on his steelyard, which it balanced at three hundred and forty pounds. The shark tackle consisted of four hundred and thirty-five feet of line and six or seven immense long-shanked shark hooks with chain and swivel attached. Some central-drift short-shanked hooks were completely straightened, proving that there are frands in shark hooks as well as in fish hooks.

At Jupiter, Buck left us, to our great regret, being compelled to return to Texas on business, for it was now the middle of February. He took passage with Capt. Hammon on the little steamer, the sharp rounded, into Indian River, and we waved our pleasant comrade in adieu with a friendly remembrance of gey, but our hearts were heavy as he left, for Buck was a great companion, a good shot, an enthusiastic angler, and a life-long hunter. As the boat passed from view around the bluff, Jack exclaimed:

"Forever, and for ever, farewell, Cassana.

If we do meet again, why, we shall smile;

If not, why, then this parting was well made."

There was no shark fishing that night, and the boys turned in early. The next day we went out over Jupiter Bar at high water slack, and with a head wind, consequently we had to use the poles in getting out. There was a heavy swell but not much sea, and with a light easterly breeze we made five or six miles in little more than an hour and a half than three hours. We ran the inlet about half way, but there not being wind enough to stem the strong ebb, we anchored until the turn of the tide. Lake Worth Inlet has increased in depth to about seven feet at low water, and withal is much straighter than at my former visit. With the young flood we entered the lake, and at once sailed down some six miles to the house of Squire Charley Moore, where we found as kind and jolly as our former location, and were vastly improved, a post office was established, new settlers were coming in, and all seemed prosperous. Two schooners were running to Jacksonville, carrying tomatoes, bananas, pineapples, etc., which, with the boats running to Rockledge and Titusville, afforded good transportation.

The next day we sailed down the lake to the residence of E. M. and John Brelsford, formerly of Xenia, Ohio, who seemed to be well pleased with their new location, and were living comfortably in their tropical home, which was doubly blessed by the presence of their charming mother and lovely sister who were spending the winter with them. We took tea with them, and afterward we all repaired to Capt. Dimmick's, where we passed a most agreeable evening, one very enjoyable feature being an impromptu concert by the ladies, with violin, guitar and piano, and a cabinet organ. Jack Squire and Skipper all took their part on this occasion, and in order to keep peace among them, and to preserve a proper state of discipline aboard the Rambler, I deemed it imperative to take our leave the next morning.

UP AND DOWN IN COLORADO.

BY HENRY L. ZIEGENFUS, RECTOR OF CHRIST CHURCH, POTOMACREEPSIE, N. Y.

WE had heard much of the wearisome monotony of the plains, and of their caustic alkali, but we found both largely mythical. Well sheltered and well fed in the snuggly sleepers of the Chicago, Burlington & Quincy Railroad, we passed through Pittsburg, Lincoln and Red Cloud, over wide stretches of rolling lands covered with thrifty villages, with almost endless fields of corn and wheat, or with that rich, succulent grass on which vast herds of horses and cattle browse freely in winter as well as in summer. The soil is so exceedingly fertile that abundant crops are the inevitable result of skillful irrigation. More wealth will yet be gathered from the "Great American Desert" than can ever be dug out of those mountains so rich in precious metals.

Leaving the Missouri in the forenoon, the next morning found us in Denver. In the year 1870 it had a population of 4,759; at this date it is generally conceded that the Queen City of the Plains contains at least 65,000 inhabitants. It is regularly built, principally of brick and stone, along wide, densely-shaded avenues. In the central portion of the city are blocks of magnificent buildings, mostly devoted to business, and many more are constantly being added. The electric light turns night into day; tramsways, Herdie coaches and the telephone bring distant points into close contact; numerous schools and twenty-five or thirty churches are scattered here and there. Of periodicals there are about twenty. The *Republican*, *News* and *Tribune* are published every day in the year. The eight-page morning *Post* is published twice a week, and six times a week, and give constant evidence of ability, enterprise and undoubted prosperity. The *World* and the *Times* are bright stars of the evening. The *Great West*, a spicy weekly, is published under the editorship of "Brick" Pomeroy.

The city can boast of gas and water works, of the steam heating system, of a rolling mill, of seven banks, of a \$300,000 smelter, a \$250,000 stock house, a \$250,000 city hall, a permanent exhibition building 300 feet in length, a \$450,000 hotel, a government building, for which there is, so far, an appropriation of \$500,000, a union depot 508 feet in length, erected at a cost of \$150,000, and a \$700,000 opera house, which, in internal finish and appointments, is surpassed by any similar structure between the Atlantic and the Pacific. In spite of all this lavish expenditure the debt of the city is but a trifle, and the rate of taxation only one and a half cents for each dollar of valuation.

Looking from the heights of Denver westward the eye sweeps along the Rocky Mountains for more than 200 miles. Eastward the rolling grazing lands extend to the Missouri River. That the entire State was originally a grass-covered plain is evident from the fact that on the summits of the various ranges there are generally found the same soil and the same growths that are now to be seen on the level of the foothills. The uprise of the mountains, at a geologically late date, simply lifted, tilted and folded the rich alluvial deposits of by-gone ages. Barring the underlying and outcropping bed formations, the Rock Mountains are, as a rule, not rocky. Some of their highest elevations are smooth and stoneless as a newly-mown lawn, so that in passing westward from range to range one is again and again reminded of the closely-clipped pasture field of New York or Pennsylvania.

The trip from Denver to Pueblo southward and parallel with the mountains for 120 miles is a fitting preparation for the coming intermontane revelations. Castle Rock is passed, and numberless formations of its kind. Lake Palmer on the Divide, with its two highwater outlets, once seeking the Platte and the waters of the Missouri, the other flowing through the Arkansas into the Mississippi. A corner of

Monument Park is traversed, where many-hued sandstone, capped with igneous rock, assumes forms strangely grotesque. The Colorado Strata and the Mission del Santonio of the plains, and much more than that in all but fully. One ward by buttes and mesas, through the cattle on a thousand hills, through sage, and cacti, and the homes of prairie dogs, till Pueblo, the great manufacturing center of Colorado, is reached.

For the last hour the Rocky range had been reeding toward the West, in which direction we now set our faces, following the Arkansas through a low wide cañon, over grass and low brush fertility. We pass through the mesuaries of acres of maize, as tall and lush of growth as that on the rich soil of Iowa, through leagues of those diminutive simflowers, ubiquitous on plain and mountain, through dense groves of cottonwood and large fields of wheat and oats, a very idea of abundance, until we arrive at Cañon City. Here an observation car is attached to the rear of the train and speedily filled with tourists. We enter a cleft in the mountains, cut down from top to bottom by the ceaseless, age-long toil of those rushing waters. The sides converge more and more, till there is scant room for stream and road bed; higher and higher rise the many-colored, seamed and jagged cliffs; closer and closer, higher and ever higher, till the wonder of the Grand Cañon ends in the amazement of the Royal Gorge.

There is but scant room for the angry stream which roars away between the narrow rock walls. It lifts themselves straight up for more than half a mile. From river bed to pinnacle tip the distance is over three thousand feet. Over a bridge suspended from iron trusses mortised in the rock overhead, and following the stream lengthwise for ten rods or more, we pass the narrowest point, but thirty feet wide, and thus through grandeur indescribable ascend to Salida, ninety-six miles from Leadville.

A bounding mountain range is defined for Leadville in the north, west, one that is located in a westerly direction, and soon cross Poncho Pass, noted for its hot springs, its scenic attractions, and the abundance of its trout.

From Meers, eleven miles beyond Salida, the ascent toward Marshall Pass is extremely rapid, the grade being frequently two hundred and eleven feet to the mile. The road climbs up on one side of a valley, makes a turn at the end of it, and ascends the other side, then, rounding a projection, it reaches one that is located in a westerly direction, and is reached, at an altitude of 10,855 feet above the level of the sea. The direct distance from Meers to the summit is hardly more than five miles, but the curvings and lappings of the road cover no less than fifteen miles. The time consumed is one hour and thirty-eight minutes.

The outlook is magnificent. On either side slope down valleys for thousands of feet. Above us rises the peak of Mt. Corral, so bare and smooth and grass-covered that a child, delicately shod, could make the ascent with the greatest ease, so far as the overcoming of obstacles is concerned; but let the "tenderfoot" not rashly attempt it, for such is the rarity of the atmosphere, that breathlessness and throbbing temples are the usual results of the slightest physical effort.

In descending we curve down along well-imbowered mountainsides, through beautiful valleys, along trout streams of crystal clearness, over meadows and richly timbered, dotted with ranches, saw-mills and hamlets, till finally we enter a wide open plateau, and far in the distance catch our first glimpse of the city of Gunnison.

The town, with its five or six thousand inhabitants, is the capital of a county that is larger than Massachusetts and Rhode Island taken together. Along its wide and regular streets are the most magnificent public buildings. Beautiful structures of stone and brick indicate stability and prosperity and confidence as to the future. There are numerous schools, five or six churches, a fine court house, several excellent hotels, two banks, gas and water works, and two more than usually alert daily newspapers. There are now in course of construction a large smelter and a hotel that is to cost \$125,000. Situated as Gunnison is at the confluence of the main mountain ranges, it is connected by rail with the exceedingly fertile Uncompaggre Valley, surrounded by rich deposits of iron and anthracite coal, and by such flourishing mining towns as Ruby, Gothic, Crested Butte, Tin Cup, Tomichi and Pitkin, there can be no doubt that it is destined to become the most populous and affluent city in Colorado west of the Divide.

From Gunnison we took the train for Cimarron, which in August last was at the end of the track. For about twenty-five miles our course lay down through the valley of the Gunnison. As advance was made the scenery became more and more picturesque. On our right were rare specimens of nature's carving—mounds, pyramids, minarets, broad domes, tall, sharp spires, and lofty castellated heights of all hued magnitudes, until we entered the rock portals of the Black Cañon.

The tireless water has here also done marvelous work. On our left, across the stream, rise up steeply well-wooded acclivities thousands of feet in height, while on our right cliffs high as those of the Royal Gorge lift themselves skyward and darken this tortuous chasm. Fifteen miles of unrivaled grandeur, a little stream is crossed, and we halt at Cimarron, a typical end-of-track town. It was near mid-night when we arrived, yet the entire place seemed as if lights glimmered through every crevasse. There were tents and a transient railway clinic. It will not be long before this entrancing corporation will have no less than seventy-two hundred miles of steel-track in full operation.

As the tourist is carefully transferred over higher than Alpine passes, and whirled along steeply where even the venturesome mountain sheep never found a footing, or through gorges whose lowest depths of darkness the eyes of man and eagle could not penetrate, it can not help admiring the skill, the patience, the liberality, and the heroism so displayed. In

his excellent manual, "Health, Wealth, and Pleasure in Colorado and New Mexico," Mr. F. C. Xmas, of Denver, writes of the Royal Gorge, and other places like it, "Men and tools, and mules and carts were let down over the precipices by ropes, and men and animals received their food, like Elijah, from above, till they cut a track through the granite cliffs; how the surveyors first picked their way through the cañon on the ice, where before only fishes and birds had been; how the rockmen hung suspended in the air, and drilled holes in the granite for blasts that sent tons of rock crashing into the stream, with a noise louder than thunder."

By supplanting the stags and pack trains of burros, the Denver and Rio Grande Railway has been a most important factor in making Colorado the rich State that it is to-day. Into every mining camp that is worthy of consideration, and in any way accessible, branches of the road have been extended or are now being so advanced. In the Leadville region it is tapping such towns as Red Cliff, Dillon, Frisco and Breckenridge, ascending at Summit an altitude of 11,329 feet; in the Gunnison region, Crested Butte, Ouray, and Lake City; in the Salida region, Maysville, Bonanza, Bismark, and Saguache; from the Cañon of the Arkansas, Silver Cliff, Rosita, and numerous coal mines; and in the south, El Moro, Del Norte, Wagon-wheel Gap, and the New Mexicana Española—the richest portions of the State being, thus nourished and strengthened by these life-giving arteries of traffic. Well worthy are these men of our admiration, and of the \$800,000 that they are earning every month.

From Cimarron we return to Salida, and after a delightful wandering through Brown's Cañon, along the base of such peaks as Harvard, Yale, and Princeton, each more than 14,000 feet in height, Leadville is reached, the city above the clouds, with its fifteen thousand inhabitants, and its altitude of 10,200 feet. We knew that during the past year Leadville had produced precious metals to the value of more than \$16,000,000, and still we were surprised by the size and beauty of the city; by its blocks of substantial stone and brick buildings; by its churches, schools, opera house and many beautiful private residences. If one is in search of a rough and lawless mining-town, it is necessary to search elsewhere—in fact, it is necessary to emigrate from Colorado. Leadville is decidedly like any Eastern city of the same size, save that here some things are done openly that in the East are done behind fast-closed doors, but that are done all the same.

Leadville is surrounded by places of unusual interest, such as the snowy wonder of Holy Cross Mountain, the delightful summer resort at Twin Lakes, whose waters attract the angler, and whose glacial moraines will not be heedlessly passed by the geologist. The civil engineer will not forget to make a pilgrimage to the Calumet iron mines, where the branch railroad attains a maximum grade of four hundred and six feet per mile.

From Pueblo southward the journey offers very little of interest, save as the ever beautiful mountains in the west, and the Spanish Peaks in the south bewitch the eye with varying beauties of form and color; but from Wahatona onward interest increases with every added mile. Toward the mountains and upward among them lies our way. In the first half of the journey we ascend around curves of thirty degrees, and up grades of two hundred and thirty-seven feet to the mile. As the plain beneath recedes further and further the lifting up is felt. Our progress is slow and arduous. We unconsciously labor with the locomotive as through the stillness of the half-lit night its dry, metallic pinging smites our ears. Of a sudden a mist sinks down upon us and shuts out the last traces of the hitherto independent and pleasing prospect, and the road made around a deep, concave bend, and a sharp spurt up a long and steep ascent, when we emerge from the clouds and look down upon a vast ocean of light, rifted here and there by abysmal darkness—lands of blackness—lapped by multitudinous waves of soft, silvery whiteness, tinged with macerous sheen, so Veta Pass is crossed almost ten thousand feet above the tide.

To the grand valley on the other side of the range a rapid descent is made. San Luis Park, the largest of all in Colorado, being one hundred and forty miles long and sixty miles wide, covers an area considerably larger than the entire State of Massachusetts. With a few exceptions the plain is level as a floor, and devoid of all timber save where the groves of cottonwood fringe the numerous intersecting streams. Of the latter the San Luis and the Saguache flow in a westerly trend, and the San Luis Lake is formed from which there is no visible outlet. The soil is amazing in fertility, producing excellent crops wherever the irrigating ditches have been sent. Men of intelligence and enterprise are now spreading the waters of the Rio Grande over thousands of acres, and there can be no doubt that they will receive large returns for time and money so expended. Vast sections of the Park are still unappropriated, and can be purchased at government prices, a fact that ought to tempt many a toiler from the East.

Pursuing our journey we pass Alamosa in mid-afternoon, and soon thereafter a tonito, hard by the adobe plaza of Conejos, with its ancient church and convent, a typical Mexican town. Further onward another ascent is made. We now take a last look backward across the Park, and behold, eighty miles distant, the graceful outlines of Sierra Blanca, most beautiful of peaks along the entire range, and with one single exception the highest in the United States, having an elevation of 14,464 feet.

We then climb mesa after mesa in interminable windings, so that frequently six miles of travel are hardly equal to three miles of direct advance. At the "Whiplash" a section-house is passed three times in less than ten minutes, the track being shaped like a low and broad S, the width of which may be half a mile, and the height certainly less than eighty rods. The higher touches the hills of the lower track. So we wind along leisurely, rising higher and higher, till on turning the crest of a hill twenty-three miles from Antonito, we are surprised to find that we are skirting along the rim of the cliffs that overlook the beautiful Los Pinos Valley.

The scenery is unusually picturesque. As far as the eye can reach, back and forth, vale follows vale. The mountains approach the eye from the west, and rise and descend below with dense groves of bright aspen, while down in the valley beneath wanders the glistening streamlet through the grayish-green of grass and sage. On our side the scene is ever changing. Now we pass through groups of highly colored monumental rock; then by dark craggy monoliths of astounding heights, standing in startling contrast with cretaceous formations of almost endless hues, of delicate rose, bright yellow, and vivid green, alternating sharply

with reds and browns, and shades of blue, constituting a landscape that is unique and so strangely fascinating.

As the winding panorama unfolds before the tourist's widely notes that the end of the valley is reached, a bold mountain range seemingly cutting off every chance of egress; but the mountain side is climbed, the train rounds the out-jutting brow, thunders through a tunnel, and then runs along a narrow ledge cut into the precipitous cliffs of Toltec Gorge. But a stone's throw across rise up opposing rock walls more than two thousand feet in height. At dazzling depths below the foam-drenched stream rushes on, and lands are way. The narrow, graceful vales of beauty so transcendent that one longs for leisure there to rest for days and days, as do the sons of Nimrod and the disciples of Father Isaac that dwell in those white tents by the Los Pinos. But we must hasten on over the Divide at an altitude of more than 10,000 feet; through Chama, blest with genial Boniface and famous for its dairy trout feasts; through the forests of the Tierra Amarilla, one hundred miles in length, on whose brushless, grass-covered plains stand grand old pines, smooth of bark, and tall and straight as masts; then onward we pass by Amargo, the agency for the untidy, shiftless Apaches; by the wondrous trap dikes between Dulce and Navajo; over the Piedra and the Rio de los Pinos; then by Ignacio, among the yellow-topped tepes of the Southern Utes, owners of immense flocks and herds, and across the Rio Florida down into bustling Durango.

The first town built in Durango was sited in September, 1880, yet at this date it contains between three and four thousand people, who support a daily newspaper, two banks, numerous schools and churches, and one theater. A fine smelter, giving employment to several hundred men, has lately been erected. The town carries on an extensive wholesale trade with neighboring mining camps. Coal and iron of excellent quality and practically inexhaustible quantity are found in the immediate neighborhood. The long history of this vital business buildings speak of prosperity and presage stability.

Not far from Durango, west by south, are found some of the most interesting ruins of the ancient cliff dwellers, whose houses are hung "like eagles' nests among the lofty crags, and which far antedate the Teutonic ruins of Middle Ages."

Following the beautiful valley of the Rio de las Animas, we pass through fields of corn, fertility by privateers, we reach that betoken thrift and opulence, till a halt is made at Rockwood, eighteen miles north from Durango. We have hardly left this station before we find that the valley converges more and more until it culminates in the Grand Gorge of the Animas. Midway between top and bottom the roadway has been cut into the side of the perpendicular cliff. Beating heights are above us, and down below, at an amazing distance, the turbulent waters of the narrowly confined river. Here beauty and grandeur have kissed each other—the beauty of rock and mountain slope, of the swish and sheen of water, and the grandeur of mass and astounding height. At every turn of the river new beauties are revealed, new vistas of exceeding loveliness. Those waters of brightest emerald flow garrulously over shingly bed, or gather quickly in still, dark pools, or rush impatiently through narrow clefts, and from height to height dash their way to a seductive whiteness. For thirty miles river and road run side by side, closely pressed by cliffs and wooded steeples that rise abruptly more than four thousand feet on this side and on that, thirty miles of exquisite enjoyment, and then the valley winds out, and there before us in Baker's Park lies superb Silverton, surrounded on all sides by lofty, snow-tipped mountain ranges. The scene is remarkably Swiss-like. The groups of low, flat-roofed houses, the beautiful meadows, and the clustering of the cool trees, and the cloudless sky of darkest blue, all these most recall for many a one memories of happy Alpine days.

But the place is intensely American. The streets are clean, wide, right-angled, and bordered with irrigating ditches filled with the clear, cold water that comes down from those snowy summits. Thousands are digging in those mountains and bringing forth treasures in abundance. With its hospital and telegraph office, its saloons, and newspapers, one does not feel as if he was on the frontier. Person and property are as safe in Gunnison, Leadville, Durango or Silverton as in any town of the same size along the Hudson River.

In a quiet way Silverton is honeycombing the mountains and gathering great quantities of valuable mineral, most of which is now being sent to Durango for treatment, but it is expected that before the close of this year the Beckwith smelter will be ready to go into operation in Silverton itself.

In returning from the Silver San Juan toward Denver we stop at Alamosa and make a side trip of 125 miles to Lake City. Forty miles northwest from Alamosa, at Del Norte, we enter one of the stages of Sanderson's Overland line at half-past ten in the morning, and reach our destination at four o'clock on the following morning. Our leisurely journey lies along the wide and charming valley of the Rio Grande del Norte, on either side of which lofty, many-colored cliffs and fiore-covered mountains are standing guard. As Wagon-wheel Gap is approached quietness gives way to grandeur, the mountains on the south and the walls of rock on the north drawing near and nearer till at last height almost touches height. A capital place is this to tarry at with rod or rifle. About a mile south of the little Maysville Inn, Fishman's, the hunter may find a most excellent and close by two hot springs far-famed for their medicinal virtues. In one of these the water boils up at a temperature of 150 deg. F., while hardly ten feet from it there is a spring of water intensely cold.

The narrow rock gateway of the gap having been passed, the scenery relaxes into the serene quietness, till at Antelope Springs the river is forsaken, and the road turns inland to the mountains. The mountains are now in the region. As we climbed up to an elevation of more than 10,500 feet on one of the last days of August, a dreadful snowstorm was encountered. With the velocity of a hurricane it rushed down upon us, churning the thickly falling flakes in a blinding fury, till landscape and pathway were completely blotted out. The horses' feet bailed so badly that we could but creep along slowly in a temperature bitter cold.

Quickly as the storm had burst upon us so suddenly it passed by. The sun shone at once with mid-summer brilliance and intensity. The dark green branches of the evergreens were heavily snow-laden, while the crystal ice speckled aloft in the air and the whiteness under foot were touched of rare iridescence.

Corduroy is here called an excellent roadway, and over six miles of it we thundered along at terrific speed, then

down the Pacific Slope in almost headlong descent, on through the scenic beauties of the unpopulated Shumagin into the diminutive park in which lies the out-of-the-way hamlet by prophetic fence called Lake City.

Like Zion of old, the result is "by situation." Lying at an altitude of nearly ten thousand feet, and remote from the centers of traffic, it nevertheless has daily mails from all directions, telegraphic, stage and express lines, two weekly newspapers, a fine public schoolhouse built of brick, several churches, a flourishing bank, and numerous shops that drive an immense trade with the contiguous camps.

To the south of the town, and several hundred feet above it, extends the distance of the Gunnison branch is but about thirty-five miles, in which direction most of the freighting and traveling is done.

Of its two thousand inhabitants the great bulk is digging in the silver-laden mountains. The extensive smelter established by and still under the management of Messrs. John J. and Robert Crooke, has been an incalculable blessing to the place, furnishing the mineral cash for his ores, and giving employment to hundreds of others.

Here, as elsewhere in the State, there are many mines that are most undeservedly buried under bad names. Rich leads lie undeveloped because capital is too timid or too faithless to come and make personal inspection and effort. Not mining stocks ought to be bought, but mines; for most true it is, that excellent claims can be purchased in almost any portion of the State for sums ranging from \$1,000 to \$10,000. Unfortunately too many buy simply on speculation, and speculation at last invariably defeats its own ends. The mine ought to be bought to be worked, fairly and honestly, just as the mine of coal or iron is worked. Success in mining means personal presence and interest—it means intelligence, clear grit and hard work. Fortunes would fill the coffers of thousands of disconsolate stockholders if they had the courage to work their mines on a large and generous scale; for as rich holds, in Colorado at least, that the deeper the shaft the richer is the mineral output.

From Lake City we return to Antelope Park, the sportsman's paradise, a quiet, restful retreat in the very heart of the Sierra Madre. Here the waters are alive with trout, and plain and height are the haunt of the antelope, the mountain sheep, the black-tailed deer, the bear, and the elk. At Galloway's, up at the head of the Park, the tourist will find a genial, sympathetic host, a warm welcome, large, comfortable rooms of exceeding neatness, and such dishes of venison and unshrooms as he never tasted before, and probably will never taste again, unless the pilgrimage be repeated. It is well worth coming two thousand miles to revel in such limitless wealth of sport, to breathe air so pure and life-giving, and to feast the eyes on such magnificent mountain views.

We have cast the fly in the Tomiehit, the Gunnison and the Cimarron; we have partaken of the treasures of the Los Pinos, the Piedra and the Rio de las Animas, and uniformly we found the fish abundant and most excellent; but nowhere can the angler so speedily burden himself with good, solid trout as he can at almost any point on the Rio Grande, between Del Norte and Antelope Park. With a red or brown hackle, a dark or whitish fly, and a vice bit of a gnat, with a little rod, high wading boots (the water is of icy coldness) and a fair share of the angler's instinct—given these, and one man can not only snip but easily ground a good-sized camp; that is to say, if sixty or seventy pounds are sufficient to compass that end.

For sixty miles or more the turpicks follows the course of the river, whose banks are generally free from overhanging trees or undergrowth. It is so shallow that it can easily be waded at almost any place.

The open season begins with July and ends with November, of which July and September are said to be the choice months. In August rains are not infrequent, and fly-casting in the turbid waters of the Rio Grande is reported to be a waste of time.

The head with trap, net and cartridge is not unknown, in fact, some mountain streams he has already nearly depleted. Giant powder does occasionally happen to kill one and another of this pestiferous tribe, but it is doing its good work with painful slowness. The angler's hope and good wishes rest with The Colorado Game and Fish Protective Association, of which W. N. Byers, Esq., of Denver, is president.

Through a blinding snowstorm the genial host took us to Antelope Springs, picking up game of divers sorts here and there by the wayside, and leaving us there to the mercies of the Overland line and the pitiless cold. James P. Galloway is an admirable specimen of the genuine Western pioneer. In times most tumultuous he has ever been on the side of law and order. Far and wide his worth is acknowledged, and it is because of his law-like ways that he has been considered in the upper house of the State Legislature. Heroic deeds he has done, yet there is in him the gentleness of a child and the courtesy of a prince. Let him that doubteth go and see.

GRAB AND GREED.

I AM more than glad to see your hands up against the Yellowstone outrage. You, with Senator Vest and others, are doing good work for the nation—building better than you think, possibly. Time only can give final results, but at least the swindlers shall not win untried.

I have lived to see the Mammoth Cave and Niagara Falls degraded to rare show for the benefit of landlords, hucksters, hucksters and hucksters. And now the three grand parks on the face of this favored land are being desecrated to the same tune of money, money, Grab and greed. When the glorious Adirondack region has been converted to a misanthropic desolation, and the sources of its beautiful rivers dried up from the Moose to the Hudson, until the latter will not flow a first-class stemboat to a hundred miles above New York, city, when these grand old streams are bringing malaria instead of health to the dwellers along their banks; when the Yosemite and the Yellowstone parks are properly parceled out, appropriated, labeled and tariffed, the public may wake up and enter a hotless protest, but too late. The mischief will have been done; rings and companies, having beaten and swindled the people in-

terly, and each other as badly as possible, will have "whacked up" and got away with their plunder. And human skill will not be able to make good the desecration and desolation by a century that a few greedy hoodlums have wrought in a single year.

I have often wondered, when cruising among the "drowned lands" of the Adirondacks, why the guides did not hoist every dam in the wilderness with dynamite. It is no answer to say this would be lawlessness; it were rather self-defense. When any man or any number of men assume the right to poison the air I must breathe and the water I and my family must drink, it is a duty to blow his villainous traps sky high, if I can. "Logic is logic."

Maybe I shall live to see the dawning of a day when the almighty dollar will be not all in all, but the outlook is not a bright one. N. S. S. S.

THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance, Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH.

STRIGIDÆ: THE OWLS.

137. Barn Owl—*Strix americana* Aud.; *Aluco fuscus* Aud. *Strix americana* Ridg. 394; *Aluco fuscus* *viridifrons* Cs. 461.—Accidental straggler. In June, 1866, I saw a fresh specimen of this owl in the workshop of L. C. Daniels, taxidermist, at Portland, Me., and was informed at the time that it was shot at Falmouth, Cumberland county, Me.

138. Great Horned Owl—*Bubo virginianus* Aud., Ridg. 405, Cs. 462.—Common. Not abundant. Probably resident. Breeds. Owls of this species abound invariably, if not always, have a very marked odor, such as is emitted by the common skunk. So constant has been this mephitic odor in all the adult specimens I have examined, as to suggest that it emanated from the birds. But close investigation has convinced me that in all cases this perfume had been acquired by contact with the mammal, which probably had been attacked by the bird as an object of prey.

An owl of this species found by a friend of the writer one morning in his henhouse, where about one hundred fowl were confined. The owl was standing upon the ground, surrounded by dead ducks and hens slain by it. During the previous moonlight night this bird had darted through a window that was close to the perches of the fowl, which were probably seen, and therefore attacked. Once within the inclosure, the owl had either remained by choice or was unable to find the aperture, effected on its entrance by the breaking of a pane of glass, and the space was too limited for flight and darting through another pane. A bit of wood in the hands of the owner of the slain poultry soon stretched the owl beside its victims.

139. Screech Owl, Mottled Owl—*Bubo asio* Aud.; *Scops asio* Ridg. 402, Cs. 465.—Uncommon. No record of the nest and eggs of this species have been found in Maine, but it probably has regular summer visitant to Western Maine from more southern localities. Mr. Boardman regards it as "very rare" in Eastern Maine. In the summer of 1880 an owl of this species flew into a hotel at Bangor, and was there captured, and its skin was preserved. No other specimen has recently been taken in that vicinity.

In Western Maine the species is not very rare, and a few may be there resident throughout the year. Prof. Verill, in his list of the birds of Norway, Me., mentioned this species as "resident, common, breeds," and the same list mentions the short-eared owl as of "probable occurrence" only. Yet the latter species is common along the coast, but the screech, or little red, owl is decidedly uncommon on the coast, even of Southwestern Maine, and does not appear to be of common occurrence anywhere in this State.

140. Long-eared Owl, Snowy Owl, *Asio auriventer* Ridg. 395; *Asio villosus* Cs. 472.—Common. Probably some remain throughout the year. Breeds. One of the most common in Maine.

141. Short-eared Owl, Marsh Owl—*Otus brenkeghous* Aud.; *Asio accipitrinus* Ridg. 396, Cs. 473.—Common. Arrives in April. Breeds on the ground; lays four dull white eggs with a slight bluish tinge. This owl is common all along the coast in suitable localities, such as meadows and marshes. It is rather diurnal in its habits, and I have observed it seeking food on bright sunny days, as well as during cloudy weather, and in the evening.

Its favorite haunts are the marshes, and it resembles the marsh hawk in its habits of flying low over the meadows in search of its prey, upon which it pounces when discovered, but rarely pursues it. I have never known of its occurrence here in winter.

142. Great Gray Owl—*Syrnium nebulosum* Aud.; *Ublu cinereus* Ridg. 399; *Strix cinerea* Cs. 474.—Rare. This is the largest North American *Strigidae*, exceeding in size the great horned and snowy owls. It is only occasionally taken in Maine, where it probably occurs merely as a rare and irregular visitor from the north in winter.

143. Barred Owl—*Syrnium nebulosum* Aud.; *Strix nebulosa* Ridg. 397, Cs. 475.—Abundant. Resident throughout the State. Breeds. The most abundant species in Maine. This owl is easily decoyed by an imitation of its cries. They are apparently of a very social disposition, and are not infrequently found together. I have called them about my camp to the number of four or five in an evening, in a favorable location where they were abundant, and they would remain in the neighborhood, uttering throughout the whole night, keeping up their peculiar call conversation, and occasionally hooting replies to more distant birds of the same species.

144. Snowy Owl—*Surnia nyctea* Aud.; *Nyctea scandiaca* Ridg. 406, Cs. 479.—Irregularly common. Visitant from the north in autumn and winter. More commonly seen along the coast than inland. It is rather abundant throughout the whole night, keeping up their peculiar call conversation, and occasionally hooting replies to more distant birds of the same species.

might was frequented by a number of white owls, and I devoted several hours of the day and evening to watching their movements. During the day they were rather inactive, perching upon rocks watching some pool for crabs or fish with a patience rivaling that of Izak Walton, and when approached would fly but a short distance from rock to rock. They appeared to be rather shy, and much more so than are usually the owls of other species.

The markings of the plumage of the snowy owls vary greatly. Upon some the black seems rather to predominate, and I have seen one specimen almost entirely white. It is reported by Mr. Boardman, *Proc. Acad. Nat. Sci.* 480.—Not very common. Autumn and winter visitant from the north. Possibly a few may be resident, but there has not been an instance of its breeding in Maine reported, yet it is quite probable that a few of the species may do so.

146. Tengmalm's Owl—*Ublu tengmalmi* Aud.; *Nyctaleu tengmalmi* *richardsoni* Ridg. 400, Cs. 483.—Rare winter visitant from the north. Mr. Barry Merrill obtained one of this species in the city of Bangor in March, 1876. The bird was in the street, and appeared to be so dazed by its surroundings that it was easily knocked over with a stick. In this connection it is interesting to recall the fact that the great naturalist, Audubon, procured at Bangor, Maine, "in the beginning of September, 1832," the only specimen that he ever saw alive. Mr. Boardman has obtained a number of specimens, and taken one winter. Two of this species were taken in Maine, were brought to Portland in November, 1882.

147. Acedian Owl—*Ublu acedina* Aud.; *Nyctaleu acedina* Ridg. 401, Cs. 483.—Common. Undoubtedly some are resident throughout each year, and it probably breeds in Maine. Although the discovery of its nest and eggs has not been reported, immature specimens have been taken, and the adults preserved during the breeding season. This little owl, the smallest I ever known, is sometimes termed the "saw-whet owl," on account of some of its notes resembling the sound produced in filing a mill saw. The immature birds have been termed "white-fronted owls," on account of the coloration of plumage, varying from that of the adults. An acedian owl was captured alive in a stable on State street, Portland Me., January 13, 1875, by my nephew, Everett Smith, and I had the honor to see it. It was seen at the time in the garden near by. This captured owl I kept alive, and occasionally permitted it the freedom of my chamber, that I might better observe its habits. Upon one night, after I had stuffed and mounted several redpoll linnets, and left them upon a piece of furniture in my chamber, the little owl aroused me from sleep by the complaint of spirited attacks upon the stuffed birds, and these attacks were repeated ever after I had arisen, illuminated the room with gaslight. No sooner had I picked up one of the stuffed birds which had been knocked down than the owl made a dash at it while held in my hands. It missed its prey, but not me, and I learned that my midnight apparel would afford but little protection against the needle-like claws of this diminutive owl. The bird was subject to convulsions, apparently of an epileptic nature, and when these attacks would utter repeated cries of distress until it fell off its perch, and after a little tremor became rigid. These attacks gradually became of frequent occurrence, until death finally ensued.

FAMILY FALCONIDÆ: THE FALCONS.

148. Iceland Gyrfalcon—*Falco islandicus* Aud.; *Meropelia gyrfalco* *islandicus* Ridg. 424, Cs. 500.—An exceedingly rare falcon from the north. Geo. A. Boardman, Esq., has in his collection two specimens of this species of gyrfalcon, both of which were killed near the mouth of the St. Croix River. A gyrfalcon was shot at Cape Elizabeth, Cumberland county, Me., October 13, 1877, probably referable to this species, and its skin is now in the collection of Prof. J. T. Stanton.

149. Labrador Gyrfalcon—*Falco gyrfalco* *islandicus* Aud.; *Falco gyrfalco* *islandicus* Cs. 500.—Mr. Boardman has had three specimens of this gyrfalcon in his collection. Two of these were killed near the mouth of the St. Croix River, in the Bay of Fundy.

150. Peregrine Falcon, "Duck Hawk"—*Falco peregrinus* Aud., Cs. 503; *Falco peregrinus* *anatum* Ridg. 414.—Rare. Occasionally seen during migration. Mr. Boardman reported the capture of a specimen of this species at Penikese Island, in the Bay of Fundy, many years ago, but there appear to have been none frequenting that locality within the last few years, and the species is now but rarely seen anywhere in Maine. The capture of a specimen in the autumn of 1876 at a house on Cape Elizabeth, occupied by Daniel W. Fessenden, Esq., is recorded in an interesting contribution to the Proceedings of the Portland Society for the History of the Birds of Maine, which was read before the Society April 3, 1882: "The hawk chased a pigeon into the corner of a veranda surrounding the house, and was so absorbed in killing its prey that Mrs. Fessenden threw a shawl over it and took it alive."

151. Pigeon Falcon, "Pigeon Hawk"—*Falco columbarius* Aud., Cs. 505.—*Falco columbarius* *ridgwayi* Ridg. 417. Not so common during migrations. Rare in the spring, but more commonly seen in the autumn. In this latter season the plumage of the upper parts of this hawk is dark blue, and this appearance, with the size of the bird and its swift flight, gives it a semblance to the common wild pigeon; hence the name "pigeon hawk." No instance of this species breeding in Maine has been reported, and probably those seen here breed in more northern regions.

152. Rusty-crowned Falcon, "Sparrow Hawk"—*Falco sparverius* Aud., Cs. 506; *Falco sparverius* *sparverius* Ridg. 420. Abundant. Arrives in April. Breeds in trees, commonly in holes; lays five or more cream-colored eggs covered with blotches and spots of brown. This species is very common in Eastern Maine, where it breeds, but is not commonly seen in Western Maine except during the migrations. The name "sparrow hawk" is quite inappropriate to this bird, as it does not prey upon sparrows, and the name is commonly given to this little hawk consists of insects and small reptiles. I have many times watched hawks of this species associating with small birds, and not only have they always refrained from attacking them, even under the most tempting circumstances, but the small birds do not evince the alarm that is always manifested upon the approach of swarms of insectivorous birds. I have never known a sparrow hawk when shot at a time when small birds were very abundant and insects, etc., comparatively scarce.

Although to a great extent subsisting upon grasshoppers, crickets, beetles and other insects, as also mice, small snakes, etc., yet these hawks have been reported as occasionally attacking with determination birds of various sorts, including even the tame swallows and domestic pigeons, unless the at-

counts of the latter incidents can be referred to the sharp-shinned hawk.

This bird of falcon much resembles the European kestrel, not only by its coloration of plumage, size and general appearance, but its cries greatly resemble those of its European cousin. And in comparison with the name "sparrow hawk," it may perhaps be rather more appropriate to term our bird the American kestrel.

[TO BE CONTINUED.]

REPTILES AND THEIR HABITS.

I AM tempted to say a few words on the innate vicious disposition of the snapping turtle, and to refer to an incident to which there are living witnesses. An adjoining farmer turned up with his plow a number of eggs, and brought them to me to examine. They were near the size of pigeon eggs, and covered with an elastic tough membrane. On opening, several they were all found to contain turtles about the breadth of a thumb nail. All were alive and soon began to crawl about, and to prevent falling off the board they were turned with a broomstraw, at which they would snap and bite as viciously as would the parent turtle.

Write on the subject of natural history, and the pen in hand, I will briefly refer to another incident, and in part in reference to articles read in FOREST AND STREAM. Some writers have on the basis of the opinion that serpents propagate their species without the intervention of eggs, and also kill their prey before devouring it. I believe neither to be correct, and know the rattlesnake is propagated from the egg. Some years ago, in company with several acquaintances, I visited a den three or four miles southwest of Oakland, Garrett county, Md., for the purpose of destroying them, early in May. We had killed quite a number—two under one rock, and one in a hollow shell. I then I stepped to a high rock which overlooked the den, on a south hillside of a acre of loose shelly rocks, on and under which the snakes were usually found sunning themselves, after leaving the den in a semi-torpid state, and before roaming abroad for food. My attention was attracted by a peculiar sound. After carefully examining the surroundings, I discovered a large rattlesnake in coil on an adjacent rock some twenty feet distant, and apparently in a good rage, possibly near its maternity. As my position was free from danger, I observed it for several minutes before firing. I had killed scores and scores of rattlesnakes, and it was the first instance of one causing any sound other than by the rattle. The snake would inflate the body to nearly double its size, then so forcibly eject the air as to produce a blowing, and almost a whistling, sound, in addition to the rattling, and could be heard twenty-five or thirty yards. After killing it and approaching to take the rattles, in the body mutilated by the explosive shell, we counted twenty-three eggs, and each contained a living serpent in embryo.

As to the belief of some that venomous snakes kill their prey by poison before devouring it, this is, in my opinion, incorrect. I have been informed by many intelligent mountaineers, whom I consider entirely reliable, that they had often seen rattlesnakes in the act of swallowing their prey, and it was invariably alive while visible, not killed previously.

Some years ago a friend in the Alleghenies sent me—and unasked for—a large live rattlesnake in a box, which he had captured in May. My first impulse was to destroy it, but it was so much of a curiosity here that many visitors—and from a distance—came to see it. I decided, therefore, to construct a secure cage, and observe its instincts; strong by themselves, but in a small, confined space, and covered with woven wire, a sliding metal door, locked, and key in my pocket. With a similarly arranged box placed at one end food and drink could be introduced without a possibility of danger. It lived two months, but during an unusually cold spell froze to death. During that time it took no food whatever, except about two tablespoonfuls of milk. It killed all the rodents put into the cage, but would not feed on them. A small crippled bird was introduced. This, on hopping on the snake, was struck on the neck and almost instantly killed, did not live two minutes. I saw it repeatedly afterward attempt to swallow the bird, but the moment it reached the poisoned part, it would invariably throw it out. Hence, with this and other evidence as conclusive, I doubt the rattlesnake's killing its prey for food—by poison. Having a ditcher at work on some small creek, I introduced a "rat" and a "snake" to its brother "serpent." When placed in the cage the snake appeared to dread it and would not permit the rat to touch it, changing its position constantly as approached by the rat, but would not strike it. It was amusing to witness a deadly serpent completely conquered and cowed by a harmless cat. I have witnessed two conflicts between snakes of different species, the first between a viper and a blacksnake; the latter was the victor by coiling around a stick, and crushing the strangling the viper; the second, quite recently, was witnessed by several persons—a mottled, black and white snake was captured by one of my sons to send to the Academy of Natural Sciences as an unusual species, and in the same box was afterwards placed one of another species, about half the length of the large one. Very soon the larger seized the smaller one, and began to crush it with its fangs; the box was so small that the snakes, by morning, the smaller one was invisible. Nor was there any mystery about it, as escape was impossible, and from the previous conflict and largely increased size and torpor of the victor, it was clearly demonstrated that the larger one had killed the smaller, and then swallowed it. Of this fact my were fully convinced beyond a doubt, and so end my snake stories. I have heard a saying that "dog won't eat dog," but I am fully satisfied that snake will eat snake just as much as that a cat will feast on his frowns. E. S.

SANDY SPRING, Maryland, Jan. 1893.

MAINE WINTER NOTES.—Bethel, Me., January.—By a private letter last week from an old hunter friend over in Somerset county, Me., he informs me that recently prospecting in those deep forests, he came across moose signs, and as he followed up the buildings and buildings, ran fall to winter works, and finally struck the droves or tracks of two moose freshly made, and by careful creeping he discovered in the distance two bull moose, both armed with fine, heavy antlers, looking the picture of loveliness to his old hunter eyes. In trying to creep nearer to get a shot, he accidentally stepped on a dry limb, which cracked with so loud a noise as to frighten the game, who made off at a tremendous pace. This shows that the Maine woods are not entirely depleted

yet of the noblest game ever roamed these woods. Today (the 25th of January) I shot a very beautiful male grouse. Snow buntings are quite common here this winter. A chickadee and a sparrow are constantly about my door yard, and the former takes his meals from a large sunflower hanging by the side of my woodshed. Our location is twenty miles east of Mt. Washington, of the White Mountain Range, and the thermometer keeps way down below zero most of the time.—J. G. R.

PINE GROSBEAKS IN NEW JERSEY.—Stanley, Morris Co., N. J.—While sitting by the window on the 16th of December I saw six strange birds light on an apple tree a few yards from the window, and commenced eating the decayed and frost-bitten apples that remained on the tree. I finally recognized them to be pine grosbeaks (*Pinicola enucleator*). They continued feeding for about five minutes, when they flew to some pine trees near by, where they commenced feeding on the seeds. Having satisfied themselves they returned to the apple tree. Thus they went from pine tree to apple tree and back three or four times. I noticed one peculiarly in their feeding, that is, each separately had selected an apple and always returned to feed on the same one. Very unluckily for me it was Sunday, if it had not been I would have added some of their skins to my collection. They were mostly immature birds with the exception of one or two mature females.—HARRY DE B. PAGE.

Game Bag and Gun.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, and will be taken from the office matters of importance are liable to delay.

THE CANEBRAKES OF ISSAQUENA.

THE cotton-planter and his sous are, as a general thing, fond of their guns, rods, dogs and horses, and in this part of the country are blest with a land teeming with game and fish, offering unequalled facilities for frolic sport. In hunting for game, bear and deer, as well as the snipe, are the dog takes an important part in the principal one. Such being the case, it may interest your readers to describe the favorite dog for the several occasions.

First is the bear dog—a mongrel, part cur and part hound, full ear, full blood—a motley collection. The "trail" dogs are usually full hound, although it is questioned by some whether the full hound or half pointer and half hound is the best for this purpose. Be this as it may, the packs I have in view are by full hound, English stag and Virginia fox-hound, and they are capital ones, too. The fighting dogs, those who do the heaviest work, are generally of the mongrel kind—terriers, curs, hounds, etc, mixed and intermixed until it would be difficult to trace distinctions. Bruin stands a poor show in a contest with these fellows, and generally loses after a race of an hour or so, and is then easily shot by the hunter.

Now and then a "tough customer" is raised, and a square fight with the dogs is made, usually ending in Bruin's defeat, and another short race, a second stand and fight, another run, and so on, until some fortunate hunter gets into the fight in time to get in a shot, which terminates in the death of Bruin. The victory is signalled by the "call blow" sounded from the horn. This "call blow" consists of three long, distinct "blows" or sounds from the horn. The sound of the horn is the signal for the hunter and has related his particular adventures during the chase, and all of the incidents of the chase have been related, the bear is placed upon a mule and sent to camp, while the rested dogs and hunters proceed to repeat the fun by jumping another bear.

The dense canebrakes make this sport partake somewhat of the hardest kind of work, and nothing, but the keenest skill for the excitement of the sport would urge a person to indulge in it, yet it is the finest sport of all our hunting. Once you try it, it sticks, and the fondness for it will not shake or wear off.

The blood-curdling stories told of the bear's dangerous fighting qualities are a humbug, for unless he is badly wounded, and cannot get away, he is, next to the panther, the veriest coward that infests our forests. There is no danger in him, except to your dogs. Thus he handles pretty roughly, and many of them are killed; scarcely a chase occurs but some of the dogs are seriously wounded or killed. Especially is this the case if your dogs are any of them green in the business.

We use in the bear chase every description of gun. My friend Smith and the members of our club mostly use breech-loading shotguns, 12-gauge, with round balls. This gun is certainly the best for the purpose, and the hammer-gun would be especially so since the danger of accidents by the hammers being caught against the cane, and the gun discharged, is removed. Several of our "bear-hunters" prefer the breech-loading rifle used in the U. S. Army, and commonly called "needle-gun." None of "Byrnes's" pistols are used here. All are armed, in addition to the gun, with heavy hunting knives, which are used mostly for cutting a way through the dense cane.

The deer-driving is made with full-blooded hound, English stag and foxhound preferred. Sometimes the hunter is placed upon stands along the favorite runs, and the deer is shot as he is driven by, but this feature of deer-hunting finds little favor here, as to occupy a stand means the loss of the best part of the sport, which is the better-skitter ride through the timber, a perfect steeplechase, with the music of the "hounds" in the air, in addition to the excitement—this is to the hunters music indeed; I've tried it and know—fifteen or twenty hounds in full cry make soul-stirring music to the hunter's ear. In our drives every man must look out for himself, each one's chances for a shot is equal to that of the others, provided all are equally well mounted. It is a race, as usual rewarded to the practiced and swiftest, who heads the deer and kills him, if he can. It isn't done every time, I assure you.

Deer were plentiful here from the overflow last spring, and our chases were generally short. But frequently if a deer gets out of the usual ground covered by the drive, he is allowed to go in peace—the dogs are recalled and another deer started. Sometimes in the course of one day's hunt twenty deer are chased, and right here let me say that the very next, or at latest, the day after the hunt, you could go over the same ground and run the same deer, or as many as on the first day, presumably the same deer. The

deer were never frightened away by driving with hounds—try it here and you will be convinced.

Some of our hunters we start a panther, one of those large, ugly brutes that are so plentiful to some upon, measuring often five feet from nose to tip of the tail. When we strike these fellows, the race is short and sweet. The cowardly rascal will take to the first tree, like his cousin the cat, and is easily shot. It sometimes happens, however, that he does not tree, especially if he is surprised by the dogs and caught before he has time to "shin up" a tree. When this happens you may count on some good fighting, for the panther will stand and show his teeth, and a small sized panther can whip all the dogs you can crowd upon him.

Several years ago, a party of us was on a camp hunt in the lower end of this county we were after deer, and bagged eleven in four days. On the morning we had appointed to break camp we were early, preparing to have a short drive before leaving. After going about five hundred yards from camp, we came upon a freshly killed doe that had been partly devoured by some animal, which had evidently been frightened by our approach, and had concealed itself. The dogs coming up soon found the trail, but seemed loth to follow it, displaying uneasiness and fear by their bristling backs and their growls; but one favorite, old Jack, a pointer-hound, came up, took the trail and bravely led off the chase. When once started the whole-pack were off in a hurry; and we followed close up. A race of a hundred yards brought into full view a magnificent young panther, which manifested no desire for a race, but a stubborn determination for a fight. She did not have long to wait. The dogs, once over their fright, were in for it, and some seized her ladyship, and the hunt began. According to their usual fighting tactics she lay upon her back, feet up, and her four feet containing twenty claws, as sharp as razors, fairly made dog meat and hairy fly. Panther and dogs were so completely mixed that we were compelled to withhold our shots for fear of killing more than one. Every second a dog would crawl out satisfied; the fight lasted only a few seconds, when Walter Smith, one of the party, got in a shot that satisfied the panther and ended the fight. Several severely crippled dogs and one dead panther were the list of casualties.

There are many of these annually here yet. One was killed within half a mile of my dwelling, by E. V. Miller, that measured nine feet from nose to tip of tail. Three were seen on the same ground last spring and were quite numerous. The negroes living on this and adjoining plantations. These three panthers came near riding the county of that nuisance the "yaller cur," that infests it by the hundred, every darkey owning at least three. The panthers killed quite a number and devoured them—in fact, the dogs were the principal food of these animals while they remained. The brutes finally became such a terror that friend Smith was called in with his bear dogs, and drove them off, failing to kill any one of them.

My dwelling stands in the center of 200 acres of cultivated field, and the tracks of these panthers were made within 200 yards of the house.

So much for bear, deer, panther, and the dogs used to hunt them. R. M. Smith, Jr.; W. J. Smith, W. P. Allen, John Steen, Mr. Westcott, and R. B. Phipps are now out on a week's camp hunt for bears, and will doubtless bag five or six more. The negroes killed two weeks by W. J. Smith, and R. B. Phipps on the two days' hunt. This swells the record of the hunt to the present time to eighty-seven bears. R. M. Smith, Jr., was in at the death of every one of these except two. How is that for bear hunting? It was not a good time for bear either.

Quail are plentiful and good bugs can be made any day. Our favorite dog for this sport is the pointer, because of his dog's keenness, who loses too much time pulling cockle burrs from his long hair.

MISSISSIPPI COUNTY, MISS.

THE NEGROES AND THE BIRDS.

IF Sir Reynard is the champion bird extinguisher of the Old Dominion—mother of States and statesmen—how does it happen that in the southeastern counties, where partridges do most abound, there, also, the fox is most abundant? "M., who writes in your issue of Dec. 21, must be amazingly unsuspecting if he thinks the freedman kills partridges for the pleasure of displaying them to his white brother, particularly during the close season. Indeed, his faith in their simplicity is childlike and blind; whereas, the craftiest diplomat that ever wore a white skin is a native in the art of concealment compared with the Virginia negro. Does "M." imagine that the colored brother never interviewed a henroost because he has never seen the trophies of the interview hanging on the outer walls of his log cabin?

I did not mean to assert that the partridge had been exterminated by the freedman, or that he was the sole cause of scarcity, but I do affirm that scores of negroes, from the James River to the Mattaponi River, and east of the Richmond & Fredericksburg Railroad, hunt for squirrels and hares all through the spring and summer, skulking along the edge of woods, swamps, and thickets, and keeping carefully out of sight of white folk; that he pretends to be nothing but a pot-hunter, and that there is no fairer mark for the pot-hunter than Bob White sitting on a rail, be an African or an Anglo-Saxon; and pot-hunting is not confined to the former.

I remember the winter of '80-81, but found no birds frozen, nor missed any from several flocks I watched closely in Hanover county (the birth-place of Patrick Henry and Henry Clay), our did I hear of any that had been found frozen, although I made diligent inquiry, and east of Hanover there was very little danger of their freezing, but the winter of '81-82 was the warmest we have had since '42, nevertheless, they were not so many birds by half last fall as the fall before. I also remember the bitter cold winter of '03-4, yet in the fall of '05 the oldest hunter in Virginia had never seen birds in such immense numbers. And why? Because for four long, weary years we had been after bigger game, or rather that bigger game had been after us, and the birds had been allowed to lay and hatch and rear their broods in peace and quiet, with none to make them afraid, save birds and bears and prey, too, that Bob White's enemies are legion—the hawk, the fox, the mink, the weasel, the skunk, the black snake and the half-starved hound, the greatest egg-sucker and poacher on earth, yet I believe the main cause of the general dearth of partridges in Virginia is the wholesale slaughter of the innocents by the insatiate pot-hunter reinforced by the aesthetic winged-foot. What more deadly weapon than a net-bird-baiter, or a net animal that walks, runs or flies half so destructive as a sportsman, who

STEELE'S BAYOU.

goes out full of vim and ardor, and who can cut down a bird by the glint of his wings in the thickest cover? An every country sportsman is a bird in the crack shots of Richmond, Lynelburg and Charlottesville.

Perhaps I do not exactly understand what "M." means when he says the freedman is not "a social or political factor" in the Northside and Piedmont counties of the State, as he has never been admitted into Virginia society (noted for its exclusiveness), but he casts 2,000 votes in Albemarle county, and is regarded by every candidate for every office as a "fact" in the State, and I am very sure, as a gentleman who ran for Congress last fall in the First District lying in part on the Potomac River up to Aquia Creek, will be enormously surprised to learn that the freedman has cleared out of that part of the politician's vineyard, when he was present in the late election to the number of 7,000 votes at least.

But "M." must forgive me if I fail to see the connection between "a political and social factor," and a shooting and hunting factor. There is a tribe of Indians on the Pamunkey River, in King William county, who make their living by fishing and hunting, and who are death on fin, fur and feather—but they can't vote, nary time.

I have no apology to make to the good-natured, shrewd, shiftless freedman, since I know he will take no umbrage at my saying he pops for a very small amount of money, as a "fact" in his hand. But if I had known my reference to him as one of the "factors" of bird scarcity would have sunk so deep in "M.'s" heart I never should have mentioned him, and it gives me genuine pleasure to bear testimony to the good character, industry and honesty of a very large class of our colored population.

"M." failed to read my communication attentively. I expressly said that part of the country north of James River, from the Blue Ridge Mountains to Chesapeake Bay.

There are a number of negroes in and around Charlottesville who keep dogs for possum and hare hunting, and all this bad, snowy weather they have scoured the fields bare hunting. Is there a white man in the world so green as to believe that they refrain from shooting partridges whenever they come upon them the game law to the contrary notwithstanding? RALPHWOOD.

VIROGINA, JANUARY, 1888.

A ROCKY MOUNTAIN DEER HUNT.

IN Montana the blacktail deer winter in the heavily timbered foothills adjacent to the main range of the Rocky Mountains, staying there until the warm sun and melting snows of April remind them that the time has come to seek the retirement of their mountain home, whence, safe from the pursuit of man, and far from the turmoil of the world, they may raise their young in peace.

The first heavy snowstorm in October drives them from the main range into the first foothills, where they stay until the heavier snows of winter push them further south. It was at this time of the year, after the first heavy snow, that my friend Dan, as fine a young man as it has ever been my pleasure to meet, and myself, decided to bring forth our rifles, which had been laid away all summer, and try our luck with the blacktail.

Early one bright October morning, having loaded our wagon with "grub" and blankets, with Bess and Moll, two little maids as pretty as can be found anywhere, to haul provisions and pack our game, and whistling to Prince, our dog, to follow, we started for our camp in the foothills, where miles away.

We had traveled some six miles, and were passing through a narrow valley when Dan says: "Look, what are those white appearing animals moving along that little reef halfway up the side of the hill?" It must have been a band of antelope. They were watching us, so we drove on till they passed out of sight over the ridge and into a little basin on the side of the hill. Hastily unloading Bess and Moll, and trying to climb to the wagon, we gradually climbed to the top of the reef. Looking between the rocks we saw some nice fat antelope feeding quietly in the basin, but out of range. We decided that Dan was to go around to the right and try to head them off, and I was to stay where I was. I waited some time, and as he did not appear, and the antelope were feeding away from me, I concluded to go around them to the left.

By dragging my rifle and walking I at last got ahead of them, and slipping from behind a tree to get a shot. I heard the report of Dan's gun and saw one of the antelope drop. The rest ran through a pass between Dan and me, and as they ran by we both shot, but still they rushed on. Following them a little way I almost fell over a two-year-old buck lying in the long grass, which had evidently been shot as he was passing us, and running a short distance had fallen dead. Passing the two antelope to the wagon we hurried on to camp.

After a hard pull, a long pull, and a pull all together, at 4 o'clock we reached the head of the little stream on the edge of our hunting ground, where we were to camp. After moving our camp out into the brush for shelter and picketing the horses, I suggested, as there was still an hour of daylight, that Dan, taking the dog, should go up into that heavy timber at the top of the hill, while I took a stroll down the creek, and as I had seen fresh signs of deer in the brush close to camp, I felt quite sure of seeing some whitetail.

The creek was a small one, with only a few bushes along it—just room for a deer to hide. I was walking quietly along the bank, above the creek, a few hundred yards below the camp, when I noticed the bushes moving a little just ahead of me. I heard a louder crashing, and out jumped four whitetail, and I was off in a scurrying, and two fawns. They started an instant to look at me, and quickly taking aim at the dog, I fired. They were too close and my bullet went over her. At the shot they loped off, waving their white flags at me in defiance. Another shot a little lower at the yearling passed through both her shoulders, bringing her quickly to the ground, when she was soon dispatched. The other three ran on till they came to the heavy brush along the Dearborn River, and I was obliged to give them up.

Bringing the cooking into camp, we prepared a supper of antelope steaks, potatoes, flapjacks and coffee when Dan arrived. He had struck fresh sign as soon as he entered the timber, and going very carefully, a deer which had heard a noise in the brush below ran across and stood in front of him, looking at him, not fifty yards off. He could barely see the deer in the brush, but aiming just back of the shoulders he fired. The deer ran and he shot again. Going no more than a dozen yards he found blood. Following the dog's lead in the direction in which the deer ran, he was taken to the dead deer, a two-year-old buck, which had run fifty yards and then fallen dead, shot through the lungs. After supper we made our beds of hemlock boughs,

or, as we call them "mountain feathers," and well satisfied with our day's sport slept as only true hunters can sleep. Breakfast I had in the morning at daylight, and we were off for the runway, one-quarter of a mile from camp. We watched from behind the scrub pines until sunrise, and as the deer thought they would stay at home and not travel that day, we followed up the gulch to visit them. We had passed through several heavy patches of timber, when we saw tracks in the old snow drifts, and then separating, Dan took down into the heavy timber of the ravine, and I kept a broken trail to the top of a crag, and then, when a three-prong buck, which had been lying down resting, sprang to his feet. He stood and looked at me. He was seventy-five yards off, and as yet half asleep. Slowly I raised my rifle, sighted carefully and fired. He sprang away, apparently unhurt. At the shot Dan came up, and I told him "I had just missed the finest shot at a buck I had ever had." There was no sign of blood. Keeping the dog silent, we let him take the trail. He led us into the open, and at a hundred yards from where I shot we stood over the body of the dead deer. He was shot through the lungs, and going at full speed, had stopped short, reared up and fallen backward dead, for he lay facing the direction from which he started. Dragging him to the nearest tree, we hung him up and marked the place.

It was not my only ten o'clock, and we were quite encouraged at the prospect of a good day's sport. Dan was to take the edge of the timber, and I was to take the inside.

Dan heard a rushing, crashing sound on the hillside above him, and saw two large bucks running nudly down toward him. The timber was so thick that he only got a snap-shot at them as they sped past him. They had winded me, and never noticed Dan at all till he fired. A meeting again, as agreed, we now came to an open glade, where the timber had been burnt off, and the ground was covered with low bushes and fallen trees. At first we saw nothing unusual, but on closer inspection Dan thought he saw a pair of horns above the grass in a little clearing. On examining it with the glass, we not only saw through the brush the owner of the horns, but three or four more deer partly hidden by the undergrowth. They were too far for a shot, and we were not allowed to get within range. We crept back over the hill out of sight, and held a council of war, which resulted in Dan making a long detour of the woods and approaching the deer under cover of the bushes till he was within 150 yards of them. A snapping of a stick, and in an instant with a snort the old buck was on his feet, followed by two does and two fawns.

Meanwhile I had gone to the ravine with the dog, and he crept behind them if they took up the mountain. Watching Dan I saw the smoke from his gun and at the report the deer jumped around a little but did not run. Again his Winchester spoke to them and I saw one of the does fall. She was up again now, and although behind the rest was making a good run. Up the hill they came, passing me 200 yards off. I shot, but my gun being sighted for 100 yards my bullet fell short. By the time the doe was within a little, and turning Prince loose I hastened after him. Presently I heard him bark; he had overtaken her and was having a desperate fight. Several times she shook him off, when Dan, closing up, finished her with a shot which broke her back. He had shot her too far back and too low down the first time. Without the dog we would have lost her, although eventually she would have died. We hung her up out of reach of the bullet, and with the edge of the timber and a roundabout way started for camp.

We saw several more deer but could not get a shot until crossing a gulch near camp. At the foot of a ravine I saw a large buck which had just come down from the timber and was on his way to water. He was 200 yards off. I missed my shot, dropped on one knee, fired, and to my surprise, saw him fall. Running up to him, I found his neck was broken by the bullet, and with a few convulsive kicks, he relinquished the struggle. Next day we packed our game to camp; fluding one of the deer which we had hung up was considerably torn by a mountain lion, and as we had all the meat we needed for present wants, and the clouds were threatening snow, we struck camp for home, which we reached in good season, feeling very much the better for our few days' camping in the mountains. Montana will come to my sheep ranch in October or November, I will be most happy to show them the home of the deer and mountain sheep, and if they can't kill one it will be their own fault. If they have lost any bear and want to find him, I can put them on the track where, if they don't find him, perhaps the bear will find them. THE ROCKIES.

THAT REMARKABLE SHOT IN FLORIDA.

IN THE FOREST AND STREAM, of January 18, "Yours for truth"—Knick," writes thus: "I see that your correspondent 'Wells,' says he doubts the statement I made of a deer being killed with No. 9 shot, etc." What part of the "etc." did I doubt? What is the "etc.?" Now I beg to assure "Knick" that I think he will find it rather difficult to discover the "doubts" to which he refers, in the article in question. I surely said I should accept the statement as being true, and I did say that it would have been satisfactory if the writer had condescended to inform us what was the distance of the unfortunate deer from the fortunate sportsman, at the time the remarkable occurrence took place. It was a remarkable shot, and for that reason, "Knick" handed it down to history—or contributed it to history. I admitted that a good charge of gunpowder would kill a deer, at very short range, with No. 9 shot in front of him. But I did say that if it would have been rather a short distance, such a charge would not penetrate the hide of a buck in the "hine season."

I suppose "Knick" inferred my doubts from the fact that I made his statement the foundation of some remarks upon the extravagance of expression. Perhaps he is rather sensitive in regard to it. But I do trust that he will not permit Capt. V. J. S. to make any outburst on the subject, there is no use of swearing about it. Ordinarily the expression of a willingness to swear to some big story suggests a doubt of its truth. But I surrender. Capt. V. J. S. killed a deer in Florida with No. 9 shot, propelled by four drams of gunpowder, "a little over twenty yards measured." How much "over"? What sort of a measure was used? Hunters' measure, or cloth measure? How did he find the exact spot where he stood, and where the deer was, before the oath of a respectable witness before a justice of the peace, all words must vanish; and so "Proul, a proud eds proud," or "do not trust that that effect." But, "I reiterate," it was a very remarkable shot.

I must be allowed to express a grave doubt whether any justice of the peace, who really comprehended the character and duties of his position, would allow his office to be used for the purpose of the solemnities of an oath, the statements made by any sportsman, as to the distance, whether he killed a deer, a duck, or a sand-hill crane. Justices are allowed, or rather empowered to administer oaths, in matters of controversy between parties in regard to legal rights. In mere matters of opinion, when no legal right or duty is involved, they have no such authority. Even if they did, somebody might object, that he did not have notice of the firing of the gun, and never yet saw one so large as that. Gentleman present either in person or by attorney, and subjected the applicant to a cross-examination. But I object to all swearing upon the subject, except, perhaps, as to that part of the comment which states that the shot penetrated the "ribs." That, I must say, requires a little corroboration. That is indeed remarkable.

Now, I trust I have not offended my friend "Knick" to such an extent that he will not have the kindness to forgive me. I always make allowance for a vivid imagination, and confess I take many statements of sportsmen "enuo grano saltu." It was just this measure I used when I saw the assertion of a hunter in the FOREST AND STREAM a few weeks ago, that about Lincolnton, in this State, it was not uncommon to find coveys of quail containing fifty birds. That I did not believe, I do not believe it now. I have seen many coveys both of this kind, and never yet saw one so large as that. Gentleman are often deceived by the appearance of things, and few men have such accuracy of vision as to be able to count the number of birds as they whir away with great velocity. So much for that. WELLS.

[We have the records of half a dozen authentic cases where deer had been killed with No. 10 shot, and in one or two instances over points. Several of these cases have been recorded in FOREST AND STREAM. It is hardly necessary to say that in every instance the deer were shot at very short range.]

INDIANA GAME INTERESTS.

A BILL to prohibit quail shooting for three years has been introduced into the Indiana Legislature. Mr. A. C. Lanier, of Madison, has published a circular in which he says:

"It does not seem possible for the Legislature of Indiana to convene without having a tilt at the game law. No State has a better law than ours, and none more universally observed. There is before the House now a bill (H. B. No. 80) for the purpose of abolishing the law for three years. The object of this bill, is no doubt, to make quail more abundant; but a greater mistake could not be made. It is not the gun that destroys so many birds, but the cold waves that sweep down suddenly from the North that freezes them to death as they sit huddled together in the field. Whenever the temperature falls 18 or 20 degrees below zero, the quails are frozen to death in whole coveys. They rarely seek a sheltered place to roost, but are usually found in the open field, oftentimes in the most exposed positions.

"During the seasons of 1854 and '55, the quail were very abundant than ever known before or since, in this State. The three preceding winters had been mild and the summers dry and favorable to their nesting; but the winter of 1856 almost destroyed the entire crop. When spring came and found the winter's nest, the bird was rarely heard. When the season arrived for shooting it was a rare thing to find a covey.

"From 1856 a gradual increase took place until Jan. 1, 1864. On the morning of that day the mercury fell from 20° to 25° below zero. Thousands and tens of thousands of birds were frozen to death before noon.

"From 1864 to 1881 the increase was slow. It more than once occurred where the winter was mild, but the summer was not so unfavorable for nesting, and so no increase took place.

"The winter of 1881, like those of '50 and '64, was also very destructive to the quail. In many portions of the State one-half or more of the crop perished from cold, and in other portions nine out of ten died from starvation, the ground being covered with snow for a long time.

"The excessive cold of winter and a wet summer both retard the increase of quail. Last summer was a fair illustration of the injurious effect of a wet season. The first nestings of quail and prairie hen were both drowned out by the excessive rains of May, June and July. Many of the quail had a second brood. The prairie hens never have but one.

"Here is a simple and true history of the increase and decrease of quail in our State and the causes therefor, for the past twenty years. It is a simple and true history, and the prohibition could effect any good I cannot see it. It has been tried in Ohio and signally failed. If it were enforced by law, the trap and the hawk would take the place of the gun. 'The Lord giveth the increase.' So let us enjoy it when it comes, and not make laws trying to forbid that over which we have no control.

Mr. F. M. Gilbert, the well-known humorist, and editor of the *Evansville Argus*, has recently been appointed game warden of the First District of Indiana. In a late issue of his paper he announced his intentions in this vigorous manner:

"It is highly probable that in this city a little more attention will be paid to the game law in the future. It has been shamefully neglected here, having been openly violated by parties who have acted with impunity, and been appointed game wardens in this district and we propose to do our duty. It is a thankless position, as all such positions are, and we don't propose to be intimidated. Right is right, and wrongs no man. Parties who have handled game in this city in past years have laughed when cautioned. Netted quail have been openly exposed, and it is safe to say that not one denier out of fifty in this city ever looks to see whether the birds are needed for the table, or by some family. The law has been a dead letter shooting anywhere in the vicinity of Evansville a thing of the past. The man who loves to go out in the fresh air and hunt game legitimately finds none; it has all been sacrificed for the sake of the stomachs of a few epicures. Every time anything is attempted in the way of stopping this wholesale slaughter of quail, a virtuous howl goes up, and the air is full of mud-slinging and name-calling. Little beetle-legged scribbles, who don't know a jack-snipe from a gutter-snipe raise their paws in virtuous indignation, and add their feeble howls to the rest. We are happy to say that things are now entirely changed and there is a general feeling all over the country that this wholesale butchery must be stopped, no matter who suffers. We wish to say right here that to any and everybody who makes any

or 30 there will be a grand journey at that place given by the sportsmen of the Ocean, Capt. Turill Williams and the rest of the Chicago shots are wanted over there to carry off some sweepstakes money. This is about all there is here, Jan. 20.

CHICAGO, Jan. 20.

THE AIR SPACE.

I FIND quite a discussion going on in your paper as regards an air space in guns. During my experience as a rifle maker for the past thirty-five years, I have seen as many as fifty guns spoiled by being fired when the bullet or some other obstruction was near or back of the center, or at the muzzle of the barrel; in most cases in rifles where the ball was wedged at a point from eight to twelve inches from the breech. The column of air in such case is driven into a space of 1/2 to 1/4 inch long, which cuts a groove in the barrel as cylindrical as though it had been done with a tool made for the purpose. The air being at so high pressure causes the barrel to bulge at that point, which loosens the ball so it passes out. A bullet driven into the muzzle from two to six inches will make a strong barrel, but the column of air is so long, and divided over so much space, that it starts the bullet without damage to the rifle, but it would be likely to spoil a shot barrel unless it was uncommon strong. A good shot barrel might stand when fired with a wad in the muzzle, but wet earth or sand would burst them. To fire a rifle or strong shot barrel with a ball only two or three inches from the breech would not be likely to damage them. It depends on the length of the air column whether it spoils the gun or not.

A light, loose-fitting ball might be fired when twelve inches from the breech of a strong steel barrel and not injure it, but if a heavy conical ball of soft lead was used it would spoil the gun, provided the ball fitted airtight, and a suitable charge of powder were used as in target-shooting. I consider it dangerous to fire a gun with the ball or charge of shot from two to three inches from the breech, and had for a shotgun when the obstruction is near the muzzle. I wrote a few lines on this subject in my letter published in FOREST AND STREAM, Jan. 24, 1878. GEO. H. FERRIS.

UTICA, N. Y.

Editor Forest and Stream:

I have seen ducks fired from the muzzle of Springfield military breech-loaders on several occasions, and once in the summer of 1880 (being captain of a team), coming from the target to take my turn to shoot, I loaded and fired hastily. I made a good four with the bullet, and made the sand fly with a half-ounce sinker and a yard of stout line with an oiled rag attached used for a wiper. No bad results to gun. The wiper had been left in the gun for safety, but was lost.

EMU, Pa.

HEAD LETTER.

DUCK TRAPS IN THE JAMES RIVER.

WHEN on the James River last December, about fifteen miles below City Point, we found on the feeding grounds "duck traps" by dozens, each visited every morning by men in boats, and yielding up from twenty-five to a hundred or more victims who are scooped out with a hand net through the opening left in the topnet, which is tied again when the trap is emptied of its contents. The ducks' necks are wrung as they are flung fluttering into the boat. The trap is built on the principle of an ordinary fyke net and baited with corn, which is plentifully strewn in the entrance. The dimensions of the trap being 12ft. x 16ft., each one will hold a large number of fowl; and I was informed on good authority that two of the most successful machines had captured, one, over one thousand, the other, from eight to nine hundred; and this in the space of eleven days only. These traps are set along the river for miles, by fours and fives, on the most frequented feeding grounds, and the destruction they cause is enormous. The effect of this wholesale slaughter is growing more perceptible, year by year, in the scarcity of fowl on their old haunts. Broad-bill widgeon and black duck are the greatest sufferers; the canvas-back and red-head avoid them to a great extent. The proprietors are mostly negroes, although the "white gentleman" is not by any means backward in the business, sometimes having three or four of them in runnup order. The first heavy ice coming down the river takes them with it, but they are easily replaced and at small expense. All condemn them, and yet no one has courage to take steps toward their removal, for fear "some one will get square," you know. Many a fine bird is sold in the Southern markets, and I dare say in New York, if the trap is within a mile of a shot mark upon them—"scared to death," one might say. But in the words of one of our notorious public men, in years gone by: What are you going to do about it? DICK.

New York, Jan. 25, 1883.

PENNSYLVANIA NOTES.

AN extract from a letter from a friend residing in the Lehigh Valley, Pa., will show how much good the planting of quail and attention to them in the winter season has done in his section of the country between Mach Chunk and Catasauqua. "What little time I put in last fall was near home. Woodcock were scarce, but quail were plentiful in certain districts where we put them out last spring. The trouble was that the young birds were all snared at the opening of the season and before they were large enough to shoot. I went West on business and did not return until it began to get cold and hungry, and I never had a fair chance at them until between Christmas and New Year, when the season was nearly over. There are any quantity of birds left over here. A friend, who was out on the last day of the season, reported ten coveys, most of them full with twelve or fifteen birds, within a few miles of town. We shall trap and keep all we can over until next spring. We have had some bad weather for birds lately, one snow after another, not very deep, however, but crust made. Winter is not half over and there is plenty of time for more."

Until within a few years quail have been an unknown bird, so to speak, in the portion of the Lehigh Valley from which my informant writes, owing to the general severity of the winter in that elevated section of the State, and it has only been by the exertions of four or five gentlemen that the birds have been steadily increasing. Your correspondent can always get a good day's sport there, and has it yearly on invitation, although the hill climbing is terrible, and a more level country would be greatly preferred. The efforts of these gentlemen may well be copied by others in every State. In New England especially, I am sure, the same re-

sults could be effected by a systematic care of the quail in the winter.

Hawks this winter, in Maryland, are very numerous, and have been very destructive to the quail. I am also told by residents of Milford, Del., that whole coveys that were left over on the "neck" farms of that section have been reduced, bird by bird, by the same pests, until but few remain.

A trip down the Delaware River on one of our city ice-boats as far as Reedy Island shows no fowl except a few shore-larks. Netters catch them by lambrus when the snow covers the ground and will supply them for trap-shooting at ten cents apiece. Their flight is slow and heavy and such practice from a trap is poor.

The weather is moderating to-day. We look for more snow.

A large snow owl was shot back of Pennsgrove, N. J., last week.

The Delaware River shores about Burlington, N. J., and Bristol, Pa., are black with flocks of crows eking out a scanty livelihood. Netters catch them by lambrus when the snow covers the ground and will supply them for trap-shooting at ten cents apiece. Their flight is slow and heavy and such practice from a trap is poor.

PHILADELPHIA, Jan. 27

"LET WELL ENOUGH ALONE."

I LIKE black flies, punkies, mosquitoes and small-pox, in their time, so already have proposed amendments to the game laws put in their appearance at Albany, to distract the attention of the legislators, perplex the public, and make trouble and expense for all interested in the protection of game and fish. No such changes or amendments are needed. First—because existing laws, as a rule, are sufficiently stringent and intelligible to accomplish the desired purpose; and secondly—and what is of great importance, because the laws are now generally understood, and in some sections of this State, where enforced, are respected, because the public have learned, and with the different seasons open and close, what the penalties and other conditions are. These being the facts, to amend or re-went will surely cause doubt, confusion and indifference, and it is therefore better to let the laws remain as they are. If after a series of years, and a thorough enforcement of present laws, defects shall be found, then, and not till then, should any changes be made. You cannot make a horse draw a load by nging him on and making him stop at the same time.

There is not a poacher or marketman in this section that does not know just how far he can go with impunity, and how far he cannot go without subjecting himself to penalties that he does not care to incur.

Therefore I say, "let well enough alone." What is needed and what the public will insist upon is a greater number of game protectors, much so the State, paid by the State, and made to do their duty by the State, and unless this is done let all game laws be expunged from the statutes, and let every man kill, or catch, or have in possession, when or where he may, and the devil ought to and will have the hindmost. SYRACUSE

SPRING WILDFOWL SHOOTING.

I READ with pleasure the article in your issue of January 15, by "Upland and Bay Shooter," and heartily advocate the principles therein enunciated. It is not only eminently proper, but absolutely necessary, in order to insure the continued existence of migratory bay birds among us, to stop spring shooting. The sagacity of wildfowl is well known to observant sportsmen. They soon get "trained," and the continuous "bazing" of them in the springtime when they have alighted in our waters for quiet and rest for the purpose of mating, and while they are engaged in this sentimental postime preparatory to their hieira homeward to their nesting places, makes a lasting impression upon them, and the consequence is that in the autumn, when the old ones are leading their respective broods southward, they take good care to avoid the places where their previous reception was accompanied by death and destruction.

Moreover, many times their eggs have commenced to germinate when they are killed in the spring, and the death or wounding of one is equivalent to the destruction of the old and the prospective young.

Notwithstanding it is pretty generally admitted that spring shooting is disastrous in its consequences and is rapidly driving all wildfowl from our waters, there are still many self-styled sportsmen who oppose its abolition. Their minds seem so deeply imbued with "the right to hunt" is a world-wide "no trespassing" principle, that they have entirely overlooked the necessity of first having the birds in the lush before they can get them in the hand.

The matter resolves itself into this simple question, viz.: Shall we for a very few years of poor spring shooting in present, absolutely destroy all shooting for the future? Shall the near future be absolutely sacrificed to the present?

In reference to the contribution of money from the different clubs for the purpose of paying the expenses of the game protector, I regard the suggestion as a good one. There should be yearly contributions and a yearly convocation of representatives chosen from each club in the State, the number of representatives from each society to depend upon its numerical force, so that whatever action was necessary to be taken would have the strength of union, and the law has been the case, occasional spasmodic and disintegrated efforts by a few individuals.

The only way to effectually establish a thorough game protective system is for the sportsmen in every part of the State to form game protective societies, then from each such society let representatives be chosen who will form a central organization, whose duty it will be to procure the enactment of proper laws leaving no society to see to their enforcement in its own particular locality.

There has always been a deep-rooted prejudice in the minds of our bucolic brethren against all game laws, and it is not until a recent date that legislatures dared even think of such measures. The injustice, severity and cruelty of the old English poaching laws are well defined traditions with them, and they still see visions of Rumyantzev before them, and all game laws and prosecutions under them are still looked upon as a part of the same old world of wrong and infringement on natural liberty, and it is this prejudice that renders protection of game so difficult. The formation of societies as above suggested would greatly tend to overcome and show the foolishness of such prejudices in these times of highly moral ideas, and when such prejudices are overcome there will be no difficulty in enacting and enforcing all proper game laws. GASTONVILLE

NOTES ON BACK NUMBERS.

Editor Forest and Stream:

Your ever welcome paper reached me this A. M., and its usual it was full of items that were interesting and instructive. First your editorial on the Peopel's Park. Now I don't know that I shall ever have an opportunity of enjoying the beauties of those grand old mountains, springs, etc., or shooting any of the game there, but this is of national interest, and I wish to thank you for exposing this big fraud.

"Nitarod in the North" was read and enjoyed very much by myself and sons. We had learned much of Capt. Hall and Esquimaux Joe and the Arctic work from our own lamented Capt. E. A. Correll, at whose fireside we have passed many pleasant hours listening to descriptions of the northern country. Then "Upland and Bay Shooter" says he is in favor of prohibiting the shooting of water-fowl in the spring (so and I). May I ask how he stands on the woodcock and grouse close season? We, in the interior of the State, are particularly interested in these birds, and would like to have the close season September 1. I have always found, when you have suggested this change, that Kings, Queens and Westchester counties, as a majority say, "We don't care what you have; we want summer shooting." But we have had summer woodcock and summer grouse shooting to such an extent that there are no birds left, and as "Nesmuk" says, "the birds must go."

I read "Fious Jeeems'" article, and being a lover of the red Irish, began to look up some of the facts, and in my limited experience of field sports found that some Irish dogs had been well to the front, and know that the Irish dogs had too many friends here to let this go by without the facts and figures. "Mont Clare" shows us that there are some level-headed Irish dogs, and I am just foolish enough to keep my little Irish bitch and hunt her another year before giving her away and buying a Llewelin.

And now a word about Speaker Chapin's appointment of Committee on Game Laws. They may be all in favor of the protection of game, but I know one that is not, or at least was not last year. "And by their acts ye shall know them." Mr. Sennermerhorn, the representative from this district (not the true sportsman's or game protector representative, he be Democrat or Republican), tried to and did do it all he could last year to help a bill through to allow the sale of the game laws on the Hudson River in Columbia and Greene counties. The swivel-gun men tell us that this year it will pass, as Sehermerhorn is right where he can do more for them than he did last year. This being the case we ask the gentlemen composing the Committee on Game Laws that they will see that four or five men owning swivel guns are not granted the privilege of using these death-dealing machines (at 200 yards) on this river or in any part of this State. We are ready to meet Mr. Sehermerhorn and all the swivel-gun advocates before the committee (if necessary), but know full well that there is not a man that would listen for one minute to any argument in favor of swivel gun. Leaving this in the hands of the gentlemen composing the committee (not Columbia's representative), I am yours,

Hudson, New York, Jan. 19

PLANKERS.

SPESUTIA ISLAND NIGHT HUNTERS.

(From the Baltimore American, Jan. 8.)

SPORTING circles in Baltimore were quite excited yesterday over the news that a raid had been made on the pot-hunters on the Susquehanna River. The interest in the affair is also heightened by the air of mystery which surrounds it. Exactly who instigated it is not generally known, beyond that it was done at the instance of the gentleman who owns ducking shores around the Susquehanna, Gunpowder, Bush and Back rivers, by clubs and individuals who live in the vicinity of Philadelphia and Columbia. It is considerable comment over the raid here, as there are many gentlemen in this city who are fond of duck shooting, and who have had occasion to bemoan the decrease of the canvas-back. For a long time there has existed in and around Havre-de-Grace a gang of pot-hunters, who, armed with huge guns, mounted in skills, go out at night and slaughter ducks by thousands, in a most cruel manner, but owing to the fact that some of these poachers are politically influential men, the law is a nullity so far as Harford county magistrates are concerned.

Last winter there was a law passed by the Legislature making the penalties more stringent. Since this the pot-hunters have become practically a band of outlaws, with a captain, whose name is Susquia Island, and who lives six miles below Havre de Grace, and made it their stronghold. No sportsman not in accord with the gang can shoot ducks in this neighborhood, as the poachers cruise around in their sloops all day, and by raising and lowering their sails purposely scare ducks away. "Taking Spesutia Island as the base of operations, the pot-hunters conduct their business, which is remarkably lucrative. In fact, it is a most profitable and successful enterprise, and undergoes a sometimes terrible. These men kill ducks by means of what are known as "light guns." They are huge fowling-pieces, on the pattern of the ordinary shotgun, but weighing 150 pounds apiece, with a bore like a howitzer, and a capacity for at least a pound and a half of powder. A gun of this kind is mounted in the bows of a small skiff, which can either be navigated in water or put upon runners, and is propelled over the ice. They have taken possession of Spesutia Island, and the recoil sends the boat back through the water, and there is no big shock as there otherwise would be. The gun is usually painted the color of the boat, some dull neutral tint, and is fitted with a patent buoy, by which the owner, if surprised by an officer of the law, can pitch it overboard and return for it again when the alarm is over. The sound of one of the guns can be heard five miles, and the water is so shallow that the boat is deep quickly upon the water. There are instances recorded where eighty-five and one hundred canvas-backs were killed at one discharge. On account of this slaughter the law passed by the last Legislature imposes a fine of \$200 or imprisonment for each and every offense constituted by having in possession, using or disposing of any sink boat, snipe boat, big or swivel gun, or killing a duck in the night, but in any manner, in the Chesapeake Bay or its tributaries, and the law further adds that if it is proved that any part so charged was at or about the place at the time when the duck was killed with a gun in his possession, it shall be deemed prima facie evidence for his conviction.

It was on the strength of this last section that Mr. John E. Semmes, acting as attorney for the parties who intended rooting the pot-hunters out of their lair, laid his plans for a raid. Proving the parties guilty before Harford county magistrates was long known to be worthless. What was

required was to get possession of the guns and confiscate them. The services of a Philadelphia detective were enlisted, and the operations of this shrewd man began the game. First he went to Havre-de-Grace and found out where the great duck killers were. Of course, nobody knew how they killed their ducks, but to these men the detective went, and being an engaging and companionable fellow, he made them all his friends. They took him down to the strong-bow on Speciosa Island and gave him all the ducks they were worth. He had splendid success in all matters, and were willing to show him how to kill ducks from a bar or a blind, but never a chance did he get to go out in a sneak boat with a "big gun." They were very reticent about these, and their hiding places for them were of the cleverest and most unsearchable character. The detective wanted to see the guns fired, so as to have unquestionable evidence. As he was taken out to the wash Barnes, the great duck-killer, and the big-legged one of the poachers. On this occasion Barnes killed 104 ducks. Afterward the detective was taken out with another man, and was shown the modus operandi. With this evidence, and the knowledge of the fact that upon a certain day all the poachers except one would be away from the island, the detective joined Mr. Semmes, and they set out in a small boat from Havre de Grace for the island for the purpose of capturing the ducks. The detective knew where they were hidden. Unfortunately, the river began to freeze, and after about five hours' hard pulling the boat became icebound when near the island. The two men were discovered by the sloops of the duck pirates which were cruising around, and three of them made a descent upon the yawl and its occupants. The law breakers suspected a raid and smelt a rat, and Mr. Semmes and the detective were taken aboard of Wash Barnes's schooner. The detective, relying on his friendship, said he was just bringing his friend, Mr. Henry, a Philadelphia hunker, down to the island for a day's sport. In the cabin of Barnes's boat there were two Henry rifles, three double-barreled shotguns, and several revolvers. Suspicions were allayed, Mr. "Henry" got his day's shooting and went back without the "big guns."

Another raid was planned. This time two Baltimore detectives were brought into requisition and several special officers. The first was a great argument, and before yesterday the party made an attack on the island, armed with warrants for the arrest of Barnes and the other man, whose friendship had induced him to take the detective out to his boat. To the surprise of the raiding party, the poachers were found entrenched on the island armed to the teeth and prepared to make a desperate defense. It was afterward learned that a special officer who had been sent to Behar to be demoted by the sheriff had acted in an officious manner, and the duck-killers had gotten wind of the affair. Here was a fix. There were eleven poachers in all, and about six in the party that had come to arrest them. The poachers swore that they would die rather than be arrested. Mr. Semmes hoisted a flag-of-truce and opened a parley. He told the men that he was going to arrest them anyhow, and that they had better submit. They could not better their misadventure, and they swore that they would die rather than be arrested, whereas, if the officers of the law should kill any one in making the arrest, it would be a praiseworthy act in the eye of the law. The poachers considered this a knock-down argument and surrendered, thinking that at best they would only be taken before a Harford county magistrate. A "cute provision of the law, however, allows the offenders to be prosecuted either in Harford or Baltimore county, and when Mr. Semmes took Barnes and the other men to Baltimore, they begged for mercy. A compromise was then effected and Mr. Semmes promised that they should be taken before a Harford county magistrate, and that he would allow the law to take its course without argument upon the evidence if they would give up their "big guns." The men begged and implored, and even wept over parting with their guns, swearing that they would rather die than give up their "big guns." Mr. Semmes took them, however, and brought them to this city yesterday, when they were broken up and given to Wintemitz, the junk dealer. They were enormous single-barreled affairs, painted a dirty white, and were both loaded. One of these guns is said to have been owned by old Captain Cadwallader, of ducking fame, and cost \$600. The lock was a beautiful piece of mechanism, and the metal was perfect. The barrels were each 8100, and were closed by the Philadelphia detective—who, by-the-way, has made himself very scarce—alleges that there are still eighteen of these guns in possession of the gang, which will doubtless cause its nocturnal depredations upon the ducks.

WHEN THEY COME AND WHY.—Cleveland, Jan. 15, 1888.—*Editor Forest and Stream:* The experience of your correspondent, Mr. Vernon, is not exceptionally mild or open writers. Our experience here, in Cuyahoga county, Ohio, for the last four or five years, is that the bird comes from the North, generally about the last of November and remains never later than the last of January. I have never seen a specimen taken here after this month, and as a rule we have always considered their appearance the precursor of the winter storm. The idea so far has generally been that the birds come from the fall of the year, or early winter of 1870 was a real stampede from the Arctic regions between the Atlantic and Pacific oceans, and that an extremely cold winter followed. Now was this great migration of owls southward due to a short crop of ptarmigan, or something else yet to be explained? In fact, do you believe an Arctic owl can catch a full-fledged ptarmigan? I should think not. He might, at times, gobble up the crows and the raven, but not the ptarmigan, especially in the winter months, when he would kill, most of all, ptarmigan dinners. As a fisherman this owl is quite expert, but does not catch his fish after the manner of the bold and honest fish-hawk. Considering the country this bird inhabits, his food must necessarily be of a "go-as-you-please" nature, of which we know but little. The same is true of his general history. Hall, the Arctic explorer, was the only one so far as I know, that ever met with its nest and eggs. "What has become of the ptarmigan?" Perhaps many years of persecution to the race has taught them to avoid the Dominion?—DIE. E. STERLING.

QUAIL IN CONSPIRACY.—Westfield, N. J., Jan. 25.—The quail are doing nicely (the two I was able to save this morning) and I have just had them all shot and have bought a dozen wild ones, part of which I will turn out in the spring, and part will keep for quail breeding in confinement on a larger scale next year.—JOHN J. WILLIAMS.

THE YELLOWSTONE PARK.

Editor Forest and Stream:
Inclosed I send you a copy of a petition I laid before the Kent County Sportsmen's Club, of Grand Rapids, Mich., on the 2d of this month, which was indorsed by the club and ordered signed by the officers in their official capacity and presented to Congress. I am not sure whether this is the first movement of a club on this subject or not. It is certainly the first I have heard of. I do not mention this boastfully, but by way of urging that game and fish protective clubs and associations are not more active in their efforts to save the National Yellowstone Park from the spoliation that threatens it, especially as a game preserve. At the annual session of the Michigan (State) Sportsmen's Association, on the 9th inst., I laid a copy of the same petition before that body, which was unanimously indorsed and ordered signed and forwarded as above. I hope every association, society, and club will go and do likewise.

E. S. HOLMES.

GRAND RAPIDS, MICH., JAN. 20, 1888.

THE PETITION.

To the honorable the Senate and House of Representatives of the United States of America in Congress assembled.

We, the undersigned, members of the Kent County Sportsmen's Club, of Grand Rapids, Kent County, Michigan, do respectfully ask your honorable bodies to enact such laws as may be necessary to secure the enlargement of the National Yellowstone Park by the addition of about forty miles of the national domain on the east and about ten miles on the south of said Park. In addition, as recommended by Lieut.-Gen. P. H. Sheridan in his report of his recent summer trip to said Park.

We also ask that the control of the said Park be transferred from the War Department and that the troops of the United States Army stationed in contiguous forks be instructed to protect all wild animals, especially game animals, of the air, on the land and in the waters of said Park, and to prevent all vandalism within the boundaries of the same.

We do so to protect against the leasing of said Park or any part thereof to private parties.

And your petitioners, as in duty bound, will ever pray.

Some of the reasons for passing Senator Vest's bill may be found in the report of Mr. P. H. Conger, the superintendent of the Yellowstone National Park. Speaking of the vandalism of visitors and their utterly wanton destruction of the natural curiosities there, he says:

"I have hardly the patience to discuss this subject without passion. The most of the depredations committed seem to me so entirely purposeless that I am unable to conceive the cause that impels men and women to wantonly destroy, purely for destruction's sake. What are we to think of a man that will pack long poles, as heavy as he can carry, a great distance for the purpose of thrusting them into the cone and down the throat of these great geysers, when the only possible effect must be to obstruct their flow and mar their beauty? This is done repeatedly, although I have neglected no opportunity to warn, admonish, and entreat all tourists who come to the Park, and to enter on any account to do so, and have also by published order forbidden the collection of any specimens and cautioned all persons having occasion to build a fire in the Park to be certain to extinguish the same before leaving camp. But notwithstanding all this tourists go into the Park with iron bars and picks secreted in their wagons, with the express intent to disregard the law and defy the Superintendent. The famous hot springs, which are already badly defaced and vast tracts of the beautiful forest, which are the wonderland are laid waste by fire annually, through the wanton carelessness and neglect of visitors. Another source of great annoyance is the hunters in the Park. I am sure you will agree with me that it is not possible for a single game-keeper to guard so vast a territory as the National Park and prevent the breach of the laws in regard to the killing of game. It comes to me that the violation and the extension of these laws which these vast solitudes afford, do not wonder that the laws are broken and the orders disobeyed. But I leave it for the superior wisdom of the Honorable Secretary of the Interior to suggest some remedy for these evils."

Billion Forest and Stream.

Allow me to congratulate you upon the fight you are making against the land grab in the National Park. I think that all the moral support possible should be given our representatives in Congress, and all others, who are trying to preserve this Park to its intended and legitimate uses. The famous hot springs are not yet fully explored, yet the honest Senator Vest weakened in an investigation, for we should not believe any subsidy will be able to cause him to swerve from a plain line of duty. Please give us all the facts as they are brought to light in this investigation. OCCIDENT.

SEDAVIA, MO., JAN. 20, 1888.

(St. Paul Pioneer-Press, Jan. 22.)

The letter of Gen. James S. Brislin to Congressman Bedford, of Colorado, under date of Sept. 26, 1887, betrays his unselfish devotion to the cause of the National Park. He says: "I have visited the Park and desire to view the picturesque shores of the lake from a private steamer or a white-winged yacht. He expected to make a million by extending to these shores a hotel and a winter resort. The General is a self-sacrificing patriot, and doesn't believe in allowing a bloated monopoly like the Hatch syndicate to serve the dear public."

(Pl. Wayne (Ind.) Fish and Feather, Jan. 1888.)

If a plain-spoken and well-known article ever appeared in public print it was the one in the FOREST AND STREAM of Dec. 25, in relation to the "Leasing of the National Park." Fair warning of gigantic frauds extended to the whole State and swindled its people, and always a gang of unscrupulous and unprincipled schemers on hand to defraud the Government or its people, when the last show is given and the rascals retreat to their holes. It is not a case of a few throttled or checked in Government matters than another party fornicators, big game, and brings forth first a hundred fold for the original. The famous hot springs are not yet fully explored, yet the honest people are started by a new enterprise ("the Leasing of the National Park") to private parties, for private interests and private aggrandizement. The famous hot springs are not yet fully explored, yet the honest people are started by a new enterprise ("the Leasing of the National Park") to private parties, for private interests and private aggrandizement. The famous hot springs are not yet fully explored, yet the honest people are started by a new enterprise ("the Leasing of the National Park") to private parties, for private interests and private aggrandizement.

(Boston Star, Jan. 22.)

Gen. Brislin has no objection to the Hatch party "lease" of the Yellowstone Park for all it is worth. He demands only a water privilege, worth a million or so within the next ten years.

(Pittsburgh Evening Chronicle, Jan. 22.)

The Yellowstone Game and Fish Commission and Uncle Rufus may realize handsomely out of it with his virtuous and unsullied partners, but in the meantime the people understand the situation perfectly, and the Government should be glad to give the game and fish to Uncle Rufus and his partners have "hogged the whole Park" with all rights, privileges, immunities, ordinary and extraordinary." And Gen. Brislin is the only one who has the nerve to say that the game and fish belong to the people of the United States.

Nobody objects to the erection of hotels in the Park. Speculators may build as many as they want to. What is objected to is the fraudulent right to lease the game and fish to private parties. The Government gives something for nothing. Neither Mr. Hatch nor Mr. Conkling nor anybody else who has anything to sell or lend ever objects to this way. But they will make their point. All the signs indicate it.

(Boston Sunday Herald, Jan. 22.)
The struggle for the control of the Yellowstone Park privileges has brought out some very interesting facts. General Brislin, who is stationed in that vicinity, has been granted the privilege of running one steamer on Yellowstone Lake, and his public letters to Congressmen have been published. He estimates that the privilege will be worth \$3,000,000 for ten years. The scheme of the Rufus Hatch combination to "lease the whole Park" is very objectionable to this modest monopolist, but he promises not to object if his navigation privilege be not interfered with. The action of the Assistant Secretary of the Interior in executing the absence of Secretary Teller, leases for seven tracts of land of 640 acres each, and including the geysers and other natural curiosities, is a very suspicious look. If there is not jobbery afoot in connection with this Park, the car marks are misleading. The Senate has not moved any too soon to protect the Yellowstone country from its "protectors."

(Kaiserbreiter, Jan. 24.)

The Yellowstone Park fund, which our able and reliable contemporary, FOREST AND STREAM, was the first to denounce, will bear a good deal of investigation. The last contribution to the pub. doc. is a lot of letters on the subject in answer to Senator Vest's call for correspondence. This has opened a pigeon-hole full of epistolary trifles, by which we learn that General Brislin got the privilege of a steamer on the lake for the convenience of the "tourists"—"convenience of tourists" is good. General Brislin, with a quick eye to the advantages of the position, writes to the secretary for authority in writing to run his little boat, as those who know Hobart, Douglas, Hatch & Co., are going to gobble the whole Park. Our Assistant Under-Secretary Joslin it was who, in Secretary Vest's absence, made the lease and sold away rights and privileges valuing millions. Nothing for nothing is good political economy. What was Mr. Joslin's share in the spoils?

(N. Y. Morning News, Jan. 23.)

The United States Government, now having a National Park on its hands, is chiefly engaged in proving to the world how incapable it is of carrying out the policy of the Park. The Government is so miserably out that, after having set it apart and barred out the worthy settlers, it must now be given up to speculators. This appears to be another case of the Government's inability to carry out its policy for the general benefit. A National Park was a new idea and a noble one. The hotel scheme is a very old one, and doesn't appear to be noble at all.

A GROWL ABOUT GUNNERS.

NOTICE an article in your last on the "Indestructibility of Game Birds," from one of your correspondents. He admits that the wildfowl and snipe are frightened away by night shooting, and have got the gauge of modern choke borer down so fine that they can keep out of range. That is just what all us "growlers" complain of. Nothing has done so much to drive away our wildfowl and snipe as the introduction of modern breech-loaders at a low price—a good one costs you no more than a muzzle-loader a few years ago. It is not that they are so easily killed, but those that are scared away, that do the mischief.

The coast is lined with "snickers" and "snipers" the whole season, everyone of whom own a gun, and so they must shoot at everything with feathers on, sea gulls, swallows, and the like. "What earthly difference does it make if the ducks and snipe are "indestructible," so long as they keep themselves where you cannot get at them. Your correspondents mention spots on the coast of what is reserved, where he has as good shooting as ever, but I notice that he takes good care not to advertise its exact locality. If he did, about one season would show him what is meant by scarcity of game birds. GROWLER.

New York.

OREGON GAME.—Cove, Oregon, Jan. 5.—For the past two weeks we have had a cold snap, with snowstorms, ice and sleet following each other. Shooting has been pretty fair among the prairie chickens, ducks, jack-rabbits and large game. Geese have left for a warmer climate. The sharp-tail grouse, called here "chickens," during a snow storm frequently settle in the trees on the streets, and are shot from the houses. Notwithstanding the depth of snow, they are in good order, and are very abundant. One day a warm creek still open, and found plenty of game. Ducks, to protect themselves from the wind, were under the banks and bushes, and as we turned sharp crooks in the stream, they would rise almost under our feet, only to fall with a bound right and left. Now and then "chickens" arose with a whirl from the snowbanks and thickets. When again settling the snow would cover us, and we were to be almost stopped on before taking wing. They afford the finest of shooting when the weather is cold and snow covers the ground; but when the snow disappears the birds are wild and difficult of approach. My companion, noting fresh tracks of a jack-rabbit, followed them only a short distance when it jumped up near by and was brought to bag. They are almost invisible now, being white. We made two particularly fine shots, bringing down a pair of mallards at twenty-five yards in the water. After a half day's sport we returned with one rabbit, six ducks and twelve chickens.—J. G. S.

NEW JERSEY QUAIL STOCKING.—Plainfield, N. J., Jan. 29.—The first installment of three hundred live quail for stocking purposes, ordered by the New Jersey Game and Fish Protective Society, arrived at the headquarters of the Society in this city last week, and are doing finely. The birds came from the Indian Territory, through Reich Bros., New York, and are in good condition. They have been placed in excellent quarters and are receiving every attention necessary to their welfare, until the proper time arrives to turn them loose in the various counties of the State destined as their future homes and breeding places. The society is in a flourishing condition, and rapidly increasing in membership. It is now desiring to become members should address the Secretary, W. S. Foster, Plainfield, N. J. There is a prospect of more quail being left over this winter than in many previous years. The writer knows of several broods which were saved over from last fall's shooting in this immediate neighborhood, by the exertions of members of the society, who would not shoot them themselves, nor allow others to do so as far as lay in their power, excepting their favorite sport because they desire the birds to increase in numbers and thus afford better shooting in the future. Grouse are scarce in this section. No important changes in the game laws are likely to be made by the present Legislature.—FOX.

MIGRATORY QUAIL.—New York City, Jan. 27, 1888.—Will you be kind enough to publish in your esteemed paper, the following description of a migratory quail, which I have been fortunate to obtain all information, etc., by applying to the undersigned, 46 Beaver street. Over 13,000 quail have been imported through me from Messina to this country.—CARL F. BRACON.

In that kind of weather one should go about sunset. I recollect one little occurrence that happened years ago, when I was a boy, that I must relate. It was on one of those warm, muggy days known as dog-days, in the month of August. Taking my rod some afternoon, I went down to Sebago Pond, where I had one fine luck the first of the season, fishing around fallen bushes. Arriving there early in the afternoon, when the sun was shining quite hot, I sat down under the cool shade of a cedar, comfortable as I then adjusted my tackle. I put on a worm and caught a few chubs for bait. Cutting off several as tempting-looking baits as I could, I put one on my hook and walked along to the bushes and began to fish. I had never failed to have good luck, and consequently I expected a bite every time I threw my bait, but nothing seemed to care for it. I fished over an hour without a bite, when happening to look down under the leaves in the water, I saw a large pickeredling lying there, and quickly noting he had been around. Winding in some line, I lowered my bait down in front of him, but he refused to take any notice of it. I got tired of trying to get him to take the bait, and putting up my rod, started for home, with the determination of giving that fish a waking up next day if I could find him. I got home and fastened three large hooks together, so as to make a first-class grapple. The next afternoon I went back prepared for another looking for the pickeredling. I saw the old fellow in another place, not far from where he was the day before. Putting on a bait, I tried to tempt him out, but he refused to stir at all. Taking off my bait and hook, I adjusted the grapple. Lowering it carefully down under his tail, I gave a good yank and succeeded in looking him just behind the back fin. He was thoroughly wide awake about that time, and never in my life did I enjoy myself for half an hour as I did then; and never did I see a pickered handle himself as he did. But it was of no use, I had him securely hooked and after a while I reeled him in, and he weighed six and three-quarter pounds. I shall always remember that—PICKEREL.

TROUTS OF LAKE HUDON.—I noticed no less than three distinct species of lake trout brought in at Alpena last fall, besides many variations in color, etc., according to the runs and localities from which they were captured. The Mackinac species predominate in numbers; these, I suppose, are the most common, and in abundance. I saw the "Buckskins," as the fishermen call them; this variety has tougher, more leathery skin (hence, I suppose, the name buckskin), and is lighter in color and weight. Then come the racers, which are comparatively scarce; luckily, too, as they must be terribly destructive, having a mouth and head of immense proportions—altogether disproportioned to the size of the body, taking the other species as a standard of comparison. They are especially anathematized by the fishermen. —S. BOWEN.

ICE FISHING, Erie, Pa., Jan. 24.—The fishermen are having fine sport fishing through the ice on the bay, at Erie, Pa.; the catch is mostly yellow perch, though some of the lucky ones sometimes hook a black bass and frequently a good sized pickerel. Herrings were not put in an appearance yet; when they had hundreds of men and boys may be seen on an acre of ice near the channel. —HEADLIGHT.

Fishculture.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

SALMON AND SHAD IN THE MERRIMACK.
The Lowell, Mass., *Chadrier* says: "Representative Varnum has introduced a bill in the Legislature which removes restrictions upon fishing in the Merrimack with net or seines certain months in the year, the proposed enactment being intended particularly to benefit the catch of shad. The nets in the Merrimack to a point above this city. The fish named are used for bait in pickeral and other fishing."

Warren Ordway writes to the Haverhill, Mass., *Bulletin*: "The fishing boats here lately have been making a fine haul. Lawrence, have waited for twenty or thirty years upon the experiments of the Fish Commissioners to restock the river with salmon and shad. They have waited in vain, for nothing of any consequence has been accomplished. The fish do not come into the river now as of olden times, and there is no good reason why the stop-laws that relate to the fishing in Merrimack River should not be repealed. The spawning grounds on the river and its tributaries are all shut off, and the fish have given up their homes to catfish and dry staff. Let every town on the river petition for the repeal of these useless stop-laws, and let the people, if by chance they can catch a stray shad or salmon, have the privilege of eating it honestly and by daylight."

The Lawrence, Mass., *American* says: "Mr. Edwin F. Hunt, of Newburyport, who was directed to make observations in the river by the Fish Commissioners, states in his report that soon after the Pacific fire when a large amount of dye-stuffs and other chemicals were dumped into the river, he found that a large number of dead salmon were to be found on the shores of the river. He made a careful inspection of both banks, and found one dead salmon below Merrimack bridge, and another below the dam at Haverhill. He is convinced that this is the extent of the injury done to the fish, although reports multiplied them into hundreds."

FISHWAYS FOR MARYLAND.

The following is an extract from the fish law of the State of Maryland, section 15, "C" of chapter 430, acts of 1882:
The commissioner of the western shore of the State shall secure and maintain over the several canals and the Potomac River, during the next ensuing year after the passage of this act, suitable fish-ways or ladders, whereby the fish may be able to ascend over the said dams, and the sum of twenty-four hundred dollars, or so much thereof as may be necessary, is hereby appropriated for that purpose.

Section 15, "D." The owner, or owners of all dams (except the canal-dams) now erected, or hereafter to be erected, in or across the Potomac River, or streams running into the said river, upon which fish-ways or ladders, shall make and keep in repair, properly constructed fish-ladders or fish-ways, to be placed on said dams so as to afford to the fish in the said river or streams, free course up and down said river or streams, and the sum of twenty-four hundred dollars, or so much thereof as may be necessary, is hereby appropriated for that purpose.

a nuisance, and liable to be abated as other nuisances under the laws of the State.

Section 15, "E." The county commissioners of the county along which a dam or dams erected now or hereafter to be erected, in or across the Potomac River, or streams running into said river, which satisfied that said dam or dams are so constructed as to cut off the fish from free course up and down said river or stream, shall give notice to said owner or owners to construct and keep in repair proper fish-ways or ladders as herebefore provided.

Section 15, "H." This act shall apply to the Potomac River and its tributaries only, above what is commonly known as "Little Falls of the Potomac."

Approved May 3, 1882.
[In this connection we learn that Mr. Delawder, the Commissioner of Fisheries for the western shore of Maryland, has approved of the McDonald Fish way and the McDonald Fish-way Company are now engaged in building several of them on the canal-dams on the Potomac river. The company has bought the exclusive control of the patents on this fish-way and is preparing to erect dams in all parts of the country. To meet the wants of mill owners on small streams they have designed a form which may easily be built of lumber by any carpenter, and at a very small expense.]

LAND-LOCKED SALMON FOR NEW HAMPSHIRE.—Plymouth, N. H., Jan. 25.—Sixty thousand Schoodic salmon eggs were received at the State hatchery to-day from Grand Lake Stream, Maine.—H.

February 20, 21, 22 and 23, 1883.—Grand International Bench Show, Washington, D. C. Entries close Feb. 12. Chas. Lincoln, Superintendent, Office, Skating rink, Washington, D. C.

March 20, 21 and 22, 1883.—The International Kennel Club Bench Show, at Ottawa, Canada. Charles Lincoln, Superintendent.

April 3, 4 and 5, 1883.—Western Pennsylvania Poultry Society's 10th Annual Bench Show, at Johnstown, Pa. Entries close Feb. 15, 1883. Chas. Lincoln Superintendent. C. B. Elbin, Secretary.

May 8, 9, 10 and 11, 1883.—Westminster Kennel Club, Seventh Annual Bench Show, Madison Square Garden, New York City. Chas. Lincoln, Sup't.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

Owing to the illness of the Kennel Editor, many communications are deferred.

WASHINGTON BENCH SHOW.

EVERYTHING looks very well here for a successful show. The applications for entry blanks have been more numerous than expected. One thing is very gratifying to say, they come from all parts of the country, and what is more important to most of their owners are coming with them, so that they may take in the sights of the gay capital, and also celebrate Washington's Birthday.

The Erie Railroad will carry one or two dogs free, but in all other respects will charge as usual. John N. Abbott, General Passenger Agent, 21 Cortlandt street, New York, The Pennsylvania Railroad Company will carry dogs in their special cars, fitted up expressly for the transportation of dogs, for a very small charge.

The express companies will return dogs free of charge to the original shippers, providing they have paid their usual rates to the show.

Tiffany & Co. give \$100 cap for the best trio of sporting dogs. The Hon. John S. Wise, of Richmond, Va., will judge English and Gordon setters; also pointers.

Mr. C. H. Mason, late of Bradford, Yorkshire, England, will judge Irish setters, spaniels, fox-terriers and miscellaneous. The Hon. John S. Wise, of Richmond, Va., will judge St. Bernards, Newfoundland, collies and all small non-sporting dogs. The entries close 12th of February, and it is earnestly requested that entries be made as early as possible, as the space is limited.

CHAS. LINCOLN, Superintendent.

NEW ORLEANS GUN CLUB.

The cold wave that struck here last week had the effect of waking up the members of the New Orleans Gun Club, and our leading gun stores were under the necessity of employing an extra force of men to fill orders for loaded ammunition. It had one good effect, at all events, for the subject of dog and gun became the leading topic of conversation whenever two or more sportsmen would meet, and finally brought about a meeting of the New Orleans Gun Club.

This was the first time a question of the organization could be obtained since their late field trials at Opelousas, and as a great deal of business, old and new, was before the club, the meeting was necessarily a prolonged one.

The principal business before the club was as to a question of another field trial, its location and prospects of success. It was clearly demonstrated at Opelousas that the season was too early in that locality to display superior field work on the part of the dogs, as the weather was excessively warm and the cover heavy and unproductive. The decision of this matter finally resulted in the club's decision that they give a field trial, this fall, immediately following the one to be given by the National American Kennel Club, and at a point convenient of access from Grand Junction.

The question as to what should comprise the various stakes drew forth an almost unanimous opinion that the Derby be left out and in its place one should be substituted to be given in the championship trials. The stakes will be open only to those dogs who shall have won a prize in some previous All-aged Stake, and it will be open to winners throughout the world, the winner in this stake to be known as the "champion of the world." It will be the sole event of the day or days of the trial, and the prize to be such a battle of the giants, so to speak. There will be a valuable prize, of course, but the honor of owning the champion of the world will run for something. The other stakes in these trials will be the "Members' Stake" and "All-ages." The two latter will be run previous to the first mentioned. Can you not induce some of the readers of FOREST AND STREAM to give their opinion of this Champion Stake for our benefit before the meeting becomes a fixed fact? The report of the treasurer showed a considerable balance in hand from the last field trial fund, and the amount was ordered placed to the credit of a future field trial fund.

The secretary read a letter from Mr. Washington A. Costar, secretary of the Eastern Field Trial Club, enclosing a copy of the resolutions adopted by that club in the case of Mr. Wm. Tell Mitchell for breach of field decorum at High Point, N. C., and requesting this club to act in concert with them in carrying out the same. It was decided that the club and owners shall be debared by them in the future. The reading of this letter brought forth a resolution that was unanimously carried, &c., &c. "That this club shall recognize

the acts of any similar organization in barring from participation in field trials any owner or handler who shall be guilty of field decorum becoming gentlemen, or who commit a breach of field decorum."

Mr. H. M. Short, the handler of Sue, Peep-o'-Day, Pink B., and other dogs at Opelousas, who was barred by the executive committee from participation further in the trials, and any future trials given under the auspices of the New Orleans Gun Club, was also present, and the action of the committee was unanimously sustained. It is shown that Mr. Short was guilty of gross impropriety, both as to language, threats and actions. The committee had acted promptly in his case, but out of consideration for the owners of the dogs he was handling, and from the fact that none of said owners were present, their action was far more lenient than the gravity of the case required. They addressed to Mr. Short the following letter:

OPELOUSAS, LA., Dec. 14, 1882.

Dear Sir:—The remarks attributed to you, and circumstances attending your withdrawal from the field this afternoon, are of such a peculiarly disagreeable character to this committee that we are in doubt as to your intentions with regard to a continuance in this trial on your part as handler of the balance of your entries, we naturally but insist that such continuance be attended with full apology to the judges and this committee for a breach of field decorum and a violation of the rules such as we cannot permit to pass in our own state, or in any other state, and we desire to establish yourself in the good will of the judges and this club purely from considerations of the highest regard entertained for the Messrs. Erpses and other gentlemen you represent.

E. L. RANLET,
Jno. K. RENAUD, Ex. Committee.

The committee gave him until the following morning in which to tender an apology before final action was taken, to which letter he refused to reply, and he was not allowed to run any dog afterward. The committee regretted the necessity of having to pass so severe a sentence on a man who, we naturally believed, was one of the best and most successful trainers of dogs in the South. He is uniformly kind to his dogs and is very well thought of by those who entrust their dogs to him. The writer speaks from personal acquaintance and furthermore, several communications addressed to members of the committee had been received, asking them to be as lenient as possible in his case and try to have him reinstated.

The meeting of the club was in every respect a harmonious one, and the committee was it is appointed at once and begin their labors. The entrance fee in the stakes this year will be the same as last, namely, \$5 to each stake, while the cash prizes will be much larger. You may rest assured that the trials of the New Orleans Gun Club will be a greater success even than the last was. —FOX HORN.

NEW ORLEANS, Jan. 25, 1883.

THE ENGLISH GUN CLUB TROUBLE.

ONE of the peculiarities in the constitution and temperament of our English cousins is their bluster whenever any aspersion or even anything with the slightest tinge of insinuation is made against their country, the people, or their institutions. We say bluster, because they are never behind the thin veil of "Briton's never, never will be slaves," we find there a slavish adherence to antiquated notions, and anything that has its claim the fact of there being a population that says of China, for its observation. We are reminded of the old saying, "The Emperor sitting on the shoulders of the next in authority in the country, complacently fanning himself; he is in turn perched on a secondary grade of mandarin, who is in turn perched on the shoulders of a third grade, and so on, until he reaches the ground beneath the supercilious weight. The picture is just as applicable to England as to China and it is surprising to note how, with what appears to be a keen eye through the microscope of the social scale support the usurpation of a few people whose social superiority is the fact that they were left a title or moiety by ancestors who had brains or brawn enough to win what they left to posterity. If necessary we could name several instances in which a few persons have usurped control of a particular branch of sport and held the power in their hands until the smoldering flames of discontent finally kindled and went in what is generally known as writing to the *Times*. We are reminded of the case of the London Field, and the poor Ah Sin flattered out on the ground beneath the supercilious weight. The picture is just as applicable to England as to China and it is surprising to note how, with what appears to be a keen eye through the microscope of the social scale support the usurpation of a few people whose social superiority is the fact that they were left a title or moiety by ancestors who had brains or brawn enough to win what they left to posterity. If necessary we could name several instances in which a few persons have usurped control of a particular branch of sport and held the power in their hands until the smoldering flames of discontent finally kindled and went in what is generally known as writing to the *Times*. We are reminded of the case of the London Field, and the poor Ah Sin flattered out on the ground beneath the supercilious weight. The picture is just as applicable to England as to China and it is surprising to note how, with what appears to be a keen eye through the microscope of the social scale support the usurpation of a few people whose social superiority is the fact that they were left a title or moiety by ancestors who had brains or brawn enough to win what they left to posterity. shows which have refused to submit to their dictation. * * * From the first we have stated that we would have nothing to do with a rivalry in the exhibition at large, and called attention to that of the K. C.; but that, if a national representative club were started, we would support it with our whole powers, and also the Stand Book, as you desired. To ascertain the opinions on this point, of exhibitors at large, we called a meeting at Birmingham, which was attended by gentlemen of influence in the show world, in numbers more than doubling that which carried the celebrated, or rather notorious, Boycotting resolution of the K. C. Prior to this meeting, we had consulted with the principal committee, and other gentlemen interested in the matter in hand; and, as a result of their consultation, we drew up the resolutions which were there unanimously carried, but the nomination of Mr. Shaw was not retained.

"In other matters relating to dog shows we have also had occasion to find fault with the K. C., and notably on account of what we considered their unfair support of the moneyed interest when in antagonism with without any comparative bias for or against them; but we challenge our opponents to the proof of any other bias against them. The club is confined to a rich class, who alone can pay the high subscription necessary to insure membership, and, even in the moneyed interest, the exhibitor of a single dog at Birmingham, Manchester, or Darlington would notoriously stand a bad chance of election. Hence we consider that this club has no indisputable right to legislate for all parties concerned in dog shows, and that, so far as the owners of the Birmingham and Darlington shows are concerned, we have little chance when he comes into conflict with a noble lord or an M. P. in the Pall Mall sanctum. For many years we considered that the tall-trimmed aristocratic owner of the setter or retriever, who in the moneyed interest is the fakers' artisan, but in vain. At length our efforts were crowned with success, and we should have rested content with the disqualifying rules of the K. C. recently published by them; but then came the Birmingham and Darlington shows, and we could not hold our hands no longer. Still, we maintain that the K. C. have peace within their grasp; but if they refuse the offer now made them, at all events their hands are clean, and what of their fate may be, they have only themselves to thank for it."

"Having thus fully shown what our opinions have always been and still are on the points in dispute between the K. C. and their Boycotting rivals, we would earnestly and dispassionately request that the Executive of the former club should consider the position they have taken up, and to compare it carefully with that which is offered them. On the one hand, they have created an opposition of the most deadly character to their assumed authority, for the simple reason that they have created a rival club, and have thus invited the fight to the bitter end; while, on the other, by acceding to the terms now amicably offered to them, they may assist in organizing a governing body whose laws all parties will cordially agree to. It is as alleged on their side, the Kennel Club and its adherents constitute a majority of the general body of exhibitors, they will be enabled to carry out their views, while, at the same time, the existing unfortunate discussions will be brought to a close, and they will occupy a position as a social club, but with a large addition to it. Again, if it is proved that they are in the minority, it is equally clear that they have no right to claim the authoritative power which they have assumed, and as gentlemen they will naturally adhere to private life."

"While this article was in type and prior to its publication the Kennel Club issued notice of a general meeting of the club to be held at the Crystal Palace on the 15th of the present day of their show, and the same date as the National Club had named for their meeting of organization. This circular totally ignored in the most ingenious manner the rival body and commencing with the Executive of the former club, and proceeded to invite discussion, and considered during the last three years bringing the club into more direct connection with exhibitors and breeders," etc., proceeded to unfold its scheme which was to allow members on payment of a fee to enter the year to have a copy of the Kennel Club's monthly Gazette, to enter two dogs in the stud book and register, five dogs in the Gazette, free of charge and to have two admission tickets to the annual shows and held trials. In addition to this good game's worth of privileges, the Executive of the former club has the privilege of attending a grand annual council and suggesting alterations or amendments of the rules. The right of voting on these suggestions is, however, to be strictly confined to the five-guinea members, and, as these regulations will practically give no vote whatever to the government of the club, though it cannot be gainsayed that they get plenty for their money. The Kennel Club, however, had to bring into "buck" against the new and vigorous opposition, and it is much to be regretted that the Executive should be overcome and harmony brought about, and we trust such was the issue of the meetings held on Jan. 17. Reports of these meetings we expected to have for publication this week, but the rough weather on the Atlantic has delayed the mails.

SPANIEL CLASSIFICATION.

Editor Forest and Stream:

The letter of "Greenhorn" in your last issue, about the classification of cocker spaniels at our bench shows wants a little consideration. I have no objection to the classification of plume, that he has never either assisted in the management of as show or exhibited at one. I may be allowed, therefore, to explain that bench show managers have to be guided in their classification by two things: First, the rules of the bench, as assigned; second, what classes will be filled by paying entries? I take the classification of the Westminster Kennel Club for 1880, 1881, and 1882:

In 1880 there were three classes for cocker spaniels, no weights mentioned, for dogs, bitchs and pups. There were thirty-seven entries and \$50 and three medals given. In 1881 there were four classes given for the same dogs, namely, field spaniels over 25 lbs., dog or bitch, cocker spaniel under 25 lbs. for dog (1) bitch, and puppy class with an entry of forty-three and prizes amounting to \$45 and three medals. In 1882 there were five classes: Spaniels other than black over 25 lbs.; dog or bitch; cocker spaniels other than black under 25 lbs.; dog or bitch; spaniel black or blue over 25 lbs.; dog or bitch; cocker spaniels under 25 lbs.; dog or bitch; puppy class with an entry of fifty-five and prizes amounting to \$55 and one medal.

"These were all good paying classes for the Club, as the entry money received was more than covered the prize money, especially in 1882, when they received \$110 and paid out only \$65 and a medal.

"Greenhorn" wishes a class made for lemon and white and black, white and tan, and if any other colors would give the class a good pay, as in the show of 1881 there was but one lemon and white, no black, white and tan; in 1882 I think there were two entries of lemon and white, and but one black, white and tan, evidently a half-bred black and white spaniel.

If the Westminster Kennel Club were to follow the example of the Dominion Kennel Club, and give a dog and bitch class in each, it would be far more encouraging, as many breeders have good ones of each sex, but will only enter one, or at best two, in any class, but if there were two classes to each breed, or rather color and weight, I have no doubt but that it would pay.

Another change I would suggest, and that is that black and solid liver spaniels and other colors should be put in one class, and other color class, which better chance. This would help "Greenhorn," and might possibly induce him and we called to

make entries of their special colored cockers. As for the puppy classes, I think the blacks and livers should be separate classes, and the whites and blues should be returned to what I started out with, the two reasons which guide managers of shows. I think by reading over what I have stated above that I have proved, from their own catalogues, and the additional number of entries they may expect, that breeders if they separate the dog and bitch classes, that they would be all right as far as the paying part would go.

As to the first reason, the improving the breed, my suggestion with regard to the greater mix of the blacks and livers, I think I am right, and that I will be sustained by the breeders of black spaniels and cockers, as no matter how carefully we breed blacks, in every litter there appears one or more solid liver pups which will have all the distinguishing marks of the black spaniel except the color. I have not myself sufficient experience in the breeding of tricolored spaniels to know exactly how they are bred, but in appearance they strongly resemble the liver and white and black and white, and think they should be kept together. In this I should like to be instructed by "Greenhorn" or any breeder of this most beautiful spaniel. Black and white spaniels ought not to be classed with blacks or livers, they are of a different type.

In conclusion, I hope that the breeders of the various classes of spaniels will unite in the endeavor which was so well inaugurated three years ago, to snatch from decay the cocker spaniel by lending their assistance to the American Cocker Spaniel Club. Good advice always abounds in bench show managers are guided.

J. S. NIVEN.

LONDON, Oct. Jan. 22, 1883.

LOST DOGS.

"Sisy" writes as follows: "If the person who lost an orange-brown pointer, the other day, at the Crystal Palace, belonging to such a bitch from the Westminster Kennel Club show of 1882 will communicate with me, care of FOREST AND STREAM, I think I can put him on the right track to secure his property."

George Ayres, of the Rod and Gun Hotel, Pawtuxet, R. I., asks us to give further publicity to the following description of his setter bitch recently lost: She is white, one ear buff the other marked with red, nudge on hind quarters, answers to the name of Psyche. A liberal reward will be paid to the person returning her to David Richards, Providence Opera House, or George Ayres, Pawtuxet, R. I.

A LIVELY TIME WITH THE FOXES.—Macon, Ga., Jan. 22, 1883.—I spent several days in Jones county shooting quail and had it very successful. My only one bird today was a red head. I used my usual killing and my gun was very good this season. I went shooting with Col. R. V. H., the crack shot of Jones county. We bagged forty quails between us, the only real good kill we have made this season. Col. H. usually hunts by himself, and frequently kills twenty to thirty birds in an afternoon's hunt. I beat him several birds when we shot and felt quite elated thereby. I anticipated a fox chase on Christmas night, but just as we were ready to start the rain began to fall and we were disappointed. I had spent the day with a friend in Monroe county, who lives a few miles across the Ocmulgee River from Capt. Ridley, and who has some of the same stock of dogs, though he has not given them the attention that Ridley has. A few days before Christmas my friends went to party with another fox hunt. On the third morning they had two on foot at the same time, and while the two best dogs ran one the rest caught it. A few minutes after the two dogs came by in full chase, and I saw the fox with my party after him. On the following day they jumped a very large red fox, and after running several hours all the pack were exhausted but one dog. This dog chased the fox alone, frequently having a slight race, and as he would pass the other dogs they would bark, but could not follow him. This particular dog was very remarkable both for speed and endurance, and though always in "at the death," had never before been known to take such a long chase. Can you give any idea of the fox's bad weather of late. Shooting has been very poor.

MERIDEN DOG SHOW.—Following is the official report of the premiums awarded to the dogs shown at the seventh annual exhibition at Meriden, Conn., Jan. 9-11, 1883: Special for best dog, any breed, Robt. B. Penn's setter Rancier. Special for best bitch, any breed, F. Stevenson's pointer. Special for best puppy, any breed, first and special, Robt. B. Penn's Rancier; second, G. R. Nichols's (New Haven) Asteroid; third, F. G. Ferguson's (Meriden) Dash; bitches, first and special, Robt. B. Penn's Mollie; puppies, first and special, G. R. Nichols's Asteroid; first and special, G. R. Nichols's Asteroid; second, J. Warren E. Smith's (Brooklyn) Triumph; second, E. P. Tillotson's (Meriden) bitches; first, John Rankin (Glastonbury); puppies, first, John F. Ives (Meriden). Gaudin setter dogs, first, S. C. Padlock (Meriden) second, W. H. Smith (Wolcott); bitches, first, G. R. Nichols. Pointer dogs, first and special, J. F. Ives's Shot; second, W. E. Miller's (Meriden) Tim; third, J. F. Padlock's (Meriden) Sanchez; puppies, first and special, F. Stevenson (Meriden) Dash; bitches, first and special, Robt. B. Penn's Rancier and special, N. Elmore's Charley Ross; second, Gilligan and Kenney (Glastonbury) bitches; first, N. Elmore (Granby); puppies, first and second, N. Elmore; third, E. A. Birdsey (Meriden). Beagle hounds, dogs, first and special, N. Elmore; bitches, first and second, N. Elmore; third, John Morrow (Southington); puppies, first, second, third and special, N. Elmore. St. Bernard, bitches, first and special, A. H. Whitney (Lanesester, Mass.). Black spaniel dogs, first and special, J. F. Ives's first and second; dog scratched. Prince Scotch terrier, first, E. E. Timson (Meriden);—JONATHAN SHUTE, Secretary.

A GOOD 'COONER.—I was in Cheyenne after Jim had got rich, and persuaded him to give me that dog of his'n, Bosc. I was out hunting one day near Laramie, when one of the men brought down a coon. I did not know what to do with him, I was all around him, I could see the storm coming, but two miles off. If I ran it would catch me. If I stood that it was death. So I ran to the dog and he ran to me. I saw the coon. I threw it down behind him like a breaking plow drawn by twenty yoke of oxen. I held on to his tail and he scratched. We hadn't got in the ground more'n two hundred feet when the storm struck us. I was all around him, I did not know what to do with him, I was all around him, I could see the storm coming, but two miles off. If I ran it would catch me. If I stood that it was death. So I ran to the dog and he ran to me. I saw the coon. I threw it down behind him like a breaking plow drawn by twenty yoke of oxen. I held on to his tail and he scratched. We hadn't got in the ground more'n two hundred feet when the storm struck us. I was all around him, I did not know what to do with him, I was all around him, I could see the storm coming, but two miles off. If I ran it would catch me. If I stood that it was death. So I ran to the dog and he ran to me. I saw the coon. I threw it down behind him like a breaking plow drawn by twenty yoke of oxen. I held on to his tail and he scratched. We hadn't got in the ground more'n two hundred feet when the storm struck us. I was all around him, I did not know what to do with him, I was all around him, I could see the storm coming, but two miles off. If I ran it would catch me. If I stood that it was death. So I ran to the dog and he ran to me. I saw the coon. I threw it down behind him like a breaking plow drawn by twenty yoke of oxen. I held on to his tail and he scratched. We hadn't got in the ground more'n two hundred feet when the storm struck us. I was all around him, I did not know what to do with him, I was all around him, I could see the storm coming, but two miles off. If I ran it would catch me. If I stood that it was death. So I ran to the dog and he ran to me. I saw the coon. I threw it down behind him like a breaking plow drawn by twenty yoke of oxen. I held on to his tail and he scratched. We hadn't got in the ground more'n two hundred feet when the storm struck us. CLEAM—SLOOP—MR. N. D. LAWTON—LARCHMONT Y. C.

of yachts in these columns does not imply a sanction of their models or rigs, unless explicitly so stated. It is our province to present the thoughts and opinions of others quite as much as our own, though radically faulty conceptions we do not permit to appear for obvious reasons. In single hand yachts, we look first to safety, ability and accommodations, and then recommend as much speed as compatible with those points for sailing.

To summarize, we deem the yawl rig, of reasonable area, supplemented with kites, a better rig than large area in lower sails of an unbandy description and no kites. The first offers every choice demanded by varying circumstances, and can be quickly brought into harmony with the surroundings. The latter leaves you in the lurch in the crisis for lack of that very adaptability the yawl pre-eminently offers. For that reason you may be more extravagant with the area in the yawl if you wish, than in cut, sloop, cutter or lugger, which must be restricted to meet widely different exigencies, for which reading offers but a laborious, risky and poorly balanced substitute, quite generally deferred until the consequences may become serious. Undergirding is safe in any plan, but we look to speed in America too much to put up with a "jury," and our weather warrants liberal provision. That respect.

CLEAM.

THE prediction a few weeks ago that the centerboard would disappear in Eastern waters seemed quite as improbable of fulfillment as a similar prognostication made to-day, regarding yachts in New York. Yet we have lived to see the board practically abandoned around Cape Cod, and we venture to assert, it is only a matter of a few seasons more before the keel will be given a life preference here in New York. All indications point that way, and we certainly consider the time not far distant when the centerboard shall be relegated to special contrivances built to meet the purely local exigencies of certain limited stretches of shoal water or for some individual purpose only distantly related to yachting viewed as the indulgence in the art of sailing. Until then, we must expect to find yachtmanship pass through the usual preliminary stages of experiment, going from the trap first to deep centerboard boats, then to semi-keels and partial outside ballast, and finally bringing up in safe, creditable construction possessing the advantages incorporated in the cutter.

As one of the latest and best examples furthering the introduction of modern ideas, we give this week details of a deep-centerboard sloop, the Cleam, now building by John Munn, of Bay Ridge, for Mr. Newbury D. Lawton, of this city. This yacht differs from her predecessors in greater depth and more freerboard than usual, and to some extent modifies the objections urged against the flat-iron-trap in her pristine form. The Cleam draws rather less water with out her board than a keel boat (about fifteen inches), and this difference disappears altogether the moment a very small fraction of her board is displayed. Her accommodations, though better than in many other sloops, are still not equal to those of cutters of her size, with the exception of a wider cockpit and more "wings" above deck transoms in the fore. The rig is of the largest, and the cost of construction, owing to amount of material and labor, rather more than in boats of moderate form, and handling the boat must involve greater exertion with only partial compensation in the speed. She will of course be a "wetter" boat than a cutter, but stiffer under a press of sail. Whether her disadvantages are fully offset by an occasional less draw and more accommodations, is a matter of angle of heel, each reader must judge for himself. We subjoin details, kindly furnished by Mr. Lawton:

DETAILS OF CLEAM.

Table with 2 columns: Specification and Measurement. Includes items like Length over all (35 ft. 10 in.), Beam on load line (23 ft.), Mast height (47 ft. 6 in.), and various deck and hull measurements.

The keel is of white oak, 82 lbs. amidships, frames 3/8 x 2 ft. beam, 3/2 x 2 ft. head, oak. Frames on bilge, 2 1/2 x 2 ft. backstake, deck framing, 2 1/2 x 2 1/2 ft. Deck beams for centerboard trunk, 2 x 4 in. oak. Stern post, and rudder of oak with locust stow. Mast, 1 1/2 yalms. of spruce, stepped, 1 1/2 yalms. of spruce, 1 1/2 white pine, square, no bits. Firmings, hatches and rail in mahogany. Cabin roof is of three layers thin boards, with canvas between. Sails of 100 duck, single lighted, also storm bunt. Cut top-sail of fox duck single lighted, and spinnaker, balloon jib top-sail of stout drilling. The bowsprit will be a bright, round spar, run early horizontal in the bows, and inflexed to the tip. It will be black with red bottom, no gilt stripe. The cockpit floor is lift, above water line, and the centerboard trunk is kept low in the cabin, the top being "sealed" and covered. The yacht is fully finished with anchors, chains, side-lights, binnacle, charts, fog-horn, etc.

DISPLACEMENT AND RESISTANCE.

Editor Forest and Stream: Having done considerable sailing in the Nevs, whose lines you recently published, I am a fair judge of the results which will sustain you in your attempts to convert builders to sound views. "Jury rig" of the Neva, it is the truth that she does more than well in light breezes, although of large displacement. In a gale of force her own in moderate winds with the best centerboards, carrying only half as much ballast. This is, to me at least, conclusive proof that displacement is no bar at all to speed if displacement is in the right place. When rough and blowing I have seen the Neva sail dry, while the light-weight centerboards were bobbing about, throwing spray and green water clear into their cockpits. You may count me for large displacement hereafter.

Boston, Mass. [Unimpaired practical demonstrations proving this class as above might be cited, but they have been taken in view of the use of builders and experts, yet we here in New York have had to wait

(till the end of last season before even the more intelligent portion of the public would accede to the doctrine set forth in this journal that the requirements of form and skin area, and thus no connection with the displacement, large or small. It was not until the cutter Bedouin showed her one hundred and two tons through the water as fast as the sloop Gracie did her sixty tons in the Savannah Fall races, the cutter carrying between 500 and 600 sq. ft. less sail, that the public woke up to the fact which FOREST AND STREAM had been trying to impress upon yachting men as one of the fundamental truths of naval science. It is disgraceful that at this day quite a class of people, including many old-fashioned builders, are still unconvinced and firm as ever in their stupid reverence of the antiquated faith, that depth, weight or displacement are hindrances to speed. We trust these old fogies will be appreciated at their worth by the public, for the sooner they are shelved out of sight the better for the cause of rational yacht building.]

A NAVAL BOAT RACE.

Editor Forest and Stream: A race between the barges of two well-known American men-of-war took place on November 3, at 4 P. M., in the harbor of Montevideo, Uruguay, South America.

The champions of the station—the racing crew of the barge of Rear Admiral Crosby, commanding South Atlantic Station—were challenged by a racing crew from the old Hartford, formerly flagship of Admiral David Glasgow Farragut at Mobile. The latter crew pulled in the Hartford's barge, which they had christened the Judite. Admiral Crosby's barge was attached to the U. S. S. Brooklyn, its flagship on this station.

The conditions of the race were in charge of Lieut. D. V. Stuart, U. S. N., attached to the U. S. S. Galena and representing the Admiral, and Master E. P. Quintrou, U. S. N., of the Hartford. The course to be one and a half miles to seaward and return to start the boats, either the other boat's water until at least two boats' lengths of clear water intervenes.

If either boat fouls the other intentionally or through carelessness, the race is given to the other boat. All objections to be lodged with the committee in charge as soon as the objectioning boat passes the winning post.

The Galea, Hartford, and foreign men-of-war in port were crowded with spectators, and Admiral and Mrs. Crosby were on board the former. The start was made by firing a pistol, after asking, "Are you ready?" and the boats succeeded in getting away well together. They kept together for about two hundred yards, after which the Brooklyn's larger draw about one boat length, which lead she retained for a hundred yards further, after which the Hartford's crew broke and steadily reduced the gap, passed them, and obtained a lead which they increased to thirty seconds of time at the turning point. On the homestretch the break was widened, and the Brooklyn's crew crossed the score one and three-quarter miles about the former's mark. The score one and three-quarter miles about the former's mark. The score one and three-quarter miles about the water was so rough that they would be of little use to outsiders.

TOM TRISTACBLE, Seaman.

REGISTRY OF YACHTS.

HAVING received several inquiries concerning the requirements of the law with regard to the registry of yachts under 20 tons Custom House measurement, the following information has been gathered through the kindness of the Secretary of the Treasury in Washington. Coming direct from headquarters, his exposition of course overrides all opinions and decisions of local collectors. It puts the status of yachts beyond question and clears up much doubt on the subject. For an "independent" vessel there are no papers of any sort. They are not covered by law in any way, and providing they do not engage in trade or in the carrying of passengers, cannot be subjected or arrested for the want of documents of any sort. For the same reason names of small yachts may be changed at will without legal formalities. In short, they lie in the same category in the eyes of the law as the "independent" vessel. The only regulations for their registry for the display of lights, fog signals and the Rule of the Road for an anchor, and so forth, which yachtsmen will be able to understand and movements of registration. They are not subject to any regulations in these directions and keep them handy in the binnacle or cockpit locker, as well as to learn them by heart.

TREASURY DEPARTMENT, OFFICE OF THE SECRETARY, WASHINGTON, D. C., Jan. 24, 1898.

Editor Forest and Stream: In a communication to the Department of the 90th inst., you inquire in regard to the documents required by law for small yachts under twenty tons burden.

You are informed that the statutes of the United States require no registry, enrollment, or license for a yacht, or any other kind of vessel, whether under or above twenty tons burden. If not engaged in trade, but if in an "independent" vessel there are no papers of any sort. They are not covered by law in any way, and providing they do not engage in trade or in the carrying of passengers, cannot be subjected or arrested for the want of documents of any sort. For the same reason names of small yachts may be changed at will without legal formalities. In short, they lie in the same category in the eyes of the law as the "independent" vessel. The only regulations for their registry for the display of lights, fog signals and the Rule of the Road for an anchor, and so forth, which yachtsmen will be able to understand and movements of registration. They are not subject to any regulations in these directions and keep them handy in the binnacle or cockpit locker, as well as to learn them by heart.

Very respectfully, R. F. FRENCH, Assistant Secretary.

CIRCULAR.

TREASURY DEPARTMENT, OFFICE OF THE SECRETARY, WASHINGTON, D. C., Feb. 1, 1898.

To Collectors of Customs and others: In order to insure uniformity, and especially the masters of sailing vessels, may be apprised of their duties in the premises, you are directed to place a copy of this circular in possession of the masters of every vessel of twenty tons or more, and the instrument herein contained will be observed in the navigation of the mercantile marine of the United States, and by provisions of the Revised Statutes, and by the provisions of the Act of March 3, 1879, which is hereby published, and it is to be understood, inclusive, are made applicable to the navigation of vessels of the Navy. (Collectors will notice the modifications of the circular of Feb. 1, 1897, which is hereby published, and it is to be understood, inclusive, are made applicable to the navigation of vessels of the Navy.) Every sail vessel of the mercantile marine navigated without the

plying with the instructions of this circular will be liable to a penalty of two hundred dollars, for which sum the vessel may be seized and proceeded against.

STEAM AND SAIL VESSELS.

Rule 1. Every steam vessel which is under sail and not under steam shall be considered a sail vessel, and every steam vessel which is under steam, whether under sail or not, shall be considered a steam vessel.

LIGHTS.

Rule 2. The lights mentioned in the following rules, and no others, shall be carried in all weather by steam and sailing vessels. Rule 3. All ocean-going steamers, and steamers carrying sail, shall, when under way, carry— (a) At the foremast-head, a bright white light, of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least five miles, and so constructed as to show a uniform and unbroken light over an arc of the horizon of twenty points of the compass, and so fixed as to throw the light ten points abaft the beam on either side.

(b) On the starboard side, a green light, of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least five miles, and so constructed as to show a uniform and unbroken light over an arc of the horizon of ten points of the compass, and so fixed as to throw the light from right ahead to two points abaft the beam on her port side.

(c) On the port side, a red light, of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least five miles, and so constructed as to show a uniform and unbroken light over an arc of the horizon of ten points of the compass, and so fixed as to throw the light from right ahead to two points abaft the beam on her port side.

The green and red lights shall be fitted with inboard screens, projecting at least three feet forward from the lights, so as to prevent them from being seen across the bow.

LIGHTS FOR TOWING STEAMERS.

Rule 4. Steam vessels, when towing other vessels, shall carry two bright, white masthead lights vertically, in addition to their side lights, so as to distinguish them from other steam vessels. Each of these masthead lights shall be of the same character and construction as the masthead lights prescribed in Rule 3.

Rule 5. All steam vessels, other than ocean-going steamers and steamers carrying sail, when under way, carry on the starboard and port sides lights of the same character and construction and in the same position as are prescribed for side lights by Rule 3, except in the case provided in Rule 6.

LIGHTS FOR STEAMERS ON THE MISSISSIPPI RIVER.

Rule 6. River steamers navigating waters flowing in the Gulf of Mexico and red rivers shall carry the following lights, namely: One red light on the outboard side of the port smoke pipe, and one green light on the outboard side of the starboard smoke pipe. Such lights shall be so fixed as to show around the horizon.

LIGHTS FOR COASTING STEAM VESSELS AND STEAM VESSELS NAVIGATING BAYS, LAKES AND RIVERS.

Rule 7. All coasting steam vessels and steam vessels other than ferry-boats, and vessels otherwise expressly provided for navigation on the Great Lakes and other inland waters of the United States, except those mentioned in Rule 6, shall carry the red and green lights as prescribed for ocean-going steamers, and in addition thereto a central range of two white lights, the after light being carried at an elevation of at least 15 ft. above the light at the head of the mast, the head light shall be so constructed as to show a good light through twenty points of the compass, namely, from right ahead to two points abaft the beam, on either side of the vessel, and the after light shall be so shown around the horizon.

LIGHTS FOR FERRY-BOATS.

shall be regulated by such rules as the Board of Supervising Inspectors of Steam Vessels shall prescribe. (See additional rules below.)

LIGHTS FOR SAILING VESSELS.

Rule 8. Sail vessels, under way or being towed, shall carry the same lights as steam vessels under way, with the exception of the white masthead light, which they shall never carry. (See Rule 3, b and c.)

EXCEPTIONAL LIGHTS FOR SMALL SAILING VESSELS.

Rule 9. Whenever, as in case of small vessels during bad weather, the green and red lights cannot be carried, these lights shall be kept on deck, on their respective sides of the vessel, ready for instant exhibition, and shall, on the approach of, or to other vessels, be exhibited on their respective sides as sufficient time to prevent collision in such a manner as to make them visible, and so that the green light shall not be seen on the port side nor the red light on the starboard side. To make the use of these portable lights more certain, they shall each be painted outside with the color of the light they respectively contain, and shall be provided with anti-collision screens.

LIGHTS FOR STEAM VESSELS AND SAILING VESSELS AT ANCHOR.

Rule 10. All vessels, whether steam vessels or sail vessels, when at anchor in roadssteads or fairways, shall, between sunset and sunrise, exhibit on their respective sides, in sufficient time to prevent collision, twenty feet above the hull a white light in a globular lantern of eight inches in diameter, and so constructed as to show a clear, uniform and unbroken light, visible all around the horizon, and at a distance of at least one mile.

LIGHTS FOR PILOT VESSELS.

Rule 11. Sailing pilot vessels shall not carry the lights required for other sailing vessels, but shall carry a white light at the mast-head, visible all around the horizon, and shall also exhibit a flare-up light every fifteen minutes.

LIGHTS FOR COASTING, TRADING BOATS, BATS, AND OTHER LAKE CRAFT. Rule 12. Coasting, trading boats, produce-boats, canal-boats, tow-boats, fishing-boats, flats, or other water craft, navigating any bay, harbor, or river, by land power, horse power, sail, or by the current or tide, or which do not carry a white light at the mast-head, shall exhibit, in addition to their side lights, a white light at the head of the channel or fairway of any bay, harbor, or river, shall carry one or more good white lights, which shall be placed in such a manner as to be prescribed by the Board of Supervising Inspectors of Steam Vessels.

LIGHTS FOR OPEN BOATS.

Rule 13. Open boats, whether steam vessels or sail vessels, when required for other vessels, shall, in addition to their side lights, carry a lantern having a green slide on one side and a red slide on the other side, and on the approach of, or to other vessels, such lantern shall be exhibited in such a manner as to prevent collision, and in such a manner that the green light shall not be seen on the port side nor the red light on the starboard side. Open boats, when at anchor or stationary, shall exhibit a bright white light. They shall not

FACT AND FANCY.

BOGARDUS AND CARVER.—There is no present nor remote probability of these gentlemen meeting for a match. Each now claims the world championship, and neither is disposed to give the other an opportunity of proving his claim.

A VERY OLD JOKE.—A gentleman, who had taken the right of shooting over a moor in Ayrshire at a high rent, bagged only two brace the first day. After counting the price, he grimacingly remarked to the tenant of the moor that the birds had gone to the devil, and neither is disposed to give the other an opportunity of proving his claim.

HEALTH REGAINED IN THE ADIRONDACKS.—Eight years ago Dr. E. L. Trudeau, of New York city, came for the first time to the Adirondacks, with his health completely broken down by hard labor in his profession. He arrived at Paul Smith's in such a reduced condition from lung disease, attended by alarming hemorrhages, that he had to be carried from the carriage to his room in the St. Regis house. He said through that season and went home in a greatly im-

proved condition, but soon the old symptoms returned, and he came back and spent the winter in the Adirondacks, and has remained there with his family about all the time since, having found that whenever he attempted to resume his former life in the city his old enemy, the lung trouble, was sure to follow. During these eight years he has spent his summers mainly at Paul Smith's and in his pleasant camp on Spittle Pond, and the winters at Saranac Lake, and during this time he has been the prime mover in the work of erecting the neat Episcopal chapel at Paul Smith's, Saranac Lake and Bloomingdale. Last Wednesday week he arrived at Plattsburg on his way to his winter quarters at Saranac Lake, hale and hearty, after a five weeks' sojourn in New York—the longest time in the eight years that he has been able to breathe any other than the life-giving air of the Adirondacks. —Plattsburg Republican.

SALE OF FOX-TERRIERS.—At the American Horse Exchange last week Mr. William Easton disposed of a draught of fox-terriers from the kennel of Mr. L. Rutherford, Jr. Eighteen lots were disposed of, of which only four were grown dogs, the remainder being puppies, and a total of \$308

was realized. The best prices obtained were \$42 for the year old bitch Careful and \$30 for her sire, Bowstring, \$42 for a dog pup by champion Royal, out of Flighty, and \$31 for a litter sister and \$27 for the imported bitch Nancy. The Supreme Court has done a fine thing in the interest of fish and game protection by affirming the judgment of the Superior Court of Martin county, in the case of S. P. Taylor, who was convicted of having violated the law providing for the erection of fish-ladders in streams the waters of which are used for milling and other purposes by the construction of dams. Taylor is the wealthy proprietor of a paper mill on one of the trout streams of that county, and his dams obstructed the passage of the fishes up-stream. The State Sportsmen's Association appealed to him to comply with the law, but he declined doing so, hence his arrest and prosecution. Messrs. Crittenden Robinson and R. E. Wilson, Directors of the State Association, personally conducted the suit, and secured a conviction and fine of \$30. Taylor appealed to the Supreme Court, and that tribunal has affirmed the judgment. His expenses have run up to something like \$1,000. This case should be a warning to violators of the fish and game laws. —Saratoga Bee.

THE MILD POWER CURES.—HUMPHREYS' OMBOPATHIC SPECIFICS.

Best Quality Braided Fishing Lines.

The Cotton Lines are all 84 feet long, two connected, if so wanted. The Linen Lines are all 150 feet long, two connected, if so wanted. The Silk lines are all 75 feet long, four connected, if so wanted. Braided Long Staple Cotton, five sizes (all same price) 25 cents each. Braided Irish Linen (reed line), six sizes, (all same price), 60 cents each. Braided Irish Linen (hand line), six sizes (all same price), 75 cents each. Braided Tangleless Silk, either raw, hoiled or oiled, per 75 feet, No. 1, \$1.25; No. 2, \$1; No. 3, 68 cents; No. 4, 55 cents; No. 5, 50 cents. Length of Lines 90ft. 75ft. 60ft. 105ft. 120ft. 150ft. 300ft. No. 1, \$1.00; No. 2, 1.50; No. 3, 1.75; No. 4, 2.00; No. 5, 2.50; No. 6, 3.00; No. 7, 3.50; No. 8, 4.00; No. 9, 4.50; No. 10, 5.00. Polished Tapered Braided Fly Lines, No. 1, 10 cents per yard; No. 2, 9 cents; No. 3, 8 cents; No. 4, 7 cents.

ALL LINES STANDARD SIZES AND FULL LENGTH. Orders received from persons residing in cities in which the dealers keep a full line of our goods will not be filled at any price. ABBEY & IMBRIE, 48 MAIDEN LANE, NEW YORK.

B. F. NICHOLS & CO., BOSTON, MASS., Manufacturers of HEXAGONAL SPLIT BAMBOO FISHING RODS, REMOVED TO 153 MILK STREET. We are obliged to have more room in our factory and greater facilities for manufacturing our goods to meet the increasing demand. We have received the highest award and silver medal at the Massachusetts Charitable Mechanics' Association Fair for our superior goods. Send for catalogue.

Kynoch's Patent "Perfect" Brass Shells MANUFACTURED BY Kynoch & Co., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base. Use either Winchester or Wesson primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weigh less than paper shells, and in consideration of their reloading and other advantages, are really cheaper than the paper. They also shoot stronger and closer, and can be loaded heavier, as inside diameter is nearly two gauges larger. They possess a great advantage over all other brass shells, as owing to the thin metal they can be closed (as represented in cut) by simple use of the thumb or fingers, and straighten out to original shape when discharged. These goods have already gained a wide and favorable reputation in Europe, and in the opinion of many prominent sportsmen will soon supersede to a great extent the old style of both brass and paper. Samples will, upon application, be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or in case lots only (2,000 shells) by

HERMANN BOKER & CO., SOLE AMERICAN AGENTS, 101 & 103 Duane Street, New York. We also carry a large stock (at all seasons) of Kynoch's regular thickness brass shells, adapted to the Berdan Primer. Price materially lower than the American make of same quality.

Standard Works. FOREST AND STREAM BIRD NOTES.

An Index and Summary of all the matter relating to ornithology contained in the first twelve volumes of the FOREST AND STREAM. 195 pages, paper. Price, postpaid, \$1.50.

SHOOTING.

Its Appliances, Practice and Purpose. By JAMES DALZIEL DOUGALL. Contains practical information on guns and gunning. Its chapters treat of the Barrel, the Stock, Locks, Triggers, Recoil, Brech-Loaders, Rifles, Care of Guns, Ammunition, Loading, Dogs, Grouse, Woodcock, Black Game and Partridge Shooting. The chapter on "The Purpose" of Shooting is the best defense of legitimate field sports ever published. Elegantly printed on fine paper, 380 pages, cloth. Price, postpaid, \$3.

SHORE BIRDS.

I. Names and Habits. II. Range and Migrations. III. A Morning Without the Birds. IV. Nomenclature. V. Localities. VI. Blinds and Decoys. This is a reprint of papers from the FOREST AND STREAM. Pamphlet, 45 pages. Price, postpaid, 15 cents.

PRACTICAL DOG TRAINING.

Training vs. Breaking. By S. T. HAMMOND, Kennel Editor of FOREST AND STREAM. Pronounced by those who have read the chapters, as published in this journal, to be the best work on the subject ever written. 100 pages, cloth. Price, postpaid, \$1.

FOREST AND STREAM PUBLISHING CO., 39 Park Row, New York.

STONEHEDGE ON THE DOG Price \$3.50. For sale by Forest and Stream Publishing Co. 1881 EDITION OF THE Hurlingham and London GUN CLUB'S TRAP SHOOTING RULES For sale at this office Price twenty-five cents.

Kennedy Repeating Rifle

The Latest and Best. Greatly superior to any other Magazine Rifle yet made. The solid metal in line of fire at time of discharge renders the Kennedy ABSOLUTELY SAFE. These rifles are made .44 cal. 40 gr., and .45 cal. 60 gr., using the same ammunition as other magazine rifles. Can be obtained from any first-class gun dealer in the United States and Canada.

\$72 A WEEK. \$19 a day at home easily made. Costly Outfit free. Address TRIZ & Co., Augusta, Maine.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 Cts. A COPY.
SIX MONTHS, \$2.

NEW YORK, FEBRUARY 8, 1888.

VOL. XX.—No. 2
Nos. 89 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$26. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Sanson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted.

ANSWERS TO CORRESPONDENTS.

THE NEW YORK GAME LAW.

WE print elsewhere the views of several correspondents on the proposed amendments of the New York game law.

We agree with Mr. Zerega in thinking the provisions of the bill relating to the collection of specimens by naturalists somewhat oppressive to the ornithologist, but it will at least, if enforced, stop the present wholesale destruction of small birds. It will be a difficult matter to make such protection effective, and at the same time to cut the ground from under the feet of the man who makes merchandise of bird skins.

It was to have been expected that there would be a difference of opinion on the provision relating to the bounty on hawks. Our correspondent is quite right in stating that, "Nature if left to herself will absolutely balance all things;" but he must remember that, at the present day and in this country, nature is by no means left to herself. On the contrary, she is interfered with in every possible manner. The game birds have a host of enemies and but few friends. The rapacious birds, on the other hand, most of them die of old age. They are terribly destructive to the quail. In order that the balance of nature may be preserved, there should be meted out to them some of the measure that they give to the game. We do not underestimate the havoc which these *Hapacae* cause among noxious rodents and insects, but that they cause a great amount of destruction to game, we know very well. Even the marsh hawk, which most people regard as no better than a mouse, we have known to catch quail, teal and meadow larks, besides other smaller birds. We have examined the stomachs of too many hawks and owls not to have a pretty clear idea of the food which they eat.

There are, of course, a number of species of *Falco* and *Strigidae*, which are of the greatest benefit to the farmer; but in framing a general law, it is hardly possible to deal with the individual species. The good must suffer with the bad.

We expected when we penned the paragraph relating to bay bird shooting, to which exception is taken by another correspondent, that it would by no means meet the views of

a considerable number of our readers. Still, we are obliged to hold to our original view, that a postponement of the open season to August 1 would result in better shooting—more shots and more birds—than if it opens July 1.

We do not regard the matter as an especially important one; the birds have bred, and may well be shot during the late summer and early autumn by those who enjoy the sport. There is usually a flight late in July, but it consists only of a few birds, chiefly dowitchers, with an occasional plover, which from the moment they sight Montauk Point, are banded at unceasingly. A few of them are killed, but the majority hurry on in the hope of finding some resting-place, where they will be free from constant molestation, until they reach the quiet shores and marshes of Virginia. If the shooting of these birds was postponed to August 1, a very different state of things would ensue. The birds would not hurry onward in the wild rush for safety that now takes place. They would loiter along the Long Island and Jersey coasts, feeding and fattening. Their presence on the beaches and marshes would call down others of their kind. This would continue for a week or two, and by August 1 there would be birds enough to afford good sport until the August flight came on. As it is at present, the appearance in July of a little flock of dowitchers is the signal for every man in the neighborhood to run for his gun, and the birds have hardly time to alight before they are being chased away again. The result of all this is very naturally the shooters in July get few or no large birds, and devote themselves to the tiny peeps, sandwings, ring plover, potato snipe and other little birds about as big as one's thumb which breed on Long Island, many of which in July are still occupied in raising their young.

From the facts presented by Mr. Collins it will be learned that the provision forbidding the transplanting of trout is designed to remedy a most flagrant abuse, and in view of these facts it is desirable that such a clause should be incorporated in the law.

The report of the meeting of the Game Law Committee at Albany in another column, gives the views of some sportsmen on the various points brought up in the Townsend bill. It will be observed that there is a tendency on the part of a great many gentlemen to ask for special provisions excepting the regions where they shoot and fish from the provisions of a general protective law. All special legislation of this kind is wrong, and tends to render inoperative a law otherwise good. If one county is to be excepted from the provisions of the act, its next door neighbor may ask the same privilege, and so for the whole State, county by county. We shall regret to see the bill materially changed except as to section 4.

The Chairman of the Assembly Committee on Game Laws, in his closing remarks on Tuesday, touched, as with a needle, the root of the greatest bar to successful game protection by law. He said that the Committee was anxious to give sportsmen the necessary protection, but they did not seem to be able to agree on what this was. Of course he did not put it quite so bluntly as we have, but that was about what it amounted to. Until the angling and shooting public come to be practically of one mind as to what is the best course to be pursued to preserve our game and fish, each step toward such protection can only be made after a hard fight.

Our laws at present are absurd in the number of exceptions, which they make to the general provisions of the act. Who can tell, for example, why it is, that "in the waters of the Walkill River, within the county of Ulster," it is "lawful for any person or persons of the same family or household to possess and fish for suckers and eels in the waters of said river during the months of March, April, October and November with a single fyke, the meshes of which shall not be less than one inch" when for the greater portion of the waters of the State, any such fishery at such times and with such a net is unlawful. Of course we all know well enough how such provisions come to be inserted.

The worshipful member from Ulster, whoever he may have been at the time when this law was passed, no doubt arose in the Assembly chamber or committee and stated that to forbid his constituents to catch suckers and eels was outrageous, and his legislative brothers who knew nothing about the subject and cared rather less agreed that an exception should be made in favor of the gentleman's constituents. And so it goes all through the bill. The members of the present committee on game laws, it must be said, give the fullest and most courteous hearing to those who appeared before them on Tuesday, and showed that so far as they were concerned this important subject will have intelligent and careful attention.

OUR RIFLE FUTURE.

THE summary, elsewhere published, of the report of the National Rifle Association of Great Britain, shows how much of a fixture in the general life of the Kingdom the practice before the targets has become. Notwithstanding apparent set-backs there has been for nearly a quarter of a century a steady growth of the interest in rifle shooting, and with that interest may be traced great improvement in the arms used.

There are many good observers who find reason to think that without rifle shooting and the rivalry which naturally springs out of its pursuit the Volunteer movement in Great Britain would have been a failure ere this. Instead of making the enrollment and the drilling of bodies of men the one great end and aim of the National Home Guard, the requirements of an efficient Volunteer embraced that of shooting fairly well. Here came in an element which set the men individually on a level, and while the metropolitan centers gave large commands admirably drilled and fit to make a brilliant showing on parade, it was the little squad of a company far off in some scrubby hamlet which, likely as not, carried off the shooting prizes, and so the honors were distributed about in such fashion as to keep the whole force a vigorous and healthy one. The city commands might have fine chances for parade over broad thoroughfares and with commodious drill-rooms, but the country guardsman with a range at his back door burned powder, kept a clear eye and a steady hand, and was very properly recognized as a very important factor in the make-up of the whole force.

The National Rifle Association came in as an important adjunct in this direction. While structurally independent of the Volunteer force it lived only for that force, and was controlled by it. It was not a bureau of the regular establishment, yet without it the force would have lost an essential part of its life, and it is doubtful whether either could have long survived the other. Shrewdly managed in a business way it has prospered through liberality. Seemingly at times over conservative, its record will show that there has been a steady encouragement of the best arms, and it is safe to assert that without Wimbledon the world-to-day would not have several of the rifles which are now recognized as the best. The rules of shooting have been changed and altered from time to time, and though always against a certain amount of protest, yet always for the betterment of rifle practice. There have been many reasons which have helped the managers of the National Rifle Association. They were enabled to draw a very large clientele from a very small area of territory. The run up to London is but a matter of a few hours from any part of the Kingdom. The time of holding the meeting is well selected. There is a widespread feeling of intense local patriotism or clanishness which institutes sharp distinctions of section, and upon this feeling it is easy to build up a rivalry such as been seen at Wimbledon from its first establishment. Then, too, special journals most admirably conducted, and generous notice and encouragement in the ordinary press channels, have helped the movement greatly, until we see it to-day rich and as firmly established as it is possible for such an agency to be.

On this side the water there have been at times expressions of surprise, that in ten years of existence, modern rifle shooting should be in such a backward state. The error which was the foundation of this surprise, is in supposing that the United States will ever in proportion to its population make such a showing as that annually seen at Wimbledon.

It will be noticed at once that many if not all of the conditions which have made the broad common on the outskirts of London such a popular resort are wanting in this country.

We have no such Volunteer force or National Guard as that which exists in Great Britain, simply because we do not need any such a cumbersome agency of defense. To preach the danger of a foreign attack is to be laughed at and with a few companies of reliable militia, ready to act on call as a sheriff's posse in suppressing any riotous demonstration, we have all the National Guard which is really necessary. The regular army is little more than this and both organizations deserve support, mainly because they serve as schools for officers, and in this fact there is a feeling of security for Americans and a quieting hint to would-be meddlers with us as a nation. We have little of that clanishness which is so marked abroad, and repeated attempts to push Inter-State matches show the absence of that sentiment. In short, the conditions and environments of position and feeling, which go to make Wimbledon such a busy center during a certain period each year are entirely wanting on this side the ocean, and all steps in the encour-

agement of rifle shooting must be taken with that fact plainly in view.

This condition of affairs does not mean, however, that there is to be a dying out of rifle practice here. Just as a single regiment of our National Guard in the late war furnished officers for an army, so the handful of marksmen who practice intelligently and persistently before the butts keep alive a knowledge of the art, and when occasion requires it they form a nucleus about which there soon clusters an efficient corps of riflemen. The American works under impulse, and it is idle to expect a large body of men to undergo the drudgery of ball practice when there is no incentive in view. We have no organization with a richly-endowed prize-list which would enco-urage, if nothing more, at least a certain amount of pot-hunting marksmanship, neither can we secure the use of the ranges by vigorous orders to our National Guard. The members would not permit their labor of love to be turned into a toil under a task master. Quick to catch and improve upon an idea, with no prejudices born of established practice, the American marksman should fill the post of an expert observer.

Wilmington itself is an excellent place for study, and had more note been taken of what was going on there, the fiasco of our International Military Match of 1882 would not have taken place. We certainly should have known something of the sort of rifles the Englishmen were using for the style of work in which they challenged our competition. That the British pursue this plan of observation and adoption is manifest by their ready acceptance of the sensible American device of a wind gauge for military rifles.

There is no reason, then, why America may not and should not hold her own with the other nations in the matter of rifle making and shooting. She should hold her place at the front of the line, but this can only be done by an intelligent noting of what is going on the world over, and it may be carried out without those great gatherings of marksmen engaging in a whirl of competitions, and then rushing away to renew the struggle a year later. A score of ranges here and there over the States, by an interchange of continuous records, can do fully as much for the real advance of marksmanship as any central gathering, and then the need of a National Rifle Association will come in as a regulating body, to make rules, secure uniform conditions of practice, and point the way to the best endeavor in the line of new work.

FRIENDS OF THE PARK.

AMONG the public men who have come out in vigorous defense of the Yellowstone National Park against the audacious schemes of the prospective monopolists is Mr. John Schuyler Crosby, Governor of Montana, whose letter to Senator Vest was published in our issue of Jan. 11. In his message transmitted to the Territorial Legislature of Montana, Jan. 25, Gov. Crosby recommends that the Legislature take measures under the Federal Government to convert the Park into "an asylum for the great game of the Northwest." This, as we have all along contended, is the one and only sensible course to pursue, so far as the game is regarded, and it is exceedingly gratifying to find in the present Governor such a public-spirited appreciation of the true interests of Montana and of the nation.

The Senate and House of Representatives of the State of Illinois have transmitted to General P. H. Sheridan, an official copy of their joint resolutions, thanking him for his report on the Yellowstone Park to the War Department, in which report he called attention to the danger of leasing the Park to a private corporation. The resolutions further declare against allowing the Park to pass into control of the Improvement Company, to be used as a cattle ranch and for the extortion of money from visitors. The resolutions also thank Senator Vest, of Missouri, for his bill, now in Congress.

The issues involved in this Yellowstone Park matter have been clearly defined, and are now well understood. On one side is corporate greed; on the other are the present and future interests of the people. No man at Washington who has a vote to east on Senator Vest's bill can escape putting himself upon record. Public interest has been aroused. The people will carefully watch the course pursued by their representatives in Congress.

THE AMERICAN EAGLE.—A bill has been introduced into the Connecticut Legislature providing a fine of \$25 with added imprisonment for the killing or snaring of "the bird known as and called the American eagle." This is good so far as it goes; but another law ought to be passed to imprison for life the perpetrators of the horrible caricature of the bird of freedom, which is stamped on the light weight coinage of the land. The average citizen of these United States never saw an eagle—unless captive or stuffed—and would not know one in the woods from a turkey buzzard.

THE ADIRONDACK FORESTS.—The bill to prohibit in future the sale of public lands in the Adirondacks went to the Governor last Monday; and it will without doubt receive his signature and become a law. This is one step in the right direction; it will put a stop to the extreme folly which has in the past characterized this State's course in relation to the momentous subject of maintaining a normal water supply for the Hudson River Valley. The present movement is all too tardy, but we hope that it is only the beginning of a wise future policy.

JORDAN AND GILBERT.—The names of Jordan and Gilbert are very familiar to those who have paid attention to the progress of ichthyology within the past ten years. In fact those who do not keep up with the labors of Dr. Gill, Goode and Bean, Jordan and Gilbert, are apt to be left behind in the modern classification of fishes. These men have partly unraveled the tangled skein left by the early workers in American fishes, and having better facilities than their predecessors, and the advantage of their labors, have been able to go over their work with more material at hand from the great stores of the National Museum, and confirm, correct and revise their work. The early workers like Holbrook, De Kay, Girard, and those who laid the foundation of American ichthyology, labored under the disadvantage of having only a limited collection of local fishes to work with, and the only wonder is that their work was as good as it is. These remarks have been culled up by the receipt of the January number of the *Indiana Student*, a journal published by the students of the Indiana State University at Bloomington, which contains a list of all the scientific papers of Prof. David S. Jordan, arranged in the order of their publication. This list comprises sixty-seven papers, principally on ichthyology, and Prof. Gilbert is an associate writer of most of them. The papers have appeared in various monthly, weekly and other periodicals, many of them in *FOREST AND STREAM*, and the list will be of value to those who wish to look up what these writers have said on any subject.

THE LONDON FISHERIES EXHIBITION.—Those who intend exhibiting at London are reminded that goods will be received up to the 15th of this month. The Albatross will take over the American collection, which will be a large one, without duplicate of anything, except canned goods, etc. The exhibition opens in May and time will be required to set up the goods and prepare for the opening day. Among other things a life-sized group of colored men, in wax, will show how oysters are opened, preserved and canned. Models of white men will illustrate how salmon are gaffed, and how the eggs are stripped from them. Everything connected with the fisheries, from the clothing and implements of the men, their boats, houses, etc., to the methods of drying, salting and curing fish with smoke, will be shown. The exhibit will be in charge of Prof. G. Brown Goode, who will be assisted by Mr. R. E. Earll, in charge of the fishculture department. Mr. Earll is prepared to make the best show of fishculture that has ever been seen and is well informed on all subjects connected with his department. The party may all depart in March in order to prepare the exhibit in time.

A HALE FISHCULTURIST.—In our fishculture columns will be found an article on carp culture, by Mr. Edward Stabler, whose "Reminiscences of an Octogeanian" we published in our issue of January 4. Mr. Stabler is now in his eighty-ninth year, and is still in active business life. He has been president of the Mutual Fire Insurance Company, of Montgomery Co., Md., for the past thirty-five years. He is also the oldest postmaster in the United States, his commission dating back to 1880, under President Jackson's administration, and he still discharges the duties of the office at Sandy Spring, this being the fifty-third consecutive year that he has held the office under the many changes of political supremacy. Mr. Stabler has taken to carpiculture and with success, and we hope that he may live many years to enjoy his fish and his well-earned rest from the more severe labors of life.

CARVER AND BOGARDUS.—As may be learned by reference to our trap columns, Carver and Bogardus have agreed to shoot a match at Louisville, Ky., Feb. 22. While the exploits of professional shooters have in the main ceased to excite much public attention, this match will be regarded with interest. There are no other professional shots in the world to-day concerning whose relative merits such a difference of opinion exists. The results of this match, and of the others which presumably will follow, will not necessarily be accepted as determining which of the two is the better wing-shot, for the public understand very well that both Carver and Bogardus shoot to make money, and that they are smart enough to manage a hippodromic pigeon match in a way to do themselves the most good.

A PROPHELY AGAINST HYDROPHOBIA.—Mention has from time to time been made in this journal of the work of the French microphysiologist, M. Pasteur, who has been conducting a series of researches into the nature of the microscopic organism of hydrophobia. Procuring a quantity of the saliva of a victim of hydrophobia, M. Pasteur succeeded in cultivating the germ of the disease through numerous generations, finally obtaining a product which, having been introduced by inoculation, proved efficient to prevent the introduction of the germ of true hydrophobia into the system. He has thus, it is reported, demonstrated the possibility of vaccination for the prevention of hydrophobia.

SUPERVISORS.—An impression appears to prevail in certain parts of this State that the county supervisors have power to extend in their counties the open seasons on game and fish. No such authority is granted them by the law. They may only extend the close season.

AN EDIFYING SPECTACLE.—That of a number of professional men in Massachusetts, who dare not venture into the State of Maine for fear of being arrested and clapped into jail because they have violated the moose and deer law of that State.

FOREST AND STREAM FABLES.

XII.—THE PUPPIES WHO DIDN'T KNOW IT WAS LOADED.
An old Hound whose Home was hard by a Ledge where many Skunks lived, had often cautioned her Puppies against playing with the Old or the Young ones for fear of most unpleasant consequences. For a time the Puppies heeded her and kept aloof from the Skunks, but at last were tempted to disobey, and presently came Home half blind, howling with pain, and smelling so outrageously that no one with a Nose could endure their Neighborhood.

"My Children," said their Mother, "if you cannot see, you can feel and smell what your Disobedience has brought upon you."

"Ah, Mother," whimpered one, between his howls, "it was such a little Skunk, that we did not think it was Loaded."

"Naughty Children," cried she, "you should always treat all Skunks as if you knew they were Loaded." Whereupon she whipped them all soundly.

MORAL.

Puppies should not fool with Loaded Playthings.

WINTER TAKES ON SUMMER PASTIMES.

XII.—THE ADIRONDACK STATE PARK.

Majestic woods of every vigorous green.

Stage above stage, high waving o'er the hills.

Or to the far horizon wide diffused,

A boundless deep immensely of shade.—Thomson.

IT is now more than thirty years since I wrote my first article in favor of dedicating the entire Adirondack region to public use as a State Park. Since then I have availed myself of frequent opportunities to press the subject upon public attention, but, until recently, without finding any general response that may have been moving caused by my appreciation of its importance as a fish and game preserve and as a summer resort where all the people could find repose and healthful recreation. But the subject expanded under reflection and discussion, until it became easily demonstrable that what was suggested was not simply desirable as a preserve for sport and recreation but as vital to the material and commercial interests of the State as well. The argument in brief was this: Forests are great natural reservoirs, holding for gradual distribution the rain-falls of the year, and thereby not only preventing sudden and destructive freshets, but furnishing steady supplies for adjacent streams during the summer months. No forest on the continent performs this office more profitably than that which grows on our northern border. Its waters, held back artificially until needed, feed the Erie Canal. Without this supply this great commercial artery would be practically useless during a portion of the season, and the gradual filtration of what is absorbed by the hundreds of square miles of spongy soil embraced within the forest limits feeds the Hudson River the supply required for purposes of navigation just when most needed. Independent, therefore, of mere recreative or sanitary considerations, the preservation of this vast forest region would be the highest wisdom, because indispensable to the permanent commercial supremacy of the State.

Since this subject was first agitated on this line of its material importance, many tens of thousands of acres have been stripped of their best timber, and large tracts have been trodden into control of the State into the hands of individuals. Fully one-third of the territory has been thus transferred within the period named, and whatever beneficial results may be hereafter secured by State guardianship and supervision will be curtailed to this extent. But it is not yet too late for the Legislature to render effective service; and I am glad to know that that body has at last passed a bill for a committee which has been so long treated with stupid indifference and criminal neglect. Statesmen and statisticians can only look at this subject in its material aspects, and these are of sufficient importance to challenge their best thought and most immediate attention. But it is of interest to all who find pleasure in seasonable out-door life as well, and all such will rejoice as heartily in what is to be done to preserve this vast forest as in the utter annihilation of those who make its destruction the uninterrupted efficiency of the Erie Canal and the Hudson River as the great arteries of our inland commerce.

The present probability is that before this article finds its way into print, the needed statutory provision will have been made to secure the dedication, forever, of this vast forest as a State Park. And no single act of the present Legislature will be longer or more gratefully remembered. Its value as a game preserve and as a summer resort for the whole people will grow into fuller appreciation with every passing year, and future generations will rise up to "call those blessed" who had the thoughtful sagacity to thus contribute to the sanitary, recreative and material needs of the State.

I find in this tardily consummated measure a gratifying illustration of the potency of public sentiment and the salutary influence of the public press. It is not many years since the proposition to preserve this immense field of forest, mountains, valleys, rivers and lakes was scouted as an absurdity which only æsthetic visionaries would suggest, and none but reckless marauders upon the public treasury approve. This idea has gradually given way before the overwhelming arguments in favor of its preservation, and now it is not only accepted with enthusiasm, but the stolid stupidity of the past is the subject of universal regret and denunciation.

The final outcome of this long-mooted subject should encourage you in your persistent and patriotic war upon the conscienceless speculators who are seeking to acquire possession of Yellowstone Park for their own benefit and to the imminent peril of the integrity of the Park. It is not what these men seek is conceded, great wrong will be done to the people, and a policy inaugurated which will result in the practical destruction of that vast province, if not in its ultimate alienation from the custody and supervision of the Government altogether. But I am hopeful that no such calamity is to fall upon the generations of the future. The present generation of public men may not be more virtuous than those of the generation which preceded them, but in some things they are wiser, and in nothing more conspicuously than in the growing idea that statesmanship embraces

a broader field than the mere material, dollar-and-cent interests of the people.

The characteristics of a nation are illustrated by the characteristics of its individual subjects. Whatever happiness and exalts the individual, happiness and exalts the nation, and whatever and whatever national repose contribute to the physical enjoyment and beautiful development of the people. That nation best performs its functions which makes most ample provision for what is so essential to individual vigor and vitality. The Yellowstone Park, if preserved in its full integrity, is destined to become the great pleasure resort of the continent, and the present is the time (sooner would have been better) to inaugurate a policy for its preservation from the reckless vandalism and the grasping avarice of insatiable.

Although large tracts of timber have been cut in the Adirondack region during recent years, the entire territory still retains its wilderness character. The forests have been simply culled, not destroyed, except at a few points where hostilities have been placed for the accommodation of tourists. The mountains are still densely covered with forest foliage. The lakes retain their primitive beauty, and the rivers still flow through their original channels with their old-time velocity. The water in both lakes and rivers still remains unpolluted by foreign substances, and is as transparent and of the same grateful temperature to-day as when the stars sang together on the morning of creation. At one or two points, to be sure, dams have been erected which, by the back-water they have occasioned, have marred the beauty of many miles of river scenery. This is particularly true of the Raquette river from Sault Ste. Marie (where the dam was built) upward very nearly to the falls. Before this obstruction interfered with the natural flow of the water, the river, for most of the distance, was fringed with beautiful hemlocks, spruce and soft maple, which were killed by the back-flow caused by the dam. The same cause also spoiled a great many old trout-hamlets by changing or entirely obliterating the current of the stream. But notwithstanding this, the Raquette is still a beautiful river through its entire length, and the whole region has still enough of its original characteristics to make it worthy of preservation and of the perpetual guardianship of the State.

A large number of small tracts of land have been sold to those who have learned to appreciate the advantages of the region as a summer resort. These will be enhanced in value by the action of the State, but as most of them will be improved and beautified by their own use, the State has no objection. It is different with tracts purchased for timber purposes alone. If possible, they should be recovered by the State—as they may be at moderate cost—that the process of denudation may be carried no further. If this shall be done (as is proposed), the State of New York will be an Empire among the States, because of the extent and magnificence of its Park, as well as because of the vastness of its commerce and the boundlessness of its wealth. G. D.

The Sportsman Tourist.

NIMROD IN THE NORTH.

BY LIEUT. FRED K. SCHWATKA, U. S. ARMY.

III.—The Rifle and the Reindeer—Concluded.

ON the 7th of May our party killed ten reindeer out of a herd of fourteen. The scene was an exceedingly short one. The herd being descried about a mile distant lying on the side of a hill, all the hunter hunters and dog Gibeons started for the sledge and dogs remained on the spot. For about half way the hunters were shielded from sight by the hills, but nearly all the rest of the distance was consummated by crawling, Indian file, in full sight of the animals, until a near hill for a minute or two allowed them to get within about a hundred yards, when a volley of rifle shots greeted the astonished herd, and almost only one was wounded at the first fire, before the bewildered herd could determine a safe direction to pursue, ten of their number were wounded and dead, all of which were secured, for it is seldom that a reindeer wounded at all severely is lost by a good hunter. Two of the remaining four were secured by Toooloah the next morning when returning to look up their missing comrades.

We were now in a country never trod before by white men or by persons armed with their weapons, so it was evidently a new world that had been heard by the gamo of the locality, and they acted with a stupidly plain revealing these facts. Where the reindeer is hunted considerably with firearms he becomes shy enough to give one excellent sport in his capture. Like the antelope he will circle around until he catches "the wind" before he is off, and this peculiarity, with a few magazine guns in full blast, thus them rapidly. They also have something of the curiosity of the antelope, but not in the degree of the latter. Like all animals that congregate in droves the false security resulting from numbers makes them much slower to pick out their line of retreat. In this manner they closely resemble the stupidity of the American elk, and like them, when often hunted and in small bands, they are game worthy of any man's powder.

On the next day, the 8th, we encountered a fresh musk-ox trail and a reindeer, killing seven; we also came upon old signs or markings of salmon and of the various natives of this country. On the 13th, the bad weather being such that we remained over, I noticed that the many reindeer signs kept Toooloah nervous, until he had sallied out in the tempestuous elements, and after an absence of a couple of hours, he returned to get the dogs and sledge to bring in the carcasses of seven reindeer that he had killed out of a herd of eight, with eight signs of salmon and a Winchester carbine. Returning with these two others were secured.

On the 14th, we passed a herd of about two hundred reindeer, but our sledges being so loaded with meat, we allowed them to trot by with easy rifle range, unscathed and astonished beyond measure at this wonderful innovation. They were singularly tame and often running toward us a few paces, would halt like a company of cavalry coming from a line, and gaze at us with dilated eyes and distended nostrils until a snort from some suspicious creature would send them off by the flank with measured tread well drilled troopers. It seemed like a grateful chance to exercise our humanity once more by not taking advantage of their confidence, and we willingly declared an armistice until our heavily laden sledges should become somewhat lighter.

Signs of natives daily grow fresher, and on the 15th of

May we came upon a band of some thirty souls, only two of whom, a couple of old men, had ever before seen any white men. We consequently attracted an unusual share of their curiosity, and their staring eyes riveted intently upon us, followed every motion that we made. If the white men were not surprised, the action of their eyes, as we showed them their faces, was truly appalling. We had expected to meet natives upon or near the mouth of Beck's Great Fish River where it empties into the Arctic Ocean, and had depended, to a certain extent, upon procuring from them dog feed and oil, but now we found the tables turned. Instead of being beggars, we were philanthropists, and instead of being receivers we were obliged to give, for we found our Esquimaux friends in a state of scantiness. Their food in the summer months is entirely furnished by the numberless shoals of salmon that then ascend the creeks and smaller rivers, and are speared as they run the gauntlet of the rapids. The flesh of the musk-ox, which they hunt with dogs and bows and arrows or spears, gives them a precarious subsistence during the remainder of the year. They kill barely enough reindeer in the summer to supply them with clothing, the noise of walking or crawling on the snow, and the action of the wind, often making it impossible to get sufficiently near to secure the game with bows and arrows. The twang of the bowstring traveling more rapidly than the arrow, the active deer has no difficulty in jumping out of the way at any distance beyond twenty-five or thirty yards. But in the summer time the wary antelope sometimes succeeds in crawling within these limits, or lying in wait on certain paths followed by the game will obtain gain.

Another plan much followed by those natives throughout the Arctic not provided with firearms is to establish a line of stone monuments at about fifty to a hundred yards interval along the crest of some prominent ridge, often two and three miles in length, which runs obliquely toward and terminates in the water's edge of some large lake or wide river. A sharp lookout is kept from some available point, and if a herd of reindeer is found feeding or walking within the cone of vision, the hunters and dogs bristling with stone cairns, the natives suggest in the distance to employ into a skidmill line sufficiently long to close the mouth of this angle and walk slowly toward the reindeer, their bows and arrows or spears and their *kiaks* (light skin caucos) being carried along or concealed in some convenient place near the water's edge. The herd, seeing the slow approach of their enemies, trot leisurely away until they come within sight of the rock monuments, which have been made to imitate the human form as far as possible, when, believing themselves to be surrounded on the land side, they take to the water as the only means of escape left them. No sooner is the herd fairly in, than the agile natives are in hot pursuit, with their *kiaks* flying through the water, and rapidly overtaking the bewildered animals, they dispatch them with arrows and spears, and haul their carcasses on shore to be butchered.

This sport is not without its dangers, as oftentimes a wounded animal or a beligerent buck seeing flight impossible, with swinging horns and plunging horns, turns so swiftly on his pursuer that he succeeds in tearing the fragile *kiak* to pieces, and the wrecked Esquimaux, unable to swim, drowns if he is not promptly rescued by some near neighbor, or manages to float on the wreck of his boat until help arrives. It is a singular fact that a herd of reindeer, so the natives say, will repeatedly give notice of their flight by the caims which they repeatedly notice, than a few suspicious glances at them as they pass by, but the minute moving figures force them against these stationary ones their suspicion is raised to a pitch high enough to make them prefer the water rather than to trust them. Yet this is not very hard to comprehend if one knows the almost half amphibious nature of the Arctic deer. I have seen them when taking up a line of march, with a wind blowing right through a deep lake that intersected itself in their direct course rather than to go around it, although this would not have exacted a marked detour, which fact, I imagined, must have been as patent to the deer as it was to myself. And the Esquimaux tell me of even bolder deeds. When pursued and "cornered" on some of the long narrow tongues of land projecting into Hudson's Bay, they have known the deer to take to the sea and swim directly out of their hands, and to be seen in the water, when they were thereby drowned or not they could not tell. The Arctic deer seems to be almost as much more amphibious than his Southern fellow as is the polar bear than his Southern brethren.

We crossed over to King William's Land on June 11, and the greatest consolation in our first few days' journeys was the great number of reindeer we here encountered, and which, as it were, notified us that we were not lost. The fact had led us to believe would be true, and could not be so interesting to note that on June 20, 1879, the civilized provisions of the party were exhausted, previous to which time they had been greatly reduced in the reindeer country, and from that date until March 20, 1880, we lived solely upon the same diet as our native allies, and as we have already said, principally upon reindeer.

On July 30, while we were in the southern part of Erebus Bay, we found a herd of some thirty or forty of meat, an occurrence which had seldom happened, owing to Toooloah's activity and good hunting. I now felt that we surely had a fast ahead of us, for the fog was one of the very thickest I had ever seen in my life, but despite all this, Toooloah secured three reindeer after being absent about four hours. The Lumlits, when hunting reindeer during thick, heavy weather, generally go in pairs, accompanied by a good, trained dog, and with their weapons, and keep well to the side of the quarter suspected, containing a "brash." The dog's nose soon tells them if their conjectures are right, and they follow him, his nose high in the wind on his aerial trail, until his frantic tuggings at the harness line by which he is held (for the well-trained Esquimaux dog never barks in the presence of game) show them to be near by, when one of the party holds the dog and the other takes his weapon and crawls cautiously forward on his usen victims. If the fog is very thick they can often get within a few yards by hugging the ground closely while crawling. During the time the snow is on the ground they may take several dogs, and after being successful in the chase, utilize them to drag in the carcasses. This is only done, however, when the skins have become useless; then the butchered deer is put into the hide and it is used as a sledge. The taken deer is held until the fog will permit a reindeer much further in the fog. It is not unreasonable to infer that the scent will not be so diffused in such a dense medium as an Arctic fog, and therefore be more concentrated at greater distances, yet I have heard good hunters in our regions

claim that fog completely kills a scent. A well-trained Esquimaux dog, with good, keen scent, will often detect the presence of game at a couple of miles distance. The greatest trouble is to keep the dog off from every rabbit or rabbit trail which he scents or encounters, and which he seems and prone to follow than that of the game which he is desired.

On August 8, while encamped in Terror Bay, and prosecuting our search for evidences of Sir John Franklin's party, I killed a big buck under circumstances probably worth relating. While sitting down, resting from a fatiguing continuous walk of five or six miles over the boggy ground near the seashore, I noticed the reindeer grazing rapidly toward me, being then about six hundred yards distant, and I immediately slipped down to the water's edge, hid the boulder on which I had been resting and converted myself into an immovable Micawber. The reindeer came eating along, and when about two hundred yards away evidently struck a patch of clover, figuratively speaking, for during the next half hour he never left a little spot, where he kept grazing backward and forward until my patience was exhausted. His skin was the exact color of the dancing flames against which he was blowing, and I waited until he was "end on," so that his white flank outlined a figure, I took aim at his head as he was grazing, fired, and hid him in the hind foot. The shock brought him down on his hams, and I thought I had made an effectual shot until I got within about thirty yards, when he first perceived me, and, with one wild snort and a sort of revenue-reform gait, that defied the best aim, he started for the seacoast, about a mile away, your humble servant bringing up the rear as fast as possible. I ran him out skin to a long point of land and thought surely that I had him. On its west side the pack-ice had been carried by the wind and was probably forty or fifty yards wide, being held somewhat open by the outgoing tide. Seeing himself out off from the land side, and my rapid approach, he struggled and plunged against the cokes of pack-ice with his broken foot swinging in the air, until he reached his boundary, when he took to the water. His progress over the disjointed pack was painfully slow, and in the time he had plunged into the water I was about nearest him, and from there sent a bullet through his brain that laid him out floating.

Now, I was in a quandary! It was beyond my reach from the furthest outlying cake of ice, and the tide setting out was not improving matters. Meat was not plentiful in camp, and further, a large supply was needed, as Toooloah was soon to leave us for a two-weeks' absence on a trip that he had planned for himself. I had a look like a flycatcher plash as the ripples of salt water broke over it. In short, I didn't want to lose that deer, and there was only one method of getting at him, and I started about that at once. Stripping myself to my underclothing, I started to wade out through the tortuous "leads" between the ice-cakes, as I deemed this method less liable to produce cramps than jumping in from the furthest cake, besides I did not know how deep, although it only seemed to be about five feet. Reiter myself, I will tell you the ocean water will be about two degrees colder than fresh water when both are holding ice in solution, or two degrees colder than the ice-water of your water coolers and other water receptacles; in short, ice sea water is two degrees colder than freezing. The first few steps made me gasp for breath and by the time I was up to my middle, my teeth had settled down to a regular drum-like rattle. I persevered, however, keeping my hands upon the nearest ice-shelf, I betaken with cramps, and as I was nearing my prize and my breast commenced sinking in the cold, I thought that I had swallowed the North Pole. When I reached one of the deer's horns I was up to my armpits. The whole transaction was done and I had my deer on land in less time than it has taken the reader to peruse it, and this reached, I wrung out my dripping underclothing, the air feeling as warm as a southern breeze, and then giving myself a good shaking over the side, I put on all my clothes, worked like a pirate butchering the deer, slung his fifty pound hams over my shoulders, walked two miles into camp, took a quart of hot reindeer soup that was awaiting me, turned into bed and dreamed that I owned a hundred thousand reindeer worth a thousand dollars apiece.

The reindeer of King William's Land, on their northward migrations, cross over Simpson's Straits from the southern end of the land or a little before the ice breaks up. About the middle of September, when the wind blowing on drives them south, and they congregate in its southern part before the straits have frozen over, and often wait a week or ten days for that occasion before they cross. I have said that the reindeer will swim anything as a lake or river that comes in his way, and the fact that he here seems to wait for the solid ice to form before crossing would appear to confirm that, but this is not so. In the first cold snap comes that tells him to go south, then the ice begins to freeze over water a kind of "mush ice," "slush ice," or "brash," as it is variously called, which is not unlike a foot or two of loose snow thrown into ice water, where it will not melt, and is sufficiently tenacious to even impede the headway of a sailing ship. This hugs the shores and islands and drifts around in the currents, winds and tides like a hilliputian ice-pack. Should a reindeer trust himself to swim through this he would be so impeded and hampered that he could not fall an easy prey to the Esquimaux who congregate hereabouts at this time, and this fact the reindeer know by some sort of instinct.

To this part of the island we also came in order to lay in a supply of meat, clothing and bedding for our mid-winter return trip to Hudson's Bay and civilization. Our camp was pitched near a high hill, on whose top a lookout was constructed to watch for the animals. On the 24th of September a cold snap nearly covered the freezing cover of Simpson's Strait, and the next day we moved camp about a mile near a large fresh-water lake and there built an *igloo* of ice, being one month and five days earlier than the commencement of our *igloo* life in north Hudson's Bay. The hill as a look-out for reindeer was no longer needed, as these animals were becoming so numerous, as the cold weather set in and upon us. On this last day a number could be seen from my station whatever the valleys almost as well as the top of the hills. On the last day of the month I felt quite sure that at least a thousand reindeer passed within in as many yards of our little house of ice, and the first and second days of the next month—October—the number was certainly no less. On the 3d the ice was just thick enough to bear them on the Strait, and the first herd was seen to cross that day, and by the 7th the vast swarms had descended southward, leaving the valleys almost as well as to bear us company. The 30th, the total score showed twenty-six killed, Toooloah scoring twelve, a number to which he limited himself only from the fact that it was the maxi-

man that he could butcher and otherwise dispose of in his stone *caches*, which were now making the surrounding locality look like a well-settled but dilapidated cemetery. With this wholesale slaughter of the reindeer came all the known carnivorous scavengers of the Arctic—the foxes, the wolves, the wolverines, and the Netchilluk Eskimaux; the last the most numerous and troublesome of the whole lot. We put them to scraping reindeer skins and making our winter ski clothing, and thus extracted some small compensation for the vast quantities of meat that disappeared down their throats, which seemed to have a capacity second only to Communiaw itself.

The Netchilluks say that in about a week or ten days after the King William Land reindeer have crossed over, another large batch of straggling herds put in their appearance on their southward migration, and this was the case, according to us in the early winter of '79 while we were there. If so, it would show them to be the reindeer of Boothia and North Somerset, that have been thus detained by the later freezing of James Ross's Channel, a much wider strait than Simpson's, although these animals could have passed on to the mainland by the Boothia Isthmus. During the time these tortuous channels, separating the many islands of the Perry Archipelago, were melting, and the reindeer were free to cross freely from one to another, but I do not believe, reasoning from the well known locality of their trails, that they ever cross unless the objective land be in full sight; that is, they have no better instinct than their eyes. Even in returning they take the most roundabout as well as the most direct ways to reach their northern grazing grounds, and it is not at all unlikely that a reindeer seen in Boothia may graze his second summer on King William's Land, or his third on Baring island and so on. This is proven by the testimony of the natives of these regions, who say that there is a great disparity in the numbers that may visit them at different years, and whose northward migrations were determined, no doubt, by some protracted storm, either forcing them into one locality or denuding it according to its direction, intensity and duration. Esquimaux told me that the reindeer graze with the wind in their faces, and that I have so often seen them feeding against it, and also at other angles in regard to it, that I am inclined to think that it can not be put down as an invariable rule. I think it probable that when the seasons have determined their boreal or austral migrations, the wind has but little effect except to deviate them through small angles as already explained, but as the windings ceased, the wind, uncomfortable from dam, or hill-sides, may influence their local migrations so as to make them obey this law, if it be so, as they claim.

We started on our return journey on the 8th of November, and did not see any reindeer (as we have not seen any since October 7) until the 12th of December, an interval of sixty-six days, when we saw two, who used their face under such peculiar circumstances that I must record it. We had just left the Dangerous Rapids, at the mouth of Back's Great Fish River, a few miles, when the natives of the advance sledge of the three reported *luk-too* (reindeer) in sight, and we soon saw two animals about a mile away, trotting leisurely from us along the west bank of the river. Before us was a large island in the river, and as it was evident that their movements would soon bring them behind it, *Toolooah* ran like a mad horse to reach its further end, and cut them off, hiding himself behind its sheltering side as regards to the deer, some of the other hunters following directly on their trail and stringing themselves along the island. When the sledges reached the nearer end of the island, about a mile and a half in length, they were stopped to await the result. Hardly had they done so when a shot was heard from *Toolooah*, and we all anxiously waited to hear the sound or more, or see the other deer, if he would run toward some of the many hunters, for you may rest assured we were eager to get both, so long had we been without fresh venison; but nothing was seen of him, although it seemed impossible for him to get away without again coming into view. The whole matter was soon explained by *Toolooah*, who came in to get the dogs, and reported that he had killed both deer, and that this had been done twelve other times by *Toolooah*, and each time he had been so quiet, enough, but when he had been absent from this kind of game for over two months, and then, stumbling on a couple, to annihilate them at a single discharge, seemed almost too wonderful to believe. I have said that *Toolooah* has done this wonderful feat a great number of times, and I do not wish to be misunderstood that I mean he killed one at a wound, and the other to reach his further end, so that of that character, but that these killings, or combinations, that no further shooting was needed. Once he killed three, and the number of times he at one shot killed one and wounded another so that it could afterward be slain was not recorded.

The 2d of January *Toolooah* killed two reindeer, the thermometer showing—08° F., and the next day brought them into camp, the thermometer showing—71° F., the coldest we recorded on the trip. I note it to show that American arms properly cared for will work under any temperature. At—71° F., or 103° below freezing, everything animate becomes enveloped in a mist that will soon obscure them, if they stop to rest, from a person at a distance, but that makes their presence doubly certain from this very sign. Herds of reindeer and musk-oxen can be located by this means at a distance of five or more miles, and this is the only way, so far as I know, to find them, or to get their trail, or to see them, or to see three times that distance. The native hunters claim that even at these extreme lengths they can tell the difference between the two kinds of animals by some varying peculiarities of the va's. Reindeer chased by dogs look like so many puffing locomotives.

The end of February saw us almost home. We had net a King-eared Eskimaux from Hesterfield Inlet, who told us that *Devoah* had been on the ice for several days, and if we took light sledges, and we accordingly left all our heavy stuff with him in order to get through, and purchased two days' reindeer meat of him to complete the journey, for none would be found on the way, he said. Our three days lengthened into five, and a terribly stormy day on the fifth saw us not yet home, out of meat, and no sign of reindeer in the country before us, but on the fourth day, during the storm and soon after returning, that it was folly to hope for such weather with such prospects. At dark *Toolooah* came in. He had found the tracks of three deer five or six miles south of camp, followed them on a circle which brought him due north of our igloos, there overtook them and killed them all, having followed their trail the whole distance at a fair run. Of such stuff was my best hunter made who that day saw his last reindeer, and on the next day we returned out of a grand total of 522 killed by all the members on the expedition.

AFTER QUAIL.

If we had been inhabitants of another sphere we could have created greater curiosity—George and I and Busy than we did as we alighted from the emigrant train that morning. Here I carried a rifle basket on a great railroad, but of such small consequence that the great railroad permitted only one train a day to stop there. Indeed, the place was so little known, even in the pretentious city not twenty miles away, that when George and I had mentioned our proposed excursion thither, one-half of our fellow sportsmen had never heard of the place, and the other half said "Pooh! you won't get anything there. Why, I never even heard of anyone going there to hunt." But George has a remarkably observant eye, two of them, in fact, and when these eyes roamed over a certain patch of ground in the momentary view afforded by the car window of the lightning express, George said, "That looks like quail," and we were to-day intent upon verifying George's surmise.

As the train pulled away out of sight around a curve the open mouth of the entrance of the Peruvians gradually relaxed from their amazed stare, and a yellow dog that had crouched by the platform made a sheepish attempt to form an acquaintance with Busy, but retired in dismay at her warning growl.

"Morin, stranger," ventured one of the group, at length. "Good morning, my friend," said George, "will you tell me where is my game, to be killed hereabouts?" "Well, now, I dunno," drawled the countryman. "I guess not much with braggin' on, but there's Jim Seely, learnin' agin them fence rails, he's game constable, and might be able to tell ye. Hey, you, Jim! Here's some city fellers that want to know if they's any game hereabouts."

Jim, at this greeting, ceased his occupation of whitening a pine stick, and, expectorating a stream of tobacco juice, repeated with great courtesies of the Peruvians gradually opened him raised him above his fellows.

"Game? In course they's game enough, if ye know how to get it. They's coons, an' they's gray squirrels, an' they's foxes, an' down to Tamarack Holler they's muskrats. But you fellers won't git none rigged in them fixin's, now I tell ye. Is that thar a good 'coon dog?" contentiously indicated Busy by a squirt of tobacco juice in her direction.

"Well, no," said George, "I wouldn't, not exactly a 'coon dog, but she's some on muskrats." "Umph!" sneered the oracle, "I wouldn't trade Tiger there for a bull drove of city dogs. Take him 'n' dad's rifle — a good twelve pound of solid iron—an' if they's fur in Seneky county, you kin git it."

"Well," said George, "we'll do our best, anyhow. By the way, he's out of the game, he's a friend here. I'd like to get posted, so as not to kill anything out of season."

"Oh, wal, I dunno," hesitated the game constable, "don't kill no little birds, and don't set no trap afir, nor leave no fence rails down, an' the law won't bresh ye."

Thanking our informant for his elucidation of the Peruvian laws, we shouldered guns and clambered over the hills back of the railroad toward George's expected quail ground.

"Now, Busy," said George, "you'll be a better quail hunter a dozen times more or less, and ought to know a good deal about it by this time. From this hill top you can see what I picked out as a likely quail ground. Now, in your opinion, how had we best proceed to get the most birds in the least time?"

"Well, I should cross this clover meadow, and work Busy over every foot of the meadow, and then the field, and all that. I fear your quail hunting hasn't taught you much thus far. But the trouble is, you don't study these matters. Now, what kind of weather have we had for these few days back?"

"Cold, with occasional rains and hurries of snow."

"Right. Now, quail aren't at all partial to exposed places in that sort of weather. To be sure, to-day, although cold, is clear, but I've found that Bob will be generally with the timber a day or two after the storm, so see if it is really a clear-up, or only making believe. So you needn't put a shell in while we're crossing this clover and that stubble field, for no quail will feed there to-day."

"But, George, just look at Busy. She's struck a hot scent, by her actions."

"Yes, she's struck a scent, but no. This bunch of thick clover, in a nook out of reach of the wind, is where a covey roosted last night. See, you can count the exact number of birds. Fourteen, isn't it? All in a covey, you see, so that, in case of a surprise, one's flight won't impede another's. Now, the company that lodged here last night will most likely be found in that scrubby patch of timber beyond this stubble field. It may be that you'll have hard work to put them up, as they'll have a goodly warren ahead of a dog sometimes in timber. But I have faith in old Busy, and she's been hunted on quail so many times that she knows their tricks even better than her master, I think."

"This 'timber' was a patch of land that had been partially cleared some years before, and was now covered over with a tangled mass of brush and briery shrubs, some higher than a man's head, but the major part reaching hardly to the shoulder. It was uninviting ground for a setter, but Busy's small, lithe body was soon working in and out in the thickest tangle. Her intelligence was simply marvelous. After striking the scent and finding that the birds were running swiftly away from her, she seemed to use every endeavor to turn them toward the open field close by, and, evidently understanding that we were unable to follow her course through the brush, she often ran ahead of a dog sometimes in timber. But I have faith in old Busy, and she's been hunted on quail so many times that she knows their tricks even better than her master, I think."

"Now, Busy, if they haven't doubled on her like a hare, as they will do when a dog is hunting on strategic principles, and not altogether from scent, we must hurry into the open, and skirt along the border, where we'll probably put 'em up ourselves. This way, all ready?"

"Where's that?" said George, "I'm not in the covey. Firing too soon, my first barrel made a clean miss, and one bird fell to my second; while cooler George, biding his time, dropped three to his gun. The frightened covey separated in wisps, and flew in various directions."

"No easy job to pick up those scattered fellows," said George, taking the last retrieved bird from Busy's careful mouth. "They'll be so close and still that the dog with the finest nose can't see 'em. That's what some old hunters call 'withholding scent.' Mark any down in your direction?"

"Yes, near that brush pile standing alone."

"Well, we'll tackle that first, as it's near by. Hee on, Busy!"

knocked over. Turning to order Busy to fetch, she was seen to be still pointing the same spot. Another kick brought another quail, and the same result as before. Still Busy had not left her point. Another kick from George, but no bird.

"She's mistaken this time, George," said I. "No, sir!" replied my friend, emphatically; "Old Busy's never mistaken; keep your gun ready," and he administered several hearty kicks in the dry brush. True enough, out started a third quail, which we grasped at twenty yards, and old Busy at once began to trot for the dead birds.

"George, will you sell that dog?" asked I. "Not for this whole country. But, there aren't ten men in A—that have her intelligence and honesty; yes, intelligence. Do you mean to tell me that it wasn't a reasoning power that worked that covey out of the timber patch?" asked I, looking directly at me, as if a denial on my part were a personal insult.

Proceeding then to another part of the field, where George had marked down three of the birds, we beat back and forth through the high grass and weeds in vain, and even Busy was unsuccessful. We were about to abandon the search, when out from my very feet sprang a quail, so close I could almost have knocked it over with my gun barrel. It was the same as the other, and unexpected and sudden appearance, one so close on another, and "rattled" us, for we both missed our first shots, and I my second, George grissing with his left at a tremendous distance.

"I'm always ashamed to miss an easy shot when Busy's along," said George, "for just to see how grieved she looks over it." And indeed, from her sympathetic eye and lowered flag, I am half inclined to believe she was blushing beneath her dark coat at our awkwardness.

Following a row of asphery bushes by the fence, we got two more, and then ensued a period of three hours or more marked with a blank, for not a quail did we start in that time. In the afternoon, however, we marked a covey of eight birds down in an orchard separated by the turnpike from the rest of the farm, and George with Busy taking the orchard, and I, in position, and every tree and timber, by careful maneuvering we killed every one of the covey, five falling to my gun.

"Eighteen birds," said George, "I guess that will do for to-day. We might get a dozen more, but I'd like to know that there are some left for our Thanksgiving hunt, and we've got enough for Sunday's dinner at the boarding-house. Let's quit. I am half dead."

"I'm willing," said I, "but meanwhile, suppose we tramp across the river and ask old Jesse at the col-pot if any ducks have come in the marsh yet."

"Just what I was going to propose," answered George; and calling Busy to heel, we set out for a six-mile tramp to the river and back. Two more unfortunate quail, rising with others out of the very yard and a farmhouse, dropped to our guns on the way, and one hare, which we crossed the road ahead of us on a kecy jump was too rash to go unpunished, and I howled him over.

"Only got one rabbit, eh?" sarcastically remarked one of the Peruvians that night while we were awaiting the train. "Oh, in course, I see all them little quails, but, Lord a massy, I'd as soon think o' shooting highlanders. They ain't no more out on a dozen o' them to make a pot small reely tuitin'."

SENeca.

AROUND THE COAST OF FLORIDA.

BY DR. J. A. HENSHAW.

Third Paper.

ON the day following we tightened up the shrouds and hobshtay, looked to the strapping of blocks, and made everything snug and ship-shape for the next day after we were to make a sail of forty miles by sea to the next inlet below—Hillsboro' River. The day broke clear and fine, and by nine o'clock a fresh wind was blowing from the north. Everything was propitious, so we made sail, hoisted anchor, and put to sea, keeping well inshore, just beyond the line of breakers, to avoid, so far as possible, the current of the Gulf Stream, which here flows northward at a two-knot rate.

As we passed the reef near the trails from the thickest settled portion of Lake Worth, we saw a lady busily engaged in picking up sea-shells. Jack seized the covey-horn and blew a shrill blast, at which she looked up and waved her handkerchief; whereupon Jack, Squire, and Skipper vied with each other in a display of pocket hunting. At the foot of Lake Worth we saw, on the beach ridge, the cabin formerly occupied by the Hubbel family, whose three years before we began our tramp down the coast to Key Biscayne. Five miles further on is U. S. Life Saving Station No. 3, and ten miles further we were abreast of the bold rocks of Boca Raton, where there is a closed inlet to a branch of the Hillsboro'. There is a great sameness in the appearance of the southeast coast of Florida, being mostly a narrow white beach, backed by a low sandy ridge which is covered by very palmetto, oak scrub, sea-pines, and myrtle, with occasional clumps of cabbage palms and live oaks. At last, after a delightful sail, we sighted Hillsboro' Inlet, with its group of cocoanut palms, which we reached at four o'clock, having made forty miles in seven hours—pretty good sailing against the current of the Gulf Stream. The tide was running out, with but a foot of water on the bar, so we were compelled to drop anchor and wait for the flood tide. Skipper, who was out of the boat, went ashore to explore the inlet, while Cuff jumped overboard and swam ashore to chase 'possums, 'coons, and hares.

I never saw a better boat for a dingy or tender than the Daisy, a Strauban folding canvas canoe, ten feet long and weighing but twenty-five pounds. I frequently passed in and out of inlets, through the breakers and combers, looking for the channels, and never shipped so many times a pint of water as we began our tramp down the coast to Key Biscayne. My sea was always on top, skimming the crests like a sea-gull. We towed her stern the entire voyage in all kinds of weather and in some pretty rough seas, but the Daisy was always right side up and dry, and moreover, was no detriment to our sailing. The wooden skiff, Wail, would not have lived two minutes under conditions where the Daisy floated like a duck, and was always hoisted on deck before sailing.

The wind hailed around to northeast, blowing fresh and kicking up quite a sea, causing the Rambler to jump and strain at her cable like a tethered mustang. Finally, through the contrary forces of wind and tide, she settled in the trough and began rolling feebly among the breakers, when Skipper and I sprang to a stern anchor in the Daisy and hauled her round into the wind, and she lay head and but poor Jack was already the victim of *mal de mer* and had

zone below, where he remained until eight o'clock, when there being a half fathom of water on the bar, we sailed into the river.

On the little bay just inside of the inlet is an old palmetto slanty and a well, constructed by old man Fitch several years before, where I then found him, nearly starved, waiting for his companion, "Sailor Jack," who had gone to Lake Worth for provisions, but who never went back, having slipped on a boat at Lake Worth for Halifax River, leaving the old man to shift for himself. I found this Sailor Jack a few days afterward at Lake Worth just as he was about to sail for the Halifax, when I took the opportunity to preach him a "sermon" on "man's inhumanity to man," which seemed to be thoroughly appreciated by the small but attentive audience.

While out hunting the usual arrival at Hillsboro' in the beach comb, an unusual object caught my eye as I was passing an open space between two bushes, which I saw at a second glance was a large rattlesnake coiled up within two feet of me. As I stepped back and withdrew a buckshot cartridge and inserted one of small shot, he began crawling languidly and slowly away and without shaking a rattle, when I shot his head off. He was six feet in length, and had a very beautifully marked skin which I took off at once, being the body of Skipper, who had often horrified the boys by telling them of his great fondness for fried rattlesnake. But although this was a fine specimen, four inches in diameter, with luscious and tempting-looking steaks along the backbone, all portehouse and tenderloin, he seemed to have suddenly lost all desire and appreciation for that kind of meat, at all events, he "didn't seem to haunter after it."

As we returned, we passed a shallow, muddy bayou, the bottom of which was left dry by the tide, where we saw some oysters, and struck it rich. These oysters were the fattest, largest, and had the finest flavor of any I had ever tasted, and this is saying a good deal for one born and bred in Baltimore. They were all single oysters, none less than six inches long, and were attached to the denuded stems and branches of sea-fans (*Gorgonia*), and were thereby carried in bunches. Our dinner that day was a royal one: oysters, raw, broiled, and fried; roast beef, broiled; venison steak; baked yams; boiled rice; sliced raw tomatoes, and for dessert bananas and green coconuts. A full-grown green coconut is a delectable, delicious and unadorned delicacy calculated to delight and tickle the palate of the most satiated and *habes* epicure. Taking off the husk, one of the "eyes" is opened, the milk poured out into a cup, and the shell cracked in halves, when the meat will be found quite raw, and to know how to eat it, the milk is then poured back and the contents eaten with a spoon.

After waiting a day or two in vain for a fair wind, we left Hillsboro' River with a strong southeast wind and a heavy chop sea, and sailed close-bowed, making long legs and short ones down the coast, bound for New River Inlet, twenty miles below. After a few miles Jack was compelled to go below and Skipper was anxious to put back, but we were obliged to know how to handle the boat, and in a heavy sea. She worked to a charm, and after an exceedingly rough passage, the sea running very high, and in the teeth of a half gale, we made New River Inlet, where, though the tide was ebbing, there was plenty of water on the bar, and we at once made the run in, with Skipper at the masthead to look out the channel. A large brig beating down the coast ahead of us and laboring hard in the heavy sea, was visible to us for some miles, but we were so close that it was, forsooth, lumpy and dusty enough, and proved to be the roughest bit of sailing we encountered on the voyage. The wind had been squally for several days, hailing from northeast to southeast, consequently, old Atlantic was on a high and tried his best to carry our bowsprit away, but it was a stout stick and stood the market bravely.

As we anchored in the river a hundred yards above the north point of the inlet, where there was plenty of water and good holding ground for the mud hook. New River, for six miles above its mouth, is the straightest, deepest and finest river I have seen in Florida, although a narrow one. It is famous for its sharks, regular man-eaters, some of them, and for the immense numbers and variety of its fishes. The boys drove down a saubing post at the point of the inlet, where they baited our shanks with their arms, which I had, in return, on that occasion, with the utmost complacency and even with hearty satisfaction, helping them to haul out some of the larger ones, for I remembered how nearly I came to being devoured by the monsters, at that very place, three years before. On that occasion Wash Jenkins, who has charge of the Life Saving Station (No. 4), eight miles above, had sailed us down the river to the south shore of the inlet, where we remained our tramp to Biscayne Bay. It was that stick of a snake near the top of the inlet, and the scrub at the inlet, so that he, seeing the smoke, could sail down for us. We were gone a few days longer than we expected, and arrived at the inlet again one day about noon. We saw an old yawl-boat across the inlet, tied to some mangroves, and which belonged to old man Fitch, but so far as we were concerned it might as well have been in the sky. We set fire to the scrub, but strong wind and rain from the north kept the smoke near the ground and Jenkins failed to see it. We slept on the beach that night, and the next morning I told my party that if they would help to build a raft, I would cross over and get the boat, when we could walk up the sea beach to the station. We found a few water-soaked logs and tied them together with vines, constructing a rude raft about seven by three feet, but which, of its own weight, settled first with its water. I found a flat stick like a garden paddle, some five feet long, a half inch thick, and three inches wide, which I don't duty as a paddle. I mounted the raft, which sank to the bottom in the shallow water, but by floating it into deeper water I managed by great care to preserve my balance, standing upright, and found that it would sustain me, though it sank beneath the surface some six inches, with my weight.

At low water slack I started, but I found it difficult naving my raft manage to rise out of the water, and I accordingly ran up and to prevent the frail structure from turning turtle and spilling me overboard; a single plank would have been a ship in comparison. But by dint of hard and careful, but extremely slow work, I reached the middle of the stream. The tide then began to make, and with it came hundreds of sharks, string-rays, sawfish and porpoises. I had not thought of them before. These man-eaters swarmed around my raft, making me rather nervous, but I was so close to the fish would come darting toward me, stop suddenly, wagging his tail, seemingly undecided whether to run a saw on me or flop me over with his tail, while the harmless porpoises went rolling by, thinking it great fun. The slightest

touch of a shark's tail would have capsize my raft and sent me floundering into the water, where I would soon have been divided, piece meal, and distributed into the maws of a dozen sharks. But I struck at them with the slight paddle whenever they came too close, and thus kept them at a respectful distance. While using the paddle in this way, I cracked at the middle of it required double caution in paddling and striking. Finally, after a half hour's hard work I succeeded in getting across safely, where I hauled out the boat, in which was an oar, and sculled over after the boys. Under such trying circumstances there is nothing like self-possession, level-headedness and presence of mind, unless it be, as Pat said, absence of body.

Rushing in and out with the tide, at New River, fishes can be seen by thousands, swimming, and in a little while the white rag tied to the hook and thrown to them by a strong hand line. We took creville from ten to thirty pounds, always large ones here, never less than ten pounds. By anchoring a hoit in mid-stream they can be speared or grained as they swim rapidly by, often pursued by sharks and porpoises. Mr. Jenkins takes them in this way up to forty pounds and eures and smokes them. The largest alligator we killed was here. He had crawled on to the shore where the boys had some heads, when Jack shot him from the schooner with a mid-range Peabody-Martini rifle at a hundred and fifty yards, knocking the cap of his skull off; he was twelve feet in length. Alligators seem to be as much at home in salt water as in fresh.

Six miles above the inlet is the "haulover," opposite the site of old Fort Lauderdale, and marked by a group of cocoanut trees. From here the river runs southerly, to its mouth, and parallel with the same heads, with intervening strips of ridge being nowhere much over a hundred feet in width. At the haulover the river spreads out into a broad, shallow bay, into which empty its North and South branches and several creeks, and is diversified by several islands. Two miles above the haulover, on the east bank, is the wharf or landing of Life Saving Station No. 4, the latter a quarter of a mile away on the sea beach. We made fast to the wharf and went to the station to see my old friend Wash Jenkins, the boatman, who had come with him alone, his family being away on a visit to Key West. He was very glad to see us, not having seen a human face since his family left three weeks before. His nearest neighbors are at Biscayne Bay, twenty miles below, and Steve Andrews at Station No. 3, twenty-four miles above.

We spent two or three days here shooting ducks, coots and snipe, and one day went out with Jenkins and his dogs for deer. Wash, one mile from the neck of land between the North Branch and creek, drove the rest of us taking stands across the timbered strip. I was sitting at the edge of some spruce pines, near an open space covered by galberry and myrtle bushes, when I heard some quail near by. I began to whistle and call them up, and soon had them all around me. There were, perhaps, thirty of them; they had never seen a human being before. I kept perfectly still, but continued whistling and calling, and had them hop about on their feet, cocking in the combing little heads and looking knowingly at me with their bright round eyes, as they ran about picking at the buds and leaves and bits of grass, twittering and chirping like so many young chickens. They soon wandered off and I was alone again.

That night we planned an expedition up the South Branch to the Everglades, to visit an Indian village, some twenty miles distant. Accordingly, next morning we moved the boats and set out on foot, carrying our arms, traps and taut. Taking our guns, a rod or two, some trolling tackle, and grub enough for several days, we embarked on an Indian cypress canoe, belonging to Jenkins, some twenty feet in length, and two feet beam, with sprit-sail, poles and paddles. We started at nine o'clock, sailing across the bay to the South Branch, which, being very crooked, we furled the sail and each man took a paddle. This branch of New River is much like other rivers in Southern Florida, about an average width of fifty yards, with perpendicular banks, green to the water's edge with a profusion of wild grasses and shrubs, and with a varying depth of from three to twenty feet. Many alligators were sunning themselves on the sand spits at the lower end of the stream. As we progressed the water became deeper and the current stronger. The banks were clothed, usually with pines, with an occasional bunch of palmetto, water oak, swampy maple, bay, Spanish ash and other timber. Here and there were little coves or bights thickly grown with rushes, and aquatic plants bearing bright-colored flowers.

We soon reached the great cypress belt, through which the amber-colored stream poured silently and swiftly, though so clear that great masses of white, coralline reefs, seams, fissured and lying in endless confusion, could be plainly seen at the bottom, through the water. There were growing in the bottom beautiful and curious aquatic plants and crosses. The tall cypresses, with pale and grizzled trunks, stood in serried ranks like grim spectres, ornamented in a fantastic fashion with the scarlet plumes of air-plants, while their long arms meeting overhead were draped in heavy folds and festoons of gray Spanish moss. The solemn and impressive stillness was broken only by the whistling of some startled egret, lily or osprey, which echoed through the weird forest with a peculiarly hollow emphasis, and at last died away in a low mournful cadence. Our own voices sounded unnatural and strangely sonorous, resounding as though beneath the dome of some vast cathedral.

Passing through the cypress belt we came to the "sloughs" where the stream divided into several smaller ones. The "sloughs" is a margin of tall grasses and shrubs of very luxuriant growth, intersected by numerous small streams, and lying between the cypresses and the Everglades proper. Getting through this we finally emerged into the Everglades seemingly a sea of waving green grasses, with innumerable islands of all sizes. But these grasses are all growing in water, clear and limpid, with channels a few feet wide, diverging and crossing in every direction, through which a canoe can be sailed or poled; there was then two feet of water in the Everglades, and the water was uninfected with the salt and went skimming along, greatly to our satisfaction and relief, for we were quite tired after paddling up stream some six hours.

It is a hard matter to convey a correct, or even an approximate idea of the region called the "Everglades," it is unique, there is nothing like it anywhere else. As far as the eye can reach stretches a broad, level expanse, clothed in verdure of various shades of green, with a few tall, thin, and leafless cacti seen nowhere but here. The surface is dotted and diversified by thousands of islets and islands, of all shapes and sizes, from a few yards to many acres in extent, clothed with a tropical luxuriance of trees, shrubs and vines. The

mangrove here gives place to the cocoa-plum, which grows in endless profusion amid the swamp maple, sweet bay, mastich, water poplar, gum, limbo, satin wood, water oak, and lowering above these, clearly revealed against the blue sky, the plume-like palmetto, while the ever and around all, running riot in their exuberance, are innumerable vines and creepers bearing flowers of gorgeous dyes.

Seeing a smoke several miles away, we sailed in that direction through the intricate and narrow channels, often making short cuts by plowing through masses of lily-pads, deer tongue and lotus. As we neared the smoke we saw several canoes shoot out from behind islands on our right and left, their white sails gleaming and darting along in the rays of the setting sun like sea-gulls, but all proceeding in the same direction, toward the smoke. Suddenly, one we had not seen came swooping down upon us like a huge bird of prey from the shelter of a small island, a tall young Indian, clad only in a light-colored shirt, a red belt and an enormous red turban, stood upon the pointed stern guiding the canoe with a pole, while an elderly Indian sat amidships holding the sheet of the sail. They sailed toward a converging channel into our course and waited until we were alongside.

"How 'd'ye!" said I.
"How!" answered the old man. "Me see 'um canoe; me see 'um white man; me wait; me glad see 'um. How!"
"We come to see you; have a good time; come to see your village," said I. "We got big canoe—schooner—at station—at Jenkins's."

"In-eh!" (yes, or all right). Me glad see 'um; in-eh!" replied he.

Hero Jack put in his oar, saying: "We like Ingu; big Ingu; Mr. Lo! Come see 'um; big Ingu, whoop-eh! squaw, hoop-la! papoose, hi-yah! wigwam! wampum! you bet! wa-hoo!"

I saw from the twinkle of the old man's eye that he understood English very well, as he replied, good-naturedly:

"Big! Young man—talk here—talk much—ho-la-wau-goo!" (and, on to go). Then he continued: "Me Tiger; Big Tiger—old Tiger—old my father—the chief—the chief! Then, pointing toward the pines on the mainland, he said: "Me go—village—you come—in-eh!"

The y, hauling at the sheet, they shot away, our own heavily-laden canoe seeming to stand still in comparison. These Indians had been at work in their fields on the islands, but seeing us coming, they quit work earlier than usual so as to get to the village before our arrival.

Natural History.

THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance.

Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH.

FAMILY FALCONIDE: THE FALCONS.—CONCLUDED.

13. Marsh Hawk—*Circus cyaneus* Aud.; *Circus hudsonius* Ridg. 430; *Circus cyaneus hudsonius* Cs. 480.—Abundant. Arrives in April. Breeds on the ground; lays from four to six dull bluish white eggs, generally faintly blotched with purple. The male incubates the eggs in May. The eggs are laid throughout the inhabited portions of the State. The light gray plumage and the comparatively smaller size of the male bird misleads some persons into the belief that it is a different species of hawk from the larger female with its rich cinnamon brown coloration of plumage. But the large white space over the base of the tail, common to both sexes, may easily be seen as the bird pursues its low flight over the fields and meadows, and is a characteristic marking of the species. The marsh hawks do not frequent the forests, but make their haunts about the fields, marshes, and open lands, where they may be seen quartering their chosen ground as systematically as trained hunting dogs. They are very destructive to small game birds, such as are found in the fields and marshes, and they also prey upon mice, frogs, snakes, &c. This hawk does not commonly pursue its prey but pounces upon it unawares.

14. Cooper's Hawk—*Accipiter cooperi* Aud.; *Accipiter cooperi* Ridg. 431, Cs. 495.—Rare. An occasional visitor from the south. I have never observed this hawk in Maine, nor even seen a specimen killed here. Prof. A. E. Verrill mentioned it in his list of the birds of Norway, Maine. Mr. Bourdman mentions it as "rare." Mr. N. C. Brown informs me that he has seen but two specimens here. One of these in the possession of Mr. L. C. Daniels, taxidermist, at Portland, April 15, 1875, and the other was alive in captivity at Gorham, Maine, in the possession of Chas. B. Merrill, Esq. Mr. Harry Merrill gives me the record of two specimens killed in Penobscot county; one in 1878, and one in 1881.

Although not a very large hawk, this bird is endowed with great strength, daring, and speed of flight. Many hawks capture their prey chiefly by darting suddenly upon it, but the Cooper's hawk will pursue the swiftness of his while on the wing, with a sustained flight that I believe to be unsurpassed in speed by any other bird. I remember an incident that well displayed the wonderful rapidity of flight of which this hawk is capable.

One autumn day in Virginia, while shooting partridge, or quails (*Ortyx virginianus*), a partridge that had been well alarmed by a shot from each of my two companions, flew close by me, and at that instant I observed the bird to suddenly increase its speed, as a Cooper's hawk gave chase. Swift as was the utmost speed of the partridge, yet much swifter was that of the hawk, which was quickly overtaking its prey as both birds disappeared from my view over the tops of a grove of small pine trees. The incident served to illustrate the facts that a swift-flying bird like the partridge, already frightened, was capable of greatly increasing its speed upon urgent and necessarily demanding it, and that a hawk of this species is capable of a sustained rapidity of flight even greater than the utmost speed of the *Ortyx virginianus*.

15. Sharp-shinned Hawk—*Accipiter fuscus* Aud.; *Accipiter fuscus* Ridg. 432, Cs. 494.—Abundant. Arrives in April. Breeds on trees. Lays four or five eggs, white with brown blotches, in May. Next to the marsh hawk the most abundant species of hawk throughout the State. This little hawk is not much larger than the rusty-crowned falcon, but in its appearance it seems like a diminutive fair sibling of the Cooper's hawk. The sharp-shinned hawk is a deadly enemy to small birds, such as warblers and sparrows, but does not commonly attack birds larger than these. It is often locally, but erroneously, termed "pigeon hawk" in Maine. I shot a

Game Bag and Gun.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

THE NEW YORK GAME LAW.

A meeting of the Committee on Game Laws of the New York Legislature was held on Tuesday at Albany, to hear arguments on Assembly bill No. 8.

Gen. S. W. Johnson occupied the chair. Of the committee there were present Messrs. Helm, O'Connor, Locke and Biltner. Messrs. Geddes, Irvin, Goddard, Bailly, Ferris, Church, ex-Senator Wagstaff and Dr. Piffard, of New York; Mr. J. D. Collins, of Utica; Dr. Phelps, of Franklin county, and a number of gentlemen from other counties appeared before the committee to represent their sections of the State.

The Chairman read the first section with regard to the change in the time for deer. Mr. Collins stated that Mr. Hoard had written him in behalf of the citizens of Ogdensburg, stating that they desired the privilege of eating trout and venison at the same time. He therefore suggested that the time in Bill No. 8 be extended so as to make the open season from Aug. 15 to Nov. 15. Mr. Irvin of St. Lawrence spoke for the sportsmen of that county, and opposed any alteration of the present law. He also strongly advocated the forbidding of the use of hounds. Mr. Goddard supported Mr. Irvin's statements. Senator Wagstaff preferred to leave November open. Dr. Phelps, of Franklin, made a strong appeal for the protection of deer from night shooters. He said that men came to the woods in August and slaughtered the deer by scores with jacks, and that it is impossible owing to the darkness to detect the offenders. He also gave a graphic picture of the manner in which the deer are killed during deep snows by men on snow shoes.

The Chairman then read Section 2 of the amendatory bill. Mr. Bailly, of Snfok, said that the provision forbidding summer bay bird shooting was oppressive to the people of Long Island. Mr. Wagstaff favored the prohibition of spring bay snipe shooting, but would have the clause relating to ducks as it stands, i. e., no duck shooting after April 1. The representative of Essex and St. Lawrence advocated the forbidding of all shooting of ducks and bay birds after February 1, but stated that bay birds should be shot after July or August 1. Mr. Church, of Queens, requested that the bill might be so amended as to allow the use of batteries in Long Island Sound and adjacent harbors.

Section 3 was now read. Mr. Wagstaff hoped that the section would be so amended as to permit the shooting of woodcock on Long Island in August. A gentleman from Lewis county desired to have that county excepted, and another from Wayne asked the same favor.

Sections 4, 5 and 6 of the bill seemed to be generally satisfactory.

Section 7 was read, and the representative of Forest and Stream said that the provision limiting the number of specimens to be taken by any licensed collector during one year was oppressive to the ornithologists, and recommended that it be amended.

In Section 8, Dr. Piffard suggested that the English sparrow be added to the list of birds whose nests might be legally robbed. The reading of Section 10 gave rise to considerable discussion. Mr. Collins explained that the provision forbidding the taking of trout of any kind at any time for the purpose of stocking private ponds, was aimed at individuals in his section who stocked private ponds, and who hire men, women and children to catch from the public waters all the trout that they can possibly take, and transfer them to preserves, from which they sell them. He stated, also, that these parties actually go to the spawning beds, secure the trout spawn, and transfer it to their private hatching houses, and suggested that this ought to be forbidden by law.

There was but little discussion over the following sections until Section 14 was reached, when ex-Senator Wagstaff suggested the placing of a bounty of fifty cents on the fox. On reading section 16 it was suggested that the time for selling venison should be extended to Jan. 1, provided that the time for killing was extended as above suggested. In Section 17 an exception was suggested in favor of tide water mills and of mill ponds.

The chairman stated at the close of the meeting that the committee were anxious to give to sportsmen all the protection which they desired, but alluded to the very widely different opinions which seemed to be held on some important points.

Editor Forest and Stream:

I am surprised that you advise the Legislature to open the season for bay snipe shooting on Long Island on August 1. Of course the date for opening named in the bill at Albany (October 1) only shows the ignorance of our game-law framers for after October 1 almost all the bay birds are gone. But a law opening the season at August 1 would only serve the purpose, if observed, of allowing many a good flight of such birds as dowitchers, which come back in July, to pass on to Jersey swamps. As bay birds come to our shores only on their way South (and back again the next spring), there can be no reason why a summer bird should not be shot whenever it arrives.

I am an earnest advocate of the prevention of all spring shooting; but I know that the Long Island people would pay no attention to a law forbidding bay bird shooting later than July 1.

Editor Forest and Stream:

As to the catching of trout for stocking purposes. The reasons for this are very important; the most so of any provision in the bill. In this section of the country, men, women and children are employed to fish the small streams for salmon trout. They are kept alive in boxes and carried away to restaurants to be served up to customers—put into private ponds to be sold out in season. In Redfield, 160,000 were carried away alive in one season. At the Trenton Falls trout ponds an equal number are caught and sold each year. The proprietor fishes the whole close season, keeping his fish alive to stock his ponds for the coming season, taking them from spawn beds and small streams and in any way he can obtain them. There are other ponds doing the same

thing. The result is, the most abundant and prolific streams are utterly depopulated of trout. At other places, they are caught in the same way and placed in a public stream, upon premises owned by a hotel proprietor, where guests that are taken to the detention of all other streams for twenty or thirty miles around. Unless this practice is prohibited, good-bye to trout, and that very soon. The plan is, to let those who want trout for stocking purposes either breed them or obtain them from the State hatcheries, as is provided for by the laws relating thereto, which are independent of the game laws. If the friends of protection are interested in the protection of trout, let them by all means insist upon the amendments as framed, or even that they be more stringent than now proposed.

UTICA, New York.

JOHN D. COLLINS.

Editor Forest and Stream:

Bay snipe commence to come about the 20th of July, and travel until about the first of November. These birds are all birds such as you shoot over decoys, namely the large small yellow-legs, jack, curlew, robin, willows, dowitchers, hunt birds, and black breast plover. They return again in May, when there is a two weeks' flight. English snipe come here about the middle of March and stay until the first of May, and return about the first of October, and stay until it freezes up.

There is a little of all kinds of shooting here all the time. The day it snowed and blew so hard I killed three wild geese in the river. I have killed some mallard ducks in the river this winter, the first I ever saw. I am greatly in favor of abolishing spring shooting. If something is not done soon, there will not be any game left. Battery shooting at ducks should be stopped from Maine to Florida. It is not any use to stop it in one State, because the birds would be killed in the next State. We could have the best duck shooting in our bay that there is in the world, if it were not for disturbing the birds on their feeding grounds. There are two marked gunners neighbors to me, since last fall they have killed three thousand ducks, mostly broadbill, with some redheads, canvas-backs, and whistlers.

What point shooting we could have if ever the time comes that every battery is burnt up! There are three things we do not want, one is spring shooting, another batteries and finally cats. The cats destroy more quail than hawks and gunners combined.

SAVILLVILLE, Long Island.

Editor Forest and Stream:

I wish to enter my protest against the amendment of Section 1, Chapter 534, which prohibits the shooting of deer with the aid of jack lights, or otherwise in the month of August. A friend and myself have, for the last seven years, spent from three to four weeks in the Adirondaeks, and the last three years have each taken a son with us, the youngest being but eleven years old the first year that he went in. We always camp out, kill what deer we want to eat, also catch fish for our own use, and have not wasted or brought any venison out of the woods. Now, if I could not in the only month I can get away from my business, and I believe I speak for a large class of persons that are situated in a like manner. I also believe that if I had not taken just such a vacation, that my health as well as my friend's would have broken down, so that we could not have followed our usual avocations the remainder of the year.

The month of August is the best part of the year for any one used to live in the woods in the North Woods, and it looks as if the advocates of this change in the law wished to freeze out just the class of persons that it does most good to take this kind of recreation. Now from my own observation I think more deer are killed in July than in August. Only enforce the law as it now stands, and after what few are killed in August there will be a good show for those parties that wish to go in September and October with their packs of dogs and run the deer into the traps. Now, if I could not in the only month I can get away from my business, and I believe I speak for a large class of persons that are situated in a like manner. I also believe that if I had not taken just such a vacation, that my health as well as my friend's would have broken down, so that we could not have followed our usual avocations the remainder of the year.

Editor Forest and Stream:

Should the number of natural history specimens (of one species) allowed to be taken, be limited to five annually, as provided in the Townsend bill, or limited at all? Neither, decidedly; for at the rate of five per annum, it would require three or four years for an ornithologist to collect a series for a simple comparison, not to mention any extensive work with a species. And now, look at it in perhaps a more practical light: Let a man start out to-day with his collecting outfit, his object being to collect some adult males of *Sayornis nigricans* (lesser redpoll). Well, let him be fortunate enough to come upon a flock of this species containing several males; and now, while creeping up to pick out the rose-breasted bird, he is left just as it is in regard to shooting deer in August. They are then in good condition and the fawns are able to care for themselves; and may the time never come when there are no deer in the Adirondaeks is the sincere wish of

HARK.

fully balance all things. It is only where that desecrating monster, man, interferes, that the scales are not evenly weighted. A sportsman or gunner will shoot a hawk or an owl, either on principle or by instinct—perhaps both—when ever an opportunity presents itself, provided only he is not in the immediate vicinity of game. To offer a bounty on these birds means to have every boy and every loafer of the country village turn out with the old musket or like arm, to try to make a dollar or two by the bounty. Of course this causes a decided decrease in the number of birds of prey. And what of it? Why just as decided an increase in the numbers of depredatory rodents and weasels, and consequently a corresponding decrease in the number of birds, both song and game. For we cannot forget that the food of our *Falco* and *Strigidae* consists mainly of the small animals, reptiles, batrachians, etc. (only about five per cent. of the contents of the stomachs of the birds of prey examined by me have been avian remains, the remainder being either those of the mammalia or reptilia). And then too, all those notes that were in your paper some time ago, concerning the depredations of our snappy little red friend the red squirrel *Sciurus hudsonicus* must be taken into consideration, for he together with like plunderers, is quite an item in the menu of these birds.

The views expressed above agree with those of all the other members of the Linnean Society of this city, with whom I talked at the society's meeting of Saturday, January 27.

New York, February, 1883.

LOUIS A. ZIEGLER.

[The bill provides that the societies which may grant bounties to collect specimens shall be: The New York State Museum; the American Museum of Natural History; the New York State Natural Sciences; the American Society of New York City; the Lyons Scientific Association of Cornell University; the Poughkeepsie Society of Natural History; or other scientific college in the State having a department or museum of natural history.]

THE QUEBEC ASSOCIATION.

THE twenty-fourth annual report of the Fish and Game Protection Club of the Province of Quebec, presented Jan. 20, was as follows: The executive committee, in presenting their annual report, congratulate the club, first of all, upon the unprecedented success which it has achieved during the past year.

This success is not alone confined to its financial affairs, which are highly satisfactory, as will be seen by the treasurer's report, nor yet to its great increase of membership, but it is to be found in the fact that the club has become known and its weight felt throughout the whole province.

The laws for the preservation of fish and game are becoming better observed every year, and people are beginning to find that the consumer is feeling even a greater benefit from the enforcement than the market hunter or the sportsman.

Your committee has great pleasure in reporting that during the last session of the Quebec Legislature an act was passed for the better preservation of the game of this Province.

The following are the amendments to the game act (as it then existed) which your committee recommended, and which were adopted before the committee of the House by a majority which twice visited Quebec for that purpose:

1. That the close season for deer, caribou, moose, and their fawn, should commence 1st January, instead of 1st February, to prevent these animals being butchered in the deep snows of January, and at a period when the females are heavy with young.
 2. That the close season for partridge should commence 1st February, instead of 1st March, so as to give one month's additional protection, this species of game being rapidly exterminated by snaring.
 3. That the close season for black duck, mallard, wood duck and teal should commence 1st March instead of 1st May, your committee contending that it is impolitic to molest these birds in the spring, when they come here to remain for the purpose of breeding; the numbers killed some seasons being immense, besides those that are driven from their natural breeding grounds.
 4. That the snaring of hares be prohibited.
- The following are the changes which were actually made in the law as regards close season:
1. Moose not to be taken or killed before 1st September, 1883. After that date close season for moose, deer, and caribou to remain as before—viz., 1st February to 1st September.
 2. Close season for hare changed from 1st February and 1st September to 1st March and 1st November.
 3. Close season for partridge changed from 1st March and 1st September to 1st January and 15th September.
 4. Close season for wild ducks of all kinds, and geese, from 1st May and 1st September to 15th April and 1st September.
 5. Close season for insectivorous birds, or more properly for all other birds than those named in the act, excepting eagles, hawks, wild pigeons, crows, ravens, waxwings, and shrike, from 1st March and 1st August to 1st March and 1st September.

Your committee, while regretting that deer, caribou, and moose have not received the protection asked for, and that the snaring of partridge has not been prohibited, consider that a great step in the right direction, and that the bill as passed is a very great improvement on anything we have heretofore had.

The thanks of the club are due to the Legislature for the manner in which they have taken up the matter, and for the kind consideration which they have shown toward the club. Throughout the past year the laws have been very well observed in and about the city. The dealers and markets have been closely watched for game and fish offered for sale. Only a few cases have been reported, and these were successfully prosecuted. Twenty-two persons in all were taken by the club during the year, out of which we obtained sixteen convictions. Seizures were made at several times of fish and game in the hands of express and forwarding agents, that had been shipped to this province during our close season, and which was distributed among the hospitals and other charitable institutions of the city.

The thanks of the club are due to the railway and steamboat companies who have allowed us to pass freely, and to assist our officers. Thirteen unlicensed acts have been seized, and a great number of fish baskets and other illegal apparatuses destroyed. In many cases it was impossible to find the owners of these nets and traps. If the funds of the club will permit of it, your committee would strongly advise that an officer be kept on the St. Ann's District constantly

from the 15th April until the 1st July in each year. This district would include Isle Perrot, Vaudreuil, St. Eustache, and Horse Island at the foot of the Cascade Rapids. As this locality contains so many islands and channels, it is very difficult to protect, and requires to have a man constantly on the ground.

Your committee has much pleasure in reporting that an officer has been appointed for the River Benedict, and that that very valuable breeding river is now well protected.

During the month of August a guardian was sent to watch the lower end of Lake St. Francis, and remained there until Mr. Baker was appointed to that district by the local government. The shooting on this lake has greatly improved this year. The new game act, which imposes a \$30 license on all non-residents of the Province, has effectively protected it from the horde of American market-hunters that formerly shot over it. Officers were also sent to look after cases which had been reported to the club from Missiquoi, Pike River, St. Hyacinthe, Dundee, Sorel, River Maskinongé, St. Jerome and other places; also to visit the lakes in rear of Terrebonne and Argenteuil.

Beside the convictions obtained by the club, we have paid rewards to persons who have obtained convictions under the game act.

At a meeting of your committee, held in November, it was resolved that the sum of one hundred dollars be asked as an extra subscription from members for the purpose of sowing wild rice on the feeding grounds of water-fowl, and that a petition be forwarded to the local government asking for a grant of \$500 for the same purpose. A deputation waited upon the Hon. Premier, and after explaining the object the amount asked was granted.

The annual dinner took place at the St. Lawrence Hall on January 26, and was attended by over fifty members and guests. It was as usual a very great success.

During the past summer the Fish and Game Club was formed in connection with the Fish and Game Protection Club, the object being to acquire and maintain a club house for the use of its members, and members of fish and game protection clubs are alone eligible for membership. It is managed by a committee of five, chosen from its members. It has proved a great success, its list of membership numbering some 120 names, and its very comfortable rooms are well patronized.

Your committee have had more to acknowledge the very valuable services of Mr. Eugène Roy, and would like to thank of the club are due to this gentleman, for the very able manner in which he has conducted our cases in court.

During the past summer your committee had printed a large number of posters, setting forth the close season for game and fish, and also the changes that had been made in the game laws. These posters were distributed throughout the Province, and posted in railway stations, hotels and country stores.

The total number of members at the present time is 387. There has been added to the list 102 new names since our last annual meeting, and 40 have been struck off for non-payment of subscription.

All which is respectfully submitted.

G. H. MATTHEWS, Secretary.

"HUNTING WITHOUT A GUN."

WHILE hunting in the Rangleys wilderness, way back gone in the "forties," when the woods were stocked with game to their full capacity, before the white man had become to thin out the moose, deer, caribou and the fur-bearing animals, I began an exhaustive trapping effort which lasted for twenty years.

In the fall hunt, while setting traps and boating here and there through the lakes, ponds and rivers, it was very necessary that I should carry a gun, but when the lakes and rivers were open and the snow had melted, and I was covered with snow, and the snowshoes had to be worn, and the heavy pack had to be shouldered, loaded not only with bread and pork and other shank for a ten day's cruise, but with traps, bait, blanket, cooking utensils, such as camp kettle, frypan, and other "calamity" beside an ax and gun, it became a serious question, what particular article of weight could be left out to lessen the load.

For two or three years, when I carried the gun and found it very convenient to bring down grouse, rabbits and larger game sometimes, for my daily living. Finally I gradually left my gun in camp through the winter months while trapping, and carried it only when on a moose or bear hunt.

Through the coldest weather very little game is stirring, and it requires considerable courage to lug a good-sized double gun that would do for I was "making unless you can get some reward for it. Yet I could have killed in all those years, I am satisfied, enough to have well paid me if I had always carried it.

I frequently saw otter, mink, lynx and other valuable game, and it was very tantalizing to stand and have it come up within easy range and know you cannot secure it, and think, "I wish I only taken my gun."

At one time I was going up the snow from the sun, which was shining brightly in the early morning, when I saw a fox coming down toward me; the sun bothered his eyes and he came down within rifle shot before he discovered me—but when he did, he stopped short—I stood still, and after looking me over for some time, he came along several rods and then halted again. I stood still from the first and thought I would see what he would do for I was "making unless you can get some reward for it. Yet I could have killed in all those years, I am satisfied, enough to have well paid me if I had always carried it.

At another time I was standing on the shore of a pond, the snow being some four feet deep and a warm winter day, when up came an otter within ten yards of me, from under the ice through the snow; and, by standing perfectly still, I had a fine view of him and his pranks. He would roll over and over, and then stick up his nose and snuff; then make two or three jumps; then slide on his belly on the hard snow; then stick up his nose toward me and snuff again. This he repeated constantly until I started to get between him and his hole in the snow, when he just let me see his prowess—he did not seem to run or slide, but he went for that hole in no time, and was out of sight.

At another time I was traveling in the woods on the side

of a mountain, when I heard a moose very near to me! "Thug, thug, thug—like striking an ax on a rotten log. (This is a common sound they make to call their mates, and is made, I think, only by the male.) This time I had a Colt's navy revolver in my knapsack, but while I was getting it out, the old fellow made off. I felt, however, that if he had discovered me, and had been in the mood of it, he could have demolished me in a minute.

Another time I was fishing on the west arm of Molly-chunkmunk Lake one cold morning, when I saw a mink come from the shore out toward the middle of the arm within easy range, had I had a gun, but I had none, and the next best was to get between him and the shore and try to run him down on the ice. Well, he allowed me to get the inside track and then it was nip and tuck across the shore. Presently as I came near to him he ran into a lump of snow, about as large as a bushel basket, which happened to be just there. I got on to my knees and peeped in, for minks were then worth ten dollars, and I felt sure I had him safe, so I began to dig away the snow with my hands, when all at once down I went into the lake all over. The bunch of snow covered a breathing hole in the ice and the mink disappeared with him, and I realized that I was up to half way to camp on the run, where I found my clothes frozen stiff and locomotion difficult.

BETHEL, MAINE, 1885.

THE WORCESTER FOX HUNTERS.

THE month of January has been exceptionally bad for the fox hunters in Massachusetts. Nearly every snow storm ended with rain, making one continuous sheet of crust and ice almost the entire month. The snow of last Sunday and Monday was, however, an exception, beginning with rain and ending with a light fall of snow. Tuesday, January 30, was mild and still, in fact a perfect day for fox hunting, and all hands were out early. The rendezvous at M. E. Shattuck's cigar store was thronged Tuesday evening with members of the "fur company" and their friends, to hear the reports and it was really an entertainment worth attending. Everybody had had a good chase, whether they had killed a fox or not. The excitement ran high when Mr. Bancroft and John Stearns came in and reported two large dog foxes as the result of their chase. The details were given in full and listened to with the greatest interest, but the climax of excitement was not reached till Mr. Kinney arrived. His report was so remarkable that I think it may be interesting to the readers of FOREST AND STREAM.

Mr. Kinney went to Millbury as usual for a chase with his friend J. M. White. They started a fox early in the morning and led directly off, and the dogs were soon out of hearing with the exception of one which failed to get on with the pack.

Mr. White followed after the started fox, while Mr. Kinney kept a stand on a runway, hoping the fox would make a turn. After waiting with rain and ending with a light fall of snow, he began to think he was "left," sure. The fox failed to get off with the pack had been at work and was beginning to bark with some animation, which caused Mr. Kinney to look in that direction which was across a large pond. Much to his delight he saw a pair of foxes come on to the pond, making directly toward him. He remained perfectly quiet till they were within easy range and then he made a "right" and "left" and "right" and "left" and "right" enough to do of course, but the chance to do it is not likely to occur more than once in a lifetime. Mr. White shot at the other fox at long range, but failed to kill him. So few foxes have been added to the list as I gave it January 1, it will hardly be worth while to give it again till the close of the season, which will be March 1.

The Sportsmen Club were challenged for the State team badge, which they lost to the Marlboro' Club last summer. The match will be shot at Marlboro', Feb. 14.

Feb. 3, 1893.

GROUSE SHOOTING PAR EXCELLENCE.

"WELL, I do know of two covers of quail within a mile and a half of your place, but less me, why don't you drive over to B.?' It's only twenty or thirty miles, and you'll see more quail and meadow in one day there, than you could find in a year in our country. Of course, I've been there. Me and John and Old Dan, went regular every season, until a few years ago, when rheumatism and the like of that, laid us by the heels."

The idea grew on us. Here were Jock and Floss spoiling for practice. Here was ourself able to take a day or two, at the most, and go with them to be lost in a strange home and "make a wife" was consulted and the faithful old dog, in many a happy outing to woods and waters, before our quiver was so well filled with "arrows of the Lord," urged our going, while she tarried by the children. She, herself, packed the sportsman's valise and sent us off with orders to "come back, when we would rather be home than anywhere else."

For years we have been spending money on a country side in New Jersey, where the introductory conversation above narrated took place. Wending our way thither, James was instructed to be on hand with the bay team, Colonel and Frank, bright and early Tuesday, A. M. Imagine the next day, crisp and bright, a good looking colored man—that's James, the "boss"—that's us (when we are in the country)—a team of big bays attached to a buggy, a small liver and white pointer dog, Jock, valise, bags, bundles, gun, etc. James was to leave the four coveted articles of seeing the "boss" shoot, and picking up a rabbit "his self"—all bound for B. Floss, a Gordon setter, was left behind for lack of room, since even a sportsman's buggy won't hold as much as an omnibus.

Before we were out of sight of the house, snap! goes the frost spring. Frost and a little sleet did it. My pride ourself goes through when we start, so did not take long to impregnate the nearest vehicle—an open juggler wagon—in the service, transfer traps and send back for Floss. Once more under way we hold it true for ten miles, and then get a little mixed as to route. But the team is a good one, the air delightful, and the country surprisingly beautiful for the season, so we don't count the extra miles, and finally call halt at a roadside inn seven miles distant from B.—to lunch and get our horses and dogs and two big dogs, turning fire of the stove in the barroom. Floss is voted the best dog of our two, "only she's got the ague, bad," as with trembling delight she interprets the halt to mean business, while Jock, who, if only one dog could be taken ahead, would be preferred by his owner to any, knows there is no use in getting excited until "boss" puts on his leggings. Turning from

their interviewing of the dogs, a volley of questions are fired at us as to whence, whether, for how long, and what (and for?) in the midst of which "hunch is read." We have fared at times more luxuriously, but seldom with better appetite, and leave the little inn with kindly feelings, that change a wee when we discover later on that we have been deliberately sent five miles out of our way in order that a dog merchant may have an opportunity of showing us a dog, which he would like to sell—this, in spite of the fact that we had explained that we only were interested in birds. Discovering the fraud too late to retrieve, we hold on our way, rejoicing that though we have driven many miles further than we had intended, our road lies through romantic and at times wildly beautiful mountain scenery, and the horses don't mind, and we finally reach B.—The hotel accommodations are fine, and—the cars from Jersey City arrived about the time we did.

Instead of primal fastnesses and the gnaner's paradise we had been told to expect, and that the scenery had been preparing us to find, handsome villas, stylish equipages and a general civilized air, made our hearts sink. Inquiring for our guide, we found him out escorting a party of sportsmen from Newark. Subsequently he and they concurrently offered to let us in, but although we had a great deal going to try for birds in the direction from which we had come, we declined with thanks, and engaged another guide, "young but experienced," and the morrow beheld us off for birds.

"Ain't seen none myself this season, but know where they must be if there are any about." For six hours we climb mountains up and down; Floss, somewhat dejected, but Jock working like a mule, and the dogs, that it should have been so exactly like a machine as to be without stopping. But not a point nor sight of any game, save that James got his rabbit and the guide likewise blew smithereens out of a sleeping cotton tail. At length, standing on a knoll on the edge of a thicket with a box of fuses in my hand, essaying to light a homemade bound sugar, a shout goes up from the guide, "The fox is in a palming stance, loop!" and with a rush, in goes the guide, off goes his gun, and the fox comes straight for me, and away across the open toward an adjoining thicket. What further happened I overheard James telling in the barroom that evening. "I see got a rabbit and the other fellow he's got a rabbit, and 'Boss he fired twice at a pheasant and didn't get nothing, and I see got to take the morning in my own self."

We came home on the cars that same evening, the conditions of our return fulfilled.

BELL-RINGING FROGS.

ONE day in June, 1881, the writer and three others, including the veteran angler, Rev. P. Parker, D. D., took a trip to the celebrated fishing waters of Floy's, beyond the Ohion River, ten miles from Dresburg. We arrived there in good time to get plenty of squirrels and a nice mess of white perch and black bass, for supper and breakfast, and after a hearty supper and the usual routine of anecdotes we spread our bedding on the heavy moss carpet, with which the banks of the basin are lined, and turned in for the night. As we were in a palming stance, and listening to the delightful strains of the knocking lids over our heads, (it must be remembered that in June they sing every hour in the night as well as in the day), when my attention was called to the "tintinnabulation that so musically wells from the jingling and the tinkling of the bells, bells, bells." Knowing that Bro. Parker "knew everything," from a life-long experience in fishing in the stream, I gently called to him if he was awake, and asked him where came with the sound of so much tinkling and jingling of bells come from. "Why," says he, "they are the bell ringers." And from a thousand little throats, down among the water lilies and the "bonnets" in the basin, came gently and sweetly the tinkle, tinkle, tinkle of a thousand little silver-toned bells that lost their echoes among the majestic oaks lining the banks.

We took our boat, and in the clear moonlight we glided across the placid water to the other shore, where was shallow water, and lilies and bonnets and other water vegetation, which afforded fine breeding grounds for fish, and which was alive with these small white-throated frogs. But we did not capture any, so we left them in peace, and returned to our camp in the morning with our traps prepared to the fun on hand for the next day. If any of your readers have any similar experience would like to hear from them.

Robias have made their appearance here in vast numbers. The boys who have been skating on the ponds about town, report having seen, under the ice, large schools of white perch and myriads of minnows. A few woodcock have put in an appearance, and quail are always here in goodly numbers. S. M. Jackson and J. W. Nichols in one day last week bagged eighty-six, and on another day fifty-four. Wild geese are to be found occasionally in the wheat fields. A. B. Tigrett has killed nineteen in his field, with a Winchester.

T. L. W.

DRESBURG, TENN., Jan. 29, 1893.

NEW HAMPSHIRE NOTES.

THE present winter has been rather unfavorable for our style of fox hunting here in New Hampshire. For about six weeks there has been a crust on the snow, which would hold up a good horse, but not a good fox, and it is impossible to out. However, within a day or two there has been a heavier crust formed, and as soon as there is some fresh snow, we shall endeavor to make up for lost time.

Last winter I killed a good many foxes in the immediate vicinity of my home, and I find it has caused them to be rather scarce; but by going two or three miles from here, I can usually start one or two. The first part of the winter I had one, one of which was a gray one, the body being gray and the breast and belly black. The last time I was out I saw another like the above, only handsomer. I had a good chance to see him, as he came almost within gunshot three times. If we have any fair kind of running I mean to kill that fox, if it takes the rest of the winter.

There are quite a number of quail about this winter, which is somewhat unusual for this part of New Hampshire; whether they will stand the rest of the season remains to be seen. The ruffed grouse are also more numerous than for a number of years. Most every night I can see four or five, within 150 yards of the house, on some birch tree picking off the buds.

C. M. B.

DUNBAR, N. H., Feb. 2, 1893.

NEW HAMPSHIRE BIG GAME.—Colebrook, N. H.,—We brought out in the month of September last, three caribou from Second Connecticut Lake. I mounted the heads of two, the largest had symmetrical antlers, 28 inches spread, 32 inches from point of brow nail to top of main branch, and ten points, estimated weight of animal 535 pounds. Head can be seen in Exeter, N. H. I do not expect ever to see a larger one. Your correspondent "R" will be sad as he looks at this, they came from his favorite pond. I have not allowed the June jack-light barbarian to look at this unknown trail and in the future I will not act as guide for any man or party that brings along a gun to protect his miserable carcasses with driving that month. I hope this may be seen by all who come this way, to avoid last year's scenes at Second Lake. I received for mounting the head of a black-tail deer killed near the Garrison River, Col., with eight points on each horn, uniform in appearance, greatest width 30 1/2 inches, 2 1/4 inches high above skull. Is it unusual in size?—NED NORTON. [The horns were large.]

"NESSMUK'S" SHIELD.—Great, noble, glorious old "Nessmuk." Thy sentiments have "such divine complexion." With a Year's Service in the woods only many thousands more like thee (there would be no pothunters and trout hogs to infest the forest and pollute the streams. There would be no park improvement companies to slaughter the "antlered monarchs of the waste" to feed gangs of laborers, desecrating the lovely face of virgin nature to build high-roofed hotels for that modern vandal, the summer tourist, if there was only more of "cynical old hunters" like thee. Aye, "old woods lover," "thy destiny" which shapes our "cud's" guide my footsteps some day to thy camp "amid the dear solitary groves where peace does dwell," where I shall find no "greasy pack of cards" to detract from their surroundings, and where I may reverently look upon that old single barrel, that will never be held to bring down "the mother doe or her bright-eyed fawn" while thou art its master.—CAPT. DORSAL FINN.

GUINEA FOWL AS GAME BIRDS.—Detroit, Mich., Feb. 2. *Editor Forest and Stream:* I read "Brindle's" communication in FOREST AND STREAM of Jan. 11, "Guinea Fowl as Game Birds," wherein he says, "How these birds would be to a setter or pointer I cannot say." Three years ago last October I was shooting partridge, and when working through a very thick piece of cover, my pointer, Don, who had passed through the thicket, pointed stiff and staunch at a little clump of bushes about twenty feet ahead of me. I came up on the "ready," and after waiting a few seconds he jumped and flew away straight and strong. I shot it and it proved to be a fine guinea hen. It was fully half a mile from my house; the bird was alone and lay to the pointer like a quail. I have no doubt that if a few guinea fowl were allowed to run wild in the woods they would skulk and hide like a quail or turkey after being hunted a little.—G. M. S.

MASSACHUSETTS NOTES.—Taunton, Mass., Jan. 27.—Quail and ruffed grouse are wintering well, notwithstanding we have had some quite severe snow storms. Quite a number of ruffed grouse were shot in the open season, but enough were left to breed next season. Quail were plentiful when the season opened, but owing to the thick swamps and woods near their feeding ground, which they were ever ready to jump and dash and flew away straight and strong. I shot a large flock, feeding in an old cornfield, that I started very early, only two had been killed during the entire open season. Several other large broods lost but a few from their ranks, and if not shot during the closed season there will be a goodly number left to breed next summer. One snowy owl was taken in the vicinity of this place in November. Hares and rabbits are as abundant as usual, and several foxes have been shot this winter.—CHESTER.

QUAIL IN NIAGARA COUNTY.—Quail have not been so plenty in this county for years, owing probably to the past mild winter and favorable breeding season. Many good bags have been made in one day's shooting, among which were Abe Tenbrook and Steve Lockwood, 31 birds; T. F. Uley and Fred Hawks, 22 birds; Andrew and Wm. Patterson, 17 birds; and other parties report doing as well. I was told by a party last week that he knew of four or five bags, and that had not been disturbed, and I know of one brood within a half a mile of the city limits that had not been molested up to Monday last week. If what birds are left are well protected and we do not have too severe a winter there will probably be an abundance another season.—I. L. D. (Lockport, N. Y., Jan. 8, 1883).

THE AIR-SPACE IN RIFLES.—Philadelphia, Feb. 8, 1883.—*Editor Forest and Stream:* In discussing the "air-space" in rifles I expressly stated that bullets which were "wedged" were quite another matter. Mr. Jordan, even, ought to fear a "burst" if they fire rifles in which the bullets are stuck fast, or rifles which contain gross obstructions, such as sand, mud, snow or scales. But it is of no use. Some people will continue to lug in those things, just as, to the end of time, they will continue to burst rifles by permitting such unnatural conditions to obtain. During the last three months, in experiments I am now conducting, I have fired over a hundred shots hereon, and expect to prove my assertion exactly as I made it in your issue of Nov. 23-30, 1882.—W. MCK. HEATH.

RABBITS IN OSWEGO COUNTY.—Oswego, N. Y., Feb. 2.—*Editor Forest and Stream:* According to the statute laws the season for hunting rabbits closed on Feb. 1 in this State. The board of supervisors passed a resolution a few years ago, giving any one the right to hunt or kill in any way, at any time during the year in Oswego county. No such local law is in force, and any one who kills, or has in possession, or offers for sale any rabbit between the dates of Feb. 1 and Nov. 1, commits a misdemeanor and is liable to a fine and imprisonment.—DANIEL BOONE.

TENNESSEE NOTES.—Quail in considerable numbers are being offered on our market, and at reasonably low prices, though I regret to say they are not bagged by sportsmen. Pot-hunters with nets and traps are doing the butchery as a rule. Other kinds of game are abundant, but, as with the quail, they are not the result of legitimate sport. In fact, the young sportsmen about Nashville have abandoned the manly exercise. The few who have not, and have the means, are off to Florida, where they find better shooting than here.—J. D. H.

LONG ISLAND WILDSOWL.—Extract of letter dated Good Ground, January 26, 1883, from William N. Lane: "The bay is all frozen over. I think we shall have lots of redheads here this spring. They come in the bay every day to look, and as soon as the bay opens they will be here. We shall have an inlet now all about a week. I think we shall have good gunning this spring, as everybody is codfishing, and there won't be many eminers. There is lots of feed for redheads, and we had more in the bay last fall than I ever knew in the fall."

THE QUEBEC LAW.—Fort Covington, N. Y.—*Editor Forest and Stream:* The new Quebec game law, which was put in force on account of the "sportsmen" who come in yachts and send out boatload after boatload of "hunters," say all fall, kill any number of ducks, keep them until they spoil, and throw them overboard to the amount of two or three hundred at a time, has put a stop to the "chickens" who didn't scratch and spoil the garden. Should the chickens suffer as well as the "old hen?" Such is the law, however.—GUYFALLON.

Camp Fire Flickerings.

"That reminds me."

IN the contribution from "Porked Deer" in Camp Fire Flickerings, issue of January 18, I see that credit is given to Mr. Newton Dexter for classifying the ibis referred to. I think that the FOREST AND STREAM must have supplied the name "Newton" for I am quite sure that "Porked Deer" is not acquainted with the gentleman nor ever had any correspondence with him. My reasons for thinking as I do are: first, I received the wing and head referred to, and have them now in my cabinet; second, I sent "Porked Deer" a long account of the bird, which I obtained from Audubon and other naturalists' works; and, further, I made a drawing of a glossy ibis, which I sent with the letter containing the description. The above would not have been written had it not been for the tale connected with the killing of the last bird, the shooting of which he wrote me about, but never once hinted about "the edible qualities of the bird." "Porked Deer" and I have corresponded for some years, and he writes me of his shooting and fishing excursions, but he has never said one word about that dinner of glossy ibis on that farm in Mason Valley. How he must have suffered in mind the past three years! Only think of it!

I have never had an opportunity to try glossy ibis, so cannot judge of its quality for the table, but I have tried one bird which every one condemns as good for nothing, even to the editors of FOREST AND STREAM, and that bird is the horned grebe, commonly known as the dipper, tinker loon, hell diver, etc. Now don't laugh, for you may make a mistake, for the bird is good. Last October Mr. Payne and myself, while gunning for ducks in Narragansett Bay, killed sixteen grebes and thinking that they might be made good (although I had never heard of anyone eating them), I took them home and cooked them for supper the next evening. A friend calling in at this time was invited to have supper with us, and he being something of an ornithologist and sportsman, was glad of the opportunity. I had taken the precaution to have something else ready in case the grebes did not turn out well, but we did not make use of it for all at the table were pleased with the grebes. I wrote "Porked Deer" at the time about our shooting excursion and gave him an account of our grebe supper, and now that he may not go wrong on the grebe, I have sent him an explanation of how I cooked them. Grebe is good; but it makes a great difference how you cook them. Some day I may tell you how I did it. SAMUEL F. DEXTER.

PAWBUCKET, R. I., Jan. 22.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

There is, I think, a love of novelty in all men. We prefer to fish new waters when we can, and it is sometimes pleasant to explore, even without success, than to take fish in familiar places. New and the scenery is always worth taking.—W. C. PRINE.

POSITION OF REEL—WEIGHT OF RODS.

FOR some time I have been tempted to say something on the subjects contained in the caption of this article, but have refrained from doing so, thinking that it would be a work of supererogation. I am forced to do so now to defend myself and many good friends of mine from the idle aspersions of some of your correspondents. I hope those of your readers who may feel interested in this matter will refer to the articles cited, and read them in full, in justice to their authors, for I will only quote the points material to a proper understanding of this reply.

In FOREST AND STREAM of October 5, 1882, appeared an article entitled "The Henshall Rod," by C. L. Jordan, of Texas. In the course of this article occurs the following: "When in Florida last winter with my friend, Dr. Henshall, I had only one rod. It was what he styled 'the coming bass rod,' with ash butt and lancewood second joint and tip. I think it weighs about eight ounces, but have not weighed it. I used that rod all the time while there, and have it now in the good condition as the day I got it, nor did I use but one tip during the time."

"As to the holding qualities of this rod, its 'give and take,' its perpetual elasticity, I don't think can be surpassed on earth."

"The bass that we took in that country are simply enormous, and an eight-ounce rod that will master these eight to ten-pound fellows is certainly good enough for the most obstinate stickler."

"But in all the bass-fishing in Florida with that little eight-ounce rod and a little silk line the size of three horse-hairs, I never lost a fish, putted a line, or broke a hook but once, when I had an old, half rotted line, a seven or nine-pound bass struck just as the line got kinked on the reel and snapped it."

"The rod that I have has the reel-seat behind the hand, and the first bass that I took in Florida—a five-pound one—came near cutting my finger off with the line, I then

look the reel off, placed it above the hand, and fished it on with a string. I had no more trouble afterward. I don't see the sense of a reel behind the hand, or where the idea even came from."

In FOREST AND STREAM of Oct. 19, "Floridian" proceeds to "enlighten" Mr. Jordan, and in the course of his article uses the following language:

"It did not occur to him (Mr. Jordan) that this was another thing for him to learn, and that the burning of his fingers was due to improper handling. For his benefit I will say that this position for the reel is the result of the heavy anglers for a long time, that a reel in front of the hand adds to the apparent weight of the rod, and one behind the hand tends to balance it. If Mr. Jordan will restore his reel to the old place and learn to use it there, he will never go back to the obsolete custom of placing it in front."

Now, Mr. Jordan knew perfectly well when he penned his article, that click reels on fly rods were properly placed behind the hand, at the extreme butt; but, as his remarks applied solely and only to bait-fishing and the use of bait rods and multiplying reels, he, of course, omitted any mention of the fly rod or click reel. He particularly mentions the bait he used—"half-grown broom"—and the manner of using it—"casting the minnow à la Henshall." Yet in the face of all this, "Floridian" tells him that his trouble was due to "improper handling," and advises him to replace his reel behind the hand, and never go back to the "obsolete custom" of placing it in front. "Shadows of Walton! What lamentable 'angular' ignorance! The only way in which a minnow or other natural bait can be cast with a reel behind the hand, is the method employed by youthful anglers and negroes, who use a line tied to the end of a stiff pole. This consists in first throwing the bait behind, and then throwing it forward overhead, when, if the bait is not jerked off the hook, it is hurled into the water as from a catapult. Nothing heavier than the artificial fly can be cast neatly overhead, and this necessitates a very pliant rod. What will our manufacturers of rods say to the 'obsolete custom' of placing the reel-behind in front on bait-rods? And how about 'the observation of anglers for a long time' that led to this 'result'?"

Mr. Jordan, thinking, perhaps, that "Floridian" misunderstood him, put in a rejoinder in FOREST AND STREAM of Dec. 28, in which he acknowledges the reel behind the hand and the method of casting in fly-fishing, and then proceeds to more fully his reel, and made a mistake, and asks: "How can you cast the minnow à la Henshall, with the reel behind the hand?"

To this "Floridian" replied in FOREST AND STREAM of Jan. 11, 1883. As his article is a short one, I will consider it *seriatim*. He says: "For the style of fishing that he (Mr. Jordan) aims at, he is right in having the reel in front of his hand, and especially with the reel behind the hand."

Then where was the necessity of finding fault with him in the first place? And why advise him to replace his reel behind the hand? Mr. Jordan clearly described his manner of casting in his first article. "Floridian" can truly say, with lago: "But I am nothing, if not critical."

Then "Floridian" delivers himself of this sentence: "This is the style used in heavy sea fishing for striped bass weighing from five to fifty pounds."

"Floridian" here shows his utter ignorance of the style of angling alluded to by Mr. Jordan, and this fact, though so palpable in his first article to any well-informed angler, needed but this statement to confirm it. Sea fishing for striped bass is practiced with a very heavy and short, two-handed chum rod, and though a rapid multiplier is used, the casting is entirely and essentially different, as all intelligent anglers know, from that of casting the minnow, single-handed, "à la Henshall," as Mr. Jordan styles it.

"Floridian's" next sentence is overwhelming, far-reaching and crushing: "Dr. Henshall, like all Southern and Western anglers, believes in and uses heavy tackle, and for those who like that style it is good enough."

I would here enter my protest against this wholesale slander on "all Southern and Western anglers." In this assertion "Floridian" believes his *nom de plume*, and this reminds me that he is solely to refuse from credit to any better anglers of the South and West that I have deigned to notice an anonymous writer. It is scarcely necessary to say to any angling reader of FOREST AND STREAM, except "Floridian," that "Southern and Western anglers" as a rule, use as light and elegant tackle as those of any other section of the country. I will go further, and leave it to the tackle manufacturers of the East to affirm or deny, by asserting that, barring the "Cuisin" fly-rod, the best tackle on any better (which we have no use), Southern and Western anglers use lighter rods and lighter tackle, for the same fishes, than those of the North and East. So much in vindication of "all Southern and Western anglers," but for myself a word or two more is necessary.

Last summer I was soundly berated in the columns of FOREST AND STREAM for deprecating the use of very light rods for sizeable fish in my "Book of the Black Bass." I made but one reply to the over-zealous and irate gentleman who inaugurated the discussion, owing to his unfairness in trying to commit me to the advocacy of "heavy rods," preferring to leave the matter to the jury of your readers, rather than to continue a profitless and acrimonious discussion. Out of this matter, as all are aware, ensued a controversy on "light vs. heavy rods," which was remarkable only for its latitude and wide divergence from facts, and the evident misapprehension on the part of some of the participants. Of course, as in most discussions, rife with a prominent part, and such irrelevant and inelegant expressions as "holding hard and killing quick," "fishing for meat," "fishing for count," "bean poles," etc., were freely indulged in. Some spoke of "Dr. Henshall and his disciples" in connection with "heavy rods," even the fishery editor of FOREST AND STREAM, usually so fair and correct in his statements, was led astray by the "book" of Dr. Henshall (in Adirondack Notes) to "Dr. Henshall and other advocates of heavy rods." And now comes the feeble echo of "Floridian." "Dr. Henshall, like all Southern and Western anglers, believes in, and uses heavy tackle." "But get the pity of it, Lago! O, Lago, the pity of it, Lago!" (I have been reading "Othello" lately).

Now, it is not necessary to state to old readers of FOREST AND STREAM, that I have, since the establishment of this journal, been prominent in the advocacy of light and elegant tackle for black bass fishing; and I flattered myself that I had done the angling guild some service by inducing the manufacturers to produce a short, light and elegant single-handed bait rod for black bass fishing, and in doing away with the long, heavy and cumbersome rods formerly made for that purpose, I have always contended for a standard

weight of eight ounces for both bait and fly rods, for the smallest calibers or rods manufactured, and for the best and most approved reels and hooks for black bass fishing. I have nowhere favored the use of a heavier rod, except for exceptionally heavy bass—straggling three pounds or more, as in Florida—in which case I have stated that a nine or even ten-ounce rod would be pleasanter to handle; but even here I inserted the proviso that the eight-ounce rod was sufficient in the hands of an expert. Now, unless an eight-ounce rod is considered a heavy one for black bass angling, I defy "Floridian" or any one else to show by the record, or in any other manner, where I have advocated "heavy rods" or "heavy tackle."

The next sentence in "Floridian's" reply is as follows: "The trouble with Mr. Jordan was that he had a reel that needs to be checked with the thumb placed on a trout rod, and then wondered who ever devised the placing of the reel behind the hand."

Most trout bait-rods have the reel bands "before" the hand, but Mr. Jordan's rod was not a "trout rod," nor a fly rod, but, as he explicitly stated, was a "conning bass-rod," or "Henshall rod" (as designed by me for black bass bait-fishing), but the manufacturer who sent it to him, for reasons best known to himself, makes and advertises this rod with "reel bands above or below the hand," and "with either standing guides or rings." It is too short for a fly-rod—eight and a half feet—and, like Mr. Jordan, I can only wonder why the reel should be so placed, unless for the benefit of such anglers as "Floridian." But the rod was an excellent one, and had another redeeming feature, it weighed just eight ounces; most makers of this rod make them too heavy.

"Floridian" then says: "He (Mr. Jordan) asks how can you find a minnow *à la* Henshall with the reel behind the hand? I can only answer that you can't."

This is the only reliable statement in either of his little screeds, but then he goes on to say:

"That style requires the reel in that position, but for fine fishing a stiff trout rod with the reel behind the hand is desirable to those who prefer science to main strength."

Now "Floridian" evolved this sentence of contrarities out of pure malice, I verily believe. There is certainly no ground in either of Mr. Jordan's articles upon which to base such a contradictory statement as to fishing with "science and main strength," forsooth, and with a "stiff" trout-rod at that—and with the reel behind the hand for "bait" fishing! "O, most lame and impotent conclusion!"

"Floridian" caps the climax with this last sentence in his "reply," thusly: "I hope that we now understand each other, and that Mr. Jordan will eventually work up to the point of using finer tackle and getting more sport!"

It is consistent with the only "fact" "Floridian" would go unadvised. Yes, I think you "understand each other" perfectly. Mr. Jordan distinctly and repeatedly stated that his rod was a supple and pliant one, a little rod of eight ounces; that his line was a silk one the size of three horse hairs (it was size G, or No. 5, the smallest made; I gave it to him myself); and his reel a "Mock" (No. 2); and that with this light tackle he averaged a half dozen black bass from ten ponds, playing some of them an average of a half hour each before he was able to land them, and, moreover, "Floridian" had just volunteered the information, in a preceding sentence, that Mr. Jordan's rod was a "trout rod," yet in spite of all this Mr. Jordan is told to "work up to the point of using finer tackle and getting more sport!" But there is the "fact" of the "stiff" rod, "Floridian" persistently says that for "fine fishing," "stiff" rods are desirable, and a "reel behind the hand," but he is silent as to the line, perhaps it also should be "stiff" for "fine fishing"—it might do to "stare" it. But then, again, how is he to get "more sport"? Is it desirable to have a large fish tugging at a light rod more than "half an hour"? And, in this case, where does "science or main strength" come in? Or who displays the "science," and the "main strength"—the fish or the angler?

If "Floridian" prefers a stiff rod and reel behind the hand in bait fishing he has a perfect right to enjoy and recommend that style, and I would be the last one to object to or find any fault with him for his preference, but he has no right to interfere with or decry the methods of others upon false hypotheses, willful assumptions and gross misrepresentations.

I am always open to conviction in all matters, and would gladly learn the merits of any particular mode of angling, or the desirability of any special feature of tackle, being always willing to cheerfully and patiently investigate them when brought to my notice in a proper manner, and will always defend my own convictions and reply to those who honestly differ with me when the matter is entertained in a gentlemanly and courteous way. JAMES A. HENSEHALL.

CRYSTALIA, Ky., January, 1888.

A MOSQUITO-PROOF TENT.

NOTICING with what unanimity my brother sportsmen complain of the persecutions of the mosquito, which in the woods, I am led to give them my experience, and it is quite extensive, beginning in 1872, in the mountains of this State, and since then extended to Upper and Lower Michigan and both shores of Lake Superior.

My first regular business interview with the mosquito was early in June, and I had pitched my camp for the night on the shore of Batchawana Bay, near Irons Point, on the north shore of Superior. Our tents were sound and we had taken the precaution to hang two thicknesses of mosquito netting inside the doors. We turned in, but alas, not to rest. The sun had scarcely set when our friends began to drop in, and in a short time the air was thick with them; they went to work as though they had not had a meal that session, and drove us nearly frantic. We brushed powder until the air was so thick with smoke that we were obliged to lie down in order to breathe; but it was of no avail, the smoke seemed just the same they needed for their meat, and finally we were obliged to take to the boats and lie off shore until morning, when we rescued our property from the tents and proceeded on our way. That night broke the spirit of P. I was days before we recovered from the effects of the poison.

That and numerous other similar experiences disgusted me so much that I invented what probably may another sportsman has made, but I have never seen it mentioned in print. In the Lake Superior country I always use a size ten and in addition have a tent the exact duplicate in size and from the same material as inside the tent, the was used. It is heavily bound at all the seams and has four brass rings made fast at equal distances along the ridge,

There are also other rugs placed at intervals of, say a foot along the eaves, i. e., the angle of the roof with the wall of the tarlatan tent.

After pitching the canvas tent I hoist the tarlatan tent up to the ridge pole by means of cords made fast to the ridges on its ridge, and passing over the ridge pole. I then hook the rings along the eaves into hooks or snaps which are placed along the top of the wall inside the canvas, thus making the tarlatan fit snugly to the inner side of the canvas. The hooks and rings along the wall may be dispensed with and pins used instead, but I have yet to see the man who loved a pin.

The tarlatan or other similar material should be used, as the meshes of ordinary mosquito netting are too coarse, and great care should be used in making it up. The seams and edges should be securely bound with linen or other suitable material to insure durability. The one I have was made in 1878 and is as good as new to-day.

My experience in the woods led me to the following conclusions, which can be taken for what they are worth, viz.: That black flies are active in the daytime and prefer the open to the thick woods, while on the contrary mosquitoes are active principally at night, and in the thick woods and underbrush. I therefore pitch my camp in the woods, within a short distance of the stream, and am annoyed but little while attending to camp duty in the daytime, while at night I build a roosting fire in front of the tent, throw open the canvas front and lie inside the tarlatan enjoying my pipe, the cheerful fire, a game of cards and above all the angry protests of the infuriated mosquitoes who have assembled in clouds but can't get in.

The tarlatan is light and packs in a very small bundle, and when on the march should be packed inside the canvas or in a bag, to prevent it from being torn. This arrangement allows you the free use of your tent without the annoyance of being compelled to use a head net or other similar device.

I have called the attention of several dealers in sporting goods to my tent, but as yet know of none who have put them on the market.

A word in conclusion. I have found that castoline or vasoline with a little pennyroyal mixed in it is preferable to oil of tar for several reasons, one alone causing me to prefer them, viz.: that you can carry them in a box and are not troubled by the bottle breaking as it frequently does when you use the tar.

EMM. A. JAMES, 1888.

JUGGING ON THE BIG MUDDY.

"Did you ever go a jugging?" We had been telling the fish warden the office of Doctor G.'s drug store one hot morning in the latter part of July, when the question was addressed to the writer by the Doctor, who had just finished compounding a prescription he had advised for the party, and poured it into the several glasses containing broken ice. The listeners of the Doctor, while averse to taking medicine except when authoritatively prescribed, could not of course question the sincerity of the generous doctor, who had suggested the catfish, and the writer who he had made of the party, and which he assured us was the proper thing to ward off the harmful effects of miasma, ever present along the turbulent Missouri.

"Did I ever do what?" I asked, as I set down the drained glass and lit off a piece of the lemon peel it contained.

"Did you never go jugging for catfish?"

"Well, now, Doctor, you've got me, I have caught a great many kinds of fish in many different waters, even the ignoble catfish have I hooked and yanked out of his muddy bed, but what the jug has to do with catching this *Pimelodus*, I own I cannot see."

"Why, out here we go jugging once a year, and I presume it's because you never lived long on the Missouri River, or you surely would have gone jugging before this. What say you, boys, let me take Pimelodus jugging."

"Why, certainly," chimed in the rest. "Finn, how long will you be in town? We'll go sure."

So it was speedily agreed that on Saturday, if I would stay so long, I should be initiated into the mysteries of jugging for catfish on the raging Missouri.

I was given an explanation of the sport, and the tackle which was necessary to be used, and the necessary supplies by the Doctor and friends, as my own kit did not contain the articles needed. What was wanted, I was informed, was a boat and a dozen stone jugs tightly corked, to whose handles were tied six or eight feet of good line, with a large strong hooked attached.

The intention was to take passage with the boat and jugs on a river steamer bound up the stream Saturday morning, to a point about twenty miles above the town of Hannibal, bait the hooks, leave over the jugs, which served as huge floats for the lines, and serenely drift along in company with the flat while we watched the jugs for a bite.

Saturday, after an early breakfast, the party of three and myself assembled on the levee, awaiting the steamer just coming in sight around the bend below the city. The boat, a river tug, being of light draft, the gentlemen, rather a heavy crew, lay upon the landing, and stowed under the seats along the bottom were twelve small stone jugs, all corked, and with short lines tied to their handles. This, to me, novel fishing outfit, attracted my attention, and while examining them I noticed one jug slightly larger than the rest, and though it had a cork there was no line to its handle. I turned to the Doctor, who had been watching my movements, and taking my attention to the pointed end, when, with a smile, he answered my look of inquiry with, "That jug don't need any line, it is for suckers, not catfish. Show you how it's worked when we get there." Of course this satisfied me. At least if not exactly satisfied, I contented myself with the thought of how easy it was to catch some kinds of fish.

The steamer soon lay alongside the levee, and out came the line and huge gangway peculiar to those craft. The roustabouts picked up the boat and its contents and deposited it upon the steamer, while we followed it aboard. The captain agreed to land us at a woodyard some fifteen miles up the river, where he stopped to wood up, and from which point we could launch our boat and jugs. We were soon off up the river, and as the sun climbed toward the zenith his rays gazed and poured down in increased intensity. The steamer was loaded and the current

strong, so that she made slow progress against the stream, and it was noon when we reached the place where we were to disembark. As we were anxious to get back to the city before dark, we ate our lunch.

We now launched our boat and went off down stream, and prepared to commence the sport. Baiting the hooks with a piece of the bell and ventral fins of bluegill fish which the Doctor had bought in the market that morning, we examined the corks of each jug, and overboard they went as fast as we could bait them. The Doctor and H. baited the hooks, while G., taking them when ready, stood up amidst splash, and swinging the jug in his right hand, held lightly the handle and hook in his left, and cast them as far out into the muddy current as he could get them. As yet no remark on the marks upon the grass and distance of the casts as the jugs splashed into the turbid water, and G., each time trying to excel his former effort, stood up on the seat to get a still better swing. Making a grand effort and swinging the jug round in a circle, he leaned forward as he cast—just a little too far. The boat, which sat deep in the water, gave a lurch in the same direction, and overboard went G. and the jug. His feet were the only thing that struck the mud-walk as he went out of sight with a splash and a lurch that half filled the boat with water. Evidence is conflicting as to how far his head went into the mud at the bottom—G. would never say when questioned—but only a brief moment elapsed, and he appeared with a splash and a gurgle a few feet from the stern, and floundering for a second or two, struck bottom on the edge of a sand bar, and was again out and sat down, a sadder and very wet man, while the boat, carried rapidly by the current, drifted some distance below.

I had put the helm hard down the moment G. went over, and every one in reach had made a grab at his heels as he went out, but it was done so quickly and the water poured in so thickly that no one was able to hold on enough to save himself. In fact, it is likely, had we done so, we would have been capsized at once. The boat drifted with the strong current out of G.'s reach when he came up, so it was lucky for him that the river was low and the friendly sand-bar near; the water, too, being warm, the ducking, save for the muddy water, did him no harm and afforded grounds for an immense amount of chaffing when once under weigh again. Still, bottom on the edge of a sand bar, and a lurch into the sand-bar, had G. sat getting the muddy water out of his ears. The sun blazed down with fury from a cloudless sky, and we were awful hot and tired when we reached it. While the rest of us got the water out of the boat the Doctor examined G.'s pulse, opened the jug, and prescribed for him, remarking that an excess of moisture upon the skin of the bottom of the feet would cause a thorough saturation of the interior of the *Siphia sordidula evanescens*, which evidently occurred in that opinion from the way he pulled at the neck of that jug.

We were soon under weigh again; our jugs went by this time all out of sight, down the river—even the ninth one, which had caused G.'s mishap, had disappeared, so we pulled rapidly along with the current after them. We cast our eyes about, remaining until the jugs in advance came in sight again.

Each jug was closely scrutinized as it came into view, to see if a fish had been hooked; but all were floating placidly thither and thither upon the dark water, mixing themselves up as they turned round and round in that eddy, or carried off by the current, and were not to be seen for two or three miles in single file. Having got them all in good sight they floated along, guided only by the rudder, and amused our selves chaffing G. on his tumble.

"I say, G.," said the Doctor, "feel better now?"

"Oh, yes," said G. "I'm all right, I only wanted to see how deep it was."

"That's the best of yours was the longest one you made," said the Doctor, winking at Finn.

"Your right, Doc," says H., "though for grace and delicacy I have seen better."

"Yes, boys, that's all right," answered G., good-naturedly, "but you all fail to see the most material point."

"Why, how's that?"

"It was not so much the cast that pleased the crowd, as the fact that you landed so quickly after you pulled them in. The fun was interrupted at this moment by H. with, "Look! Look there, boys, a cat has got that jug out yonder. See how it hobs around. Something has got it, hasn't it, Doc?"

"That's a cat got hold of it, I guess," said the Doctor.

"Pull away boys, before he runs into that bayou."

H. and G. seized the oars, and we were soon nearing the bayou, the water, and the eyes of the crowd, and the fishes efforts and the current which circled and eddied about it.

"Steer above it, Finn," said the Doctor, "and the current will drift you on to it. Unship your oar, G., and stand ready to catch the jug, while I put the gaff in him as soon as he comes within reach."

The boat, as it grasped the jug with both hands and hauled steadily. A jerk or two, a splash of a tail, and a great catfish stuck his ugly brownish-black head above water; another struggle and the Doctor had the gaff in his side, and with a flounder and a grunt he landed in the boat. He was hooked to stay in the booby jaw, and the Doctor, not stopping to mistake it, gave him his quietus with a stab in the back of his head. He was a fair specimen of the Western catfish, but for my eyes he had less attractive than a Government mule, now that he was captured, and as for eating him, he might do us a pinch, but I prefer something else.

"There's another member of the family trying to run away with a jug," said G., who had been eyeing the other jugs in sight. "There that one right in the middle of the river, trying, don't you see it?" The crowd, who had been so far from the boat, spreading out from bank to bank without a sandbar, and right in the middle of the current was one jug either stationary or coming up stream toward us, bobbing up this way and that, as if some mighty fish was towing it where he pleased, while all the rest in sight were sailing on placidly some distance below.

"Pull, boys, pull," cried the Doctor, standing up, "that's an old wren got that jug."

G. and H. pulled the oars, and with the strong current swept along at a rapid rate. The Doctor clambered forward and stood up in the bow and as we neared it, G. laid down his oar and knelt down on the seat ready to grab it as soon as within reach. On we went with all the impetus of a pair of oars and the current, another moment and we shall be upon it when—did you ever notice how queer it feels to have the air brakes applied suddenly and strongly to a

AFTER ANTELOPE.

ON the 9th of January, as I was returning from an Eastern trip over the Texas & Pacific Railroad, having heard that some acquaintances were hunting antelope near Marienfeld, I concluded to stop and spend a couple of days with them.

Their camp was eight miles from the depot. I had a corral cyclone indeed. My friends regretted that I had not arrived sooner, since the warm weather, which had lasted two weeks, had caused the antelope to drift northward, so that there were comparatively very few near camp. We concluded to take a wagon the next morning and go up to "Ranger Wells," some ten miles further up the "draw." This "draw" seems to be a dry slough, very much like the old bed of a river, winding through the plains. I was told that it extended more than a hundred miles, and was formerly the road, which the Indians, when on stealing expeditions to the settlements, mainly traveled. Water is to be found at different places along the "draw," always in basins or wells, the latter dug by the rangers or surveyors. I could not help meditating on the former days when countless herds of buffalo and hordes of savages roamed over these plains free and unscared. It has not been long since. Ten years ago it was so.

My companions, "Buffalo Bill" (Wm. Jenkins), and Billy Wagon, are genuine plainsmen. "Buffalo" formerly was with Gen. Custer, and was for a long while one of his most trusted soldiers. Latterly he was a Texas ranger, and did the State valuable service in scouting for Indians and thieves. He followed Sam Bass, a noted thief and desperado, nearly all over the State, one time capturing his whole outfit. Sam escaping only on account of the dense thickets about him. "Buffalo" now wears a knife scabbard made out of leather cut from Bass's saddle. He knows all about life on the plains, and is withal a modest, clever, congenial companion. Billy is a young man just learning the craft of plains life, but he is an apt scholar—a fine hunter. "Buffalo" has Billy both use Martin rifles. I had my three-barrel Baker.

On our way to Ranger Wells, "Buffalo" ranged off to the left, leaving Billy and me to travel on with the wagon. We discovered near the wells, a large herd of antelopes, but before we could get within range they concluded to leave the country, and they did it. Antelope frequently take a run of several miles without having been frightened at anything. While I was waiting for Billy W. to bring up the wagon, a coyote showed himself about 125 yards, and I very easily drove a bullet through his heart.

After filling the water kegs at the wells, "Buffalo" having arrived, we concluded to go out into the hills four miles east. Just as we reached this undulating country, we saw a

mustang quietly grazing. Perhaps we would have shot him if we had not discovered a small herd of antelopes a half mile away. "Buffalo" and I went after them. By taking a circuitous route and some crawling we managed to work up to about 150 yards of them. "Buffalo" told me to shoot and he would "corral" them. By this he meant shooting so as to strike the ground just beyond and ahead of the antelopes, which generally causes them to jump from the dust raised by the bullet and run nearer to the hunter. He showed the red part of his coat lining, to make the antelope bunch up. They did so, and I had just the prettiest chance in the world; but unluckily for me I failed to set my rifle trigger, so that instead of firing the rifle, I shot the left barrel. Of course, I didn't kill anything. Away bounded the herd. "Buffalo" failed to make them "corral," but I got in three shots before they got out of reach, killing a fine buck, and crippling two more. "Buffalo" went after the wagon and dogs. While waiting for him, three antelopes ran across the hill and stopped full 250 yards off. I sent a bullet through the liver of one, which soon doubled him up.

By the time the wagon and dog came it was too late to catch the crippled antelope, and so we had to let them alone. Gathering up some roots for fuel, we made camp. Billy soon came in reporting the killing of an antelope. I forgot to mention the fact that on our way to the wells "Buffalo" killed one, so we now had four to count. The next morning Billy took the wagon to get the antelope he had killed the evening before, while "Buffalo" and I ranged toward the permanent camp. We saw several herds, but they were on the level land and unapproachable. Finally we managed to get within about 200 yards of the herd, and when they started to run we fired several shots. "Buffalo" failed to corral them, but I hit one, though not badly enough to make it leave the herd. The dogs (with the wagon) were so far away we did not try to get them so as to catch our wounded game. By the time the dog came with Billy, who had killed a very fat buck, and had seen a large herd of mustangs. In this section we found plenty of buffalo sign, but the animals had left several days before. "Buffalo" felt certain we could find them fifteen or twenty miles to the north.

We now concluded to hunt toward camp. After traveling several miles without seeing anything, we discovered forty or fifty antelopes feeding along near a hill. Billy and I went for them. By circling considerably to the left, we managed to get within 150 yards undiscovered. I saw a very large buck standing alone and put my gun on him, but the cartridge was bad, and I had a snap. I tried again and had another snap. By this time the antelopes discovered us and bolted away. Billy fired in ahead and crippled them, and as they ran broad side about 200 yards, I had a beautiful shot, and I made it count, for two dropped

as I fired. Billy fired ahead again and the herd turned directly toward us. I got both shot barrels ready and began to speculate on how many I would kill if they kept on toward us. On they came until they got within about 100 yards and then suddenly turned to the left. I fired one shot barrel, but don't think I did any damage. I sent three rifle balls in quick succession after them, dropping an odd buck and badly wounding two small ones. Buffalo seeing the direction the herd had run, bolted across the country and intercepted them, getting several shots, and bringing two in good style. As soon as we could get the dogs, we had two beautiful rags after the antelope I had crippled. By the time we got all our game together it was late, and we went immediately to camp, carrying in twelve antelopes.

Well, it was delightful! I shall never forget the bright plums, the pure, dry atmosphere, the glow of enthusiasm when firing at a herd of running antelopes, the ecstasy of seeing them tumble to shot. Nor shall I ever forget the two congenial spirits who did everything in their power to make my stay pleasant. They seemed to care for nothing but my enjoyment. I shall meet them again, if nothing serious prevents. I am expecting a piece of buffalo meat soon, for they told me they would go out into the buffalo range shortly. Good luck to them.

In conclusion I would advise those who want a profitable antelope hunt to go to Odessa on the T. & P. road. On my return I saw thousands near that place.

EL PASO, TEXAS. GEORGE W. BAINES. (QUESTIONS. 1. Was the distance at which the game was shot paced in each instance or estimated? 2. If estimated, was the party who did it a competent person to determine the distance. 3. Why would there have been the object of shooting the mustang, or the excuse for doing so? What defence can be made for such hunting of large game as is here described.—Ed. F. & S.)

A MONSTER BUCK.—The hunters say there is no end in the vicinity of Craycroft Hill the largest deer they have seen in the mountains. They have shot at him at long range, but failed to hit him. Mike Gilson heard of his whereabouts, and thought he would try his hand to bring him down. Cautiously stealing along the hillside one early morning, he saw what appeared to be a stump with the roots sticking up in the air within fifty yards of him. To his surprise when he looked that way again the stump was gone, and heading away from him was the big buck, at full speed, and, as Mike expressed, with antlers five feet long and six feet apart at the points. He thinks this is no deer will play roots on him again. Downville Messenger.

Kynoch's Patent "Perfect" Brass Shells

MANUFACTURED BY Kynoch & Co., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base. Use either Winchester or Wesson primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much as the thicker makes. We have received the highest medals and silver medals at the Massachusetts Charitable Mechanics' Association Fair for our superior goods. Sent for catalogue.

HERMANN BOKER & CO.,

SOLE AMERICAN AGENTS 101 & 103 Duane Street, New York.

We also carry a large stock (at all seasons) of Kynoch's regular thickness brass shells, adapted to the Berdan Primer. Price materially lower than the American make of same quality.

B. F. NICHOLS & CO.,

BOSTON, MASS., Manufacturers of

HEXAGONAL SPLIT BAMBOO FISHING RODS,

REMOVED TO 153 MILK STREET.

We are obliged to have more room in our factory and greater facilities for manufacturing our goods to meet the increasing demand. We have received the highest medals and silver medals at the Massachusetts Charitable Mechanics' Association Fair for our superior goods. Sent for catalogue.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

NEW YORK, FEBRUARY 15, 1883.

VOL. XX.—No. 3
Nos. 39 & 40 PARK ROW, NEW YORK.

TERMS, \$1 A YEAR.—10 CTS. A COPY.
SIX MONTHS, \$2.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Scarle and Bivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 35 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

PARK PROTECTION.

THE consideration of the Tariff bill and other matters have so occupied the attention of the Senate that the bill for the extension and proper protection of the Yellowstone National Park has not yet been called up for consideration. A matter of such deep interest to the people at large must not be overlooked, and we hope that before long it will receive the attention it requires.

The Park is the only one among the many natural wonders of this country that has not yet been turned into a peep show to fill private pockets, and it is hoped that it may yet be saved from the grasp of the unscrupulous monopolists who have endeavored to seize it.

From all quarters are heard protests against the grab, showing that the people are at last thoroughly aroused on the subject.

The letter from our correspondent "P." in another column calls attention to a wonder in the immediate neighborhood of the Park, as it at present exists, which should be saved to the people.

By so amending the bill, now in the hands of Senator Vest's committee, as to extend the Park sixty miles to the eastward instead of forty, as now proposed, and southward to the parallel of 43° 30', a great number of natural wonders which really belong in it would be included in the reservation. Such are the headwaters of Clark's Fork of the Yellowstone, of the Stinking Water, Gray Bull and Owl rivers on the east; on the south, the Three Tetons, and a considerable portion of the range to which they belong, Jackson's Lake and Hole, and a number of beautiful lakes, mountains and rivers which would add much to the attractions and the picturesqueness of our wonderland.

Even if it should not be thought advisable to extend the Park westward any further than Cedar Mountain, or that would be better, the 103th meridian, we hope that the extension to the southward may be made. Any one who

will look at a good map of the region will, we think, see the desirability of including within the Park a region of so much natural beauty as this.

Another most important provision which should be inserted in Senator Vest's bill is the one suggested by our correspondent, forbidding the erection of any building whatever in sight of the points of interest of the Park. It is only too true, as he asserts, that in their eager haste for gain the men who are seeking to secure control of the Park will not scruple to degrade its natural wonders to any use that may serve their short-sighted and selfish ends.

VISIONS OF THE NIGHT.

WE know one "ardent sportsman"—he is not a thousand miles from our elbow, as we write—who is a crack shot in the field, and a better one in his sleep; the real bird rarely fails to drop at the explosion of his gun, the phantom never. Our friend was one night following his dog over the Elysian fields of dreamland, when the dog, coming to a point, wavered and flushed the birds. The sportsman, enraged at such a breach of duty, doubled up his fist and struck at the dog, planting a tremendous blow on the bedpost. Perhaps the pain and the subsequent soreness of scarified knuckles had something to do with his conversion to that humane treatment of his dogs, for which he is now well known.

A somewhat similar experience one night befel our friend H., who was out on a visionary grouse shooting expedition. The birds were plenty and he was having a capital time of it. Old True pointed staunch; our hero walked up; the bird flushed and darted away in circuitous flight through the brush. Instantly wheeling and throwing his gun around to cut down the bird in an opening, the shooter's hand came in violent contact with the trunk of a sapling—and he awoke to find himself sitting erect in bed, his arms outstretched as if holding a gun, and his wife by his side, a very badly-frightened woman with a bleeding nose. He did not soon forget that dream, not so long at least as the black and blue marks on his wife's face remained to remind him of his exploit.

But these misadventures are trivial in comparison with the fate which overtook Mr. Joo. L. Cross, of Highland, Virginia. One night, some months ago, we are told, Mr. Cross dreamed that he was pursuing a deer in the Alleghany mountains, at the base of which is his home; and in the excitement of the chase he leaped from bed, and was severely bruised in the operation. One night last week the same phantom "stag" returned to vex his slumbers, and again the dreamer started on his fanciful chase. Hard-pressed by the hounds, the buck turned at bay, and the hunter, with a wild cry, springing to the scene of conflict, jumped from his bed and rushed headlong down a stairway, receiving injuries from which on the following day he died.

Such is the veracitastic of the press dispatches. There is a ready moral to the story, but we shall permit the reader to frame it, each in his own way.

It is well known that dogs dream of the field, and sometimes an experienced old dog, lying before the fire, will rise from the floor to a staunch somnambulistic point, and then sink down again, still sound asleep. One of the most beautiful points we ever saw was thus made in his sleep by an unbroken puppy.

Sportsmen and their dogs dream of the pursuit of game. Does the game ever dream? May it not be that the sleeping deer springs from his slumber in altright at the visionary hounds upon his track? Is the sleeping circle of quail ever startled by the phantom form of a pointer or the horrible nightmare of a gun barrel? These are questions simple enough to ask, but hard to answer—like the letter that came to the FOREST AND STREAM the other day wanting to know the prospects for success in the diamond fields of Africa, and promising to send ten cents for a copy of the paper containing the reply, upon receipt of a letter telling the letter writer in what issue it would appear.

CLARK'S FORK CANYON.—In our "Sportsman Tourist" columns will be found a communication from our well-known correspondent, "P.," in which he briefly describes the Yellowstone Park country, and gives an account of his exploration of the Grand Canyon of the Clark's Fork. This is, so far as we are aware, the first exploration and description of that region, which, in some respects, is superior in grandeur to the Yellowstone Park itself. Our readers will await with interest the more detailed account promised by our correspondent.

THE DOGS OF HOMER.

IN a former article upon the chase in the time of Homer, we saw how highly the ancient Greeks valued their dogs for the assistance those gave in protecting their flocks and herds and in the pursuit of game. Aside from this much prized service, these animals were held in no less repute for their sterling qualities of sagacity and fidelity. Long before the time which is the object of our study, the dog had become the symbol of trustworthiness, for in Homer this character is proverbial. We cannot avoid drawing this inference from the fact that even then the figure of this animal wrought with skill in costly metal graced the entrance to the abode of wealth and taste. Hephaistos himself with highest skill fashioned of silver and of gold the dogs which were placed on either side the entrance to the palace of Alkinoos to protect the royal household. Homer quaintly adds that dogs of this breed are immortal, and are not liable to be all the time growing old (Od. VII., 91-94). The Romans of a much later time displayed a similar though less cultivated taste in the way of decorating the approach to their houses, for Petronius Arbiter mentions the practice of painting on the wall near by the entrance to the house, the figure of a burly watchdog, and just above the figure the words, *Cave, cave canem!* Look out, look out for the dog!

Priam, referring to the dogs he had reared in the palace, calls them not only the guardians of his gates, but also his messmates or table-companions (Il. XXII., 69). These table-dogs, as we may call them, seem to have been of a distinct breed from those whose duty it was to guard the house. They were kept as pets and for companionship, and were prized for their beauty of form and for their intelligent and affectionate character, as we shall see from what Odysseus says in reference to his old dog Argos. Nine of these table-dogs had Patroklos reared and trained as pets, and when their master's body was laid upon the funeral pyre two of the number were slain and their bodies burned with that of their dead owner, that their shades might walk around his ghost in the sunless regions of the dead (Il. XXIII., 178).

Homer was a close observer of these animals as he was of the men who were their masters. Some of the poet's most delicate touches are employed in displaying their peculiar habits. No one having the slightest appreciation of nature can fail to note with pleasure the fidelity with which he pictures some of their more striking traits. In reading of his dogs, it is not easy to realize that they lived more than three thousand years ago, and are not waiting for us at our own or at our neighbor's gate. One of the most familiar passages is that in which is related how Odysseus came back to his home from Troy after an absence of twenty years in war, and in not less adventurous wanderings. Upon his coming to his native Ithaka, Athena changed his form to that of an old man infirm from years and from hardship, and his limbs were scantily clad with menial apparel. In this guise of a homeless beggar the hero came to the cottage of his old and faithful swineherd, who failed to recognize his master in such plight. To the four dogs that were lying outside the yards where the swine were brought at night for protection the new-comer was a stranger, and his unseemly garb but increased the fierceness of their ill-natured greeting. So bitter was their hostility, that had not Eumaios dropped in haste the leather from which he was then cutting for himself a pair of shoes, and rushed to the rescue of his guest, the dogs would have endangered the old man's life. (Od. XIV., 29). Further on in the course of his story, the poet tells how these same dogs behaved the next morning when they heard the familiar footsteps of Telemachos coming to the cottage upon his return from a short visit to Sparta:

Now the two men in the hut, Odysseus and th' excellent swineherd
Breakfast prepared for themselves at the dawn having kindled a fire—
Saw off the heaviest in charge of the swine collected together.
"Round Telemachos frowned the dogs accustomed to barking,
But they barked not as he came. Then noticed the feeble Odysseus.
How the dogs wagged their tails; and he caught the faint echo of
footsteps.
Spoke to Eumaios at once addressing him words that were winged:
"Really, Eumaios, some comrade of mine to thy cottage is coming,
Or some acquaintance it is, since the dogs refrain from their barking.
But they are fawning around, and I catch the faint echo of footsteps."
(Od. XVI., 1-13.)

But the completest picture Homer anywhere gives of the dog is found in the account he gives of the meeting of Odysseus with his old dog Argos. The passage is a familiar one, but it will bear a second reading by all who estimate at its full worth sincerity and devotion in friendship, though it be shown on the part of an humble brute. The

swineherd was too poor to entertain for any length of time the beggar who had sought his hospitality, and so he proposed to the old man as the best he could do for him that he would take him to the city where he might ply from door to door his vocation as a common mendicant. The poet gives the talk that passed between the two on their way to town, and as they entered the court of the palace from which Odysseus had set out for Troy, and then he adds:

That was the way they discussed such matters talking together,
Only raising his head the dog pricked his ears as he lay there.
Argos that long since was reared by stout-hearted Odysseus,
Not for his master's sake, too eager to be sacred,
That one had gone. But the dog yomg men had formerly taken
Going to hunt the wild goats, the deer and the swift-footed rabbits.
Object of loathing then when long from home was his master,
Lying on heaps of filth which was piled in front of the stables
Where were kept oxen and mules manure awaiting the season
When of Odysseus the slaves should use this for dressing his acres.
There lay Argos the dog all covered over with vermin.
Then, indeed, when he knew Odysseus standing beside him
Favored the dog with his tail, and he lapped both ears for his glad-
ness.

Having no longer the strength that he could go to his master,
That one turning aside brushed a tear unobserved by Eumæos.
Raising a question at once with a view to diverting attention.
"Really, Eumæos, a sight is this dog lying here on the dung-hill.
Well indeed he is formed, but this I do not know clearly
Whether in truth he is swift to run as his looks may betoken,
Or if he be of such sort as attend their masters at table,
Such as gentlemen keep to give them an air of distinction."
Now in reply to the man did thus speak, Eumæos the swineherd,
"This is a dog that belonged to one who died far from his country.
If he were only the same in form as well as in action,
As upon going to Troy his owner Odysseus once left him,
You would quickly admire observing his strength and his fleetness,
For there was not any chance that game which he was pursuing
Should in the forest escape, for he knew the game by the footprints.
Now is the dog taken ill, and far from home has his master
Died, and the negligent women have no concern for his welfare.
Well, but the truth is that slaves when their masters no longer give
orders

Not any longer themselves have a care to do what his becoming,
Half at the least of his word does Zeus whose view is extended
Take away from a man as soon as he falls under bondage."
Holding such converse he came to the palace pleasant to dwell in:
Straight through the hall he went to join illustrious suitors
Then indeed did the fate of dark death fall upon Argos
Soon as Odysseus he saw come after twenty years' absence,
(OLD STYLE, 200 B.C.)
L. B. CHOAPE.

The Sportsman Tourist.

THE YELLOWSTONE REGION.

IT is believed that there is no part of the North American Continent where there is to be found so much (and of such varied character) of these four things as in the Yellowstone region, which is grand and beautiful and wonderful in nature, as lies within a circle, described with a radius of sixty miles, with its center at or near the outlet of the Yellowstone Lake, on the head of the Yellowstone River.

On the Pacific slope is that succession of beautiful lakes, bordered by beautiful parks, that are unsurpassed in this regard in any country, such as Jackson, De Lacy (unjustly called Shoshone on the maps), Lewis, Hunt and many smaller lakes, though none the less beautiful. Overlooking this panorama are the highest and most remarkable mountain peaks north of the Union Pacific road, "The Three Tetons," whose needle-shaped pinnacles tower 8,000 feet above the waters of Lake Jackson, immediately at its feet, and 6,000 feet above the main Continental Divide, lying forty miles to the north. These peaks are nearly 14,000 feet above sea level, and are a noted landmark hundreds of miles down the valley of Snake River.

Overlooking this same region is the Red Mountain range, ten miles south of the main range. From the highest peak of this range, Mount Sheridan, (10,400 feet above sea level and 2,500 feet above Heart Lake, immediately at its feet) is the grandest, the most extended, and most beautiful view it has ever been my good fortune to enjoy. Seven lakes are in view almost at one sight, while to the south is a very fine view of the grand "Tetons" and to the north is a splendid view of the Yellowstone Park proper, with Pilot peak and the high mountains at the head of the Clark's Fork of the Yellowstone River, on the horizon to the northeast, and the Shoshone range on the head of the Stinking River, to the east. The main Continental Divide, ten miles to the north and 2,000 feet below, with its small lakes and parks, almost on the very summit, is, apparently a beautiful valley. This divide is not exceeding 400 feet above the waters of the Yellowstone and Heart lakes, and their waters might be intermingled by a canal not exceeding twelve miles long, and without the use of locks.

On the Atlantic slope are the various and very remarkable cañons of the Madison, the Gallatin, the Yellowstone, the Boulder, the Rosebud, the Clark's Fork, the Stinking River, the Gray Bull and the Upper Yellowstone. Near the center of this enchanted circle the most important waterfalls are the Gibbon (named from General Gibbon), the Gardner, the Tower and the Upper and Grand falls of the Yellowstone, the latter with a single vertical leap of 397 feet, the remainder with single leaps of from 120 feet to 160 feet.

What gives this region its celebrity, however, and entitles it to be called the "Wonderland of America," are the numerous groups of overhanging and spouting geysers scattered throughout its entire extent. At the head of these groups stand prominent the spouting geysers of the Upper Geyser Basin, on the head of the Madison. These are, doubtless, the most wonderful geysers of the world. Then come the groups at the Lower Geyser Basin, the mammoth Hot Springs on Grand Island, the Clark's Fork, the Tower and the Gibbon Basins on Platteau Creek, on Alum Creek, and the various groups around the Brimstone, Yellowstone, Heart and De Lacy lakes. Besides these larger groups there are localities where the mountains are full of smaller groups, either active or extinct.

To most of the readers of the FOREST AND STREAM these wonders are more or less familiar, either from personal inspection or the description of others. In the past six

years it has been my good fortune to have explored the greater portion of this wonderful region, and I can truthfully report that the delineation of these wonders, either with the pen or the camera, falls greatly in coming up to the reality. New explorations are discovering new wonders each year.

A portion of the past three years has been spent in a hunting and exploring trip on the heads of the Clark's Fork, Stinking and Gray Bull Rivers, most of which region is but little known, except to a few trappers; and the opinion is entertained that there is enough of the grand and wonderful in this region lying east of the present boundary of the Yellowstone Park to induce a trip across the Atlantic. The Shoshone Mountains, occupying this region, are one of the most rugged and remarkable of the Continental Divide, many of whose peaks are from 12,500 to 13,000 feet above tide-water.

Through this mountain chain the Stinking River has worn a deep valley, denuding in its course that most remarkable formation of red silicious pudding-stone conglomerate, that also crops out at the Lower Falls on the Yellowstone, and on the head of the East Fork of that stream, (forming what is known as the "Hoodoo" region of the mountain men).

For twenty miles the North Fork of Stinking River is walled in by vertical cliffs of this formation, from 200 to 500 feet heights, that assume sometimes such fantastic and wonderful shapes that by their weird appearance they carry one back to the days of the fairies and giants of the story-books. Sometimes the mountain peaks are crowned by castellated structures of this formation. The most remarkable of them is "The Giant's Castle," a noted landmark of the upper valley. Space does not admit at this time of a description of the details of this formation, that is far surpasses in extent, and in every other respect, what has been published in regard to the "Hoodoo" region.

At the point where the Stinking River debouches out to the plains, bordering the Big Horn, is the easternmost outcrop of the geysers. At the lower end of what is known as the "Stinking River Basin" the two forks (North and South) join and run for a distance of about 20 miles to a possible cañon cutting off to the south "Cedar Mountain" from the main or "Sheep Mountain." From this point to the head of this stream, seventy miles west, there is no indication of geyser action. At the upper end of this cañon the side of Cedar Mountain is incrustated with this unmistakable formation, showing evidently that the hot water had at one time flowed down its side and left its deposit. On a bar near the junction of the cañon, at every sulphur spring bubbles up, its waters highly surcharged with carbonic acid gas, while all over the bar and in the shallow water this gas is constantly bubbling up. This water has a sulphury, pungent taste, is a fine appetizer, and is to me as pleasant as the famous Saratoga water, with many of its good effects.

At the lower end of this cañon is quite an extent of this same formation, with several well-developed ones, that were at formation, but now extinct. Though the water has ceased to flow from these cones, it boils up from the bed of the stream, in one case in an immense spring extending half way across the river. From this spring bubbles up a large quantity of gas, supposed to be carbonic acid gas, with probably some hydrogen sulphide, for the unmistakable smell of this gas can be detected for a mile or two. The Indians give this river the present name, what in their language means "stinking." The "sign talk" of the Crows in alluding to this stream is most amusing and suggestive. The formation near this spring was almost pure alum, of such an alkaline character as to burn holes in a silk handkerchief in a short time. There is, also, near an abundance of almost pure sulphur, with a warm sulphur spring on the opposite bank.

On two occasions I have crossed this stream in mid-winter. On one occasion, after leaving camp, above the forks, with both streams frozen solid, from a temperature of -32, a few days previous, and approaching the ford below the cañon and looking into its clear and limpid waters, without even a skin of ice fringing its borders, the contrast seemed so marked as to suggest the idea of a spring of warm water, but a slight current here, as if produced by carbonic acid or dilute sulphuric acid. To produce this marked change in such a volume of water, and in so short a distance (two or three miles), presupposes the existence of many more and extensive springs near the center of this cañon. This stream has never been known to freeze over at this point, and yet there is said to be an abundance of trout to be caught at the proper season. This cañon will bear a great deal of investigation.

But by far the greatest wonder of the Shoshone Range is the Grand Cañon of the Clark's Fork, located near where this stream debouches on to the valley of the Yellowstone. As there is an old traveled trail passing within four miles of the deepest part of this cañon, it is the more remarkable that its wonderful features are entirely unknown to even the guides and mountain men.

Within the past few years a half-dozen military expeditions have passed along this trail, but having no information of the locality, made no investigation. In 1879 I spent six days in the South Fork Park within six miles of it, but never happened to stumble upon it. In 1881 I spent two months on "Sheep Mountain" and within twelve miles to the south, and only saw enough to induce further investigation, but as it invariably descends to the South Fork Basin, at a distance of 21 or 24 miles, and down a much drenched trail, it was not undertaken that year. From a high point, at least 3,000 feet above the water below "Lookout Point," its most interesting features, then known, were discovered, including the "Zeta" Falls, formed by the "South Fork" apparently leaping out from a hole in the vertical wall into the main gorge. All these features were pointed out to me by one of the boys on his way into the Grand Cañon Park during that summer. As I have never seen his report, do not know whether the limited time at his disposal admitted of a further examination of this cañon, as neither of us were aware of the depth of the upper part of the cañon outlined in the distance before our eyes.

During the past summer (June and July, 1882), circumstances gave me an opportunity to make a further examination. Having been detained at the mouth of this cañon three or four days by the laborious and dangerous business of rafting my camp outfit of 1,200 pounds across this rapid stream, advantage was taken of the delay to explore the lower end for about seven miles, to a point where the cañon walls close in to the water's edge. This point, however, is only one mile below the lower edge of the South Fork Basin, which can be reached by a circuitous route involving the extending of this cañon having been detailed by high water in the Stinking River, I spent several days in this exploration, at and below

the mouth of the South Fork. This involved a great deal of the severest labor (one day climbing up and down a vertical height of 2,600 feet), but the results amply repaid the effort.

I have seen all the principal cañons of Montana and Wyoming, and have seen enlarged photos of the Royal Gorge on the Arkansas River of Colorado, yet I have no hesitation in asserting that this cañon, in most regards, surpasses them all, and is only secondary, in this country, to the "Grand Cañon" of Arizona.

The lower seven miles of this cañon are rather open, sufficiently so for a good wagon road (at one place there being a little park). The walls rise up with a slope of about 1 to 1 with the highest peak on the East Side, of 4,000 or 4,500 feet above the water; and not exceeding 1,200 yards to the east on a horizontal line.

The point where the water shuts in to the water's edge is opposite "Point Lookout," 3,100 feet vertically above the water, and not exceeding 500 yards away on a horizontal line. Looking down from this height you imagine you can cast a stone into the water, apparently just at your feet.

From this point to a point just below the mouth of Crandall Creek, about twelve miles, this stream rushes through a narrow chasm, or rather "crack," in the granite rock ledges, evidently of recent origin. The solid granite walls, slanting in the stream to the water's edge, are almost vertical, their slope being about $\frac{1}{2}$ to 1, and near the lower end are at least 1,200 feet in height above the water.

From the south comes in Dead Indian Creek and the South Fork, through chasms of a similar character, except not so wide, and falling, from the fords on the trail near the level of the basin, three and one-half and four miles above, to the level of the main stream, 1,200 or 1,400 feet vertically. The former stream descends in a system of cascades and rapids the entire distance. The latter and much larger stream descends in the same manner but not quite so rapidly, until the gorge of the main stream is reached, when it loops out from the face of the vertical wall and tumbles down 300 feet into the valley below, the first 100 feet being the most beautiful, and the most successful of cascades. On the brink of the fall the width of opening in the wall is about 50 feet, with walls rising 700 or 800 feet, almost vertically, on each side. Near the top of this wall, on the east, is, apparently curved in the face of the cliff, the letter Z of colossal proportions. Hence I suggested as the name of these falls, "Zeta," from the Greek letter Zeta, which is the letter Z. It appears sloping out from a hole in the solid cliff. It is this an incalculable river, as those can testify who have seen it at its average stage.

This stream joins the main stream about 200 yards above Dead Indian Creek (the military maps indicate they come together before their junction with the main river), and in that distance the side of the chasm is a mass of huge boulders, evidently having rolled down from the original convulsion of nature. One of these boulders by its weight, contained 820 cubic yards, which would indicate a weight of about 700 tons.

The gorges through which these tributaries passed were scarcely secondary in interest to that of the main stream. On Indian Creek a point was reached stopping further progress where the water flows over a ledge which was 25 feet, with 600 feet walls on each side. Just above this point the head was heard the noise of no inconsiderable fall. On the South Fork was found a point where a stone could be cast into the water below with a little more effort than merely dropping from the hand. A succession of trials with its round boulders as could be found showed that their descent took eight seconds to the water. In leaping, by the law of falling bodies, without allowing for air resistance, a depth of over 1,000 feet. A lead ball would have fallen in somewhat shorter time. The next day a descent was made, by a side gorge, to the water's edge, a little below, and the anemoid indicated 700 feet. This point was estimated 400 feet above the main stream. The width between walls at this point at top, as determined by the known curve of a rifle ball, was 180 feet, with a wall which across the mouth of the cañon was not exceeding 200 to 250 yards. The water channel was 75 to 80 yards. The main stream falls for the entire length of the channel, say 19 miles, 2,300 to 2,500 feet.

I have thus briefly given the main features of this remarkable cañon, and will defer to a future paper to give more details. The vertical height are no guess work, but are given by personal observation, and the anemoid barometer, checked by such means as the case suggested.

Comparing this cañon with that well-known one below the Grand Falls of the Yellowstone; it has something less volume of water, but is fully as long; has vertical, solid granite walls instead of walls of earthy material, with slopes of 1 to 1; its depth is greater, 1,200 feet, whereas the depth of the latter cañon, at the point of Mt. Washburn, does not exceed 1,000 feet, with highest peak, within one mile of the water, of not exceeding 1,500 feet, whereas, the first descent cañon has a peak of 4,000 feet height and within three quarters of a mile of the water.

There are no landscape views from points near the Yellowstone Cañon. There are, on the contrary, mountain peaks immediately overlooking the Clark's Fork Cañon below, including Zeta Falls, but one of the grandest views of park and distant mountain peaks to be had in Montana or Wyoming. There are peaks within twelve miles of this locality 12,000 feet above tide level.

I heartily concur in the recommendation of Gen. Sheridan, that the boundaries of this Park be extended, on the east to the line of Cedar Mountain and on the south to the forty-fourth parallel. I would recommend the southern boundary be extended farther to the west, a third and a half degree parallel, or at least far enough to include the "Three Tetons" and the Teton Basin. Hayden's Survey shows that none of this district will be of less elevation than 6,500 feet above sea level. I have never known any crops either in Montana or Northern Wyoming, to be raised at a greater altitude than 5,500 feet, so that no interest will be injured by a further extension. The extension of the eastern boundary to Cedar Mountain will take in the "Stinking River Basin," the summer range of two large lands of cattle and some small bands of horses. That vicinity might be obviated by making the line pass through the "Two Sentinels" of Captain Jones's survey, situated immediately at the lower end of the Cañon of the North and about twelve miles west of Cedar Mountain Fork of Stinking River, and consequently having no prospecting for minerals, and in case of valuable mineral deposits being found, to give facilities for

the working of such mines. There can be no serious objection to this proviso in the new bill.

Doubtless it has occurred to the minds of many visitors how invaluable the exclusive hotel privileges of this grand Park would be with the railroads approaching its borders. But who ever thought such exclusive privileges could be bartered away to anyone? It was, therefore, not to be wondered at that the public were surprised, a short time since, to learn that not only were the exclusive hotel privileges with a large tract of land leased at each point of entrance to the Park, but the exclusive right to furnish transportation and guides, as well as the hotel, had been leased for a term of years to a syndicate of distinguished gentlemen for a mere song. To any one acquainted with the Park and its surroundings, it was apparent this magnificent woodland was placed entirely under the control of a few individuals, and no one could visit it without their consent, or at least without passing through their hotels, guides, stages, etc. A man of moderate means even could not "do" the Park, much less the poor man who would in the old-fashioned but pleasant way by pack horses and camp outfit.

I presume there is no one who finds fault with this syndicate of distinguished and patriotic gentlemen for accepting the terms of this lease. It is even claimed by some of their friends that some of these privileges were forced upon them. Who can blame them for accepting? One of them enthusiastically excluded, in the confidence of friendship, not only the boys but his "little millions in it," but there is "\$1,000,000 in it." But that a high official of the Government could be found who, in the absence of his chief, and, as it is understood, without his authority, and almost surreptitiously, as the papers have it, to contract away these privileges for a song, is a most remarkable occurrence.

The thanks of the people are justly due to Senator Vest, seconded by the trenchant blows of the FOREST AND STREAM, for turning the full glare of public opinion on this extraordinary transaction.

There are a few other points to be guarded in this lease that I have not seen mentioned, and they are respectfully commended to the attention of Senator Vest and his committee. It should be expressly stipulated that no hotel building nor bath-house nor structure of any kind should be erected in sight of any of these wonders of nature. Such an act would be an outrage on "the eternal fitness of things." This especially should be guarded against at the Upper Geyser Basin. There are hotel men catering to the people to buy their sacrilegious hands on "Old Faithful" and "The Grand," and who would quench their wonders by clapping a common square frame building over their craters, and utilize their perpetual-motion powers to supply their guests with hot and cold water. No building should be allowed within less than three hundred yards of this grand group of geysers. There is an abundance of hot water and steam, large and hotly discharging pools, with boiling hot water, for all bathing and culinary purposes, within one-half mile of this group.

Another requirement should be inserted into the contract; i. e., that the lessees should supply a great abundance of pure cold water, not only for their own guests, but for all other visitors. The water of Fire Hole River being almost always contaminated with the Geyser water, is unwholesome and unfit for drinking. The delicious water can be had from the extreme westerly fork of Fire Hole River, by bringing it in pipes 2 1/2 or 3 miles, and with head enough to "squirt" much higher than Old Faithful. Good water can also doubtless be obtained from the main Fire Hole River by tapping it above the falls.

The length of this communication does not admit of an allusion to the game question, as intended. I see, however, by the Beacon paper, that additional contracts have been made for elk meat by the agent of the Park for sale at seven cents per pound, also additional contracts for Cook City, and hunters have gone into the Park to kill elk for that purpose. Outside of all questions as to the "fitness of things," this syndicate can have beef delivered at that price, and of much better quality for food than poor elk meat. Elk meat at this season is unfit for food. P.

DENVER, Colorado, Feb. 5, 1887.

THE NATIONAL PARK GRAB.

IN the course of a letter, written by John Schuyler Crosby, Governor of Montana, to the Chairman and Committee on Territories, under date January 17, he very pertinently says:

"I received a recent letter which I had occasion to write to Senator Vest on the subject of preserving the Yellowstone Park, as a refuge for the large game of the Northwest. I lightly touched on certain leases made to private parties disposed to speculate in this national pleasure ground. But I did not mention the names of the speculators. As the newly appointed Governor of Montana, it was my duty to guard her interests in the public Park for her borders. But, as I learn from a special dispatch to the New York World, Mr. Rufus Hatch, disregarding my forbearance as to mention his name in an odious connection with a proposed trespass upon public rights, arraigns me by name, for guarding the interests of the Territory which I have the honor to preside over, and accuses me of posing as a public reformer. I cannot retort the accusation. Mr. Hatch has achieved a certain sort of national reputation as an unscrupulous monopolist and speculator. But it would be irony to call these vicious things reform. I am not unwilling to be called a reformer. My great grandfather was one when he signed the Declaration of Independence. I should be sorry to forget "the price of liberty."

I am attacked in good company to be sure, for General Sheridan, whose official report struck a damaging blow at the scheme of Mr. Rufus Hatch and his coadjutors, is fiercely assailed by this notorious speculator, who, however, is totally mistaken in his statement. The letter to Senator Vest was written from General Sheridan's office quarters. Neither General Sheridan nor any of the officers at his headquarters, ever saw the letter till it was ready for publication, though I believe he, in common with many patriotic men who do not believe in the business of feathering nests by plucking the public, approved of the sentiments of my letter. Mr. Hatch's dissent is natural.

The issue between Mr. Hatch and me is neither important, nor of my seeking. The real issue is national and personal. It is whether the Yellowstone Park shall be, in the language of the dedicatory statutes "a public park and a pleasure ground for the benefit and enjoyment of the people," or whether it shall be the cattle ranch of Mr. Rufus Hatch et al, who propose to establish vast "cattle enterprises close to the Park" and secure unlimited forage and immunity from disturbance in their trespass, by controlling the

Park as hotel monopolists, who lease some four thousand acres embracing every object of interest to the tourist, and mean to let their cattle obtain free pasturage over the remaining millions of acres. The issue is "shall the public, or shall a band of speculators profit by the Yellowstone Park?" Mr. Hatch knows that if he shall carry out his defiant threat to push his cattle ranches close to the Park, the cattle will swarm into it. That is his purpose in choosing this proximity. By his monopolistic schemes within the Park he intends to exclude all trespassers, except his own. No possible fence could separate Mr. Hatch's cattle from the public domain that is covered by the fishing rods, the great purpose of the Park, as an asylum for the hunted game of the Territories that border it. The fence would exclude the game also.

It is rather amusing to have Mr. Rufus Hatch pose as a patriotic and public spirited citizen. But so he does, according to the World's dispatch. Yet it is demonstrable that his patriotic desire to protect the National Park, came into being only when he proposed to make money out of it by monopolizing every curious feature in it, and running his "cattle enterprises close up" to it. Because he is proposing something prejudicial to the Territory which I have the honor to govern, and hostile to the interests of the great Northwest, and odious to unselfish public sentiment throughout the United States, I need hardly apologize for taking a little space in following him through his inconsistent statement of motives. He has unwisely uncovered his hand too soon, and shown that my letter to Senator Vest was not premature. Under Mr. Hatch's accidental avowals, and his impudent defiance of Congressional authority, and interpretation of contracts but his own, he has made it clear that if any man in the United States is not to be trusted with the slightest power within the Yellowstone Park, that man is Rufus Hatch, of New York.

AROUND THE COAST OF FLORIDA.

BY DR. J. A. HENSHALL.

Fourth Paper.

WE soon came in sight of the Indian village, a cluster of twenty-five or thirty huts, on the ridge of the pine woods, where we soon landed, and were immediately surrounded by the young bucks, who looked on with great interest and curiosity as we unpacked the canoe. Cuff was at once at home with the Indian dogs. Big Tiger then came down to the landing, and pointing to a group of two or three huts a little distance inland, said:

"You house—you eat—you sleep—in-ah!" We carried our plunder to the huts indicated, followed by the young bucks, who were much interested in the guns, rifles, and especially in the fishing rods, the use of which had to be explained to them by signs.

This village is one of several, where dwell the four hundred Seminoles "remaining in Florida; the largest village is in the "Big Cypress" some thirty miles distant. These villages or communities are governed by petty chiefs, who owe allegiance to Tallahassee, the great head center, who lives sometimes at the Big Cypress and at other times at Pease Creek. This village was governed by Little Tommy and Big Tiger. The latter is the son of old "Tiger-tail," the late principal chief of the Seminoles, who had been killed by lightning a year or two before. Tiger-tail fought at the battle of Okechobee, and he is said to have been one hundred years old at the time of his death. Besides Big Tiger and Little Tommy there was Big Charley, Tommy Doctor, and several others with their squaws and families, half a dozen or more young bucks, several old women, a good many children and a host of dogs. The sun was setting in the Everglades as we got everything up to the huts and prepared supper.

These Indians lead a quiet, peaceable and semi-pastoral life, cultivating fields of corn, pumpkin, sweet potatoes, beans, bananas, etc., in the rich hammocks on the adjacent islands, their villages being in the pines or the border. They also make starch from the "comptic," or wild arrow-root, which grows abundantly in the pine woods, and in the winter they hunt deer and bears. Such a life is not without its charms, shut out, as they are, from all the world by the penitentiary crosses, swamps, the only avenues to civilization being by way of the streams which drain into the Everglades, the currents of which are so swift during high water that few attempt to ascend them to the Everglades, and still fewer succeed. In the spring and early summer the Everglades are comparatively dry; as Big Tiger said: "In two moons all water gone—cause no go more." During the autumn and winter the men go to the settlements, mostly to Miami on Biscayne Bay, by way of the Miami River, where they sell tobacco, buckskin, beeswax, comptic starch, vegetables, bird plumes, alligator teeth, etc., and buy cloth, calico, ammunition, tobacco, etc., and occasionally wy-ho-mee (whisky).

The men are tall, well-formed, straight and clean-limbed, and are quite neat in their dress, which consists of a calico shirt, a burl, breech-cloth and a turban; the latter is a head-dress quite remarkable in its construction and conspicuous and picturesque in appearance. It is some two feet in diameter and six inches thick or high, with a hole in the center to fit the head. It is formed of bright-colored shawls, the outside layer being sometimes a light red cotton or bandana handkerchief; its shape is exactly that of a flat cheese, or a grindstone. It is quite heavy, and the body must be carried very erect to keep it balanced on the head; perhaps the erect carriage of these Indians is to be accounted for, to a great extent, by the wearing of this singular head-dress, for they are never seen without it, except sometimes when hunting.

The men's legs and feet are always bare, and look like columns of polished mahogany; sometimes, when hunting in the scrub, they wear buckskin leggings and moccasins. The women dress in short calico petticoats and a jacket or short sateen of gay-colored cloth. Their necks are ornamented by many strands of beads, sometimes a hundred or more, and weighing many pounds. The young women and girls have usually very good features and are very vain of their personal appearance. The hair of the men is shaved at the sides, that on the top and back of the head is formed into a long plait and coiled on top of the head. The women dress their hair in a way perfectly incomprehensible to me, though plaited part a part of the arrangement. The old squaws are not dressed with good looks, and do the drudgery of the camp. The children are bright, active and full of fun; some of the boys go entirely unclothed, though when they stay they wear short calico shirts. The boys are never without their bows and arrows, in the use of which they are very expert, killing quail and other birds, hares, squirrels, etc. The older ones, with their dogs, hunt gophers (land-tortoises), and spear aquatic turtles and fish. The two sub-

chiefs, Big Tiger and Little Tommy, wore a kind of hunting shirt of light blue calico with a broad collar, the whole ornamented with bright-colored fringes, and strips of turkey red chief along the seams. These shirts have agreeable, musical voices and talk in low, pleasant tones.

The houses are formed of upright posts set in the ground, a thatched roof of palmetto leaves, and a floor about three feet from the ground, the sides being open. They sit on the floors during the day, and sleep on them at night, their beds being rolled up in the day-time. They all sleep under mosquito bars, which are laced up during the day. The mosquito bars are a strip of muslin, and are loosely thatched all around, with a door in one corner. The interior of the village is a level, cleared space with a tall pole in the center, where they hold their dances at stated periods, the "green corn dance" being the most important. These are occasions of feasting, revelry and the wildest enjoyment, in which, wy-ho-mee (whisky), as in more civilized assemblages, takes an active and prominent part.

As the twilight faded upward, and the darkness closed around, the night was filled with wondrous, small camp-fires were kindled in the open spaces between the huts, casting a ruddy glare around, lighting up the gay attire and swarthy features of the Indians as they silently moved about, gilding the trunks of the lofty pines and setting the shadows dancing and flitting through the open huts. The white smoke glided upward like tall ghosts and disappeared in the gloom above the tree tops. The young moon hung low in the west, carrying the "old moon in her arms" across the mysterious wastes of the Everglades, leaving a trail of silvery tracks behind her. The jeweled belt of Orion and the flaming Southern Cross blazed in the heavens above, while myriads of fire-flies flitted and flashed their tiny lanterns over the slender spires of reeds, rushes and rank grasses, their reflections gleaming and sparkling with the stars in the still reaches of the channels. The air was heavy with the redolence of balmy shrubs, honey-scented flowers and the spicy aroma of the pines. Strange night birds flew by in noiseless wing, great moths whirled about in erratic flight, and fierce beetles went buzzing overhead. The chuck-will-widow was calling loudly, and the great horned owl woke the solemn echoes of the dense pine forest, while an incessant twittering and clattering of waterfowl, the piping of frogs, and the occasional hellow of an alligator came from the marshes. What wonder that the Seminoles found the nocturnal and desparingly for their sunny homes.

We repaired to the largest and best of the huts, where the village were sitting and lounging about. The squaws, each with a babe in her lap tugging at the fount of nature, were shelling beans, pounding hominy or pulling tobacco, the men looking on, talking and smoking, and the children and dogs romping and playing. We were offered the best log at the fire and sat down. I performed a few simple sleight-of-hand tricks, such as, by palming half-tobacco, making them disappear and then taking them from under the young bucks' turbans, out of the older men's tobacco pouches, or from under the boys' shirts; but they were especially delighted when I took two from the mouth of a baby. Other tricks were performed with a string and a handkerchief, which were received with grunts of applause and nods of approbation. They wanted Squire, Jack and Skipper to do something, but I told them I was "mechanic man," and that I was not a "crack" but a "good" man, which pleased them amazingly. Skipper then put Cuff through his paces, who is a very intelligent dog and performs a variety of tricks. There was a large garish roasting on the coals, at which Squire spit tobacco juice as at a target, in spite of Jack's nudges, and he seldom missed the mark. I said something about baked fish and tobacco sauce, but still, as Jack said, "he didn't tumble to the racket." Finally a squaw turned to me and said "tumble" to me. "I thought it was a stick of wood," said he apologetically. But the besting did it no harm, for the squaw cracked it open with a stick, the hony covering parting in halves like a bivalve shell, the meat appearing white and savory, which was divided among the children, together with some sweet potatoes which she raked out of the ashes.

The young bucks and squaws are not allowed to talk to white men, but they do talk to each other about; they affect not to understand, answering only "Duh-uh-uh-uh," but get the bucks apart to themselves and they can talk "Englis" well enough for all practical purposes. Big Tiger prides himself on his ability to "Englis" talk, good. I asked him why he did not succeed his father, Tiger-tail, as "Big Chief" instead of Tallahassee. I gathered from his answer that it was (as in the affairs of some other people) the man who talked the fairest and promised the most who was selected. He said:

"The chiefs and officers have council. All come. All smoke. One man get up—talk, talk, talk! No lie—good talk. Other man get up—talk, talk, talk! Must no lie—must good talk! Every man must talk, talk! Every man good talk—must no lie! When all men talk, they say who chief. Tallahassee he talk heap—good talk—no lie—make him Big Chief, but," he added commiseratively, "lie no 'Englis' talk. Englis' talk good." Capt. Hendry, of Fort Myers, took one of the young bucks (whom he is educating) and Little Tommy to the State Fair at Jacksonville a few months before. I asked Tommy what he liked best of all things that he saw there, he answered, "Big hog!" The admiration of these Indians for hogs (of which they have a number) seems to surpass that of all things else.

Little Big Tiger if he was fond of wy-ho-mee (whisky); he said:

"In-ah; little my-ho-mee, good; too much wy-ho-mee, ho-la-wat-gus! You got 'um?"

"No; where can I get 'um?" asked I.

"Miami, you get 'um; Key West, you get 'um. Miami wy-ho-mee, ho-la-wat-gus! Key West wy-ho-mee, good, in-ah! Miami wy-ho-mee, me ho-'um; in four days (holding my hand out fingers), sour, ho-la-wat-gus! Key West wy-ho-mee good! No sour, strong! In-ah!"

We discovered that night why the Indians used mosquito bars; but my pen is inadequate to describe the other things and torments we endured through neglecting to take our wits with us. We slept, or rather tried to sleep, in the hut assigned to us, where by maintaining a circle of fires and smudges around the open hut we managed to pass the night. We spent two days at the village and were much interested. The Indians are good hunters and fair shots, but we beat them all at the target, as you thought it necessary to do so in order to convince them of the superiority of our rifle. They were much interested; we modified their defeat, however, by attributing our success mostly to our superior rifle, which we told them were even inferior to most rifles now made. Jack then kicked the fat into the fire by beating each Indian with his own gun; but

when he donned up crows at a hundred yards with a Steves's pocket rifle, twelve inch barrel, they refused to shoot any longer, saying their guns were ho-la-wau-gus! Jack said that the white man's supremacy must be maintained. The Indians use modern breech-loading rifles of the best manufacturers, .38 and .44-calibre. Their canoes are made of huge express logs, are beautiful and are handled carefully and skillfully by the crew. The boys learn to handle and sail them when quite young. They use the pole in preference to the paddle, owing to the shallow water, and always sail them when there is a fair wind. In the fall there is from four to six feet of water in the Everglades, caused by the heavy rains of summer, but in the spring "navigation closes."

We purchased some sweet potatoes, and when we reached the canoe and prepared to leave when Chif was missing. I had seen him not long before with a large Indian dog in the woods. Skipper was sorely troubled, fearing that the bucks had secreted him; but I was satisfied he had gone limning to show off his smartness to the Indian cur. Finally we left without him, Tiger agreeing to bring him down to the station next day, saying:

"When sun so, printing in the west to where the sun would be at an high, 'me come—canoe—white man's dog—me bring um—in-ah!"

Three hours of sailing, paddling and the swift current of New River took us to the station landing, where we found the Rambler all right. The next day at the appointed hour Tiger was seen pulling a small canoe across the bay, with Chif seated in the bow.

The most favorable wind for sailing on the East coast of Florida is a westerly one, which, blowing off the land, renders the sea comparatively smooth. The day after I returned from the Everglades the wind was north-west, and had Cuff been aboard, we should have at once set sail for Biscayne Bay, that being the most favorable wind we could have had. As a rule, the wind in Florida boxes the compass in the regular way, following the sun, so that by the time we were ready to sail it was easterly, but rather light, and though there was not much sea, the water was long and heavy swell from the northeast. We went out over the bar at old tide. New River Inlet is one of the best on the southeast coast of Florida, there being at low tide three or four feet of water on the bar. As the channels to these inlets are constantly changing, owing to the shifting of the sand, it would be useless to describe them in detail; but as a rule the entrance there was not very deep, they were long and heavy swell from the northeast. We went out over the bar at old tide. New River Inlet is one of the best on the southeast coast of Florida, there being at low tide three or four feet of water on the bar. As the channels to these inlets are constantly changing, owing to the shifting of the sand, it would be useless to describe them in detail; but as a rule the entrance there was not very deep, they were long and heavy swell from the northeast.

The shore line for ten miles below the New River Inlet is of a similar character to that already described, but it afterwards becomes more heavily timbered, owing to the proximity of streams about the head of Biscayne Bay. Twelve miles below New River we were abreast of Life Saving Station No. 5, the last one on the coast, under the charge of El. Barnott, and eight miles below it we entered Bay Biscayne through Narrow's Cut, between the mainland and Virginia Key. The lighthouse on Fowey's Rock (formerly on Cape Florida), and the first buoy marking the entrance to Hawk Channel from here to Key West, were in plain sight as we passed in. We at once sailed across Biscayne Bay, about eight miles, to Miami (old Fort Dallas), at the mouth of Miami River.

We sailed into the river a few hundred yards and anchored off the wharf of Mr. Ewan, who keeps a store and lives with Mr. Chas. Peacock in the old stone officers' quarters of Fort Dallas. Here I met my old friends, Mr. and Mrs. Peacock and family, Mr. Ewan and his mother, also Mr. and Mrs. Tuttle, of Cleveland, O., E. O. Gwynn, Esq., Mayor of Key West, and Mr. Curtis, of Jacksonville. Mr. Curtis was collecting specimens of woods for the Smithsonian Institution and other scientific museums, and had a valuable collection. We crossed the river to the store and post-office of Mr. Brickell, where we found an abundant supply of mail matter, this being the only post-office between Lake Worth and Key West, the mail being received via the latter place. We also met here Little Tommy, one of our Indian friends from the Everglades, who was down on a trading trip, coming in his canoe by way of the Miami River, which penetrates the Everglades. There are many points of interest about Biscayne Bay, among others the "Punch Bowl," a large spring in the lakam of Mr. Brickell, and near the shore of the bay. In times gone by the lucaucers, pirates and wreckers of the Florida Keys and Spanish Main frequented this spring to fill their water casks from its great rocky bowls. There are several stories of buried treasure near the haunts of pirates obtain, and many and vain have been the scorchings in the vicinity of the Punch Bowl. A few miles up the Miami there is quite a rapid, called "The Falls," which will well repay a visit, being a lovely and most romantic spot. At the lower end of the bay the "Indian Hunting Grounds" begin, running to Cape Sable, where large gnu woods. At the head of the bay, Snake and Arch creeks empty. Spanning the latter is a natural stone bridge or arch of coralline rock, under which boats may pass and the fortunate occupants enjoy the beauties of the scene.

In a beautiful grove of cocoa-palms at the mouth of the Miami, were encamped Mr. and Mrs. M., Mr. and Miss H., and Mrs. O., of Staten Island, New York. The group of white tents added an additional charm to the spot, and lovely and romantic as it is, the scene was not unbecomingly and fit were as complete and comfortable as possible, and they really enjoyed their open-air life. Mrs. M. and her sister, Miss H., were afflicted with pulmonary consumption, and had been drawn hither, as a last resource, to try the healing virtues of the chlorinated breezes, balmy atmosphere and warm bright sun of this, the fairest, the most charming and most healthful season in Florida. Miss H. had been greatly benefited by the disease, not having made such fearful inroads and rapid progress in her case, but the fell and insidious destroyer had already impressed his flaming red seal upon the fair, was cheeks of her patient and courageous sister, and claimed her for his own.

One evening, as the full, round moon rose grandly over the beautiful bay, bathing the palms in a flood of silvery light, we sat under the shade of the tent, the fair sufferer propped up by pillows in an easy chair, the soft and grateful breeze fanning gently her fevered brow, while her great, dark-gray eyes calmly and peacefully drank in the glorious and wondrous beauty of the scene, and loving ones whispered words of hope and encouragement; but as the silvery track of the moon was flung across the waters of the broad bay almost to her very feet, I knew, alas! that she was slipping pathway by the side of the tent, and was already traveling heavenward. She is now, doubtless, at rest and calmly sleeping under the wintry snows of her Northern home—a fitting winding-sheet for one so pure and lovely.

Natural History.

THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance, Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH

169. Ruffed Grouse—*Tetrao u. rufus* Aud.; *Bonasa umbellus* Ridg., 473, C. 562.—A abundant, resident throughout the year. Breeds. Nests upon the ground in the woods, and early in May lays from ten to fifteen brownish yellow eggs, sometimes obscurely spotted. This is the grouse locally termed "partridge," "birch partridge," or "grain partridge" in Maine, but its proper name, ruffed grouse, is gradually coming into popular use through the aid of sportsmen, by whom this name is now quite generally used. The ruffed grouse's habit of seeking a shelter beneath the snow in severe winters, sometimes occasions much havoc among their numbers when the weather suddenly changes to a thaw or rain followed by such freezing as to form a crust that imprisons the birds beneath it until starved to death. It is said that the bird darts into the snow while flying. I have seen it emerge from under the snow, but have not seen it enter. Yet an examination of many of their burrows has proved to me that it does not always dart in, as above mentioned, but often first alights on the surface of the snow.

A more frequent cause of destruction than the snow crust is a continuance of cold, wet weather during that period of spring in which the young are hatched. Whenever either of these destructive causes becomes generally prevalent, there results a scarcity of grouse for several succeeding seasons.

But the most insidious enemies to these birds, and far more destructive than all natural causes, are the snares set by man. I have known the ruffed grouse in a locality where naturally very abundant to be almost entirely exterminated by snares. Yet no one in the vicinity appeared able to assign the cause of the disappearance of the birds, not even the man who had snared them.

A friend of mine, familiar with the subject, thus man told me of his success, which continued until "all of a sudden there didn't seem to be any at all in the woods where they had been plentiful," and he gave up snaring in consequence, without appreciating the fact that the total disappearance of the birds was a result of his snares. His skill and experience had enabled him to take all the grouse there were resident in the woods, but he had not been successful in his migratory, the place would remain depopulated until by some chance a new generation should be started there.

The "drumming" of the ruffed grouse may be heard occasionally in any month of the year, even in mid winter. But it is of most frequent occurrence in the spring and autumn. This "drumming"—performed by the bird's rapidly beating its wings, while standing upon the neck of a fallen tree, a rock, or the ground—produces a noise that resembles the sound of a muffled drum, hence the term "drumming." The performance is usually written of as peculiar to the season of early spring, and the charming writer Mr. John Burroughs has criticised the poets for referring to this drumming as occurring at other times, yet it is of frequent occurrence during the warm sunny days, and moonlight nights, of autumn, a fact well worthy of notice, and which, I believe, where these birds are found, and probably in nearly every farmer's hoy in Maine. I have heard the "drumming" of the ruffed grouse in winter as far north as the species is commonly found in Eastern America.

FAMILY PERIDIAE: THE PARTRIDGES AND QUAIL.

170. Virginia Partridge or Quail—*Ortys virginiana* Aud., Ridg. 480, C. 571.—This most widely distributed species of the American partridges has at various times been introduced into Maine, but never with any permanent success. Our long winters with deep snow render starvation almost certain, excepting in occasional seasons of unusual mildness. An abundance of food may be found here in summer, and some sport may be attained by annually introducing the birds to favorable localities, and shooting them and their progeny during the autumn, their places to be supplied the following spring by the liberation of others to be obtained from Southern States.

171. Migratory Quail—*Coturnix coturnix* Linnaeus; *Coturnix douglasiana* C. 579.—European species first introduced to North America in 1877. (Martin G. Everts, Esq., Rutland, Vt., 290. Mr. Warren Haggood, Massachusetts, 100) and to Maine in 1879 (100) and 1880 (2,600).

In the "Report of the Commissioners of Fisheries and Game of the State of Maine," for 1880, I gave some account of the migratory quail, and from that report I quote some of the following notes:

"This quail (*Coturnix coturnix*) is the common migratory quail of Europe, that for centuries has crossed the Mediterranean Sea from its winter home in Africa to its breeding places throughout Europe, returning again to Africa in the autumn. The bird resembles in outward appearance our American partridge (*Ortys virginiana*) that is termed "quail" in New England. The migratory quail is one-third smaller, and the throat of the male is more brightly colored. The throat of the female extends from the bill downward. The notes of the quail may be expressed, as nearly as possible to translate into words or syllables, by "who-ah—ah—ah—ah—ah," the preliminary crescendo "who" not being heard at a great distance, but the three clear notes may be heard a quarter mile away. Often the notes seem to come from a bird near by, but really afar off, and upon this point the migratory quail repeats a low thrilling note as it flies away. This note resembles the ordinary cry of the pectoral sandpiper (*Tringa maculata*), but is softer, and only to be heard when uttered within a few rods of the listener.

The quail is strictly a terrestrial bird, and inhabits the fields, where it also nests. Fifteen eggs to a nest is not an unusual number, and the eggs are laid by a bird and not an incubator. The weight is as large as the egg of our robin, we have been frequently asked how so small a bird manages to lover and hatch so many eggs in one nest.

The nest is a depression hollowed in the ground, and lined with grass by the bird. In this nest are laid the eggs in regular order, upon the bottom and around the sides of the nest, the upper ones supported by the eggs beneath and the sides of the shallow, lower ones resting upon breast and sides by the eggs, while its wings are raised to cover the top layer of eggs upon each side. Many nests, of fifteen eggs each, have been reported as found, in which all the eggs were hatched.

One nest of eighteen eggs deserves especial mention, as of

interest to students of ornithology. The eggs in this nest were laid in tiers or layers most carefully and compactly arranged, one above the other, as if placed by the hand of man, the bottom layer most entirely laid from view by the eggs above. But twelve of these eggs were hatched, and evidently the bird was not so unskillful. Probably the remaining eggs were so covered by the others, that sufficient warmth was imparted to them from the body of the bird.

The eggs of the quail are of a greenish color, profusely blotched with brown. Like other eggs, if deserted and left exposed to the sunlight for days, the color will fade until it becomes almost white. This year [1880] the eggs were laid in June and hatched in July. The young birds leave the nest as soon as they are hatched, mature very rapidly, being strong of wing in September.

Among the noteworthy characteristics of the quail are its gentleness, and the extreme pertinacity with which it adheres to its domestic duties. We found two nests with eggs with in a few rods of a farmhouse, where a lot of the birds had been liberated, and close by a traveled highway, as well as near a railroad. The birds were occasionally observed among the chickens about the house.

Quite a number of quails have been killed by mowing machines. One might naturally suppose that the clatter of one of those machines approaching would sufficiently alarm any bird, even while sitting upon its eggs, to cause it to leave its nest temporarily. But some have had their heads cut off by the knives, and in one instance the machine was a typical "lawn mower" which passed over and completely crushed the quail and its eggs on the nest beneath it.

The quails have a strong seek, readily detected by setters and pointers, but they often seek to escape by concealment, or without taking flight.

Some young quails were captured near St. John, N. B., this year, although none were liberated nether than at St. Stephen. Several quails were heard and seen near Mackinac Island, Michigan, and Ontario. None had been liberated nearer than the Penobscot Valley on the west, and at Calais, forty miles to the east. This is not remarkable, however, in consideration of the fact a quail can easily fly fifty miles within an hour. Unlike our American partridge, or "quail," it is capable of long sustained flights without stopping to rest.

No quails were imported to Maine in 1881, but some were observed early in May of that year at various localities in the State, and as no newly imported birds had been previously liberated elsewhere that season, it was evident that some of the migrating quails had returned.

It has been proven that these birds can find an abundance of suitable food here, that they are hardy, and do not lack that instinctive love of home which is the prime incentive to common migratory birds to return to the place of their nativity.

The domestic sparrows were repeatedly introduced from Europe ere the desired results were attained, and the similar experiments with quails may not be at first entirely successful. Probably the liberation of a considerable number of birds in one favorable locality, repeated for several consecutive years would insure permanent success. I feel confident in the belief that the migratory quails can be permanently added to the avifauna of North America.

FAMILY CHARADRIIDAE: PLOVERS.

172. Black-bellied Plover—*Charadrius hiaticula* Aud.; *Squatarola hiaticula* Ridg. 513, C. 580.—Common on the coast during spring and autumn migrations. Arrives in May. Locally termed "beetle-head." Unlike other species of the plovers this bird has a small, well-developed hind toe. In ordinary plumage its lower parts are grayish white, often mottled with black. But in adults in the perfect plumage of spring it is uniformly pure black over the whole surface of the head, neck, breast and belly, hence the name black-bellied plover. Nearly all of the birds of this species have passed by Maine to their breeding places in the far North ere attaining this perfection of plumage, yet a few such specimens are observed here each season. The black-bellied plover frequents the sandbars, beaches and soft marshes along the coast, but is not commonly seen far inland here, nor in any of our ponds and swamps.

173. Golden Plover—*Charadrius auripennis* Aud.; *Charadrius dominicus* Ridg. 515, C. 581.—Common during autumn migration, August and September and sometimes abundant. Never seen here in spring. Locally termed "black-breasted plover." The lower parts are pure black in spring only, and in this plumage the bird is never seen in Maine. The upper parts are spotted with golden yellow, and hence the name of golden plover. The favorite resorts of this species are high pastures and fields, as also newly mown meadows and marshes; it is rarely found frequenting the beaches, although common at times upon the high land of grassy islands. There was a remarkable flight of golden plovers through Maine during the last of August and first part of September, 1875, such has never since been witnessed here, and which resembled that of pigeons. For days the air was clouded with the incessant passage of flocks of these birds, and great numbers were killed.

174. Killdeer Plover—*Charadrius vociferans* Aud.; *Onychos minutus* Ridg. 516; *Agallites vociferans* C. 584.—Rare. An occasional visitor from the South. I have the following record of the occurrence of this bird in migration at Seaboard, Me.: August 9, 1852; three, August 10, 1853; one, March 29, 1855 (the sole instance of its known occurrence here in spring, and this a remarkably early date); one, August 1, 1870.

175. Semipalmated Plover, Ringneck—*Charadrius semipalmatus* Aud.; *Agallites semipalmatus* Ridg. 517, C. 585.—Abundant along the coast during migration. Arrives in August. Frequents the sandbars and beaches. I have procured an egg of this species on an island in the Bay of Fundy, but it is a very unusual occurrence to find the bird breeding so far south as that, and none are known to breed in Maine.

176. Piping Plover—*Charadrius melanotos* Aud.; *Agallites melanotos* Ridg. 520, C. 587.—Common on the coast. Arrives in early April. Breeds upon the ground, four eggs, laid in dark brown spots. This little plover much resembles the ringneck, but does not associate in large flocks, utters quite different notes, and the general coloration of plumage is much lighter. Unlike the ringneck it is very gentle and unwarlike.

FAMILY HEMATOPODIDAE: THE OYSTERCATCHERS AND TURNSTONES.

177. Oystercatcher—*Haematopus pilularis* Aud., Ridg. 507, C. 596.—Accidental. A Southern bird. The only record of its occurrence has been reported by Geo. A.

ber. I have three old ones in the same piano box, with glass windows laid on top; they are healthy, and don't seem to mind the cold.

[The bird is a tree sparrow (*Spizella monticola*).]

SNIPES WINTERING IN COLORADO.—Fort Lyon, Colorado, Feb. 3, 1888.—A soldier brought me to-day a true snipe (*Gallinago Wilsoni*) and stated it was in company with another. It was a male, in very fine condition. Size, average. Gizzard contained partly digested fish. In one of them (about one-fourth of an inch long) the eyes and tail could be plainly seen by the aid of a good lens. The bird seemed more lively plumped than usual. I have skinned and stuffed him. He was shot at a spot where a small underground stream issues from the sand and the water does not freeze. It would seem an unlikely place to find snipe at any season, being perfectly barren—all sand and small stones. The ground here has been frozen solid for two weeks. No rain since last July. Severe nother with snow for the three days previous to this; temperature last night, 22 below. As all the wintering of snipe North of which I have heard described them as being found in sheltered, springy places, I thought the fact of their being found in winter in this bleak, barren country might be of interest. It is also, to me, a surprise to learn that Wilson's snipe sometimes goes a fishing. I would like to know if this fish diet is adopted from necessity, or if the bird ever eats fish when it can bore in the ground?—L.

PINE GROSBEAKS IN NEW JERSEY.—Lockport, Niagara Co., N. Y., Feb. 3.—In your issue of this week I noticed Harry De B. Page's mention of pine grosbeaks in New Jersey. Last Sunday while taking an after-dinner stroll in the western part of the city, I noticed a flock of birds in an evergreen a few rods from the street. I approached within less than two rods of them, and watched them for some minutes while they were feeding. I came to the conclusion that they must have been pine grosbeak, although I had never seen but one specimen before, which was secured by a young friend some years ago, and the only one I ever knew of being taken here. On Monday, after banking hours, I took my gun and went to the same place, and found the birds within twenty rods of where I saw them the day before. They were in the light of the sun, No. 13 shot, and seemed fond of them, one hawk and three female. My son has stuffed and mounted them in different positions, as I saw them while feeding, and they make a fine addition to his collection.—J. L. D.

OPSSOMS ON LONG ISLAND.—We were shown this week an opossum which was killed at Wading River, Suffolk county, L. I., on the fifth of February last, by a dog belonging to Mr. L. C. Valentine.

"WHEN THEY COME AND WHY."—In sixth line of the paragraph under this head, page 11, for "four or five years" read "forty-five years."

MINNESOTA SENATE RESOLUTIONS.

UNDER date of February 8, comes the following dispatch from St. Paul, of the proceedings in the Minnesota Senate relative to the seizure of the Yellowstone National Park:

In the Senate to-day Mr. Wilson offered a concurrent resolution reciting the attempt of a party of capitalists to secure control of the Yellowstone National Park, and the warning of H. S. Sheridan and Senator Vest upon the topic, and requesting that the Senators and Representatives of Minnesota in Congress use their influence to secure this Park for the public good, free from the extortions of monopolists. The resolution also thanked Gen. Sheridan and Senator Vest for their timely efforts to prevent the securing of the Park for a cattle ranch and for the purpose of extorting money from the general public. The resolution is a copy of one passed by the Legislature of Illinois. Some inquiry was made as to the certainty of the charges, which Senator Wilson stated was a matter of general report.

Senator Peck remarked that the matter had been before Congress and the people for thirty days. In Senator Vest's resolution the matter was fully explained and widely published at the time. Senator Gilliland moved to refer the resolution to the Committee on Federal Relations. He held that the Senate would show unseemly haste in adopting a resolution upon insufficient knowledge. The yeas and nays were called for on Senator Gilliland's motion to refer, and the motion was lost by a vote of 20 to 2. Mr. Gilliland gave notice of debate. Objection was made by some Senator to the words "cattle ranch," and Senator Wilson ceased there.

THE SEVEN-LEAGUE BOOTS.

I CAME yesterday into possession of the Seven-League Boots. How this rare good foot time was attained need not be detailed; but I beg to assure you it was no such infernal compact as that by which the ubiquitous Peter Schlemihl once wore the same wondrous leathers.

Sitting in my easy chair before the grate last evening, impatient to test their magic, I pulled on the Boots. Of what followed I shall not attempt to give more than the barest of time. Hardly were my feet fairly encased in the Boots before I found myself two thousand miles away to the North, amid the peaks of the Arctic, jangling the reindeer with Lent, Schwatka and his faithful Toobah. The change in temperature was, as you may well conceive, something tremendous, but partly because of the excitement of my novel position and the exhilaration of the chase, and partly because of certain properties of the Boots, I felt it not. With barely time to count the Lieutenant's game, I was whisked away another two thousand miles, and as quickly forgot the reindeer, in company with "Seneca" putting up and bringing down the Bob Whites in an out-of-the-way spot in Western New York. But only for a moment—for quick as comes and goes the buck's flag in the opening of the brush, I passed twelve hundred miles to the South, and with Dr. Henshall explored the borders of the Everglades, where I was as much interested in the sweltering Seminoles as but a few minutes before in the frozen Esquimaux three thousand miles away.

From southern Florida it was but a bagatelle of fifteen hundred miles to the Maine woods. Thence to the London Argentin, three thousand miles, and a like distance back to New Hampshire. Thence with the speed of lightning I was transported to—but, my dear FOSTER AND STREAM, you must long before this have perceived that I have been all this time sitting here in my comfortable chair, before the fire, reading the pages of your last number, which came in my mail yesterday. Neither you nor I would be so bold as to declare the Boots themselves a myth, though I confess for myself that I never expect to wear them; but do you know? I really don't care much for them, so long as I am sitting in my chair. I can travel the world over without such a companion as yourself.

MEAT-HAWK.

Game Bag and Gun.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

RUNNING FOR LIFE.

IT WAS three o'clock of a starlight morning in November, 1846, that I mounted as fleet a filly of four years old as I ever rode. I was to go down the river fifteen miles on an errand and to be back before breakfast. My father had a large farm, and I was the chore boy for all; so I was always at home in the saddle.

I had to pass through a thick hemlock growth of about four miles without a clearing. Soon after entering the woods I was thrown forward on the neck of the colt, and she snorted and made an effort to turn. I looked ahead and discovered what I supposed to be a large dog. I was vexed with the pony to think she should be afraid of a dog, so I struck her with the stick, and she bounded up with a leap that would have thrown me had I not been used to riding; and as I passed the creature it leaped toward me and grazed the colt on the hip. That made her about as frightened as it did me, for I then discovered that the animal was a very large catamount. The pony flew like the wind; and as I recovered from my first fright I looked over my shoulder and found the creature was right after me. My knowledge of the panther's habits, furnished by the old hunters of that day, was all correct. I thought if I could only keep the colt at the distance now gained I might out-wind the panther, but I had no experience to tell how long she might follow.

The filly hugged the ground and flew like the wind. Every moment I looked back to see if the creature was gaining on me; but I found I was holding my own. The time I passed over that four miles was very much quicker than I need to wish it, although I never enjoyed it. I had a pack of twelve wolves one dark night through a piece of thick hemlock timber in another part of Oxford county, and the filly had come out all right, although I came near being left; but this was quite another kind of beast. The first three miles it was about nip and tuck, but as we neared the first clearing I found I was gaining on the panther, and I began to take courage. The colt still hugged the ground, and she rattled behind her like hail; and still we flew on, with the panther in the rear. While I was thinking over what I should do if she still continued to follow, I came to the clearing on which was a log house; but I knew it would be useless to stop there, so I made up mind to keep on; and I passed the house I looked back, and the panther had turned off in the woods, perhaps thinking that I was not good meat.

I did not go back as soon as I had intended; but when I did return I measured the track and found the leaps, which averaged twenty feet. The creature was shot a few days after by a man named Spencer, in the town of Baldwin, Oxford county, and I measured it. It was just nine feet from tip to tip. I think that it was the largest panther there is any history of being killed in this region.

S. P. HUBBARD, M. D.

FREEDMAN vs. BOB WHITE.

IT IS funny to me that your correspondents, after telling I, you of the almost universal scarcity of partridges, should inform you the negro is in no wise responsible for that scarcity, because, forsooth, he has lost all fondness for hunting. I wonder it does not occur to those gentlemen that the sable Nimrods have given up the hunt wherever it may be for the simple reason—"I don't pay." It gives them no more pleasure than it does us to carry a gun all day long, and come home with an empty bag. In autumn, for weeks together, negroes, by scores and hundreds, go out every night in fresh tide-water marshes after sora, which they kill in great numbers by torchlight; and this they did in the time of slavery, when they had to work all day; now they are out all night if they choose, and sleep during the day. And old Virginia, at this very time, would be a possum paradise, but for the nocturnal darkey, who would not swap a big fat possum for all the canvas-backs of the Chesapeake.

No doubt Dr. Ellzey speaks correctly, for the part of Virginia with which he is acquainted is the grazing section of the State. But I apprehend he knows very little of the system of farming, the physical condition of the country, or of the habits of the negroes in tide-water Virginia. In the counties of King William, New Kent and Charles City, extending from the Mattaponi south to James River, farming is not done so carefully as before the war, but it is exactly the farming partridges delight in. Hedge-rows, ditch-banks and springy places all grown up in briars and bushes. Wheat, oats and peas are grown on every plantation that pretends to be cultivated, and the manner of harvesting is the same now as for the past thirty years. There is an abundance of cover and of food—wheat, oats, peas, Magotha bay-bean, and sometimes millet, but no birds. Whereas, for several years after the war, the whole low country was alive with Bob White notwithstanding there was not so much of small game then as now, particularly of peas and the bay-bean, a spontaneous growth in lower Virginia, highly esteemed by birds and supplying excellent cover.

If Dr. Ellzey would only make one visit to these counties he would never again in his description of the general condition of Virginia talk about "the thicker settling of the country, and clearing of forests and swamps and brushlands;" for the reverse is exactly true in every particular as to nearly every part of tide-water Virginia, away from the cities of Norfolk, Hampton and Suffolk. The second day of Christmas, 1882, three deer were distributed at King William C. H. among the huntsmen. Deer are not found of a thickly settled country where forests, swamps, etc., are cleared up; yet they are largely on the increase in all the counties I have named. And to-day I believe King William county is nearly ever part of tide-water Virginia, away from the cities of Norfolk, Hampton and Suffolk. Still I know of but one farm in the county which affords good sport, and that is owned by a gentleman who does not allow hunting or trapping by his tenants.

In the country of which I am writing, most of the negroes, who are heads of families, like to rent a piece of land with a cabin on it, so as to be near their fields and near to their wives and children, and raise a crop of corn and such vegetables as grow without much attention; but

not one of them will hit a lick, Saturday, in his own crop. For their meat they depend on hunting, trapping and fishing, although they are always glad to sell what they catch (except possums), themselves, finding only what is not salable; and it is remarkable how little they eat when they have their own food to find. For money they rely on wood-chopping, loading vessels, working at saw-mills and in the harvest field, and gathering the crops of corn on the large farms. In this way they handle more money than those who hire themselves to farmers by the year, although they are not so well paid when Christmas comes, because so much of their time has been spent loading and unloading a gang; and "there's where the money goes." But the negro is going to hunt small game till the crack of doom, if the small game will only abide with it. He never goes for large game.

So I stand to my text that the partridge has been ever night exterminated by the ever active, eager, ingenious dog streetiveness of man, which has become of the bison on the sunrise side of the Mississippi? Done to death by the fur hunter. And why are we propagating fish artificially? Let seines and gill-nets and fyke-nets and purse-nets and pound-nets and gun-o manufacturers answer.

RALLYWOOD.

VIENNA, February 8, 1888.

[In issue of Feb. 1, article entitled "The Negroes and the Birds," last line on page 7, for "destructive as a sportsman" read "destructive as a city sportsman."]

IMPROVED SHOTGUN SHELLS.

DURING the past year the English sportsman has been investigating the merits of a shotgun shell recently placed on the market under the name of "Kynoch's Perfect Case." This shell is composed of very thin and flexible brass in order that when loaded the end may be closed to retain the charge as in paper shells. The shells are of course, waterproof, and as regards shooting do not appear to possess any special advantage over paper shells shot in the same gun. They are, to say the least, a little different in pattern or penetration between a 12-gauge Kynoch and a 12-gauge paper shell each charged with the same load. Continued and careful experiment, however, brought to light the fact that a 14-gauge Kynoch shot in a 12-gauge gun gave much better results than a 12-gauge paper shell shot under similar conditions. To about a 14-gauge K. in a 12-gauge gun, or rather, to shoot the chambers of the gun, or obtaining a new pair of barrels specially chambered for the 14-gauge Kynoch. When this is done there is little doubt that greatly improved shooting results, as careful trials by the editor of the London Field, by Mr. Greener and others testify. Our British cousin is now trying to make up his mind whether he will have his barrels altered or new ones made, or whether he will stick to his old barrels and paper shells. We make these statements in view of the fact that we have recently had an opportunity of examining an American invention which promises to more fully meet the requirements of sportsmen than does the Kynoch. Theoretically the shooting should be as good, if not better, than that of the English shell, and it can be used in guns chambered in the ordinary manner. It appears to possess the same strength and strength as the brass and paper shells without their special defects. It is reliable, waterproof, tight, capable of being crimped, but slightly more expensive than the paper shell, and probably not more than one-fourth the price of the ordinary brass shell. We hope at an early day to be able to give full details concerning it. The improved shell is the invention of our occasional contributor, "H. G. P."

ADIRONDACK WINTER NOTES.

A FEW days ago I met one of our best still-hunters, who in five days last fall, had killed nine deer.

"How many did you and the boys kill with the dogs?" "We hunted ten days," he replied, "and got one big buck and two does. The buck I killed on the runway; he had got by all the other boys and was making for the swamp; we had run him three or four different times, and he always got away, but I smoked him."

"Then you better still-hunt than with the dogs?" "Yes, I can kill five to one, when the snow is good. But the deer are wild this season; they have been dogged so much. I wish every dog was dead—no, I don't, either. We guides get lots of days' work that we would not get if we did not hunt with dogs, and if we did not hunt with dogs very few people who come from the cities would ever see a deer."

"That is so, and don't you think that the dogs are a protection to the deer in this way, that they make the deer harder for the still-hunters to get up to?"

"Yes; I used to kill ten deer where I do one now, and I had to work harder every year to get up to them. Four is the most I ever killed in one day. Bill Danforth says he has killed seven in one day. I have known of his killing five in a day, but he has been out a number of days this season, and the last time I heard from him he had not killed a single one. He says he never saw them so wild."

"Do you think the deer are growing scarce about here?" "No; I never saw the deer signs so thick as I did the day I was in back of your house, where I killed the two bucks. I could have started a dozen deer that day. No; I think the deer are on the increase every year."

"Do you think the dogs by running deer worry them so many of them die after the dogs leave them?"

"No; I never found but one that I thought would have died. I found him in the ice where he could not have got out, and I killed him and took him home to save his life!"

I have given this conversation just as it took place, showing the opinion of one of the best of our still-hunters in a day, but he has been out a number of days this season, and the last time I heard from him he had not killed a single one. He says he never saw them so wild."

I have read much about bears in the FOREST AND STREAM during the season, and have one little story that has not been told in print. About the first of last year, "Lime" De Bar set a trap at Hayes Brook to catch a muskrat. His first day's work was a three-mile tramp to about a half-mile, and he set a trap with the trap of twenty pounds, and meat twenty-five more. One week from that day he visited his bait and found the trap gone, with good signs of bear. He followed the trail about one mile and found the trap by the side of a stump—a "little hair, no bear."

"Lime" is naturally of a thoughtful turn of mind; so he set down to "study the signs" and satisfy himself as to how the bear set a trap, and then he set a trap to about an hour, then he picked up the trap and went back to the "cubby house" to set the trap again, and found that the bear had

THE MISSOURI ASSOCIATION publish in convenient form their constitution and by-laws, with rules for trap shooting, together with the game and fish laws of the State. The pamphlet gives these facts concerning the society: "The origin of the Missouri State Sportsmen's Association, though not quite a tradition, has not been preserved in its minutes. The credit of the original organization belongs to St. Louis, Kansas City, and St. Joseph, and the clubs of those cities. The first meeting was held at St. Louis, in 1878, and D. H. Hall and J. E. Guinote, of Kansas City, elected president and secretary, respectively, for ensuing year, and Kansas City was selected as place of convention of 1879. The second meeting was then held October 22, 1879, at Kansas City, the constitution and by-laws adopted, officers for 1879-80 elected, and Mason City chosen as third place of meeting. In 1881 the convention was held at St. Louis, and tournament consisting of St. Louis Gun Club, and in 1882 at Sedalia, and tournament given under auspices of the Sedalia Gun Club. The present officers are: F. Houston, Sedalia, President; Paul Francke, St. Joseph, First Vice-President; W. W. Judy, St. Louis, Second Vice-President; J. C. Parnelle, Sedalia, Recording Secretary; W. R. Thomas, Sedalia, Corresponding Secretary.

PENNSYLVANIA GAME AND FISH LAW.—Catwissa, Feb. 8.—The Catwissa Fish and Game Protective Club held a meeting Feb. 3, and reorganized by the election of the following officers: W. G. Yetter, President; Abel Thomas, Vice-President; Wm. Eyer, Treasurer; A. H. Sharpless, Secretary. It is the intention of the club to strictly enforce the game and fish laws in this vicinity. A committee consisting of W. G. Yetter, H. Aldrich, W. H. Brown, Esq., and A. H. Sharpless was appointed to draw up and circulate a petition asking the Legislature to amend the fish laws relating to illegal fishing, so as to enumerate more explicitly what is meant by "permanent set means," etc., and the game laws to allow the killing of pheasants or ruffed grouse from Sept. 1, also asking that a bounty be offered for the killing of hawks. The club think the above changes proper, and ask the different clubs throughout the State to take a similar action, and through their representatives to bring the subject before the Legislature now sitting.—A. H. SHARPLESS, Sec'y.

PENNSYLVANIA.—Hollidaysburg, Jan. 15.—The past shooting season has been rather a poor one in this section; ruffed grouse are scarce and wild and white rabbits are plenteous than ever before, the quail have just begun to reappear, and the deer are the victims of the terrible winter of 1888-89. If we could only get the "sacch" law, as our grouse friends call it, on the statute books again, we might have reasonable hopes for the return of the splendid quail-shooting of four years ago. Woodcock shooting during the past summer and fall was a farce. I think not over four score birds were killed in the county. Since the close of the season our young shots have turned their attention, and with fair success, to the destruction of the foxes, whose numerous dog-like tracks dot every thicket, field and knoll. One of our young men has seven hides laid away to dry, all of them shot before the dogs, and proudly has the distinction of making a right and left on this cunning "bunt," as they played along in front of his pack of beagles.—T. D.

MINNESOTA.—Andubon.—I am very glad to note the stand you have taken against the park grab. Whatever the outcome may be, there are here many ardent admirers of your action and fearless treatment of the steal. I have been interested in their discussion of "hounding vs. still-hunting" and I would like to see the "sacch" put on, and every man who aspires to hunt the deer obliged to match his own skill against the instinct and cunning of that much-hunted and inoffensive animal. I have lived years in the deer country of Minnesota, and did I hold the pen of a ready writer, I think I could convince those who hold themselves open to conviction that the use of hounds is destructive to the best interests of the sportsman, which means the fostering of the deer to be hunted, and should love to see that he will be willing to sacrifice the use of the dogs.—VETERAN.

"RISING YOUNG SPORTSMEN."—Editor Forest and Stream: After you get through with the Yellowstone Park speculators, could you not fire a single volley at the benighted press of this State, so that one might read so influential a journal as the Philadelphia Times without running on some half a dozen clippings like this: "Young Johnny Pig-head bids fair to become one of our best shots. On last Monday he killed seven quail with one shot from his father's marshy field." Or, "Mr. C. has just taken a large party of our most successful sportsmen; he recently killed a wild turkey with one shot as they followed a trail made with corn to the blind in which he sat." It is "a thundering pity" they did not beat his pot-hunting head off with their wings, for a very few such men will more thoroughly clean a country of game than a regiment of decent shooters.—T. D.

UPPER MICHIGAN.—Union City, Ind.—I noticed that in your issue of November 16, Major H. W. Merrill recommends Mackinac and Schoolcraft counties, in Upper Michigan, as a good hunting country. I went there last October with four others on a hunt, and must say it is the worst country I was ever in. The railroad from Point St. Ignace to Marquette runs nearly the whole way through a marshy country, but there are no roads nor teams there, consequently you gave it up in disgust and came home without seeing a deer or bear.—D. B. C.

NOTE FROM FLORIDA.—An Oak Hill correspondent writing under date of Feb. 1, says: "The shooting has been wonderfully good this year, big bags of all kinds of game being the rule instead of the exception. The fishing has not been extra good thus far on account of inclement weather, still some good fish have been caught, the largest weighing 42 lbs., a channel bass. The Duke of Newcastle and a friend, Mr. Langley, of England, are here now, fishing and shooting.

NEW YORK.—Foxes are plentiful; one man here got a double shot, killed one, and shot one foreleg off the other, and then it got away from him. Your correspondent, Clarence A. Farnum, of Wellsville, has been appointed County Judge of Allegheny county. If his judicial decisions show any real sense in the game question, then Allegheny county is to be congratulated.—J. ORIS FELLOWS (Hornellsville, N. Y., Feb. 4).

NEW GLASGOW ROD AND GUN CLUB.—New Glasgow, N. S., Feb. 3.—The annual meeting was held on the 1st inst., and the following officers were elected for the ensuing year: President, W. B. Moore (re-elected); Vice-President, A. M. Frazer; Secretary and Treasurer, J. H. Cavanaugh (re-elected); Executive Committee, Norman McKay and H. T. Sutherland.—GLOBE SIGUR.

MANASSAS SETTS.—East Douglas.—Game has been quite plenty here this winter; the woods were full of squirrel; grouse were plenty, but quail were scarce.—AMATEUR.

NEW ORLEANS, LA., Feb. 5.—Our hunting has never been so poor as this season; no woodcock; very few snipe and ducks; quail, of course, plenty, also rabbits.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

The wary trout that thrives against the stream;
The well-grown carp, full laden with her spawn;

To take the fish, is give her leave to play,
And yield her line."—Shepherd's Eclogues (1644).

WITH HACKLES AND GENTLES.

"Angling our summer mora alone,
I sat me down upon a stone,
A little purple brook beside,
Whose modest, silver, rippling tide,
Mow'd by the zephyr's softest sigh,
Was scarcely heard by passer by."

FEW are the friends from whom the angler can choose a boon companion to fish with. There is that in the "gentle art" which shrinks from a coterie and can only be thoroughly enjoyed by the "lone fisherman" or, at the utmost, by two, and then the twain must be as "one flesh" in the pure and simple love of the pursuit. Yet who dares call angling an "selfish pleasure"? No brother of the craft, I trust, and cynics always sneer at what they cannot comprehend, or lack in taste to enjoy.

The angler is "never less alone than when alone" for the varied forms and phases of nature are with him in sympathy, pleasant thoughts are inseparable from him, and the very trout which he deftly and humanely transfers from the stream to his creel seem to have a subtle understanding that he is their friend and no foe at all.

"Do I write a paradox? Let us see. No angler, *par excellence*, is a butcher, nor does he crush the daisies by the meadow brook athirst for blood. He comes alight intent upon pleasure, to which the blithe birds, the flitting butterflies and the sweet flowers in the way minister. The very air is bathed in the perfume of him, and a charm beyond that of being in the habit of fish. The graceful sway of the birch and the alder he mimics as he casts his fly, and mercy, not greed, controls his entch. Didn't ever see any "cold, pitiless depths" in an angler's eye? I never did, and I have looked straightforwardly into many (some were, alas! closed to the pleasant scenes of earth) since I threw my first fly, at the callow age when the very thought of "crossed" feet and gray moustaches was unknown. How- ever lined and flamed by age and care, the face of the orthodox angler auger than a gleam of youth upon it, and the kindly touch which Nature gave it can never be effaced.

Here and now I am constrained to pay a fond tribute of praise to an honest angler whose genial and kind face has been lately hidden by the cere-cloth of death, and whose form has been lain in the dust to await the general resurrection of the last day. How often, in our piscatorial faith, have I seen his eye gleam with pleasure and his face alight with the love of the craft of which he was so thoroughly the master. His was a type—and a right noble one—of an honest angler's life and love, and those who knew and loved him the best miss him and mourn him the most sincerely. Quiet, gentle, unobtrusive, like many a pure stream he was wont to love and cast his fly upon, he passed from our sight so suddenly that his loss cannot be fully realized. "Lon to me, my memory green" and may his light perpetual shine upon him!

Of necessity the life of the angler, in practice of his craft, is contemplative and, barring short "runs" and doubtful crises, there are few exciting incidents in brook fishing. An angler may, perchance, ride hard to hounds, or put no dog to shame on the moor, but, pent in the "blind alley" of truth, the odds are he will confess that his first and dearest love is his rod and the "sparkling stream."

"Peachy nature" is the word, so many a time, of an angler, and once an angler always an angler may be as positively asserted. True, he may have little or no practice with his rod for years, but present the opportunity and the angler is "to the fore," with nerve aquiver for the first cast, and eye ready to mock the guilt of the captured fish.

Once (forsooth a few times) in a long life there may be found a congenial soul with whom we can be at one as we fish and "read in the beauties of Nature, but the harmony must be so complete and perfect as to be unique in common fellowship and purpose. Deny it who may, there is a subtle influence in the pursuit of the gentle art that may be as easily affected as the flexions of the magnetic needle, and then all becomes awry, "like sweet bells jangled," the gentle spirit shrinks and shudders like the aspen in the blast.

Desolation is a tireless hound and gives no quarter! It follows "hard upon" the tread of civilization and in many places a mead and over many a mere may be read the legend "Irlabod,"—its glory is departed! Depleted waters, dammed (and damned) streams and befoiled lakes are the order of the day and generation, and it becomes the bounden duty of every angler to befriend his craft, the goodly fish and his favorite haunts.

It is high time to send the "black flag" to the peak, and all "two legs" should be taught its significance. The gentlest stream may be need the need the angler's nature when rude feet and ruthless hands invade realms of nature that should be forever inviolate against the Goths

and Visigoths, who have no scruples as to how, or with what size of fish, their creels are filled.

Zounds! I have written myself into a furious pet, and digressed a long way from my intent.

One hint! Every reader must answer for himself, and every fisherman must act, as he best can, in what I have suggested, or there will not be a decent fish to "sweat by," much less to catch, by the time we slip into the "clean and slippery pantaloons" period of life's pilgrimage. O. W. R.

FISHING THROUGH THE ICE.

THINKING that a few words from this section of the country to my fellow sportsmen in the East might be accepted, I have determined to give you a short account of a fishing trip I had to-day along with a fellow "tenderfoot." I have been located in this part of the country (they call it God's Garden in the Leadville and Gunnison papers) for just one week and probably heard more of swopped about mountain lions, wild cats, elk, deer, haw, beaver and trout than I ever heard before, but I did want to have the chance to do something myself. Tails of trout of fabulous size and gameness that could be caught "in the spring" were continually being sounded in my ears, but to my oft repeated question "Why don't you catch them now?" the never-failing answer was, "They won't bite, they ain't in the creek now, and there will be any day," said I, "I dun no, you get down to the river, I reckon." To do a long story short, I got tired of that inevitable answer and determined to look for them in the Surface Creek, and with what success you may judge for yourself.

Last night Al said he would go with me, so we hitched the two mules to the "democrat" this morning and started off. I must confess, with no hopes of success.

In the way we stopped at "Sleep's" to get the mail and there had the surprise and pleasure of getting the opinions of three of the oldest settlers in the country, and they all agreed that "we couldn't catch a trout now, might get one, etc., etc." That, of course, was a splendid thing for our already much depressed spirits. However, we jogged along till we reached an old beaver dam, the point we had settled upon to make our trial. Al grasped the axe with a sort of a now-or-never determination, and set to work to cut a hole in the ice. After chopping for a while we found that a shovelful was not the surest and best method, and he set to another "old settler's" cabin and there once more had the benefit of four wise heads' opinion on the trout question. They all agreed again, though finally old "Trackie" did say that his boy had seen one trout not long since where they got their water. Back we marched again and finally succeeded in cutting a hole.

I was carefully "putting a look on my line and getting ready for business when a wild yell from Al announced the pleasing fact that he had hooked a fish, but he lost him. Of course he was a "whopper." Procuring short poles from the brush we set to work, and then the fun began. Al had the start of me, and had landed five large fish before I dropped my hook in, and when I did get started the second fish took my hook, and things then were blue. By the time I got ready again Al had ten fish the start, but the way we fished did fly for about fifteen minutes was a caution. When one of our was taken off the hook, and another fish, and so we kept it up for half an hour. Finally we dropped two more holes, but they were not up to our first location, so we stuck mainly to that one. We fished, I should say, about three hours, and the total catch was eighty fish, largest one pound, no "fingerlings," five fish weighed to gather three and a half pounds, net weight of all sixteen pounds, average three and one-half ounces. Not very bad for our first day, but when we were tired and were on our way home we came by the "back way" not wishing to get all of our good fortune to the entire settlement, and to-morrow we intend trying another spot before the news spreads. Think of it—people settled all along the bank of the creek and living on hog, venison and rabbit altogether, when within fifty yards of their doors such dainties can be so easily had, you might say for the asking. Maybe John, our host's, eyes did not close on us when we came home. This, you know, is a new country, and any sportsman can find a lot of game if he will come so far. TENDERFOOT.

THE PRESERVATION, COL. JAN. 29.

PENNSYLVANIA ASSOCIATION.

THE Anglers' Association of Eastern Pennsylvania has taken a very handsome club room at 1020 Chest street, Philadelphia, and at a meeting on Saturday evening the 3d, President Spangler told of his taking a large shark in our bay in which when opened were found sixty-eight pounds of beef bones, crabs, etc. Other members narrated similar adventures.

This meeting was the first one held in the new rooms, which are large and commodious, and will go far toward promoting sociability among its members. The old rooms at Broad and Fairmount avenue were not central enough, and consequently but few of the association frequented them. It is the purpose of the society to decorate the walls of the new rooms with angling scenes, trophies, specimens of tackle, etc., and to have the tables supplied with appropriate literature. In addition to this it is said there will be weekly bulletins from all the fishing centers as to whether the fish are biting, and regarding the condition of the weather and streams.

President Spangler stated the society was in communication with the State Fish Commissioners on the subject of stocking the rivers with fish, and a committee on that subject on Perkiomen Creek was read, recommending that body of water as an excellent breeding place for the rainbow trout. This we do not recommend, as the stream is stocked with black bass—at least that portion a mile from the Schuylkill—and these fish will be destructive to the fry in their growth.

The new club was organized last November, and has now 120 members. Its object, as they appear in the prospectus, were the encouragement of fish culture in Pennsylvania by the restocking of its streams with game and other valuable food fishes, the protection of the same by a rigorous enforcement of existing laws, which are strong and good, and the advancement of the art of angling and the promotion of sociability among anglers. Doubtless a fly-casting tournament will be inaugurated in due time.

HOMO.

MANASSAS SETTS.—East Douglas, Feb. 1883.—Some fine strings of pickerel have been caught here of late through the ice, one of twenty-one weighing 33 pounds; another of forty weighing 32. Among these were several weighing between four and five pounds.—AMATEUR.

* Mr. Lorenzo Prouty.

THE NEW "SCREED."

ALTHOUGH "Nessmuk" is perhaps the first to publish the law in such a truly original and emphatic way, I trust that he will believe that there are many others who in this respect have long been a law unto themselves, and through their example have perhaps been the means of restraining others from ruthlessly destroying the already fast diminishing game.

That game must go is not only an inevitable conclusion, but in many localities has become a fact. Trout streams whose waters were once teeming with the speckled fellows now yield only an occasional straggler fit to basket. Were it not for the beautiful scenes which surround these crystal streams and for the pleasant memories which hang over each rift and pool I think I should soon forget my usual trips to their solitudes. Even the solitude is about gone.

It is only a short time ago that I remember of meeting one of those chaps "Nessmuk" tells of. "T. H.," in large capitals, was marked on his face. He stood on a half-submerged rock just below a pretty country bridge fishing one of the best pools on the stream—a pool I had just walked five miles to make, and I do not forget that man. He was of medium size, clothed in a suit of dark gray flannel, him almost without a wrinkle; legs and feet were encased in the proverbial long rubber boots, and a high crown, soft felt hat covered his head. A "lightish" colored beard, trimmed neatly to a point, grew on his chin close up to a pair of thin lips, over which hung or protruded a somewhat long and pointed nose. Eyes, an indescribable gray, small and restless. This was the man; "sleek," I think, would be a good word to sum up with.

"Good morning, sir," I said.
"Good morning."
"What luck?" I asked.
"I have about seventy in here," he answered, tapping an ordinary sized creel as he spoke.

I stayed no longer, but turning to my partner, we hurried away. As we passed out of sight Charles opened his creel, wherein, upon a bed of bright green moss, lay twelve hand-some trout. As he gazed upon their wholesome proportions he seemed lost in a deep study; finally he asked: "Did he say he had seventy trout in that basket?" "Yes, Charles, and as he raised the lid I saw it was not nearly full."

RUDOLPH.

MUSCALONGE OUT OF SEASON.—Buffalo, N. Y., Feb. 5.—One of our Sunday papers reports: "Two of the prominent residents of 'over Grand Island caught twenty-six muscalonge, ranging in weight from fifteen to thirty pounds, off Sunkus Island, on Jan. 23. The information is volunteered that they fished with a night, line baited with cats." Muscalonge were openly exposed for sale here last week and we hear of arrests. Sometime ago District Attorney Hulet considered it a trouble, succeeded in getting some "seiners" convicted, but they were let off with a fine of \$3, as they were "poor men with families." It is to such unlawful practices as the above that we owe the scarcity of good fish in the Niagara River. Perhaps if measures were taken to enforce our present laws instead of mulling new ones the time would come when the people who can not afford to go to Florida, the North Woods or the seashore could enjoy one or two days' sport near home.—CABALEIRO.

ONE TROUT ON TWO FLEES.—Seattle, W. T., Jan. 27.—Queen fishing and hunting adventures seem to be the order of the day in FOREST AND STREAM, and I wish to add my tribute to the general interest. The writer, and I, and a friend, a writer and a companion were fishing for trout, and I regret to say were using salmon roe, the weather being cold and the water high. While standing about twenty feet apart, fishing in the same "hole," we simultaneously felt a "bite" and truck, and upon bringing our hooks to the surface, were surprised to find that a ten-inch trout had attempted to appropriate both baits, and that each of us had him hard and fast. Let some one now raise me with a story of a trout and three anglers. The capabilities of this style of story are only limited by the number of hooks a trout's mouth will contain, but this was a fact.—ALKE.

CANADIAN FISHERIES.—A paper on "The Fishes of the Ottawa District" has just been published by the Ottawa Society, by Mr. H. Beaumont Smith, Ottawa. The lecturer said that probably not more than one-half of the species really existing had been made known. The fishes of Canada, and especially of the Ottawa district, presented a field of observation as yet partially traversed, and one that will repay minute investigation, as there are very few works of reference on this subject. Valuable statistics are furnished by the Fisheries Department of Canada; but this is of little use to the naturalist. Mr. Small urged the project of having a large public aquarium, accessible to visitors, with a working model of a fish hatchery, which could be attached to the museum.—W.

A NEW ANGLING BOOK.—We have just seen the proof sheets of some colored plates of flies which are to appear in a book to be issued by Mr. C. F. Orvis next spring. They were finely done, and if the entire work is in harmony with the beautiful plates of flies it will be a good one. Mr. Orvis assures us that he intends it to be a standard work and in no sense an advertisement. Articles on various topics will be contributed by a corps of writers whose names we are not at liberty to publish at present, but who are all well-known anglers and writers. Mr. N. Cheney is assisting in the preparation of the work. When it is issued we will announce the fact.

Camp Fire Flickerings.

"That reminds me." LAST fall a gentleman from Auburn, N. Y., was visiting a brother here. They went out for a night hunt. Eyes were seen. One of the shooters "let go" of them. Then there was a good deal of racket in the brush. Venturing up a little nearer, they saw a large black object, which suggested that whoever saw a bear "let go" of him? The farmer has an odd ox now, and forty dollars for the other one. One more. A young Nimrod went about three miles along the railroad track, when he saw an eye, at which he made a fine double shot, but failed to dim it in the least. It proved to be a headlight on an engine—some five miles away.

BEANK.

Fishculture.

MEMORANDA ON LAND-LOCKED SALMON.

BY CHARLES G. ATKINS.

A.—SYSTEMATIC POSITION.—There have been thought to be several distinct species, or at least several varieties, of land-locked salmon in this or that district, have thought their new species and have called them *Salmo sebago*, *S. gloveri*, etc. Within a few years Bonar, and others in Washington, have carefully compared them with *S. entar*, and find no specific difference.

Difference in size is commonly very great, land-locked salmon in general being but one-fourth or one-fifth the size of the river or sea salmon. Same differences in color. Land-locked salmon never in the young season assume so bright colors as male river or sea salmon. Aside from these important differences may be mentioned as more important the difference in habits, land-locked salmon never going to sea, as a rule, though rarely they do so. In fact, they are observed to stray individuals to descend the St. Croix or Presumpscot to the sea. They find their normal sea in the lakes. Also may be noted that though in maturity smaller, in embryonic stages the land-locked salmon are larger, the eggs being perhaps ten per cent. greater in diameter than those of the sea.

Another interesting point of comparison is the retention of the embryonic markings to a much greater age by land-locked salmon than river salmon. I have seen a Sebago salmon thirteen months old with the dark bars on the sides still very distinct, and in removing the skin of adult land-locked salmon, I have found the marks still distinct on the under side of the skin, and on the membrane that still covered the fish, as though the fish were only a few days old. Land-locked salmon to fresh water had stopped his development, keeping him still in a somewhat embryonic stage.

B.—RANGE.—FOUR DISTRICTS IN MAINE, viz: 1. Basin of Presumpscot River (Lamoignon, etc.). 2. Basin of Sebec River, a branch of Penobscot Basin. Singular that they have not spread all through the Penobscot. It has many lake basins throughout. 3. Basin of Union River, Hancock county. 4. Basin of St. Croix River.

The fish of the Presumpscot and St. Croix had earlier wide range than the others, and in both rivers were occasionally taken almost to the head of the streams. The first specimens seen two that were taken at Cooterland Mills on Presumpscot.

C.—SIZE OF ADULTS.—This varies much. The Sebago fish often reach eight and a half pounds in weight. In Lake Umbagog (or Schoodic), as we commonly call them rarely exceed six or eight pounds and average two and a half. They are larger in some parts of Schoodic lakes than others, but these differences are not constant. In 1875, three caught at Dobbs Bay were nearly twice as large as those of Grand Lake. It is probable the latter have increased in size year after year, until now they are about same as the Dobbs fish. The Union River fish are large, about like the Sebago. The Sebco fish about like the Union River fish.

There are local differences recognizable to one acquainted with the different varieties, but hardly to be described. One interesting point of difference between Schoodic and Sebco fish is that the Sebco fish average at a smaller size than the Schoodic, and, while still small, frequent some grounds with large ones. Sebco fish apparently mature having lost the red spots and dark bars, may be taken same day, with hook, all the way from eight inches up to two feet in length, but the smaller forms with red spots and dark bars (young fish) are rarely found on the same ground with the larger fish.

D.—Grand Lake Stream is the headquarters of the variety of "School Lakes." That is, to no other streams do so many resort to spawn and in many instances, and in many instances, home as in Grand Lake. After prevailing backwoods system of nomenclature, the stream that flows out of Grand Lake is called Grand Lake Stream. Here, as in many other instances, the flow of the salmon moves down from the lake into its outlet at the spawning season, instead of up into the tributaries. It follows that the young fish instead of dropping down with the current as young sea salmon do, are in fact ascending their native streams till they reach the deep water above.

Grand Lake is one of the finest spots of water in Maine—clean, wooded shores, and very clear water. Grand Lake Stream is a bright, dancing stream, three miles long, quick water almost everywhere, and abundant spawning.

E.—THE BREEDING OPERATIONS.—For eight years we have been conducting almost the entire business of spawning for the fish. Our traps span the stream at the outlet of the lake. No fish ever get out of the lake, and no spawning naturally. With line-meshed nets we build a series of inclosures. Those which the fish first enter are on the principle of a weir or pound, and few fish ever get out against our will. They come in passively by the force of the current, and are held in the traps. We assert them, taking spawn from all that are ready. The earliest fish begin to spawn in the stream before the end of October; we begin to take eggs a few days later, till 8th of November. Many of the females have to be kept some days before they are ripe. (Not so with Penobscot fish—sea salmon—which are generally all ripe together, and some days earlier than Schoodic.) Yield, 1,000 eggs per female. Commonly catch four females to three males. Males come in first in the season, and are ready to spawn as early as the females. Full fish continue to come in until November 20; sometimes not all manipulated till December. Often there is severe cold weather during the spawning season. We operate in the open air, and the fish are exposed to the elements in communication with the lake; but if not, we take the fish we have manipulated in cars and tow them one or two miles up the lake, where they are set free. One-fourth of the spawn taken is hatched, and the rest lost in Grand Lake, in the water and the mud. There is no loss of spawn, or no falling of it so far. Young are reared along the shore scotterly where there are loose, rough rocks for them to hide under.

We have threespawning houses, or rather one developing house (extensively so) and two rearing houses. The first is a small house is fed with lake water. Its location compels us vacate it in March, but the long stay of the eggs in the cold lake water keeps development back so that none are hatched and grown enough for planting till June, when their natural food is become abundant.

Our best hatching house stands on the lake shore and is a very substantial structure, partly under ground with massive stone walls; capacity for developing four million eggs or hatching one million. It is arranged on six floors and water runs through the series, so that it can be used at least three times, with ample facilities for aeration. We pass water from one trough to another by letting it fall in a broad, thin sheet over the side of a trough. It is so effective, and young hatched in this house are exceedingly vigorous. The above hatching house covers 1,500 sq. ft. of ground. Have also a small little cottage for the superintendent, and lodges for foreman, ice house, woodshed, etc. In winter part of the house is heated.

Our method of manipulating fish is, perhaps, common. Use "dry methods," wholly. Ten quart tin milk pails receive spawn and milk. Fish are used just as the "dipper" hands throw up, male or female first, as may chance. After eggs of four or five fish are ripe and well milted, another hand takes

them, agitates them diligently for a few minutes, and then slashes them off at once, after which they stand in pails on sides till convenient to carry to hatching house. Careful observation shows loss of vitality in instances where, upon contact of milk, and all agitation and waiting is merely to secure contact. Milk in pure water loses spawn in few seconds, retaining scarce any power after one minute. Eggs liberally mixed with milk, and put into water, lose vitality in few minutes. Either eggs or milk can be exposed to air for hours without losing power. The mucus that comes from the fish when they are milted, and the eggs liberally mixed with milk, it retains its power for hours. If males are scarce we stain out the milted liquid from a spawn pan and use it again. In a can standing in water I have kept it forty-eight hours and it has retained its power. Eggs liberally mixed with milk, and put into water, lose vitality in few minutes. Either eggs or milk can be exposed to air for hours without losing power. The mucus that comes from the fish when they are milted, and the eggs liberally mixed with milk, it retains its power for hours. State of Michigan to, at present, interrupt the admirable work done which has been prosecuted under its commissioners. Even if the work of multiplying the whitefish in the great lakes is abandoned, there is much to be done in the way of stocking the inland waters. For this I have recommended both the blue herring and the whitefish, the former perhaps most readily adapting itself to the requirements. To obtain these, however, in sufficient quantities to affect the 5,000 lakes in question would require the maintenance of at least one fishery, in Michigan where the work can be prosecuted. From 100,000,000 to 300,000,000 of eggs of the lake herring should be taken every year for the purpose of stocking. Hoping that I have furnished the information desired, I remain, yours respectfully,

SPENCER F. BARTD, Commissioner.

CARP CULTURE.—Carp will live and multiply almost anywhere, grow very rapidly, and are of excellent quality. I am solicited almost daily for instructions how to prepare, care for and manage them. In detail I shall now speak to farmers and small pisciculturists. I shall not go into the considerations of principles, but merely give the foundation for them. First, let us speak of small ponds, such as will answer for family use. One with eight or ten square rods in it, with good care and attention, produce as many fish as a pond ten times the size, and, in fact, larger the pond the better. It makes but little difference how they are made or what shape they are in, so that there is, say, four feet of water in the deepest part, with considerable shallow water. In very cold climates, where water freezes to a considerable depth, one of the best methods is to dig a trench deep as you wish to freeze the pond to the bottom. All ponds should have a drain-box in the bottom of the dam, for at least two reasons; first, that all the water may be drawn off without injuring the dam, and next to separate the fish, if desired, also to see if there is anything wrong, or any enemies to the fish in the water. This box may be made of four boards sufficiently long to reach through the dam. The two side-boards should have a groove cut across them about six inches from the end, deep and broad enough to admit a gate. These side-boards should set on the bottom board, the ends crossing even, and the top board coming just against the gate. From the gate to the ends of the side and bottom boards it should be covered with a net, driving them down well. The net next to the gate and the one at the end should be mudded smoothly and trim. Now you want a wire screen over the end of the box to keep the fish from going out when you draw the water. A fine old wheat riddle will make a good one. As to the two-board operation, you will fill it with earth so as to prevent any leakage; but with a good flow of water this top space may be covered solidly, omitting the earth filling. The net, of course, will be made to fit the pond, and in making dams I prefer, and think it will pay, to board them up on both sides. Have, say, four stringers, two on a side, one at the top and one at the bottom. Then set the boards and the net, driving them down well. The net next to the gate and the one at the end should be mudded smoothly and must be a waste-box to carry off the water. This may be made of three boards, one on each side and one on the bottom. The upper end of this should also be screened to keep the fish from going out. The net next to the gate and the one at the end should be mudded smoothly and must be a good fit. The pond should have plenty of water-cress, lily and grass, or some aquatic vegetation in it, for several reasons. First, it gives shelter to the fish; second, there is a very good reason for this, in the case of the carp, and third, it is indispensable, for on it the fish deposit their spawnings. The eggs are adhesive and stick, or adhere to the sprigs or branches, and without this the eggs would fall to the bottom in the mud and be lost. There is no need of netting the ponds, and no need of a net in the gate. If you must have a pond we must protect it, and to do this we must have a good canal or ditch all around it to carry all the surplus water away and not allow any overflow. This all the water, fresh or salt, as the history of these fish proves that they will adapt themselves to all waters; but the warmer the water the better up to one hundred degrees, and this will be the growth of your fish. The water should be kept at or near a uniform depth. The flow of water is important, so that there is plenty of life in it. Of course the greater the flow the better (so you can control it), and the greater number of fish can be crowded into a given space.—LEVI DAVIS (Forestville, Saouma county, Md.).

FIXTURES.

BRNCH SHOWS.

February 20, 21, 22, and 23, 1888.—Grand International Bench Show, Washington, D. C. Entries close Feb. 12. Charles Lincoln, Superintendent, Office, Skating Rink, Washington, D. C.
 March 26, 27 and 28, 1888. Dominion of Canada Kennel Club Bench Show, at Ottawa, Ontario, Canada. Entries close Feb. 12, 1888.
 April 3, 4, and 5, 1888. Western Pennsylvania Poultry Society's Fifth Annual Bench Show, Pittsburgh, Pa. Entries for the Bench Show hereby for England and Scotland, close Feb. 12, 1888.
 May 2, 3, 4, 5, 6, 7, 8, 9, 10 and 11, 1888.—Westminster Kennel Club, Seventh Annual Bench Show, Madison Square Garden, New York City, Chas. Lincoln, Supt.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

PITTSBURGH BENCH SHOW.

PREMIUM LIST.

1. Extra champion English setter dogs, champion gold medal. 2. Extra champion English setter bitches, champion gold medal. 3. Champion English setter dogs, \$30. 4. Champion English setter bitches, \$20.

OPEN CLASSES.

5. English setter dogs, \$20, \$10, \$5, silver medal. 6. English setter bitches, \$20, \$10, \$5, silver medal. 7. English setter dog puppies, under 18 months, \$10, \$5. 8. English setter bitch puppies, under 18 months, \$5, \$3. Puppies that have been qualified for the Derby Bench Show must be also entered in either classes 7 or 8, according to sex.
 9. Extra champion Irish setter dogs, champion gold medal. 10. Extra champion Irish setter bitches, champion gold medal. 11. Champion Irish setter dogs, \$20. 12. Champion Irish setter bitches, \$20. 13. Irish setter dogs, \$30, \$10, \$5. 14. Irish setter bitches, \$20, \$10, \$5. 15. Irish setter puppies, under 12 months, \$7, \$3.
 16. Champion Gordon setters, \$30. 17. Gordon setter dogs or bitches, \$20, \$10, \$5. 18. Gordon setter puppies, under 12 months, \$7, \$3.
 19. Champion pointer dogs, \$20, \$10. 20. Champion pointer bitches, \$20, \$10. 21. Pointer dogs, \$20, \$10. 22. Pointer bitches, \$20, \$10. 23. Pointer puppies, under 12 months, \$10, \$5.
 24. Champion Irish water spaniels, champion gold medal. 25. Irish water spaniels (open class), \$10, \$5. 26. Champion field spaniels (any color), over 28lbs., champion gold medal. 27. Black field spaniels, over 28lbs., \$10, \$5. 28. Champion cocker spaniels (any color), over 28lbs., champion gold medal. 29. Black spaniels (small size), dogs or bitches, under 28lbs., \$10, \$5. 30. Cocker spaniels, other than black dogs or bitches, \$10, silver cup, \$5. 31. Spaniel puppies, under 12 months, \$5.
 32. Foxhounds, \$10, silver cup, \$5. 33. Foxhounds, \$10, \$5.
 34. English beagles, \$10, \$5. 35. Bench-legged beagles or basket hounds, \$10, silver cup, \$5. 36. Beagle puppy, dog or bitch, under 12 months, \$5. 37. Dachshunds, \$10, silver cup, \$5.
 38. Champion fox terrier dogs, champion bronze medal. 39. Champion fox-terrier bitches, champion bronze medal. 40. Fox-terrier dogs, \$10, \$5. 41. Fox-terrier bitches, \$10, \$5. 42. Fox-terrier puppies, under 12 months, silver cup, \$10, \$5.
 43. Greyhounds.

NON-SPORTING DIVISION.

44. Mastiffs—dogs, \$10, silver medal. 45. Mastiffs—bitches, \$10, silver medal.
 46. St. Bernard's (rough-coated), silver cup, \$10, silver medal. 47. St. Bernard's (smooth-coated), silver cup, \$10, silver medal.
 48. Newfoundland, silver cup, \$10, silver medal.
 49. Champion collies, champion gold medal.
 50. Collies—dogs, \$10, \$5. 51. Collies—bitches, \$10, \$5. 52. Collies—puppies, under 12 months, gold medal, silver medal.
 53. Bulldogs, \$10, silver medal. 54. Bull-terriers, \$10, silver medal.
 55. Scotch or hard-headed terriers (except Skyes and Yorkshires), silver cup, \$10, silver medal. 56. Champion Skye terriers, silver cup, \$10, silver medal. 57. Yorkshire terriers, \$10, silver medal.
 58. Champion pug, champion gold medal. 59. Pugs, \$10, silver cup, \$5.
 60. Black and tan terriers, silb. or over, \$10, silver cup, \$5.
 61. Toy terriers (any breed), silb. or under, silver cup, \$5.
 62. King Charles spaniels, \$10.

63. Italian greyhounds, silver medal.
 64. Black Russian pointer dogs, over 28lbs., silver cup, \$10. 65. Foodles, small size, under 25lbs., silver cup, \$5.
 66. Miscellaneous class. For the best specimen of any breed of dog that has not been assigned a separate class, two prizes will be given each of \$5.

SPECIAL PRIZES.

A.—The Bench Show Derby Stakes (closed for fifty entries) for the best English setter dog or bitch, whelped on or after January 1, 1882. Purse to be divided as follows: fifty per cent. to first, thirty per cent. to second and twenty per cent. to third, \$10 added. A sportsman also adds \$15 cash to the Derby.
 B.—The society offers for the best sire of the greatest number of field trial winners in the American Derbys of 1882, \$30. Entry \$2.
 C.—Society offers for the dam of the greatest number of field trial winners in the American Derbys of 1882, \$30. Entry \$2.
 D.—Society offers for the best bench show setter or pointer, dog or bitch, that has won a first, second, or third prize, at any field trial held in America, \$30. Entry \$2.
 E.—For the best English setter, dog or bitch, entered in the open classes, Parker Brothers offer through J. Palmer O'Neill & Co., double-barrelled, breech-loading shotgun, value \$125. Entry \$5.
 F.—For the best English setter, dog or bitch, owned in Pittsburgh, Joseph Eichbaum & Co. offer side-board set, value \$25. Entry \$2.
 G.—For the best English setter bitch, and litter of puppies two or more, under 3 months old, E. F. Tolcher & Sons, offer silver water pitcher, silver and goblets, value \$30. Entry \$5.
 H.—For the best English setter brood bitch, to be shown with two of her progeny, progeny to be under two years old of the progeny to be considered with the dam in judging, D. McKay Lloyd, offers cash, \$25. Entry \$2.
 I.—For the best matched brace of English setters (regardless of sex), color and quality considered in judging, Frank Shanley, offers pair lace leather hunting shoes, value \$15. Entry \$5.
 J.—For best English setter bitch entered in the open classes, Lafin & Rand Powder Co. offer one case Orange Lightning powder, value \$32. Entry \$2.50.
 K.—For best English setter dog or bitch, shown in the best bench show condition, James Kerr, Jr., offers case grooming implements, value \$25. Entry \$1.50.
 The President's Prize.—L.—The president of the society, Edward Gregg, offers gold medal, value \$30, for best English setter dog, owned or entered, either from Canada, Great Britain or Ireland. Entry free.
 The Secretary's Prize.—M.—C. B. Eilen, secretary of the society, offers \$25 for best brace of Irish setters, dog and bitch. Entry, \$2.50.

N.—R. B. Campbell offers barrel refined oil, value \$5, for hand-smeared English setter dog in show. Entry, \$15 cents.
 O.—For best Gordon setter, dog or bitch, entered in the open classes, J. D. Clcott offers painting of Mike, a champion Irish water spaniel. Entry, \$1.
 P.—The society offers Currier's ball rotating trap, value \$7.50, for best pointer dog. Entry, 50 cents.
 Q.—For best pointer bitch entered in open classes, J. Palmer O'Neill & Co. offer Ruperius single-barrel breech-loading gun, value \$15. Entry \$1.50.
 R.—Walter E. Hague offers \$10, gold, for best pointer, dog or bitch, owned and entered from Canada.
 S.—Capt. W. C. Beringer offers dog collar, whip and whistle for best Irish water spaniel, dog or bitch. Entry free.
 T.—For best cocker of field spaniel, dog or bitch, silver cup, value \$5. Entry free.
 U.—Society offers bronze medal for best foxhound, dog or bitch. Entry free.
 V.—Society offers bronze medal for best beagle, dog or bitch. Entry free.
 W.—Society offers \$50 cash, or a piece of silver plate, same value, for best mastiff, dog or bitch. Winner of prize can take his option. Entry \$5.
 X.—Boggs & Buller offer black silk dress pattern, value \$30, for best pig, dog or bitch, in open class, entered and owned by a lady. Entry \$2.

Y.—Society offers China tea cups and saucers, (24 pieces), hand painted, value \$30, for best Skye, Yorkshire or black and tan terrier, dog or bitch, that has not taken a first prize. Entry \$2.
 Z.—T. P. Bedlion offers pallias vase, value \$10, for best toy or pet dog or bitch, owned and entered by a lady. Entry \$3.

Z.—Merwin, Hurlburt & Co. offer set toilet vases, value \$7.50, for best King Charles or Japanese spaniel. Entry, 50 cents.
 B. A. Elliott offers plants and flowers, value \$5, for best pet pointer, dog or bitch. Entry free.

BB.—A lover of dogs offers hunting scene, painted on tile, value \$25, for the best large sized imported Russia pointer. Entry \$2.50.
 C.—Society offers J. Palmer O'Neill & Co., donate two cases Enreka dog biscuit, to be given to the second best mastiff. Entry free.

DD.—Heymer & Bro. offers for best bull, dog or bitch, box of collars, value \$7. Entry free.
 EE.—Society offers for best collie, dog or bitch, entered in the open classes, silver cup, value \$10. Entry, 50 cents.

FF.—Haworth & Dewhurst offer for best bull-terrier, dog or bitch, box of cigars, value \$7.50. Entry free.
 GG.—Society offers for best fox-terrier, dog or bitch, silver cup, value \$5. Entry free.

HH.—Society offers for best Yorkshire terrier, silver butter dish, value \$5. Entry free.

ENTRIES FOR SPECIAL PRIZES.
 All dogs to compete for the special prizes, must previously have been entered in their regular classes. This refers also to progeny of stud dogs and brood bitches.

It is expected that more special prizes may be donated; if so, they will be duly announced in the sporting papers, and should there not be time to make the entries before the date of closing, they will be received up to the first day of the opening of the show; but it must be distinctly understood that this refers only to the special prizes that may hereafter be offered.

Prizes of prizes can have cups or medals in place of cash, if they so desire.
 All entries for prizes that are published in this list must be made on or before the 10th of March.

Address: Charles Lincoln, Superintendent, Lock Box 303, Pittsburgh, Pa.

PUPPIES' BITES.—The St. James's Gazette (London) says: "The verdict of 'Death from Hydrophobia' returned at an inquest held yesterday on the body of Thomas Jenkins, a baby of fourteen years of age, who died in a hospital in London in the habit of teasing puppies. The evidence showed that deceased pointed at a retriever of three months old now dogs of all kinds hate to be pointed at, which thereupon usually bark and cough. The cause of the death of which was grazed." That was in September last, and on the 16th inst. the boy showed symptoms of hydrophobia, and died in St. Mary's Hospital on Saturday last. It was stated in evidence that the boy had been bitten from puppies several times, and that from old dogs—a fact, if it were so, more dangerous than generally known as it should be. If puppies bite and scratches be more dangerous they are certainly far more common, especially if a "graze of the skin can be called a bite, and if a dog's teeth can be called a scratch, it is sufficient to induce hydrophobia." We very much doubt the alleged facts. It is exceedingly improbable that the boy died from the effects of the bite of the puppy. The statement that the boy was bitten from puppies are "more dangerous than from old dogs" is pure nonsense. We have been bitten hundreds of times by puppies and have yet to suffer any inconvenience therefrom.

A GOOD SCHEME.—A citizen of Paducah, Ky., recently became possessed of a litter of pups of a worthless breed, but being a humane man, was averse to slaughtering them. So he put them in the capture net, and gave them a good meal, then up the Tennessee River and try and give them away. The captain told the owner to put them in a basket, cover it with mosquito netting, and invoice them to some person in Florence, Ala. at a value of \$25 each. This was done, and the basket of pups placed at the foot of the cabin stairway, where they were surrounded by an admiring throng, the captain occasionally speaking a good word for them. Before the boat reached Johnsonville every pup in the basket had been stolen and spirited away by admirers of choice dog flesh.

MORE BEAGLE CLASSES WANTED.—Editor Forest and Stream: In your issue of February 8, I am much pleased to see Mr. J. M. Bergold second Mr. Elmore's letter of last week, in which he proposed to give me \$100 if I would send him up my name to a list, which I hope you will have before long, asking for such changes as will bring out a grand display of hounds at our bench shows, with classes arranged so as to show all our good ones of different types. I also hope you may show me a few kind of good ones, increasing gradually until 1-16 grains can be taken, the idea being to keep just short of the dose which causes this spasm or stiffening of the muscles. Cod liver oil should be given if needed, as shown by experience. Good living and a dry kennel are necessary adjuncts to a cure.

THE WASHINGTON SHOW.—By the time this is published the entries will have closed. Up to this time, judging the entries so far received are very good, and include the best dogs in the country, nearly all the crack champions are entered, beside a large number of new dogs in the open classes, and owners who have not heretofore exhibited. Washington's Birtch dog will be a gala day in the city, and as the railroad companies grant reduced rates, it will afford spectators a rare opportunity to visit the city, and take in the dog show at the same time.

PUBLISHER'S DEPARTMENT.

We have received from Messrs. Schlegel & Fattler, 25 Southmarket street, Boston, Mass., their seed catalogue for the spring of 1888.

ADVERTISERS will please bear in mind that this paper will go to press next week on Tuesday. All advertisements must be in our day earlier than usual.

Yachtsmen, attention! Do not fail to have your yachts fitted with electric apparatus. Mr. J. H. Longstreet, No. 9 Barclay street, New York, has a catalogue which appears in this issue, makes a specialty of furnishing yachts with all the latest and best electric apparatus.

Who smote the marble gods of Greece? Nobody knows. Why are Bacchus and his revelers, and the gods of Olympus, and the gods of the world, because they are quick, powerful and sure. Who will ride in a coach when he can travel by rail? Why will you not take a special car when you can be relieved to-day? For sale everywhere, Price 25 cents.—Ad.

AN EXCURSION TO CUBA.—Messrs. Levo & Alden, the well-known tourist agents, inaugurated last season the first series of sea-water excursions to Cuba. The experiment proved a flattering success. Messrs. Levo & Alden are now engaged in forming a party for the winter season, to Cuba, leaving New York by steamer, upon February 27, in charge of a competent conductor, and will be absent one month. The rate for merchandise has been reduced to 75% of the time when John Jacob Astor first engaged in handling fur, etc. He associated with Ramsay Crooks, who ultimately succeeded Mr. Astor, and who secured the contract for the winter season, 1873-74. Mr. Macnaughton died on Mr. Crooks's death. In 1879, Mr. Wm. Macnaughton died, and the business passed into the hands of his son Ramsay. With such a pedigree, it is not surprising that the business should be successful. Messrs. Macnaughton buy all sorts of furs and pelts and advertise correspondence from trappers. Attention is called to their advertisement in this issue.

CLAY PROCEEDS FOR LIVE BIRDS.—It appears from our English exchanges that the agitation against the use of live birds for sport is doing much good. The following is from the London Globe of Jan. 31: "Nothing could be more graceful and womanly than the rumored action of certain ladies who have been in the habit of supporting and exhibiting Hurlingham, and the Gun Club shall give up slaughtering pigeons and use the newly-invented 'terra cotta' pigeon." The ladies and humanity, are, as might also have been expected, the first suggestion of this pretty conspiracy came from the kindly heart of the Princess of Wales."—Ad.

for foxes to take upon leaving the hills for the woods. The hounds having been put on the scent by Mr. Whittaker...

"The hounds pressed the fox so hard that he had to leave, and broke cover in full view at the northeast corner, running a small distance in the open to another small opening, which he ran through without stopping; and going again into the open, running straight for Ed Jennings, who, when within ten paces or nearer, let go two barrels, missing him each time...

Captain Ross, seeing his chances of a shot gone, got behind his last pony and went tearing along, taking the lead of all the others, and going full gallop, he reached, by a short cut, the hill near the North Shimecock Gate, and as the hounds crossed the road, he having had a view of the fox which was now about half a mile ahead...

Report says Ed Jennings (who is a money-making farmer) has made a fox and practices shooting at it at seven yards distant, while his son-in-law attends to the farm.

SOUTHAMPTON, Long Island, February, 1883.

CHAMPIONSHIP OF THE WORLD.—Editor Forest and Stream: The New Orleans Gun Club has done well in providing a stake for the winning dogs at Field Trials; but would it not be better to style the winner of that stake "Champion of America," rather than "Champion of the World?"

DOG COLLARS.—A person unaware of the number and variety of dog collars and trimmings manufactured, would be well paid a visit to the establishment of the Medford Fancy Goods Company, formerly at 90 Dnane street, but now in more commodious quarters, at 101 Chambers street, corner of Church.

EASTERN FIELD TRIALS CLUB.—There was not a quorum at the meeting on Tuesday evening of the Board of Governors of the Eastern Field Trials Club, and the meeting was adjourned to next Tuesday evening the 20th, when the committee on grounds for holding the trials will make their report.

NATIONAL AMERICAN KENNEL CLUB DERBY.—Remember that the entries for the National Derby will close March 1. Entries are received of the secretary, Mr. D. Bryson, Memphis, Tenn., or at this office.

CELERT. "For the want of something better," writes "Wells," "nor even half so good, I ask you to publish the following pretty and touching piece of verse, the production of Hon. William Robert Spencer. I have never seen it in your columns, and I feel sure some reader of your excellent paper will be obliged to me and to you for giving him an opportunity to read it."

BETH GELERT, OR THE GRAVE OF THE GREYHOUND. The spearman heard the bugle sound, And cheerily smiled the morn, And many a brach and many a hound Obeysd Lewellyn's horn.

Oh where does faithful Gelert ram, The flower of all his race, So true, so brave, a laub at home, A lion in the chase? 'Twas only at Lewellyn's board The faithful Gelert fed, He watched, he served, he cheered his lord; And scented his bed.

In sooth he was a peerless bound, The gift of royal King, But now no Gelert could be found, And all the chase rode on. And now, as o'er the rocks and dells, The gallant chidings rise, All Snowden's scrabby chas-yells The many mingling cries.

That day Lewellyn little loved The chase of hart and hare; And scant and small the booty proved, For tielert was not there.

Unplensed Lewellyn homeward bled; When near the portal set His truant Gelert he espied, Bounding his lord to greet.

But when he gained his castle-door, Against the chief-stain stood; The bound, all his' was smeared with gore; His lips, his f'ours ran blood.

Lewellyn gazed with fierce surprise, Unused such looks to meet. His favorite checked his joyful gait, And crocheted and licked his feet.

Onward in haste Lewellyn passed, And on went Gelert too; And still whenever his eyes he cast Fresh blood gouts shocked his view.

O'erturned his infant's bed he found With blood-stained cover rent, And all around the walls and ground With recent blood besprent.

He called his child—no voice replied; He searched with terror wild; Blood, blood he found on every side; But nowhere found his child.

'Hell bound, my child's by thee deyoured,' The frantic father cried, And to the hill his vengeful sword He plunged in Gelert's side.

His suppliant looks, as prone he fell No pity could impart. But still, his Gelert's dying yell Passed heavy o'er his heart.

Aroused by Gelert's dying yell Some slumberer wakened figh, What words the parent's joy could tell To hear his infant's cry?

Concealed search a trembled heap His hurried search had missed, All glowing from his rosy sleep The cherub boy he kissed.

Nor scathe had he, nor harm, nor dread, But the same couch beneath Lay a gaunt wolf, atony and dead; Tremendous still in death.

Ah, what was then Lewellyn's pain? For on the truth was clear. The gallant hound the wolf had slain To save Lewellyn's heir.

Vain, vain, was all Lewellyn's woe; 'Best of thy kind, adieu! The frantic blow, which laid thee low, This heart shall ever rue.

And now a gallant tomb they raise With costly sculpture decked, And marbles stori'd with his praise Poor Gelert's bones protect.

There never could the spearman pass, Nor fosterer unmoved, There, oft, the tear-besprinkled grass Lewellyn's sorrow proved.

And there he hung his horn and spear, And there, as evening fell, In fancy's ear he oft would hear Poor Gelert's dying yell.

And till great Snowden's rocks grow old And cease the storms to brave, The consecrated spot shall hold The name of Gelert's grave.

KENNEL NOTES. NOTICE TO CORRESPONDENTS. Kennel notes are inserted in this column free of charge. To insure publication of notices, respondents MUST GIVE the following particulars of each animal:

- 1. Color. 2. Breed. 3. Sex. 4. Age, or date of birth, of breeding or of death. 5. Name and residence of owner. 6. Name of owner's imported stock. 7. Sire, with his sire and dam. 8. Owner of sire. 9. Dam, with her sire and dam. 10. Owner of dam.

NAMES CLAIMED. See instructions at head of this column. Lela and Sheila. By Mr. Fred W. Rothera, Spring Creek Farm Kennels, Simco, Ont., for Scotch collie bitch, whelped Jan. 22, 1883, by Ch. Marcus out of owner's imported Lassie.

Bred Harle, Billy Tombar, Juby Taspie. By Mr. Geo. W. Leavitt, Jr., Boston, Mass., for spaniel puppies (Beau—Gene). See sales.

Comps. By Mr. W. H. Lee, Boston, Mass., for black, white and ticked setter dog pup, whelped Nov. 17, 1882 (Dash III.—Bessie). Corrier Belle. By Mr. S. B. Dilley, Rosendale, Wis., for liver and white pointer bitch, whelped Sept. 1, 1882, by his Ranger out of White Lily (Dine—Queen).

Clippers. By Fulton Kennel Club, Canal Fulton, Ohio, for white, black and tan beagle dog, whelped Dec. 13, 1882, by their champion Boxer (Cameron's Boxer—Webb's Lady) out of their Lill (Warrrior—Rosey).

Clubs. By Fulton Kennel Club, Canal Fulton, Ohio, for white, black and tan beagle dog, whelped Dec. 13, 1882, by their champion Boxer (Cameron's Boxer—Webb's Lady) out of their Lill (Warrrior—Rosey).

Freddie. By Fulton Kennel Club, Canal Fulton, Ohio, for white, black and tan beagle dog, whelped Dec. 13, 1882, by their champion Boxer (Cameron's Boxer—Webb's Lady) out of their Bergold's Lady (Vidocq—Fussie).

Lill II. By Fulton Kennel Club, Canal Fulton, Ohio, for white, black and tan beagle dog, whelped Dec. 13, 1882, by their champion Boxer (Cameron's Boxer—Webb's Lady) out of their Bergold's Lady (Vidocq—Fussie).

Milly. By Mr. W. H. Lee, Boston, Mass., for mastiff bitch, whelped Sept. 3, 1882, by Wm. H. Lee out of Wm. H. Lee's Bessie. Rory O'More III. By Mr. Frank Storr, Brookline, Mass., for red Irish setter dog, by Rory O'More out of Gay (Elcho—Fire Fly). Wag and Lory. By Mr. Stewart James, Jamaica, L. I., for red Irish setters, by Wenzel's Chief out of Pettie's Bessie.

Nodman, Bona, Duncan. By Mr. Chas. J. Stewart, Jamaica, L. I., for lemon and white English setter puppies, by Water-fury's St. Ives out of Forsley's Beauty.

Sir Kay, Fritz Pack, Lady Enid. By Payne-master George R. Watkins, L. S. N., for white and orange English setter puppies, whelped Dec. 1, 1882, by Kaymaster out of Grand Crook.

Carrie H. By Payne-master George R. Watkins, L. S. N., for blue belton English setter bitch, whelped June 14, 1882, by Empirer Fred out of Crook.

Briarstone. By Mr. Washington A. Coster, Flatbush, L. I., for lemon and white English setter bitch pup, whelped Dec. 15, 1882, by champion Gladstone out of Swager (Duke—Juno).

White Noble. By Mr. Edward Odell, New Orleans, La., for black, white and tan English setter bitch, whelped April 9, 1882, by Count Noble out of Sabina's Jack.

Bruce. By Mr. J. W. Houston, Chicago, Ill., for liver and white pointer dog, whelped Nov. 12, 1882, by Hindoo (champion Faust—Devonshire Lass) out of Flight (champion Row—Madge).

Tot D. By Mr. H. M. Delapole, Hyde Park, Mass., liver and white ticked pointer bitch, whelped March 11, 1882, by Sport (Duke—Betsey) out of P. (Sandy—Venus).

Valor, Chancellor, Guard, St. Nicholas, Judge. By Mr. Chas. E. Shaw, Clinton, Mass., for mastiff dogs, whelped Jan. 20, 1883, by his Duke (Earl—Bellet) out of his Pride (Duke—Juno).

Count Elcke. By Mr. James Anthony, Fall River, Mass., for black, white and tan ticked English setter dog, whelped Oct. 16, 1882, by Cashier (Duch III.—Opal) out of Flake (Duchess—Suzette).

Capitoline. By Dr. N. F. Spencer, Fall River, Mass., for black and white ticked English setter dog, whelped Oct. 16, 1882, by Cashier (Duch III.—Opal) out of Flake (Duchess—Suzette).

Count Dash. By Mr. Edward Odell, New Orleans, La., for black, white and tan English setter dog, whelped May 21, 1882, by Count Noble out of Dashing Novice.

BRED. See instructions at head of this column. Holly—Buckferry. Mr. T. P. Conolly's Flatbush, L. I. lemon belton setter bitch Sally (Belton—Blonde) to Mr. W. A. Cosser's Flatbush, L. I. Buckalane (Dread—Ruby), Jan. 13.

White Lily—Ranger. Mr. S. B. Dilley's (Rosendale, Wis.) pointer bitch White Lily (Dine—Queen) to his Ranger (Dine—Y.) liver cocker bitch Nell—Turk—Mr. W. H. Lee's mastiff bitch Nell (Mam—Fawn) to owner's Turk (Rajah)—Brewia, Jan. 3.

Queen Bess—Dr. Wm. Jarvis's (Claremont, N. H.) mastiff bitch Queen Bess (Turk Baby) to Prince Waldemar (Queen Prince—Necessity), Jan. 5. Druidess—Turk. Mr. W. H. Lee's mastiff bitch Druidess to owner's Turk, Jan. 7.

Jule—Turk. Mr. C. W. Cook's mastiff bitch Jule (Jack—Baby) to Mr. W. H. Lee's Turk, Jan. 7. Dot—Duch. Mr. C. A. Dole's (Lynn, Mass.) lemon and white pointer bitch Dot (Guss—Spot) to Mr. A. M. Tull's lemon and white pointer Dash (Duch—Tull's Jenny), Jan. 7.

Spider—Hornell Dandy. The Hornell Spaniel Club's (Hornellville, N. Y.) black and white cocker bitch Spider (Bob III.—Trix) to their black cocker Hornell Jandy (Hornell—Bessie) Jan. 1.

Feevey—Bonanza. Mr. J. Bryson's liver cocker bitch Feevey (Dunkirk Dan—Josie) to the Hornell Spaniel Club's black spaniel Bonanza (Brush I.—Janet), Jan. 1.

Hornell Anna—Bonanza. The Hornell Spaniel Club's black and tan cocker Anna to their black spaniel Bonanza, Jan. 1. Madge—Hornell Dandy. The Hornell Spaniel Club's liver cocker Madge (Benedict—Madcap) to their Hornell Dandy, Jan. 1.

Terle—Hornell Dandy. The Hornell Spaniel Club's black and tan cocker Belle (Waddell's Beau—Blanche) to their Hornell Dandy, Jan. 25.

Hornell Flora—Bonanza. The Hornell Spaniel Club's black cocker Hornell Flora (Bub—Jenny) to their black spaniel Bonanza. Carly—Bub. Mr. Marion Jay's (Woodbury, Conn.) liver cocker bitch Carly (Jack—Topsy) to the Hornell Spaniel Club's Bub (Brush I.—Janet), Jan. 25.

Aileen—Rock. Dr. J. S. Niven's (London, Ont.) Irish terrier bitch Aileen to his Rock. Lorna—Dr. Dr. Wm. Jarvis's (Claremont, N. H.) Irish setter bitch Lorna to Mr. Mcintosh's (Pittsburg, Pa.) Bix, Jan. 21.

Lady Abess—Prism. Mr. Fred W. Rothera's (Spring Creek Farm Kennels, Simco, Ont.) imported rough-coated St. Bernard bitch Lady Abess (Hero—Lottie) to his imported rough-coated St. Bernard dog Prism (champion Hero—champion Amy).

Notice—Prism. Mr. Fred W. Rothera's imported rough-coated St. Bernard bitch Lottie to his imported rough-coated St. Bernard dog Prism (champion Hero—champion Amy).

Harbell—Saugher. Mr. A. H. Wakefield's (Providence, R. I.) English beagle bitch Harbell (Cassie—Olette) to Mr. H. A. Short's (Johnston, R. I.) Singalar (Flete—Queen), Jan. 31.

Her—Dicks. Mr. George Ayre's black and tan setter bitch Her (Sheep—Gypsy) to Mr. Hart's (Dunstable, Eng.) black and tan setter Lohia—Luice. Mr. Bayard Thayer's (Boston, Mass.) imported rough-coated bitch Lohia to Mr. J. E. Thayer's Luice (Bran—Maida II.), Feb. 5.

Gay—Rory O'More. The Rory O'More Kennel's (Albany, N. Y.) red Irish setter bitch Gay (Elcho—Fire Fly) to champion Rory O'More. Ance—Rory O'More, Jr. The Rory O'More Kennel's (Albany, N. Y.) red Irish setter bitch Anne Boley (Rory O'More—Queen Bess) to their Rory O'More, Jr. (Rory O'More—North O'More).

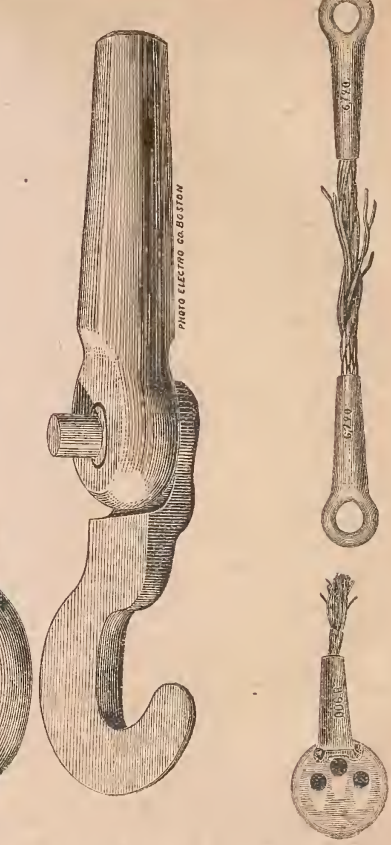

Mignon—Gloss. Mr. Eugene Powers's (Cortland, N. Y.) black and white ticked cocker spaniel bitch Mignon (Dart—Daisey H.) to his Gloss (Bub—Jenny), Feb. 5.

Boatella—Turk. Dr. J. W. Alsop's (Middletown, Conn.) imported mastiff bitch Boatella (Rajah—Queen) to Mr. H. W. Lee's (Boston, Mass.) Turk (Babe—Fay), Feb. 5.

WHELPS. See instructions at head of this column. Lassie—Karens. Mr. Fred W. Rothera's (Spring Creek Farm Kennels, Simco, Ont.) imported Scotch collie bitch Lassie, Jan. 22, one (one dog) by champion Marcus (seven dead).

Lill—Bowie. The Fulton Kennel Club's (Canal Fulton, Ohio) champion beagle bitch Lill (Warrrior—Rosey), Dec. 13, 1882, four (two dogs) by their champion Boxer.

Bergold's Lady—Bowie. The Fulton Kennel Club's (Canal Fulton, Ohio) champion beagle bitch Bergold's Lady (Vidocq—Fussie), Dec. 13, 1882, four (two dogs) by their champion Boxer (Cameron's Boxer—Webb's Lady) out of their Bergold's Lady (Vidocq—Fussie).

METALLIC SPLICING.

The usual method of splicing wire is in imitation of the practice pertaining with rope. The splicing, if well done, is strong enough, but never perfectly reliable, so much depending upon the workmanship. Objections are the time consumed, the waste of wire and the difficulty of making repairs away from a regular riggers' establishment. This last objection is the most serious to owners of yachts, as they seldom command the ability or tools to effect repairs, except in a temporary and crude way, and such repairs are seldom to be trusted, often involving new rigging to make up for the loss of length incurred by the attempts of the crew. The new metallic splice is put on the market to overcome the inconveniences of "making and sticking." It can be recommended for durability, economy of time and material, neatness, and the facility of application and removal. It is practically indestructible by any ordinary usage or exposure. No repairs are needed, and when a rope is worn out the socket may be easily removed and used on new rope. This is a marked advance over the old style splice which requires the frequent attention of a competent rigger to repair or renew the coating or surface of tarred hemp, which, without such care, soon becomes worthless either to hold the splice together or to keep water from going into it, thereby causing rot, expanding the hemp core and spreading the splice laterally and destroying it.

There is a large saving of rope by this method, as none is required to go around thimbles or deereyes; none is used for furling; none to trim off, and in fact no rope is wasted and no hemp service is required either to strengthen or to protect the splice. For ship use no chaffing gear is required, as the socket is a smooth metal which will neither chafe nor be chafed. No repairs are required. The time taken to fasten the rope may be safely stated as less than one-tenth of that required to make and finish the old style splice.

The arrangement is simple to describe. The wire having been cut to the required length, the end is inserted in the socket, cast in one with the various fittings used in rigging, such as eyes, hooks, hearts, fair leaders, etc., and there secured by pouring a strong fusible metal around it, completely filling all the spaces in and around the rope, and forming a perfectly solid and thoroughly united structure which no strain can break, as has been amply proved by a great number of tests made at the U. S. Arsenal, Watertown, Mass., and several other places; and also by practical use on shipboard.

This invention is likely to work important changes to the manner of rigging yachts of all kinds, from the fact that these sockets may be terminated by any kind of device or fastening commonly used in connection with wire rope, for which purpose the Metallic Splice Manufacturing Company have brought out many useful and neat patterns, among which we have selected the principal ones for illustration.

The socket cast in one with the fittings is made with care and always cylindrical inside, as shown by the sectional cut of an ordinary eye bearing presented. The socket is first cut out conical, but subsequent experiments showed a cylindrical hole all that is necessary, since the wire rope invariably wears away before the splice or wearing rope. No special sockets shown in the illustration are not even necessary, for perfect fusion takes place between the wire, filling and surrounding casting if the directions are properly followed. These are written with the comprehension of every one, as appears from the following: Pure tin, or a compound of half lead and half tin. Either of these may be used with the utmost safety, and are obtainable in any part of the world.

except as necessary to assure persons likely to use the splice, that it has been put through well authenticated experiments before competent experts, and that no risk attends the introduction of a method of splicing we regard as a great improvement upon existing customs. The general results of the experiments are set forth in the subjoined table obtained before a board of U. S. naval officers at the Watertown Arsenal, Aug. 22, 1881.

SOCKETS.	STEEL WIRE ROPE.	ULTIMATE STRENGTH.
Malleable Iron, " "	Two Inch,	30,000 Lbs.
" " "	Three " "	45,700 "
" " "	Four " "	73,000 "

The rope was broken in every case and the splices were uninjured.

The following is an extract from a report of tests, made to Commodore O. Hager, commanding the U. S. Navy Yard, Boston, Mass., March 31, 1882:

Commodore—In obedience to your order of the 10th inst., we have examined and witnessed the testing at Watertown Arsenal of the patent fusible wire socket splice presented by W. P. Healey. In one case a five-eighth iron rod—Norway iron—was inserted in the socket, the rod parted and the splice remained intact. By the request of the board two ends of wire rope were put together, and the socket splice put on similar to two ends of a shroud being shot away and put together and the result of the two tests. The rope was broken each time, the splice remaining good. (A splice of this kind does not shorten the rope.)

From the results of the tests and the opinion that if the sockets and splices are carefully made, and a sufficient space given in the socket to allow the metal to go freely to the bottom and penetrate the wire spaces, that it will more than stand the strain of the rope. It is also more durable and economical than the old method of splicing.

(Signed) C. C. CARPENTER, Captain U. S. N.
E. T. SMOOK, Lieutenant U. S. N.
J. B. Aiken, Boatswain U. S. N.
M. H. WENDELL, Supt. Rope Walk.

The strength and reliability of the metallic splice is therefore not open to doubt. Its neatness and advantages will be readily appreciated by the reader. Hon. Benjamin Dean, owner of the well known sloop *Undine*, of Boston, who tried the arrangement on his yacht, has the following to say:

Boston, September 14, 1881.

Supt. Metallic Splice Manufacturing Co.—I am much pleased with your Metallic Splice. It is the nearest thing possible, and secures the entire strength of the rope. Nothing could be better.

Yours, very truly,
BENJ. DEAN.

Since the above is given by the captain of pilot boats and the owners of vessels generally, so we deem ourselves warranted in aiding the introduction of the splice throughout the yachting fleet. We have at our office a sample, cut across in several places, demonstrating the complete welding of all parts in a single mass.

The only caution required is to follow absolutely the directions with regard to heating the socket; the object being to cause contraction of the surrounding iron as the filling metal cools. No skilled expert called for, any builder or carpenter or boat-sharp can execute high thorough work in much less time than they could with the old rickety process. Owners of small boats can doctor their rigging without the trouble of carrying it to a rigger's loft and paying high price for rigging work.

The various sizes of sockets are known by numbers, and suited to rigging according to the circumference, which may be taken as equal to three times the diameter and a trifle over. The amount of filling metal is small and the cost purely nominal, being only 24lb. for a socket 2 1/2 in. internal circumference. Among the yachts fitted with the metallic splice may be mentioned the schooner *Ray*, new of New York, the schooner *Meteor*, the sloop *Crocket*, built by the Woods Bros., of Boston, for Mr. Holt, of Oswego; the *Glosson*, R. V. King, of Boston; the *Charm*, M. Driscoll, and the *Thaetou*, of the same place. Also the sloop *Blanche*, T. C. Lyman, of New York, and the *Undine*, before noted. Quite a large fleet will be similarly supplied this fall, as builders generally are giving the new method their preference. The accompanying illustrations explain themselves. They include the common "round eye," useful for many purposes and a general substitute for eye splicing in all parts of a ship. The dead eyes are neater, stronger and lighter than those of lignum vitae. The "key sockets" or "hearts" are adapted to setting up bowsprit blocks, halyards, and smookestack stays. The slider hooks are familiar in their application to all.

Other cuts illustrate the breaking of the wire before the

crew during a t. official tests. With such handy appliances, yacht owners will be able to find many occasions to work them in to advantage where at present they refrain on account of the trouble and difficulty involved in the old method. Double sockets for joining two ends are also manufactured, so that a break can be overcome without shortening the rigging, by sticking the ends as formerly required. The means for quick repairs, alterations or additions are to be found about even the smallest of boats, so the work can be all done aboard ship with a few spare sockets in stock among the boat-swall's stores. We refer those interested for further information to the Metallic Splice Manufacturing Company, 55 Oliver Street, Boston, from whom samples may also be obtained.

STEAM YACHTS.

DISDE a lot of wretched, half-drowned, ill-shaped launches upon the steam yachts, we have few if any regular steam yachts deserving the appellation. The sausage shaped things, so low in the waist as to be quickly swamped in rough water, and surmounted by tenement houses with a couple of bean poles for rig are at best to be classed as launches which have come into vogue on the strength of their supposed high speed. Nine out of ten of them, however, can lay claim to nothing of the sort, and if not for speedy conveyance up and down rivers to suburban residences, their right to exist may fairly be questioned. With the exception of the Liverpool yachts, these steam launches with their ungainly form, dangerous proclivities, clumsy, antiquated boilers and the engines, are lamentable failures in respect to high speed. Lacking in the only quality justifying their existence, they are worthless toys of no service or value. The cruising steam yacht affording a floating home, and able to make a passage to any parts as reasonable, evenly maintained speed upon the lowest coal consumption and the smallest engine space, is one of these luxuries not yet existing in our waters, and it is fast hourly understood in her ports of excellence and adaptability to yachting. For the vast fleet of steamers ranging from seventy-five to seven hundred tons in British waters we have as yet no counterpart. That they will compose an important element in the near future can hardly be doubted when we keep in mind their fast increasing popularity abroad, and the wide range of their usefulness. Such fresh-decked screw yachts as we have so far built, are to a great extent reproductions of the little launches on a larger scale, and with two or three exceptions, their excessive consumption and cramped engine spaces render them unsuitable for cruising and voyaging purposes. Of the class of economical cruising steamers the English and Scotch have so long made a specialty that now designs will naturally be sought to fill the lack of our own experience. Those in search of the latest practice are directed to the ripe knowledge and close familiarity with the subject for which the architect and engineer, Mr. St. Clair, of Liverpool, have well established reputations. In applying to his professional ability, gentlemen contemplating the construction of steam yachts should certainly first consult him, for by studying his work in the dark, leaving to carpenter and blacksmith the intricacies and neat balances of size, power, rig and accommodations. The clumsy attempts at originality now existing in our waters prove how futile it is on the part of even our best engineering establishments to reach at a single bound upon first attempt the maturity in plan and the nicety of detail which can only be acquired by gradual approaches through many years of time and the closest attention. We are induced to give this warning, because we hear of a cruising steam yacht about to be designed and built by a concern which has never turned out anything of the kind, has no one in its employ who ever stepped aboard such a vessel, and who know nothing of a cruiser's requirements in work, which is being taken in hand by naval specialists, and to renounce their advice and knowledge in favor of the overweening confidence of a brusque agent in search of a commission is to insure failure from the start and another disaster upon the introduction of steam cruisers.

MEASUREMENT IN GERMANY.—After discussion of the systems in vogue the North German Sailing Union has decided to adopt "bulk measurement" and has voted in favor of a system which has been used in practice. An official measurer will be selected, whose expenses will be covered by the union. Expert engineers and army officers, took part in the deliberations, and their support of bulk measurement is strong evidence of its equity. There is nothing unaccounted in their conclusions, nor did they build upon false assumptions and prejudice like certain young club members here. The clubs at Hamburg, Stettin, Danzig, Kiel and Berlin are included in the union. The Royal Copenhagen Club, of Denmark, now in danger of displacement, but as the yacht has been produced by a producing school, dangerous yachts is already becoming apparent; the Danish yachtsmen are likely to follow the lead of the Germans soon.

HULL YACHT CLUB.

PROPORTION OF PRIZES WON BY H. Y. C. YACHTS IN RACES OF OTHER CLUBS.

Table with columns: DATE, CLUB, WHERE SAILED, Total Yachts, Hull Y. C. Yachts, 1st prize, 3d prize, 5d prize, 7th prize, Total. Lists various races from May to Feb.

A MEMORY OF MOROCCO.

I HAVE just read in Blackwood for December, an article entitled "Four Months in Morocco," and the sporting incidents and adventures there recounted have carried me back in memory to ancient days, long before that wild and singular land was invaded and subdued by the armed forces of old Spain.

At the time to which I allude, I was a light-hearted subaltern quartered with my regiment on the Rock of Gibraltar—a youth devoted to sport—and reveling in the lavish opportunities for its indulgence that surrounded us.

The "crack corps" in which I had the honor to serve, numbered among its officers more sportsmen than any other regiment in the garrison; and during the autumn and winter months the raids made by us on the fair domains of Andalusia produced bags that "astonished the natives" and for the number and variety of game may well be remembered in after days with pleasurable satisfaction.

In these excursions we were frequently joined by officers of the United States Navy. The commodore's flag-ship and a splendid frigate being anchored for many weeks—where we hope we may ever find them side by side, with our guns, we struck up a warm friendship, and the frigate was felt as much at home on board their ships, as they did in our mess room and quarters. I never met a set of officers I liked so much. Time and separation has almost severed those agreeable associations, and many an old friend has "joined the majority," but I wonder whether any are left who may possibly have these lines and awaken the pleasant echoes of "Andaluz syde."

At all events I take keen delight in following the doings of the rising generation "by flood and field," and nowhere do I find them so pleasantly recounted as in the pages of FOREST AND STREAM.

CRIMMA.

WHERE DO THEY BEAG?—While hunting near Green Lake, Wis., about May 10, 1879, I shot in a small marsh four cockbirds, the first was the common red and buff shouldered blackbird, the second was a yellow-headed blackbird, except that the buff patch is wanting, and each of the scarlet feathers, both of the lesser and middle wing coverts, is tipped with black, the terminal spot being quite small in the lesser coverts, but prominent in the greater. Number three is the same, except that the scarlet is altogether wanting, and in its place is a patch of light orange shading into lemon-yellow, and bordered by a wide band of pure white. Number four is the common yellow-headed blackbird, X. leucorhynchus. The yellow on the wing patch of number three is just the same as that on the head and neck of number four. Who will tell me under what variety of A. phoeniceus to put numbers two and three?—W. W. Cooke (Jefferson, Wis.).

A NEW BIRD BOOK.—We understand that the Rev. J. H. Lawrence will publish next summer a work on the Birds of America ornithology, entitled "Our Birds in their Haunts." This work will be an attempt to popularize the sum total of our present knowledge of the birds of Eastern North America. Special attention will be given to the nidification and to the peculiar zoological characteristics of this class of vertebrates. The results of his investigations of a new and carefully explored territory ranging from Western New York through the region of the Great Lakes to Hudson's Bay will be given by the author, who will call attention to the evidences of design in nature as revealed in bird-life. The work will be illustrated.

A CALIFORNIA DUCK TRAP.—The wild ducks are more destructive to grain this winter than are the geese. At least that is the complaint of the ranchers. While the geese feed more or less during the day, the ducks confine their depredations to the night, the result being a great deal of grain lost on successfully warning against them. Charles Chapman has been greatly annoyed by ducks, and his grain has suffered to a considerable extent. But Charley has hit upon an expedient that is not only protecting his grain, but threatening to annihilate the duck band from the vicinity of his farm. One of the latter a small wire ran to the trigger of the gun. This trap was set Thursday night. The wires were only thirty-four feet in length. About 2 o'clock Friday morning work up, but didn't go out. When he arose in the morning he picked up thirty-seven dead ducks—making a total of sixty killed during the night. He was in town on Friday, and told us that he intended erecting at least 500 yards of the trap on his grain fields.—Grizzly Herald.

ANEQUIN, THE INDIAN.—The Secretary of the Navy yesterday received a telegram from the Alaska Fur and Seal Company, January 5, announcing the death from small-pox of the Alaskan Indian, Anequin. The poor Indian, who survived all the perils of the Jeannette expedition to perish at last of small-pox, was a native of Alaska. He joined the Jeannette at St. Michaels, Alaska, in August, 1858, as dog driver and hunter. He spoke a little English, and as time passed on he became more familiar with the language. He was with engineer Melville in the whaleboat and reached land in totemally "waka-ya," but didn't go out. He assisted in the capture of the island. He did his duty manfully, was a capital hunter, and very popular with the crew, who gave him the nickname of "Queen Annie." There were two Alaskan Indians on board the Jeannette, Anequin and Alexy, who were regarded as both great favorites with the officers and men, as they were brave and willing and often assisted their companions by their native singing and dancing. Alexy, it will be remembered, perished with De Long's party, and in De Long's diary Alexy's name figures very prominently. It was Alexy who always went off exploring and hunting, and would keep the commander from freezing in the night by the warmth of his body or by taking off his own coat and wrapping it around De Long.—New York Herald.

FOR Coughs, Asthma and Throat Disorders, use BROWN'S BRONCHIAL TROCHES, having proved their efficacy by a test of many years. Sold only in boxes.—Ad.

less the intention of the framers of the law meant to include Jan. 1 in the close season, but the present wording is not to that effect.

J. E. B. New York.—My dog has a white film on one eye, please prescribe. Ans. Drop in the eye twice daily a small pinch of finely powdered sugar.

A. P. Branchport, N. Y.—There are eight game protectors in New York. The salary is \$500 per year, with an allowance of \$200 for traveling expenses.

J. T. C. Boston, Mass.—You may find shooting on the beaches near Boston in proper season, provided you were on the ground before "the rest of the boys."

T. W. N., Porterville, Cal.—For cocker spaniel see our advertising columns. 2. White rice may be had of Mr. C. S. Gilchrist, Port Hope, Ont., price 82 per bushel.

A. F. L., London, Ont.—Your dog probably has distemper. Keep him in a dry place, and give him with plenty of good food and give twice daily two grains of creosote.

J. H. A., Lockwood, N. Y.—Yes, the pills are good for the money. The arms are not manufactured now, we understand, which will account for the dealers' high prices.

F. P. H., Fort Missoula, M. T.—You may find no trouble in shooting the round bullets from a choke-bore gun, provided the ball easily passes the choke, but we should prefer not to do it.

W. H. P., Concord, N. H.—The 26-inch barrel will give good service, though a longer one is generally preferred. One of the best shots at ruffed grouse we know, uses a 22-in. 16-bore.

G. W. J.,—For map of New Hampshire write to Colton, map publisher, William Street, New York. For New Hampshire game law write to the Fish and Game Commission, Newbury, N. H.

T. S., Port Washington.—We cannot tell you when the bill will be discussed by the Legislature. The bill becomes law and goes into effect immediately upon receiving the Governor's signature.

T. J. F., Freeburg, N. Y.—"The Gun and its Development," by Greener, will answer your purpose. You might supplement it by applying to the various manufacturers for their illustrated catalogues.

SHORT, Newville.—Loaded paper shells which fit, will generally slip out in the way you mention. 2. Choke-bore has been adopted by all the best marks. 3. We cannot well compare the penetration pads to a magazine.

Olo H., Hudson, N. Y.—There are several excellent rifles, both single-shot and repeaters. We must decline to give an opinion as to which is the best. You will find any one of them good enough if you know how to use it.

H. R. T., Georgetown, D. C.—Buckshot can be used in a choke-bore provided they are chambered to fit the choke. To do this insert a wad into the chamber and press the shot to the point where the choke is closest. Then chamber the shot on the wad.

C. H., Havana, Cuba.—It is not customary for first-class gunmakers to fill up barrels in gun barrels with solder. If you write the firm you name, in one of whose guns you have discovered such a defect, we think that they will make it good.

W. O. W., Charlottesville, Va.—How large do German carp grow? Ans. They are sometimes found of a weight of twenty to forty pounds. They will grow to six pounds in three years or more in favorable localities, and sometimes in less time.

J. D. G., Canby, Ore.—For information respecting climate of Southern California, consult the "California" book published by Harper & Bros., of this city. Also Mr. Van Dyke's "Ride, Rod and Gun in California," price \$1.50, for sale at this office.

C. A. M., Skowhegan, Me.—For all practical purposes the 12-bore is as good as the 10 at 100 yards. Choke-boring is a system by which the barrel is constricted near the muzzle. You can use buckshot in a choke-bore, if you use a soft clay-colored egg, spotted and blined with dark brown or black.

W. R. P., Athens, Pa.—The sparrow will do for trap shooting, if you like the sport. 2. The spotted snapper, Tringoides macularius, it is common about rivers and about lakes and pools, nests in the grass, and is a very clay-colored egg, spotted and blined with dark brown or black.

CAHOSET.—Please give the address of some firm from which I can obtain enough carp to stock several ponds. Ans. Milton P. Peirce, 17 Market Street, Boston, or George T. Peirce, Erie Street, Erie, Pa. The United States Fish Commission may have more for distribution in the spring. Apply to Prof. S. F. Baird, Washington, D. C.

R. W. W., Wrigleyville, Ill.—The male of the Canada goose has a tail about two inches from the end, which looks rather bad. It was caused, I think, by being broken at that point. Would you advise me to cut that much off, or to do nothing without any risk? Ans. If the injury is likely to be permanent we should advise that the end of the tail be taken off, which can be done without danger.

YOUNG ESTABLISHMENTS.—I should be much obliged if any of your readers would tell me any good means of securing your descriptions very really good fly-fishing can be had, and where it would be possible for a young fellow to board reasonably. Ans. You can find good fly-fishing on both sides of Lake Michigan if you go toward the northern end. About Petoskey, Mich., there are numerous good trout streams, and you can get board at reasonable rates.

R. H. D., Canandaigua, N. Y.—It is impossible to identify with any certainty the bird you mention, because your descriptions are so meager. Your No. 1 may be a horned lark (Zenopsis nebulosa); No. 2 perhaps, is a white crowned sparrow (Zonotrichia leucophrys); and No. 3 is almost certainly a vesper sparrow (Zonotrichia leucophrys). If you wish to have birds identified you had better send on the specimens.

This is to say, out of a total of 329 prizes offered in races open to the yachts of the Hull Y. C., 118 were excluded, the latter captured 127, or 38 1/2 per cent. of the lot. Furthermore, this was accomplished with 593 boats out of a total of 690 or with 85 1/2 per cent. of the entries. The prizes taken were therefore one-quarter in excess of the number proportionate to the entries. As regards first prizes, the total taken by all hands was 132. Of these 73, or 55 per cent. fell to the lot of representatives of the Hull Y. C., while by the number of entries their share should have been only 51. In other words, yachts of the H. Y. C. landed half as many firsts again than if the prizes had been allotted according to number of entries.

The above table is valuable for more than club statistics. It exhibits at a glance the great activity displayed in Eastern yacht racing, though only representing that portion of races to which Hull Y. C. craft were admitted. Judging by the present, it will be many years before New York and vicinity will be able to match this gratifying table display.

Starts with 56, 73, 82 and 144 yachts going across are things unknown to New York waters, and must ever remain so until such a maritime nuisance and drawback to legitimate sport as the shifting of dead weight and live weight ballast is once for all stricken from the sailing regulations of all clubs of standing, whether far-reaching or local in their influence. Races in the East follow upon one another so fast that the doings of even the smallest boat can be followed with interest and to good purpose. Several matches a week throughout the season bring together the best material for crews, principally of the amateur sort, and the end of a season finds them so well shaken down in accustomed places that they begin to grow tired of expert handling, creating a vast body from which the future finds fresh recruits to add to the swelling list of owners. Racing in the East, though carried out purely on the basis of genuine sport, an air of business and earnest about all its proceedings, compared to which the desultory, meagre, half-aimed competition in New York waters is but a skeleton and a by-gone, in which the most worthless style of trap is fostered at the expense of yachts proper.

Answers to Correspondents.

Kynoch's Patent "Perfect" Brass Shells

MANUFACTURED BY Kynoch & Co., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base. Use either Winchester or Wesson primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells, and in consideration of their reloading and other advantages, are really cheaper than the paper. They also shoot stronger and closer, and can be loaded heavier, as inside diameter is nearly two gauges larger. They possess a great advantage over all other brass shells, as owing to the thin metal they can be closed as represented in cut by simple use of the thumb or fingers, and straighten out to original shape when discharged. These goods have already gained a wide and favorable reputation in Europe, and in the opinion of many prominent sportsmen will soon supersede to a great extent the old style of both brass and paper. Samples will upon application, be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or in case lots only (3,000 shells) by

HERMANN BOKER & CO., SOLE AMERICAN AGENTS. 101 & 103 Duane Street, New York.

WILLIAM READ & SONS, Boston, Mass., Agents for New England States. We also carry a large stock (at all seasons) of Kynoch's regular thickness brass shells, adapted to the Berdan primer. Price materially lower than the American make of same quality.

B. F. NICHOLS & CO., BOSTON, MASS., Manufacturers of

HEXAGONAL SPLIT BAMBOO FISHING RODS, REMOVED TO 153 MILK STREET.

We are obliged to have more room in our factory and greater facilities for manufacturing our goods to meet the increasing demand. We have received the highest award and silver medal at the Massachusetts Charitable Mechanics' Association Fair for our superior rods. Send for catalogue.

C. B. WILKINSON, 8 John St., near Broadway, N. Y.

RELIABLE AND STANDARD CIGARETTES AND TOBACCO.

UNSQUALIFIED FOR PURITY AND EXCELLENCE. Manufactured by WM. S. KIMBALL & CO., The Connoisseurs and in Fine Goods. Established 1848. TWELVE FIRST PRIZE MEDALS. Fragrant Vanity, Three Kings, New Vanity Fair, Orientals. Peerless Tobacco Works. SOLD IN ALL PARTS OF THE WORLD.

Kennedy Repeating Rifle

The Latest and Best. Greatly superior to any other Magazine Rifle yet made. The solid metal in line of fire at time of discharge renders the Kennedy ABSOLUTELY SAFE. These rifles are made .44 cal. 40 gr., and .45 cal. 60 gr., using the same ammunition as other magazine rifles. Can be obtained from any first-class gun dealer in the United States and Canada.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR, 10 CTS. A COPY, 1
SIX MONTHS, \$2.

NEW YORK, FEBRUARY 22, 1883.

VOL. XX.—No. 4
Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per copy; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to a line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

ANSWERS TO CORRESPONDENTS.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

GEORGE DAWSON.

GEORGE DAWSON died at his home in Albany, New York, last Saturday morning, after a brief illness of less than a week.

His death brought to its close a long and active life, well rounded with usefulness and honor. Mr. Dawson had almost attained the allotted three score years and ten, and had retired from active life to spend a well-earned leisure in the companionship of his chosen books and many friends.

George Dawson was born at Falkirk, Scotland, March 14, 1813; and when three years old came to this country with his family, living first in New York City, and afterward in Toronto, Canada. At the age of eleven, in 1824, he entered as an apprentice to the printing trade in Niagara Falls, Canada. In 1826 he went to Rochester, New York, and there became an employe of the late Thurlow Weed, and in 1831, Mr. Weed having established the Albany Evening Journal, Mr. Dawson became foreman of the printing office. This position he held, meantime reporting the Legislature proceedings, and doing other work upon the paper, until, in the spring of 1836, he was called to the editorship of the Rochester Daily Democrat. Thence, after three years, he went, in August, 1839, to the editorial management of the Detroit Daily Advertiser, where, in return for his services to them, the Whigs made him State printer. In 1842 a fire destroyed the establishment, and Mr. Dawson returned to Rochester, and again became the editor of the Daily Democrat, which position he held until 1846. At the invitation of Mr. Weed he became an associate in the editorship of the Albany Evening Journal, of which he became senior editor and proprietor upon Mr. Weed's resignation. In the history-forming years that followed, Mr. Dawson's position was one

of great influence. He wielded a sharp, lucid pen, and through the Journal moulded public opinion in the great crises of the day. In the arduous duties of his editorial management Mr. Dawson did the best work of his life, finding brief rest and recreation in his favorite pastime of angling. In March, 1877, he retired from the active management of the Journal, and devoted himself to the pursuits of a leisure well earned. In 1879 he again took up the pen and assumed control of the Journal, relinquishing it in September of last year. The life we have thus briefly outlined was a busy and influential career. But like many another man born with a love for the beautiful things of nature, Mr. Dawson found time—or made it—to gratify to a normal extent his tastes for out-of-door life. His summer vacations were spent in the woods, in the companionship of chosen friends of like spirit, and in a communion with nature, from which he returned each year renewed in mental strength and vigor, and, like the Norse heroes of old who ate of the magic youth-restoring apples, young again in years.

Mr. Dawson was one of "the simple wise men who love to go fishing." The pastime was a passion with him, and few men could write of its charms with more appreciation or more delicately. His annual angling trips were described in the Journal in several series of letters, fragrant with the fresh, spicy odor of the North Woods and the Canadian forests. In 1879, after returning from his thirty-fifth annual trip to angling waters, he collected several of these letters together into a handsome volume entitled "Pleasures of Angling with Rod and Reel for Trout and Salmon," a book which has taken its place among the classics of this literature.

Among his angling friends and camp companions were many of the distinguished men of the day, President Arthur, ex-Vice-President Wheeler, ex-Treasurer Spinner, Senator Edmunds, Secretary Folger, ex-Governor Seymour, Chief Justice Ritchie, of New Brunswick, and Chief Justice Gray of the Supreme Court. Of his days in camp with these friends some pleasant chat was given in the "Winter Talk," published in the FOREST AND STREAM of Dec. 21 last.

When Mr. Dawson retired from his editorial duties last fall he expressed to the writer the pleasant anticipation of devoting himself to more congenial occupations, and shortly thereafter he began the series of charming "Winter Talks on Summer Pastimes" that have given so much pleasure to the readers of this journal. These essays are believed to be the last of his writings, and in them will be found the reflection of "the calmness of spirit and a world of other blessings attending upon it," which were the crown of a well-spent life.

THE PARK AND THE SENATE.

THE Senate of the United States is displaying a strange apathy in regard to a matter of such vital importance as the preservation to this country of the Yellowstone National Park. The time has come for the members of the Senate to give some attention to the subject. They are apparently over-awed by the impudence of the would-be Park grabbers, who in the very face of the action of the standing committee of the Senate and without any lease, have gone on cutting down timber in the Park, killing game and erecting a hotel, as if they were above Congress and the people. This unblushing conduct calls for prompt attention.

Last Saturday, Senator Vest offered a resolution for the appointment of a committee of Senators to report to the Senate at the next session what is the actual condition of the Yellowstone National Park, what action has been taken by the Department of the Interior in regard to the management of the Park and the leasing or contracting to lease any part of it, and what legislation, if any, is necessary to protect the timber, game, and objects of curiosity, and to secure the proper administration of justice therein.

The resolution also requests the Secretary of the Interior to take no action in the matter of leasing or contracting to lease any portion of the Park for any purpose until the Committee shall have reported, to cause the cutting of timber and the erection of hotels to be discontinued, and to take immediate steps for the protection of game and objects of interest, and to call upon the proper military authorities for this purpose.

The resolution went over to Monday, and was then put off again, to come up when they get through with the interminable Tariff bill. It is very evident, as it has been from the first, that the monopolists have a strong lobby. We hope that Senator Vest will compel the friends of the Park defenders to show their hands.

THE CHICAGO GAME MARKET.

A BILL now before the Illinois Legislature provides that the open season for selling game shall be extended to February 1. This bill is being pushed for the benefit of the game dealers, and is most decidedly against the interest of game protection. The circumstances are these: The Illinois law now permits the sale of grouse to December 5, and of quail to January 5; this allows five days for the sale of game after the season for killing it has expired. This is all the time that can reasonably be asked or wisely granted. But it does not satisfy the dealers, and they have set about securing a change.

Their first step was the organization of a Sportsmen's and Game Dealers' Association, in which it is needless to say the latter class, who appear to have shrewdly originated the scheme, hold a controlling influence. At the same time, by making it appear that the association is a sportsmen's society, they count on winning the concessions to their demands, which, as simple game dealers, they know they could not do. The present bill is fathomed by this unequally yoked team of sportsmen and marketmen.

There are many good and sufficient reasons why such a bill should be opposed by honest advocates of game protection. It is an axiom that so long as there is a market for game so long will it be supplied to the market, legally or illegally, by fair means or foul. The sale of game ought to stop when the season for killing it expires; a period of five days, as now provided by the Illinois law, is ample time to dispose of the supply on hand. If not, then let the supply be less. If the season for killing game in Illinois is extended to February 1, the sportsmen of that State may make up their minds to the fact that game will be killed to February 1. There is no reasoning that fact out of the way.

Such an extension of the selling season would be alike disastrous to the game interests of other States. So long as the Illinois game dealers, during the close season, could sell game received from other States, or game from their own State under pretense that it had been shipped in from somewhere else, they were content with the old law. But the Wagner decision cut off this privilege. If the selling season is extended to February 1, the Chicago market will be flooded with game illegally killed in Michigan, Minnesota, Iowa and Wisconsin. Indeed, such is now the case.

It appears that through the influence of their association the game dealers have this year secured immunity from the law, and have been selling great quantities of game illegally killed in other States. One case in point has just come to our knowledge. It shows most clearly, first, that an open Chicago market means wholesale and illegal destruction of game in other States; and, second, that Chicago game dealers, who are also members of the Sportsmen's and Game Dealers' Association, have no scruples whatever about selling such game, provided only that they can put the proceeds into their pockets and escape arrest.

On the 22d of last January Mr. R. W. Matthews, of St. Paul, Minn., telegraphed to an ex-president of the Illinois State Sportsmen's Association that a large number of pinnated grouse had been, in defiance of the law, shipped from Osakis, Minn., to Bond & Ellsworth, game dealers, of Chicago. But instead of taking any steps in the matter, the recipient of the letter handed it over to the head of the firm against whom complaint was made, who is, by the way, the president of the Sportsmen's and Game Dealers' Association. A reply from this gentleman went back to Minnesota that Chicago game dealers were selling game in the close season, and proposed to sell it up to February 1st, and that the sportsmen had pledged themselves to stand to one side and make no prosecutions. So the dealer received and, presumably, disposed of the goods which, according to the laws of Minnesota and of Illinois, were contraband.

This is only one case among hundreds and thousands of the same kind. It shows how little sincerity there is in the game protective pretensions of the parties implicated; and it should be a warning to the sportsmen of Illinois to guard their interests as now secured by the present law.

The Chicago marketmen plead that if they do not sell game in the close season others will. This is the silly easiness of men of the world over who can find no valid excuse for engaging in business of doubtful morality. Because the New York and Boston markets are open is no reason why the Chicago market should be added to them and the illegal traffic in game thereby increased. They ought all to be closed when the killing season expires.

For the sake of the Illinois game supply, and of that of neighboring States, true friends of protection will regret to see any such opening of the Chicago market.

THE RIFLE SEASON OF 1893.

WITHIN a few weeks the clearing up of the ranges and the settling of the weather will enable practice to open before the target, and the work of the shooting season of 1893 will be on in full force. It promises to be a brisk season for those interested in rifle improvement, and in official military and amateur civilian circles as well, there is a desire to see progress as well as mere relaxation and enjoyment.

The great event will be the International match, and to secure a creditable showing in this every effort should be bent. There must be no such disgraceful fight against the odds encountered in the last contest. The team of 1893 must not be sent out to any such sure defeat, and it certainly looks as though they were to have choice of some excellent weapons.

Of course it will be a very agreeable outcome of the contest should victory come home with the visiting team, but the match can have only a good effect, at any event, in so far as it points attention to the matter of non-cleaning matches. They are to be the contests of the future in the line of practical rifle practice, and there could be no more instructive series of experiments at Creedmoor than comparative tests with the ordinary military rifles in prolonged series of shots without cleaning. A rifle which becomes useless from leading or jamming, or stripping of bullet patch under such trials, is not worthy of support as a desirable weapon. It does not come up to the requirements of a military arm, where oftentimes it is necessary to have shot after shot for long periods fired, and often very rapidly, too, where cleaning is entirely out of the question. If the arm shoots the more wildly the more it is fired in this way, it very soon becomes a mere stick, and is no better than a quarter-staff or policeman's billy. There would be an added pleasure to target practice if the marksman could be certain that in ridding himself of the labor of cleaning his rifle here he was not at the same time placing himself under a heavy handicap. It must not be inferred that the practice of ten years past on American ranges, where so much attention was paid to cleaning, was misdirected practice. The results obtained were valuable, and make the building of a non-cleaning rifle a comparatively easy task. There is to be no general overhauling of the construction, but by care in a few minor points it will be found that any good shooting weapon under the present system will be serviceable for prolonged shoots without cleaning.

If in place of offering for prizes for the marksman who may hit the best score in a match under our present rules, the N. R. A. should encourage original experiments and carefully tabulate the results obtained under certain known and defined conditions, something could be accomplished in a single season which it would require a dozen years to reach under our present hap-hazard system. In all reports of rifle matches as now given there are so many omissions that the records are of little value as guides to riflemen wishing to improve their own practice. A single score might serve as the text for a very complete lesson of practical rifle shooting, but if the only point aimed at in publication is to designate differences between individuals, then the system now in use is a good one and answers every purpose. Progress, however, is not to be made by years of this sort of work. The experimenter is the leader and there is no reason why the several clubs of the country and organizations generally should not devote some time and attention to securing and tabulating results in these systematic endeavors to overcome some of the present impediments in the way of good and reliable scoring at all times.

It is time, too, in military practice that, there should be a general exhibit of what is and has been done. The regular army has made great progress since rifle practice was taken up a few years ago, and it is to be hoped that with the carrying out of the wise suggestion for the concentration of the troops and the breaking up of the present series of detached posts something may be accomplished in the direction of rifle improvement. In the militia it would be wise if a uniform system of scoring could be introduced so that the relative standing of the men of the several States could be readily fixed, and especially the fact brought out in strong relief that in many parts of the Union absolutely no attention is paid to building up this strong arm to the civil power of the body politic.

It is one of the difficulties of this sort of target practice that it must be kept up under the guise of a pleasure. It must not be made too irksome as a task, for there it is thrown aside as a bore, and all interest in it ceases. It will not do for the authorities to insist upon men making up for the defects of an inferior arm by extra practice and precaution. The best weapons should be secured, and then can the best result be insisted upon from the men into whose hands the rifles have been placed. In this respect the militia of several of the States have very just cause for complaint, and it is not at all surprising that some lively grumbling should at times be indulged in.

It is probable that this year will see some interesting experiments in the direction of repeating rifles for military use. It is an open question whether for sporting rifles to be used in hunting there is any legitimate demand for a magazine rifle, but in military circles it is recognized that the morale of a body of troops is wonderfully strengthened by having them armed to the very highest point of excellence,

and competent experts are working in the direction of magazine rifles with great determination. Much has been done abroad, and most excellent results have been shown on this side the ocean; but there is the service test to be yet applied to many of the models put up for trial.

It would be well if the season of 1893 should see a more general diffusion of rifle shooting, and the sport become popular in all quarters of the country. If for every one of the thousands upon thousands of little pistol plagues which are scattered in every quarter, a good weapon was made and put in careful use, we should have a big decrease in accidents from firearms. To infer from the number of fatal shooting occurrences that small arms are *per se* responsible is most absurd. Carelessness, ignorance or design come in to explain the mishap in fully ninety-nine per cent. of the cases reported. If the season of '93 will see more intelligence on the questions of petty arms scattered among the people, it will see a corresponding reduction in the number of shooting accidents.

NETS IN LAKE CHAMPLAIN.—We would call attention to the article by Dr. C. Hart Merriam in another column, in which he shows how the valuable food fishes of Lake Champlain are slaughtered on the Vermont side of the lake while seeking their spawning grounds. A year ago one of the New York game protectors complained in our columns of this same thing, and regretted that he was powerless to remedy the matter. The greed of fishermen in all parts leads them to try to capture the last fish in the waters in order to make as much out of them to-day as is possible and to neglect the future harvests. We hope some action may be taken by the authorities to prevent the annual March slaughter this year, and thus secure a fair crop of young fish the coming season. If the fisherman took the fish after they had spawned it would not be so bad, but according to Dr. Merriam they are doing all they can to exterminate the fishes of the lake, whose main spawning grounds seem to be upon the Vermont side.

"ASLEEP AT HIS POST."—Had the artist chosen to tell his story in prose, instead of by a sketch, it would properly have been placed in our Camp Fire Flickerings. The picture is suggestive. The hero is by no means the only unfortunate sportsman who has, by falling asleep, missed one of the golden opportunities of his life. A similar experience has befallen others. We recall an occasion when a fox hunter (New England style), overcome by fatigue, fell asleep at his stand. When he woke to find that the fox had passed within six feet of him, he delivered an oration to himself and the other stumps, which, though eloquent in the extreme, our limited space will not permit us to repeat here. To his friends it was plausibly explained that the fox had been missed because his gun had hung fire; the real truth has never been told before, and it is now given to the reader only in the strictest confidence. May we not ask in return a like confidential relation from some one else?

THE LOCAL PRESS may be utilized to further the interests of sportsmen if a little attention be given to the matter. The local editor is, in nine cases out of ten, willing to give his influence to the cause of game protection, provided only that his attention be properly called to the subject. How clearly and truly the local press can talk, witness the words of the Huron (Dakota) *Leader*, reproduced elsewhere. With such an ally as the home paper, the sportsman of a town or county can accomplish a vast amount of good.

THE MAINE COMMISSIONERS.—We are pleased to learn of the reappointment of Messrs. H. O. Stanley and E. M. Stillwell as Commissioners of Fisheries and Game for the State of Maine. The latter gentleman, although not appearing as such, has in reality held the position and discharged the duties of commissioner during the past year, having served at the request of the Governor's Council. His reinstatement will receive the cordial approval of citizens of Maine.

SEAL HUNTING.—The hardy sport of seal hunting has not found favor with many of our sportsmen, yet no doubt it may be an enjoyable one. We learn that the well-known naturalist, Dr. C. Hart Merriam, whose contributions have often enriched our columns, will start next week for Newfoundland and the Northern ice fields on a big seal hunt. We hope he will have all the success that he has hoped for, and that he will give us some account of the trip.

MAINE BIRDS.—Many of our ornithological readers will no doubt be surprised, as we confess we were, at Mr. Smith's arrangement of the families of the *Grallatorae* in the list of Maine Birds, now being published in these columns. This arrangement was not determined upon by the author without consideration, and we leave it without change and without comment.

THE CHESAPEAKE BIG-GUNS.—Just as we go to press we are in receipt of a telegram from Baltimore dated February 20, which reports that three more big-guns have been captured, making seven in all, and the remainder are located.

OUR READERS will confer a favor by sending us the names of such of their friends as are not now among the subscribers of the *FOREST AND STREAM*, but who would presumably be interested in the paper.

The Sportsman Tourist.

NIMROD IN THE NORTH.

BY LIEUT. FRED' R. SCHWATKA, U. S. ARMY.

IV.—Nimrod with a Shotgun.—Part One.

WHILE in the winter time the Arctic regions are an almost barren country for the sportsman after small game, there is no place on this planet where it is more plentiful during the short summer, especially of the aquatic variety, and the lover of duck-shooting could certainly gain his fill in a short while.

While camped in North Hudson's Bay it was considered no great doings at all to take the shotgun out to one of the many lakes in this vicinity and get a good mess for our little party. These lakes, which were nothing more than great impetuous basins of granite full of drainage water, were so numerous and oftentimes so large that I do not believe I exaggerate when I say that their superficial measurement would be one-third of the whole country thereabouts; certainly they were a most annoying impediment to inland traveling in the summer, and an equally fortunate boon in the winter when we followed their level surfaces with dog-teams and sledges. Each pond or lake contained its little family or families of elder ducks, and if it were at all large, and especially if it were dotted with flat, grassy islands, which gave them protection while breeding, they would be in large bands over its surface. They only inhabit the ponds and lakes near the sea shore until the young are large enough to fly, when they congregate in the flocks, inlets and bays of the sea, and oftentimes in these vast areas, where they are most plentiful, they will penetrate their ironclad coating of feathers, the greater majority of those secured being shot in the head and neck. As small shot was equally efficacious in this method of destruction, we adopted it, with the effect of increasing our scores.

Our first efforts were often laughable. Colonel Gilder one day turned a duck's feet into the air with a shot of lead, and the bird, as the saying is, "went over the hill" nearly into shore all the time kicking vigorously. The Colonel, desirous of facilitating his travels, commenced throwing large stones just beyond him with the effect of bringing him right side up with ease. The duck looked around astonished, sneezed a couple of times, and when the next stone splashed alongside he disappeared in the water and came up over a hundred yards away, where he proceeded to arrange his feathers for the last disturbance. Could any of the many dealers or manufacturers in shot-guns who advertise so extensively in *FOREST AND STREAM* get a good record on the Arctic duck, I think he could rest perfectly satisfied with his practical test.

The compass is a sluggish, unreliable instrument in the northern part of the bay, and it became necessary to establish a good long north-south line on the water. To this end I proceeded to arrange his feet for the last disturbance. Could any of the many dealers or manufacturers in shot-guns who advertise so extensively in *FOREST AND STREAM* get a good record on the Arctic duck, I think he could rest perfectly satisfied with his practical test.

The compass is a sluggish, unreliable instrument in the northern part of the bay, and it became necessary to establish a good long north-south line on the water. To this end I proceeded to arrange his feet for the last disturbance. Could any of the many dealers or manufacturers in shot-guns who advertise so extensively in *FOREST AND STREAM* get a good record on the Arctic duck, I think he could rest perfectly satisfied with his practical test.

The north point was fixed near camp, and the south one approximately about a mile away across a lake; and one night I sent Henry to it to fix it as accurately as possible by this method. I gave him a small torch to define his position, and then expected to find the meridian by signals in the line of culmination, which I had sent in my shotgun case contained a duck call, and I fixed up a good instrument to be heard a long distance, and told Henry that one *quack* meant the right, while two meant the left. The night came and Henry took his place, and I could see that he would be out of the way even a quarter of an hour ahead; and I gave a *quack* that sent him nearly as far out of the way on the other side. *Quack, quack*, was sent to him, and he had just gone about half way back and nearly where I wanted him, when there came floating over the lake *quack, quack*. That dragged him way out again. A single signal from my call to rectify this was answered by about a half dozen single and double calls all over the lake; and I soon found that I had stirred up about a hundred ducks, all of them fully educated in the art of snuffing, and I was very busy in the matter of culminating this party. At last I once gave up the *quack* method and returned to the standard rules of the regular school, but I wasted a bag of shot on that lake next day, and we lived for a week on Jupiter birds, as Henry called them.

One writer says that the mother will lead the young ones to the water almost as soon as they creep from the eggs. Going to the water-side, she takes them on her back and swings a few yards with them, when she dives, and the little ones are left floating on the surface, and are obliged to take care of themselves. After once initiated to the water I think they never return to the land. From these birds is produced the soft down so well known, and which the female plucks from her breast to line her nest. In the sub-Arctic regions the people regularly rob them of this, and it forms an important item of commerce. It robbed, the female forms another nest in the same way, and the third time she is compelled to call on the master of the household for a supply of down from his breast. Each female yields, it is said, about four ounces of this material, and so soft and light is it that it has to be mixed with moss roots and gravel by the old bird to prevent the chicks scattering it away, and she gathered within two or three times its final weight. Upon King William's Land my party in one day saw about forty of these nests, the whole island being comparatively abundant with them, and I have but little doubt that one person alone could have seen as many had that been his sole object. Should aerial navigation ever be completed, such wages as \$25 to \$30 per day (or even less) for the market should become stocked would undoubtedly draw many thither during the breeding season of nearly a month in length.

I have said that the elder favors the little islands in the large lakes or those along the seashore for protection while breeding, the Arctic fox being the most inveterate egg-sucker I have ever met, and consequently their worst enemy. One method they have of circumventing this pest in Spitzbergen is too curious to pass by. If driven off of their nests they will draw the down of the nest over the eggs, and give it with a copious supply of yellow fluid, which not only retains the warmth of the eggs for a long time, but is of so extremely offensive a nature, that the foxes would not touch the eggs tainted with it.

The elder-ducks of Hudson's Bay are mostly the common variety; all of those of King William's Land being the crested or king elder. Yet an indifferent observer would believe that there were a great variety of species, and widely different is the plumage of the sexes, and the fact that when

in large bands they are nearly always separate. The male is dressed with a fleshy topknot, the male vivid yellow, and his whole "set-up" is the most conspicuous contrast of complementary colors, all of the liveliest hues; while the female is a mass of rusty brownish-black almost the exact color of the half-dried moss in which she makes her nest, and where she will never be seen until with a whirl like a ruffed grouse, she springs up right under your feet apparently. Sitting in a line on the edge of a large ice cake, the males look like a regiment of Hussars or a squadron of dashing dragons in full uniform, while the females look like a procession of Carthusian monks in their sombre garb.

We almost lived on our eggs for a short time while on King William's Land, and the suddenness with which they became added was wonderful. One day nine eggs were obtained, all of them good, as had been all previous ones, and the next day (which dates I have always regretted not recording) twelve out of thirteen were added so they had to be thrown away; and after that not one good one was found, although we kept feeding them for three or four days, until we were convinced that further efforts would only result in an unwarranted destruction of small ducks. The manner in which the young ones appeared about three weeks later was almost on a par, and it seemed as if we had suddenly been visited by a shower of young ducks. In some parts of the Arctic slippers made from the breast of the older are used instead of the inside reindeer stockings, and do not wear so long, and are ruined by damp.

One day, in the last part of September, I walked along the eastern shore of Terror Bay, and here I saw the elders marshaling for their southern crusade. This shore is seven or eight miles long, and from its very southern cape until I reached its head I was passing by straggling bands reaching half a mile to a mile from shore, the outlying members of each little party being so efficiently mixed to say the least, as to not wear so long, and are ruined by damp.

But of all the Arctic ducks that will force themselves upon your notice, there is none like the noisy *tauk-sok!* of the Esquimaux, evidently the "old wife," "old squaw" of the winter in the temperate zones (*Uveralla goralis*). I have never seen them in large flocks in the North, but they make up in noise and variety of sounds all they lack in numbers. This garrulous bird, however, is not a common sight in the highlands of the temperate zones, seems to multiply them as it visits the North to breed, and whenever we asked any question of our Esquimaux comrades regarding the numerous, wild, unearthy and variegated sounds that we euphantly heard, the stereotyped answer was *tauk-sok! taik-sok!* until we accredited everything to this mocking-bird of the North, the "scrittologist," as Colonel Gilder called him, who had seemed to be the only accomplishment of his many others. He loves the North, and sticks to its dismal regions long after others of his species have left, or as long as he can find the least bit of open water. As long as a few are in a lake near by, the Arctic does not seem in the least deserted. I have no desire to speak further of the many kinds of ducks familiar to both zones and with which the sportsman comes in contact every shooting season at his own home.

[TO BE CONTINUED.]

A MISADVENTURE IN SOUTH AFRICA.

BY EDWARD MANNING.

A QUARTER of a century ago I found myself in Cape Town, South Africa. I was then a sailor, and making the abusive and cruel manner in which the commander treated his crew, I declined to continue longer in his ship. While waiting for a vessel that needed an officer I became acquainted with two Englishmen, by name Mr. Whitley and Mr. Baker. They had come to Africa solely for the purpose of hunting the large game which at that time was said to be found in one forty or fifty miles to the north and east of Cape Town. This was the country of the Bushmen, and as they were not of a particularly brave or warlike character, a party of hunters could generally get along without meeting with any serious obstructions from them. The danger of treachery from the Bushmen added zest to the sport, and if a thieving negro was shot now and then instead of a rhinoceros or a hyena, when there was no other game in Africa.

When I first made the acquaintance of Whitley and Baker they were preparing to start for a week's shoot, and they kindly invited me to join them. They also generously offered to supply me with a large calibre rifle, ammunition, knife, and everything else which I should require for such a journey. This liberality I did not attribute to an excessive fondness for my company. On the contrary I had the pleasure to see that another white man added strength to the Anglo-Saxon element, which was a very important item when it is considered that our attendants were all black men, who had been picked up while looting about Cape Town. The savage instincts of the race had not been so thoroughly eliminated by their frequent contact with the white men as to make them altogether honest and trustworthy, and it was necessary that this fact should be borne in mind. The food supplies consisted largely of hard bread prepared in the manner of the natives, and to supply the party with fresh meat, I should neglect to say that my English friends were careful to see that the hind part of the provisions was not overlooked, and as this consisted of a generous quantity of old English ale in bottles, I thought their forethought very commendable.

The provisions, a shelter tent, three rifles, two shotguns, and the ammunition embraced about all we cared to be encumbered with. To the negroes we assigned the duty of hunting out supplies. This was very well so far as the ammunition and shelter tent were concerned, but we found before long that a great mistake had been made in committing to their care the food and liquid supplies.

The arrangements being completed, we started off one fine morning, and after trudging through a mountainous country for five hours, we selected a cool and shady spot, where we prepared to partake of some refreshment and to rest for an hour. While munching we heard some very suddenly made aware of the presence of one of those slimy and poisonous serpents which inhabit this part of the earth, by observing the excited manner and wild gesticulations of one of the negroes. Looking up I saw the basilisk eyes of a snake glaring at me, and as it was not more than fifteen feet away, and ready to spring, I was in a position of great danger. But the man who was a few rods to my left, seized his gun and shot the snake dead. Fortunately for me he had carried

his gun, expecting to shoot some birds before we uncovered the large game. The probability of this cool and shady place being the favorite resort of poisonous snakes was not pleasant to contemplate, and the proposal to move without further delay met the hearty approval of the party.

We pursued our journey until nearly seven o'clock that night. The creeping vines and rank vegetation made the walking difficult and fatiguing, and had Whitley or Baker suggested the advisability of camping long before this hour, I should have been very glad to have done so, but we were anxious to reach the borders of a small river or creek, where they expected to find the hippopotami and rhinoceros in the jungle which extended along its margin.

The lazy negroes were now becoming restive, and I believe they would have refused to continue longer with us had not Whitley threatened to shoot them if they dropped our stores. This was not a Christian-like way of persuading men to do one's bidding, but it must be remembered that our men were savages, and I do not know of anything a savage can understand is force. This was the opinion of Whitley and Baker, and as their experience in such matters was much greater than mine, I suppose they must have been the most competent judges.

When at last the order was given to spread the tent, we had gotten within eight or nine hundred yards of the river. We were on the verge of the forest, and the jungle was within one hundred yards of the spot. Supper was prepared, and ample fuel was done to not over luxuriant fare. We had expected to shoot an antelope during the day, but none had been seen. An antelope steak would have materially improved our larder and been appreciated by the party.

After the negroes had eaten their supper we set them to work gathering fuel for the fires we intended to build around the camp, and when night set in the torch was applied and we worked our way into the forest, and were glad to keep off the prowling hyenas and other wild animals during the darkness. As we could not trust the negroes to keep the fires burning without being watched, we divided the night into watches, and Whitley agreed to stand the first, Baker the second, and I the last watch.

Wrapping a blanket around my body I lay on the ground inside the tent and was soon asleep. I had been asleep four or five hours when I was aroused by a series of prolonged howls and snarls, and I started up, and when I had jumped up, and seizing my rifle, rushed out of the tent. The fires were burning low, and some were quite out. Whitley and Baker were standing close together holding their rifles cocked, and when I saw them in this fighting attitude I cocked my rifle and joined them. The cause for the alarm was soon explained. The negroes had stolen our stores, and they had gorged themselves with the food and drunk so much ale that they were ready to burst. They were crazy drunk, and while their stomachs were so distended they could not stand, they could still use their tongues, and this they did so well that the forest fairly resounded with their cries. Four or five hyenas were prowling around the camp, and when the dogs attacked them two of the dogs were killed and one was badly wounded. The injured dog was moaning pitifully, while the unhurt one was yelling with all his might. We could hear the crunching of bones just as they were being devoured, and when I was learned later that one of the negroes more drunk than the others had fallen in a stupor outside the fires, the horrible thought became a certainty, and we knew the hyenas were holding their ghoulish feast over his body.

"Hist!" said Baker. "Don't you see those glittering eyes yonder under those bushes? pointing with his hand toward a clump of bushes not over thirty yards away.

Whitley and the direction pointed out, and we saw the gleaming eyes of some animal.

"That's no hyena," said Whitley. "Stand close together, and take the best aim you can, and when I give the word let's fire together. For God's sake be quick or he'll charge us!"

In the presence of such imminent danger our nerves became as firm as steel, and in less time than it takes me to tell you, we had drawn our rifles together. Hardly had the word "now," we fired at the glittering eyes. The report died away when a fierce growl, followed by the fall of a body within twenty feet of where we were standing, made us spring aside. The animal gave several fierce growls and struck out mightily with its paws, scattering one of our fires to the four winds of heaven, and then it rolled over and remained quiet. We loaded our rifles, and cautiously advancing we fired three more shots into the animal's head. As the bullets crashed through the forest, a tremor of the body could be seen, and we were now convinced that it was dead.

On examination it proved to be a large male lion, and after this was known we mentally thanked God for our deliverance. Of all the beasts of the forest we dreaded to encounter, the lion was the one which we feared the most, and it was understood among us when we left Cape Town that should one cross our path a shot should not be fired unless it was imperative to do so to save our own lives.

"Fix the fires at once," cried Whitley when he saw the carcass of the lion. A large quantity of brush had been piled up in the camp before night set in, and from this the fires were fed, and soon they were burning brightly.

The probability that more lions might be prowling around the camp effectually destroyed our inclination to sleep any more that night, and we agreed to remain on guard until daylight.

The sharp report from the rifles, followed by the growls of the lion, seemed to arouse the drunken negroes to a sense of their danger, and they staggered to the center of the camp and huddled close together, perfectly submissive now, and as docile as kittens. Whitley expressed the greatest contempt for them, and had it not been for Baker, I verily believe he would have driven them beyond the fires to take their chances with the lions. Some time later Whitley explained that he fell asleep during the latter part of his watch, and the negroes had taken advantage of this to steal our supplies and get drunk. He knew it was a bad thing to do, but he was so overcome by the bodily exertions of the day that he could not help it.

The fact that lions and other savage beasts were prowling around, only waiting for a favorable opportunity to make a dash at us, kept our nerves strung up to the highest tension, and when at last daylight appeared, and if a mighty load had been lifted from our minds. The negroes had nearly demolished our stores, for what they could not eat they had scattered over the ground in the most wasteful manner. We gathered enough bread and cheese to last for a day or two. Baker found some coffee, but for awhile we thought we should have to go without it,

as the coffee-pot could not be found. Knowing that the negroes could not eat it, we made a close search, and finally found it under some bushes twenty feet beyond the camp. It smelled powerfully of stale ale, and this was convincing proof that the negroes had used it to drink out of, and when they were well "set up" they had tossed it away. The bold manner in which they had acted convinced us that we had picked up about as bad a lot of black thieves as could be found in Cape Town, and it was decided to drive them out of the camp as soon as they could stand. It was impossible to continue out a week, and it was agreed that we should hunt that day and return to Cape Town the following day. The wounded dog was beyond the hope of recovery, and we shot him to put him out of agony.

Whitley took the coffee-pot and started toward the river to get some water, and after an absence of ten or fifteen minutes he returned with it filled. He said he had seen a full-grown hippopotamus just emerging from the water not more than one hundred yards from where he was standing, and not wishing to alarm it he had filled his coffee-pot and made his way back very quietly.

Whitley was a true hunter, and I could see how intensely pleased he was at the chance of getting a shot at the hippopotamus. Our bad luck and misfortune of the night had temporarily flown from his mind, and while waiting for the coffee to boil his impatience to be off to the river was manifested by several vigorous expressions, and the coffee-pot was banged about more than once. At last the coffee was ready, and after making a hearty breakfast we gathered up the few remaining supplies and the tent, and hid them under some bushes, piling a lot of brush on top to make them as safe as possible. As we apprehended no immediate use for the two shotguns, they were hidden in another place, and more carefully, as we did not care to have the negroes find them after we left the camp.

We now took the ramrods from our rifles (this was before the era of the breech-loading) and applied them to the carcasses of the negroes, and so vigorously and heartily was this done that it proved the very best medicine we could administer to the half-drunken brutes. They were soon dancing about, and after Whitley had explained to them that their company could be immediately dispensed with, they realized that their fun was over, and slowly slunk away in the forest. The only dog left belonged to the negroes, and he followed them despite of what we could do to coax him to remain with us. This dog, I regret to say, for we could have used him to advantage in the jungle.

After reaching the banks of the river we made an effort to walk along its margin, but the soft mud was so yielding we had to abandon the attempt. We now forced our way into the jungle, and after an hour's laborious work we struck a rift leading from the river in the direction of the forest. It was apparent that it had been caused by the fall of many large animals, and Whitley thought it was their path to the water. As we approached the water we saw a large hippopotamus coming out of it. His body was well out of the water, and offered a good mark for our rifles. We had come upon him so suddenly that he was not aware of our presence, and before he had time to discover us, Whitley and Baker gave him a shot from their rifles. He belched and tried to back into deep water, but it was evident that he had been hit hard, for he soon after rolled over and after a few minutes he was dead. As the water was not very deep where he fell, we had a good view of his body, and we found him to be a large specimen of his kind. If our negroes had been with us they could have had a royal feast off his carcass, for it was certainly large enough to supply even their wants, gluttons that they were.

While viewing the dead hippopotamus we were startled by hearing several loud and savage yells, which were followed by the barking of a dog.

"What's up?" cried Baker. "It sounds like the yells of a party of black devils. Let's investigate," and moving toward the border of the jungle which faced the forest, we saw a large party of Bushmen, who were shouting and pointing with their assegais toward the place where we were standing.

"Our thievish niggers have joined them," said Whitley, and they started to attack us. "Stand up! make a dash for the forest and fight them from behind the trees!"

"We can't do it," replied Baker. "They will overtake us before we reach it. We had better lie low here and give them a few shots before we make the effort."

The Bushmen ran huddled together, and advanced toward the jungle, and as they came on we heard the yelping of a dog some distance ahead of them. The cur seemed to have scented our whereabouts, and as the Bushmen followed us, it was evident that in a few minutes they would be upon us.

In silence we awaited the onward rush of the savage negroes until they had gotten within one hundred yards of us, and then, picking out three of the leaders, we raised our rifles and fired. Every shot took effect, and the three negroes dropped to the earth. This brought the party to a sudden halt, and we improved the time by loading our rifles. The respite, however, was of short duration, and they were about us within a few minutes, and they were now on us, and a fierce rhinoceros charged right into their midst, trampling one of the negroes on his horn and knocking down and trampling on all whom he encountered in his fearful charge. The monster's charge was so sudden and unexpected that it demoralized the negroes, and they scattered and ran in all directions.

The appearance on the scene of such an ally astonished us, and in a few seconds we were quite dazed by the event. But we soon recovered our senses, and we were given the chance offered by the panic among the negroes, we ran for the forest, and in a very short time we reached its sheltering fold and were hidden from the view of our enemies. We continued on a "dog trot" through the forest until quite exhausted. As the shouts from our foes had long since died away, we moderated our pace and proceeded more cautiously. Whitley had a small pocket compass, and we looked to him to extricate us from the wilderness and guide us to Cape Town.

As night approached and the shadows were cast over the forest, I imagined that I saw spectral forms flitting before me. Hungry, with no chance of getting anything to eat; weary and footsore, with no safe place to rest, we felt truly miserable. How should we pass the night? In a tree, was the only solution to the query, and we looked around to find a tree which we could use for a perch. There was a large enough to protect us from the attacks of snakes, and

Deliverance from this woful predicament was near at hand, for while we were in the act of ascending a tree which Baker had hit upon for a "roosting place," the barking of dogs was heard some distance on our right, and soon

after we heard the cracking of twigs and a creaking sound which we could attribute to but one cause—namely, an excitement much in need of a lubricant. The party (for such it proved to be) soon after came to a halt, and through the oppressive stillness of the forest we heard orders given in a language that sounded as sweet to us then as the most heavenly music, and soon the cheerful blaze of a fire illuminated the forest.

"We now cautiously approached the camp of the strangers, and when the dogs began barking Whitley cried out in a loud voice, "We are Englishmen in distress."

"The dogs were beaten back and we heard a voice calling us "to come into camp." This we were not slow in doing, and we found the strangers to be a strong party of hunters returning to Cape Town after a month's shooting. They were thoroughly equipped with arms and supplies, and had a pair of oxen to haul the cart containing them. The party consisted of four Englishmen and two trusted Caffre servants, and when I asked one of the Englishmen if he did not fear an attack from the Bushmen who treated us so fearfully he laughed, and said "he thought they wouldn't bother us. If they did a volley from the rifles of his Caffres would scatter them."

We ate a hearty supper, after which our friends supplied us with a blanket, and we were completely exhausted. We were excused from making a very lengthy recital of our adventures that night.

Nothing occurred during the night to disturb our rest, and very early in the morning we ate our breakfast, after which the party resumed the march to Cape Town, where we arrived, without further misfortunes, late the same night.

The last time I saw Whitley and Baker they were getting ready a strong party of friendly Caffres "to have that shoot out anyhow." They swore they should get even with the Bushmen, and when this remark was made I saw by the wicked look in their eyes they meant business.

TWO AFTERNOONS.

SAM and I had been hunting quail all day, and late in the afternoon, as we were working over toward Ellis Hollow, I suggested that we take a run through the olders down in the Hollow and get a few grouse before dark. "Sam," said I, "do you remember how even our bags have always been when we have hunted over here? We have usually killed about the same number of birds each, even if you are the best shot; but this time I'm going to try to get only one response was a simple grin, which spoke volumes to me, as more skepticism was crowded into that one contraction of the vocal chords than could have been expressed by any combination of words.

Ellis Hollow was a ganey little valley, through which a small stream runs. A strip of alders a few rods wide shades the richest of boring ground, for woodcock, and on either side are knolls of beech and oak woods in which ruffed grouse are always to be flushed, the birds usually being found along the stream late in the afternoon. Here and there are open places grown full of cat-tail rushes, and along the tumbledown, lichen-covered fences the dogs sometimes get into a chronic condition of pointing, with few intermissions, for an hour or so at a time.

Sam and I renewed their noses up to their widest gauge as we approached the alders, for they had been before and knew what was to be expected. A little more cautious step, a little more pausing with heads high in air, and a more careful eye to each other's movements marked their actions. Just as we passed through a clump of hemlocks old Belle's legs commenced to grow stiff, and the youngest Grouse was soon in the same condition. At that instant, with a sudden rattle, a grouse dashed from under a log and flew straight for Sam's head, and the latter, turning quickly around, coolly wound his gun up in a festoon of grapevines, vainly trying to pull over that part of the woods to which the grapevines were attached, as the bird made his way across an open place in plain sight. Another grouse sprang out of a hemlock and disappeared quickly, leaving only a little wave of branches to mark the place, and an old cock bird ran clucking a circle of a patch of briars, and then, with crest raised and tail spread widely, and started a circle of rustling leaves in his wake as he, mounted on wing. The Parker was on him in an instant, and he turned over and over in the air, leaving a stream of feathers floating back on the breeze as he bounded in among the wintergreens.

"Tell you what it is, Sam," said I, "this was a pretty fine thing. You can see your bird will be better before your eyes, and can fairly see the shot hit him." "Yes," said Sam, "that's a fact; but my bird didn't happen to wilt, and, besides, I ran a stick so far into my eye that it poked my hat off from the back of my head." "That's a poor excuse, old boy," I answered, "and you want to get another excuse ready for the next bird, and hurry up with it, too." Old Belle fetched the helpless bird proudly, with her short tail wagging and ears up, while Grouse stood trying to poke a feather off from the end of his nose with his paw, and then we started into the alders in earnest, but worked clear across them without finding anything except a rabbit or two. Both dogs again made game at the edge of a beech knoll, and the bird flushed wild. Sam failed to stop him, and as he came hurrying past me at forty yards distance I pulled up. One leg fell dangling in the air, but the grouse still kept on flying like an arrow, and went way up in the swamp. We started after him, but he had not alighted at the place where we marked him down, and the dogs finally had to give it up. It gives one a very disagreeable feeling to wound a bird and then not be able to find the poor thing and put it out of its misery; but this bird did not want to be put out of his, and we left it to his choice. We went on through the alders again, and we found a lot of borings where a late woodcock had stopped over night, but the bird could not be found, and the dogs started off on a new trail, with a grouse sort of behavior, trailing toward an old fence where we usually started a grouse. Sam kept near the dogs, while I went to one side, hoping to get a more open shot.

Suddenly Sam called out, and both dogs were steady on a point, and at the sound of his voice a bird rose, and I immediately following the report of his gun, I then saw another grouse sprang out from almost under my feet, and by the time that he was far enough away to shoot at, the alders again hid him from sight. A quick double snap shot failed to stop him, and he went a long way up on the side hill and over the fence into the woods. "I suppose that you are wondering how I got that bird," said Sam, "but if you'll look ahead there you will see that he was about six rods of solid alders, and the under will be

cleared up well enough to plant potatoes on in the spring." "That's all right, Sam," said I, "but I usually use the right barrel to clear up the brush, and the left one for killing the bird after I have got him shucked, and that was certainly hard hit." Sam was very skeptical, but I started up to cross the lot to the place where the grouse had entered the woods and there found him lying on his back as dead as a stone, and nicely laid out on a wide bed of green moss. I picked the handsome fellow up, smoothed his feathers, tucked his wings close to his side, and then slid him down head first into a hole in the ground, just where he fell with a thump against the one already there and the quail. How nice it feels to shake the edge of your coat a little and settle a heavy bird down in the corner where he will fit. And how your dog's eyes do sparkle as he watches the bird sliding out of sight and knows that it is safe.

Turning back toward the alders again I heard a quack double snap below me, but no following "w-h-o-o-p" from Sam, and two grouse hurrying off over the tops of the trees told the story.

Both dogs commenced working together again along an old cart path, and slowly and cautiously followed up the bird for several rods, finally coming to a point in a narrow strip of alders. Old Belle was crouching low, with nose raised as if he was still as a poker, while Grouse stood square alongside of him, with his nose down, and more than his anticipations that he had forgotten all that he had seen, and one hind leg raised in a most awkward attitude, but one which meant business nevertheless. Sam stepped over on one side of the alders and I stayed on the side with the dogs and very near to them. For a moment we watched them admiringly and then, with a sudden rush, out went the bird, dragging up his legs as he jumped and raising his crest as he thrashed his wings. He ran a rod away from me, and flew out across the open. How the black bars on his sides and the spots on his back did look as I fixed my eyes upon him and snatched still he was four or five rods away. The gun came to my shoulder, fitting as neatly as a glove, and I coolly pulled the trigger. The lusty bird halted in his swift course, and dropping his head and raising his wings put his head down, and then, knocking the dry leaves from his bill, swung his head and stood with the branches swish as he tumbled crookedly through, and lay bending a tattoo on the ground with his wings, leaving a few prettily marked feathers hanging in the branches of the maple, while two or three others floated down with the gyrating leaves. Belle fetched the bird eagerly, and after smoothing out his feathers and feeling of his plump breast I slipped him into the pocket on the other side of the coat for ballast.

By this time we were almost at the upper end of the alders, and the dogs were making game near the edge of the brook. There in a patch of soft ground on the bank were several groups of small round holes bored into the rich mud, with here and there a patch of white about the size of a half dollar. We expected every instant to hear the familiar twitter of the long-billed, brown-eyed, black feathered bird, that had left his mark, but we could not have the pleasure of seeing him top the alders and fall lifeless back, for he had evidently only tarried there awhile the evening before on his journey South.

It was fast growing dark, and we started for the road, stopping at a farmhouse long enough to get a couple of glasses of sparkling elder and to light our pipes, preparatory to our long walk home in the dark.

The next day was devoted entirely to grouse in a favorite hunting ground of ours, and we killed as usual enough to make us thank our fortunes that we were hunters. I remember one remark which Sam made on that day. We had flushed a magnificent cock bird twice without getting him, and then cornered him under a fallen tree-top. Sam mounted the tree-top, and as the grouse dashed out with a startling whirr-r, sent him head over heels into the bushes; and when the bird was fetched, Sam held the splendid bird out at arm's length, and gazed at him fondly for a moment; then, taking a deep breath, exultingly said: "Look at that bird! Just look at him! Who cares for titles! Who cares for millions! They are all vanities! Shallow! when a bird of that growth will in our woods! How many times since in a morning have I seen a hundred grouse on the Indian summer light under the overhanging branches of the great forest trees in an inspired attitude, repeating that sentiment.

Shall I ask pardon for this digression? Well, we will go on to the following afternoon. Sam and I had again been hunting quail, and had gradually worked over into the vicinity of Ellis Hollow again. Grouse getting rather late in the day, and Sam suggested that we get a few birds to take a run through the alders, and give him a chance to get even with me on the previous score made there. I willingly consented, and we started in enthusiastically, but hunted over one favorite bit of ground after another without raising anything except a couple of rabbits, which Grouse watched wistfully with one eye, as he kept the other on my wily pocker. When we had almost finished the trial of alders, and were wondering what had become of the birds, we suddenly noticed that the dogs were quiet, and just then a grouse jumped out and was handsomely tumbled over by Sam. The dogs instantly began following another trail, and followed it clear to the last bunch of alders, and as I turned to look for Sam a grouse flashed close to me and made off in safety, my charge of shot being stowed away in the trunk of a tree about four feet from me. That was provoking certainly, for it did not seem possible that that grouse could get away in such an open place, but the fact remained that he had gone, and we marked him down closely. Although the day was fast closing, we decided to go back after the bird, and before we had gotten half way to him I walked "right on top" of a pair of grouse that had probably just come down to the alders. As they tumbled away from me, I saw a forked branch, one foot each, but a forked branch held my gun barrel about a foot under the first one, and something else from the bird's lucky star prevented me from getting bearings on bird No. 2, so that they escaped in the style.

My chagrin was rendered more poignant at seeing a grouse arise at a long distance from Sam and fall circling back to me, and I saw as though Grouse and Belle glamed reproachfully at me as the bird was brought in. Sam, I firmly decided to kill the grouse which we had marked down anyway, and as both dogs pointed staunchly at his hiding place it seemed that the bird must come my way. He didn't do anything of the sort, however, but acted just as grouse have acted before, by getting behind the fence, and keeping behind it until out of range. Another bird just pulled up a short distance from Sam, and another started the feathers but did not kill the bird, which

followed the first one, and we watched both as they climbed up the side hill, and on bent wings went sailing into the woods. In a moment we were upon them again, and the dogs had hardly commenced to work before they pointed. Sam flushed a grouse and down past me at full speed it fell dead before my very nose just as my trigger was on the point of being pulled. The other bird then started from behind Sam, and as it made straight for the tops of the trees, Sam pulled and reversed the bird's lever so that it came quickly backing down again. The grouse on striking commenced fluttering and bounding at a great rate and went bounding down the side side hill. This was too much for the nerves of young Grouse, in spite of his knowledge of the rules of propriety, he rushed in and made a grab for the bird, stumbling as he did so, and rolling over and over alongside of the fluttering bird, his feet in the air and his neck stretched to its fullest extent, reaching for the grouse amid a shower of dry leaves which were being kicked into the air. The spectacle was so amusing that it was hard to punish the eager youngster afterward, but it was necessary to punish him just a little to remind him that there were certain limits to his usefulness.

Sam now had four grouse and I had none, and it was already dusk. We had hardly re-entered the alders, however, before both dogs came to a point near an old fence, where the brush was so thick that I could barely see them.

As they stalked forward I flushed the bird, and, catching a faint glimpse of him, I fired a snap shot. A whop from Sam was enough to show that the grouse was down, but I rather doubted the fact until the thumping of his wings on the ground pushed the fact into my willing sensorium. Sam could see the whole performance from where he stood and swore that my shot did not kill the grouse. He explained by saying that he believed the bird to have been so mortified by the absence of the man who possessed check enough to try a snap shot like that, that he flew against the top rail of the fence and deliberately committed suicide. Sam accounted for the shot marks by saying that it was a bird which he had fired half a dozen charges into during the autumn. "Now, see here, Sam," said I, "you know perfectly well that that was a better shot than you ever made. All of your birds this afternoon gave you such easy work that I fired a snap shot, and myself with a hope that I had been standing in your shoes. I'd rather have a bird in my pocket than a dozen of yours, but anyway we will hunt for grouse all day to-morrow and try and get our records smooth again. I'll acknowledge that you are even with me on the score we made here day before yesterday, but don't think that it was quite fair in you to try and get ahead."

That evening, after we had reached home and had disposed of an enormous quantity of slip-jacks, stewed grouse, milk and pumpkin pie, Sam set a big pitcher of cold cider on the table and we tipped our chairs back on two legs against the wall, lighted our pipes and told yarns till bedtime with two or three of the boys who had dropped in as usual after supper.

AROUND THE COAST OF FLORIDA.

BY DR. J. A. HENSHALL.

Fifth Paper.

WE left Miami at eleven o'clock in the forenoon with a light easterly wind. H. E. Gwynn, Mayor of Key West, having concluded his business at Miami, accompanied me, but not leaving for several days, in fact had not yet arrived from Key West, we offered him a passage, as we intended going direct to that city. We greatly enjoyed his genial society on the trip, for being well informed, and a close observer, he possessed an abundant stock of information of that section of the country.

As we sailed out of Miami River a group of small boats in the bay from the ocean were plainly visible toward the southeast, the most northerly being Virginia Key, then Key Biscayne, Soldier Key and Ragged Keys. The south point of Key Biscayne is Cape Florida, upon which stands the Lighthouse tower, now abandoned as a light station. Eastward of Soldier Key, and five and a half miles S. E. 3/8 S. from Cape Florida, is Foley Key's Lighthouse, on the northern extremity of the Florida reefs. It is an iron framework, with the lantern one hundred and ten feet above the sea, showing a fixed white light, visible in clear weather some sixteen miles. This light is situated at the northern entrance to Hawk Channel, leading between the line of Florida Keys and the outlying reefs, along the Florida Straits to Key West. The channel is from three to five miles wide and is from one hundred and forty miles from Virginia Key to Key West.

Biscayne Bay is broadest almost of Ragged Keys, and about here begin the Feather-bed Shoals, a series of parallel and shoals stretching across the bay. They are easily discernible, showing quite white at a distance, and by following the shoal in either direction an opening will soon be found. Below Ragged Keys is a long one called Elliott's Key, we sailed out of Miami River a group of small boats stretch across Biscayne Bay, separating it from Card's Sound. Small boats may proceed through Card's and Barne's sounds, and then keep under the lee of the line of keys to Key West; but it requires some previous knowledge or the employment of a competent pilot, to avoid the many mud flats, shoals and reefs of this route, for the water is shallow. Beyond Key West is a delightful but not a safe anchorage, which I hope some day to make. Owing to the many keys, mangrove islands and shoals, with the mainland to the north and the Florida Keys to the southward, the water is always comparatively smooth. There is an abundance of shore and wading birds, an endless variety of fishes, oysters, turtles, etc., while on the Indian hunting grounds on the mainland there is plenty of large game, indeed, with a few caribous or moose, a few deer, and Florida panthers, and a few bears in a small canoe, capable of being sailed and paddled, and it is surprising to me that some of our enthusiastic and venturesome canoeists do not attempt it.

Sailing down Biscayne Bay we took a number of tarpon, groupers, eavalle and barracudas on the trolling lines, and saw numerous loggerhead and green turtles. At the south end of Elliott's Key is a passage to the sea called Cesar's Creek, winding between the Key and some smaller ones. We followed Cesar's Creek to the main channel inside the Florida reefs, before mentioned, where we anchored at sundown, some thirty-five miles from Miami. The next morning broke clear and fine with a fresh E. N. E. breeze, and leaving the mouth of Cesar's Creek we went dashing along, leaving Old Rhodes Key to the starboard. We next came to the mouth of the Key, and saw a number of white birds we caught the last glimpse of the mainland that we would

have until we sighted Cape Sable, after leaving Key West. Jack, catching the inspiration of the theme, mounted the cabin roof, waved his hand toward the distant peninsula, seen through the fast-closing gap between the keys, and dramatically declaimed:

"Adieu, adieu! my native shore
Fades o'er the waters blue."

"Ta, ta! Jack," said Squire, "I'll see you later; 's'mother evening."
But Jack was not to be smothered in any such manner, and continued;

"O'er the waters of the dark blue sea,
Our thoughts as boundless and our souls as free,
Far as the breeze can bear, the billows foam,
Survey our empire, and behold our home."

"If you want any surveying done, call on Mr. Gwynn, here; he is county surveyor of Monroe county, as well as Mayor of Key West, and has jurisdiction all along these keys."

The wind continued to freshen, bringing in a long-rolling sea between the outlying reefs, which caused Jack to seek the cabin and his bunk; so we had no more poetry that day.

We were now opposite Caystrot Reef Lighthouse, which is twenty-three miles S. by W. from Fowey Rocks Light. It shows a bright flash every half minute, visible some seventy miles. Key Largo, is some twenty miles long, and is the largest of the keys, and has the largest pine-apple plantations, the largest being those of Mr. Baker. These keys are, most of them, thickly wooded with a variety of hard timber, buttonwood, crabwood, bay, palmetto, etc., with a fringe of mangroves. Several vessels were in sight, in the channel and outside the reefs. Those moored up were heading northward under reefed canvas, but the Rambler, with the wind abaft the beam, had just enough for her cruising rig, and went bowing along with every third drawing in the spinnaker breeze. We were in succession, leaving them all to starboard, Rodriguez and Taverier keys—both small ones—and Plantation, Vermont, Upper and Lower Mattacomb and Umbrella keys. Indian Key, a small, but high and prominent one, came next, where there is good anchorage and a number of large cisterns, where water can be purchased by passing vessels. Southwest of Indian Key is Alligator Reef Lighthouse, thirty-one miles S. W. ± S. from Caystrot Reef Light. It is an iron frame pyramid, showing a scintillating light flashing every five seconds, every six flash being red. These lighthouses, built on submerged reefs by iron screw piles, are completely isolated, their keepers being shut off from all communication with the keys except by boats, a few very secluded and semi-hermit life, while exposed to the fury of fierce gales and the fashing of the angry seas.

The Florida keys are now nearly all inhabited, and new buildings are being erected on many of them, owing to the "cocoon boom." These keys were all being taken up, pre-empted, leased or bought, principally by Key West parties, and set out to cocooned trees. As these trees will grow wherever there is soil enough on these rocky keys, and require little or no care after being planted, and as each tree is said to pay at least a dollar and a half per annum after six years old, it will be seen that a few thousand trees will yield a handsome income in a few years. If all accounts are true. On some of the keys are coconuts, palm trees, now full grown and in bearing, and whether they pay or not financially, they certainly add very much to the beauty and tropical appearance of the islands, and viewed in this light the "cocoon fever" will prove of lasting benefit to this location.

At Long Key we left the main channel and went inside the line of keys to Channel Key, where we anchored at five o'clock, under the lee of the Key. The route usually taken, it being somewhat shorter, is to go "inside" or on the northerly side of the keys from Long Key to Bahia Honda, from whence the main channel is again followed to Key West. The choice of routes is, however, usually determined by the direction of the wind and the state of the sea. With a northerly or westerly wind, the main channel is the smoothest, being then under the lee of the keys, while with an easterly or southerly wind, the other route is taken for a similar reason. The next morning we set sail at seven o'clock, the wind blowing harder than on the day before, and from the same direction, or a few points nearer east. We passed Grassy, Bamboo, Vaccas, Knight and other keys in quick succession, leaving them to port, and with the strong breeze and smooth water, under the lee, we made ten miles an hour from Channel Key to Bahia Honda. Coming outside the reef, we found a heavy sea running, catching us on the port quarter, but the Rambler, very high in the water, and being under full sail, skimmed the rollers like a sea gull. We did not ship a sea on the whole voyage. The fishing snooks, turtles and spongers were all lying at anchor under the lee of various keys, waiting for better weather.

In plain sight was Sombrero Key Lighthouse, thirty miles S. W. by W. ± W. from Alligator Reef Light. This is a conspicuous open frame iron work tower, one hundred and fifty feet high, showing a red light, visible in light breeze, and being under full sail, skimmed the rollers like a sea gull. We did not ship a sea on the whole voyage. The fishing snooks, turtles and spongers were all lying at anchor under the lee of various keys, waiting for better weather.

Key West, a thriving and prosperous city of some fifteen thousand inhabitants, is situated on the western portion of the island, the latter being five miles in length and about a mile wide. From its position as the "Key to the Gulf," with a deep and spacious harbor, and as a naval depot and coaling station it is a place of great commercial and maritime importance, and has a number of fine residences, buildings, and churches, several of which are of great value. The Russell House—a marine hospital, a custom house, and U. S. naval depot, is under a neat and commodious barracks

with well-kept grounds, though the troops are at present stationed at Tampa. There is also quite a large convent, surrounded by handsomely arranged grounds, just outside the city. The cemetery is tastefully laid out and charmingly adorned by tropical trees, shrubbery and flowering plants. The city is defended by several forts, the largest being Ft. Taylor, a brick and stone fortress mounting some two hundred guns. Steamers for Havana, Mexico, New Orleans, New York, Galveston and the Gulf coast touch here almost daily, beside a great number of sailing vessels. It is but sixty miles to Havana, and some four or five days by steamers to New York.

Key West is a quaint and charming city, full of oddities and incongruities, a veritable town of eccentric "patch-work" wherein each edifice forms a piece. Buildings of all sizes and of every conceivable style, or no style, of architecture, are promiscuously jumbled together, but are joined or seemed to each other by a wealth and profusion of tropical foliage, which surrounds, invests, surmounts and overshadows them, softening the asperities, toning down the harsh outlines, and uniting the separate pieces, which merge their individuality in a harmonious *tout ensemble*.

The modern stilt and bushy Gothic church glazes superciliously through its clasp, and catches the window, as through an eye-glass, at the weathered eaves, but stout and solid old Spanish chapel, which looks up dreamily and good-naturedly at its prin rival, while the cocoa palm stretches its long arms over it protectingly, the date palm caresses it with slender, green fingers, and the almond tree looks on with conscious pride. The stilted, upstart frame residence, with scroll work hanging from large-board and eaves, like cheap cotton lace ostentatiously displayed by a vulgarly-dressed woman, looks down lightly on its little neighbor—a rambling one-story cottage, of stone, with broad, projecting roof and cool verandas, almost hidden in a mass of vines, creepers and flowers, which cling to it in loving embrace. The iron-front store, with plate-glass windows, shoulders aside the dark and sombre Cuban café with its cages of singing birds and parrots hanging in the Pride of India trees, and its cool shadows embowered and emblazoned by the bloom and fragrance of the olanders.

And so, many a thing, in its own way, canopies, porches, lattice windows, oriel and dormer-gables, hoods and pavilions—pillars, columns and pilasters—are mingled in endless confusion, but harmonized by arabesques of fruit and foliage, festoons of vines and creepers, wreaths and traceries of climbing shrubs and trailing flowers, and shady bowers of palm and palmetto, almond and tamarind, lime and lemon, orange and banana.

And its population is as diverse as its structures. Americans, Englishmen, Frenchmen, Germans, Spaniards, Cubans, Bahamians, Italians and negroes make up its numbers, the majority being Cubans and Bahamians, or "Couchs," as the English natives of the Bahamas are called. There may be seen every shade of complexion, from white to yellow, brown and black, cosmopolitan all, though each class seems to live in its own particular quarter of the town—as "birds of a feather" mostly congregate in specialized groups—where, after a night's sleep, they enjoy themselves, each class after its own fashion, drinking, dancing and even drinking in its own language. Jack said he learned to drink beer in seven languages while there, which is a linguist accomplishment that few attain, and fewer enjoy.

But there is a large and popular dance house at the west end of town, which we "took in" for Skipper's benefit, where the harmonizing influences of the place are again exemplified, and where white, yellow, brown and black meet on a common level, dancing and even drinking in their own language, with "lyric" test" to the aspiring strains of a cracked violin and a piano which seems to possess a thousand wires and all loosely hung. And if the test of enjoyment is the energy displayed, they certainly enjoyed themselves to the top of their bent.

But we will take a long and upward step to a nobler and far more attractive scene, where the youth and beauty of the island city are assembled at the "Rink," a large and brilliantly lighted hall in the heart of the town. Here youths and maidens who had never seen a snowflake or an icicle, and who had never heard the merry jingle of a sleigh-bell; but all the same they were gliding along gracefully and smoothly on roller-skates, or dashing around the outer edges on the swift-whirling bicycle to the fascinating strains of the "Beautiful Blue Danube," while the mingled odors of the epee jessamine, the tobacco and the orange blossom were inhaled in the waltz and the quadrille. Oh, what a subtle and potent power in beauty, music and flowers! And they had their influence on Jack, who was deeply enamored of a little Cuban beauty; and no wonder, for she was perfectly brilliant and glorious in a wealth of jet-black hair, a clear olive complexion, pouting coral lips disclosing regular and pearly teeth wreathed by a perpetual smile, while her eyes were as black as midnight, with her soul looking up out of their mysterious depths, and her form was even more lovely than her face, and its loveliness was enhanced by her grace. Poor Jack! "Beauty draws us with a single hair," and here he was harnessed to each particular hair of the beauty's head, frizzes and all. We tried to convince him that it was the effect of the music or the fragrance of the flowers, and that he would get over it when he went out into the fresh air; but he answered;

"If music be the food of love, play on;
Give me excess of it, that, surfeiting,
The appetite may sicken and so die.
That strain again; it had a dying fall;
O, it came o'er my ear like the sweet south,
That breathes upon a bank of violets,
Stealing and giving odor."

Then Squire made the only quotation he was ever guilty of, though it did him credit, for it was from the "book of books,"

"Stay me with figs, comfort me with apples; for I am sick of love."

But he spoiled it all when he added: "But I think it will be better to rub his hands of unattractiveness with a soap stick!" The chief industries of Key West are the manufacture of cigars, sponging, fishing, turtle and wrecking. There are, perhaps, a hundred cigar factories, from the one-story hut, scarcely bigger than its sign, to the large, airy and extensive buildings, each giving employment to hundred of hands. The cigar makers are mostly Cuban refugees, and the tobacco is imported from Cuba, though for a time some Eastern dealers made a fortune in a large quantity of domestic tobacco, which they sold at a high and broad discredit on Key West cigars, so that the demand for a consider-

able extent; but, happily, the dishonest practice is discontinued, I believe, and only Cuban leaf is now used.

A large fleet of vessels are engaged in sponging, the crews being mostly "Couchs" and negroes. The sponges are taken in shallow waters, off the reefs and banks, where by means of the "sponge boats," a wooden pail with a glass bottom, the sponges are plainly seen attached to the rocky bottom, and to shells, when they are torn loose by a strong iron hook affixed to a long pole. Each vessel tows six or eight small boats or yawls, in which the men work. Some Eastern houses have sponge depots here; among others I noticed that of McKesson & Robbins of New York. The sponges are here washed, dried, bleached and assorted, and are of various grades and kinds.

Every morning may be seen many small fishing smacks, moored stern on along the fish wharf, with their wells filled with live pan fish, such as grunts, porpies, groupers, snappers, hogfish, yellow tails, spots, etc., which are killed and strung in bunches as fast as sold, selling for five or ten cents a bunch, and on account of their cheapness form the principal part of the diet of the working classes. These pan fish are some of them very beautiful, as well as excellent food fishes, and are caught in the channels near the city, but are taken principally with the sea-crawfish bait, for they are all caught with hook and line. The larger smacks bring in kingfish, otherwise known as cero, or black-spotted Spanish mackerel, a large and handsome fish weighing from five to fifteen pounds, almost equalling the real Spanish mackerel in flavor; they are usually taken by trolling off the keys. The fishermen are mostly "Couchs," who are by nature nearly amphibious, learning to fish, to bait, sponge and handle a boat almost as soon as they are able to walk, or at most, when old enough to walk pants. They are the descendants of the English settlers of the Bahama Islands, and have the cockney habit of changing the "w" to "v." Even a negro, born in the Bahamas, said to me one day:

"The weather ain't no good for fishin', an' the vater is too rough, and the vind too 'igh fur spongin'!"

A number of large smacks regularly supply the Havana market with kingfish and red snappers. By leaving Key West about sundown they are in Havana by daylight the next morning. Had we not been pressed for time, or been in Key West a few weeks earlier, I should have made the run in one of these smacks.

The fruit and vegetables and products brought to Key West from the mainland and keys are always disposed of at auctions, which are held every morning, and are attended by the citizens as regularly as Northern people go to market. The supply of the staples is small, onions and other commodities are scarce, for the average Key Wester is not happy without an auction.

We were shown every kindness, consideration and courtesy during our stay in Key West by Mr. and Mrs. Gwynn and their two charming daughters. These young ladies possessed all the advantages of a good and thorough education, being well versed in belles-lettres, music and painting, and were as refined and graceful as our Northern ladies, though they had never been away from their little island home, having been educated entirely at the convent of Key West.

A PLEA FOR RECREATION.

AFTER Herbert Spencer had been in this country a few weeks and had tested the pessimistic qualities of saddle-rocks at Dorlon's, the hills of fare at Delmonico's and the Brinswick, seen the famous trotters of Vanderbilt and Bonuer, and whizzed up and down a few times on the Elevated roads, he concluded that we were "going too fast to stand it" and must hold up, or mental and physical depreitude would ensue.

But seriously, what he said at the banquet given in his honor was as true as preaching; but who are the men who are breaking down in the face of the modern machine he describes? Not alone those who are apparently in pursuit of the almighty dollar, for all callings contribute their quota to swell the tide that goes down to premature graves. While it is indispensable to success that all the faculties of brain and body should be brought into requisition, it is just here that so many make the fatal mistake of their lives. No man can run his mental machine in one groove long at a time without firing. Exhaustion of the nervous system and disorder of the body is the certain result of an excessive whipping-up of the tired faculties, and finally prostration ensues. The trite saying that, "All work and no play makes dull boys" is so true that he who runs may read

I can recall a score of bright men, both business and professional, who within ten years have succumbed from simple exhaustion. For awhile apparently tireless, their powers suddenly failing and nought but a wreck was left. At fifty years of age they were indeed "dull boys," and all work and no play had done the business.

Various motives impel men to "dare and die." The heroes of a forlorn hope, the discoverer of a truth the world spurns, the zealot who abandons pruderee for principle, may perish on the field of battle, expire at the burning stake, or die by "pendulous strangulation;" yet there may be compensations for sacrifices like these; but the man who virtually commits suicide, who equally certain though slower, process of a profligate waste of the nervous fluid, is a well, he isn't smart.

The causes that lead to this undue work are not obscure. We inhabit a comparatively undeveloped country. The natural increase of population, augmented by an unprecedented immigration, forces every capable man to strenuous efforts as a producer. We have to compete with older nations for the markets of the world; they have so long monopolized in short, we have to do the work of two generations in one. We seem really unable to "go slow;" we are hustled and crowded forward, until the tax upon the nerves and endurance of the ordinary man is tremendous. It is wise to halt now and then and get our breath, and the ability to do this can be acquired when once the necessity for it is fully comprehended. The trouble is, we do not stop to consider that the daily and yearly wear and tear is killing us.

Very few people are naturally athletic, the majority die by violence, self-imposed, it is true, but violence nevertheless. The advice of Punch is in order; "Don't!"

Thousands owe Mr. W. H. H. Murray a debt of gratitude for the attractive setting out he gave the North Woods. But for those well-written drafts on his imagination, as well as a literal portrayal of facts, scores would now rest under the sod. To be alive and kicking (when the wind but in the north-east) is glorious if one feels good. To be able to say that one may have been a little better off on October, is a matter to be thankful for, so we thank the

promoters of the game laws. To be able to handle the swift canoe, the well-poised rifle and that artistic thing of beauty, the light fly-rod, we thank the constructive skill of our mechanics merely, but genuine artists, but for superabundant health, love of the wild woods, and all the beautiful things a trained eye perceives in nature's retired places, we thank our Maker.

Now I affirm, and "defy successful contradiction," as a local blower is wont to say, that "all the world and the rest of mankind in general," ought to be able to use a gun skillfully, and a fly-rod artistically. In that case, the gun works that "Nessmuk" says have "got to go," would have a chance to stay and pay dividends. And the rod makers and a host of that ilk would "smile a smole" all the year round, too, and grow fat and sleek, sport side-whiskers, part their hair in the middle and carry a cane.

I don't see for my part, why more of "yon fellers" don't take your wives to the woods with you. They enjoy trout and venison as well as you. You don't own one, ha? Well then, I would take time by the foretop, as the Californian is said to do: "My pet?" "You bet." And straightway proceed to the nearest minister who loves "to go a fishing," hand him a shining piece of the needful and be put in possession of the treasure who can cook your trout, make your coffee, and perpetrate your name.

Referring to Thoreau, I heard Dr. Collier say, a few evenings ago, that had he lived in these days he would have been honored with the appellation of "crank." "Pshaw!" says that would sound like "Henry D. Thoreau, crank." "Well, why not have "woods cranks" as well as any other cranks? To make a thing go well—just a little better than the other fellow—one must be something of a crank.

TENNIS,
RIVERTON, CONN., Feb. 9.

Natural History.

THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance, Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH

FAMILY SCOLOPACIDÆ: THE SNIPES, SANDPIPERS, ETC.

179. Woodcock—*Microptera americana* Aud.; *Philoctetes minor* Ridg., 525, Cs. 605.—Abundant; arrives in March and April. Breeds on the ground, lays four eggs (sometimes five) dull greenish white. Commonly remains until November (and in rare instances until December), whenever an abundance of food offers inducement. The young birds pass through a partial moult the first year. In Maine this moult usually occurs in September and early in October, and the moult of the adult birds occurs in August and early in September. The eggs are usually laid here in April and early in May.

A remarkable circumstance was that of a woodcock, picked up dead in Camden, Maine, February 23, 1882. For the record of this fact I am indebted to Mr. James Wight, of Rockland. Since the summer shooting of woodcock has been abolished in Maine these birds have much increased in numbers.

Formerly, when these birds were hunted by comparatively few persons in Maine, large numbers were to be found congregated in favor of the sportsmen, just previous to their departure in the autumn. Now, the same places are so persistently explored by very many sportsmen during the season as to prevent the assembling of many birds together in any one place; but the aggregate number of woodcock now killed in the State each year vastly exceeds that of former years. While the number of these birds annually killed here has been more than trebled increased, the number of persons pursuing them, and among whom those killed are divided, has been more than tenfold increased. For these reasons it is now rarely possible for a single person to kill so many in one season as formerly. During the season of courtship these birds may be observed at dusk mounting high in the air and circling about on whistling wings, pursuing one another, and performing various interesting movements in the air, or they may be seen strutting upon the ground, with upturned tails and drooping wings, much in the manner of a male turkey.

During the migrations all birds are accustomed to signal each other by calls, and the woodcock is not excepted from this habit. It utters a quaint cry, somewhat like *quack*, which is repeated while the bird is on the ground, as also when upon the wing. By this cry passing birds are called to tarry, or tarrying birds are called to join those which are journeying. Immediately after the moulting season, the woodcock begins to assemble at favorite feeding places, families coming together from their various breeding resorts, which are often in places not visited by sportsmen. The movements of the woodcock in autumn are quite similar to those of nearly all of our native birds which are migratory. During the period of moulting they are more secluded in their habits than at other times, are timorous as if realizing their weakness at that time, and will seek safety by running, or by rising upon wing as at other times. When in the midst of moulting these birds do not emit their ordinary scent, and the best dogs often fail to detect their presence, even when in very close proximity. The birds then resort to the warm, dry hillsides, but always near to suitable feeding grounds. During the daytime they usually remain secluded away from the haunts where they have been accustomed to seek their food, but as soon as the moulting process is so advanced as to render them strong of wing, again the woodcock will be found in the haunts where sportsmen are accustomed to look for them, if there be food for them. Sometimes their usual feeding places become dry early in the summer, and fail for a time to yield a supply of food. The birds then, from necessity, go elsewhere. But they will return to the same haunts later if the season is favorable.

The woodcock which breed east of Maine remain there in autumn as late as, and often later than those in Maine, but when birds start on their migration to the South long flights are made in a single night, so that only rarely do any of these more Eastern birds tarry in Maine en route. Occasionally a sudden change of weather, such as a snow fall, will stop the birds for a time, but only for a day, or at the first favorable weather occurs. The movements of the native birds from the many secluded nooks where they have been bred to the coverts where they are found congregating in the autumn, form the preparatory assembling

for migration. Such an assembling is common to birds of other species, the warblers, sparrows, swallows, crows, etc., and usually extends throughout a number of weeks. These movements for assembling are local, and governed not by any cause, but by the action of instinct, and occurs simultaneously over a large territory, the final departure of the woodcock varying but little throughout Maine.

Woodcock are both diurnal and nocturnal in their habits, feeding in dense coverts and secluded places during the day, and going into the open fields, pastures, plowed ground and meadows in the night. They are very active during the day, and at night, and often seek their food far from any growth of trees or bushes, especially just after a rainfall, which brings the earthworms in the fields to the surface of the ground.

180. Wilson's Snipe—*Scelopax wilsoni* Aud.; *Gallinago wilsoni* Ridg. 526a; *Gallinago wilsoni* Cs. 608.—Common. Arrives in April. Breeds on the ground, lays four eggs, brownish-yellow with blotches of light and dark brown, in May. Abundant only during the autumn migrations, which occur in September and October. But few breed in Maine as compared with the great numbers which breed further east. This is the common snipe, sometimes locally termed "English snipe."

181. Red-breasted Snipe—*Scelopax noveboracensis* Aud.; *Microptera grisea* Ridg. 527, Cs. 609.—Abundant along the coast during migrations. The spring migration occurs during the last two weeks of May, when the birds pass by on their northward journey in large flocks, after the manner of sandpipers. At this time they are fat and delicious for the table, but the flight is very brief and chiefly over the sea, so that it is only in favorable places, such as the marshes at Scarborough, and at some of the islands on their route, that many can be obtained. The males arrive the first week of May, and the females a day or two later, and all have passed by before the first week of June, and usually before the first day of that month. Early in July a few returning ones make their appearance from the far Northern breeding places. The first arriving from the North are generally adult males, which are followed by their relatives in straggling numbers, rarely in flocks of more than a few individuals, throughout July, August and September. These birds are locally termed "blue snips," and are not commonly known here except along the coast.

182. Long-legged Sandpiper—*Tringa hudsonius* Aud.; *Microptera hudsonius* Ridg. 528, Cs. 611.—Not common, but apparently a regular autumn migrant. No record of its appearance here in spring, and probably it is one of those species which chiefly follow the valleys of the Mississippi River and its tributaries during the northward migration in spring, but during the less hurried migration of autumn a portion of their numbers return along the Atlantic coast.

I append a record of specimens shot in Cumberland county, Maine, all in the Scarborough marshes, excepting one at Cape Elizabeth, and possibly the one recorded for 1870, as the locality is given for that specimen in notes quoted. 1849, three specimens; 1849, one; 1850, one; 1851, eight (possibly four of these were taken in two or three records quoted, and if so, the number for 1851 should be given as five); 1852, two, August 9; 1854, two; 1856, four; 1860, one, September 18; 186., one, September 21, one September 23; 1868, one, August 14; 1864, one, August 14, one, August 31; 1865, one, September 10; 1866, one, September 16; 1872, one, August 12.

During a period of twenty-eight years. Of course many others may have been shot in the same locality and not recognized nor recorded. My friend Nathan Clifford Brown has given me the record of the captures of several specimens. In 1875, July 19, at Chebeague Island, Casco Bay, and one August 14 at Cape Elizabeth; one August 24, 1877, at Scarborough; one September 16, 1878, at Scarborough; one July 25, 1879, at Scarborough. At Scarborough, in July, 1879, two were taken, and five more of these birds came to the decoys of Mr. J. W. Pillsbury, and all but two were shot. Afterward a single one was shot at the same locality of the marsh at Scarborough. One shot at Scarborough September 1, 1882.

183. Semipalmated Sandpiper—*Tringa semipalmata* Aud.; *Ereunetes pallidus* Ridg. 541; Cs. 612.—Abundant during spring and autumn migrations, especially along the coast. Arrives during the latter part of May and early in June. One of the "peeps," and locally known as "black-legged peep," also "winter peep" on account of its presence here in the autumn long after the disappearance of the next named species.

184. Least Sandpiper—*Tringa pusilla* Aud.; *Actodromus minutilla* Ridg. 538, Cs. 614.—Abundant during spring and autumn migrations, and frequent along the coast. Arrives in May, and arrives here in advance of the next preceding named species, in spring.

185. White-rumped Sandpiper—*Tringa schenki* Aud.; *Actodromus pusillifrons* Ridg. 536; *Actodromus leucoparvus* Cs. 617. Common in autumn along the coast. Regular autumnal migrant, yet the species is not abundant here. Not common in spring. The autumn migration extends far into the month of July to October. Messrs Harry Merrill and N. C. Eddy inform me that they procured several specimens near Bangor, October 23, 1881—a noteworthy occurrence as a record of the late date in the year, and the species is rarely found here far from the coast, although Bangor is on tidal water. I am indebted to my friend, Nathan Clifford Brown, for the sole record I have of other species taken at Bangor, in the State of Maine. On September 14, 1875, at Lake Umbagog in land in Maine. There were shot two, one on October 14, and one previous to that date. Mr. Brown has also given me the record of a specimen shot at Scarborough, May 30, 1881. The only other record I have of its occurrence here in spring is that of a single specimen, shot at Scarborough, May 29, 1882. Probably its spring migration is over the ocean, when passing Maine, in company with other shore birds, when passing Maine, and its spring migration is such a route, and are never seen on our shores at this season except in rare individual instances.

186. Baird's Sandpiper—*Actodromus bairdi* Ridg. 537; Cs. 615.—This sandpiper is a common Western "peep" and is accorded a rank as a species distinct from the white-rumped sandpiper, which it much resembles. But few specimens have been recorded as taken in Maine, and are recorded in the following: One September 1, 1875, at Umbagog Lake, (Wm. Brewster in Nutt. Bull. No. 1, April, 1876); one shot by Mr. Philip G. Brown at Scarborough, September 9, 1875, (N. C. Brown in Nutt. Bull., Jan. 1877); one September 4, and two September 5, 1880, at Lake Umbagog, (Wm. Brewster in Nutt. Bull.).

If the many "peeps" shot here yearly were carefully examined, probably many more would be found referable to this form.

187. Pied-billed Sandpiper—*Tringa pectoralis* Aud.; *Actodromus maculata* Ridg. 534, Cs. 616.—Abundant in flocks during autumn migrations. Commonly known as "grass-bird," by local sportsmen. This species is so very rarely seen here in spring that I cite the only instances of which I have any records. Locality of observation, Scarborough. Several seen May 8, 1852; one May 11, 1853; one April 30, 1864; one April 13, 1871. The first arrivals of the southward migration are rarely seen before August. During September and October these birds become more abundant about the marshes, and occasionally a few linger here into the month of November.

188. Purple Sandpiper—*Tringa maritima* Aud.; *Argus-tella maritima* Ridg. 530, Cs. 620.—Abundant in November and throughout the winter about the outer islands of the coast, more especially of the easternmost portion of the State. Exclusively a maritime species. Locally termed "rock peeper" and "rock snipe." But few of these sandpipers proceed further south than Cape Cod in Massachusetts, and no other sandpipers range further so far north. Their summer homes and breeding places are in Arctic regions.

187. Red-backed or Black-bellied Sandpiper, American Dunlin—*Tringa alpina* Aud.; *Ptilidus alpina americana* Ridg. 539a, Cs. 624.—Abundant on the coast late in the autumn, but very rarely seen here in spring. May 27, 1879, I shot a single specimen, which was detected in association with a flock of "black-bellied snipes" on the coast. This was an adult female in the plumage of spring, having the belly black. The name black-bellied sandpiper is given to the bird only on account of this temporary phase of plumage. Like the preceding species, these birds frequent the coast and rocky shores, and are termed "rock snipe" and "hill snipe." But they also resort to the sand beaches, and are not so common as the other, frequent, and are also sometimes found on the marshes, as in the case of a specimen, in early autumn, upon one of the marshes of the upper portion of the St. Croix River, which had not completed the moult of its summer plumage. This fact and its presence so far from the coast led me to suspect that possibly a few of the species may occasionally breed in that region. This is not probable, however.

Although some are resorting the purple sandpipers in form, the dunlins differ much in their habits. None remain upon our coast during winter, but great numbers pass by and go beyond the southern limits of the United States. I have observed them upon said islands in the Gulf of Mexico early in May, as they were returning to the North. Probably the greater portion of their numbers went their way to the breeding places in the North, via the Mississippi and St. Lawrence river valleys. Those which come along the Atlantic coast in spring leave the shores of Massachusetts, and pass by Maine far from land over the ocean. Cold easterly storms prevailed on the coast of New England during their migration in May, 1882, and dunlins, as also many other shore birds, were driven out of their usual course. At Scarborough two dunlins were shot May 28, 1879, and one May 31, and one June 2, total of nine specimens, all were in the summer plumage.

190. Curlew Sandpiper—*Tringa subarquata* Aud.; *Ptilidus subarquata* Ridg. 540; *Aegialitis subarquata* Cs. 625.—Accidental. Extremely rare. Apparently occurs in America only as a straggler from Europe. Audubon found but three specimens in America in all his explorations. One was shot near Cape Cod, and the other two were taken on three specimens near the mouth of the St. Croix River. A single specimen was shot at Scarborough, Maine, September 15, 1880, and its skin is preserved and in the possession of Mr. C. H. Chandler, of Cambridge, Mass., who obtained the bird at Scarborough. By the courtesy of Mr. H. A. Purdie, who has examined this specimen, I am assured of its identity.

Red-breasted Sandpiper—*Tringa hudsonia* Aud.; *Tringa caudata* Ridg. 529, Cs. 626.—Common on the coast during migrations. Arrives in latter part of May. With various other birds of the same family, this sandpiper extends its migration to extreme northern regions. I have seen a specimen of *Tringa caudata* in the ornithological collection of the British Museum in London that was killed at St. George's north light, and the coloration on the breast and lower parts of the body, which is due to the moult. This sandpiper is peculiar to the plumage of spring and summer. Specimens in this phase of coloration are obtained in Maine during the last of May and first of June. When next seen here upon their autumnal migration the plumage appears quite different, and the birds are then sometimes termed "blue plover," the upper parts being bluish gray, and lower parts white.

(TO BE CONTINUED.)

THE HORNED LARK.

BY REV. J. H. LANGILLE.

IT was early winter. The ground was covered with snow, but the atmosphere had been laden with a dense falling mist. The temperature falling below the freezing point, throughout the night, a zephyr-like wind from the northeast continued to crystallize the moisture on every object, arraying the landscape in a most magnificent hoar-frost. The delicate plumose or spinulose ornaments increased every twig and sprig of grass to many times its size, and every tree and shrub seemed almost as dense as when arrayed in a young foliage; telegraph wires were as thick as cables, and the delicate array of spinulose plumes on the evergreens was of greater magnitude than their own dark covering. The exquisite delicacy and beauty of the pattern of crystallization were indescribable. The whole landscape was a charming fairyland. As the hoar-frost of rural night was falling, and the stars were beginning to appear, the delicate had been at work; while in this inimitable robe of snow-white purity the Christian fanatic might read the thoughts of Him who is the author of the beautiful as well as of the true and good.

Perfect stillness reigned. The slightest sound was awfully menacing. What could be more pleasing to the lover of nature than to see a flock of many times its size, of many flocks at such a time than a flock of many times its size, of many flocks (*Ereunetes alpina*) appeared, alighting in the fields and along the highway, and they seemed as social and happy as so many Frenchmen, as they flew and ran, and squatted and hopped, vying with each other in their soft conversational *leap, leaper*.

This is one of the most characteristic birds of Western New York. In Orleans county and westward, throughout

the year, unless it be in December, there is none which one is more likely to meet. Though in much smaller flocks, he may as frequently appear in the snowstorm as the snow-bunting, and is much more common in the finer weather of mid winter than the goldfinch or the lesser redpoll. From the frozen fields or the frost-clad fence, he greets us with his song already in early February, several weeks before we hear the soft warble of the bluebird or the resonant notes of the song sparrow, and so gives us the first bird song of the year. When the earth is soaked and the air is chill from the thaws of spring, he is as merry and chipper, and full of song as ever. He is amid the happy throngs of May, traverses the heated dust of the highway in July and August, and in the mild, hazy days of Indian summer, gives forth a respectable echo of his more vigorous song of the breeding season.

Until very recently, the habits of this species have been wholly consigned to the far north, but it is now well understood that it breeds abundantly in the lake country of Western New York, and in corresponding latitudes westward, raising two broods, the first of which is very early. Rev. Wm. Elgin, now of Indianapolis, Ind., a competent observer, writes to me as follows: "On the 29th of April, 1875, I discovered in the park near the lake at Buffalo, the nest of a pair of horned larks containing four young birds, which he was at the age of six days old. I had observed the parent birds in that locality early in the month, and had been watching their movements ever since, being convinced from their actions when first noticed that they were nesting."

But my search was not rewarded till the day above named. When the parent birds were first seen, the ground was bare, but about the 10th, there fell several inches of snow, which lay on the ground several days, during which time the temperature frequently fell almost to zero. Under these circumstances it seemed to me a marvel that any of the eggs hatched, since the bird must have been sitting while the ground—and in fact herself—was covered with snow. Yet, the nest was admirably contrived for this weather, being placed in a small basin scooped out of the level ground, and carefully lined with the dried grass, the top being on a level with the surface. Such a case of nidification certainly argues a high degree of intelligence in the species. Another circumstance which fell under my observation, and which tends to confirm this opinion. On the 7th of April, 1878, near the village of Wayne, in Steuben county, I observed a female horned lark feeding a pair of young in the nest; the young being so far matured, as to be able to fly from the road to the fence, a distance of fully three rods. In this case, the nest must have been begun early in March.

These instances accord with the nest reported as found near Wisconsin, while the snow was on the ground. On the 6th of April, 1880, as I was crossing a meadow a few days after a snowfall of some three or four inches, a female horned lark flew out from under the snow near my feet. Thrusting my finger carefully through the cold covering I touched the eggs still warm; and picking out carefully the snow which had fallen into the nest as the bird left it, I found four eggs about half incubated. Who would not be impressed with the fidelity of this bird to her charge, thus allowing herself to be snowed over and continuing to sit as she no doubt would have done, till she thawed out again.

The second set of eggs is laid in June. The full-fledged young are of a mottled gray color, somewhat like the first plumage of young screech owls. The nest is made of stubble, rootlets and dried grasses, sometimes having a little wool or horse-hair in the lining. It is well sunken into the ground and is generally a frail, loose and inartistic structure. The eggs are usually four, but 887, 63, are grayish white, thickly speckled all over with greenish brown, having a small marking of pale blue or purplish-brown. They cannot be easily mistaken for any other egg in this locality. Our outly bird's egg which they resemble in color is that of the shrikes, and the marking is very much finer than that of these.

Mr. James Booth, of Drummondville, Ontario, for thirty years a distinguished taxidermist for Niagara Falls, Buffalo and the region about, says that the horned larks did not breed here formerly; that the southern extension of the species was with greenish brown, now having a small marking of pale blue or purplish-brown. They cannot be easily mistaken for any other egg in this locality. Our outly bird's egg which they resemble in color is that of the shrikes, and the marking is very much finer than that of these.

They cannot be easily mistaken for any other egg in this locality. Our outly bird's egg which they resemble in color is that of the shrikes, and the marking is very much finer than that of these.

But no, he has alighted in safety, and steps along with all his wonted statelyness, dividing the time between his lunge and his song. Many a time since, and sometime as early as the last days of February, I have witnessed the same manoeuvre, and always with renewed pleasure. No Bayard Taylor is not mistaken after all, when in his "Spring Pastoral" he speaks of—

"Larks responding aloft to the mellow flute of the bluebird."

And though the song of our bird can bear no comparison to the astounding song-flights of the sky-lark, their similarity of manner indicates the relationship of the two species.

But in the distant Northwest we have a very wonderful bird, the Missouri skylark, which its lofty flight and great powers of song, seems scarcely if at all second to the famous bird of the Old World.

The horned lark is 7 to 7½ inches long, somewhat larger than an ordinary-sized sparrow, its shape being as peculiar as its voice. The bill is rather long for a song bird, quite pointed, and a little curved; on the head of the male are two tufts of crested black feathers, from which he receives part of his common name. As in the case of other larks, but unlike the rest of the song birds, the scales of the leg extend around behind, and its hind claw is very long and straight. This lark is always in a squatting position with drooping tail when at rest. With a long black patch on each cheek, a somewhat triangular black spot on the upper part of the breast, reddish light brown above and dull white beneath, with yellow throat, long pointed wing-tipped with black and a tail of the same color, a peculiar undulating flight often accompanied with a soft *teep* or *teeper*, whether sitting, walking or flying, this bird readily appeals to the eye of the observer. It was formerly placed with the *Fringillidae* family among the sparrows and their relations, but it now stands with a lark family formed by later ornithologists. In the main it is a seed-eating species, but also subsists largely on insects.

FEEDING THE PINE GROSBEAKS.—Kennebec County, Me., Feb. 12.—This is not a game county, but it contains some sportsmen, one of the greatest pleasure in reading the FOREST AND STREAM, and says amen to the stand taken in relation to trout hogs, pot-hunters and park grabbers. This being close season, the only game we have is fox, which are quite plenty, but just now the snow is so light that it is hard to follow them, even on snow shoes. Only yesterday two foxes were seen from the village of C. This being an unusual cold winter, our northern friends, the pine grosbeaks, are with us, and find they can be easily tamed if, instead of giving them a charge of fine shot, a person will take the trouble to throw out a little cracked corn or crumbs for them. As I write, about a dozen of the birds are gathered out and about the window still eating canary seed and cracker crumbs, which are daily thrown out to them, to the delight of two very small boys who stand within a foot of the birds as they are eating.—12-GAUGE.

MIGRATORY QUAIL.—DOVER, N. H., Feb. 1.—Thirteen migratory quail were seen in the yard of the Cocheo Manufacturing Co. yesterday, by several persons. This yard is in the center of the city, and the quail came there?—G. A. W. [We should like to have further information about this matter.]

Game Bag and Gun.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

WHEN THIS OLD GUN WAS NEW.

WHEN this old gun was new
 'Twas in life's youthful time,
 When flowing locks were golden-brown
 That now are white with time.
 When skies were bright and meadows green,
 Days all too short for play,
 And precious was each moment,
 Of the weekly holiday;
 Ah, then when first the flush of dawn
 Lit up the eastern sky,
 Now joyous from the garden gate,
 Out to the fields to fly!
 Sometime with little slender rod
 With line of silken strand,
 We'd seek the winding river's marge,
 A gay, exultant band.
 Sometime we'd seek the old mill-pond,
 Down where the trees leaved o'er,
 Where water-lilies were afloat,
 And cat-tails lined the shore,
 To cast for club, or perch, or trout,
 Or pike, or yellow bream,
 And fill our wicker baskets
 With treasures of the stream.

But greater yet the joy to lift
 This old gun from the wall,
 And pass forth where the pine-woods
 Rose bravely and tall.
 For there the blue wood-pigeons flew,
 There on wild berries fed,
 And when this little gun outspoke
 How many were the dead!
 'Twas but a simple flat-lead thing,
 Long ere the cap and cone,
 But still its powers seem'd marvelous,
 And the gun was all our own!
 How precious seem'd our powder store,
 Precious as sands of gold,
 Our shot-bag was a treasury
 Of leaden wealth untold!

Since then full many years have sped,
 We've hunted far and near,
 But never was such sporting joy
 As in that earliest year.
 A costlier weapon we have swung,
 The smart breech-loader come,
 But none so dear-beloved as this,
 The child-gun, bruis'd and worn!

—ISAAC McLELLAN,

IN THE ST. LOUIS VALLEY.

ALAMOSA is situated nearly in the central part of the San Luis Valley, in the southern part of Colorado. Pleasant met Bert, a good woodman as there was in the valley, who was going out prospecting. He kindly invited us to go with him, assuring us we would have a good time.

On the 7th of July, the day after our arrival, we started for the mountains, going to the southwest and turning our backs on the snow-capped Sierra Blanca.

There were four of us in the party, and the outfit consisted of an extra solid platform spruce wagon, a good team, a good saddle, a good pair of boots, a good pair of trousers, and the requisite cooking utensils, four repeating rifles, two shotguns and two fly rods. After a very pleasant journey, during which we passed the plaza of San Rafael with its gaunt and vicious dogs and villainous-looking inhabitants, we came to Conejos with its Church and Convent of the Sacred Heart, both of which are constructed principally of adobe mud. Here we met its good-accured, accomplished sheriff, Joe Smith, who is ever willing to render the stranger any favor he may ask in regard to shooting and fishing.

After leaving Conejos, prairie dogs become very numerous; but the owl and rattlesnake found further north are here wanting.

When we struck the Los Pinos Creek we left our wagon, and after packing our outfit on "Rocky Mountain elevators" (burros), started on. About five miles up we pitched our tent in a clump of pine trees, the lines right by the creek. We were now about two miles east of "The gorge" and just over the line in New Mexico, and in as pretty a country as one could wish to see.

The following day we went up into the mountains, and before returning Bert shot a doe, and my friend Charley and I bagged five grouse. After returning, just before sunset, I joined my rod and started out for trout, and before landing a half a dozen I managed to break the tip of my pole on account of my ignorance of the manner in which to land them. It, however, did not take me long to learn a point or two, and in two hours I had fully ten pounds of fish. Bert, however, had been more successful.

That night we had a glorious supper of venison, grouse, trout and the never-to-be-forgotten flapjacks. After a smoke and some yarus we turned in.

Between hunting, fishing and prospecting I passed seven of the happiest weeks of my life. On one occasion when we happened to get out of venison, and were sick and tired of trout, we invested in a goat from a Mexican herder that happened to pass through the mountains with the herd. Though the meat was not as delicate as some other, I was surprised at its passable relish.

In fly-fishing I found that any fly not highly colored was good, although the "professor" and "dunghill" seemed to be the best.

During the seven weeks we were in the mountains a cinnamon bear was shot by Bert, and Charley and I shot three deer. Deer seemed to be very plentiful, but at that season they were in the aspen timber and very hard to shoot. Bert, however, got two.

One night we were annoyed by a mountain lion, and at one time thought he was bothering our stock; but after an inspection found everything all right. He had evidently smelled the meat that was hanging up near our tent, and the shooting on the prairie in the valley is very fine. After saddling our ponies, and with a shotgun and ear-tricks stuffed in every available pocket, we started out duck or goose shooting. Riding along the Rio Grande, beginning near Alamosa, we swung along at an easy gallop, and when a flock of ducks or geese are sighted we circle off on the prairie. When opposite the ducks or geese, jump from the ponies, and running up to the bank shoot the few that rise. If the river being considerably lower than the banks, this can easily be done.

The lakes in the valley also afford good shooting for fowl, and lots of sport can be obtained.

The three months I spent in the valley were the most pleasant I can look back to, and should any wishing sport go to Alamosa he will find it, certainly if he is lucky enough to get into the company of Bert. CASON PETER.

JERSEY CITY, FEB. 15.

THE DUSKY DUCK.

TWENTY-EIGHT years ago I shot my first dusky duck. My father was a fine shot, and spent a great deal of time in the woods and on the lakes of New England. He had four boys, all of whom were very fond of the gun. We were not allowed to have a gun till we were fourteen years of age, and as I was the youngest boy my turn to have a gun did not come until all my brothers had left home. I used to go with my father in the woods and on the lakes long before I had a gun, and I know how to set the decoy ducks well.

We lived on the shore of a small pond called Smith's Pond, situated between Fresh and Spy ponds in the town of West Cambridge, Mass. It is now Belmont. This little pond was quite a place for dusky ducks, teal, bluebills, coot, etc. We always kept forty or fifty dark colored tame ducks for decoys. Many of them were fine callers, and when a dusky duck or teal came to the pond, were sure to bring them in.

Very few ducks are as shy as the dusky duck, but they are very easy to decoy, if one has tame ducks that are good callers. When they come into the decoys they will sit motionless on the water for fifteen or twenty minutes, then if nothing disturbs them (if there are more than one) they will swim together. But if they see the least motion they are off like the wind, and will seldom stop till they get to some other lake or pond.

Sandy Pond, in Lincoln, Mass., was a fine place for black or dusky ducks. They like shallow, wooded shores of that beautiful sort of water. Seventeen years ago I came to Northwestern Iowa and since then have seen but three dusky ducks. One was killed ten miles north of this place by Messrs. Kaip, Foster and Howland, of New York; which killed I do not know; it was with a flock of mallards; all of them shot and this duck came down. It was one of the finest specimens I ever saw. Since then my brother shot one at Buffalo Fork, a small stream twelve miles north of town. I saw one three years ago with two mallards, on the upper Des Moines, but did not kill it. I think they are scarce in the West, as most of the Western sportsmen have never seen one. J. G. S.

ALGONA, IOWA.

THE BIG GAME AND THE PARK.

Editor Forest and Stream:

I commend the course taken by the FOREST AND STREAM in the matter of the National Park grab, and your hearty support of Senator Vest's bill, all of which I endorse, except the proposed Park extension. This I deem unwise and unwarranted. This clause in the bill was inserted, I believe, to conform to the recommendation of Lieutenant General Sheridan in his report of Nov. 1, 1882, to the War Department, which proposes to extend the limits of the Park forty miles east and ten miles south. The extension west would take in a large portion of the district known as the New World Mining District (so-called the Clark's Fork Mines). These mines have been occupied for ten years. The entire tract which the bill proposes to take in is a mineral-bearing country. But this matter we will leave to our delegate in Congress. I hope Congress will not grant any exclusive privileges within the limits of the Park; 640 acres would be a very large tract of land, as it could be so mapped out as to take in the entire upper geyser basin, in which are situated nearly all the most wonderful and interesting geysers in the Park. I trust that in granting privileges Congress will not allow any hotel or other structure to be erected nearer than one-fourth of a mile to any of these great wonders, and that a survey may be made and permanent lines established, taking in all the beautiful springs and geysers, and that the same may be forever free. The PARK AND STREAM has well said that pasture lands are very scarce, particularly in the vicinity of the geyser basin, and for this reason should be free to all. I should think that twenty acres of land with each hotel privilege, would be a very large one, and that this rule should apply to location of such privileges throughout the entire Park.

Much has been said upon the subject of game protection, and I believe Gen. Sheridan recommended the extension of the Park particularly that the noble game of the Rocky Mountains might find a retreat from skin hunters. I herewith submit some figures showing shipments of skins from Bozeman, which has been the principal shipping point of Eastern Montana for many years, which, however, is now somewhat changed by reason of the settlement of the country along the Yellowstone River and the opening of new markets for skins. I am sure you will be interested in the figures with these matters and submit the figures to show what species of game most need protection. In 1874 the following shipments were made from Bozeman:

Elk skins, 97,000 lbs.; deer skins, 82,350 lbs.; antelope skins, 33,407 lbs.; mountain sheep skins, 760 lbs.; moose skins, 4 skins only; bison, none.

Average weight of skins: Elk, 12½ lbs. each; deer, 3½ lbs.; antelope, 2½ lbs.; mountain, 3½ lbs.

This includes the entire catch of skins sold by white hunters and Indians. The average prices being for elk skins 20 to 30 cents per pound, deer 24 to 35 cents per pound, antelope 27 to 40 cents per pound, mountain sheep 15 to 20 cents per pound, moose skins 20 to 30 cents per pound. During the two years following shipments were light, owing to the market being overstocked and the consequent fall in prices. The shipments of skins from October, 1881, until July, 1882, were as follows: Elk skins 45,000 lbs., deer skins 35,000 lbs., antelope skins 5,000 lbs., mountain sheep skins 960 lbs., moose, three skins only, bison, none.

Never within my recollection has a bison skin been offered for sale by a skin hunter in this market, and I have knowledge of but one skin having been brought to this vicinity from the Park. The bison has been the prey of all wild skinners most valuable to the hunter. In November and December—the bison does not leave the high altitudes. Therefore to hunt him is to encounter deep snows; his whereabouts are uncertain, for there are but few herds; his skin is heavy and cumbersome to handle; hence it does not pay the skin hunter to hunt him; for these reasons only he is safe from skin hunters. Tourists and sportsmen, who linger to hunt in the Park, are his only enemies. The only game found in all seasons in the thick forests of the high mountains, and are not numerous enough to warrant hunting them for their skins. The mountain sheep, from their peculiar habits, flourish in the highest and most rocky and rugged mountains, and if protected during lambing season will take care of themselves and last for many generations to come. Of these animals the bison and moose should be particularly protected from sportsmen when the hunting the summer season, when the feeding grounds are accessible.

It will be seen by the larger quantities of elk and deer killed for skins, they are by far the most numerous, and must be soon protected, or it will be too late. Two or three severe winters with deep snows, a good demand for skins with such prices as prevailed in 1874, will seal the fate of the elk and deer of the Rocky Mountains. The all important question presents itself, can the animals be protected? Surely not by simply extending the limits of the Park; certainly not by any law that Congress can devise for their protection within the Park. I believe this can be accomplished only by the hearty co-operation of the Territories of Wyoming, Montana and Idaho, and the passage of such laws by the Territorial Legislatures as will entirely stop the killing for skins only. Killing should only be allowed from August 15 to December 15, and then only for food. The migratory habits of the elk and deer are such that the first October snows are the signal to descend from the secure summer retreat high up in the densely timbered mountains, even above the timber line, where snow banks are found at all seasons of the year, to lower levels; and as the season advances the journey is continued until the base of the mountains is reached, then the table lands, then a general scattering—far but not far from the timber line. However, remain near its borders, during mild winters, and are killed more or less by skin hunters. Deer do not remain in or near the Park during the winter. The great slaughter, however, takes place along the tributaries of the Yellowstone and Missouri rivers, and goes on unceasingly from November until May, when, as the snow begins to disappear, and new grass starts, such animals as have survived this season follow the melting snow until the summer retreat is reached.

To illustrate how mercilessly game is slaughtered, I will relate one instance that came within my own observation. While traveling down the Yellowstone in the winter of 1880, in the month of February, the snow being deep, sleighs were used by the stage company in place of wagons. There was a crust on the snow, and the sleighs were not to be weighed. The driver and I discovered a band of antelope in the road some distance in advance of us. At first they were somewhat shy, and would run as we approached, but finally we came quite near them. There being about fifty,

they occupied a long space in the road, and as they became accustomed to us, we came very near them. I would reach out of the sleigh, pick up pieces of snow crust, and throw among them. They seemed quite as tame as a flock of sheep. We noticed that the legs of nearly all these animals were badly lacerated, this being caused by traveling and breaking through the hard crust. These animals traveled in advance of us some miles, never attempting to leave the sleigh track. We finally met two hunters, and the animals bounded off through the snow a short distance and stopped. The hunters got down from their horses, and the work of slaughter began. Before we passed the next ridge, a quarter of a mile, we noticed that the animals were all dead, the remainder were scattered around, none beyond rifle range. These animals had scarcely life enough left to run from the hunter, even if the depth of snow and crust had not rendered such a thing impossible.

In this way the antelope of the great Yellowstone Valley have been nearly exterminated; and I repeat, that unless a very early season found, the elk and black-tailed deer will share the same fate. The reader will ask, "Have you no game laws?" Certainly. Section 641 of the Revised Statutes of Montana prohibits the killing of bison, elk, black-tailed deer, white-tailed deer, mountain sheep, Rocky Mountain goat and antelope, from February 1 until August 10, penalty not less than \$50.00 nor more than \$250.00. Section 442 prohibits the killing of any of these animals at any time for less than \$25.00, or more than \$50.00, their skins not to be sold, but these laws are a dead letter and cannot be enforced, for the reason that our Territory is so vast in extent, there being ninety thousand square miles within its borders, with a population of about sixty thousand. Many of the best game districts are distant from settlements, and difficult of access in winter and spring, when it is the most necessary to protect game. Many hunters locate in the fall before snow falls, and have the privilege of game, antelope and deer skins until June and July, after the snow has disappeared. The entire United States Army, while it might protect, or partially protect, the 3,344 square miles included in the National Park, would be powerless to enforce the game laws as they now are.

Can a remedy be suggested? In my opinion, your correspondent has sounded the keynote when he recommended the safe shipment of game, antelope and deer skins from skins from the Territory he prohibited, and the passage of laws, making it unlawful for any railroad or steamboat company, or any other common carrier to transport or carry the same from the Territory. That article came from a person thoroughly conversant with the subject in question.

ANGLER.

BOZEMAN, MONTANA, Jan. 24, 1893.

The *Cheyenne Daily Leader*, February 8, reports: "Public-spirited citizens are at work, independently of the Governor and Secretary of the Territory, endeavoring to bring the United States Senate to a sense of the injustice which would be done Wyoming if the Yellowstone Park were to be placed under the jurisdiction of the laws of Montana. The following letter, written by Hon. Harry C. Crosby, to Senator Vest, Chairman of the committee on Territories, contains sound arguments from a good authority for the retention of the Park under Wyoming laws:

THE HOME RANCH, CHEYENNE, WYO., Feb. 8, 1893.
To the Hon. George H. Vest, U. S. Senator, Washington, D. C.

Honorable Sir—Referring to a letter dated December 29, from Gov. Crosby of Montana, to you and relating to an interesting question in the preservation of game in the Yellowstone National Park, I address you in the name of the Wyoming Game Protective Association, and in reciting certain facts, which may be new to you, and in offering a few suggestions, I trust they will be received in the same good spirit of national pride and sport which dictates them. Although sympathizing strongly with the object which prompts Governor Crosby's letter, I fear it has, with its general publicity, tended to mislead, both as regards the geographical position of the Park, as well as the efforts of the good people of Wyoming to protect game for the same. As the large proportion of nineteen-twentieths of the country set apart as a national reservation was taken from Wyoming, the odd one-twentieth coming from Idaho and Montana, and as a movement is now on foot to give incorporation to the Park into a county of Montana, our people are naturally growing jealous. Thus far the only laws of either Territory which in any way affect the interests of the Park, are those for the protection of game near its borders. The Wyoming Territorial Legislature of 1882 enacted game laws, of which the enclosed is a copy. In them will be found embodied all the points Governor Crosby recommends for his Territory. He suggests imprisonment instead of fines as punishment for violation. We are in favor of that punishment, but in judgment of one law either, or both. It is urged that transportation companies be prohibited carrying game unlawfully killed. We go a step further and forbid individuals or corporations even to have in possession game unlawfully killed, or any green or untanned hides.

Our people have organized and incorporated a game protective association, which has, by its organization, been enabled to accomplish the following results: All common carriers have been forced to refuse contraband game or parts thereof, except in the extreme northern part of the Territory, where such game is transported into Montana, where traffic in the same is apparently allowed. We can furnish proof positive of parties having started from the southern portion of this Territory on hunting excursions to the protection of their guides (and the violation of our laws) killing more game than they could use until they reached Montana, where they were taken across the border to indulge in the alleged sport of murdering buffalo. We know of parties who had made arrangements last year to hunt here, but learning that the Wyoming laws were being enforced, changed base to Montana. Hide hunters and game murderers in the extreme north have openly defied the Government, knowing they could find a market and protection in Montana.

As the people of Wyoming have, through their Legislature, made wise game laws, and have also shown their ability to enforce them—at all events more thoroughly than Montana does—it is most earnestly to be hoped and prayed for that if it should be considered necessary to place the National Park under the laws of a Territory, it will be given to you whom it was taken from the Federal Government, and to whom we have practically looked upon as their own by a zealous regard to the preservation of the Park's greatest beauty—its game. If the area of this reservation should be increased, as suggested by Governor Crosby, it would be taken from Wyom-

ing. If the preservation of game is the real issue, the following notes, which are gathered from real experience, are respectfully submitted. In this open prairie country game ranges in a very different manner from that in which they do in the Adirondacks or Allegheny mountains. There a prey of fifty square miles might be effectual; here even the extent of the Yellowstone Park (3,500 square miles) would be virtually useless for such a purpose. Buffalo are apt to wander four or five hundred miles between their summer and winter ranges. Elk, black and white-tailed deer, as well as antelope, leave their ranges to bring forth their young; therefore, preserving a small area would not avail much. The strictest protection in all the wild country is needed; but if anything is to be done it should be done at once.

If the Federal Government would give at least her Territories a general law on the subject, then United States Marshals and their deputies would have to see to the enforcement of the same, and they would also carry against the bands or companies of hide hunters the good, moral weight of having the "blue eyes" to back them.

Indians are allowed to leave their reservations to hunt on passes from their agents. As they have neither use for hides nor meat, being liberally provided with both blankets and beef by the Government, and as their slaughter is invariably wanton, it might be well to stop the issuance of such passes.

Assuring you of our appreciation of your efforts to secure the preservation of game, I am, yours respectfully,

President of the Wyoming Game Protective Association.

THE GUINEA FOWL AS GAME.

THERE are numbers of guinea fowl wild in the island of Santo Domingo, and they have been there beyond the memory of the oldest inhabitant. They are very prolific. I have often seen as many as fifteen in a brood, I think they hatch out in one year; at least, at the rate of one an egg, and all seasons of the year. They are to be found about the corn and rice fields, as well as in the open savanna miles away from any food, except such as is afforded by the native grasses. Their crops often show nothing but grass seed of different varieties. They are an exceedingly shy bird, difficult to approach, and wonderfully strong and swift on the wing. I have never seen the tame bird, and I find it is from the domestic animal.

On one occasion we made camp late in the afternoon at a cattle station in the savanna, where the proprietors came twice a year to brand the calves and select the heaves, stopping three or four weeks each time. During the rest of the year no one lived there. Near sundown, tempted by the balmy atmosphere and winking lights and shades, I strolled some distance from camp, and saw a very large covey of guineas. I promised myself some sport in the morning and was up and away at the first break of day. After a time I discovered at a distance a flock of guineas feeding in a portion of the savanna where the pine trees were three to four rods apart, tall, straight and free from limbs for a long way from the ground, and not a brush beside. I endeavored to get within gunshot by going from one tree to another, keeping myself in the middle of the path, and as possible, at the same time watching the birds closely, and on seeing the least sign of apprehension, making a statue of myself. I spent over an hour in this way, the birds constantly feeding away from me. Then I flushed them out of range and they flew for a run that I densely timbered. I followed but failed to get a shot, and was forced to return to camp without a bird. I do not think that these birds had been shot for months.

They are harder to get a shot at than the ruffed grouse, but are much easier killed. With a 16-bore 6½ lbs. gun, I shot one from the limb of a small pine tree at a distance of fifty-two long paces, striking the bird with one shot in the body. It fell immediately to the ground; and when I picked it up, was dead. I have shot a green parrot at so short a range that four shot passed through its body, and then I had to resort to the same means to obtain another. There were no bird dogs in Santo Domingo at the time I was there. A friend had a mongrel shepherd that he thought a very good dog to hunt birds. I tried him. He would trail the guinea fowl. They would allow him to come quite close, and then take position in the nearest tree and watch the dog. I think from their actions they would lie pretty well to the proper kind of a dog. The wild guinea is similar in all the qualities to the ruffed grouse. Although I have bagged a great many, I never saw a very fat one. They were plump, juicy and tender, and a very fine flavor. I had the best success in shooting them by scattering a flock just before roosting time. The following morning, being on the ground before daylight, when the calling would commence, the chances were favorable for a few flying shots.

L. KENT, M.D.

PHILADELPHIA NOTES.

THE late continued rain has completely freed the Delaware River from ice, and the marshes bordering it which were until the past week frozen up, have been completely cleared, owing to the high tides having liberated and floated off their hardened covering. Some seasons we have had a return of the marsh ducks to our streams as early as this, but I cannot learn of any ballpits or spritfalls having appeared in the Delaware yet, although the feeding grounds might be said to be in good condition for them. We shall have some severe weather before spring, and need not look for marshfowl before the first week in March, and not then unless the season is favorable.

I wish our sportsmen would content themselves with autumn shooting alone, and allow the comparatively few ducks which stop in our marshes in the spring, preparatory to going northward to breed, to pass the winter unmolested. In fact, the snipe should not be hunted; but we cannot blame the boys so long as a law permits.

Some few purple grackles and robins have shown themselves in Delaware county, near Media, I am told. This is very early for them. We seldom look for them before March. One of our local papers tells of a "brown thrasher" (feruginous thrasher) that has wintered in Chester county. This is remarkable, as the bird is migratory and passes the cold weather in the South.

Several of our Philadelphia hotel and restaurant proprietors have kept over a number of quail this winter. One has a covey domiciled in his front show window, the bottom of the window being covered with moss, etc., and the quail made comfortable. The birds attract much attention. Howso.

ASLEEP AT HIS POST.—DRAWN FOR THE FOREST AND STREAM BY W. H. McDUGALL.

SUMMER SHOOTING.

"Hear the other side," says the proverb.—"Clericus."

Editor Forest and Stream:

"Clericus" in his article on "Summer Shooting," in your issue of February 15, laments the restrictions cruelly put on certain human beings called "brain-workers." These poor creatures, as he groups them, are clergymen, college professors, school teachers, lawyers, actors, artists of all kinds, and the "physicians at least of the wealthy classes." [How many "classes" have we in this republic?] This list excludes engineers, whether military, mining, mechanical, or civil, that is if the last named do not meddle with the architect's scaffolding men, baggage-masters, officers of the army, telegraph operators, foreign ministers, street-car drivers, dentists, hotel clerks, members of Congress, dealers in fishing tackle, officers of the internal revenue service and plumbers and pawabrokers and a few other "classes."

Placing myself in the smaller and more exclusive class, I feel privileged to join the lament with that of "Clericus." "Clericus" asks: "Now is there nothing owed to the above classes?" (That's my class, you remember. You see he starts right, for he puts us, *A. C.*, our class, on the Cr. side of the sheet. The reader will note that the plumber belongs to the class containing the officer of the internal revenue service and the pawnbroker.) "Are there no concessions to be made in their behalf?" "What lover of the chase cares to go to the North Woods if there is no chance on the deer?" This last lament in behalf of my class is no doubt all right, but to me reads a little ambiguous.

My wife, who has just read it, says: "It is all clear enough, it means that 'Clericus' won't go to the woods if the deer have any chance. How stupid! My dear, your brain is overworked." "No, my love, my brain is not overworked—worse than that—I am a victim!" "What? Victim! Haven't I lost any of my money, I hope?" "No, love—don't!—just one moment. I'm the victim of the strange fascination of—" "Who?" "Who?" "One moment, my darling, of—the trigger." "Oh! that's all, is it?" "Yes, and that's what 'Clericus' says he has badly. Yes, and he says it is hard to get rid of. He also says: 'There is no encouragement for the professional man [*i. e.*, our class, you know, my dear] to give themselves to a recreation which, like sleep, knits up the ravel'd sleeve of care, is balm of hurt minds and chief nourisher in life's feast.' Those are his words and he knows. He says I ought to 'take to the woods' and—" "My dear, I thought you called me to listen to an article you had written for *FOREST AND STREAM*?" "Oh, yes, I forgot, here it is, short and—well, like yourself, my North Woods woman, my anglertrix."

It is to me, a "brain-worker," incredible how a "Clericus" could have written that article advocating summer shooting. The close season does not suit the time of the vacation of clergymen and others. This is a reason, sufficient to "Clericus," why the game laws should be changed. The law of the land and the law of nature are against summer shooting. The game laws, after much discussion and infinite trouble, have been laid down so that, on the whole,

they follow the law of nature, which fixes certain times and seasons for the bringing forth of young, and for the mother's care for her offspring. To shoot her then, in the fullness of her love, and to leave her darling to the merciless elements, and beasts of prey, or starvation, is a cruelty that no one, if thoughtful, can be guilty of. This is the sentiment which underlies that legislation whose intent is to protect our game during the season of motherly love and of helpless infancy.

A PROFESSOR.

MICHIGAN NOTES.

The winter in this region has been unusually severe. In December there was a depth of forty-six inches of snow at one time, and there are now ten feet or more on the ground. This has no crust, but is very solid, so as to make it difficult for any animal of large size to wade through it. There were a good many deer here last fall, and a number were shot. I do not think many have been killed since the expiration of close time, but a few have suffered. Those who hunt out of season keep it quiet, as there is a strong feeling among many of our hunters that the practice should be discouraged. I learn that one man, living on the "Six-mile" Lake, has captured three or four deer and has them in his barn alive. Probably he has not read the law against "hunting or pursuing" these animals out of season. This same man was once fined for crust-hunting, and his turn may come again.

The deer were trusted about lively enough on the first snows. I knew eight men to meet on the track of one buck, and they didn't get him, either.

There are no quail near here. Ruffed grouse have been quite abundant this fall, and there are a good many winter ducks in the open rivers connecting our lakes.

Foxes are abundant, and a few are shot. No one can keep hounds here, as the still-hunters always shoot them.

Two or three bears were shot this season; one of them was pursued one day by seven hunters through a swamp covering a few hundred acres. The snow was deep and they gave it up at night, and went to bed. So did the bear. Next day an old hunter went alone and shot him.

We were for several weeks interested in the gambols of three or four otters in and about the open water at the head of one lake, and in the river which empties therein. The same thing occurred two years ago, and although the creatures were often seen within a few rods of the bridge, I do not think that any of them were injured during their stay. Some of the boys tried to shoot them, but you know their guns generally miss or "hang fire." One of them, however (not the boys, but the otters), probably owed its life to the courtesy of one of our best shots and hunters, who had his carbine levelled on it at point-blank range, but refrained from shooting because he knew that if killed the animal would sink and be lost in the deep water.

It has heretofore been my impression that otters seldom remained for so long a time in one place, unless when the young were very small, and it seems strange to me that they should stay so long in sight of a village, and play about in rifle range of a constantly traveled thoroughfare.

CENTRAL LAKE, Mich., Feb. 11, 1888.

EFFECTS OF SPRING SHOOTING.

THE sportsman that has lived in the Quaker City for the past twenty years can note many changes that have taken place in the shooting grounds in and about Philadelphia county in that time. Where one particular spot was yearly visited by snipe and a fair bag could always be counted on, it has long since been deserted by the birds, and they have to be sought for elsewhere. Who that has shot at all does not remember the meadows bordering Darby Creek, Potts' meadows, the grounds near the Cross Keys and around Captain Serrill's? All were close to the city, where ten or twelve years ago it was a poor day when twelve or fifteen birds could not be killed in proper season. Now a tramp over all these meadows would not start a brace of snipe in the most propitious weather, unless, as it was last autumn, an unaccountable flight suddenly appeared and reminded the old stager of what had been once a common occurrence, especially in the spring.

The writer can call to mind the daily killing in the afternoon, ten years ago, of two or three brace of snipe by Mr. George Twaddell and himself within the limits of West Philadelphia, not a mile from Mr. Twaddell's homestead. This favorite feeding ground is now never visited by the birds, and it is evident their numbers are yearly decreasing, doubtless owing to spring shooting, which we are all guilty of and which we will still indulge in so long as it is allowed by law.

It was common not many years ago to find good woodcock shooting within and but a short distance of Philadelphia. Many birds were killed along the Schuylkill River, and almost every river, creek or brook in Philadelphia county covers fringing the different creeks in Philadelphia county were sure to be the home of more than one longbill. Some of the Philadelphia readers of *FOREST AND STREAM* can remember how they once slipped in back of Woodland's Cemetery early of a July morning and brought out two or three woodcock, and can call to mind the excellent feeding grounds on the Cobb Creek running at the foot of Mr. Morial enclosure. All these grounds are as they once were, not a whit changed. But the birds are not there as of yore. Would it not be wise to abolish all summer woodcock shooting as a means to increase the number of our fall visitors?

Bunting's thicket, long since cut down, and a growth of sapling—now a wood—just outside Philadelphia county limits, on the Baltimore turnpike, was a dozen years ago regularly frequented every autumn by woodcock. Similar good ground lies in the same neighborhood now, but it is seldom a woodcock is found there. We are told that the main cause of this scarcity of snipe and woodcock in the immediate vicinity of Philadelphia of late years may be attributed to the increase of sportsmen, the improvement in shotguns and to the education of the mass in shooting matters by sporting journals. All this may be true in a measure, but the prime reason is the killing of migratory game birds in the spring of the year. Granting that sporting literature has done its share in fostering a desire for field sports on the part of the public, for this very reason it should advocate the total stopping everywhere of all spring shooting, and

to the passage of such laws as will prevent the total extinction of our venal visitors.

A positive proof of the same thing done during the return of the bay birds from the South in the spring is the great decrease in their numbers that is noticed every year. Some species have almost entirely disappeared. Duck shooting likewise must be limited to autumn and winter; and it is becoming a question in the mind of many whether battery or gun shooting should not be also entirely abolished. It is in some respects a pity that could be done, and it is pleasing to notice that FOREST AND STREAM is ever ready to advise a proper method of remedy.

BALTIMORE DUCKING NOTES.—Baltimore, Md., Feb. 15. It is next to impossible, it would seem, to crush the band of lawless big-gun marauders headed by Barnes. He has paid spies in his employ, who give him timely warning of every movement of our local authorities. It is even intimated that he has a confederate belonging to one of our ducking clubs. It is stated on good authority that the man is known and that strenuous efforts will be used to collect evidence sufficient to cause the arrest of this particularly despicable specimen of pot-hunter and spy. This individual knows that he is under police surveillance and is becoming decidedly uneasy. I understand he is endeavoring to dispose of his skill. Blackhead ducks are beginning to arrive in Gunpowder, Middle and Back rivers. This is a sure indication that the noble canvas-backs and redheads are soon to be among us again for a month or six weeks. During their sojourn in our waters an incessant fusillade all along the line will be kept up against the poor ducks day and night. Your correspondent is himself a spring shooter (as who is not), because it is lawful and every one else does the same; but he would gladly welcome a law that could be enforced imposing a heavy penalty for wildfowl shooting after March 1 in the States of the CHESAPEAKE.

Baltimore, Feb. 16.—Mr. John E. Semmes, attorney for the sportsmen who are protesting against the return of the Susquehanna River, returned from Harre de Grace last night with two more big-guns, which had been surrendered to him by John Day and Edward Barnes, their owners. Day is the uncle and Barnes the brother of Wash Barnes, the chief duck killer of Spesutia Island, and whose gun was captured first when the raid was made by Mr. Semmes and his associates a few weeks ago. Two guns brought back yesterday were possibly his, and he thought them Barnes, while on a visit to Mr. Semmes, in Baltimore, to obtain a return of the fine imposed upon him (and which, it is needless to remark, he did not get), was informed that his two relatives were among a number of others who were to be prosecuted for killing ducks at night with big-guns and snark boats. After considerable palaver they agreed to surrender the guns if their prosecution was not pressed. Mr. Semmes then went to Harre de Grace and brought them to Baltimore. They will be broken up to-day at a junk shop. This makes six big-guns thus far captured. Others will follow. The night gunners are becoming alarmed, as they may well be. Mr. Semmes says he is determined to break up the gang root and branch, and he is accredited with some of the attributes of his uncle Raphael, of Alabama fame. He is informed by gentlemen who spent yesterday at the Gunpowder that the redhead ducks are putting in an appearance slowly, and are exceeding poor. Good shooting is expected by next week.—C. A. P.

THE FLIGHT OF DUCKS.—A correspondent writing from Rutland, Vt., says: "In conversing with gunners as to the velocity of the different birds in their flight, I find quite a difference of opinion. If you or any of your readers can throw any light upon this matter it would be of considerable interest." A series of calculations on this subject was made some years ago by our valued correspondent, Mr. D. W. Cross, of Cleveland, Ohio, the results being published in his "Fifty Years with the Gun and Rod." For the flight per hour of birds in full plumage and at the highest rates of speed, he gives the following estimates: Crow, 25 to 40 miles; mallard, black duck and shoveler, 40 to 50; pintail, 50 to 60; woodcock, 55 to 60; wildgeon and gadwall, 60 to 70; redhead, 80 to 90; big-winged, 90 to 100; redwing, 90 to 100; blue-winged, 100 to 110; canvas back, 80 to 120; sparrow, 40 to 92; hawk, 40 to 150; wild geese, 80 to 90. The distance traveled by birds in a second is given as follows: at rate of 5 miles per hour, .92 ft.; rate of ten miles per hour, 1.83 ft.; rates of 12 miles, 2.2 ft.; 20 miles, 3.66 ft.; 30 miles, 5.5 ft.; 40 miles, 7.33 ft.; 60 miles, 11 ft.; 80 miles, 14.66 ft.; 90 miles, 16.5 ft.; 100 miles, 18.33 ft.; 120 miles, 22 ft.; 150 miles, 27.5 ft.

CANADA CONVENTION.—At the suggestion of several of the leading sportsmen in each province, a committee consisting of Mr. F. J. Boswell, Major H. R. Smith and Mr. W. A. Allan, has been formed for the purpose of holding, if possible, a representative convention of the sportsmen of the Dominion to consider the present anomalous condition of the game laws, and, if thought advisable, to take immediate action with a view to bringing into force the laws of the foreigners, and the export of game, and for the discussion of other matters of interest to lovers of sport. At a meeting of the Central Committee, it was resolved, "That the Secretary be instructed to issue a circular requesting some leading sportsman to call a meeting of the sportsmen in each county in the Dominion for the purpose of electing a delegate to attend a convention to be held at the city of Ottawa on Easter Monday, the 29th of March, 1888." The Secretary's address is Mr. G. A. Gouin, Ottawa.

CAMPS IN THE ROCKIES.—Alpine Club, London, Jan. 31.—Editor Forest and Stream: I have just seen your flattering notice of my Hut on the Camp in the Rockies, "in a recent issue of your paper." Though I much appreciate the "naive and unconscious frankness" to which my reviewer draws attention, I think the instance by which he chooses to prove it, is not one fairly selected. It is the occasion when I approach an apparently dead big-horn ram—in reality he was only "creased"—without my rifle in my hand. This reads fresher than it was, for the leaving behind of my arms was not a matter of choice but one of dire necessity. The narrow and narrowness of the ledge overhanging a deep precipice, along which I had to creep, being of such a character as to oblige me to do so, for a rifle on such occasions when down-right climbing has to be done is a great impediment. I am afraid I exhibited worse instances of "fresh tenderfootedness" in the course of my four years' travel in the Rockies than the one which my considerate reviewer has selected.—Wm. A. BAILEY-GROHMAN.

DAKOTA GAME PROSPECTS.—A sportsman's club has been formed in Deadwood, for the protection and propagation of game. Such associations are needed throughout the Territory. Our vast prairie now swarms in summer time with myriads of wildfowl, yet but comparatively few quail and prairie chickens are to be found. It is advisable that, in order to keep our lands well stocked with small game, that a new code of game laws should be enacted by the Territorial Legislature, which will give increased protection to wildfowl, quail and chicken during the breeding season, thereby preventing the gradual diminution of game birds, which is sure to follow unrestricted shooting time, and around which there is absolutely no law for the protection of wild ducks in this Territory, and they can be slaughtered during the entire twelve months, even out their breeding grounds. It has been the universal experience of all Eastern States that the game supply is rapidly disappearing before the increasing army of sportsmen, and it behooves the lovers of field sports in Dakota to see to it that the same unfortunate results do not follow in this comparatively new land. Dakota is now a vast game preserve, and it is necessary in order to maintain it as such, that stringent laws should be enacted, and enforced for the preservation of game. Heretofore this matter has been of little interest on account of the comparatively few sportsmen residing in Dakota, but now that a grand tidal wave of immigration has set in, and tens of thousands of people are pouring in upon us, sporting matters will soon assume an entirely different aspect. Although it seems hardly possible, to the casual observer, that there is any immediate danger of exterminating the multitudes of wildfowl that now cover our prairies during the warm season, yet we state it for a fact, which similar experience in the East universally demonstrates, that unless restraining laws are enacted soon, ten years from today there will be a marked decrease in the game supply of this Territory. There are but two or three States and Territories throughout the Union but that have laws restricting the shooting of wildfowl, and we should have such a law in this Territory. The best way to handle such matters is not to wait until it is too late, and then endeavor to replenish the stock by artificial means, as all Eastern States are now doing. To push matters it is necessary that organized sportsmen's protective clubs which will take the matter in hand, and present it to the Legislature.—Huron (Dak.) Leader.

DUCKING IN THE ICE.—Norristown, Pa., Feb. 15.—Editor Forest and Stream: I send you the following extracts from a letter received from a friend at Long Branch Club House, Barnegat, New Jersey, dated Feb. 1: "I must tell you of the shooting I had on last Saturday in an air-hole near Sandy Island. I started about eight o'clock with my boat and twenty decoys on the wagon, and drove to the southwest point of the ledge; there put boat on the ice, and as she had runners under her it did not take me long to reach the open water near the island, from where I drove at least five broadbills and redheads. Before I could get out half the decoys they began to come back. I paid no attention to them until all the decoys were out, and the boat covered with ice and my white canvas suit on. Then I got down for business. In the first bunch five came and three stayed; next about twenty came and five stopped; after that not more than four came at a time. Before two o'clock I had over fifty wild with their toes up in and around the air-hole, when, without an instant's warning, the whole field of ice started up the bay. The ice ran over decoys, ducks and all, striking some man and others on the top of their heads sometimes raising my little boat out of the water. By hard work I succeeded in getting all my decoys and thirty-eight of the ducks, and then tried to reach the shore, which I succeeded in doing an hour after dark, about as near played out as I ever want to be. When trying to work through the ice, I passed within twenty feet of seven dead ducks lying in one bunch, but left them 'alone in their glory,' for by then twenty feet toward shore was worth me to me than seven ducks. There was a dense fog and a piercing southeast wind going at the time. I missed but twice during all the shooting, which I think is not so bad for a chap that can't shoot pigeons, and considering that the ducks were going like lightning.—J. K. R.

TENNESSEE GAME NOTES.—Nashville, Feb. 12.—Robins by the million have appeared among us, and the boys are having fine times in firing them. This mode of exhausting the bird supply is to be limited. Thickets, where the little creatures roost, with lighted torches; these blind the birds, and the work of gathering them begins. Thousands are taken in this way, put into bags, and those that are not suffocated by overcrowding are killed on reaching home. Larks in considerable numbers have been brought to market, and quail are abundant. But few ducks and geese have been brought up from Reelfoot, as so people here do not care for them as food. It is astonishing that so few turkeys and deer have been seen here this winter. I have only heard of one or two deer and perhaps a dozen turkeys. The veteran Commodore Wallman told me this noon that he had been shooting last Friday and barged nine English snipe. He and Hermann Burkholz go up the river next week, taking with them a fine large skiff and camping outfit, intending to float back to the city with the quail and shore birds they come in their way. I have often thought that a canoeing excursion up the Cumberland at a favorable season would prove a very delightful trip; but to float down a turbulent stream, as it is now, with rain and cold to add discomfort to the danger, seems to me a foolhardy undertaking.—J. D. H.

IOWA NOTES.—Aulife, Feb. 14, 1888.—Owing to the severe winter we have had quail have wintered poorly—a great many freezing to death. A flock of about thirty last fall I have watched all winter, and have seen them decrease until only one remains, and this solitary quail comes around every morning to a corn-crib the same as the rest of his flock did. It is very probable that quail will be scarce next fall. Pinnated grouse have wintered well. Rabbits plenty, but slow too deep to hunt them without a dog. Snow is melting.—C. B.

MAINE.—A man was recently arrested in Machias for shipping nineteen partridges during close time, and on examination before a trial justice was found over in the sum of \$200 to appear at the April Term of the Calais Court. MICHIGAN.—East Saginaw, Feb. 13.—Quail are being killed by the winter. Some are being kicked up out of the snow and fed by the farmers.—BEX B.

ANOTHER TAMED WILD DUCK.—Latimer, Franklin County, Iowa, Feb. 2.—A year ago last fall a brother of the writer who lives in Illinois had some tame ducks in a small pond about twenty rods from the house. One day a mallard duck came along and lit among the ducks; one of the boys took a gun and went to the pond to kill it, but as it would not raise, and kept among the other ducks, he did not get a shot and left it there. That night the mallard followed the tame ducks close to the house, but when anyone went near it flew back to the water, where it remained until the ducks went back the next day. The following night it got as far as the barnyard, where it stayed, while the tame ducks went to the barn. After a short time the boys succeeded in getting it in the barn, when they clipped its wings. It is still alive, and mates with a small tame duck. Have you ever heard of a similar case?—H. A. C. [Yes, we have published records of several such instances. Wild ducks and wild geese are occasionally caught in this way. In our issue of December 21, 1882, our correspondent J. L. D. of Lockport, N. Y., reported the capture of thirteen wild geese, which during a storm alighted among his tame geese in the barnyard and were driven into the barn.]

THE MASSACHUSETTS ANTI-SPARROW BILL has been definitely postponed.

THE FUR MARKET.

Table listing fur market prices for various skins and furs, including Antelope, Deer, Rocky Mountain, Elk, Western skins, Mountain Deer, Reindeer, Beaver, Lake Superior, and others, with prices in dollars and cents.

Camp Fire Flickerings.

I HAVE read with great interest your recent articles about hunting without a gun. The incident I am about to relate happened to an old uncle of mine living in a small village of the fatherland. He was a peevish kind of a fellow but good-hearted after all, as our alert sportsman as ever pulled the trigger, and a splendid wingshot. One Sunday afternoon he made up his mind to take a walk through his hunting ground, being disaunt only a few minutes' walk from his house. The weather being cloudy he thought he had better take his umbrella along.—It need not be mentioned that the faithful dog Hector never went from his side. A few hundred paces brought him to the open fields. On he went along the stubble-field where a good many bevers of partridges could be found. Passing through a small cover his dog suddenly came to a stiff point, and out rushed a hare of at least ten pounds size. In his zeal, my uncle raised the umbrella to his shoulder, covered the game, and barked away—in his imagination, I suppose, uttering a loud and angry plaintive cry a wounded hare always utters; a moment later Hector had him. Many a hearty laugh we had when the old fellow told us the story how beset that big hare with that umbrella. The merit of this is, that it is a true story and to convince your incredulous readers let me add that the hare had been wounded by some other party, hunting without a dog, which shows that hunting without a gun is by far preferable to hunting without a dog. A. P. New York.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence the office millers of importance are liable to delay.

Foeta naves, non fili. So may it be said of an angler, and once an angler another angler, may be as positively asserted. True, he may have little or no practice with his rod for years, but present the opportunity and the angler is "to the fore," with nerve aquiver for the first cast, and eye ready to mock the gint of the captured fish.—O. W. R., in last week's Forest and Stream.

A TRIP TO NORTHERN MICHIGAN.

NEARLY two years had passed since I had had the pleasure of firing the speckled denizens of the swift-flowing streams from their places of hiding, and the fever was becoming higher and higher still, metaphorically speaking. I was a very sick man, and needed the only medicine which could cure the disease, i. e., a few days' fishing. The FOREST AND STREAM had much to do with the attack of fishing fever, and "Kingfisher's" articles on Northern Michigan were eagerly perused each week. They but "added fuel to the flame," and at last, after much inquiry, which I am forced to confess did not yield much information, I determined to go North and see if some of the wonderful stories told of that region were true. After considerable exhorting and long labor I succeeded in imparting to my friend M., a little of the enthusiasm which I felt myself, and we laid in a fine stock of flies, hooks, etc.—enough to capture "nearly, if not all," the fish in Michigan. I had been advised by a railroad friend to go to the Boardman, but after examining the guide-book of the G. & R. I. R., we concluded to make our first stop at Kalkaska. Leaving Detroit one pleasant July evening on the Potoskey express of the D., L. & N. R. R., we obtained a good night's rest and arrived at Kalkaska between five and six the next morning. Wending our way through the deep sand, which is one of the chief characteristics of that section, to the hotel, which had the word "Exchange" standing boldly forth as a sign, we registered and ordered breakfast. Then I began to look round for a likely person to "back" on the fishing question. How about the promising being in sight, I returned to the hotel and questioned the clerk. He was not posted, but turned to another party and asked him what he thought about it. He said he had not fished much, and did not think trout were plenty this year; thought the best thing for us to do if we wanted fishing was to go to the Au Sable and try the grayling. "That was not of the question, as our time was limited and we had no time to prepare for camping." "How about the Boardman? were there no fish in it?" "Well, there might be a few." "Where was there any fish?"

Just then in walked the proprietor of a lively stable and a companion. They evidently sensed game and drew near. The lively man thought if we wanted trout the Rapid River was the place. How far was it? Oh, ten miles or so; he could furnish teams and his companion could be hired for a guide. Then I began to question a quiet, middle-aged man, here held a sublimed conversation, and he wanted to know. Having made arrangements for starting as soon as possible, we went into breakfast.

This was M.'s first experience in the country, and his appetite was not equal to the "grab" laid out on that table. His "fortiori hope" was the coffee, and when that proved to be anything but what he thought was coffee, it made him weak. I did not take us long to dispatch the breakfast, and after changing our clothes we procured a launch, boarded our demurest wagon and were off. The ride through the pine woods was pleasant, as the morning air was cool, and our ponies trotted along smartly. The road was fair, except very sandy in some places. M. was very much taken with the country, and enjoyed the wildness of the scenery and the novelty of the situation. I tried to improve my time by "pumping" our guide in regard to the fishing in the country. He had been to the lake the first party over to Rapid River. They were from Chicago and out on a lark. The guide did most of the fishing, but at that time it was no trick, according to his story, to take from thirty to fifty pounds of trout in a day's fishing. He admitted, though, that now trout were not as plenty. I showed our guide my stock of flies to get his opinion, and was not very much chafed to hear that "they" used worms mostly and "fin," I. But you don't find worms up here in Michigan, I remarked. "No," they had to send below for them. He had relatives at Royal Oak (a few miles from Detroit), who sent him a box of worms every year, and he sent them a box of trout. This was the first time in my experience that worms were of so much consequence.

Our ten-mile drive lengthened into twelve before Catton, our guide, concluded he had reached the spot he wanted. We stopped, unhitched the team and prepared for business. Catton took a small bottle from his pocket and proceeded to anoint his neck, ears, face and hands. "What's that?" said M. "Skecterizer, I call it," replied Catton; "you fellows better try some." M. was a little fastidious and thought not, while I concluded to brave it out. As a boy, I had tramped the upland salt meadows of New Jersey, the home of flying, biting pests, and never had to use "dope," so I thought I could stand it. Whether my skin was thicker in those days or whether Jersey has been basically changed I will not attempt to argue, but before the morning was over I wanted some "Skecterizer," and like the old chap in Texas with his revolver wanted it "blunk badly too."

This being M.'s first experience I told him to keep with me, so we walked down to a bridge that crossed the stream near where we stopped, and I climbed out on a log and dropped my fly. M. took the other side of the bridge, and under my instructions tried several likely looking places, but nothing and he was about to give up when I made the fish. I was more successful, for I managed to entice a small trout from beneath a log, and after one or two false moves hooked him. M. looked at the little fellow a moment and turned up his nose. "Pshaw!" said he, "might as well catch minnows at the St. Clair Flats." M. had been there the summer before and had, by chance, when out bass fishing, hooked a minnow, not in the month, but in the side, and after making a mistake he got a trout, not a bass. Whether he expected to find thirty-pound fish in Rapid River I do not know. One thing I do know, that is, that trout fishing had no charms for M.; he said he would stay at the bridge and I could follow Catton down stream. I did so.

Of all the streams I ever fished this was the worst, fallen timber, brush, undergrowth and flies. Mosquitoes, gnats and hidden holes, tumbling along seeking a clear spot where I could drop my fly, but finding few. I kept bravely on for about an hour, but giving up with a sigh. He had crossed the stream, and was wading some of the time. To the call, "What luck?" he replied, "Poor, never saw the time front bit so poorly over here." I agreed about the trout, but wanted to inquire about the flies. He had to acknowledge they were bad. Catton said I had better try "worm," as it was of no use trying to fish with a fly, the stream was so rapid and full of logs, brush, etc., that there was no chance to cast, besides, the trout would rise. "You must sink out your sinker, and use a cork," said M. "I did not happen to have any split shot for a sinker, and was forced to continue as I had begun."

It was now nearly noon and I proposed that we go back to the wagon for lunch. This Catton agreed to, as he "loved that after the sun began to sink a little the fish might bite better." So we tramped back through some pretty tough woods to the wagon. Here we found M., who had given up fishing and was now killing time and flies the same time. After lunch Catton proposed that we go down the river again about two miles and he thought there we would get some fish. M. said he was not inclined to be pigzich, he had enough; in fact, a little went a long way with him. I had come to fish, and so, telling Catton to lead on, I followed. Our experience of the morning was hardly improved upon, and after a tiresome tramp and very poor luck I voted a start for home. Catton was not satisfied, and he said "I had never had such poor luck on the river before, had often taken a basket full and not fished on half the ground we had." This was fine consolation for me, of course.

We wended our way to the wagon and counted our spoils. Catton had forty and I had eleven trout, most of them small. Of course he had the advantage of me knowing the stream and the best places, but, laying that one side, the worms, not the fly, did the fishing. I think all I can say is that all the trout streams that that description can be fished with any success except with bait. Although it looks very nice on paper to advocate nothing but scientific fly-fishing; it makes any man feel better contented with himself and the world at large to take a fair amount of fish, even if it must be done with the despised worm. So let any one who goes to Northern Michigan go prepared to fish with bait.

Our ride back to Kalkaska was pleasant, and we arrived there soon after dark. M. concluded he liked to eat trout if he did not care to catch them, and he did full justice to those prepared for us at the hotel. The next morning we were up early, ready to take the north-bound train for Potoskey. When we arrived there it was raining as if a second flood was upon us. By a bold dash we got from the train to the Arlington House, where we sat down to the first "square meal" we had enjoyed since leaving Detroit. M. had never been to Mackinac, and concluded he would leave me at Potoskey and go on to the island. I had been there, and was very anxious to go through the small lakes and try the fishing. So I left the train at Odin, where it connects with the little steamers that ply from that port to Cheboygan. The rain still came down, and after I had reached the "City of Cheboygan" (the steamer was named for the city at the other end of the route) I almost regretted that I had not gone on with the other party. I had a fine party of about thirty Indians came on board, bound for the huckleberry pastures at Indian River. They had their bedding and household utensils, and filled the cabin to overflowing. I put on my rubber coat and sought the fresh air of the deck.

A sail through this chain of lakes, which with its connecting rivers, passes across the State of Michigan from Lake Michigan to Lake Huron, would be delightful on a pleasant day, and I would advise any one visiting that region to try it, but take more advice at the same time, and wait for a pleasant day. There were several young gentlemen on board, who were camped on Indian River, and three others who were going through, one of them had a 32-caliber rifle and the party amused themselves by popping at every living thing they saw. One gentleman (the owner of the rifle) was a capital shot, and after he had dropped a kingfisher that was on the rocks, he fired one of his friends remarked "that settles it; did you ever see a Kentuckian who could not shoot a rifle?" At Indian River the Indians left us and also the campers. We could see their white tents from the boat and they did not look comfortable in the rain—too much dampness is not conducive to comfort when camping.

Passing through Indian River we came into Mullet Lake, and upon rounding the point the Mullet Lake House was before us. The location is good. I mean it is good for a nice place to stop if anyone wished to be away from noise and confusion, and to any person who wants to try the country in this part of Michigan I would recommend a stop at Mullet Lake. There were very few people at the hotel, and I understand it has been a losing investment. The location is good, but there is so little to attract the multitude, and it is so out of the way, that the chances are it will never pay. When I say the location is good, I mean it is good for the place, being on high ground, with a fine view of the lake, and admirably situated in case of fire, as a bridge leads from the top story to a high bluff just back of the house. Boats, a steam yacht and the daily steamer, make it very convenient to get away from the place, as Indian River station in the Mackinac Division of the M. C. R. R. is only a short distance by water. I was told the fishing was fine in the lake, and at the head of Indian River, so I concluded to stop over night.

After dinner I secured a boat and went trolling. Had great hopes of catching such a fish as "Kingfisher" tells of in the FOREST AND STREAM, but did not succeed in getting anything but pickerel. Bass were not biting. I saw only one caught while there—a "small mouth." Plenty of sunfish can be taken up the river, and pickerel also. Trips can be made from the hotel to the trout streams, but they are too far away to be of much moment. In the fall the shooting can be had—as the ducks come up in great numbers, and later deer and bear are to be found near—but the hotel is closed at that season, though no doubt some arrangements could be made for a party. The weather turned cold suddenly and a cold storm set in, the second day of my stay, and I concluded to move on, as there was no fishing to be thought of in the wind and rain. Every one in the hotel was in a hurry to get away, and the steamer was set going. Not much July about the weather, more of October. The next day when the Queen of the Lakes (the companion steamer of the City) arrived I was glad to leave. We came in a storm and departed in one. News was brought by the down steamer that Cheboygan River was jammed

with logs—another pleasant prospect—and when we got there we found it was, but managed to get through them, over them, or around them—in some manner. As Cheboygan I took the Mary, a staunch little vessel that runs in connection with the Inland Lake boats for the island. It was a nasty night and I thought I would get shaken up before getting over, but the wind went down before we got out of the lee of the land and I was not called upon to pay tribute to Neptune. It was late when we arrived at Mackinac and I had the misfortune to just miss M., he having gone back to Potoskey. I followed the next morning, not caring to stay long on the island.

Now I want to make a few deductions from my experience, and even at the risk of drawing down upon my devoted head the wrath of "Kingfisher" and some other whose articles I have read in the FOREST AND STREAM, I shall say a few things not complimentary to Northern Michigan, but as I understand the FOREST AND STREAM is open to the views and ideas of its contributors without inordinance of them, I will risk destruction, as I do not jeopardize myself excepting myself. First, the attractions of Northern Michigan are overrated, because the flies, mosquitoes, gnats, etc., are too plenty for comfort. The streams are too full of logs, the underbrush too thick and the swamps too tangled for pleasant, and in some places for unpleasant passages; there is too much rain and too much dampness. Any one who has camped out or lived much in the open air knows that of all the miserable places is camp in wet weather. If the climate is only dry, many other disadvantages can be overlooked, will not deny that there are plenty of fish to be caught in the lakes and rivers; but taking other things into consideration, the fish are not so much more plenty to make up for certain disadvantages. At St. Clair Flats, near Detroit, a person can catch as many fish and at less expense (excepting trout). And for trout, "go west, young man," way west. For camping, do likewise. I remember hearing an old chap, who had not made his state of Colorado: "There is only one thing that blurs the country is good for us campers." The accessibility of Michigan is the only point in its favor, and of course that is a great deal; but to those who can afford both time and money, they can spend both to better advantage elsewhere. "That's my sentiments."

PIRIARIE DOC.

ILLEGAL FISHING IN LAKE CHAMPLAIN.

A HINT TO THE VERMONT FISH COMMISSIONERS.

Editor Forest and Stream:
While engaged in studying the Ichthyology Fauna of Lake Champlain I became cognizant of certain facts, concerning the illegal taking of fish from its waters, that are of grave import to the inhabitants of the adjoining country, both in the States of New York and Vermont. There are several of the principal market fish of Lake Champlain are: Perch, *Perca americana*, Schrank. "Wall-eyed pike," *Stizostedion vitreum* (Mitch.), J. & C. Black bass, *Micropterus salmoides* (Lac.), Gill. Pickerel, *Esox lucius*, L. "Lake shad," *Coregonus clupeaformis* (Mitch.), Milner. "Miller," *Alosa maculipinna* (Les.), Jord. "Mill-pike," *Alosa melanostomus* (Thompson), Nelson. East, *Alosa melanostomus* (Les.), J. & C. Sturgeon, *Acipenser rubicundus*, LeSueur.

The above list is not supposed to include all the food-fishes of the lake, but those that are commonly sold in the markets. Of these, the pike, black bass, pickerel and "lake shad" are by far the most important, each averaging from 3 to 6 lbs. in weight, and retailing at Plattsburg for 12 cents per pound. A few bass are taken with the hook and line and some are speared; with this unimportant exception all the market fish are caught in nets. What is here known as "lake shad" is a true whitefish, equal in every respect to the whitefish of the Great Lakes. How it came by its local name I cannot imagine, unless because of its superior flavor and the absence of shad in Lake Champlain, the early inhabitants thought they would do it honor by giving it the name of one of the most esteemed of the food-fishes of the world. It frequently attains the weight of 8 lbs., and individuals of some size taken that turn the scales at 10 and even 12 lbs. The perch are small and sell for ten cents per dozen. The "millie" averages from 2 to 6 lbs. in weight, though sometimes growing to be much larger, and retails for six cents per pound at Plattsburg. The bull pout weighs a pound or a little over, and sells for eight cents per pound dressed, or twenty cents per dozen fish, undressed. The cels average from 2 to 4 lbs. and sell for 20 to 50 cents per dozen. The sturgeon weigh from 20 to 100 lbs., each, and bring, at Plattsburg, ten cents per pound dressed, and eight cents undressed. Many are speared every spring when they ascend the river to spawn. They run up the Missisquoi with great regularity about the 24th of May, but the dam at Swanton (Vt.) prevents them from reaching their old spawning beds; hence, after remaining less than forty-eight hours, they return to the lake. When the spawn is deposited they are so fat that they are unable to ascertain. On the 24th of May last a millie measured one from the bridge at Swanton that weighed 89 lbs., measured 6 ft. 1 in. in length, and contained a bucketful of spawn. Several others were killed in the shallow rapids under the bridge at this time. The next morning sturgeon were seen sporting "like porpoises" in the deeper water below, after which they immediately returned to the lake. When the dam at Swanton was built, the sturgeon were taken that many of the inhabitants seek spears in readiness for them, and I am told that they rarely vary more than a day or two in the time of their appearance.

The only fish markets of any consequence on Lake Champlain are at Burlington, Vt., and Plattsburg, N. Y., the fish selling for a trifle less on the Vermont side. The hotels do not generally patronize the markets, but purchase direct from the fishermen. Practically, all the fish are taken in nets, and those caught after the first part of April come mostly from certain parts of Grand Isle, which belongs to Vermont. But the wholesale slaughter takes place earlier than this. In March and April seines are set to catch the fish upon and on their way to the spawning beds. Last spring (1892) there were six large seines in the Missisquoi River below Swanton. Few escape to deposit their spawn. One of the fishermen's method is practiced in other rivers, and an crab-bait is formed that is used in the same way. Last spring, from thirty to forty barrels of fish are shipped daily from the north end of Lake Champlain alone. Most of them go to New York. Inquiries at Rouse's Point disclosed the significant fact that an average of twenty-five to thirty bar-

rels pass through that place daily "for a period of at least five weeks in the months of March and April." In the spring of 1878 twenty thousand pikied in a small pond in which they were placed to await "a raise" in the market price of herring. As a result of this scandalous depletion of the spawning beds has already made itself felt, and fishing with the hook and line is no longer practiced in places where it used to prove very remunerative.

I feel confident that the above facts, however appalling, constitute but a half-told story—that the enormity of the crime will never be fully known—and it is sincerely to be hoped that the proper authorities will spare neither pains nor cost in bringing these outrageous slaugthers to a speedy termination. The food fishes of this magnificent lake are of too great value to the inhabitants of its shores to be sacrificed for the benefit of a handful of worthless outlaws. The time for action is now at hand.

C. HART MERRIAM, M. D.
LOCUST GROVE, N. Y., Feb. 15, 1885.

MAINE NOTES.

Editor Forest and Stream:

A short visit to Augusta a few days ago, satisfied me that the present Legislature is alive to the demands of the public for laws which will be more protective in regard to fish and game.

The Chairman of the Committee on Fisheries and Game, Hon. J. H. Kimball, of Bath, is himself a lover of field sports and the angle, is deeply interested in all of these matters, and is a gentleman of ability and culture. Also Hon. G. W. McAllister, of Bucksport, of same committee, Hon. A. G. Lebeck, of Foxcroft, and many other prominent members of the Legislature are anxious to do all in their power to further these important interests and enhance the rapidly increasing business of the people of Maine, which is the result of the "summer travel."

This committee have reported several bills which will doubtless receive a favorable passage in both houses, and which will mark a new era in the protection of fish and game in this State.

Among them is the repeal of that terrible nuisance called the "Tank Pond act," amending the law relating to the disposition of the fines and penalties recovered for all violations of the game and fish laws so that one-half will go to societies which will use the funds for the propagation of trout and salmon instead of to the county as now, thus saving the people the expense of repelling such lakes and ponds which he lawlessly depletes, restricting the transportation of trout and salmon beyond the limits of the State at any time of the year, conferring upon all sheriffs, deputies and constables the powers and duties of game and fish wardens, etc.

The friends of protection to the Maine game and fish may hope for a new order of things here if the bills reported by this committee become law. J. F. S.
BOSSON, Me., Feb. 10, 1885.

POSITION OF REEL—WEIGHT OF RODS.

I WILL make a reply to Dr. Henshall's letter in FOREST AND STREAM of February 8, but have no desire to enter into a wordy war with him, nor with any other person. My remarks to Mr. Jordan, which roused the Doctor's wrath, were intended to instruct one who claimed to be a novice. If any one cares enough about it to look over Mr. Jordan's letters, as published, he will find me praising a rod "unsurpassed on earth," and at the same time acknowledging that it was the first bass rod he had ever used. His lack of skill is managing a reel placed behind his hand, the only fit place for it on a light reel, led me into writing for his "enlightenment."

If Dr. Henshall has not been an advocate of heavy rods then the inferences were wrong which I and others have drawn from the last of his voluminous correspondence between himself and Mr. Van Sicken, when both those gentlemen seemed to forget what was due to those who honestly differ with them. The tone of his last letter wherein he belabors me and hurls epithets at my "ignorant" head, led me to decline to answer it at first, but that course might lead him to think that he has effectually silenced me.

In our striped bass fishing we use the reel in front of the hand and cast a bait of any size from an ounce to an ounce and a half, with a stiff eight-foot rod. All who have cast in this manner know that when Mr. Jordan casts "a half-grown bream," or Dr. Henshall tells in his book of casting an ounce-and-a-half minnow, that it takes a stout rod to do it. When I answered Mr. Jordan that "for the style of fishing that he aims at he is right in placing the reel in front of his hand," and again when he asked how one can cast a minnow "4 to 6 feet" with any rod, and I replied "as he could not, I then saw that this style was the height of his ambition and that he looked up to the Doctor as the father of all bass fishers. My reply was intended to mean "enough said, if that is what you want it will suit you." It does not suit me to throw an ounce-and-a-half minnow at a black bass, with any sort of tackle. If it pleases Mr. Jordan and Doctor Henshall to have no objection, only they should not attempt to enlighten the worthy "novice" in a delicate manner. The splash of a "half-grown bream" may be music to some anglers while to others it might arouse of coarse fishing.

I am not ignorant, as far as reading goes, of the style in which Dr. Henshall fishes, and, begging his pardon, I do not like it. I claim the right to have opinions and to express them. I have read some of the Doctor's writings, especially his "Around the Coast of Maine," and I cannot say that I admire the style with which he treats those who dare to differ with him. His book may be of value to an ichthyologist—that I do not pretend to judge—but it is badly defaced with advertisements in the reading portion, and will never rank high as an authority on bass fishing. He makes long scientific distinction between the two species of black bass, and then writes of taking them as if they were all one. The stupid big-mouth appears to crush him as much sport as the quick-fighting small-mouth.

I did not intend to go into such a criticism of the worthy Doctor, and will not again reply to what he may have to say. In his last he charged me with "false hypotheses, wilful assumptions and gross misrepresentations." A week has passed and he has not forwarded any apology for the language, so I will ask the readers of FOREST AND STREAM to please excuse him, he will feel better some day. I certainly hope that he will find none of those terrible things in this answer, and will settle down to the belief, however much it may hurt his self-love, that at least one man who claims to be a fair bass angler does not think that the highest style of the art is "4 to 6 feet." FLORIDA.

BAIT-CASTING IN NOTTINGHAM STYLE.

WE have received a book entitled "The Nottingham Style of Float Fishing and Spinning," by J. W. Martin, (the "Trotter Otter"), published by Sampson Low, Mars-ton, Searle and Rivington, 188 Fleet street, London, E. C. This is something which we have been desirous of seeing because we have heard so much on the "Nottingham style" of casting at the English tournaments, and had an idea that as the cast was made from the reel it was similar to our sea coast or "Cuttyhunk" style. A picture on the cover shows a man casting with the reel on the under side of the rod, and with his right hand below the reel, checking it on over-running with the forefinger. Other cuts show that some line is pulled off before the cast, as in fly-fishing, and one figure shows two such loops "in order to make an extra long cast." This would point to the use of a much poorer reel than our coast fishers use, which run like a fine watch, without friction.

The book is devoted to what in England are termed "coarse fish," a term which includes chub, barbel, roach, perch, bream, carp, tench, dace, gudgeon, etc., and has a chapter on pike fishing. In reading of the "Nottingham" style of fishing we learn that the rod is as light as possible and a spring is put in that will hook a roach by a single turn of the wrist and will reel in a fish. It is made of three joints, the butt is red wood, the middle piece of the same wood and lancewood spliced together about one-third of the distance from the top ferrule, and the tip is made entirely of lancewood. It is a little over twelve feet long. They are sometime made in as many as six pieces, but the author wisely prefers three. The reels are usually of wood and are in two pieces; the barrel of the reel turns upon a spindle in the center and spins freely. Fine silk lines are used, floats of quills or cork, and a gut casting line completes the equipment. After casting in ground bait and having baited his hook the author says: "We will now suppose the swim the angler has selected is from twenty to thirty feet from the bank, and he is fishing with very light tackle, too light to be cast from the reel (for the reel would not be so light as a spring cast), and he will cast a light weight and that he cannot coil it upon the grass at his feet, or allow it to hang loose from the reel; the fine line he is using would twist and tangle it up. He cannot reach the swim with the rod, and what line there is hanging from the point. What is to be done? A Nottingham angler holds the rod in his right hand, and with his left takes hold of the line as high up the rod as he can reach, and draws it down as much line as he requires. He then has some four or five yards of line in his left hand, and with it hangs from the point of the rod. He can throw the distance he requires, which he does by bringing the rod away from the river at about an angle of 45°." He then sends the point of the rod smartly over the river, at the same time letting go of the line he held in his left hand, the line will now go fair and neatly to its destination without tangle or catch.

Again we are told "if the Nottingham bottom fisher uses a cork float and a heavier tackle, he mostly throws his bait from the reel, that is in a manner somewhat similar to jack spinning. He winds up the line until the float nearly touches the top ring of his rod, and then gives it the desired swing over the river."

Illustrations of the several fishes are given, but they are not very good, being much like those in Walton's Directory, are given for taking them, and the floats and hooks are shown also. The price is two shillings.

McCLOUD RIVER TROUT.

I N answer to the very interesting article on McCLOUD RIVER trout by Mr. Livingston Stone, in FOREST AND STREAM for Feb. 1, permit me to offer the following:

So far as the collections sent to the National Museum permit us to form an opinion, there is, in the Upper Sacramento, but one species of black-spotted trout, and this species is *Salmo gairdneri*. There is also a red-spotted trout or char, the so-called "Dolly Varden," *Salmo gairdneri*. The small or "finny" trout of the mountain brooks, is, we think, the same species as the river trout, and Mr. Stone seems to be quite right in supposing that the "younger and smaller trout affect the brooks and the larger and older trout prefer the river." In many streams, where food is scarce, or conditions unfavorable, this species reaches, when full grown, only a very small size. I obtained specimens in the San Luis River, in California, and they were, as far as largest of them were not weigh three ounces. We suppose that if these little trout were transplanted to the McCLOUD, their progeny, at least after a generation or two, would be large like the McCLOUD River trout, while the latter would certainly be dwarfed if removed to the San Luis River.

As to the scaling of the two forms. I find no real difference and doubt if any exists. The fineness of the scales in the brook fishes is evident to the eye, but there is no difference in the numbers, either lengthwise or crosswise, when we come to count them. Mr. Roosevelt is quoted as saying "that the distinctions between the McCLOUD River and the mountain trout are quite apparent to the eye," and "that there is some difference in their habits." Both these propositions, I grant. The first is dependent on the second, and the second is due to the necessities of the case. Change the surroundings and the apparent differences will disappear, and these differences are apparent only, not affecting any of the specific characters of the species. These remarks are based on the supposition that the National Museum has a full series of McCLOUD River trout. If this supposition is erroneous, we stand open to correction and conviction.

The *Salmo purpuratus* of "Clarke's trout," the common trout of Washington Territory and the lakes of the Cascade Mountains, and etc., is quite different from the rainbow trout. It grows much larger, has a much larger mouth, and is, in my opinion, altogether a superior animal and better worthy the attention of fish culturists. It can be readily distinguished from the rainbow trout by its more numerous (i. e. smaller) scales, there being about 130 in a lengthwise series instead of 130. When fresh, there are two crimson blotches on the under side of the lower jaw. This is an excellent mark for distinction for one who does not like to take the trouble to count the scales. The famous trout of Lake Taloo is a variety of this species. A few specimens have been taken in the Lower Sacramento, but the species has never been traced up to the McCLOUD. DAVID S. JORDAN.

INDIANA UNIVERSITY, Feb. 13, 1885.

A NEW SHARK.—Last week Mr. Blackford received a telegram from Prof. Baird asking him to attend to forwarding a large basking shark caught at Amagansett, Long

Island, and shipped by the lighthouse keeper at that station. This is an early response to a request by the U. S. Fish Commissioner addressed to those in charge of life-saving stations, to report to him at once at Washington the presence of marine animals on the coast—such as whales, porpoises, blackfish, grampuses, etc. which may be stranded on shoals; also, to inform him of schools of mackerel, menhaden, bluefish, porpoises, or blackfish making their appearance after tolerably long intervals along the coast. This letter has been indorsed by S. I. Kibblin, the General Superintendent of the United States Life-saving Service, and keepers and crews at the various life-saving stations have been notified to comply with the wishes of the Fish Commissioner. The fish arrived at Mr. Blackford's sand beach with much attention. It was not the basking shark, as supposed, but a strange one, and proved to be an entirely new species of shark, inasmuch as it is the first specimen caught on our coast. It has been found, so far, only in deep water off the Portuguese coast, and is known as the *Pseudorhynchus moribundus*. The shark was 9 feet 6 inches long and weighed 180 pounds. The mouth was without teeth, and placed underneath quite distant from the snout, and had the ordinary shape, full of the shark, but its dorsal fin is not more than five inches high from the dorsal line. This shark had been heretofore known from a single specimen described by Capello, in 1867. Dr. Bean states that the teeth are no longer than those of the common skate, and have three points. The taking of this rare specimen is the result of the request that the Life-saving Service should communicate with the United States Fish Commission in regard to fish of strange appearance which might come under their notice.

OHIO.—Windsor, O., Feb. 14.—We have been catching quite a number of muscogone in a stream known as Grand River; it runs through Ashtabula county and empties into Lake Erie at Fairport Harbor, Ohio. We commenced trolling for them about two years since. They are not plenty as we scarcely ever get more than three or four in a day. —S. S.

LORENZO PRUTY.

At the last meeting of the Massachusetts Fish and Game Protective Association, the following resolutions were adopted:

RESOLUTIONS.

By the death of Lorenzo Pruty the Massachusetts Fish and Game Protective Association has lost one of its earliest and most beloved members; and it is fitting that it should pause in its work and express its appreciation of the worth of the character, and respect to his family in this, their hour of affliction, the sympathy and sincere sorrow felt for one whose presence at its meetings and at his place of business was a joy and sunshine to all who knew the simple beauty of his life, his truthfulness, his helpfulness and his kindness of heart. Therefore be it

Resolved, That this Association, admiring his noble qualities, his fondness and enthusiasm for those innocent and healthful pastimes, which he his companions and friends prized in union with him, bow in humble submission while we deplore the sad and sudden ending of a life, that, though about to assume greater cares and responsibilities, would, if it had been prolonged, have filled a larger sphere and developed into greater usefulness and happiness.

To her, who has shared with our departed friend the duties and pleasures of life, who has been his fond companion in his journeys to lake and stream, ready at all times to rejoice in his success and sorrow at defeat, to her and to the one whose pride and joy it was to call him father, to those whose happy home was by his bereavement been desolated,—request upon that writing, through his bowed and reverent hands, unwilling to intrude upon such sacred grief—we bear our consolation in the sweet and hopeful lines of our own beloved New England poet:

"We see but dimly through these mists and vapors.

And these earthly damps

What seem to us but sad funeral tapers

May be Heaven's distant lamps.

"There is no Death! what seems so is transition!

This life of mortal breath

Is but a suburb of the life elysian

Whose portal we call Death."

Resolved, That a copy of this tribute be read upon the records of the Association, and a copy sent to the family of our deceased associate.

CARP AND MOSQUITOES.

DOES the food carp feed on the mosquito in its larval form of "wiggler" and "tumbler"? From a fact that came under my observation last summer I am decidedly of the opinion that they do. My carp ponds, four in number, are located in Ocean county, N. J., in the cranberry region, where, as is well known, mosquitoes do abound. Three years since I constructed a pond of about five-sixths of an acre but a short distance from my house, and was not mistaken in my supposition that this would not tend to diminish the supply of mosquitoes. Last May I placed in this pond a few carp, received from the Government the preceding autumn. In August last, when bitter complaints were uttered all over the country at the abundance of mosquitoes, we had very few, so few indeed that my attention was arrested by it. Beside, some carpenter in my employ at the time reported that while on their way to my place they were "nearly eaten up" by the mosquitoes, but when they reached my place they were annoyed by them. So I am inclined to place carp among the benefactors of our race. The female mosquito, as is well known, deposits her 250 to 350 eggs on the surface of quiet water. These hatch out in a few days, and are known to many country people as the "wiggler." In ten to fifteen days these are changed into "tumblers," in which form they remain from five to ten days, thus spending from fifteen to twenty-five days in the water before they have become fit to fly and acquire their musical and phlebotomizing capacities. The carp doubtless find their larvae most palatable tidbits, that are greedily sought after. In one particular the chosen habit of carp and mosquitoes are alike, both delighting in quiet waters.

By the way, my carp did reasonably well last season, notwithstanding the circumstances under which they were placed were anything but favorable. Many millions of them were lost in the last week of the season, but the Government had last autumn a year, when changed to a larger pond in October last I found them to vary from twelve to fourteen and a half inches in length, and to average about one and a half

BOATS.

THE average yacht's boat is a cranky consumptive affair, distinguished for lacking in the very qualities most to be expected, and not entitled to admiration unless in the light of a poor copy of a Whitehall wigger boat. The tenders and gigs slung to spiderweb davits aboard most our yachts provoke a smile and compassion when trying to reconcile their gaudy race boat build and the hard service a yacht's boat is continually undergoing. As in the vessels to which they belong, speed, and speed only, has been aimed at by the talent in the river trout shop, and this with a coat of bright paint, some fancy fixings thrown in here and there and a name displayed in huge letters on the sternboard, constitutes the standard universally accepted. Real worth, adaptability to purpose, the yacht's boat of the present has next to none at all. She is narrow, high-bilged with much dead rise, great sheer, low waist and small carrying capacity. She pulls easy and fast, but neither is wanted and should be kept secondary in scheming out her form. As a consequence our tenders are dangerously tippy, easily swamped, can stow very little, and as life boats to escape from the yacht, to effect a rescue or to assist some one in distress they are beneath contempt.

The first thing an ideal yawl boat or tender should possess is swiftness and dryness. To this end she must be wide, have long, flat floor, small draft and little weight, and above all be high in side, and ahulls quite as well as in the ends. She must be well put together of light stuff accurately fitted, clinch-fastened with copper throughout. Her stern must be kept broad to carry the bearings well aft. She must be fuller in form than usual. Finally, if possible, air chambers and various minor provisions of a lifeboat should be incorporated in her construction. The next thing to be sought is good carrying capacity. A tender is used for the conveyance back and forth of skipper and guests, often also for carrying ice and stores and water, sails and gear, and room and buoyancy are therefore more essential than a fancy mold for speed. In short, swiftness and not speed should be the dominating consideration. In large yachts swinging a number of boats, one devoted to show and speed as a fancy gig, may be permitted, though even then the number available in case of disaster is seriously diminished, for the average schooner's gig could hardly be depended upon in ugly weather or in a line of breakers. A small iron centerboard is always a useful appendage, and if placed well forward partly under one of the thwarts, will not be in the way and often contribute to boxing about harbors, or save labor when anchored a distance off.

For very small yachts an additional feature must receive attention. To tow a yawl boat is tedious and damaging to property. Hence a form must be adopted which can readily be stowed on deck without sacrificing stiffness and good service. This is no easy thing. As a solution we offer this week some general cuts of a peculiar hull building by Stephens for the four-ton Aneto. This plan is a cross between the canoe and "sloop boat," the object being to obtain something narrow enough to fit into the yacht's gangway, ready for use at all times and also stiff and safe. The features of this boat are a "shovel nose" to facilitate towing when preferred, rather small beam, well held deck and aft, long flat floor, quick bilge and high side with a light deck and coaming gun fashion. The shape of the molds at three cross sections are shown by the dotted lines.

She is 9 ft. long, 2 1/2 ft. wide, 1 ft. deep in center with a sheer of 2 in., and supplied with an iron centerboard and triangular sail 7 ft. on foot, head and leach. The board is of 3/4 in. boiler iron with 1/4 in. vertical drop. The sail is set upon a short stump pole after the plan of the Lord Ross lateen for canoes.

A boat of the ordinary style, but extremely serviceable, we also illustrate with two diagrams. From these it will be seen she possesses great width, with long, flat floor and high sides, tumbling home at the stern and along the side. This tender belongs to the three-ton cutter Teal, and is remarkable for the load she carries and for her stiffness, which makes her a more reliable and useful adjunct than many dingies twice the length. She is only 6 ft. 6 in. long over all, with an extreme beam of 3 ft. 1/2 in. Her fault is towing heavily when sailing fast, and the difficulty of stowing on deck on account of her width. But, on the whole, she is much nearer what a tender ought to be than the crazy imitations of the Whitehall boat.

Collapsible or folding boats there are innumerable. Few of them can be recommended as they are crank and complicated. The objection to their use lies in the fact that when wanted in a hurry they have to be expanded at a loss of time which may be very precious in serious cases. The best style of folding boat, occupying the least room when stowed and the simplest and quickest to put into shape, is probably the new model now being perfected by the Osgood Manufacturing Company of Battle Creek, Mich., which we hope to speak of more in detail at an early day. That such a boat is wanted by the owners of small yachts we know from the number of inquiries reaching us, and we believe the new Osgood will supply the long-felt want.

FIRST IN IOWA.

Editor Forest and Stream:

We organized a canoe club in July, 1882, for which we claim the first honors for Iowa and we are now organizing the Iowa Canoe Club as a State association, of which you will receive notice in due time. The club formed last year we call the Potowomoc Canoe Club, of which the following are the officers: Commodore, Dr. John Rix; Vice-Commodore, M. O. Warner; Treasurer, Chas. H. Peters; Secretary, Will H. Ailee.

FOUR MAISON, Iowa.
W. H. A.

[The future of canoeing in America is assured. The sport appeals to every one within a stone's throw of any kind of water. Few there are in America who cannot reach a streamlet, river, lake or the sea within a short walk. The Iowa clubs will be welcomed as additional members in the great family, and to their enthusiasm in a good cause we look for many new swimmers of the hides, now over from people who now fight shy of the water like old hens.]

NEW YAWL.—Commodore Wynn, Jersey City Y. C., has a very handsome model, made by Snelgrove, for a yawl 30 ft. on deck, 26 ft. load line, 10 ft. beam and 4 1/2 ft. draft, from which he intends to build in time for the season. The boat is a keel, will have outside weight and yawl rig.

A SPORTSMAN'S VIEWS.

Editor Forest and Stream:

It would hardly occur to you that an old still-hunter and canoeist would be the man to follow most closely the controversy between catboat and cutter, shoal water and "outside" cruising. But no man has more closely followed your articles, diagrams and arguments, than the present writer. As regards the deep, narrow cutter, you are well right. A catboat has no business beyond the lightship. A cutter like the Neva—well handled—ought to be able to double Cape Horn.

And you discount the catboat too heavily. She is the result of our peculiar waters. "Take your eye and throw it along" our coast line from Maine to Florida, tell me just how many thousands of miles you count up of sounds, bays, inlets, etc., etc., all safe inland cruising, so to speak, and all most delightful pastime for the outer, who doesn't care to risk gales, cyclones and other manly and energizing chances that are quite likely to drown him. The catboat—the "skimming dish"—is just the boat for these pleasant inland waters. She is not a deep sea cruiser; she is the natural result of a natural demand, and of course the thing is overdue. She is not a deep sea cruiser; she is always over-spurred and over-laden with canvas; she is backed up for outside cruising by her admirers, and she does better there than an old sailor would expect. But her place is sounds, bays, quiet waters. There she has no superior—even in a race. But don't take her to sea, unless you are insured for more than you are worth. And yet, knowing these points years ago, I was within an ace of starting for the Amazon River, in June, 1850, in a Perry Bridge catboat. I think, cutting her rig down more than half, I should have made it. Even now I am sorry I did not try it. On the Amazon she would have been a model cruiser; and I should have tried it, only "bully Charley Coleman," one of the original crew of the America, backed out at the last moment.

He said: "We can get through easy enough, but look at the comfort of the thing, cooking, eating, sleeping—and forty days of it at that."

I went down to the Amazon in the Ed. Burnett. Coleman sailed as mate of the Gersh Banker. I think yet he would have done as well to stick by me. I have not seen him since. I only wish I had a title of the money that some fortunate fool spends yearly on wine, woman and horse. I would take a cutter of the Neva type from New York Bay to the Amazon, make a two years' cruise on that river and its tributaries, come home, and make a book.

(It would really outfit a man to that much.)

But brains go one way, money another.

I suppose I must content myself with a cruise in a tea and a half pound canoe next summer, which is quite as risky as a cruise in a cutter on the outside passage to South America in May or June. *En passant*, on a cruise of that kind I would reduce the sail to jib, main-sail and driver; a crew of sail entire, 500 ft. Bulmast, all comprised in lead keel, 400 lbs. Setting, rials, cyclones, pomperos, etc., such a yacht, well-handled, would live longer than an ocean stammer of the narrow Clyde type.

And, my dear old boy, wouldn't there be something grand and ganey in such a cruise?

Ah! I have the pluck—the ability. I can navigate, can handle tacks and sheets, can write up the log, but lack the money.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. |
SIX MONTHS, \$2.

NEW YORK, MARCH 1, 1883.

VOL. XX.—No. 5.
Nos. 29 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. (Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.)

SUBSCRIPTIONS

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsvendors throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Sampson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

THE PARK GRAB.

THE fight for the protection of the People's Park still goes on. Although not much has been done in Washington toward the passage of Senator Vest's bill, its friends have made strong efforts to accomplish its objects. On the 17th of February, Senator Vest submitted a resolution, which was ordered to be printed, as follows:—

Resolved, That a committee of five Senators shall be appointed by the President pro tempore of the Senate, whose duty it shall be to examine and report to the Senate, at its next session, what is the present condition of the Yellowstone National Park, and what action has been taken by the Department of the Interior in regard to the management of said Park, and the leasing or contracting to lease any part of the Park for building hotels or other houses thereon. Also, what legislation, if any, is necessary to protect the timber, game, or objects of curiosity and interest in said Park, and to establish a system of police, and to secure the proper administration of justice therein.

Said committee shall have power to sit in vacation, at such times and places as they may think proper, to send for persons and papers, and to employ a stenographer, the expenses thereof to be paid out of the contingent fund of the Senate.

And until said committee shall report by bill or otherwise, the Secretary of the Interior is requested to take no action in the matter of leasing or contracting to lease any part of said Park for any purpose, and to cause any cutting of timber, or erection of hotels or other buildings by any person or corporation, to be discontinued within said Park.

The Secretary of the Interior is also requested to take immediate action for the protection of the game and objects of interest in the Park, and to this end he is requested to call upon the proper military authorities for such force as may be necessary to accomplish such purpose.

This resolution has been called up at least once, but before a vote was reached on it, the time expired, and, Mr. Windom objecting to the postponement of unfinished business, the resolution went over.

It is easy to understand the reason of the objections by the Senator from Minnesota. It is generally believed that he has a direct monied interest in the Improvement Company's plans, and when it comes to a question between the success of this gigantic steal and the good of the people, he

naturally takes the side of his own pocket. Even if it is not the case that Mr. Windom is a shareholder in the Improvement Company, there is another reason for his fighting against the public welfare. Mr. H. P. Douglass, who is one of those to whom the worthy Assistant Secretary Joslyn tried to make the original scandalous lease, is the brother-in-law of the ex-Secretary, and so the latter places himself at the head of the ring and unblushingly rises from his seat in the Senate to combat the rights of the people whose interests he has sworn to defend.

We have already more than once adverted to the methods pursued by the lobby of the "Improvement" Company, and a late attempt of theirs to blacken Senator Vest emphasizes what we have said on this subject. A despatch was recently caused to be sent to a New York paper, stating that Mr. Vest's bill was drawn in the interest of the "Improvement Company," and by its own attorney. A foul accusation was thus made, but the falsehood had but a brief life. Senator Vest promptly branded it as a lie, "wifful, malicious, unmitigated, made out of whole cloth from beginning to end." He further said that he drew the whole bill with his own hand. Such a denial, while it had to be made, is not needed by those who are acquainted with the Senator from Missouri, or by such as have from the beginning watched his firm patriotic and high-minded opposition to one of the greatest outrages which has ever been attempted on the long-suffering and much-swindled American people.

The fight is now to stave off legislative action as long as possible. The reason for this is clear. These trespassers upon the Nation's pleasure-ground have, in defiance of all law, boldly invaded this Government reservation, have cut down the timber belonging to the United States, have slaughtered its game, have set up their sawmills on its waters, and erected stables and buildings upon its lands; they have entered the Park and seized it, treated it as if it belonged to them, and now they impudently laugh in the face of the people, and proceed to make further "improvements," as if indeed all the execrations which have saluted them as they have gone on were merely the mutterings of a distant storm which would soon blow over. They feel that the longer they can hold the Park, the stronger becomes their position and the better will be their chances of ultimately securing an impregnable position there. They reason, too, that if they are finally expelled, they will have claims on the Government for their "improvements," and will make a fat thing out of this, even if they do not accomplish their grand robbery. And Mr. Windom, United States Senator and sometime Secretary of the National Treasury, lends himself to these nefarious plans, and aids and abets the schemers. Is it not a sight to make every American blush to see one who has held such exalted positions enacting the rôle of a lobbyist-in-chief to such a gang of men?

They will carry on the fight as long as they can, for the prize for which they are striving is a rich one, and what do they care for the people, so long as there is a prospect of lining their own pocket? In the meantime, however, new friends of the people are arising. In the House, on Friday last, during the consideration of the Sundry Civil Appropriation bill, Mr. McCook, of New York, when the clause relative to the Yellowstone Park had been reached, moved to strike out the provision authorizing the Secretary of the Interior to lease portions of the Park, under certain restrictions, and proposed to substitute for it a proviso prohibiting the Secretary of the Interior from leasing any portion of the Yellowstone National Park to any person, company or corporation for any purpose whatever, and further, declaring of no force nor effect any lease, agreement or exclusive privilege or monopoly already granted or entered into, and authorizing the Secretary of War to make necessary details of troops to prevent trespassers or intruders from entering the Park with the object of destroying the game therein, or for any other purpose prohibited by law. The amendment was adopted.

The next day Senator Vest submitted to the Senate an amendment to be offered to the Sundry Civil bill calling for an appropriation of \$25,000, to enable the Secretary of the Interior to protect the game and improve the roads in the Park.

All these steps are in the right direction, and will accomplish much good, but it is extremely important that the employés of the "Improvement Company," which has seized the Park, should be at once treated as the trespassers that they are, and should be, without the loss of further time, ejected from the Park.

We are inclined to believe that the Secretary of the Interior has full power, if he chooses to exercise it, to call

on the War Department for troops to aid in this work. When a lot of colonists seeking desirable homes invade the Indian Territory with the purpose of occupying lands held by the Government in trust for the red men, troops are sent after them, they are arrested and brought back. The present state of the Park is similar. A band of men, actuated by greed of gain, have invaded and taken possession of lands held by the Government in trust for its own citizens. Why should not such trespassers be punished, not only for their invasion, but for their robbery of timber and game? Heavy damages should be collected from this "Improvement Company" for the ruin that they have wrought in this beautiful region.

We receive frequent advices of the killing of game in considerable quantities within the Park. A recent number of the Bozeman *Account Courier* speaks of a contract for 4,000 pounds of wild meat given out by a Cook City firm at fifteen cents per pound, and the hunters are going into the Park to kill it. Rules and regulations are all very well, but there must be some power to enforce the rules and regulations which have been made. Mr. Conger and his assistants are of themselves powerless to prevent violations of the law. Troops are needed in and about the Park, and some sharp punishment should be meted out to these marauding meat and skin hunters as well as to the Park grabbers. For the present several small details of troops are required in the Park, as well as other larger bodies to patrol its outskirts, but after the immediate and pressing necessities of the time shall have been attended to, another and better system of policing for the protection of the game and of the geysers and of the forests may be suggested.

Just now, however, the Secretary of the Interior should call for troops to expel the jobbers who have seized the Park, and the almost equally criminal and reckless skin hunters.

Will Mr. Secretary Teller turn for himself the thanks of the people by doing this?

THE MARKETS AND THE GAME.

FROM Maine to Minnesota came the same reports. The game is killed in large quantities out of season and shipped by market hunters to the open game markets in other States. Minnesota grouse killed out of season have gone to Chicago, and Maine venison killed in the close time goes to Boston. The Boston market is legally open by reason of an unwise compromise made with the dealers of that city when the present law was enacted, and the Chicago market has been illegally kept open through the combined influence of the dealers and some of the sportsmen of that city.

Last week we noticed the fact that the Chicago market men, notably a prominent member of the Sportsmen's and Game Dealers' Association, were receiving grouse which had been killed contrary to law in Minnesota; and in another column of this issue will be found a report from one of our Maine correspondents, of the shipping of unseasonable game from that State to the Boston market.

There is nothing about this state of affairs to excite surprise. Every intelligent man who has given the slightest thought to the subject, knows perfectly well that a game market open beyond the legal season for killing game means that the game will be supplied contrary to law. It is the same old story, rehearsed time and time again in every State in the Union, and in the Provinces beyond. The relation of the game market to the game supply is well understood, and earnest efforts have been made to provide some efficient check to the slaughter. Michigan sportsmen, after careful investigation, found that their deer supply was being exterminated by the market hunters, who shipped the game to the great city markets. Michigan thereupon passed a non-export law. Other States have adopted similar laws. The sportsmen of Indiana saw their game netted and snared by pot-hunters and sent to outside markets in season and out of season. They secured a non-export law which has since been declared unconstitutional. Minnesota tried the same expedient; it has not proved efficient. Nebraska, Dakota and Colorado, Connecticut, Iowa and Missouri followed, each with more or less good effect. The Province of Ontario contemplates a non-export law. To strictly enforce a non-export game law is an exceedingly difficult undertaking. There are many devices well known to the market shooter, and by means of various deceptions it is an easy thing for him to run his contraband goods through the lines. So long as game markets are kept open, inviting the law breaker to send in his plunder, just so long will the

ame be butchered and smuggled out of one State into another. The only correction of the abuse is the absolute prohibition of the sale of game in the close seasons, which generally obtain in the districts of game supply. The Boston and New York markets should not be kept open for months after the Maine and Minnesota open seasons have expired, nor should the St. Louis and Chicago dealers be permitted to pay premiums to the grouse snarers and deer butchers of neighboring States. It is a much simpler undertaking to stop the open sale of game than to detect its covert illicit transportation. If the market is closed the shipping will be stopped.

As we have already said, the Chicago marketmen's plea is that if they do not sell the game other markets will. New York dealers say the same, and the Boston men reiterate the argument. Now the right thing would be to close all of these markets upon the expiration of the open season for killing game in the respective States. If the supply of game proves too great to be disposed of in the prescribed period, let the dealers refuse to receive it from the pot-hunters. It is a very easy matter for them to regulate the supply. They will never do this, so long as they can get legislation to suit them, or can evade the laws themselves or else secure such evasion by other parties. The marketmen want all the game there is, and he wants it all now. A compromise between sportsmen and game dealers means a tinkering of the law to suit this improvident greed of the market. The Boston compromise some years ago proved it; the New York "refrigerator bill" proved it again; and now the proposed Illinois amendment affords a fresh illustration.

We have noted with much surprise the proposal to open the Chicago game market for the reception of game illegally shipped from other States, for that is what the contemplated amendment to the Illinois law practically amounts to, and we trust that the real sportsmen of that State who have no grist of their own to grind at the dealers' mill will stand out most decidedly against the change.

PROFESSIONAL MEN AND GAME.

IN our issue of February 15 we printed the plea of a professional man—a clergyman—for summer shooting. Last week was published a reply, written by another professional man—a professor in one of the prominent educational institutions of the country. To-day we give another letter on the same subject, written by one who belongs to none of the classes named by "Clericus." Our own views on summer shooting are so well understood that there is no necessity of rehearsing them here.

We appreciate very fully the value of angling and shooting as rational recreations, in which the hard-working professional man of this busy age may find much-needed recuperation. It would certainly be most fortunate if this class, as well as the working men of all other classes, could shoot deer and birds in mid-summer. But, very unhappily, the laws of nature are irrevocable and cannot be altered in favor of any class, however deserving it may be. If the mother of the tender, helpless fawns be killed, the fawns must perish, no matter whether the man who kills her be a doctor of divinity or a refugee from the sheriff.

And—we regret to say it—professional men, as a class, have not and do not conduct themselves while in the woods very differently from other people. They certainly have given no warrant for allowing to them greater privileges than are permitted to men of humbler stations in society. On the black-list of Maine summer deer-shooters are the names of two men who belong to the same profession with "Clericus." If they hunted deer and moose when the law forbade it, what would they not have done had the law been off?

THE NEW YORK LAW.—A bill to amend the law of New York has been prepared and introduced by the State Association. It provides for several changes in the open seasons, among others permitting July woodcock shooting. As we have already discussed the merits of the subject, we need not go into it here. Another provision extends the season for sale of game through the month of February. There are abundant reasons why such a proposition should be opposed; we have stated some of these considerations in another place.

FOOD OF FISHES.—At the suggestion of Prof. Baird, who desires to have more knowledge concerning the food of our commercial fishes, Mr. E. G. Blackford will institute a series of investigations into the stomachs of those species which come to him in Fulton Market. To this end he has secured the service of Prof. Henry J. Rice, well known from his experiments in oyster hatching, who will record the contents of the stomachs of the fishes, and report upon the food found therein at different seasons.

THE CARVER-BOGARDUS MATCH.—It has been held by very many that while Dr. Carver was a phenomenal rifle shot, he could not hold his own in a match with Capt. Bogardus at the traps. The result of the Louisville shooting showed pretty conclusively that the Doctor knows how to hold a gun as well as a rifle. A full report of the event will be found on another page.

The Sportsman Tourist.

FLORIDA.

WHEN winter with his icy hand
Has swept across our northern land
His cold white robe of snow;
When all the woods are bare and brown,
And all their feathered songsters frown,
And fierce the north winds blow.

When summer with his joys has fled,
Its pleasures o'er, its flowers dead,
And ice-bound about each stream,
'Tis then my wandering fancy flies
To a milder land 'neath sunnier skies,
And of its joys I dream.

My fancy turns to that bright land
Where Ponce de Leon and his band
Of Spanish soldiers hold,
Sought for the Fount of Youth—a draught
Of whose clear waters he who quaffed,
Would never more grow old.

Ah, Florida! sweet land of flowers,
I stray in thought beneath thy bowers
Of dark moss-mantled pines;
I breathe the heavy, rich perfume
Of flowers in perfume bloom,
And ever fragrant vines.

In those embowered vales is heard
The note of many a bright-plumaged bird
In Northern climes unknown;
Those dark lagoons are the safe lair
Of many a creature strange and rare,
That haunt their depths alone.

Beside St. John's slow moving stream
Low coits and broad white mansions gleam
'Mid palms and orange trees;
In the low and fertile plain,
Wide fields of green and rustling cane
Bend to the balmy breeze.

Thy broad sea shores in thought I tread,
And now through tangled swamps I tread
My slow and toilsome way;
Or, happier thought, in my light boat
Upon thy crystal lakes I float,
And catch the filmy prey.

Still fate my waiting fortune binds
To regions of harsh chilling winds,
Where frost rules half the year,
And yet methinks some day I see
That land, wash'd by a Southern sea—
That land to fancy deer.

NORMAN B. DRESSER.

NIMROD IN THE NORTH.

BY LIEUT. FRED'K SCHWATKA, U. S. ARMY.

IV.—Nimrod with a Shotgun.—Part Two.

IN no place in the world is aquatic life so abundant as in the polar regions during the summer. The instance I have given of the elders in Terror Bay is but one in many constantly encountered in polar literature. The little auks, or rogets, says a writer who has been in Spitzbergen, are so numerous that he has frequently seen an uninterrupted line of them extending to a distance of more than three miles, and so close together that thirty have fallen at a distance of four or five miles, these numbers do not appear so great.

The dovesies are the most numerous of the summer ducks in the northern part of the bay, and they are especially thick about Depot Island, whose Esquimaux name is Pike-a-lik, meaning the island of birds' nests, and where the dovesies deposit their greenish-blotched eggs in innumerable quantities. They seem to make no nest whatever, but crawl under the broken granite boulders and lay in such concealed places that a white man will look over a large tract and find nothing, and a few Inuit children will follow and fill their hands and pockets. The first year, '78, we were too late for their eggs, which are here collected in countless scores in July; but that same year, on the 5th of September, we visited Pikkenuik, and some of the Esquimaux we had with us collected a fifty of the squabs they caught in the rocks, and then old enough to eat, and gave them to us. Colonel Gilder and I attempted to kill a few of the older ones with our shotguns, but with less success, as they soon scampered some two or three hundred yards out to sea, where they resolutely persisted in remaining while we were on the island.

While on the "Polaris" expedition, Joe, who had been out hunting in February, reported seeing three dovesies in the open water, saying that they were the young of last year, and that it was well known among the Esquimaux that this species of bird spent their first winter in the Arctic regions. Joe spoke to me of this also, and added that when they remain they turn almost white like the ptarmigan. I have never seen any in the winter, but my journeys have been such that I seem to make no nest whatever, but crawl under the broken granite boulders and lay in such concealed places that a white man will look over a large tract and find nothing, and a few Inuit children will follow and fill their hands and pockets.

The Esquimaux take great pleasure in hunting small game without a shotgun, and it must be the true spirit of the Nimrod that prompts them, for the returns in pounds of food can in no way remunerate them for the time lost and cost of powder and shot. I have several times seen Esquimaux have the preference of shot or bullets in exchange for some article they desired to trade, and they would invariably choose the former, with which they would probably not secure a dozen ducks, while with the latter they could certainly secure as many reindeer, walrus or musk-oxen.

Toolooah enjoyed a good duck-hunting tour with all the eagerness of an amateur in the art.

We will not speak of the phalaropes, the dabchicks, the grebes, the sandpipers, the gulls, the snipe and the whatnot of the water-loving varieties of birds, for we only saw them here and there without adding any knowledge of their habits, and seldom added any of them to our "bags." The Esquimaux of some localities that I visited, separate the year into moons instead of months, (that is about thirteen months) and each one is named after some event conspicuous at the same, as the arrival or departure of some of the migratory birds, the goose month, the dovekie month, and so forth.

To the sportsman who finds pleasure in pursuing the partridge, the pheasant, the prairie chicken, or grouse, probably the Arctic grouse or ptarmigan would be his first effort with the shotgun as soon as they put in their appearance, for they seem to be exceedingly hard to find in summer. At this season of the year the ptarmigan's plumage is of a pale brown color, mottled with small black and gray spots. The head and neck are marked with broad bars of black, rust color and white, the wings and belly being of the latter color. I noticed, while on our sledge journey, that it was particularly the stormy weather that brought us in contact with the many bands of ptarmigan who seem to enjoy this sort of bluster; and they cheered the dreary waste of winter when nearly all other life had perished on its journey for the more congenial South. With his brother of the black coat—the Arctic raven—he is the only living winged thing that remains on the land to cheer the deep Arctic winter. Long after the great flocks of dovesies, the noisy loons and stately flying burgomaster gulls have departed from the North, the ptarmigan may be found diligently searching the barren rugged hilltops for his daily food.

In the summer time or breeding season, they are rarely seen, and then have a plumage so much like the prevailing color of the mossy plains as to afford them splendid protection. They are then only seen singly or at most in pairs, but as winter time approaches they flock together often in bands of hundreds; their plumage is then of a pure white, and they are very hard to see, and are much more common in farm ducks. The sportsman at this time seldom has much trouble in securing ten or fifteen out of a flock, for when frightened they fly but a short distance, and for five or six times after firing they will allow him to approach quite closely. Where hunted considerably with firearms, however, they become as shy as any of the grouse family in warmer climates. They are so shy that the Esquimaux unless the opportunities are brought directly before them while in their pursuits. I have often seen the small boys using them for a target when practicing with bows and arrows, and they were occasionally successful in securing one in this way, driving them along the ground like so many chickens in the poultry yard. It is said that the Greenland natives hold the idea that ptarmigan, in order to provide for their winter food, gather in a supply of berries into the hollows of rocks, and during very severe cold they form retreats under the snow and bunch together to keep warm. This would hardly coincide with the facts that I have seen them seeking their food at all months of the year, and at all temperatures of the winter, unless their habits vary in the two countries. They are excellent food and taste very much like the ground and waterfowl species in the lower zones. I have never heard them utter any cry beyond a coarse clucking when waddling along on the ground in front of a person, and my queries from the natives failed to extend my information. I have noted this simply because it has been represented that this bird has a most singular and extraordinary voice, which it exerts only in the night time, and instances are given where superstitious natives have been frightened by the sound of their hearing it. So white is the plumage of these northern grouse that when squatting in the snow a person even searching for them may get within two or three yards before he sees them, if he be not apprised of their position even then, by their rapid woodcock-like whir of their retreat. Especially is this the case in the cold, blustering, snowy weather, when the birds look almost like snow.

But bird-life is not the only kind of game in the frigid zone that furnishes food and fun for the double-barreled smooth-bore. There is the Arctic hare, the fox, the lemming, and a few other four-footed but small fellows, which are valuable for palate or peltry, and generally the most sagacious of all. Every now and then when on our sledge journeys the dogs, half asleep and very talkative about at their heels, and taster of the food, will pick up the trail, and will were light, dash forward after some unknown object which would finally resolve itself into some insignificant rabbit trail, and as this boreal bunny is somewhat predisposed to the stormiest of weather, like the ptarmigan, he will often lead a team of dogs a merry run if the driver does not stop them, or imagines they are on the scent of reindeer, as he often does. I always found the rabbits living in the crevices of the boulders, leaped over each other, the covering snow forming a little leap, which, with their immense coat of hair, is sufficient to protect them in the coldest weather. I have seen them in all months of the year, and if they store up a winter's supply of food (which I do not believe), they are very busy in the winter maintaining it by excursions from other quarters. While probably a trifle smaller than the Jack rabbit of the American plains in quantity, he is in his peer in size, if not larger in the winter, when he looks like a great bundle of white feathers. He is not eaten so much by the natives as by the wild animals, the foxes, wolves, and wolverines.

The Arctic fox is much smaller than the common variety we are used to seeing at home, and equally sagacious. He is seen everywhere, but some say he is more common in one so far as to procure his peltry. It was either too far to reach with the scattering argument of a shotgun or too agile for a rifle in anybody's hands less active than those of Dr. Carver's. It is not often that the natives get one by shooting, but they manage to trap large quantities for their skins, which they trade to the Arctic whaler, although their meat is not rejected by the Esquimaux. Even some Arctic explorers have pronounced their meat worthy of the table, and probably it may be by comparison when long isolated from all sorts of fresh meat. The traps of the natives are simply slabs of ice with the common figure 4 spring, and when they visit the traps at rare intervals, the slab falls on the top of a small rectangular pen of ice, thus enclosing Reynard alive, as otherwise when crushed and the snow pressed in, he would have been long since outwitted and the fur pulled out. These ice-traps were often seen about Hudson's Bay. On King William's Land the Netschilluks built pens of the slabs of

sandstone and then set the trap in winter by covering it with the usual slab of ice. Having no means of trading off the skins, they use them in making clothes for their children. They rarely make beyond mere defense as illustrated in his procuring subsistence. When fishing he approaches the shore, and splashing in the water with his forefeet, allures the fish near him, near enough to spring on them with effectiveness, says Crantz. In North Hudson's Bay their fishing is similar to that of the Esquimaux dogs, the wolves, the polar bear, and even the wolverines I believe. In this way the rise and fall of tide is greatly availed of, the rocky ponds into a lake-like form, with the rocky mouth of the water in falling is drained through great piles of kelp held by the rocky bar, and this entangles all the fish that have been unlucky enough to enter this trap. Wherever such an inlet is found on an island well out to sea there the Esquimaux store their dogs for the summer, and here they grow very fat, and where such fish traps exist along the main shore there the wild fish-eating animals may be found when the ice has not covered the bay. The fish usually caught is a sort of pout, most horrible looking, and called by the whalers fish-pout.

When Ross was with his Franklin Search Expedition and wintering in the ice, having heard nothing of Franklin's whereabouts, he trapped a great number of Arctic foxes, put brass collars round their necks, having stamped in them the location of his ship, and turned them loose, thinking and hoping that one might reach Franklin's ships or crews and inform them in their retreat or movements by such timely information.

The ermine, the lemming and the true fur-bearing small game of the Arctic save so much of the shop, so much of the market reports about it I doubt if their cold-blooded pursuit for mere gain would be interesting to the readers of the FOREST AND STREAM.

AROUND THE COAST OF FLORIDA.

BY DR. J. A. MENSALL.
Sixth Paper.

W left Key West on Sunday afternoon, March 12, with a light easterly breeze, bound for Cape Sable, some sixty miles northeast across Florida Bay. The usual route to the northward is by the Florida Channel, and I proceeded to Bahia Honda, and thence across to Cape Sable, but not wishing to retrace that portion of our route to Bahia Honda, I resolved to add variety to our voyage by going to the westward and northward of the keys, or on the Gulf side, then sailing eastward to Key Vacas, thence due north, thirty miles to East Cape Sable. Accordingly, we left Key West by the Northwest Channel, leaving all the keys to the northward, and anchored before sundown at N. W. Boca Chico, a small key with a beautiful white sandy beach, some ten miles northwest from Key West.

The Florida Keys, like the southern portion of the peninsula, are of recent formation, and underlain by oolitic and coral limestone. These coral lime rocks are formed by the action of the waves and weather upon the calcareous secretions of coral-polyps, those beautiful "Flowers of the Sea," which are still building, better than they know, on the outlying submerged reefs, and there may be seen those "pillars of the sea," madroppers, astræans, manadrinas, porites, gorgonias, etc., rivaling in beauty of form and colors the most charming and delicate ferns, fungi, mosses and shrubs. The fishes about the keys are very handsome, both in form and coloration; silvery, rosy, scarlet, brown and golden bodies, with sky-blue, bright yellow, rosy or black stripes, bands, or spotted, stellated and mottled with the blues of the rainbow, and the reds of the eyes of scarlet, blue, yellow or black; fins of all colors and shapes, and lips of scarlet, yellow, blue or silver. Some of the larger keys, such as Sugar-loaf, Saddle-bluff, Pine and Largo, contain a few deer, and some of the oldest settled ones harbor a few herds of quail, but most of the keys of the Florida Straits are barren of game.

The next morning, with a splendid breeze from the south-west, we left N. W. Boca Chico, and under the lee of the keys we made good time, arriving at Key Vacas in the afternoon. The spongers and fishing smacks were lying at anchor under the different keys as we bowled merrily along, the wind being too high for them to pursue their vocations. At Key Vacas we found several brothers, named Watkins, with their families, all "conchs," who had quite a large clearing, or cultivation, "as they called it, and who were engaged in raising and other vegetables for Key West and the Northern markets. The soil is thin and very rocky, but rich, and produces well. There is a fine spring of excellent water pouring out of the sharp and jagged rocks of this key, east of the Watkins settlement, where we filled our water casks. We collected a number of beautiful land shells on this key, and a rich variety of botanical specimens, for we stayed here the following day, the wind having backed up to the north, blowing hard. The next day thereafter, however, it hunted to the eastward, when we again set sail, due north, for East Cape Sable. We were out of sight of land for two hours until we sighted Sandy Key, and made the cape in six hours sailing from Key Vacas. Had we not gone to Key West we should have crossed to the cape from Long Key or Channel Key. Very small boats can cross from these points, and by keeping well to the eastward can be in and out of the Cape of Barnes's Sound all the way, but the water is shallow, with numerous banks and shoals of sand.

We sailed eastward of East Cape Sable to the mainland, where there is abundance of deer, turkey and other game. We here saw for the first time that magnificent bird, the flamingo, with great numbers of egrets, rosy spoonbills, and herons. The next day we passed East Cape Sable and proceeded to the Middle Cape, or Palm Point, where there was a house. We landed to call on the occupants, who were very desirous for us to stop a day or two to kill some deer, which were plentiful, but being pressed for time we kept on to the N. W. Cape, and a few miles further on entered Cape Sable Creek, where we anchored. This creek is an admirable harbor for small boats, and the only one near Cape Sable. With a narrow entrance, some twenty feet in width, it soon expands into a narrow, shallow, quiet deep, where a vessel can be safely moored alongside, and in running out from the shore; a hurricane blowing outside would not ripple the water of this quiet basin. Sharks and other large fish may be harpooned or grained from the deck of the vessel, or with line and hook the angler can get a surfeit of fishing. The stream heads in a large lagoon back of the cape, the resort of innumerable waterfowl and aquatic birds. The region about the Cape is the seat of the Charlotte Harbor for camping, hunting and fishing, there being a broad, smooth,

sandy beach all around the cape, abounding in beautiful shells and other marine curiosities, with good dry ground for camping, and an abundance of game on the savannas, and in the mangrove swamps.

From Cape Sable Creek to Pavilion Key there is a succession of mangrove keys and islands, and but very little beach or hard ground. Between these points lie Shark, Lostman's, Harvey's and other rivers, and Whitewater and Chatham bays, which are studded with the "Thousand Islands," had they been called "Ten Thousand Islands" it would have been a more appropriate name. This whole region lies in Bahia Honda, and is separated from the mainland by the Gulf to the mainland, which latter can only be reached by following the intricate channels between these numberless so-called islands, many of which have not a particle of soil, being merely clumps or thickets of mangroves. It would take a month or more to get an idea of Whitewater and Chatham bays by penetrating to the mainland and to the Everglades, and as we were already behind time we did not attempt it, leaving that unexplored region for a more convenient season.

Mangroves here grow to be tall trees, as tall as water oaks or even pines. There are small bunches of them, and great forests of them—nothing but mangroves, mangroves. It is wonderful how these mangroves grow, and, when once started, how rapidly they increase. The seeds are about as long and of the shape and appearance of the old-fashioned "long nine" cigar. These fall into the mud or shallow water, and attempt to take root, the upper and giving off shoots, which, growing upward, send down other shoots or roots parallel with the main stems, and these taking root, again grow upward, and the parent stem as it continues to grow continues to send down other branches or roots to the water. I have seen these pendulous branches descending twenty feet to the water, as straight and smooth as an arrow, and an inch thick. I have walked a quarter of a mile through a mangrove thicket, on the level and dry roots, two or three feet above the water, where there was not a particle of soil. But in time, drift, sea weeds and shells accumulate about the roots, and floating seeds lodge and germinate, so that at last an island is formed and lifted up above the surface of the water.

Another reason for our not tarrying long in this section was the scarcity of water. Our supply was getting short, and there had been no rain on the south-west coast for four months. We attempted to get an idea of the creek to the mainland or to fresh water, but the tide left us aground, and we were forced to return on the next tide. The water in these bays is quite shallow, so with an offing of several miles in the Gulf we sailed for Chucaluskoc River, where we expected to get a supply of water from cisterns at that settlement, the first north of Cape Sable. Stopping at Pavilion Key we found a boat with two men who told us the cisterns at Chucaluskoc were dry, so we went on to Panther Key and anchored for the night.

We went ashore at Panther Key the next morning, where we found a hut and a bright-eyed old Spaniard and his wife, Mr. and Mrs. John Gomez. Old man Gomez is a noted character on the Southwest coast, having lived there for thirty years or more. He is reputed to be a hundred years old. He told me that he went from Spain to St. Augustine when he was a child, and before Florida was ceded to the United States, which would make him about that age. He is held in wholesome dread by the settlers, who throw out dark hints of his having been a slaver, and even a pirate in his younger days; but "He was the mildest mannered man that ever scuttled ship or cut a throat." He had a plantation up the creek, near Panther Key, but his well going dry, he had come down to his place on the bay, where there was a little water, before Florida was ceded to the United States. But he informed me that there was a good well on Cape Romano, some five miles to the westward. Gomez was under contract to furnish provisions to a Government surveying party, who were then some six miles up the creek on the mainland. His schooner had gone to Key West for provisions, and he was daily expecting her.

"Are there any rattlesnakes on this island?" asked Jack. "No, no see any, nor a long time," answered the old man. "But I kill a one, long a time ago; very big a one." "Oh-h-h! Such a snake!" Such a snake!" broke in the old lady—a Georgia woman—with both hands before her face, waving away the imaginary rattle. "Dear me; dear me! I can see it now! Oh-h-h! Such a snake! Such a snake!" "How long was it?" asked Jack; "ten feet?" "Oh, dear me; longer than that; longer than that!" answered she. "I can see it now! Oh-h-h! Such a snake! Such a snake!" "Was as long as this room; it was; it was; it was! I can see it now; I can see it now!" The room was fifteen feet in length. "Did you save the rattles?" asked Jack. "No, no, no! Oh-h-h! Such a snake! Such a snake! No, no! I saved myself; I saved myself! Oh-h-h! Such a snake! Such a snake!"

"How thick was it?" persisted Jack. "As big as my leg?" "Oh, dear! bigger than that; bigger than that! Oh-h-h! Such a snake, such a snake! Dear, dear, dear! I can see it now! I can see it now! Such a snake! Such a snake! Oh, it makes me sick! it makes me sick! I can smell it too! I can smell it too! It was as big as a water bucket! it was, it was, it was! Oh-h-h! such a snake, such a snake!" "Well, I believe it," said Jack, "and it wasn't much of a snake either, for if it was always as dry here as it is now, there is no need of a water bucket, but if it was as it is now, as the old man could give us no water, he did the best he could by giving us a bountiful supply of tomatoes, sweet potatoes and bananas, for which he would take no money, saying:

"Me give you tomato, sweet a potato, bman". Me no want a non; me give you a non."

We departed for Key West, where, on the southern shore, a quarter of a mile from the water point, we found a well of excellent water, from which we replenished our water casks. We took a ramble on the beach, where we found great quantities of shells, sea-urchins, starfishes, sea-fans, sponges, etc. We then sailed for Coconut Key, five miles S. N. E. from Cape Romano, where there is a pass leading to Marco and Horr's Islands. We anchored off Grand Point, near Marco, near the house of Capt. Roberts, who has a fine plantation of tomatoes, bananas, etc. These islands are high, with good soil, and are very productive, but the long drought had told on the plants. Capt. Roberts owns a fine schooner, in which he carries his fruits and vegetables to Key West in their season, and at other times engages in fishing, turtling and sponging. On Horr's Island I found Capt. Horr, formerly of Ohio, who was well located for raising sub-tropical fruits and early vegetables, for these

islands possessed the best soil I saw on the west coast. At the west end of Marco, near Christmas Pass, a brother of Capt. Horr has also a large and excellent plantation, and on the northern side is the location of Capt. Collier, who also owns a good weatherly schooner, transporting his produce to Key West. This is a fine settlement, very pleasantly situated, the waters teeming with fish and turtles, green and logehead, and the flats with clams and oysters. Immense tarpon and jewfish are speared under the mangroves with "grains," a stout, two-pronged fish spear, in the use of which these people are very expert.

Being tired and having just landed on the fringe of mangrove bushes at the edge of the channels, the man standing in the bow with the grains ready at length spies a great tarpon some six feet long, like a giant fish of burished silver poised motionless in the shade. When within striking distance he hurls the grains by its long handle with a skillful and dexterous thrust and an unerring aim, born of long experience, which strikes home with an ominous thud, when the monster tears away with a tremendous spurt, leaping clear of the surface, and, falling back, makes the water fairly boil and scethe in his desperate efforts to escape. But the barbed grains holds fast, the long, stout line is as tense as a bowstring. The great fish tugs the boat around like a corkscrew, until his fierce struggles and grand leaps begin to tell on him, and at length he is towed upshore completely exhausted. Something the boat is captured or swamped by an unusually large and powerful fish, but, as I have mentioned before, these "Conchs" are almost amphibious, and seldom lose their fish, even under the most adverse circumstances.

Imagine a scene like this. A schooner under full sail, plowing the shallow waters of the Gulf, her prow proudly dashing aside the spray as "she walks the waters like a thing of life," when a pensive young "Conch," standing on the weather bow, clad only in a cotton shirt and trousers, throws his hat on deck as he turns his face toward the man at the tiller, and quickly, but unobtrusively, "Luff" or "ay" flings himself head first into the sea. One not accustomed to these people would think the young man mad and intent on suicide or a visit to Davy Jones's locker; but as the vessel comes up into the wind with shaking sails, the pensive young Conch also comes up, shaking the short tail of an immense green turtle, which he has adroitly turned on its back, and, towing it to the schooner's side, a running nose is pushed around a flipper, and it is hoisted on deck. Though it is not the usual way of catching turtle, it has been done.

The mud flats about Caximbas Pass at low tide swarm with bay snipe and shore birds, and at flood tide the channels under the mangroves teem with redfish, groupers, and snappers, while near the beds of oyster oysters are schools of sheephead and drum. In fact, all of these passes and inlets of the west coast are fairly alive with fishes, from the mud flat to sharks and sawfish. While lying in this cove, one can hear all night long the voices of the deep, under and around him. The hollow, muffled boom of the drumfish seems to be just under one's pillow; schools of sparoid fishes feeding on shellfish on the bottom sounds like the snapping of dry twigs on a hot fire; while a hundred tiny hummers in the hands of ocean sprites are tapping on the keel. Then is heard the powerful rush of the tarpon, the blowing of porpoises, and the snapping jaws of the shark, the strong stream of mullet, which, leaping from the surface by thousands, awake the water echoes like showers of silver fishes falling in fitful gusts and squalls.

On the islands about Caximbas Pass are many shell mounds, bearing witness to the many "oyster suppers" enjoyed by the aboriginal inhabitants. From the proximity of wild lime and lemon trees, it may be presumed that they took their "on the half shell," and also in the form of "beef steaks," if you may judge from the fragments of pottery and fire-cakes scattered through the heaps. We are also reminded by tangible evidence that "clam chowder" was no novelty to them, and that they were on familiar terms with "fried scallops;" but whether a prehistoric "Dorian" catered at these feasts, or whether the "Ingin meal" was moistened by libations of primeval "Mummi" or pristine "Piper Sec," or were washed down by copious draughts of primeval "lager" is a mooted question.

We left Caximbas Pass in the middle of the forenoon, with a northwest wind, sailing close-hauled all day until an hour before sundown, when we put into Estro Pass for the night. We had just made everything snug; the kingly was sputtering in the frying-pan, the venison broiling over the coals, and the aroma of old Government Java was ascending toward the mist-heads, when a small schooner also put in, and, having made anchor, lay within fifty yards of us. The sails were lowered away and furled by the crew, which consisted of a solitary one-armed man. In a short time the receding tide left the little schooner aground, when I went over in the Daisy to see if we could be of any service.

"Oh, no," said the combined skipper and crew, "she'll lay all the easier aground, and she'll be afloat time enough for me in the mornin', bet you ribs!"

In making a fire in his stove he began preparing his supper. He had a cargo of hammas for Cedar Keys. This man, from the habit of hunting alligators in the summer, had obtained the sobriquet of "Alligator Ferguson," and was a character of some note on the west coast. After supper he came over to the Rambler and assisted the boys in shark fishing, regaling them, between bites, with accounts of his prowess in hunting the huge saurians, which with him had become an all-absorbing passion. "But I don't know 'bout 'gators, gentlemen," said he, "the 'gator don't know himself. If I can catch his ugly eye, I can tell just what he's thinkin' 'bout. If he sees me a comin' with old 'Sup-Death,' my big Springfield rifle, he jest sez, sez he, 'Thar's Alligator Ferguson; my hide's good as off, my teeth's good as gone; I've done swallerin' fish an' pine knots in this wain world; my watterly pilgrimage is over.' 'Fare you well to Florida, my friend!'"

"Well, yes; a good many, and more too. I couldn't 'zactly say just how many I've killed and skun, or how many teeth I've pulled; but there ain't a butcher who hez skun more beef-cattle or mutton-sheep than I've skun 'gators; and there ain't a tooth-carper in the Newwited States who hez extracted more teeth from humans than I 'gators, if he dod-busted 'if there is!"

"I suppose that with the blades and teeth it is a pretty profitable business," said Squire. "Well, I care more for the fun than the profit. The hides and teeth buy grub and tobacco; that's bizness, bet your ribs! But the enjoyment of the fun is what makes life with livin' with me. You cleau out the 'gators, and you cleau out me; 'terminate 'gators, and you 'xtinguish Alligator

Ferguson. Without his open countenance and lively tail this vale of tears 'ud hev no attractions for me!"

"Take it altogether then, hides, teeth and fun, and it pays you pretty well," said Squire.

"Bel your bills! I get half a dollar for the hide, five dollars a pound for the teeth, and a dollar and seventy-five cents in fun for every 'gator I kill!"

Jack, who was lying on his hunk, fished out from under it the skull of the big one he had shot at New River, and like Mr. Boffin in Mr. Venn's shop, "lying behind his smile," said:

"How is this for a specimen head, Mr. Ferguson?"

"Well that ain't half a bad head, but I've seen bigger ones, with bigger teeth, but I never saw one just like it on this coast; how long was he?"

"Twelve feet to an inch," answered Jack.

"I've killed a good many 'gators, but I never killed one over twelve feet. And 'gators is like hmanos, some has big heads, and some small heads; and 'tain't allus the biggest 'gator as has the biggest head, but generally the bigger the head the smaller the brain, just like hmanos; but I'm bound to say no 'gator's got much brain to brag on. I've caused a good many to die with water on the brain, but I'm bound to say none ever died of inflammation on the brain, cause they ain't got enough to inflame. There's another cur'ing thing 'bout 'gators, the smaller the brain, the more musk they carries, just like hmanos!"

BOYHOOD REMINISCENCES.

As we get along in years, portly and gouty, nearing the serene and yellow leaf, as it were, and can no longer climb the rough mountain-side for the whirling grouse, nor take long tramps behind the faithful dog for quail or snipe, but have to content ourselves behind the blinds for hay-birds or water-fowl, or ride to a runway and take things easy for a shot; how natural it is of an evening at home, especially after perusing your glorious paper, to look those days when we were wont to consider ourselves second to few in those sports where hardihood and perseverance were the *sine qua non* of success. From several articles recently in the FOREST AND STREAM, I see that others than "Jacobstaff" are going back to years ago. That is a sure sign that they are growing old, and they cannot hide it.

My boyhood and early manhood were spent among the rugged hills of Madison county, in the State of Tennessee, or more miles from Cooperstown and the beautiful Lake Osego, a more mile made known by Cooper, the greatest delineator of woodcraft character the world ever produced. The original from whom the novelist took his Leatherstockings, was well known in our little village. When I was a boy he was an old man, and went only by the name of Old Hunter. He had lived for many years in a cabin in the woods, and hunted and fished for a living. For a few years before his death he lived in our village, age and rheumatism fast breaking the old man down. It was said that Old Hunter had a history; that he was a man of education and a lawyer of promise, but his domestic relations proving unfortunate, he had left his family, and with his dogs and gun had taken to the woods and had there lived for many years a hunter and trapper, rarely visiting the settlements until his deer and furs were gone and he had to come down to the crowd and squirrel. But Old Hunter was a character, very taciturn, almost moody; and never, even when in his cups, would he tolerate any quizzing in regard to his earlier life. He was always hunting and fishing alone, and invariably successful. At an intimation he given a day or two in advance that Judge Mason wanted a brace of grouse, a half-dozen squirrels, or some trout, and he never failed to fill the order.

He was an object of great veneration to us boys, and many were the pleadings to be allowed to go with him on some of his tramps, but of no avail. I had given the old man a promising pup, and he was well disposed toward me, but I never could get his consent to go with him; he always had some excuse—too far for us boys, we were too noisy, etc., until one day in the spring—drumming time for the partridge, we knew nothing about, except our close seasons in those days—I was out on a little hunt by myself, when I espied the old man slowly climbing the wooded hill. "Now is the time," thought I, "he has got to take me now." I insisted upon accompanying him. He didn't like it, I knew; said he "had got to git a couple partridges for Lawyer Mitchell," but that if I would "keep still and obey orders I might follow along." I followed along very quietly up that rugged hillside.

Finally we came to a thicket of undergrowth. Here the old man paused. "This," said he, "is a good place for a partridge. You go that way," pointing to the right, "and I'll go this. We'll come together on 'other side; perhaps we may start one out o' here."

I started around and had not gone more than half way when I heard the old man's gun. Upon his joining me, sure enough a grouse leaped at his belt. "You've got one, I see," "Yes," said the old fellow, "he was on a log and I shot him through the head." The marks of the bullet were there, clear through the eyes.

We trudged on a while longer, until in his judgment we came to another likely place, when the same arrangement was proposed: "You go around that way and I'll go this." Now about this time I began to suspect something, I hardly knew what. "All right," I said, and started off, but only a short distance, when I whirled back, dodging behind the trees, and followed the old fellow. He didn't go far; but looking around carefully and being apparently satisfied that there were no prying eyes on him, he parted the bushes and stepped in a short distance. I was close behind, holding my breath, when what did I see! A drumming log and, hanging by a noose, a grouse. The old hunter took the bird from the stick, and, with a flourish, held it up, and through its head hung it to his belt, and then deliberately fired his gun off in the air. That was for me. I retreated a wiser boy for the future, and with some of that veneration gone. My idol was somewhat cracked, if not entirely broken.

I watched the old veteran after that, and I found his favorite trout resort away in a swamp where no one ever dreamed of finding a trout at all, much less fish of a pound or more in weight.

All those were good old days. We boys didn't have much pocket money in those times; Baptist ministers' sons generally, I believe, don't have, and we sometime were hard put to our trumps to get the ammunition we wanted. My first gun was an old flintlock musket, with hard peas scooped surreptitiously from the farmers' bins for use. What a red-letter day it was for me when my father, wishing to reward me for being an exceptional good boy, put into

my hand my first shotgun—a percussion cap, 14-gauge, single barrel. How the squirrels, crows and partridges (grouse) caught it for the next few seasons. But I outgrew that, and my longing was for a rifle that came in one time.

All those indeed were halcyon days, roaming over old Madison county hills. There was not a spot that I did not know; and every bitmurt or history tree was a wonder for miles around. How I watched for the compels near certain pieces of woods, and how angry we all used to get at the farmers when they cut down for the wood our favorite squirrel resorts.

And those "coon hunts o' nights! What an immense amount of tramps and downright hard work we used to go through; and the snaker and beaver hooking through the ice; and the fox hunts. Of course we shot them—if we got a chance; we straddled no horse after them in that region. And the hares (big white ones) in the cedar swamp; and the chicken shoots, and afterward, when we had achieved our rifle, the turkey maties; and the trapping for muskrats and mink. How proud I was the day I caught my first mink. It brought me \$1.25; and what an amount of ammunition that bought. Let me see, we used to pay—for powder a pound, 9 cents; shot, 2 pounds, 13 cents; eggs, G.D., 10 for a cent, 30 cents. That was about the amount of our purchase at one time, except on Fourth of July, when we had saved up for the occasion.

I am becoming garrulous. But these are about the usual experiences of boys fond of sport, and it does my old heart good to go back to them. JACOBSTAFF.

7 A FEW WORDS FOR THE WOODS.

EVERY sportsman should be a wood-lover and foe to the ruthless axe which is being swung with such indiscriminate zeal throughout the country.

Tree after tree falls to the ground, hillsides are made bare and unsightly objects, and ugly vistas are opened up by the destruction of forests.

To be sure there are voices raised and able pens wielded against this vandalism, but it is the duty of every man who carries the rod or the gun to be alive to the interests at stake and in every way possible to stay the hand of the wood-chopper.

Year by year has the writer mourned the loss of favorite trees in his walks and drives; every spring and every fall he has sought some sturdy elm or oak in his fishing or shooting excursions, and found in its place a hideous stump, and the expected shady halt a baneful, barren place, open to the gash day.

If the woods go, the game and the fish must also go, for the one must have cover in which to rear and to rest, and the other must have pure water, which depends upon the forests. Some men are so utterly pig-headed as to be blind to their own greed and interests, and such must be made to heed the laws of nature and to follow in her gentle, kindly ways.

It ought to be made illegal for a man to fell a shade tree without a "good and sufficient" reason, and that reason to be considered by an intelligent and authorized body of men who know the value (other than as merchantable cord wood) of trees. Every winter the felling of trees—the utter destruction of forests—goes on, and every summer follows a drought and intense heat. Thin cut, dry wildiers of the oak, birch, and pine, and the desolate, bare farms, plant your barren, bleak hillsides with goodly trees, and increase your comfort, the beauty of the land, and, most assuredly, your revenues, by so doing. O. W. R.

Natural History.

APPROACH OF SPRING AT ST. LOUIS.

JEFFERSON, Wis., Feb. 10, 1888.

The following letter from Mr. O. Widmann, of St. Louis, Mo., is too good for me to keep all to myself.—W. W. Cooke:

St. Louis, Feb. 16, 1888.—We have had unusually cold and disagreeable weather since the first of January. Old Boreas was reigning and kept the ground white and the temperature below the pleasant point for ornithological work. The weather was cold and windy. February tried to make things better by two days' rain, with the mercury below 30°. Of course it succeeded splendidly in making matters worse, and everything, from the smallest grass stalk to the largest tree, was covered with a heavy coat of glittering ice. Ornithology had to go on skates or stay at home. This miserable weather lasted a whole week, strong breeze from the south raised the thermometer to 62°.

This first warm breeze brought the first flock of ducks, and since that time thousands and thousands have passed north. Between 4 and 5 P. M. on the 15th twenty-eight large flocks passed, and at 5 P. M. twenty gulls were in sight, passing slowly up in beautiful gyration; two small and two very large flocks of geese were also seen. Between 7 and 8 P. M. the 16th, I counted over fifty flocks of ducks, amounting to over two thousand individuals, going up the same way and at the same great height. To-night the mercury stands at 25° and all is white and hard again. Did these ducks know about this approaching great change in the weather and did not mind it, or contrary to the belief of some ornithologists, are unable to read probabilities?

Since this first south-wind period seems to mark a new era in our bird life, it will be well to close the chapter of mid-winter notes now and report what I have seen.

As the weather during the first six weeks of this year did not permit excursions to new fields, I contented myself with revisiting the ground gone over in December to see what had become of my little friends enumerated in my New Year's report.

Of the three mocking-birds mentioned there, two stood the weather bravely and are doing well, but the other has not been seen since the freezing rain of 2, 3. Bluebirds have also remained at their old places, and as a sign that they did not suffer even during the ice-coated spell, the first milk day two males were already courted a female, with as fine a cat as ever heard of in a sparrow. The bluebirds, chickadees, wrens and nuthatches are not disturbed by any kind of winter weather, as they can find food where few other birds would think of looking for it, and

tree hives afford unexcelled shelter. Nevertheless they all appreciate southerly winds, and become loquacious in their exultation over a big rise in temperature.

Most, but not all, of the yellow-rumped warblers have vanished. The purple finch has become very numerous. Long-tailed weavers collected during the "glacial period" in all places where the coral-berry or Indian currant grows. In those cold days, when everything, even their favorite acorn buttons, was buried in a sheet of ice, they had to put up with this meager food. They worked hard all day to appease their hunger, but did not succeed. Hard, unsatisfactory work it was for them, as they do not eat the whole berry, but merely the small seeds within, and even these they do not eat until the berries are thawing. After the birds had worked there a few days, the ground was covered with the husks, skins and pulp. On six acres, overgrown with patches of this plant, I found about a hundred purple finches. About ten per cent. were in erimson, and the other in plain brown. When the weather moderated they left the coral-berry. The American goldfinch braved the cold of January, but the freezing process of February 3 was too much for them. They have almost wholly disappeared. A walk of nine miles in nine hours revealed only two birds.

White-throated, white-crowned, song, and tree sparrows and the black snibbirds remained the same at their winter quarters. Old Pipplo has braved the cold well, his call comes from the same thicket as in December, and Mrs. Pipplo is seen not a hundred yards off. The cardinal grosbeak is a hardy fellow, but he likes warm days in winter better than cold ones. When the sun shone brightly on the 12th inst. he was much pleased with it and put in a lovely song.

The crow seems to degenerate! It cannot stand so much as it used to. I found them badly starved and frozen, with a terribly empty stomach, and the whole bird not more than one-half its usual size.

Some jays do not know how to keep from starving, or else they manage to live on noise making.

The downy and hairy woodpeckers remain at their places, and are bound to make love the first warm day, no matter how deep the mud is. Mr. Redhead tried his best to stay and live on ice-cold acorns and such like. I met him in cold days, but he did not say much, and seemed to suffer from the cold. He was not so fat as in December. They remained, and were doing well on the 13th inst., but they looked as if resolved not to stay with us next winter.

- New species seen since last report:
- Pine goldfinch—One bird, 18.
- Golden-crowned kinglet—Two pairs, 1, 6.
- Brown creeper—One bird, 1, 6.
- Red poll hatter—One bird 3, 7, and flock of 30-40 5, 12.

They were wholly unacquainted with such a thing as a shotgun.

Lapland longspur—1, 6. A flock of thousands on a field grown over with a sedge, on the seeds of which they were feeding eagerly. It seemed that they had made a contract with the owner of the field to clear it of every seed in the shortest time. And how they went to work! A pretty hard work, as they had to break the minute seeds. They were not willing to leave their task undone, and a shot had no other effect than to make them go up in a cloud with a thundering noise, whirl a few seconds, and come down again near the same spot. They seemed to do the work systematically; every few minutes the rear part of the array flew over the heads of the others to the front, and all moved in the same direction.

Swamp sparrow—One bird, 1, 29, same place where I found one last winter.

Purple grackle—Four seen 1, 18, and two on 1, 29. A few gulls (*L. argentatus* *Sialisoides*) remained here and were seen several times over the Mississippi at the south part of the city, where the strong current prevented the forming of ice.

BREEDING OF THE RATTLESNAKE.

Editor Forest and Stream:

In your issue of Feb. 1 "E. S." writes of the habits of reptiles, gives some information from personal knowledge, and arrives at certain conclusions, in one of which I think he may be mistaken. He says that he "knew that rattlesnakes are hatched from the egg," but I have been brought to the contrary, and will relate a circumstance wherein for once, at least, there was no "interference of eggs" to bring a lively lot of young rattlesnakes into the world.

I spent the summer of 1881 at a watering place in this State, where rattlesnakes are not unknown. At the hotel was a French cook named Joe, who had a fondness for rattlesnakes, particularly those which made a noise with their tails. Not a great way from the hotel was a "den," and one day Joe, accompanied by an old rattlesnake hunter named George explored the mass of broken rocks constituting the "den" and returned to the hotel with several live rattlesnakes; their fangs were drawn and they were placed in a box with a glass cover. Snakes are not exempt from accidents; one died on the way and was killed and one was dead; one died on the next journey to the den to keep up his stock, so that near the close of the month of August the snake box contained two large snakes, nearly four feet long each; one a black male without fangs, the other a yellow female with fangs. About the 1st of September the female was delivered of nine young snakes, each about eight inches long, including the young. As soon as born the little snakes rolled themselves in the sand, and in a few days they were born alive, one dead. After five were born, at intervals of only a few minutes, there was an intermission of nearly two hours, then the others followed. When I saw the snakes bits of the sacs were in the bottom of the box. Did not "E. S." mistake the sacs in the snake that he killed for eggs?

The Frenchman, Joe, took the snakes, old and young, to Albany, and after the arrival there was bitten by one on the hand by the female snake, and his death followed in a few hours. This has nothing to do with the birth of the snakes, but much to do with their death, for the authorities ordered them killed. A. N. CRESKEY.

GLEN'S FALLS, N. Y., Feb. 17, 1888.

THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance, Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH

192. Bartramian Sandpiper—*Tringa bartramiana* Aud.; *Bartramia bartramiana* Ridg. 555, C. 640.—Abundant. Arrives in April and early May. Breeds upon the ground in fields and pastures, and congregates with the brown spots sparingly distributed late in May and early in June. The young birds are well grown in August. The Bartramian sandpipers are locally termed "highland plover" or "inland plover." During the latter part of August they commence to wend their way toward the south, moving in small flocks from the inland breeding places to the marshes and fields along the coast, and but few, if any, remain until the month of October. Their movements, as well as their flight during the latter season, are peculiar, and as to be witnessed at no other time of the year. Various evolutions are performed in the air, and cries are uttered which bear no resemblance whatever to the familiar notes heard later in the season.

Sometimes rising so high in the air as to become nearly invisible, the bird will repeat these cries, circle about, swoop with set wings somewhat in the manner of a night hawk, etc. It is difficult to follow the cry unless uttered at such times. A quick repetition of short shrill whistles resembling those of the fish hawk is followed by a diminishing descending terminal note much prolonged. But few of our wading birds are so highly esteemed for food as are these sandpipers, which may well rank with the woodcock and snipe in this respect. Leaving Maine in very fair condition during the month of September, they migrate to regions beyond the southernmost limits of the United States. When returning they arrive upon the Southern shores in such lean condition and gray plumage that their general appearance is greatly changed from that of the summer.

193. Buff-breasted Sandpiper—*Tringa fuscescens* Aud.; *Tringoides fuscescens* Ridg. 556, C. 641.—Rare. Although a little larger than the sandpipers, most commonly known as "peeps." Yet this bird is so small as to be given little rank as game, and therefore it is probable that but few of those shot ever appear in the markets or are reported to ornithologists. Very few species is now more represented by large numbers, and in Maine it is the rarest of the sandpipers known here. It has the following record of specimens shot at Scarborough, Maine: Two in 1850 by Caleb G. Loring, Jr.; two in 1864 (one by the writer, August 31, and the other September 30; one August 21, 1866, by the writer. My friend Nathan Clifford Brown has given the following additional record: One "shot out of a flock of golden plover," September 18, 1875; also one shot by Mr. J. H. Bond in September, 1875; one shot by Mr. Henry Fletcher, August 1, 1874; and one shot by Mr. Brown himself, September 1, 1877; one shot by Charles E. Somerby, Esq., September 1, 1882.

194. Sandlinger—*Tringa arenaria* Aud.; *Odibria arenaria* Ridg. 542, C. 627.—Abundant along the coast during autumn migrations, August and September. Locally known as "beach bird." Associating in flocks upon the sand beaches. The birds of this species may be distinguished from the "peeps" by their larger size, general white appearance of plumage (in autumn), and upon examination by the lack of a hind toe. The latter feature is peculiar to no other species of our sandpipers. The spring migration of the sandlingers past the coast of Maine is made far out at sea. The sole instance of their occurrence on the shores of Maine in spring that I have learned of was at Scarborough, May 30, 1882. A flock of eight was seen and five of them were shot.

195. Ring-billed Gull—*Larus delawarensis* (Aud.) *Macrotis pipitoides* Ridg. 554, C. 639.—Incidental visitant from Europe or Great Britain. Rare! It is native to the male species, and reeve to the female. I shot a reeve at Scarborough, Maine, April 10, 1870. The bird was alone, flying swiftly near the water, down the course of the Nonesuch River, and uttered no cry. Although about to shoot some ducks as this bird passed me, I sacrificed my opportunity to procure a specimen. It was shot at one of the lakes in Upton, Maine, September 8, 1874. Mr. Boardman has reported the capture of a specimen at the Bay of Fundy and several other specimens have been killed in New England at various times and the facts publicly reported.

196. Spotted Sandpiper or Tattler, "Tester"—*Totanus macularius* Aud.; *Tringoides macularius* Ridg. 557, C. 638.—Abundant. Arrives in early May. Breeds. Nests upon the ground late in May and in June, and lays from buff eggs blotched with spots all over. The nest is made of grass is usually made. The downy young are light drab upon the upper parts, with a brownish black median line from base of bill to tail. Straight black line each side of head, from nostril to rear of head, interrupted by eye. Lower parts white. Feet flesh color. The "testers" are generally distributed throughout Maine, about the inland streams and lakes as well as along the coast.

197. Solitary Sandpiper—Tattler—*Totanus solitarius* Aud.; *Rhyacophilus solitarius* Ridg. 550, C. 638.—Common. Arrives in May. Frequent muddy ditches, wet banyards, etc., and is sometimes known locally as "barnyard plover." Some birds of this species remain in Maine throughout the summer, and probably breed here, although the discovery of their nests and eggs here has not been reported as yet.

198. Yellow-throated Tattler, "Yellowleg"—*Totanus flavipes* Aud.; *Ridg. 549, C. 634.*—Abundant during summer and autumn upon the marshes along the coast. Locally termed "summer yellowleg." Very rarely seen in Maine in the spring, and the following record comprises all the notes I have of its occurrence here at that season or before July. (Doubtless the June specimens were unusually early return arrivals from the north. This species and the red-breasted snipe were observed at Scarborough, Me., July 5, 1868.) One May 22, 1862; one May 23, 1862; one May 25, 1862; one May 27, 1862; one June 24, 1863; one April 30, 1864; one June 28, 1877.

I once procured a specimen with the plumage of the breeding season upon the second day of July, at an island in the Bay of Fundy, and saw another one, apparently its mate, at the same locality.

199. Great Yellow-hunts Tattler, "Yellowleg"—*Totanus*

viriferus Aud.; *Totanus melanoleucus* Ridg. 548, C. 633.—Locally termed "winter yellowleg." Abundant during spring and autumn migrations, especially on the marshes along the coast. Arrives early in April, and the spring migration extends throughout this month and May. The autumn migration occurs during August, September, and October. The latest date I have record of its occurrence is that of two specimens shot at Scarborough, November 5, 1861.

200. Semipalmated Tattler, "Willie"—*Totanus semipalmatus* Aud.; *Symphotus semipalmatus* Ridg. 552, C. 632.—Not very common. Summer visitant. I have the record of but a single instance of the occurrence of this species here in spring, a bird found at Scarborough, May 21, 1896. It is of not uncommon occurrence in summer and autumn, but apparently rather an irregular visitant, and the species is never abundant here.

201. Great Marbled Godwit—*Limosa fedoa* Aud.; *Limosa fedoa* Ridg. 543, C. 628.—Rare; occasional visitant from the South. The following record is from notes of the occurrence of this species at Scarborough, Maine: Two in 1859, one in 1855, one in 1857, two in 1863 (two shot Aug. 20, three Aug. 21, five Aug. 25), two in 1868 (one shot Aug. 12, one Aug. 25), one April 20, 1865. The latter is the sole record I have of the occurrence of the species here in spring.

202. Hudsonian Godwit—*Limosa hudsonica* Aud.; *Limosa hudsonica* Ridg. 545, C. 629.—Not uncommon at the Scarborough marshes during the autumn migrations, but never abundant. Not seen in spring. Sometimes locally termed "brant bird" and also "spot rump," on account of the conspicuous white mark across base of tail.

203. Long-billed Curlew—*Numenius longirostris* Aud.; *Ridg. 558, C. 643.*—Occasional visitant in summer. Uncommon. My only record of its occurrence here in spring is that of a single specimen shot at Scarborough, May 2, 1866.

204. Hudsonian Curlew, "Jack Curlew"—*Numenius hudsonicus* Aud.; *Ridg. 559, C. 643.*—Common during spring and autumn migrations. Arrives in May. Never abundant here.

205. Esquimaux Curlew, "Dough bird"—*Numenius borealis* Aud.; *Ridg. 560, C. 646.*—Common during spring and autumn migrations. Irregularly abundant. Great numbers of curlews migrate along the coast of Maine for and at sea, and only appear here upon the land when heavy weather causes them to pause in their flight and come to the shores.

[TO BE CONTINUED.]

THE PHOEBE'S NIGHT SONG.—*Editor Forest and Stream:* A recent year "Visions of the Night," does anyone doubt the dreaming capacity of birds and animals? In the case of the phoebe bird it is very evident to me that such is the fact. Take a night in August or September and fancy yourself with me listening to Nature's voice, after the world is asleep. Scarcely a breath stirs the treetops and the full rich moonlight glimmers on the dense foliage, casting the clearly out shadows of trunk and branch on the grassy carpet below. The air vibrates to the sound of myriads of katydids, which the drone-drone drone-drone of the crickets, lending a monotonous and soothing accompaniment comes to us in regular pulsations from the woods. Then it is that you may hear the phoebe's voice ring out from the dark aisles among the trees clear and sweet (though plaintive) above the insect chorus, as though the little fellow slumbered uneasily.—DICK.

OHIO BIRD ARRIVALS.—East Randolph O., Feb. 16, 1888.—Saw two killdeer plover flying north. This is the earliest record of its arrival in this vicinity I ever heard of. Weather warm, thermometer 65°. Bluebirds, robins, and crows are here. Crows have been here all winter, and also the song sparrow, which is now in full song. It may not be out of place here to give dates of earliest arrivals of blue bird during the past five successive years: Feb. 23, 1878; March 5, 1879; Feb. 17, 1880; Feb. 22, 1881; Feb. 13, 1882; Feb. 16, 1888.—A. HALL.

Game Bag and Gun.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in order to save from the office matters of importance are liable to delay.

A HOLIDAY CRUISE TO MAINE.

HAVE you ever forgotten your first deer hunt? How every article in the outfit was examined, criticized and talked over again and again, and that rifle was in such prime condition that its various parts seemed to be out on dress parade, and had imbibed so much of your excitement that you could actually feel a tremor running through its fine fiber, and how—but, of course, your memory has played you no such prank, and the recollection is, undoubtedly, as fresh as the present time as it was on that memorable day, when you, while telling the boys that you had brought the quarry to camp, vainly tried, under an assumed air of unconcern, to hide that pardonable and natural pride of the heart which we both know.

For I have recently experienced my first deer hunt. In company with two congenial spirits and fellow students, Fred Todd, of Milltown, N. B., and Harmon J. Coulter, of Georgetown, Col., I hurried away from the classic halls of the University of Michigan to the pleasant seclusion of the Christmas vacation and took train for Todd's home.

We left Boston at 9 A. M., Dec. 22, 1882, and after a delightful ride reached Bangor, Me., at 3 P. M. At the latter place we transferred ourselves and belongings to a sleeper, and made all preparations for a tasty change at McAdan Junction, N. B., to the night train for St. Stephens, and then turned in, but not to peaceful slumber, for scarcely had we sunk into the arms of sleep, when a sharp knock afforded fair opportunity had been given to a bunch of into sweet dreams of deer, and deer hunts, in which every tree had the wonderful faculty of turning into one of these beautiful creatures, when we were roused by a Custom House officer, while "crossing the line," who went through us, and came mighty near nipping Toddy's trip in its infancy, by walking off with all his rifle shells. It was only after the most strenuous and heroic efforts and our united persuasive powers that we three night-lighted and excited youths bore back the shells in triumph.

Upon reaching McAdan Junction, at about 2 A. M., the bracing news greeted us that the night train had been taken off, compelling us to make this our headquarters for the time being; so rousing the inmates of the Junction House,

we secured rooms and finished our interrupted sleep. Making a cautious survey in the morning we found that we were anchored in the midst of about a dozen houses and an ocean of bare, blackened stumps (the result of one of those destructive fires that so often swept over these wooded countries). "Not much excitement to be found here," thought we; so setting back with the latest FOREST AND STREAM, we gave ourselves over to its pages. But mine host, Capt. Herbert, proved himself a jolly good fellow, and entertained us with not a few stories of bear and deer hunting, and re-echoed these were plenty to whet the appetite, and try so that the time passed about very pleasantly until the train gave in sight. To Harvony and myself this "down East" trip was an entirely new experience, and it was with a deal of pleasure that we took note of the country, the people, and their dress.

Have you, reader, ever been down this way? If so you will recall the many fine specimens of manhood that appeared at every station as you hurried toward the wilderness. After leaving Bangor the great interests of the people are centered in their forests, and fully nine tenths of the inhabitants in the immediate vicinity of the great water ways are interested, in some way or other, in the lumber trade. This of course accustoms a vast deal of out-door life; the result of this active exercise is plainly seen in the natives: They had long since donned their winter garb, and with the body snugly encased in numerous shirts and thick homespun, and with feet inclosed in their fancifully colored stockings and hawkins, many of the costumes were really picturesque. At about 8 P. M. of the same day we sped away to St. Stephens, a city which with two others (Calais and Milltown), constitute what is known as the Union.

These places, distributed on the east and west banks of the St. Croix, are connected by three bridges, and with each recurring spring are the scene of bustling activity; the many thousand feet of lumber felled around the headwaters and branches of the St. Croix are rafted down, and here meet their arch enemy, the ever ready saw.

It is needless to say that at Milltown, at the residence of Mr. Charles F. Todd, a most hearty welcome awaited us, for any one who has had the good fortune to tarry with him has always carried away the most pleasant memories. We remained at Mr. Todd's until the 26th; in the meantime all the necessary paraphernalia had been collected, and it was with a few minutes to spare that we were ready for the starting. Having a few snowshoes, axes, guns, etc., and one of those comfortable and tough little sleighs known as pungs (in which the Butswiekius draft about), we arrayed in the prevailing mode of the country—heavy caps and mittens, each with six pairs of woolen stockings under our moccasins, deposited ourselves in the interstices of the baggage and started for Princeton, Me., twenty miles away, where we met our guide, Mitchell Seavey by name, a tall, muscular fellow, a native of the Passamaquoddy tribe. He proved himself thoroughly acquainted with the country and with the most likely places for game, at the same time an intelligent, hard working fellow. I feel no hesitation in recommending him to any one that may visit the region.

Leaving Princeton at about 11 A. M., we drove rapidly across Lewey's and Big lakes to Grand Lake Stream, twelve miles distant. Here is located one of the State hatcheries. We were very able to inspect very thoroughly, but found everything in excellent working order, and were gratified to hear of the good results of their work. May it keep on.

From Grand Lake Stream, under the direction of the guide, we struck off on a bark road for a logging camp, fourteen miles off, known to be in the center of a great deer country. Oh! the horrors of that bark road, the worst corduroy in the country could not equal it. After unsuccessfully trying to bang out the pung as it walked, with the assistance of one driving, not on and walked. The sleigh was first up, and then down, with a soul-stirring plunge, then a violent lurch to one side of the road, and after exerting the pung from the bushes, only to go ahead a few steps and strike an unexpected root, a snap and spring of the pung, and a general movement of the baggage was the inevitable result, and so it was repeated until, when still far from our doubtful destination, the night closed in upon us, the prospect of making the night to these woods with the thermometer loafing around the zero point, seemed to gain ground as we went on; for roads crossed and branched off from the one we were on in the most perplexing confusion. The thought was not at all inspiring, for we were more than tired after our hard day's travel, and our horse was nearly tuckered. We were more in sympathy with this faithful animal than with ourselves, and feared the consequences of the night bivouac for its sake.

The guide kept far ahead, and with the aid of a torch explored most of the roads; so keeping up a steady trudging and following his directions, at about 8 P. M. the most welcome sight of smoke from a logging camp met our eager gaze; with a "view Hallo" we lost no time in ensconcing ourselves within its spacious walls.

The hospitality of the woodmen are proverbial; rough and uncouth as they are, they always share with you a generous portion of their food. Their welcome appeals directly to the heart, said member generally being reached through the stomach.

The cook hustled around and soon had a piping hot supper of beans, camp bread, and tea sweetened with molasses. No matter what time a man may strike one of these camps, the first question plumped at him is: "Well, stranger, had anything to eat?" Other categories seem to be of minor importance. An hour or so spent in pleasant conversation over the prospects for game, and in making all preparations for the morrow's early start. The choppers had seen deer quite often while going to and from work, though many doubts were expressed as to our chances for capturing one; the snow being hardly deep enough for snow-shoeing, but making very uncomfortable walking, it would be necessary to exercise the most skill in still-hunting, and meet cunning deer on their own terms. The pleasant evening was closed by depositing ourselves in the bunk (better known as the man's pasture) with the men.

There were ten men in the gang all told, under the leadership of Joshua Crockett, of whom I shall write hereafter. This bunk occupied the larger portion of one side of the camp, and had a thick mattress of spruce and hemlock boughs. No time is lost in disturbing the woods, the refinements of civilization are left to the morning, and the morning of the morning, and dislodging yourself from four or five pairs of stockings completes the necessary toilet. Securely wrapping yourself in a blanket, you soon, on those aromatic boughs, sleep the sleep of the blessed.

I stayed up a while longer and buried my cranium in Hallock's "Sportsman's Gazetteer," in order to glean addi-

ional points on the nature of the animal we were in pursuit of. After finishing my reading, I leaned back on the deer's seat, and while the crowd gathered around the camp spent a few moments in delightful musing. So while the heavy breathing of the sleepers and the snapping and crackling of the fire, are the only sounds that disturb the silence, let me transfer a few of my thoughts to this paper, and fill in the gaps of this long-drawn narrative. First, I am sure you would have me call persons and things by their right names, it seems to me that I have been so long in the habit of writing my friend's name "Todd," in this style. He had been with us but a short time before he was universally called "Toddy," the transition to "Whisky Toddy" was the easiest and most natural thing in the world, and thus, no matter how disagreeable this cognomen may be, it sticks. It is wonderful how nicknames will fasten themselves to a person, and really in the multitudinous cases of bustlers, or of old-time pleasure hunters, it is greeted with the old-fashioned name of school and college days; and so with Harmon Coulter, Harmony it is on all sides.

But the uneasy farrings of some of the men recall me to my senses, and as I turn toward the bunk, I cannot refrain from contrasting this sort of life with that of the laborers in the cities. These men after day in the woods about September 1st, stay in the city, and then come back to camp, in the meantime, day after day, great roads are made, and the forests; it usually pained me to see some powerful tree, the proudest among its fellows, seemingly conscious in its strength, leveled low to the ground.

When the men first come in they at once go to work and put up the camp, which is the work of a few hours only. The sides are generally made of straight, well-matched timber, and are built up in the shape of a house, the outer layer of bark is put up for the roof, and thickly covered with boughs. In these modern days nearly all the camps have stoves instead of the open fire and hole in the roof for the smoke, which affords the men a vast deal more comfort.

About time to turn in, you say. Well, I shall, so, stepping over Mitchell's (the guide's) prostrate form, I lie me to my well-earned bed. In the morning a general shake and a few finds of the morning, and then the men get up, and the antelope over the plain" very early, and are always up before daybreak. No need for the cook to summon more than once to breakfast—a meal of beans (again the inevitable bean), codfish and tea. Harmony and I look at one another agghast at the prospect of this tea arrangement in store for us. Tea sweetened with molasses is far from my ideal; but as we are in the woods, it was never without a wry face and a sidelong glance at one another that we have seen I absorbed the compound. The "Hardy Whisky," like a true Brunswicker, eagerly drank it at all times and seasons. To ye, O wise men! let me caution you to take in sugar, and if fond of the morning cup of coffee, convey that also.

With the daylight we hurry off on one of the logging roads. Whisky with a new .44 cal. Winchester repeater, Harmony with a heavy 10-bore, double-barrel Scott gun, myself with a 12-bore and the guide with a substantial muzzle-loader. We noted numerous tracks along the road, some comparatively fresh, but we kept on to where one of the teamsters had sent back word he had seen a very new track, and Mitchell, examining it very carefully, pronounced it the trail of a large doe; he could distinguish a buck from a doe, he said, the putting HB sharp and the deer's tail hoar.

Tightening moccasins and bucking BB cartridges into our guns we lost no time in taking up the trail. We had not traveled more than half a mile before we realized fully that we were in the Maine woods; the snow was about sixteen inches deep, loosely packed, making the walking very difficult, especially for still-hunting; fallen trees still further made our progress anything but pleasant. On every possible ledge place huge chunks of snow had formed, and at the slightest provocation these had the most dumping and chilling trick of sliding down a person's back.

Nevertheless, we were constantly cheered by the appearance of new tracks; never in all my life have I seen any thing compare with it; the woods had the appearance of a huge sheep pasture. At every ridge we would separate and cover the ground carefully. We realized that we were running up with the game very rapidly, having found two separate spots, where, after the deer had browsed around a bit, it had lain down and rested. We were now approaching a thickly wooded ridge, so each of us, striking off in such a way that the whole ground would be thoroughly covered, went ahead as noiselessly as possible. We had passed over about three-quarters of the ridge when the stilling was broken by a quick succession. Standing motionless in my tracks I listened intently for any further sound, but some little time had elapsed before I heard a cautious bark (the signal agreed upon to call us together). We found that Whisky had had the honor of the first shot, but owing to the snow on the cedars and bushes he had not been able to peer ahead more than twenty-five yards and had thus been compelled to take two hasty snap shots, as the deer, discovering him, had "hit out."

From blood on the snow we thought the deer had been badly hit, but upon following the trail a short distance discovered that it had a hind leg broken, which it dragged along. Taking a hasty lunch, Mitchell, after giving us the most minute directions to the likely crossing-places, plunged ahead on the trail, and we made the best possible speed to the crossings. As we took up the trail on a level, open ground, with a space of about five hundred yards between us, and watched until far into the afternoon. I had serious thoughts of summoning the boys and with the aid of a compass pushing out for camp, when a report, which sent the blood coursing through my veins, sounded away down the ridge at Harmony's crossing—a vigorous barking made Whisky and me scramble along as fast as possible to the place, where we found Harmony, who, looking calmly at himself and viewing the carcass of a well grown doe, it proved not the one that Mitchell had started after, but I suppose it had been frightened out of some favorite trying spot by the noise occasioned in the pursuit. All speed was taken to make out of houghs a rough sort of sled so that we could drag the body easily, and with abundant sprits we struck out; after a hard pull, about noon o'clock, we reached a very warm logging road, only a mile from camp. We were received with open arms, the men supposing that we were lost in the mazes of the forest. In about half an hour Mitchell came in, and said that although keeping pretty close to the deer, he was not able to get near enough to turn it in our direction, but thought it had crossed the logging road far down.

As, however, had started four others. Great was our relief as we went over the incidents of the day, laughed at the mishaps and sympathized with the mistofurnes. After

supper we had a jovial talk with Joshua Crockett (the loss; an original old fellow is he; many of his ideas, though somewhat out of fashion, are still of great value. A favorite story of his and his constant injunction to the men was—"If a man wants ter smoke, let him smoke, 'en if a man wants ter chew, let him chew; the more terbacca a man uses the fiercer, madder, angrier he gets; that's the man 'en slash into a tree. I tell you, I wouldn't give ten cents a day for a man that didn't chew anything stronger 'en spruce gum." Another was, "No sir, I don't want to be 'round me in the summer time after the ice has melted, 'en I'm in the water; it's agin nature." Water don't have no ice in summer, never meant that man should; follow natur', says I."

In the morning we went to where Mitchell thought the deer had crossed, and sure enough there were the tracks. Despite all difficulties we determined to try the snowshoes, and found that on them we could cut out a much faster path than on the day before, and on occasional falls the end of the shoes caught on some unseen stump did not cause us a deal of annoyance, traveling together one would help the other, for now you, Harmony and I were novices at it. We had gone scarcely forty rods, when we discovered the bed upon which the doe had passed the night; two hours of steady, rapid work, carried us along the trail to where the tracks seemed to have just been made. The deer had rested all night, but notwithstanding this, it was not long before we were remarkable to notice the tremendous leaps it would make over fallen trees and obstacles of all kinds. Keeping up a pretty fair gait and plodding along, great was our surprise when we discovered that the noon hour had been passed, in fact, it was close upon 2 P. M.; this discovery made us realize that we were nearly finished; just a few moments for a last look at the woods before Mitchell, Whisky and I started back in all haste, leaving the loggers to go on. Mitchell said, the deer was traveling in a circle, and in all probability would soon cross the road. Sure enough, Whisky and I were not yet on the road, when we heard Mitchell's bark drawing nearer, so spurring ahead we reached the road almost breathless. Hardly had we broken through the bushes before the deer, about eighty yards up the road, broke cover and ran as fast as it could, but it was not long before we had it, which had the effect only of stopping the deer, the second shot went clear through the head, Plucky animal, it deserved almost to live after such a fight, but after we knew that its leg was broken, we were determined to put it out of further pain. A roasting time did we have that night, the cook made some doughnuts (a little luxury in camp) especially for us, and the men did many little things to show their appreciation of the fact that they were to be coming home, and afforded them. Joshua held forth at great length upon the benefits and greatness of Free Masonry (he being a mason) and frequently grew quite eloquent in the recital.

From one of the men who had been scouring the country for hemlock bark, we learned that at Monroe Lake several deer had been seen. We decided to make this our last trip, for we were in a hurry to get home. We were on the woods long before "sun up." When Old Sol did begin to raise himself from his icy bed, we wished that all lovers of the gun could have been out that morning; for the snow had never looked so fine, the rays of the sun danced and gleamed from trunk to trunk, and brightened up the most sombre corners, until the very air seemed to be rendering thanksgiving for this great goodness. I know that we were all of us, at that time, particularly glad to get out of our shoes sounded more than ever with clock-like regularity.

When about a mile from the lake we branched off in different directions; so that the lake might be approached from the best vantage grounds. Harmony and I made a long detour to the further side of the lake; Harmony posted himself, while I proceeded about a quarter of a mile up the lake about several coves to one particularly inviting spot. My choice was a good one. I had not waited long before I saw two deer coming down the lake at a brisk trot, started, no doubt, by the guide, who had gone around the head of the lake. I felt the first symptoms of buck fever, but remembering the advice of Mitchell, I looked away from the deer for a moment and tried to control myself, but it took all the will power I had. Fortunately the deer kept close to the shore, and I was able to keep my eye on them, and myself, holding my gun as steady as possible, I pulled the forward trigger on a well-aimed buck, and as soon as the smoke cleared away, saw my first deer struggling in the snow; another shot at closer range gave me full possession of this noble fellow. At the first shot his mate darted across the lake in Whisky's direction, but he being too hasty, his two shots, which we effectually prevented from doing, were fired further up the lake. We had no time to take up the trail, for all preparations had been made to start at noon. Cutting up the buck and distributing the best parts among us, we pushed out rapidly for camp.

Upon setting up, Joshua said: "Well, boys, ye loggers don't generally charge strangers for board 'en fix'n, but seen't your city chaps, and college bred, I'll put the figger at fifty cents a day for each of you, and sixteen cents a day for the boss." His manner was so solemn, that we could scarcely refrain from giving vent to our feelings.

Bidding the crew good-by, we set out on our return trip, over that abominable bark-road. But it proved too much for the pung this time; half of the distance had been covered when the dash-board parted company, though we made use of it as a back-rest. It was with the greatest difficulty that we got over it, and I thought of driving my front wheel shot under the horse's feet. Grand Lake Stream was reached at six o'clock; there we bade adieu to Mitchell, and spent a few days longer in cruising about the country after foxes and partridges, with fair success. Thus ended one of the most enjoyable shooting trips we had ever taken. The region visited is a great one for game; the sportsman may enjoy many sports if he uses his privileges with moderation, and does all in his power to keep down the deer-herd. I am sure that all sportsmen will join with you in crying down the proposed amendment to the Maine deer laws. Diges.

ANDOVER, MASS.

NEW YORK GAME LAW.—A bill, which we understand has been proposed by a committee of the New York Association for the Protection of the Game, is now before the Legislature. It provides for a Deer, Aug. 1 to Dec. 1 (fawns in spotted coat protected, also deer on Long Island for five years); wild duck, goose and brant, Sept. 1 to Dec. 1 in his power to keep down the deer-herd. I am sure that all sportsmen will join with you in crying down the proposed amendment to the Maine deer laws. Diges.

THE PARK STABLE OUTRAGE.

Editor Forest and Stream:

In a late paper in regard to the wonders of the Yellowstone Park, the suggestion was made that in the construction of leases it should be expressly stipulated that no building of any kind should be erected within view of any of its great wonders, believing that such an act "would be an outrage on the eternal fitness of things."

As an indication that the suggestion was not made without a basis of fact, I am following extract from a letter in a late issue of the *Bozeman (Montana) Courier* is appended, which will explain itself.

MAMMOTH HOT SPRINGS, Feb. 6, 1888.—The Park Improvement Company have about finished a large stable, located northeast of the capital east of the road on the old location, judging from the size of the stable, they anticipated a very business next summer. The intention is to utilize it for a boarding house and offices until the completion of the hotel proper. They have just commenced framing the timbers for the hotel, but this draws as all work does now, on account of the extreme cold weather we are having. The contract meat is not coming in very fast, which leads me to hope that it may fall of fulfillment, so that a few head of elk and other game may escape butchering.

Think of it! A large stable alongside and in the immediate presence of one of the most beautiful and wonderful formations of the whole world! Will not the Park Improvement Company, who are the very lovers of the grand and beautiful in nature, in the whole land, rise up and join in a protest against this stupendous outrage! If this is allowed, what will become of "Old Faithful," and "The Grand," and "The Geyser," and "The Castle," and all the other wonders of this region?

It was bad enough for a former superintendent of the Park to erect what he here designated as "the capital," a kind of a block-house of a building, loop-holed for musketry, on a high eminence, overlooking the spring, and an eyecore to every visitor.

At the time it was built, there was about as much use for it, as a block-house, as there would be to-day for the erection of a similar building at the head of Pennsylvania avenue for the protection of the Capitol, and it is to be hoped that some appropriate action from Congress will be first utilized in pulling it down and removing such an eyecore.

BOZEMAN, Feb. 22.

The *Zealand Courier* editorially says: "We publish another letter in this issue from our Mammoth Springs correspondent, who gives an account of the work being done by the Park Improvement Company. According to the report the millionaire lessee is providing stable room for his cowboys' animals. It does not look as though a generous desire to provide for the comfort of tourists prevails, but the lessee is using an alarming extent. The average sightseer will prefer another stopping place than a stable. The true inwardness of the company is becoming apparent, and legislation which will defeat the schemes of the Rufus Hatch Cable Company will be hailed with more than ordinary delight."

SUMMER SHOOTING.

IN many places farmers have a strong dislike to the average sportsman. Summer shooting lies at the bottom of much of it. The farmer works early and late. His life is one of hard realities. Seldom a sportsman himself, he looks on the pursuit of birds as a waste of time at best.

They find his lot very different from that of the "brain-worker," and finds himself at a great disadvantage. To crown all, his ears are saluted by the echoing shot in the alders, and his eyes by damaged fences, tangled grass, and trampled crops, which advertise too plainly what he calls "cussed idleness." This when summer shooting prevails. It will be objected that the true sportsman is not guilty of these offensive acts.

How many of those who use guns are true sportsmen? The best of us will work the corn and potato fields in summer shooting, and who can resist the spring-hole shaded by the clump of trees, even if the way to it lies over a field of grain or innately green.

In my immediate vicinity some of our best ground has been posted by the owners. A few quail had taken refuge there. Their beat was a very good one, and many of our great favorites with the farmers and their families. Then came the most insatiable shooter I ever knew—a "brain-worker," of course—who makes it exceedingly sulphurous for those quail from noon till dewy eve, and from dewy eve till pitch dark, day after day, day after day, and the land was posted, and some twenty-five or thirty of us shut out, not, however, till harvest came over to us, when we had a malodorous let down. We are aware that he was the exciting cause of our affliction. It would, no doubt, grieve him much, as he is really a most estimable gentleman and good fellow, only he is a "victim of the strange fascination of the trigger," and it sometimes "gets away" with him.

Take the case of the farmers here mentioned as illustrating, to some extent, the position of their class. Not one of perhaps the whole dozen ever has killed or will kill a game bird.

Shall we cry "dog in the manger?" Well, the manger is his and he will stay there. As we cannot drive him let us try other measures. Suppose "Clericus" converts him to the belief in St. Hubert. Vaccinate him with the "strange fascination of the trigger." Keep off from his fields till his harvest comes over to us, when we have a malodorous let down will not let cattle into his crops to his great damage, moral and pecuniary. Respect his pet quail. Treat him like a man and a brother and he will treat you like one.

"Clericus" asks for "some shooting in the vacation season"—"without sacrificing the game" or "killing the goose that lays the golden egg."

What time in the season? How kill the game without sacrificing it? Are the "brain-workers" alone to have the advantage of the supplementary season?

Imagine the "tens of thousands" of college professors and school-teachers, and ten times tens of thousands of lawyers, actors, clerics, etc., turned loose with dog and gun for a portion of the vacation season, the woodcocks would soon write the epitaph of rail grouse and quail. "Gone to meet their Dodo and the Ark."

Woodcock being nearly exterminated, the first day would finish them. Last September two men drove about twenty miles from this place to the borders of Massachusetts, hoping to find a bird or two for a puppy that had never seen one killed. Acres and acres of the finest cover were worked without finding a single woodcock.

There was no mystery about it. The season opened August 1. About that time four "brain-workers," etc.,

Clericus I think, took their abode within a short distance of the famous old grounds

They probably had "shooting without sacrifice" to the full extent, for Clericus when he does get the trigger fever, is the most ferocious of sportsmen. "I could a tale unfold," says Clericus, "speaking for the entire body of professional men?" I had supposed this matter of summer shooting was agitated for the benefit of market gunners and their wealthy patrons, with perhaps a crazy trigger-puller now and then. Here at the top of Connecticut we know how it works, and out of forty or fifty sportsmen in this little borough, I doubt that one vote could be had for summer shooting. To be sure most of us are workmen, but, speaking from observation again, the moral process is as active and wearing in many of our mechanics as it is in our so-called "brain-workers." They also find rest, refreshing, nature beautiful, and sport delightful. Sometimes, at rare intervals, a white day dawns for them, so with dog and gun they start for field and cover, too often to find the pleasure all in anticipation; the summer shooting of years ago and the "brain-worker" "knitting up the ravel'd sleeve of care" leaving but a small margin on which to realize.

As I have never thought the "brain-workers" are entitled to special privileges over the rest of us.

They seem to have a pretty good time of it, generally speaking, and what they cannot help themselves to is hardly worth having.

I might, perhaps, be willing to make an exception in favor of "Clericus" himself. For after a tremendous contest with the powers of darkness, what could be nearer a perfect rest than a wrestle with a July woodcock? OTHERS.

LARGE GAME AND SMALL SHOT.

I HAVE been reading in the FOREST AND STREAM week after week "Deer and Small Shot," and the wonderful exploits accomplished with these tiny specks of lead by the "craft" at sundry times and divers places, especially Dr. Sterling's experiences as recorded in your issue of Feb. 15, which reminds me of similar achievements in the "long ago" of my own hunting life.

A goodly number of those that is called "West Arm" of Mullycheukunk lake to Cranberry Bog, in the month of June. The path or blaze line passed over a high hill of second growth woods, and when about half way over this ridge, as I stepped up on to a large flat ledge of rock over which the path led, a middling-sized bear stepped upon the other end, some three feet up, and each of us was greatly surprised, as you may suppose.

As I stepped up on to the bear, and the bear stopped when he saw me, and we each of us stood stiff as a moment to catch a thought of what was the next best to do. We were about three rods apart, and we both wished we were further, for I had only a partridge charge in my gun; and the bear soon showed signs of uneasiness, for after eyeing me a moment he turned his head half way around and limbered up his forward legs in the act of getting down; he had been staring at his own shadow.

On the impulse of the moment I raised my gun and fired at his ear. The bear dropped; the No. 6 shot had pierced his brain, and I stood over him with my watch to see how long he would live, being prepared to give him another shot should it be necessary. He died in thirty minutes. The bear had been drinking at a spring which boiled up at the other end of the ledge.

At the same time I saw the same sized shot in "C" Pond. I was following up a streak of air bubbles on the pond, my skiff, one morning before sunrise, to get sight if possible of the animal that made them, when all at once up came two large otters within easy range. I dropped the paddle and caught up my gun and fired the right, which was loaded with double B. The otter kicked over on his side and floundered about, but before I could get to him he sank in a moment and I never saw him again. But very soon his mate came up and crawled out on a floating log near by, and I let go the left, which had No. 6, and he rolled off the log, kicking up the water fearfully. I paddled up to him this time and took him into the boat before the wind was out of him, and I believe this is the only way, for I think they invariably sink when dead, as their bodies are very much heavier than those of land animals of the same size.

HERRIN, MAINE. J. G. R.

Last fall, while spending my usual annual vacation at my charming camp home on Indian River, in the northern portion of the Lower Peninsula of Michigan, on the great internal thoroughfare between Petoskey and Cheboygan, one great distinction as it appeared to my hand at the deer which abounded in that river. Lying close in the end of my little sneakboat, waiting for opportunities to bag my game whenever they presented themselves, we glided noiselessly around a sharp bend in the river, when we heard the frequent splashes of water, such as would come from a large animal wading through the sedge and bulrushes that grow all through the overflowed marshes. On it came with great distinctness as it approached, and being perfectly satisfied now that it was a deer, I ordered my man to remain quiet, and with muffled oars turn the boat to the river's bank where the wind and tide were carrying her. The splashes came nearer and nearer. Our boat lay close to the north bank, just opposite the point of a long, dense clump of sedge and bulrushes. I quietly rose from my seat, and holding my gun close to my shoulder, with bated breath I waited for the animal to appear. In a moment more I saw a deer's head appearing at the point of sedge just in front of me, his ears thrown forward and his eyes glaring at me. It was a sight—a pull and an explosion. I heard a plunge, and all was silent. We hastened to approach the spot where I last saw the deer, and clearing away the driftwood which lined the river's edge, we pushed and pulled our boat over half-sunken logs and through the weeds, but could hear or see nothing. On the edge of a sudden I perceived the floating carcass of my fine deer. The outflow was about eighteen inches deep, and we tugged away at our secured game and after no little effort succeeded in getting it snugly fixed in my little duck-boat, only twelve feet long by three feet beam. We then pulled out from the marsh into the river, and by dint of rowing and paddling reached my camp home a little after dark. Now, summoning my neighboring campers together, among whom was my friend, P. Morrison, of Jackson, Mich., who is an ardent hunter of deer, we succeeded in dragging our prize to my ice-house, a few yards distant. All around the country congratulations were given me for securing the first deer of the season. Those unacquainted with the facts in the case I found it quite difficult to convince that I killed that deer with No. 4

duck shot. Subsequently I measured the distance, and it was about 60 feet. I was astonished at the success attending the shooting. But the fact remains nevertheless true, and I must be entered upon the list of those who have bagged their deer with small shot. SENEX, ASS. ANSON, MICH.

THE FREEDMAN AND THE QUAIL.

Editor Forest and Stream: It would be much more satisfactory to your readers to have the opinions of correspondents on this interesting subject who have not yet delivered themselves, than its prolonged discussion by those who have already spoken. Permit me, however, to add a few words more, not for the purpose of maintaining any pet theory in regard to the matter, however contrary that theory may be to truth and justice, but in order to invite the further expression of opinion on the part of persons rendered capable by experience and observation to testify in this behalf.

We all understand "Rallywood's" position. He ascribes the security of "Bob White" to the poor freedman. I do not know "Rallywood," and therefore have no means of judging whether his opinion is worth anything on this subject; but of the four correspondents whose articles with reference thereto have appeared in print, two I know are entitled to the highest consideration. One of these, "Chasseur," agrees with "Rallywood." "Chasseur" is well known in this State as a gentleman of exceptional high character, ability and culture, whose opinions are entitled to respect at least.

Upon the other hand, Dr. M. G. Elzey, a gentleman also well and favorably known and identified with the best material interests of the State, than whom few have better opportunities of forming a correct opinion upon the question under discussion, agrees with me that the freedman is not responsible for the decrease of quail, and that he has, as a rule, abandoned the inclination to hunt, which was formerly so characteristic of his race. This is beyond cavil or dispute true as to the portion of the State with which I am familiar; and it is a singular fact that it is the opinion of every farmer with whom I have conversed on the subject. As was stated in a former communication, there seems to be as yet no accepted theory as to the cause of the decrease of quail within the last few years. "Rallywood" is perfectly correct in his statements of fact going to improve Dr. Elzey's theory. The conditions mentioned by the latter do not exist in the localities indicated by "Rallywood." The facts already alleged, showing that our colored friends are not to be held responsible for this mysterious disappearance of quail, taken in connection with other circumstances, and bearing in mind that quail are scarcest in the northern counties, where there are fewer negroes than in any other part of the State, should induce us to seek for some other and more satisfactory solution. In the extreme northern counties of Fairfax, Loudon, Prince William and Hampshire, there is a population of whites, 89,487, and of blacks, 18,648. Here the quail are scarcest. In the south side counties of Brunswick, Southampton, Greensville and Mecklenburg, where the birds are abundant and there has been no decrease, there is a population of 24,448 whites and 43,288 blacks.

In discussing this subject with an intelligent and highly educated country physician residing in one of the northern counties, who is an observing sportsman, the idea was advanced that the quail had migrated from the northern to the tidewater and southern counties and to North Carolina, where quail are in great abundance. He stated, as a circumstance inducing this belief, that in the early part of the season there were very few birds on his place, but one evening in November, in company with a friend, he was hunting on a stream passing through his farm, and in the course of a few hours finished fourteen distinct coveys. A few days afterward they hunted the same ground, but started no birds, nor have any been since found in the vicinity. On another occasion he, with a friend, finished a covey with a white bird among the number. They endeavored to kill this specimen, as they had never before seen a white quail, but did not succeed. The following day his friend returned home a distance of ten miles, and with a gun bearing home his dog pointed. Upon being shown the same covey with the white individual got up, and the white bird was killed. No one in the neighborhood ever saw a white quail before or since, and it was evident that the covey had within twenty-four hours gone a distance of ten miles. If quail migrate, that fact would account more satisfactorily for their scarcity in Northern Virginia than any other hypothesis that has been suggested.

It is to be hoped that the invitation extended by you to your correspondents in this State and elsewhere in the South, to give their opinions upon the interesting question of the abatement of the freedman's hunting proclivities, will receive fitting response. We would like to hear from "Wells" on this question. No one is better qualified to speak, instead of venting his mind and cross-examining "Knick" with reference to the remarkable case in Florida, let us have the benefit of his views on the quail. If I mistake not, his tall-tale non de plume, and irresistible propensity to pun, points him out as a recent representative in Congress from the "Old North State," and he has doubtless had abundant opportunities in his cloistering experiences with the "American citizen of African descent" to enable him to speak authoritatively. Although his repudiation to "Knick" exhibits rather too great intolerance of the license which "Knick" should enjoy in common with other sportsmen to "swap lies," especially when "Knick's" statement was to be supported by the affidavit of "V. J. S.," yet his reply was extremely witty and enjoyable. It would be instructive for him to tell us whether his experience bears out the assertion of "Rallywood" as to the skill of the freedman as a diplomat. M.

NORTHVALE, VA.

Editor Forest and Stream:

In a recent issue you ask for information as to whether the Southern colored brother is as destructive of game as he used to be. My candid opinion is that while he is still entitled to high rank as a game destroyer, he is not quite as bad as he used to be. When they were "turned loose," as they generally express it, they became at once a race of sportsmen. Every man and boy was eager to be the owner of a gun, and as old and new sportsmen were very cheap, they were in those days, they had not much difficulty in supplying their wants. Thus equipped they made a rush for the fields and woods, and for a long time, summer and winter, there was a perpetual fusillade. They slaughtered indiscriminately, shooting everything above the bluebird in size. Even

the mocking bird, for all his songs, was not safe. The sweet singer fell in the midst of his singing. Since this sporting craze continued to this day, the South must have been completely bare of game. But it gradually wore off, for various reasons—first among which, no doubt, was that the new-fledged sportsman found that such business would not keep him and his family in food, and clothing. The fact, too, that shot and powder and percussion caps could not well be had without some money, and that money could not well be had without some work, may have acted as a gradual extinguisher to the new enthusiasm. At all events, that the colored man has cooled off immensely as a sportsman, compared with what he was when the country was first flooded with freedom and old muskets, cannot be denied by anyone, at least in these parts. I can only speak for Texas on this matter. My judgment is that there is not one bird killed now by the freedman where there were ten killed by him in the early days of his freedom.

I have often meditated over the sudden conversion of the colored race into sportsmen, which we witnessed at the close of the civil war. What was it due to? Perhaps to their wild ancestral instinct, which, suppressed so long in slavery, broke out beyond all reason when their freedom was given. In the mean time, in the north, we do nothing what, ever but hunt and grow gourds. To hunt, therefore, and to grow gourds, must be their peculiar race instinct, which will crop out on every favorable opportunity. We saw the great hunting mania, and every Southern man knows that you will rarely see a negro's cabin in the South without gourds growing around it. It may be, also, that they looked upon the possession of firearms and gunning as the highest privileges of freedom and as a means of doing nothing what, ever but hunt and grow gourds. To hunt, therefore, and to grow gourds, must be their peculiar race instinct, which will crop out on every favorable opportunity. To hunt, therefore, and to grow gourds, must be their peculiar race instinct, which will crop out on every favorable opportunity. We saw the great hunting mania, and every Southern man

were constantly on the wing, flying from place to place. All this caused my special wonder. Suddenly a gun fired very near me, and I gazed lustily in the direction it came from. I found an aged colored man busily fishing his cane duds out of the water. I soon perceived, he explained to me that the shooting I had heard of was from negroes along the banks of the river, who were so well concealed that I had not seen them, though no doubt sometimes passing within a few feet of them. He showed me his own hiding place, and it was so good I might have passed him hundreds of times without suspecting anybody's presence. After much duck hunting, I am satisfied, if ducks are plentiful, as they are on Sabine River, that this is as good a plan of hunting them as any that can be invented.

We had Mr. Chas. Hallock with us in Texas some two months this winter. He did me the honor to call to see me, but am sorry it was impossible for me to be with him much on his trip. Hope to see him with us again next winter, and that I may then have a better chance to see him through.

N. A. T.

PALMISTINE, TEXAS, FEB. 22.

PENNSYLVANIA NOTES.

ALTHOUGH great quantities of snow have fallen during this winter, I do not believe that the game of this locality has suffered much. Ruffed grouse are careless alike of snow and cold, and if sly ryanard would only leave them alone I have no doubt next fall's crop of birds would be good; but foxes are very plenty, and foxes get hungry, and then grouse must die to satisfy their insatiate gnaw. The Gardner boys, living about a mile from town, have killed ten gray foxes this winter, and but for the fact of some unwhom scandalous shooting and wounding their lead bound, would have killed as many more. I rather think the person who shot Truebody would not have indulged often in this sport had he not been able to distance Doc Gardner in a walking contest immediately after the shooting.

Speaking of ruffed grouse reminds me that every year their numbers are diminishing. Now, don't say that subject is worn out, for a discussion that deals with the king of American game birds can never wear out. I do not believe that it is on account of improvements in guns or dogs, or in "tracing" them, or on account of the fact that I attribute it to the advance of civilization and "clearings," but I believe with some former contributors on this subject that their numbers are decreased by some disease which may be new to their species, or more malignant in late years than formerly. Last spring I found quite a number of their nests and know that quite a large per cent. of the eggs were hatched, and I saw numerous broods of them yet in the down shortly afterward. It is a well known fact that grouse do not travel much from their original home, and when the shooting season opened I went direct to the localities where I had seen the young broods, and much to my discomfiture found none, actually none. I know that they were not all shot, even if the pot-hunters did kill some of them. I hunted my dogs in the same locality several times during the fall, but found none. I do not believe that any or all the enemies of the grouse family, beest and fowl, could have done so much to them, but it is my firm conviction that disease of some description exterminated them.

Wild turkeys were quite plenty last season and numbers of them were shot, but enough were left for breeding purposes. I was told by a granger the other day that they were wintering well. Although there was a crust on the snow, he said the oak trees had held the snow long enough to permit this winter and last winter on the crust made capital food for the turkeys. Deer were more numerous than for years before, and scores of them were captured. Woodcocks were scarce; I suppose they were drowned out by spring rains. There is quite a growing interest in dog, gun and rod in this direction, and a man who can hit a bird on the wing is not such a rare character as formerly. I believe that "L. J. Newcomb" could have his hands full with the first to start that long controversy on the "Hunting Grouse." I was glad to see in a communication from him some time ago that he had achieved his desire—that of shooting a grouse on the wing, and I know from the graphic manner in which he describes it that he enjoyed it greatly.

OCTO.

GUINEA-FOWL AS GAME.—A correspondent, "Oeto," calls our attention to the following note on this subject in Col. Hutchinson's work on "Dog Breaking": "Mr. M.—I, an officer high in the military store department, wrote to me but last Christmas, 1863, almost in the following words: 'When stationed in Jamaica, quail and the wild guinea-fowl were the only game I ever hunted. I was very successful, and I am about to apply for a New York license for hours through the long grass and brushwood, and will not rise unless hard pressed; but when once flushed they spread through the cover and lie so close that one may almost kick them before without raising them. My dog Albert was broke on grouse before I had him out from home. A steadier or better dog you will rarely see. The first time we went out after guinea-fowl he set to work as though hunting for grouse, bounding up, bounding off, making a wide circle until he headed his game, when he commenced beating back toward me, driving the birds before him until they were sufficiently near me, when he dashed suddenly in among them, forcing the whole pack to take wing. They spread through the surrounding grass and cover, and Albert and his mother Peggy went to work, picking up the birds singly or in pairs where they lay.'

"AFTER ANTELOPE."—El Paso, Texas, Feb. 17.—*Editor Forest and Stream:* In response to your queries concerning antelope shooting, made in your issue of Feb. 8, I have to say, seriatim: 1. The distance was estimated in each instance given. 2. Yes, the person making the estimates was competent to determine the distances. Really there is nothing strange in such shooting. I am quite certain that I can kill antelopes further than any of the distances given. 3. Because mistakes are mischievous and are worthless. They frequently may even be good losses. The stock men want them all killed. Their only defense is the common one, to wit: fondness for sport and good eating. I wish you had an antelope saddle now.—G. W. B.

MISSOURI NOTES.—Maryville, Mo., Feb. 16.—Quail have been very plenty this season, with plenty left over for next. Chickens are not as plentiful as they were a few years ago, although one man killed, he claimed, in four days, over four hundred; he had them by night, whether he killed them in the time mentioned or not. Rabbits are very thick, a friend of mine had the best he ever had for him, and in one day killed seventy-nine. Running wolves is also one of our amusements, and Uncle Jake with his pack of hounds, is a general favorite. Our jack-snipe shooting on the bottoms, when water is plenty, is very fine. Ducks and geese are usually very plenty. Our shooting club always spends a week both fall and spring in quail, when ducks and geese come. In December I was shooting quail in a corn field grown up with grass, and had a covey nearly scattered, and Tricks, my Gordon, and I were having fine sport. I had three birds down and the dog retrieving the third bird when he stopped and came to a point. I called to him; he looked at me a moment, turned and walked away from me some ten feet, came around to me in a half circle and gave me the bird. I sent him in again. He walked directly back and came to me when he had found game with the dead bird in his mouth, and in a moment I had the pleasure of adding one more quail to my score. Have any of your readers had a like experience?—GUYDETT. [This occasionally occurs. We have often seen it.]

NEW YORK WOODCOCK SEASON.—Wellsville, N. Y., Feb. 10, 1882.—*Editor Forest and Stream:* In a recent number of your esteemed paper you advocate a game law for the whole State, and object to all local exceptions to its provisions. In this we agree when the provisions of the law do not favor the sportsman of one part of the State, while they rob those in other parts of the sport to which they are justly entitled. For instance, we object to making the open season on woodcock begin September 1, for this reason: Nearly, if not all, the birds we have are those bred here. Sometime the flight begins so early that by the last of September our birds are gone. When the last change was made from July 3 to August 1, it was proposed to make it September 1, but we sent in a protest from this county; other counties did the same, and August 1 was finally agreed upon as a compromise. We are satisfied with the law as it is in this respect, but any change to a later date we will feel justified in opposing. We have few birds here of any kind; what we have we shall take pride in defending against every enemy and against every law. In capturing them we will endeavor to be sportsmen, faithfully observing the restrictions of a just game law, by example as well as by precept, leading those who are inclined to murder for plunder to forsake their shameful practices and come over, if they will shoot, to the ranks of those whose banner is inscribed, Sense and Decency.—C. E. M.

WORCESTER, MASS., FEB. 23.—The *Gazette* of this afternoon in its "County News" has the following:—"Mr. James P. Whitin has for some time been feeding in his yard a lot of gray squirrels and quails. They are now very tame and will come into the house. All his family have become very much attached to them. Ambrose Nokes shot and killed several of the squirrels. Mr. Whitin remonstrated with him, but it was of no avail. He came again Wednesday afternoon and killed six quails. A warrant was made out and placed in the hands of Sheriff E. O. Bacon, who after a chase of eight or ten minutes, arrested him, and he was taken before Judge Putnam this Friday morning and fined \$30 and costs, amounting to \$29.70, which he paid. Nokes is a stone cutter and is employed by George M. Blanchard, of Whitesville." Mr. Whitin lives at Whites, a station on the Providence & Worcester Railroad in the town of Northbridge. Nokes must be a hard-hearted wretch.

CENTRAL ILLINOIS.—Decatur, Ill., Feb. 14.—The great snipe has just left us. I was fearful that every quail in Central Illinois would be starved and frozen to death. But I am happy to learn of at least two birds that have survived the storm. One covey of twenty-two was counted near our house yesterday. And a neighbor has been caring for a covey of twenty-one that has been feeding in his barn lot (and apparently quite tame) all winter. We have not many prairie chickens near here, but there are some left. I have seen none this winter, but the party five years ago counted twenty in one flock two days ago. I suppose they have all "bunched," and they were all here for eight or ten miles around.—D. T. S.

GUN BARREL OBSTRUCTIONS.—When hunting in Michigan a year ago last fall I met some boys, and one of them held my gun, a single barrel shotgun, for a minute. He slipped a small snake down the barrel. In trying to get it out it got wedged in at about three inches of the muzzle. I could not start it an inch, and finally gave up trying. I very foolishly fired the charge, but it did not hurt the gun a particle, though it nearly knocked me over. At another time I got a shot cartridge stuck about half way down the barrel, and fired it without any injury either to the gun or myself.—F. L. D. (Boston, Feb. 17, 1883).

THE QUEBEC LAW.—By an act now before the Legislature of the Province of Quebec, it is proposed that the game laws of the Province be amended so that it shall be forbidden to hunt or trap live birds between March 1 and October 1, yearly. Also that it be forbidden to hunt or take any wild swan, wild goose, or wild duck of any kind, wildgeon or teal, between April 15 and September 1, yearly, and any Canada geese between May 15 and September 1, in each year. The act formerly read for here, March 1 to November 1; and for Canada geese from April 15 to September 1.

MAINE DEER.—A correspondent of the *Ellsworth American* says that the number of deer shipped from Maine the past year has exceeded 100,000 and it is safe to say that three-fourths of those deer were killed by less than 100 men, and a curious fact is that not one in ten of the venison saddles shipped before the ponds froze had a bullet hole upon them, and of those that had the heads on, nine out of ten were shot in the back of the head, thus proving that they were slaughtered in the water, driven in by hounds.

MONTANA GOOSE SEASON.—FORT CUSTER, M. T., Feb. 12.—Referring to your schedule of game laws published December 1, I would say that ducks and water-fowl, including ptarmigan and wood ducks, (Franklin's grouse), are protected in Montana till August 15, not August 1, as stated.—ARK-BARDIA.

FLORIDA NOTES.—Cedar Key, Florida, Feb. 16.—It takes about 100 shells for a full day's hunt here. I was out yesterday and killed about forty birds—ducks, snipe, curlew, marsh hens, etc. They hunt by taking a boat and going to the islands along the coast, where there are any quantity of birds of all kinds, though mostly ducks. I saw three Philadelphia sportsmen come in from the country a few days ago with 150 quail, which they killed in one day. I would take a quail hunt, but can get no dog. It is very warm; temperature about 85° during the day.—WM. EYER.

"OUR NATIONAL BIRD."—Hartford, Conn., Feb. 23.—The lower house of the Legislature to-day discussed the bill for the protection of American eagles. A number of splendid eagle speeches about "our national bird" were made. Many members poked all sorts of fun at the bill, but it was finally passed by a rising vote at the suggestion of patriotic members. The bill had its origin in a desire of residents of the venerable town of Litchfield to preserve some eagles which have been in that section for years, and which sportsmen are gradually killing off.

ENFORCING THE MAINE LAW.—Bangor, Me., Feb. 25, 1883.—James E. Betty, American Express agent at Bar Harbor, Mount Desert, upon complaint of Fish and Game Warden Morse, was fined \$50 for shipping trout during closed time in November. Geo. L. Bunker, for killing one deer Feb. 7, upon complaint of same officer, was fined \$41.50. Freeman Collins, for killing a deer Feb. 20, was fined \$40, on complaint of same officer.—LEX TALONIS.

MESSRS. WILLIAM READ & SONS, of Boston, Mass., have removed from their former establishment in Faneuil Hall to more commodious quarters at No. 107 Washington street. The firm is well-known in New England and throughout the country as dealers in first-class goods. We bespeak for the Messrs. Read in their new establishment the patronage of an increasing host of friends.

OREGON DEER are reported more plentiful in the hills along the coast than ever before known, and have become quite tame since the game law went into effect, in some places running with the sheep.

MAINE SUNDAY SHOOTING.—Maine has passed a law forbidding the killing of birds and game on Sunday, but an amendment to prohibit fishing was voted down.

Camp Fire Flickerings.

That reminds me.

JOHN H., as is apt to be the case with whole-souled sportsmen, is a thoroughbred joker and lets us appreciate so by when he can raise the laugh in a quiet way against any of the boys. Sitting in a hotel the other day conversing with a friend about a recent trip to Sandusky Bay, some remarks were made touching some extraordinary shots at ducks. These remarks caught the ear of a commercial traveler, who, all unasked, clipped in and immediately monopolized the whole conversation with glowing accounts of his wonderful skill with the gun. "Ninety-six glass balls straight was a bagatelle" to him. "Nine out of ten shots at grouse in the worst of cover, you know," had been his season's average for years; and the number of matches in which he had come out victorious was simply countless. John listened attentively, and after the first or two shots his man said when the fellow stopped for breath, asked in an innocent voice, "What charge did you use in that last match with Bogartus when you beat him ten birds?"

"O, just an ordinary charge," answered the C. T.

"Well, but how much by actual measurement? I would like to know."

"O, just the same as I use at all times."

"Well, what do you use all times?"

"O, sometime more and sometime less, just as it happens."

"Then thinking to see his way out of a difficulty, he continued, 'How much do you use, Mr. H.?"

"Well," replied John, "in my every day field gun which is a very heavy piece, a thirty-six bore weighing eighteen pounds, I use seventeen drams of powder and four drams of shot."

The commercial man's face brightened, for he now saw his way out, and speaking up boldly, he said: "Well, you shoot a heavier gun than I do, so of course you can use a bigger load; now I only dare use in my thirty-five bore, fifteen pound gun, sixteen drams of powder and three and a half drams of shot, and I tell you even then I have a pretty sore shoulder after an all day's shoot."

The boys laid by this time gathered around, and all saw the point but the C. T., who, shouldering his gipsack, moved complacently out, scowling fiercely at the roving crowd as much as to say, "What in thunder you laughing at?"

J. W. D. L.

It was in September. The owls had killed some of our most valuable fowls. One night I was aroused by loud squealing and cackling among some fowls that roosted in some cedar trees that stood almost under the window where I slept.

I jumped up, seized my gun and ran out. I could hear the owl as he darted at his victim, but would fail to strike it, but I could not see it in the darkness. I threw up my gun and touch both triggers—a splendid snap shot—I hear something strike the ground. Walking up to the tree, there lies a turkey, and further on a chicken.

PORT ROYAL, TENN.

I like your new departure in the line of illustrations; the sketches of dogs on point were excellent, and "Asleep at his Post" is still better. An accident precisely like that occurred last fall to an attaché of the Rochester post office. A fellow O. man, who is an expert fowler, laid on a good point, and drove a big flock of ducks to the decoys. After waiting an age, and not seeing his friend shoot, the man in the boat went ashore and found his companion snoring.

ROCHESTER, N. Y., FEB. 23.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

Settle—And when the weather

Serves to angle in the brook.

I will bring a silver hook,

With a line of finest silk,

And a rod as white as milk,

To deceive the little fish;

So I take my leave, and wish

On this lower may ere dawn

Spring and summer.

—The Fish and Game Laws, Act. IV, sec. 2.

FISHING AND FISH LAWS OF OHIO.

THE lover of natural beauty seeks the secluded spot to indulge his fancies, no matter how peculiar other people think him. He is found often away from the haunts of busy men, where nature revels in her wildest moods; where the only sound reaching him is the splash of the "rippling waves" against his boat or the screams of the sea-gull as it follows the windings of the stream, or perchance the peculiar noise of a rail or familiar sound of a stray duck hidden from view in the tall wild rice that hems the creek for miles away. In early spring the grass, weeds, and wild rice appear at the surface in wonderful rapidity, following a clear, beautiful channel rarely exceeded in width 100 feet and an average depth of eight feet for many miles, until it widens and loses its name, emptying into the great waters of Lake Erie. Such is Ottawa River or Ten Mile Creek, the sportsman's home of the members of the Toledo Fishing and Hunting Club. To the lover of nature it is ever charming; to the lover of the gentle art it commends itself by its numbers of black bass, pike, rock bass, often pickerel and muskalgone. The object of the association is to educate the youth in the same peculiar habits as to when they will bite, as other fish in all streams and lakes.

The Toledo Fishing and Hunting Club was organized in April, 1881, with a charter membership of 150, containing, scientifically speaking, some of the best fishermen and hunters in the State, and when you come down to a genuine fish story, that rings with truth, there are members in the club without an equal in the United States, and I am not speaking personally either. The object of the association is similar to others throughout the States, the protection of such game, and feather, whose flesh affords nutritious food and the pursuit of which furnishes a healthful recreation. Some time when the thermometer is above zero I will write more particularly about game in this section and at present talk about the fish and fishing grounds of the association. Ten Mile Creek, as above mentioned, is a peculiar stream about ten miles in length, winding through a beautiful country and is particularly adapted to the haunts of the pike and black bass. Our efforts to enforce the laws of Ohio were particularly aimed at unlawful fishermen in Ten Mile Creek, notwithstanding Maumee River offers inducements equally as good, if not better, in the way of black bass fishing, but seining is carried on at such a great rate that our means were not sufficient to handle them.

Ten Mile Creek, on account of its ready accessibility for fishing and hunting, and being located within half an hour's walk from street car accommodation, the club has spent its time and money in getting its waters clear of nets. Many of our own citizens relate with pleasure how, many years ago, they could catch fish from five to twenty pounds, and consider it no fish story to haul out a muskalgone weighing thirty or even forty pounds, and with almost any kind of bait catch in an hour what we now catch in a day. The scarcity of fish in Ten Mile Creek is certainly attributable to the continual fishing with nets. Previous to last year fishing with hook and line for five years back was no pleasure. Since the organization of the club we have been actively engaged in fighting unlawful fishermen, and while our success was only in Ohio waters, our best fishing is in Ohio, but Michigan State line cuts off the creek before it widens into the bay, and for half a mile the nets placed there prevented the fish from running up the stream. The result can be seen quite a number of instances where parties having nets stretched across the creek in Ohio, and upon being notified to remove them or stand consequences, would, in a night's time, take up and reset their nets ten to forty feet beyond in the State of Michigan, and thus be clear of any attack.

During the fall of 1881 the owners of nets were convinced of the earnest intentions of the club to clear the creek in Ohio, and the nets began to be less each month. In the spring of 1882, instead of twenty-five nets in a distance of three miles, the creek was clear, and reports came to us from residents along the creek, as having seen an unusual number of black bass and pike, and also reports of splendid fishing all along the line. After a year's steady work the club was rewarded by success number one and an unusual quantity of fish returning to old haunts. So surprising was the success in the fall fishing that the district had the pleasure of being with a two-day limited experience, five caught over sixty fish black bass in less than half a day, and at other times forty and fifty were caught in unusual short time. I recall one afternoon when bait was getting scarce that we had to cut up our minnows, and frequently only use the head or tail, and would catch black bass all the same. It was surprising to the major one afternoon to see a boy in a boat opposite catch bass with common household articles, and being with his hands in the boat. These fish stories, when told to fishermen who had abandoned the grounds years ago on account of no fishing, were considered a fish story in all its true sense, and the "colossal preparation" was known for miles around. The actual truth soon spread, and the local reporters of our Toledo papers, which by the way, the club is under everlasting obligation to for their generous support in having published and approved our work, soon covered with stories beyond anything heard of for years, and last fall's fishing was the most successful one had for many seasons. With this partial success and showing with the creek only half protected from lawless fishermen, what would be the result should the entire creek be kept clear of nets? This gave new encouragement, and an earnest effort was made to get a law passed in Michigan to protect the mouth of streams emptying into the lake. By the personal efforts of Hon. E. D. Potter, president of our club, and through the uncer-

ing kindness of the members of the Michigan Sportsman's State Association, a law was passed equally as binding as our own Ohio law, and now the club will put every effort forward to protect the fish, and in a year's time the fishing in Ten Mile Creek will equal any place in the country. Its waters and natural surroundings are not excelled in the State. The intention of the club is to make an effort to keep the waters of Maumee River clear of nets, but in order to make it a success it is necessary to get clubs already in existence in towns near to and on the banks of the river, or start new ones, to go in and assist us.

The black bass fishing at Maumee Rapids cannot be excelled in any of the famous inland lakes of Michigan. From the annual report of the Ohio Fish Commission I find that black bass have been planted in considerable quantities in the inland waters of the State, and from the superintendent of the hatcheries I learn that the supply has not been equal to the demand, or in plain fact the necessity caused by the unlawful seining. The commission heartily endorse the protection associations of the State, and depend almost wholly upon them to enforce the law. As an illustration of the above, I have seen taken from the mouth of the creek mentioned, in flag nets one day, not less than 500 black bass, not exceeding in weight a quarter of a pound each. They were brought to the city in wagons and sold for three to five cents a pound. The reader can see that it is useless for the State, and the superintendent of Ohio hatcheries says, "It seems absurd that the State should appropriate money to restock the streams if they are to be captured at the rate they are now, and at the very time of all others when they should not be." The superintendent, continuing, says: "The State is supplying food that will be cheaper than any other kind, and before it is really ready for the market it is being caught in nets by the thousands."

Sportsmen are becoming more abundant every year, and people are appreciating efforts made by members of protective associations to a surprising extent. Some eighty leading business men of this city were presented a petition to the General Assembly of the State of Ohio to revive the fish laws, and not one refused to sign, and the remark was not unfrequently made that "we wish fish could be protected so that a person could catch enough to make it pay the time."

Man wants recreation, and for the want of it worn-out men fall by thousands on the thresholds of the palaces of success which they have built. Stimulants have been resorted to in order that flagging strength might be kept up, but these have only given a deceitful flicker to the waning fire of energy. The resources of medicine are taxed in a futile attempt to repair shattered constitutions, broken down by overwork. It is vain to counsel greater moderation in work. Every discovery in science, and each new resulting application to art opens new fields for effort and quickens the desires and the activities of men. Something needs to be done by which repair shall keep pace with the increased wear. How to recreate the spent forces is a problem better solved by a true sportsman, who loves the open-air exercise and enters upon his duties for such purposes: to such men is attributed the patience of wading for hours along some inviting stream in search of a good fishing ground.

In all sciences need has been followed by discovery. New sports, greater proficiency in old ones, increasing holidays, regular seasons of vacation, are all movements but as yet only beginning in the right direction, and there is scarcely a day passes but what we are reminded of this increased demand for recreation. To the feeble in health, to the overworked brain, relief can be found in a few miles' walk in search of a good fishing ground; and after you have found it let me know, and I will catch the fish.

J. E. GUNCKEL.

In this connection we print the following petition which has been presented to the Legislature of Ohio, and is now before the House in the shape of a bill. A similar one was first introduced in the Legislature of Michigan. A Toledo paper says:

Within a few days great interest has been aroused in certain circles over the fishery question. Petitions have been circulated, and one carried by J. E. Gunckel is signed by every business man on the east side of Summit street for a long distance. The petition is addressed to the Legislature of Ohio, and asks that section 6,968 of the Revised Statutes be so amended as to better protect the small fish in certain waters. The section of the fish law is too loose in its construction. It exempts from the provisions of the act the waters of Lake Erie and certain reservoirs. The petition seeks to supply this omission by having the law include Lake Erie and its bays and estuaries. Certain persons who are flagrant violators of law contend that all streams up to the head of tide or back water are a part of Lake Erie, and that back water is included in the term waters of Lake Erie, as excepted in section 6,968. The petition asks that the said section be so amended as to "prohibit all catching or killing of fish (except by hook and line), in any of the creeks, streams, rivers or canals within the State, tributary to the Ohio River, Lake Erie, the bays thereof and the reservoirs within the State."

"To prohibit seine, trap or gill net, or pound fishing in Lake Erie and the bays thereof, from May 20 to October 10, in each year."

"To prohibit the setting up fish nets, gill nets, pound nets or traps of any kind upon any of the shoals or reefs, in any of the waters of the State of Ohio during any season of the year."

"To prohibit the buying or selling of fish caught in violation of such enactments, and making it the duty of the fish commissioner of the State and the superintendent of the fish hatchery to enforce the law."

POSITION OF REEL—WEIGHT OF RODS.

IN reading the article in FOREST AND STREAM of February 8, by Dr. Henshall, "Position of Reel—Weight of Rods," I am reminded of the time I first came here in 1861. At that time a good straight tamarac "pole" (the longer the better, weight was of no account) was the best thing known for a "fish."

Being something of a fisherman I sent to New York for half a dozen bass rods. They sent me one-half dozen four-jointed rods, about fifteen feet long, and weighing nearly one and one-half pounds each. At that time we thought these rods elegant.

Dr. Henshall came here soon after and made himself a rod, of three joints, ash butt, middle joint and tip of lance wood, and about eight feet long, weighing one-half or eight ounces in weight. I shall never forget our testing the

casting qualities of this rod from a boat, with a No. 2 Meek reel and a sinker for a mitnow. It seemed as though we could cast half way across the lake, half a mile.

I made one like it and sent it to New York for a pattern, and had some made. We called it "The Oconomowoc black bass, or coming rod." I advertised it in FOREST AND STREAM as the "Oconomowoc black bass rod," and had orders for quite a number of them from the East and South, which I filled, and the rod took at once.

From this came the light rod, so much in favor at present. We consider this the best place and Dr. Henshall, the father of this light rod. And when anyone undertakes to say that we in the West, and I will not except some portions of the South, use heavy tackle for bass, they don't know what they are talking about. If they will come here we will show them tackle and bass fishing that will astonish them, where you can go out and catch from fifty to one hundred large and small-mouthed bass from two to seven pounds, with an occasional twenty-five-pound pickerel thrown in, on a 71-ounce reel and a silk line "about the size of three horse hairs," in a day, if you know how to handle a bass, and your reel is in front of your hand.

I think that anyone that fishes for bass with the reel behind the hand, has had his education in that line sadly neglected, and would advise him, for his own comfort and pleasure, if he knows how to handle a bass, to try the other way at once and be happy.

J. C. H.

OCONOMOWOC, WIS.

Editor Forest and Stream:

If you deem my experience in black bass fishing as here set forth worthy of publication, I think you will find my deductions regarding position of reel-weight and length of rod, etc., will receive the approval of all true anglers. Some 75, 1877 I started for my first try at black bass. As I had never seen one caught, and had heard such exciting descriptions of their leaps and lunges, I armed myself with a four-jointed general rod of about 20 ounces weight, multiplying reel before the hand, 30yds. braided line, and No. 2 Aberdeen hooks (by the way, I use Aberdeens for all kinds of rod fishing), and salt water shrimps for bait.

My friend Charlie met me at the station, and we were soon over the spot in the pond that he said was the best for the day, wind, sun, etc., considered. He soon had one in the boat of 14lbs or so, and I lost my first bass. Soon after I had another bite, and when the fish flung himself into the air Charlie begged me to give him the rod. Although it was my first day with the bass, it was by no means my first day's fishing, and I declined, and fought the fish to the end. He weighed 53lbs. after being out of the water three hours, the largest ever taken from that pond, although one was taken a few days later, weighing just the same fresh from the water.

After that fight a black bass had no terrors for me, and as I never liked a reel before the hand, that was my last day with that rig. Since that time I believe I have taken as many and as heavy bass from that pond as any one in the same number of days' fishing, and always on the following tackle: a 10ft. 10in. fly rod of about eight ounces; white grass line not much heavier than line serving thread; six feet of single gut, a Aberdeen hook, and shrimp for bait. The bass will not rise to the fly in this pond, but with this fine line I can hook a fish in fifteen feet of water, and although I have never duplicated my first monster, I should have no fear, as I have taken several of 35lbs. and one of 45bs.

Now, I have two friends, as true anglers as ever lived, who have often gone with me to this pond. How do they do it? First they put over-hand lines with the finest hooks, baited with live worms and catch on small size fly higher than baiting their bass hooks, take up their rods, which are about seven and a half feet long, rather stiff, and of about ten-ounce weight, with Frankfurt reel before the hand, reel the perch to tip of rod, bring both hands to right ear, rod pointed back, and a little up, then whiz the rod through the air, gently thumb the reel and drop the perch some fifty or sixty feet away. At the end of the day we usually have about the same number of fish per man, and catch on small size fly higher art; while on the other hand they claim that it requires more delicacy of hand and touch to hurl the perch without killing or tearing it, and to tell just when to strike a fish, in this, and that their tackle could be as easily broken in the hands of a duffer as mine.

From all of which I deduce the following regarding the subject under discussion: The position of the reel, the weight and length of rod to be used in black bass fishing depend entirely upon the style, which gives the angler himself the most pleasure.

LAKK SALMON.—FOREST AND STREAM of Feb. 15 gives its readers some interesting memoranda of the lake salmon (*Salmo salar*, variety *Sobago*, etc.), by Mr. Atkins, and the range of this fish in Maine is divided into "four districts," viz.: "Basin of St. Croix River, basin of Union River, Hancock county basin of Presumpscot River (Lake Sobago, etc.), and basin of Sebago River, a branch of the Penobscot." In connection with the latter district are the following remarks: "Not known to be found in other parts of Penobscot Basin. Singular that they have not spread all through the Penobscot. It has many lakes seemingly well fitted." The Penobscot River is a broad, shallow stream, with water very warm in summer (although cold streams are tributary to it), and not to the nature of the salmon or trout to abide therein. Many of the cold lakes tributary to this river are inaccessible to fish from the main river, else some of them might, by chance, become populated by stray salmon. But a salmon wandering from its home in a cold lake to the warmer and impure water of this river would quickly return whence it came if possible, or if barred out by obstructions would incur capture by the persistency with which it would seek to return home. The lake salmon (variety *Sobago*) in the west branch of the Penobscot River. Perhaps the sill salmon of one to five pounds weight, occasionally taken in other portions of the Penobscot River are all of the lake or *Sobago* variety. I believe that the "grills" form has never been found, at least above tide water, in the Penobscot River, nor in any river in Maine, although both the "parr" and "smolt" are abundant.—EVERETT SMITH.

THE MICHIGAN NETTING CASE.—The Bay City *Tribune* gives an account of the trial of the suit brought by State Game Warden C. W. Higby, against netters, from which we make the following extracts: "The so-called fish case, wherein Joseph Robert and David Trombley and Louis Trudell were the defendants, and the salmon or trout to abide therein was the subject of the trial, was held in Bay City, Mich., on the court yesterday afternoon. Those in attendance were mostly fishermen or parties interested in fishing. The

case was a test suit, the complaint having been made under the law passed in 1879, found on page 190 of the public acts of that year. The gist of the charge was that the defendants had so placed their trap on the bottom of the canal of the river in Saginaw River, and that on the commission of the offense being February 1-12, inclusive. C. W. Highty, of Jackson, fish warden, was present to assist the prosecution. A Mr. Paron, the first witness for the prosecution, said that the defendants were fishermen and used trap nets. He thought they lifted the nets on February 3; it might have been February 5; could not swear positively as to the date. Harry Harbeck, in line of duty, interviewed the defendants and defendants; knew where they fished near the mouth of the river; they had one net between the range lights and another outside; did not know how far apart they were; never measured the distance; did not know whether they fished in the river or outside; thought it was in the river; thought Saginaw River was a harbor; had retreated to Saginaw River during a storm for shelter. John Sharp had been fishing for ten years; don't know where their nets are; saw the stakes and supposed the nets were there; never saw defendants lift the nets; should say that the range lights are in Saginaw River, one of them at least; the river begins to widen about half way between the lights. The prosecution reviewed the testimony of the witnesses and endeavored to show that the mouth of the Saginaw River, where the nets were set, was not a harbor, that a boat could anchor further out with perfect safety. The defense said that the time as sworn to in the complaint had not been fixed by the witnesses; that according to Tiffany's criminal law it must be shown that each of the four defendants were guilty as charged; the guilt of only one had been partially shown, and therefore the four could not be convicted. After some further remarks from the prosecuting attorney, the jury retired and returned a verdict of "not guilty" on the charge, and therefore the charge was dropped. This the bottom has been kicked out of the first fish suit in Bay county under the act of 1879.

"TENDERFOOT" POACHED.—DENVER, Colo., Feb. 20.—We noticed in your last issue (Feb. 15) a communication from "Tenderfoot," Colorado, Jan. 29, giving a very graphic description of fishing through the ice. We take it for granted that the fish captured were trout and do not doubt that the fishermen were "tenderfoot." Indeed, else they would not be quite so anxious to herald and thus incur the flagrant violation of our fish laws. For "Tenderfoot's" benefit we will add that the open season for trout fishing in Colorado is from July 1 to December 1, and that a diet of "hog, venison and rabbit" is preferable to a violation of the same.—FISHERMAN.

BETHABRA WOOD.—Philadelphia, Feb. 21.—*Editor Forest and Stream:* In your issue of last, you say: "Bethabura wood looks like greenheart, if not the same." Now the facts are, that it looks like it only as much as the large-mouth black bass resembles the small-mouth (viz., only partially so). Bethabura is much darker in color and closer grain, and aside from its being more elastic and stronger than greenheart, it has in it a resinous red dye, which comes out in washing it, not in washing the hands with soap will color the water a brick-red. This is an infallible test as between the two woods.—A. B. SIMPLY.

Fishculture.

TRANSPORTATION OF ADULT BLACK BASS.

Editor Forest and Stream: I send you the following interesting and instructive account of the transportation of over six hundred adult black bass from Sandusky, O., to the lake of the South Fork Fishing and Hunting Club, of Pittsburgh, Pa. The whole matter was under the charge and direction of Mr. Wm. A. McIntosh, vice-president of the club. I had not seen the article before the previous to the undertaking, giving him such general advice and information as I was possessed of.

The remarkable success attending Mr. McIntosh's efforts, and the ingenuity and ingenuity of his devices for aerating the water, and his entire methods of transportation, will be useful guides for the imitation of others for similar purposes. He writes:

Dr. J. A. Henshall, Cynthiaana, Ky., Feb. 18, 1883.
MY DEAR SIR—Your favor of December 7, 1882, has been quietly resting on my desk awaiting a time when I could fully reply to it. Two years ago our club, the South Fork Fishing and Hunting Club, was desirous of stocking their lake in the mountains with black bass, but as it was thought that failure was almost sure to attend any attempt in that direction, no person but myself could be obtained to undertake the enterprise. The club placed \$500 at my disposal. The first thing to be done was to procure the fish. The only person who would contract to furnish them was Oscar Listel, of Sandusky, with whom I contracted for one thousand bass, to average one and a half pounds in weight, none to weigh less than three-quarters of a pound and to be ready for delivery in Sandusky about the first of May.

Owing to extreme backwardness of the season, and large accumulations of ice in the lake and bay, no fish were ready for the time agreed upon, and it was necessary to wait until the last of May when bass Mr. Listel might be able to procure by that time. The information which I could obtain on the subject of transporting large numbers of live adult fish was extremely meagre; none of it being deduced from experience, and I was reluctantly thrown upon my own inventive resources.

First I arranged for a baggage car, and made a diagram of it. Then I had four fifteen-cask casks, three feet high and three feet in diameter, with both ends open, and cut a hole eighteen inches in diameter in the top head of each cask. I also procured five galvanized iron tanks, each three feet in diameter and five feet high, entirely open at the top. I then procured an air pump, with both ends open, and cut a hole in the air escape of this pump I attached one end of a piece of rubber hose, fifty feet in length and one inch diameter. The other end of the hose I attached to an affair of my own contriving consisting of a horizontal tube, one inch in diameter, and one inch in diameter, joined together so as to form a hollow square; then two cross tubes, the ends of which are fitted to holes cut into the inside of the hollow square tubes.

This affair is then placed on the bed of the intersection of the cross tubes and on top, a hole one inch in diameter is cut, over which is placed one end of a tin tube, one inch in diameter and three feet long, open at both ends, and being at right angles with the cross tubes. The other end of the tin tube is connected with a hole punched into the upper surface. The remaining end of the rubber hose is drawn down over the upper end of the upright tube and the whole is complete and ready for use. Holding the upper end of the tin tube in the hand the water is placed at the bottom of the cask, the lever of the air pump is worked and im-

mediately the air passes through the 200 small holes and comes bubbling up through the water. The "airfall" is easily worked from through the water, but thoroughly aerating all parts of it.

No wishing to have "all my eggs in one basket," I arranged another tin affair, of which I give you a meager description. A funnel eighteen inches in diameter at the top and four inches at its intersection, with a four-inch horizontal tube to which five four-inch tubes, six inches long, are soldered to the lower side, a four-inch hole being cut into each intersection of the lower ends of the tubes are closed with caps, which are perforated with small holes. This apparatus was fastened to the side of the car in such manner that each tube hung immediately over the center of the top of a cask. The water in these casks was aerated by dipping it out of the casks and pouring it into the funnel, whence it ran along the horizontal tube and through the perforated holes in the lower ends of dependent tubes. Closed caps were made to fit the latter which could be placed on one or more of them, and thus confine the aeration to any particular cask desired.

In addition to the above, I had several tin buckets made, eighteen inches deep and eight inches in diameter, the bottoms being perforated with a large number of small holes. Hooks were screwed into the roof of the car in such manner as to bring the buckets, when hung on the hooks, immediately over the center of the casks. Aeration was performed by dipping the buckets into the casks, filling them with water, and hanging them on the hooks above the casks. Sixteen such buckets in diameter at the top and four inches at other paraphernalia in position on the car, not forgetting a couple of thermometers, and forwarded it to Sandusky, following next day with another member of the club and two men who had for a long time been in my employ and whom I know I would find faithful and able to put in two days and a night without sleep or rest. We arrived in Sandusky on the forenoon of June 1, the rain pouring down in torrents and making a rheumatic individual feel anything but comfortable. As we were to have a fish market in the lake (or bay) as long as possible, we did not commence putting them into the casks until about two o'clock. The party who was to furnish the fish had them "corralled" in a boat about twenty-four or twenty-five feet long, and one or two feet wide. The net, the track at this point running out into the bay. We had a long, hard and tedious job getting the fish on board the car and into the casks, but at six o'clock were ready to be towed by the engine, and in half an hour were on our way, being distant, having taken on board about two tons of ice. Having arranged beforehand with the officials of the several railroads over which we would have to go for transportation on our train, we had every prospect of making a trip that would be a success. The lake was about two hours behind time, which would cause us to miss connection a Cleveland and throw us back twenty-four hours in arriving at our destination, so it is a fit result of the delay. The officials of the Cleveland & Pittsburgh Railroad, requesting that the train on that road be held until our arrival. I received no answer, but on arriving at Cleveland was delighted to find that my request had been complied with. Our car soon shifted into position and we were again on the way.

We arrived at Alliance in time to have our car attached to the fast express on the Pittsburgh, Fort Wayne & Chicago Railway, and at eight o'clock were on our way. At the first stop and after a stop of less than half an hour were off on the Pennsylvania Railroad "fast day express," bound for South Fork, which place we reached at eleven o'clock. The members of the club were on hand with wagons, on which we had to transport the casks and fish two and a half miles over rough mountainous roads to the lake of the club, which was successfully completed by six o'clock P. M. The fish in the lake in apparent good condition six hundred fish, weighing from three-quarters of a pound to two and a half pounds each, losing about sixty of the six hundred and sixty with whom we started, had been completed with.

During the few days following quite a number of dead fish came to the surface of the water, perhaps one hundred, which is not to be wondered at considering the very warm weather, the nearness of the lake to the city, and the fact that the water in the casks had confined, many of them, in close quarters in Sandusky Bay.

I can assure you there was not much rest taken by any of our party, as the air pump was worked all day, and the water and the free use of ice the temperature of the water in the casks was kept down to about sixty degrees.

We are all quite well satisfied with the result, as along the shores of the lake we were able to see, in one great many of from six to eight inches in length jumping out of the water, apparently after insects.

I am just a little proud of my invention for aerating water by means of air, as I have described. If any body has a valid prior claim let me know and I'll retire. The nearest approach to it that I know of consists in pumping air into the water through a hand bellows—rather a slow process than to you have 300 or 400 gallons of water, and to pump into it a hundred or seven hundred fish, averaging one and a half pounds each, is quite a different affair from transporting in one inch in length.

Should you be in this line of business, visit our lake with me, I will be pleased to have you visit our lake with me.

Permit me to express my thanks for the pleasure I derive from reading your articles in FOREST AND STREAM, of Florida. Very truly yours, Wm. A. MCINTOSH.

After the reception of the foregoing letter I at once wrote Mr. McIntosh to ascertain if he had taken notes of the mortality of the fish in the different tanks and casks, so that I might be able to give you a more detailed report. The following is his reply:

PITTSBURGH, Feb. 17, 1883.
DR. J. A. HENSHELL, Cynthiaana, Ky.
 DEAR SIR—I had your favor of the 10th inst., and in reply would say that constant attention was required of all parties engaged in applying ice, pumping air and raising water from casks into aerating apparatus, and I being ill, it was impossible for me to do more than to see that the other method of aerating will be found of importance, i. e., the air pump or the funnel and pipes. If I were to undertake a similar job, I would try to arrange for two large tanks, one on each side of the car, and a force pump. Then, by suspending a wide, perforated trough over each tank, the water could be forced from the tanks by means of the force pump into the troughs. The manual labor required in working this is severe, but could be obtained in great measure by working the pumps by means of a belt connection with one of the car axles. Yours truly, Wm. A. MCINTOSH.

The lake of the South Fork Fishing and Hunting Club is about 90 miles east of Pittsburgh, and 2 1/2 miles from South Fork station on the Pennsylvania Railroad. It is formed by the building of a dam 1,300 feet long, between two ranges of mountains. The lake covers a total of 40 acres, and is from fourth to three-fourths of a mile in width, and nearly three miles long. The water varies in depth, being about sixty feet deep at the dam, and gradually decreasing in depth to the head of the lake, where it is only five feet deep. It is fed by a mountain stream, the south branch of the Conewago River. A part of the bottom of the lake is

the original bed of the stream, some twenty or thirty feet with rock and gravel. The rest of the bottom of the lake is for the most part ordinary soil, with a mixture of some gravel.

These particulars I received two years ago from Mr. McIntosh. The black bass of Lake Erie cannot fall to do well and increase rapidly, and grow to a very large size in this fine lake, provided they have plenty of natural food. J. A. HENSHELL.

CYNTHIANA, Ky., Feb. 18, 1883.

TEMPERATURE OF WISCONSIN LAKES.—MESSRS. E. M. Gifford and G. W. Peckham, in their investigations into the temperature of Wisconsin lakes found, that at a depth of eighty feet there was a temperature of forty-two degrees Fahrenheit in summer and thirty-nine or lower in winter.

The Kennel.

FIXTURES.

BENCH SHOWS.

March 29, 27 and 28, 1883.—Dominion of Canada Kennel Club, Beach Show, at Ottawa, Canada. Charles Lincoln, Superintendent.
 April 3, 4 and 5, 1883.—Western Pennsylvania Poultry Society's Show, at Erie, Pa. J. J. Davis, Superintendent.
 May 1, 2 and 3, 1883.—English setters whelped on or after January 1, 1882, close February 1, 1883. Ches. Lincoln Superintendent. C. B. Ehling, Secretary.
 May 8, 9, 10 and 11, 1883.—Westminster Kennel Club, Seventh Annual Dog Show, Madison Square Garden, New York City. Ches. Lincoln, Supt.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, inasmuch as the names of the officers matters of importance are liable to delay.

THE WASHINGTON DOG SHOW.

THE bench show held at Washington last week under the management of Mr. Charles Lincoln was quite a success. There were 592 entries, nearly all of them present. Including the puppies there were over 400 dogs in the building. The show was held in the Roller-staining Bank, which is well adapted for the purpose except that it is not large enough. The quality of the dogs shown was excellent, many of the best animals in the country being present. We were surprised to see so many good dogs that are owned in Washington. The show was held in the Roller-staining Bank, which is well adapted for the purpose except that it is not large enough. The quality of the dogs shown was excellent, many of the best animals in the country being present. We were surprised to see so many good dogs that are owned in Washington. The show was held in the Roller-staining Bank, which is well adapted for the purpose except that it is not large enough. The quality of the dogs shown was excellent, many of the best animals in the country being present. We were surprised to see so many good dogs that are owned in Washington.

We were pleased to learn that Mr. Lincoln was able to show a handsome balance upon the right side of his books. The judges upon the whole was fairly satisfactory. Owing to pressing matters of business (apt. Wise telegraphed at the last moment that it would be impossible for him to be present, and the exhibitors selected Mr. Chas. H. Mason to fill his place.) Messrs. Mason and Watson were nearly all the classes assigned to him, and in these he made but few mistakes. Mr. Watson also understands the classes he judged, and his decisions were generally undoubted. We were sorry to see that the dogs that had the highest number of votes were not the most prominent ones in the country were present, and many of them expressed their delight at beholding so grand an exhibition. The ladies were also out in force; many of the classes were crowded with admirers, and the prizes and crosses were lavishly bestowed upon the lucky dogs.

Everything pertaining to the show, so far as Mr. Lincoln was concerned, was of a course managed to our satisfaction; all; we have never seen dogs better cared for. We understand that it is Mr. Lincoln's intention to hold an annual bench show at Washington. Should he decide to do this, we have no doubt he will be well sustained by both exhibitors and the public.

Friday evening was the occasion of a very interesting ceremony. In behalf of the numerous friends and admirers of Old Leckers, Col. Tom Leckers, in a very complimentary and silver collar upon which was his name in large raised letters. The Colonel was very happy in his allusions to events in the career of the grand old dog. Closing with a glowing tribute to his usefulness, and a highly complimentary to the dog and his owner, he placed the collar on the neck of the hero and crowned him with a wreath of laurel. Loud and long continued applause greeted the graceful act. Col. Leckers then turned to the beautiful Petrol III, and in well-chosen words presented her with the medal she had won. She was also applauded to the echo, and for a long time admiring crowds gathered around and paid honor to the wonderful pair. Below will be found our comments upon the dogs.

MASTIFFS.

There were three grand dogs in the dog class. Cesar was absent. Major, who was first, is a magnificent animal and a credit to his site, champion Girth. Amy and Jumbo were also very good. Crook, in the bitch class, won first, she is a splendid specimen of the breed, although rather old to show well. Dinah II, who was placed second, is a very well bred bitch, and a credit to her owner. She has a good head, good points and good looks. Leda, the only other entry, was not like as a mastiff. Only one puppy was entered, Europa, who gives promise of turning out something nice.

ST. BERNARDS.

The St. Bernards were very good all through, with scarcely a bad one in the lot. The collection of St. Bernards was a credit to the club. The champion class was properly divided into a dog and bitch class. Harold, the only dog, was in grand form. Judy, who won in the bitch class, also looked well. In the rough-coated dog class St. Elmo was the only one to put up a contest. He got his prize, but was not entitled. He is a very fair animal, although he stands too high behind and is rather weak in the hind legs, which he may overgrow. He reminds us, especially in head, of Snip, which was a very good dog. Marcus was a very good dog, he arrived after the judging was over and of course too late to compete. They are a splendid brace and will undoubtedly develop into grand dogs. Lohengrin was the only good one in the smooth-coated class. He got his prize, but was not entitled. He is a very fair animal, although he stands too high behind, and will undoubtedly be his fair to make a magnificent dog, and will undoubtedly be his fair to make a magnificent dog, and will undoubtedly be his fair to make a magnificent dog.

NEWFOUNDLANDS.

Mayor of Hingley was properly placed first. He is a splendid specimen of the breed. General Grant is also very good for his age; he was given second.

RETRIEVERS.

There were some very good ones in this class. Fain, who won first, was in splendid condition. She is all over a greyhound, and deserved the place. Maude, who got second, is a fine animal with a capital muzzle and head. She is too wide in

ter, showing the location of the grounds, names of owners, and a schedule designating the acreage of each owner.

Your committee further report that in their judgment about five hundred quail should be set out during the present season. Although the offer of the proceeds of the sale of the appointment, they have written to High Point for the purpose of securing as many as possible up to five hundred birds, and have requested Mr. Abner Holten to have them set out.

Your committee further reports that Mr. Coster has made inquiries of residents in the neighborhood of Salisbury, N. C., where grounds were offered to the club, but that there were no grounds within fifty miles of Salisbury available, and that it would be necessary to sleep at Salisbury and take a train every morning and evening to the grounds.

Your committee are of the opinion that the grounds at High Point are the most available for the purposes of the club, and they recommend that the grounds designated on the accompanying map be accepted by the club.

Your committee further report that Mr. Coster has arranged with one of the hotel keepers at High Point for about any number of handlers up to 100 for \$1.25 per day, including the board of one dog, and 25 cents extra for each extra dog per day.

The lively stable will furnish a three-seated wagon for \$4 per day, or \$2 for half a day with room for five persons and the driver. A buggy for \$4.50 per day, and \$1.50 for half a day for two persons. Saddle-horses \$1.50 per day, and \$1 for half a day. The price of the dog is 50 cents per head, to go three and a half miles from High Point.

Your committee further reports that Mr. Coster reports that no objection will be made by the land owners to shooting quail members, under the permission of the club, over the grounds reserved.

All of which is respectfully submitted.

(Signed) GEO. T. LEACH, ELLIOT SMITH, WASHINGTON A. COSTER.

The report was approved and adopted, and the committee were authorized to carry out the arrangements proposed in their report. It was also voted that every member of the club be furnished with a card signed by the president and secretary, entitling him to shoot over the reserved club grounds after the trials until the close of the season, and that the secretary furnish each land owner a copy of such card.

The number of birds that may be killed to be limited to such number as the committee may designate at the time of the trials.

Mr. John Bouland, of Avon, N. Y., and Mr. D. S. Gregory, of New York, were elected members. It was voted that Mr. H. Abbott be debentured as a member participating in any of the field trials of the club, unless approved by the New Orleans Gun Club, and that the National American Kennel Club be informed of the action of the club. It was also voted not to reconsider the action of the club in relation to delimiting Mr. J. Mitchell, and that he be so informed. Monday, Nov. 19, was decided upon for the commencement of the field trials of 1883, which will probably allow the All-Aged Stake to commence on the 31st. Twenty-five dollars was appropriated to be given in prizes at the coming bench show of the Westminster Kennel Club for the best field trial winners exhibited—setters and pointers.

THE SIMCOE BENCH SHOW.

THE fourth annual exhibition of the Simcoe Foultry, Dog and Pet Stock Association was held at Simcoe, Canada, on Feb. 4, 5 and 6, and was attended by a large number of the nearly all of the prominent breeders in the Province. The show was held in the Military Drill Shed, which is spacious, well lighted and ventilated. The coops for the poultry occupied the center of the shed, and the kennels for the dogs were arranged around the sides. There were quite a number of first-class specimens of the different breeds exhibited, among them are some not unknown to fancy.

In the English setter class, Mr. T. G. Davey, of London, won two first prizes in prizes at the kennels for his dog and his bitch Gleamilly. I thought Dan O'Shay's Lily full as good as the latter. Jack and Jock in the Gordon class made a splendid brace, and it took Dr. Niven some time to decide between the Count, his splendid specimen of the Irish setter, and easily won first. There were quite a number of very good setter puppies present. Neat and Ranger, in the pointers, were both good and nearly equal. Dan O'Shay's couple of English Pointers, bred by the late Mr. J. G. Hecker, and his beagle Music, are hard ones to beat. I was surprised that he brought to show them at Ottawa, Pittsburgh and New York. Fennel, in the fox-terriers, is the best one that I ever saw. Mr. Gibson should send him to the large shows, where I am sure his merits would be fully placed. In the collies, Bob, Jr., and Black Mac, were also remarkably good. Mr. Rothack's splendid collection of St. Bernards were the best feature of the show, and attracted a great deal of attention, his magnificent Prima being the best prize, the best animal in the show, an honor that is richly merited. Dr. Niven, of London, filled the position very acceptably. Following are the awards:

- English Setters.—1st, T. G. Davey, London, Lavo Rock. Bitches.—1st, T. G. Davey, London, Dan O'Shay, London, Lily. Black and Tan Setters.—1st, Lome Campbell, Jack. 2d, J. Purdie, London, Jack. Vix, L. Hart. Fox Terriers.—1st, D. Flinlay, London, Dan O'Shay, London, Lily. 2d, D. D. Ward, London, Fennel. Pointers.—1st, Capt. Ermattinger, Nell. 2d, John Hall, Hamilton, Ranger. Foxhounds.—1st and 2d, D. O'Shay, London. Forester and Ringwood. Fox Terriers.—1st and 2d, D. O'Shay, London, Music II, and Rover. Fox Terriers.—3d, B. Gibson, Bletton, Music. 2d, D. O'Shay, London. Other kinds of Terriers.—1st and 2d, D. O'Shay, London, Margy and Lady. Field Spaniels.—1st, J. G. Marshall, Woodstock, Bob, Jr., 2d, J. R. McNeil, Black Mac. Water Spaniel.—1st, P. D. Hart, Curly. Cocker Spaniels.—1st, D. O'Shay, London, Verne. 2d, T. Marshall, Colfax. 3d, F. W. Taylor, London, 4th, G. Glazebrook, St. Bernards.—1st and 2d, J. G. Hecker, New York. Eggs.—1st, D. O'Shay, London, 2d, Lorne Campbell, Bugh or Bull Terriers.—1st, J. Marshall, 2d, J. Purdie, London. All other breeds classified.—1st, D. O'Shay, London, D. Ward, D. O'Shay, London. Special Prizes.—For the best dog on exhibition—Fred, W. Rothack, St. Bernard. For the best brace English setters—T. G. Davey, London, Lavo Rock and Gleamilly. For best pointer—John Hall, Ranger. For best cocker spaniel—D. O'Shay, London, Verne. For best setter—T. G. Davey, London, Lily. For best fox-terrier—Chas. A. Flinlay, Ponto and Vix. For best fox-terrier—B. Gibson, Fennel. For best dog on exhibition—Fred, W. Rothack, St. Bernard. D. O'Shay, London, Music II.

KENNEL NOTES.—The publication of the Kennel Notes is for the benefit of dog owners, breeders and buyers. We are not conscious of asking too much when we request correspondents to write us with notes in writing, to follow the style of the printed notes. A very little care on the part of our friends will insure early and correct publication of news.

THE PITTSBURGH DOG SHOW.—Everything promises well for the Pittsburgh show, and the managers are sanguine in the belief that it will far surpass any that they have yet seen. Major J. M. Taylor, of Lexington, Ky., will judge the English, Irish and Gordon setters and pointers. The other judges have not yet been selected.

NEW YORK DOG SHOW.—Mr. Charles Lincoln is in the city attending to the preliminary arrangements for the seventh annual bench show of the Westminster Kennel Club. An office has been secured at No. 23 Park Row, rooms 53 and 54. The office will be ready for the show, which will have the prize list and entry blanks will be ready. A number of changes in the classification will be made and some new classes added.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of each animal:

- 1. Color. 6. Name and residence of owner, 7. Buyer or seller. 8. Date of birth, of breeding or 9. Dam, with sire and dam. 10. Owner of dam. 11. Name of dam.

All names must be plainly written, communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

See instructions at head of this column. Lady Rose, Starling Bush, Starling Bush, By Mr. Edward Odell, New Orleans, La., for pointer pups, whelped Oct. 12, 1882, by his Bow out of Mr. J. C. Walker's bitch.

Rifle and Trap Shooting.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Office and not to individuals, in whose absence from the office matters of importance are liable to delay.

NON-CLEANING RIFLE MATCH.

THE FEATURES OF THE RIFLE THAT WILL WIN.

Editor Forest and Stream:

I heartily concur in the gist of your editorial, under the above heading, in relation to the issue of rifle cleaning. There are really but two practical uses for the rifle—the killing of game and the filling of the public enemy in time of war. When put to these two practical uses, it is totally useless for either of these purposes unless it is kept in such a state of cleanliness that it will "clean" or wipe out; but, on the contrary, there is frequently required a long series of consecutive and rapidly-delivered shots, without stopping, that puts the accuracy of the shooting to the severest test.

Clearly, therefore, it should be the aim of the rifle expert and the rifle builder to produce such an arm as will give the most destructive results, combined with the utmost accuracy obtainable under such

THE COLT DISC ENGINE FOR YACHTS.

THE introduction of steam as an element in yachting has within the past few years added a new chapter to this instructive and exhilarating sport, and has been the means of bringing out a vast amount of enterprising ingenuity and a great deal of friendly rivalry among yachting men, some of whom have carried the spirit of emulation so far as to build a new steamer every season, or nearly so, with the object of beating former records as to speed and relieving all rivals. Of course a great deal of the enterprise thus displayed has been entirely misplaced, owing to the want of practical knowledge on the part of these amateur marine architects; but, on the other hand, a great deal of valuable data has been obtained from these numerous experiments by men of sufficient means to carry out their hobbies, and this has been fully taken advantage of by those who make a business of building steamers and marine engines.

Steam yachts may be roughly divided into three classes, namely: Racing Machines, or boats constructed without regard for any other consideration except speed, such boats, indeed, having but little claim to the title of yacht, which, strictly speaking, implies a pleasure boat; Steam Yachts proper, or steamers constructed with a due regard for all the conditions necessary in a pleasure boat, namely, comfort, safety, elegance and reasonable speed; and Combined Steam and Sailing Yachts, in which both canvas and steam power are available, and in which in some instances the steam power is only considered as auxiliary.

The first-mentioned class will always find some advocates in a country where the almost universal motto is "Go ahead," and a brief allusion to them is, therefore, not out of place.

Allowing for the comparatively small advantages or disadvantages due to more or less perfect models, the speed of a boat may be said to depend upon the relation of the available power to the displacement or weight of the boat and its contents. Thus in order to obtain increased speed, either the weight of both hull and machinery must be reduced or the capacity of boiler and engine increased,

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. |
SIX MONTHS, \$2.

NEW YORK, MARCH 8, 1883.

VOL. XX.—No. 6.
Nos. 29 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 49 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Sanson Low, Marston, Searle and Rivington, 188 Fleet Street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications,

MANIPULATING THE ZODIAC.—We do not question the sincerity of our correspondent, "Clericus," who puts in another plea for summer shooting, but it is quite evident that he has allowed his zeal to get the better of his logic. The naive manner in which he has manipulated the Zodiac and classed September among the summer months, "for the reason that the vacations of professional men and others extend as a rule into that month," is quite as ingenious as his reasoning that the present game laws represent the average sentiment of sportsmen on the subject, or that if they did, they would of necessity be right. The game laws are at best but a compromise between perfect laws and no laws at all. Nor is the average sentiment of the day any competent standard of right and wrong. "Clericus" would not use such an argument in his pulpit. He should not forget that "average sentiment" once burned witches at the stake, and in Massachusetts supported the institution of African slavery. He must not forget that the world is moving, and he ought not to forget that it is folly to cite the privileges enjoyed by our "fathers" when there was much more "howling wilderness" full of game than there happens to be to-day. But without now needlessly considering his arguments at length, we shall leave "Clericus" to the tender mercies of our correspondents.

Mr. C. P. KUNHARDT, for several years the yachting editor of this journal, announces elsewhere his resignation of that position. Mr. Kunhardt was well fitted for his work, both by a natural enthusiasm for yachting and a thorough naval training. Under his able control of its yachting columns the FOREST AND STREAM has taken an important part in the development of the sport in this country, and it will be the ambition of his successor to maintain the prestige of the journal among yachtsmen and canoeists. We take this opportunity of testifying in the heartiest way to the uniformly happy relations which have existed between Mr. Kunhardt and the other members of the editorial staff, and to express the keen regrets of both editors and publishers that his connection with the paper has been brought to a close. We trust that he may meet with most abundant success in his new field of enterprise.

MR. VEST'S VICTORY.

THURSDAY last in the United States Senate was devoted in part to a discussion of the Sundry Civil Appropriation Bill. Among the amendments to this bill which were passed by the Senate were a number relating to the Yellowstone Park, by which it is for the present efficiently protected from the greed of the body of men who have so earnestly striven to wrest it from the people of this country and turn it into a speculation with which to line their own pockets. The bill as amended and as passed by both houses of Congress contains the following provisions:

"For the protection and improvement of the Yellowstone National Park: For every purpose and object necessary for the protection, preservation, and improvement of the Yellowstone National Park, including compensation of superintendent and employes, \$40,000, \$2,000 of said amount to be paid annually to a superintendent of said Park, and \$900 annually to each of ten assistants, all of whom shall be appointed by the Secretary of the Interior, and reside continuously in the Park, and whose duty it shall be to protect the game, timber, and objects of interest therein; the balance of the sum appropriated to be expended in the construction and improvement of suitable roads and bridges within said Park, under the supervision and direction of an engineer officer detailed by the Secretary of War for that purpose.

"The Secretary of the Interior may lease small portions of ground in the Park, not exceeding ten acres in extent for each tract, on which may be erected hotels and the necessary outbuildings, and for a period not exceeding ten years; but such lease shall not include any of the geysers or other objects of curiosity or interest in said Park, or exclude the public from the free and convenient approach thereto; or include any ground within one quarter of a mile of any of the geysers or of the Yellowstone Falls, nor shall be leased more than ten acres to any one person or corporation; nor shall any hotel or other buildings be erected within the Park until such lease shall be executed by the Secretary of the Interior; and all contracts, agreements, or exclusive privileges heretofore made or given in regard to said Park, or any part thereof, are hereby declared to be invalid; nor shall the Secretary of the Interior, in any lease which he may make and execute, grant any exclusive privileges within said Park, except upon the ground leased.

"The Secretary of War, upon the request of the Secretary of the Interior, is hereby authorized and directed to make the necessary details of troops to prevent trespassers or intruders from entering the Park for the purpose of destroying the game or objects of curiosity therein, or for any other purpose prohibited by law, and to remove such persons from the Park if found therein."

These provisions appear to give ample assurance that the people are to be allowed to possess their pleasure ground in peace, and are not to be passed over to the tender mercies of the corporation, which, with a shrinking modesty that has rarely been equaled, attempted to seize for its own benefit about two and one quarter millions of acres of the domain of the United States. If they did not succeed in accomplishing their object it was not for want of energy, shrewdness, money, nor powerful backing. Some of the sharpest intellects, some of the best business ability in the country, worked for them; they had unlimited money with which to influence legislation; they had an enormous political power behind them. Senators and ex-Senators, men whose names are known to every voter, nay to almost every woman and child, throughout the country, did not hesitate to lobby for the success of this project, to speak for it in the halls of Congress, to use every influence, personal and political, to further it. The press of the country, with a few exceptions, was on the side of the jobbers, and they used it in such ways as they pleased. Captured by a shallow device, which we long ago exposed, the newspapers lent themselves to this scheme, and became the willing tools of the ring. There were some notable exceptions to this rule, but it was none the less the rule. With all this in their favor the question may well be asked, "Why did they not succeed in their plans?" The answer can readily be given by one who has watched the fight from its inception. They failed because Senator George G. Vest, of Missouri, occupies a seat in the Senate of these United States. Therefore every citizen owes to this gentleman warm thanks.

No one who is not thoroughly familiar with Washington and the methods of the lobbyist can at all conceive the difficulties against which he had to contend. The opposition which he had to meet in his patriotic efforts to protect the people came from all sides. The politicians, the press, the

lobby, and a considerable number of his colleagues were all against him. Only the people were on his side. If persevered, and in the face of every opposition succeeded in carrying through the measures above cited. We congratulate the Senator on his victory.

It is a matter of regret that the bill which provided for the extension of the limits of the Park could not have been passed during the present session of Congress, but we trust that at the next steps may be taken, in time, to set aside from settlement a considerable additional tract of territory on the south and east of the present Park.

In his effort to save the Park, Senator Vest has received efficient aid from Mr. Harrison, of Indiana, a gentleman who last summer visited the Park, and was thus able to speak intelligently of its needs.

We print in another column the remarks of Mr. Ingalls, of Kansas, and Senator Vest's reply. Our readers can very clearly judge from these remarks just exactly how broad and liberal are the views of the Kansas Senator, and how intelligent an interest he takes in the important matter of the National Park. It was scarcely to have been supposed that in a body like the United States Senate any one could have been found to express such sentiments as those quoted, and from their tone we should imagine that the Senator was a kind of a Rip Van Winkle, only more so—a hundred years behind his age. Senator Vest's admirable reply seems to have left Mr. Ingalls nothing to say.

The time will soon come, even if it is not already here, when the Yellowstone Park will be cheap to this nation at a million dollars a year. The picaresque policy of saving a few dollars now, and by that means losing in the future something that it will be then wholly out of our power to regain, cannot be too strongly condemned. The Park is at present all our own. How would our readers like to see it become a second Niagara—a place where one goes only to be floored, where patent medicine advertisements stare one in the face, and the beauties of nature have all been defiled by the greed of man?

It is the boast of the day that this is a practical age, and its motto seems to be, "Put money in thy purse." Get money; get it—honestly, if you can—but get it. Sacrifice everything to this hunger for lucre. Set Niagara to turning millwheels, build your manufactories over the geysers, for in them you have perpetual motion. Cut up your parks and sell them for farms or for building lots, as the case may be. The man whose pockets are to be filled will not say a word against the work of destruction.

The progress of this spirit must be checked; and for having interferred to save the Park from the monopolists, we thank you, Senator Vest.

HUNTING WITHOUT A GUN.—III.

ALL seasons are good wherein to go hunting without a gun, but none better than when the arbutus is blooming or a little earlier, when of all flowers the liverleaf alone has raised its head above the mold. For then you are in duty bound not to hunt, it being close time for all game except wild ducks and geese and the persecuted snipe—and ought to be for them.

The trees are waking from their long sleep, showing it not only by the swelling buds that give a purple tinge to all the gray woods, but by a more living look in their trunks. Their old leaves, pressed flat by the snow, that so long has lain upon them, thickly cover the ground and will add a nail's thickness to the crust of the world.

Here and there on the brown carpet, are tufts of evergreen ferns, cushions of moss, blotches of the purple green leaves of hepatica and dots of its flowers. The sun shines down through the lattice of branches, and checks all with meshes of shadow.

The chipmunk and woodchuck have left the darkness of the under world and are out in the sun again. The birds that spend the year with us are here—jays, woodpeckers, titmice and nuthatches—all busy and noisy, and some of the migrants have come. A hawk is cruising high above the tree-tops, his broad sails golden brown in the sunlight, and a black guard of crows are challenging a fox in his own woods, or an owl in the tree, that has been his home these ten years. A peewee makes sudden flights from her perch and back, gathering an insect in every airy loop. A bluebird crawls in a tree-top against a sky as blue as his back, and a flock of slate-colored snowbirds are thridding a thicket, and filling it with their light warble and sharp metallic chirp, like the clucking of cuckoos. They are not snowbirds with us, for they go further southward when the first snow comes, and are by no means the earliest spring comers.

o'clock P. M. come back and feed until sundown, when all again returned home for the night. After a while, however, especially on cloudy or cool days. But when the weather was very hot they would again seek the shade for the middle portion of the day.

Oftentimes when they came to the marsh at high tide I would mark them down, and quietly approaching in my boat the one most accessible, watch its movements unobscured. When suspicious of danger or slightly alarmed the bird, if not taking water at once, will quietly walk away with head and neck low, as if in a hasty and better concealment, or else will assume an upright position with stern depressed, body and neck nearly perpendicular, and the bill elevated at an angle of forty to fifty degrees from the horizontal. Standing thus, perfectly motionless, its plumage assimilating in color to the surroundings of grasses and brown reeds, the bird so closely resembles a stake as often to deceive a passer-by. I once sat in my boat and sketched one standing in this position, within thirty-five yards of me. After waiting some fifteen minutes, I landed and made a detour around the bird in order to observe its first movement, expecting that the head would be turned toward me. But not so, for the slightest change in position could I observe. Gradually approaching nearer, I really began to be suspicious that my assistant had placed a stuffed bird there for the purpose of deceiving me, but on clapping my hands the bird immediately flew away.

August 28, I shot three of my pets, and, as I expected, found them in very fine condition. The others remained undisturbed until October, frequenting the same locality. Some one may ask why I killed these birds, and I confess that it was not for sport, for they do not afford it, since they are too easily to be approached and killed. Although wishing to make simultaneous comparison of the plumage, dimensions, etc., of several specimens of different sexes and ages, I had the more sensual desire to gratify the cravings of the palate.

The bittern is a most desirable addition to the cuisine, and to appreciate this delicacy requires no more cultivated taste than is necessary to appreciate a woodcock, snipe, or Barmatian sandpiper. Probably the popular prejudice against the bittern on account of an obnoxious vulgar name generally applied to it, as also to various herons, has deterred the bird from the water for the last few years, hence it is traditionally reported by them as unfit for food.

But if one has a taste for any of the waders, let him try a young bittern in September. If in plump condition and well broiled (underdone), the bird will prove an acceptable morsel.

In the "old country" the bittern is considered a delicacy; hence I was not surprised to find the bird so regarded in the Canadian provinces.

Although the night herons, or "quawks," somewhat resemble this species in form, size, mode of flight, choice of food, and during immaturity, or in summer and autumn, in the general coloration of plumage, yet the habits of the two species are different in various respects.

The night herons are truly nocturnal birds, and do not habitually seek for food throughout the day, except during the breeding season. But as the sun goes down they may be seen singly, in pairs or groups, wending their way from the heronries to their favorite feeding resorts. Early in the morning they return to their roosts in the woods. Their cry, "quawk," is more frequently uttered while on the wing than at other times. They always breed together in colonies, in trees, and never upon the ground.

In contrast to the life of the night herons, the usual habit of the bittern is to remain on the ground, and to return in the morning from the marshes to their roosts in the trees, the bitterns sail forth in quest of food, winging their way silently and singly, or in little groups of a single family each. They nest upon the ground, and not in colonies, although several pairs may nest near each other in favorable localities.

Previous writers upon the subject of the habits of the bittern are to be seen reiterating the statement that it is "wild, shy and solitary."

In the various localities where I have observed them, and at all seasons, I have ever found it to be a gentle, unwary bird, solitary as regards its secluded habits, but never very wild or shy, being easy of approach even in localities much frequented by sportsmen. I have, when driving across a bare marsh from which the grass had been cut, seen a bittern near by, and, starting my carriage, quietly walked within forty yards of the bird without disturbing it from feeding, except momentarily. At other times I have marked one down in the long grass and passed very closely thereby without flushing it. After seeing its enemy, man, in close proximity and in full view, the bird would not resume feeding if paralyzed with fear. And while my observations agree with those of Audubon so far as they go, I draw an entirely different inference from my own experience, as also from the incidents mentioned by him. He has written: "That they are extremely timid I well know, for on several occasions, when I have suddenly come upon them, they have stood still from mere terror, until I have knocked them down with an oar or stick."

To my mind this is evidence, not of paralyzing terror, but of the unsuspecting gentle nature of this bird, which seeks safety in remaining motionless in the hope of escaping notice, or else steals quietly away in the rear of the grass.

Again Audubon writes: "I never saw one of them fly further than thirty or forty yards at a time." When flushed quietly this is often the case, and so tame are they oftentimes as to be repeatedly disturbed without taking longer flights than that. But I remember that at Machias the boys of the village began to shoot in the vicinity of the feeding place of my pets after September 1, and the four remaining bitterns very soon became very wary, so much so as to elude capture by the boys, although still daily frequenting the same feeding place until well into October.

The bittern differs in general habits from the common varieties of herons, in that it never nests upon trees, nor associates in colonies, nor repeats its cries while flying to or from its feeding place. It is diurnal and not nocturnal, prefers fresh meadows to salt marshes, and it is not very gentle and unwary. I have found the bittern exceedingly abundant in some parts of Minnesota as well as elsewhere in the West.

213. Least Bittern—*Ardea exilis* Aud.; *Ardeola exilis* Ridg. 465, Cs. 667.—This smallest species of our heron family appears now to be quite rare in Maine, although formerly common in certain localities. In 1863 several pairs were breeding at Scarborough, as also others at Falmouth, but within the last couple of years I have found the bitterns exceedingly abundant in some parts of Minnesota as well as elsewhere in the West. The latest occurrence of the species of which I

have record was a single specimen shot near Fort Popham, at the mouth of the Kennebec River, early in September, 1881.

Like the common bittern, which it somewhat resembles in plumage and much in form, although so diminutive, the least bittern nests upon the ground, laying its four or five eggs in June. The young are well able to fly and take care of themselves early in August, although the parents, both male and female, still remain with them at that time and continue a fostering care. I once watched a family of seven during July and August. Their daily nocturnal retreat was the gunwale of an unused boat anchored in a small cove, and while perched there would permit me to swim within a few yards without showing fear or being at all disturbed.

The habits of this species much resemble those of the greater bittern. They are very gentle, are diurnal and not nocturnal, nest upon the ground, do not associate in colonies, and I have never seen one alight upon a tree, although not infrequently I have observed them upon the large stalks of marsh hay, where they were industriously seeking and devouring insects. I have also observed the little green heron thus engaged.

[TO BE CONTINUED.]

THESE MARINE MONSTERS.

OUR notes on the strange marine monsters, loosely called "sea serpents," continue to accumulate, and we are not without hopes that from this discussion may arise some facts which shall be of permanent value to science.

We owe to the kindness of Prof. Spencer F. Baird, U. S. Commissioner of Fish and Fisheries, the opportunity to print the two letters given below. Our readers will remember Captain Platt's account of his own observations published in a recent issue of FOREST AND STREAM, and these appearances to Captain Howes adds most interesting details concerning the creatures seen at different times in almost the same locality. The letters explain themselves:

U. S. NERVE DEPOT, MALDEN, MASS. }
February 17, 1883.

Professor Spencer F. Baird, U. S. Commissioner, Fish and Fisheries, Washington, D. C.

DEAR SIR:—I take great pleasure in inclosing a thoroughly reliable account of the sea serpent seen by Captain Frank M. Howes in 1875 in almost the same place that I saw the one that I reported. Captain H.'s account is better than

mine, from the fact that he was nearer and saw its head and mouth; but the fin and its manner of holding its head was pretty much as what I saw. You will see by Captain H.'s letter that he made a note of seeing these creatures in the ship's log. I think now you can say safely that these creatures are sea serpents, and I believe that they are often seen, but those seeing them feel that they would only be ridiculed by reporting them. ROBERT PLATT.

BAITWORM, Feb. 13, 1883.

Robert Platt, Master, U. S. N.

MY DEAR CAPTAIN:—At last I have found my log-book which had the sketch of the "sea serpents," which I saw on the 13th of August, 1875. The sketch I made immediately after seeing them. A cut taken from my sketch was published in the Boston Globe of August 14, 1875. I saw three of them: two large and one small. All the family were out that day. They were a different animal from any I ever saw before, and I have been around the Horn into the Pacific twice. I inclose a rough sketch. I shall never

forget how they appeared, but I wanted to find my time-book, thinking that I had made some memorandum which would give the particulars more fully than I might remember them. The large ones showed about fifteen feet of their length, and carried their heads about six feet from the water. I estimated that through the head they measured from twelve to fifteen inches, and grew gradually larger until at the water line they were, I should say, about two feet six inches to three feet in diameter. They were going quite fast in an opposite direction. We were about two miles from Cape Cod Light, by the way. They looked remarkably like a snake. The head was flat, and when they were right abeam about 250 to 300 feet away, the small one came up head on to us. I had my glasses right on them at the time, and I noticed under the jaw it was perfectly flat, and there was a sort of rim formed by the mouth and lips, such as snakes and frogs usually have. When they came up the body was at an angle to the water of about fifteen to twenty degrees or perhaps more. On their backs was a long slender fin projecting forward at an angle of twenty degrees from themselves, and I should think it was five or six feet long. It would oscillate or vibrate very perceptibly. The upper part of the body was a blackish color, shading into a cream color on the under part. Another thing I

remarked, they did not curve down when they disappeared, but gradually sank. Taking it altogether I think there is no doubt but that they were "sea serpents," judging from appearances—and I am no Polonius. A number of my officers and passengers saw them; and one of the captains of the Philadelphia and Boston steamer which passed Cape Cod a short time ahead of me went close alongside of them, and his description, as told me by a friend, tallied with mine.

This is about the thing. I hope Professor Baird won't say as Judge Bond did; "That I must have had 'em awful bad to have seen three." FRANK M. HOWES.

The explanation of a supposed monster by "C." is interesting, but it is not to be supposed that all or any considerable portion of the trustworthy and credible individuals who have reported that they have seen these animals should have been deceived, as was the ancient mariner, whom our correspondent quotes. He says:

Editor Forest and Stream:

I was quite interested in Dr. Ayre's article on the sea serpent, and chanced to be in the company, a short time afterward, of Mr. Alexander Renney, an old seafaring man, who is perfectly reliable for all he may say. We were conversing on various adventures of his, until finally he said he had seen these serpents, and I was all attention at once. At his request he gave the following account of it. He said:

"About forty-five years ago I was with Capt. John Luce, engaged in coasting. Just at that time the New London papers were full of accounts of one being seen off the east end of Long Island, and we had just been reading about it. We were coming through the Sound, and had scarcely any wind, but there was a sort of steamboat roll on. When we were about opposite New Haven we saw, distant at least half mile or so, what we had just been reading about—the sea serpent. His head was pretty well out of the water, his tail lost underneath it; the humps corresponded exactly with the description, there being eight or ten of them. It was apparently swimming in the same direction we were going. After viewing it for quite a while, Capt. Luce said he was going to have a closer look at it, lowered the yawl and said to me, 'Will you go with me?' I did not like to refuse after the captain said he was going, so I told him I would go with him. We had a good pair of oars, and started for the creature. As we neared him we saw the monster more plainly, and stopped and looked, and he seemed an ugly-looking fellow. We now turned the boat and backed toward him very slowly, all the time ready to bend on the oars for our vessel, in case he put for us. We finally got quite close and stopped, and then after a while we made him out. Now what do you think he was?" I guessed the serpent, of course. "No," "Seaweed, then?" "No," "Well, what was it?" "A water fence of about eight or ten lengths tied together with grapevines. Seaweed had collected at the joints, and gave the appearance of humps at a little distance off. The head or high part was the shore end, and the other had been under the water so long it had become heavy and scarcely floated."

Capt. Luce says he has no doubt that this was the sea serpent seen off New London, the wind and tide bringing it in the Sound. I confess I felt disappointed at the finale, and almost wished they had not gone quite so close to it. If the above will be the means of hearing more of the serpent, it will be interesting to C. WATKINS RIVER, Jan. 22.

In the Portland (Me.) Press of Jan. 27, appearing the following item:

Capt. William Richardson, of the fishing schooner Village Maid, near Baitworm, when about six miles from Cape Elizabeth, the two lights bearing northwest, had his attention called to a monster by Herbert Elliot. Whatever it was it was disturbing the water, and when one-eight of a mile from their heads the monster raised itself some twelve feet out of the water in a perpendicular position, with its head bent forward at right angles from its body; it appeared to be two feet in diameter, with hoars, shining scales. The water was lashed into foam as it disappeared under the sea with a long, sweeping motion. It continued to rise at short intervals, the same appearance until lost in the distance.

We have taken some pains to investigate this report; but the information received, while it adds something to the newspaper report, is not wholly satisfactory, being somewhat meagre in its details. One correspondent, who was requested by us to investigate this matter, writes us as follows:

PORTLAND, Me., Feb. 19, 1883.

Editor Forest and Stream:

The sea monster reported as seen near Cape Elizabeth, Maine, in December, 1882, was observed by Wm. L. Richardson, of Ferry Village, Me., master of the fishing schooner Village Maid, and by Herbert Elliot, of same place and vessel. The vessel was drifting under mainsail with boom gaged out, with only the captain and cook aboard, the crew in dorics a mile to windward, when the creature was first seen by Mr. Elliot, who exclaimed to Capt. Richardson, "Is that one of our dorics to leeward?" The captain leaped up on the binnacle for a better view, and saw that the object, at first apparently lying quietly at the surface of the water, was a living creature, and the water could be seen to dash up about it as it moved.

Capt. Richardson says that it would have attracted no especial attention in the summer season, when whales, sharks and other large creatures of the ocean abound on this coast, but it was seldom seen when here in winter.

This "sea serpent" when seen was about a quarter of a mile to leeward, and the time half-past three o'clock in the afternoon of a bright day; sea smooth, no swell, and breeze very light from the north; the vessel then being on the "White Head" fishing ground, about eight miles to the southward of Cape Elizabeth. While being watched the creature raised a part of itself above the water, appearing then to the observers to be about the size of a barrel or "larger," black and glistening in the sunlight, with its head "fully six feet above the surface of the water," and held horizontally at right angles to the erect part of the body seen. The body seemed larger near the water than at the head of the creature. Remaining thus raised for several seconds, the monster, with a curving motion, disappeared beneath the water and was seen no more. I have thought it possible that this "sea serpent" may have been one of the enormous hauled seals, astray from the coast of Labrador, but the observers are confident that it was quite a different creature. A late officer of the U. S. Navy collected a voluminous mass of evidence upon the subject of the sea serpent, much of it of great value, as showing conclusively the occurrence of some such strange monster along the coast of New England, but not yet captured nor accurately described. This manuscript evidence was in possession of the Rev. and Hon. Andrew H. Story Smith, and destroyed by one of our unfortunate fires.

EVERETT SMITH,

Rochester has such a fall, she need not apprehend any such fate as befall the capitals of Greece and Italy.

The advantages of this place for a shooting ground have long been appreciated. It was formerly the range on which the celebrated Billiard Club met to test their prowess before being sent out to challenge the world for accuracy and spread the repute of this city as a manufacturing center. Ages before the sound of a rifle was heard in the Genesee Valley there were shooters on this flat, for they have left evidence of their existence in numerous flint arrow-heads, of which I had a finely chipped specimen picked up on the field a few years ago.

The region appears to possess for wildfowl some of the attractions ascribed by Tom Moore to the Skellig Islands in the county Wexford, Ireland.

Islets, so freshly fair,
That never hath bird come nigh them,
But from his course through
He hath been won down by them.

The place is only a short distance from the middle of the city and surrounded by dwellings and manufactories, but the river flows beside it and its water seems to attract the feathered tribe as a magnet does a needle.

I remember one occasion on which a flock of Canada geese, going south, lost their way or became demoralized in crossing the river at this spot, and after flying wildly about the mills swooped down in the river and seemed to collect their scattered senses from contact with its water, for in a short time they arose and went off hooking, leaving, however, one of their number behind to testify to the skill of Rochester wildfowlers. When the weather is very cold a few winter ducks come into the rapid. I shot one of them from the west bank of the river one very cold day some time ago, and it fell on the ice on the east side. I was looking for a safe place to cross, when two men with guns rushed down the bank and made for the bird. As one of them picked it up the ice broke under him, and he was immersed to the shoulders—a clear case of poetic justice. One day last fall as a part of us were shooting glass balls a novel trophy was added to the edge of the river. The traps were deserted instantly, and the bird paid forfeit with its life for having thus ventured into the lion's mouth. At a recent ball shoot of the club the sport was varied by the presence of merganser amid the floating ice, and it too was brought to pot.

ROCHESTER, N. Y.

SENATORIAL OPINIONS ON THE PARK.

WE give below the remarks made by Senator Ingalls, of Kansas, during the course of the discussion of those amendments to the sundry Civil Bill which relate to the Yellowstone National Park. These sentiments do not require much comment from us, and we leave our readers to form their own opinion thereon. The remarks of Senator Vest is worth reading, because it shows so intelligent an appreciation of the needs, present and future, of the American people. Let our readers compare the two speeches;

MR. INGALLS.

The best thing that the Government could do with the Yellowstone National Park is to survey it and sell it as other public lands are sold. I have no doubt there are great curiosities, spouting geysers, crimson cliffs, and inaccessible mountain summits within that domain; but these features are not peculiar to that portion of the country. I know of no greater reason why the Government should exercise exclusive dominion over that domain than that it should assume to exercise control over Pike's Park or the Garden of the Gods or the Falls of Niagara or the Mississippi River, or any other of the great natural features of this continent.

It is getting to be a good deal of an incubus, and it is very rapidly assuming troublesome and elephantine proportions. We are already engaged in a very good-sized wrangle and quarrel with our own people about the best way of disposing of a way of unauthorized leases, as alleged by the Secretary of the Interior. Ten thousand dollars has already been spent in laying out roads that nobody uses. Last year we appointed a superintendent at an expense of \$2,000, and this year the appropriations are \$40,000. There is to be a corps of assistants to stay there summer and winter to look after the spouting geysers, to see that patent medicines are not sold around on the cliffs, that timber is not cut away, and that the noble game is not excluded from those preserves. If this thing continues and the engineers of the Government are to lay out a system of roads and bridges, it will not be five years before it will take a million dollars a year to run that Park.

I do not understand myself what the necessity is for the Government entering into the show business in the Yellowstone National Park. I should be very glad myself to see an amendment to this bill to authorize that portion of the public domain to be surveyed and sold, leaving it to private enterprise, which is the surest guarantee for proper protection for such objects of care as the great natural curiosities in that region. I believe they would be safer that way, and that the interest of the public would be better preserved that way, and we should have easier and better and surer access, and less encroaching demands upon the Treasury of the United States.

MR. VEST.

I do not think that this is exactly the time to discuss the question that the Senator from Kansas has brought to the attention of the Senate. I was not a member of the Senate when the dedicatory act was passed. I believe, if I am not mistaken, that the Senator from Kansas was. That was the time that he ought to have made the speech that he has delivered here to-night.

I am very frank to say, however, that I thoroughly indorse the purpose for which the act of 1873 was enacted. I believe that this Park is necessary to the American people. The Senator speaks of cutting it up, or surveying it, or selling it. This mountain wilderness is absolutely without value unless it be for mineral purposes, and the minerals have not yet been discovered. If the Senator from Kansas thinks that the noble game that inhabit that region, which is fast being exterminated, should utterly disappear from this continent, he should destroy this Park. The last hope of the preservation of the bison, the buffalo, the moose and the elk upon the continent of North America exists in the preservation of that Park, and to such an extent that it will be a great preserve.

The Senator speaks as if this was some proposition *sub genere*, unknown before. France has such a park, Germany has such a park, England has her royal parks, and why should

not America have her republican park, free to the people of the States, with these great curiosities that exist nowhere else?

Mr. President, the great cause of this age and of the American people is its materialistic tendencies. Money, money, *Argent, Argent*, is the cry everywhere, until our people are held up already to the world as noted for nothing except the acquisition of money at the expense of all esthetic taste and of all love of nature and its great mysteries and wonders.

I am not ashamed to say that I shall vote to perpetuate this Park to the American people. I am not ashamed to say that I think the Government answers a great purpose in our national life. There should be to a nation that will have a hundred million or a hundred and fifty million people, a park like this as a great breathing-place for the national lungs, as a place to which every American citizen can resort instead of spending his money amid the Alps of Europe or wandering on the Eastern continent in search of the wonders of nature. This is the great wonderland of the world, and if Senators will take the pains to write but an hour to reading as I have done lately the account in plain, unvarnished phrase, from men who have no artistic taste but who love nature, the description of the great wonders that exist here, I shall not be afraid that speeches like those of the Senator from Kansas will find suffrage in the Senate.

But the question now before us is whether we shall keep this Park free from vendors. If the Senator hereafter proposes to survey it and cut it up and sell it, I shall be perfectly willing to discuss that question.

GUINEA FOWL AS GAME.

Killor Forest and Stream.

I have seen the guinea fowl lie in flocks among wheat stubble in the fields as closely as quail, not flushing until almost stepped on. They are kept around farm houses like chickens, but unlike them do not stay in the yard, but run around the way all day, only coming back for their morning and evening meals. They roost in the trees at night, and in fact go almost wild. When wanted for the table they are generally hunted up in the woods and killed with a shotgun. They fly fast for a heavy bird—very much like a prairie chicken. Instead of flying in a bunch they string out in a line like geese or ducks. When flushed they utter their peculiar note several times very sharply until they are well on the wing, and again as they alight. If the hunter can get on a bird with the direction of their flight, he ought to get several at a shot, as they are strung out so.

Last fall, while on a quail-shooting trip in the country, I was asked at a farmhouse to kill some "guineas," as they were called, for dinner. They had been noticed some time before feeding in a large field on the edge of some woods; the field was covered with high grass, so they could not be seen. Keeping close to my dog, I in a little while began to give signs that they were near, and pretty soon pointed. As I came up the "guineas" rose with a terrible cry directly above me for the nearest piece of woods. They were all in a line, and as I fired the first barrel seven fell, and three came down to my second. This was more than half the flock. The rest I let go as I had already more than I wanted. Some of them were only wounded and had to be retrieved, but as a double shot I did this one was very successful, as I had never before killed more than one at a time. If the guinea fowl is allowed to run wild and hunted a little, I see no reason why it should not make a very good game bird. Its flesh tastes good like one anyhow. A law for shooting them should be made very strict because they would sell for a good price, and on that account would be very much hunted for the market.

PHILADELPHIA, Pa.

THE RECEPTION OF THE "SCREED."

SOME weeks ago I sent a "New Year's Scree" to your office, which was fairly rendered and might well be calculated to provoke returns. It was written hastily, not thoughtfully, and I have never before shouldered a little maybe; but, in the main, well right.

The returns have been encouraging. I do not stand alone by long odds. The "scree" has brought me dozens of letters, some of them six to eight pages in extent, all flattering and commendatory. The letters bear evidence of sportsmanship, fair play and culture. The adverse criticisms have been light. "Meat-Hawk" has a mild protest against being thought a fool because he has several dogs that cost him over \$100 each. I did not say that; but I can't help thinking of the old adage, "A fool and his money," etc. The fair cost of raising and training a good business hunter, setter, pointer or hound never ought to be more than \$25. I have owned, raised and trained hunting dogs for more than fifty years. The highest price I ever got for a dog was \$30. This was for a pointer that stood a snipe, in a raw March wind, for thirty minutes by the watch, without a perceptible hitch or uneasy movement. I thought him well sold.

The hound has loathed me most. I can train and break three pointers, setters or cockers more easily than one eager hound. I have trained and broken the fiercest and gamiest hounds. But, alas, when they were trained to voice aid whistle, their vim and *elan* were gone. They became "ridge dogs." They listened for signals and ran short races. The ran well for a little while and came back. "Meat-Hawk" thinks I might call the man a fool who paid \$500 for an oil painting when he could buy a chromo for five cents. I dare say I should. I know something of this painting business. I think I can name a parvenu of New York who paid not \$500, but \$4,000 for an oil painting by an "old master," the same having been painted in Rome by a sharp young artist of Cincinnati and duly manipulated by a shrewd live dealer in Vienna. In 1870 I was shown in New York a painting of two rappers for which \$6,000 was paid by the owner, who would not have given six dollars for the originals. Is a "counterfeit presentment" then worth more than the original?

Recently I read a paragraph in a New York daily stating that a painting on a canvas eight inches by six had been sold for \$85,000. And I will bet that signals and ran short races. The ran well for a little while and came back. "Meat-Hawk" thinks I might call the man a fool who paid \$500 for an oil painting when he could buy a chromo for five cents. I dare say I should. I know something of this painting business. I think I can name a parvenu of New York who paid not \$500, but \$4,000 for an oil painting by an "old master," the same having been painted in Rome by a sharp young artist of Cincinnati and duly manipulated by a shrewd live dealer in Vienna. In 1870 I was shown in New York a painting of two rappers for which \$6,000 was paid by the owner, who would not have given six dollars for the originals. Is a "counterfeit presentment" then worth more than the original?

afford the originals, but the copies are good enough. "When the mountain streams are frozen and the norland winds are out" I get my little array of art to the front and arrange it first in the direction of the wind. First, the Damascus barrels of the shotgun. The intricate and beautiful pattern is just as fine to me as a good oil painting. Then a card of trout and bass flies by the best makers; next a few of Prang's best chromes; one or two oil paintings; my best rod; photos of friends, etc. One of the paintings represents a henlock tree of perfect pyramidal form. Right in front of me as I write stand three henlocks, perfect as nature made them, all pyramidal in form and the growth of thirty years. Now I turn to the naked eye or microscope. The painting is the dabb of a plasterer. The work of nature stands the test from minutest twig and leaf to the root—more and more beautiful the more fully it is developed.

As to the five-cent chromo ("Meat-Hawk's"), I do not see it. But the last Prang chromo, I indorse. I can give my wife and children the benefit of a good picture at a cheap price. They enjoy, and see it. "Tuxis" pays his respects, and thinks I had better draw it a little finer—take the bow and arrow instead of the old muzzle-loader. He is well right. The suggestion is good. Now, let us have a law something like this: "From and after the first day of April, 1883, it shall be unlawful for any person to kill or have in possession any deer or part of a deer, killed by any device save only by the bow and arrow. Penalty, \$1,000 or imprisonment for 1,000 days. All collections of money to be paid to the informer on whose testimony conviction is attained."

Pass such a law and enforce it. Extend it to every bird and animal now recognized as game. I dare say they would vote for it, with a chance. It would develop a good deal of muscle and skill in archery, and some deer would still be slain. It is not so very long ago that they were killed in no other way.

As to the covert snar at the old muzzle-loader, let me state a few provable facts. "Ben Gitchell," "Joel Culver," "Old Foster," "Jim Locke," "Jim Steele," "Eph Steele," and "Old Man Young," each killed from 1,000 to 2,000 deer with a single-barreled whole-stocked flint-locked, long-barreled Lancaster rifle. Is that enough? Or would it have been better that they had the modern breech-loader? "Capt. Dorsal Fin" gives me a lift. My dorsal fin is worn flat from toting the knapsack. But here's my dexter doctor. Let him cut me off somewhere in the Adirondacks if he can, and dare.

A word as to the Yellowstone Park business. You, Senator Vest and the best intellect of the country have got on the matter heavily and earnestly. All have spoken well and heartily. *Cudiono!* Mr. Rufus Hatch, *et id genus*, etc., are going right along as though nothing had happened to disturb their serene plans. Are they going to heat?

WELLSBORO, Pa., Feb. 26.

SUMMER SHOOTING.

IT is proposed by the FOREST AND STREAM, and others of the shooting fraternity, to repeal all laws permitting summer shooting, and thus to sweep away forever privileges which many of us have esteemed and enjoyed, and which our fathers enjoyed before us.

There was a custom in Athens of old, whenever a law was about to be repealed, to appoint an advocate, to plead its cause as that of a defendant.

My object in this article is to call for the advocate who will make an effective plea for summer shooting, before this question shall be decided. My solution shall be that "Nothing is settled till it is settled right," and how shall we get at the merits of a case unless we hear "the other side."

While waiting for the advocate I beg to submit a few thoughts to the reader.

You have noticed that it has become—shall I say fashionable—to denounce summer shooting. A few editors of the sporting press and hook-makers have passed the word. "No summer shooting," and certain self-appointed guardians of shooting interests in various parts of the country have caught it up and re-echoed it after them, till at length it is fanned to be "the thing" to cry down and sneer at any who favor the old ways in this matter. You have noticed also the supercilious and lordly way in which these persons deign to touch the subject, assuming, as they do, that the question has been decided on its merits, and that all who differ from them are disloyal to the guild—are indeed "masked pot-hunters," could they be uncovered.

Well, sarasinu won't always accomplish its end. Byron said, "Cervantes laughed Spain's chivalry away," but the poet's success lay in "the ripeness of the times" even more than in his matchless sarcasm. In order to clear the way for our conclusions, let us put down the things on which we are all agreed:

1. Game laws are dependent for their execution on the sporting public, on the men who use the rod and gun. No game constable can succeed so long as these are indifferent or hostile.

2. These laws must represent the average sentiment and convictions of the shooting public. They must be free from the suspicion of having been framed in the interests of a class. They must be just, and aim at "the greatest good of the greatest number."

3. They must vary in various States according to climate and topography. Uniformity is impossible.

4. They must be framed so as to protect the young. Full-grown birds alone are lawful game, and the fawns must be brought to maturity. The rights of the farmers must be respected.

There is no better way, perhaps, to get at the average sentiment of the sporting fraternity on this question of summer shooting than by an examination of the game laws of the country.

I have been looking at these laws with a view to classification, and with the following results: Of the several States and Territories of the United States—
15 permit quail shooting in summer, viz., 9 in September, 5 in August, and 1 in July.
24 permit woodcock shooting in summer, viz., 13 in July, including New Jersey, Pennsylvania, Ohio, Delaware, Illinois; 7 in August, including Massachusetts, New York, New Hampshire, Michigan; and 4 in September, including Maine, Vermont, Rhode Island.
23 permit ruffed grouse shooting in summer, viz., 1 in June, 7 in August, 15 in September, including New York, Massachusetts, Rhode Island, Vermont, Ohio, and Maine.
19 permit partridge shooting in summer, viz., 1 in June, 1 in July, 7 in August, including Michigan, New York, North

Carolina; 10 in September, including New Hampshire, Virginia, Wisconsin.

In these statistics September is classed under summer shooting, for the reason that the summer vacations of professional men and others extend as a rule into that month.

It will be seen, then, that the game laws of the country do not indorse the new watchword of our reformers, "No summer shooting."

These laws may be wise or otherwise, but they indicate public sentiment, and are the best expression we have of the convictions of the country.

Let us now take a model law and examine its working. Let us take the law of Connecticut, which fixes the open season for upland birds at October 1.

What are the facts in the Nutmeg State? Why, in the first place, there is widespread discontent. For several years an organized party has been made at Hartford to restore July woodcock shooting.

In the second place, the law is not enforced or obeyed. In many parts of the State the shooters have agreed among themselves to shoot in July, affirming that their local birds are gone in October, and that the flight birds do not touch them; while in other parts of the State the shooters open the ball in September. A third objection to the Connecticut law is that it is open to the open season on quail. Many of the coveys are but half-grown at that date.

November 1 is quite early enough for quail.

Uniformity, or a universal law, is impracticable.

Your correspondent at Wellsville, N. Y., in last week's paper gave the judgment of his section in favor of woodcock shooting in August. He tells us that it is summer-shooting or none.

Let us propose the law now with the Legislature at Albany, if passed, will restore July shooting in the Empire State.

Let us now ask for the objection which appeared so conclusive to our friends on the other side. We are all agreed that our game laws should be framed in harmony with the four principles stated above.

It is obvious that you will enforce your exclusive fall shooting, you had better give it up, unless, indeed, like our temperance friends, you hope to convert people "by act of Parliament."

These objections are as follows:

1. In summer the game is not full grown. But let me ask the "Professor" whether that is not what he calls *petitio principii*—begging the question? We insist that certain kinds of game are full grown, and therefore lawful prey, long before October 1.

2. The season, it is said, will be too long if game is killed from summer to mid-winter. We answer; then shorten it at the end and not at the beginning. Let the open season be when it will best suit the public, and not when only the wealthy and the market shooters can enjoy the sport. Let the men who have protected the birds during their nesting have some recompense for their trouble.

3. The destruction of game is inevitable if summer shooting is not stopped. Well, if that proposition could be proved, it would end all controversy. But it is untrue. Game is plentier in England to-day than it was centuries ago, and yet the open season is in August. The fact is, game preservation is not a question of summer-shooting or of fall shooting, but of judicious and executed laws. I have been told by Abiraud guides that deer are plentier today than they were twelve and fifteen years ago; and this though New York permits deer shooting in August.

4. But the piece de resistance of our friends is that men who shoot woodcock in July will "pull on everything that rises before them." But this is a boomerang. It proves too much.

It would prohibit all shooting till November, for it is conceded by all the open season on quail should not be earlier than November 1. It means that there should be no shooting till all game is full grown. But not even the editor of FOREST AND STREAM would defer cock shooting till then, for he knows that the flight occurs in October, in the Northern tier of States, and that by November 1 the long-hills have got well on their journey toward their winter home.

The fact is that something must be trusted to the honor of men, and in the long run it will be found to be as well to assume that even men who use the gun are gentlemen. One thing is certain, that the whole question of game protection rests with the shooters vastly more than with the laws or the constable.

A recent contributor, who chose to call himself "Otherus," seems to be concerned for the fences and potatoes of the poor farmers if summer shooting is allowed. Poor Otherus has his sympathy. The spectacle is a beautiful one—"Otherus" in tears over the woes of the farmers' and in genuine pithos it is only surpassed by Mark Twain's weeping at the tomb of Adam. CLEVERUS.

THE WEATHER AND WESTERN GAME.

FROM a good many and varied sources your correspondent learned of the following facts about the chances for quail and other game prospects. Nearly everywhere the disastrous floods and the preceding extreme cold and heavy fall of snow has killed off the quail at a terrible rate. There will be little show for hunters this spring, and very little chance for these sixty-quail-in-thirty-days fellows. Briefly stated, the reports are as follows: From Peoria comes word that the quail in that section are faring better than most anywhere else. Bloomington sends word that the quail are killed off by whole coveys. The weather February 5 was very severe on them. There will be no quail this season in Northern Indiana. Reports from Jerseyville, Ill., say that there will soon be plenty of ducks there with present temperate weather. There will be good feeding on the Illinois bottom soon. Reports indicate that ducks are moving northward. At Winona, Wis., the snow has been over a foot deep, and the thermometer has been below zero all along, and there is little hope for the quail. The poor Bob White has been found frozen in bunches where they huddled together in the fields near Lyons, Iowa. Dayton, Iowa, and Rockhouse, Ill., report the same state. The boys all rushed around, frantically Thursday and Friday, when they saw set and bait, but the thermometer showed fifty degrees above zero. They looked for a regular breaking up of winter's backbone and the consequent arrival of the ducks from the South. It was reported that they were at Jerseyville, Ill., and even that some were seen near Alton, on the Illinois River. Then came the arduous duty of loading shells and getting guns out. Lo and behold! Saturday loomed up clear and out in the open, and the thermometer meter and excessive cold weather blotted all hopes of ducks. Chicago, Ill., Feb. 27, 1888.

THE WORCESTER "FUR COMPANY."

I HAVE resided in Worcester about twenty years, and during that period I cannot remember a single year when foxes were not plenty in this vicinity. There were about six years of this time that my business compelled me to give up bird shooting almost entirely, and as I had about three months of leisure in winter in those years and must have something, I purchased a homed and substituted fox hunting. I have since October 1, and was on the list of the best of the best; but to my mind it does not compare with bird shooting, and as soon as my business would permit I was quite ready to "return to my first love," and the past five years have done no fox hunting, unless, perhaps, to go out once or twice in a season with some friend. Very few of the "fur company" do much bird shooting. The season of November and December is, however, an excellent one, and it is difficult to make the old man say which he likes best; but I have shot with him for many years and have noticed that he goes fox hunting very little until the woodcock have gone. Probably if any one should accuse him of having a preference for the woodcock, he would say there was time enough to hunt foxes after they were gone, and wind up with the remark that either was good enough for him.

The season of October 1, and closes on the last day of February by mutual agreement. The first three months the weather was fairly good for the sport, but January and February have been exceptionally unfavorable on account of the crust and ice which has covered the country the entire two months, and this fact has affected the score very materially. Wednesday came on bright and clear with a new snow, and gave promise of being all that could be desired for the closing day, but the wind was so strong a gale and it rained out very unsatisfactory. There were, however, two foxes killed in the party, and when one of them was skinned the fact was revealed that there would be eight less foxes next season. The company respect the close season as faithfully as the bird shooters do the game laws, and if one should kill a fox after the first day of March, he would be read out of the company.

The names which appear in the list are all citizens of Worcester except Mr. White. The Tourtelotte House in Milbury, of which he is the general proprietor, is justly celebrated for its elegant game suppers, and so thoroughly does he please his patrons, the house has gained an enviable reputation, and being a thorough sportsman as well as a very pleasant gentleman, Mr. White has a good many friends who like to accompany him on his fox hunting trips. Of the number set against his name in the list eleven were killed by him personally, which is the best individual string. The score follows:

Table with 2 columns: Name and Score. Includes John M. White and company (14), A. B. F. Knepp (3), M. French (3), Leonard Hand (2), John A. Slocum (2), Henry (2), E. H. Smith (2), Horace Adams (2), S. N. Harrington (1), John R. Thayer (1), and Total (60).

Worcester can shake hands with Abitau, Ga., on the panther question, having enjoyed (2) a sensation the past winter quite equal to theirs. Had your correspondent the descriptive powers of "Uncle Remus" he would certainly write up a complete history for the FOREST AND STREAM. Ours should be properly called the panther "here," as for the past two months it has been almost impossible for a citizen who is never known to shoot a gun to get fairly off his doorstep in the morning before he would be accosted with "Why ain't you after the panther?" etc., etc.

The newsboys cry has been "All about the panther," and for a time the local papers received a perfect avalanche of "verses" about the panther from the amateur poets of the county. For several weeks the neighboring town of Douglas monopolized the business, but of late his "hircocervus" are heard and his "huge tracks" are seen in various other towns in the county. Meantime, Douglas is taking a rest. After the monster is killed, I shall hope to see him, and if I do shall forthwith send a full description to the FOREST AND STREAM. K.

WORCESTER, MASS., MARCH 3, 1888.

THE BIG-GUNNERS.

(Reported for the Baltimore Sun, March 3.)

MAGISTRATE ADAMS yesterday, at Havre de Grace, delivered his decision in the case of Robert F. Galloway, tried on Thursday on charge of shooting ducks at night with one of the big-guns which kill and cripple a flock at a discharge. Court was held in the City Hall, which was packed with several hundred spectators, among whom was Judge Stump, of the Second Judicial Circuit. The magistrate said that the evidence of Detective Lindsey showed clearly that Galloway was out gunning on the night in question, but there was some doubt as to the defendant having used a big-gun, as the detective had not testified as to the weight of the weapon, which must weigh over fifteen pounds to come under the penalty of the law. He would, therefore, fine him \$100 for the one offense and hold him not guilty in the other.

There was a great uproar. Men crowded about the stage loudly denouncing the decision. Lawyer Vandiver said it was a compliment to Lawyer Semmes's rich clients. Lawyer Marine plumped out a strong eulogium of censure, and took an appeal. Magistrate Adams called the attention of the spectators in sending a Pinkerton detective there to arrest the gunners. Mr. Vandiver demanded that Detective Lindsey should give security to appear at court in October as a witness or go to jail. Mr. Semmes went bail for the detective.

While the sympathy of the people of Havre de Grace is with Galloway, they are not in favor of big-gunning. Their feelings were aroused by the action of the committee of sportsmen in sending a Pinkerton detective there to arrest the gunners. They think the authorities of Harford county ought to have had charge of the case, and that the gunners ought to have been arrested by the regular police appointed for that particular duty. The sporting men say that the police are slow to act, and that they cannot break up the shooting unassisted. Mr. Semmes says that he sent Semmes Attorney Marine to call on the witnesses against the gunners, and asked him to prosecute them, but the letter was not even answered. Mr. Semmes then took hold of matters himself. His clients are nine-tenths of the property owners along the ducking shores, and are sportsmen from Baltimore, New York and Philadelphia.

Detective Lindsey smiles blandly at his present unpopularity. It takes it like the doctor who cures all ailments with melon-water and the hisses, which attest the cleverness of his playing. He came here some months ago with his wife, and was thought to be an English gentleman in search of

amusement. He won the intimate friendship of Wash. Barnes, the king of the big-gunners, and went out and helped Barnes pick up the ducks killed with a big-gun. So close did their friendship become that Mrs. Lindsey volunteered to teach the piano to Barnes's children. What fun Lindsey didn't learn from Mr. Barnes. Mrs. Lindsey learned from Mrs. Barnes. The detective was on the bay in all sorts of weather. Once he came near losing his life by being swept along by drift-ice. He was such an enthusiast about the sport of duck shooting that it was whispered he was a crank, but there's not a man, woman, or child in Havre de Grace who thinks so.

In the testimony it was brought out that Lindsey in his operations here after the big-gunners had violated the wild-fowl law himself; hence this afternoon charges were filed against him before Justice Adams for two violations of the law. The cases were tried at once, and he was fined \$25 for the first offense and \$50 for the second. The fines were paid.

The big-gunners are very bitter over the detective's work. They say that if the law should be amended so as to permit them to gun at night from January 1 to April 1 they would not gun at any other time. It frequently occurs, they say, that the bay in this vicinity is frozen over after Christmas, and it is difficult as well as impracticable to shoot from boxes. At night the ducks burn and feed. Then it is the big-gunners' special opportunity to do some good work. To get a big-gun brought down 95 ducks this season. To get two shots a night is good luck. The guns are put in skiffs which are placed on runners when necessary. The gunner is shrouded from head to foot in white canvas, so as to escape detection. Sometimes he moves along on skates. The big-gunners urge that if a man cannot make his living in day-time in frozen weather, and will go to sea for any amount of discomfort for that purpose at night, it is neither fair nor right to deprive him of the privilege. The owners of shore-side property say that if the big-gunners are not stopped, wildfowl will be brightened off permanently after awhile and their property become comparatively valueless. They say that the legitimate gunners, who greatly outnumber the big-gunners, make a very good thing of their business throughout the ducking season, and there is no reason why others should not do likewise except it be that nothing less than wholesale slaughter will content them.

Ducks have been plentiful this season. The champion legitimate gunner is Wm. Dobson, who has been known to bring down 300 in a day's shooting. The money spent in Havre de Grace by visiting sportsmen, and their liberality in giving the best of the best service has done a great deal for the place and its inhabitants, and is one reason why so many persons side with the sportsmen in desiring to prevent the big-gunners from driving the ducks away. There are no visiting yachts at Havre de Grace now, and but few of the sportsmen owning property along the shore, as they come earlier in the season, which begins November 1 and ends April 1.

PHILADELPHIA NOTES.

SPRIGTAILS and bald pates are now coming back to our river; these, with a few mallards and black ducks, which the open feeding grounds and marshes are attracting, are drawing the attention of some of our Philadelphia duckers. I learn that a great many brant have reached both Barneat and Tuckerton Bays, and that a number of ducks were being killed in both of these bays by the market-gunners, and that some remarkable work has been done. From the fact that considerable ice has made this winter on the flats in these bays, the natural sedge-grass beds have been destroyed by the floating ice when it broke up and good blinds are difficult to make; hence brant will be found hard to stool, when it is also well known these fowl are more wary in the spring than they are in the fall, when they are in the North with the ice.

We hear that the ice in the upper Delaware River, above tidewater in the mountain section of Pennsylvania and New York, and in the Susquehanna River, above Williamsport, is gorged at some points. This a week since raised the expectations of a few duck shooters here, who imagined that this ice would have to pass by Philadelphia and the Delaware, and that the ducks would be coming or padding on the late-arrived bald pates and sprigtail ducks. It should be remembered that ice made above Trenton, N. J., only about thirty miles above Philadelphia, never reaches our city in its drift, but melts long before it can be carried by tides past our eiry.

We shall have no more "ice shooting" this season unless we have a hard freeze in the river at and below Philadelphia, and that will be a long time coming. I am sorry to say that a man called the trip of a gunner on the river, and long barrel in the direction of a sitting or swimming duck when an even quarter of a pound of No. 3 killed or crippled half of its numbers, but I shall never be guilty of it again. One trip sufficed me and gives me reason why to condemn such shooting. Few but market shooters now systematically indulge in it, I am happy to write, but there is no one against it who is wrong, root and branch, and out of all order nevertheless.

Some of our sanguine sportsmen are even now looking for an advance coming snipe. Spring is here to be sure, but in name only. Mr. Longhill will postpone his visit to us (and few have been their numbers about Philadelphia in the past five years) until more genial weather attracts him. Home.

MINNESOTA PINNATED GROUSE SEASON.—Mantorville, Minn., March 3.—Editor Forest and Stream: The bill making pinnated grouse season to open August 15, instead of September 15, has been passed. The law as it stood last season was of very little use; sportsmen did not observe it in this vicinity, and I think are reported unassiduously on this winter, and shooting for next fall looks good. Quail are not very numerous, the unusual depth of snow may have something to do with it.—DELL WELLS.

QUEBEC FISH AND PROTECTION CLUB.—Quebec, Canada. —The adjourned meeting of sportsmen and others to form a club to prevent the illegal slaughter of game, etc., was held on Thursday, the 15th inst., at the Board of Trade rooms, at which Messrs. C. W. Deane, Capt. J. H. Thomson, F. C. Wurtel, Richardson, McNabb, Gauvreau, Comou, W. D. Campbell, Graddon, D. C. Thompson, C. P. Dean, C. F. Smith, H. Stanley Smith, J. Hamilton, Jr., and A. F. Hunt, W. D. Campbell was appointed chairman, and F. C. Wurtel secretary. It was then moved by D. C. Thomson and seconded by W. A. Griffith, and carried, that the constitution of the Quebec Fish and Game Protection Club, and those present do sign the constitution. Moved by W. A. Griffith and seconded by H. H. Sewell, and carried, that this meeting do adjourn until the 26th inst., when a general meeting of the club will be called for the purpose of electing officers, adopting by-laws, and other business. In the meantime a committee be named to prepare a draft of by-laws, to be submitted at next meeting, and also that between this and the next meeting the members be requested to induce their friends to join the club. Copies of the constitution were prepared and put into the hands of several members for signature. Before the meeting separated those present enrolled themselves as members of the Quebec Fish and Game Protection Club. —F. C. WURTEL, Secretary *pro tem.*

MONROE COUNTY SPORTSMEN.—Rochester, March 4.—The annual meeting of the Monroe County Sportsmen's Club was held last evening at the rooms in the Arcade, President M. M. Hollister in the chair. L. A. Pratt, secretary and treasurer, presented his fifteenth annual report, showing cash on hand \$803.84 and no debts of consequence. The number of active members is sixty-two. The Committee on Game Laws reported that they had made suggestions to the members of the Legislature on the new game law, and thought that the suggestions would be adopted. They recommended that trout fishing begin April 1, and that imported sparrows be taken from the list of birds which may not be shot. M. M. Hollister was re-elected president, James H. Brown vice-president, and L. A. Pratt secretary and treasurer. The chair appointed as Finance Committee George W. Crouch, Jr., and Edmond Redmond; Vigilance Committee, H. B. Hooker, Homer C. Babcock, H. H. Morse and William H. Bowman. Homer Jacobs was appointed a committee of one on supplies for the State convention.

THE AIR-SPACE.—Philadelphia, Feb. 28.—The experiments which I commenced last fall, having for their object a determination of the question as to the effect of "air-spaces" in rifle cartridges, has been progressing, though slowly, during the winter. It has been impracticable to secure here permanently a room in all respects suitable for such a purpose; hence, I have had to use distant fields and to defer to the weather. I must ask the indulgence of some correspondents whose queries I shall not be able for some weeks to answer. The results of these experiments will also be delayed in publication. To my readers who are kind enough to send me their suggestions on a postal card I will endeavor to mail a copy of a daily paper giving some of the results. This trial has to do with rifles principally; but I am trying some shotguns—arms that I think ought not to be fired in that way. A Colt twelve-bore, seven and a quarter pounds breech-loading gun, which I tested this some days since, however, stood forty-five discharges, showing no injury whatever. —W. MCK. HEATLY.

A CRUSTER DUCKED.—Central Lake, Mich., *Editor Forest and Stream:* In "Michigan Notes," page 69 of your paper of Feb. 22, you say the snow is ten feet deep! My communication read "three" (3) feet, and that is about all we can "get away" with to good advantage. Please correct. One man in these woods, derided at the effect of the "cruster," and he was a sporting hunter with his powder (the correct term, I believe) he broke through, mercury about the ephers, and a pair of thirty-six inch snowshoes on his feet. The buck floated off under the ice, and after several ineffectual efforts to climb out, the man was obliged to sink, or dive until he could manage to loosen the snowshoe-slings, when he succeeded in getting ashore. Now, if there had only been an efficient game warden to clasp his claw upon the soaked and shivering law-breaker, and give him a taste of his quality, the dissemination of that particular "cruster" would have been as complete as anything I happen to think of at this writing. —X.

NEW HAMPSHIRE.—Colebrook, Feb. 28.—Nature has caused the slaughter to pause, and the deer are having a fine time on the crust. Dogs and their allies fail to catch them. I visited Second Connecticut Lake last week; found "Tulee Tom" in happy solitude, catching beaver and otter, and anticipating what the next day's excursion along his lines would bring to hand. Logging crews have not encroached upon the game resorts about that lake, as the main operations are confined to the upper towns of Vermont. —NED NOTTON.

ENFORCING THE MAINE LAW.—Bangor, March 3, 1883.—*Editor Forest and Stream:* Warden Morse went to Dover last Tuesday to get three parties indicted before the grand jury. After attending to that agreeable little ceremony he returned to Bangor, where he is one of an invading horde of mind, and looked into the American Express office there. Thirteen saddles of venison packed in barrels and boxes rewarded his research.

TENNESSEE.—Memphis, Tenn., (March 3.—Mr. W. A. Wheatley, of Memphis, Tennessee ("Guido"), recently had a pleasant visit at home from Mr. Justin van Lencroix, of New York. One afternoon was spent at Mr. Jerry Cockrell's kennels; one over the traps with fifteen Memphis sportsmen, the guest making best score, and one day affield, four guns bagging seventy-two quail and a few snipe.

TALKING ON FIREARMS.—The drill on firearms which will go into effect July 1, is: On breech-loading guns of all kinds, 35 per cent.; on muzzle-loading guns of all kinds, 25 per cent. Duty on wads, 35 per cent.; on cartridges and cartridge shells, both metal and paper, 35 per cent.; on percussion caps, 40 per cent.; on gun materials of all kinds, 45 per cent.

MICHIGAN QUAIL.—Grand Rapids, Mich., March 2.—Birds have stood the past severe winter here unexpectedly well. Many bevies alive and well have been seen lately and no dead ones reported. —E. S. HOLMES.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

Of course, the supreme business of the hour when hooked to a fish would be to lose its charm if, during the progress of the struggle, the eye was not occasionally relieved by those visions of beauty. No, it is not all of fishing to fish. If it were the angler would not be able to claim fellowship with the long line of poets, philosophers, divines and statesmen whose names, from the time of St. Peter to the present hour, have adorned its annals.—George Dawson, "Pleasures of Angling."

POSITION AND WEIGHT.

I HAVE no fault to find with "Floridian's" reply in FOREST AND STREAM of Feb. 23, though the lofty air of injured innocence which he assumes is not warranted by the facts. I admit that the language I used in my article was strong and vigorous—it was intended to be so, for the provocation was great—but it had the merit of being at least plain and honest, and devoid of all vagueness or insinuation. I see no necessity at present to retract anything. I have said, for I think it was fully justified by "Floridian's" articles.

Let us see. He stated, without any qualification or extenuation, that: (1) The custom of placing the reel in front of the hand on bait rods is an obsolete one. (2) The mode of casting the minnow *à la* Henshall is the same as used in heavy sea-fishing for striped bass weighing from twenty-five to fifty pounds. (3) Dr. Henshall and all Southern and Western anglers believe in and use fly tackle.

Now, if (1) is not a false hypothesis, and (2) a willful assumption, and (3) a gross misrepresentation, then I am ignorant of the true meaning of these words. And then when Mr. Jordan distinctly and explicitly stated that he used a pliant eight-ounce rod, a G line, and a Meek reel No. 3 for black bass weighing from five to ten pounds, and played them a half hour each, "Floridian" hopes that he will eventually "work up" to a better and more reliable and getting more sport. I leave it to the readers of FOREST AND STREAM to characterize this portion of "Floridian's" article.

Now, when "Floridian" apologizes for the above-mentioned statements relating to Mr. Jordan, "all Southern and Western anglers" and myself, my retraction of, and apology for, the trenchant language used will be in order, and it will be done in the unfeigned cheerfulness and sincerity.

An explanation is due to Mr. Jordan in regard to his use of "half-grown bream" for bait. His use of this large bait was exceptional, they being used on one occasion only—the one referred to in his articles. He wished to secure a large bass for a specimen. A fuller account of this will be found in FOREST AND STREAM of October 19, 1882, page 230. In this article he says: "I had all the time been using medium sized minnow or small perch, and could not take all the bass wanted up to five pounds, but the Captain kept telling me to use the half-grown bream, and even the grown ones, if I wanted to catch the big bass, so I concluded to act upon his plan, etc." The small perch alluded to here were sunfish an inch or two long, and which were often the only bait we could get; and the medium-sized minnows were "top minnows" (*Zygopterus*) which rarely exceeded two and a half inches in length.

Nowhere in my book do I advise, mention or "tell of casting an ounce-and-a-half minnow," and "Floridian" and I agree perfectly when he says: "It does not suit me to throw an ounce-and-a-half minnow at a black bass, with any kind of tackle." "Floridian" says my book is "hadly defaced with advertisements in the reading portion." I say that neither my publishers nor myself have received either fee or reward for any mention made of tackle manufacturers. I used their cuts and recommended their tackle whenever I could honestly do so, solely for the guidance and benefit of my readers. And as these cuts were especially designed to portray the special features of their tools and tackle, they were the very best ones I could have used. They were not inserted in the light of advertisements, but as illustrative of the implements of angling, and I am sure my readers will not be misled by an authority on bass fishing. I should certainly be much surprised did "Floridian" entertain any other opinion of it; but after all it is merely an opinion. And he says I make a long scientific distinction between the two species of black bass, but when I come to write of taking them they are all one. And that the stupid big-mouth appears to furnish me as much sport as the quick-fishing small-mouth. Exactly so and eminently proper. To the naturalist there are two species; to the angler but one, so far as the mere matter of taking them is concerned, for the same ways and means are employed, and the two species respond in the same manner to said ways and means. In all matters pertaining to the taking of the species I use the general term black bass advisedly, for this reason.

My opinion that there is no difference in the game qualities of the two species where they inhabit the same waters, all other things being equal, has yet to be successfully controverted. Before I had much experience with both species I held the same opinion that "Floridian" does now; and when he experiments to the same extent that I have in the matter he will arrive at the same conclusion that I did; and as conclusion is a good word in this connection, I eagerly embrace it and conclude.

When he things me, however, just to agree with "Floridian" when he says my book is "hadly defaced with advertisements" I conclude his reply by saying that he "does not think the highest style of the art is *à la* Henshall." Granted; for I claim fly-fishing to be "the most legitimate, scientific and gentlemanly mode of angling." But I also claim that "next to fly-fishing, casting the minnow is the most artistic mode of angling for the black bass." J. A. HENSHALL.

CYNTHIANA, Ky., FEBRUARY, 1883.

After all that has been said on the subject, I presume all anglers will suit their own tastes. In the fashion, whether it suits their convenience or not. We fishermen, you know, like to talk of the deeds done on the water, of the fish taken and the big ones not taken—the big ones are generally lost—got snagged on the bottom or somewhere else, gone in some mysterious way, the bungling of the fishes, or other remote

cause, not a word of censure on the little pet, or as a woman would express herself, the "little duck of a rod." Of being very robust, having turned the beam at one hundred and fifty-eight pounds, consequently lacking in muscular power, I am a great admirer of a light rod, six ounces being as light as I would dare risk in my hands. I like to use it on all convenient occasions, where I know the water and the size of the inhabitants that I am about to engage in mortal strife. If the water with its natives are unknown to me, it is more reasonable to swing an eight or nine-ounce rod, for the sole reason that I go out for sport and recreation, not to be made sport of by the tiny little fishes.

Let us illustrate: Some few years ago striped bass in great numbers made an annual pilgrimage to our doors, it was one of the pleasures of our life to spend an hour, morning or evening, in their company. The six-ounce rod casting the bread (flies) upon the waters snaking out the fish, which would weigh from half a pound to one pound, was a half each. We would often get two or three fish at one cast, and sometime get one of two or three pounds weight, which I could accommodate, although it was a sore trial to the joy forever.

One evening in the early part of September, 1874, I reached the brink, got my leader wet and mudded down, and sent the flies dancing over the water. My trail fly was snatched, and as the hook was balled in the lip of the fish, and not liking the restraint, it made a good start down stream. One hundred and fifty feet below where I stood the river took a sudden bend, and when I reached the turn the fish was one hundred yards down and toward the far shore, headed for the sound, while I, with a few turns of line on the reel, dared not put on another ounce of strain. The last straw was on the camel's back. One of two things was open to me, either to part company with the fish, or take to the water, and the latter course was chosen. No doubt the fish thought I had fine sport, for after some rough usage which the fish thought a good joke, he tried to thoroughly soak his captive, and a new idea struck him. He turned in his tracks and faced up stream. Improving the opportunity, I made some line and returned to the shore, but, alas, he had hardly begun his sport, for heading for South Hadley, he soon had all the line, and was enjoying the sport of playing the angler through the strong current from one of the fish. It certainly was fun, by the time he had me, for the second time up to the artifice, he began to show signs of relenting, and wanted to come in and parley. My turn had now come and I soon had him under control, but not through any service the rod had rendered. The graceful curve was not there. There was a perceptible short bend above the hand, and from the bend out to the tip the rod was straight with the line, and when the fish, a fifteen-pound striped bass, came to the sand, my staying powers were all well. I was glad to stay in a reclining posture for some time, with all the consoling influence soaked out of pipe, tobacco, and matches. With the same tackle and a nine-ounce rod, that fish would have wiggled its way to my feet, and I would have remained dry shod and enjoyed all the sport.

Now let me tell you a short story for your own edification: Many years ago, when Joe Cabins were the fashion, and neighbors were few and far between in the State of New York, a Scot and a Hollander were the nearest neighbors and made the time pass pleasantly by their families spending the Sundays together at either house. In early summer Hans, with his family, were spending the day at Sandy's house, and while the two cronies cracked omelet and ky, the two matrons prepared the mid-day meal, cracked eggs and pressed the babies. The guide wife was preparing some lettuce, and Hans noticed the meal alternate additions of one and a winged and at dinner he could not be prevailed on to touch the salad. "No, no, mine good friend, me don't want him, you put sugar in him, make him sweet, you put vinegar in him, make him sour." Sandy tried to convince him that it was good, that it was a matter of taste. "No, no, mine good friend, you taste mit your tongue; sugar him sweet, vinegar him sour." After many ineffectual efforts to convince him, and in despair of his success, he said: "Well, I don't know whether you there have married her or not, but the Lord knows I never could have married your wife." "Xaw, yaw, mine friend, dat ish goot, how haw haw-w." The moral of this is that one man's meat is another man's poison. I am wedded to Dr. Henshall's fancy.

A few words more on the position of the reel, and I have doubt no doubt some of your readers will say Chalmers is an old fogey. Well, he is so. I prefer being an old fogey, with something substantial to hold on to, than have a well-fangled, unreliable something to be a source of trouble. I have said that I am not very robust. I cannot hold an outstretched arm with a copper cent on the palm for any length of time. How, then, can I hold the rod out with the left hand and manipulate the reel with my right hand, and a one-pound fish tugging at the far end of the line? I have tried it and have seen it tried.

"Oh, wad some power the giftie gillie gus
To see ourselves again as we see us,
It wad frae me ane a blunder tree us,
And foolish notion."

I have seen the tip of the rod oftener under than above the water, and the rod in a continued angle. I have seen the corker for any or all twisted body of the rod under the water with the reel behind the back, and the hand twisted round clutching for the crank, which could not be found. I have also seen the unexpressed thought: but of course there was no thought of the position of the reel; it was that the consummate fish would not keep still. Mr. Jordan decidedly showed common sense in placing the reel above the hand. With the reel above the hand on any rod, I am better prepared for any or all twisted body of the fish and fishing. Now fifty years since Mr. Jordan's fancy and I were wed, and we are this year celebrating our golden wedding. During that fifty years there has been but one jar in the happy union. When Miss Back-of-the-hand stepped on the stage with her allurements and apparently bewitching smiles, we forgot ourselves and decided the old love for the new flirt for a short season. Soon (trifling of the change, ere was too late repentance) we saw, as we like the proverbial saying, we returned to our old home and our old love, where sport and pleasure in its truest sense extended the hand of thrice welcome to THOMAS CHALMERS.

P. S.—This is as you please and is everybody's business. I have a light rod mounted for the reel behind the hand; it is kept only for show. C.
HOLYOKE, MASS., MARCH 5, 1883.

MAINE FISH LAWS.

A NEW and stringent law for the protection of fish and game has just been passed in Maine. The first section provides that no fish shall be taken in any of the waters of the State, except tide waters, with any net, seep, weir or trap, under a penalty of \$50 for the offense and \$10 for every salmon or land-locked salmon so taken or caught. This provision is designed to prevent the wholesale destruction of salmon with nets.

The second section prohibits the taking or killing of any land-locked salmon of less than nine inches in length, or of any trout of less than five inches in length, and it makes the penalty \$5 for the offence and fifty cents for every trout or land-locked salmon taken of less than the above dimensions. Possession of any fish less than the prescribed dimensions will be deemed evidence of having taken them. This we hope will have a good effect upon trout hogs and unthinking persons who do not realize the fact that small fish will grow to be large ones and should not be wantonly destroyed. If this law is enforced it may stop the sport of the small boys for a year or more, but will give them much better game in the end, for the small boy, if not a trout hog, is an unthinking person.

The trout law is especially provided for in a clause which punishes the taking or having in possession of more than fifty pounds of trout or land-locked salmon, or both, together. The new law makes the penalty \$5 for every pound in excess of fifty, and \$50 for the offense. It also forbids the transportation of over fifty pounds in weight of those fish, and makes them liable to seizure on complaint, and the fish to go to the person making the complaint. This phase of the law will be of great value to the best trout waters in Maine, and a source of much aggravation to those sportsmen hunters who are not satisfied with the reasonable number of trout, and those who catch trout for the markets. Now let it be enforced.

MICHIGAN FISHING RESORTS.

YOUR correspondent "Prairie Dog's" experience in Northern Michigan is much the same as mine upon the occasion of my first trip there, when I listed the Boardman and about the same success that he did the Rapid River; and I returned home heartily disgusted with the arrangements as detailed in "Tourists' Guide."

But I went again the next year to Charlevoix, eighteen miles south from Petosky, which is away from the railroad and less frequented. There I found most excellent trout fishing in the streams tributary to Pine Lake, specially the Jordan River. If "Prairie Dog" would go there about June first he would be able to catch all the trout he wants and would also meet with fair success fly-fishing and be entirely free from mosquitoes.

Worms are generally used with much better success than flies. Most of the streams do not afford the necessary room for casting. There are also several small lakes south from Charlevoix, where the finest kind of bass fishing may be had. I have caught over sixty pounds of bass in an afternoon, the smallest fish weighing two and a quarter pounds, and I am now an ardent advocate of the healthful climate and splendid fishing to be had in Northern Michigan.

But I pray don't consult railroad guides and landlads, for where the road runs and (about ten miles from where) the hotel stands are always the best places according to their advice, which invariably is wrong. It is useless to add that there are always horses at your command if you pay about three prices for them. G. H. W.

KALA AZADE, Mich.

THE LAND-LOCKED SALMON.

WE print, by permission, the following extract from a private letter written by Gen. R. U. Sherman, of the New York Fish Commission, in which he refers to the recent article on the land-locked salmon which appeared in our columns from the pen of Mr. Charles G. Atkins. He says: "Probably Mr. Atkins has read as much practical observation of the habits of the fish as I have in this country. His statement that their habit is to go down stream to spawn instead of up, as other salmon do, is confirmed by what occurred at Woodhull Lake last fall. From appearances the whole stock went out of Woodhull dam through the open gates and gathered in the stream below to spawn. They could not get back to the lake, as the water falls periodically three or four feet from the outlet of the flume into the stream below. So the whole family will probably take up quarters for the next season in Sand Lake, a mile or more below. But if they get working down in this way they will eventually get into Lake Ontario, and I don't know why this will not be a good place for them. It has been contended, I believe, by some that the salmon which formerly ran up the streams from Lake Ontario did not come up from the sea, but had their habitat in that lake. It may be that the land-locked salmon ran down and out of Woodhull Lake because there are no suitable streams to run up; the inlets of that lake being too small, and at the spawning time, too low to be available."

BIBLIOTHECA PISCATORIA.

SEVERAL years have elapsed since we first announced that a new edition of this work was being carefully prepared by Mr. Thomas Satchell, and now that we have the volume before us we realize the immense labor required to finish it. The book is a full octavo of 397 pages, and as a book of reference to those who are interested in angling literature it is invaluable. We have looked through the volume and find that the American books on the subject are all there, and conclude from the number of titles that other countries have been as fairly represented.

In our issue of April 27, 1892, will be found a full list of the different editions of Walton's "Compleat Angler," which was printed from the advance sheets of this work, and which now appears in the appendix as a "skelton chronicle of the life and times of the author," with editions and reprints, with dissimilar imprints of Isaac Walton's "Compleat Angler" enumerated in this work, a full account of which is given in the body of the volume.

Not only are books on angling and fisheries recorded with their full titles, both under their titles and their authors' names, but catalogues are also included, as well as all papers and periodicals which treat of angling, and many writers of

note on the subjects are also given place, even though they have never written a book or published an octavo book. The painstaking character of the author is visible all through it, and it is evident that it has been a labor of love to him. He has gone through the great collection of the British Museum and many private collections and gathered much from well-informed correspondents in foreign countries.

There are 8,158 editions of 2,148 distinct works registered. The titles and authors of them are given from a personal examination, and others are inserted on the authority of correspondents. The sales of such a work of reference can never compensate the compiler, and the consciousness of having his labors appreciated by those to whom they will be useful will be his only reward.

A limited edition has been printed, two hundred of which will have the sale of them here and there. The price, when we learn these facts we will publish them. The price in England is fifteen shillings bound or thirteen shillings unbound. This, with duties, will probably bring the price of the bound volume near five dollars. It is well worth it.

THE SAWFISH.—At the meeting of the Boston Society of Natural History on Jan. 3, Dr. S. Kneeland spoke of the use of the saw of the sawfish, which we do not remember to have heard suggested before. In presenting the beak of a sawfish (*Pristigaster*) from the Lakes of Bay, Philippine Islands, Dr. Kneeland suggested a use for this toothed projection. In this sawfish thirty-three inches long, which seems more reasonable than the ones usually given; viz., that it is an instrument for more or less horizontal insertion in the mud or sand of shallow waters, which, by a vigorous sweep of the long upper-labeled, shark-like tail, is quickly pulled out for a sawfish. The lateral teeth are sharp-edged in front for easy insertion, but converge behind to offer resistance, and more thoroughly slip up for bottom; this action is doubtless accompanied by a series of short horizontal movements of the anterior part of the body. The mouth is small, underneath, with pavement-like teeth, as in the rays, adapted for crushing the mollusks, crustaceans, and hard-shelled creatures on which it feeds. He thinks the stories of its attacking and opening the smaller cetaceans are errors of observation, arising from confounding the sawfish with the swordfish (*Xiphias*); neither its weapon, its mouth, its teeth, its habitat, nor its habits, can be reconciled with the active carnivorous propensities ordinarily ascribed to it. Ray-like, it is a bottom feeder, with crushing and not tearing teeth; the snout is too blunt for piercing, and its lateral teeth would be an impediment rather than an advantage.

PUGET SOUND.—Seattle, Washington Territory.—The waters of the Sound abound with all kinds of salt water fish, including myriads of salmon, and our streams are full of trout. Look for the advertisement of a party to visit this "sportsman's paradise" upon the establishment of a railroad communication with the East, which will take place upon the completion of the Northern Pacific Railroad in July next. Sportsmen visiting the National Park can then, by a small expenditure of time and money, extend their travels to Puget Sound, and I can guarantee that they will be amply repaid for such expenditure, both by the scenery and the opportunities for hunting and fishing afforded them. In common with all sportsmen I am very much pleased with the determined stand taken by the FOREST AND STREAM in the National Park, and I am glad to see that the good work done by the paper.—ALKI.

FISHES OF OHIO.—Prof. D. S. Jordan has an article of 268 pages in the Report of the Geological Survey of Ohio, vol. IV, published by the State of Ohio, by Messrs. J. C. Columbus, 1892. In this is given a brief survey of the earlier publications treating wholly or chiefly of the local fish fauna. A table of four lists of fishes as classified by Rafinesque, 1820; Kirrhland, 1840-'46; Gunther, 1859-'70; and Jordan, 1879, are given so that the identity of species named by each can be determined at a glance. This is followed by tables of the distributions of fishes in Ohio, terms used in the descriptions, and then by the fishes with their systematic and popular names, with complete descriptions of them. It is a valuable contribution to ichthyology, which already owes so much to Prof. Jordan.

BAIT PRESERVATIVE.—Mr. W. Thomas writes to the London *Fishing Gazette*: "I send you by post a sprat that I have kept in my solution for more than a month. You will observe it is as tough and as bright as when taken from the fishmonger's shop. In addition I will guarantee it keeps in this state for years. My solution is made by the addition of half an ounce of boric acid to every ten ounces of glycerine. Probably half the quantity of boric acid would answer as well."

Camp Fire Flickerings.

"That reminds me."

I HAD been out hunting with George Waters in one of the best deer ranges in Colorado for over a week, and had not killed a deer, though I had lots of good shots, while he had almost loaded the wagon. One morning at day break George wanted to know where I was going, and I declared that I was disgusted and going home.

He said, "You get breakfast and feed and harness the horses, I will go for the deer I killed last evening. When I get back we will eat and both go home." I assented, and in about an hour Waters came back to camp with two deer.

"Where did you get the other deer, George?"

"I shot her over on a point near where I had the other hunt up by; by the way, there was a curious circumstance. While I was going down the cañon I saw this big doe and two yearlings come out on a point. One of the yearlings saw me and said, 'Oh! mother, there is a man.' 'You need not be afraid of him,' responded his mother, 'it is Dick, and he cannot hit the side of a barn.' 'No,' persisted the little buck, 'I think it is someone else.' The old doe looked again, and shrieked, while she trembled with fear. 'Run, children, for your lives! He is a man! He is a man!' It was of no use, I killed her before she had gone ten yards."

I grunted, and didn't pay much attention to him, but he relished his old lashed up and warned over tale so much that he told it a dozen times when he got me in a crowd, and the fools always laughed. W. J. D.

WHITEFISH FOR LAKE ONTARIO.

THE Rochester, N. Y., *Herald* of March 2 gives the following account of the shipment of three million whitefish for Lake Ontario, by the Ontario Fish Commission, and also a description of the transportation car:

Yesterday afternoon the second Atlantic express pulled into the terminal depot with one of the two cars belonging to the U. S. Fish Commission, which was being loaded by the *Herald* reporter found it to be in charge of Mr. F. E. Ellis, who willingly answered the numerous questions asked. The car, called States Hatchery at Northville, Michigan, contained five million of young whitefish, which Mr. Ellis intends to plant near Oswego in Lake Ontario. The car in which the fish are transported is worthy of a brief description. It is of the same length as an ordinary freight car, and was built at the shops of the Buffalo and Ohio road at a cost of nearly \$10,000. The interior is finished throughout in ash. At the end of the car is a range with all the necessary cooking utensils, as the inmates live in the car throughout the year. Through the center of the car on either side of the aisle is a row of lockers, in which are the large tubs containing the young fish. The water in these cans is changed every few hours from tanks at either end of the car, which are in turn supplied with fresh water from a large reservoir containing a reserve supply. These tanks are filled by a force pump worked by power obtained from the wheels beneath the car. The forward end of the car is neatly fitted with an office, bathroom and bedroom for the use of Mr. Ellis. Four berths for his family are located in the rear of the car. All the space in the car is utilized and it is truly a triumph of railroad architecture. Mr. Ellis has as his assistant, Mr. Newton Simons, Mr. C. W. H. Ellis, John Horan and Hobart Chamber, besides a cook. The fish can be packed in other cars similar in all respects to the one mentioned, which is now on the Pacific coast. Mr. Ellis said that he had taken another car load of four millions of whitefish to Oswego next week through the home. Waterbury and Genesee road, provided the bridge at Newfane is completed by the end of the year. Superintendent Van Horn gives the Commission free transportation over his road. Two weeks ago the car was in the hands of the Ontario Fish Commission and its carboys with fish. Mr. Ellis said the whitefish season in the last year was longer, after which he will begin the transportation of young shad. The Government has recently established a new fish hatchery at Alpena, Michigan, which is proving a success and there are other hatcheries being established in other parts of the great amount of business the Commission is thinking of building another car which will be superior even to those now in use.

THE MENHADEN QUESTION.

THE question whether the striped bass feeds upon the menhaden at all, or to any extent, is one that has arisen since the discussion of the effect upon our sea fisheries of the system of taking menhaden for oil by means of purse nets. We are glad to see that the *Herald* has published an article by a prominent manufacturer of menhaden oil and gear.

TIVERTON, R. I., Jan. 22, 1898.

DEAR SIR:—We send you by this mail an article in regard to the menhaden fishery, and its assumed connection with the striped bass. We are glad to see you publish it, for our opponents, we notice, have access to your columns. Your sporting patrons ought to know that bass don't hanker after salt bait, and if you will read Capt. Mosher's suggestion, you will see there is a sure and cheap way to procure it.

The article referred to is a fourteen-page pamphlet, entitled "The Menhaden Question," from the press of J. H. Franklin & Co., Fall River, Mass. In order to give the oil men a fair hearing, it is published in pamphlet form. It says:

"The article is manifestly a gross and unscientific attack in regard to the problem of the movements and multiplication of menhaden, along the American coast. This fish is one of the most numerous of the many useful fishes that inhabit the Atlantic coast, and its population is so large that the dependence of the striped bass, or the so-called rock fish of the Virginia waters. The latter fish is a great favorite among anglers, and has been found to be rather scarce the past season. The fishing of the menhaden, as it is done, is a very risky shore of Rhode Island and Massachusetts, finding their chief dependence for profitable amusement gone, or at least, unreliable, have cast about for reasons or causes for the lack of success, and have concluded that the menhaden was the result of steamer fishing for the menhaden, on which they assumed that the bass feed. This rash and hasty conclusion has been adopted assiduously by a writer in the New York *Herald*, and in the *Norfolk* and *Providence* papers, and has been mentioned boldly advocating the theory. As an offset to the assertions or assertion of said writer the parties interested in the menhaden fishery have procured the affidavit of (Gideon) Mosher, an old fisherman and expert in the menhaden fishery, who has devoted his time and attention to catching the striped bass for many years for market and studying its habits, in which he emphatically states that striped bass do not feed upon the menhaden, but on certain species of insects. Mr. Mosher's opinion or rather statement of facts in this connection is a great deal more reliable than theory or assertion with no facts for its basis, and doubtless will be corroborated by many old and skilled fishermen.

It is great difficulty in dealing with this problem is the want of definite and extended knowledge of the habits of all deep sea fishes, as the wide expanse of the ocean forbids a minute research, without an immense period of time. What is known has been gathered by the long experience and observation of fishermen, and an energetic and sagacious man, who has devoted his time and attention to catching the striped bass for many years for market and studying its habits, in which he emphatically states that striped bass do not feed upon the menhaden, but on certain species of insects. Mr. Mosher's opinion or rather statement of facts in this connection is a great deal more reliable than theory or assertion with no facts for its basis, and doubtless will be corroborated by many old and skilled fishermen. It is great difficulty in dealing with this problem is the want of definite and extended knowledge of the habits of all deep sea fishes, as the wide expanse of the ocean forbids a minute research, without an immense period of time. What is known has been gathered by the long experience and observation of fishermen, and an energetic and sagacious man, who has devoted his time and attention to catching the striped bass for many years for market and studying its habits, in which he emphatically states that striped bass do not feed upon the menhaden, but on certain species of insects. Mr. Mosher's opinion or rather statement of facts in this connection is a great deal more reliable than theory or assertion with no facts for its basis, and doubtless will be corroborated by many old and skilled fishermen.

The irritation against steamer fishing, evident in the arguments put forth, is wholly baseless and unreasonable. What effect on the habits of fishes can the floating around on illumined spaces of water, or on four or five hundred tons of steamers and sail vessels have? If they can scare the menhaden from their haunts, why not the codfish and mackerel, or any other of our coast fishes? Why do not the multitude of

TALLMAN.
MISS M. L. ROESSEL'S ORANGE AND WHITE ENGLISH SETTER DOG "COSSACK."
Winner of First Prize in Open Class for English Setters, Washington, 1883.

huge ocean steamers scare all the fish out of their course between America and Europe? Who has any evidence that the denizens of the great deep have any fear or respect for the floating craft on the surface?

If the argument is that by steamer fishing the menhaden are caught so rapidly that they are reduced so much in number as to show a lamentable decrease, the folly of such a position is evident at once, when it is known that very rarely, if ever, is a fish caught with spawn, and further, who does not know that the multiplication of these and other fish is too rapid for any manifest depletion by human agency. The spawn of the menhaden produces 150,000 living fish, and Professor Baird estimates that 1,300,000,000,000 fish are consumed by the bluefish alone in a period of four months of summer and autumn along the New England coast. And yet who notes any diminution of the quantities of fish? That billions of menhaden are digested by voracious fish is undisputed. Every voracious swimmer feeds upon them. Whales and dolphins feast upon them by the thousand; sharks do full duty in destroying them, one hundred having been found at once in a shark's stomach, and the tunny makes horrible havoc, not only killing for food but destroying for pleasure. The pollock, the whiting, the garfish, bluefish and bonito—in fact every carnivorous corsair that swims in our coast waters, from Casco Bay to Brazil, gorges itself with the menhaden, and yet the accidental scarcity just now is attributed to the terrible fact that man takes from the ocean waters some eight hundred to nine hundred millions annually of these fish. In 1878 the menhaden oil and guano industry employed 64 steamers, 279 sailing vessels, 3,257 men and a capital of \$2,550,000, and took and consumed 77,000,000 fish. Now allowing Prof. Baird to be within ten miles of the truth in his estimate of the destructiveness of the bluefish, the above number caught by the menhaden fishermen is not a drop in the bucket of what is destroyed. Moreover it is well known to all intelligent men that a free and full catch of fish, especially those hugging the shore, tends rather to their increase than extermination. Whoever studies the science of ichthyology and the business of fishing in the open sea will not dispute this position.

To sum up our brief statement we aver:

1. That striped bass do not feed on menhaden.
2. That the habits of menhaden are not fully understood.
3. That catching menhaden does not visibly diminish their number.
4. That steamer fishing does not scare them.
5. That the number caught by men is of no perceptible amount in the vast multitude destroyed by voracious fishes.
6. And, lastly, that attempt to connect the small number of menhaden with a diminished supply of striped bass is wholly illogical and unworthy of scientific discussion.

STATE OF RHODE ISLAND, ETC.)
NEWPORT, R. I.

I, H. KNOWLTON, on this twenty-sixth of December, A. D., eighteen hundred and eighty-two, before me, a notary public, duly commissioned and sworn, residing in Tiverton, in said county and State, personally appeared Gideon Mosher of said Tiverton, and being sworn according to law, testified as follows:

How long have you been engaged in the bass fishery? Ans. Forty-five years.

From whom your observation do bass feed upon? Ans. Crabs and lobsters.

From your observation do bass feed upon live menhaden? Ans. They do not.

Have you been in the habit of preparing bass for market? Ans. That was part of my business for three years or more, and I have prepared tens of thousands of bass for market, but I have never found any menhaden in them, except what had been fed to them for bait.

How long a range of coast does your experience cover in taking and observing bass? Ans. My experience goes from Monomoy to Evertall. My observation goes from Baitmore to Cape Cod. I have found the bass the most numerous in Chesapeake Bay, which I attribute to the great quantity of crabs that are found in that bay. I have always observed that bass fishing was best when lobsters and crabs were most plentiful.

Where has been your principal locality in taking bass? Ans. West Island, Rhode Island.

How many years before the West Island Club was formed were you located there? Ans. About thirty years.

What has been your experience as to the plentifulness and scarcity of the bass? Ans. When there is plenty of food (lobsters and crabs) there is generally plenty of bass. If food is scarce, bass are scarce.

Do you think the absence or presence of menhaden on this coast affects the bass fishery? Ans. No, except in the difference it makes to the catch by leaving or not leaving fresh bait.

What has been your experience in regard to bass bait? Ans. You cannot catch bass with stale bait.

Do you think menhaden taken in the vicinity of Sandy Hook carried to a factory and from there transhipped, are likely after arrival here to be fit for bait? Ans. No, sir.

Providing the menhaden in 1883 are as far from this coast as they were in 1882, how would you proceed to get fresh bait? Ans. I should put an experienced man on board a menhaden fishing steamer and ice them alive. The bank fishermen treat them in that way and preserve them in a fit condition for bait for a month.

Is the bass a rover of the sea or shore fish? Ans. He is both a shore and bottom fish.

Have you ever been engaged in the menhaden fishery? Ans. Yes.

What is your observation and experience as regards bass and menhaden? Ans. I never observed or heard of bass feeding on or troubling menhaden. My business has brought me in contact with many of the most successful menhaden fishermen, and have never heard of but two bass being taken in a purse seine.

Subscribed and sworn to before me, the said George N. Durfee, notary public as aforesaid, the day and year first above written.

GEORGE N. DUREE, Notary Public.

We, the undersigned, indorse Gideon Mosher's statement in full.

Bass Fishers of Newport, R. I.

GERMAN TROUT IN AMERICA.—The North German Lloyd steamer Werra, which arrived on February 24, brought 80,000 eggs of two kinds of German trout. They were sent at the request of Professor Baird, and came in care of Mr. E. G. Blackford, consigned to Mr. Fred Mather, superintendent of the New York Fish Commission hatching station at Cold Spring Harbor, Long Island. One lot of 60,000 is described as enormous trout, the upper Rhine (Baden), and the other 20,000 is called "that delicious but very small mountain trout of Baden highly esteemed by epicures." We have at present no further information concerning these fish, and think it possible that the larger one may be the common brook trout of Europe, *Salmo fario*. Whether the small one is a distinct species or only a variety we cannot say at present. The eggs came in good order, and were presented by that enthusiastic promoter of fish-culture, Herr von Behr, president of the Deutschen Fischerei Verein, from the ponds of Oberbürgermeister Schuster, in Freiburg, Baden. We shall look anxiously to see how these fish thrive in this country, and also to test their merits.

CARP IN WASHINGTON TERRITORY.—Seattle, W. T., Feb. 16.—We are about to try the experiment of carp culture in this Territory, three cans of the fry having been received at Fort Townsend, and one at this place. They traveled all the way from the East in small tin pails, and seem to be none the worse for their long trip, as they are very lively and strong. As they are small, being only about two inches in length, they will for the present be placed in a shallow pond near town, and should they thrive and increase, will afterward be placed in Lake Union, a lake about a mile from town, three miles in length, which is at present inhabited only by trout and a kind of fish which we call chubs, although I think they are not the chub proper. I am not very much interested in the result of the experiment, as the carp, as I understand it, is of value only as a food fish, having no gamy qualities, and we are abundantly supplied with fish of all kinds for food.—ALB.

The Kennel.
FIXTURES.
BENCH SHOWS.

March 20, 27 and 28, 1883.—Dominion of Canada Kennel Club Bench Show, at Ottawa, Canada. Entries close March 12. Charles Lincoln, Superintendent, Perth, Ont.

April 3, 4 and 5, 1883. Western Pennsylvania Poultry Society's Eleventh Annual Bench Show, Pittsburgh, Pa. Entries close March 19. Chas. Lincoln, Superintendent, C. B. Elbert, Secretary.

May 8, 9, 10 and 11, 1883.—Westminster Kennel Club, Seventh Annual Bench Show, Madison Square Garden, New York City. Entries close April 13. Chas. Lincoln, Sup't.

FIELD TRIALS.

November 19, 1883.—Eastern Field Trials Club, Fifth Annual Trials, at High Point, N. C. Entries for the Derby close July 1. W. A. Coster, Secretary, Flatbush, N. Y.

December, 1883.—National American Kennel Club, Fifth Annual Trials, at Grand Junction, Tenn. D. Tryson, Secretary, Memphis, Tenn.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

BEAUFORT AND COSSACK.

WE give this week cuts of the pointer dog Beaufort, owned by Mr. C. H. Nixon, Leesburg, Va., and of the English setter dog Cossack, owned by Miss M. L. Roessle, Washington, D. C. Both dogs won first in their classes at Washington. Beaufort is a fine, large, upstanding dog of great beauty, and one of the best Bench Show pointers that we have seen in a long time. His owner informs us that he is also a capital dog in the field, and that he will run in the Trials next fall. He is liver and white ticked. He is three years old, and is by champion Bow out of Beulah, who is litter sister to Mr. Orgill's champion Rush.

Cossack is also an animal of rare beauty of form with a splendid coat and feather. He comes honestly by his good points, his sire being Mr. Theodore Morford's Don and his dam Mr. Chas. H. Raymond's Fairy. He is nearly white, with orange markings. He is just in his prime, being nearly four years old. The cuts are from sketches by Harry Tallman.

BEAGLE JUDGING AT WASHINGTON.—Philadelphia, Pa.—*Editor Forest and Stream:* I wish to criticize the judging of beagle hounds at the late Washington bench show, and think I have just cause for so doing, for, as I understand, one of the principal objects of a bench show is the bringing together of the different varieties of the best dogs in competition, and to have a dog win alone on its merits, by honest judgment, with a judge (who ought to know) what he is to judge by and for, I felt secure in making my entry for the show, that the gentlemen who had gone to the trouble and expense of getting it up would have had a competent judge, one who would have known the points necessary for a dog to win; such I find, however, has not been the case, and had I been present just after the judging of the class (I entered) I would have entered my protest, but not getting to the show until the next day, I was informed I was too late and was not allowed to enter it then, so I requested to be introduced to the judge, and had, for the first time, the pleasure of meeting Mr. C. H. Mason. When after a few moments' conversation I asked him (as an exhibitor I had a right to do) if he would be kind enough to show me the difference in value by points of the winners over me and also to show where my dog was deficient, by so doing he would greatly oblige me, he said, "Mr. A., I know nothing about beagles, I have made a mess of it and will let the next day, I was informed I was too late and was not allowed to enter it then, so I requested to be introduced to the judge, and had, for the first time, the pleasure of meeting Mr. C. H. Mason. When after a few moments' conversation I asked him (as an exhibitor I had a right to do) if he would be kind enough to show me the difference in value by points of the winners over me and also to show where my dog was deficient, by so doing he would greatly oblige me, he said, "Mr. A., I know nothing about beagles, I have made a mess of it and will let the next day, I was informed I was too late and was not allowed to enter it then, so I requested to be introduced to the judge, and had, for the first time, the pleasure of meeting Mr. C. H. Mason. H. Mason. When after a few moments' conversation I asked him (as an exhibitor I had a right to do) if he would be kind enough to show me the difference in value by points of the winners over me

MR. C. H. NIXON'S LIVER AND WHITE TICKED POINTER DOG "BEAUFORT."

Winner of First Prize in Open Pointer Class, Washington, 1883.

THE GREYHOUND.

Editor Forest and Stream:

The attention of American sporting gentlemen has for many years been directed to the improvement in the breeding of pointers, setters and other game-seeking dogs. These game-seeking dogs are the sportsman's aid and companion over many a weary tramp in search of feathered game. But every gentleman does not use a gun or have the privilege of sporting preserves or good game country. With these few remarks I would respectfully introduce to the American sportsman, whether the "crack shot" or the "just for fun," the well-known but little used English coursing greyhound. This grand breed of dog, whose vocation, like that of the bloodhound, is not yet gone, and whose antiquity is such that, long before the signing of Magna Charta, his destruction was looked upon as an act "equally criminal with the murder of a fellow man," claims your patronage. For many years the kennels of our sportsmen and the benches of our shows have shown but few specimens of this "flying course." But there would seem a time not far distant when greyhound coursing will rank as one of the gentlemanly sports of America.

To the true sportsman the race-course has always had something "fast" or degrading in its associations. Every gentleman cannot keep his racing stable and its expensive equipment, but every American sporting gentleman can, upon a far more economical, respectable and high-toned basis, maintain his brace of coursing greyhounds at a mere nominal cost.

In 1591, England's queen, from the turret of the castle, witnessed these fleet dogs in their coursing, and to this day the grand coursing meets of England are as well known as the celebrated Derby, Oaks or Goodwood Cup. And the names of Donald, Misterton, Contango, Judge, Buccauer and hundreds of others who have carried their noble owners' colors to the fore on many a "pumping course," are as celebrated as are the winners of the racing calendar.

The greyhound runs or courses only by sight, and as we have plenty of fine, level tracks in close proximity to our large cities, coursing, as a gentlemanly sport, can be readily introduced. The English hare is not difficult to procure, and in de'te "Jack-rabbit" of the West, a "shoot in himself," will give us any good greyhound all the running he can wish and bring out his points of endurance and fleetness.

As a fancier of greyhounds I would say that freshly imported stock does not do well in this country until they have become accustomed to our climatic changes, but they are easily acclimated and become hardy, easily kept and perform well. We have in the many greyhounds now shown at our bench shows, the opportunity of introducing greyhound coursing as a gentlemanly sport.

Let us endeavor to raise our greyhound standard still higher, and let this noble and neglected dog come in for a share of sporting honors. And may the day soon come when the coursing meets of America will have their share of attention and thousands be clamored in seeing the greyhound "well shipped," watch closely the "turn," the chase, the "go by" and the "kill." Then the coursing cup of the Westminster or some other club will have its regular patrons, and its possession as eagerly sought for as the champion medals of the bench shows circuit.

BUCKINGHAM, Pa.

PITTSBURGH DOG SHOW.—In explanation of my name appearing in the Pittsburgh premium list as judge of certain classes, I would state that I received a letter dated February 3, requesting me to act in the classes I had passed upon last year. I replied as early as possible that I felt it was impossible for me to absent myself from business and respond to their kind invitation. There I presumed the matter rested, as I had no reply, but on February 17 I had a visit from Mr. Elben, who handed me a premium list on which my name appeared. I then stated that I would reconsider the possibility of my accepting the honor thus thrust upon me. However, I found it impossible to do so, and I so informed Mr.

Elben on March 1. I very much regret that I could not oblige the Pittsburgh committee in return for their last year's kindness.—JAS. WATSON.

THE RED IRISH SETTER.

Editor Forest and Stream:

In your journal of the 11th ult. I read with deep interest a letter on "Dogs and Trials," by "Pious Jeems," and owing to a statement of his, which I consider a libel on the Irish red setter, I feel constrained to ask you for space to say a few words in defense of my favorite.

I am not, of course, in a position to dispute the assertions, "That in his experience the Irish always were a failure at field trials," but the impression it has made on my mind is that, his experience of Irish setters must have been very limited indeed, or he could not possibly have so maligned the finest breed of sporting dogs in all the world. No doubt long ere this some friend of the Irishman has come to the rescue. I know one at least who knows and appreciates his worth and who will be quite ready to break a lance on his behalf. I allude to the well-known "Mont Clare," who, as I am aware, has a few good ones in his kennels, field trial winners, too, and if "Pious Jeems" has not seen them the sooner he does the better. But "Pious Jeems" adds further, "That with the exception of the Campbell strain of red Irish, etc., he knows no good ones." There is something very wrong here. Either the change of air to the other side of the Atlantic has caused the race to degenerate very rapidly or the specimens which came under "Pious Jeems's" observation were of that class so many of which are bred for the market nowadays, weedy, snipe mongers of the first water, utterly unlike, save in color, the pure bred, handsome and dashing Irish setter. That numbers of this class of so-called Irish setters do cross the Atlantic I have had abundant proof, having seen many of them shipped at Queenstown during a residence of some years there. That they could not be the same animal about which "Istone," "Stonchonge," "O.I.," and hosts of well-known sportsmen have written, is, however, certain, for the former, a well-known authority on the subject, says, "That he had seen and known a good many Irish setters and he candidly confesses that he never knew or heard of a bad one;" but this most wonderful "Llewellyn," whence does he trace his descent? From the Laverack, "whose crowning glory" it is, says "Pious Jeems." And does he not know by this time that the Laverack has Irish blood in his veins and that to this fact, beyond a doubt, he is indebted for some of his best and finest qualities? I notice that "Vitus" in your journal, in alluding to the fact that the Irish are so much crossed with other breeds and the produce entered as a pure breed of either one country or the other gives this as the cause why the Irish setter has dropped to the low standard he holds in America, but it seems to me that there is a further cause and it is this: That your countrymen spare no expense in procuring the very best Laveracks or Llewellyns from this country. They are the rage at present, and I do not for a moment attempt to deny their excellence, but I do most emphatically deny that for style, pace, nose or stamina they exceed the merry Irish red, he being the oldest and purest setter, has been used for the purpose of giving backbone to some breeds and forming others, with what good results is well known, whereas, if any part of the time, care and money lavished on other breeds had been spent in improving him, sportsmen would be in possession of a setter, in color, gait, and in a form a model of grace and beauty, and in all the qualities necessary in a sporting dog, holding a position second to none in the world. I need scarcely say that I am an ardent lover of the breed, and I have bred some good ones in my time, the celebrated Plunket to wit. For some years past the exigencies of the service to which I have the honor to belong have, however, prevented me from doing more than merely preserving the grand old breed, but I cherish the hope of being able at no distant date to prove that my favorite is worthy the faith I have in him.

ROBT. O'CALLAHAN, R. N., Chaplain H. M. S. Hector. NETLEY, Southampton, Eng., Feb. 3, 1883.

IN RE BEAGLES ET AL.

... their heads are hung
With ears that sweep away the morning dew;
Slow in pursuit, but match'd in mouth like bells,
Each under each.

—Midsommer Night's Dream.

WHEN such a genial gentleman and evident lover of hounds as "Dorkin" is calls for my "idea of a dog," I am constrained to make a brief hiatus in my papers on angling and write a few words upon the "little hound," yclept the beagle, as by "dog" I infer that that particular breed is meant. "Dorkin" however, must parlova me if I decline to give, in *imitating* my best ideal of a beagle, for a person's ideal of any thing, animate or inanimate, is his own picture of perfection, and as one man differs in many ways from another so does his ideal. This is evident and need not have been expressed, but pens and hounds will "run riot" sometime.

I claim to be no judge of dogs, of any breed, but I love and admire them—yes! I respect them, and always like to have one near me. I very seldom use one in the field to shoot over, for I very seldom shoot, being a lover of the angle rather than of the gun. Of all sporting dogs I prefer the beagle because he is petite, pretty, companionable and affectionate, and furthermore, because he is of ancient lineage and can boast of royal patronage. Of course there must be a standard of excellence, and I have no doubt that if "Dorkin" and I could agree on one, we could soon make a short pilgrimage to the kennel of a common friend and find more than one beagle to fill his requirements. With Kingwood, Elmore's celebrated stud dog, and with some whelps of his "get" I have the privilege to be acquainted, as also with King, Lucy, Music, the imported "basket" bitch, and others of "that ilk."

Now, I venture to join with "Dorkin" in the hope that the consulted judges at bench shows may fully know what they are expected to judge, and that such an honest standard of pure beagles may be adopted as shall be beyond all cavil. Will "Dorkin" clasp hands with me over the above? The beagle is an "interesting" dog, either in the field, "a hunting of the hare," or as a gentleman's pet and companion, and is bound to come "to the fore" as a favorite.

"Every dog has his day," and as "history repeats itself," so doth the fashionable fancy for different breeds. I am as one with "Dorkin" in his demand for pure blood, for I believe in "blood" thoroughly. It is "thicker than water," and whether flowing in the veins of man or beast it should have no taint. There are too many mongrels (both bipedal and quadrupedal) in the world now, and a bit of advice to all may be summed in one word, "Ware!" and I repeat it, "Ware!" Intelligent and judicious breeding and honest judging will give us a race of dogs to be proud of, and very low in the scale of humanity is the soul who is not proud of a fine-bred dog. There are such, but I always feel like giving a "cautionary signal" when I see them—they are the stoats and "other vermin" in the social economy and should be "run to earth" and effectually "stopped."

My dear "Dorkin," do you catch my "idea" of a beagle? When I go for my next puppy to friend Elmore's kennel, I will give you an "object lesson" if you are "to the fore." Shakespeare knew a good hound and I doubt not he had a beagle, or pack of them, in mind when he wrote what I have used the caption of this paper.

"Good Queen Bess" was an ardent lover of the beagle and especially of the "basket" breed of which she had some very tiny and perfect specimens. I hold the FOREST AND STREAM to a "long syne" promise to give an article on the beagle, and join with you in wishing well to the breed and breeders. Au revoir.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR, 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, MARCH 15, 1883.

VOL. XX.—No. 7.
Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newscasters throughout the United States and Canada, on sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Sampson Low, Marston, Searle and Rivington, 288 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

THE PARK LEASES.

THE Secretary of the Interior has leased to the Yellowstone Park Improvement Company a portion of the National Park. The lease executed covers seven different plots in various portions of the region, which aggregate ten acres. The law as passed during the last session of Congress protects this national pleasure resort from being seized by a vast monopoly, and the orders of the Secretary of the Interior should be sufficient to save the geysers and the game from destruction.

By this law the responsibility for the care of the Park is placed where it belongs, that is with the Interior Department and its servants. The public will look with interest on the action of Superintendent Conger, who has now been furnished with money and means to patrol the Park. If he does his full duty, the work of destruction which for ten years past has been going on in this beautiful region will be checked, trespassers and butchers will be promptly dealt with and punished, and the game, soon recognizing that it has here a safe abiding place, will increase and multiply. If the superintendent is careless and slothful, if he appoints as his assistants a lot of Eastern men who know nothing of the mountains and the habits of game, the old style slaughter will be kept up. We have every reason to think that the superintendent will do his duty by the Park. He has already shown a deep interest in it, and this interest will no doubt increase rather than flag. We warn him, however, against falling into the mistake of appointing for his game keepers and police incompetent men. Let him make his selection of those officers from among the mountain men of Montana, whom he can easily find. From among them he can select good men, who will be honest, reliable, faithful and fearless in the performance of their duty. If the care of the forests, the game and the natural wonders of the Park be placed in such hands, we have no fears for their future.

Any failure to act up to the provisions of the law will

readily be learned of in a region such as this will soon be, and the assistants who fail to do their duty must speedily be removed and make way for better men. The responsibility of the Park thus resting on one pair of shoulders, it is certain that it will be well cared for, and the country looks to Mr. Conger to see how its Park is to be looked after. The people's temper has been somewhat aroused by the monstrous attempt to take from them their rights, and they will look sharply after this reservation for the future.

It is stated that other parties besides those above mentioned have filed applications for leases, and these the Secretary is now considering. A healthy competition in the hotel business in the Park is very desirable. If, however, the Improvement Company had secured their 4,500 acres of land as at first attempted, there would not have been much opportunity for other hotels to have been started.

A DISGUSTED DOG.—It is Hamerton, we think, who says, in one of his charming essays, that a poor shot should never go into the field with a good dog unless he is willing to be despised by the dog. In another column our ever-entertaining correspondent "Wells" relates a story illustrative of this; and "that reminds us" of a similar case that once came under our own notice. We have owned several dogs who seemed to take great delight in the killing of the birds, and it was plain to be seen that unless the birds were brought to bag their interest flagged. Many years ago we had a dog who possessed this trait, which grew upon him as he became older until it was impossible to get a good day's work out of him unless we did our share. He was one of the best animals we ever owned, and one of the most intelligent. In those days we selected our shooting companions as we did our dogs—for their good qualities in the field—and we nearly always succeeded in bringing to bag birds enough to keep the old dog, if not at his best, pretty well up to the mark. After a long career of usefulness he became too infirm for anything more than an hour or two in the field, and was seldom taken out. One afternoon we loaned him to a friend, who was a capital shot, except that at times he would have a "poor streak." Both man and dog started off in high spirits, but when they returned it was plain to be seen from the dejected appearance of the dog and the sheepish face of the Doctor that their fond anticipation of sport had not been realized. The Doctor explained the matter by saying that he had had a "poor streak." Said he: "I never was so disconcerted as when I caught the reproachful glance of the old dog's eye after missing as fair a shot as I ever had; and as I soon repeated the performance, I could plainly see in his expressive countenance disgust as well as reproach. Although I have stood behind the trap and, amid the jeers and hoots of the crowd, missed my ten birds straight, I never was so utterly demoralized in my life, and of course I missed the next one, when the old dog, with a look that will haunt me to my dying day, hung his head and, curling his tail between his legs, dejectedly marched back to the wagon, and actually showed his teeth when I tried to coax him out again."

JUDGES FOR THE NEW YORK SNOW.—The judges for the bench show of the Westminster Kennel Club are as follows: Mr. J. C. Higgins, of Delaware City, Del., will judge the English setters; Dr. J. W. Downey, of New Market, Md., the collies and beagles; Mr. J. F. Kirk, of Toronto, Canada, some of the non-sporting classes. The remaining classes are, as yet, not assigned, although it is probable that Mr. E. C. Sterling, of St. Louis, Mo., will judge the pointers, Irish, and black and tan setters. This list is unexceptionable, and one that is sure to receive the unqualified approval of the exhibitors.

PROPOSED KENTUCKY ASSOCIATION.—Doctor W. Van Antwerp and other prominent sportsmen of Kentucky are about to form an association for the protection of fish and game in the State. Such an organization is needed, and if the new one takes hold vigorously and helps to enforce the laws, it will take higher rank than those clubs which exist merely in order to hold shooting matches. As the proposed society intends to assist in stocking the waters, let us hope that it will protect them from the depredations of thieves who would take the last fish in them by any means in their power.

HOW MUCH HE MISSED!—It is related of the eccentric Dearborn Giles, of Escocawau, N. H., who recently died at the age of seventy-seven years, that although the best trout-brook in the town ran through his land, he made his boast that he never owned a fish-pole, a dog or a gun.

ANTIQUATED MILITARY ARMS.

THERE is a growing feeling in the ranks of the National Guard that when the State makes a demand upon the soldier for a certain amount of range practice, the State thereby incurs the duty of seeing to it that the very best arms obtainable are placed in the hands of the men. In many of the States this is not the fact at present, and the guardsmen of this Empire State feel the annoyance of an antiquated arm probably more than do the soldiers of any other State. It was the guard of this State which established Creedmoor, and gave to modern rifle practice in this country its first impulse. Knowing next to nothing of the art of rifle shooting it is not surprising that for a time there was no open objection urged against the State model arm. It was the regulation weapon, and shooting home matches there was little hardship, as all were equally handicapped by it, but when the marksmen from other States came up to Creedmoor and engaged in the matches they came with the best arms obtainable, and it goes without saying that they were not the New York State arm. The New York boys found themselves pushed to the wall by men in no wise their superiors in knowledge of all the many details which go to make up the successful bullseye hitter, but there was the difference of a superior weapon, and this decided the match.

Under such circumstances it is not at all surprising that there should be a disposition on the part of the New York teams to stay out of matches where by the conditions they are doomed to almost certain defeat. This indisposition to enter into competition is significant, for once crushed out the desire to measure effort in friendly rivalry with fellow-workers, and soon the whole subject of butt practice will die out despite all the general orders that may be issued to bolster it up. Competition is life and rivalry is vital in this matter, and if the men of one section are weighted down by an antiquated arm, they must soon cease to use it as anything more than a dummy with which to go through the manual of arms, and one of the most valuable lines of endeavor on the part of the soldier is cut off.

It may be urged that the cost of rearming such a large force as the entire National Guard of a State is too great to be lightly incurred, and then there is the risk that the work may be, after all, but temporary. There is no knowing when the time may come that shall see an invention which shall sweep away our entire small arm system, and there is a continuous line of improvement which makes the winning weapon of to-day the discarded arm of to-morrow. Still this is no excuse for absolute inaction, and a start, at least, could be made toward the better arming of the men by the issue of a limited number of rifles which are beyond question, and by general consent, superior to those now in use. They might be placed in the hands of the men best qualified to appreciate and use them, and their possession would come to be looked upon as in some degree a badge of proficiency in one of the soldier's duties. It would not require such a great outlay to issue enough of these improved rifles to enable all the official scoring under the State orders to be made with them, and so show the men at their very best.

Of course, for a great majority of the work which the National Guard may ever be unfortunately called upon to perform, the present arms are amply accurate and deadly. It is quite enough for a mob of riotous citizens to know that the blue-coated young men marching against the disorderly ones are armed, even though it be with .50-caliber rifles, which may not shoot above an average of inches at the long ranges. Across the street, or at the distance of a block away, they are quite accurate enough to render a deadly fire, and they will be the more deadly, and, therefore, the less likely to be called into use in proportion as the men can handle them with certainty. Yet an essential point is to keep the interest of the men up to the highest point, and this can only be accomplished by letting them feel that their personal endeavors are not set at naught by the inherent defects of the instrument in their hands.

That there is a feeling in the matter which the National Guard is shown by the expression of opinion on the part of Company C, Seventh Regiment, N. G., S. N. Y., where, at a recent meeting, resolutions were passed, as shown in the following synopsis:

The rifle with which the National Guard is at present armed will not carry accurately more than 500 yards. In all matches at Creedmoor and elsewhere whenever our National Guard are called in competition with those of Pennsylvania, New Jersey, and other States, they find themselves heavily handicapped, their opponents being furnished with a much better arm. The late International Match and other matches have created a spirit of emulation in our National Guard that in our opinion should be fostered by the State; this can only be done by arming us with the best rifle procurable. The ex-

ports using the .50 caliber State model at Creedmoor are almost disheartened when entering the matches for "The Army and Navy Journal Cup," "The Million Trophy," "The States" and other names where they have to contend against teams from the aforementioned States with their superior arms of .35 or .41 caliber. Probably no one appreciates this fact more than our present Inspector-General of Rifle Practice, Gen. C. F. Robbins.

The Board of Officers are therefore respectfully requested to take action in a matter which the rank and file consider a great stride to the advancement of skill in shooting and efficiency in the use of the rifle.

OBADIAH S. SNEDECOR.

OBITU FEBRUARY, 1883.

"*Justum et laetivum propositi ultimus.*"—HORACE.

"This sportsman, keen and on his game intent,
Nor wind nor weather could disturb."

A SHORT time ago, amid the fery of a February storm, there were continued to their last resting place, near Bayton, L. I., the remains of a man who, in his day, had been the associate, friend, and host of three generations of sportsmen. And yet Obadiah Snedecor, known to hundreds of congenial hunters as Obé, had not reached the span allotted to man.

By descent, and association from infancy, Mr. Snedecor was a lover of the gun and rod. Where the South Side sportsmen have their club-house, three miles east of the village of Islip, his father, "Uncle Lif," known and beloved of sportsmen of the older time, had his hostelry fifty years and more ago, and in spring and autumn welcomed with radiant face and friendly greeting the sporting guest, the angler with his tackle, and the rest fish and pond air. The creek, the accented waters of which form the "Great River," or the hamlet of the deer, which then roamed in godly numbers through the pine forests and scrub oak barrens to the "morad." A short distance west of the club house and just where the "Westbrook stables" and country seat of George L. Lorillard attract the view, stood the ancient wooded house in which Obé was born. The manuring of the waters of Westbrook as they quietly glided down into "Great River" was his first hobby. The air he breathed from childhood was freighted with the freshness and flavor of the Great South Bay, or rock of the neighborhood trees and pines, and the music of his boyhood was the splash of the trout, as it "broke" on the adjacent waters, the whistle of vicinial "Bob White," the baying of the hounds and the notes of the hunter's horn. Long before the days of railroads the disciples of Izak Walton and of Nimrod, from New York, Philadelphia, and other points further off, found their way to the hospitable doors of "Uncle Lif Snedecor's" little inn, now part of the club-house, under whose roof were welcome, warmth, ease, and the best of entertainment.

Harry Tinker, James Henshaw, James H. Thibet, Chester Harding, the eminent portrait painter, whose speaking likeness of "Uncle Lif" now adorns the walls of the Bayton cottage, Peter Delmonico, who has "last up the brook" in the excitement of the chase, Gen. Cadwallader, Isaac Wright, William W. Hayes, author of "Fire Island Ana," and a host of others who have all "fallen by the way," and William Nicoll, Benjamin D. Stillman, Philo T. Ruggles, and associates whom we meet in our daily walks, hale, hearty and instinct with spirits and vigor, largely due to their love and practice of woodcraft and placidly passing time, formed the circle of the old man's life, refining influence young Obé grew from boyhood into manhood.

Old John Murray, at the age of eighty, would run and shove the hunters up "the brook" to their "stands," while Obé, with horse and hounds, his horn swinging across his youthful shoulders, giving forth rye and upon the stirring notes of the hunt, would dash through the pine trees and the oaks to start the quarry, which instinctively sought the waters of the brook to bask the dogs, but thus rushed to certain fate from the ambush of the lance.

And then grew up by Obé's side a son of John Murray, a half-breed, "Steve," who was subject to Obé as John had been to Obé's father, "Uncle Lif," and served him all the days of his life with a fidelity "akin to the constant service of the antique world when service sweat for duty not for need."
"Steve" it was, who after ever fished those waters or dwelt in that hostelry can forget "Steve," or deny him a tear, as he recalls his shining face, his black and well-combed hair, his head eyes, his quick smile, his ready wit and shrewdness, and his disposition ever on the Indian all over, he knew every hole, nook, bog and log where or where, under the lurking trout poised himself, eager and alert for his prey, and it was a thing of general credence, that every decent trout knew "Steve," and he has long since passed to the happy hunting grounds of his race.

Then came the next generation, Hackett, Jones Rogers, Waldo, the Johnsons and the Knapps, Develin, Banks and the Wilmerdings, and a few other kindred spirits. With these he was on terms of close intimacy, and with the others, his companions in many a day's fishing, or on hunting "bound," or on a long tramp after "Bob White," with dogs of breed and training unimpaired. And then the dimmers he served for his guests, returning fatigued from the hunt, but refreshed by bath and brush. Rosate light shed by isaps, shrouded in lace and stuff of Tyrian dye, suffusing and softening the atmosphere of the cosy old dining-room, attuned the guests to the melow influences that surrounded them, and added sharper zest to the repast; while the portly figure and bright face of the genial host was everywhere, but that the nose should overlook or lose his share of the dainty viands, Ah! those were happy days and the nights, passed in song and story and with the music of the guitar, and occasional dance and "breakdown," worthy of the classic Rice and Christy, were nights indeed; *noctes amabiliores*.

Still another and a third generation of sportsmen who knew him not as intimately as the last but well enough to admire and esteem him and feel his loss: the Redmonds, Bonkard, Nelson, Curphey, Nicholas, DeForest, and, indeed, well nigh all the hundred members of the South Side Sportsmen's Club.

For some years Mr. Snedecor had been in failing health and his immediate friends had for months anticipated his demise, and yet it came at last, not without a shock. The void it has created is broad and deep. Mr. Snedecor was a typical Long Islander; quiet, never in a hurry, cautious and non-committal in speech, keen in discernment of character, serene and undisturbed by passing events, loving the soil upon which he was born, the waters, woods, meadows and fields of his dear old Long Island, and leading among men a blameless life; a gentleman by nature and education, a benevolent host; a hunter, shooter and fisherman by taste and in practice, and above and beyond any one of Nature's noblemen, an honest man.

The twin "Brotherhood of the Gut and Angle" has lost one of its most skillful and conscientious members and many, a friend near as a brother. Peace to thy ashes, dear, gentle, considerate, whole-souled Obé Snedecor.

OUR READERS will confer a favor by sending us the names of such of their friends as are not now among the subscribers of the FOREST AND STREAM, but who would presumably be interested in the paper.

The Sportsman Tourist.

AROUND THE COAST OF FLORIDA.

BY DR. J. A. HENSHALL.

Eighty Paper.

AS we sailed into Tampa Bay we saw the steamer from Key West sail in through the main pass, near the lighthouse on Egmont Key, and proceed across the lower end of the bay to a village near the mouth of Manatee River, and then continuing on its way up the Manatee River, and Tampa, where we left them transferring passengers and cargo. We anchored at sundown near the mouth of Little Manatee River, and the next morning sailed up to the old town of Tampa, which we found rather a neat village, with some pretty residences surrounded by orange groves. The barracks consist of a number of well-arranged and commodious buildings, models of neatness and good order. The grounds are tastefully laid out with well-kept parade grounds, lawns and drives, and magnificent pine oaks and other shade trees, rivaling our best parks in beauty and attractiveness. Several companies of artillery are stationed here. There is not much attraction for the sportsman about Tampa, on account of the scarcity of game; for the invalid and tourist, however, it is a pleasant place. Hillsboro' River, the third of that name I have seen in Florida, empties into the bay at Tampa, a small and uninteresting stream.

Tampa Bay is a large body of water some forty miles long and ten miles wide, and is often rougher than the Gulf itself. We experienced several days of squally weather there, with the wind continually shifting, so that we were obliged to skip from one lee to another in quick succession. We lost our large anchor on the east side, but found it again the next day during a lull in the wind, but a violent rain squall coming on we put across to Pappys Bayou, near the mouth of Old Tampa Bay, where we remained a day or two. The usual varieties of aquatic birds were here, and one day I gained a sturgeon in shallow water while in the coveas boat, and had quite a tussle with it. We sailed down the bay to Point Pinellas, anchoring in Big Bayou. Here were plenty of fine waters and fish. The peninsula lying between Old Tampa Bay and the Gulf and cutting in Point Pinellas, is high and healthful, clothed with pine woods and a few hamaks. Quail are quite plentiful, and fine sport may be had with the dog and gun in the open pine woods. Mr. W. P. Noid has a fine orange grove near Big Bayou. The trees are eight years old, in bearing, and look remarkably healthy and vigorous. There are a number of mango and alligator-apple trees, several cypress trees, with figs, guavas, guano, ducks, etc. I judge Point Pinellas to be one of the most salubrious and healthful locations on the west coast. There are a number of ancient burial and domiciliary mounds on the peninsula, and it seems to have been a favorite resort or dwelling place for the prehistoric tribes. A lake near the point is famous for its large and numerous alligators. On some of the keys near Point Pinellas are deer and other game.

Rounding the point we left port several large keys as Mullet, Arena, Pine and a number of smaller ones, and stopped at Boca Ceiga Pass. It will be observed that this is the third or fourth pass of that name, Boca Ceiga (meaning Blind Pass), that we visited on the west coast. This duplication of names in Florida is often annoying and confusing. The early Spanish explorers seem to have been particularly fond of the name. Boca Ceiga, Boca Ceiga Pass, Boca Ratones, Boca Grandes, Boca Seas, Boca Chicas, etc., while contiguous keys are big and little Gasparilla, big and little Sarasota, upper and lower Mattocombe, etc. And the English settlers are not far behind in this respect, for I know of at least twenty Bird keys, several Alligator keys, a dozen Pelican islands, three Hillsboro' rivers, two Sebastian rivers, several small keys, with Alligator, grasses, Gull islands and Raccoon keys, innumerable. At this Boca Ceiga Pass there is a fine beach, thickly strewn with shells, sponges, sea-fans, etc., and frequented by pelicans, herons, cormorants, etc. We also saw here a few flamingoes and roseate spoonbills.

Proceeding up Boca Ceiga Bay, we went out at John's Pass into the Gulf with a light breeze. When within a few miles of Little Clearwater Bay, we encountered a dead calm. The breeze, I believe, became as smooth as a sea of molten glass, while the setting sun loomed up, a huge red disc, in the soft yellow haze. It was such a calm as is invariably the forerunner of a storm, and we resolved to reach Little Clearwater Pass if possible that night. Putting Jack ashore, to walk up the beach to discover the inlet, we poled slowly along in two fathoms of water, not far from the shore. The sun, clouds, and stars had ceased to shine and sea like a great globe of fire, sending up to the zenith broad, fanlike rays of molten gold, diffusing fints of amber and saffron through the dense and heavy atmosphere, while a deathlike stillness pervaded the scene. The broad leaves of the palms fringing the shore were in quiet repose, and nowhere o'er land or sea could be seen the tremor of a wing or the ripple of a fin; not the slightest movement was discernible. Even the pelicans, gulls and ducks had ceased to stir and were as motionless as the white beach. All nature had been seemingly struck motionless as though by an enchanter's wand. The swish of the poles as they were withdrawn, and the water dripping and tinkling from them like drops of amber, were the only sounds to be heard. Finally the yellow twilight seemed to sink into the sea, the stars began to twinkle through the haze, and the murky night closed around us.

Jack returning toward the schooner from an unsuccessful search for the inlet, set fire to the beach scrub as he walked along, causing a long line of flame to shoot straight up into the still night, casting a broad red glare far out upon the untroubled waters. After supper we put out a second anchor, lengthened the cables, took in a double reef all round, furled and stoppered the sails, made everything snug and tight in. About midnight the boats were hauled by the main-boom lashing around furiously, and found the Rambler pitching, rolling and straining at the cables like an untamed steed. I turned out to secure the boom, and groping around in the darkness for the main lanyard cleat, I caught hold of Skipper's hand intent on the same office; it was so dark I could not see him. We lowered the boom and furled sail to the deck and secured it, and then looked out at the sunset of a few hours before! Then all nature seemed asleep—now she was raging in a perfect frenzy. The waters were tossed luminously, seething and hissing before a gale from the southwest, drenching us to the skin with spray. The swell was tremendous. It whirled and tossed the Rambler like a

cockle-shell, the cordage creaking, the shrouds shrieking and the balyards rattling madly against the masts. The sky was black, the waters black, and the shore line still blacker. Inky souds flew across the sky, northward, at a fearful pace. The water rose, heaved and rolled as in agony, with a sickly pallor of phosphorence that only rendered the darkness more visible. The breakers roared and thundered on the beach but 200 yards away. Oh, how we longed for daylight! We were bound for an inlet the exact whereabouts of which we did not know, and were ignorant how to enter it, if found, in the darkness. Skipper was for sending before the gale under the double-reefed foresail, but the breakers were so close that we could not do this until daylight, or so long as the anchors continued to hold. After paying out more cable we waited and watched the eastern sky for the first glimmer of the dawn.

It seemed as though the night would never pass away, but grew even blacker, were that possible, while the gale increased in violence. Squire and Jack were sleeping peacefully and calmly, perhaps dreaming of loved ones at home. We did not wake them; we only marvelled how they could sleep so soundly with the elements at war around them. But men can sleep tranquilly on the battle-field. Skipper and I sat in the cockpit watching the east with eyes of faith, but, oh! would the day never come. We could not see each other, but our pipes glowed fiercely red in the black night—spraks of comfort, indeed. At last I saw a suspicion of dawn, the pale lining the eastern horizon, causing the flying decks to assume a shade less black. Then I heard a shore bird twitter.

"Skipper," said I, "the day is coming!" Soon the eastern sky showed a faint glaze; like the passing away of a dense mist, disclosing a heavy, dark curtain, against which could be indistinctly outlined the palm-trees on shore. Then a slight rosy tinge, like the delicate blush of a sea-shell, was perceived along the edge of the horizon, a narrow pink border to the dark gray curtain—and at last came the glorious day. We roused Squire and Jack, hoisted the reefed foresail, hauled up the anchors, and fairly flew before the fierce gale. It was but a few minutes ere we sighted the inlet, the breakers dashing furiously over the bar. As we neared it the day broke brighter. Then we roused the rest of the crew, and over the narrow inlet, and through the narrow channel, we sailed, and further we reached a shelter and a harbor, with the water securely ruffled, under the lee of the beach ridge, white out after the storm demons still raged and howled.

After breakfast a schooner came flying in the pass under a small sail rigged on a jury-mast, her foremast having gone by the board. We sailed across to Dundin and anchored. The schooner had a number of small houses, the houses appearing to good advantage on the bluffs, surrounded by young orange groves. This is one of the few desirable points on the west coast. The banks are higher than any place we had seen. The bay is a fine body of water, shut out from the Gulf by several large islands, Clearwater, St. Joseph's, Hog and others, with passes between. Fish and small game are abundant. At Dundin is a store and post-office. The schooner was called the "White Mountain," fifteen miles above. Near the mouth of this river are two stores and a post-office, and close by is an old Spanish well, where good water can be obtained. They were expecting a railroad at this place, and we found this same railroad expectancy and consequent "boom" at nearly every place on the Florida coast; though what benefit would accrue to the railroads was not apparent, the freight transportation now offered is deemed to be amply sufficient for the produce of the country. A few miles up Anclote River is a large bayou, where good fishing may be had. Still further up the stream will be found Salt Lake and a salt spring, and near the source of the river a sulphur spring. Off the mouth of the river lie the Anclote Keys, behind which is a safe and deep anchorage, and where we found a fleet of fishing smacks driven in by the gale. On the fishing banks, some a mile or more from shore, these smacks take red snappers for the Havana market.

From Anclote we proceeded ten miles northward to Pith-laestotic River, called "Costie" for short, a small stream with its mouth completely blocked by oyster reefs; and ten miles further north we came to Bayport, at the mouth of Weckawachee River. The channels from the Gulf to the mouths of these rivers, and those above, are staked. Near the mouth of Bayport, some two miles from shore, a sudden blockade runner, but got off without sustaining any importance. Bayport is an old place of some note, formerly quite important as a shipping point for cedar. It consists of a store, post-office, and a few pleasant residences. It is a pretty place, with some of the largest orange and lemon trees I saw in Florida. Mr. Parsons is proprietor of the store, and will be found an agreeable and intelligent gentleman.

At the mouth of the river some two miles with the schooner, and then proceeded to the head of the stream, about ten miles further, in the small boats. The source of the river is a large spring, in a basin of an acre in extent, surrounded by a rim or ridge of considerable elevation. This "White Mountain Spring" as it is called, is a subterranean river bursting out at this point with great force, geyting to the surface, and boiling with a very strong current. The spring is fifty feet in depth and so clear that one's boot seems like Mahomet's coffin, suspended in mid-air. Great numbers of sheep-head and gars can be seen swimming near the bottom, but, as might be expected, refuse to take a bait in water so clear. The smallest object can be clearly defined on the bottom of pure white sand. The water boils up through great rents in the coralline rocks at the bottom, the hot below rich banks above in the form of a fountain.

starts suddenly, with hoarse cry, from a secluded nook by the water's side, and lazily flaps away, with its long legs sticking straight out behind; and the mainly water turkey or snake bird sits awkwardly on a limb projecting over the stream, tilting back and forth in vain efforts to balance itself. Its long legs are poking about in every direction, seemingly undecided whether to drop to the water or take flight. Black bass, sunfish, sheephead and gar-pikes, with an occasional alligator, can be plainly seen swimming along in the clear, white water.

Returning to the Rambler we put back to Bayport and up the coast, ten miles, to Chessowiskee River. This part of the coast abounds in masses of black rock, called "nigger beds," for which the cruiser must keep a sharp lookout or he will come to grief on them, as they are up to several inches of the surface. This river, as do most of the streams in this section, rises from a large spring. Some of the rivers of the interior suddenly disappear under ground, and most probably they reappear at the surface through these springs. At the mouths of the rivers are numerous oyster banks where sheephead and drum do mostly congregate. Ten miles further north we come to Homosassa River, and following the tortuous channel at its mouth we anchor one mile from the Gulf. The Homosassa is a beautiful stream, unlike most others on the west coast. It rises from two large springs, and seems to have forced its way suddenly and with great violence toward the Gulf, cutting its way through the rocky soil by numerous channels, leaving many islands of coralline rock crowned by cabbage palms, for the last four miles of its course.

The next morning we sailed up to the charming resort of Capt. A. E. Jones, four miles from the mouth of the river. This is the most home-like hotel in Florida, and under the able management of Capt. and Mrs. Jones has become a favorite winter resort for many Northern sportsmen and their families. There are two long buildings with spacious and comfortable rooms, all on the first floor, shaded by verandas, and facing each other, with a beautiful lawn between adorned by orange, lemon and fig trees, with the beautiful ferns and orange groves in the rear. We were warmly welcomed by Mr. and Mrs. Jones, who abandoned and burnt during the war; the large sugar plantation adjoining, with its mills and machinery, being also deserted and destroyed and permitted to lapse into a state of tropical wildness. The fine fishing and hunting at this place is so well known, having often been described in FOREST AND STREAM, that I will not dwell upon it here; suffice it to say that we went out one day with Mr. Giles and Mr. Curtis, and saw many fine specimens of Mr. and Mrs. Jones' birds. A mile from the hotel, where I killed my last deer in Florida, before a young deerhound belonging to Mr. Giles. We went to the springs at the head of the river in the schooner without difficulty under the pilotage of Mr. Chris. They are similar to the other river springs of this section, but the river itself, I think, is by far the most beautiful. To the fishing, the comforts of a home while enjoying the fishing, shooting, boating, and tropical scenery and climate salubrity of the Gulf Coast, I would say, by all means go to Homosassa and put yourselves under the hospitable roof of Capt. and Mrs. A. E. Jones, whose efforts to secure the comfort and well-being of their guests are unflinching and proverbial, and moreover, you will there meet with some of the best people of the North, to associate with whom will be one of your greatest pleasures.

One night while anchored off the wharf of Capt. Jones I was awakened by strains of melody floating over the water, and turning on I beheld several large lights floating down the stream above us. Soon I discovered it to be a long raft of cedar logs being poled along by negroes, whose dusky forms were brought out in strong relief by the blazing fires of pine-knots in hoop iron baskets, and whose clear and musical voices, singing their boating refrains, had been softened by distance and borne along the surface of the water in the same manner as the music of the wind.

At daybreak we were anchored near the mouth of the river, laying in supplies. Skipper was in the dingy tending oysters. Squire was standing on the cabin roof watching for ducks and shore birds. Jack had gone ashore in the canvas boat to shoot snipe, while I was catching sheephead. A sudden blow of wind sent the forestal sweeping over the cabin roof, the boom striking Squire amidships and sent him sprawling in the water. I seized the conch-horn and blew a terrific blast to attract the attention of the boys, for the scene was too good to enjoy alone. Jack and Skipper looked over just as Squire emerged upright with the water up to his shoulders. Jack, taking in the situation at a glance, shouted:

"Great God! I'd rather be
A Pagan suckled in a creed unknown,
So might I shun the waltzing matron,
Have glimpses that would make me less forlorn;
Have sight of Proteus rising from the sea,
Or hear old Triton blow his wreathed horn."

MUSICAL FRAGS.

SOME time ago you printed a note from one of your many observing contributors in reference to certain musical frags.

It reminded me that one night last summer while drifting with the tide up the Potomac, a dead calm having fallen upon us, I thought I heard instrumental music on shore just above Mount Vernon. The soft tinkling rose and fell, increasing and diminishing, while at times the sweetest strains floated over the water, as if an opera of fairies was rendering some favorite work of an elfin Verdi or Beethoven. The music was so sweet and so much of a mystery to me, not being able to tell whether it was on shore or on the water, that I took the small boat and rowed as quietly as possible toward the place the sounds seemed to come from.

It was two o'clock of a warm, starry night, and I enjoyed that music wonderfully. As I rowed toward it, it would die away, and then, when I rested the oars, it would increase again, the sweet silver notes making me delightful swells and cadences, as if my rowing or being quiet governed the artists somewhere in the shadowy distance. At one time there was a good imitation of the "Turkish Patrol," the crescendo and diminuendo being marked, starting with soft tinkles, increasing to a full chorus, and ending with delicate cadence. Finally I discovered that the musicians were frogs, and all in a little space of an acre or so near shore, where the grass was not entirely covered by the tide.

(The frog, as you may well know, but I never heard any that made that kind of music before, though I generally hear them all, from *hyla* to *pipiens*, from those that tunc up almost as soon as the song sparrow in the spring, to the rum-jug-o-runs of the summer, J. C. B.

EXPERIENCE OF THREE AT REHOBOTH.

A PARTY of congenial souls had congregated at the corner grocery store of C. located within an hour's ride of the city of Wilmington, Delaware, on evening in the early part of last December, and while sitting around the stove toasting their shins, and recounting their gunning and fishing exploits, the subject of duck shooting was introduced by Silas Merrill, an enthusiastic lover of the rod and gun. "Boys," said he, "I've been seriously thinking of spending a week among the ducks. It is an entirely new diversion to me, and something I always wanted to do after my row of years of fishing. I will accompany me the thing is fixed. We'll have lots of fun, and probably bring home enough ducks to convince our friends that we did not purchase them. Who will go?"

Tom Stetson and Harry Wilson declared that nothing would suit them better, provided that good partridge shooting could be had in the neighborhood of the ducking waters. As each was the possessor of a well-broken setter, they naturally desired to spend some off-time at their favorite sport.

A place was next to be decided on. Barnegat Bay and Gunpowder River were contemplated on account of the last mentioned requisite being lacking. Rehoboth Bay, on the southeastern coast of Delaware, was unanimously chosen as the place offering the greatest inducements. A letter was forwarded by the next mail to John Martin, a farmer living within a short distance of the bay, who accommodated gunners with boardings, and lodged for a consideration, on throwing in the use of his decoys and services as boatman, notifying him they would be there either on Monday or Tuesday evening of the following week. It was finally decided that they should start on Monday.

Accordingly the trio, with their dogs, guns and ammunition, left C. early on Monday morning for Rehoboth, via Wilmington and Harrington. The trip to Lewes was devoid of interest. Here the road facilities ceased. Rehoboth is situated about eight miles southwest of Lewes. To cover this distance they had either to walk or engage a team, as they had not definitely stated in their letter what day they were coming, and Martin, of course, was not there to meet them. Inquiry of a native elicited the information that for \$6 he would hire them a conveyance and send a driver along. His proposition was accepted.

Calling a genuine Delaware darkey to him, he said: "Pete, you go down to the stable and hitch up the bays and take these gentlemen over to Jack Martin's." In a short time the "bays" were driven around to the station.

"And what a team! A pair of mules, whose appearance indicated a propensity for airing their heels and perpetrating all the tricks peculiar to the race, were harnessed to a rickety old open-topped wagon.

Harry W., whose avoirdupois was over 235 pounds, looked at the vehicle rather dubiously, and then asked the proprietor if he hadn't a cart and a pair of oxen handy, as his party wasn't much on style and didn't want him to send his best rig that distance. Pretending not to see the point, the man answered: "Oh! that's all right, stranger, I allus like to give my friends the best. Won't you step over to the hotel and hev sumthin' before you go?" Deceiving his offer, they mounted the vehicle and ordered the driver to drive on. As they moved off the proprietor halted, "Now you be durned careful, Pete. Them mules be chock full of oats and feel mighty spongy." They had not been long on the road before a trace parted. It was spliced with a piece of rope, and again everything was lively.

"We're getting tar now, we're yar," exclaimed Pete as the mules broke into a trot. "These yar animals are sumthin' on the git up and git, I tell yer." Hardly had the words escaped him when the wagon, without his sitting on it, was observed to suddenly turn a flip-flap, and alight in the sand on the roadside. Before his friends could divine the cause of this strange maneuver, they were all dumped in a heap alongside of their fallen comrade. The darkey was the first to take in the situation. "For to goodness, if de lynch pin ain't gone and dropped out." Such was the case. He was sent back to find it, while John and Silas righted the wagon and replaced the wheel. Harry meanwhile held the mules, and in a short return with the best lunch-pail. It was securely sealed, and once more the party were en route.

The mules had been very meek and well-behaved during these trying circumstances, and no trouble with them was apprehended. But alas for our friends' confidence in mule flesh! When about three miles from Martin's the off mule, evidently becoming tired, quietly lay down in the middle of the road, and in a moment of possession could induce him to get up. This sort of traveling was becoming monotonous. It was now almost dark. Something had to be done, and very soon at that. While they were consulting as to the best means for raising the refractory mule, a smile suddenly illuminated the countenance of Pete, who exclaimed: "I know what will fetch him; he's awful afraid of a gun. S'pose we all git in de wagon, and one of you gentlemen shoots off his gun, with start him, small." Wonder I shouldn't think of that before, they started themselves. Pete gathered the lines; John inserted two shells, raised his gun and fired both barrels. With a bound the mule sprang to his feet, and the circus then began in earnest. The near mule had remained quiet up to this time, but now took a hand in the performance. They reared, plunged and kicked. It was a ludicrous sight to see Pete dexterously avoid their heels. The harness, fortunately, held the fear-stricken animals to the wagon, but at first they were so frightened themselves futile, started off at a spanking gallop, and without further adventure the tired and disgusted Nimrods arrived at John Martin's, having been three and one-half hours in making the eight miles.

A man was standing at the door of a rather comfortable-looking farm house, and as the team stopped in front of the gate he came forward and inquired, "Be you the party that was comin' in C.?" Answering that they were, he continued, "If I'd a known you folks was comin' to night I'd a had a team down to Lewes and banied you over; your letter didn't say what day to look for you. Howsonever, your old woman'll soon have supper ready. Here, Jake—" turning to a young man, whom he afterward introduced as his son, "take these gentlemen's dogs and put them in the stable." He then led the way into the house, where they were soon seated before a roaring wood fire.

Presently Mr. Merrill, after being introduced, graciously announced that supper was in waiting, and "would the gentlemen be kind enough to step into the dining-room?" What a feast was set before these hungry sportsmen! Cold roast duck, broiled quail, fresh white bread, scaming hot

coffee, and different kinds of sauces. After partaking heartily of the repast, they adjourned to the sitting-room.

"Mr. Martin," inquired Harry, "what are the prospects for duck and partridge shooting?"

"Gentlemen," answered Martin, "I'm afeard you've left it too late for ducks. There is a fringe over and you can't sneak up on the ducks. Your only chance is to lay fur 'em at night, and shoot into 'em as they fly over the punt for the fresh water pond beyond. It's froze over, too, but there be air-holes where the ducks can get fresh water to drink. They allers go there at night. Soon as ever the moon gets up you won't have much trouble in bringing some down. As fur partridges, there's plenty of 'em, but take my advice, and when you find a covey, give 'em both barrels as they get up, 'cause ten to one you won't see an argus. They make straight for the swamps, and the devil himself couldn't hunt 'em there."

"Boys," said Silas, "suppose we try the ducks to-night? We might as well have a little fun before turning in." The proposition was agreed to, and in a short time they were en route for the "point" above alluded to, accompanied by John Martin. The point proved to be a narrow strip of land projecting some distance out into the bay, and which John Martin had erected a blind, sufficiently large to accommodate four or five gunners. Our friends took possession, and anxiously awaited the first appearance of Linn. As the ducks flew overhead their forms could be dimly outlined, and it was with some difficulty that Martin could restrain the excited sportsmen from opening fire. "Now, jist hold on a bit, and don't waste your powder and shot," said he to Harry as the latter was on the point of raising his gun. "You'll leave all the shooting you can get very shortly."

The time dragged wearily along, but at length the scene changed from darkness to moonlight. "Harry, you take the first shot," said Tom. "Get ready," whispered Martin, "here comes a bunch." He put up the gun, and when the birds approached within shooting distance, gave them both barrels. "I didn't hear anything drop," laughingly exclaimed Silas. "I guess you must have forgotten to put shot in your cartridges. Now Tom, your turn next. If you miss, I'll see if I can stop them. A flock of eight ducks soon came in range, and with the report of Tom's gun two birds fell, and as the others flew by, Silas gave them a parting shot, killing two more. "Jist give me another chance, and I'll show you what duck-killing is," exasperatingly ejaculated Harry, as the others chaffed him on his misses. "Well, here's your chance," said Tom, as two more were reported coming toward the blind. "Now, redeem yourself, here bang!" "There comes one, and another, clean shot that," shouted H., exultantly. "By George, he's only wounded, and is making for the ice."

The thought never occurred to give the wounded duck another load, but rushing from the blind he started in pursuit. The bird gained the ice, Harry close behind. Crash! He had stepped upon the ice, which, not being more than an inch thick, broke under his weight, precipitating him into the chilly waters below.

Scrambling to the shore, he returned to the blind. "Did you get the duck?" asked his companions. "No, blast the duck, but I've got an infernal good ducking. Guess I'll go up to the house and borrow some of Mr. Martin's old clothes."

Silas and Tom concluded to remain awhile longer, as the fun was just commencing. After enjoying the sport for upward of an hour, and securing twenty ducks, they, too, retired to the farmhouse. There, lying on their beds, Harry sneezed into one of the old man's suits, looking the very picture of despair.

"I want it distinctly understood," said he, "that duck chasing for me is played out. I'll fill the next one full of shot that tries to get away."

The forenoon of the following day was devoted to partridge shooting. The dogs worked excellently, and killed a number of the boys were taking very good care not to quail when flushed sought safety in the swamps. Don and Nig followed and pointed, but the gunners could not approach. Indeed, H. endeavored to do so once, and became so imbedded in the mud that his friends experienced great difficulty in extricating him. Notwithstanding this discouraging state of affairs, they succeeded in bagging thirty for one morning's work.

After partaking of a hearty dinner they turned their attention to cleaning their guns and putting everything in readiness for an evening with the wildfowl. The old man and his son entertained them with recitals of some of their marvellous gunning exploits. It was amusing to behold the countenance of Tom, as Mr. Martin, Jr., related the greatest feat of his life in long range shooting. Said he:

"I had 'bin ginnin' for ducks and had got 'bout as many as I wanted, when I spied comin' my way six geese. I dapped two cartridges of big shot into my gun, and waited. Presently they come a little nearer; I looked and they looked, but durn if I could git 'em inside of a hundred yards. Thinks I, 'Them birds are goin' to light out pretty soon, so I'll cut loose on 'em anyhow.' I puts up my gun and blazed away. You oughter see the feathers fly! I thought that 's'bout all the damage I'd done, but, as true as my name is Jack Martin, them six geese dropped, one after the other, stone dead. That's what I call pretty tall shooting!" Although his listeners felt that the story was gotten up for their especial edification, they nevertheless agreed that it was a remarkable shot and one worthy to be placed on record.

About 9 o'clock the party were again within the blind. The ducks began to move, affording some excellent shots. H.'s nervousness had worn off, and he scored five more birds than that of his comrades. The fusillade continued until 11 o'clock. Upon counting the result, it was ascertained that thirty-five ducks and three geese had been killed. Highly elated they returned to the house and were soon wrapped in the arms of Morpheus.

It is hardly necessary to detail their actions during the remaining four days. Each day's shooting was but a repetition of Tuesday's. When they arrived in the village on Saturday evening, they divided the game that had not been sent part of some consumption among their friends. H. enjoined his companions to secrecy regarding his various mishaps. But somehow they all leaked out, and now he is asked whether he caught his ducks or shot them.

OCCEASIONAL.

NEBRASKA.—Falls City, Neb., March 6.—Since the ice has begun to melt we have been having fine duck and goose shooting on the numerous lakes in this immediate vicinity. Squirrels, rabbits, etc., are plentiful. Quail wintered in this section well, though undoubtedly a number were frozen.—TYRO.

Natural History.

THE YELLOW-BELLIED WOODPECKER.

Picus.

I SEE as with "the spirit of prophecy" that the FOREST AND STREAM is destined to be an encyclopaedia of natural history, and the only one in the English language. To sustain that reputation it is necessary that the compiler, the naturalist and compiler of facts, unite their efforts on this common or useful ground. The sportsman must rise to the plane of the naturalist, then both must be lifted from savage to civilized life, while the compiler must come down from the high stool he has mounted, and in a manly way acknowledge his indebtedness to the others, and to the labors of other men. The sooner this is done the better for all parts, since it is plain that the sportsman tourist now carries into the woods the highest grade of intellect, which, fired with the excitement of the chase, gives life, interest and humor to a narrative that no tarry-at-home, however sentimental or scientific, can reach. I would not be considered modish or inclined to "thrust my nose" into other men's business, but I often read an article in this paper to the significance of which I might possibly add a trifle, and the same article perhaps to its value as a historic record. My object is simply to preserve strong points of character frequently overlooked, and which, once true, are forever true, in the orders of life below us.

In running my eye over the list of "Birds of Maine," substantially the birds of New England, I noticed that the yellow-bellied woodpecker was passed over with a few words, just what every author gives the bird, showing most conclusively that ornithology as a science had not as yet reached his character, habits and peculiar instincts. I am obliged to set down first, that this is the most destructive bird in our climate. I have seen the best trees in an apple orchard destroyed, while the owner looked sadly at the trees ceasing to bear and dying, not once dreaming that so small a bird could cause it. "Sometimes called a sap-sucker." I falsely so-called. It has no sucking apparatus. Forging for worms is often asserted and stoutly defended. False again, he never borrows a wormy tree, and besides he has no barbed tongue like his tribe for pulling out a worm when he gets almost to it. Still worse, he kills a tree leaving no mark of his bill on the wood equal to the scratch of a pin. Then what under heaven does he do?

Well, he kills the tree most certainly. I have seen the white birch cut off, or rather broken off, twenty feet from the ground, in more cases than I can number, all his work. I have seen the yellow birch destroyed in the same manner; branches of the tree cut off, shriveled branches struggling for life, but dying. I have seen a tree girdled with spots twenty feet from the ground, then again a few feet lower, then below that, repeating the process to the roots, leaving a dead and dry section above each bell. I have seen the white pine destroyed in the same way. I have seen an eight to ten inch diameter, whose trunk of twelve feet was spotted with "gimlet holes" in the bark nearly one inch thick, and where for ten summers past I have shot the pests and thereby saved the tree. But this was a "honeydew" elm, of thicker, darker, greener foliage than hundreds of others in the neighborhood, and from the tips of the leaves a drop of sweet liquid falls—hence the name.

What other crimes against property this bird may be guilty of, I leave others to discover. What I have seen any one can see if they have the same opportunity. The bird crawls closely the snow line in its northern migrations, and although leaving his "trade mark" on many trees, does little damage in Massachusetts. But further north, where the bird breeds, white orchards are severely injured, if not destroyed, by them covering the trees with holes, and the gimlet holes in the bark, abandoned without enlargement for some distance of the sap. In that case the wound in the soft inner bark would grow over, while the rough outside bark would show the holes ever afterward. The first impression might well be that sweet-apple trees would be selected, but the rule is not reliable, since the sour, "pickery," crab-apple seldom escapes.

The bird usually commences operations early in May, on the smooth, green, healthy bark of a tree just beginning to bear fruit, and just as the bark swells out with the soft pulp for the year's deposit of wood. With true philosophy he invariably begins just below the offshoot of branches, where the upward flow of sap is retarded by knotty fibres above, and where the accumulation presses, causing the sap to flow more freely than at any other place. If the taste is satisfactory the insect returns to the first, lapping out the sap with a tongue fringed with hair on both sides, meeting at the point. This is the key to all his eccentric habits. Thus alternately pecking new holes, and lapping out those already made, he soon girdles a tree with bleeding wounds. Then perhaps flies off to other trees picking bugs and worms from the bark, but soon returns to the flowing sap where three-quarters of the day is spent. The heat of summer dries a hole he at once enlarges, it laterally, causing it to bleed afresh. Thus by a process constantly intermittent, the work is carried on often by a whole family in turn.

In this way the holes approach each other till the flow of sap is so diminished that the leaves fade and the fruit withers on the stem or falls to the ground. Perhaps not half the apple trees attacked are killed outright, but the which tree invariably dies. This is true in degree, and to every possible degree, from the round gimlet hole, which is not fatal, to the broad "countersink" which kills the branch or the whole tree. I must allude here to the fact that when the woodpecker leaves the tree, a humming-bird invariably drops down from a twig on which he has been waiting his turn, thrusts his tongue into the holes in rapid succession and darts off the moment the opening appears. I have often thought the reader will acknowledge my first assertion sustained, and also that this species is misnamed "a sap-sucker," although at a certain season sap is a prime article of food, and that he is more of an insect than a worm eater, lacking the necessary machinery for reaching worms in the true picarian style.

To return to introductory remarks I trust the sportsman naturalist will not feel that to "go after other respects" in natural history is beneath the dignity of the sharpest intellects in society. The subject is not yet exhausted, nor will it be for many days to come. Another thing, there should be a free interchange of thought among writers. A postal card will ask and answer many questions where the record of a fact has obscure points. My skill is thick as a board, I acknowledge; yours may be in spots; in any case

let us be neighborly and abolish fictitious names. Record every natural fact that comes under your eye, even at the risk of feeling the chagrin I have more than once felt on finding what I supposed new to the world was new only to myself. One thing further. Let no man expect to see all these things in a minute. The experiences of a lifetime, and the fruit of its researches are often embodied in a single page of record, and it is only from a great store of incident that we can sift what is reliable, and separate the true from the false.

A word of explanation for using Picus—There is in ornithology substantial agreement as to genera, while species and variety afford a boundless field on which young ambition spreads itself with wonderful effect. Distinctions

CRAB-APPLE TREE KILLED BY YELLOW-BELLIED WOODPECKER.

without differences, as synonyms fully demonstrate, have been multiplied about as long as it will pay. I herein give a "difference" in this bird without a "distinction," and throw the gate wide open for my friends above referred to step in and reach "immortality" by a shorter cut than usual. Give us, please, a term (not as long as your arm) embodying some idea of its character and habits, else we must give it up, and fall back on yellow-bellied wood—no—sprinkpecker, very near the place from which we started. B. HORSFORD.

SPRINGFIELD, MASS.

WINTER BIRDS.

AROUND Boston this winter there has been an unusual flight of birds, especially several species that have not been seen in its vicinity (excepting a few scattering specimens) for at least fifteen years. Several birds have been taken here during the past three months that have never before been known to pass the winter here. For instance, I know of an authentic case of the taking of two cowbirds in the middle of winter. Although the season has been severe, robins, song-sparrows, bluejays and yellow-rumped warblers have stayed in this vicinity in greater or less numbers. I saw a red-winged blackbird the 17th of February, and bluebirds arrived before the 1st of March. I have taken many white-winged crossbills and pine grosbeaks, but the American crossbill has been scarce. On the 22d of February I shot forty redpolls out of one flock, about thirty of them being Greenland or greater redpolls. Redpolls have been here in great numbers, and snow-bunting and shore larks are frequenting the seashore in large flocks. On the 24th of February I saw an Ipswich sparrow, which was shot by a friend accompanying me. Thinking this a remarkable winter in regard to the number of birds visiting us, I have deemed it worthy to write to you about it. W. A.

BOSTON, MARCH 7.

I here send you a list of birds observed during the winter months, as follows: Robin, *Turdus migratorius*; bluebird, *Sialia sialis*; black-necked chickadee, *Parus atricapillus*; white-bellied nuthatch, *Sitta carolinensis*; cedar bird, *Ampelis cedrorum*; pine grosbeak, *Pinicola enucleator*; American goldfinch, *Chrysomitris tristis*; song sparrow, *Melospiza neotoma*; chipping sparrow, *Spizella socialis*; English sparrow, *Passer domesticus*; crow, *Corvus americanus*; downy woodpecker, *Picus pubescens*; red-headed woodpecker, *Melanerpes erythrocephalus*; golden-winged woodpecker, *Colaptes auratus*; screech owl, *Scops asio*. CAL. OLIVER.

SEASIDE, N. Y., FEB. 25.

A friend of mine shot a high-hole on January 25. Another high-hole was seen at Woodside a couple of weeks ago. Robins and a few meadow larks have been around since winter, and several large flocks of meadow larks and fox sparrows have appeared during the past week. A large white owl was seen by a friend at Locust Valley on January 25. I have heard of three being killed in this neighborhood during January. Will you please inform me if the horned lark, about which an article appeared in your last issue, and the larkunting, abundant here during the winter, are the same? TR.

LONG ISLAND CITY, FEB. 26.

A pewee (*Sayornis phœbea*) was observed here to-day, an unusually early date for the arrival of this species. G. MILFORD, CONN., FEB. 8, 1888.

THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance, Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH

FAMILY RECURVITROSTIDÆ: AVOCETS AND STILTS.

214. Avocet—*Recurvirostra americana* Aud., Ridg. 566, Cs. 600.—Accidental visitant from the West. Rare. Several specimens have been shot on the eastern shore of the Bay of Fundy at various times, and sent to a taxidermist in St. John, N. B. One was killed at "Simonton's Cove," Cape Elizabeth, Cumberland county, Maine, November 5, 1878, and its skin is now in the collection of the Natural History Society of Portland, Maine.

215. Black-necked Stilt—*Himantopus nigricollis* Aud.; *Himantopus mexicanus* Ridg. 567, Cs. 601.—Accidental visitant from the South or West. Very rare. Mr. Boardman has recorded a specimen taken near the mouth of the St. Croix River in 1862. Mr. Montague Chamberlain has recorded (Bull. N. O. C., April, 1882) the capture of a specimen by Mr. John Ellis, at Mace's Bay, on the eastern shore of the Bay of Fundy, in September, 1880. The species is rarely found on the New England coast.

FAMILY PHALAROPIDÆ: PHALAROPES.

216. Red Phalarope—*Phalaropus fulicarius* Aud.; Ridg. 563, Cs. 604.—Not uncommon along the coast during migrations. Mr. Boardman reports that "some breed" in the region of the St. Croix River. Mr. Boardman Hardy, of Brewer, Maine, informs me that a pair, male and female, were shot at Hermon Pond, Penobscot county, in May, 1881, and they were probably there for breeding purposes, although the spring migration occurs in May and these birds may have been merely stragglers from the coast.

217. Northern Phalarope—*Lobidys hyperboreus* Aud.; Ridg. 564, Cs. 603.—Not uncommon along the coast during migrations. Probably a few breed on the outer coast. I have observed phalaropes, probably of this species, at sea near our coast in June and July. The phalaropes are locally termed "sea geese" by fishermen and others. I have failed to learn the origin of this very inappropriate name for birds that most resemble in size and form the small sandpipers, although their feet are partially webbed, and they are swimmers more habitually than waders when found upon our coast. "Black old-growth" is another and less common, local name, I have heard applied to the phalarope.

218. Wilson's Phalarope—*Lobidys velox* Aud.; *Steganopus tricolor* Ridg. 565, Cs. 602.—Rare. I saw three phalaropes alight in the Noneseuk River, near "Black Rock," Seabrook, June 9, 1881. My companion, William H. Stephenson, Esq., shot one of them, and it proved to be of the species above named.

FAMILY RALLIDÆ: RAILS.

219. King Rail—*Rallus elegans* Aud., Ridg. 569, Cs. 676.—Rare. The only record of the occurrence of this species here, for which I can vouch, is that of a single specimen, shot by my friend Alpheus G. Rogers, Esq., at the Starbuck River marsh, October 1, 1881, the skin of which is preserved in the collection of the Portland Natural History Society.

220. Clapper Rail—*Rallus clypealis* Aud., Ridg. 571, Cs. 673.—Rare. An occasional visitant from the South. Specimens have been taken at various times on the coast, and one was shot at "Seabrook Pond," in Androscoggin county, in 1874, by Mr. C. P. Nason, of Auburn, Maine. For this sole inland record I am indebted to Prof. J. T. Stanton, of Lewiston, Maine, in whose collection the skin is preserved.

221. Virginia Rail—*Colinus virginianus* Aud., Ridg. 572, Cs. 677.—Not very common. Breeds. Formerly abundant but apparently not very common during the last few years, excepting in the autumn of 1881, when rails of several species were remarkably abundant here.

222. Carolina Rail, Sora Rail—*Ortygma caroliniana* Aud.; *Porzana carolina* Ridg. 574, Cs. 679. Common. Breeds. Abundant in favorite localities during September and October.

223. Yellow Rail—*Ortygma melanotos* Aud.; *Porzana melanotos* Ridg. 575, Cs. 680.—Not uncommon but scarce.

224. Jamaica Rail, Black Rail—*Porzana jamaicensis* Aud., Ridg. 576, Cs. 681.—During the autumn of 1881 great numbers of Carolina rails were shot in the vicinity of Portland, Me., as also numerous Virginia rails and yellow rails, and a King rail. Upon the fourth of October, while my friends, Jonas Hamilton and Alpheus G. Rogers, of this city, were shooting in Seabrook, Mr. Boardman's father shot a Carolina rail, a black rail, and a King rail. The bird was probably of the species *Porzana jamaicensis*. Both gentlemen have a familiar knowledge of our common species of rails, and especially noted that this bird differed from the "sora" or Carolina rail and the yellow rail in form as well as in plumage. Unfortunately the specimen was not preserved, and it may possibly have been an instance of melanism of the young yellow rail.

225. Purple Gallinule—*Gallinula porphyrio* Aud.; *Javanais martinica* Ridg. 578, Cs. 685.—Accidental visitant from the South. This species has been recorded as of occurrence as far north and east as New Brunswick (v. Bull. N. O. C., July, 1881, and April, 1882).

Mr. Boardman mentions it in his list of the birds found in the vicinity of Calais, Me. Mr. H. A. Purdie has recently shot a specimen of this species in the Adirondack region near Boothbay, Maine, by Mr. Jos. G. Nickerson. This bird was "taken alive and afterward escaped."

226. Common Gallinule, Florida Gallinule—*Gallinula chloropus* Aud.; *Gallinula galeata* Ridg. 579, Cs. 684.—Accidental visitant from the South. Mr. Boardman obtained a specimen some years since that was shot in Calais, Maine.

227. American Coot—*Fulica americana* Aud., Ridg. 58, Cs. 682.—Very common, but usually occurring in limited numbers during the autumn migration. But little known here, and the name *Pele canis*, or water-hen, is not used in Maine.

I have heard it locally termed "blue peter" and "blue marsh-hen" in Maine. The name coot, properly applied only to this bird, is erroneously used in Maine, as well as throughout New England, to designate any one of the three species of surf ducks or scoters so abundant along our coast.

FAMILY ANATIDÆ: DUCKS, GEESSE AND SWANS.

228. Common Swan—*Cygnus americanus* Aud.; *Oloranus icterus* Ridg. 588; *Cygnus columbianus* Cs. 689.—Rare straggler from the West or South. An immature swan of this species was shot by Mr. Wm Williams, of Bondedinn, Me., in the Kennebec River, near Brick Island, at the

junction of the Androscoggin River, known as "Merry-meeting Bay," in November, 1881.

220. Snow Goose—*Anser hyperboreus* Aud.: *Chen hyperboreus* Ridg. 591, Cs. 695.—Rare. Some years ago a flock of geese of this species alighted in the Nonseuch River at Scarborough, Me., and remained there undisturbed a half day. An immature specimen was shot at Glenburn, Penobscot county, Oct. 18, 1884, and its skin is in the possession of Mr. E. S. Bowler of Bangor. An immature specimen was shot near Hollowell, Kennebec county, November 25, 1881. An adult specimen was shot in Casco Bay, Cumberland county, in December, 1880, and its skin is preserved in the collection of the Portland Natural History Society. Geo. A. Boardman, Esq., has procured an immature specimen in the region of the St. Croix River. The three immature specimens above cited are probably referable to "variety *atlantica*" (Ridg. 591, Cs. 965).

230. Brant Goose—*Anser bernicla* Aud., *Bernicla brenata* Ridg. 595, Cs. 700.—Common; migrant along the coast, but usually passing far out at sea, hence not often shot here. Arrives late in April and early in May.

231. Canada Goose—*Anser canadensis* Aud., *Bernicla canadensis* Ridg. 594, Cs. 702.—Abundant during migrations, arriving in numbers March 20. The spring flight continues until a month, but stragglers are sometimes seen late in May, and early in June, in Maine to the "variety *holkitchii*," which appeared to differ in no respect from the same "variety" shot in Dakota Territory. The Canada geese are usually termed "wild geese" in Maine, and no other species is commonly known here, except the brant geese on the coast. They vary much in size, and shades of coloration of plumage. The average weight of those shot here is less than eight pounds each, and ten pounds is an unusual weight. I once shot one whose lower parts were of a bright buff or cream color, the yellow being more brilliant than the coloration of Audubon's plate in "Birds of North America," with which I made a comparison.

232. Mallard—*Anas boschas* Aud., Ridg. 601, Cs. 707.—Not common. An irregular visitor, usually as a straggler associated with ducks of other species.

233. Dusky Duck—*Anas obscura* Aud., Ridg. 602, Cs. 708.—Abundant. Many breed about the lakes and streams throughout the State, and nesting upon the ground, and laying their eggs usually in June. In August the young ducks, "variety *holkitchii*," which appeared to differ in no respect from the same "variety" shot in Dakota Territory. The Canada geese are usually termed "wild geese" in Maine, and no other species is commonly known here, except the brant geese on the coast. They vary much in size, and shades of coloration of plumage. The average weight of those shot here is less than eight pounds each, and ten pounds is an unusual weight. I once shot one whose lower parts were of a bright buff or cream color, the yellow being more brilliant than the coloration of Audubon's plate in "Birds of North America," with which I made a comparison.

234. Sprigtail or Pintail Duck—*Anas acuta* Aud., *Defula acuta* Ridg. 605, Cs. 710.—Not common. A few seen during autumn migrations, but rarely in spring. Termed by local gunners "gray duck."

235. Gadwall Duck—*Anas strepera* Aud.; *Chaulelasmus strepera* Ridg. 604, Cs. 711. Very rare. Mr. Boardman has procured a single specimen. Two ducks of this species were shot at Scarborough, April 29, 1879, by my friend Mr. Ira Crocker, of Portland, Me.

236. American Widgeon—*Anas americana* Aud.; *Mareca americana* Ridg. 607, Cs. 718.—Not uncommon in autumn, but never abundant. Rarely appears here in spring.

237. Green-winged Teal—*Anas carolinensis* Aud.; *Nettion carolinensis* Ridg. 612; *Querquedula carolinensis* Cs. 715.—Common migrant. Most common in the autumn. Arrives early in April, and is seen in the autumn after all of the new species have passed by. Rarely abundant in spring.

238. Blue-winged Teal—*Anas obscura* Aud.; *Querquedula obscura* Ridg. 609, Cs. 716.—Common autumn migrant, arriving early in August. Sometime rather abundant. I know of but a single instance of the occurrence of this species here in the spring. The late Caleb G. Loring, Jr., shot one at Scarborough, Me., April 28, 1859.

239. Shoreline Duck—*Anas platyrhynchos* Aud.; *Spatula platyrhynchos* Ridg. 608, Cs. 718.—Rare. An occasional visitor from the South. My friend, James Hamilton, Esq., shot a fine adult male at Stratton Island, Scarborough, Me., April 7, 1879. Five ducks of this species were shot near Portland, April 18, 1881, and several more in the same vicinity two days later.

240. Wood Duck—*Anas sponsa* Aud.; *Aix sponsa* Ridg. 613, Cs. 719.—Abundant throughout the State, except on the rocky and sterile hills in the north-western part of the State. The eggs are laid in May, and the young birds fly strongly ere the expiration of July. Strictly a fresh-water duck in habits; this species is only found on our coast as a straggler, where it is occasionally shot in company with ducks of other species. The wood ducks and the dusky ducks are the only species of ducks that breed abundantly in Maine.

[TO BE CONTINUED.]

along, and following were the imprints of the owl's wings, here and there feathers of both, and blood upon the snow. Following this trail a short distance, I reached the spot where the owl had celebrated his triumph by devouring the greater part of his victim. For several feet around were black feathers, blood, pieces of crow's skin and numerous imprints of the owl's feet in the snow. Doubtless the owl took advantage of the crow while sleeping among the hemlocks, and so fiercely pursued him that he fell a victim to beak and claw. This being my first intimation of owl feeding upon crow, I hope to learn more about it through the columns of your valuable journal.—G. ALBERT KNAPP. [We have in two instances known of the killing of the crow by the great horned owl (*Bubo virginianus*).]

MASSACHUSETTS BIRD ARRIVALS.—Brookline, Mass., March 9, 1888.—Having kept notes of the time of arrival of some of the birds in spring, as observed by myself, I send you the record from 1879 to 1883, inclusive, taken at my residence. Following at Newton, Mass.: 1879—February 20, robins; March 11, bluebirds. Following at Brookline, Mass.: 1880—February 27, bluebirds; March 6, robins; March 9, bluebirds; March 13, bluebirds; March 10, robins. 1881—March 3, bluebirds; March 10, robins; March 19, woodcock. 1882—March 2, bluebirds; March 4, robins. The above record for five years shows that in only one of the five have the robins come to us earlier than the bluebirds, viz., in the spring of 1879. The number of woodcock seen in the spring of 1882 led us to anticipate a good season for those birds, but when the season opened, August 1, there were a few broods to be found, and our full flight of woodcock was an utter failure, as far as number was concerned. We shall look for their arrival now as soon as the weather moderates, March thus far having been as severely cold as any part of the past winter, and there being still several inches of snow on the ground.—C. T. D.

A EUROPEAN WOODCOCK IN CANADA.—The occurrence of *Scolopax rusticola* in America is so unusual that every instance of its capture should be noted. Sportsmen should be on the lookout for this species, and if they find it lose no time in reporting the matter. The Canadian *Sportsman and Naturalist* says: "A specimen of the English woodcock (*Scolopax rusticola*) was shot on the 11th ult. [November] by a French Canadian at Chambly, P. Q. Color, size and weight of the bird confirmed the man, who carried the stranger to Mr. Brock Wiltse, a sportsman of this town, but he became incredulous—as we did when it was brought to us in the flesh—that a fat, twelve-ounce European woodcock could be obtained in Canada in November; but its freshness settled the doubt and the bird is now stuffed. We believe that this is the first specimen shot so far inland in Canada. The other record of a specimen occurring so far north on this continent is one taken in Newfoundland in 1866."

DRUMMING OF THE SPRUCE GROUSE.—Editor *Forest and Stream*: The drumming of the Canada grouse is performed exactly as I have related it in *FOREST AND STREAM*—the bird drumming while descending in a very small spiral, from a limb overtopped, and after strutting on the ground for about two minutes, flying back in the ordinary manner. I have seen it performed in a single colony over thirty years. Mr. Smith's account is quite new to me, and if correct, shows a very surprising difference in the drumming habits of different individuals of this species.—PENNSCOTT.

SPRING IN VIRGINIA.—Leesburg, Va., March 7.—Black-birds, frogs croaking, robins, geese going north and other like signs have made us all think of fishing. The small boys have tried the succulent creek with some success, and older folks have caught the young ones. One was taken, however, nipped our plans in the bud. Pies called here "shad" were put by thousands on Goose Creek three weeks ago. These flies are, I think, the caddice flies, having four wings, only two showing when at rest, of a delicate lead color.—T. W.

TO ENTOMOLOGISTS.—We have been requested by its author to call attention to the following circular of inquiry concerning canker-worms:

U. S. DEPARTMENT OF AGRICULTURE, DIVISION OF ENTOMOLOGY, Washington, D. C., Nov. 1, 1882.

SIR: In preparing a bulletin upon the subject of canker-worms, to be issued from this department, I find that much of our present information is of a very general character, and that the two entirely distinct species of canker-worms were confounded in description, seasons, habits and geographical distribution. In many of the publications issued by this department, the two species are not all or insufficiently. The most widespread and best known species is the spring canker-worm (*Plectiscia variata*, Peck). The female rises early in the fall, and lays her eggs in series and exposed manner. If you have any information as to its habits, or delicate eggs. The second species is *Azotopsepsa pometaria*, Harris, and the female rises chiefly in the fall, and lays her eggs in series and exposed manner. If you have any information as to its habits, especially upon the following points, in regard to the occurrence of canker-worms in your own locality:

- 1. Which species, if either, is now found in your own locality, or has ever been found there?
 - 2. When was it first observed there?
 - 3. During what years has it been especially injurious?
 - 4. During what years has it been entirely unnoticed?
 - 5. Has the appearance of the perfect or parent insect been confined to either the fall or the spring, or has it occurred both?
- Whenever any doubt can or does arise in regard to the species observed, it is particularly requested that specimens may be sent to the department, and that the name of the collector, and whether he is a contributor to the department, or a collector, be stated. Boxes and stamps for the return of specimens will be sent to any person who will notify the department of intention to contribute information and specimens.
- Observations may be made during all mild weather from the present month (November) until the middle of June, and the more detailed and the observations the greater will be their value. If you have not the time or inclination to make these observations personally, you will confer favor by handing this circular to some person who will be interested.
- Should this circular come to the hands of any entomologist who has not been notified, it would be respectfully requested that you inform him that you may pass that will throw light on the range and preferred food-plants of either. Respectfully,

C. V. RILEY, Entomologist.

Game Bag and Gun.

To insure prompt attention, communications should be addressed to the *Forest and Stream* Publishing Co., and not to the individuals whose absence from the office matters of importance are liable to delay.

MY FIRST PANTHER.

ONE Sunday afternoon I was seated in my tent on the banks of Bayou Bartholomew, some twenty-five miles below Pine Bluff, Jefferson county, Arkansas. I was engaged in deadening a tract of land for the purpose of opening a plantation. My laborers had all gone off for various objects, and I was left alone. Except my riding horse and pack of hounds there was not a living object about the camp, even my rifle and shotgun were not at home, having been loaned to some of the hands for still-hunting. It was about the middle of November, and the weather though cool was not disagreeable. I was employed in studying some (it ought to have been my Bible) township maps, as I was anxious to enter some lands adjacent to mine, when the son of a neighbor galloped up to the tent in great excitement.

"Colonel, old Colonel papa has got a big panther up a tree on the cypress brake, not far from Couchart Bayou, and wants you to come quick and shoot it."

Now this was breaking the camel's back; my guns loomed out at a time when I needed them more than I ever did before. How provoking! no gun, and this the first opportunity ever offered me to shoot a panther.

"Ride to your uncle's, Sam, as fast as your horse will carry you, and request him to loan me his gun. I will saddle my horse and be ready to go on hawk with you. Perhaps by that time some of my workmen may return and I may get my own gun."

It was two miles to the residence of Mr. Price Copeland. He and his brother, William Copeland, were the noted bear hunters of the country. They were the early pioneers who settled on Bayou Bartholomew, in the southeastern portion of Jefferson county; but being the chain carriers when the land was first surveyed, and were now widely known for their hospitality.

In a short time Sam returned with the gun, and when I looked at it I lost all confidence in its shooting qualities; yet it was the only chance, and I intended to kill that panther if I had to do it with my case-knife. My horse was ready saddled and hounds coupled to prevent their running after any game before I should get to Mr. Copeland; none of the laborers had gotten back, so I was forced to set out with the miserable excuse of a gun that Sam brought. It was quite dark when I left my camp. I was afraid some other bad luck would attend me before reaching Copeland. Our horses were put to full speed to keep the bounds from leaving the road and striking the track of a deer, turkey, bear or other wild varmint.

As we rode together Sam informed me "that he and his father had ridden over on the Arkansas River to Richland, a small country store sixteen miles south of Pine Bluff, and the same distance from my tract of land. On their way home, after crossing Couchart Bayou, they saw a very large panther spring out of the cypress brake and cross the road. Fortunately several of their bear dogs were along, and they gave pursuit. The panther ran parallel with the road for nearly a mile, when it went up a tree on the side of the road. His father concluded to stay in the camp to pick it up the tree until he should get after me, and if I were not at home, to go after a gun and return as soon as possible."

Fortunately I succeeded in getting my hounds to the tree in which the panther was crouched without their striking any trail.

"Furies and thunder and lightning, what kept you so long, Sam? Did you expect me to sleep out the night and you to come back in the morning?" exclaimed Mr. Copeland as we dashed up to him. I explained the cause of my delay, and this seemed to satisfy him. It was now 8 o'clock at night. He had sat on his horse under the tree not thirty feet from that ferocious animal for four long mortal hours to keep it from jumping out, and he was one of the most tired and fretful men that a person could imagine. While I was tying my horse to prevent his running off when I should shoot, I asked him how he managed to keep the panther there, and he said "Oh, I hung on to him, and the dogs, and everything else, until he was afraid to leap out."

My arrival with so many dogs seemed to infuriate the beast. I could hear him tashing his tail against his sides and the deep angry growls, but I could not see him. His color and that of the leaves were so nearly alike that I could not make out his form until Copeland took my gun and pointed him out. I stood in front of Copeland, who was still seated on his horse, though he had turned it round to keep it from jumping on me when I shot, as this was not his hunting horse. I was perhaps some ten feet in advance of Copeland. With many misgivings as to the certainty of that gun's killing the panther I fired a random shot. With the report I felt a rapid movement of the air just over my head and next angry oaths from Copeland and a yell to the dogs to seize him. When I shot, the panther leaped out of the tree, evidently with the intention of springing on Copeland, but he was so very wounded that he fell short of its object and lighted on the rump of the poor horse, most fearfully lacerating it with its fore claws as it struck the ground and then it hounded into the thick cover followed by all the dogs. Running some hundred yards it mounted a snail, bending sapling, and when Copeland and myself got to the place we saw it hanging with its fore feet while the hind feet swung clear. I fired the second barrel, and by the time I fell to the ground it was seized by the dogs and Copeland plunged his knife to the hilt in its side behind the shoulder, before it could do much injury to a dog.

On my way to our respective homes, Copeland asked me, "had I ever eaten any panther meat?" Replying "no," he said, "it was the sweetest of all flesh he had ever eaten, and if I was willing, he would come over to my camp the day after the next day, which would be Tuesday morning, to kill a regular barbecue." To this I readily consented. Before separating, near the head of the cypress brake, not a mile from Copeland, the dogs flushed a large flock of turkeys. "Now," said Copeland, "you come out here early to-morrow morning, and kill a turkey, and perhaps you may get a fat doe also. I saw a track of a bear going into the cane brake just as I crossed Couchart, and I know where he will be to-morrow; I price and I will go after him. I am fully sure to kill a man when I will show you how to cook panther, which you will declare the finest eating you ever had of wild animals. When you return from hunting the turkeys

WELL OWLS KILL CROWS?—Onondaga, March 5.—On the 23d of February, while hunting crows and snowbirds, my rife led me to the banks of what has long been known as the Furnace Brook, about ten miles south of Syracuse, N. Y. Among the hemlocks fringing this stream, the crows, of late, have found a comfortable roosting place. In the early morning, these dusky birds take their flight eastward, seemingly in companies and battalions, under the guidance of appointed leaders. As the sun is about disappearing over the western hills, the sky is fairly darkened by these dusky birds, and they return to the hemlocks. While hanging about in the neighborhood of the brook, I had the evident evidence that a conflict had recently occurred between a cat-owl and a crow. Here and there in the snow were visible impressions of the crow's wings where he had flapped

gator teeth, two young bald eagles alive, live gators, photographic views, etc.

Across the river Mr. Wheeler, of Templeton, Mass., is collecting birds and curiosities for Maynard of Boston. Each boat day brings a large assemblage of yachts to our wharves to take visitors up or down the river. Many of them are boats of small capacity, while the large boats of last year are engaged in Government employ or longer voyages with freight. Capt. Hammond, with his gun, is repairing the houses of refuge on the Pennsylvania. Capt. Bowers, has a Government survey party, the Illinois. Capt. Hendrickson, is carrying lumber to the light-house at Jubiter, and bringing up pineapple slips from Key Largo and banana plants from Lake Worth.

The Hambler, that took Dr. Henshall's party round to the west coast last year, has not returned. We welcome to our waters the new naval sharp-shooter, Com. Douglas, which came in at Indian River inlet two weeks ago, and is lying at Jubiter. Also the New York, a new yacht, built at Jacksonville and run in at Mosquito inlet and through the haul-over to Indian River. She will start on a cruise down the river soon. We propose to haul our sailboat over from the St. Johns immediately and take a large delegation of our party down the Indian River to hunt and fish at favorable places, and visit the big grounds and rookeries on the head waters of the St. Lucie.

The regular southeast winds have set in; the thermometer stands from 70° to 80° in the shade, which gives us just the weather to eat, drink and sleep in the open air. Last year we had five or six weeks of continuous pleasant weather without a single rainy day; and now, as the weather has become settled, we shall look for it to continue this year.

ROCK LEDGE, Fla., Feb. 6.

RICE BIRD.

IOWA NOTES.

THE winter here has been of unusual severity. Sixty-five days straight of excellent sleighing, with snow from one to two feet deep, has, of course, done much to make our course such weather is terribly destructive of small game; we look for no more quail shooting here for years. Quail have been growing scarcer and scarcer here of late, yet in spite of this, and in spite of the prospects of this extraordinary winter, two of our so-called sportsmen, who hunt invariably for the bag all through the season, and for aught I know, none after the season, persisted in the pursuit of the poor Bob Whites, whose whereabouts they learned from their allies in the country, until they have secured it, is proved, nearly all that were left. They probably killed 500 or 600. They have no care for others, and no concern for the future. There are many like them, and while such exist it does seem almost needless to attempt the practice of the rules of honorable sport. The parties with whom I hunted the past season, however, refused steadfastly to kill a single mallard. We did that much; it was so much more for the pot-hunters; they should thank us.

So great has been the scarcity of food that game and birds of all kinds have been rendered almost helpless or unaccountably bold. The rabbits, of which we still have considerable numbers, grew so thin that it is alleged they are quite transparent when skinned. Large flocks of crows have wintered in the door-yards of the residences in our town in many instances loitering so close to man's presence that one could approach within twenty feet of them. Such has been their unnatural desperation that, lighting in numbers about the stock yards of the C. R. I. & P. depot, they have actually been known and seen to alight on the shoulders of a living hog and peck a hole into the living flesh. It became necessary to station men with guns to keep them off. The above statement has been met with Homeric laughter all through the West, but it is nevertheless true.

We saw our first wild geese on the 1st of March. They do not stop here very often now, though twenty years ago, they tell me, the Skunk bottoms were black with them. Most of the geese have passed north of us before the ice is broken up in our streams, and are all gone before the duck season begins. I am told that ducks were seen a week ago; two weeks later, or possibly before, we will have duck-shooting. Everything here depends on the height of the water in Skunk River during the migratory period. When there is, as often there is, a broad strip of water a mile or more wide, running diagonally across the State directly in the line of flight, we often have good sport.

The ducks are about the only game we have. Pinnated grouse almost gone in this section. Ruffed grouse very rare indeed. Even the ducks are becoming scarce and wild, under the incessant fusillade which meets them at all seasons from every boy and every cursed market-shooting pot-hunter who can steal enough to buy one of those abominations, a cheap English breech-loader. Oh! if I were Congress, wouldn't those guns be taxed and barred. I am discouraged. I am disgusted. It is so useless to try to stop the war of extermination. Our game laws are dead letters. Our citizens are afraid to enforce them. The sworn officers of justice, and the very justices of the peace, are too apathetic or too cowardly to take a stand. The gun clubs are the worst pot-hunters of all. I am discouraged, I am disgusted. I am of a mind, at the age of twenty-five, to hang up my gun.

Here in our river, probably the best stream in the State for number and variety of game fish—here where enormous black bass, pike-perch and muscallonge once played unshamed, and would not be fished sport for ages if only gentlemen pursued them, you may notice the effect of the undue greed of man. Traps, set-nets, gill-nets, seines—every poaching device imaginable, and all practiced right under our very noses—have all combined to deplete our fertile waters, till a few under-sized fish, last among the unfortunates, represent the lack of an average day's fishing.

We do not use very fine tackle out here. Our stream is muddy, lined with mud, and fished sport for ages if only with fly bait, is found most effective. Spoon-hooks are often effective in the bayous during the early spring. The fly can be used only rarely to any advantage. The live minnow is our most killing bait.

This is a famous stream for big muscellonge. The nets don't stop them so readily. My father caught one a few years ago that weighed twenty-five pounds. Many have been caught of nearly the same weight. If the schooling were stopped here for five years, our waters would be well restocked. It is a horrid fate for a game fish to die in a prison. It is a horrid death for a game fish to die in a net. May the souls of these slaughtered ones haunt and curse their destroyers!

You see even our fishing is falling off. At the last fishing trip we made last fall, Judge H. S. W., as ardent and jolly

an angler as ever spun a reel, recorded a solemn vow that he would fish no more in Skunk River. But then the Judge was very warm; and he had broken his first-run in a tree.

By the way, in an old number of FOREST AND STREAM, I see that Lieut. Thurston and wife, of our State University, were up in Michigan last season. The big trout that Mrs. Thurston caught should have considered his death a privilege. If the Lieutenant had only told me when I was under his instruction at the university, that he too was a lover of the rod, I should have studied my infantry tactics harder for him.

Let me close my rambling notes by a word of hearty approbation of your course as to the Park monopoly fraud. Be sure your readers will hold up your hands in what way they can. We hope that dreaded national disgrace will not be blotted into our record. And we know FOREST AND STREAM is doing much to keep it out.

NEWTON, Iowa, March 9, 1888.

THE BIG-GUNS.

WE give herewith a sketch of the big ducking guns recently captured from the night hunters of Spessitta Island. From the description already given of the manner in which these destructive weapons are employed we quote: "A gun of this kind is mounted in the bows of a small skiff, which can either be navigated in water or put upon runners, and propelled over the ice. The stock of the gun is braced against a block, so that the recoil sends the boat back through the water, and there is no big shock as there otherwise would be. The gun is usually painted the color of the boat, some dull neutral tint, and is fitted with a patent buoy, by which the owner, if surprised by an officer of the law, can pitch it overboard and return for it again when the alarm is over." The gunner lies in the bottom of the boat and propels the craft with a paddle. "The sound of one of the guns can be heard five miles, and the destruction of ducks is great, as they sleep quietly upon the water. There are instances recorded where eighty-five and one hundred

BIG-GUNS OF SPESSITTA ISLAND.

couvau-bucks were killed at one discharge. On account of this slaughter the law passed by the last Legislature imposes a fine of \$200 or imprisonment for each and every offense constituted by having in possession, using or disposing of any sink boat, sneak boat, big or swivel gun, or killing a duck in the night time in any manner in the Chesapeake Bay or its tributaries." Our sketch is taken from a photograph, for which we are indebted to the courtesy of John E. Scumers, Esq., of Baltimore, through whose exertions, it will be remembered, the guns were confiscated. The sketch represents them as standing by the side of ordinary shotguns, and shows by comparison the difference between the two styles of arms. The largest of the big guns was 10 feet in length, 1 1/2 inch bore, weighed 160 pounds, and was loaded with a charge of 1 or 1 1/2 pound of powder and 1 1/2 pounds to 2 pounds of shot. This one with the next in size were made by an old gun, smith of Havre de Grace, who is still living, though, we understand, he "has gone out of the business." The smallest gun, weighing about seventy-five pounds, was an imported one.

CONNECTICUT QUAIL.—Windsor Locks, March 10.—Good sport for the quail here this winter, most all lived over.—YOUNGSTER.

ST. LAWRENCE GAME CLUB.—The third annual meeting of this club was held at Ogdensburg, N. Y., on the 7th inst. President Hoard reported a steady growth of public opinion in favor of the support of the objects of the society, the indictment of fourteen persons for violation of the game laws; the destruction of seines and gill nets in Oswegatchie and adjacent towns by the agents of this club, and not by officers elected by the people to enforce said laws. He was emphatic in the opinion that the State needs more game and fish protectors, and that there is an urgent necessity for their services; that respecting the appointment of a committee to confer with the Governor on the subject. The report of the treasurer showed receipts amounting to \$512, disbursements \$503, with no unpaid bills. The following twelve trustees were elected: M. D. Packard, J. H. Rushton, S. D. Kimball, of Canton; George H. Clark, of Fullerville; Iron Works; John Webb, Jr., George P. Ormiston, of Gouverneur; J. L. Brown, Alieu Ormstead, of Potsdam; James R. Smith, of Russell; J. McNaughton, J. H. Brownlow, Wm. Peters of Ogdensburg. The Board of Trustees then met and elected the following officers for the ensuing year: L. D. Hoard, President; E. F. Beardslee, Vice-President; N. W. Howard, Secretary and Treasurer. Mr. McNaughton then moved that a committee be appointed by the president, the number at his discretion, to confer with the Governor as to the appointment of game and fish protectors. The motion prevailed, and the following were announced as such committee: J. McNaughton, D. Magone, William Peters, Leslie W. Russell, John Webb, Jr., D. S. Lynde. Mr. Peters moved that L. D. Hoard be added to the committee—it was so ordered.—N. W. HOWARD, Secretary.

"WE ARE FEARFULLY AND WONDERFULLY MADE."—Near Peake's Cross Roads, Virginia, March 5.—Editor Forest and Stream: I have come to the conclusion, after some thought, that our friends of the North are blessed with much more volubility of stomach than their brethren of the South. Some years since, a gentleman from Virginia was on a business trip to a town in one of the Northern States, and after he and the guests had finished their breakfast on the second day after his arrival, a man came into the general room of the tavern where the Virginian was and told the tavern keeper he wanted breakfast. My friend said, judging from his general appearance, he had been "making a night of it." Upon being asked what he would have for his breakfast, he ordered "a salt herring, two large cucumbers and a quart of buttermilk." My friend scraped an acquaintance with the fellow to see what his strange breakfast, and avers that "he finished off the mess with two bisuits, and a half pint of molasses." "Mark West," in your bright elegant issue of the 23d of February, gives us the second bowler to this order, but takes his liquids after instead of before the feast. Hear him: "That evening, after we had reached home and had dispatched of an enormous quantity of shiplocks I believe the men fried in grease, stewed (o) grouse, milk and pumpkin pie. Sam set a big pitcher of cold cider upon the table." Mr. Glover, same issue, informs us that in his part of the country they "consign" undesirable whelps "to the water bucket."—R. M. C.

NOTES FROM WORCESTER, MASS.—March 10.—The annual meeting of the Worcester Sportsmen's Club was held Wednesday evening, March 7, at the Bay State House. The officers elected for the ensuing year are: Maj. L. G. White, President; Wm. S. Perry, First Vice-President; John B. Goodell, Second Vice-President; Chas. Hartwell, Secretary; O. L. Tait, Treasurer; G. J. Rugg, A. B. F. Kinney, C. A. Allen, O. A. Benoit, Executive Committee. The club was organized nine years ago, and was never in a more flourishing condition than at present, the treasurer's report showing a larger surplus than for several years. It was voted at the annual meeting to hold a "fishing day" sometime during the trouting season, which will be conducted on the same general plan as the annual hunt, the fish dinner to be served on the evening of the following day. C. A. Allen and O. A. Benoit were chosen captains, who, with Secretary Hartwell, constitute the committee to arrange a scale of points and perfect all the arrangements for the affair. It was thought best not to fix the date later in the season. The perfect one is an enthusiastic trout fisherman; but anything that is to wind up with one of Landlord Shepard's elegant dinners at the Bay State House is apt to take wonderfully well, and the members look forward to this affair with much pleasure.—K.

SUMMER SHOOTING.—Would not the law respecting deer be about as satisfactory as possible if it permitted the shooting of bucks in July, August and September, but forbade the killing of does before October? I know summer venison is poor stuff; still there is such a desire for it that perhaps the law would do wisely to allow it to be killed if that can be done without infamously or dishonourably unduly the sport. The only objection to killing the males in July (as compared with September) is their poor condition. I suppose the supply would not be materially reduced, although the bucks should be much less numerous than the does. An apparent objection to this suggestion is the difficulty of enforcing the proposed law. But is it not, generally, nearly as easy to prove that a doe was killed as that a doe was killed, at a certain time and place? On the other hand, the temptation to break the law would be much diminished.—PICKET.

NEWS FROM WOLF POINT, MONTANA TERRITORY.—Feb. 25.—Editor Forest and Stream: We have had a very severe winter, but game of all kinds has done well. Buffalo, deer and antelope up to this date are in good condition. The Indians and white hunters have had quite a dispute over hunting on the reservation; but with the aid of the military and the Indian agent, N. S. Porter, the whites had to win the ranebe. Ducks and geese will be along to visit us again in about twenty days. Have done very little hunting this winter, cause, I lack of time, but earlier part of the season I have used my premises, and myself saw him fire (tests these words) he had more than a hundred shots from his traps, the loads of which were "air-spaced." Neither rifles nor shooters were injured.—C. A. M.

CONVERTING THE GUNSMITHS.—Philadelphia, March 12.—Editor Forest and Stream: As a dealer and gunmaker I could at first hardly support Mr. Heath's astonishing statement; but there need be no doubt entertained by any reader that his statement has been proved. In the earlier part of the tests I have used my premises, and myself saw him fire (tests these words) he had more than a hundred shots from his traps, the loads of which were "air-spaced." Neither rifles nor shooters were injured.—C. A. M.

GUINEA FOWL AS GAME BIRDS.—I will give you my personal experience. In the year 1856, living in Deaorchon county, Southern Indiana, on a farm that was not being cultivated, I bought a large number of common domestic fowl, also about one dozen guinea fowls. At first the guinea fowls stayed around the barns with the others. In a short time they missed them. Occasionally during the summer we would hear them in the neighboring fields, which were grown up with high weeds. In the month of September, while out with my dog and gun after quail, I noticed the setter act in a strange manner. He would come to a point and then start on again. Finally the dog flushed a guinea fowl; soon afterward two more. I came to the conclusion that they were my own birds, as there was no other house within half a mile. Soon my dog came to a very strange point. I walked in and put up a guinea, and shot and killed it. In one hour's time I shot four more. This being all I wished, I returned to the house. During the fall months at different times I shot forty-one guineas, and had capital sport. When the weather got cold, in December, the rest of the guineas came up to the house (I should judge at least thirty birds) and roosted in the barns and sheds with the other fowls. As a game bird they make capital sport, being somewhat quicker in flight than the prairie chicken, to which their habits are very similar, only that when the weeds are dry they would run a long distance before taking flight. Their flesh is quite dark, and when young they are very luscious eating. I prefer them to the prairie chicken.—**B.R.D.**

MAINE LAWS ENFORCED.—**MORSON**, March 5, 1893.—*Editor Forest and Stream:* Warden Morse of Eddington, Me., has been making some official visits to this region, which have proved very effectual. Some members of the Piscataquis Game and Fish Protective Society informed him of the transportation of a quantity of deer en route for Boston, and Tuesday, February 27, he pursued them and seized thirteen venison saddles at the express office in Dexter. The Grand Jury being in session at Dover he had the parties indicted, but up to this time they have not been taken by the officers. They appeared as soon as they received information that their plunder had been taken. The game laws are being unusually well enforced here now. We have a sound public sentiment among nearly all of our citizens in favor of prosecutions, which is a great aid to the officers in their work. The bill before the Legislature to raise the annual appropriation to the Fish and Game Commissions from \$5,000 to \$7,500 will undoubtedly become a law.—**J. F. S.**

MASSACHUSETTS.—**TANNON**, Mass., March 10.—*Editor Forest and Stream:* I clip the following from the recent issue of a Cape Cod paper, the *Harwich Independent*: "Mr. C. A. Cuhnon is getting signatures to the following petition: 'To the Honorable Senate and House of Representatives assembled: We, the undersigned, do hereby ask your honorable body for a special act prohibiting the shooting or taking in any way any wild duck, commonly called black duck, by the use of decoys, whether wood decoys, live duck decoys, or any other kind, at any season of the year, except the months of October and November of each year, for the term of five years (such act to go into effect on its passage), in any of the ponds commonly called and known by the name of Cliff Ponds, viz., Big Cliff, Little Cliff and Lower Cliff, situated in the towns of Brewster and Orleans, Barnstable county, State of Massachusetts.'"
—**CHESTER.**

LONG ISLAND ASSOCIATION.—The annual meeting of the Long Island Sportsman's Association was held at the headquarters of the Remondin Gun Club, No. 451 Flatbush avenue, Brooklyn, Monday evening. The following officers were elected for the ensuing year: President—Henry Allenbrandt, Washington Club; Vice-Presidents—Charles W. Wingert, Fountain Club; Hugh McLaughlin, Coney Island Club; Robert Rinson, Long Island Club; Charles W. Rodman, Garden City Club; Samuel S. Conant, Nonpareil Club. Secretary—Henry Thorpe, Long Island Forester Club; Treasurer—N. D. Cooke, Fountain Club. Legislative Committee—Abel Crook, P. O. Chamberlain and P. S. Massey.

EUROPEAN BIRDS IMPORTED.—The steamer *Hohenstaufen*, of the Bremen line, which arrived here March 10, had on board a large shipment of English partridges and pheasants, consigned to Messrs. Charles Reiche & Bro. The birds are for the stocking of Mr. Pierre Lorillard's large game preserve at Jobstown, N. J. There were also several pairs of golden and silver pheasants, which will not be returned out, but kept in the pheasant house. Mr. Lorillard has received 100 pintaded grouse (prairie chickens) from Indian Territory for stocking the same farm.

THE ENDLESS DISPUTATION.—**LEESBURG**, Va.—The shooting season having come to an end the gunners spend their time quarreling over the merits of their respective guns, each having advocates who claim to have severally "the best gun in America." Then they quarrel over hammerless and with hammers made by same maker. All the disputants are disinterested, of course, though strange to say, each happens to admire his own.—**T. W.**

STONEHAM, MASS., March 7, 1893.—At the annual meeting of the Stoneham Sportsmen's Club, the following officers were elected: President, P. H. Horne; First Vice-President, Elbridge Gray; Second Vice-President, J. D. Pierce; Secretary, B. R. Houghton; Treasurer, E. M. Switzer; Trustees, B. W. Jones, John Norton, William Whowell.

NEW JERSEY.—**LAYTON**, Sussex County, March 8.—Quail have wintered good, and thus far have found plenty of good feeding ground; the prospects are that they will be more numerous this coming fall than for many years. Partridges are scarce.—**D. B. L.**

NEW JERSEY.—**TOMS RIVER**, N. J., March 11.—Quail have wintered well in this section. I do not believe that a single bird has perished from cold or want of feed. Am looking out for snipe to be along very soon.—**H. CLAY GLOVER.**

Statistics of a quail hunt in Georgia, gathered by the *Atlanta Constitution*, the Marietta & North Georgia road is the great route for quail hunters. The other day there were 23,000 worth of dogs (cash valuation in the baggage car on that road, attended by \$6,000 worth of negroes (old valuation), and the catch was 81,400 worth and 59 worth of quail hunters. On the return trip they had \$5,800 worth of birds, and they ate a \$20 tubach.

Camp Fire Flickerings.

"That reminds me."

READING "Reidgold's" account of a remarkable coincidence happening to him on Long Island, recalls to my mind as singular a coincidence; but I can hardly call it similar, as neither the place nor birds were the same. It was in the latter part of November, and we lay out a point in the Great South Bay, directly opposite Babylon. The sun was slowly looting up in the east, the wind blowing from the same quarter in a way that would have gladdened the heart of Wiggins, could he have foretold its coming; and as for the cold, well that can only be appreciated by those of you who have spent a winter's day in a crumpled-up shawl on the unprotected "marsh" of the great South. My man and myself were lying in the bottom of the boat shivering, and not the sign of a bird, excepting a great bunch of broadbills, that seemed to drift lazily along with the wind, at a distance of a mile or so from shore, but never venturing nearer.

You can well believe that I was not feeling extremely lively; so to make things agreeable as well as to kill time, my hayman (thanks to him for the attention shown me during that pleasant week spent on his trim little styer sloop), led off with a string of manylegs, shooting exploits, all of which had been performed by either himself or his father. I listened to a number without comment, until he came to one which struck me as being a "Davy Crockett," sure. The story went as follows:

He was gunning at the mouth of a small creek with a miscellaneous lot of "stoos" set out and upward, of forty birds heaped upon the stern. Suddenly he discerned a bird of enormous size making directly at him or his birds, he was in doubt which to put himself in the line, he fired two barrels simultaneously, but although he wounded it, failed to stop the bird's onward course. "I saw now," said he "that it was an eagle, and a big one, too, so I did not lose any time getting" overhead, although it was near the middle of winter. He struck square in their boat and in a minute was out in their water after me, but I took an oar with me when I went over, and although I killed him with it he tried to drown hard to get his claws in me.

This yarn I received with an ill-concealed sneer, and suggested that probably he had indulged too freely in "tangle foot" that morning, and had fallen overboard, and I was ridiculing the idea of the bird falling into the boat, etc.; but I was cut short in my remarks by the sudden appearance of a dark object directly in the sun's rays which seemed to be coming straight at us. I took a snap shot at it and passed for results, which came in a very unexpected manner—*such a bang!* and before we could duck our heads—a fat old sheldrake landed directly in the boat between us. "There now," triumphantly shouted my hayman, swinging the bird aloft, "you won't believe my eagle story?" "Yes," said I laughing, "I believe it now, after having it so well illustrated." We had a narrow escape indeed. **H. L.**

BROOKLYN, L. I.

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

I enjoy a good joke or argument, but I don't think much in a man who uses such words as "blow me," "stump me," "havin' about wits," "Darns in stockings is signs 'er" "onst en' unobjekshunabul poetry, but in conversayshn they show a poverty of lengwidge.—*The Kalkreuth Advertiser.*

WITH HACKLES AND GENTLES.

VIII.

"Bright blaid' the fire of crackling wood,
And they around a charming gleam;
In front a vast oak table stood—
A bacon-rack hung from the beam;
Pipes, mugs, the chimney-peece well graced—
In rows the fishing-rods hung o'er;
On each side other skins were placed—
A rap!—cries dame, 'Who's at the door?'"

CHORUS.

"Some jolly anglers," loud they call,
"T' enjoy the pastime at Trout-Hall!"

WHAT a pretty picture of an English angler's inn doth the above verse give, and especially to those "to the manner born!" The old song goes on to portray the good cheer of the dame's house, and often reminds one of the simple and pleasant conceits of the "Compleat Angler," and of the "innocent mirth" indulged in by the great master of the "gentle art" and his beloved pupils and "chance-not fellow craftsman."

How effective are the "otter skins," hanging by the quaint old chimney-piece in that they suggest to the angler that, at least, just so many deadly enemies of the trout are well rid of. A brace or two of other hounds should have been added to the scene to make it perfect! Left to the imagination, however, we can place them to suit ourselves, and thus that generous blaze or under that sturdy table, but before being placed to the old and cunning four-legged race of otters has given place to a new and less noble genus, wholly devoid of the better and fully endowed with the baser qualities of the extinct species.

This new pest of our trout streams goes about on two legs, and has not the discriminating taste for noble fish that the old-time otter had, but is equally greedy. It is a shame—a pitiful shame—that such human otters exist, and it were well if a breed of hounds were "to the fore" capable of "drawing" them and giving to each and every one the fate of "varmin." Their skins, however, should never be displayed in any "Trout Hall," but, rather, at cross-roads and by streamside, as a warning to any existing whelp of the family of the probability in store for him.

It is the boulder days of every sportsman, angler, shooter, or huntsman, to constitute himself, as far as may be, a game keeper on his own "preserve." In other words, to guard his own interests and those of his craft against the encroachment of any poaching pursuit of game in close season, the needless destruction of game at any time, and to see that the

laws are wise ones and rigidly enforced. There are many towns (alas! too many, in this beautiful age and country!) which have no more respect for the game laws than for the noble trees that are, one by one, felled to the ground. It were well if some movement might be made to post, in many conspicuous places, cones or signs, to close seasons, and the penalties for infringement of the same. The publisher of every local paper ought to be willing to publish such, if concise and digested, and in every village, post-office and shop there should be a copy, also. Ignorance (even in these enlightened (?) days) is an excuse for many a wrong doing, where, if it be, the unwitting transgressor would be a model of propriety, if he but knew what the law declared, right or wrong. One point suggests itself: Early in April of last year, I was driving on a country road, and enjoying the first advance of spring and the songs of robins and blue-birds, when in a neighboring field I saw a man (he proved to be snick after all) with a shotgun in his hands and two little boys at his heels. I kept "my eye on him," and by so doing plainly saw him level his gun at a robin and fire, evidently without effect. He then deliberately loaded his gun, and before the charge was driven "home" challenged him to halt, and leaving the hunters, I stalked him, and a brisk walk brought me within talking distance and to confront him. Telling, by a glance, how best to address him, I asked him if he was aware that a law existed forbidding the shooting of song birds at any time and especially in the spring? He replied that he was not aware of any such law; that he came out to shoot a bird or two, to please his boys, who were teasing him every day to "go a-hunting"—as he expressed it.

He said he had not shot any nor injured any and promised me not to do so. I told him the penalty was ten dollars for every bird killed and that he should set the "boys" a better example. That I felt it my duty to tell him and that "a word to the wise," etc. I left him and drove on my way. A few weeks since I had occasion to take the cars at the little station nearest to the above mentioned road and field, and to my surprise the "hunting" pater familias recognized and addressed me. He said that he found I was right and very courteously thanked me for "stopping his little game." In the few minutes before the coming of the train we had a little rational talk about game laws and humanity, and I was pleased to find that, barring this one graceless, thoughtless act, he had a fleshly and considerate heart hidden away under his coat. This man might have shot robins and bluebirds all day long had I not chance to be near him, but he was not a bad fellow, and as he is known and respected quite as well as the forgotten one of the "Hedes and Persians," but I have reason to think he was honest and that he will make others so likewise.

This is a long digression from my subject and intent—so long a detour is it that I shall not try to find my way back, but will "run riot" to the end of this rambling chapter.

The passing sweet once in a while to wander up and down a brook, with now a "pasher handle," and now a "May fly" on the leader, and to bring to credit on to a few brace of well-conditioned fish. To go from deep to deep, from one likely "hole" to another, pausing often to note the changes of the passing months on the banks of the stream, and to be quite as well pleased to know there are still trout in the favorite stream as to take them thence. Trout are not always "on the feed," and why should the angler be always on the greed to kill them?

There are waters in which I would not cast a lure for a "sizable" trout, even if I knew I could bring him to net. Why? They are sacred to the past! To the past jolly anglers, "who have fished with me there; to the past goodly trout that erst bent my rod there!"

"Valve of bliss! what joy to wander
Where thy glittering waters flow!
Here en Gault in peace may ponder,
Here Despair forget his woe!"

Too sentimental? Nay, not so, good friend. Think for a moment what sport would be if robbed of sentiment—mere cold-blooded butchery! Who would go to an abattoir for sport? I will add, also, who would go to a battle, in the wildwood, when the half-famed birds almost touch the muzzle in their startled flight? The average life is too void of sentiment, as many a goodly dish is too void of seasoning, giving no zest to the palate nor vigor to the stomach.

The will and forthright only is needed to make of his life less full of care; to place a rose here and a lily there in the pathway, to unbar the senses to all the genial influences that revel in wood and water, in the sky above and earth beneath, and let them in to join with sentiment in making life less a treadmill and more of a goodly pleasure. At any rate, and however with others it may be, our beloved master, "honest Izaak Walton," set the craft a noble example of cheerfulness and sentiment, and we can but follow hard after. Few anglers can have a "Trout Hall" in every "outing" or at every corner; but, when arrived at the welcome portal, let him stay without doors who cannot sing with honest zeal:

"Begone, dull care! shouts every soul;
To thee this is forbidden ground.
Begone! Thou never canst enthrall
The jolly anglers of Trout Hall!"

O. W. R.

SOMETHING ABOUT THE PIKE-PERCH.

Editor Forest and Stream:

Ever since your call for something concerning the wall-eye pike-perch I have been expecting some game warden to send in praise of his beauty and goodness and game qualities. But so far nothing has appeared but the short and disparaging communication of "Wall E. Pike," which only goes to prove what I long ago said in your columns, that the habits of game and fish so differ in varied localities that it behoves those whose observations have been limited to their own neighborhoods to be careful of making sweeping assertions in matters of natural history. In instance whereof, one of our foremost and most delightful writers on out-door life held for twenty years that bees never gathered honey from the arbutus, but at last he caught them in the act, as eager for the sweet heart of the scented blossoms as any woods-haunting dower hunter for the blossoms themselves. If anyone else had reported such doings he would not have believed the tale, but his own eyes were witnesses whose testimony he could not gainsay.

If you were to ask those who "go a-fishing" in Lake Champlain what fish is of its waters afford most sport, I am sure that nine-tenths of those who fish for sport would name, first the black bass, and next the pike-perch, and would tell you that the last is generally a bold bitter and fights well, if not

Salatoga. Heap washee in Salatoga, water all taste like old tin pill, all tist."

"Well, Sam! was that all the trout you took, one horned dace?"

"Yes, tont, hawn dace, alle same, some calle tloute, some calle hawn dace. Calle tlout when Melican man scoope himself, calle hawn dace when oller feller or Chiu-na-man scoope. Alle same, I cateche tlout like Melican man in Adonckock."

"With a smile that was childlike and bland, Sam Lung pungled off in the direction of the Brewery, scarcely soiling the white soles of his shoes in the mud of Broadway as he crossed it. I think I'll take him into the woods next season."

THE THIRSTY PELICAN.

"SKIP THE HARD WORDS."

IF there be any among the readers of FOREST AND STREAM disposed to doubt the truth of that alliterative axiom embodied in the copy-book sentence of their boyhood, "Many men of many minds," they will find ample ground for the re-establishment of their faith in perusing the communications of some of your correspondents concerning weight of rods, position of reels, and other moot points in connection with the angling art, and these discussions certainly form most interesting and instructive reading, especially to those who, like the present writer, are tyros in the craft, or, at least, are not above seeking an addition to their stock of wisdom from that supply which, according to the Good Book, is possessed by "the multitude of counselors." Indeed, I presume that I am, as the genial "Nesmuk" observes, "well right" in supposing the arguments contained in those communications to be intended for the benefit and edification of an audience who may be interested in the subjects discussed, and not for the sole behoof of the disputants themselves; otherwise they would send them to each other through the usual channels of private correspondence, instead of displaying them in your columns.

Acting on this presumption, I am emboldened to offer (together with thanks for the share of their knowledge which I have thus received) the suggestion that in the discussion of matters of detail pertaining to a "gentle" rod, a little more gentleness might not be out of place, and that objection, insinuation and vituperation add nothing to the strength of an argument. Siding humbly at the feet of these piscatory Gamaliels, I, for one, am willing and glad to hear all they may have to say about fish and fishing—the habits of the first and the methods of the last—but it does seem to me rather hard to be compelled to listen also to the disagreeable things they may choose to say about each other; for, while it interests me to know what so expert a fisherman as X thinks about the proper position of the reel, and what are the opinions of so high an authority as Y, on the subject of weight of rods, I don't in the least care to be informed that each of those gentlemen considers the other an ass, or that Z, who differs from both, holds them to be a pair of knaves; and I muckly, but argently, appeal to argumentative members of the craft to "study to be quiet," and to leave barking and biting, growling and fighting to Congressmen and truck-drivers, and not to degrade their vocation by making faces and calling names, especially after all that has been said and sung concerning the mild and refining influence of the pastime of angling.

What would our patron Saint Izaak say to such acrimonious disparagement as his followers, think you? And would you care to encounter such an episode as this among the pages of "The Compleat Angler"?

- VICTOR.—Methinks, Master Piscator, that your wined is misplaced on your rod, being behind your hand.
PISCATOR.—Humph!
VI.—And I would further make bold to say that your rod, in my opinion, is a trifle too long for the dexterous casting of a fly.
PISCATOR.—Humph!
VI.—And moreover, your line, to my eye, is prodigiously heavy for the use of an angler, and I have no doubt that the catching of his fish, but rather profane to the pleasure of the fish, his sport shall arise from the skillful handling of his trout or grayling with his light tackle.
PISCATOR.—Humph!
VI.—Also I think—
PISCATOR.—Those fish—
VI.—And both neglected to crop (thine ears? Thou sayest varlet) dost thou undertake to instruct thy grandmother in the snaking of eggs? Why, thou malapropos scound, thou pol-walloper, thou dol, dost thou venture to vex thine ears with the senseless chatter? Look now, thou curvy-kaw, how I shall speak thy nose—no. And take thou this enty—and tise—and this—and now this stinky kick in the middle of the broom. And so, be thou there, and may thy manners be bettered by the wetting! [Exit.]

TRUCHEUX JAMES.

PIKE FISHING THROUGH ICE.—Onida, N. Y., March 3. —On the 23d of last month, with a friend I went to Fish Creek, at the head of Oneida Lake, for a little fishing. Arriving at the hotel, we found mine host, Spencer, of the "Forest Hotel," had some fine holes cut and looks ready set which we could use. After an early dinner, set to work. Five of us had all we wanted to do to tend forty hooks, and Thursday P. M. and Friday morning we captured one hundred and twenty-six pike, which weighed over one hundred and sixty pounds. If anybody in Central New York would like a few days' fishing next summer, they will do no better than to try Onida Lake, Constantia being, in my opinion, the best place for bass. Game Warden Dege and his rindsey wanged an increasing war against trout here the past three years, and are to be thanked for the fine fishing, which was never better than last summer. They destroyed in one week as high as eighteen trap nets.—E. C. W.

NEPESIN RIVER.—Indianapolis, Ind., March, 1888.—I usually get statements of the number of visitors to Red Rock after the close of the fishing season, but it was delayed, and I have only just received it for last summer. The number was smaller than the average, being only forty-two, twenty-four of which were from the "States." The catch reported averaged about sixty pounds per visitor. This is not large, nor can it ever be large if the rules of the river are observed, but it is a good luck to supply fish for an Indian camp, as sometime happens. The season being cold, prevented many from visiting Red Rock last year.—H.

NATIONAL ROD AND REEL ASSOCIATION.—There will be a meeting of the association at the Metropolitan Hotel on Friday, March 16, at 2 P. M. Business Dege and his rindsey will be brought up, and it is possible that preliminary steps will be taken toward a tournament to be held some fine next summer. All anglers are invited to attend.

Fishculture.

IMPREGNATING SALMON EGGS.

Editor Forest and Stream:

I was much interested in the report in your columns of Mr. Stone's experiments on the impregnation of salmon eggs, having at various times made many similar trials myself, and as I have expressed a wish for further reports on the same subject, I will give you a selection of my own experiments. If in some points my results do not agree with Mr. Stone's, it will be well to bear in mind that we were working with different species of salmon. Further, it is very true, as you say, that to establish a rule of procedure the trials should be often repeated. Contradictory results are sometimes obtained from what are supposed to have been identical methods; but as like will unerringly produce like, a divergence of results proves that there were some minor differences in the conditions of the experiments which were at first overlooked. Such minor sources of error can generally be selected by many repetitions carefully performed and carefully compared.

To-day I will give you the results of some experiments, all being on a single point, the one aimed at by the first three in Mr. Stone's series, namely: How long salmon eggs may safely remain in the air before the molt is applied.

EXPERIMENTS WITH SCROOD'S SALMON, NOV. 17, 1877.

Table with 4 columns: No. of experiment, Species, Time in air, and No. eggs which hatched. Rows include Scrood's salmon and various other fish species with their respective incubation times and hatching percentages.

* This experiment will appear again in another series, which will show that the failure to impregnate was not wholly the fault of the eggs.

These eggs were placed in a vial without water, corked tight, buried in sand under the water of the stream, and left for 24 hours, after which they were treated with fresh milk from a new mare.

Taken as it stands, the above would lead to the conclusion that it was much better to keep the eggs, exposed to the air an hour or two, than to mix them immediately. But I think I shall be able to point out in another communication the source of the error that leads to such a remarkable conclusion.

CHAS. G. ATKINS.

GRAND LAKE STREAM, Mo., Feb. 25, 1873.

THE WISCONSIN COMMISSION.

THE ninth annual report of the Commissioner of Fisheries and Wisconsin for 1887 opens with a sketch of fishculture and a description of the State hatchery at Madison. The statistics, however, are somewhat meagre, and the property of the State at this point, which is worth at least \$10,000, are in good repair and condition. The capacity of the institution now is 4,000,000, and it will be run to one-half its capacity, or 2,000,000, and the company has been engaged in excavations in the earth, three to four feet deep, and of varying lateral dimensions, lined and bottomed with hemlock plank and supplied with screens so that the whole body of water may be drawn off into gravel at the bottom. In accordance with the opportunity of daily cleaning, the fish, thus of considerable importance in view of the large amount of animal food that sometime sinks to the bottom. A branch hatchery is being established in the building of the Milwaukee Exposition building, and after that, which will be devoted to whitefish and lake trout.

The superintendent, Mr. James Nevin, makes a very good report of work done. He says: "The ova in the new hatchery are laid on wire trays instead of on gravel as formerly. We have at this date in the hatching houses 1,500,000 brook trout eggs, with the expectation of half a million or more by the 1st of February. Unless some unforeseen event occurs we expect to be able to fill all orders for trout fry this coming spring. From the number of moonfish trout we have on hand we ought to be able to have some two hundred thousand fry to distribute during the month of June next. The Milwaukee branch of the State fish hatchery is in the basement of the Exposition building, and is a most comfortable room can be found for the propagation of lake fish. During the past summer the hatchery has been overhauled and renovated to harmonize with the improved apparatus for hatching, and its interior is a model of economy and convenience. The apparatus consists of a large glass jar over the Holten hatching-box for the hatching of whitefish and wall-eyed pike was so apparent that the board directed their disbursement, and authorized the purchase of one hundred glass jars to take the place of the iron work is now done by one man, Martin O'Brien, and other men in charge. Otherwise, with the Holten box, he would require the help of four or five all winter through. These jars are 20 inches deep and 7 inches wide, with an oval-shaped bottom, with a glass tube extending down the center of the jar to within one-eighth of an inch from the bottom. The water is brought from the supply pipe by a half-inch wooden faucet, a small piece of hose connects the faucet to the center tube, and when the water is turned on, the water rises in the tube, and over the bottom of the jar and branches off, and keeps the eggs in constant motion. The motion of the eggs is regulated by the faucet. The eggs that are not impregnated turn white, and being much lighter in weight than the good ones come to the surface. The officer in charge of the eggs notes the impregnation, and with the increased volume of water the bad eggs rise and flow off, which saves a great deal of extra labor. I was not successful in getting our full quota of eggs this fall to all the one hundred and twenty-five hatcheries in the vicinity where we collected the eggs and not knowing where

the spawning grounds were. However, we succeeded in collecting in all seventeen millions, and will have in the neighborhood of sixteen millions of fry for the lakes this coming spring, as the eggs at this date are in extra fine condition."

An appendix contains an extract from the Michigan report, corrected and "State" and "Federal" fish culture, and the commissioners of fisheries. "We notice a trifle of carelessness in the make-up of the report, such as the retaining a printer's error in inserting a whole paragraph not intended to be printed in the New York report, and the omission of fish culture was taken; and the publication of a two-year-old list of fish commissioners and superintendents, in which the name of their own present superintendent does not appear; other wise the report is very readable."

THE CONNECTICUT COMMISSION.

WE have the Seventeenth Report of the Fish Commission of Connecticut for 1887, also the First Second Report of Shell-fish Commissioners. They call attention to the pollution of waters by the refuse of mills and factories, often lime or other bleaching material, which is deadly to fish, and quote the article on "Preventing and Raising of Fish by Bleaching Powder," from the Chemical Review, which has appeared in our columns. The hatching and distributing of brook trout is increasing. In 1880 the number distributed by the commission was 10,000; in 1881, 277,000; and in 1882, 525,000. Of brook-trout eggs, 10,000 were planted in the waters of the sea salmon over 265,000 were planted, 10,000 of them in Mill River, at Southport, and the remainder in Farmington River. Nearly five million shad were hatched and liberated. The demand for carp continues to increase, and the supply from Prof. Baird and sent to different persons. Some that were only two inches long when received two years ago are now of two pounds' weight, not as great a growth as in more northern waters, but fair for these colder ones. They have not been taken out here for sale, but are being planted.

The report on the shell-fisheries is somewhat larger, and contains a map of the triangulation of the Connecticut shore of Long Island Sound from the Connecticut River to Rye. The report contains much information concerning the oyster beds.

FISH-CULTURE IN KENTUCKY.

—Our fish commission has made an allowance of funds could do, and work for glory, and our Senators have done all they could through our Central United States Fish Commission. We have planted in the principal waters of Kentucky the California salmon, glass-eyed perch and Mackinac trout. In our private ponds we have also planted the edible qualities of the carp have been called in question. "That reminds me!" Some people would grumble if they were going to be hung; and the same party that says that a carp is not good eating (when properly cooked), most likely would sneeze at the idea of eating a wild fish. Now for the cooking. A carp of five pounds weight, nicely cleaned, wrapped in a towel, and cooked in a kettle of boiling water. Then boil fifteen minutes; turn off the water; take up the carp, cut of head, and cook in a kettle of water and baste as it roasts in the oven. Serve on hot dish and garnish to suit taste. Now I have eaten almost all kinds of salt and fresh-water fish, and say without fear of contradiction it is a fair, agreeable fish, and will call Col. Ferguson, of Baltimore, to back me.—W. J. AYRWAY.

THE KANSAS COMMISSION.

—The Fish Commission of Kansas has issued his third biennial report for 1887. Many carp have been distributed to the principal waters of the State and a monograph on carp and carp culture, with illustrations, by Capt. Milton P. Peave, comprising forty pages, is also given. The latter is substantially the same as that given by Capt. Peave in his book.

THE DELAWARE COMMISSION.

—The first biennial report of the Commissioner of Fisheries of Delaware for the years 1885-86 is before us. As the State has just begun to take a hand in the good work and has made no appropriation for it, not much has been done except to distribute the carp received from the U. S. Fish Commission. A beginning has been made, however, and we have no doubt that the Commission will be granted the necessary appropriation if a hatching house is needed and also money to do other work. The report is very creditable under the circumstances.

SOUTHBIDGE, Mass., March 8.

—The Rod and Gun Club are perfecting arrangements for a weekly shoot. They have some good shots among them, and hope to make an enviable record. The few carp which they have received have been raised in one of the ponds. They also have applications for more.

"NIGGER MIGHTY HAPPY."

PLANTATION SONG.

HOG start a-plantin' when de overseer callin'; Whipperr'y holler when de Jew-traps fallin'; Doo de cow-a-quackin' when de black-birds callin'; Crows caw together when de young corn growin'; Pig gwine to squeal when de milk-maids churnin'; Nigger mighty happy when de blackberries tumin'; Sute'l go to jump when de sick-barks comin'; Bee-marth start when de honey-bee hummin'; Loo-baw nicker when de punkin-ripe spreadin'; Rabbit kick his ear when de cabbage-stalks headin'; Dog howl when de corn growin' in de row; Nigger mighty happy when de hoe-cake bakin'; Big fish flutter when de bone catch de cricket; Bullfrog likely when he sing in de licker; Frog sit slicker when de water in de gutter; Cot' it mighty early when you turn him in de clover; Cot' it mighty early when de nigger man do; When he squint in de eye, he say de nigger Nigger mighty happy when de hoe-cake bakin'; Backsack watin' while de old hen hatcher; Sparrow hawk lookin' while de little chicken scratchin'; Big owl jolly when de little bird singin'; Pigeon gwine to squawk when de white-birds swingin'; Nigger mighty happy—ef he ain't w' a dollar; When he startin' out to 'bin' in 'a tall tan' 'briar.—J. A. MASON, in The Century "Culicidae."

A NEW FREEMEN'S DEVICE.—The Milwaukee Wisconsin is proud and happy in the belief that if the Newhall House were to occur again there would be little loss of life, because the firemen of that city, taught by misfortune, have become experts in the use of all sorts of fire-appliances. One scheme in particular recommends itself to every one of imagination and experience. The plan is a future emergency will be to shoot ramps, with string attachments, into the windows of the burning room. The only drawback is that the execution of this idea is that a terrified guest, standing in a window shrieking for help, will be very much surprised, and not immeasurably tranquillized or reassured, on finding himself suddenly trampled with a three-foot ramp and a coil of string. And, unless the firemen of Milwaukee become vastly better marksmen than the police usually are, the probability is that not a window in the hotel will be broken, while the streets will be filled with a throng of firemen and firemen's citizens palling ramrads out of each other.—Philadelphia Press.

The Kennel.

FIXTURES.

BENCH SHOWS.

March 26, 27 and 28, 1888.—Dominion of Canada Kennel Club. Bench show at Ottawa, Canada. Entries close March 18. Charles Lincoln, Superintendent.

April 3, 4 and 5, 1888, Western Pennsylvania Veterinary Society's English Annual Meeting, Pittsburgh, Pa. Entries close March 19. Clin. Lincoln, Superintendent. C. R. Ebbett, Secretary.

April 3, 4 and 5, 1888.—Westminster Kennel Club, Seventh Annual Bench Show, Madison Square Garden, New York City. Entries close April 15. Chas. Lincoln, Supt.

FIELD TRIALS.

November 19, 1887.—Eastern Field Trials Club, Fifth Annual Trials, at High Point, N. C. Entries for the Derby close July 1. W. A. Foster, Secretary.

December, 1887.—National American Kennel Club, Fifth Annual Trials at Grand Junction, Tenn. D. K. Bryson, Secretary, Memphis, Tenn.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

N. A. K. C. DERBY.

FOLLOWING is a complete list of the entries for the fourth Annual Derby of the National American Kennel Club, to be run at Grand Junction, Tenn., next December. All were whelped in 1887, and are of the following colors:

- 1. COUNTESS VIC.—H. Bailey Harrison, Tilsontown, Ont., English setter bitch, January 8, Dick Laverack—Bell.
2. SAXON.—W. B. Gates, Memphis, Tenn., black, white and tan English setter dog, April 19, Count Noble—Bessie T.
3. LA BELLE.—W. E. Gates, Memphis, Tenn., blue belton English setter bitch, April 19, Count Noble—Bessie T.
4. LITTLE CURB.—W. B. Gates, Memphis, Tenn., black, white and tan English setter bitch, April 19, Count Noble—Bessie T.
5. VAN HORNE.—D. S. Norton, Dowling, Mich., blue belton English setter dog, May 21, Count Noble—Dashing Novice.
6. JOE BOWERS.—D. C. Sautborn, Dowling, Mich., blue belton English setter dog, May 21, Count Noble—Dashing Novice.
7. KATE D.—D. C. Sautborn, Dowling, Mich., black, white and tan English setter dog, May 21, Count Noble—Dashing Novice.
8. NOVELTY.—D. C. Sautborn, Dowling, Mich., blue belton English setter bitch, May 21, Count Noble—Dashing Novice.
9. FRED H.—J. Hayward, Jr., St. Joseph, Mo., black and white English setter dog, June 6, Dash III.—Countess Tru.
10. LADY FAY.—J. Hayward, Jr., St. Joseph, Mo., black and white English setter bitch, June 6, Dash III.—Countess Tru.
11. PRIMROSE.—R. T. Vandevort, Pittsburgh, Pa., liver and white pointer bitch, Oct. 2, Don—Luck.
12. LUCK'S BABY.—R. T. Vandevort, Pittsburgh, Pa., liver and white pointer bitch, Oct. 2, Don—Luck.
13. MAJOR CROXTETH.—L. J. Pettit, Milwaukee, Wis., liver and white pointer dog, April 13, Croxteth—Lass.
14. MICE.—F. B. Law, Chicago, Ill., red Irish setter dog, Feb. 23, Elcho—Rose.
15. RHODE.—Sidney Law, Chicago, Ill., red Irish setter bitch, Feb. 23, Elcho—Rose.
16. BESSIE.—W. H. Knight, Chicago, Ill., red Irish setter bitch, February 23, Elcho—Rose.
17. FAYL GLADSTONE.—Chas. Tucker, Stanton, Tenn., black, white and tan English setter dog, June 19, Gladstone—Lavalotte.
18. GRACE GLADSTONE.—Chas. Tucker, Stanton, Tenn., blue belton English setter bitch, June 19, Gladstone—Lavalotte.
19. LEORA.—Dr. G. W. Ware, Stanton, Tenn., blue belton English setter bitch, June 19, Gladstone—Lavalotte.
20. KING HARVEY.—B. T. Price, Memphis, Tenn., black, white and tan English setter dog, July 15, Gladstone—Donna J.
21. QUEEN BESS.—B. T. Price, Memphis, Tenn., black, white and tan English setter bitch, July 15, Gladstone—Donna J.
22. SHOT.—H. M. Short, Atoka, Tenn., black, white and tan English setter dog, April, Prince Laverack—Native Bitch.
23. DON NILSON.—W. F. Thurd, Lewisville, Ark., blue belton English setter dog, January 4, Druid—Nilson.
24. MAY FRIGG.—W. G. G. Ware, Stanton, Tenn., black and white English setter bitch, February 19, Count Noble—May Laverack.
25. COUNT GLADSTONE.—J. K. Henricks, Pittsburgh, Pa., black, white and tan English setter dog, April 35, Gladstone—Comtesse.
26. COUNTESS GLADSTONE.—J. K. Henricks, Pittsburgh, Pa., lemon and white English setter bitch, April 23, Gladstone—Comtesse.
27. DON QUICKOTE.—F. Huntington, Memphis, Tenn., liver and white pointer dog, March 20, Pat, Cleburn—Mag.
28. PAED.—Benj. Macleaner, Trevorton, Pa., black and white English setter dog, February 10, Thund—Peggy.
29. SUE.—Benj. Macleaner, Trevorton, Pa., black and white English setter dog, February 19, Thund—Peggy.
30. KATE S.—Benj. Macleaner, Trevorton, Pa., black and white English setter bitch, February 19, Thund—Peggy.
31. COUNT GLADSTONE.—W. G. G. Ware, Stanton, Tenn., blue belton and tan English setter dog, March, Count Noble—Spark.
32. JEFF D.—J. E. Mask, Hickory Valley, Tenn., black and white English setter dog, June 23, Gladstone—Ress.
33. BRAVO.—W. W. Condon, Emma, La., black, white and tan English setter dog, 4 months, Brussels—Jenny Lind.
34. ALICE DALE.—W. A. Buckingham, Norwich, Conn., orange and white English setter bitch, February 5, Waters's Grange—Daisy Dale.
35. ROSE DALE.—W. A. Buckingham, Norwich, Conn., orange and white English setter bitch, February 5, Waters's Grange—Daisy Dale.
36. TONY FAUST.—C. B. Rhodes, Moberly, Mo., liver and white pointer dog, July, Cane—Bessie.
37. NELLIE W.—M. P. Walter, Indianapolis, Ind., blue belton English setter bitch, 7 months, Rake—Minnetta.
38. LADY C.—B. M. Stephenson, La Grange, Tenn., black, white and tan English setter bitch, July 11, Coleman's London—Belle of Hatchie.
39. STARTLE.—Elliott Smith, New York, pointer dog, August 30, Rab—Minnie.
40. PRIGANS.—N. Rowe, Cherokee, N. C., black, white and tan English setter dog, June 15, Penuloke—Burg Wolfington.
41. COUNTESS ELEANOR.—C. K. Drane, Burdick, Ky., lemon and white English setter bitch, March 2, Prince Loffy—Bonny Kate.
42. COUNT LOFTY.—C. K. Drane, Burdick, Ky., lemon and white English setter dog, March 2, Prince Loffy—Bonny Kate.
43. GLADSTONE'S BOY.—Dr. G. W. Ware, Stanton, Tenn., black, white and tan English setter dog, January 10, Gladstone—Sue.
44. PRINCE GLADSTONE.—P. H. and D. Bryson, Memphis, black, white and tan English setter dog, January 10, Gladstone—Sue.
45. LOTTIE GLADSTONE.—P. H. and D. Bryson, Memphis, black, white and tan English setter bitch, January 10, Gladstone—Sue.
46. DANIEL BOONE.—P. H. and D. Bryson, Memphis, black, white and tan English setter dog, January 10, Gladstone—Sue.
47. CANNON.—E. L. Mallory, Memphis, black, white and tan

- English setter dog, July 11, 1882, Coleman's London—Belle of Hatchie.
48. DOT GLADSTONE.—W. L. McDonald, Tipton, Tenn., blue belton English setter bitch, July 22, 1882, Gladstone—Blaze.
49. SHADW.—E. S. Worthington, Glenora, Miss., lemon and white English setter bitch, May 15, 1882, Gladstone—Shadow.
50. NELLIE II.—S. Worthington, Glenora, Miss., black and white English setter bitch, April 9, Count Noble—Nellie.
61. PRIDE.—S. Worthington, Glenora, Miss., liver and white pointer dog, Croxteth—Royal Pup.
52. MAIDEN.—E. S. Wannerker, Elmwood, N. C., blue belton English setter bitch, February 25, Darkey—Rosey Morn.
53. PAUL.—J. E. Toul, New York, red Irish setter dog, 5 months, Spy—Shilpy—Royal Pup.
54. COUNTESS ROUSE.—J. H. Trezevant, Houston, Tex., black, white and tan English setter bitch, August 10, Gladstone—Hido.
55. LADY NOBLE.—E. Odell, New Orleans, La., black, white and tan English setter bitch, April 9, Count Noble—Nellie.
56. NELLIE B.—E. Odell, New Orleans, La., black and white English setter bitch, February 6, Rake—Meg Merles.
57. RAY.—H. B. Diggins, La., liver and white pointer dog, August 16, Bow—Roxie.
58. LADY BOW.—E. Odell, New Orleans, La., liver and white pointer bitch, October 12, Bow—Tick.
59. STRIP.—H. B. Diggins, New Orleans, La., lemon and white pointer dog, October 12, Bow—Tick.
60. STRIP BOW.—E. Odell, New Orleans, La., lemon and white pointer dog, October 12, Bow—Tick.
61. DING.—W. W. Hughes, St. Louis, Mo., liver and white pointer bitch, February 20, Croxteth—Trinket.
62. DAISY.—W. E. Hughes, St. Louis, Mo., liver and white pointer bitch, February 20, Croxteth—Trinket.
63. LADY.—W. E. Hughes, St. Louis, Mo., liver and white pointer bitch, February 20, Croxteth—Trinket.
64. LEAH.—E. C. Sterling, St. Louis, Mo., river and white pointer bitch, February 20, Croxteth—Trinket.
65. PRINCESS TECK.—Geo. C. Marsh, Sycamore, Ill., black and white pointer dog, February 20, Croxteth—Trinket.
66. BUCH.—J. W. Sterling, St. Louis, Mo., liver and white pointer dog, February 20, Croxteth—Trinket.
67. KATE.—J. W. Sterling, St. Louis, Mo., liver and white pointer dog, February 20, Croxteth—Trinket.
68. DOX ROE.—W. H. Robinson, Wabasha, Minn., liver and white pointer dog, October 20, Don—Gipsy.
69. COL THUNDER.—G. A. Soman, Marysville, Kan., blue belton English setter dog, February 20, Thunder—Lass.
70. PRIDE OF DRUID.—E. W. Wallin, Monmouth, Ala., blue belton English setter dog, May 26, Gladstone—Countess Druid.
71. CHATTON.—M. Parker, Memphis, lemon and white pointer dog, March 30, Belle of Memphis.
72. LADY BOW.—M. Parker, Memphis, liver and white pointer bitch, March 20, Bow—Belle of Memphis.
73. HAZENT.—E. Orgill, Brooklyn, N. Y., lemon and white pointer dog, April 3, Rocket—Belle.
74. RUSH.—J. E. Crossman, New York, Y., lemon and white pointer dog, September 22, Rush—Nan.
75. COUNTESS C.—J. Yearns, Jr., Coatsville, Pa., black, white and tan English setter bitch, March 24, Dashing Lion—Ardmore.
76. SAN ROY.—H. H. Matlock, Riceville, Tenn., lemon and white English setter dog, March, Count Noble—Spark.
77. DASHING LINCOLN.—A. G. Sloo, Vincennes, Ind., blue belton English setter dog, July 23, Dashing Jockey—Last.
78. NORT NEMO.—A. G. Sloo, Vincennes, Ind., English setter dog, Count Windham—Novel.
79. NELLIE.—J. H. Crossman, New York, lemon and white pointer dog, February 19, Sensation—Hill.
80. RUSH.—J. E. Crossman, New York, Y., Valley, Tenn., black, white and tan English setter dog, July 18, Gladstone—Donna J.
81. FORTY.—J. M. Avant, Hickory Valley, Tenn., black and white pointer dog, January 13, Count Noble—Ress.
82. BANGOR.—E. B. Dowling, Wilmington, Del., liver and white pointer dog, July 11, Bang—Jean.
83. NORT NEMO.—J. H. Kraft, New Albany, Ind., orange and white pointer dog, July 11, Bang—Jean.
84. KING BANG.—W. B. Stafford, Brazil, Tenn., lemon and white pointer dog, July 11, Bang—Jean.
85. BEAUTY G.—L. F. Patterson, Bainbridge, Ga., black and tan setter bitch, January 13, Count Noble—Ress.
86. GAMBETTA.—E. S. Carr, M. D., Gallatin, Tenn., black, white and tan English setter dog, July 22, Gladstone—Blaze.
87. GRAND BONCE.—E. S. Carr, M. D., Gallatin, Tenn., black, white and tan English setter bitch, July 22, Gladstone—Blaze.
88. LUCKY STONE.—R. M. Boyd, Racine, Wis., black, white and tan English setter dog, March 12, Gladstone—Flossy.
89. DAN ROYAL.—J. W. Boufford, Atlanta, Ga., black, white and tan English setter dog, January 22, Prince Roy—Vic.
90. FLOY.—Wm. Bowles, Jr., Memphis, Tenn., black, white and tan English setter bitch, April 29, Pride of South—June II.
91. NORT NEMO.—Wm. Bowles, Jr., Memphis, Tenn., black, white and tan English setter dog, July 10, Gladstone—June.
92. JAR.—Wm. Davidson, Niagara, Canada, black ticked English setter dog, July, Beacon—Fly.
93. FANTLESS.—C. H. Raymond, New York, blue belton English setter dog, July 10, Beacon—Fly.
94. MARY.—E. C. H. Raymond, New York, orange and white English setter dog, May; pedigree not given.
95. BRANDY PENCK.—C. H. Raymond, New York, orange and white English setter dog, April, Brandy—Lemonade.
96. MARY.—E. C. H. Raymond, New York, orange and white English setter dog, April, Brandy—Lemonade.

PITTSBURGH BENCH SHOW.

I ENCLOSE a list of additional special prizes which have been offered for the show. The society are confident of having a grand exhibition. The Coliseum building is admirably adapted for a bench show, and is a great improvement over the old City Hall, as the beauty of light and air is well ventilated, beside having a spacious yard attached surrounded by a high, tight board fence. Mr. James Watson has written the secretary, saying it is impossible for him to attend in the morning classes owing to business engagements, but the society have been fortunate enough to secure the services of Mr. J. F. Kirk, of Toronto, Canada. The entries close on the 19th inst. The following special prizes have been donated since the publication of the premium list: 1.—The Cleveland Bench Show Association, a silver cup, value \$25, for the best exhibition of sporting dogs, regardless of sex, entered from Northern Ohio, quality to be considered in judging. J. J.—H. Malochu, Esq., Baltimore, Md., a Gordon setter puppy, eight weeks old, by Malcolm out of Dream IV., for best light-colored Gordon setter dog. To be competed for only by dogs owned outside of Maryland, Virginia and District of Columbia. Entry \$2, value \$50. K. K.—J. J. Snellenburg, Esq., \$10 cash for best dog, bitch or puppy, set on to the 19th inst. in the morning classes. W. W.—W. Lawford, Esq., Baltimore, Md., case Little's svelte phenyle, through James Ken, Jr., for best setter dog or bitch entered in the open class. W. W.—W. W. Waddles, Fifth avenue, jewel casket, value \$10, for Laverack setter puppy under eighteen months old. Entry \$1. N. N.—A friend of the Irish setters, \$10 cash for best Irish setter dog in show. O. O.—Same gentleman, \$10 cash for best Irish setter bitch in show. P. P.—Messrs. Grogan & Murr, silver cup, value \$5, for best pug bitch.

QQ.—Messrs. O. M. Chuteok & Co., sheepskin mat, value \$5, for best liver pointer dog or bitch. R. R.—J. R. Henricks, Esq., musical organina and music, value \$15, for best toy or pot dog owned and entered by a lady residing in Illinois. S. S.—J. J. Snellenburg, Esq., \$5 cash for best collie bitch exhibited with a litter of puppies. CHAS. LINCOLN, Supt. Printed Jan. 9, 1883.

LAVERACK PEDIGREES.

Editor Forest and Stream: Mr. J. B. Bowers has recently made an attack on me in a contemporary, and published in support certain private letters written to him, in which Mr. Laverack's name is mentioned. I do not know whether I should have taken any notice of Mr. J. B. Bowers, had he not made a false accusation. Doubtless Mr. Laverack deceived him as to the ownership of Fairy; but when Mr. Bowers gives as his authority the Standard for saying that Mr. Laverack's name is mentioned in a wrong name, he makes a false accusation, which he certainly has the means of knowing to be false. In the report of the Vainoy Trials, in the very self-same volume of the Stud Book which Mr. Bowers quotes, it is printed in plain type, thus proving that when his name occurs further on in the book, where she is called Fanny, it is purely a printer's blunder. It has been pretended that I detracted the Laverack setter. On the contrary I have done more than any to render it famous, and I have refrained from expressing my opinion as to his faults, which I now, under provocation, allow Mr. Laverack himself to describe in his own words. For my own part, I was content, and should have remained content with giving to sportsmen a breed of setters, vastly superior to the originals, from which they were produced, but I could not allow that breed to be ruined by in-breeding, without protesting. Last the false precedent set up by those who have since then tried to imitate my breed, took the opportunity afforded by the first occasion of their being publicly accepted as authentic, to enter a protest, which has caused a thorough exposure of the Laverack false. I have no subscribers to the Standard, and I am not a member of the division of the Laverack breed was crossed, hence the verdict, which allowed those dogs which had through custom become known as "pure Laveracks," to remain as such, in contrast of my "mixing" proved not only that one, but the whole breed crossed. What I have taken the trouble to prove before the committee of the Kennel Club I do not intend to prove over again. Those who do not choose to accept the proof will in time have no alternative but to do so. I shall not trouble myself to deny Mr. Laverack's charges against me, I shall merely place quotations from his letters referred to, and others, one against another. The letters I quote from were many of them published in the Kennel Club's pedigree, where they proved unreliable through his own words, and some of the most comest of his statements share the same fate. As you saw below Mr. Laverack's private opinion of his own breed, and what they would have been worth if in other hands than those he mentions. See also his change of front towards regard to certain persons after he became inspired by the Standard for the Laverack (the Llewellyns that had grown up stronger than his own. [To Llewelin—Saturday morning.] "If agreeable to you I propose dedicating this book to you, viz., of Tregwyn, Dr. Haverford, West South Wales, as a tribute of respect, esteem, etc., to a gentleman who has endeavored to restore the breed of setters, and who has spared no money, time, etc., in this pursuit." [To Llewelin—Oct. 15, 1871.] "I give you and Buckell very great credit for your great liberality. You remain the greatest observation, and I can endorse all you say about the cunning displayed when out of sight, etc. Don't despair; carry on day after day when tired down and you will subdue. Remember me to Buckell, and no does deserve great credit." [To Bowers—Oct. 1, 1871.] "Your friend, Mr. Buckell, must have them in time to prepare, etc. I desire to be particularly remembered to him, and both of you richly deserve your success. Had Countess been in other hands she would have been success." [To Bowers—Sept. 26, 1875.] "Llewelin, with all his venom and treachery, cannot injure the breed." [To Bowers—Sept. 26, 1875.] "Buckell and Llewelin don't understand setters; how should they?" Seeing that he (Laverack) cannot make head openly against the Llewelin setter, he is driven to the petty expedient of calumniating Llewelin, and circulating privately behind my back what he knows to be falsehoods in regard to Fairy and Pedigree. [To Llewelin—Sept. 7, 1871.] "Privately keep quiet until spring, and you shall have the pick of some clippers." [To Llewelin—March 10, 1872.] "If Pedigree and Fairy are no use to you for these Trials, send them back." [To Llewelin—March 11, 1873.] "I duly received Fairy to-day by your keeper, for which I feel most obliged. I return by him a check for her, viz., \$250 lbs." [To Llewelin—Nov. 19, 1873.] "As Fairy does not come up to your standard idea, would it not be more satisfactory, and avoid misunderstanding, for you to return her safely to me, and on receipt I will return you a check for the same you paid for her." [To Bowers—Jan. 14, 1873.] "The articles of Llewelin and Buckell show the petty malignity of envious men, and all owing to my not letting him have the services of my Pedigree and not selling him Fairy." [To Bowers—Feb. 3, 1876.] "The sole cause of my writing this letter of animosity is my refusal to sell him Fairy and refusing him for love or money the services of her brother Pedigree." The following clearly shows the truth of what the editor of the Standard stated some years ago, to the effect that Laverack habitually claimed everything that was good to his own, and repudiated whatever he did not find it convenient to acknowledge, although knowing it to be his own. Thus we see that he kept his own name out of his own pedigree, and only a very few months later, after he has failed to make people swallow it, he finds out that they are dreadfully faulty, and abuses them as though he had been bitten by them. By the way, how his fear and jealousy of Dan shows itself through all this. [To Bowers—Feb. 3, 1876.] "The sole cause of Llewelin's vindictive animosity is,

NEWARK MARCH TOURNAMENT.

The Newark tournament was shot on the Warren Street Range, corner Lock and Warren streets, with the following result:

Table with 2 columns: Name and Score. Includes names like J. T. Cobb, W. McLoud, S. S. Bradford, etc.

Table with 2 columns: Name and Score. Includes names like W. Yanley, T. Burns, J. Wolf, etc.

Table with 2 columns: Name and Score. Includes names like J. Leitz, W. A. Crocker, B. Jeffries, etc.

The tournaments are shot under the auspices of the Newark Rifle Association, 1 series consisting of 4 weeks...

BOSTON, March 10.—At Walnut Hill to-day there was a large attendance of members and friends of the Massachusetts Rifle Association...

Table with 2 columns: Name and Score. Includes names like R. Reed, C. E. Palvay, A. B. Roland, etc.

Table with 2 columns: Name and Score. Includes names like G. Warren, W. H. Whitcomb, G. W. Whitcomb, etc.

Table with 2 columns: Name and Score. Includes names like G. Warren, J. N. Frye, P. J. Nass, etc.

Table with 2 columns: Name and Score. Includes names like A. Duffer, A. Adams, C. Weston, etc.

Table with 2 columns: Name and Score. Includes names like G. Warren, G. E. Goodale, F. H. Knowlton, etc.

Table with 2 columns: Name and Score. Includes names like B. Williams, G. E. Goodale, etc.

Table with 2 columns: Name and Score. Includes names like Burns, Fenner, DeLisle, etc.

Table with 2 columns: Name and Score. Includes names like Burns, Fenner, DeLisle, etc.

The individual scores of Oak Grove Club have not been received. The use of the boomerang.—The thrower kicks hold of the end of it, holding the rounded side downward...

THE TRAP.

CARVER BOGARDUS.—St. Louis, Mo., March 9.—Capt. A. H. Bogardus and Dr. W. F. Carver set for the third time to-day...

Table with 2 columns: Name and Score. Includes names like Bogardus, Carver, etc.

* Dead out of bounds. The first of a series of twenty-five exhibitions at clay pigeons, 100 each, was disposed of before the main event.

CINCINNATI, March 10.—A clay-pigeon shooting match between Carver and Bogardus occurred here this morning...

KIRTLAND vs. CLEVELAND.—Match between the Kirtland Shooting Club and the Cleveland Gun Club...

Table with 2 columns: Name and Score. Includes names like O. Alder, A. Beady, W. C. Brown, etc.

ENGLISH PIGEON SHOOTING.—London, March 7.—In the House of Commons to-day the bill preventing the shooting of trapped pigeons passed its second reading.

MALDEN GUN CLUB.—On Saturday last there were fifty or sixty lovers of the gun met at Walden...

Table with 2 columns: Name and Score. Includes names like F. T. Noble, J. Buffin, etc.

Table with 2 columns: Name and Score. Includes names like J. Buffin, G. Sawyer, etc.

First sweep, 20 birds.—F. T. Noble and W. D. Gooch secured first by yards of 18 each; J. C. French and J. S. Sawyer second, scoring 17 each...

The LEATHER MEDAL.—Topham, Mass., March 7.—Editor Forest and Stream: I see in the last number of your paper that my name appears first on the list in the report of the wonderful doings of the famous Riverside...

WORCESTER, Mass., March 10.—W. S. Perry is matched to shoot with W. Taylor Howard, of Stoughton, on Thursday, March 15...

SAVING THE GUN CLUB.—Washington, March 8.—The regular annual meeting of the Capital Gun Club was held on Wednesday evening, March 7, 1883.

OSTRICH FARMING.—In reply to several queries we quote from a San Francisco exchange the 6th of March: "A company, with a capital stock of \$30,000, has been incorporated under the name of the California Ostrich Farming Company."

Kelden and Stoddard respectively won second and third prizes.—J. E. H.

A SUN YARN.—Pigeon shooting will not do this year: a snail voyage was raised in protest against the wholesale butchery. It gained strength and weight when the highest lady in the land declared herself against it...

CAMDEN, N. J., March 10.—The seventh shooting match of the Pinecroft Social was held March 7, 1883, at their rooms, Fourth Avenue and Market streets.

Table with 2 columns: Name and Score. Includes names like W. Stein, J. E. Stein, etc.

MAINE ANTI-PIGEON SHOOTING LAW.—Augusta, March 7.—The Cruelty to Animals bill came up in the House to-day and was passed by a large vote.

TRENTON, N. J.—Second shoot of the Trenton Gun Club, March 1, at the glass halls, Barn's revolving trap screened, 18yds. rise, 13yds. shot.

Table with 2 columns: Name and Score. Includes names like A. Leigh, W. Cook, etc.

LONDON GUN CLUB.—London, Oct. 6.—The annual meeting of the members of the London Gun Club was held on Monday evening, Oct. 6, 1882, at the Metropolitan Hotel...

PITTSBURGH TOURNAMENT.—Pittsburgh, Pa., March 10.—A grand shooting tournament will be held in this city during the week of March 10-15.

Answers to Correspondents.

No Notice Taken of Anonymous Correspondents.

A. B. J.—Yes, the gun is strong and reliable. A. M., Jr.—Talladega.—For wild rice supply, see our advertising column.

J. F. W., Boston, Ala.—For wild rice supply, see our advertising column. S. & T., Providence, R. I.—For buffalo heads for mounting, write to parties named in answer to F. J. C.

L. C. N. York.—Will you kindly give me the name of the game and fish warden living at Rochester? Ans. G. M. Schwartz. J. E. H., Philippi, W. Va.—The combination gives general satisfaction...

F. J. Sander, New York or to E. H. Gun Broadway, New York or to F. H. Sander, 199 William Street, New York. T. Long, Falls City, Neb.—Will a short-barreled gun shoot as well as a long-barreled one? Ans. Within certain limitations of difference there will be no medicinal difference in field work.

A. E. S., Hastings, Minn.—The rifle mentioned is a standard first-class arm; but we cannot compare its relative merits with others; it will answer all legitimate purposes. Select a .4cal. H. R. G., Kittanning, Pa.—How large should English setters grow? Ans. They vary greatly. A medium-sized dog is of about 50 lbs. weight...

D. R., Montreal, Canada.—Will a gun with two sets of barrels of the following dimensions, viz: 10-bore, 32in., and 10-bore, 26in., be balanced when using either set? Ans. You could have such a gun made to balance by selecting heavy 26in. barrels and light 32in. barrels.

H. D., Baltimore.—I, would I, not knowing the points of an Irish setter, be able to distinguish a good specimen of the breed by having a look at their points? What is the best work on the judging of the points of the setter and what is the price of the best work on a little experience? "The Dogs of Great Britain, America and Other Countries," price \$2.00, we can furnish it.

J. E., Riverside, Cal.—Will you please inform me where, and at what price, I can obtain Ridgway's "Nonameclares," North American Birds, and Dr. Cooper's "Check Lists of North American Birds"? Ans. We do not know that Ridgway's list is on sale anywhere. Write to either of the publishers of the "Check Lists," viz: D. C. Cooper's Check List can be had of Estes & Lauriat, Boston, Mass., price \$3.

W. H.—Is a straight stern, made for hauling a rudder, a detriment to a trolling canoe? If so, what type of canoe is considered the best for trolling? Ans. The type of canoe is considered the best for trolling, and the type of rudder is considered the best for trolling. The modern straight bow, like that in Joyner's advertisement, is 3' 6in. I can get numbers of your paper. Ans. 1. Straight post canoe is no detriment to trolling. 2. The price of the canoe is the medium type can be had from any of our advertisers. 3. You can get back numbers.

OSTRICH FARMING.—In reply to several queries we quote from a San Francisco exchange the 6th of March: "A company, with a capital stock of \$30,000, has been incorporated under the name of the California Ostrich Farming Company. A tract of 600 acres, partly owned by the company, and situated near Los Angeles, California, has been secured, and will be placed under the superintendence of Dr. C. J. Skeelby, who has had considerable experience in ostrich raising in South Africa, and who has also had considerable experience in ostrich raising in California. The company has commenced laying. Her eggs weigh three and one-half pounds each."

ONLY ONE MATCH.

A RESIDENT of Indiana has received the following letter from a friend at English Lake, Indiana: I have not had time to fill you with details about Johnson's adventure upon the lake that terrible night. This is the way that Johnson was prevented from getting down the lake: He had noticed that the floating ice in the river was hard when he went up in the morning, and that it became soft and mushy in the afternoon. He thought that the lake would be partially open and the ice soft, so that he would have no difficulty in pushing through it. Everything went along smoothly until he struck the ice near Johnson's goose. He got about two boat lengths into it and could not get through. It was still daylight when he got there. He took in the situation at once, and said to Bell, the man that was with him, that it would be impossible to undertake it. The weather was getting intensely cold, and the drifting snow was so dense that he could scarcely see the length of his boat ahead of him. They were about two rods from the north bank of the river; there was nothing left for them to do but to turn the boat and seek shelter in the woods. Here they encountered much difficulty, as the boat could be scarcely moved on account of the ice and snow that had been frozen to it, and the river was so deep that Johnson had to put his hands down into the water so that the paddle would reach the bottom. They were fully fifteen minutes in getting to the shore. By this time it had become quite dark and bitter cold, with the snow setting down in torrents. The boat was so full of snow that it was impossible from the wind and to make a fire. An examination revealed that they had but one match.

The situation was getting desperate in the extreme, and a pitiless night before them. The boat was dragged a short distance into the woods. Johnson then dried off the decks with a paddle, took a look at his gun, and, finding it full of snow, and turned the boat over the coast. He then crawled under the boat and whittled the deckboard into fine shavings upon the rubber coat, then taking his oiled gun rags from his cartridge pouch, he took a little of gun oil upon them; some of the rags he saturated with whiskey. Not wishing to use the match until he had exhausted other means, he proceeded to obtain fire by extracting the shavings from some of his shells and putting the rags therein, also putting rags in the barrel of the gun. In this way he tried several times to get fire by shooting under the boat, but did not once succeed in lighting the rags. By this time they were nearly frozen. The time had passed so rapidly that there was very little time left to obtain a fire with the gun, and they were fully five minutes in getting to the shore. They were fully fifteen minutes in getting to the shore. By this time it had become quite dark and bitter cold, with the snow setting down in torrents. The boat was so full of snow that it was impossible from the wind and to make a fire. An examination revealed that they had but one match.

strike the match, which Bell lacked the courage to do; so, with fingers numb and nearly frozen, Johnson took from his rubber matches the solitary match upon which the lives of two souls depended, and, with trembling hand he at first struck, oh, so carefully, on the end of the match-saf. The second stroke less gentle than the first. The third stroke, with more vigor, ignited the match, and they were safe. The rags and shavings in the shell box immediately took fire. A few dry twigs and limbs were immediately added. Near the boat was a hollow ash tree, and to this the shell box with its precious contents was conveyed. In another minute the ash tree was in flames from top to bottom. Other trees and shrubs were set on fire. They kept as many as four or five fires burning at a time, during the whole night; so if the snow should extinguish one there would be others left. On account of the difficulty of getting a supply of fuel, they having no ax or hatchet, and nearly all the dead limbs lying on the ground being frozen into the mud, it became necessary to set fire to a hollow tree when one could be found. Consequently the fire extended over twenty acres of ground. About 6 o'clock in the morning (faded nature asserted itself. A mallard was picked and cleaned and broiled. There was one piece of frozen bread and some salt left in the lunch box, which served a good purpose. The voyagers broke camp at 8 o'clock in the morning, walked down the lake over the ice, and were soon at the house. Johnson had one ear frozen and his clothes badly ruined. Bell was nearly done for. He slept all that day and night, and he and Johnson went to work on the train the next day. They heard our guns when we fired, and replied by shooting also, but, as you are aware, we did not hear them.

POT LUCK FROM OUR EXCHANGES.

The Russian General Ignatieff is now living near the Winter Palace in St. Petersburg. A correspondent says: "The workshop of the general contains a collection of historical arms, unique of their kind; each piece has a tradition, and each is marked by rich and curious workmanship; all have been given to him at one time or another by their owners. For instance, one sees the pistols of the last Sovereign Prince of Albania, a long pointed of schamy, and a gun richly chased presented to him by the Sultan Abdul Aziz."

The good observer of nature exists in fragments, a trait here and a trait there. Each person sees what it concerns him to see. The fox-hunter knows pretty well the way and habits of the fox, but on any other subject he is apt to mislead you. He comes to see only fox, fruits in whatever he looks upon. The bee-hunter will follow the bee, but lose the bird. The farmer notes what affects his crops and his earnings, and little else. Common people, St. Pierre says, observe without reasoning, and the learned without observation. If one could apply to the observation of nature the sense and skill of the South American *rastreador*, or trapper, how much he would track home. This man's eye is keener than a hound's scent. A fugitive can no more elude him than he can elude fate. His perceptions are said to be so keen that the displacement of a leaf or pebble, or the bending down of a spike of grass, or the removal of a little dust from the fence are enough to give him a clue. He sees the leaf-obliterated foot-prints of a cat in the sand, and carries the impression in his eye till a year afterward, when he again detects it in the suburbs of a city, and the culprit is tracked home and caught. I knew a man blind from his youth who not only went about his own neighborhood without a guide, turning up to his neighbors

gate or door as unerringly as if he had the best of eyes, but who would go unerringly on an errand to a new part of the country. He seemed to carry a map of the township in the bottom of his feet, a most minute and accurate survey. He never took the wrong road, and he knew the right house when he had reached it. He was a miller and fuller, and ran his mill at night, while his sole man ran it by day. He never made a mistake with his customers' bags of wool, knowing each man's by the sense of touch. He frightened a colored man, whom he detected stealing, as if he had seen out of the back of his head. Such facts show one how delicate and sensitive a man's relation to outward nature through his bodily senses may become. Heighten it a little more, and he could forecast the weather and the seasons, and detect hidden springs and minerals. A good observer has something of this delicacy and quickness of perception. All the great poets and naturalists have it. Agassiz traces the glaciers like a *rastreador*, and Darwin misses no step that the slow but tireless gods of physical change have taken, no matter how tiny they cross or retrace their course. In the course of his career he has seen an agent that has kneaded and leavened the softlike giant hands.

Century. It is a noticeable fact that the wholesale and wanton destruction of the forests in the northern counties is having a marked effect upon the annual rainfall and is seriously affecting the navigation of the Hudson River. The bill presented is a wise measure, suggestive of statesmanship of a comprehensive order. There is no need to which the interests of the public should be more frequently called. The destruction of the forest lands in the Adirondack region is a menace to the Empire State. Every falling tree is a presage of drought. Where no trees grow the waters never descend, except upon the occasion of destructive storms. The falling of timber is the banishment of moisture. Every rift which floats lazily down the stream is an eloquent prophecy of drought and famine for future generations. Every blow of the axe upon the living tree is the knell of a drop of life-giving water. The moaning and cracking of each falling oak is a dirge and requiem for the loss of productive power. The buzzing saws, which hum and whiz through the inanimate logs, are but touching the surface of the forest's irreparable loss. *Nature's Republic*, Yale campus has caused considerable comment. A shot entered the dining-room of a professor of mathematics, who has made the study of curves a specialty. He was determined to find out the reckless student, and he brought his mathematical knowledge into play. Knowing the breadth of the room, he measured the fall of the bullet in crossing it. Then he measured the distance from his house to the West Divinity building. With these data, and knowing the curve which a bullet takes, he computed the length from which the shot was fired, and fixed upon the very window from which the bullet must have come. The next day two students were greatly surprised by a call from the professor who accused them of firing the shot. They denied it and the professor gave his proof. The proof was so strong that they finally admitted their guilt.

A young lady tells of a plump dog in a family where she was making a visit, which she trained to lie under the table as a foot-stool. Now, whenever a chair is placed at that part of the table the dog locates in front of it, but cannot be induced to remain unless the young lady occupies the seat.

Tested by Time. For Throat Diseses, Colds and Coughs, BROWN'S BRONCHIAL TROCHES have proved their efficacy by a test of many years. Price 30 cts.—Adv.

THE MILD POWER CURES.—HUMPHREY'S HOMOEOPATHIC SPECIFICS.

- In use 30 years—Each number the special prescription of an eminent physician.—The only Simple, Safe and Sure Remedy for the Cures. PRICE. 1. Fevers, Coughing, Inflannations, etc. 25 2. Worms, Wind, Colic, Spasms, etc. 25 3. Croup, Whooping Cough, etc. 25 4. Diarrhea, Cholera, etc. 25 5. Dysentery, Griping, Bilious Colic, etc. 25 6. Cholera Morbus, Vomiting, etc. 25 7. Headache, Cold, Rheumatism, etc. 25 8. Neuralgia, Toothache, Sciatica, etc. 25 9. Headaches, Sick Headaches, Vertigo, etc. 25 10. Dyspepsia, Bilious Stomach, etc. 25 11. Stomachic, Indigestion, etc. 25 12. Whites, Gonorrhoea, etc. 25 13. Croup, Cough, Difficult Breathing, etc. 25 14. Salt Rheum, Eruptions, Eruptions, etc. 25 15. FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR, 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, MARCH 22, 1883.

VOL. XX.—No. 8.
{ Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C. London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 189 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications,

Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.

With its compact type and its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

BACK COPIES OF THE FOREST AND STREAM can be supplied.

SAINT SALVELINUS.

ON the first day of April the brook trout season opens in California, Connecticut, Massachusetts, Minnesota, New Hampshire, New Mexico, New York, Pennsylvania, Virginia and Washington Territory. Other States and Territories make the season open earlier or later. In parts of the State of New York no trout fishing is done until May, but in the city the anglers look forward to the opening day as the coming of an annual festival. Long Island trout are early, owing to the fact that the ice is usually out of the streams early in March, and on the first day of April there is an exodus of New York city anglers to the island.

This year the opening day comes on Sunday, and we know of a score of enthusiastic anglers who will go down on Saturday night in order to be on the ground early on Monday morning, and who will fish on that day, no matter what sort of weather may be dealt to them.

At the South Side Sportsman's Club the members are feeling of their rods, oiling their reels and looking after frayed gut and moth-eaten flies. The well-stocked preserves of this club promise much sport in the way of extra-sized trout. All along the island from Shinnecock Bay to Canarsie on the south side, and from Fort Jefferson to Whitestone on the north shore, there is a bustle of preparation that denotes a vigorous opening of the campaign. For our own part we usually prefer to wait until the blustering March winds have blown themselves out and there is no danger of one's marrow being solidified by a blizzard from Manitoba, which goes through a spring overcoat like a black-fly through a patent fly-net.

In Fulton Market there will be a goodly display of trout from all parts of the country, and also from abroad. Mr. Blackford has been quietly arranging for his yearly display,

and no doubt it will be equal, if not superior, to his former efforts. Trout and flowers are the attractions at Fulton Market on "trout opening" day, and they harmonize well together; gems of the land and of the water, the condensed poetry of the earth and the streams which flow upon it. Anglers, who do not go down to the seaside to take the trout from the streams, should not miss the sight of the beauties in the market, where their differences, caused by food and water, are better studied in an hour than by a lifetime on the streams.

THE NATIONAL PARK.

A FEW newspapers, whose proprietors were interested in the attempt to capture the Yellowstone Park, are whining about the Government's loss of rent on the lands leased for hotel purposes. To these splenetic grumblers Mr. Assistant Secretary Joslyn adds his voice, and the querulous moans of the defeated gang are laughable to listen to. They say that if the original forty-five hundred acres that the Improvement Company so longingly reached for had been leased to it, the annual revenue to the Government would have been \$9,000, whereas it is now only a pitiful \$20. This is very true, but whether the loss of the \$8,980 to the United States Treasury is as serious a matter as these sad-voiced scribes would have us believe is open to a little doubt. If the Interior Department had, as it seemed at one time likely to do, bartered away all the rights of the people for ten years to this lovely spot for \$9,000, would it not have been thought that these dollars had cost the nation dear? We think so. It is to be expected that the vanquished will continue for a while to lift up their voices in sorrowful wailings. They still feel the effects of their beating. But life is too short to be devoted to such dead issues as the Park grab. The Improvement Company may yet try to seize on portions of the reservation, but it is for the officers of the Government to look out for this matter. The law is on the side of the people.

The Secretary of the Interior has, we are happy to say, called on the War Department for a detail of troops to guard the Park and its game, and this detail Secretary Lincoln has promised to furnish. Things are, therefore, marching along in a very satisfactory shape.

A dispatch to the public press credits Superintendent Conger with the statement that the reports to the effect that game was being killed within the Park are untrue. It may be that just at present the slaughter has ceased, but we can assure Mr. Conger that a short time ago, and during the progress of the fight against the encroachments of the Improvement Company, game was being killed in the Park and in considerable quantities. All this sort of thing must now cease, and we look to Superintendent Conger to see that it is put an end to at once and forever.

With the opening of the next session of Congress we hope to see a bill introduced embodying the essential features of Senator Vest's bill of last session, and providing for the enlargement of the Park on the east and south, as suggested by us recently. All who are familiar with the region are agreed that such increase in area is most desirable, and we trust that within a year it may be made.

NEW YORK FISH COMMISSION.—A bill has been introduced into the Legislature of New York forbidding any person who deals in fish to be a Commissioner of Fisheries. As there is no good reason for such a proscription it is evident that it is aimed at Mr. Eugene G. Blackford, who is both a fish dealer and a fish commissioner. The same bill was introduced last winter, and it is believed to be instigated by a man who was once in the employ of Mr. Blackford, but who was discharged for dishonest practices in connection with the capture of trout out of season, while pretending to do other work. The fact that Mr. Blackford is a large fish dealer and one who has paid much attention to fishculture and kindred subjects, fits him to be a commissioner of fisheries in a degree that no other man in the State is fitted, and the introduction of such a bill shows its animus. Last winter when the same bill came before the Legislature, the late George Dawson said to us, in a private conversation: "Why, you might as well pass a law that no man should be a professor in a college who is qualified to teach!" That such laws, framed to gratify a personal spite, will pass we have not the slightest idea, we only wonder why our legislators introduce them. The fish commissioners serve without pay, and none but those who have the best interest of the public at heart would burden themselves with the office. Mr. Blackford's well-known public spirit and his knowledge of the habits and values of fishes are of the greatest service to the New York Fish Commission.

"AMERICAN KENNEL REGISTER."

THE necessity of a printed register of the breeding of fine stock is thoroughly appreciated, and for most kinds of stock, horses, cattle, sheep, etc., such records are regularly published. The demand for a similar promptly published registration of dogs is urgent and is becoming more imperative with the lapse of each succeeding month and the increase in the number of sporting and pet dogs. At the request of some of the prominent breeders of the day the Forest and Stream Publishing Company have undertaken the task of supplying such a record and will at once begin the publication of the *American Kennel Register*.

It is of the utmost importance for the convenience of all breeders, and owners and purchasers of sporting dogs, that there should be ready access to the pedigree and record of the stock in question; and this can be secured in no way more conveniently than that now proposed. The *American Kennel Register* will be published monthly in convenient shape for filing and binding in an annual volume. Its main feature will be the register of names and pedigrees and the supplying of a number to each dog entered. There will be also registers of "bred," deaths, sales, etc., all fully indexed under each breed at the end of the volume.

In addition to this registry, there will be given complete prize lists of all American dog shows and field trials, with summaries of such foreign shows and trials as may be deemed important; and a monthly compendium of all matters of interest in the canine world. The aim of the publication of the *American Kennel Register*, in short, will be to make it a *code meum* for breeders and owners.

The initial number will be published early in April. Fuller particulars will be given in our next issue.

A BAD BILL.

TWO provisions of the O'Connor bill to amend the game laws of this State are most unwise. One opens summer shooting; the other extends the market time. The law is much better as it stands than it would be if tinkered as this bill proposes to "fix it." The bill bears very good evidence of having come through the same manipulation that not long ago produced the notorious "refrigerator amendment," in fact it comes from the same source. Section 24 provides that venison and grouse may be sold for two months after the lawful killing season has expired. Every man of ordinary intelligence knows what that means. It means that for two months game will be killed out of season and smuggled into market. This game will come from New York and from other States in which the markets have been closed. This State and others are expending money in salaries for game commissioners and wardens and detectives, and the originators of the O'Connor bill with their extended market hold out fresh inducements to the poachers.

The market ought to be closed when the killing season closes. The framers of the bill in question know this. The probable reason why they have not acted on the knowledge is that they are attempting to serve two masters. They want to make a "game law" that will answer the purposes of the market men. The market men want all the game there is, and they want it now. The O'Connor bill framers are perfectly willing they should have it, and if the bill passes, it will be just one advance in their favor. We do not believe that the O'Connor bill was framed in the true interests of sportsmen and game protection. It bears the signature of the men in this city who advertise for snared game birds, and of the hotel proprietors whose kitchen back doors are always ajar for the sneaking midsummer slayers of immature game.

THE LONDON FISHERIES EXHIBITION.

THE American Commission will sail from Philadelphia on the 21st of this month on the steamer Lord Gough. It will consist of Prof. G. Brown Goode, Deputy U. S. Fish Commissioner; Mr. R. E. Earl, in charge of fishculture; Capt. J. W. Collins in charge of nets, boats and marine fisheries; Mr. Joseph Palmer, taxidermist; Mr. Reuben Wood, in care of the angling exhibit; a secretary, and perhaps others. Mr. Wood will remain in London until July 1, and then take a trip to the salmon rivers of Scotland. We hope that "Uncle" Reuben will remain over until the annual tournament of English anglers takes place so that he may be able to see how they conduct those things abroad, and if there are any points worth adopting our National Rod and Reel Association may have the benefit of his experience.

THE ADIRONDACKS.

THE State of New York has been very remiss in not caring for the large tract of land, larger than the State of Connecticut, which is popularly known as the Adirondacks. It has sold land to lumbermen at a nominal sum in the vain hope that it would get into the hands of men who would pay taxes on it and so bring in a revenue to the State. This hope has not been realized. The lumbermen have bought large tracts, in some cases as low as five cents an acre, and after skinning it have allowed it to revert to the State for non-payment of taxes.

A bill has just been introduced into the Legislature authorizing Mr. Verplanck Colvix, Superintendent of the Adirondack Survey, to locate the detached portions of State lands with a view to the preservation of the forests, and the laying out of the boundary of the proposed State reservation in that region. It needs no argument at this time to show how these vast woods shelter the sources of the Hudson and give off the water gradually which, if the forests were removed, would come down in floods and sweep over the cities in the valley, as has lately been done in the West. We hope this bill may pass and protect the water supply of our rivers and canals before it is too late.

The forthcoming report of Mr. Colvix will be looked for with great interest. It will contain important maps, records of horizontal measurements of lines and the determination of the latitudes and longitudes, etc., of lakes, mountains, villages, and the corners of the great land patents. It will also give scientific papers on forestry, rainfall, water supply for New York and the cities of the Hudson valley, descriptions of the fish found in the region, and an historical and descriptive account of the Adirondacks, as well as an official list of the several pieces of State lands, amounting to 573,872 acres, with details of their location. This will make it a volume of exceptional interest, and one that the Legislature will do well to have widely distributed. The State cannot afford to treat the Adirondacks with the neglect that it has done. Already the Hudson River has hardly a steamboat channel in midsummer, where fifty years ago there was plenty of room for the sailing craft that carried the commerce of the upper Hudson.

HORSES IN HOMER'S TIME.

THE ancient Greeks and the Trojans as well made great use of their horses in battle. Among these people the horse was as thoroughly domesticated in Homer's day as he is anywhere at present. Apollo looking down from Pergamos and urging the Trojans to fight calls them "the trimmers of steeds." (Il. IV., 506.) Elsewhere they are distinguished as those employing horses in battle. Diomed, a champion of the Greeks, is commonly addressed in a respectful way as a "tamer of horses." Horses were used in battle only when harnessed to the car. Thus Hector was driving to the field with his fleet steeds yoked to the chariot, when he reminded them of the wheat they had eaten from the gentle hand of his wife Andromache, and of the wine that had been mixed for them to drink as though they had been the favored guests of a luxurious house; and he called upon them by noon that day to prove themselves worthy of such favor.

Speaking after this way, he called to his steeds and addressed them, Xanthos and you, Podarge, and Aithon and Lampos divine one, Now repay me the cost of your keeping, which in abundance Andromache, who was child of Eetion, the great-hearted, Put in your ears for your food as wheat d-lighting the palate. Misting wine for your drink whenever you should feel thirst, Before bringing dhanor to me who am proud of being her husband. Hastily make the pursuit to see if perchance we may capture Shield of Nestor, which now to the gods is familiar in story, S it be wholly of gold—the body and even the handles. And from the shoulders may strap of Diomed, tamer of horses, Breatheplate skillfully wrought—Hephaistos toiled at its making. If only these two we take, then hope can I have the Achaians Thus very night for retreat will go on board their swift vessels. (Il. VIII., 154-197.)

Hektor calls his horses by their names which will be found expressive, and as appropriate as any pet names a modern jockey would find in English for his favorite steeds. There was Xanthos, the yellow-coated one, named after one of the horses given by Poseidon to Hera, and his yoke-fellow was Podarge, so called from the nimble movement of her feet. Next was Aithon, the fiery, named either for his bright color or for his impetuous spirit. This name had been borne by one of the horses of the sun. Last of all Hektor calls on Lampos the divine, whose name is the same as that given to one of the horses of Aurora who brings the light of day to mortals. (Od. XXIII., 246.) These names of Hektor's horses, and the many others which Homer makes famous by his verse, will remind the reader of Virgil of the name that poet gives the horse upon which Dido was mounted when she joined the hunting party. Its equivalent in English would be Foot-of-Sound. This is commonly taken as a mere epithet describing the horse by the heavy sound with which he strikes the pavement with his feet; that is, the horse of the sounding hoofs. But the queen's horse was a palfrey for gentle rein and of easy step, and it seems better to understand the poet as giving it a proper name, and calling it Foot-of-Sound to indicate the speed and ease with which it traveled.

The horses of Achilles were two, Xanthos and Balios, immortal steeds which Poseidon had given to Peleus. These were groomed and fed with a care no less assiduous than that bestowed by the gentle hand of Andromache. Often such care was shown by their master's comrade Patroklos,

and this we may suppose was the reason why at this hero's death these steeds so sensibly felt his loss. From his hand were they accustomed to receive their provender, and he used to wash their limbs with pure water, and pour the generous oil over their glossy manes. (Il. XXIII., 281.)

Horses of Atalides, also from the battle-field standing, Went as soon as they had intelligence of their driver Having fallen in dust at the hands of man-slaying Hektor. Surely Automedon, the stout-hearted son of Diros, Often with quickening tones he urged them on with his lashing, Often with coaxing tones he spoke, and with threatenings often. Now no more to the ships on the shore where the Hellespont broadens, Lured the horses to go, nor to battle with the Achaians; But as a pillar remains firm fixed which has been erected Over the tomb of a man deceased, or that of a woman, So did they wait and hold unmoved the beautiful carriage, Drooping their heads to the ground, more over tears that were scalding.

Fell from the horses' lids to the soil as they were lamenting Loss of the charioteer, and their flowing manes were polluted, Having escaped from the hand, and the yoke on both sides over-hanging; Seeing these two shedding tears, the son of Kronos felt pity, Nodding and shaking his head he talked with himself and he queried: Ah, moid why did we make you a present to Peleus the royal, Him who is mortal, while you are both free from age and undying? Was it that you among men most wretched should suffer misfortune? For there is not anywhere than man a more pitiful object. Of all, as many as breathe and crawl upon the earth's surface, Surely not by yourselves, and in chariots skillfully fashioned, Hektor, of Priam the son, shall be drawn, for I will forbid this. (Il. XVII., 430-462.)

The former of these two horses of Achilles was gifted by the favor of Hera with speech and with prophecy. The death of its master was foretold with confidence, and with too certain fulfillment. (Il. XIX., 400.) This cannot fail to remind of the experience of Balaam as told in the Hebrew scriptures, the practice of the Persians to keep horses for purposes of divination; and what Tacitus says of the same practice being common among the Germans in his day.

The horses of Diomed had served to them for provender wheat which was sweet as honey. (Il. X., 568.) This was fed them before going to battle. So, too, near by each of the eleven cars belonging to Lykoon stood a span of horses feeding upon white barley and rye. (Il. V., 166.) When in camp and idle, the steeds of the heroes were kept on less expensive food. While Achilles was encamped apart from Agamemnon, indulging his resentment, the horses stood unyoked about the chariots munching the lotus plant and the meadow-nurtured parsley. (Il. II., 775.)

It is worthy of notice that those portions of Greece abounding in meadow lands are such as were the favorite pasture grounds for horses. It was Argos abounding in springs, and Thessaly watered by mountain streams, that were famed for their steeds in Homer's day. This is a fact that should be taken into account by those who attempt to show that the intellectual and political deterioration of that country is due to the increased dryness of its climate. When Telamachos was about to leave Menelaos whom he visited at Sparta, his host presented him with three horses and a well-polished car, but the youth declined the present on the ground that Ithaka was fit only for the browsing of goats.

As to the gift you would make, pray let it remain as a keepsake. These horses I will not take into Ithaka, but in your keeping. Here will I leave them as pets, for you of a plain are the owner. One that is broad and in which grows lotus and bay from the marshes, Wheat and the kernels of maize; the white and the wide-spreading barley. Broad roads has Ithaka now, nor has it the least bit of meadow; Fit for the browsing of goats; too steep for the grazing of horses. None of the islands admit of driving, nor are they good pasture, As strong as they be in the sea, Ithaka being best for its meadows. This was the way he spoke; unmoved was loud-voiced Menelaos, Gave him a slap with his hand, and blunty took up the discourse. (Od. IV., 600-610.)

Horses were always driven to the battle-field harnessed to the car; but that the ancient Greeks were familiar with feats of horsemanship that would excite wonder in our day appears evident from a comparison by which the poet tells how Ajax strode over the decks of the ships when he would urge the Greeks to battle:

But as for Ajax high-souled, not yet it suited his temper There to remain where the rest stood it—the sons of Achaians. Over the decks of the ships he strode and hanged; his feet step: Sprang in his hands a spear that was long and fit for the sea-fight, Jointed with rings driven on—its length was twenty-two cubits. But as a man who well knows how to ride several horses, When from a numerous drove four horses he has selected Out from the pasture, he takes these steeds and drives to the city Over the public highway, and many, admiring, watch him, Men and matrons as well; not losing his balance, the rider, Springing he changes from one to another while they are flying: So did Ajax upon the numerous decks of the swift ships Stride with a lordly step, and his voice rose up to the ether. (Il. XV., 673-685.)

ISAAC BARRETT CHOATE.

DEATH OF S. H. TURRILL.—Mr. S. H. Turrill, Chicago, Ill., died at his home in that city, Wednesday morning, March 14. Mr. Turrill was widely known among the sportsmen of the country. Mr. Turrill was at one time a stockholder in the ROD AND GUN before the consolidation of that journal with the FOREST AND STREAM. He was for many years prominent as a trap shot, and took great interest in the Illinois Sportsmen's Association

The Sportsman Tourist.

SKETCHES OF LABRADOR LIFE.

BY J. U. GREGORY, OF QUEBEC.

DURING the month of July, 1872, my official duties required me to visit the coast of Labrador below Point de Mont.

The steamer Druid, upon which I made the journey safely, reached the snug little harbor near Egg Island and lay at anchor while workmen, taken down for the purpose, repaired the lighthouse and other buildings belonging to the station there.

Finding that the necessary work would detain us for two or three days, I organized a party to visit a small river some six miles off said to contain salmon. We started in the steamer's boat with the captain and four men, well provided with rods, flies, a tent, and provisions for a couple of days' camping.

On our way we kept near the shore, where we encountered quite a number of seals basking upon the rocks laid bare by the low condition of the tide. They would glide off their resting places at our approach and then come to the surface of the water, staring at us and often affording a fair rifle shot. We fired at them, but could not obtain possession of any, owing to their sinking as soon as hit. Next day, however, a resident fisherman passing picked up three which he found lying dead in the shallow water when the tide was at its lowest.

Near the mouth of the Little Trinity River, our destination, we found a fisherman's hut at the edge of the woods, with about an acre of cleared land on which was grown a patch of potatoes, a great luxury to the owner. We landed on the beach opposite the hut, and were met by a tall, powerfully built man, who bid us welcome in the language of his native country—France. We inquired about our chances of getting salmon, and were assured that about seven miles up the stream, at the foot of the rapids, we would find them. We engaged this man, whose name was Gitony, to act as guide. We fired soon after our departure, but the fisher-boys walk through a tangled foot-path brought us to the pool, where we toiled fortwofours trying to get a "rise." We caught several fine trout, but salmon did not then show themselves, notwithstanding our changing flies, and employing all the art we were possessed of to make them do so. We therefore decided to return at once to our boat and row back to the shore, but just as we were about to start, our boat was blown toward the homeward path, each one shouldering his load of the supplies, we heard a splash, and a fine salmon disappeared under the water. This cousteoed our guide, who until then looked crestfallen at our want of success and apparent des- less in his report that salmon would be found in the river. Feeling convinced, however, that the fish, although there, would not take the bait that day, we continued on our way back to the boat which we reached tired and hungry after our fourteen miles' walk. Fortunately we had hauled our boat well up on the shore, for a stiff breeze had sprung up, and the waves were rolling on the beach with such force as to render it impossible to launch her; we were therefore compelled to remain overnight, and accept the shelter of our guide's one-room dwelling, of which his wife and himself were the only other occupants, as they had no children.

Mrs. Gitony soon prepared a good meal out of our own supplies, and when this had been partaken of, pipes were filled, and the men began to relate adventures of different kinds to while away the time. Our hostess not taking any part in the conversation, I looked around, and through the thick tobacco smoke could distinguish her form sitting in a corner, and also the slight glimmer of a pipe. The air was quietly smoking. I asked her to come near and tell me how she enjoyed her Labrador life, at the same time placing a three-legged stool near me for her to sit upon. She complied with my request, and after some conversation I noticed that she was very intelligent, and rather well educated for a person of her position. This led me to inquire into her past life, as far as she could remember.

She appeared to be quite communicative, and informed me that she was born in Quebec, of respectable and well-to-do parents, had been educated in a convent, and intending to become a nun, had studied with that object in view, but, owing to some illness which unfitted her for the calling, her doctor prescribed a sea voyage or residence near salt water as her only means of cure. Her uncle, who owned a schooner, afforded her the opportunity of making the desired sea-trip. They left Quebec late in the summer, bound for the Straits of Belle Isle, but were wrecked near Esquimaux Point, barely escaping with their lives. She was kindly treated by the inhabitants and thoroughly recovered her health. While there she met Gitony, a Frenchman and a cooper by trade, who had come to the coast to build up a small town. She managed to build up a fortune making barrels for Canadian fishermen. This he did not succeed in accomplishing; but he wooed and won the would-be recluse, and they were duly married, when a life began for her such as she had never even dreamed of.

Not long after their marriage Gitony built a fishing harbor with his young wife, provisions and traps crossed over to the island of Aster, and put up a small hut. She was one of the most isolated localities, and then led the life of a trapper; often leaving his wife for days and even weeks at home, her only companion being a large Newfoundland dog—not a neighbor within twenty miles of her. It would be difficult to imagine a more solitary, cheerless life for anyone, particularly a woman, and one whose early training was so calculated to exist in the world. But she was provided with a common single-barreled gun, and plenty of ammunition, and soon became an expert shot. During one winter she killed five black bears and a large number of geese and ducks. Her depression of the utter solitude, her mental depression, and the vicissitudes through which she passed was most touching.

Once, during the severest winter weather, when entirely alone, the hut took fire and was burned down. She managed to save her gun, ammunition, some flour and clothing; everything else was destroyed. She made for herself a suit of men's clothing, with old boat sails, which she lined with her own warm female apparel, and thus she passed six weeks in a cabin made by her own hands from the trunks of trees which she cut near by, stuffing up the interstices with moss to keep out the Arctic cold. Upon her husband's return they set to work and erected a new hut.

The following summer, her husband being away on the

other side of the island, she was again alone for several days. One fine calm day, an American fishing schooner, which had remained almost stationary for several hours opposite the hut, cast anchor, and made preparations to land part of the crew, with the evident intention of visiting the house. She, fearing that her unprotected state would expose her to insult and danger, hastily caught up a pair of scissors, cut her hair short, and made herself as respectable as a man, slipped on some of her husband's old fishing clothes, besmeared her face so as to give it the appearance of being covered with a young growing beard, and quietly awaited the arrival of the visitors who soon made their appearance, carrying with them a jar of whiskey, cards and provisions. Not being able to speak English, by signs she made them welcome, and all that afternoon and next night she was forced to drink, play cards, and smoke in a perfect career with the unruly set. However, she acquitted herself so well as to excite no suspicion in the minds of the rough seamen, and parted with them the best of friends, but feeling thankful to have got rid of such unwelcome guests. For many years she spent such a life on Anticosti as few women have ever experienced anywhere.

At last Gitony decided to come over and live on the north shore, where I met them. She often begged her husband to come to Quebec, but he refused to do so. One day she ran away from home while he was absent, with the intention of sending him word to follow her on her arrival at Quebec, this being the only plan she could conceive of inducing him to leave such a desolate place, but he, reaching home earlier than she expected, followed her footsteps in the sand on the beach, and overtook her on the road to a locality where she hoped to find a schooner to bring her back to the civilization she had fled from.

My presence appeared to give her new courage, and I strongly urged her husband to come up, promising to procure work for him. The next summer he did so and soon found employment at his trade, but after a few months' residence in town Mrs. Gitony's health broke down again, and I was surprised to learn that they had returned to Labrador once more.

Only a year afterward a woman dressed in black was shown to my office, and I again beheld Mrs. Gitony, this time a widow. She told me that upon their return to Labrador they had gone far back into the wilderness with the necessary supplies to spend the winter trapping. They had two dogs and a "commetic," or sled to assist them in carrying their outfit; but they had hardly reached their destination when her husband was stricken with paralysis and died in her arms. Fancy her dreadful position! A hundred miles away from Quebec, but he refused to do so. One day she ran away from home while he was absent, with the intention of sending him word to follow her on her arrival at Quebec, this being the only plan she could conceive of inducing him to leave such a desolate place, but he, reaching home earlier than she expected, followed her footsteps in the sand on the beach, and overtook her on the road to a locality where she hoped to find a schooner to bring her back to the civilization she had fled from.

Recently, however, I was astonished to learn that, although now past forty years of age, she has married another fisherman, and come back with him to that desolate coast, to resume the life that she once so dreaded, but she now evidently prefers to any other.

Some persons eventually become so fascinated with the wild, free life of a trapper or fisherman, that, notwithstanding its hardships and vicissitudes, starvation often staring them in the face, a few months' residence in a large city becomes so irksome to them that they long to return to their former mode of life.

I have known a well educated, born and brought up Quebec, formerly a storekeeper, married to an educated woman, who accepted a situation as light-house keeper on the island of Anticosti, and afterward obtained, through family influence, a good government appointment with sufficient remuneration to enable him to bring up his family well and live comfortably, actually shed tears when he left his isolated island home, and a year afterward trying to get back to his former position; but I have also known others to go out of their minds from the dreariness and monotony of their lives. These were invariably men. Women appear to bear up better, and frequently do the most of the work, keeping the station in order, while their husbands look the picture of unhappiness. Again, there are some stations, where husband, wife and children seem to be perfectly contented, the family well educated and even accomplished in music and other recreations. The latter are all supplied with literature, and their conversation is free from slang so often noticeable in town-bred people.

Professor Linden, in his interesting and truthfully written papers published in your last volume, mentions one of such families, that of Mr. Edwin Pope, of Anticosti, whose amiable daughters, who have never left last year left the island, would do credit to any city family. His sons are educated, and it would appear to advantage anywhere, and Mrs. Pope was born and brought up on the island, and to the best of my knowledge has never left it.

There are others in my district on the coast of Labrador who are possessed of considerable education and even refinement.

At the solitary Bird Rock Station, where the lighthouse is perched on a square rock a few hundred feet in extent, which one can reach only by being hauled up in a box by means of a crane 120 feet from the water, the keepers have never been sadly tried. The first keeper there, a young man, whose residence, became insane from the monotony of the life. It was replaced by a very respectable man who, after having filled the station for nine years, was one day tempted to leave his station to hunt seals on the surrounding ice, but was overtaken by a storm and perished with his son, their bodies never being recovered. His successor, one of the most able and intelligent of our keepers, was a young man, by some means ignited a barrel of gunpowder in a hut at hand, and with his young son and assistant was blown to atoms; yet notwithstanding these fatalities, no sooner does a vacancy occur than applications for it pour in, invariably from those possessed of all the necessary qualifications to earn a living elsewhere.

Two years ago I visited the coast in the steamer Druid, together with His Excellency the Governor-General and a number of the most interesting localities, among others Seven Islands, and anchored in the beautiful bay of that name. His Excellency and myself, taking guns, embarked in a canoe paddled by two men, hoping for a shot at something. We had been informed elsewhere that porcupines were plentiful, and were eager to shoot them. When nearing the shore we were hailed by a Canadian fisherman, who, seeing me, and, having heard, I asked him if there was anything to be shot at. He pointed north shouting. He answered, "Yes, if you know what you want." As we did not know which direction to take we requested

him to procure us a guide, whereupon he said he knew a young Indian, an excellent sportsman, who, he thought, would answer our purpose. His Excellency whispered to me to try and get a full-blooded Indian, no sham, for some of those he had employed on similar occasions elsewhere bore Scotch names, such as McLeod, etc., and resembled too much the white man; he would like to see the real Indian, and expected to find him in such a far off place as this. I told the fisherman to bring us a real Indian, and he said he would do so. Fancy our surprise when he ran back a distance toward an encampment of some twenty wigwags, on hearing him shout at the top of his voice to a perfect looking Indian, whom he called by the name of McKinzie—Scotch again. However, since then His Excellency has had the "Simon pure" in the West, without a Scotch name, and doubtless enjoyed the novelty.

NIMROD IN THE NORTH.

BY LIEUT. FRED K. SCHWATKA, U. S. ARMY.

V.—Nimrod with a Fish-rod.

THE devotee of Isaak Walton, the sly old trout fancier, might allow his fish under the deep shadow of the overhanging cliffs to fly unhurt on a hot summer's day, winking and blinking at the feathered hook with impunity—here there before expression; the graying with his voracious endeavors to swallow hook, line, pole and fisherman; the bass, the pike, the pickerel and all the gamy gladiators of the genial climates are waiting in the frigid zones; yet there is some grand old sport, excellent spiced with danger—that suite of man's noblest essays—in many of the fisheries of the frigid zone, on the high water cleaving the clipper-built bow of his pursuers, into fragments with one stroke of his huge tail, to the finest little "finny" fellow that scratches his head on the under surface of the treacherous ice.

Ever since Captain Edge and Poole on the 13th of June, 1611, struck and captured the first whale, and the amphibious sailors of the Dutch, English and Scotch have developed this rude sport, it has been a wonder that so many sportsmen in secure and low lands, who could give as well as receive death—have never crossed weapons with these tigers of the sea. Perhaps their pursuit proves to profit and loss; but so does the buffalo in the hands of hirelings. Perhaps his hunts are too remote to be invaded cheaply, but whoever heard the true sportsman stand on such ground when we consider the great expense of excursions to such lands as Africa and elsewhere to kill the lion, tiger or leopard. However may be the reason, the noblest "game" given to man is left to the hands of those who kill him for the coin he will bring in the markets. I can imagine nothing more exciting than a good whale chase, and I think it would send any sportsman's blood up to (buck) fever heat. I had been promised a royal old chance; to participate in such a chase by the mate of the Eothien, the whaler that bore us to Hudson's Bay, should they ever "power" for one before my little party was set ashore to prosecute its Arctic explorations, but no such chance ever came, although no one probably watched the man in the crow's nest at the masthead for "there she blows" more than I, not even those to whom their pocket was more than their pride.

The Esquimaux catch considerable numbers of whale and trade their bone and oil to the whaling ships, and this fact creates considerable rivalry between the different vessels to reach the whaling grounds. In order to barter with these native fishermen, who have been so long in the position for a month before the ships can get in. The ancient Esquimaux, or purely native method of killing a whale was to pursue him with the harpoons and bladders we have described in the walrus and seal hunt, by a large number of natives in their *kicks* or skin caoes and literally fill him so full of them that when exhausted after a long chase he was unable to sink beneath the water and fell prey to their sharp lances made of wood and tipped with walrus ivory heads. Many of the old Iwlikik Esquimaux told me that their ancient whale hunts, the flesh of these monsters keeping a fair sized village in dog meat for the winter while the skin about an inch thick was used by themselves; the whalebone cut into strips was used to lash their *kicks* frames together, while the bone proper from the jaw was swain into long batten-like strips twelve or fifteen feet long, three or four inches wide and an inch thick, with which they worked their whaling sledges to give them a broad running and bearing surface. This with the oil and blubber for light and food made the whale one of the most useful game they could pursue.

Now they hunt them like the whalers, oftentimes in boats supplied by them or obtained from wrecked whaling ships, and sell the proceeds for almost insignificant results, the beneficial results of the contact of civilization with savagery. The Esquimaux also form, wherever they can be obtained, a fair portion of the crew of these vessels, for nowhere can be found more hardy harpooners, braver boatmen, than these natural fishermen in their seas of ice and storms.

The skin of the whale is considered the best part for eating. It is "as black as the ace of spades," and when boiled in the trying-pots its taste is not unlike that of tripe. It is an excellent article of diet in that it assists to keep away that base of the sailor, the scurvy. Before their contact with white men they would not "try out" the whale blubber in such a wholesale manner as now done for their benefit, as they believed, and probably with some truth, that the smell of the rendered oil would drive away the reindeer and musk-oxen, especially if there be an inshore wind. Game once frightened away in this manner is very slow to return.

If the natives are "whaling" from a station on the coast, the *ang-ahoo* or medicine men on the shore, assisted by those who have remained behind, beseech the god of the seas to give the whalemen luck by their reciting of *ang-ahoo* these of a system of gymnastic devotion more fatiguing than the chase of the whale.

One use of the whalebone to which the natives put it, and one case of which came under my personal observation, I must not allow to pass unnoticed. Whenever wolves have been unusually predatory, have destroyed a favorite dog or so, or have done up *caché* of reindeer meat just when it was so, or in any way have aroused the ire of the Inuit hunter, he takes a strip of whalebone about the size of those used in corsets, wraps it up into a compact helical mass like a watch spring, having previously sharpened both ends, then ties it together with reindeer sinew, and plasters it with a compound of blood and grease, which is allowed to freeze and forms a binding cement sufficiently strong to cut the snow string at every second or third turn. This, with a lot of similar looking bits of meat and blubber, is scattered

over the snow or ground, and the hungry wolf devours it along with the others, and when it is thawed out by the warmth of his stomach, it elongates and has the well-known effect of whalebone on the system, but having the military advantage of interior lines its effects are more rapid, killing the poor wolf, with the most horrible agonies, in a couple of days.

The narwal, narval or narval, or, as it is sometimes called, the sea unicorn, gives the natives of the North much sport in its capture, which, in general, is by the electric type method of inflated bladder and harpoon, a method which has never been improved upon, even by the ingenious Yankee whaler, for their whaleboat is nothing more than the float, and their harpoon looks wonderfully as if it had been borrowed from that of the Esquimaux, with civilized workmanship in its detail. The natives in Hudson's Strait brought up some to Britain, but I have never been able to see any in the bay, and in fact the Esquimaux there know of no such fish at all. Its peculiar twisted ivory tusk, of from about five to eight feet in length, is its weapon of defense, and it is not altogether a bad one if it can be once gotten through the frail covering of the native skin caoe, but accidents from it are rare; in fact the pursuit of the narwal is not a common sport even in waters where it is the most numerous. The flesh of the narwal is considered very fine by the Esquimaux, and as they are from fifteen to twenty feet in length exclusive of the horn, it obtains a reputation that they are not pursued more when they obtain so much meat in one animal. Probably the tusk or rather its active use mostly influences their practical minds. The fish themselves use it to transfix fish which they pursue, to break the thin ice so they may breathe and blow, and as a weapon of defense. It has been known to bury it in the wood of ships, into the sides of whales, and even run it through the copper of ships; in truth, the hardest ivory known, being worth double that of the best clear-cut ivory.

As we were entering the eastern entrance of Hudson's Strait we managed to while away a few hours pleasantly from time to time in shooting with our revolvers at the grampus whales that came sporting alongside of our ship, with a familiarity that seemed to take us to be one of their kind. It is needless to remark that we "bagged" none, for a pistol shot would have no more effect on their black, wrinkled backs that protrude from the water, than upon a Creedmoor butt; in fact they really seemed to enjoy our sportings because greater and their familiarity stronger in direct ratio to the amount of firing we would do at them, a sort of satire on our shooting. It is probably their penchant for seal meat that attracts them into the sub-Arctic regions, some of the sailors believing that they dislodge them with their tail or back fin from their frail abode on the edge of the ice or the rocks, when they are unable to back in the snow. When the Arctic sky is deeply overcast and the water of the sea by sympathy have taken on the same garb with the blackest lung swells, there is nothing more beautiful than a school of white whales passing by, their ivory white skins contrasting conspicuously with the dark green fluid in which they swim; or when the sun is shining brightly their backs, as they roll gracefully along, shine like so many mirrors so bright as their poles.

They are seen in Hudson's Bay early in the spring traveling along the coast as soon as the shore ice breaks up, generally toward the east at Depot Island, and then again become numerous in the fall just before the new ice forms, traveling in the opposite direction. The natives are eager in their pursuit, as it gives them some variety from the summer walrus hunt, and nearly as much blubber and meat. One thing I could not help noticing in their movements, while they were in the bay, and that was the manner in which they passed, and that was the almost simultaneous manner in which the whole school, however widely dispersed, would appear at the surface. It almost seemed as if they were figures joined by immovable rods and raised and lowered by machinery. Even when the island split them apart this synchronism was still observed, and on one occasion this happened when there were but two which were thus separated. These two broke up the school, and were seen to be in their highest state of discipline in their individual movements, as they appear to have more leisure; their spring actions being more the method of a mob scurrying along in a hurry to their feeding grounds. The porpoise is sometime seen and caught in the Arctic, but it is, in general, a very scarce game, not to be depended upon. I know that in a strict scientific sense all of the above are mammals, and therefore not strictly speaking fish, but are introduced, and their chief interest in their natural history sense. They are really no more fishes than the seals and walrus already described.

Those old piscatorial pirates, the sharks, often invade the Arctic, no doubt tempted by the carcasses of the whales or seals and walrus left to rot by white men engaged in their pursuit. Natives angling from their skin caoes in deep water, occasionally catch a sluggish shark who has engulfed the bait, but there is no use pulling against such a mountain of flesh and relying upon their strength to bring him up; and this the Inuit *Isaak Walton* fully knows, and overcomes his strength by sagacity. At every brisk pull by Mr. Shark, showing him to be irritated, the line is lowered to appease him, but cautiously hauled in again almost immediately, the shark slowly rising to this strategic manipulation, until "like a finny fool" he rests upon the surface of the water, and is then pulled up by the weakest fishing-line, when with a long terrific fisherman's defiance, he catches him by a well-directed thrust through the spinal cord. From their well-known voracity in warmer climes it seems singular indeed that they do not often attack the native fishermen in their little skin caoes, but there is not a recorded or known instance of such attacks even on the west shore of Greenland, where they are most numerous and the shore in that manner is frequented by from ten to twenty thousand a year, according to Dr. Blak, Danish inspector of this coast for a long number of years. The most usual method of catching these fish can hardly be said to be fishing at all. Near a hole in the ice a lighted torch is placed, and two natives stand on opposite sides of the hole with two sharp hand-hooks, like deck bands of a steamer at the end of a shaft waiting for merchandise, until the shark sticks his nose out, when he is treated in about the same business-like manner as the Inuit, the shark's carcasses often accumulate to hundreds of the carcasses, which when once commenced is generally carried on through the whole winter. The cartilaginous bones are the favorite parts for food, as the raw frozen flesh seems to have a depressing effect when long continued, and to it is attributed the dog disease of the North when fed to them, and which every few years carries off so many of these useful animals.

AROUND THE COAST OF FLORIDA.

BY DR. J. A. HENSHALL.

Ninth Paper.

As we passed out into the Gulf from the mouth of the Homosassa, the negro boatmen were mooring the raft of cedar logs under the lee of an island, to await the arrival of the little steamer that was to tow it up to Cedar Key. While thus employed the song, one of their peculiar and pleasing melodies, the "A-b-a!" or refrain "O-ho-ho!" and "A-b-a!" being caught up in full chorus in a wild, chromatic intonation, which floated out to us over the water in harmonious hursts and prolonged minor cadences:

- I pole his raft way down de river,
O-ho! O-ho-o! A-b-a! A-b-a-a!
De shakas and sawfish make me shibber,
O-ho! O-ho-o! A-b-a! A-b-a-a!
You thought you heard a gator beller,
O-ho! O-ho-o! A-b-a! A-b-a-a!
Twas only his brack bacula feller,
O-ho! O-ho-o! A-b-a! A-b-a-a!
De fish-bawk kotched a big fat mullet,
O-ho! O-ho-o! A-b-a! A-b-a-a!
But I found its way down de eagle's gullet,
O-ho! O-ho-o! A-b-a! A-b-a-a!
De tarpon chased a great big jerefish,
O-ho! O-ho-o! A-b-a! A-b-a-a!
Oh, sez de shark, why did you do dis,
O-ho! O-ho-o! A-b-a! A-b-a-a!

We put out into the Gulf some five miles, beyond the group of Martin's Keys, and ten miles northward came to the Sweetwater Keys off the mouth of Crystal River. The mouth of this river is beset with oyster banks, but about it is a fine clear stream navigable to its source, some twelve miles, where it arises from several springs, near which is the village of Crystal River. Along this pure and beautiful stream the usual fishing, game and oysters are to be obtained.

Ten miles farther northward we came to the sand banks off the mouth of Withlacoochee River—called "Coochee" for short. This is a narrow, deep river, more than a hundred miles long, arising in Polk county, to the eastward of Tampa, and flows northward along the eastern border of Hernando county, from Lake Harris, in the Gulf. It is navigable for some twenty-five miles. As this river penetrates so far into the mainland, and flows through so extensive and varied a range of country, where the finest hunting, shooting and black bass fishing can be enjoyed, it is a desirable stream for the sportsman with a small boat. An entire winter could be profitably spent on this river. Connected with it is Panasoffee Lake, a large body of water but twelve miles from Lake Harris, in the hands of Oklawaha River, and during high water a still larger lake, to the westward of the river Lake Trafi or Charliepoka can be entered. To the canoeist a delightful and interesting trip would be from Jacksonville up the sluggish St. Johns and Oklawaha rivers to Lake Harris, thence by a portage of twelve miles (by wagon) to Lake Panasoffee and the Withlacoochee. From the mouth of the latter river it is but twenty miles to Cedar Key, the Keys of Waccasassa Bay, where the water is shallow and smooth.

Along the Withlacoochee the sportsman will find forests of pines, wild deer and quail, broad savannas and cypress swamps, abounding in herons, cranes, greys, water turkeys, ospreys, eagles, etc., and ponds, lakes and bayous, the resort of innumerable flocks of ducks, coots, plover, snipe and curlew, while in the swamps and low hamaks can be found porches, herons, wild cattle and hogs, and in the high hamaks squirrels and turkeys. In fact, the whole of Hernando county will prove of the greatest interest to the sportsman, canoeist or tourist. On the coast, between the mouths of the Withlacoochee and Anclote rivers, are numerous keys and many harbors, the rivers and creeks being only from five to ten miles apart, while lying outside, parallel with the coast and some ten miles distant, is St. Martin's Reef, breaking off the force of the waves of the Gulf. This portion of the coast as smooth as a mill pond, and in consequence, the shores are green to the water's edge.

The rivers emptying into the Gulf between the "Coochee" and the Anclote have their sources in beautiful and wonderful springs, which burst out from the base of a high sand ridge running parallel with the coast, and distant from it some twelve miles. This ridge is covered by open pine forests, and consists of the extensive banks of tropical luxuriance. In the edge of this hamak Jack and I were standing one day, feasting our eyes upon its strange and wondrous beauties. Maple and milkberry, myrtle and magnolia, cedar and cypress, willow and water-oak, mastie and acacia, palmetto and dogwood, red bay and live oak, elm and sea-shal, gum and hickory were thickly crowded together, interlaced, intertwined and overtopped by grape vines, morning glories, climbing the Jack and other creepers, and their trunks beset and hidden by thickets of Spanish bayonet, satinwood, paw paw, Indian fig and cacti. Flowers of every hue greeted the eye from tree, shrub and vine. The great snowy blossoms of sweet bay and magnolia, the tall white racemes of Spanish bayonet, morning glories of every tint, and the gorgeous scarlet and yellow flowers of the cacti mingled with fragrance with odors from spicy shrubs and aromatic leaves.

Jack essayed to cut a bouquet of the choicest bloom, but his feet becoming entangled in the meshes of a "climbing Jack," he fell full length and was lost to sight among the bushes and vines. He came bounding out again with a yell of anguish, and danced around, rubbing his legs where the acuminated, ensiform leaves of the Spanish bayonet had pierced them, and picking out the minute prickles of the cactus from his hair and face.

"Ah, Jack!" said I commiserately, "The least that is spouset awake to the flowers Is always the first to be touch'd by the thorns."

"Yes," answered he ruefully, "Beholding heaven, and feeling hell!"

These lines of Tom Moore as applied to Jack's case embodied more truth than poetry, but they are worthy of being recorded, for it was the last poetry indulged in on the voyage, for from the mouth of the Withlacoochee we took our course northwest, direct for Cedar Key, where we arrived in the afternoon of the first day of May, and the "Cruise of the Rambler" was ended.

Cedar Key is now a thriving and flourishing city of several thousand inhabitants, situated on Way and Alsenca oaks keys. Its principal industries are cedar and pine saw-mills,

fishing and turtiling. It is the shipping point for the produce, and the commercial emporium of the west coast, being the western terminus of the Florida Transit Railroad, running across the State from Fernandina, and connecting the Gulf with the Atlantic. Lines of steamers connect it with Tampa, Manatee, Key West and Havana, Mobile, New Orleans and Galveston. There are several hotels; the Swanwick, the Gulf and Bettolini's, and many good stores. The sportsman can be fitted out with everything needful for camping and cruising except fine fishing tackle, fixed ammunition and cartridge shells.

The visitor cannot fail to be interested in the cedar mills of the Paber and Eagle Pencil Companies. The logs are here run through saw after saw, until finally reduced to pencil stocks and penholders, when they are packed in boxes and shipped East to the pencil factories to be filled and polished. Even the cedar sawdust is utilized, being packed in casks and sent to New York. Some of the machinery is very ingenious and interesting and will repay a visit. Cedar is becoming scarce, even in Florida, and what we will do for pencil stocks when it is exhausted is hard to tell, for no other wood will answer, and Florida cedar is the best that could be had for the purpose.

There are several fish houses where great quantities of fresh fish are packed in ice and shipped North in the winter. Thousands of green turtles are also shipped from this point. They are taken in gill-nets with a mesh of eighteen inches. These nets are not staked down as on Indian River on the east coast, but are anchored on the grassy banks and shoals, and wherever the turtles are found, sometimes many from shore.

The Gulf coast of Florida is, perhaps, the finest cruising ground in the world. The water is shallow and seldom rough, for it takes a gale of wind to kelp up much of a sea, and harbors lie plentifully all along the coast. Small boats can find an inside passage from Cedar Key to Cape Sable, almost the entire distance. The principal passes and inlets are short and usually straight, with plenty of water and easily entered. Generally there are long sand spits and shoals making out from them for a long distance, between which the cruiser must proceed, though usually there are swash channels along the shores by which small boats may enter. The rise and fall of the tides is greater than on the southeastern coast. A harbor for small boats can be found at any time behind the numerous keys and islands. At length, on the morning of the tenth day of May, I stepped aboard the train of the Transit Railroad, and was soon rattling over the keys to the mainland, leaving behind the broad bay, the white sails, the skimming gulls and the mangroves. At last we were whirled into the pine woods and hamaks, and I caught the last, grand and glorious view of the boundless, blue Gulf, sleeping and shimmering in the bright morning sun.

- Farewell, Florida!
Thy stately palms and whisp'ring pines,
Thy silent yppress, clamb'ring vines,
Thy orange groves and flowers rare,
Thy spicy shrubs and scented air,
Farewell!
Farewell, Florida!
Thy Everglades, savannas green,
Thy crystal streams and lakes serene,
Thy coral reefs, thy sunny keys,
Thy mangrove isles, thy summer breeze,
Farewell!
Farewell, Florida!
Thy starry nights, thy balmy days,
Thy azure seas, thy white bird rays,
Thy coral blue, thy land-locked bays,
Thy silver sheen, thy golden haze,
Farewell!

Natural History.

A SALMAGUNDI OF NATURAL HISTORY.

In Two Parts—Part I.

BY JOHN DEAN CATON, LL.D.

MAJOR — is a character in his way—yes, and an instructor too. He has well educated the East, where he was born, and came to the Western frontier more than fifty years ago. Of good natural parts and a close observer, he has accumulated a fund of information. He affects an uncouth form of expression sometimes, which he contracted of the backwoodsman in early life, which pleases him much better than more scholarly language, while it serves to impart his ideas. He has been a land surveyor, and has often executed Government contracts, and thus have his observations of men and things been extended from the Ohio River to Lake Superior. He has lived in camp almost as much as in a house, and his fondness for the wilderness, whether forest or prairie, has never abated. Of course he was an expert hunter and was sure to supply his camp whenever in regions where game abounded. In early life he was much addicted to language quite inappropriate to a camp meeting or the vestibule of a church, but this he has succeeded in dropping out of his conversation to a large extent; but the frailty of exaggeration still clings to him to a certain extent, but it seems to lead a sort of piquancy to his discourse without detracting much from its instructiveness; for you readily see from time to time the paper allowance to truth he would give. He has said he was an instructor, and so he is. Nothing pleases him so much as to sit on a box in front of the store, and gather about him the boys of the town and discourse to them by the hour. Often in the balmy mornings of spring have I seen the Major cast himself on a bench or box on the sidewalk, when immediately the boys would begin to gather around him till he passed on. He was fairly obstructed, when the interview would begin, but he frequently stopped and listened with interest and felt I was instructed, though his object evidently was to both amuse and instruct the boys.

I cannot resist the temptation to repeat one of these interviews.

One of the boys who had worked up close to him said: "Now, Major, won't you please tell us some more about the Black Hawk war?" He said he, "you always want to hear about war and bloodshed. Better cultivate hearts of peace. That war was more'n than fifty years ago, and long before many of your fathers were born. Then I won my spurs, and used them, too—at Stillman's Run—then I will not talk about that. That war was only the chirp of a cricket to the roar of a gun when compared with the great war of the Rebellion, which was only twenty years ago. In that war I did some real service, and I may at some other time tell you about my campaigns in the South, but I am more peacefully inclined this morning."

"Well," said another boy, "tell us, then, something about this country when it was all new—when the prairies were wild, and the groves had no fences around them, and the deer and the prairie chickens had it all their own way. Come here, some of my twenty years ago. In that war I did some real service, and I may at some other time tell you about my campaigns in the South, but I am more peacefully inclined this morning."

From Cedar Key he can follow the shore of Waccasassa Bay, inside the keys if necessary, to Withlacoochee River. Thence along shore and inside the keys and islands if he wishes, to Crystal, Homosassa, Chocowiskee and Weckawatche rivers to Bayport. The reef before mentioned lies off shore, some ten miles, rendering this portion of the route very smooth sailing, with plenty of water and along inside Helley's Keys to the "Coochee" River, and thence inside Anclote Keys to Anclote River. From here to Hog Island, at the head of Clearwater Harbor, there is another long outlying reef. Sailing down Clearwater Harbor to Boca Ceiga Bay he will reach Tampa Bay, where he can proceed up to Old Tampa and Hillsboro bays, or keeping to the southward to Estero Bay, where plenty of water and he will enter Big Sarasota and Little Sarasota bays, and proceed to Casco's Pass at the southern end of the latter bay. From here he can await a favorable opportunity and a fair wind to run outside for a dozen miles to Kettle Harbor, which connects with Charlotte Harbor.

If he wishes to go below this point, he will sail inside to Punta Bessa, and a few miles below. In sight, either Matanzas Pass, sailing down Estero Bay, or the Estero Pass, where a dozen miles again of outside work will take him to Gordon's Pass, from whence he can follow the channels along the inside keys and Marco and Horr's islands to Cocoonet Key, behind Cape Romano. From here to Cape Sable there are outlying banks and reefs which render this portion of the route smooth, and the water is quite shallow anywhere within three miles of the shore, and the reefs can be found at a distance of one to three miles from the shore.

This would be a delightful trip in a boat drawing less than a foot of water, for it is in shallow water, and in the neighborhood of mud flats, oyster reefs and sand banks that game, fish, clams and oysters are found in their greatest abundance. The cruise could of course be varied by passing up the numerous rivers and creeks to the mainland, and once there could be safely navigated in small weatherly craft by Mosquito Lagoon and Indian River, and with the tributaries of the latter river, and the contiguous coast, it is preferable, in my opinion, to the west coast for a winter's sojourn, though in the eye of the sportsman each coast has its special advantages.

My pen is inadequate to describe the pleasures to be enjoyed, and the beautiful scenery of nature to be witnessed during a winter sojourn on the southern coast of Florida. The wealth and glory of the vegetable kingdom, the varied and curious forms of animated nature, and the balmy atmosphere and snaky skies of the Southern seas must be realized by appreciative senses to do them justice.

And of all the pleasing objects of that perpetual summer clime, the ever-present palmetto, with its beauty and freshness, with the eye of the beholder as the grandest and most graceful, and the most characteristic and picturesque feature of those sub-tropical shores. To the camper it is house, food and raiment. A good shelter can be flatched with its broad leaves; its berries are palatable, nutritious and healing to the diseased lung, and furnish a good wine;

the embryonic leaf-bud of the young tree provides a good "cabbage"; two of its broad fronds hung over the shoulders, in front and behind, form a waterproof garment in a shower; its leaves provide a carpet, a bed, taliecloth, plates and platters, and their mid ribs, forks; its dry foot-stalk furnishes fuel, and its fan, a torch; its green leaf stem, a fishing-rod, or spear; its bleached green leaves, cordage, hats, mats, fans and baskets. But don't sit on its trunk, for its brittle and sharp fibre is nearly as bad as cactus prickles.

can't prove it by me. He was headed to the northwest, and I have always believed that he went straight to the Bad Lands, which was bad enough sure. But the serpent didn't go—not a bit of it. There is no record that he was driven out, and I have conclusive evidence that he stayed in this Ed. I saw a boy, that serpent was a massauger! He stayed and multiplied! What's that?

"Massauger! What's that, Major?" shouted a little rnrchin on the outer circle of the crowd with his shoe-brush and blacking-box slung over his shoulder, as he adjusted his tattered straw hat.

"There, now," shouted the Major. "What is this world a-coming to that a boy born and bred right here should ask what a massauger is! Where is the schoolmaster now, that the ignorant should prevail in the rising generation? Yes, in one who is growing up to make a voter and may decide a Presidential election, it may be, and I dare say, his mamma thinks he will be President himself—most mamma think so in this country. But you tell her for me, sonny, that such ignorance looks bad for her hop-foll. Massauger! That is the little black prairie rattlesnake. He is the meanest little euss that ever walked the earth. I just know it as theascal that presented that apple to Eve. The evidence is abundant. He is found in the right place. He is just mean enough to do it, and then he is just the size. When the record is silent we must look to probabilities. Now, if it had been a big snake it would have scared away the timid maiden, and he could never have accomplished her ruin. No, it was a little serpent that she was not afraid of that offered her the apple."

"Stop, Major, a moment," howled Tom Slack, "and tell us how such a little snake could have held such a big apple in his mouth?"

"There it is again," cried the Major, "another presidential candidate going under very fast. Don't you know that a snake's mouth is a great deal bigger than he is himself? Don't you know that a snake can just unjunge his jaws when he pleases and open his mouth as wide as a quozoh if he can make anything by it; and you just bet that little fellow did his very best to handle a big apple, and I have no doubt it was a real feat on his part."

"Mean, did I say, yes, indeed. Would you believe it, in the nesting season of the prairie chicken, they prow around and find all the nests and eggs, which they gulp down as if they were sugar-coated. One will swallow a whole nest full, till he is bloated out like a bologna sausage. But this is not all. If a nest escapes them they are always on the lookout for the little chicks, which they seem to like even better than the eggs, and thoughtfully believe they are mean enough and small enough to take care of the nest, that they may thus profit by the patient industry of the old hen. On some prairies I have seen them so thick that not a prairie chicken could be raised there, and how they supported themselves I don't know, unless they eat each other, which I am sure they did, for they are just mean enough to be cannibals. Why, if I were to tell you of some of my experiences with the massauger you would actually think me exaggerating, and would lose your confidence in my veracity which I prize so highly."

"No! No!" they all cried. "Tell us about it, we know we can depend on every word you say."

"Well then," said the Major, as he smoothed down his long white beard and changed the position of his legs by swinging the right over the left, "I will venture this once to tell you how it was. When surveying in the prairie in those days, I always wear heavy boots and a buckskin suit throughout."

"I was once running a line across a large prairie when I came up to the flagman on the top of a swell in the prairie, which overlooked a valley about a mile wide, and in the middle of the valley was a wide swale where the grass was very high. I told the flagman to go quite across the valley. I set the compass and sighted across, when I observed in the exact line a clump of the compass plant in full bloom, which stood a mile by itself, though many others like it were near by on all sides. I thought if I could keep my eye fixed on the object till I could reach it, I could save some time, and I determined to try it. The compass under one arm and the tripod under the other made a pretty good load, but I was young and strong, and I fixed my eye on the object a mile away and started. The first half of the distance I got over very well, but after that I began to get lousy, and before I reached the object from which I never once removed my eyes, it seemed almost impossible to drag one foot after the other, and I felt as if I must stop and rest. I however persevered to the end. So soon as I reached the object I looked down and saw that more than fifty of those cursed massaugers were fastened to my buckskin leggings. The pisen pests had been striking at me all the way across, whenever I came near one, and from the peculiar texture of buckskin, whenever one struck my leg it would not let go, especially if I seemed in motion. Well, boys, they just covered both legs nearly to the knees and they made it lively down there, I tell you. My legs then would have made a good match for the Medusa's head. To draw my hunting-knife was the work of an instant, and I struck off heads faster than you could count. That was the biggest massauger funeral I ever attended, and the ceremonies were the shortest."

"But the messenger is not without its uses, and proves the truth of the saying that nothing is made in vain. The early settlers, before they had time to raise a crop of corn, used to fatten their hogs on massaugers, finishing off with acorns in the groves. Now the hog is an omnivorous animal, and—"

"Hello, Major, what is omnivorous? What breed of hogs is that?" cried a little rnrchin, whose pants were rolled up to the knees and who was in the act of lifting as a suspender over the left shoulder, and whose mamma had not had time to repair his breeches torn on a picket fence, which he had climbed the day before to plunder a neighbor's garden.

The Major stroked his long beard as he looked at the inquirer with a benevolent rather than offended expression, and said:

"Come here, sonny, till I tell you. There is another case where the candidate is likely to be elected by the force of ignorance. What did your mamma design you for? Not the General of the Army, I am sure. You will make a man of peace, for I see you always carry a white flag. But let me advise you hereafter to carry it in front of you rather than behind, that your flag of truce may be seen before you are injured. Omnivorous, did you ask? You are an omnivorous yourself, and eat everything you can lay your hands on, and that is the way you get them. All created are divided into three classes—carnivorous, omnivorous and

herbivorous. Will you remember that, sonny? The carnivorous eat only the highest organized kind of food, namely flesh, and would starve to death in the midst of all the vegetable food in the world. Of this class is the massauger and the tiger, for instance. The omnivorous are those who eat anything that comes along, whether flesh, fish or vegetable food. You are of this class, as I said before, and so is the hog as well as the bear, the roon and the porcupine, for example. This class can live anywhere where anything can be got to eat, and so may be called lucky."

"The herbivorous is a class of animals that live on vegetable food alone, of which there is a much greater abundance than of animal food. Of this class the elephant, the camel and the horse and the rabbit are examples, so you see that these vegetarians embrace the largest of all our animals. Now, you know what omnivorous means, there may be some hope for you."

"But why didn't the serpents bite the hogs?" inquired a bright-eyed, round-faced lad, who stood with gaping mouth listening to the Major's lecture on zoology.

"There, now," said the Major, "what a question for a boy born and bred in a prairie country. The hog is the only animal I know of that the rattlesnake can't hurt, and what's more I don't know of anything that will poison him. I once tried a pesky mean one with a senic an he grew fat on it, and I reckon it was because they are so contrary. Why, he just goes for them like a terrier among a lot of rats in a pit. A hog will smell a rattlesnake as far as a pointer will a prairie chicken, and will go for him twice as fast, and the more there are of them the faster he goes. I once saw an old sow who had widdled a big lot of those varmint run up wind so fast that it fairly took all of the kinks out of her tail, and when she broke in upon a flock of the meon as they were hawking in the sun on an old muskrat house, she slashed away right and left in a most astonishing way. One nip and one shake was enough for one, when she would drop it and go for another, and before you could say Jack Robinson, the ground was covered with the slaughtered reptiles, when she rooled over the old muskrat house, where she found a few more. She then pilled them all up heads and points, and went off for her litter of pigs that had come trailing and squalling after her. They had a choice family dinner that day, I tell you."

"Without that supply of hog fodder many an early settler would have run short of meat."

"What kind of bacon did those hogs make? you ask. I tell you it was first-rate. A little strong, it may be, but we had strong men in those days, and they needed strong meat. It's more than thirty years since I have tasted a bit of it—meat that is."

"Massaugers beat civilization as much as civilization hates them; so soon as white men began to come in they began to leave, and I don't believe there has been one this side of the Mississippi River in the last twenty years. That is why I say if they hadn't cleared out Adam the first time they tried, they would all have left themselves, long before Cain was grown up so he could strike a hard lick."

"But was a white man?" asked a strapping lad near the outside of the circle.

"There, now," said the Major, a little tartly. "There is another promising piece of timber spoiled for some great place. No amount of teaching can ever get him out of a log cabin or raise him above the plane of a rail-splitter, a tanner, or a canal driver. But never mind, for there are enough left to keep trying, and it may be some of them will win. Where the schoolmaster? Was Adam a white man? The same he was. Wasn't Ham the first negro? I say again, where is the schoolmaster, to let such nonsense find a place among the rising generation? What kind of rulers will he make of you?"

"You ask again what breed of hogs those were? I tell you they were the plowshare breed, or the 'prairie rooters,' as some called them. They had snouts as long as a tapir, and as stout as a crowbar, and the way they went for the wild arctiches was a caution. The wood break up a ten acre piece quicker than you could whip a pair of oxen, and twice as well. And many a settler who was short of a team depended on them to break his land. But then they were always troublesome, for they would come back for the crop after it was raised. Fence them out! As well fence out the prairie chickens or the spotted gophers. I have seen one clear a ten mile fence without touching a hoof, and I can show you the marks. After pigs at her heels, slip through a space in a paling fence not three inches wide, as slick as both sides were greased, and the way she went into those flowerbeds was a caution. But a circus soon followed—the old woman and the stalwart girls rushed out of the cabin with shovels and tongs, mop and broom, and set up a yell that would have drowned Gabriel's horn, and you might have seen that old sow scot back quicker than she came, and all you could see after that was a blue streak leading away to the prairie, and the pigs squealing along after. That was a remarkable instance, I admit, for a hog is the contrariest animal ever civilized by man, and if you want to get him out of a lot the surest plan is to try to keep him in."

"But," said Jack Tuhs, "didn't those hogs sometimes run off and the settlers lose them?"

"There, now," said the Major, "there is some sense in that question, and there is some hope for that boy if his mamma only licks him often enough."

"Yes, a good many of those hogs did run off and set up housekeeping on their own account. The hog is a strange animal after all. He is a direct descendant of the wild boar of Europe, which your story books tell you is so fierce and ugly. But he is easily domesticated, and in a few generations, if he is kept close, treated kindly and well fed, especially the latter, becomes the quiet, plump, porker you see at the country fair. But then the pig and the pigs squealing along the fattest hog into the range and make him shift for himself and in a few years he becomes as wild as his grandfather was a thousand years ago. He gaunts up, becomes bow-backed and long-legged, and will run like a deer and will fight like a tiger, and even his children will become striped like the pigs of the wild boar. This is what they call reverting to the wild state, and this he seems rather fond of doing."

"Yes, forty or fifty years ago there were a good many gangs of wild hogs in the great prairies of Illinois. They kept clear away from the timber if there were any settlements there, and took to the most secluded places they could find many miles away. Those plowshare brutes didn't want much change to make them wild, either. Once I was surveying on the Grand Prairie, not a hundred miles from here, and came across a lot of these wild hogs. As I had been challenged us at a place I made up my mind directly that I had lost no hogs in that neighborhood, and left. The flag-

man, who stumbled on them first, ran as he never ran before nor since, hotly pursued by the boar, who was clamping his teeth and frothing at the mouth, and pitched right in among us, as if he thought he was Samson, and wielded the jaw-bone of an ass, and only a ride bullet changed it from a man funeral to a hog funeral. We went a long way around the settlement, and I calculated the distance without chaining it, and told you I would turn out a prairie wild boar against the best in the old country and would ask no odds, either."

"But, boys, I only told you about half of that snake story. When the pesky massaugers handicapped me so, when crossing that valley, you know both hands were full, and I couldn't take my eyes off the bunch of pilot plant. When about half way across, a flock of gallinippers lit on me, like a flock of pigeons on a grain field. They could not make much headway through the bushes, doves or the buckskin clothes, though they did some; but the face was naked, and they soon found it out and fought for the chance. That fighting alone saved me, and not much, either, for when I got through and planted my foot at the object, my face was covered as thick with them as a squash poltice. I laid down my tools and brushed them off by the handful. Before I could see to cut off those snakes' heads I told you about a thousand arrow flag-like leaves, but got their snouts in so far that they tore away when the owner went to grass, and it took one of the chain men an hour at least to pull them out with tweezers. He was a prudent and considerate youth, and when I saw him carefully laying them down on an old letter which he took from his pocket, heads and points alternately, and asked him what he saved them for, he said that Jane (she was his sweetheart and had written that letter) had told him she was nearly out of pins, and had asked him if he could carry any first-rate gallinippers, to save her a good lot of their bills, which were sharper and stronger and better every way than store pins!"

"While Jim was busy collecting the hairpins the rest of the party had been busy digging and muncing a good supply of the root of the rattlesnake weed (*Eryngium yuccifolium*).—Ed.] This is a plant that grows abundantly all over the high prairies. This plant throws out from the root a cluster of long narrow flag-like leaves, the edges of which are slender blades. The seed stalks shoot up from the center of the cluster of leaves, on the top of which a burr grows, which contains seeds which will germinate and bear seeds again the third year and the two succeeding years, and then it dies. Near the top of this seed stalk a number of branches are thrown off, upon each of which a small seed burr is grown, but their seeds are generally blasted."

"Bears are much affected by mosquito bites used to carry a piece of the root in their pocket in their camp, and when the end of it a little and hold it on the bite for a short time, when the irritation almost instantly disappears."

"Whether the sap of the leaves or the stalk is an antidote for poisonous bites I do not know, but the root certainly possesses properties worth examining by the doctors, and this is true of many other plants of the prairie which were used by the early settlers for medicinal purposes. One I have seen which grows in the prairie, and which is used in place of quinine, and with similar effect to cure the ague. It grew up in a single stem from the root and bore a number of small white flowers with short, small leaves. The leaf of the plant grew out from the stem two and a half inches long and one and a half inches broad, and was very bitter [*Verbena stricta*,—Ed.] Of these leaves a strong tea was made, which was drunk freely, and produced a sensation almost a slight intoxication. This tea was sometimes boiled down and made into a jelly, one of the best as a small pea, was as much as I cared to take at once."

"By the time Jim had finished collecting hairpins, I had the big head badly. But the poultice was ready, and applied all over the face. Almost instantly the burning pain ceased, and in an hour I was as well as ever."

"But what are gallinippers, Major?" cried out one of the boys, who seemed to have an inquiring mind.

"Gallinippers, sonny," said the old Chief, "said the instructor in natural history, 'for they, too, were all gone with the massauger long before you were born, and it is lucky for you that they were. They are a kind of mosquito, only a good deal more so. They are most as big as grass hoppers, with speckled or barred wings and legs, and they have bills long enough for hairpins, as was shown by what Jim did for his sweetheart. They are as sharp as a two-edged needle, and as strong as a musket. When one struck you in the face, you would think a mule had kicked you. They hunted in flocks, and each one was more savage than another. The only way to sleep when they were around was to lay down on the lee side of a big fire, and when you would awaken in the morning the dead and the wounded would cover you like a blanket. I once got a pan of skimmed milk at a cabin when we were out of provisions, and I had to scald it, and when I did so, it was all around it, and I had to divide it by each one taking one swallow—honest. Each swelled his checks out big and it disappeared fast, but before it got round there was more than half an inch of gallinippers on it, but the last fellow didn't mind it, and said he got more good out of it than any of the rest."

"Why! a half-dozen smart gallinippers would clear that bottom of the mosquitoes any day in half an hour. Once, when I was surveying a Government contract on Lake Superior we camped on a beautiful lake—Lake Gratio. It was a charming little lake of clear sweet water. 'Now, boys,' said I, 'we will have a nice dish of trout for supper. You, Bill, get some bait for that lake. I am sure is full of the speckled jackets.' 'What shall I get,' said Bill, 'for you know there are no anglers in all this country.' 'I knew Bill was right—not an angle worm ever existed in the Lake Superior country. All their worms were made and planted by white men. I myself took a painful of them up there about twenty-five years ago and planted them along Eagle River, and in a few years they were as plenty as blackberries on Indian Creek. Angle worms are migratory and follow civilization, but they won't follow the Indians, they are too fond for that."

"I told Bill to clear an old log to pieces and get some grubs, and I did better than that angle worms, because the trout were not used to them. An old Chinaman Indian who had sauntered into camp and heard what was said spoke up: 'No trout in that lake.' I was too polite to tell him that I knew he lied, for I thought no trout could keep out of such water, but after fishing the lake all over in every nook and corner for three days, I found the old savage was right. So let no one else fish for trout in Lake Gratio."

"Before Bill had found any grubs a crowd of gallinippers, which he had seen in the lake, was in a white froth, and settled down on us. Then such a jumping for bear's grease

mixed with gunpowder you never saw before. We smeared ourselves all over with that, when the hawk was on our side again. Luck came out of that threat, for we immediately built our hooks with gallinippers, and although we caught no trout we caught a fine string of yellow perch, and some black bass.

"Now, boys, I think I have told you enough for one day. If you remember it all you will do well. It is of no use for me to tell you things if you turn away and think of them no more. Right now on your way home to get your dinners you should not think of me. I have said and done what you should do, and you should remember it. I have told you, and the offender you think it over and try to remember more and more of it, so much the better, and if you will talk it over among yourselves and see which can remember the most, so much the better still. If you try hard you may have it all well tanned into you so you will never forget it. Those who do this will have good hopes for the future, but those who turn away and forget all had better keep to shining boots, for they will never be fit for anything else."

"One important difference between great men and little men is that the former think over and ponder and try to remember what they learn, while the latter immediately forget it. It leaves no more impression on their minds than a passing shadow. Those who want to remember what they may need to know, should be up at nine o'clock and I will tell you more about things. I have been in the western country in the olden times of long ago, if only the day is pleasant."

As the Major closed his discourse and bade the boys a good morning in a kindly tone, I slipped my note book into my pocket and looked as innocent as a lamb when he gave me a nod of recognition as he passed me.

[TO BE CONTINUED.]

OUR WINTER BIRDS.

BY GEORGE E. INTY.

VERY few of the many persons that are interested in our birds in the winter, are studying their habits and habits during the winter months. Even the snowbirds and one or two others, all birds are supposed by the general public to go south at the approach of winter. And yet, if people only take the trouble to look around them a little, make an occasional tour of their park or some wood, go along some hedge or tramp through the brown fields, they would be surprised to find so many birds that were wild and able to defy the fiercest weather. They were sprung from the birds that winter in our northern States and Canada excites our warmest admiration.

The snowbird (*Junclo hyemalis*) is the most common of all our winter birds. Breeding in the British Provinces and the mountainous and high wooded regions of the Northern States, it comes, in wonderful numbers, to pass the winter with us. They usually arrive during the first weeks of October, and leave again for their homes in the woods, about the middle of March or first of April. While here it is one of the most cheery of birds. When the snow has fallen enough to entirely cover the ground, then the snowbird is in his glory. How he swings from the tops of the brown ragweed! How he twitters! A flock of a hundred will be feeding thus, and their united voices make a harmony that it will pay us to go far to hear. In the evening, when the night threatens stormy and cold, we see them scurrying around our gardens, stopping long enough to glean a few scattered seeds, and then hurrying on to find some old barn or thick evergreen tree in which to pass the night.

In the country, when the snow has covered the ragweed and the catnip, from which they get a large part of their daily food, they fly along the rough rail fences that are everywhere to be seen, and pick the seeds out of the crevices where they have been deposited by the wind. How sociable are these little birds. We swept away the snow and few seeds and crumbs to a dozen snowbirds. The next morning there were more than a score of snowbirds and a few song sparrows enjoying their breakfast. In two days we had more than one hundred boards of the feathery order, all of whom came regularly, morning and evening, to pick up their food, gossiping as amiably with their musical chattering. When nothing else was to be had, stacks of hay and grain afford them subsistence.

Next to the snowbird in point of numbers comes the song sparrow (*Melospiza melodia*). It must have a strong love for home associations, for the patch of hiramites, the grassy knoll, and the field of grass and stubble that it frequented in summer, are also its haunts during winter. Its deep, musical chirp and its happy singing as it flies over the snow, are so much enjoyed by the birds, that they are usually frequent lower and damper ground.

The fox sparrow comes among us only when forced to do so by the severity of the weather, and the clipping sparrow remains with us so irregularly, that he is seldom seen in winter.

The goldfinches, those exquisite little songsters, resembling in color some varieties of canaries, always winter in our northern States, and are often seen in flocks of forty or fifty, and move about the country in search of food. Sometimes they will not be seen for several weeks in a locality, and then they will come sailing around with their unmistakable undulating flight for several days. Occasionally a pair of birds, usually young, will leave the flock and take care of themselves for a day or two, and then, tired of solitude, they seek the main body of flocks.

One soft Philadelphia snowflake was seen in the city. Last, we heard the song of a *Chonotrichus tristes*, and upon going to clump of sumacs, saw a young male and female goldfinch. The male sat on a twig, a foot or two below the object of his affection, and sang most sweetly. Few old birds, in balmy June eve, could equal this bird, on this gloomy day. We listened for half an hour, and went away wishing that we had it in a cage so that we could hear its thrilling song always.

Bluebirds (*Sialia sialis*) and robins (*Turdus migratorius*) sometimes brave winter's cold and snow, and stay in the land of the apple and pear. Rarely more than a half dozen of each species are observed in one neighborhood, and never in cities or towns. They are usually quite silent and cheerless during the time that their friends are sojourning in the Gulf countries. The robins feed on dogwood berries, buds,

green plants, and whatever of insect life can be obtained in cold weather. They are never seen near dwellings, but love solitary woods and points of hills, and are sometimes seen in henlock or other shrubby woods. At this season he is ever silent, and seemingly sad. When seen he flits quietly away, not that he is afraid, but that he desires solitude. But in the spring, when the warm days do come, our hardy robin will be the first to triumph over fallen winter, and sing the praises of genial spring.

The bluebird has his habitation in the cavity made by a woodpecker in the trunk of a usually seen in an open wood of large timber, or what in the New England or Middle States would be called a "woods field." They do not venture forth in very cold or rough weather often than every two or three days, and then they only make short excursions among the neighboring trees for the purpose of finding a few beaumbed flies and bugs to appease their appetites. Ah! how sad is their "cheerily-cheerily-cheerily" as a woodpecker in their flight, as they hover in the dead oak, while the mercury in the thermometer is drops of rain and the wind whistles a dry through the leafless trees. But when the snow is melting on the eastern hill, and the ice upon the river is broken, their "cheerily," now so sad, will be a gushing note of joy.

What a gay and dashing fellow is the blue jay, the *Cyanocitta cristata* of ornithology! He is just as vivacious and spirited in action as he is in dress of all our birds, while the mercury in the thermometer is drops of rain and the wind whistles a dry through the leafless trees. But when the snow is melting on the eastern hill, and the ice upon the river is broken, their "cheerily," now so sad, will be a gushing note of joy.

What a gay and dashing fellow is the blue jay, the *Cyanocitta cristata* of ornithology! He is just as vivacious and spirited in action as he is in dress of all our birds, while the mercury in the thermometer is drops of rain and the wind whistles a dry through the leafless trees. But when the snow is melting on the eastern hill, and the ice upon the river is broken, their "cheerily," now so sad, will be a gushing note of joy.

The jay's mode of obtaining a livelihood in winter is, of all our hibernating birds, the most interesting. During the fall months he is ever industriously concealing chestnuts, acorns, corn and sometime hickory nuts. Only one mit is buried in the same place, and they will have their winter's supply scattered over a mile or more of all sorts of rough ground. But how they find these nuts again is beyond our comprehension. And yet, we suppose, they find every buried treasure, for after having examined many hundreds of places where the jays had been scratching, we have never yet found one where a nut of some kind had not been unearthed. What a wonderful memory for locality must they have! No wanton or hungry they can be independent, even if the nut does lie white and dead on the ground. For does not each one know just where to alight upon the smooth surface, to dig to find his dinner?

When the winter comes with too grim a visage our blue jays retreat to some hollow tree or thicket of white oak shrubs to shelter themselves from his fierce blasts. Then, too, to shorten operations, do our jays stoop to methods that are more practical, making in all the coldest mornings that they will apply to the worthy granary. They dig under corn, and, without waiting for consent, will help themselves. Perhaps they think that they have earned that much by destroying slugs and noxious insects during its cultivation. Most social bird! Come and see us, as you do, often, and fear us not. Ah, you saucy, inquisitive fellow! We wish you no harm.

The black-eyed titmouse (*Parus atricapillus*) is one of our happiest winter birds. He is snug of by peep and rightly, for no other bird shows a more brave and cheery spirit. The chickadee, as this bird is commonly known, really is not in his happiest element until winter time. Then he will swing from the peach trees that grow by our garden walls, and all the time talking so cheerily in bird language. And, we suppose, that if we could only understand bird language we really would hear him say—

"In picking the gum from the old peach tree.

And the storm doesn't trouble me.

Peed-ee-ee-ee."

The country children have a beautiful habit of hanging bits of meat upon the post or tree near their homes for these birds to eat. The chickadees, with their neighborly and woodpeckers, will come every day to feast on the bounty so generously given. And while they are so happy, the children are more so, as from the windows or doorway they watch their protégés of the time being. This little bird is very sociable. It is usually seen in company with a half dozen of its fellows, and sometime, a couple of woodpeckers or creepers, making in all a lively company. Insect hunters. It is surprising the confidence that they show by the timidity. They will suffer you to approach within a few steps of them, and then will only cock their head on one side, look at you critically, and then go on about their ever busy task of searching for food.

Several varieties of woodpeckers are more or less familiar as winter residents. And closely allied to these are the sapsucker birds, of whom we are reminded the entire year in the vicinity of their nesting ground. They will make us "flying visits" at intervals of several days or weeks, according to the amount of food to be found and the sort of reception they receive. These birds are very fond of working on the beest tree, as beneath its rough bark many bugs and their larvae are found. They are not only pleasing to the eye, but are of much practical use to the horticulturalist and the grower of fruit. The woodpecker and sapsucker both like the bluebird, have a permanent home, even though they are rarely "in" excepting at night. In some dead tree a hole is bored horizontally two or three inches, and then down six or six inches, and made large enough to contain the owner comfortably, lined with a nest of fine wood or grass, and it is completed.

All the grouse and the Virginia quail (*Oryzopsis virginiana*) hibernates in the vicinity of their summer homes. Of the grouse, the ruffed is justly famed for his intrepid spirit and hardihood. No hills are too wild or craggy for him. No thicket is so brambly but that he will pierce it with crushing wings. Let the snow be ever so deep, and the winds ever so fierce and wild, he will only condescend to pluck the buds from our apple trees, and with this apology for a supper of winter, he will then proceed to dig, or to some dense thicket, and sleep as becomes the king of game birds. Sometime, however, a more domestic whim will seize him, and he will pick up the grains of oats and corn to be found along the roads, when he can do so without approaching too near to civilization. That he cares little for the average winter, is proved by the fact that we have frequently heard him drumming to midwinter.

We would not say the same of the quail. His "spirit, indeed, is willing, but the flesh is weak." He is such a happy, good fellow, that, for his sake, we wish 'twere always autumn. How proudly they strut among the brown chestnut leaves in balmy October! How swiftly courses the blood through our veins—

"When the sun's fruit is red,

And the quail is piping loud

In the huckleberry where he fed."

But there comes an end to such days. Winter spreads his heavy mantle o'er field and wood, and then all its gay and haunter is thrown to the winds. Now, your saucy "Peep," as the Germans more reverently say, "Poor God," will be given for the plaintive "wii-ee-wi-ee." Now, you no longer have the buckwheat fields to revel in; but struggling through the snow, a disheartened troop of little birds, you seek for food and shelter, and your cry of anguish is but the overflowing of your cup of bitterness. And he who will not give you an armful of brush or a handful of grain, or a handful of grain or crumbs to sustain life through the bitter night, will not give you a breath of life, or the protection of Him who loves alike all the good and beautiful of His creation.

BRUIN'S VARIED MOODS.

Will a bear attack a human being? Yes, one bear will attack a strong and courageous man and another will flee from the presence of a child, though far in the woods and alone. How is this all true? There is as much difference in the courage, tempers and general dispositions of bears as there is in the human family, or the dog family, or the horse family. Who has not seen a litter of little dogs who, when upon their feet, will start to frighten, will show all the varied dispositions of the litter, and all the variety of the same parents. One will meet you in the arena, one will scamper away under the bed yelping murder; a third sits down unconcerned and awaits the results and feels willing to stand his chance, and so on. Is not this true of nearly all animals?

One saw three cubs, all of one litter, one was tame and quiet and loved to be petted, and when scratched would run up his back like the pet pig. Another was shy, wild and cautious, but not angry, still when convenient, he would snap if a chance presented itself. The third was a demon, and was confined with a chain; he was unmanageable and showed no quarters, kept up a moaning howl and whine, and wanted no visitor, but would climb up and dig down, and would not let him be sure to bite the neck, does not this settle the question? These bears were all of the same man, in the same room, and on exhibition together.

This is a bear country, and from personal observation and conversation with scores of men who have had to do with the animals, I feel justified in asserting that the foregoing is the only true theory. When a man meets a bear he is in treacherous company, and knows not what he is to encounter. Bruin may run from you now, but he may return and may sit down or stand up and look at him, or may pretend not to know he sees him, or may creep away easily for a while and then run wildly. I have lots of evidence of all these appearances without regard to age, size, time of year or sex. The mothers of all animals stand by their young and fight for them as a general rule, especially if the infant is in trouble and gives the alarm of distress, and by no means is bruin an exception to the rule, neither is the unmanageable fox, and to outside, we will add the partridge. All females will defend their young.

Some people think bears kill sheep naturally as the bee sips honey. This is not so, if it were we could not keep sheep in the border towns in Maine. Some bears learn to take sheep the same as dogs, and when one of these sheep killers arrives in a neighborhood his name is more likely to have to suffer. I will confine the foregoing to the State of Maine, as I am not so well posted in other places, but presume the statements will apply generally. P. E. B.

Wata, Maine.

EXPERIENCE WITH WATER WITCHES.

I WAS much interested in reading the several articles on water witches, as they have appeared in FOREST AND STREAM, and, judging from your remarks, I infer you are disposed to doubt the fact of fluiding water in the ground by the aid of a green stick or twig.

Something over fifty years ago, being a lad of some ten years old, I was on a visit at an uncle's, who desired to procure water in a certain field on his farm in Hillsdale town, Columbia county, State of New York. He called on his sister, who, it seems, was a water witch, to go into this field and find it, if there. "This was the first I ever heard of such a thing, and of course, my mind was very much interested. My uncle cut a forked twig from a willow. Anna (that was her name) held one twig in each hand, with the butt end up, walking around the dooryard. At a number of places I saw it point down and work in her hands. I did not go to the field and see the operation then, as I had to return that afternoon to my grandfather's, a few miles away, where I then lived. I was told afterward the willow twigs indicated where to dig, and the water was found as desired.

I did not see nor think of water witches until many years afterward. In the mean time I had married, and afterward settled in the city of Detroit, about 1844 or '45. I bought a lot at the extreme southern limit of the city; one line of my lot was the city boundary; it was adjoining an orchard, being a "fat out" of the neighborhood was sparse, and the water pipes had not been laid, so the citizens of that section depended on wells. I built, and residing on my lot, and not having put down a well, depended on my neighbor for water. We had long dry spells or droughts, when most of the wells were dry. I delayed putting down a well until the next season of drought. Then the question to be decided was, "fat out" of the neighborhood was sparse, and the water pipes had not been laid, so the citizens of that section depended on wells. I built, and residing on my lot, and not having put down a well, depended on my neighbor for water. We had long dry spells or droughts, when most of the wells were dry. I delayed putting down a well until the next season of drought. Then the question to be decided was, "fat out" of the neighborhood was sparse, and the water pipes had not been laid, so the citizens of that section depended on wells. dropped her twig. I was as much surprised as they were, and at first thought they were playing a joke; they declared they were not. However, I quickly marked the spot, and to remove all doubt I blindfolded both and led them all around the yard; whenever we came to where the stream of water ran underground the twigs would point down in both their hands. At one point, on one side, and nearly at the back end of the lot, the twigs worked so strongly that one of the branches would generally twist so much that it would be broken half in two, when a fresh one would be required. In leading them toward this one central point the twigs seemed to feel the influence of the water, commencing to turn in front of them toward the underground water, or approaching nearer and nearer down, down, further and further, until the crock or pot pointed directly plumb at the point designated in former trials. Passing on straight ahead (now going from the water) the twig would bend back toward them, coming up to nearly a horizontal position, or, in other words, making nearly three-quarters of a circle. Keeping on straight ahead the single ends will go back, the reverse to an upright position as at the first, when the distance traveled (say two or three feet) is noted. The twigs which they have seen, and they reversed the order of approach by walking toward the point backward. In this case the crock will commence to lean toward the person carrying it, their back at the time being toward the water. Keeping on in that way the twig keeps bending in and down, until it strikes plumb at the time they arrive over the stream. So keeping on backward, now receding from the stream, the twig will gradually come up to nearly a level in front of the person. The tendency of the twig is always to point to the water, whether approaching or receding from the stream or spring, whichever it may be. After this thorough test I had full faith to dig a well around the point indicated, and I found abundance of water. Even in times of drouth, while my neighbors' wells gave out, mine had plenty; so much so that my well furnished our family and neighbors and their domestic animals during such periods.

FOXES OF THE EAST.—We receive frequent inquiries from fox hunting readers of the Eastern States giving descriptions of foxes of the South, which they have seen, and requesting their identification. East of the Mississippi are found but two species of fox, the common red (*Vulpes vulpes pensylvanicus*), and the gray fox (*Urocyon cinereo-guttatus*). The former is distributed over the whole country, from the Mississippi to the Atlantic coast, and from the British line south to the northern tier of the Southern States, and even further southward. The gray fox is most abundant in the South, and is less so than its larger relative north of Virginia, Kentucky and Missouri. Of course it must be understood that there is no fixed line beyond which neither species intrudes. The ranges of the two overlap each other, and the red fox is often killed in Virginia and North Carolina, while the gray has been killed in New England and is abundant in Ohio, but is not common so far north. While the common pelage of the red fox is, as its name implies, red, it varies considerably in color, running into so-called varieties, such as the cross and the black or silver gray fox. The best authorities regard these colors as examples more or less perfect of the not very unusual phenomenon of melanism. A red fox may give birth to a litter of puppies, in which there will be red cross and black individuals, and the converse of this is true. An essential difference by which the red fox, whatever his color, may be distinguished from the gray is to be found in the tails of the two species. In the red fox the tail is covered with soft fur and long hair uniformly mingled with, while in the gray fox it has a concealed ridge or mane of stiff hairs without any soft fur intermixed with them. The so-called Samson fox is a red fox with a peculiar crisp, woolly condition of the fur. Professor Allen is inclined to attribute this peculiarity of pelage to some disease.

SPRING NOTES.—Stanley, Morris Co., N. J., March 14, 1883.—The birds are here with the very first indication of spring. On the morning of the 12th the air resounded with the songs of robins, bluebirds, sparrows and blackbirds. As I went from my window at sunrise, a morning, a clanging apple tree near the house was fairly reddened by the specter of robins, whose bright breasts reflected the earliest rays of the sun. The snowbirds, which have been closely occupied all winter in securing food, were chasing each other joyfully on cager wing in their love making. Great flocks of blackbirds were seen passing north. One flock lit in tall cypress, chattering long in fluttering funeral garb. I am much pleased to hear of the success in making game of our two species of quail as late as the season as they were poultry. Two hens quite as large as the ones I have seen killed and partly eaten. This evening I saw the first woodcock within a stone's throw of the New Providence depot of the Delaware, Lackawanna & Western Railroad, a favorite place every spring. As I sat in my carriage expectantly waiting, one lit in the muddy road but twenty feet away; I heard several others in the adjoining fields. They are a week later than last year. —GEORGE SHEPARD PAGE.

The first robin arrived February 9, the earliest on record here. Bluebirds February 27; Killdeer March 4; crows, kingfishers and meadow larks have been here all the winter. —J. OTIS FELLOWS (Hornelsville, N. Y., March 15).

THE GREAT CAROLINA WREN IN CONNECTICUT.—While out collecting on Friday, March 2, 1883, a warm pleasant spring-like day, in passing by an old abandoned granite quarry, I heard a bird's song quite new to me. I found the bird perched on a low bush, among a pile of rocks, singing almost incessantly. I shot it, and on examination it was found to be a great Carolina wren. It now makes a valuable addition to my cabinet of specimens as note in C. H. Merriam's Review of the Birds of Connecticut, says it doubtless occurs as a rare summer resident from the South in the Connecticut Valley. I find no record of its being taken in this State previous to mine.—C. H. NEFF (Portland, Conn., March 10, 1883).

THOSE MIGRATORY QUAIL.—New Market, N. H., March 12.—Editor Forest and Stream: I have read with interest two notes in FOREST AND STREAM, Feb. 22 and March 8, both from Dover, N. H., and referring to migratory quail. I think that "G. A. W." is correct in making his statement. I was in Dover the 10th of February, and while passing along Chapel street, about 200 yds. above the gas works, I saw what is now known as a migratory quail. I do not claim to be an ornithologist, but can tell a quail from a pine grosbeak. I think it probable that they were seen the 1st inst. —W.

REDPOLE LINNETS IN CONFINEMENT.—Seeing in FOREST AND STREAM of March 8, Mr. Calton's account of a linnet he has caged, reminds me to give him my experience with them. Early in February I was fortunate enough to capture a pair of the little fellows, male and female, and I have had them caged since that time. They show signs of molting now, and I am in hopes to be able to report the fact before the end of the present month. They eat freely of all kinds of seeds, but seem to prefer canary seed to anything else. They eat sparingly of cracker, and not at all of bread crumbs. They drink a great deal of water, and are very uneasy if I do not give them a dish of fresh water every morning. I have never seen them offer to wash or bathe as canaries do, but I think they may do so in the summer time. I have not observed the habit of longing downward from top of the cage, but my birds use the little swing lung in the cage, and will sometimes fight fierce battles for possession of it. They are very chatty and sociable, and the "guide wife" says are a deal of company.—J. E. M. (Deering, Maine, March 10, 1883).

SPRING IN MONTANA.—Helena, March 11, 1883.—Editor Forest and Stream: Spring has fairly opened with us yesterday, the 10th. I had the pleasure of hearing for the first time this spring, the song of the bluebird, but unfortunately I was unable to see it. To-day I was more fortunate, as a pair, male and female, took possession of my bird house, seeming to make themselves perfectly at home. I would state that this is the earliest arrival noted for the past three years. Last year and the two preceding years the first arrivals were on the 20th of March. I think all of our migratory birds will arrive earlier this year than usual, as our spring has been exceptionally mild and clear. Some few mallards have been shot in the open ponds and creeks, but they are very wild, making for the river as soon as shot at. I recently had the largest sage cock brought in to me to be stuffed that I ever saw. It measured thirty-three inches. The party bringing it in stated that he saw at least fifty in one flock ten miles north of Helena.—R. W. D.

A CAPTURED GOSHAWK.—Charleston, Me., March 12.—I have a goshawk which was captured one day last month under peculiar circumstances. He was observed flying round the house, each time bringing him nearer and nearer, until he suddenly dashed through a closed window, on the inside of which being a cage of canaries. The force with which he struck the window stunned him and he was secured. Is it a common occurrence for hawks to fly through windows? We have several flocks of goshawks wintering with us. Grouse and deer in this section, especially the latter, have become almost extinct, but owing to vigorous enforcement of our game laws are once more on the increase. We have several disciples of Isaac Walton. Notwithstanding the severity of our weather the common crow has once more appeared on the field of action, and his melodious notes warn us that spring is near at hand.—BLAKE JAY.

PLEW AGAINST THE HOUSE.—Rockville, Conn., March 15, 1883.—An occurrence happened here to day worthy of note, being very strange. Yesterday was our first warm day, and last night the first one that ice has not made for ten weeks. This morning the janitor of the school building found a dead woodcock lying by the side of the building. His head was somewhat crushed, having struck the side of the brick wall. The bird was large and in very fine condition.—S. K. Jr. [We have occasionally known of ruffed grouse flying against houses, as well as quail and the Virginia rail.]

FOOD OF THE CHIPMUNK.—Is it known to be a common thing for the chipmunk or ground squirrel, to feed on animal life? I once shot one which had just killed a small green snake, it then had two or three small scottions of the snake in its cheek pouches. The chipmunk might be added to the list of "enemies of reptiles," brought forward some time ago in your columns.—C. B. H. (Attleboro, Mass., March 12, 1883). [The ground squirrel's fondness for animal food is well known.]

LARGE WHITE OWL.—Fort Covington, N. Y., March 9.—I have just stuffed a female white owl, shot in January, 1883, near Huntington, P. Q., which measured from tip to tip plump five feet, five inches. The spots on it are unusually dark, almost jet black, and head very large and broad. Pine grosbeaks have been abundant this winter, but are about all gone now.—GYRELL COON.

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

NEW YORK GAME LAW.

[Special Dispatch to Forest and Stream.]

ALBANY, N. Y., March 21.
THE Towsend Bill came up to-day in Committee of the Whole in the Assembly. The clause prohibiting the hunting of deer in St. Lawrence county was so amended that the clause applies to the whole State. Mr. Boynton, of Essex county, attempted to have this amendment stricken out, claiming that it was unjust to New York city sportsmen. He also put in a plea for the Adirondack hotel-keepers, and said that while the city sportsmen would not undergo the fatigue of still-hunting, they would be on hand in the autumn, when the guides would drive the deer to them. Their stay in the autumn would put money into the landlords' pockets. But it was the decided sentiment of the Assembly, however, that hunting ought to be prohibited; and the amendment stood.

An attempt was made by Mr. Rogers of Seneca to have a part of Cayuga Lake exempted from the provision forbidding the catching of fish through the ice. The proposition was defeated. When the clause offering a bounty of 50 cents on hawks and owls came up there was

a debate by Messrs. Irwin, Johnson and Roosevelt. Mr. Roosevelt sturdily defended the owl as a friend of the farmer and useful because it caught mice and other rodents. He thought that a fine ought to be imposed for killing owls. The Assembly voted to protect owls and fish-hawks.

The attempt to open the month of July for woodcock shooting failed. Mr. Roosevelt contended that no true sportsman would take pleasure in shooting half-grown woodcock in mid-summer.

The bill was ordered to a third reading.

SUMMER SHOOTING.

"And he smote them hip and thigh with a great slaughter."

Editor Forest and Stream:—The bill for the repeal comes from some quarter, and it is as true of the game laws as of any other code, and there are instances where this is proven necessary, and it seems to be the case with that which legalized summer shooting.

For one I cannot understand how any humane sportsman can advocate or practice the destruction of game in mid-summer. A shooter of this sort always calls to mind the raid of Samson on the Philistines, and although he may make no "great slaughter," he is a butcher in will if not in deed.

The killing of game (even in a sportsman-like way) out of season is sheer butchery. 'Tis a cruelty to animals, in that it interferes with the breeding and the rearing of the young; 'tis a thoroughly selfish and ignoble pleasure or pursuit, in that it diminishes the chance of a legitimate sportsman to secure his quota of game in the "open" season, and 'tis lastly a violation of a wise and just enactment of the "powers that be."

Now, the making of laws to protect game is, first, in the interest of the natural procreation and sustentation of the game itself, and, second, for the benefit of sportsmen who have respect for "the times and the seasons."

Should summer shooting be made legal (which God forbid it ever be), what a death-dealing gauntlet would bird and beast have to run! Not only those who appreciate and enjoy the use of a gun would be "to the fore" (some of this class, at any rate), but the vast army of Cockneys, whose rank and file go forth into the sweet country-side when the reign of the star Sirius approaches. To be sure, these shooters might not make a "great slaughter," nor have plethoric bags to bear to quarters, but the peace of the game would be gone, and the peace and quiet also of wood and field. Game has been treated like the Philistines were in far too many ways and places, and the time has fully come when every sportsman should protest against its "slaughter," and rise en masse to protect both game and himself.

And to the making of laws—wise and just ones—let the enforcement of the same be supplemented. Is it not contrary to law that the sale of venison is now made? It is killed, it is shipped, it is sold! These three assertions are short, but they are suggestive and cannot be denied. Who is the purchaser of the venison? Is it not? But, like many others, it does not prove satisfactory.

Where, when and what to shoot are the three W's that are most significant to legislative bodies and to protective associations.

We cannot change, without dire result, the laws of nature, and the safest guide for lawmakers to follow is these same laws, especially as regards the protection and preservation of game. We cannot reasonably wise laws and a proper enlightenment of the people as to their need and worth, together with an impartial execution of them, and the whole body of honorable and intelligent sportsmen will be satisfied. These laws will not include summer shooting, however! For the sake of humane principles do let us give fur, fin and feather time to be born and to be hatched; time to be nourished and reared and in proper estate, both for the purposes of sport, and, moreover, let us all be thankful, "in season and out of season," for the pleasures and privileges of moor and mere, of rod and of gun. O. W. R.

Editor Forest and Stream:

In your issue of March 8 I understand you to open the columns of the FOREST AND STREAM for a free discussion of "Clericus's" claims for summer shooting. I therefore take the liberty of giving my views of it.

The shooting of game birds, except for the purposes of game, is a wanton act of murder. Therefore to shoot a game bird when it is not fit for game is murder. Now, is a woodcock fit for eating in July or August? I say no, and my reasons are that the young birds in July are not fully grown, have no fat about them, and are weak, immature things, while the old birds, having just raised their young, are poor and scrawny—precisely in the condition of a hen which has just hatched her chickens, and which no one would think of eating. How then can it be that a woodcock in the same condition can be good to eat? And as woodcock raise but two or three young, one is just as fit to shoot an old as young bird, neither of which is fit to eat.

In August the birds, both old and young, moults are weak, feeble, sick and feverish, from which they do not recover and become fat and too soft to eat at the earliest till late in the fall. No one will attempt to claim that a domestic fowl is fit to eat when moulting. How, then, can woodcock be? I say it cannot, according to my taste. Green quills and feathers no doubt help to thicken broth and give it a rich dark color, and "Clericus" may consider them a most savory addition, but I do not.

"Clericus" seems to think that the poor farmers are receiving too much consideration, etc. The fact is, the farmer has no other way of getting any profit, for the purpose of cultivation and grazing, and not that to raise birds for "Clericus" to shoot. And they know it; they know that every time he comes on their land without leave he is a trespasser, and they know from experience the trouble and loss it is to have pot-hunters, as most of the summer shooters are, tramping over their fields, sending their dogs through their cultivated and growing crops, kicking mud off their feet, leaving bars down and gates open—for the pot-hunter acts on the theory "that farmers have no rights which he is in the least degree bound to respect." What is it to the pot-hunter if the farmer's cows follow him into the corn or potatoes? What cares he care an acre of corn is ruined? Nothing. Neither does he care how many pellets of shot the farmer finds in the side of a choice cow simply because she was in range when he kicked mud off her feet. But the farmer has no other way to earn him when, as it frequently happens, that the dan-

age the summer shooter does him in a single day is more than the value of all the birds that are on his place in a whole year. Neither does he admit a charge of shot spluttering among his crows when he is milking—a circumstance that has occurred in this town.

So great is the early shooting, and fence-destroying nuisance become in some sections, that the farmers, to protect their own interests, have been obliged to post their lands and prohibit friend and foe alike from hunting on them.

When October comes the farmer has gathered up his crows, and he frequents the fields where the crops were grown, so that he suffers but little if a fence is left down, and as the birds are then in the swamps and pastures there is but little necessity for crossing his cultivated fields. He does not then feel the animosity toward a hunter he does in the summer.

Game birds of all kinds are rapidly disappearing; and unless great care is taken to preserve them, in a few years they will be entirely gone. It is a self-evident proposition that the longer the season for shooting the more birds will be shot; and as their numbers are decreasing so fast under the open season, restricted as it is now to the short late one, how much faster will they disappear if the season be lengthened by adding the summer!

Therefore, if we wish to keep the present scant number of birds good, it would seem the correct policy rather to shorten than extend the length of the present open season. W.

Would it not be well for such as "Clericus" to rent a trap and buy a lot of chry pigeons for use in the vacation season? They could then get their shooting "without sacrificing the game," and my opinion is it would be much more honorable than to kill any kind of game in the close season. It is good sport, and let me say here, he or anyone else will find it about as warm work as camping the fields, and the "brain workers" will find it more interesting to sleep in the tent just after a contented shoot at glass balls or chry pigeons from rotary screened traps. Pica.

APLETON, Wis.

WILD BOAR HUNT IN SANTO DOMINGO.

THE winter of 1870-71 found me with my companion Conroy and a guide (Monway) encamped on the upper waters of the Rio Wau, at the junction of Rio Cedra in the province of Sebou, Isla Santo Domingo, enjoying existence in the climate as the world affords. I cannot conceive wherein it could be made more pleasant or more conducive to health and longevity. As I write a few lines of pleasant memories of the exquisite pleasure of existence in the mild soothing atmosphere of this favored clime, fill my heart with longing for enjoying once again these happy hours. The location of our camp was in the foot-hills of the main range, small savannas, deep gullies, and high hills with almost perpendicular sides. The gullehes were clothed with a dense growth of tropical fisher, strubs and tropical plants, with their broad, rich-colored foliage, and at the foot a stream of cool crystal water. The savanna was adorned with pitch-pines, tall and straight, from four to eight rods apart, with a carpet of a variety of grasses.

At the point where we were encamped there were some wild hogs. By crossing the river we set foot on wild land, and all was game that came to the hunter's bag. I had not at this time had a model for a wild boar, and I had only known him by the representation of Sir Walter Scott and others, but I was anxious to become more familiar with his ways. Monway and myself, accompanied by a mongrel lot of the canine species to the number of eight, one day crossed the river, following slowly a path on the ridge of a spur for half an hour, when the pack gave tongue. Monway moved off at a lively pace, leaving me to follow as best I might. When I came up with him he was standing by the side of a grisly gray boar with a monstrous head and neck running off to almost a peak behind, the whole forming a striking contrast to the plump porkers of the Western States. I informed me this was the second one he had killed, there being one other short distance from there. After partially dressing them we each shouldered one and started for camp. They were skinned and the bones removed. This meat lying under the skin was well saturated with sour orange juice and sufficient salt, and hung over a pole to dry.

At this present moment I am debating in my mind if the stew made from this meat would offer their delicious flavor to a gameness derived from the pig's diet of palm nuts and roots of various plants, or to our sharpened appetites and romantic surroundings. Whichever it was, I would give much for the condiment that would make my meals once again so palatable.

Weeks passed by and although we were indebted to the wild hogs for our supply of meat I had so far failed to be in at the death. I felt somewhat disgraced, for I fancied myself something of a hunter, having hunted and killed deer and bear in Canada and in different States of the Union, and that brings me up with him, he was waiting for my opportunity. We had elunged camp three times, and at the present time our camp was made high up on the Rio Cedra. Cassava, rice, sugar and coffee were getting at a low ebb. 'Twas decided that carna de puorko would not satisfy all our cravings; therefore Con would keep camp, and myself and Monway would go down to the nearest ranchos for a supply of the necessities. Two days' ride over a mountain trail brought us to Bonabare. In the afternoon, when the three dogs gave tongue, the pack was taken to the ranch. The following day we purchased a jack ox, a very strong creature much for packing in the West Indies) and provisions consisting of plantains, rice, sugar, coffee and cassava.

Monway wished to stay at home for a few days, and Thursday I started for camp, driving the ox ahead loaded with a portion of provisions purchased. The Thursday night I camped, and Friday traveled in the afternoon, when the three dogs gave tongue. The pack was taken to the ranch. The following day we purchased a jack ox, a very strong creature much for packing in the West Indies) and provisions consisting of plantains, rice, sugar, coffee and cassava. very cautious not to make too intimate an acquaintance, just giving a nip and in their turn retreating. Forward and backward, advance and retire, went the fray. I enjoyed the sport until in one of his rudds his eyes lit on me, and he advanced with a speed I did not suppose he was capable of to possess. In a moment's time he had received a bullet in the back of his neck, and had torn my pistol band with his wicked tusks. The dogs had nipped him, and before I could give a second shot, away they went with the boar in hot pursuit. Then I began to realize that a wild boar is really formidable. He ran about twelve rods and again stood up, and I fired, grisly twistles all pointing toward his ears, writing his tusks which projected far above his snout, the froth dripping from his jaws and his head-like eyes throwing forth their malicious hate. He looked the embodiment of twenty devils instead of one. I approached within four rods, taking the precaution to stand under a tree, the lower limbs of which I could reach with my hands. The knife in my left hand and pistol in my right I opened fire. The chambers were emptied in quick succession without visible effect, when he seemed intent on coming to closer quarters, observing which I put myself above that limb with an agility that would have done credit to a professional gymnast. He stepped under the tree and saluted me with some sonorous grunts, then disappeared in the woods with the dunes in hot pursuit. I then decided to hunt no more hogs, without a rifle or double gun, which I never recovered religiously kept.

On arriving at camp and relating my adventure, Con complimented me by the information that he had not supposed me so great a coward; that if so good a chance had offered him, there would have been pork for supper. The next day, armed with a double gun, I secured three hogs.

Later we demonstrated the fact that a ball fired from a navy revolver three feet distant, would not enter the vitals of a full grown wild hog if directed toward any portion of the forward part of the body. Con did not often indulge in hunting, as he preferred keeping camp and letting Monway and myself look for pork. About six weeks after my first hog that I did not get, Con and myself decided to leave camp for a week. Taking a blanket and tin cup each, and tin pail to hold the coffee in, and salt, we went into the heart of the main range, and probably went over ground that was never before gazed on by mortal man. We placed our reliance for pork on a breach-loading rifle and one dog, the others having become disabled.

Toward night of the first day the dog was set loose and soon gave tongue. Con followed with the rifle. In a few minutes a report, followed by distressed hallooing, impressed me that the shot had been a failure and Con was being badly dealt with. Armed only with my knife, I made haste to the spot from which the cries proceeded. There stood Con, in vain endeavoring to withdraw the empty cartridge, his excitement preventing success. Taking the rifle and reloading I fired a shot at the hog, about four rods distant, the ball breaking his spine and one shoulder. Con explained that the first bite of the hog's whereabouts it was making a charge, and that he fired a shot, but the game was scarce eight feet from the muzzle of the gun. The dog immediately closed but was shaken violently off and pursued. Con's shot had broken one lip and the opposite gumbrel. This gray porker had pursued the dog four rods in this crippled condition. After my shot the dog again closed with her, and she fought as best she might until she was close to the end of the world, and out of my heart. There was a very good opportunity to return Con's compliment of cowardice, but I forebore, simply asking his opinion of wild hogs, and if he thought there was any fight in them. He replied that never again would he venture near one until he was sure it was dead. L. KENT, M. D.

THE NEGRO AND THE GAME.

Editor Forest and Stream:

Perhaps a few more words about the negro as a sportsman may not be uninteresting. Some days ago I was taking a little recreation with my gun not far from Palestine. I noticed two negro men beating about the bushes in company with a solitary stump-tailed "yaller darg." As they had no gun that was visible to me, I could hardly imagine what they were about. I concluded, however, that they were rabbit-hunting, and that their stump-tail dog was their sole dependence for catching the rabbit. This dog's peculiar build was such that it did not seem to be possible that he could be very swift. I therefore concluded that these two sportsmen would be quite sure to go home at night without any rabbit. At last it occurred that the two sportsmen had not come into the game, but that one of them carried an old-fashioned horse-pistol, smooth bore, and the other carried no other weapon than a hickory stick, about five or six feet long. I said to them that I had noticed them beating about the brush for some time, and that my curiosity was greatly excited to know what they were driving at. They replied that as it was Saturday evening they thought they would go out and get a rabbit or two, in order to have a good rabbit pie on Sunday. One of these gentlemen was a powerful man of at least 240 pounds weight; the other considerably less in size, but a full grown man. They had secured no game yet, but were in high spirits and enthusiastic. They were entirely confident that they would reveal in all the luxury of rabbit pie at upon the next day. Now, it is my opinion that these negroes had not come into the game, but that one of them carried a horse-pistol, smooth bore, and the other carried no other weapon than a hickory stick, about five or six feet long. They had secured no game yet, but were in high spirits and enthusiastic. They were entirely confident that they would reveal in all the luxury of rabbit pie at upon the next day. Now, it is my opinion that these negroes had not come into the game, but that one of them carried a horse-pistol, smooth bore, and the other carried no other weapon than a hickory stick, about five or six feet long. I said to them that I had noticed them beating about the brush for some time, and that my curiosity was greatly excited to know what they were driving at. They replied that as it was Saturday evening they thought they would go out and get a rabbit or two, in order to have a good rabbit pie on Sunday. One of these gentlemen was a powerful man of at least 240 pounds weight; the other considerably less in size, but a full grown man. They had secured no game yet, but were in high spirits and enthusiastic. They were entirely confident that they would reveal in all the luxury of rabbit pie at upon the next day. Now, it is my opinion that these negroes had not come into the game, but that one of them carried a horse-pistol, smooth bore, and the other carried no other weapon than a hickory stick, about five or six feet long. vice or assistance required, and under their directions precautions for the illegal killing of game, followed by convictions, have been the inevitable consequence. Some parties have been tried and convicted in the neighborhood of Oil Springs for killing deer out of season through the intervention of one of our energetic members, and another of our members is now investigating a matter of a similar kind in the township of Down. Our society may safely congratulate itself upon its being the only game society in Western Ontario that has taken any interest or prominent part in game protection and the extension and observance of the game laws, and in the future as well as in the past will always be found to the fore. In conclusion, we would suggest, in the hope that it may be acted upon, the formation of really good and strong game and protective associations in West Elgin, Kent, Bothwell, Lambton and Essex, and that such societies keep up constant correspondence with each other, and act in unison in obtaining any further legislation that may at times appear necessary to protect our game and to further the interest of game protection generally. It is to the interests of every genuine sportsman to take the matter up and carry it through, and the assistance and experience of this society will be at their disposal.

The very energetic fishery inspector of the district, Mr. Peter McCann, one of the vice-presidents of this society, reports that there have been no prosecutions for the violation of the fishery regulations since our last annual report, which shows that he is attending faithfully to his duties.

W. C. L. GILL, President.

LONDON, MARCH 13, 1883.
The following were elected officers for 1883: President, Dr. Woodruff; Vice-Presidents, Messrs. W. C. L. Gill, and P. McCann; Secretary, D. Skirving; Executive Committee, George Kelly, Jno. Paddock, T. H. Smallman, R. Wallace, Dr. Niven, C. A. Stone, R. Mercer, A. Chisholm, John Cousins; Finance Committee, Messrs. Paddocke, Stone and Kelly.

Dr. Niven reported that he had appeared before a committee of the Local Legislature in reference to legislation bearing on the protection of fish and game proposed to be passed at the late session, and had found the bill proposed by Mr. Monck somewhat unsuitable and inhospitable. It proposed a tax of \$25 upon any stranger shooting within the Province, which precluded the possibility of taking a visiting friend for a day's shooting and would permit American residents to send into the Province and shoot to any extent they please on payment of the prescribed fee.

Mr. W. C. L. Gill was appointed a delegate to attend the meeting at Ottawa referred to in the president's report.

HINTS FOR NEXT SEASON.

THE other side of all enchanting tales would not come amiss, as sportsmen are now making preparations for future trips to unmolested game resorts.

1. Never locate camp near the feeding ground of large game, to enable you to get the best and first chances at what could be seen there. I will give the reasons after you return to your homes with bad luck pictured on your faces.
2. Do not go fishing or hunting before October 1 without a good fly mixture, in which the odor of tar can be detected.

3. My diary, date January 23, 1879, says: "Don't flood down the Suwanee, River, Fla., without an antidote for the bite of water-moccasins and scorpions. Remain under shelter until the dew disappears, and do not drink the waters of the State until it has been boiled. Provide shelter for mosquitos outside your tent before sunset."
4. After establishing headquarters remember that game and fish in American forests will not be around to dine with you.
5. In Northern wilds rugged clothing is as necessary to your enjoyment as a good fly-rod.

6. If you think a gun with single grip to hold the barrels down as good as the best, put it in some other fellow's hoat. If a \$5 gun shoots well, find the mark the striker made when it backed out of one shot a year ago. The gun has strayed since. No information wanted.

water, and not a few have been picked up on the beach.

During the past week it has blown so hard on the days allowed for box-shooting at Havre de Grace, that it has been too rough to comfortably lie out in a box, consequently there has been but little shooting, although redheads and blackheads were plentiful. A duck supposed to have been an English teal was brought into Kriders for stuffing last week. It was killed at Havre de Grace. No snipe have arrived here yet, the first pair of the week was warm enough to bring them, but it closed wintry and blustery, and we have given over looking for them until the next pleasant spell.

Brant are in great numbers in both Barnegat and Tucker-ton bays, but the fowl stool poorly.

In our own river sprigtails are very numerous and the marshes on the Delaware shore are now black with them. It is very hard to get shooting at these ducks on these marshes, unless one sinks a box in the mud where they come to feed, puts a few decoys out and waits for the arrival of the fowl. The job is a dirty and hard one, and scarcely repays the trouble, for the ducks soon steer clear from the place where the hide is made after being shot at a few times and resort to other feeding grounds, of which there are hundreds of acres.

Last week a large flock of Canada geese was seen flying northward high above our city.

MARCH 20.

EXPANSIVE BULLETS.—Pittsfield, Vt., *Editor Forest and Stream:* I called on our gunsmith and had him turn a bar of steel, about $\frac{1}{16}$ in. in diameter at base, $\frac{1}{8}$ in. at point, for $\frac{1}{16}$ in. long, filed like a twisted drill, for drilling a hole through bottom of moulds to receive pin which projects into the point of the mould $\frac{1}{16}$ in., tapering from $\frac{1}{16}$ in. at point of bullet to a blunt point $\frac{1}{16}$ in. from base of ball. This I find just the thing to turn a Thomas cat or ground-hog inside out. For deer make the point a little shorter, leaving more solid base to increase penetration. On the shank of bar, at the base of ball, forge or clamp on projecting lips, with cutting edge to face the mould and make the ball perfect. To make it hold, use a pin that will just reach the point of the mould; the pin can be finished to make the point of the bullet flat or round, as desired. My mode of loading the Winchester rifle, model 1873, with this bullet is as follows: Into the rifle put a primed shell; then into the muzzle turn 70grs. of P. G. rifle powder; next over the muzzle place a fine line patch $\frac{1}{16}$ in. in diameter, using care to place the bullet in the center of the patch; then with the driving rod the end of which is countersunk to fit the (bullet) drive it home. Owners of Winchesters, with this bullet cast solid, and loaded as described, will find the arm very accurate at long range. They will also find the flight of the expansive bullet up to 250 yds. (which is as far as I have tested it) very accurate, and with the magazine full of regular cartridges you are prepared for any game that breaks cover. The regular ammunition for the rifle made expansive in this way increases the killing power of that arm fourfold.—EDWARD SMITH.

THE BOY-HUNTER OF BASH-BISH.—From a letter sent to us by our occasional correspondent, Charles Lanman, we copy the following: While recently looking over some of my notes of summer recreation, I found a fragment which I think will interest your readers. I had been spending a few weeks with a relative who has a summer home in Berkshire, and where the ruling spirit was a boy—a wild and noble little hero—about thirteen years of age, who has the unspeaking pleasure of spending his school vacations among the mountains, and it was from one of his journals that I picked the following:

- ANIMALS CAUGHT.
- June 23—1 small woodcock.
 - June 25—1 large woodcock.
 - June 29—1 medium woodcock.
 - July 7—2 large woodcocks.
 - July 17—1 large woodcock.
- All killed by my dog Major.
Chipmunks and rats in cornfield—a good supply.

- SKARKS.
- One rattie killed and brought home.
 - Of common snakes—a big lot.
- TROUT.
- In eighteen days in June killed 284—one day 34.
 - Sunfish, suckers and pickerel a big lot.
 - Expenses for new fishing June, \$100.
 - My Crampton Lannan rod has been all smashed to fragments.

One night when all the family were in ecstasies over a magnificent aurora, this Nitro-rod came rushing out of the house with this exclamation, "What a glorious night for 'coon hunting!'"

THE PONGKEEPSIE CASES.—Pongkeepsie, March 6.—*Editor Forest and Stream:* G. A. Maas, the game dealer, was found guilty of having in his possession seventeen rabbits on the 2d day of February, which he offered for sale on that day. This man, in connection with others, were indicted for a violation of the game laws. Two of the persons indicted plead guilty, and were fined \$5 each. Maas, the third person, stood his trial, and admitted willful perjury, swearing that the rabbits were stuffed with salt and were used as a sign. The presiding judge said to Maas: "You made a mistake in not telling the truth (that is in committing perjury). You swore the rabbits were stuffed; nobody believes you, and as you have made more trouble and cost the county more, we shall fine you ten dollars. It is only a small affair; you simply had a rabbit at the wrong time, and although I know you have committed perjury, I will make the penalty more severe in your case and fine you ten dollars." This very judge has sentenced persons to the State prison for milder offenses than perjury. How very encouraging all this is to persons who are anxious to protect our game. Kaess was indicted for having in his possession 20 partridges and 10 quail; Smith Bros. for having in their possession 20 quail, and Maas 17 rabbits, all of which were seen and examined by Brayton, the game constable, and in Kaess's case many more. The two first are let off with a fine of \$5 each, and the latter, with perjury thrown in, \$10. Is there any use in trying to uphold the game laws?—S.

NEW HAMPSHIRE NOTES.—New Market, March 12.—Partridges are scarce; there were some woodcock in their season. Within two or three years there have been a few quail around here, whistling Bob White almost always from an apple tree. We have never heard of any being shot around here. Gray squirrels were very plenty last fall; and a great many were killed. Foxes and white rabbits are abundant this winter, but it has been a bad time for the sportsmen, as for the most part every snow storm it would rain and form a crust, thus making it impossible to see a track. But on every favorable snow every man that owns a dog, (no matter what he is as long as they can call him hound) is out either foxing or rabbiting. Quite a number of both kinds of game have been killed. A party of nine, with three dogs, went out the other day and got fourteen rabbits. The handsomest fox we have seen this winter was shot by a young man at Parkers Falls. It was a cross between the red and gray and weighed over eleven pounds.—W.

THE SHONGEN COMPANY.—At the annual meeting of the Shongen Company, of Morrislow, N. J., held March 13, the following officers were elected: President, Henry W. Miller; Vice-President, Charles H. Raymond; Secretary, J. Frank Lindsey; Treasurer, Henry T. Hull; Counsel, Mahlon Pitney. Directors—H. W. Miller, E. M. Quimby, H. T. Hull. Committee on Membership—Francis Child, J. Frank Lindsey, Geo. B. Raymond, Henry M. Smith, Mahlon Pitney.

AMERICAN WOOD POWDER.—In reply to several queries in regard to the American wood powder, we would state that the Rev. Geo. S. Senter, at some time ago submitted a quantity of the material to a chemist for an exhaustive test, which is now in progress. The result will be published in due time.

SOUTH ABINGTON, MASS., March 19.—As the season for hunting foxes in this part of the country expires by mutual consent about the first of March, I will give the number of foxes, mink, coons, etc., captured by members of the South Abington Sportsman's Club during the last five months: Wm. B. Lincoln, 19 foxes, 4 minks, 4 coons; M. Hall, 13 foxes; Seth P. Gunney, 1 fox, 4 minks; C. L. Smith, 1 fox; D. B. Howe, 1 fox; E. E. Bates, 1 fox. Total, 36 foxes, 8 minks, 4 coons. At our annual meeting, March 1, Mr. Wm. B. Lincoln had his entire collection of fur on exhibition. David, who has been very unfortunate considering the number of days out, proposes to show a better record next season. Mr. P. H. Smith wishes to form his numerous friends throughout the country that his total score for the season was one squirrel.—SASSACUS.

MUSKOKA DEER.—Bramford, Ont., March 12.—A friend of mine who has just come from Muskoka says he never saw such a slaughter among the deer by wolves. The snow was deep with a heavy crust, so that a man or a wolf could go with safety on any place, but the deer would break through at every step. He said their legs were skinned to the bone, and some were found with their throats lacerated through, and others partly eaten, in places where they had yarded up for the winter. He thinks not one has escaped. Then, in some localities where there are no four-legged hunters, the deer-legged ones are, if anything, worse. Muskoka was a good hunting ground for deer. I was there last fall and found deer in plenty; in five days I got five deer. But I am afraid it is all up now.—G. A.

CHICAGO, ILL., March 17.—The ducks have captured the local sportsmen, and everywhere about Chicago decoys are afloat, shells loaded, and club-houses occupied by the sportsmen. At English Lake there were plenty of ducks Saturday. The Kleinmanns are at Lake Seneca wine hunting, and have sent in plenty of the feathered animals for the boys. Reports from Ptman, on the Illinois, are that ducks are now plentiful and the feeding fine. The overflow of water is fast passing away, and in a day or so the boys will be taking a turn down on the Illinois Bottoms. The kankakee and muskrat decoys are, if anything, worse. The kankakee is a good hunting ground for deer. I was there last fall and found deer in plenty; in five days I got five deer. But I am afraid it is all up now.—G. A.

TENNESSEE.—Savannah, March 5, 1883.—The season just past has been the most discouraging I have ever known here. Warm weather and consequently dense cover made the bird shooting a failure, and notwithstanding the excessive crops of wheat and corn the ducks gave us the go-by. Since January 1 the weather has been unfavorable to all kinds of sport, nothing but rain and mud repeated ad nauseam. There is this consolation, that if few quail were shot there are all the more left to breed for next season, and I trust that next November Bob White and relatives will "bob up serenely" and in great numbers.—WITL.

MICHIGAN.—Detroit, March 17.—The market hunters are sending in large numbers of red-head ducks of excellent quality. In fact, the market is glutted with them, but as the weather is still cold the dealers hold them at seventy-five cents per pair. Although the winter has been one of much snow, such reports as have come to hand indicate that grouse and quail have had plenty of food and fuel and are promisingly numerous in number.—B. F. W.

THE FUR MARKET.

THE following prices are for prime skins only, according to size, color and quality, as realized by the New York commission merchants. Ship in bags or bales, as boxes add to freight. Mark bales, etc., with your initials:

Antelope—North America, raw, $\frac{1}{2}$ lb.	\$ 80 00	35
Dressed, as to quality, $\frac{1}{2}$ lb.	1 25 00	1 50
Reddish, as to quality, $\frac{1}{2}$ lb.	1 00 00	1 25
Rocky Mountain, raw, $\frac{1}{2}$ lb.	2 50 00	3 00
Black, as to quality, $\frac{1}{2}$ lb.	2 75 00	3 00
Pacific Coast, raw, $\frac{1}{2}$ lb.	2 50 00	3 00
Western skins, $\frac{1}{2}$ lb.	3 00 00	4 00
Dressed, as to quality, $\frac{1}{2}$ lb.	8 00 00	1 00
Mountain Deer—Western, $\frac{1}{2}$ lb.	2 00 00	2 50
Reindeer—American, raw, $\frac{1}{2}$ lb.	2 00 00	2 50
Dressed, as to quality, $\frac{1}{2}$ lb.	1 00 00	1 25
Black Labrador, $\frac{1}{2}$ lb.	3 00 00	3 50

Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

They greatly mistake the temper and tastes of the true angler, who assume that he is attracted to these quiet places simply to kill and to destroy. To have the opportunity to fish constitutes but one of the threads in the golden cord which draws him to the grand old forests, in whose mountain streams trout and salmon "most do congregate." If he finds pleasure in the rise and strike and struggle of a mummichog fish, so also is he fitted up out of the roost of common-place emotions by his majestic surroundings—by the ever-shifting shadows on the mountain; by the incessant music of the birds; by the never-ending melody of the singing waters; by the splash and foam and sparkle of the leaping cascade; by the gliding sunlight upon ripple and rapid; by the shadowy depths of the impenetrable forest; by jangled rock and giant boulder and sharp rock and drifting river, and a thousand and other "things of beauty," which remain upon the canvas of his memory long after the minor incidents of fish-taking are forgotten. No; it is not all of fishing to fish. That is but an incident in the angler's pastime. They have other and higher, if not more invigorating and exhilarating tastes to gratify.—George Downes.

TWO SONNETS.

MOST RESPECTFULLY DEDICATED TO ALL BOTTOM-FISHERS.

AD VERBUM.

WRIGGLE! Wriggle, mightily "bob,"

As we strive to place ye

On the hook, aneath the "bob,"

Struggles can't release ye!

How I wonder if ye feel,

In your colon, the barb'd steel,

As ye enter;

To your centers;

Do not, prithee, be so froward

'Een though ye are well "secured";

But like "gentles and commons,"

Success and to our summons,

And if ye have another lure,

Pray save it to allure the perch.

AD PERCE.

Deep down, under a tree,

Sporting or lazily lying,

The "hog-backed" perch fishes nestle.

As it their fate defying;

Now, as if dreaming of vermes,

Now, as if longing to smoke!

Now rubbing their operium

Against a stone in a stroke!

Aha! now glancing, in light,

Their dorsals uprise to a right—

Not the hook, so gently sinking,

Nor ourselves, so earnestly thinking.

In a trice, lusty fishes, and we

Will grasp you in hand tenderly;

O. W. R.

NATIONAL ROD AND REEL ASSOCIATION

A MEETING of the association was held at the Metropolitan Hotel on Friday, March 16, at 4 P. M. President Endicott, in his opening remarks, said that interest in the association was increasing all the time, and that it was destined to become a large and influential society. He had called this special meeting to consider and, perhaps, to fix the date at which the next tournament should be held, and invited an expression of opinion on this subject.

Mr. Mather said that last tournament was held on October 19 and, and in his opinion that time was too late. The weather was uncertain at that time, and he favored September, although if the city people were back from the country in August that month would be best.

Mr. Holberton thought more people would be back in October, and that if held early in the month we might expect good weather.

Dr. Elmhurst said that anglers who go to Maine are absent in September, and for one he would probably be there in that month.

Mr. Wilbur suggested May, as then the anglers were fresh from Long Island and other trout streams and consequently in practice.

Mr. Mather objected to May, as not giving time enough to prepare for the tournament.

Mr. Wilbur moved that the tournament be held on the first Wednesday in October. Carried.

The president stated that it would be necessary to have a committee of arrangements and asked how they should be selected.

Mr. Wilbur suggested that they be appointed by the president.

Mr. Mullaly moved that the president appoint an unlimited number as such a committee. Carried.

The secretary then read the following letter, which had been received by Mr. James L. Vulliamy, president of the Pasque Island Club, from a gentleman in Boston:

"MY DEAR SIR.—I was pleased to note your hand writing on the envelope covering the circular of the National Rod and Reel Association. I am much obliged to you for the same, and am glad to hear of the formation of such an association. Certainly, we ought to do what we can to preserve the game fish of our country, which has become so scarce in many of our rivers. In view of the fact that in this part of the country for the association I shall be pleased to do it. It is a matter to which I have given much thought and I hope, in addition to the influence exerted by the members in regard to proper game laws, an effort will be made to stop the wholesale slaughter of trout, by parties calling themselves anglers, on the streams and lakes of Maine. My only wish is to induce in your association to boast that he took them! The enormous catches of some of our young people are a disgrace. They are probably not aware that it is so, and only need the influence of your association to make them true anglers. I enclose my check for \$3, as my membership fee to the association, which please hand to the secretary. Very truly yours," etc.

Mr. Wilbur moved that one thousand copies of the constitution be printed for use and distribution. Mr. Holberton amended the motion by requiring that the names of the members be added to it. Carried.

Mr. Van Cleef asked if the association had made any effort to secure legislation to protect our fishes.

The President replied that it could not be expected that the

association, which is a national one, should attempt to influence legislation in the States. While it is true that the headquarters of the association are in New York city, because of its great center of population and therefore influence, it is a great mistake to think that in any other city, if attempts were made to influence New York State laws, it would make us appear more like a local than a national society. Our objects are more social and for the advancement of angling as an art and we had better leave the laws to local organizations. Covering the ground we do we could accomplish little in the line of legislation over the whole country.

Dr. Elmhurst inquired if any steps had been taken to incorporate the association.

The President answered that incorporation would make us local, a thing which we wish to avoid.

Mr. Mullaly thought it desirable to form an anglers' club out of this association and suggested that a committee be appointed to consider the advisability of forming such a club.

Mr. Burks agreed with Mr. Mullaly.

Mr. Mather thought that the formation of such a club would destroy the association.

The President had never heard of a society entertaining a proposition to dissolve itself, and that would be the result in this case, a club would necessarily take in all the members, or, if any were left out, they would be dissatisfied.

Mr. Mullaly withdrew his suggestion and made another that the meetings be more frequent. He disclaimed any desire to change the character of the association.

Mr. Holberton thought that monthly meetings could be arranged.

The president remarked that the meetings had meant business and not sociability. If the members chose to have a social meeting afterward, as they have done before, there was not only no objection to it but on the contrary, he thought it a good thing. He would be sorry to see the objects of the association changed. If an anglers' club was formed outside of this society he would join it. He considered all these propositions out of order.

Mr. Bloomfield thought that at the next tournament a line should be drawn that would exclude all that might be termed professional anglers.

Mr. Mather assured him that the point had been long under consideration and that he should advise that the lines be sharply defined and closely drawn.

With a vote of thanks to Mr. Henry Chair, proprietor of the Metropolitan Hotel, the meeting adjourned subject to the call of the president.

THE PRIMITIVE FISH-HOOK.

UNDER this title Mr. Ernest Phillips has an illustrated article in *Country* for April. He considers that man first used the spear for taking fish, next the hook and line, and lastly the net, with perhaps an intermediate stage between the spear and the hook, which the bow and arrow would be. The first implement which approached the hook was the "fish gorge" of stone, pointed at one end with the line attached to the middle and held in place by a groove running around the stone, a specimen of which, found in the Valley of Somme, is now in the New York Museum of Natural History. The fish swallowed this, when baited, and it lodged crosswise in its throat when pulled upon.

Mr. Phillips believes that, starting with this crude fish gorge, he can show, step by step, the complete sequence of the fish-hook, until it ends with the perfected hook of today, and he certainly makes a good showing of these steps, so that one is compelled to admit that he has given much thought to the subject, and that it would be difficult to refute his argument.

Other forms of gorges, called "hrioles," from Lake Neufchatel, are shown, which grade into a well defined double hook found in the same locality, make his theory extremely plausible. Then follow barbed hooks of bronze, Alaskan halibut hooks of wood and bone, which somewhat resemble the steel hooks of Russian make figured below them. Then come the shell hooks from the collection of the National Museum at Washington, and the artificial stone shrimp from the Mayan collection, making a very interesting contribution to the record of the fishing of primitive man.

EVENING FISHING ON THE LYCOMING.

OF the many trout streams that I have fished in in different sections of the Middle States none can compare with the Lycoming River, in Pennsylvania, in water beauty, nor miles this stream runs through a narrow valley, now rushing over wild rapids, now flowing lazily through deep, long pools. The forest-covered hills tower on either side, and the tall hemlocks almost meet over the water.

During the latter part of the month of June the laurels and rhododendrons which line the stream are a mass of pink blossoms, while the banks are covered with violets and other wild flowers in great profusion. It is a perfect river for fly-fishing, and during the time two anglers can cast side by side without interfering. Before the coal mine was opened, a few years ago, the fishing was excellent and was improving every season, but poaching and market-fishing have about ruined it. I used, almost daily, to start from the hotel at Ralston about sunset and fish until dark. No prettier sight have I ever seen than this same river late in the afternoon, when the last rays of sunset tipped the purple mountains with gold, while under the shadows of the dark old hemlocks the big trout would rise quickly after some unfortunate fly, and out in the shadows the little fellows noisily splashed and chased the midges and gnats. The wood-robber's sweet note was almost the only sound to break the evening's stillness, except the swish of my fly-rod or the occasional splash of a trout, until darkness supervened. My valley and the river were dark and I expected I would take this place.

When too dark to see to wade I would select some big, deep pool, where there were no branches in the way, and with a coachman or white miller enjoy royal sport. The big fellows then rise more boldly and fight with redoubled vigor when they feel the hook. I remember one evening in particular, arriving about dark at the head of a long, deep pool, where the trout were very numerous. I cast my fly into the water. It was a lonely place, under the shadows of the big hills; the mournful "Hoo! Hoo!" of the great horned owl sent a chill down one's back, even while knowing the innocent cause. Presently a small boy came down to the stream for the purpose of fishing for the eels which came up to the riffles to feed at night. While watching him setting his lines under the stones, I noticed a large trout rise under the

bank on the other side of the pool. It was a long cast, and when at last I reached the spot he took the fly with a splash that startled me. The elick buzzed as I struck him, and away he started for the other end of the pool, but the steady possession caused him to circle slowly back; then he tried for a smoken hemlock, but soon gave that up and flung himself with an ugly leap out of the water. Gradually I reeled him within reach of my landing net, but the sight of that instrument started him off again. Presently his bright side was gleaming on the surface, and I knew that his race was run. I had the pleasure of slipping my net under a good fifteen-inch fish.

My little companion was so excited that his eel lines were forgotten. "My! Wasn't he whopper!" he exclaimed. The boy had never seen such a trout, although living close to the stream. His struggles had evidently frightened his brethren, for not another rise could I get. I was satisfied, however, as I already had a dozen fine trout; so lighting a fresh pipe I started for home. W. HOLBERTON.

MONSON LAKES AND PONDS.

THE township of Monson is situated in the northwestern part of Piscataquis county, Maine, fourteen miles south of Moosehead Lake, ten miles west of Sebec Lake, and six miles north of the B. & P. Railroad. A branch railroad is about to be constructed, leading from Monson village to the former road. The town is more than 900 feet above the level of the sea. Three-quarters of its area is a vast unbroken wilderness.

The largest sheet of water within its borders is Lake Hebron, three and one-half miles long, at the foot of which nestles a pretty and picturesque village, noted for its production and manufacture of roofing slates. This is surrounded by mountains, hills and vales, farms and farm habitations. Lake Hebron is well stocked with spotted and lake trout.

Besides this there are within this town twenty-four other ponds, every one of which is filled with trout. The following is a complete list of these ponds, which are from two to four miles in length:

Spectacle East, Spectacle West, Bunker North, Bunker South, Tibbets, McLarion North, McLarion South, Bell, Jullie, Ward, the Twin Doughtys, Strout, Doe, Duck, Monson (Goodale), Eighteen, Spangquiquin, Meadow, Jacobs, Pleasant, and Four, Carleton, and many others. The next most important chain of lakes and ponds in this immediate vicinity is in Elliottville, eight miles distant. Lake Onaway, otherwise known as Ship Pond, is the best known and most famous of any in this entire region. It is about four miles long, encompassed by the towering Bear, Rochelle, Benson, Houston, Barren and Greenwood mountains, and all within the dense forest of many miles in area, and extending in every direction further than the eye can reach. This is the home of the land-locked salmon, which has migrated to Sebec Lake and other neighboring waters.

Elliottville contains forty-six square miles. An old high way, scraggy, moss-grown and hoary, leads through several miles of the township. Where there is a few days of year's driving settlement are now seen only a few scatter of log houses, the only ones that suggest the village of a "deserted village." Its land being covered almost entirely by the "forest primeval," as a consequence its grand old mountains, myriad lakes, sparkling ponds, roaring rivers and crystal streams challenge the admiration of all sportsmen and lovers of nature. There they may find every species of game known to the wilds of Northern Maine, and delicious trout in every part in the season.

Beside Onaway, I herewith give you a partial list of the more prominent ponds in and around Elliottville: Big Greenwood, South Greenwood, North Greenwood, Bear, Round, Long, South, Barron Mountain, Twin Benson, Sluogundy, the Rochelle, Summit, Butternick.

Shirley on the west, which is a portion of the immense watershed reaching through to the forks of the Kennebec River, contains some forty-eight square miles. For a distance of twenty miles in a westerly direction and at the north as far as the Canada line, this vast forest has no human habitation except the hardy lumbermen winters, and the brave hunters and sportsmen in the summers. At Shirley Corner the tourist finds a neat and comfortable hotel, the Shirley House, kept by Mrs. E. Smith and who keeps the best of the country. These wilds are Shirley, Mt. Sugar Town, and Squaw Mount Town, within a radius of eighteen miles from the Lake Hebron Hotel, are a large number of attractive and charming ponds inhabited exclusively by spotted trout (*Salmo fontinalis*). Every pond has almost a plentiful supply of these choice fish. Among the most inviting of them may be named the following: Moxie, Knights, Trout, Green Pond, Fox, and the big Indian, Little Indian, Coffee House, Carter Bag, Marble.

In Howard, on the east, five miles distant, is the lovely little "Grindstone Pond," about which has been an action at law of some importance and notoriety, as it settled certain questions relating to the ownership of ponds and the rights of fishing therein. (See 73, Me. 441.)

Also, within a few miles at North Guilford Pond in Guilford, Greenwood Pond, and the Thorn and Piper ponds, and around Abbot on the south. The last named is the only one in all of the above mentioned ponds that contains pickerel. There is an abundance of that fish in Piper.

In Blanchard, on the west, are the pretty little Russell Mountain, Thorn and Mud ponds and some others. I do not claim that this region surpasses all others in attractiveness, beauty, or scenery. What I do claim is that it is a place, undisturbed by too tempest which ripples the Merimack's surface, he lives happily and contented, in a little cot, whose shadow darkens the much maligned fishway. Year in and out, stormy or fair weather, beneath the sun's smiles or frowns, our re-elected fish warden is found at his post, ready, anxious, and willing to induce the funny tribes to seek the historic stream, and equally as anxious to do the same to the presence of depredators. Mr. Henry Noyes, South Lawrence's

A HERMIT WARDEN.—A correspondent sends us the following notes taken from the *Lawrence, Mass., American*: Yearly among the first officers appointed by the incoming city government, is that of fish warden, and there has been great speculation as to the individual, who, with each ensuing year, manages, without political chicanery, to retain this important position in the eye of the law. Quietly, undisturbed by too tempest which ripples the Merimack's surface, he lives happily and contented, in a little cot, whose shadow darkens the much maligned fishway. Year in and out, stormy or fair weather, beneath the sun's smiles or frowns, our re-elected fish warden is found at his post, ready, anxious, and willing to induce the funny tribes to seek the historic stream, and equally as anxious to do the same to the presence of depredators. Mr. Henry Noyes, South Lawrence's

respected hermit, was born in Enfield, N. J., October 4, 1817. He worked on a farm until he came to Lawrence in 1846, when he went to work on the dam, and drove team, but he established himself as a fisherman at his present location, paying the Essex company as high as two hundred dollars a year for the privilege of fishing between the falls bridge and the dam. He followed the business here for many years, employing about eight men through the season, and it was not unusual to see thirty to forty teams call at his market daily to purchase fish. He has sold his money as well as his fish in a single load to Lowell parties, for two cents a piece. He has been fish warden for twelve years, and is paid by the city forty-five dollars annually. Fishing within 400 yards of the dam is not allowed. Beyond these limits fish can be taken with hook and line at all times, and with net and seine only three days of each week from March to June; a fine of fifty dollars is imposed on each fish taken inside the prohibitory limit, but this high reward does not stimulate the fish to any unnecessary arrests. Thirty years this March, he resolved to live in solitude during the years allotted him, in a one-room cottage beside the Essex Company's dam. The entrance to his retreat is from No. 3 South Broadway. From this barren ledge he has reclaimed about one-eighth of an acre for his vineyard, yielding about fifty gallons of wine annually, for which he finds a ready market, at four dollars per gallon. This little cot and vineyard "has laid in the Essex Company for many years, but to retain the title of the property the company was obliged to charge a nominal rentage. He has been married twice, and has been a widower over forty years. He had one child, who died in infancy, and has no living relatives. He is the only survivor of a family of seven sons and six daughters. He has voted the Democratic ticket from Jackson to Hancock with one exception, when he voted for Abraham Lincoln. For a man of eighty years, his appearance, physically, is very good. His sight and hearing are well preserved; he reads without spectacles, and does his own house-keeping, cooking, washing, and mending. He smokes and uses tobacco in other forms, and is not averse to the use of liquor. He has not been sick nor had a doctor in twenty-five years.

FISH AND FLOWERS.—That there is a vein of poetry in the rough fishermen of the coast is shown by the following testimony taken by Prof. Baird, from a fisherman of Narragansett Pier, and published in "The Professor's report." It shows that under a rough exterior there was not only an observation and memory of the sequence of events but also a poetic feeling that is charming:—"Did they [the snappers] come much earlier than used to Point Judith this year?" Answer.—"About the same. They had then in the water in March. I always judge by the dandelions: when I see the first dandelion the scup come in with the haddock, and when the haddock are smaller fall than our traps go in. When the dandelion goes out of bloom and runs to seed the scup are gone. That is true one year with another, though they vary every season. I am guided by the blossoms of other kinds of plants for other fish. When high blackberries are in bloom we catch striped bass that weigh from twelve to twenty pounds; when the blue violets are in blossom, they come early—you can catch the small sea bass. That has always been my rule. That has been handed down by my forefathers."

BOMOSEEN LAKE.—(Chesham, Vt., March 16.)—At last Vermont has awakened to the necessity of preserving the cod fish in her waters. For several years we have had a law protecting trout. Last fall a law was enacted for the preservation of fish in the lakes of the State, and a special law for Lake Bomoseen in this place, the largest body of water in the State. The fish have been caught by nets and spear in the spawning season, and it was impossible to keep them with hook and line. This will stop it. Legitimate angling will now be fine. The lake is some nine miles in length, and from one-half to three miles wide; clear, deep and cold water with bold slate shores and fine feeding grounds. It is stocked with rock bass, pickerel and Oswego bass that weigh as high as eight pounds. The pickerel attain twenty-eight pounds. A beautiful island is in the lake whose shores are dotted with resorts. The village, three miles from the lake, is a handsome place with a fine hotel, well kept. The angler will find it a lovely resort, now that the fish are to be preserved for him to take with hook and line.—**ASPLEIN.**

BETHABARA WOOD FOR RODS.—The following letter gives a new feature in bethabara wood, which we do not remember to have seen:—"CHICAGO, March 15.—Messrs. A. B. Shipley & Sons: This article is as very singular. It presents two features in the wood that is somewhat unique and singular. I mean its cleansing and softening qualities. I have noticed when I have been rod-making—amateur rod-making—and I have sometime had dirty and oily lumps, if I take the dust and scraping from the bethabara wood and rub into the hands thoroughly with the soap, it removes every particle of oil mark, making the hands soft and clean, the finger-nails especially so. This article is as very singular, but I thought it was possible that anyone working this wood all the time might get used to it and not have the same effect.—**W. DAVID TOMLIN.**"

Fishculture.

THE COLD SPRING HARBOR HATCHERY.

On Wednesday, the 14th, a party of about two dozen gentlemen and four ladies visited the new hatching station of the New York State Fish Commission, at Cold Spring Harbor, Long Island, by invitation of Mr. E. G. Blackford, the commissioner in charge of it. The party consisted of relatives of Mr. John D. Jones, who so kindly gave the use of this station to the commission, and representatives of the city press. A special train was placed at their disposal by courtesy of the Long Island Railroad, and the party arrived at the hatchery about 11 A. M., where they were received by the superintendent, Mr. Fred Rice, who, in talking along the various parts of the water works, could not help pointing out the facts which at high tide are covered with salt water up to the edge of the ponds, the old wooden mill which lies almost below the reservoir, the harbor stretching into the Sound, and the Connecticut shore beyond.

The water comes into the building on the upper floor where the troughs are placed, and is then gathered again and led to the lower floor where there are nine more and a McDonald hatching table and jars. From this floor it is again gathered

and used in two series of troughs, numbering ten altogether, out of doors, making it practically a three-story hatchery. From the door of the building a stone can be thrown into salt water at high tide. The station has been supplied with eggs this year by Prof. Baird, of Boston, for the purpose of increasing our stock, as follows: 350,000 Peabody salmon from Mr. H. H. Buck, Bucksport, Me.; 100,000 land-locked salmon from Mr. Charles G. Atkins, Grand Lake Stream, N. J.; 100,000 brook trout and 1,000,000 whitefish from Mr. Frank N. Clark, North Ferrisburgh, N. Y.; 1,000 German brook trout have been received from Herr von Behr, president, Deutsche Fischerei Verein, Berlin. The salmon and trout are all in the usual wooden troughs, and were nearly all hatched. The whitefish were in the McDonald glass jars, and in the glass aquaria of which they were four, were jars of the golden file and carp, three to five inches long, and some eggs of the tomcod, the first salt water fish attempted at this station.

Prof. Rice accompanied the party and with the microscopes of Messrs. Blackford and Mathew showed the visitors the circulation of the blood and the formation of the embryo salmon. Prof. Rice, it will be remembered, experimented with the hatching of oysters at Fulton Market last season, and intends to try it at Cold Spring Harbor again this year. The New York Times has already given the longest and best report of the formal opening of this station, and we make the following extracts from it:

"The position of Cold Spring is admirably adapted for the purpose of fish-culture, and has many natural advantages, and in the experience of those having some acquaintance with fish-culture it was declared by them to be the best in the country. In the first place, water can be supplied from springs that never fail; in fact, the water here seems to be boiling with water heated from natural sources. Then, again, the water is at just such a height as to give the necessary fall, so that no pumping is required, while its close proximity to the salt water of the Sound will permit of the hatching and rearing of sea fish, which was the object of the establishment of John D. Jones, Esq., a lease of 10 years has been given, without any cost, of a piece of land of at least 20 acres for the use of the State.

Last year, when the general appropriation was made by the State it was estimated that at least some \$5,000 would have been allowed to the Cold Spring fish hatchery, the remainder, \$12,000, to go to the Caledonia Works, but only \$1,000 were allotted to Cold Spring. This year, so far, no special appropriation has been made, but the State has given the preference of the work and the excellent beginning made, it is quite desirable that an additional sum shall be granted for Cold Spring—some \$2,000—or that a larger portion of the appropriation than was allowed last year shall be placed at the disposal of Mr. E. G. Blackford, who has devoted the best part of his time and energy to the development of this special hatchery.

"The reasons why there should be more than one State hatchery are quite obvious. Though the work done at Caledonia has been successful, it is not so well adapted to the needs of the State have found it both difficult and expensive to procure fish from a distant point. Not counting risk of loss, there was always a large item of expense. When trout had to be forwarded from Caledonia to points near New York City the fish had to be sent under the charge of an experienced person, whose fare and time had to be paid. It was hardly just that one portion of the State should receive the larger part of the fish, while another could derive but few. But the greatest advantage of the hatchery is the large quantity of fish, though at first little understood, are to-day beginning to be better appreciated. Means of communication between distant points are more rapid and continuous in our large city like New York than in the interior. But the strongest reason why we should have a hatchery is the fact that it is of more advantage for a hatchery is that material of all kinds, even the eggs themselves, can be more readily obtained, and the fish, when produced, can be more readily and safely distributed. The hatchery has advantages of the largest kind that the State had no business to make any experiments. Now it is quite well known that there is no place in the whole country where trout can be reared as advantageously or with as little expense as on Long Island. Whether it is owing to the favorable conditions of the water, or to the abundance of food that trout are more plentiful among Long Island trout-risers than elsewhere can not be stated, but it is quite certain that the trout establishments of the South and West do not do so well as those of the North. It is a mistake to find fault with any commissioner who is desirous of experimenting with the sole desire of increasing the stock of fish. Trout alone can never meet the needs of the State in any way of any money. The *Salmo trutta* can never become the common food of the people. At best it is an exotic. It requires a peculiar kind of water and of a certain temperature, two conditions which are not always to be found. It is all well enough to stock particular streams with trout, but it is not so well adapted to the requirements to our anglers, but poor people do not have time to catch these fish. The stock of trout which is sent to market is always limited, and commands a price which persons of moderate means can never afford. In fact, trout is food for the rich and not for the poor.

"The Cold Spring Hatchery will, of course, hatch out trout, but it is believed that, when the season comes, it will devote its attention to shad. As to the experimental part of the hatchery, with the exception of the salt water hatchery, right at its door, it ought to try and propagate the striped bass, the Spanish mackerel, the cod and the sheepshead. With improved apparatus and a better acquaintance with the habits of these fish, it is possible to propagate the eggs and hatch out trout eggs, of shad eggs, and the rearing of the fish present no possible difficulties. It would be wise, then, on the part of those having the Cold Spring hatching house in charge to extend their labors, for there can be little doubt that in the future they can be restocked with those fish which were once so abundant.

"The experiment will be tried with the whitefish of placing some of them in the larger fresh-water lakes of Long Island, and the Connecticut coast. At March 15, said the commissioner, it is not impossible that it might adapt itself to its new surroundings.

"With the fall of water, which is rightly described by those who prospected Cold Spring as 'inextinguishable,' advantage should be taken of the high water to erect a continuous source of salt water from the Sound could be had. The expense for this, and for the construction of a few salt-water ponds would be a small sum, and the benefits would be great. The eggs of the cod, obtained by the mill at Fulton Market slip, could be fertilized, hatched, and carried out into the Sound. Should any sole be sent in the future, instead of wasting them by putting them at once in the sea, these fish could be kept and propagated, and from the parents of a few millions of young fish could be produced. Striped bass, Spanish mackerel, sheepshead, might all be experimented with in a very trifling cost, while the actual routine work of Cold Spring would be left to the State.

"All present on this pleasant visit, to many of whom fish-culture was a novelty, expressed themselves delighted with the progress made at Cold Spring, and the work done by Mr. E. G. Blackford and Mr. Fred Rice, who were highly commended. After a couple of hours spent in inspecting the hatchery the whole party partook of a luncheon at the house of Townsend Jones, Esq., a brother of the gentleman to whose liberality, in great part, the hatchery at Cold Spring is due. Both Commissioner Blackford and Mr. Mathew were very proud of the hatchery, and have great hopes of it, particularly because of the salt water facilities. They intend in a short time to have a constant supply of sea water, and the experiments that are

to follow will, doubtless, be extremely interesting. Striped bass, fresh mackerel and oysters will be experimented on, and from the unusual facilities great things are hoped for."

The Times of Sunday, March 18, again refers to the station and to the pleasure and interest of the party. The hatchery on Long Island, the new work of the New York State Commissioner, was the presence of several young girls, in the employ of the superintendent, who were lustily engaged in caring for the young fish. As there is nothing inhospitable about the place, and many of the ladies, with some common sense, being all that is necessary, women would be well adapted for this special work. Some of these days we may have a regular trained corps of "fish nurses."

SALMON IN NEW HAMPSHIRE.

Editor Forest and Stream.
I enclose you a letter which I have just written for the Manchester Mirror, which you may find of interest.

I have just returned from a visit to the State hatching house at Plymouth, which is in excellent condition and order under the careful management of Superintendent E. B. Hodge, who proves to be the "right man in the right place."

He has now in the trays 400,000 Atlantic salmon eggs, 125,000 of which were taken at the hatchery from salmon which went up the Merrimack last year, and the remainder came from Maine, being partly eggs donated by Massachusetts, and partly those procured by Prof. Baird, of the State Fish Commission. In addition to these he has 125,000 land-locked salmon eggs, 75,000 trout eggs, and 200,000 whitefish eggs, the latter also presented by Prof. Baird.

These, from all in private order, Mr. Hodge has introduced an improvement over previous practice by placing a large block of ice at the head of each trough, thereby cooling down the spring water to about the normal temperature of the water in the rivers and returning to the country after a month. Thus the trout are just coming to the hatching out of their shells. This will keep them all back till into May, when the waters in the brooks and rivers are in suitable condition to receive them.

Mr. Hodge also tells me that many salmon found suitable spawning beds below Plymouth last season, in the towns of Bridgewater and New Hampton, and confirms my statement that the Peabodys were in literally swarming with the young fry.

All the breeding trout in the ponds are looking well, and the young *Salmo trutta* are perfect beauties, and there is a vacant space saved in the hatching boxes for another lot of eggs, which are daily expected from California.

These, from all in private order, Mr. Hodge has introduced an improvement over previous practice by placing a large block of ice at the head of each trough, thereby cooling down the spring water to about the normal temperature of the water in the rivers and returning to the country after a month. the common perch, which the trout of the first season have also, disappear, as do the red spots, and at the end of the second summer the young fish assume the salmon coloring and is ready to seek sea water, or at least the majority of them; for from what we have noticed I am inclined to the opinion that some of the "smolts," as they are called in Great Britain, do not go down to the sea till the third season. Two years, at the least, may be taken as a "fixed fact," as John Tyler said.

Now let us review briefly the history of pisciculture on the Merrimack River for the last ten years. Penobscot eggs were introduced by the late Mr. New Hampshire and Massachusetts and planted in the Penigowasset in 1872 and 1873. In 1875 the whole plant was made in the Connecticut. In 1876 and 1876 more young fry were placed in the head waters of Merrimack, and here the labors of the State board of commissioners began, and I say the present board, as two out of three are still in office. In 1877 and 1878, no Penobscot eggs could be procured, and the commissioners were indebted to Professor Baird of the U. S. Fish Commission, for a supply of California eggs. These hatched out much earlier in the season, and were planted through the ice and probably froze to death or starved to death, as nothing has ever been heard of them since.

In 1878 the hatching house had been built at Plymouth and a few eggs were procured from salmon which had found their way up through the new fishways, and these were hatched at Plymouth in the spring of 1879, together with a fresh lot of California eggs, and the result was nearly a few from the Penobscot. Since then in 1880-81, there have been large and increasing plants of Penobscot and native Merrimack salmon.

From and after this coming spring we have every reason to expect the return of salmon in large numbers, and is the duty of every citizen of New Hampshire, as well as of every true sportsman, to protest most earnestly against any such turning loose of the "robbers of the river" again. In Massachusetts, through her legislators and commissioners, has acted most honorably in this whole matter. She has helped stock the river, she has built fishways, and she has passed laws against netting and seining, and her commissioners have endeavored most faithfully to carry them out, and are now fighting the same petition in the Legislature, and it is incumbent on New Hampshire, through her press, to come to her aid.

This is a long letter, but it is impossible to make it shorter, and I have omitted much that I should have liked to do. The fishways might, perhaps, be somewhat improved, but they are all right when there is an average amount of water in the river, and as all the salmon except one, which has been hatched at Plymouth, have been taken at night, it shows that the fish run at that time, when there is usually plenty of water over the dams and in the fishways.

Yours truly,
SAMUEL WEBBER.

BLACK BASS IN GERMANY.—A postal card from Mr. Eckardt, dropped at Southampton, England, February 24, announced his safe arrival there with all his fish. A private letter from Mr. Max von dem Borne, dated March 3, acknowledges the receipt of seven small-mouth and forty-four large-mouth black bass.

The Kennel.

FIXTURES.

BENCH SHOWS.

March 30, 27 and 28, 1888.—Dominion of Canada Kennel Club Bench Show, at Ottawa, Canada. Entries close March 12. Charles Lincoln, Superintendent.

April 3, 4 and 5, 1888.—Western Pennsylvania Poultry Society's Eleventh Annual Bench Show at Pittsburgh, Pa. Entries close March 19. Chas. Lincoln, Sup. of Entries; C. E. Ellen, Secretary.

May 8, 9, 10 and 11, 1888.—Westchester Kennel Club, Seventh Annual Bench Show, Madison Square, New York City. Entries close April 13. Chas. Lincoln, Supl.

FIELD TRIALS.

November 19, 1888.—Eastern Field Trials (Fifth Annual Trials, at High Point, N. C. Entries for the Derby close July 1; for the "Masters' Stake," at the All-ages State, Nov. 1. W. A. Coeter, Secretary, Mathias, Long Island, N. Y.

December, 1888.—National American Kennel Club, Fifth Annual Trials, at Grand Junction, Tenn. Entries close, Secretary, J. Tompkins, Tenn.

To insure prompt attention communications should be addressed to the *Forest and Stream Publishing Co.* and not to individuals, in whose absence from the office matters of importance are liable to delay.

NATIONAL AMERICAN KENNEL CLUB DERBY.

THE following entries for the National Derby have been received since I published the last list:

96, FAN IV., Edward Armstrong, Gosnont, England, liver and white English setter dog, Jan. 7, 1883, Diamond—Slut II.

97, FAN, Edward Armstrong, Gosnont, England, liver and white English setter bitch, Jan. 7, 1883, Diamond—Slut II.

98, DRAB, Edward Armstrong, Gosnont, England, liver and white pointer bitch, Feb. 3, 1883, Bang II.—Jane.

D. BRYSON, Secretary.

A CLEVER RETRIEVER.

THE dog always has been a curious subject. It is petted by one and hated by another. Those who love won't hear anything but about his tricks, and those who hate won't hear him at all. A retriever's deary love is a good dog, and the following story is told of a retriever in his own graphic way in his handbook on the "Dog Dog":

"In the winter of 1871, after the season was over, I saw two excellent young dogs of the name of Gorse's sort, who were broken by an old servant of mine—merry, light-hearted and full of spirits at the kennel, or when first loosed from it; chasing their own tails, with arched backs, and half knocking over the pretty daughter of the keeper, who might have been the model for Frith and Ansell's famous picture, but subdued and sensible, and full of what Oxford tutors call "application" when sixteen-stone-five took down the gun, and accompanied me to see how much they knew of the rudiments of the trade.

"They can both go, sir," he said, "if you're minded; I can send which I like, and 'Other will wait her turn." I did not quite expect this, and yet seldom see it—once in five years, perhaps, and when you say a thing wrong, I take care to look a note of it, or, as collectors say, I "stick a pin through it."

A busy little spaniel went with us to push out the rabbits from some good piece of about ten acres, with wide ridges, cut in it, for the pretty keeper is rather slow upon a rabbit run—"for the bare life," and he can't, he says, "get on 'em at less than nine yards"—or couldn't—until he found out that as soon as a rabbit has crossed a ridge, he stops one or two seconds directly he is concealed, to listen and fix upon his next cast or scamper; so he said, "I shoots at the place, and there they are, white side uppermost, nine times in ten."

"Well, we went to compare the two, and in a couple of hours' light hunt in the old winter's sky, all three dogs behind, and when we got to the gorse he sent us Dussy, the little

cocker, a white one with a liver head, and flecked body, legs, and nose. But that her tail was barbarously shortened to about three inches she might have passed for one of Mr. Plincha's Butcher's. I was not, but was bought—as many a good one has been and will be—of tramps in the road just by, who, no doubt, "borrowed" her "hustled" in. I believe, the rogues' pleasant phrase, and while her owner was "hunting."

She divel under the thorns and gorse as though she liked it, and the keeper hit the rabbit as he squirmed from his concealment, but he dragged his hind legs along for shelter, and he looked and began waggling her apology for a tail, and the next encounter. "Which is it to be, sir?" said the breaker, touching his low-crowned hat, which fitted so tight and was so hard that he seldom took it off, except, as he said, to lady folks, or when he drank my good health, and then saw that the two young gorse puppies—were about nine months old—were both down-charging.

"Yet," I said, "for choice?"

The old man flipped his finger as he looked at her, and in she went.

"Call her back," I said, as I saw her feathering across the trail, "and send the other."

"Almost too much that, sir," he said, but he crooked his little finger, and put the edge of it to his mouth, and gave a shrill whistle—an achievement I could never learn—and back she came, but rather mortified. "Come behind, det," he continued, and signalled the other, and she went in, the other dropping steadily and obediently.

Presently there was a shrill squeak, and a rush in the bushes, and Rose vaulted over the gorse with the crippled rabbit alive in her mouth, and brought it to the keeper's hand.

"Think that 'ull do, sir?" said the feather-weight.

"Yes, my man," I said, "very well. Go on and prosper." And we parted, mutually satisfied.

THE NEW COCKER CLUB.—Ann Arbor, Mich., Feb. 27.

Editor Forest and Stream: Scarcely a week passes by that I do not receive letters from lovers of the dog who regard the new cocker organization, as well as earnest inquirers about what I consider the "true standard of the genuine cocker spaniel." In the columns of the *FOREST AND STREAM* I have read letters and articles on "Stoncherry." Now, I have throughout the works of "Stoncherry" does he attempt to describe, with any degree of accuracy, as to points and standard, the "genuine cocker," but on the contrary everywhere refers to the cocker as the "modern cocker," which he says "and that is the dog of the present day, the Sussex and clumber." Now if this is true, it follows that the cocker is nothing else than a mongrel. All spaniels ("except the Sussex and clumber") are, he says, tinged with the cocker, therefore all spaniels are mongrels. Now can any of us, who do profess to have an intelligent knowledge of what the true cocker is, and there are many who do believe that the cocker of the A. C. S. Club is not in accordance with that authority? If he is, it is not in accordance with the dog and the true cocker. Therefore, it is both our determination and duty to restore the cocker to his true position, and to disassociate him from the mongrel classes referred to. In doing this, there need be no injustice done either to "the modern field spaniel," which breeders are advancing to a distinct and useful family, nor to the other varieties of the spaniel that have to a great extent preserved their family identity.

Our aim, if I understand the sentiments of all who have corresponded with me, is to separate the different varieties of type, and isolate him from the other varieties to which he has given both character and prestige. This should bring all true lovers of the cocker together, and can have no deleterious effect upon the standard of the breed. Now can any of us, on the contrary, it will tend to purify and improve all classes of spaniels, and break up the confusion that exists at present on this chaos of spanielism. All the types will become more perfect, and the public will be interested in the preservation of his own strain.—SEXEX.

ESSEX COUNTY HUNT—SPRING MEETS.—Wednesday, March 21, 7 A. M., at the kennels; Saturday, March 24, 4 P. M., Mansion House, Montclair; Wednesday, March 28, 7:30 A. M., Glenridge (late Edgewood) Station; Saturday, March 31, 7:30 A. M., at the kennels. For particulars apply to Water Works, East Orange; Saturday, April 7, 4:30 P. M., residence A. F. Brown, Esq., Gates avenue, Montclair; Wednesday, April 11, 7:30 A. M., main entrance, Llewellyn Park; Saturday, April 14, 7:30 A. M., at the kennels. A. Heckscier, Esq., Orange, Wednesday, April 15, 7:30 A. M., Watnessing. For the accommodation of parties coming out from the city, arrangements have been made with the N. Y. & G. L. R. R. (Orange branch), to provide box cars for transporting and hunting parties to regular passenger trains on most days.—HAS. A. HECKSCIER, Master.

MERIDEN BENCH SHOW OF 1884.—Meriden, Conn., March 6. *Editor Forest and Stream:* At the annual meeting of the Meriden Poultry and Kennel Club held last evening, the following officers were elected for the ensuing year: President, L. E. Coe; First Vice-President, Chas. S. Sleeter; Second Vice-President, P. Stevenson, Jr.; Corresponding Secretary, Josiah Shute; Recording Secretary, W. H. Dickerson; Treasurer, W. H. Bell; Executive Committee, D. S. Marcham, A. G. Birdsall, J. F. Ives, P. J. Quigley; Superintendent of dogs, W. E. Miller. It was voted to hold our next annual exhibition of poultry and dogs in this city January 1, 2, 3, and 4, 1884.—JOSHUA SHUTE, Sec. Secretary.

VALUABLE DOGS FOR SALE.—Major G. R. Watkins, who will soon depart upon foreign cruise, offers his valuable setters Tom, Crook and Captain Dorset for sale. They will be exhibited at the Pittsburgh Show in care of Mr. E. S. Wannaker, who trained them. Tom and Crook have appeared so often in our columns of bench shows, and felt it right that the dog of this description here. Captain Dorset is a very handsome blue belton nearly two years old. He is pronounced by Mr. Wannaker to be a capital feeder and thoroughly trained. All are well bred and should readily find purchasers.

BEEF FLOUR FOR DOGS.—Having received a number of inquiries regarding the value of "beef flour" as food for dogs, all speak in high praise of it. We were especially impressed with it when we first saw it, and are pleased to learn that it has stood the test, as it supplies a want long felt among sportsmen for something of the kind that would enable them to properly care for their dogs when on their shooting excursions. Messrs. Von Lengerke & Detmold inform us that it is meeting with a good sale.

DOMINION OF CANADA KENNEL CLUB.—The second annual general meeting of the shareholders will be held in the city of Ottawa, on Tuesday, the 27th day of March, 1888, for the election of officers and directors for the ensuing year, and the transaction of other business.—B. H. G. VICARS, Secretary-Treasurer.

"VETERAN FOX-HUNTERS."—Charlottesville, P. E. I., March 7. *Editor Forest and Stream:* From childhood I have regarded Sanson as the champion fox-hunter. His speed and dash, and his ability to give the belt to a couple of dogs of Connecticut, who saw Sanson's 300 foxes and went 600 better.—D. L.

A NOTABLE CANINE VISITOR.—We received a call on Monday from the pure Laverack setter bitch Meg Merrilies, owned by Mr. H. F. Grant, Newport, Isle of Wight, England, who sends her to this country for the purpose of breeding her to Mr. Jas. H. Goodson's setter, or rather to her son, Mr. Goodsell's Don Juan. She is a racy-looking, handsome animal and is exceedingly well put together. The progeny from this union should be very fine.

THE PHILADELPHIA KENNEL CLUB.—We understand that there is a movement upon the part of quite a number of the sportsmen of Philadelphia to reorganize the Philadelphia Kennel Club. We trust that the effort will prove successful, and that we shall soon see the association assume its rightful place and again become a "power in the land."

THE HORNELL SPANIEL CLUB.—*Editor Forest and Stream:* I have purchased the interest of the associate members of the Hornell Spaniel Club, and am now sole proprietor. I propose to devote my time to breeding and showing, to exhibit occasionally.—J. OTIS FLETCHER (Hornellville, N. Y., March 15).

SAN FRANCISCO is to have a bench show next month.

KENNEL MANAGEMENT.

NO Notice Taken of Anonymous Correspondents.

SENECA, Boston, Mass.—This is not a rare occurrence; we know so readily.

C. H. B. Your description not full enough; may be the result of distemper. Show him to some medical friend.

G. E. M., Charleston, S. C.—Give three grains iodide of potassium in syrup three times daily and repeat result.

J. H. If the symptoms of any disease are vague, the color of the eye may be due to catarrh, in which case a cure can only be effected by an operation. Show him to an experienced oculist.

W. J. P., Sado, Mien.—Your description of symptoms is rather indistinct, a teaspoonful of nuxvomica may have the effect of salivating of pale every three hours for three days, and write us if no improvement takes place.

W. J. P., Sado, Mien.—Your dog is undoubtedly troubled with epilepsy, which may be caused by debility, nervousness, or by over-exercising just after feeding. Remove the cause and you will probably have the result you desire.

H. S., Jordan, N. Y.—Your account is not clear; for you say that the bowels are all right and regular, yet state that the passages are very bad and small. Clear the bowels with a dose of rhubarb, a teaspoonful of nuxvomica, and the medicine apply Herra's white diachylum ointment daily, and report again to us.

INQUIRER, Baltimore.—My setter puppy had a touch of the distemper about four months ago. Since then he has had a slobbering at the mouth, and has been unable to sleep soundly. What treatment would be best to cure him? He is eight months old and very well grown. Ans.—Look to the condition of his teeth. If he is otherwise well he will outgrow the slobbering tendency.

C. H. H., Bogota, Canada.—I. My bound dog, seven years old, is paralyzed in his hind quarters. What would be the best will cure him? 2. What is a scotch-hound? Ans. 1. It is impossible for us to say what caused this paralysis, or to prescribe for it without a minute description of the case. 2. A scotch-hound is a breed of dog that follows the track of game by the scent. The term is generally understood to refer to the bloodhound.

L. B., Falls Village.—I have a young English dog that about five months ago was taken with the distemper, and it left him twitching his legs. Some say he has the St. Anthony dance, and will never get over it. Can he be cured or not? Ans. Chorea following distemper is rare. See article on Chorea in *FOREST AND STREAM* Oct. 20, 1878, where treatment, etc., is given. Chorea and St. Anthony's St. Vitus's dance are the same.

W. J. P., Sado, Mien.—The teeth of the dog are affected with some kind of caries, the enamel of almost all the front teeth being destroyed in circles extending round them. This has been a yellowish matter, which has corroded. He is in good condition otherwise, keeping constipated. His food consists of mush, beef, and milk sometimes warm. Ans. The condition is probably caries, and if the teeth are not cured, he can be done except good feeding. Keep bowels free by diet of cornmeal mush, or a meal of raw liver when necessary.

DICK, Honey's Falls, N. Y.—About four weeks ago a small cocker spaniel puppy was perfectly well, and the morning following this first symptom he appeared quite stiff in the hind parts, and before the day closed he lost all control of his hind legs, and since then has been unable to get up, and has no sense of feeling in his legs; left leg was swollen for about one week; after swelling went down, he was unable to get up, and he has no sense of feeling in his body part; he has no sore spot on back or any part of his body. Ans. Your dog has myelitis or inflammation of the spinal cord; the treatment is rest, and if the disease is not cured, he will leave the dog unfit for field work. The trouble is often the sequel to a mild case of distemper.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication, notes correspondents MUST GIVE the following particulars of each animal:

- 1. Color.
- 2. Name and residence of owner, buyer or seller.
- 3. Sex.
- 4. Age, or date of birth, of breeding or of dam.
- 5. Name of dam, if known.
- 6. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

See instructions at head of this column.

Kynoch's Patent "Perfect" Brass Shells

MANUFACTURED BY

Kynoch & Co., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base. Use either Winchester or Wesson primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weigh less than paper shells, and in consideration of their reloading and other advantages, are really cheaper than the paper. They also shoot stronger and closer, and can be loaded heavier, as inside diameter is nearly two gauges larger. They possess a great advantage over all other brass shells, as owing to the thin metal they can be closed (as represented in cut) by simple use of the thumb or fingers, and straighten out to original shape when discharged. These goods have already gained a wide and favorable reputation in Europe, and in the opinion of many prominent sportsmen will soon supersede to a great extent the old style of both brass and paper. Samples will, upon application, be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or in case lots only (2,000 shells) by

HERMANN BOKER & CO.,

SOLE AMERICAN AGENTS.

101 & 103 Duane Street, New York.

WILLIAM READ & SONS, Boston, Mass., Agents for New England States.

We also carry a large stock (at all seasons) of Kynoch's regular thickness brass shells, adapted to the Jordan Primer. Price materially lower than the American make of same quality.

Kennedy Repeating Rifle

The Latest and Best.

Greatly superior to any other Magazine Rifle yet made. The solid metal in line of fire at time of discharge renders the Kennedy ABSOLUTELY SAFE.

These rifles are made .44 cal. 40 gr., and .45 cal. 60 gr., using the same ammunition as other magazine rifles.

Can be obtained from any first-class gun dealer in the United States and Canada.

NOTICE.

JAMES PURDEY & SONS,

Late of 314 1/2 Oxford Street, London, W.

Gun manufacturers, by special appointments to Her Majesty the Queen, H. R. H., the Prince of Wales, and the most noted shots of Europe, give notice that they have removed to a new and large manufactory erected by them, and their address now is

AUDLEY HOUSE, SOUTH AUDLEY ST., LONDON, W.

They take this opportunity to inform American sportsmen that they have patented A NEW REBOUNDING HAMMERLESS GUN, which, after the most careful practical trials and severe tests, they confidently recommend as by far

THE BEST AND
HAMMERLESS

ONLY PERFECT
GUN MADE.

Its advantages are STRENGTH, SIMPLICITY, SAFETY AND FREEDOM FROM MISFIRES. JAMES PURDEY & SONS will only make one quality of gun for the United States, viz.: THE BEST Gun, take about five months to make, and can be ordered direct from the makers, or through the agencies of SCHUYLER & DUANE, 189 Broadway, New York, and JOS. C. GRUBB & CO., 712 Market street, Philadelphia.

N. B.—Messrs. Purdey & Sons are prepared to sell the rights, or grant a license (subject to certain conditions) for the sole manufacture of this gun in the United States.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR, 10 CTS. A COPY. SIX MONTHS, \$2.

NEW YORK, MARCH 29, 1888.

VOL. XX.—No. 9.
Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsmen throughout the United States and Canada. On sale by the American Exchange, 419 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money of they will not be inserted.

ANSWERS TO CORRESPONDENTS.

With its compact type and in its permanently enlarged form of twenty eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

THE NEED OF RANGE DATA.

TO revert to a subject on which the FOREST AND STREAM has before thought it necessary to speak, we would ask why it is not possible for our rifle associations to take more definite and active steps toward making more valuable reports upon the work accomplished on the several ranges.

It is not enough to have a mere clerk who can present an accurate copy of the score-sheets. That may be necessary enough for the determination of the prize lists. But that after all is but a small part of the field that should be covered by an association which pretends to be organized for "the encouragement of rifle practice." There is not that steady progress in the development of small arms which there should be met with when so many men give so much of their time to practice before the butts. Every shot fired is an atom of experience which it should be the endeavor of the controlling body to gather up for the use and guidance of succeeding riflemen.

It is not enough to say that this work of experiment and carefully noted trial will be carried on by private individuals or by rifle-making firms interested in securing good results. The best results cannot be reached in this way, and the trial of a decade shows that they are not. What are needed most just now are carefully condoned series of shooting trials, so that the riflemen going out to practice may know at least in what direction he may expect fruitful returns for his effort, and what he may not expect to find in other directions. The association will be able to make impartial trials, and the conclusions, whatever they may be, will be accepted on all sides as conclusive at least for the time being. By exploding many old and antiquated notions which still cling about the theory and art of gun and rifle shooting, the way will be cleared for progress in the right direction toward simplicity of mechanism and accuracy of result.

For example the amount of shooting which during

the past ten years has been done in different parts of this State by the members of the National Guard. Have any general conclusions been drawn from that practice? Has there been any compilation of results in such form that succeeding officials may find a fund of information awaiting them, drawn from the rich mine which the annual practice of nearly twenty thousand men opens? There are an abundance of figures, but they are useless records of what was accomplished by the hap-hazard system in vogue.

A small club devoting itself to this line of original research and test can do more for the advancement of the art of rifle-shooting than the richest and most extensive organization which aims only at merely gathering a number of shooters together to compete for prizes. The work now done is an important one. There must be grand field days, when in open matches opportunity is given for a careful and keen comparison of results. In this way different experimenters are enabled to air their theories and get the knock-down quietus of defeat or the encouraging indorsement of victory. But there are dozens of needed tests—of charges, of shells, of rifling, of holding, of powders, of wads, of bullets, of all the hundred et ceteras which enter into that most complex of results—a well-delivered bulleye. Such a series of tests should run over an entire season in order to gain the advantages of varying weather conditions; and when carried out by different individuals they include that personal equation without which factor tests are apt to become mere bench trials, and correspondingly misleading.

THE MAINE INDICTMENTS.

IN our issue of August 10, 1882, we called attention to the summer killing of moose in Maine by three parties who we stated were residents of Worcester. One of the three who were thus named, subsequently called at this office and explained—that the other two did not live in Worcester—which was certainly much to the credit of the sportsmen of that city. We do not know just how much more he had intended to explain, but we convinced him that we "had the papers" for our statements; which did away with the necessity of further explanation. By reference to our "Game Bag and Gun" columns, it will be learned that indictments have been found by the Grand Jury of Somerset county, Me., against the other two of the party named, as well as against their guide, for the very offense reported by us. Many other individuals have been indicted on similar charges, and the public is now given to understand that Messrs. Stillwell and Stanley, the Maine Game Commissioners, "mean business."

In addition to the parties against whom indictments have been presented, were many other offenders against the Maine game laws, who eagerly accepted the Commissioners' offer to allow a private settlement, and paid up their fines. We are glad that the detectives failed to discover evidence that the Hon. George F. Hoar, of Worcester, Mass., was present at the moose killing which has been somewhat freely coupled with his name during the past months. The publication of the names, given elsewhere, of which we have been in possession some time, will also relieve from worry several other gentlemen who have been quite oppressed by the thought that their good name might be tarnished by unfounded suspicions.

It is a pleasure to know that there is a gradual change of sentiment among sportsmen tourists, and this change is very largely due to the influence exerted by right-thinking men who annually carry their home principles with them into the woods. Among the Maine summer visitors are many individuals who have by persistent preaching and consistent living exerted an influence in behalf of respect for the game laws. Wholesale condemnation of Maine tourists is, therefore, most unjust.

THE GAME PROTECTORS.—We understand that the bill to increase the force of game protectors in this State to sixteen has been passed. The new law will put the wardens under the control of the Fish Commission, and there may be some possibility of making them do their duty. We have been unable to learn that any of the eight wardens, always excepting Mr. Dodge, have earned their salary, or a tithe of it. They have been unprofitable servants, and ought to be cast out of office. We hope to see Mr. Dodge reappointed, for he has proved himself to be an admirable man for the place, and if the fifteen others were like him game protection would mean something in this State. Special care should be taken in the appointment of these game wardens to supply officers at points where they are most needed. Long Island should not be neglected, nor the New York markets.

TROUT DAY.

THE legal opening of the trout season in the State of New York is the first day of April, which this year falls on Sunday. While many of the northern lakes and streams are still ice-bound, the streams of Long Island have been free of ice for a month, and the trout are feeding to make up for lost time. How many anglers from the city will visit the island it would be hard to say. The new penal code makes it an offense to fish on Sunday, and we hope that all our readers will strictly observe the law and wait until Monday morning.

Those who are fortunate enough to have friends who own preserved streams and are in possession of invitations to fish them are mortals to be envied. We have several such invitations but cannot accept them for a week or two yet, and it is this fact that disturbs our sleep and makes us thin of flesh. Long Island is the greatest trout country in the State. Its waters have always been filled with trout by reason of their coolness and their plentiful supply of food. To-day there are nearly two hundred private ponds and streams which afford excellent fishing, and also a few streams which have been open to the public for years, and are not yet fished out. The famous South Side Club has been adding to its preserves several new streams, which will be stocked from the abundant supply in ponds and lakes belonging to the club. Its members comprise some of the most prominent citizens of New York. Near Yaphank, the Suffolk Club has its grounds and its excellent fishing. Mr. Austin Corbin's, near Babylon, are well known, and here and at the ponds of Mr. W. Floyd Jones, at South Oyster Bay, President Arthur occasionally wets his fly. At Green River, near Sayville, are the preserves of Messrs. E. R. Wilbur and Charles F. Imbrie, which afford some wild trout fishing.

Beside these places where only invited guests may fish, there are other preserved waters where the angler may cast by paying for the privilege, usually about a dollar a pond for fish taken. There are Thompson's pond, at Nyoc, near Sag Harbor; Clapham's pond, at Roslyn; Seaman's, near Ridgewood; Carman's, at Amityville; Furman's, at Maspeth; Douglass's, at Huntington, and others.

The charge of a dollar a pound is certainly very reasonable and is less expensive than to go miles by railroad where the fishing is free. Of free fishing on the island there is little or none that is good. A few trout may be taken from Cedar Brook, near Baldwinville, the Fish Commission at Southtown, and in the streams at Mt. Desert, Vinal Haven, and Cape Cove, but they do not yield much and are not worth the number of rods and the expense which would be required to preserve them before the opening of the season.

CAVIAR.

THERE are many people who pretend to like caviar, and it is possible that a few may have forced themselves to relish the intensely salt or rancid preparation of sturgeon eggs called by this name. We believe the "delicacy" first came from Russia, and we can imagine that a native of Siberia, half Indian and half Esquimau, might find caviar a delightful change from whale's blubber and decayed seal. We have tasted caviar, and think that old rusty mackerel brine is nectar beside it.

The Germans pretend to love caviar, and Americans who have been abroad eat it before their friends to show their acquired taste contracted in foreign lands. We read in the *Deutsche Fischerei Zeitung* that some Germans have been making caviar from the eggs of the pike, and we wish them success in their search after a new source of supply of delicatessen. Shakespeare speaks of something which the general public cannot relish as being "caviar to the general." The hard is correct, as usual. Caviar is caviar, whether made of triple-salted rancid sturgeon eggs or of the ova of the pike flavored with seal blubber and stale mackerel brine.

To our friends who have not yet met this luxury we will say that at dinner, after the pudding, ice cream, cheese, nuts, figs and raisins have passed, you take a piece of toast about three inches square and cover it with a quarter-inch layer of something that looks like broken rice stewed in coal tar. On this you put a thick layer of finely-chopped raw onion and squeeze lemon over it. You raise it to your lips; you bite into it and roll your eyes heavenward and declare that you never tasted anything half so delicious before. At the first opportunity you slip down-stairs and take a quiet drink out of the kerosene can to get up a proper after-taste in your mouth.

Yes, the Germans have discovered a new source of caviar

in the pike, and don't we wish we had some of it. The memory of the caviar we have eaten comes over us like the recollections of an Arctic explorer when he thinks of the train oil he has swallowed.

THE MINNESOTA MOVEMENT.

THE sportsmen of Minnesota have become thoroughly aroused on the important subject of a more efficient conservation of their game supply, and have set about securing a better order of things. After a protracted struggle in the State Legislature they have succeeded in securing several amendments to the game laws, among the most important of which is a non-export clause, so worded that it is thought to be capable of standing the severest test in the courts. This law will provide a much-needed remedy for the traffic in game illegally killed out of season and shipped to Chicago markets, where the dealers are always willing to receive it, however unlawful may have been its capture. The sportsmen of Minnesota have expressed their determination to secure a stringent enforcement of the non-export law, and it is stated that the principal game dealers of the State will second their efforts.

The work of the game protectors will not, however, be confined to suppression of the illicit traffic in game. The Minnesota Sportsmen's Association, through its active and efficient secretary, Mr. W. S. Timberlake, has given notice that its members and agents throughout the State will report all violations of the game law, and the association's officers and counsel will prosecute the offenders in every instance.

We sincerely trust that the zeal of the gentlemen now interested may not abate; the need of well directed and persistent effort is great. All right-minded sportsmen, whether residents or non-residents, will indorse the present movement.

There has been in certain quarters a tendency to dory non-export game laws as wholly unconstitutional, but this criticism has come from a source which is not altogether above suspicion of being hampered by entangling alliances with the game dealers, and such opinions must consequently be taken for what they are worth, and no more.

FISHING AND SHOOTING ON SUNDAY.—The new Penal Code of New York, Section 265, prohibits "shooting, fishing, playing, horse-racing, gaming," etc., on Sunday. This was amended in the State Senate last week so that fishing is exempted from the forbidden pleasures; but an effort to also permit shooting and hunting failed. We have not at hand a record of the votes cast on this occasion, but it is probable that the city members of the Senate voted in favor of Sunday fishing, for the bait and hand-line fishermen of this city are numerous enough to be a power at the ballot-box; and a queer lot they are, too, but quiet and inoffensive. There is a very good reason why shooting should be prohibited on the Sabbath; for if it were not, there would be no peace for the dwellers in the vicinity of our large cities. The Sunday shooters would inaugurate a reign of terror, and the familiar feathered denizens of the Long Island banyard would become a *rara avis* in the land. Some of the other States need laws prohibiting Sunday shooting.

SOME PICTURES.—Mr. Charles Lauman, of Washington, the well-known traveler, author and artist, has completed a series of paintings of scenes on famous Canadian salmon rivers. Mr. Lannan's work is of a very high order of merit; his pictures are admirable, and fortunate will be the man who secures them. Mr. Charles Zimmerman, of St. Paul, Minn., who some years ago made a happy hit with his pictures, "The Tight Shell" and "Trying for a Double," has added to the series of duck-shooting scenes three other water-colors, "A Lost Opportunity," "Stopping an Incomer," and "A Side Shot." The pictures are well conceived and most happily executed; they will appeal at once to the duck-shooter, and cannot fail to add very greatly to Mr. Zimmerman's already pleasant reputation as a sportsman-artist.

ALASKA.—We are in receipt of the report of Captain J. A. Beardslee, U. S. Navy, relative to Alaskan affairs during his command of that Territory, on board the U. S. S. Jamestown. Capt. Beardslee justly won great credit for the admirable way in which he governed the Territory; and we are pleased to know that the wisdom of his course was appreciated at Washington. Our readers, who will recall the delightful letters from Alaska, contributed by Capt. Beardslee to the FOREST AND STREAM, will be interested in a perusal of the present report.

"AMERICAN KENNEL REGISTER."—The announcement in our last issue has already brought in numerous responses, which signify the welcome to be accorded to the *American Kennel Register*. The initial number will be issued April 10, and all entries for it must be in hand by next Friday at the latest. We give details of the *Register* in our Kennel columns.

BIRDS OF MAINE.—The publication of Mr. Smith's notes, which has been interrupted by Judge Caton's very entertaining "Salmagundi," will be resumed in our next issue.

The Sportsman Tourist.

NIMROD IN THE NORTH.

BY LIEUT. FRED'K SCHWATKA, U. S. ARMY.

V.—Nimrod with a Fish-rod.—Concluded.
CODFISH of several varieties swim over the various parts of the Arctic seas, no less than a quarter of a million being caught annually in Greenland alone. There is the larger variety similar to those on the "banks" of Newfoundland and elsewhere, but are only caught on the banks of the Arctic seas during the summer with hook and line. The smaller cod—the *obovate* of the Esquimaux, seems to be a more Arctic fish. My first personal contact with this variety was when I first encountered the Netschells of King William's Land in a little cove on the Adakids Peninsula. A short distance out on the ice of this cove were a number of holes dug through the ice, some fifteen or twenty, and at nearly every hole was a woman or child hauling out these herring-like cod as fast as they could put in their lines and pull them out. Their lines were made of the sinew stripped from the superficial dorsal muscles of the reindeer, their hooks being simply twisted bits of metal barbs, and depending upon the rapid hauling in of the line to retain the fish, a dexterity which they acquire to such a degree that they lose but few. Still, our barbed hooks excited their curiosity and desire so that they were fain to give us almost anything for them, but we were glad enough to exchange them for their rough ones of copper that had been crudely hammered from the sheeting stripped from the bottoms of Sir John Franklin's and other Arctic expeditions, and the wind would blow with a disagreeable strength the fishers would build a high snow wall on that side to protect them, and this could be varied in a minute or so to suit every varying gust of wind. Even the many dogs in sneaking around would make out to steal a good meal of fish in the course of the day.

One thought could not help impress itself upon me very forcibly. Right near this place was the spot where the last survivors of Sir John Franklin's ill-fated expedition perished from cold, hunger and scurvy, the terrible tripod of death that determined their destruction. Here they landed, some ten or fifteen in number, in the summer months, when the first cause was at its minimum, with the means of appeasing the second cause almost immediately, swimming in compass numbers under the very feet of the anchors, and the same being the means of curing the last in the next future. Man's life hangs on a thread, as the old proverb says, for it certainly hung on a fish-line in this case. The old women of the village pressed around us with their hands full of curious little pearl buttons that came from the head of the *oo-wahk*, wishing to trade them for needles and such material. There is also a large number of Eskimos, and in the Arctic seas caught by whites and natives. The large halibut often weigh a hundred pounds, and a few years ago some American ships went into the business of catching them on a commercial speculation, but I think it has failed. The little halibut is much fatter and sweeter, and is angled for in the ice-floors of Greenland, at depths of about 200 to 250 fathoms of water. In somewhat shallower water, in some places, are from 150 to 200 fatidoms, and the anchors will often obtain the "red fish," whose flesh is likewise rich in oil and good to the taste. The *netipok*, a fat little finny fellow, runs inshore during the spring to spawn, and then those natives lucky enough to be in the course of their "run" can live off of them for a couple of weeks or more.

The northern capelin is a fish that warms the un sportsmanlike soul of the native from its great abundance when it does come, and may in a dried state in winter time, says Dr. Hink frequently be said to have constituted the daily bread of the natives. They are actually shoveled on shore for a month during the running season in the spring by the help of nets and seines and strewn over the rocks of the beach like manure over a field. The natives of Greenland do not catch much less than a thousand tons per year, especially if the season be successful.

There is one tribe of Esquimaux, and only one tribe, that my journeys brought me in contact with, who may be said to live upon fish, or, at least, it is their principal diet. I refer to the *Oo-que-sik* Sô-lik Esquimaux, who live on the largest branch of Back's Great Fish River, the *Koo-ri-ook*, about forty miles from its mouth, and at the Dangerous Rapids at the mouth of Back's River. At the former place, on the *Koo-ri-ook*, there is a long series of rapids in the river, and when the ice breaks up and is clear of the river, about July the salmon commence to ascend, and they are speared by the hundreds by the fishermen, who holdy wade through the rushing torrent until a good standing place is found.

Their fishing spears are about ten to twelve feet long, in the inch and a half shaft, and at the lower end is placed a sharp-pointed spike about four inches in length, generally made of copper. Two flaring pieces of horn are bound to the shaft, and at each one of the free extremities of these pieces is a metal spike bent back like a barb, the points of the three spikes nearly touching and at about equal angular distances from each other. When thrust over a salmon in the water the central spike pierces his back, the two outer ones flaring over his sides until they are pulled up, when the elasticity of the musk-ox horn-progs drives them into his sides and there is a long series of rapid jerks, and he dies with deadly certainty until he is thrown upon the land. The women and children then clean them, and they are placed to dry on double rows of reindeer sinew strings, drawn from one rock to another and back. When dried it is packed in sealskin bags for winter use, and even as late as May, when we visited them, they had a tolerable supply of *pisces*, as they call it, among them.

Those at the Dangerous Rapids, beside the salmon, catch a herring-like fish which they call *oo-wahk-sik-luk*, and as it comes later in the year they have no time to dry it, and pile or *cache* it away in pens of rocks looking like huge granite beehives often as high as they can reach. Late as they are caught, they have plenty of time to acquire that taint so characteristic of stale fish, and so much is this killed by freezing, and so generous is the benefit of thawing, that the raw frozen fish are decidedly a luxury as a diet compared with those that are cooked. This is true of all tainted meats, vast quantities of which are devoured by the natives throughout these regions. Taken in large quantities sickness supervenes, accompanied by a practical nausea, and cases often occur of death from this cause when driven to it by necessity, or indulging in it too freely under other circumstances. Out of 4,770 deaths among the Esquimaux of Greenland, 36 were poisoned by putrid meat, 16 of putrid

fever, probably brought on by this cause, and 73 of complaints of the stomach, 33 of vomiting, of which over half would die of this cause, if my experience among them should hold good in the case of the natives.

Colonel Gillet was fain to compare tainted walrus meat to Limburger cheese, and certainly when meats so perfectly marbled with interstitial fat as that of the walrusmeat is it more that of the rancidity of old cheese than a true putrefaction; but no such claims rest with any of the true fishes, even in the cold zones of the Arctic, although we are anxious to caution ourselves to this diet in homopoeitic doses. In small shallow streams the natives select a place, on the bank, and build an oblique dam across, open for about a yard on either end and inclining to the axis of the stream at an acute angle as the length of the ripples will allow so as to keep the dam within them. After the *oo-wahk-sik-luk* have passed up the stream the upper opening is closed and a large number of natives getting on the up stream side of the sheet of fish frighten them into returning down the stream where they must pass through the lower opening of the wing dam. This dam is continued along the bank for some distance, if there be one, or the water is directed out into a basin if there is none and in either case the fish are piled into a place so thick they are raked out with a large wooden rake on the bank and from thence deposited in the large earthen pits, and eaten through the winter.
