## COMMENT

## Governor Fisher

It is interesting to know that \$1,422,000 is that there are always five candidates for Governor here, and, possibly, a sixth man, but very few with so constant a capacity for union.

If the right sort of political fuel is shovelled into him, he may make a very blazing Governor. And when you think of all the stuff there is that needs burning, that's rather a joyous thought.

Here's wishing him good luck, an honest success, and perpetual continuation through all this glad New Year.

## The Old Year Proposes

Whatever else he may be said about the year 1912, it was not a sluggish or indifferent or timid sort of year. It may not have settled many questions for humanity and civilization, but it certainly wasn't heedless about raising them. On the contrary, it was a pretty distinctly inquiring sort of year, and some may even call it a trifle reckless and irreverent.

On the other side, for instance, instead of sound the long-tried New Eastern stirred it up with a vengeance. While

Powers were using all the old methods, and perhaps some new ones, to keep it from raising itself, the continuous little Powers fit right into it unobtrusively—incidentally, at the same time, lighting into Turkey. Just what is going to be left of either the old Turkey does not yet appear, but it seems highly probable that there will be decidedly less of both, although, unfortunately, they will doubtless be left enough of both to cause more trouble, and at any rate to keep up apprehensions.

Over here there's simply no end to the questions that 1912 has either stirred up or stirred into unquiet beds, and which we can only hope that 1913 or some other future year will know how to settle or to drop with dignity and safety. Who would have thought, for instance, that such a question as that of the continued existence of the Republican party could have been seriously raised at all—let alone to the question of the future of its well-to-do success? Of course, most of us know now that some of the other questions we have been so warm over are not really new at all—the referendum and recall, for instance, which in a way are as old as ancient democracy—but the events that have made them so remarkable about 1912. It raised them quite as vigorously as if they had been new—and it left them thus unsettled. It raised, too, some mighty interesting and amusing questions about men, public characters, but as a rule they were not very pleasant questions, and it would be a good New Year's change if we could manage to drop them.

Let us hope that it has settled at least one old question: if not completely, at least substantially; in the main, if not in detail. Of course, we mean the tariff. Its action is yet to be taken, but maybe it will be taken well as reasonably definite as a legislative and controlling act to other years. It may help to make it so. Let us, if we can, surely it is time, so far as that

question is concerned, for this country to know its own mind.

## The Office-seeker—and "Friends"

Every sensible man deplores the way a new President's time and energy are taken up by office-seekers. Every man of decent instincts and breeding is disgusted at the selfishness and bad taste of the habit of "petitioning" that bears down upon a President-elect, the moment the fact of his election is known, oblivious of everything but their own personal claims to recognition. Every man of any standing in the victorious party, or of any imaginable influence, is, moreover, sure to be annoyed by appeals for help to this or that friend, or this or that friend's friend, who does not want a job.

But how many of us, when we receive such appeals, have the moral courage to turn them down as most of them deserve to be? How many of us—even those of us who most heartily inkorse the "merit system," and feel most strongly that nothing but fitness should be considered in the choosing of public officers—act on that principle when it comes to a question of signing some man's petition or adding on more letters to the lute-alike deal of mail a newly elected President or Governor has to struggle with? How many of us are in the least conscientious or even honest in our acknowledgments and recommendations?

It is a vexatious matter. The office-seekers, it is generally believed, killed one President by mere importunity. Another President, GARFIELD, was assassinated by a disappointed applicant. Even in 1901, in the presence of civil war, LOGAN had no respite from this quackish plague. He said that he was like a man so badly engaged in letting down the load of his horse that he had no time to get out the fire in the house that. The President is the busiest man in the world, and in the most responsible position; yet his strength is wasted, his temper is tried, his good nature is imposed on, worst of all, his time, which is all so well spent for the properly important duties of his office, is continually monopolized by place-hunters and their "friends."

The place-hunters themselves have not missed the impression that they merit, but at present it is the "friends" we are thinking about. The same are usually supposed to be friends also of the hard-earned success of enterprise. He has to be a friend, of course, but is importunity advice? And how much of the advice he gets is really honest, really of a nature to help him in his appalling responsibility? How much of it has even the semblance of patriotism, or is in the least determined by a consideration of the welfare of the country? How many of them, on the contrary, are making out a cowardly compromise with selfish requests, on personal grounds, that could never have been made?

But that isn't the worst of it, reader. To what extent are you and I figuring as the "friends" of those people who are willing to hold up everything till they are served? How many petitions have you signed, how many letters have you written—merely because you didn't like not to be?

New Year's is the time to make good resolutions. There's one that needs't last much beyond March 21st. Let's all resolve that we won't endorse or recommend a single applicant for public office unless we personally know him to be a fit man, and fully believe he is the fittest man, for the job he is after.

## As to a Department of Health

This journal has often enough confessed its uneasiness over the swift increase of the scope and functions of the government at Washington. We hardly need to refer to the various means and means of an inclination toward centralization or a fondness for bureaucracy. That is not our trouble. Still, we are quite unable to ignore the force of the argument for one new department, a department of health, as presented, say, in a recent article by Dr. JENNY A. WYETH of this city.

We hardly need to refer to the various means and means of an inclination toward centralization or a fondness for bureaucracy. That is not our trouble. Still, we are quite unable to ignore the force of the argument for one new department, a department of health, as presented, say, in a recent article by Dr. JENNY A. WYETH of this city. There is simply no denying the fact that the other departments of the general aim of such a department as compared with the aims of most of the departments already established. It is reasonable to have a Secretary of Agriculture to look after the condition of our farms and the health of our flocks, then it is equally reasonable to have a Secretary of Health to look after the health of our people. If the one's action is covered by the phrase "general" then surely the other is also. Neither can it be successfully argued that there is not enough in a Federal department to do for the public health. Dr. WYETH points out too many ways in which it could render simply invaluable service. It is the States, sitting sep-

arately, cannot render so well and do not render at all. He is quite logical in citing the example of the Panama Canal Zone and the conquest of yellow fever as indications of what we might expect from a properly constituted, properly headed, properly officered national health department.

But right there, as we see it, is the real difficulty. The real question is not of the desirability of the kind of a department of health, but of how to get it. It is a question of constructive legislation, and then, we are sorry to add, of politics; of framing a wise, sound law on the subject, and then of getting it through Congress.

Both jobs are troublesome. It is not a simple matter to decide precisely what shall be the functions of the proposed department and the powers and duties of the new Secretary. Even when these things are satisfactorily worked out, there is sure to be a powerful and resourceful opposition, an opposition quite likely to continue even after the passage of the law, just like the opposition to the pure-food law. Indeed, it will be in large measure the result of the passage of the law that it will all be intensely active in it. Does not Dr. WYETH himself admit that the OWENS bill, to establish the department he wants, is now a worthless compromise? Why?

Not that such opposition ought to prevail. By no means. Our point is merely that the best line for advocates of the department now to take is the constructive, practical line—not argument as to the theory of such a department, but work on a proper bill to establish it, and the hardest kind of work to overcome the opposition to it. In a word, the time has come in this matter for constructive statesmanship—and for practical politics.

## Dr. Morris' No Nisi Dossus

In a letter on page 6 Brother WILLIAM BARNES rhymes us for speaking disrespectfully of his platform in the late campaign. He would not have them disparaged merely because they did not prove victorious, since it was not so vain that they were made, but to perpetuate the American institutions that protect the individuality of the citizen.

We shall lay nothing but palms or ribbons wreaths on Brother BARNES' deceased platform hereafter.

## Mr. Melles and His Trials

To a reporter the other-day Mr. CHARLES MELLES described his manner of life. It is a life extended over all New England, spent mostly in railway trains, a sensible for meals, for work, for sleep; exposed daily to the perils of the system of transportation which he controls, and he is accompanied by brief calls at his nominal residence in the Berkshire. As he pictures it, it is a terrible life. He is sixty-two years old, and entitled, it would seem, to a form of existence that had breathing-spells in it. To be indicted, and have before him the possibility of a rest, even in jail, from this day's work is effort, ought to bring to him satisfaction not unlike those of the martyr who sees the fagots kindling for his release, and rejoices in the prospect of coming into his reward.

Certainly there could hardly be a tougher job than Mr. MELLES has imposed on to himself in the control of the railroads and water-ways of all New England. What does he want that he should go after it at such expenditure of energy and sacrifice of rest? Is he merely trying to earn his salary and acquire a proper rainy-day surplus?

## Of course not.

We do not think at all that the driving impulse back of all Mr. MELLES' exertions is the ambition to give to New England the very best and safest transportation system that its business can support. He goes at it like a captain in a war; has his plan of campaign and sticks to it, makes forced marches all day, and sleeps on the floor. This is his duty, and apparently he is doing his best for it, but for two things his forces are disheartened, and the country in which his operations proceed is almost universally hostile. He can't last long for all New England all by himself. He must have his operatives at his back and a better sentiment among the people his lines aspire to serve. His work will be a failure unless he can get on with his line of thought that would seem to be a defect not so much of mind as of spirit. Here is what the *Railway Age Gazette* has to say about him:

If you ask a New Englander what the New Haven long enough you will find that the real greatness of his indignation is not in the fact that the message was sent, but in the fact that it was sent so carelessly, but that it is not that it has caused the power of monopoly. Even so, it is not that it has caused the power in the rate. — *Railway Age Gazette*

per ton per mile—was 1.43 cents in 1908 and 1.37 cents in 1912—to average rate per passenger per mile in other years was 1.7 cents and in 1912 1.72 cents. In other words, since the wages the MEXICO management paid for its labor and the MEXICO management to pay for materials and equipment have gone up both its freight and passenger rates have declined. However, wherever there is a monopoly, there is a suspicion that it is being used for the sole benefit of the possessor. Therefore, to get along with their patrons, monopolists must treat their users more diplomatically than competing firms do. And Mr. MEXICO is exactly the man apt to do this.

He is an extraordinarily strong man and also a very shrewd one. In taking over the management of New Haven he assumed heavy responsibilities to his stockholders and undertook the operation of a property dependent on one enterprise, in one progressive movement. He was fully capable of doing the improvement work needed. His courage and his knowledge of what a monopoly would do after he failed. But his courage was of a kind that could not explain itself, or he did not want to. It is one of those men who should be made to learn a lesson or two. If he had been diplomatic, he would have made clear long ago to the people of New England not only that he was seeking to establish a transportation monopoly, but the reasons and what it would do for them, but the public might benefit by it. But Mr. MEXICO is seldom a talking man, and when he does talk he is apt to put a strong case for himself, but never rather than conclude. His curt manners and arbitrary methods have made him numerous enemies among those who would not do only the railway, but him. When he has felt that public changes should be made in the service of the road he often has not considered what other people might think about them, but has made them first and found out what other people thought afterward; and very commonly he has been so sure of his own right that he has not even considered that they might not be right. His management recently made a searching investigation of the New Haven affairs and gave the management a clear bill of health for integrity. If Mr. MEXICO had been a little less of an individualist and a little more of a diplomat in his attitude toward public opinion, the bill of health given by that investigation to the commonwealth would have been relatively less important.

It is a good deal to ask that the same men shall be a trained railroad expert, a highly efficient executive, and at the same time a philosopher with all attitudes, and with a gift for conciliation and persuasion. All those qualities are seldom put up in the same package, but Mr. MEXICO seems to need them all, and to be in danger of disaster for lack of them.

Perhaps as a substitute for an unlikely aggregation of virtues, the paper we have quoted recommends to him to learn the lesson that other eminent railroad presidents have had to learn, to take the public into his confidence, tell it what he is trying to do, and how, and "live absolutely up to his promise to do"—a thing the MEXICO management has not done.

The people of New England could be handled like sheep. They don't drive wild—never did. But they are so indignant a lot of people as there are in the world, so apt as to reason justly from facts if they can get the facts, as reasonably they can, and so likely to be so inefficient in treatment. They have in Mr. MEXICO a very able public servant. It will be a pity if they lose the benefit of his abilities for lack in him of the gift to make his abilities acceptable.

#### Mr. Fagan on Railway Wrecks

In the decision of the Interstate Commerce Commission going over railway accidents, Mr. JAMES O. FAGAN, of West Cambridge, Massachusetts, has made a point which seems to be well taken. Mr. FAGAN is a writer of reputation, with a book or two and various Atlantic essays to his credit; but that is not the immediately important thing about him. He is a railroad yachtsman, and has been one for many years. In the course of his travels he has certainly seemed to rattle him on a hearing on the question of how to promote the safety of people on railway trains.

Substantially, Mr. FAGAN's point is that we are not paying enough attention to the choice and discipline of the men that run the railroad trains. He does not say that we are not using the best mechanical safety appliances, but he holds, and he gives good reasons for holding, that all the mechanical appliances conceivably will not prevent accidents and the loss of life if there are careless or otherwise unfit men on the train crews and in the signal-towers and dispatch-offices. He goes further and points out ways in which this human factor in the accidents can be better handled by being handled with the extreme care that ought to be given to it.

He doesn't put the blame all in one place. He wishes the Interstate Commerce Commission would take a "firmer and more aggressive stand in the matter."

He wishes the railroad managers and stockholders to be first in the matter, but he is a consistent opponent of existing practices. But he

seems to feel that the "labor machine," as he calls it, has a lot to do with the trouble, by the way it has been protected, instead of being checked or discharged from its ranks, men found guilty of negligence or carelessness of a nature dangerous to the traveling public.

As we say, Mr. FAGAN's point seems to us well taken. He has got a wide hearing, too, and we see no good reason why his timely word shouldn't have great effect. We can only say we had our own say for selecting it—reasons that in the long run would prove bad for the commission, for the railroads, and also for the "labor machine."

#### "A Divorced Giant"

Under the heading of "A Divorced Giant," Colonel WARRIAM contrasts the present estate of the Hon. JOHN C. SPOONER with that which was his when as Senator from Wisconsin he thundered in debate "while the admiring galleries rejoiced." The Colonel scoffs at a Wisconsin politician with other qualifications of the same profession he lately accompanied a client to Washington, and exclaims: "From what heights to what a level!"

What would Marse HEXAY have a man do? Blasted by an attachment, amply reciprocated, to a leading newspaper in an important center of sport and news, he has been able to devote most of the years of his manhood to the study of the affections of people, improving their minds, rectifying their errors and other products, and leading them with their respective approval among the stills and blue-grass pastures of one of the fairest of States. These labors have not only made Marse HEXAY beloved, but we hope and believe that they have made him reasonably rich.

Mr. SPOONER, on the contrary, put in the best years of his maturity commanding the applause of listening Senates, and working on committees of Congress. He got five thousand a year and probably spent it all. While his reputation in Washington was still at its best, his services as a Senator were valued at the highest valuation, the less conscious that his constituents at home had been attracted by new prophets and had come to see things from a different angle from his, and that his hold on his seat had become insecure.

He did not want to be turned out of the Senate. He excused himself from that body and, being then thirty-four years of age, turned his mind to the consideration of expedients to avoid becoming a public chameleon. What would Marse HEXAY have had him do next? Let a ketoeship at Malabar! Practice law there, or in Milwaukee! Go back to a State which belonged to BONEY LA FORTY!

It didn't suit him to do that. He came to New York, got up a hotel, hired a law office, and hung out his shingle, as COLUMBA and HAZZ had done before him. It was not his choice of an occupation. It was a choice upon upon him by the people of Wisconsin. It is to them that Marse HEXAY should address any remarks implying his disaffection with Mr. SPOONER's change of employment. It is better, at least, that he should address them from remarks about it. Blessed himself with a steady, inspiring, and remunerative employment in which his talents shine, why should he not offer sympathy, and admiration, too, to an eminent man who, having spent most of his strength in the public service, finds himself able to employ the remnant of it in a successful self-support.

#### Some Trouble

A number of things are not going as well as they should. There's the Medical Secretary KNOT, it seems, has lately had to write quite a pressing letter to the government of that large country, begging that better order be kept, so that American doing business there may work to better purpose by day and pass more restful nights, and that investors who have bet money on Mexican civilization may get a return in their capital. Whether the letter will help matters at all, who can say? President MARXON is a well-disposed man, and would make Mexico a paradise of representative government if he could, and is doubtless trying to; but can he!

Besides that we hear of some stungish, more or less hidden, in the School Board of New York City. And there are no marks on the calendar. It used to be that the men teachers began at \$500 a year and the women teachers at \$250, but when the bill passed the Legislature that men and women teachers should have the same pay for the same grade of work, the pay of the beginning men was cut down to \$250 to match the women's pay. And there are no marks on the calendar. The School Board is considering whether to use

moving pictures or photographs as a substitute for men. For it seems to be the opinion of the educational agents that there was a bill in connection with public education that women do not fill, and which calls for men and ought to have them.

#### And Another

And here is another troublesome thought, extracted from an article by President-elect WILSON in the January number of the *World's Work*:

Some of the biggest men in the United States, in the field of commerce and manufacture, are afraid of something, are afraid of something. American industrial agents that there was a bill in connection with public education that women do not fill, and which calls for men and ought to have them.

That is important if true; but isn't it? Do you think it is true? If it is, it implies a condition that it will take a great deal of hard thinking to clean up. It is Governor WILSON's opinion that it has come about by force of circumstances; it is not one induced by "bodies of our fellow-citizens who are trying to grind us down and do us injustice," but one arising because "we are all caught in a great economic system which is hopeless. If that is the case we ought to hope to extricate ourselves from it as expeditiously as is safely possible, and with the minimum of economic loss, violence, heart-burnings, and bad blood."

#### Written or Rotten

Will that inquirer who asks whether Brother TOM LAWSON'S writings should be classified under the head of "composition" or of "discomposition," please excuse us for stopping a moment. The holiday activities have not yet had our due leisure to reflect on so delicate a question.

#### Walt Whitman's Birthplace

In a letter on page 6 Mr. ALFRED WHITMAN-ORRIS asks attention to the birthplace of WALT WHITMAN at Huntington, Long Island, which he thinks should be rescued and cared for by somebody, so that posterity may find it there when it comes looking.

Mr. LITTLEWOOD has a domicile close to that neighborhood and has a large experience in the preservation of historic homes, and if Mr. WHITMAN-ORRIS could interest her in the WHITMAN cottage it would be as good as saved. The north shore of Long Island is now densely populated with cities who often pay much more for ruins than the WHITMAN cottage would cost. Why doesn't Huntington pose the lot and buy it?

#### A Friend Writes from Columbus

We beg to acknowledge the letter of the friend who writes from Columbus, Ohio, about "one very dangerous suggestion" in "an otherwise delightful story in the Christmas number of HAZZIE'S MAGAZINE"—to wit, where she tells of the university professor smacking with such delight in the presence of the young man, that she could not help counting their daughter in all right and "hasn't a vice except he does not smoke." "I do not see," says our Columbus friend, "how any good woman could write such a sentence. Are you teaching in HAZZIE'S that a young man becomes virtuous by refusing to use tobacco?"

This is, of course, not our affair, since the publication of the letter is in HAZZIE'S MAGAZINE, a periodical with principles quite distinct from those of the WEEKLY and, possibly, not so high as ours. We will show to say, though out of a long editorial experience, that it is impossible to weed all the depravity out of contributors to periodicals so that they will deliver an utterance except such as all readers will be glad to accept. Their personal views, or, as in this case, their taboos, will creep into what they write and remain there in spite of the utmost vigilance of the devoted guardians on whom falls the responsibility of presenting their discourses to the public. 31999

Our friend in Columbus must find what consolation he will by thought that "what good and virtuous citizens of progress are there who would lose such low value in the world if they did not find such occasional opportunities for display as this aberration from decorum in the December MAGAZINE. What would be the good of saints in the world if there were no sinners? Would more enjoyment—more breath—more happiness of spirits be the portion of the virtuous if there were no low beings to be raised up by contemplation of it?"

# GENERAL HOMER LEE

November 17, 1876—November 1, 1912

BY CHARLES E. VAN LOAN

THE death of General Homer Lee is a thirty-sixth year removed from the theater of world events a figure in history, and ended a career stronger than any to be found in the annals of the world.

A hopeless cripple from early childhood, physically deformed, never free from pain and the bondage of physical weakness, this young American held a commission as lieutenant-general of Chinese revolutionary troops before he was twenty-five years of age; at thirty he was the author of a work on modern warfare which amazed the military experts of many nations and gave him permanent place as an authority on the subject; at thirty-five he was the confidential adviser of the first President of the Chinese Republic, and yet his one regret was that he had never completed so little! It is hard to measure a spirit like that but only another example.

It is impossible to guess what he might have done had he lived ten years longer. His ambition was infinite. His belief in himself was absolute.

All sorts of vague stories have been told about Homer Lee's husband. It has been said that before he was ten years of age he amused himself by forming his companions into companies and working out military problems. This is not true, his great interest in those days were no promise of military genius. His teachers in the Los Angeles High School remember him as an apt though often inattentive pupil. He never seemed to study, yet rather to rely upon his power of perception, which was remarkable. He absorbed information without lines or papers.

It was during this period that he began to read historical works dealing with the life and career of Napoleon, the one character in history who held a fascination for him. This was unquestionably his first impetus to thought and military lines. Besides his captivation he had mastered every detail, every strategic move in every battle of Napoleon's campaigns, as well as the history of every great engagement of which there was definite record.

"I recalled then," said he some years afterward, "that the only really great careers in history that were made with a tremendous improvement upon him, for he left nothing and sailed for the forest. The Emperor was then at his height, confident with King Ya Wei's movement to banish the Dowager Empress and seat the young Emperor Kwang Hsin on the throne. King Ya Wei, then Premier, was secretly enlisting as many army officers as possible, and this under the very eyes of the Dowager Empress. Although China presented the promise of a fair three-headed giant, and this was the magnet which drew the young American outward."

I know there would be a chance to get to somewhere," said General Lee afterward. "Whenever there is fighting, there are opportunities for leadership. China has never had the best chance in the world at that time. No I want there."

This is the simple truth concerning Homer Lee's motive in going to China.

Always and without backing of any sort upon his private resources was his undiminished confidence in his ability. The American he turned himself to the Premier and offered his services. King Ya Wei felt no amazement, but was so deeply impressed that he took Lee to a conference attended by several Chinese officers who were pledged to the revolutionary cause. One old man looked at the diminutive American and shook his head.

"Boy," said he, "you are very young to aspire to the command of troops."

Homer Lee's answer was characteristic of the man: "I am so old as Napoleon was at Errol."

King Ya Wei gave him a commission and ordered Lee to proceed to the Province of Shensi, there to be commanded a body of troops. General Lee was not popular in China just then, but General Lee set out in a palanquin, accompanied only by his interpreter and two servants. The route he followed was miles inland, and within one hundred miles of his destination a rumor brought news of disaster to the United States. General Lee and the remainder of the revolutionary force left his palace under pretext of surrounding the province to them, and the next morning their hands appeared in a ghastly row along the palace wall. General Lee and the remainder with a message to the troops, hiding their feet in the mountains and wait his coming. It was not until the day that the revolution was over that the soldiers, led by General Lee, had thrown down their arms and dispersed.

Lee started back for the coast. On the way he learned that the Shensi disaster was no more than the beginning of trouble. The really old Dowager Empress had banished King Ya Wei's child, and but for a whispered warning the Premier himself would never have left the Forbidden City alive. It died in the night, and many of the officers implicated with him were beheaded. At the same time a reward of \$10,000 was offered for the head of the "foreign devil" Lee.

How he managed to make his way through five hundred miles of hostile territory is a wonderful story in itself. The country swarmed with Beavers and imperial troops and a meeting with either force would have been fatal, but luck was with Lee, and he arrived in Hong Kong, where friends of the revolutionary party gave him shelter. There was in Hong Kong at that time a man whom Lee had never seen and with whom his father was to be found. Homer Lee had never had described his first meeting with Homer Lee in those words:

Homer Lee

"It was now that another important event happened to me. I was speaking to a company of my followers when my eye fell on a young man of slight physique. He was under five feet high, about my own age; his face was pale and he looked dejected. Afterward he came to me and said: 'I would like to throw in my lot with you. I would like to help you. I believe your propaganda will succeed.' 'His accent told me that he was an American. He held out his hand. I took it and thanked him, wondering who he was. I thought he was a missionary or a student. After he had gone I said to myself: 'Who was that little hawkback?' 'That,' said he, 'is Homer Lee, one of the most brilliant—perhaps the greatest brilliant military genius now alive. He is a perfect master of modern warfare.' 'I almost gapped in astonishment.' 'And he has just offered to throw in his lot with me.'"

The next morning I called on Homer Lee, now General Lee and the famous officer of The Valor of Jefferies. I told him that in case I should succeed and my countrymen give me the power to do so, I would make him my chief military adviser."

He saw me right. It was an important meeting to both men. Lee was the freethinking, probing, skeptical, skeptical, Lee the student, deep thinker, of military genius. The friendship was a lasting one. When General Lee escaped from Chinese territory he went immediately to Japan, where he spent several

months with Dr. Sun Yat Sen. Lee then returned to his home in Los Angeles, and the story which he told to his intimate friends staggered belief.

"Impossible," said they, "for they can't be true."

But if Homer Lee had no distinguishing characteristics it was his faith in himself and his supreme disregard of all other things of importance.

He knew that the Chinese movement was well under way. He knew that the losses were working and that China's "great change" was a matter of time, halfhearted opposition, and complete leadership. The leaders of the revolutionary movement were his friends; they had given him their confidence, had asked his advice. It mattered little to him when his Los Angeles acquaintances thought about him. They were to be surprised later.

King Ya Wei came to America and landed in Los Angeles, where he had long consultations with General Lee. Afterward Lee toured Europe with the deposed Prince.

The Chinese embarking reached America in Seattle, Portland, San Francisco, Oakland, Berkeley, Los Angeles, Chicago, Pittsburgh, St. Louis, and New York Chinese military companies were formed. Serious young Chinese students marked the trend toward modernism by cutting off their queues and leaving the mass of hair on one side. Homer Lee was placed in command of those forces, and it was his idea that American-born Chinese should be trained that they might furnish officers for the coming struggle—a sort of connecting link between republican countries and the active masses. General Lee had a very high opinion of the efficiency of Chinese troops when properly trained and offered.

With this task on his hands Lee still found time to devote to a close study of military problems and conditions, particularly those which were open to the Japanese empire. He recognized in Japan a military nation, believed in war as the inevitable end of international matters, and had little or no faith in The Hague and the dream of universal peace. He believed that it was better to be prepared to fight than to trust in peace with.

With this end in view he began to gather material for a book which should point out the weakness of most defenses and the general comparison of the Chinese country for its own army approaching by way of the Pacific.

It was a tremendous undertaking, involving another great study of geography, the topography of the western slope, a knowledge of every mountain range and pass, every fertile valley and every stream and pure water. This information he gained at first hand, making long trips into the mountains. When at last the book was ready it reached the printer's hands. It was a well as ahead. It gave General Lee his place among the great military minds of the century, and the first military occasion at home as well as abroad. It gave General Lee his place among the great military minds of the century, and the first military occasion at home as well as abroad. It gave General Lee his place among the great military minds of the century, and the first military occasion at home as well as abroad.

Early in 1911 General Lee's health began to give his friends serious concern. He was threatened with influenza, and his physicians told him that unless he took a complete rest he would surely lose his sight and perhaps his life. Lee refused to believe this. There was in him a lasting belief in destiny. He had a favorite saying:

"In this spirit he started for Germany to consult specialists about his eyes. They made him rest for five months. Examination of the book itself will show the magnitude of the undertaking. In London, where he was hospitalized by Field Marshal Lord Roberts and other eminent military leaders, Dr. Sun Yat Sen joined him. The time was at hand when Dr. Sun was to be summoned home to assume the reins of government. General Lee, however, still under the empire and the revolutionists were sweeping every thing before them. In December of 1911 the call came, and Dr. Sun was in London, accompanied by General and Mrs. Homer Lee. Lee went as confidential adviser. The Premier made at their first meeting was relieved. Working so desperately as if he knew that he was in the last of his life, he completed The Day of the Nation. The last chapters were written in China only a few days before his death.

For a short time Lee was the earnestest attending the closing scenes of the Manchu empire unprofessionally hurried the doctor. Lee's life of general was devoted to the little group's activity but not to his ambition. Until the very end he persisted in the belief that he could not die until his work was finished.

Lee was a man of great intellect, a weak body, great health and strength, and no known how high he might have written his name upon the history of his people. His life in a word is a word of things accumulated under adverse conditions, an inspiration to those who know and loved him.

# THE TWO DROMIOS OF TRADE

Why Railway Rates Must Be Advanced  
to Meet the Advance in Prices

BY GEORGE D. MUMFORD

ILLUSTRATED BY EDWIN F. BAYNE

**H**AVE money and prices anything to do with railway rates?

The difficulty of engaging in a discussion of railway rates is that the railways know too much about them and the public knows too little. The public feels that it is hampered by lack of exact knowledge and that in the discussion the roads may be stacked against it. The so-called cost of fuel water.

But if the question of railway rates is not a rate question but a price question, then the railways must come out in the open without the protection of their statistics and have a discussion about prices. Now prices are one thing that we all have on our minds, and we are glad of the opportunity to discuss them. But to get a clue to the mystery of prices we find we must first investigate money.

Money and prices are the two Dromios of commerce. In this struggle of prices we are always getting into trouble or getting laughed at by mistaking one for the other. And when we get laughed at the joke is just as appetizing to us as when we get into trouble. Much of the time when we think we are talking to Dromio Money we are really talking to Dromio Prices, and when we think we're talking about prices, we to one we are talking about money. Money is an elastic togar at the best, but when in addition it has a double, where are we coming out?

Farmer Abigail Jones, who sells today for \$10,000 the farm that cost him \$5,000 twenty years ago, is perfectly sure that he has done a very good stroke of business and "made five thousand dollars in real money."

But has he? That depends. If after selling his \$10,000 stay in the bank for six months he decides he wants to buy another farm, he will find that to get another as good as the one he sold he will have to pay his \$10,000 out again for it. The net result is that he will have simply traded farms. The farm he bought may be no good as the farm he sold. But where is his \$5,000 real profit? It has disappeared in the shuffle!

Was his money profit real or imaginary? It is true that if he decides to move with his family across the Canadian border to the best Northwest or the best North he can buy, apparently, an good land for \$20 an acre as he has just sold for \$100. He can get five acres in Alberta for every acre he sold in Illinois. That is because he has sold dear land and good fertilizer in Illinois and has bought cheap land and poor fertilizer in Alberta—and has expected himself to do it. To make the money price that he received for his farm really go any farther he has had to abandon his old-price environment. For he has really made anything by trading cheap goods for cheap. He has traded a comfortable living for the opportunity of the pioneer. But most of all of all of one would he want to be pioneer and don't want to expatriate ourselves to "skin a profit." We want to keep on just where we are in the same environment. That being so, have we really made any money by the advance in prices? We can sell our farm for twice the money we paid for it, but if all other farms cost twice as much as they did to buy, and not only wheat, but clothes and rent, and twice as much as old time, what have we made by the transaction?

One thing is sure: If each farm was worth 10,000 bushels of wheat in 1904, and is still worth just 10,000 bushels of wheat, the value of arable farms now wheat has changed. But something has changed, because the farm was worth \$5,000 in 1904 and is worth \$10,000 now. If farms have not changed in value, money must have changed in value. Five thousand dollars in 1904 must have been worth as much as \$10,000 in 1919. Two dollars in 1912 must then be only worth as much as one dollar in 1926—that is, if things had actually doubled in price, the dollar today would be only worth as much as fifty cents in 1904. Is it the dollar, then, that has lost half its value? The farm has not really doubled in value at all. It is simply the value of the dollar that has been cut in two. Farm values have not changed, but money values have.

Now here is an illustration of our two Dromios. We thought we were talking about money as something real and fixed, something we all know about and recognize when we see it—a good, dependable, reliable Dromios—and here this other tarrish Dromios of prices has snarled in and played a joke on us. We have either mistaken prices for money or we have made a bigger mistake still in our estimate of the character of money.

Is it possible that money itself is absolutely exchangeable and irresponsible—a fellow off instead of a good man Friday? Have we always got to think of the

value of money as well as of the prices of goods? Does the value of money change with the price of wheat? Let us see.

Although it seems far afield, let us go northward on the American continent to where for over two hundred years the "skin" and not the dollar has been the standard of value. The untamed Cree who trades his furs at the good, old, reliable Hudson Bay posts along the Peace or Athabasca rivers—with their white-skinned stockmen and cover blockhouses flying with Red Cross standards with the familiar letters H. B. C.—does not have to bother with such troublesome questions as the value of money.

"Skin" were a good enough currency for him. Musquash were his dimes and beaver-skins his dollars. If he wanted to, he could take in his skin all at once and get a little stack of red, white, and blue chips good for five, ten, or twenty "skins," as the case might be, in trade at the Hudson Bay Company's store. The "skin" is the real unit of value and medium of exchange. Didn't he know that ordinarily, if he needed a muskrat, all he had to do was to take beaver-skins out on the floor, one on top of the other, until they reached up to the mantle of the muskrat bed upright by his good friend the Hudson Bay factor? True, the Hudson Bay Company in time lengthened the barrel of the muskrat about six inches, so that it took more beaver-skins to come up to the

It took more beaver-skins to come up to the 'mark'

# The Truth About Tobacco

By **Leonard K. Hirshberg, MD, MA, AB**  
(JOHNS HOPKINS) **DRAWINGS by F. STROTHMANN.**

**L**ET the postmen of the political-historical commission get busy at once and claw out for us, from the tubs of antiquity, the origin of the anti-tobacco crusade. Privately I suspect that the grounds will be found to resemble that of the Puritan's primitive against heart-lunging. They objected to the sport, not because it hurt the liver, but because it afforded pleasure to the spectators. The same attitude of mind, I fancy, accounts for my father's hatred of tobacco, of being of lower-caste, of the Continental Sabbath, and of the army courts.

Tobacco, in brief, is merely a blinding and a smelting, not because it does any normal man damage, but because it gives its users constraint, pain, and a healthful, normal sort of enjoyment, a sublime enthusiasm in the ethical and theological postures which first and frankly its comes, a beautiful and irritating indifference in all but physical things of life. Your typical smoker hangs to the sedulousness he has had in this is a pretty comfortable old world after all. It is inconceivable, indeed, that a good judge of Human nature, of Pittsburg sinners, or of Virginia pig out should ever care a hang for epidemiological charts, supernormal manifestations, or the doctrine of the infinitesimal soul.

But I am sure to be lost tobacco with the acids of chemistry and pathology, and not with benevolent metaphysics, to please it. The ladies of the Woman's Christian Temperance Union, I must respectfully submit, are qualified to be either judges or witnesses in the ensuing disputation. It is unlikely that many of them are smokers themselves, and I am confident that any of them knows more about tobacco than that which is contained in patent medicine advertisements and the physiology books of the primary and grammar schools. Of patent medicine I can say nothing, but it is sufficient to say that they are commonly written by professors who used the money that they took from the schools by constitutions of well-meaning persons who used common sense.

Fortunately all of the world's gigantic store of anti-tobacco literature is based upon four fundamental propositions:

1. Tobacco contains nicotine, which is a powerful narcotic and poison.
2. In the process of smoking, nicotine is absorbed into the body and produces or induces many ills, including cancer, paralysis, insanity, heart disease, bronchitis, emphysema, and tuberculosis.
3. Tobacco engenders a craving for alcohol.
4. Nicotine is such a powerful poison (this is a charged argument and appears in all the school physiology books) that we drop placed upon the tongue of a dog is sufficient to kill the animal.

How we have four allegations, Every American, in all probability, has heard them. They are laid down as pathological axioms in our public schools. They are believed, with more or less reservation, by nine-tenths of all laymen, including millions of smokers. And yet it happens that not one of them is entirely true, and that the resolution to which they lead is incorrect, illogical, and ridiculous.

Tobacco, it may be admitted very truly, does contain nicotine, and nicotine, considered as a chemical, is decidedly narcotic and poisonous. But it happens that the drug is seldom, if ever, used as a beverage, and that, where it enters the body in that other way, it does so in such small amounts, and the body so soon grows immune to its effects, that it does no harm whatever. Among civilized humans beings tobacco is commonly smoked or chewed or snuffed. At the start, as every one knows, it causes nausea and other painful symptoms. The small boy, when he takes his first cigar, becomes violently sick and after a few days, if he smokes again, his second cigar gives him less discomfort, and his third still less. By and by he becomes utterly immune, and in the end smoking becomes to him a habit and a pleasure, and nicotine has no more effect upon his internal economy than so much magazine dressing or vegetable soup.

consequence, has gone through the small boy's respiratory and palatal, in human, there, and may take into his system daily the small quantity of nicotine which lies in tobacco smoke without the slightest quiver of fear.

But the dog experiments of the tobacconists are, by the last degree, useless and unnecessary, for the effect of nicotine upon a dog that neither smokes nor chews has no relation whatever to the effect of nicotine upon a man who has done both for years. To make their experiments logical and fair, the anti-tobacco pseudo-scientists should choose dogs that have been immunized. If they ever do so, they will discover, I wager, that nicotine, in small doses, has practically no effect whatever.

The amount of the alkaloid present in tobacco smoke varies with the manner in which tobacco is used. The leaf of the weed, ground and dried in the sun, contains a very large amount, but in the process of curing this is reduced by one-half. In good Havana cigars there is from two to five per cent. of nicotine; in very common tobacco there is sometimes as much as eight per cent. But not all of this reaches the smoker's mouth, by any means. The flow at the end of the cigar, while it volatilizes some of the alkaloid, burns and destroys more of it, and a good part of that which is volatilized is held up and sub-irradiated during its passage through the cigar.

Historians, to very painstaking investigators, has found that not more than one-third of the nicotine in a cigar passes into the smoke inhaled, and that the rest, as a result, a single cigar introduces little more than one milligram of nicotine into the smoker's system—an amount so small that, except in the case of children and invalids, it may well be disregarded. Pipe-smokers, especially if they use long-stemmed pipes, take a very long time to finish their cigars. This also collects most of it, so a chemical analysis of the residual of an old pipe will show. Short stem smokers, on the other hand, inhale their nicotine, and it is not so readily absorbed by those who smoke in a tin can. In a tin can, every milligram of nicotine is inhaled. Every sailor delights in the fact that a pipe long smoked without changing grows magnificently rank, but, fortunately, among humans beings with more pretensions to culture, the process of reversion to induration is brief.

As for cigarettes, it is said that the destroyer of the little white tubes gets more than his share of nicotine. But the same effect will be produced by smoking his six pipe cigars with a smoke of handling wood, lay or dried leaves. The white paper wrappers of cigarettes do him no harm. They are made of clean rice-paper, and while neither nourishing nor stimulating, they are too small in amount to do damage.

The nicotine, as it appears in cigar smoke, produces all the mischief credited to it, in the case of the smoker. It has been found that it is comparatively little of it in the smoke of an ordinary cigar or pipe, and we must remember that the greater part of this leaves the mouth again by exhalation and expiration. If one smokes swilled smoke, or if those distinguished priests and others who claim to be immune do it, he inhaled there might be different story to tell, but fortunately the customs of the tobacco smoker are such that the smoke he exhaled, no or may proceed upon the hypothesis that every little nicotine ever gets into the vital organs of an ordinary tobacco user.

But it does not do a little, or any damage? Does it cause cancer, emphysema, tuberculosis, paralysis, insanity, heart disease, bronchitis, emphysema, and all the other ills mentioned in the list? It is impossible for me to enter into the conclusions of a physician of world-wide reputation, who has spent many years of his life in the study of the subject, and who has been one of the largest contributors to the literature of the subject. He says that in every sailor delights in the fact that a pipe long smoked without changing grows magnificently rank

"I have yet to see," he said, "is either a clinic or a pathological laboratory, any evidence in modern tobacco in any form, not excepting cigarettes."

Probably this man, if his attention were called to it, might admit that the specialists in ophthalmology have produced what seems to be testimony regarding the bad effect of tobacco upon the eyes of certain rather abnormal persons, but this is scarcely fair evidence, is essential, and so his proposition may stand. It is apparent to any one with common sense that, in studying the effects of tobacco on the human system, one must consider healthy adults of normal constitution. There are people who cannot abide cigar smoke, just as there are people who cannot abide opium. But when folks were palpably designed by nature to enjoy the weed.

Tobacco, alcohol, and weather are blamed for the great majority of all diseases that have an obvious origin. If a man is killed by a fallen derrier, even a mental healer is clever enough to accuse the broken rope, but if he dies of acute peritonitis or chronic bronchitis, and his family weeps for enlightenment as to the cause of his untimely, your average, old-fashioned family doctor, with a headable desire to be agreeable at an expense of medicine, will mention opium and let it go at that. But such a mode of reasoning, to put it mildly, is childishly unscientific. As well say that an infant physician who dies of gangrene owes his demise to the mortal purple pie.

Dr. Ober, in his monumental *Principles and Practice of Medicine*, speaks of "swelled tobacco heart," and mentions three varieties, but he discusses all without name and says in the next paragraph that "cardiac pain without evidence of atherosclerosis or valvular disease is not of much moment." In other words, he seems to decide that "tobacco heart" has nothing to do with tobacco, and is convinced that, whatever its cause, it is merely distress enough to be seriously considered.

Formerly a great many affections of the motor and sensory nerve centers, in middle-aged men—hemiparesis, paralysis, paralysis, etc.—were laid at the door of tobacco, but every physician now knows that they are usually merely symptoms of the final stage of a foul and terrible malady which has nothing to do with tobacco whatever.

Every sailor delights in the fact that a pipe long smoked without changing grows magnificently rank

The constant irritation of the tongue caused by smoking with a jagged stem, with a stem so short that it introduces an excess of hot oils into the mouth may eventually cause a form of oral epithelioma. It is not, however, anything that happens very often. A great many cancer experts, in fact, deny absolutely that irritation has anything to do with producing the disease, and this is a very good reason for believing that some who develop cancer do so because he was born with the specific cells in his body and not because of any habit he may have acquired. Indeed, the cancer of the tongue is not confined to smokers, by any means.

That smoking causes diseases of the respiratory passages is a matter of common knowledge, and there is no evidence that this is true. A man who smoked one hundred cigars a day might possibly irritate his bronchial tubes with a frightful amount, and death would follow, but I am sure that in this article with lunatics, but with men who smoke in moderation and know that there is a time and a place for all things. Ordinary smoking produces a perceptible irritation of the air-passages. Indeed, the London Lancet has recently advanced the view that its effect upon them is decidedly antiseptic and beneficial.

Hemoptoe, which sometimes follows excessive cigar or cigarette smoking, particularly in winter, is due not to tobacco, but to the general irritation of the smoker. A man who smokes in the open air when the temperature is at twenty degrees, and then inhales alternate blasts of hot and cold air, or begins to smoke before breakfast and keeps his mouth full of cigars and masses of stubs may well be liable to cough at night, is certainly not to be regarded as a normal man, and it is unfair to condemn smoking in normal men because this one singular happens to be injured by it. If a man talked all day or drank all day or walked all day, he would be hardly more damaged. Again, he would grow weaker much more rapidly if he ate unwholesome or tainted food, or smoked in a draught of air in his workman's shirt. Indeed, I am convinced that the smoke of tobacco is less injurious to the air-passages than the smoke of any other substance that burns.

Dyspepsia and loss of flesh very rarely follow the use of tobacco, and, if the latter may be held at fault at all, it is but indirectly. Whenever the salivary glands are stimulated and saliva flows, the stomach is stimulated also and extra acid and pepsin are secreted. This is nature's method, when food is introduced into the stomach, of preparing for its process of digestion. Now, if the salivary glands are stimulated by something other than food, the stomach does not know this, but goes on secreting digestive acids and pepsin usual. Thus, eating food as usual, and engaging then, may cause trouble, and the labor of producing them to an purpose necessarily drains the body. So it is apparent that excessive tobacco may cause a "sour stomach," just as chewing gum may do the same thing. However, I am not dwelling in this article with its scientific interest upon the smoking. There is no evidence whatever that the very slight irritation caused by smoking injures the stomach in any way.

The nervous headache, nervous, and dizziness commonly led to smoking are fanciful creations of our moral minds. In all the literature of medicine there is no proof that tobacco ever causes any of these diseases. I have on that point, in a past issue of this journal, a cigar may bring on an attack, but, as the risk of influenza epidemic, but no substantial gain that it is manifestly unfair to condemn tobacco because it does not agree with invalids. There are plenty of sick people who cannot eat roast beef, and there are plenty of well people with a mysterious individual antipathy to other things. But we must leave out different conditions and idiosyncrasies when we consider the effect of tobacco upon the normal, healthy man.

The same mistake has been made in condemning smoking out of hand because of its obviously pernicious influence upon children. Let us admit, for the sake of argument, that cigarette smoking is a bad practice for small boys. Does that justify anything regarding its effect upon grown men? I think it only fair to answer in the negative. The French and Germans laugh at us because we attempt to judge the fitness from the standpoint of the young person. They point out, very wisely, that a play which is rank poison in the mind of a girl of seventeen may stimulate her to prodigious thought five years later when she is married and the mother of a family. It is so with tobacco. Ten cigarettes a day may injure a boy of twelve, but that is an argument against ten cigarettes a day for a man of thirty-five.

A great many eminent observers have investigated against smoking in bees and have pointed out the

As a matter of fact, the only physicians who have made out any case of a case against tobacco are the eye doctors. They report very positive organic disease not explainable upon other grounds than those of smoking. In brief, their patients cannot be classified as normal men.

Indeed, in nearly all of the evidence adduced by anti-tobacco crusaders you will note a singular lack of specific facts. Indeed, Professor Woodcock and Dr. William Broadbent, in their report to the select committee of the House of Commons on juvenile smoking, make most of their charges conclusively. The eminent professor of pathology at Cambridge (Woodcock) expresses the opinion that "smoking interferes with the normal action of the sympathetic nervous system." It stimulates the sympathetic nerves, he thinks, and after this stimulation has passed off there is a distinct depressant action. Finally the vague remark is made that the heart was slow. The whole circulation is thus disturbed and nutrition is greatly altered. Dr. Broadbent agrees with his colleague, but says that the worst mischief is done before the age of sixteen.

Both of these very distinguished investigators, it will be noticed, do not mention the habit of tobacco upon children, and both of them confine their remarks very largely to mild expressions of opinion. In brief, they adduce no evidence whatever that smoking injures the adult.

That tobacco excites a taste or craving for alcohol is a prejudice: Selwyn proved for us, in a frigid form, by the Sunday-school tract and physiology books. Against it I lay the fact that no one has ever produced an iota of evidence that smoking and drinking have any substitution whatever. Indeed, it is a constant observation that doctors of the weed are often totalitarians, and that dipsomaniacs not infrequently avoid tobacco altogether. It may be alleged with some reason that drinking now and then is smoking if we have the charge upon the venerable American custom of selling for a cigar when one's capacity for liquor has been reached, but the opposite transition is something that occurs only in the pages of moral reformers.

I need hardly say that tobacco does not deal kindly with everybody. But in this respect it is no worse than food. Some of the human responses to nicotine may be compared by analogy to certain kinds of food. Go to your family doctor and ask him if he has not at times been called upon to treat cases of tomato poisoning, fish poisoning, crab, oyster, berry, and—yes—egg and bread poisoning. Why, only the other day I was called upon by a better physician to determine definitely with him just why one of his patients became nervous, nervous, thin, and almost completely sick each time eggs were present in his dietary. It soon became apparent to me that his was a case of egg-allergism susceptibility—met by any means as unusual that a special medical meeting would be summoned to discuss the trouble. This was simply caused, almost every time, by his system. His body cells and tissue juices are incapable of assimilating the white of egg with their arms and lymph. In a word, eggs are to him what henlock, snake venom, or, for that matter, tobacco is to some people.

This hypersusceptibility to articles of diet, disease toxins, drugs, and words, such as tobacco, opium, and poison ivy, has been correctly named as "idiosyncrasy." The relation in treating people with such idiosyncrasy is to advise them to avoid the eggs, berries, oysters, tobacco, or even bread that disagrees with them. A cure that is based upon establishing an increasing immunity to the bread, egg white, nicotine, or snake venom, is at times suggested, but unnecessary.

Dyspepsia and loss of flesh very rarely follow the use of tobacco

indefatigable fact that the average boy smoker is not so bright as the boy who does not smoke. But I suffer heavy doubt, in part at least, they have suffered cause and effect. It is my own observation that boys who are naturally indolgent and healthy and bright do not seem to smoke, and that the heaviest smokers among the youth of America are those who were born with rather less than the average amount of common sense, moral balance, and respect for their elders' wishes. In brief, your typical boy smoker is a youth who was stupid when a babe in arms and will remain stupid all his life. His smoking is not the cause of his stupidity, but merely an evidence of it. A bright and healthy boy, if he is kept away from evil companions, prefers his books and his games to cigarettes. If you don't believe that, ask any thoughtful school-teacher of your neighborhood.

# THE HIGH COST OF DYING

## How the Expensive Funeral Eats up the Insurance Policy

BY ARTHUR B. REEVE

ILLUSTRATED BY HENRY RALEIGH

ONE-HALF the world has no idea how the other half dies. Those who have never seen death in the home and have not had the education of the grim solemnity that follows this constant visitor. For all the great incidents of life are explained in the home by a growth that grows on them: birth, marriage, accidents, sickness, and death.

It is time to lay aside prejudice and deal frankly and sympathetically with this great and ever more pressing problem of what it costs the poor to die. Distressing? Yes, but that is the very reason why it should be averted. Here is a subject that has long been kept in darkness. And darkness makes it only the more hideous and iniquitous.

To all, rich and poor alike, comes the tragedy of bereavement. But to the poor the loss of the support-giver is a sudden sting even to death itself. Not to that all. Death not only bereaves the living and thrusts them downward in the struggle for existence by cutting off one who contributed to the family support; it overthrows the living, already struggling under too heavy burdens.

Mark has been written about the increased cost of living, but no one has known, or, if he has known, has dared to speak of the increased cost of dying and what it means. The undertaker—he now wants to call himself a "mortician"—feels that he must raise his prices to live. The newspaper does not want even for that excuse. And the worst of it is that there is going on a change of standards by which even the very poor now habitually desire and have quite as elaborate funerals as the well-to-do, often more so. The tragedy of it all is a story that has long been crying to be told.

What the changes wrought by death entail on the living who remain has often been guessed at, but has never been really known until very recently. Some time ago the New York School of Philanthropy caused an investigation to be made through its Bureau of Social Research, and this sensational report on the cost of burial among the poor of New York City has since been supplemented and partially revised. In Illinois the Hon. Quincy L. Durand has for years been engaged in studying this question and has prepared a monograph which will shortly be published by the Chicago University Press. Both of these studies have been utilized and some idea of what they contain has been given by Professor Graham Taylor in *The Salary*, a magazine of social, civic, and philanthropic interest, published in New York. The large industrial insurance companies are also offering themselves to action. Settlement workers, charity organizations, women's clubs, workers of all kinds among the poor today are beginning to grapple with the problem quietly. Here is a bread-and-butter and highly important. It needs to be met. If the new social science and the new profession of social work are to do anything at all, they must solve this question of the high cost of dying sooner or later.

Take a few cases. A head of a family died after several years of debilitating illness. He left \$250 insurance, of which the funeral expenses ate up \$125. After his death the combined earnings of the two eldest children were not quite \$25 a week, and there were three dependent on them. Within three years the eldest of these children was married. The funeral bill was \$125, \$130, and \$132. Today the mother is earning a provision for living by washing and supporting two other children after having spent \$600 on funeral expenses in her years.

In another case a man died leaving a widow and one child. The insurance amounted to \$125. The undertaker's bill was \$140. He still owes her family. He had just finished paying \$52 for the funeral of a six-month-old baby when the mother died. The funeral bill was \$122 and the father and mother and other children had to pay it out of an income of \$24 a week, besides supporting themselves and two dependent children. A shocking case was that of a family of which he has seven children. No sooner was one bill paid than another was incurred, keeping the family constantly in debt to doctors and undertakers.

One entered an evening the poor very often without hearing more or less conventional stories of how the newspaper undertaker forces them. In fact, nothing less than ghastly are some of the stories that are related to show how pressure is brought to bear on distressed people to cause them excessive expense in burying their dead.

A dying husband begged his wife that she give him only a plain funeral. She promised, but when the undertaker came the relatives were present. As he said she wanted only a modest funeral the undertaker sneered. "Is that all you thought of your husband to have him like that?" She was ashamed, but agreeing not only more than she had promised, but more than the insurance he had asked her to save.

"This is the last thing you can do for your wife," the undertaker urged a poor mother, "and you must want to be honored by the thought that you were wiser." Then the cruel truth came in death pointed to the children and cruelly sorrowing mother by adding, "If you don't do the right thing by their mother they will curse you to their dying day." It is hardly necessary to say that this distressed man demonstrated his love for the dead wife and mother

by having a funeral which costumed the children to actual hunger and want.

Another undertaker refused to go to Bellevue for the body of a child until the mother gave him a public crucifix, an heirloom, as security. Such cases could be multiplied if it were of any use. Mr. Barrett remarks that this is not the usual thing. But it is no reason among the very poor as to be allowed

particulars for funerals. There are only a fixed number of deaths, anyhow. In fact, all he can do is to advertise and attract business from other undertakers. But advertising is forbidden by the code of ethics of the leading undertakers' association.

Thus it comes about that the competition among undertakers is keen. The first act after a death occurs is to call in the undertaker unless, as often happens, he appears before to be called in. These mysterious appearances of the undertaker within a few minutes after a death—like that of a vetting awaiting a corpse—have often been a cause for comment. Of course such highly professional acts are frowned on by the better class of undertakers, just as the practices of the "choker" lawyer are frowned on by the honest practitioners. "Slopers" undertakers arrange with the pallbearers on the boat, or with people living in a tenement, or sometimes with an insurance agent, or even with a doctor, to pay a commission for such information as leads to a "man." At the first hint that the victim is dead at last, the undertaker races to the stricken home, trucking to luck and the stage "first come, first served."

"I was called to a certain family," says a well-to-do worker, "upon the death of the father about three o'clock one morning in the autumn. They had notified me promptly after the man's death, and it could not have been more than a few minutes after his demise that I reached the home. At the doorway I encountered a policeman. 'Amphibly dead?' he asked. 'Yes,' I replied. 'Who is his name?' he inquired. I gave him the name, and he asked on which floor the deceased had lived. I told him, and he went away. I had not been in the house more than five minutes before an undertaker came. I asked him who called him in, but he evaded the question. The people explicitly told me they had not called him."

Once having been accepted, the vulgar undertaker has the family at his mercy. For instance, in one case a child's mortgage on all the household furniture was demanded. The family refused indignantly. But when they approached a second undertaker they found he would not take the rate because the code of ethics forbade him. They either had to make the original undertaker on his own terms or submit to having a paper burial.

It is not all the fault of the undertaker, however. There is often another side to the story. In fact, it is not right to judge the whole undertaking profession and they insist that it is a profession—for the sake of a few. Often it is the undertaker who acts as a check against the extravagance of the poor, who must violently oppose the family which wants an expensive funeral. Such was the case of a woman who wanted a \$250 funeral for her husband. She had \$225 insurance and promised to pay the balance at the rate of \$15 a week for the rest of her widow's life. The undertaker refused her offer and advised a \$15 funeral. She left indignantly, but later came back, and after it was all over she was very grateful. In another case a family had become dependent on charity because of intemperance, on the death of the father they decided on a \$120 funeral, although there was but one to pay except the widow and two young girls, none of whom had ever earned one dollar a week.

In another case, where a man developed delirium tremens, the insurance was kept up for years at a low sacrifice in order that he might have a \$400 funeral, and, besides the insurance to cover it, the

The undertaker rushes to the stricken home

provisional. That is not to say that all undertakers, or even a majority of them, are rogues. They are precisely the every other body of man—some honest, some unscrupulous, charging "all that the traffic will bear."

The trouble is that the undertaker cannot extend his business like other business men. People are not going to die simply because he offers exceptional op-

"That all you thought of your husband to have him like that?"

which had to make up 230 of the total sum in small instalments out of her own earnings.

The fact is that it is a very difficult and delicate matter to urge simple funerals on the poor, and the family always rears itself on the side of the highest prices. Insurance, strangely enough, is often an incentive to expense. It seems like easy money and, indeed, is often kept up solely for the purpose of providing an elaborate funeral. In many cases the funeral is a great social occasion, the only excuse for a day off with the family, an entertainment carried out with business and ostentation, a mark of the prosperity and popularity of the family of the deceased. If the funeral were cheap they would lose out. Some people will go to any extent to get a good funeral with a long list of savings, banners, flowers, and after a band. The family will work for years without a penny to pay the bill.

Another thing which adds terribly to the cost of dying is the large number of burial customs of the various races and religions. There is a wide difference among Catholics, Protestants, and Jews, and again among many nationalities composing these three great religious divisions. These customs are most marked in the newly arrived immigrants, though the differences fade later and the treasury is more and more to standardize funerals.

For example, investigation has shown that the typical Italian funeral is the most ornate of all as well as the most expensive. The average expense for adults in the cases studied was \$135.26. From two to four days the home is draped in mourning, candles are kept burning, and a watch kept over the body. The service in the home is the Catholic rite for the dead. But one of the most important features is the procession, and this bears mark. A band is customary, and many carriages are requisitioned. The affair is carried off with great pomp; often, if the doctor to the ferry or bridge is not good enough, a circuit is made of a block or two. An almost invariable feature in the carriage filled with flowers, and nearly always there is some Italian society marching in its full regalia. Such societies are universal. They take an important part in burials, and their existence alone makes such display possible.

Next to the Italian funerals is paid of expense come the Irish, at an average cost of \$124.52 for the same investigation. The make is a most expensive feature, the refreshments often being on a lavish scale and including liquor and cigars. In one case there were a lot of cigars and a case of beer; but in another, where the crowd was large, several kegs were ordered. Of 8119 in one case only \$2.50 was charged to such expenses: in another of \$135.42. Usually the cost ran from two to twenty dollars. Large processions are also a feature of these funerals, but they are not spectacular. There is an band, as against no marching society, and there is little difference in the religious rites.

Jewish funerals show a wide difference worthy of serious study. As the body is only an earthly remainder, it is not regarded as a sacred thing. The belief is that corruption atones for the sins in life, and, under the old Mosaic law, the body must be removed within one day; there is, therefore, in the strict orthodox classes no care for embalming. The body is not viewed, and hence there is no cost for clothing except for a winding-sheet. Moreover, the plainest

wooden coffin are often used without any outside box, indeed, in some cases the bottom of the box is broken in to hasten the work of the worms of Nature after burial.

And the funerals are conducted with marked dignity and a stately which is very impressive. The real services come about a week after burial and are rather of the nature of a memorial. Thus, among the orthodox, extensive meals are almost unknown. However, there is a growing tendency to conform to the so-called "standard" Protestant funeral, as many of the Jews have theretofore, and among thoroughly Americanized Hebrews there is considerable ostentation. There are, on the other hand, no paper banners, for the average always provides the funeral, and extra charges, if any, are borne by the relatives.

As usual, when one considers such a question as this, the true local make comes or later, to a "trust," or at least what is called a trust. In this case there is what is commonly known as the "coffin trust"—a company that makes coffins. What effect has this combination in restraint of funerals on the high cost of dying? Most authorities will tell you that there is no such thing as a "coffin trust," and its very existence is denied strongly by the undertakers' trade journals, one of which bears the emphatic name of *The Undertaker*.

In the last census report there were found 530 manufacturers of coffins in the United States. This does not look as if the sources of supply were restricted. But the greater part of them were small, experimental companies. Of the leading makers that of the Minneapolis the great majority are consolidated into one dominating concern, which exerts a nationwide influence in markets and is the general regulation and selection of supplies.

In is a trust? It would be pretty hard to say so legally. It would seem, five years ago a Western financial association asked Congress to investigate, and in 1908 the Interstate Commerce Commission considered the question, but no action was taken. A Hitter was over the question has raised in the trade journals. Many undertakers declare that there is no trust; others as strongly deny this. Mr. H. A. Butler, editor of *San Francisco*, asserts that the facts and figures show that the company indicated is not a combination in restraint of trade.

Coffins are costing more every year. Some one said recently that it was rapidly becoming referred to die than to live. The cartoonist referred to takes care to relieve that part of the undertakers' code of ethics which prevents competition and the lowering of the price of coffins, and advocates increased cost of funerals. This is generally admitted. More than that, it refuses to deal at all with those who cut rates or advertise. It has organized state and local associations, and those have a subtle and specious influence in favor of the "trust."

The extent of the explanation in coffin and markets was disclosed in the "undertakers' war" in Chicago some time ago, when a Western cabinet company advertised its sale for \$53 of a market for which from \$35 to \$50 was charged elsewhere; \$20 for what others sold for \$30 to \$40; \$25 for the same article offered at \$25 to \$30; \$20 for what others asked from \$20 to \$30. These figures were followed by the claim, "We will save the people of Chicago \$5,000,000 a year which will be needed in necessary articles for the

living." It is also worth noting that the six leading "875 funeral companies" on the Atlantic coast are all refused the advantages of the alleged "trust," and are thus compelled to deal with the other outside companies.

The tremendous profit in the business can be judged when it is known that the manufacturer often makes twenty per cent. always from twelve to fifteen. The undertaker, in addition to the huge profit, makes from two hundred to three hundred per cent. on the accessories. For caskets and drapery he gets two or three dollars for a few days; the original cost is from ten to twenty dollars, and they are used many times over.

In defense the undertakers say that the charges really cover services which are not included. If that were the case, then the remedy ought to be charged for separate items separately and not concerning the real charges. As it is, one cannot compute the costliness that a body is actually charged to, as has been said, "all the traffic will bear."

What are the remedies? They range all the way from public funerals provided for by the State, as advocated by many who have studied the subject, to relief in the whole instance of privately conducted funerals. For the present at least the idea of state funerals may be set down as an issue for the future. To-day the question is of controlling the abuses under private management.

Some five or six years ago the question was answered in Baltimore by an undertaker who announced that he was ready to furnish a regular standard \$75 funeral. Thousands of organized attacks were made on his business, but he replied that he could do so for \$60 without loss, then \$35 and \$20 and even \$10, with a 20 per cent. profit, by cancelling certain things and doing a large enough business. This was a first step in lifting a grave burden from the poor, and it is hard to maintain in the face of the success of the so-called "standard funerals" that nothing can be done.

From Baltimore the idea spread to Philadelphia, though in the former city the movement reached its highest development. As the profit was somewhere in the neighborhood of 230, the undertaker must get plenty of business and hence he began to advertise, thus breaking with another tradition. During the next year another firm followed suit and then a third, until they had about one-half the patronage of the city. Pressure was brought to bear on the municipality, but their reply was one of the most striking advertising campaigns on record. Huge pictures of coffins were displayed on bill-boards; pictures of the undertakers were shown in street-car advertising. The result was that one firm got 102 funerals, while the largest of the obnoxious competitors had but 224. The public caught the idea and backed the reformers lustily.

Today there are such firms also in Newark, Union Hill, New Jersey, and New York, though the latter have different conditions to meet owing to the distance of the country, outrage here, and higher cost of living. Nevertheless, those who have studied the subject clearly have prepared detailed figures showing that the thing can be done on a large scale in New York and three classes of funerals offered at a profit: one for from \$30 to \$50, the second for from \$10 to \$25, and a third for from \$25 to \$100. For children it can be done at \$20, \$30, and \$50, respectively, in the same places. The third is such as to entirely pay one except those who want really unnecessary display.

## GILMORE'S MARE

BY WILLIAM COOPER HOWELLS

ILLUSTRATED BY ROBERT W. AMICK

**I**N the early eighties eighteen horse-racing was as popular a sport as baseball is nowadays. Men of considerable means had horses, and those who could not afford them spent a great part of their time talking of the merits or performances of this horse, or discussing what they might hope from that one. Farmers, even, retired from actual farming and built great stables on their farms, which from that time forth would begin to run down. Business men, and lawyers and doctors who lived in towns, would take up fast horses, and as their enthusiasm gained headway one would notice their business gradually falling into neglect and ruin. The main street of the village, broad, smooth, and shady, had become a speedway, where every summer afternoon, and soon dark and even after dark, horses raced back and forth for a mile or so; they raced in friendly matches, or were driven slow for exercise. Once a week, or once every two weeks, there would be racing matches, and every year of the county fair the

races drew most people's attention. It was before professionals had taken the sport so much to themselves, and the interest was of an intensely personal sort, but none the less intense because it was neighborly.

It was at such a time that young Gilmore came to Northfield. He had had some training as a veterinary, and, so it was in the days when this science was new, he succeeded at once. The villagers found him a likable young fellow. At first he seemed rough and businesslike, but later they looked at him as only frank and brisk, and he professed to be independent in his roughness, but would go miles into the country to any weather to help a farmer who sent for him, and he loved horses; at least he understood them, although he was so rough and impatiently harsh toward them as he was toward his fellow-men. He did so well that he soon laid away a great deal of money, for that time and the community. Perhaps it was the realization of this fact—that he was almost independent, or not so dependent on his daily earnings as he was accustomed to being—or perhaps it was constant association with men who understood horses to instinct,

or constant association with horses, that started him in horse-racing. He began buying and trading and training horses, and then breeding those again, such time getting a better horse, and, finally, as he had been known for owning the best hunting dogs and the best guns, he now was known to have the best brood-mares in the country; in fact, "Goldie," as she was called, came to be known to several breeders from the larger cities, and they made Gilmore offers of large sums of money for his horse; they were all rejected.

It was the day before the county fair that the last of these came to him; he offered twice what any of the others had offered. It would have made Gilmore independent in a modest way for many years, but Gilmore had been drinking a little; he had come to take great pride in the consciousness that his horse was "not for sale," and he blithely and briefly refused. "Nope, she's not for sale," he said. He had come to like the phrase, because the village had come to discuss this phrase as his customary reply. He was really a little sorry that he had refused the offer after the man had gone, but he consoled himself by thinking that this would make more talk among his neighbors, and would increase their wonder at him for his devotion to his trotters and to horse-racing, when the sentiment represented so much to him in a material way.

"Joe Gilmore refused five thousand dollars for his mare to-day," he imagined their saying, and he imagined a reply:

"Isn't it funny how he keeps tossing down such big offers!" (He might say: "He surely has come, after what has happened to every one else who has held a horse too long. He ought to sell—that is the only thing for him to do.") And Gilmore was pained to be considered more daring than the rest.

The next day, with groups of farmers and villagers standing near, pretending to wonder at the excellence of the mare, or pretending that they were not wondering, and attempting with a show of critical knowledge to analyze and discuss the mare's various "points," Gilmore hastened her into the stable, and, after looking over the straps and buckles with more care than was necessary, he jumped into his seat, and, uttering the specified farmer boys and old men on races, was off around the track; his mare had been accustomed, and so he was tearing away to beat some one else:—

"And he slept in the stall with her last night, too."

It pleased him that they knew this and had remarked it.

After the several false starts he heard the starter shout "Go," and he caught a glimpse of a great crowd, full of people and excitedly on their feet, and then he easily took the pole and the lead which he held all the way around the track. Coming down the home-stretch he saw men straggling to the edge of the track, and the people in the grand-stand were on their feet waving, and he heard their shouts. He was admiring the way his mare moved in better style, and seemed to half her height, and her long, easy stride; every muscle and every hair of her body told him that she was doing her best.

It was then that he caught sight of the crowd in the grand-stand that seemed to be watching him and shouting to him, and he was pleased that he saw the starter of an such interest, and pleased because he would win the best; but it was in his excitement that he let the whip that he held in his hand, and that he had not yet used, fall on her back. The mare increased her speed a little, and then, with a shout, Gilmore

Attempting to analyze and discuss the mare's various "points"

wildly raised the whip high above his head and brought it down again on her back with a snap. The lash lashed her across her face. He had the same feeling of exaltation and pride as he did this, but that feeling changed to shame when the mare broke helplessly, and she fell from the wire, full behind. It flashed through his brain then that perhaps the mare would never be any good again, and this feeling of shame and fear he hid in defiance and anger, and as he drove to the barn he was full of regret for the mare's back in his rage.

Unhappily, he led her into his box-stall, and the drooping of her head and the look of dejection below the men who, a few moments before, had stared at him, he secretly rebuked and pouted the mare, trying to assure himself that she was quitting her, that when he drove on the track her best heat the mare refused to start; and then he whipped her again, and finally cast her down from an end and led her back to the stable. He knew that he had

That night he shut himself to his house because of looking the barman at the fair grounds or at the hotel downtown, and gossiping with them. He avoided the rows the rest of the week, and desired to see any one that he knew and lead him into his house. "Why and what do you know the man, Jim?" that you whipped and beat. "I'm afraid that she won't be much good any more."

He also regretted what they would say because he had ruined so much money for his horse. He thought of saying that some one had dragged his horse, or of saying that he was nervous, but days and then weeks passed, and he said none of these things to himself, however, that others were saying that he was "a good with horses any more." "Why it was because they were saying this that he learned his business was falling off. Or because he had been neglecting his business, and because the thing—pride and interest in his mare—that had made him neglect it was now gone, that he imagined that he was actually in disgrace and his business was falling away."

He drank heavily and more heavily the time that he was to be lost here. Where before he had been only rough and angry, he became ugly. His wife would when he used to mistake himself; and those who used to laugh at him for his unbusinesslike ways, now looked at him with a scornful and cold eye. He would openly tell him that they wanted nothing more to do with him. He would tell him after a year and look their boy with her; his dogs ran wild on the street, snapping and barking at the villagers. One day, one of them bit a little girl, and the mother rebuked the dog about it. But when the constant case Gilmore barraged himself in his house and threatened to kill any one coming near. Later, they might him with the dog in his arms, trying to smash through the back lot, and took the dog from him and what it was he was inevitably protesting.

As he appeared about town in daylight, and when he did, it was to walk through the streets in the lively stable, where he would be with drooping jaw and heavy eyes and seldom to listen to the talk without speaking. The house that he had bought, like his life, crumbled away. He fell from the roof and was not replaced, and windows were broken and never mended. The planks of the sidewalk loosened and rotted away and the floor of the porch fell in; it, too, had rotted in the yard that had once been a well-tended lawn, grass grew high and rank, and weeds flourished wildly and almost obscured the smooth, marble driveway. All his horses, save the mare "Gidfall," were sold; as one would buy her because of the bad name that she had. Gilmore had his head bowed, and more and more sadly, when he said that he was going to leave up and start protesting again, and he clung to this idea and to the mare to help out his life. Then he would lead himself in to the stable and there he would stay.

It was whispered about that he "used dogs." Others said that he was going mad. At one time nothing but a mass of hair and dirt, and others pried open the barn-door to see if the horse had food; they found both hair and water, and that night they saw a light in the stable house where he had slept, and knew that he was still alive. His money could not hold out much longer, they said, and it was only a question of time until he would have to be taken care of in this way, or that he would have to be sent to the infirmary or Workhouse or to an asylum.

He was seen no morning, when it was hardly light, coming from the creek, wearily carrying a basket full of stones that he had picked up. He disappeared with them into his barn, where he had a little emmity, which he had used during the time when he had been successful with his horses. That night a late passenger saw smoke and sparks rising from the chimney; thinking the barn was afire, he ran back, and, peering through the crack in the door, saw Gilmore heating the stones, and then standing there in bits on the sawdust. The neighbor watched him as he picked up the shiny bits and placed them in a box. His eyes were wild and his head shook as he worked. "Diamonds!" he muttered, and then he would exclaim: "Ah, a dandy, a fine big one!" and by the light of the fire, he would examine the pieces of rock and then put it carefully aside.

On a night shortly after this, Gilmore was more in mourning and whinny than usual. The mare coughed

was cold and shivering. It was raining—a cold rain. His hands shook with cold and with the effect of the opium that was working off. He was very unwell, and his mouth was thick and pasty with the brine that follows the use of morphine. He was very nervous. He glanced at his horse and by a moment thought he saw him standing at the back door, and then he thought his own new skin, and cried out in terror and ran away. Then he thought his wife called to him, and when he went to her he saw a big black bear, with his hind legs buried away, stepped in between them. And then in a instant he went back to his room, and he was very wretched that he had lived alone, and he saw himself pointed at in the street, and a boy threw a stone striking him over the head, and he was so afraid that he did not get up to see the boy. He saw the bear's head. His own little boy then seemed to have thrown at him, and the stone whirled shrieking through the air; then he saw that it was aimed on his head, and that the bear that the boy had heard was that of his mare. The shriek of a horse in pain is a terrible thing; and he heard it many years ago, and the terrible impression it made on him lasted for days.

"Why, my mare is on fire!" He jumped up, fell to the ground again. His legs, he thought, would not support him.

"Good God! And all my horses are in there! I must get out of here! I must, I must," he kept muttering, as he crawled on his hands and knees toward the door, which now was all aflame inside, roaring and crackling. He passed and shivered. He could never get out. The hall and the rain tortured him.

In a moment the flames will reach the hay under the stall. He tried to get up, but he was so weak. His cry must have awakened me. How did I come to fall asleep? And why is my wife and the boy? Of course they are not in there. Still they are not in there. And yet, in effect, he guided his feet, having crawled to the door of the blazing barn. It seemed warm and comfortable within the flames, but he would never be able to fall asleep in the cold rain, and why he had not thought of going to the fire to get warm. It was so comfortable to him, in his cold, wet, shivering state, that he was, for an instant, inclined to sit down and warm himself, but again he heard the cry of his wife.

"Yes, I must hurry and get her out," he thought. "Then I'll get my horse." He reached for a blanket; his hands found the place where his horse had been, but he could not see the sack was empty; he wondered how it came that he had forgotten to put the blanket in his way. Then, trembling with his coat to take it off, he stumbled toward the stall and noticed the mare had struck the side of the stall when he threw the coat over her head, but he did not mind the pain, and he led the mare toward the open doors. They were ten feet from the door when the coat fell from his numbed hands. At the sight of the mare the mare whinnied, knocking Gilmore to the floor.

Then, he seemed to be on a heavy sea in a small boat that rocked and cracked; the motion became every minute. He was so unwell that he could not stir; he started only; it was the log next that every one always looked forward to. That night he seemed to have had a dream; he remembered that he had seen his mare as she was crossing the line, and that she had been without ever once, and that he had been riding.

"What an ugly dream!" he thought. "Of course, I will not whip her." Then he led the mare stifle down into a steady rain, and he watched her strain every muscle. Yes, he would do it. The mare had a good head. He saw the whip raised in his hand, and as he came under the wire, he waved the whip to his wife in the crowd. Then he felt himself being lifted down from the saddle and heard once about their grain to him.

Yes, it had been a dream; the mare did not break. Gilmore was very happy; he was warm and dry; he opened his eyes, saw the mare standing beside him; he moved out to see the mare, and he saw the mare for the next day, and then everything began to grow black, and he took pleasure in falling into sleep in quiet and comfort.

Neighbors running up came just in time to see the mare, her feet lowered black, standing alone in the doorway; they saw her with a white mist in her eyes, and with a crash, the roof fell in on both and sent a shower of sparks flying upward.

Fumbling with his coat, he stumbled toward the stall

fire from the hearth. Gilmore stood at his stall and watched the blaze spread slowly; he saw his mare, her eyes wide, peering out over the side of her stall, and on the blue lighted up the barn more brilliantly he saw that she was trembling with fear and he heard her snorting. He thought that he would lead her out; there would be no trouble now, he told himself, vaguely, and then it flashed through his head:

"No, she has been the cause of all my trouble. Let her burn, and then when she is gone and I am free from that curse I'll start in again. My wife, too, she always wanted me to get rid of my horses, and—"

He stumbled to the door and out into the night air and sat down, scarcely knowing what he was doing. A few feet from the barn he watched the flames creep along the walls of hay that lay on the floor, and work their way up the wall toward the hay-mow. The room where he had been working filled with smoke. He saw and then a little flame burst out, and by its light he saw the mare still watching him over the side of the stall, her nostrils dilated and her eyes red and wild. Once he heard her snort, and then more smoke filled the room, and it was for the moment dark.

"And I'll write my wife tonight—no more on this side of my head, I have sold the horses. I'll tell her it was sick and dead, still, I don't know where my wife is. Yes, I'll write her and she will come back to me, and I'll work up my practice again. It will be good way to get rid of the horse."

And Gilmore dozed again and roused himself; he

### FOR DIFFICULT MOMENTS

(A Compendium of Uncensored, Funny, Entertaining, Confessions.)

**FORGOTTEN:** Those little conversations are designed to help individuals who find themselves at a loss for words at times when a ready command of fluent speech would save a difficult situation, and to relieve all, especially the party of the second part, from all embarrassment. They are not copyrighted, and have been prepared in a spirit of pure philanthropy by the author to help his fellow-men.

WITH ILLUSTRATIONS BY JEROME, R.F.D.

(For a Booklet, Essay Men Who Has Indiscreetly Stripped I got a Lady's Frail.)

**Wife:** You idiot, you have ruined my gown!  
**Man:** Ah, madam, I confess that I was not looking where I was going.

**Wife:** You should have a dog to lead you!

**You:** It might have helped, madam, but, alas, I doubt it. From my youth upward I have dreamed that the day might dawn when Helen of Troy, the most beautiful of women, for whom the Greeks and the Trojans waged sanguinary warfare, and performed such deeds of prowess that even Homer himself found words inspiration for the most exalted poetry on the page of literature, would pass before my vision, that I might at least find my eyes upon her immediate loneliness. They also stay, work after work, year after year—my madam, for while dreamers have I wished for this glad hour, and now, lo, lo, here, and now, comes the realization of my fondled hopes, my desired ambition, for you now sit like a vision of heavenly beauty my enraptured eyes—the hair, noble, beautiful, abundant white and utterly unadorned by save, the cheeks, delicately dimpled, wearing the lifted bloom of the rose; the eyes, lustrous as the heavens, sparkling as the sun, like an unclouded violet; the voice like lightning clings in some far-distant nook of loneliness and peace. It is she, quoth I, and my dazzled eyes, absorbed in a contemplation of this dower of beauty unimagined through all the ages, my wayward steps wandered witheredward they knew not, and have wrought this wrong in the most supinely fitting, dignifiably chic, and becoming gown the genius of our sartorial artists has ever designed. Besides, madam, I am a naturalist.

**Wife:** Oh, indeed, a suburbanite! Your suburbanite is self-evident, but what is that to me, and what has it to do with the fact that you have stepped on my gown?

**You:** That, madam, also that it should be so— but what, of which I fear I shall never be able to break myself. We suburbanites have to travel on foot as those that come along if we desire to get anywhere.

At this point the party of the second part should

make a courteous advance to the offended lady, and fade away with as much alacrity as is possible under the circumstances.

### NOT NEEDED

"I see," said Nankin, "that the French Academy has just approved the publication of an official dictionary of the slang language."

"Too late, too late," moaned Hilders. "The slang is out!"

### WHATEVER WAS THE RULE

With Apparent only a few days off, the Union and Confederate forces were daily drawing closer together, and cavalry squads of either side now and then picked up a few stragglers of the enemy. A group of Confederate troopers one afternoon captured a Yankee infantryman who wore a spot-and-stripe new uniform,

with bright new buttons, all in their proper places, and carried a new, clean, shiny musket. After the custom of war in such cases, they started for camp with their prisoner and began to gey him gently by way of passing the time. To their great surprise he could hardly understand them or they him.

"Where'd you come from, Yankee?" they asked.

"Yan Pecosiah," he answered, stolidly.

"How long you been in this country?"

"Zee moon—maybe five month."

"And you came down here to fight us?"

"Yah—for honey," said the prisoner, indifferently.

The Confederates decided to scare the Prisoner and have a bit of fun.

"Look here," said their leader, "a Yankee soldier is all right, but a Dutch Yankee—ah! Say, do you know what we'll do with you, you d—d Dutch Yankee? We'll stand you up over a rifle at sunrise tomorrow and fill you full of lead!"

"Yeh," said the German, with a phlegm shrug.

"Yeh, soldier in der rule!"

### AN INTERESTING STUDY

"Where is your daughter Harriet now, Mrs. Winkles? I haven't seen her all the winter," said Mrs. Wallips.

"Oh, she's joined the colony at Reno," said Mrs. Winkles.

"Dear me," said Mrs. Wallips. "Why, I didn't even know she was married!"

"Oh, she's," replied Mrs. Winkles. "She's out there studying lebanistry."

### THE LOVE LYRICS OF PHYLLIS

#### WHEN STEPHEN ARRIVED

When Stephen smoozes I sit me idly by  
And watch the clouds go racing to the sky  
In purple masses and fantastic forms  
Sometimes like shapes of war before the storm;

They gather, too, with misty murmurs  
Or bounding forth from Stephen's cigarettes;  
And now, again, in shapes the most absurd,  
Like Carroll's Hibernian or Duke-Dino.

Sometimes great rings spring upward from his lips  
And curl in quills about my hair-dress;  
They roll away into the land of dreams,  
The rim of night upon pale Luna's bosom.

To greet the norths with their invisible rays  
Of that sweet July in the moon up above,  
Who goes home finally at me from her place,  
Majestic Empress of the Realm of Space.

And as the smoke inevitably comes forth  
To float all round me and to kiss me and to scorch,  
And stir the hair of my hair-dress and to me  
The quills of my hair-dress and to me

Will I be a

That it is a

For them

For me

For me

For me

For me

For me

# OLD-FUNNY-STORIES OF THE SOUTH-AND-WEST

BY CHARLES JOHNSTON

Pictures By ALBERT LEVERING

**A** only on 1813 a witty observer had put on record some of the most amusing points in the dialects of the Western and Southwestern States. Texas, in those days, had a large number of Spanish words; Louisiana, of French; and Georgia and Alabama, of Indian. North Carolina was notorious for a peculiar bling of pronunciation in such words as "crisp" or "slip," "mash" for "mass," "peart" for "pear," and so on. "I miller," meaning "I think," was accredited to Alabama, as the place of origin, as was the quaint expression "done done," implying "completely gone or done." In Virginia, many of the lower class pronounced "th" as "d," saying "dat," "dar," "dec," for "that," "there," and "this." The negro, no doubt, gathered this authority tells us, particularly on "own haate, because habitual, but at that time it was becoming at that imaginary division, Mason and Dixon's line, and those running south and west.

The term "western" is somewhat indefinite, so that no State is compelled to bear the burden of that title. But here is a Western tale the location of which is very clearly defined. The editor of the Cincinnati *Nemerald* recently had occasion, says the story, to pay a visit to Dayton in the west. He says he noticed a prettiness and a lady seated in close juxtaposition, and, judging from their conduct, one could well imagine that they were devoted to each other. In front of the comfortable pair sat two worthy German gentlemen, editors of papers in that notorious tongue. When one Dayton, the train passed through a long, dark blidge. Amidst the thunder and rattle the doors, a sound was heard in the neighborhood of the lady and gentlemen alluded to which might be described as circumstantial evidence. As the train rumbled like daylight one of the German editors slowly drew his spectacles down over his nose and exclaimed: "Well, I think dat is a beautiful bridge. I hear him creek one, two, three, four times!"

The lady drew down her veil, and for the rest of the journey the pair were silent as still. Perhaps the name of Cincinnati suggests Presidential politics. If so, then the suggestion may constitute my quoting this little prose poem. A lad stood by a butcher stall, awaiting of a sign (in very short vein), and "Ald Lang Syne" he whistled; he was old. And time or one moved soon on foot, issued no smiling word; he did and prepared for never above, re-approaching where he stood. He, gazing down on a was breathing, dreamed not mistake was near, but told his heart to his heart and breathed a sob to it. He was a palmer's "justice boy"; I need not paint his name; he was from high descent, indeed; but stood, "Ye all the name," that is, the name the more it fell, as if with fell dodge; he kicked the bucket—down he topped—he died and made no sign.

Reader, can you divine my motive in quoting this? It is not, let me candidly confess, the belief that I have

swayed from oblivion an early American lyric, the first, perhaps, of a genre afterward brought to high perfection. Nor is it the skill in rhythm, the perfection of the rhyme, the touching tenderness of sentiment. Reader, let me confess, and those toprided me, but the little phrase "a silver T. R." I took the liberty of changing the word "bear" to more sure modern conditions. It was a thought the contemplation of which I found it impossible to resist.

From Ohio, one really passes to Indiana. Here is a rustic little tale of Hoosier courtship in the days of James Whitcomb Hiler's grandfathers, which is not without its charm. If, I believe, one of the first blossoms of the spiritings of Hoosier literature, to move, as we know, into a glorious summer.

The scene takes place in a log cabin housing a single room, half of which is occupied by two beds, one containing "the old folks" and baby; the other, whose duty it is by day to stand beneath the shadow of its latter mate, is taken with two younger members of the family.

In the foreground are Eustiel and Sarah, between whom the following dialogue takes place:

EUSTIEL (in a whisper). I sware two goah, Sary, I luv yer!

SAR (in a high key). Good, Zeb. 'Tis glad we'll

Zebk. Will ye have me? That's what I want to know!

SAR (continued). Have you? To be sure, I confide to!

ZEB. When will we get upland?

SAR. Well, soon, that's what I've been thinking on,

I w'd dat that if so be he'd go to mill to-morrow, we'd get ficed next day.

ZEB. Ye did! Well, then, wrap a bonn with me!

FARMER (from the bed). There, son, varmint, if ye've got the blains settled, do quit for the night;

ye make sich a racket a fellow might as well go to bed!

Nice old person, the father. In view of the historic fact that Indiana is the home of Vice-Presidents and Vice-Presidential candidates till you can't rest, I dare

The "Buckeye," says the straggler of the tale, are an original people and not a good one have their origin, rise, and progress among them. A gentleman who was traveling in Illinois some time ago says he called at a house on the roadside to ask for a drink of water, when the following colloquy took place between himself and a boy who answered his summons:

TRAVELER. Well, my boy, how long have you lived here?

BOY. I don't know, sir, but my mother says, since I was born.

TRAVELER. How many?

BOY. Ten or eleven, I reckon.

TRAVELER. Pretty healthy here, isn't it?

BOY. Yes, but sometimes we have a little ager.

TRAVELER. Ager of you got it now?

BOY. Yes, a few on ye goin' to have the shakas this afternoon.

TRAVELER. How many of you?

BOY. Why, all on us, except Sister Nancy, and she's sick a cross matter, that the ager won't be bile on her;

and if she she's an duced contradictory she wouldn't bling, show you could fix it!

I leave to linger over these small beginnings of mighty things. It is an anecdote we surveyed the shores of the Mississippi and then traveled down to New Orleans. Which reminds me that I have a little story of that fair city which will come in most suitably here.

A ship, says the recorder, was recently lying in the harbor of New Orleans when an Irish emigrant came aboard and then addressed the cook, whose attention the recorder conscientiously explains. The present teller of the tale is not so candid, but will leave the credit to be divided. Said the emigrant: "Are you the mate?"

"No," responded his mate who was addressed. "O'n the mate we cooks the mate."

Which induces me inevitably to another somewhat story. Not long since the straggler in speaking of sixty years ago—a steamboat called the Old French bling up near the mouth of the Ohio, by which accident a lady rejoicing in the name of Jesse lost her husband and her trunk, for both of which an article was brought. There was strange to say, great difficulty in proving that the wife Jesse had been on the boat at the time of the explosion, that worthy having been unfortunately drunk on the wharf-boat just as the steamer left Tri-city.

Many witnesses were examined to prove the fact, until finally a Mr. Deitman, a German, was placed upon the stand. Our friend, James Smart, was attorney for the boat, and elicited his testimony from Mr. Deitman:

"Mr. Deitman, did you know the Old French?"

"Yah, I was there up mit her!"

"Was you on board when she collapsed her fire?"

"Yen she busted de W'ort? Yah, I was dere."

"Did you know Mr. Jones?"

"To be sure. I took passage together mit him."

"You did? When did you last see him on board the boat?"

"Well, I didn't see Mr. Jones on board de boat last time!"

Mr. Smart, certain that he had his case, with a triumphant glance at the jury asked:

"You did not? Well, Mr. Deitman, when last did you see Mr. Jones?"

"Well, when de schump-pipe and me was goin' up, we met Mr. Jones comin' down!"

To go now a little farther south to Florida. An officer asked an old lame Seminole how he got a fitting:

"Oh," said he, "I preach."

"The preacher," interjected the officer. "Who pays you? What do you get?"

"Oh, I sometimes gets turkey, sometimes potato, an' de hammy."

"I should think," said the officer, "that was damned poor pay."

"Yen," said the Seminole, "but p'yape it's dems poor pray!"

Another yarn with a theological twist. This is said to come from North Carolina.

A negro preacher, referring to the Judgment Day, cried out: "Dere shall be veevins and gaudins' and credit and dew what's got so teeth wit him to gain it!"

Here is another little sermon, is a re-entrated key:

"Redeem us, O savior, in dat day de Lord shall divide de sheep from de goats, an' brins de Lord, we knows which agers de wool!"

"Well, we met Mr. Jones comin' down"

not venture here to speculate whether he did go to mill on the morning, to be and Sary being themselves happy ficed. I may all certainly be touching the fringe of family history, the Missouri age of Hoosier grandmothers.

Compare with this homely, pathetic scene a first ball of literature in Illinois:

## The Author of "Toby Tyler"

There are grandfathers today, as well as fathers and boys and girls who have not being a sense of poignant loss at the news of the death of the friend of all boys and girls of Toby Tyler. It was on December 11th at Portland, Maine, that James Otis Kaler's productive life came to an end.

For several years he had lived in South Portland, where his interest in youth had been expressed in his duties as superintendent of schools. Beyond South Portland a long point of land stretches out into the sea, and at the end of that point, facing the water, stands a modest house which was Mr. Kaler's summer home. There in the days of vacation sunshine he wrote and read and enjoyed the sun, leaving the shore at times for a canoe and fishing trip among the forests and lakes. In this quiet life of his later years, in association with the young and enjoyment of outdoor life, both of which lay near his heart, he was able to indulge. Thus, too, in his native Maine, he Mr. Kaler was born in Maine at Winterville on March 19, 1848. His education, for as a classmate, was common, was a matter of the public schools. His tendency to write was natural, not acquired, and so was literary avocation when he entered the field which was reserved for some years. Later he came to New York and joined the staff of the Sun. In this field he made his mark, perhaps, was the authorship of the *Probus Letters*. In these newspaper experiences he gained a sympathetic acquaintance with newspaper

use in supplementary reading. His books dealt with American subjects. They were wholesome and they were interesting. Our juvenile literature is the richer and better because James Otis Kaler has lived.

When the news came of the end of this productive life some of us thought of Charles Darwin's words in the closing pages of *Mr. Stubb's Brother*, and one could almost hear the author himself saying, "He will die here, Toby, boy, but it is simply an awakening into a perfect, glorious life to which I pray that both you and I may be prepared to go when Our Father calls us."

## Army Commissions for Civilians

In former years, if a young man desired to obtain a commission in the United States army, his only hope lay in obtaining an appointment by West Point or enlisting and working his way up from the ranks, which was difficult. At West Point he received four years' training, and at the end of that time he received his commission as second lieutenant.

In recent years, however, the demand for officers has been in excess of the number of men who are graduated from West Point each year. This condition of affairs has induced the War and Navy Department to institute yearly examinations, which, if satisfactorily passed, make the candidate eligible for appointment as second lieutenant from civil life. The young civilian who receives his commission in this manner enters the army as if he had just gone to school with the West Point graduate.

The examinations in question are in two parts. The first part embraces such subjects as arithmetic, spelling, geography, and other subjects, which are usually taken up in grammar schools and high schools, etc. If the candidate is the holder of a degree given by a recognized college he is relieved from taking this part.

In taking the second part of these examinations the candidate has his choice between two sets of papers. One of these sets embraces advanced mathematics, mechanics, and various technical papers. This set may be taken by the candidate who wishes to obtain a commission in the Civil Artillery branch of the service. The other set of papers to be taken by those men who prefer some other branch of the army, such as infantry, cavalry, etc. This set of papers is to be taken by those men who are French, or German, United States history, international law, etc.

These examinations are not competitive, but the mere fact that the candidate passes them does not necessarily mean that he will receive a commission. The responsibility of the appointment has a great deal to do with whether he is granted a commission or not. He must be of such caliber that he will be acceptable as an associate to those who will be his brother officers if he is appointed. Many college men are not prepared to take these examinations. Other men who had always wanted to go to West Point, but did not possess sufficient leisure to do so, find in these examinations an opportunity of gratifying their ambitions. The officers whose duty it is to make recommendations as to commissions are so careful in their selection that the men who are chosen for civil life are a type that will be a credit to our army.

## The Women Divers of Japan

A GREAT many of the pearl-divers of Japan are women. Along the shores of the Bay of Ago and that of the cities of Misaki and Misaki-ya, where they have completed their primary school course, go to sea and learn to dive. They are taught to keep their heads above in halibut and spend most of their time in the water, except in the coldest season. From the spring they begin the business of February. Even during the coldest season they sometimes dive for pearls.

These girls and women wear a special dress and their hair is fastened in a hard knot. Their eyes are protected by glasses against the entrance of water. They are suspended from their waists. A boat is composed of a man is assigned to every five or ten girls, and the women to carry them to and from the fishing-grounds. When the divers arrive on the ground they drop into the water and then and begin to gather oysters at the bottom. The oysters are dropped into the tubs hung from their waists.

When these oysters are filled the divers are pulled to the surface. They dive to a depth of from five to thirty fathoms without any special apparatus and retain their breath from one to three minutes. They now vary from thirteen to forty years of age. In some instances five and thirty they are in their prime.

## Seven Million Watch-Towers in the Bell System

The original campanilli were the watch-towers of old Venice, guarding the little republic from invasion by hostile fleets.

Later, bells were mounted in these same towers to give warning of attack and celebrate victories.

Judged by modern telephone standards, such a system of communication seems crude and inadequate.

In the civilization of today a more perfect intercommuni-

cation is essential to national safety, convenience and progress.

The Bell System binds together a nation of nearly one hundred million people, by "highways of speech" extending into every nook and corner of this great country.

Seven million Bell telephone stations are the watch-towers which exchange, daily, twenty-five million messages for the happiness, prosperity and progress of all the people.

## BUFFALO LITHIA SPRINGS WATER

The Most Effective of the Natural Mineral Waters, in Bright's Disease, Albuminuria, Renal Calculi, Gout, Rheumatism, etc.

Dr. I. N. Love, New York City, former Professor of Clinical Medicine and Diseases of Children, College of Physicians and Surgeons, and in Marion Sims College of Medicine, St. Louis, Vice President of American Medical Association, 1895, etc., in an article in *Medical Review*, February, 1901, says: "While being the most effective of the natural mineral waters, it is strikingly superior to emergency solution of lithia tablets and pure water, even where the said solution is an exceedingly strong one."

Dr. J. Allison Hodges, President and Professor of Nervous and Mental Diseases, University College of Medicine, Richmond, Va.: "Each year I am more and more impressed with the value of BUFFALO LITHIA WATER, No. 2, in the treatment of that class of diseases dependent upon a Uric Acid Diathesis, Rheumatism, Gout, Urinary Calculus, Vesical Irritations, etc., for I have time and again witnessed its undoubted efficacy in relieving these cases, and in many instances curing them by disintegrating and eliminating Urinary Calculi when they were present."

Medical testimony on request. For sale by the general drug and mineral water trade.

## BUFFALO LITHIA SPRINGS WATER CO. BUFFALO LITHIA SPRINGS, VIRGINIA

## ABBOTT'S BITTERS

Make the Best and Most Effective of all the Bitters. It is the only one that is pure and safe. It is the only one that is made in America. It is the only one that is sold in every part of the world. It is the only one that is recommended by the highest authorities. It is the only one that is sold in every part of the world. It is the only one that is recommended by the highest authorities. It is the only one that is sold in every part of the world. It is the only one that is recommended by the highest authorities.

James Otis Kaler

and other boys who were making their own books. It was this interest which later prompted a change to an editorial position with *Frank Leslie's Boy and Girl*.

It was toward 1880 that he wrote his famous Toby Tyler, which was published in a special volume of *Harper's Young People* and promptly brought out in book form by Harper & Brothers, who followed it with the continuation volume, *Mr. Stubb's Brother*, and only last year with the third book of the Toby Tyler series entitled *His Boy*. The tradition has been handed down that Toby Tyler was derived by nearly every publisher before it was accepted by Harper & Brothers. In the earlier years of the *Young People* Mr. Kaler was closely associated with the old Franklin Square publishing house in company with other writers like Horatio and Rogers and other of the artistic and literary circles whose company he sought in New York. His work in the *Young People* was not without other results, but also stories in two or three parts. Three of them were published last year in a volume called out in the coming year. Of the books due to this association were *Harper's Young People*—*Robert*, among all his books—the famous Toby Tyler easily takes precedence, but an enduring popularity was accorded to other stories like *Reveries of the Poet*, *Robert Peck*, *Left Behind* or *Peck's*, *Veranda*, and *Tin and Tip*.

Mr. Kaler was a contributor also to *McClure's* and other periodicals, and as the work on the number of his books for boys and girls rapidly increased, until they have reached a total of nearly one hundred and fifty. Nearly all were stories, though it was no light achievement to have done so many titles and incidents and to have found such a variety of themes. A few years ago he wrote a series of stories of Colonial history intended for

Copyright by the International News Service

It seemed as if the next instant must witness an awful crash and the blotting out of four lives.

## "AUTOPOLO"—A SPORT FOR SUPERMEN

BY WILLIAM INGLIS

**F**ROM the hidden field with its high black fence of the Highlanders' baseball park came the swirling of figures and the deadly rattle of explosive guns intermingled. I went in to explore, and immediately fell away to a vast field of empty gray benches—the vacant bleachers. At the very top of the dish, starting at a few inches, perched a casual young man in a plash cap, cardigan jacket, and overalls. Beside him lay his pasteurized lunch-box.

"Well," he remarked as I approached, "there's an ace talker—the American people certainly is crazy. Polo is automobile! Nawaw! Whaddya know about that?"

We looked down from the dizzy height and saw two racing automobiles stripped to their gray steel frames and flashing to and fro over the green turf in scintillating bands of speed, their aerial, zigzag flight accompanied by rattling volleys of bullets, snags, and explosions. The machines had no mufflers, and such ruck and snarl was accompanied by jets and bursts of flame. The skeleton steel cars seemed to be living models of devilish ferocity and cunning, and they darted here and there with the voracious haste of hornets seeking a victim. But that was only seeming, for the two men in each car were busy peering for the nearest sport—automobile turf, or, as it already has been observed in all American speech, auto polo. Each car was piloted a tall biber and thinner about the field. It was about as big as a football, but perfectly round and finished with thick leather ribs. The game is similar to the orthodox ancient polo—in that the ball over the line between the goalposts and to keep the other side from doing the same by any means short of assassination.

A few privileged persons sat in the grandstand and shoulder as the starting cars backed up under the goalposts, ready for the fray. An expert explained to me that the game was played in five periods of ten minutes each.

"How many cars can you kill and cripple in one game?" I asked Uncle Fred, the expert.

"Oh, polaw!" he answered, impatiently, "we don't

kill any one. We've had number public games at Wichita, Kansas City, and through the West, and only one man was hurt. His machine turned two men—snags and plowed him, but he wasn't hurt much, anyway—only three ribs and one leg. He's in hospital and doing fine."

Uncle Fred spoke as if the monstrous game were really a delicate job like Mary's Little Lamb, with a pink ribbon around its pretty neck. There was a drizzle of a few minutes to replace a burst tire, and he called out "the boys" who were going to juggle with their lives. They were wiry young athletes of one hundred and forty pounds of us, with smiling eyes, gentle voices, and lean, hard jaws—the sort of fellows who sell voluminous air aeroplanes cheaply enough, but get all tangled up when any one tries to make holes of them. Quite the opposite of the windy, gossamer, air-spitting—but be that as it may.

The new tire was on, the cars cranked up and started in their places, and the players standing each on the running-board of his machine and brandishing his bulky mallet above his head as Hercules brandished his sword on a noted occasion. The ball lay midway of the field. The empire standing near dropped his outstretched arms. Away flew the roaring cars in a shower of sparks, flame, and snags at a speed fast enough to rival the speed of horses. Each player clasped and clucked on his running board—"to help her along," as Uncle Fred explained—that the car actually hounded as it flew. As the two cars came head on at the ball, the players whooping defiance, it seemed as if the next instant must witness an awful crash and the blotting out of four lives, yet no one could back away from the fascinating peril. The flying cars seemed to graze as they passed, yet at that moment Jackson hit the ball true with the head of his mallet and sent it flying thirty yards or so.

His car stood after the ball, slowed, he swung again and ball moved, and so the ball flew ahead it was nearly blocked and nipped aside by the fore wheel of the enemy's car. Where had he come from? Memory produced the blurry picture of the car swooping with the jets a house under a Spanish hat, whirling around on two wheels and flying back into the trap. But all the movements in the wild game were so

swift and dazzling, and the scattering of the snags and backing of the explosives were so noisy, that the whole business seemed so blurred and yet fantastic as a nightmare rushed along at extraordinary speed.

The cars dove after the ball, spun dizzily around in their own length to follow it, leaped in-circular distances, stopped, jumped backward, leaped forward again, locked wheels, bumped each other, flew apart and came together again over the ball. Now the previous object was hidden from sight for perhaps half a minute. Then one saw the driver swing himself far out and down over the left side and poke the ball with his fingers so that it rolled across within reach of his malletman on the opposite side. Just as he poised for a long swing, the enemy, with a gaspous snarl and a snarl of explosions, fell whirled around and was atop of him, and the mallets were feeling for possession of the big sphere.

By the situation that every wheel lay loose and no man knows anything about, thirty or forty youngsters with their hands under their arms had needed the battle, dodged into the grounds, and worked their way into the front row of seats in the grandstand. That is, they were in the seats until the two cars played into action. After that they spent all the time as tight, dancing bristly and yelling "When-over!" at every crash of wheels or mallets. Young Romance with every crash of Christian and those could not hear him happen.

The two cars were interlocked before the northern goal, and the mallets were flying fast, when the empire suddenly began to leap higher and higher and was his arms wide grand television.

"Who's wrong?" I asked.

"Nothing," Uncle Fred replied. "That's up—fast period—in minutes."

"Ten seconds, you mean?" a dozen voices corrected him; but he was right, just the same. The speed and the inevitable deadly peril, which although innocently always on the point of happening never did happen, had made six hundred seconds seem like ten. Every body breathed a long, slow, quivering sigh of intense relief, sat back and looked a little self-conscious while his neighbor smiled as if to say: "Sorry for you, I wasn't worried a bit."

## Cutting Stone with Shot

It is popularly supposed that the wearing of stone into shales or blocks is done by sand and water beneath some suitable cloth. But sand and water have been abandoned in favor of rifled steel shot. Shot is now made in such a hard that it cannot be bruised or crushed under the constant pressure, whereas sand or gravel is soon reduced to an ineffective powder. A piece of work can be done three or four times with shot, at the same rate of working, whereas it now takes ten times as long to do. The wear on the stone is far less also and there is greater accuracy in the cut. A particle of sand is ineffective in scoring only when it happens to fall in the lead, to stand there as a small, sharp tooth, which removes from the stone a little more grain at a time and so on. A shot also over and over between the blade and the stone, and as the point of contact is very small the pressure there concentrated creates the hardest stone to operate of appreciable size. Shot of about six sizes should be worked together, as the largest first to scrape from under the blade first, then the next in size, and so on, leaving none under the blade to the end of the cut. The durability of the stone is amazing. Under a ring drill steel shot is employed in borings of all sorts in quarrying, etc. In making the foundations for the Hudson Terminal in New York some six to eight inches in diameter were thus taken out more economically than was feasible by any other method. Instead of the trouble of taking the place of sand and using in grinding and polishing stones, finishing a job far more rapidly than formerly. No special machinery is required and only the simplest of tools. A strip of sheet iron stretched after the style like a saw with both ends at each end and five inches apart will cut away through a stone by aid of the shot at a rapid pace.

ver, and gold; but the mass of the people generally used glazed pottery or common ware. The pottery used was very hard and some materials like granite and limestone shapes, often with very beautiful ornamentation.

As early as the reign of Thothmes III, 1490 B. C., elegantly shaped bottles and jars were made; and the first use of glass for this purpose is supposed to have been first on the eighteenth dynasty. In Egypt originated the art of cutting glass into various shapes, and it is supposed to be seen representations of cut-glass bottles. For some time all bottles of glass were made in Egypt. The makers had not yet learned how to handle large masses of the molten material. Some of these glass bottles were rough on the inside, and the occasional grains would adhere to the surface, which may have been caused by filling the vessel with sand as a means of cooling the glass, a process used before blowing had reached the perfection it did later on. The earliest glass bottles were mostly without a shape, the usual bottle arriving with more inventive ideas in machinery. Manufacturing of bottles from the most elaborately engraved and cut crystal in the common article of commerce, has become an enormous industry amounting annually to many millions of dollars. Dark green and brown glass cut the least to manufacture, as certain ingredients which enter into the making of the dark green and brown glass are the most expensive chemicals. Certain colors in glass also cost more than others to produce, a purple tint red being about the most expensive of all.

## Fireworks

You may guess it was assumed that the inventors of gunpowder led to that of fireworks; but now, it is thought, the classes are that the invention of fireworks is in time, to the invention of gunpowder.

To make twenty ounces of the best gunpowder we mix together six ounces of sulphur, three ounces of powdered charcoal, and two ounces of powdered saltpetre. This proportion is not always observed, but it is a standard mixture.

Offiting the sulphur, we will have a very explosive substance and one that will burn the entire quantity in a few minutes tolerably well. Sulphur imparts the article, but the combination of sulphur and charcoal is the essential secret of gunpowder, and it was this fact that led to the first production of fireworks.

Improve into the origin of fireworks. Fireworks had their origin in China. All over the great plains of that country and India saltpetre is found in abundance here or mixed with the soil. It is easy to suppose that long ago people made fire in the open air upon some piece of ground strewed with sulphur. Suppose a fire extinguished, leaving upon that nitrous soil may smell a great deal of sulphur and charcoal. The bread of the peasantry or the tramp of rattle could grind that sulphur and that charcoal into crude gunpowder. (Then imagine a soldier going to the wars with the same sort. In this way, it is thought, or at least in some similar accidental manner, occurred the discovery or invention of gunpowder.

The Chinese themselves say, and the legends repeat, that Peking, after that they have used gunpowder in fireworks for about two thousand years. To the present day the Chinese are probably the most extensively fond of fireworks. Every great festival in China is a tremendous and marvelous Fourth of July.

The chief materials used by the maker of fireworks are sulphur, charcoal, and saltpetre, which are combined with filings of various metals, chiefly iron, lead, copper, and zinc. These filings produce the various colored fireworks which appear upon each explosion in whorls and scrolls. Copper filings impart a greenish tint, zinc a fine blue color. The chief danger in the making of fireworks is the flame, while sulphur burns an intense red. The trade has a thousand secrets, but a chief one is that although there are many extensive treaties on pyrotechnics.

## Handicuffs

It is in the land that we find the first use of the hand-cuff. We infer also that Proteus was by means of such a device, fettered and rendered helpless, during his captivity.

It is of record that about four hundred years before the Christian era an army of Greeks, under the command of a general, Charis of Carthage, which, among other things, contained a large number of hand-cuffs. The word "hand-cuff" is derived from the Anglo-Naxon "hand-cop" in the

Naxon days these hand-cops were used in the case of nobles, while "foot-cops" were used for those of the lower class. The word "hand-cop" was first employed in the fourteenth century when "black hells" and "swivel manacles" and "cuffs" were used. They have come down to us to show that the instruments were as cumbersome as their names.

Only two kinds of handcuffs were employed previously to the nineteenth century. One, the French, was very similar to that now in use; and the other, which was called the English, was similar to the modern violent pressure. This "figure eight" was greatly dreaded, since once fastened upon the wrists the fettered person did not attempt to move a link.

There used to be a form of handcuff, now happily abolished, called the "buttoned" handcuff. The two handcuffs fastened at each end. This chain was placed about the wrists; the handles were brought together and twisted until a firm grip was obtained. The great objection on the part of the unfortunate captives resulted in the greatest suffering, for the chains bit deeply into his flesh. A similar form of handcuff was that called by the French "le figure."

In some instances of escape there is still used an exceedingly primitive form of handcuff. It consists of a V-shaped piece of metal, the ends of which are twisted and the open ends being drawn together by means of a cross lock, which, however, must be unlocked before the whole time the captives is held.

The most ingenious and effective of all handcuffs is that used by the United States coast-guard, adopted by the police of most civilized countries. It is much lighter and much less clumsy than the old-fashioned handcuff and is not painful to the wearer.

## The Speed of Animals

According to authorities, an animal is known to have exceeded the speed attained by the famous race-horse Synnoby. In a photograph album as long as twenty-five feet. In the strip of the last end runs the bird gaiter and (such as in the case of the bird gaiter) the bird gaiter, and from this relatively great height brought downward and forward, mainly separated from each other, as a spectacle, says, "to avoid striking the feet legs." The hare which is hurred with fast bounds has not in reality the speed of the bird gaiter. The dog on other hand, does not attain the speed of the horse. The giraffe is said to run at the rate of thirty miles an hour, but it is not the most favorable conditions. The elephant, going at the rate of two yards a second, is said to walk approximately that carried by air.

## The French Aerial Squadron

The French squadron has spent \$5,000,000 this year on the aerial fleet and in planning the expenditure next year of \$6,000,000 more. Each squadron will consist of eight such air divers, two pairs; two monoplane, two biplane, two triplane, and reserve composed of six biplane.

On the first day of last March the government had thirteen squadrons of this kind, eight active squadrons and five reserve representing a total of 104 airships, but this number was considered too small and it voted to double it with the utmost speed practicable.

To each squadron having six aeroplanes. Thirty orders of aviation are to be issued in the next few weeks, which will be a school for the training of aviators and a definite point of centralization and departure for each squadron will be fixed.

The separate squadrons will be named by seven pilots, one of whom is the captain. The other officers will be four sergeants, one of them an adjutant with the training of a mechanical engineer. There will also be forty-four men.

## Revolving Houses

A PARMIAN inventor has conceived the idea of having small towns which will revolve on their axes until the country districts for invalids, thus furnishing a change of scene, light, and air. The revolving houses will be built in some rooms should always get the sunlight and the remainder be always damp and unhealthy. The houses will revolve once every year on a revolving house was built in Normandy. The door was constructed in such a way that it could revolve once each year at the house was turned, the one occasion these boards opened set like an opened fan, closing the wall. The house revolved by a capricious hand, but the house pulled down.

The aging of a cocktail is as necessary to perfect flavor as the aging of wine or whisky.

The delicious flavor and aroma of

## Club Cocktails

is due not alone to the precise blending of the choicest liquors obtainable, but to the fact that they are softened to mellowness by aging before bottling.

Menthol, Marjol and other standard blends, bottled ready to serve through cooled ice.

**Hausfrauenvereine**

A LEASERS feature among housewife associations in Germany is the upkeep of market halls for the purpose of co-operation between town and country housekeepers. A market hall consists of one or more rooms centrally located, to which country members bring their goods for sale to the consuming market. These producers pay yearly dues of seventy cents to \$1.20 and undertake to sell all products through the hall except in the case of perishable or very bulky commodities. According to the by-laws of the association, inferior goods may not be supplied in any circumstances and may be sent back to the subscribers. Eggs must always be clean and bear the stamp of the hall. New laid eggs must be stamped with blue or black ink; older eggs with red ink. All articles, in fact, must be stamped or marked to show their origin. Prepared meats, such as sausage, ham, etc., must be accompanied by a certificate of the official meat inspector. Fresh meat must be stamped by the local slaughterhouse authorities.

Prices set by the producers or sellers are slightly higher than in the general markets. These differences, however, it is claimed, are more than compensated by the better grade of goods, the work received and selling at the market hall is done by subscribers, who act by direction of a committee appointed by the hall. The cost of the upkeep of the hall, payments to the subscribers, etc., is met from a fund of ten per cent. deducted from the gross receipts. The remaining ninety per cent. is paid to the remaining members for their goods.

These halls have been established not only with a view to providing farmers' wives with a ready market, but also to bring together and improve the relations between producers and consumers. Members, both country and city, should keep in touch with the subscribers and learn from them what products are in greatest demand, or vice versa.

A supplementary activity of these associations has been the establishment of schools for the economic education of young country women. Of these four have already been in existence for some time and three has recently been opened a fifth, which will receive from the government an annual subsidy of \$1,000. The most necessary funds having been made good by local contributions. The school consists of a substantial kitchen, equipped with model kitchen, library, class-rooms and dormitories. On the grounds around it are experimental vegetable gardens, facilities for poultry raising, etc. The full course covers one year.

**Chinese Porcelain**

NEAR the year 200 B. C., in the beginning of the dynasty of Hsin, some workers in southeastern sea of the province of Szechwan, and later in Yunnan. When they remembered them and opened the oven doors they found that the pots were vitrified in a brilliant opalescence. The use of porcelain was discovered. When fired of its druse the substance grew lighter, became clear, and acquired a pink or rose and smooth as velvet and in this, hard, translucent body that rang like a bell.

The art of monochrome glazing was discovered in the time of the dynasty of Sung (960-1290 A. C.). Occasionally the action of the fire separates the pigments and produced excessive richness of color. The Sung wares, checked the previous art of their art. In 1517, the Chinese, after a day's labor, deflected the course and founded the dynasty of Ming, whose reign extended to 1644. The first time in coloring the imperial manufactory. He gave the national manufactory the monopoly of the work in the pottery manufactured by the actions of Japan. Under the new impetus all the new methods were revived and perfected. The system of three-color and five-color decoration, after a preliminary firing, dates from the restoration of art under the Ming dynasty.

**The Highest Railroad**

BETWEEN the Matto River in Chile and Ponce in Bolivia a railroad line whose highest point is 15,000 feet above sea level has been constructed. This is the highest railroad in the world. The road connecting Argentinian and Chile reaches about the same height. An English company proposes to construct a road still higher in south Mexico City with Puelco as second highest point. An English line will cross 17,000 feet above sea level. This new line will serve principally to transport sulphur from a lode in the mountains, according to the estimate of experts, millions of tons.

**The Chemistry of Commerce**

By ROBERT KENNEDY DUNCAN

Author of "The New Knowledge"

The Chemistry of Commerce is a graphic narrative of the wonderful work of applied chemistry in the industrial world today. It affords an engrossing story of the invention and manufacture of commodities that are close to the business or home interests of each one of us. It is packed with information upon such topics as the making of artificial rubber and diamonds, of non-bleakable Webelach matter, of the obliteration of perfumes in quantities sufficient to float a freight, of the coloring of glass, of the engineering tests accomplished by high temperatures, the preparation of drugs the complete and quiet, the extraordinary behavior of industrial catalysts. Professor DUNCAN—himself a student of science and a practical chemist—spent a long time of study abroad and secured his material personally from famous scientists at work in their laboratories.

**Gold Pens**

THE tiny tip of white metal seen on the under side of the point of a gold pen may be platinum, but it is more likely to be iridium. Iridium is a very hard metal and a very expensive one, since it costs about four times as much as gold. The purpose of the iridium tip, it is claimed, is to give the pen a more durable point.

The gold-pen maker buys his gold at the assay office in bars of pure twenty-four karat gold, which he melts and alloys with silver and copper to the degree of fineness desired, most making ten per cent. but good pens made in this country for sale in France are of eighteen karats. The French government requiring that all articles exposed for sale in that country as made of gold shall be not less than eighteen karats.

The gold from which the pens are to be made is rolled and redried until what was originally a thick, heavy bar of gold has been rolled into a thin gold ribbon about three feet in length by four inches in width. This gold ribbon is put into a machine that shapes it. It produces almost all sizes. On the tip of each of these pen shapes is fused the iridium point, and then the shapes go to a slitting-machine which cuts the ink pen from the slitting-machine the pens go through another which gives them their rounded, familiar pen form. Finally they are ground and polished and finished ready for use.

American gold pens in fountain pens or as dip pens are sold in every country in Europe in competition with pens of French or of German manufacture, and appear to have more competition there are sold throughout the world, in South America, Africa, Japan, China—wherever pens are used.

**The Feet of Ancient Belles**

ARMY engineers say that on first winter snows have ever dreamed of putting a six-inch layer of five-and-one-half-inch women. The type for the classic marble figures were taken from the most perfect female of the period. Unconventionally the human foot, as represented by the ancient sculptors, was larger than the modern one. The feet of primitive folk of all peoples were to have any record, either of stony or otherwise, was much larger than the feet of the restricted lot of later times.

The marble line, forming an approximate average of the different feet, was about twelve inches long. This would require at least a No. 10 shoe to cover it comfortably. The average marble foot today is made about a No. 8 1/2 shoe, and is therefore not above ten and seven-eighths inches long. Now, by the old standard of proportion, the average foot six inches in height should have a foot above and one-half inches long, or one-sixth its height. It was not so great consequence what size should be worn, but he would have required a woman's shoe at least a No. 10 for her comfort.

For women, allowing for the difference in the relative size of the arms, which was about the same then as now, a woman of five feet three inches in height would have had a foot six inches long, regarding modern shoe of the same size, the most comfortable, or a No. 10 1/2 as the limit of comfort.

**Dipping the Flag**

THE celebration given when a vessel is christened "dips" the flag, and is very old and most honorable of all forms of marine greeting.

In this form of salute has always been described by the English-speaking seaman, and its origin has been the boats and the number of generations of naval commanders. It is said to have originated on a ship, whether merchant or naval, to enter an English port without calling on the shore or dipping the flag. The ship was brought to her anchor by being hauled through and through. Such was the tradition according to the Duke of Devon in the sixteenth century, to the Spanish admiral who, in time of peace, sailed into Portsmouth, England, and, calling to his boats or lowering his flag.

Salutes are essential matters at sea, and the salute is a very old and honorable one. The number of guns to be fired, the order of firing, is usually stipulated.

## COMMENT

## Duly by Bryan

THEODORE BRYAN says in the *Commoner*:

Conscious of my responsibility to God for every thought and word and deed, and in duty bound to render to my fellow-men the largest possible service as the best evidence of my love for my Heavenly Father, I resolve to strive during the remainder of my life to increase my capacity for usefulness. To this end I will give up any course of conduct that tends to weaken my body, impair the strength of my mind, or lower my moral purpose, and I will not only endeavor to cultivate habits of industry in both body and mind, but will seek and follow worthy ideals.

Which, being interpreted, means:

Conscious of my deep obligation to the Democratic party and in duty bound to manifest my undying gratitude for the unexampled honors conferred upon me, I resolve hereafter to set aside all considerations of self-interest, self-seeking, and self-nourishment, and to strive earnestly, generously, and patiently to increase my party's capacity for usefulness. To this end I will give up any course of conduct that tends to create dissension within that organization or to add in the slightest degree to the burdens of its chosen leader, and I will not only endeavor to cultivate the habit of upholding his hands in all works that seem to him to be good, wholly regardless of any personal or political advantage that might accrue to me from doing otherwise either openly or covertly; but I will also seek and follow, instead of demanding the right to shape and direct, the worthy ideals embodied in the man who has been designated by the Democratic party and the American people as their voice and their guide.

To this pledge I set my hand and seal and avow my firm determination to act in all ways, without deviation or mental reserve, in accordance therewith—

So help me God!

WILLIAM JENNINGS BRYAN.

And we say, softly: Amen! Amen!

## Brother Bryan and the Congress Committee

No lot or no tie so quick to get harsh and sarcastic with Brother Bryan. Let us not be too quick to get bitter and or scold over his halfhearted remarks about the chairmanship and the committee assignments in the new Congress.

We are all to know by this time that Brother Bryan's idea of patriotism comprises a lot of legerdemain. Like the late A. W. Weaver, of Tennessee, he finds a perpetual difficulty in believing in anything without violently disbelieving everybody who disbelieves in it or even fails to believe in it precisely as he does. Naturally, he also has a Jacksonian disregard of everybody who shows any sign of not believing fully in Brother Bryan himself, and a Jacksonian inability to distinguish between loyalty to Bryan's cause and public devotion to the Bryan personality and leadership. It's all human and understandable. There are others. The Democratic party is not the only one

that has to make allowances for a leader with a decidedly personal way of taking things.

Undoubtedly, too, there is a modicum of sense and justice in Brother Bryan's contention. He is all wrong in practically saying that no attention should be paid to seniority, or that it is undemocratic to give due weight to it. But he is right in saying that the new Congress should be led by men in full sympathy with the new administration and of unquestioned loyalty to the party's policies and platform. His fault, as we see it, lies partly in going too far, demanding too much, being too violent, but partly also in the mere whims and less palatable efforts of confounding the words "Bryanite" and "progressive," of mistaking personal antagonisms with differences of opinion and principle.

His method is not doing very much harm. The matter is of real importance, and cannot be ignored, anyhow. In view of the fine judgment and temper displayed by men like Cavan and Cavanaugh and Senator O'Donnell, not to mention others, we are hopefully of the two Houses will deal with it both wisely and justly. Governor Wilson is undoubtedly alert to the situation and has not done or said a thing which indicates that he cannot handle it wisely. The Democratic party is still doing pretty well, thank you. At any rate, it will hardly go out of business before it has even gone into business. We confidently predict that it will survive till March 4th, anyhow.

## Mr. Taft is Charmed

President Taft is the worst-liked, the least-esteemed, and the least-liked of any defeated Presidential candidate we ever had. He has passed the points where his defects as a politician were troublesome and come to the point when his merits as a man all show at their true value. His speech last Saturday night at the dinner in New York of the Republican was full of good-humor, contentment, and good sense.

It is to congratulate the President on his disposition and a good deal on his views. It has been apparent all along that, though he would be beaten, he would not be discarded by defeat. But the truth is that in the light that we viewed his last night's most important contribution, he was not a loser. In Roosevelt's defeat he won; a victory by no means nullified by the Democratic triumph.

Mr. Taft has had sore trials and has come through them all to a state abounding in consolations. It is good to see his appreciation of present blessings and the cheerfulness with which he contemplates future usefulness and distinction in private life.

## A "Gospel for the Future"

MR. WILSON said at Stoughton:

While I would be liberal in interpreting the service, I want to prohibit for my fellow-citizens the gospel for the future, that the men who serve will be the men who profit.

But that is not a new gospel. It is the same gospel that put *Ich Dien* on the shield of the Black Prince and that made Aeneas say he had no time to be morally perfect. The men who have served here usually put it in English as an easy degree of worth in a sufficient degree. Most of the very noble people—except some of the legislators and poets—have usually applied their own needs, and in the ideal of useful service there has always been an appeal that has drawn the finer spirits by the thousand away from mere money-getting for the sake of the money-getting. It is no secret that all men are not world or the life of service is the happy life, or that the greatest rewards of life and work are not paid in cash.

The inspectors of the future have been telling us for years past that signs point to increased consideration and remuneration for useful talent; that the professional men—the engineers, doctors, lawyers, accountants, and the like—are the rising men in the world that is to be.

That accords with Mr. Wilson's hopes. Nevertheless, we guess that in the future, as in the past, the men who will get the most money will usually be the men who go out after it hardest, and that they will get it because they are the men who are worldly-wise and perhaps greedy, and without any exact relation between the size of their pile and the value of their services.

No enforcement of the Sherman law, or any improvement on it, is going to change the dispositions of men, or secure an intimate relation between moral, or even economic, desert, and pecuniary acquisition. Of course what Mr. Wilson means is that honest and ungracious and unscrupulous and slight-of-hand financiers have been getting too

big a role-off, and that other honest men in the economic machine have charged too much for turning, and that he hopes it one way or another to make it harder to get something for nothing.

Good luck to him in that endeavor! Time makes a good many of the odds come even, but it is a hard operation to hurry and very hard to accomplish by statute. Very few men want money with enough intensity to devote the bulk of their lives and strength to getting it. We guess those who do usually get it. It is not very scarce, and for those who begin soon enough, work long enough, and pay the price, it can usually be had in the quantity desired.

It is interesting in a gospel that is not new that our numerous members of consideration by a Power even stronger than the Money Trust, and that if we use a sound discretion as to what we seek we shall get just as much as we want. That old gospel has good points. You don't have to devise, and then enforce, any new statute to make it work. We would that its premises are still as good as those of the politicians and the money-makers considering. It has nature and the laws of nature working to fulfill it, and that is a big help which legislation is liable to lack.

## Two Judges and Three Jurors

If we were called on to name the two men who rendered the best service to the country in the closing years of last year we should probably have to name our choice as Judge A. W. Cannon. However, we are not running for Congress and will name Judge A. W. Cannon, of Indianapolis, and Judge Gorr, of New York City. If we were called on to name thirty-four other men who deserve well of the Republic we should look through the newspapers and find the names of the men who sat on the cases which were the most important cases tried in New York and President Bryan and the other dignitaries in Indianapolis.

None of these public servants did anything out of the common. On the contrary, they stuck in the most commonplace fashion to the practice and the precedents of something like a thousand years. The judges explained the law and the jury applied the law to the facts and the evidence. The cases were rendered to death or to imprisonment men who had committed crimes. They simply did their plain duty.

Incidentally, they gave an impressive demonstration of the value of a judicial system which certain politicians here do find shown themselves quite ready to weaken and to ignore. Judge Cannon, we believe, has been a special mark for the animosity of the men who have led the movement of discontent with our courts. Very well; we will not defend Judge Cannon; we are at present engaged in taking of our hat to him. We are quite willing to leave to his neighbors the question whether they are or are not best equipped to discharge his judicial duties.

Another judge, Judge Archbald, is at present under trial before the Senate, under impeachment proceedings instituted by the House of Representatives according to the Constitution. We will not anticipate the verdict, but we think it will probably be in favor of the judge. He is a man of high rank under our system and got rid of it. It is necessary, in order to be a democrat, to contend that everybody shall wear crime. Neither is it necessary, in order to defend American democracy, to contend that every judge is upright. Our judicial system is based on human nature as it is and the outcome of an immense experience. It can be improved, but it is not to be improved, would be the worst disservice imaginable to the Republic and to civilization.

## Brother Burns

One word more about that letter of complaint from Brother Burns of Albany in last week's *Weekend*. Brother Burns doesn't misunderstand us. We do not undervalue his opinion, but we do not like him and Senator Cavan to Roosevelt and his platform at Chicago. We do not undertake adherence to former hopes in politics when principle is involved. Our disagreement with Brother Burns is over the question of what his party most now do to be saved. We think it should have a house-cleaning, particularly down South. Apparently Brother Burns doesn't.

## The Parrot Post in Welcomes

It is early at this writing to talk about the benefits of the parrot post, but one can speak with confidence of its popularity. It seems to be working well in all directions. It may be popular because it is a novelty, or it may be popular because the department may get talked up in its new business,

As it is, the provision of special stamps has proved inefficient, and the office that prints them is running night, day and Sundays. But that shows that it is popular.

Mr. HIRSHCOCK, who seems to have shown commendable zeal and enthusiasm in making ready for the change, has also given out a pretty good statement of the main benefits we may reasonably hope to get from it. It seems we are all to get a cheaper service than we do at the moment, and Mr. HIRSHCOCK estimates that some twenty millions of us, living in places where there are no express offices, are getting something which heretofore could not be had at all. Naturally, therefore, he expects the parcels post to make life in rural communities much more comfortable and attractive, and we do not believe he is by any one else has exaggerated the gain to be hoped for in this direction. Neither do we believe that it is in the least unreasonable to expect in time a quite substantial reduction in the cost of living all over this country. There is no sort of doubt that it exists far to meet in America to get things from producer to consumer, for besides the figures we have the fact that in England we get a far more efficient service than we do in this country, and that not only costs much less, but is much better rendered. We suspect, indeed, that foreign travel, now so common with nearly all classes of our people, has done more than any other one thing to bring us to the point of demanding the parcels post effectively.

And we believe the parcels post is going to lead us on to other like reforms and improvements, some of which we shall mention elsewhere, but some of which we shall discuss for ourselves, once we set our minds to this class of problems. We are not really stupid about the ways and means to get ourselves served better and more cheaply. We have simply neglected them, as is the way of new countries with abundant resources. Now that we begin to realize that perhaps we are not so rich as we once guess that we shall do as well as other folk in the matter of making our money go farther and farther.

#### Two—

Shall we do it mainly through government, and by continually widening the scope of government, reasonably within the functions of government? It is that question. Mr. HIRSHCOCK, whose entire training has been in the strong government school—or, rather, the much government school—does not think it and apparently is not worried about it. He thinks government is going to take over the entire business of the express companies, and evidently has no qualms in assuming that a measure of this kind will as expeditiously purchase outright the property and goodwill of the companies.

Unquestionably, there is force in what he says. As government is undertaking to run an express business at cost, and the companies must make profits and pay dividends, the competition would seem to be mainly a matter of form, and it would be to do the companies' stockholders, and the only just arrangement he can find is for government to buy them out at a fair valuation without undue delay, to the end that thereafter all express business shall be, like carrying the mails, a government affair, to the complete exclusion of all private enterprise.

Now most of us would doubtless admit that that seems to be what we are coming to; but it would be mighty interesting to know how many of us would admit it forbearingly, and how many, like Mr. HIRSHCOCK, with cheerful alacrity. The difference of mind on the subject would prove to be decisively fundamental. The line between the two groups is a very narrow one, and it separates the Hamiltonians from the Jeffersonians. For we take it that a Jeffersonian, even though he may concede that in this instance the course of economic development has necessitated a big concession, cannot see without regret private enterprise superseding, and government occupying, a field so important. Indeed, we expect a Jeffersonian to hope that in at least a corner of this great field private enterprise may still have a chance, and we suspect that a fairly intelligent Jeffersonian could give pretty good reasons for the hope.

On the other question, being something of a Jeffersonian ourselves, we venture a positive opinion that we shall not have to look to government for all or nearly all the money by which we shall from now on make our money go farther and get more and more out of our resources, and make our American life, whether in city or country, more and more attractive to people of moderate means. Government will help. Its scope will continue to widen. But its best and its chief function will continue to be that of securing to private enterprise a wider and wider range of opportunity,

and to individual liberty of development and action a greater and greater security.

#### On Yes, Arbitrate if Necessary

President TAFT says we must arbitrate the disputed free tolls to coastwise-trade clause of the Panama Canal bill, unless we can settle the matter satisfactorily by negotiation.

By all means? After that or reveal the objectionable clause and strike again? If we are to arbitrate, it is money in our treasury to be hoarded, and good evidence of a provision that is not worth in any estimate what it promises to cost us.

And if we win, the judgment of Congress on the interpretation of treaties will be vindicated. That would be worth something and we could still avoid the bill.

#### British Protectionists in Trouble

Mr. BOSAN LAM, the Unionist leader, made a speech recently that is pretty sure of a place in future histories of England, for it was one of those public utterances that precipitate controversy, and surprise and disturb the disciples of arbitrary support to precipitate storms. The division in his own party that has followed is undeniably serious, not for the party only, but for the entire Empire; but it also has, undeniably, its comical aspect. The Unionists have for months been making all the capital they could out of the Liberal party's struggles with the Home Rule question. Bosan Lam's speech is actually responsibility they have, in fact, made so much capital out of their opponents' constructive undertaking that it up to the day of Mr. BOSAN LAM's speech at Lyme-Under-Ashton nothing would have suited them better than an immediate appeal to the country. And now Mr. BOSAN LAM can with a straight face threaten that if the Liberal party there is actually serious talk of the government's resorting to it.

Evidently Mr. BOSAN LAM has put his foot in it. But not just upon one either ridicule or blame Mr. BOSAN LAM. It is hard to see how any leader of the Unionist party could have long avoided putting his foot in it. For "it" in this instance means Home Rule, and it is just as troublesome to the Unionists as Home Rule has long been to Liberals—the question, namely, of protection, or, as the English call it, of "tariff reform." Mr. BOSAN LAM and his associates in the Unionist leadership have been trying to force a general election. They cannot go into a general election without a programme. That programme must say something about "tariff reform." And the question of "tariff reform" involves the question of food duties. Mr. BOSAN LAM spoke of food duties and any one else in his place would have had to speak of them. That was enough, however, to put him and his party immediately on the defensive.

For "tariff reform" and Imperial preference are usually food matters. So long as protection and free trade were the only policy of the Liberal party, Imperial preference forced on the Unionist party. Imperial preference means that Great Britain, in return for tariff favors from the dominions, shall exempt from duty some of the things the dominions want to sell. Hence it must first put duty on those products. Dominion products are usually food products. So long as protection and free trade were the only policy of the Liberal party, Mr. BOSAN LAM spoke of food duties and any one else in his place would have had to speak of them. That was enough, however, to put him and his party immediately on the defensive.

The division may or may not mean a smoother passage for Home Rule, but it certainly indicates that the British Empire will have a hard time going back to the policy of the past. The policy of free preference are irreconcilable concessions. One might as well speak of heaven-hut self-seeking or of self-altruism. The world-wide Imperialism of British subjects is the strongest political sentiment now in existence, but it cannot compare the impossible task that has been set before it by the extraordinary sick men of Birmingham.

#### Fear in Europe

In spite of the report that Servia has come to terms with Austria so to her demand for an Adriatic seaport, the prophets of war have not yet gone out of business. There seems to have been a knocking together of knaves throughout all Europe, as though the Powers, with their perpetual con-  
dumns, concessions, and intrigues, had suddenly

been caught up into the vortex of some larger and malcontent desire which was sweeping their petty malice toward destruction. Fewer recall the probability of the German southseer that 1871, 1888, and 1913 would prove eventful years for Prussia. From all over Europe no hoards of deposits being withdrawn from banks, of governments hoarding gold, of Russia and Austria mousing all their available troops on their common frontier, and a fear that is epidemic grows with each report of international harmony.

#### Keep Them Heed

These matches do not give out the break fall off it is the assurance on a box of Swedish matches.

Just the kind of Democrats we need in Congress.

#### Poor Mr. Canine

We haven't paid much attention to the reports that Mr. CARNEGIE has just away pretty nearly all of his money into various funds absolutely controlled by trustees. He had such an everlasting box of it that we didn't suppose it was possible. But it must be true, and it is a fine thing. The Laird now has personal control of only about thirty millions; that nearly eight millions of these are already divided to various institutions upon fulfillment of certain conditions; and that the income from several millions more is required for some hundreds of personal pensions provided by will. In other words, Mr. CARNEGIE has now reduced to net very much more than is needed to keep up his various establishments, about \$600,000 a year.

That is the most remarkable thing of its kind we ever heard of. How many of us who are kicking all the time about million fortunes could or would have done it! Just as a matter of preference we prefer to have a million and a some hundreds, say, fifty out of the four hundred million! It is all well enough to say one might as well get rid of his money while he lives because he can't take it with him when he dies, but that theory suffers from the fact that, no matter how old or feeble one may be, one always expects to live another year, and that is the case with some hundreds of us. We are folk, doubtless good folk, who never have been tempted and think they have great will power, who believe they could and would have passed it all up, just as the Laird has done. Maybe so; we don't know, and we don't believe they do.

As for ourselves, we have our doubts; so, that's not true; we have our doubts, and we don't know very well that we should have kept a fair amount just to throw away if the spirit should happen to move that way.

But the Laird is built on other lines; he is different; he certainly is; different from anybody we ever knew or heard of. You may or may not feel your heart going out in his direction, but you will certainly realize that; you can't help it.

Good gracious! Think of it!

#### Teachers Who Don't Know

We of the United States seem to have turned the Bible out of the public schools and put in the flag, and since religion is needed in education the disposition is now to have a flag religion with an appropriate motto.

Better than none, no doubt. Its defects, at least, are like the defects of other religions. It is adopted and straightway inconsiderate people want to enforce it by compulsion. As if that had not been sufficiently tried out in the last thousand years. If it were ordered that public-school children should recite a motto that, you can't help it, would, to compel them would be recognized as religious persecution. But when it is ordered that they shall salute the flag and a few take a salute not to the compulsory measures that sometimes follow are not recognized as of the family of our old friend who knelt first at Westminster and was so lately so much the mainstay of the public schools.

Two little school-girls in Sub Lake City got the idea that they were Socialists (the paper says) and wouldn't salute the flag. Whereupon the Utah State Teachers' Association, finding a lack of temporal authority to regulate these young politicians, passed a recommendation for an amendment to the state constitution making the teaching of patriotism compulsory in the public schools. Who will teach these teachers, first, that the State constitution is not a fit place to record rules about schools, and, second, that compulsory patriotism, like compulsory religion, is not worth anything when taught? Don't the teachers know that our flag stands for freedom and that freedom is a condition from which all unnecessary compulsion has been eliminated?

# A STUDY IN KICKS

DRAWN BY E. W. KEMBLE

# THE COMING OF THE NEW HOTEL

BY EDWARD HUNGERFORD

DRAWINGS BY ARTHUR WILLIAM BROWN

**I**f is a pretty poor sort of American town that cannot boast a new hotel in these days. It may cling to old traditions in one case, and in another try to capitalize its hopes, but it is sure to boast on its main street somewhere a palatial sort of a hotel-like skyscraper. You may go back to Billeville—and just let Billeville be about any typical middle-sized city in the land—and recall pretty distinct memories, pleasant or otherwise, of the hospitality that held you there twenty years before. It may have been a dingy, barlike affair, echoing its solitary grandeur all the black decoration and furniture horrors of the Victorian age, or it may have been, and rarely was, a comfortable old ark, with low ceilings and wapping open wood fires, with a landlord who was a local lord, to greet you when you stepped from outer cold into its barlike atmosphere. But those old fellows—the Congress Hotels and the Nationals and the Americans that used to be sprinkled across the land—are nearly all gone, or else reduced to utter degradation in their old age. Sometimes you will still find them stately standing, like the historic Monongahela at Pittsburgh, the Monument at Springfield, Massachusetts, the Kutva House in Baltimore, or

the great Logan House at Altoona, and enjoying only a slight dimination of their former glories. Sometimes, like the Fifth Avenue Hotel, they were torn down rather than that the shadows of old age and lessened respect should come upon them. Fire has wrecked and havoc with many of them. They have gone into American history along with the bookbind, the brewer, and the ally-with. And yet some of them have more than played their ordinary part in the making of history. In the grand upper rooms of that same Logan House, rising above the railroad tracks at Altoona, the war governors of Northern States were wont to gather in the troublesome days of the early sixties, the history of the Republican party might have been written from the famous Avon center of the old Fifth Avenue Hotel, while the stageboxes that formerly lined an upper mezzanine of the Monongahela House spoke widely of bitter battles for supremacy between old-time steamboats on the Ohio and the lower Mississippi. From the quiet balcony of that same hotel, facing the green-grover levee of Pittsburgh, every President of the United States from Lincoln to Taft has spoken.

But today each Billeville all the way across the land boasts loudly of its new hotel and looks indignantly upon the old. The Billevillians who merit you at the inn, call your attention to its unobtrusive magnificence as you approach it from afar. "The very jewel of metropolitan elegance," he says slowly, thinking of his own check baggage in the thing. "It's the Wakker of this end of the State." When you raise inside the new Hotel Billeville, where the historic decorator has perished his passions to play material, and have passed your eye at the gorgeously of artificial marble and heavy marble, you are permitted to delve still further into the wonders of this supreme wonder. There may be a roof-garden and there is surely a grill-room seaward crissed and embellished with into which Billeville usually comes after an evening at the show, to indulge in champagne and lobster mazzoni and order beer and portwine, while a happy hand places your marble powder from a satisfactory little perch over in the corner just under the ceiling. Billeville has had her own servant problem: its reputation is too glibly in detail for these columns. Billeville is being out. To be more exact, Billeville is beginning to die out. It has already acquired the restaurant and club habit for week. Twenty years ago, the chief articles of the town were filled all noon with men coming to and from their dinners. They used persons in American towns of more than ten thousand population have started their heavy coats from noon till eight and set a light on an expensive lunch downtown.

This is all fact, not fiction. It all explains how a new era in hotel-keeping has come in the larger towns across the land.

Take any typical Billeville. Its own American house, wick with its study parlors, its travelled marble floors, and its elaborate if grotesque carvings, all were regarded as nothing less than architectural triumph, is today descended from the high plateau of local renown. The new hotel, with the marble-top marble in its lobby, the roof garden and the grill, as already described, is now the town's chief boast of pride. Probably Billeville has all but bankrupted itself in the erection of the palace—generally deemed for a hotel hotel of triumph. It has a jocosous boast that it is a degree ahead of the rivals and that, to its civic mind, is worth several tons of worthless hotel stock.

With the coming of the new type of hotel there has also disappeared the so-called "American plan," the famous three-times-a-day gorge that was the delight of every hungry man taking his way across the land, at an old-fashioned, reasonable cost of living. In the place of the scientific of many institutions with little bits of vegetable and the menu "gourmet" under seven or eight kinds of meats and vegetables and slices of pie and of cake, has come the esthetic "European plan," over the card of which you prick your way with an inflexible rule, hoping to pin a medal that will set more than triple the rest of one over the old plan.

There have been several reasons for the change, not the least of them the great increase in food cost, which the average hotel-keeper has felt as heavily as any housekeeper, the trade being that he is only a house-keeper himself. The going is, at least, no such national pasture as it was thirty or forty years ago. The national stomach is becoming a national regard. The man who gets drunk at a public table is no longer an object of emulation.

The European plan first became popular in the small towns through New England. The growing use of the automobile and the demand of the automobilist that time first need be ready here and there and everywhere to serve him with a quick word at almost any reasonable hour of the day hastened the change. Today the old-fashioned American plan is holding on with a feeble grasp, and that is rapidly slipping from it. One Boston hotel of high grade still boasts that it serves five meals a day on an inclusive charge to its guests, but it is a great exception. The commercial traveler, with his expense account, a not very expensive thing, has watched the passing of the "American plan" with ill-concealed regret. Hence that consider him as a factor in their yearly routine sometimes modify their European-plan eating to suit his more strict purse. They have "club breakfasts" and various forms of table d'hôte luncheons and dinners, to suit his necessities.

But on the other side of the fence there sits tight the biggest of the newer houses, the large hotels, and these are not conforming to any trend. They make little account of any sort with the days of old in hotel-keeping. A great modern house in New York has based on distinctly an American dish as steak from the hills-of-fare; several of these have long since pleased the host on pie. Single dishes are in their distinctive and unimpaired before of non-European articles shows great preference in remodeling and remodeling—even a new-way hotel that has "king a little long" in the old-fashioned way, with the right amount of strong dressing, may be transformed into a foreign lounge so deftly as to make the regular patron of the house believe the host waits to secure it for them. As a star dish it may go upon the menu card at \$1. per "the p. p." means that the comfortable large portions with which the European plan first acquainted itself

You have gazed at the artificial marbles and heavy mazzoni.

upon American hearts no longer exists, and now he is the thrifty diner who tries to make a single portion piece out for two. That deadly "P. P." absolutely prohibits that.

The success of a new dish in New York means that it is going to be copied all the way across the land. You can pay just as much for a portion of lobster in New York as you can in the smartest restaurant on Broadway. If you are daring enough to protest against the price of your small cups of lobster floating in a little puddle of yellow gravy in the New York hotel restaurant, he will tell you stories of vast costs and great expenditures that will convince you that in giving you lobster at 25¢, costs a cent in doing nothing less than impressing charity. And if you protest to the finest City landlady he will smilingly remind you that "you never kick or pay \$1.50 for a portion of lobster Newburg back east on Broadway."

That shows the weakness of an imitative business. A big hotel in the capital of hoteldom on the island of Manhattan has recently introduced a "cover charge" of twenty-five cents a person to reimburse the proprietor for bread and pepper and salt and ice-water and butter, all neatly smoothed in the meal. That will probably also soon become nationally popular; perhaps sooner or later some daring wit of a hotelier is going to discover that he can make fifty cents a "cover charge" and still escape with his life.

There are also and now others that have spread across the land with the coming of the metropolitan hotel in all of the little towns of the land are perhaps, after all, but minor chords in the main theme—the architectural problems that have been raised up high by the coming of the new sort of hotel.

For, truth to tell, when we imported European methods of living hotels, the good with the bad, we failed in living across the sea the personality and charm of the hotel-ies of the Continent from which they came. Unfortunately the best of our new order of great hotels were built in the city of New York; unfortunately, because the narrow squares and the high prices of Manhattan real estate have created a peculiarly cramped type of building. While the type of hotel architecture which resembles a parking-car stood upon road is a necessity in New York, it is not a necessity in most other American cities. But almost all the others of our American cities have followed New York blindly in this regard, and there is a hideous monotony of parking-lot hotels all the way across the land, from one coast to the other, from Canada to Mexico. And to-day a Texas city situated in a flat sandy the size of a New England state is building a monstrous sky-scraper hotel.

None of the personality that some American towns possess in their degree is reflected in their great new hotels. These are apt to be pretty much alike in all the largest towns across the land—usually, raw, overdeveloped. Boston is a bit of an exception, because she believes that if Young's or Parbur's or the Adams House were good enough for his fathers and his grand-

fathers it is good enough for the Boston of to-day. So that thrifty of the old-fashioned hoteliers still describes, and you can read the very fashion favor is then when you go to your room and find the catalogue of the house library hanging there. In their restaurants the chief of the Hotel still confirm in secret admiration of serot and renewed reviled, and all the other venerable old-fashioned dishes of the rock-bound New England shore. And in building Boston's newest hotel, the first of the great new hotels of America to be architecturally sufficient, recognition has been made of that fine New England sentiment by making the chief feature of the hotel's main facade, facing Cooper Square, a typically Boston "low-window."

Washington has done better things architecturally than almost any other of our American cities—its new railroad station is a model for terminal design. Yet Washington, with her great open squares and her wonderful vistas down long boulevards, has not yet realized a great hotel, typically American in design and decoration, being one of those squares of boulevardier hotels are all replicas of the peculiar style of New York.

Out of all these things there is bound to come a change. The beginning of that change are already being noticed across the land. Miss Linn is bound to believe that there is more than a merely novel plan of serving and charging for food and drink that can be borrowed from the successful hotels of Europe. A great hotel in Portland, Oregon, although it is no longer new, is able to hold for itself first place in an important town as well as an attraction in the hearts of those who come to patronize it by the fascinating and unusual courtyard. In that courtyard the Portland hotel opens on pleasant summer nights to all as the hotel owners and listen to its architect in the open, indifferently than any glass-enclosed, skylight-roofed "palm garden" of the more modern houses. Denver felt still delight in sitting on the stairs in the imposing courtyard of their fine, old-fashioned hotel.

The regular patrons of the house visit the head waiter to secure it for them

San Francisco felt that the roof of all hotel-keeping was reached when the court of the Palace went down to ruins and when in her fearful catastrophe six years ago. And in giving San Francisco a new Palace the architects and the owners cleverly complied to reform, in part at least, that famous architectural feature. One inspired and imaginative head down at Riverside, California, is a lover-keeper and a poet. He believes, and rightly, that a typically Californian hotel should breathe something of the architecture and traditions of California and not imitatively resemble a Maine coast summer hotel colored like a lady's glove, and picked up overnight and carried overseas. So he has incorporated into the building of his wonderful house all the rich and exquisite details of the crumbling mission.

The new hotels have gone up by the hundreds in the past seventeen or eighteen years, and their cost has ranged high into the millions. They are but one thing that typifies the growth of a great nation. They are new, and that need is overworked in describing each of them. But there is a better order of things coming. In the next generation of hotel-keepers and hotel patrons we are going to see it.

# THE POOR MAN'S MOTOR CAR

by Thaddeus S. Dayton  
Illustrations by Gordon Grant

**P**ROBABLY no subject is more frequently debated in the homes of the moderately well-to-do than the relation of the monthly income to the personal automobile. Many people would like to know whether the cost of the upkeep of a machine is actually great as is often stated, and, whether it is or not, they would like to have some idea what that expense amounts to.

There is no question but that the high-grade touring-car or limousine that is sold for \$3,000 and up, when operated by a skilled chauffeur and used constantly, runs into considerable money every month. It is generally figured that the "keep" of such a machine is \$3,000 a year at the very least. But every day in the streets one sees newly dressed men who are not paying \$20 to \$300 for their suits of clothes, and prettily enough arrayed women who are not purchasing expensive dressmakers. Is it not possible to do the same with an automobile—to own a car and get the good out of it on a small, average income? If so, and it is being done all over the country.

A man in the suburbs who has an income of \$30 a week and pays \$20 a month house rent can afford a car. He will need to buy it carefully and with forethought as to its weight on the tires, an important consideration in running expenses, and he must handle it himself, drive, clean, and make all small repairs, but he can own one without paying, especially in other directions and without getting into debt. Of course he must have his own garage—what is, he must have a little building alongside his house for the machine. A portable structure costing a hundred dollars or so will do. There will have to be some close calculating, but it can be done, and the owner of the car will be able to have an infinite amount of pleasure without its costing him very much money.

What many people do not realize in car-keeping is this: The man of very moderate means who is in the sway of a machine seldom has much time to use it. Hence the wear and tear is relatively small and the cost of fuel is little. The rich man's car is in constant commission. They cover many miles each day for the owner and his family, they are used on long tours. But the man of small income has little time for his machine. It is a comparatively rare enjoyment. He may go out now and again in the evening for a short spin, but not by any means every night. The real day for his car is a Sunday or a holiday, and for the man who is not a seasonal, rich automobilist anything like a hundred miles in a long, long trip, not to be taken very frequently. The average Sunday trip for the man who is operating his machine occasionally is seldom anything like this distance.

It follows, therefore, that the monthly cost of the inexpensively handled car runs down to a very low figure, so low that it is not a tax on the \$1,000-a-year

man. If he is a good and careful driver he can keep his bills down to three or four dollars a week easily, perhaps even below that figure. Of course such a man will be something of a mechanic and know how to keep his car constantly in trim. An expense of two or three dollars here and there, covering this part and that, when coming weak seasons and near new ones, will save twenty or thirty or even more later on. No man who has not this ingenuity and forethought can afford an automobile on a very small income.

The man who possesses it can afford one. It is astounding what a man can operate a machine on, if he only will. Well-off people who are constantly drawing checks for repairs, garage charges, supplies, chauffeur salaries, and spending large sums of money whenever they go out bearing, cannot understand it, and declare these calculations impossible. But the so-called impossible is being done in hundreds of towns and small cities, and even in the heart of large cities like New York, Chicago, Boston, and Philadelphia, though in these running a car for a very small weekly sum within the range of the very small income is much more difficult.

Some have said that for the apartment-house dweller or the man in the "black house" in the large cities—where a garage of one's own, no matter how small, is quite impossible—it is entirely out of the question to attempt to own one's own machine on an income of less than \$50 a week. Investigation has proved an income like this to be unnecessarily large. The man is a big city man manage it on much less, if he will, and not cramp himself in so doing. He has, of course, one extra expense that his suburban brother avoids—he must pay garage storage, having no spot of his own to store his car. The lowest possible garage

charge in New York City, for example, is \$25 a month, and an owner may feel that he will have to pay \$25. He will very likely find that he has to. This does not include cleaning or overhauling. The owner must do all of this himself. Naturally over the circumstances, especially when it comes to minor repairs, he cannot

He must handle it himself, drive, clean, and make all small repairs

do it as well as if he had his own little place. Then the city man's car is not kept up quite so economically, whatever the owner's skill and laborious may be. In dollars and cents the city man has to put out at least six to eight dollars a week additional, use every ounce of ingenuity that he will.

But even those figures, say \$30 a month for the man in the city, are a long way off from the "absolute minimum" of \$1,000 a year expense, "taking advantage of every economy" that the well-off people talk about. It all depends upon the point of view. No one will deny that it is pleasant to be able to spend \$100 a month, or even \$200, on running your car. The question is not that, but how far down a man and woman can figure without running into debt. Naturally the advantage is all with the suburban residents or those who live in very small towns, but an automobile today is not an impossible proposition for the city-dweller who has a small, steady income.

The question "who can afford an automobile?" is very much that of "who can afford anything?" The ordinary, free spender who has twice \$20 a week will find a car too much for his means, while the man of another type, with one-half his income, can manage well. Of course, there is an in-between class, a danger point. In the country a man should not be an automobile-owner of any kind unless he can comfortably spend three or four dollars extra a week at least, and the fast-dweller in a big city should be sure that he can afford about twelve dollars weekly. The joys of automobile-ownership are but few for these small sums. It is no longer a very rich man's pastime. It looks as if the prophecy made several years ago would become true, that practically all people of moderate means would find it possible to become automobile-owners within a short time.

The ease of ordinary, average salary finds it an easy matter to buy a machine today. The price of new cars of good makes is steadily decreasing, and there are always a number of excellent second-hand ones in the market. There is no trouble at all in buying a very good machine for a hundred dollars down, or even less, and paying off the balance monthly. In fact, as with pianos and many other articles, a man can make almost any terms he wishes. If the buyer has a turn for mechanics, he has a golden automobile opportunity these days. For \$400, \$200, and even \$100, he can get a second-hand car of one of

A quiet suburbanite bowed among the rains and suddenly made an offer of \$200 spot cash.

the high-grade makes. It will not be, at the moment, a perfect car, of course. But such a man can take it, and at little expense can gradually make it into a first-class car. The process will be to replace the worst parts step by step. A man does not have to be a mechanical genius, by any means, to be able to accomplish this. There are thousands of men in America today who would find it possible and the work an actual relaxation and enjoyment, and hundreds who are actually doing it.

Two or three years ago a car that was practically new and had cost over \$2,000 got a tire which was on the road. By the time the tire was put out it looked pretty badly damaged. The owner, a rich young fellow, was disgusted. He never visited the car again, and he'll tell you of course he would, to any one who was free enough to buy it. A motorist would more quietly among the ruins and probably would not offer of \$200 spot cash, take it away himself. He pulled a small check-book out of his pocket. The owner, who had telephoned for another car, was still waiting, and he was angry at having his trip interrupted, closed the bargain like a flash.

Six months after that Mr. Suburbanite had a \$2,300 car that was the envy of people miles around. It had cost him, all included, \$400, and he had worked on it steadily. Now and again he took a day from the bank to fix his car, and he had a mechanic or two come out to help him; but in the main it was all his work. Piece by piece, at a cost of a few dollars at a time, he had brought his car to the condition as he afterward told his intimates, it was the cheapest in he ever had.

This man was a \$1,200 a year man. His automobiles for he did not have very much space time in two—cost him scarcely more than five dollars a week all told. He had the advantage, of course, of the man who cannot afford to buy a car, and he had a mechanic or two come out to help him; but in the main it was all his work. Piece by piece, at a cost of a few dollars at a time, he had brought his car to the condition as he afterward told his intimates, it was the cheapest in he ever had.

The question of "affording" begins with the purchase of a car. Many a man has found he could not "afford" one and has had repeatedly to give up

the purchase merely because he has bought wrong. The heavy automobile is no car for a man to buy when every cent of expense thereafter has to be considered. There are cars that can be run inexpensively and cars that will be costly in the extreme. The man who thinks of this when he is buying and picks out the right type of car for a slim purse comes out right every time.

Many manufacturers are now considering just this type of customer. He has come to be a big factor in the market and has been found quite as worth while catering to as his rich money-spending brother. A man like this wants not only a fairly low-priced car to start with, but one that can be run at very little cost. Such a car, made specifically for the man of moderate means, not only saves first cost, but so to speaking, too, for example, one of its prime principles that there should not be too much weight on the drive. Many men about to buy a car would not give attention to this point. The man who has his head about him, though, will spend a reasonable sum of buying his car as a small income, does. It is in ways like this that he demonstrates his ability to afford an automobile. He has grasped the idea that it is management and forethought rather than actual money that makes car-owning possible for the man of little means, and when he starts out to buy he studies every detail of weight and convenience and simplicity of mechanism. A car a few pounds lighter than another may mean the saving of a number of dollars yearly for him. He buys with an eye like a hawk.

The matter of weight works this way: Tires are supposed to be a costly proposition for the automobile. He who is for the man with whom it makes little difference when they money goes. But in actual practice, if a man knows how to do it, the tire bill can be cut down to very little indeed. Here is a good instance.

There is a man who lives in New York City who, ten years ago, bought one of the smaller light-weight, well-adapted cars. The tires for this cost a hundred dollars for the four. They are the smallest that are made. Probably they would not appeal any more than the car itself to the rich man to whom hundreds-dollar bills are more incidents of daily life. But they are good tires, and the car provides many pleasant rides at a trifling price.

These tires are guaranteed for 3,500 miles. But this man who really knew how to afford an automobile

and was an expert at it managed to make them last for 8,000 miles. It was near the end of the two years before he had to renew them. Now, \$2,000 miles in two years does not represent a lot of wearing, but it means a good many delightful hours of what this man made at very small tire cost per mile. It is more like this who run auto machines, for they know how to get the best out of them.

Tires like these could not be had, of course, on the heavy cars. Here comes in the judgment of buying the economical car—about it, for the man who must persistently consider ways and means. The man who considers finds that there are many other points he must look into in an automobile. Some new services were the first thing he looks into. They allow small repairs to be made more readily. Every man drives a car just a little differently. There are a thousand and one chances to save money or to waste it every mile that is traveled. The shrewd man of little means knows the way to favor his car and prolong its life and lessens the cost of driving. It is not the first thing he learns, it is a very near to it. The ordinary automobile does not realize what savings are possible in a year, with care.

A garage may cost what it will. An ingenious man will very likely be able to put up one with his own hands at a cost of less than twenty-five dollars. Built specifically for the man of moderate means, it would probably cost not far from \$100. In many cases, however, it flows through the country, there is one class of men who are not so particular about the thing. However, the garage does not give the careful owner much worry. An automobile does not need to be expensive to be a good one.

One of the things he bought, there should be no need of effort to keep expenses down. The owner can do this by strictly restricting his losses whenever the automobile is out of the way. This means in a word that if the automobile is to be a pleasure instead of a necessity, it should be a pleasure. The man who has his car in his own hands can always afford one, while he who depends on never afford this luxury. The old device of having the man and the way he knows how to manage. This is why many cars today are driving their own gear, while they are more progressive in their own gear, while they are. They, too, could afford an automobile, but they do not know how.

# NEW CARS FOR THE NEW YEAR

Some Innovations and Inventions that are to be Seen in the Newest Types of Automobiles

BY LAWRENCE LARUE

**A**SK one motor-car manufacturer what he expects to do in his 1913 product and he will tell you, indignantly, that he makes no yearly models. He makes one car, and he makes it in his cars as soon as they are perfected, and he doesn't keep the public waiting a year for a new one. It is the type of man, no matter what his salary may be, who can best afford an automobile, and who, on an income that would seem to most people altogether too meagre, manages to be an owner without the slightest hardship.

The question of "affording" begins with the purchase of a car. Many a man has found he could not "afford" one and has had repeatedly to give up

last year. Consequently this year finds the self-starter as inoperative, but the fact that it is to be used on well over ninety per cent of the various makes of new machines is in itself a most impressive indication of the demand of the day.

It is probably the success of the electric self-starter that has made possible the large advances in the make of the electrically illuminated cars. The idea

or mechanical form of self-starter. It is not to be expected that such equipment will be found in the cheaper cars, but even these may be provided with electric-lighting outlets at but a comparatively small advance in cost. On one of the switches is a device which will self-power and firmness. This switch is a necessity if the automobile is to be a pleasure instead of a necessity, it should be a pleasure. The man who has his car in his own hands can always afford one, while he who depends on never afford this luxury. The old device of having the man and the way he knows how to manage. This is why many cars today are driving their own gear, while they are more progressive in their own gear, while they are. They, too, could afford an automobile, but they do not know how.

Having learned your lesson, approach the next manufacturer and question him as to the specifications of his "Series XXIV" or "Type 22" car and you will probably be told that his factory has been working for the last six months on the 1912 models, that his entire sales force has been busy taking orders for next year's cars during the usual dull season, and that the opportunity for obtaining a 1913 car in the latter part of 1912 is so alluring to purchasers that the production end of the organization is working night and day through the year. It is the fact that improvement is added to his product as soon as the former is perfected, but that he doesn't think it necessary to remove or give a new number to the car because of a series change in the design (production sense) and he will exhibit no visible evidence of disgust over those who have departed from the yearly model system. He will tell you, however, that he did the first man you approached when you mentioned "1913 car."

It is, perhaps, unfortunate that there is not more unanimity among motor-car manufacturers as to the proper designation of their latest product. It is a convenience, of course, that it is difficult for the consumer to keep such distinctions in mind. He will turn a car by the year in which it was bought, regardless of the fact that it may be a 1912 model in every way by the maker or that the factory had been working on its parts for a full year when it reached the market.

But, regardless of personal opinion as to types, series, or yearly models, the automobiles that are now being produced are noticeably better than those of any manufacturer one take exception to that term. Also, regardless of the pretensions and good intentions of all of the manufacturers, there are a few things to keep their products up to date. There are many changes and improvements to be found in the new cars which were not possessed by their cousins of last year. These improvements are not only being made, but nearly all of them have been thoroughly "tried out" before in one or more instances, but they merit a level of confidence that is not to be had in the very common and cheap cars. Take the matter of self-starters, for example. They were used with great success in probably thirty per cent. of the cars made

The teeth cut in the fly wheel which engage with the gear of an electric motor on a popular form of self-starter. This installation also furnishes current for the lighting system.

of employing the same electric generating and storage outfit for starting the motor, furnishing power to the lights, and in some instances supplying current to the ignition system. As compared to designs of years ago, and we find that the number of outlets employing this system has increased several fold over the last year. Electric lighting systems are not restricted to the cars equipped with electric self-starters, for a simple generating and storage outfit can be used on any automobile employing the explosive, pneumatic,

or mechanical form of self-starter. It is not to be expected that such equipment will be found in the cheaper cars, but even these may be provided with electric-lighting outlets at but a comparatively small advance in cost. On one of the switches is a device which will self-power and firmness. This switch is a necessity if the automobile is to be a pleasure instead of a necessity, it should be a pleasure. The man who has his car in his own hands can always afford one, while he who depends on never afford this luxury. The old device of having the man and the way he knows how to manage. This is why many cars today are driving their own gear, while they are more progressive in their own gear, while they are. They, too, could afford an automobile, but they do not know how.

But the vast increase in the number of electrically lighted cars does not constitute the only features of 1913 lighting systems. There have been refinements and improved well over every part of the motor and body can be illuminated at the turn of a switch or the pressure on a button. Gags lights for illuminating the instruments on the dash and "trouble-lights" attached to long flexible wires have been considered some of the appointments of electric-lighting systems, but it remained for our ingenious designers to devise a light so placed, beautiful and effective as the "running-board" that is step in front of each door of a closed car will be brightly illuminated. These lights are fired within the space of the wheel and the mechanism is made whatever one or the other is exposed. It is only those who have had occasion to enter or step from the brilliantly lighted interior of a modern motor car who can appreciate the beauty and the safety of the new design. This is the feature of the 1913 cars, it is an example of the refinements and ingenious applications to which the modern electric-lighting system is susceptible. The interior of the car is illuminated in a way which is arranged within each panel of the driver, while the switches for the interior lamps are placed where they are most convenient for the driver's reach. These lamps are operated from the driver's seat are the pair of headlights, the pair of side-lights, the tail lamp, and two or three page lamps. On some more intricate switchboards there has been added the steering post, and from this the ignition system, the self-starter, and any individual light or set of lights may be operated by the turn of a single button. A pull on this same button will throw off the switch and thus stop the car or extinguish any light desired.

Just a decade ago the advent of the first four-cylinder gasoline automobile engine took the motorist world by storm. It was called a "runabout" because it was so easily all of the front part of the car. It was a cylinder—and in case more two-cylinder—motors, and consequently the three-hundred-horsepower. Increase in the number of cylinders has been the rule, and it is not long before all makers were adopting the four-cylinder motor, however, and it therefore logically comes that the four-cylinder motor has become the standard cylinder. A few years later more largely produced "six" cylinders, but for several years the "four" remained as the standard power plant.

A baggage outfit ready to be attached to a car

the "six" was new or less of a luxury, and it was only in the expensive cars that it could be found. But the public has now become accustomed to "sixes," and therefore the statement that there will be more six-cylinder motors produced this year than there were cars of all kinds manufactured in 1910 will hardly cause the attention that was occasioned by the appearance of the first "four." Such figures are important, however, for while in 1910 of course the "four" will still hold the lead, the number of manufacturers who have lately swung into the "six" line this year marks one of the most important eras of the automobile industry. Manufacturers who had hitherto confined their efforts exclusively to "fours" are now producing "sixes"—not as a side line, but as leading models, one per cent, if not of greater importance than, the "fours." Other concerns which produced both types of cars last year are now confining their efforts exclusively to the manufacture of "sixes." And these six-cylinder cars are not all high priced; several manufacturers of expensive "sixes" have produced 1912 with a "little six" that is smaller, lighter, of less power, and that sells at a lower price than does the big brother and yet in the peer of the best four-cylinder automobile of two or three years ago.

But even such changes do not mark the limit of the price reduction that has been made for the "six" of 1912. The aforementioned "little six" will sell at from one-half to one-third of the price of their five and six thousand dollar brothers. And for 1912 the man to whom \$1,500 represents the limit of his motor investment can still become the proud possessor of a "six" that would have cost double the \$1,500 mere four years ago. These low-priced "sixes" are smaller, of course, and of less horsepower than the more expensive machines, but so effective and far-reaching have been the refinements of the past few years that this new crop of "sixes" easily hold its own with any machine of other classes.

The substitution of six-cylinder motors for "fours" under the banner of many of the cars has resulted in lengthening the forward portion of the machine. Therefore, to prevent the car from appearing to be "tail ending" the body has been lengthened in proportion to the increase in size of the motor, with the result that machines of longer wheel-bases are in vogue among the medium-priced class than was the case a season or so ago. This change has increased the carrying capacity of many of the cars, or, in cases in which this has not resulted, the space allowed for each occupant is greater than formerly. In some models both comfort and capacity have been increased, and, in addition, more of the necessary equipment and baggage for long tours is provided.

But because the increase in "sixes" is one of the mainlines of the season, let not the motorist think that the "fours" have been neglected. These have kept pace with the general improvements of the times and are today better cars than ever. There, too, have increased in roominess, power, capacity, and

comfort, and the provision for traveling equipment show that the modern motor-car is more a touring vehicle than ever. Pockets in the sides of the rear doors and at the back of the front seat afford accommodations for the articles, while provision is made for the storage of small necessities in drawers that are placed under the seats and may be reached from the interior. Folding trunk-racks are placed at the rear, and, as spare tires are now carried here also, the rear-benches are left free for the accommodation of suit-cases, trunks, and boxes. On some cars an extra touring equipment is provided—at additional cost, of course—which consists of a dunes or moon leather-covered boxes and cases, each of which is

A car with four doors and switchboard (attached to the steering-post) for the control of the ignition, self-starter, and lighting systems

shaped to fit a certain portion of the body. Some of these are placed on the rear-benches, others are attached to the back of the front seat in the tonneau, while still a third set is secured in the inside of the doors. Those placed at the rear end of the rear-benches are shaped to fit the curve of the feet, and each piece is an designed and located that its contents may be reached without the necessity for disturbing the other boxes or cases.

In general appearance the new cars are not greatly different from their predecessors of 1911. The same long, low, straight-line effect is maintained and even accentuated by the increase in the length of the wheel-base of many of the cars. In fact, it is probable that the sides are slightly higher and the bodies a bit lower than last year. This increase the "torpedo" is

or "grouse" appearance of the bodies, and as in some cases the bodies of the cars are actually higher than the top of the dash and meet the sides in the same general curve, the "smooth side" effect is more in evidence than ever. The end-over approach last year to keep the fenders-boards and sides free from impediments and projections seemed to meet with approval on the part of the public, for the majority of the new cars carry the spare tires at the rear, place the tool and battery boxes and gas-tank under the seats or floor boards, and employ invisible hinges and concealed inside latches on the doors.

The closed cars are more comfortable and luxurious than ever, and the tendency toward the enclosed driver's section, or "Pullman front" design is plainly apparent. Attention has been paid to the ventilation of the interior of both compartments, and several ingenious devices for this purpose are to be found in regular equipment on many of the latest models, coupes, and town cars. Convertible bodies have met with great success, and it is probable that many of them will be found in use this year by those who can afford to purchase this more pretentious type of car. These convertible bodies may be so arranged that the car in all appearances resembles an ordinary touring automobile, but only a few moments are required to convert the machine into a limousine with the conventional high partitions between the front seat and the rear compartment and with sliding glass windows in the sides and doors. When set in these glass partitions and windows are fit down into the floor, and the partitioning is composed of a collapsible material that may be folded back and set in the same line as the roof of the car.

So far as mechanical changes are concerned, the new cars are free from innovations. Refinements are apparent, such as an increase in the dimensions of couplings, provided with hollowed tube stems, anti-power glands—which include the motor, clutch, and transmission

mounted on a positive base—and lubricating system which automatically regulate the oil supply to correspond to the speed of the motor and the load carried by it. Four-speed transmission systems will be found on some of the cars this year, although the three-speed type still retains many adherents who consider that the superior flexibility of the six-cylinder motor renders a fourth gear unnecessary.

In considering the number of designers who have entered the "left hand drive" field cannot be overlooked. City traffic conditions and the inability of motorists to leave the driver's seat on the left-hand side of the road immediately in front of the passing stream of vehicles have long made the left-hand drive vehicle for town cars and taxicabs, but 1912 finds this design applied to a large number of touring cars. The improvement of the average country road and the elimination of the dangerous dips at either side have made the driver of to-day more interested in the space between himself and the vehicle that is in passing at his left than in the narrowness of his wheel in the "gutter," and consequently there are many motorists who prefer to operate their cars from the left side. Some of the cars in which the driver's seat is placed at the left are provided with transmission and emergency brake levers projecting from the center, so that they may be operated with the right hand. This design possesses the further advantage of allowing the driver and his companion to alight from or enter the forward compartment at either side, and also provides the upper fire escape exit, the rear—and also makes an ideal change in the method of control in which the operator has been accustomed when the levers were placed at the right side of the right-hand seat. The chief advantage of the left-hand drive, however, lies in the fact that it enables the driver to alight directly upon the curb and immediately on the almost universal use of the self-starter has eliminated the formerly frequent necessity of stepping out to crank the motor right-hand entrance is combated by many designers in sufficient and such. Therefore, place the control levers at the left.

But whether it be a four or six cylinder car, right or left hand drive, center or side control, or three or four wheel propulsion, the buyer of a new automobile may not realize that he is receiving full value for money invested. This holds true this year as never before, for, as new manufacturing processes are inaugurated, a greater number of parts made of more-elastic and better materials used, and a more general use of better bearings, rollers, and ball bearings of vital companies cause the motor car as a vehicle to be used to be improved.

Cars fitted with the new left-hand drive, enabling the driver to gaze the clearances closely

# CAR-TROUBLES: HOW TO CURE THEM

Their Symptoms and their Cure. A Clear and Comprehensive Guide for the Motorist in Trouble on the Road

BY HAROLD WHITTING SLAUSON, M.E.

The various motor troubles here dealt with are classified alphabetically according to the predominating symptom. There are also numbered numerically for each part of the motor. Where there are two or more possible causes all are given together with their remedies. The sub-classifications thus formed bear a letter preceded by the number indicating the paragraph of which they form a part. Remedies for symptoms are not repeated in the text, but references are made in the paragraph number and letter in which the hint appears.

## I.—CLUTCH TROUBLES

1. Harsh or "Pierce"
  - a. Lack of lubrication (if in used clutch or disk clutch running in it) or use of inferior surfaces dry and resulting in undue engagement of the members. Apply oil or grease or use oil on surface of leather-faced new clutch and keep parts well oiled thereafter. Fill racing of disk clutch with oil about half of the space quality of oil.
2. Surfaces rough, preventing gradual engagement. "Dress down" new clutch surfaces or apply new leather. Dress edges of disks with a file to remove "burns".
3. Operation Difficult
  - a. Shifts out of alignment, producing unequal pressure at various points of contact. This makes disengagement impossible. Shafts and bearings should be aligned by eye.
  - b. Spring tension too heavy, requiring strong pressure to disengage. Reduce spring tension by adjustment provided, but aim should be taken not to make spring so weak that clutch will slip.
  - c. Surfaces worn in form of grooves or overlapping edges which grip the adjusting piston of a disk clutch. Level all edges with a file. (See Fig. above.)
3. Slips
  - a. Leather of cone clutch slicked, preventing surfaces from gripping properly. Apply a small amount of powdered resin to leather or new leather.
  - b. Surfaces glazed from wear, gummed lubricant, or running when plates were dry. If cone clutch, new leather method. If plate clutch, remove disks and clean with gasoline, or, if difficult to hand, with some chemical such as petrol naphtha. Dress out old oil and replace with fresh.
  - c. Spring weak, preventing friction surfaces from being held together with sufficient force. Tighten by moving up roller against which one end of spring rests, or send to factory for original spring.

## II.—ENGINE TROUBLES

1. Back-firing
  - a. Mixture too lean; adjust carburetor. (See "Fuel Troubles," 1a.)
  - b. Valves leak, allowing force of explosion to pass through intake pipe. Recut and grind valves.
  - c. Valves stuck; same effect as above. Caused by expansion of rust or scale or by hard push rod. Remove rust and "dress down" with emery-paper or straighten, as necessary.
  - d. Valve tappets improperly adjusted, preventing valves from returning to full closed position. Turn down tappet until so that they equal to thickness of piece of tissue-paper is allowed between push rods and tappets. Adjustment should be made only when valves are in full closed position.
2. Exhaust-smoking
  - a. Excess of oil fed to motor. (See "Lubricating Troubles," 3b.)
  - b. Excess of oil reaches combustion chamber although proper amount may be fed to other portions of motor. (See "Lubricating Troubles," 2a, c, and 4.)
  - c. Motor speeded up with too load. Avoid racing motor unnecessarily.
  - d. Quality of oil in cylinders poor. Use only oil of grade and make recommended by manufacturers of car.
3. Explosions Excess Irregular
  - a. Batteries overcharged. Test with pocketrometer and Brown, recharge, or have field strengthened. (See "Ignition Troubles," 2a, 3a, 3b.)
  - b. Connection loose. Tighten all terminals and binding posts. Look for broken soldered joints. See that all electrical connections are tight and free from grease and dirt.
  - c. Intake valve or pipe leak. Grind valves or spark joints in engine immediately.
  - d. Mixture rich; will make explosions weak and irregularly timed. Adjust carburetor. (See "Carburetor Troubles," 3a and 4.)
  - e. Piston ring broken; will allow compression to escape before ignition. Employ expert to remove piston of affected cylinder and fit new ring.
  - f. Pre-ignition. Carbon or soot collecting on piston and in cylinder head. This becomes dislodged from cylinder walls and strikes before occurrence of spark. Four screws into spark-plug opening, or remove cylinder and scrape interior surfaces thoroughly.
  - g. Short circuit in ignition circuit. Examine insulation of all wires, especially those leading from coil to spark plugs. Look for leaks on ground or oil which may cause that dry batteries do not test on any belt or other metal portions of car.

4. Thine compressor or brushes worn; may cause irregular conversions at high speeds. Remove brushes and compressor, dress down and increase diameter of brushes. Add springs to allow for decreased diameter of compressor.
5. Water in gasoline; will produce intermittent skipping. To detect see "Fuel Troubles," 3b. When tank is empty refill only with fuel obtained of reliable garage or supply station. Strain all gasoline through strainer.
6. Explosions in Muffler
  - a. Ignition failure, allowing unexploded charge to pass into muffler, where it is ignited by hot exhaust gases from other cylinders. Kaminite plugs for occurrence of spark at proper time. (See "Ignition Troubles," 3a and 3.)
  - b. Switch thrown off when motor is speeded up to pass into muffler, where it is ignited by hot exhaust gases from other cylinders. Throttle down before spark is turned off.
  - c. Valves leak, permitting portion of charge to enter exhaust pipe and blow through muffler before ignition occurs in cylinder. Grind valves.
7. Inefficiency
  - a. Carburetor improperly adjusted, preventing correct mixture at high or low speeds. Adjust needle valve or auxiliary air valve. (See "Fuel Troubles," 3a.)
  - b. Fuel of poor quality, preventing vaporization from taking place at certain speeds.
8. Knocking
  - a. Boring of crank shaft or wrist-pin end of connecting rod loose; such a knock will be independent of all speed of motor. Cylinder must be removed and bearing adjusted by competent mechanic.
  - b. Main bearings too tight, rubbing motor.
  - c. Spark advanced too far for speed of motor, allowing explosion to occur before piston has reached upper end of stroke. Advance spark or speed up motor; motor capable of greater spark advance at high speeds than at low.
7. Overheating
  - a. Circulating system clogged; sufficient water cannot reach joints or cooling surfaces of motor. (See VI, to be read in connection with this.)
  - b. Fan belt slips, preventing proper rotation of fan and thereby reducing amount of air drawn through radiator. (See "Cooling System Troubles," 4c.)
  - c. Fan blades bent, interfering with air-drawing capacity of fan. (See "Cooling System Troubles," 4c.)
  - d. Mixture too rich, causing a slow burning charge that exposes a large part of the cylinder walls in the same way as petrol descends. Close needle valve of carburetor slightly.
  - e. Radiator empty, furnishing no medium for transferring heat from cylinders to air. Fill radiator and search for leak, although water may have leaked away.
  - f. Oil supply to cylinders insufficient, increasing friction between piston and cylinder walls and also losing advantage of oil as a lubricating medium. Fill crank case or increase supply of oil to connecting rods and cylinders.
  - g. Motor run continuously on low gear, making motor run at high speeds with consequent increased number of explosions, although speed of car and engine slow. Increase speed through the radiator in air. Keep radiator filled; use plenty of oil.
  - h. Spark retarded, preventing occurrence of explosion on full surface of cylinder walls has been removed by piston in its downward travel. Advance spark to center.
8. Power Connections, but Irregular in Strength
  - a. Fuel of poor quality, resulting in uneven mixture fed to cylinders. Test fuel with hydrometer or buy only that known to be of good quality.
  - b. Fuel pipe clogged, allowing groove to be fed with air and causing irregularities. Take apart and clean with kerosene.
  - c. Load merely applied, as in a slipping clutch. (See "Clutch Troubles," 3a, b, and 4.)
  - d. Pressure line of pressure pump or fuel tank clogged by carbon or other impurity, preventing regular application of sufficient pressure to force fuel to engine. Remove pressure pipe line; clean out with kerosene; make certain that all openings are free from obstructions before replacement.
9. Power Causes Electrical
  - a. Breaks electrical connection at burned-out coil or loose wire in ignition circuit. Search for broken wire or terminal. Have coil tested for broken interior winding.
  - b. Cell or battery if "short" is only temporary but recurring. Spark cannot occur at plugs when vibrator of coil does not operate be-

- tween its magnet and platinum plug. (See "Ignition System Troubles," 2a, b, c, and 4.)
  - c. Current supply weak. Brown or recharge battery. Use only good storage or storage-recharge type.
10. Starting Difficult (assuming motor apparently run well previously)
  - a. Carburetor adjusted for weak mixture suitable only for high speeds. Close "butterfly" valve or open needle valve slightly.
  - b. Fuel of low grade, making vaporization difficult and motor will not start. "Prime" each cylinder with gasoline through top cock of spark-plug opening.
  - c. Piston rings worn or broken, allowing escape of compression, under which condition the charge is not so susceptible to ignition.
  - d. Switch thrown on magnets instead of on battery, preventing formation of sufficient ignition current until motor is whirled rapidly in order to impart high enough speed to structure of magnets. Throw switch to battery or drive on magnets and engage motor. (See "Ignition Troubles," 3a.)
  - e. Valves stuck or dirty, allowing escape of compression. (See "Engine Troubles," 1b, and "Engine Troubles," 1b, and 4.)
  - f. Weather out, preventing sufficiently rapid vaporization of fuel to carbonize. Prime cylinders (see "Ignition Troubles," 4b) and apply hot-water-soaked rags around head of motor to increase temperature of mixture. If hot air or hot-water steam is supplied on carburetor, open so that heat chamber will be warmed at first explosion.
11. Stopping Difficult
  - a. Carbon deposit on piston or cylinder head, forming petals which become dislodged from head of piston, and explosions and ignite mixture without necessity of spark.
  - b. Oil supply to motor insufficient, causing irregular burning of fuel, and partly with same result as above. Stop motor by shutting off gasoline supply entirely. (See "Lubricating Troubles," 1a and 4.)
  - c. Overheating from defect in cooling system or confined running on low gear. (See "Engine Troubles," 3a, c, d, e, f, g, h, and 4.)
12. Stopping Suddenly and Unusually Early
  - a. Broken electrical connection if explosion comes suddenly and motor "dies down" of its own accord.
  - b. Overheated pistons or rings, causing piston to "stick" suddenly. This trouble will arise from defective fuel, explosions or lack of sufficient cylinder lubrication.
  - c. Turning (see Cranking) Difficult (or Impossible)
    - a. Bearing or piston seized through lack of lubrication when motor was run previously.
    - b. Oil ginned in pistons and bearings due to use of too heavy oil or cold weather. Loosen with kerosene poured in through spark-plug openings and work with crank until rotation is free.
    - c. Transmission not in neutral, causing operator to expect car to be cranks motor. A dangerous condition, for if motor "catches on the spur" the car will move suddenly under its own power.

## III.—FUEL TROUBLES

1. Back-firing through Carburetor
  - a. Carburetor adjusted for weak mixture at low speeds, thus permitting ignition when inlet valves are still open. Open needle valve to allow passage of more fuel or slow auxiliary air valve.
  - b. Gasoline contains water or other impurities, forming a weak charge. Strain all fuel through muslin before filling tank.
2. Flexibility of Control Lacking
  - a. Carburetor improperly adjusted, allowing of irregular mixture at low speeds and too rich mixture at high speeds of motor. Adjust needle valve to give sufficient fuel at low speeds of motor, but not sufficient air for high speeds that irregular running does not occur at high speeds.
  - b. Fuel of low grade, or filled with impurities, preventing sufficient vaporization at low speeds.
  - c. Throttle thine limited, preventing proper response to increase of speed of intake pipe to permit of desired range of speeds. Adjust set screw to allow of further opening of throttle. Use of heavy leather robe from throttle lever to permit of closing "play."
3. Joints of Pipes or Carburetor Leak
  - a. Fuel leaks from joints of intake pipe or from carburetor. If ground joints are used remove, clean, and polish both and replace, making certain that all surfaces are in perfect contact. Use of heavy leather robe from throttle lever to permit of closing "play."
  - b. Leak of Gasoline from Carburetor (Flooding)
    - a. First set too high on engine, allowing fuel to

- to overflow before controlling valve is closed. Set float down on stem if such regulation is provided, or lead arm down slightly so that valve will close before float reaches overflowing level.
3. **Float** faulty (if of cork) or leaks (if of metal). Check float for leakage. If float assembly and float rest level in the passage so that controlling valve will not be closed when paper level is reached. Try such float to cover entire width of orifice. Plug leakage around float in hot water to facilitate inspection of gaskets contained therein and adjust valve.
4. Foreign matter resting under gaseous valve, thus preventing proper seating of the valve and blocking its cover and float chamber, but if this does not carry away the foreign matter remove valve and clean valve and seat.
5. **Mixture Rich**
- Auxiliary air valve too far closed, cutting off proper proportion of air to gasoline and resulting in irregular combustion, especially at high speeds. Open air valve until proper running occurs at high speeds of the motor.
  - Needle valve open too wide, giving too much gaseous vapor for the proportion of air sucked in by motor. Close needle valve until motor runs properly at low speeds.
  - "Starving" (Inability to obtain sufficient fuel, regardless of position of needle valve.)
  - Float too low or, since, raising closing of control valve before proper level of gasoline in chamber has been reached. Raise float on stem if this adjustment is possible. Otherwise lead arm so that float will not operate gaseous valve as soon.
  - Obstruction in feed line, preventing sufficient flow of gasoline to float valve, or in the pipe, and leak through all parts. Remove gasoline strainer and clean.
  - Obstruction in pressure line, if pressure feed system is employed, preventing formation of sufficient pressure to force gasoline to carburetor. Remove pressure line, clean with benzene, examine check valve for accumulation of carbon.
  - Tank cap leaks (if pressure feed type is employed), allowing gasoline to escape, which should be stored far being fuel up in carburetor. Screw cap down tighter or install new washer or gasket and insure tight joint between it and tank.
  - Tank cap screws down too tight or vent hole stopped (if screw fuel feed system is employed), preventing sufficient air to pass gasoline feed to carburetor. Loosen cap slightly to allow entrance of air so that pressure can be equalized, or fix obstruction in vent hole.

IV.—IGNITION SYSTEM TROUBLES

- Coil Sticks, but no Spark Formed**

  - Short circuit in secondary (not in primary), allowing high secondary voltage to be cut off passing through spark-plugs. Keep high tension wiring away from metal parts. It will leak in distributor if repaired.
  - Wiring (secondary) of coil broken out, allowing current to pass from battery, but breaking passage of high-tension current lead coil to motor for examination and repairs or replacement.

- Coil Sticks**

  - Battery or magneto weak. Test former with pocket ammeter. Ammeter should show above six. Storage battery should be kept filled with distilled water to a level above the tops of the plates.
  - Platinum contact points pitted by excessive sparking. Wipe the platinum point on the vibrator and that of the contact with light burnish until the surfaces are level and three smooth down with a piece of emery-paper.
  - Vibrator set too stiff, requiring high current consumption for its operation. Loosen tension of vibrator until loose, while measurement is not as "heavy" as formerly. The lens should remain at same place as long as adjustment is made.
  - Vibrator spaced too far from magnet of coil, requiring high current consumption. Set down vibrator by means of contact wear until distance between vibrator and magnet of coil is about one-third-second of an inch. Better broken on vibrator correspondingly, so adjustment will increase the stiffness of action.

- Coil Sticks**

  - Wiring screw set too tight. (See above.)
  - Vibrator set too far from magnet of coil. (See above.)

- Current Consumption High**

- Coil Stiff, requiring high current consumption to operate vibrator.** (See 2c above.)
- Leak in insulation of wiring, allowing current to pass to wires contact or to motor, especially, power and wire coils.** Cover wiring exposed to grease and oil with coat of insulating varnish. Use insulation tape around wires coming in contact with metal part.
- Vibrator set too high, requiring excess of current to operate.** (See 2c above.)
- Current consumption and damage through insulation.** Insulation disintegrated. Caused by exposure in oil, grease, or gasoline. (See 2c above.)
- Lead wires and magneto wiring.** If caused by wrong wiring of the motor, the wiring away from contact with coil, magneto, and gas-insulating tape freely at contact parts.
- Wiring or insulation small for current; amperage use of too small and light wires used for high-tension circuits.** Water current will leak through insulation. Use heavy wire and insulate covering.
- Magneto will not run.**
  - Circuit-breaker of magneto set too far ahead, thus producing slightest spark when time is advanced and causing vibrator to work too weak for operation of motor. Set circuit-breaker back on its stop slightly.
  - Field too magnetized. Use soft iron circuit-breaker. Run magnets to factory, where fields can be strengthened.
  - Spark-plug points too far apart, producing a high resistance that cannot be overcome by the weak current generated at low speeds. Bring points closer together so that about one thirty-second of an inch separates electrodes. Use gauge for setting spark gap properly in magneto plug, as this requires constant attention, rather than do otherwise current from battery.
- Spark Absent**

  - Interlock weak so that sufficient current is not produced to operate coil.
  - Short circuit in wiring, forming "short-cut" return to battery or magneto without passing through plug. This short circuit may be in the plug which may have become fouled with carbon or acid. (See 10a, b, and c below.)
  - Wiring broken; preventing flow of current.

- Spark in Air when plug is placed on cylinder head, but none in cylinder.**

  - Battery weak. The resistance to the passage of the spark is much higher in the compressed mixture of the cylinder than in the atmosphere. Increase pressure.
  - Spark-plug too wide. (See 8a above.)
  - Bring spark-plug electrodes closer together.

- Spark Absent**

  - Battery or magneto weak. (See 2a, 2b, 2c above.)
  - Coil sticks. (See 2a, b, c, d above.)
  - Oil reaches spark-plug at intervals, forming short circuit which is alternately burned off and replaced by fresh. Use the same amount of oil fed to cylinder. (See "Lubricating Troubles," 2a, b, c, and d.)
  - Timer mechanism dirty, forming occasional contact "kickback" between coil and down with gasoline.
  - Timer contactor weak, preventing regular contact between contactor and distributor, insulator and "dress down." Particles of copper from the contactor and brushes may have collected on the contactor, forming a short circuit. (See 10c above.)

- Spark-plug Fouled or Sooted**

  - Lubrication of cylinder excessive, allowing too much oil to reach plug, where it becomes burned by the heat of the explosion and forms carbon. Reduce oil supply to cylinder.
  - Lubrication of cylinder poor in quality, the oil used forming a large carbon deposit when burned. Use only the best of motor oil of all recommended by makers of the car.
  - Mixture of gasoline and air improperly generated, resulting in a large amount of carbon burned leaves a sooty residue. (See "Fuel Troubles," 5a and 5b.)

- Spark Weak**

  - Spark plug in plug too wide, preventing formation of "fat" concentrated spark. Bring plug together with screw until about one-thirty-second of an inch intervenes.

V.—LUBRICATING SYSTEM TROUBLES

- Distribution Uneven, (Some parts receiving too little and others insufficient supply.)**

  - Adjustment of sight level improper (if force feed with individual level and sight feed to each part is used). Turn adjusting nut on top of each sight feed until proper quantity is received by each lead.
  - Strap in pipes of portless receiving lead. If force feed with individual level and sight feed is employed. Remove leads and clean with kerosene. Remove strainer and clean. Reconnect with clean oil.

- Excess Fuel to Cylinders (causing dense clouds of smoke at exhaust)**

  - Beefy plates between crank case and cylinder cover. Tighten nut of plate if adjustment is supplied for piston adjustment. Beefy plates should fill all of openings except those supplied for oil or gas, for which it is designed to deliver its highest efficiency. Place slab of cardboard or leather like size on top of oil or gas inlet, to reduce the surface through which the oil will pass. This is a trouble encountered only during the coldest winter months.

- Oil ring on piston broken or loose, allowing oil against the cylinder to be carried back to the cylinder walls, where it will burn.** Employ expert to renew or retighten ring.
- Too much oil on each of cylinder engaging biting trough for regulating dip of connecting rod is used, causing an excessive "spike" at end of the connecting rod.** Lighten trough by filing it down, if located on metal or on dash. If this is applied in connection with throttle, change to a valve which can be tilted later for all positions of throttle lever.

NOTE.—The above directions are given on the assumption that the proper grade of lubricant is used in the motor.

3. **Leaking**

- Gaskets placed between all flat abutting surfaces and covers, brooks, hose, or worn. Tighten in latter case by means of screw-wrench or old brook, clean with gasoline, and set new gasket in place.
- Ground joints (used at pipe connections of oil leads) worn. Remove old connections of oil leads; clean surfaces of joint; grind smooth with coarse emery paper.
- Packing in stuffing-boxes worn. Loosen nut of stuffing-box, remove packing, and replace with fresh.

VI.—WATER-COOLING SYSTEM TROUBLES

1. **Clogged**

- Deposit accumulated in radiator and pipes from contained use of "hard" water. Drain out system and use distilled or demineralized water as recommended by manufacturers of car.
- Belts and other foreign matter in water. Strain out water and set absolutely clean.
- Tube valves or pipes of radiator broken, bent, or collapsed, preventing flow of water through system. Employ expert to repair broken tubes.
- Pressure too low (temperature is below thirty-two degrees Fahrenheit).
- Lack of anti-freezing solution in water. The amount of solution or other matters are recommended by manufacturer to reduce freezing-point of cooling medium.
- Water in radiator or motor is idle, allowing rapid cooling of circulating water. Turn heavy lap robe over radiator as soon as motor is stopped in order to retain the heat.
- Motor idle too long. If car is standing still and an anti-freezing solution is used, motor should be started occasionally to reheat cooled water.

NOTE.—A frozen circulating system may crack a cylinder or it may damage only one of the water-pipes, the pump, or the radiator. The latter damage may sometimes be repaired by a good mechanic.

2. **Leaking**

- Pump or pipes. Repair stuffing-boxes.
- Water in radiator to carry off heat and cooled by complete thermostat. Maladjustments are satisfactory; addler or new belts or valves may be used to correct.
- Steam formed in radiator, causing water to boil over. (See "Engine Troubles," 7g.)
- Overheating

  - Cold cylinders, increasing thickness of walls and thereby interfering with transfer of heat to water. (See "Ignition System Troubles," 3a, b, and c.)
  - Circulation through only portion of radiator, reducing amount of cooling surface over which heat can be carried. Check for existence of fouling of radiator, portion of which is hot and red hot. Cold portion of radiator indicates lack of circulation there. (See 3a, b, and c above.)
  - Circulating system clogged. (See 3a, b, and c above.)
  - Deposit on interior of pipes and tubes of circulating system, preventing satisfactory transfer of heat, although apparently not interfering with proper circulation of water. (See 3a above.)

- Fan belt slips, preventing sufficient suction of air through radiator to carry off heat from cooling water. Tighten by means of increasing distance between pulleys or whatever other adjustment is provided. If none is available, use a fan belt of a different size.
- Fan blades bent, reducing efficiency of suction of air. Twist adjusting blades to shape again with the fan.
- Radiator clogged, caused by leak; rapid evaporation due to boiling or leak; rapid evaporation of air from cooling system as an anti-freezing solution.
- Running on low gear, resulting in high speed of motor with abnormal low speed of car. Turn car over or back to a higher gear, or if the car is in order to allow cold air to be sucked into cylinders. Avoid continued low-gear running.
- Temperature of water too low when running

  - Air too hot, allowing circulating water to give up too much heat and keeping temperature of motor too high. Check for which it is designed to deliver its highest efficiency. Place slab of cardboard or leather like size on top of oil or gas inlet, to reduce the surface through which the oil will pass. This is a trouble encountered only during the coldest winter months.

# WHAT SALESMANSHIP MEANS

BY HOMER MCKEE

DRAWINGS BY J. J. GOULD

"LUXURIOUS, clean, and dainty," pronounced the advertisement for which somebody had "bumped up" to the tune of several thousand dollars.

Mrs. Jones admired its superb art and typography through her spectacles, sighed deeply, and then ventured to me to buy very practical husband: "Really, dear, I wouldn't wonder that you are here in what you'd like. It's really beautiful."

"The kind that makes the world run the round," quoted Mr. Jones. "Go look at it."

"I shall," said Mrs. Jones. "The local dealer's name is printed down at the bottom. He'll be easy to find."

"By the way, Margaret," said Jones, at the breakfast-table next morning, "you know, if you really like that car you speak of, show up with the check, however he is, and please me. I'll send a check right to find."

"I'm a salesman," says the feet

down. I like the quick action. Three thousand is lots of money, but keeping fire won't sink it any."

"I think I'll buy it," remarked Mrs. Jones—"that is, if it lives up to my expectations." And right there is where good advertising had reached its limit of efficiency. Advertising cannot write a check. That is the result of salesmanship.

Mrs. Jones arrives.

She opens the big door to the salesman with dainty circumspection. She anticipates a blouse of bright silk and elbow, with hair and then an skirt—some stepping daintily about among indoor plants. Instead of which she sees a dirty, ugly light-colored interior.

On the unpolished floor, all stained in smudges, threatening puddles.

She pulls her skirts out of the danger zone. Her searching eyes catch kindly. She is just about to bust a retreat when she sees the greasy sole of two feet protruding from beneath an old "used"

"Pardon me," she ventures. Her remark is directed in the prone gentleman who seemed to be gazing absently in front. "Can you direct me to a salesman?"

"There comes a grunt, and two sharp raps of a hammer on metal.

"I'm a salesman, sometimes," says feet. "What can I do for you?"

"—and long your pardon. You handle the Elizabeth Theoret, I believe. May I look at it, please?"

"There it is, over to your right—hop to it, kids," and the little monologue is concluded by another couple of sharp raps.

In the mean time, modest and refined little Mrs. Jones has managed to find the door.

"That night at dinner husband asked her if she bought the car.

"Yes," she replied, "but not the one I was talking about last evening. I found another much more pleasant. I found a gentleman who showed me another one. In other words, if you are making a commodity sale as to one else is making, and for what there is a

demand, the public will buy it voluntarily—you will not be compelled to sell it. As others begin overhauling the prospect and the prospect and a choice possible between your product and other similar and competitive products, you find yourself more and more the problem of convincing them that your product is preferable. At this point the need of salesmanship begins. The moment the first word of salesmanship is uttered by you, you are now a new industry as well as a new industry which in speedy development and magnitude was to surpass any industry in all commercial history.

The growth of the motor-car industry has been spectacular because it found its development in the fundamental need of the human race to get about quickly and easily. Until this moment, no vehicle fitted the requirements. The street had been slow. The steamship and the locomotive could save humanity only within certain mechanical limitations. The horse was a thing of muscle, and muscles grow tired. Here was a thing that ran where you steered it, and as long as you fed it fuel. It promised a longer hour and a shorter one to be counted to in order to give some of the pleasure, to bring us closer to our desires with greater despatch than had heretofore been possible. It promised to save mankind its greatest enemy—the fulfillment of its craving for omnipotence, which is a fundamental need of the human heart. Making instantly recognizable what the motor-car was, and the heart for "immediate shipment" was drawing.

It mattered little what the car was like, so long as it moved on its own power.

Now it is all different.

Every man with a hammer, a line of credit, and an ambition, has gone into the business of manufacturing motor-cars. And the surprising thing about it is that most of this hysterically conceived and conservatively circumscribed production is a pretty good value. The time was, and not long since, when there was ten hours for every motor-car built. Now there are ten million for every car produced. Every advertising man dig up; meaning that the fellow who gets the order will have to stretch the cigarette stave from his fingers and cross up an scientific salesmanship.

The great army of unemployed theorists have thrown a more than an common mortar with that terrific term—scientific salesmanship. For every man wherever you find it, is usually the makeshift of the academic devil who through out a space of fifty ungloriously under-estimated years has been making his mental "get-away."

Scientific salesmanship simply means getting the order at the lowest price. There is nothing different about scientific salesmanship. It is as easy as riding an electric door-bell—after you find the button. And once you have mastered its very simple principles you can "write them regularly" every day.

Three things are essential to scientific salesmanship. These three things are: A thoroughly good product; a thoroughly good understanding of the product in all its details; and the simple act of telling the uninterested truth about that product to the right person at the right time.

Real salesmanship," says the Theoret, "demands enthusiasm, clear approach, convincing logic, forceful personality, and the ability to present a strong, clear argument. Furthermore, it implies a fundamental knowledge of human nature; the occult power, as it were, to grasp the subtleties of mood and sensation, of harkening to the wailing cry of the brow, the sharp mouth line, the evidence of disapproval. Real salesmanship ability is the outgrowth of a keen, sensitive, and clear-headed, and forceful, common sense, the personal equation, the principles of supply and demand."

Real salesmanship is all that, and more; as the point is, such obscure trouble gives the hungry mind no food.

Real salesmanship is truth, that is all, and truth is the great, broad, and clear-cut word in the dictionary.

As applied to real salesmanship, truth means conviction, conviction, and the method to push your convictions to a conclusion.

Real salesmanship is a conviction. Let us assume that you want to be an unobtrusive salesman. You have several goods, and caught the idea that big things lie in it. All right. Follow our definition and see where it leads you.

First, get a really good product and learn it by heart. Know every advantage it offers. What happens when it has been sold? How does it feel? How good a thing, you automatically get enthusiastic and ambitious to convert others to your newly found good. You believe when you say, and you say when you believe. That's conviction. You can sell the truth about your product only for it is good and the truth is in it. No man can sell the truth without knowing it. He can't sell the truth if he doesn't believe it. If you have a good motor-car, from radiator to rear axle, —it means to tell the whole truth about it. You can't get away with it. You can't get away with it in your prospect, you make his mood for him.

Second, know your product so well that you can give a good motor-car regardless of price. Praise takes care of you personal behavior and appearance and address. You can't get away with it. In these simple words, he who is advanced and he is clear and he is clear and he is clear. Back to mental days they need to say that

"a tongue cannot serve a king without becoming corruptly. So with your salesman, if he carries a false prospectus to a salesman, he is his master. King Philip's Opinion, he lives up to his task, and it doesn't take a huckster to tell him that he is a successful line—his job tells him that."

The point is that your theorist has only grazed the edge of a great principle—he has not comprehended it, grasped it, it and put his hand on it. It would say to the salesman: "You may have been rewarded by the pharisee of the theoretic sales authority. If his logic has bothered you—forget it. It is better forgotten, anyhow."

"The thing for you to remember is that on the salesman the whole future success of the motor-car industry now hinges, and that you yourself can be a salesman if you go about it simply, instead of academically."

Don't forget the three essentials: a good product, a full knowledge of that product, and then a truthful statement of what you know about that product. This is real salesmanship—and it's absolutely all there is to real salesmanship. This definition covers and implies all the vague generalizations that the Theoret has written in."

To the manufacturer of motor-cars who proposes to succeed—meeting all of you: "You have adopted efficient engineering. You have perfected a product at the rate of billions of dollars. You have spent another billion in type and printer's ink and expensive copy. You have also had the prospect up to the buying point—then, alas, too often, when the prospect brings his money to your door, you send a drowsy, half-bled fancy graduate out to meet him. Give proper attention to your production—the fact is, however, that the thing we which your production depends is not a thread, but a capable set of eyes—a salesman with truth in his eye, an intelligent individual who can look the world full in the face and say, 'Yes, this is the thing advertised. I can tell you about it.'

A great department-store merchant evolved a great idea. He dreamed that he could sell a certain kind of very good soap at a certain price and in a certain way, and make a million profit. He set expensive experts to work building a plan. When the plan was complete it represented a superb pyramid—but the pyramid was upside down and the apex rested on the head of four-dollar-a-week Lincoln, the manager. It fell down. It decreed to fall down. Any plan which is upside down decrees to fall.

So with the sale of the automobile. If your life were at stake, would you have your own to be a

Salesmanship implies a knowledge of human nature

leave at whom the jury laughed, or would you say to a man of power: "I am innocent. Study all the books. Tell me the way the truth?" Here similar is the matter of selling a particularly valuable product—your motor-car outfit! Don't underestimate the importance of the man on the door. He is your only possible point of contact between you and the man who buys. The day of the order-taker is gone. Motor-cars from this minute on are to be sold—not bought.

And, in passing, remember that only the really good motor-car is going to survive, because it is the only sort that the man on the door can safely left to itself about.

"But I won't go!" Molly had cried, stamping her foot vigorously. "I won't! I won't! I won't!"

"My dear child," said the Colonel in his most manner, the manner that always went with his most to the point, "believe me, you are doing a very foolish thing. I shall see you off myself, although I have most important things to attend to tomorrow.

And perhaps if I had known of your other girl than Molly Wilder the Colonel's confidence would have been fully justified; but unfortunately for her father's plan, Molly was herself the daughter of that same respectable parent, and had already come into a certain portion of her inheritance in noble estates if not in power. Not such of her time was wasted in such an effort as would have been the case had her help been called on, or in futile arguments with an unreasonable father. She too realized that it was a matter for a close and a long study, and she had plunged into the question or eleven innocent trucks that were to carry her modest wardrobe, she found especially, even under her father's eye, a scribble of notes in Winktop's back of an envelope which she remembered as follows:

DEAREST,—Am to call on Podatic tomorrow at two unless you interfere. Do something! I don't know what, but do it! I am yours always,

MOLLY.

Which little love letter was surprisingly handed to the understanding Balette, that also little package of intrigue who served in the capacity of maid to Molly, who, with sympathetic intuition, knew at once, without words of explanation, for whom it was designed, which knowledge, with all those unmistakable expressions of the eye which most be seen to be concealed, she conveyed to her father, who, when he would deliver it—far out! And deliver it she did. It was shortly after midnight when Balette, in possession of a telephone appointment with Winktop on urgent business, set out worthy on a subway train bound for Brooklyn.

By George! muttered Winktop, as he took in the import of the message, "what a respectable degree he is!"

"Oh, Molly—she is so good! Father?" whispered the little maid. "But what about the letter?" she asked, indignantly, her eyes filling with tears.

"I don't know who is going to stop you, my dear Winktop, presently."

"Why, said Balette, with a note of surprise in her voice, "you are, M'lord! Winktop—are you? Miss Molly she says to me M'lord! Winktop will stop you."

"Oh, she said that, did she?" said Winktop. "She really thinks I can stop it, does she?"

"No—she does not think so. Unless you will, you'll see her out or not?" said Balette.

In the face of such confidence as that there was no need for Winktop as a married man to do, and that was to declare his intention to her, the returned letters that he would—that he would—what that he would do something, anyhow.

"You tell her for me to tell Balette," he said, gallantly. "She won't say to Winktop on the Podatic or any other ship."

"Oh, James, James," splashed" cried Balette, ecstatically.

Winktop could not repress a smile over her enthusiasm.

"You see to be glad, Balette," he said. "Now I should have thought that a little French girl like you would have been glad to go back to Paris."

"You mean," said Balette, "I mean that you, I should be glad; but now! Novel! Novel! Not without James!"

"I don't think I know James!"

"He has no Colonel's chauffeur," said Balette, blushing deeply.

"Oh!" laughed Winktop. "I see—you are engaged to be married?"

"No, m'lord," said Balette.

"But you expect to be married?"

"No, m'lord," quavered Balette. "We are married since two 'twelve—but it is a secret, m'lord." So Winktop could not but be gratified.

"I see," said Winktop, gravely.

And then, as the red sunlight above the light of a red sun dawned upon Winktop,

"Balette," he said, after a few moments of deep thought, "will you please write a little note to your husband for me and tell him it is that if he really loves you he will be so ready what I tell him to do to amuse me?"

"Ah, m'lord—will it should get James into trouble," said Balette.

"I'll get him out of it," said Winktop. "I'm getting a new car myself, and if James gets into any kind of trouble with Colonel Wilder or my servant he runs here as good as job with me as he has now. Besides, Balette, you will miss Miss Molly to be happy—"

"Sure do!" said Molly, fervently.

"Well, then," said Winktop, "it is all right."

And that is how it came about that, when at nine o'clock the next morning, Colonel Wilder's limousine rolled up to the front door of the Colonel's and his daughter and Balette the maid down to the pier where the Podatic lay ready to depart for foreign waters, the chauffeur, in the name of the Colonel, had puggies and furs, was—well, he wasn't James!

III

"Four twenty-three, North River, James," said Colonel Wilder, gruffly, as he entered the car after having first seen his daughter safely stowed within. "You are right, James—or rather the man who was not James—fortunately."

The chauffeur or he leaped forward and proceeded down the Avenue at a brisk pace, as far as the Fifty-sixth Street, and then, stopping in any, paying an heed whatsoever to the restraining hand of the traffic signal as late there, plunged forward as if an oak of the road had ever existed. Minute indications of the law of the state always served the

Colonel, and he was about to reconvert with the chauffeur when, much to his surprise, the car with a broad sweep around into Fifty-sixth Street, passed its way westward, instead of leaving straight on down the Avenue as it should have done.

"What the devil is the matter with you this morning?" demanded the Colonel, prominently, lowering the window and addressing the chauffeur. "What are you doing this way far?"

"In a moment, Colonel," was the chauffeur's response, "and a minute please."

The plea could hardly be ignored, for all the chauffeur's attention was required to make the turn at Twenty Avenue without colliding with a certain car, but then, to the Colonel's amazement, the motor was not speeding westward to the Park.

"We're not going to Yorkton!" roared the Colonel. "Very sorry, Colonel," said the chauffeur, "but

I've been up against you!" protested the Colonel, as Forchelder here to night, and just then, strange to relate, the mechanism seemed to right itself quite as suddenly as if it had gone wrong, for the chauffeur, feeling himself free to face with a large motor-truck laden with coal, with a nod effort to regain control once more speeded busily in bringing his car to a standstill. The Colonel was just one and a half seconds in getting out of the limousine, and the estimable James was an less quick, taking care to be under the vehicle before the Colonel had a chance to inspect his features.

"Get a move on there, James," the Colonel snapped out impatiently, as he glanced at his watch. "We've missed the steamer, but, by George, I can't afford to miss my appointment with Governor Blagden at one-thirty. Molly, you stay where you are. I'm going over to that house to telephone the office."

Tommy Jackson, divested of puggies and furs, grinning back at him from the chauffeur's seat

there's something the matter with the brakes, and I can't see to stop of the power, sir."

"Can't stop of the power?" roared the Colonel, and very much excited.

"No, sir," replied the chauffeur. "That's why I stop at Fifty-sixth Street when the car had up to his hands. The gear's gone wrong in some way, and the only thing for us to do is to stick to the clear tracks until she runs down."

"Here we wait through all sorts of antics with which and leaves it. If trying to make anything out of that would save the day."

"But," protested the Colonel now again in the verge of apoplexy, "we'll miss that steamer—it'll be just as well now—"

"It's afraid on, Colonel," returned the man who was not James, "but what can I do? I can't take a runaway car down a crowded thoroughfare, sir, and I'm sure you don't want to kill as all with a small inch like a motor-car on the highway to be." "Well—about it—don't they say any?" cried the Colonel, panting with rage.

"Nothing can stop but to let a tire at a stone wall, or a head on collision, till the power gives out," said the chauffeur, still manipulating the machinery. "It's our stunt, Colonel, to steer for the clear route of the street, and pray the Lord that when we get to Hudson Bridge the draw isn't open."

The Colonel sank back into the cushions of the car dumfounded—such dumb and foundered! Balette's eye twinkled; and Molly, with a huge gasp fixed upon the chauffeur's back in fright almost, betrayed a confusion in the hour of danger that was truly admirable. As for the car, it sped on and on and on. Everything along the road seemed a confused blur. Fortunately it was at such an hour of the morning that there were no school-children on the highways to add to the peril of navigation, as that with moderate skill there was little real danger, save when a crowd of children's feet was to be encountered, and then the man who was not James dutifully avoided. That as far as that street was concerned, John Gilpin on his famous ride was in no worse state than was Colonel Wilder at that moment, and the old gentleman fumed accordingly, and it was a relief to Molly that he did so, for if it were by the trouble of avoiding and beating herself by the only joy and triumph that must have come in her— "but she says," at half past six, with the Colonel grinning and very much excited, and notwithstanding all the whoops without— "Hiring up! the River Zone, and about the time in the Podatic was passing Sandy Hook the morning of his next night passed through River, headed for Forchelder, outwardly apparently under perfect control, but in reality, if the chauffeur spoke the truth as few of these pretend as the

"Well, if I don't see the pre-arranged compliances

The Colonel started along, but he had not gone far when a cherry tree behind him reared him to him.

"The long, Colonel!" cried the voice, which sounded rather familiar, and the Colonel, pausing in his walk and glancing back, was transfixed by the sight of his limousine. His daughter and her maid, speeding up the road with no less a purpose than Tommy Winktop, divested of puggies and furs, grinning back at him from the chauffeur's seat.

"Well, I'll be lordly!" he began, but realizing that words were useless he concluded his way in falling silence in the railway station, where, fortunately enough, he caught a train back to New York which enabled him to meet his appointment with Governor Blagden without any unreasonable delay. In fact, he was only twenty minutes late.

IV

That the young people had lost no time was shown by the fact that they were waiting for the Colonel's arrival at the place of meeting a telegram for him which she received there. It read very briefly:

If you have messages to add please to send them now. (Are working admirably. Wife and I return aboard of her this afternoon. Will go out on to Plaza. No more. Love from both.

THOMAS WINKTOP.

The Colonel stared his throat vigorously, and then, strange to say, he laughed.

"Sorry to be late, Governor," he said, folding the message up and putting it into his pocket. "There are some things that take precedence of business. My daughter was married this morning and—"

"Good! Fine!" said the Governor.

"Yes," said the Colonel. "Married one of the cleverest young men in New York—far below—very successful—well-off, and an fortune-hunter. When I think of some of these club-woman boys, with no brains, that pass for the real thing hereabouts, and really that she might have chosen that sort—well, I've—no! glad to have a chap like Winktop in my family."

"I congratulate you, Colonel," said the Governor. "We'll all take to one some-how the that."

"Thanks," laughed the Colonel. "You can bet your shavers of re-election that I was completely carried away by misadventure."

And then, checking quietly over his job, the Colonel added the page, and sent the following wire:

MR. AND MRS. THOMAS WINKTOP.

THE PALACE.

Congratulations. Will dine with you at night. Have proposition for Test, and love for Tom both.

BALE.

# Specify the Tires Which Reduce Car Expense

## Service Security Comfort Economy

These are the *sure extra values* you get when you insist on

## Firestone Non-Skid Tires

The service of longer tire wear and less car repair by extra thick, tough, resilient tread.

The security of sharp edges, abrupt angles and deep hollows, which grip the slipperiest pavement, the slickest boulevard, the muddiest road. Skid, slip or mishap cannot occur.

The comfort of car springs aided by a built up and unqualified thickness of high percentage rubber tread.

The economy of tire and car bills reduced, of fullest traction assured.

Most Miles per Dollar of Cost

Most Miles per Gallon of Gasoline

Least Miles per Dollar of Car Upkeep

we proved Firestone accomplishments.

HERE are seven hundred and fifty thousand car owners in the United States alone.

Three million tires will be constantly in use this year, and far more than that will be bought.

Yet it is safe to say the vast majority of owners outside of the experienced and knowing driver will give little study to the tire equipment of their new cars. It has become a habit to accept, without question, any tires with which the car happens to be equipped.

The car is studied from motor to lamp-bracket. The tires, on which the full efficiency and continued service of the car depend, are taken for granted.

Beginning with January 11, at Madison Square Garden, New York, the car manufacturers will be showing their new models. You will investigate them all before you buy. That's good business.

Continue this investigation and learn every point about your tires. Resilient, long service tires such as those of Firestone make, will add to the value of your car, will give that car protection and final touch of superiority which you want your automobile to have.

Tires in which quality or workmanship are skimped can add nothing but tire expense and car repair bills.

A good car with inferior tires is like a mansion with a leaky roof.

Tires, to give you the service they should, must be built to the absolute standards established by actual road conditions, everyday road emergencies.

It is therefore of vital importance that every car owner or buyer be sure the tires which he places on his car measure up to this positive basis. It is just as vital that he specify and insist on the tires which will meet all essentials in the fullest degree.

If the tires which are on your new car don't measure up to sure values, you don't have to take them. Demand the tires you want—you will get them. Guesswork need not enter into your decision in any way.

Guesswork has no part in the building of Firestone Tires. Nothing but material which will certainly meet every road demand, nothing but design and building which will master every emergency are employed.

Specify the tires which have never had an off season in their twelve years of leading quality. Insist on the tires which are backed by the personal responsibility of the builder, the tires which bear his name.

Get the unbiased guide book to sure tire values and service, "What's What in Tires," by H. S. Firestone.

**The Firestone Tire & Rubber Co.**

"America's Largest Exclusive Tire and Rim Makers"  
Akron, Ohio All Principal Cities

## Sure Standards of Tire Worth

**Fabric**—Finest grade combed Sea Island cotton, tested and inspected, filled with pure Up-River Fine Para Rubber, built up wall by wall.

**Cushion Layer**—Pure Up-River Fine Para, applied layer by layer and cured into one solid piece of fullest resiliency.

**Breaker Strip**—Combed Sea Island cotton cord filled with pure Up-River Fine Para Rubber.

**Tread**—Extra thick though light in weight. Scientifically exact proportion of pure Up-River Fine Para. Must be tough yet resilient. Built layer on layer by hand.

**Side Walls**—Extra high percentage of Up-River Fine Para, built to liberal measure of thickness.

**Bead**—Combed Sea Island Cotton Cord, filled with Up-River Fine Para, pressed into foundation of extra strength and cured into tire.

These are the Standards to which Every Firestone Tire is Built

# Firestone

## Non-Skid and Smooth Tread Tires

# WANTED 500,000 MOTOR-TRUCKS

Some Reasons why the Business Men of America will Cease to Spend \$7,327,500,000 Annually upon Horse-drawn Vehicles

BY THADDEUS S. DAYTON

**I**N a hundred big offices in this country are some very various and interesting figures. The figures show that taken for statistical facts here, they are as astounding, very if not that clear, reliable, and a wealth of documents behind them are proof positive of their accuracy. All had practically the same conclusion. The offices are those of the motor-truck manufacturers—the commercial men, who they often call themselves, and they were in a market for half a million motor-trucks and motor-wagons at the lowest valuation, an immediate market, based on present conditions.

There are 20,000 motor trucks and wagons in operation now, the greater number of them installed during the past five years. Practically the first of these came into existence just two years ago. Truck reports calculate that in the latter half of 1912 and the first half of 1913, 43,000 more business vehicles will be built. The motor wagons and trucks are being represented investments of \$60,000,000; the new will cost approximately \$122,000,000, the demand for better and larger power trucks having increased.

The extension of the market this year, calling for half as many more trucks and wagons in one single year, has naturally encouraged the manufacturers. It is not so much that, after years of experiment, the trade finds itself able to produce ones that will stand every test to be put upon them, but that it has at last made the business world see the success and realize that horse-drawn vehicles are an antiquation in the advance of any commercial enterprise. Enthusiasts say that 5,000,000 motor-trucks are easily possible in the America of a few years hence. Conservative manufacturers claim to 1,000,000 as the market within reasonable years, and directly at hand, the number that would be set right to work today if they were already built and horses should be eliminated from country roads and city streets.

Even half a million motor-trucks seems a vast number as a matter of possibilities in the country. But it is not large. There are 30,000,000 horses in the country. Carefully compiled statistics show that there are 2,500,000 mules and pack animals in the same. These could be supplied by one-fifth that number of motor-trucks, or 500,000. The killing price in is the greatly reduced cost of operation. The daily cost of one motor-truck is three cents, that of a horse and team is ten cents. In a year the comparison is even more striking. The business men of the country are spending \$7,327,500,000 to operate their horse-drawn trucks. If they gave up horses and used only motor-trucks, the cost would be at \$1,200,000,000.

It is becoming less and less difficult to get business men to see this, though the real economy of the power wagon is not comprehended as yet by many of the smaller storekeepers and factory-owners. For one thing, the number of motor-trucks have not reached those in their carefully planned campaigns. They are after the recovery which can be secured for contracts of twenty, thirty, fifty thousand dollars, or even more in a lump, and the smaller men are not approached. Frequently they will be examined, if in the mean time they themselves are not in the market for the motor-wagon and order without solicitation. Here and there, all over the country, are "little houses" who have grasped the situation and are making the motor-wagon and a few cheap retailers, the farmer is among the relatively few buyers of single "commercial cars."

The motor-truck manufacturer is not disturbed at this, however. His customers are not in a good deal of money to get, because each individual car has to be studied with elaborate calculations. Therefore his profit at this stage is with the large campaign. His selling campaigns are the most dignified and systematically prepared of any manufacturer. They cost rather more than any other, but they are not made to ever fail. His is a commodity that is necessary because it introduces economies that can be proved readily. He is finding, the customer, that a good deal of money is being lost by the industry, men who are in the sweat and is asked to spend thousands of dollars in a trip.

It is only within the past few months that the future market in the motor-truck business has been taken into careful consideration and studied as a vast commercial proposition. The motor-truck industry has only recently been looked upon with an eye to "big business." Today, the National Motor Vehicle Association of pleasure automobiles, it is relatively small. The total number of employees—workers and clerks—concerned

is, it taking all the factories into consideration, is only 80,000, and the annual pay roll scarcely \$60,000,000. The figures are of course not yet set out. The average motor-truck now costs about \$2,500. That is nearly twice as much as it used to cost. In 1902, when motor-trucks were first heard of, the average price was \$1,000. By 1910 this figure had risen up to \$1,500, and by 1912 to \$2,250. Within the past two years the price has advanced still farther, to \$2,500. This does not mean that the motor-truck is any more expensive a proposition than it used to be. As a matter of fact, every vehicle turned out now is far cheaper than any of those of six or ten years ago, were they efficient, rapidly, reliability, and cost of operation now covered. The motor-truck of 1902 at \$1,000 would be a bad purchase to-day compared with the motor-truck of 1913, which almost pays for itself the first year in its lower cost of operation. Here is an actual instance of the motor-truck's real savings to the owner.

In September a contract with a certain important concern in Indiana was made by a motor-truck manufacturer in New York. The contract called for something like thirty trucks a truck unit. This is the ordinary product. The amount of the contract was a little under \$90,000. There was already a delivery contract for the same thing with another of the trucks and stables established a quarter of a century before, and relatively very expensive in their sphere. The motor-truck manufacturer put out on the delivery system, planned for the abolishing of the stables and the sale of this property and all the horse and wagon property, the building a garage and figured out a balance-sheet which showed that, by the expenditure of less than \$80,000, no operating expense of \$70,000 a year could be incurred. The motor-truck men are steadily pushing their product and developing local transportation as it has never been developed before. The motor-truck is not only being sold to farmers, but engineers and executives of law-abiding firms who are imbued with the understanding of this new location and the wit and judgment to apply it so that money can be saved.

Men like these are not visionaries, though they are not without a certain amount of imagination. They are men who are like those who worked on the telephone years ago, or those who brought the electric incandescent in preference. They are practical men, and are advancing step by step. If he has been put in a single place, "They dream, and then work day and night with the tools of the present world to bring about what they have seen."

The one unchangeable idea in the mind of the motor-truck maker is that less or twenty years from now all of a business of entering gain absolutely inevitable. But at the same time he says openly that this development will not come of itself, but will be the result of constant work and teaching.

If half a million motor-trucks are to be sold and installed to take the place of horses, it means a mighty business, one almost too vast to contemplate. It will amount to not less than a billion and a quarter of dollars, probably even more, considering the way the cost of commercial cars is rising. Few American men manufacturing industry can possibly give up those proportions. Here is a new business, one scarcely yet on its feet, with all these possibilities that are being made manifest, and many of them are saying that such estimates as here have made are far too low, that the American people have so far been slow to grasp the possibilities in motor-trucks and motor-wagons, and that when they are understood the market will grow in proportions literally undreamed of.

Meanwhile every motor-truck manufacturer is working hard to get in his factory, to his mind. The world of industry means just one thing to him, a place in all motor-trucks. He is planning his campaigns and advertising in his factory, to his mind. He does not go back and forth asking for orders. In fact, there is none of the usual business of going through the hands of the customer. He is not a peddler of anything that way. Each time he must present a plan for economy, and this necessitates a close and accurate knowledge of the weakness of various industries.

Each plan is different. The manufacturer and his experts must spend much time in studying local conditions, the character of the sections of the country where the trucks are to be used, and the character of the people who live in it; the climate, the state of the roads, the nature of the soil, and the kind of soil so insignificant to figure upon. The requirements of a plant in Massachusetts may be a very different proposition from that of New York, or Jersey, or Indiana, or New Orleans, and, next—and probably still more radically different treatment from covering the same

proposition out in Denver. All of those conditions, peculiar to each division of the country, the motor-truck maker must take into consideration. The motor-trucks delivered must prove profitable to the buyer. The generality of business men do not understand the new product, and it must be made available explained to them. Even then they are in the hands of the motor-truck manufacturers and must trust to their judgment.

This puts great responsibilities on the motor-truck and wagon makers. But they have risen to the occasion. The failure of the motor-truck depends upon their active work. It would surprise most people to know the infinite care and toil the motor-truck producers put upon their plans to create a market for their product. Their study and analysis of local conditions is but the beginning of every individual campaign. After those conditions are known, there comes the most important part of the business—the operation of each plant. It must be studied out to the last detail. Nothing must be left to guess-work; there must be no half-and-half methods here. A vast quantity of information must be assembled, and then painstakingly related to table and chart form, a new system of sending out people devised, a system that is probably revolutionary and certainly most improvement on what has been done before.

There is no other way. The inventors have to be made to great. The customer does not reason to a level-headed dealer because enthusiastic men ask them to do so. It is true that the motor-truck men are beginning to do so. It is not only a matter of knowledge and practical ideas. They are developing their great market because they show certain results as they are being possible, and the business men find themselves obliged to believe. Before he signs his contract he has before him tabulated information as definite as a builder's specifications—every man, for one, is a hard-headed business man.

In a study of the big future market of those vehicles their present disposition is astonishing. New York is the most prominent, with 7,200 trucks. The relative figures of the different States will surprise many people. Good roads do not seem to count, especially in the present stage of criticism, according to the most recent figures, are the following elements. Next to New York in Pennsylvania, with 5,000 trucks, and also in California, with 4,000 trucks. Next in California, Indiana, Oregon, Massachusetts and Ohio, California having 2,100 to her credit and Massachusetts 2,045. Ohio is very far behind with but 1,125.

Indiana is well down the line with 870 trucks, and New Jersey has only 1,000. The only other State having the thousand mark is Michigan, with 1,145. The Southern States fare badly in the tabulation. Texas is best of all, but with only 200 trucks, West Virginia has only 22, Mississippi but only Louisiana's record is but 44. Iowa is not up to the 500 mark, and Missouri but a little above it. For its size Rhode Island is doing its motor-trucks, with 408. Virginia has only an even hundred.

Until now the big trucks have been relatively few. Statistics show there are only 1,000 five-ton motor-trucks in the country, and only 1,000 of four-ton capacity. The popular vehicles so far have been the light delivery wagons and the one-ton truck, together aggregating 10,000 of the former and 6,000 of the latter. Of five-ton trucks there are 2,500 in all of three-ton trucks, 1,000. But these proportions are changing rapidly. The motor-truck maker is now turning out the bigger truck. People experimented at first with the wagons of less load and the smaller trucks. It has been some time that the maximum power vehicle to make its way. This is a question of the quality of the product, every year sees a better product on their part. Five, seven, three years ago many five-ton trucks of the standard quality of the day could not have been built. Moreover, even larger and more powerful trucks are in vogue. They are becoming profitable and an article in their own right and as responsive to the driver perched high in his seat as a pleasure car is in the hands of a girl.

The motor-truck maker is not only a manufacturer, a close rival of the pleasure car as a business proposition that is a maker of dollars. Its growth has been slow, steady, and substantial, and commercially the motor-truck is the industry of the future. The men who have made investments in it, and those who are investing conditions for that purpose, see handsome profits and an certainty in their future. It is especially gratifying because it remains permanently with the reliable, progressive maker. Motor-truck manufacturers are not only producing a new product, but are selling of pleasure automobiles, but, as the demand for the former increases, there is a growing recognition of the possibilities of the motor-truck that is inducing some of the other automobile people to enter the field.

# KEEPING TROUBLE OUT OF TIRES

BY JOHN S. HARWHITE.

**T**HE tire problem is one that is always old and always new. It is the one ever-present bane of the motorist. It is a problem upon the solution of which years of patient experiment have been spent and millions of dollars invested. With the increase in the weight and power of the cars have come higher average speeds and hence ever rough and rocky roads and through sections of the country highways considered closed to all forms of transportation except horseback. This calls for extra service and endurance from the tires, and he it said that, all things considered, they have stood the test nobly. The modern tire is a marvel of workmanship and design and is the best product that it is possible to create for the purpose. Nevertheless, the tires can be easily abused, and neglect of a few essential details may shorten out the life of the average motor engine in half—and it is this "care" that is the most expensive part of the tire.

Every motorist understands that the engine and the other moving parts of his car require lubrication—moving parts in the sense of those that rub in contact with other surfaces, that is. But the tires form an exception in this rule. Oil, grease, gasoline, or any of the other hydrocarbons has a disintegrating effect on any rubber with which it may come in contact. This effect is not immediate and will not prove serious if the tires are wiped clean after each day's use, but to allow the car to remain standing in a pool of oil or in a greasy floor in parking tire trouble as surely as an ungreased nut invites a puncture. The application of a heavy oil or fat to road surfaces has been found very effective as a means of laying the dust and producing a hard bed that will endure for several months. It may be assumed that to run a car over long stretches of these freshly oiled roads will result in serious harm to the tires—and such would be the case were the oily nature allowed to adhere to the tread for an indefinite period. But it is the tread is thoroughly cleaned each day it is hardly probable that the oil will damage the rubber so much as would a rough road.

In the above paragraph the tires were closed as "moving parts that rub in contact with another surface." "Moving parts," they certainly are—however they are attached to a car that runs—but that they "run in contact with another surface" may be doubted by those cautious drivers who always slow down when rounding curves and never "skid." But side skidding is not the only form of tire-slipping that occurs on a modern car. At high speeds the wheels slip on the road surface to an extent little imagined by the driver. At speeds of thirty miles an hour this slipping of the wheels is slight, but when the automobile rate is reached the rubbing of the tires on the road increases out of all proportion to the increase in

speed. At this speed a thirty-six-inch wheel will slip about six complete revolutions during each mile-minute-of travel. This will amount to a total slippage of about 2,000 feet every hour that a subliminal speed is maintained, and it will easily be realized that the tires are called upon to withstand a tremendous strain. When the greatest amount of slippage takes place it is hardly probable that the tires are bearing the full weight of the car, as it is the continual "bouncing" at high speeds that causes the wear on the tires—rather than the road travels with them, but nevertheless the wear on the rubber tread is tremendous. It is small wonder that tires are changed frequently in races in which high speed prevails, and it is a marvelous tire that will withstand the wear recommended in ten or eleven hundred miles of track racing.

A parametric tire is nothing but a collapsible air tank surrounding the outer circumference of a wheel. Thus the car, literally, "rides on air." It is the compressibility of air that produces the cushioning effect when an obstruction of irregularity in the road is encountered by the wheels. The tire is depressed at the point of contact with the obstruction and the area of the cross section of this portion is thereby reduced. This, naturally, compresses the air in the tire, and the shock, instead of being concentrated at the point of contact, is distributed throughout the entire interior of the cushioning space. The compressed air stores the energy imparted to it and produces the "resilience" for which the pneumatic tire is famous. If the air in the tire is already highly compressed before the shock takes place the additional compression, or absorption of the shock, will not be so marked as though the tire were not pumped so "hard." On the other hand, a tire containing but a relatively small air pressure will be exceedingly susceptible to depression of its tread when an obstacle is encountered, and the rubber at the point of contact may be flattened almost to the rim. Thus a "hard" tire is able to encounter many abrupt inequalities in the road, but will not absorb slight shocks and jarrs; while a "soft" tire is sensitive even to the slightest obstacles in the road, but will be overladen at the first suggestion of "rough going."

It is to be noted that a tire containing too great an air pressure will cause the roads to seem rough; while one that is too soft may prove comfortable on good roads, but will provide insufficient cushioning for rough surfaces. But, strange as it may seem, a hard tire will last longer than will one that is never pumped to the proper pressure. In the case of the latter the tread and fabric are depressed at the slightest irregularities and a gradual wearing of the material occurs. A tire containing a high air pressure, however, retains its contour under all but the most severe conditions, and the fabric and rubber are, therefore, not so susceptible to leakage or weakening. The average pressure recommended by the manufacturers

is about twenty pounds per square inch for each inch of diameter of cross section of the tire. For example, a four-inch tire should be pumped to an approximate pressure of eighty pounds per square inch, while one six inches larger should carry about one hundred pounds.

It is a simple matter to determine the pressure of a small pocket or pump-pressure gauge is available, but it is not exactly easy to "guess" at the proper hardness of the tires. A pressure indicator can be obtained for a small cost and should form a part of every well-equipped tool kit. It acts as a thermometer as well as a barometer; the proper pressure may be roughly approximated by observing the contour of the tires, as they carry the full weight of the car when normally loaded. As soon as the tires are pumped to the point where they retain its shape and do not flatten at its point of contact with the floor the proper pressure has been reached. If the side walls bulge out at the point carrying the weight, however, more air should be pumped until these straighten to the same shape as the remainder of the tire.

The so-called "squeaking" wear of tires, in which a tire will "go to pieces" after only a few months' use over good roads, may often be caused by an improper alignment of the wheels. This may not be detected easily by a casual examination, but it may be detected easily by means of a long rule with which to measure the distance between the rims at the front and rear of both pairs of wheels. If the two wheels of one pair do not revolve in planes parallel to each other in a horizontal direction, the tread of the tire will rub, or will as rub, over the road surface in such the same manner as though the wheel were jolted slightly sideways at the same time that it rolled. The measurements should be taken at points directly opposite each other in front of and at the rear of the hub of the wheel. If the distance between the two wheels is less at the rear than it is forward of the hub, it is evident that the axle or spindle are so bent that the wheels do not revolve in parallel planes, and the car should be taken to the nearest blacksmith or repair shop if the owner desires to save his tires. It must be understood that this refers only to a difference in measurements taken between the forward and rear portions of a pair of wheels and not to the top and bottom.

The case of a tire when the car is out of commission in the water is somewhat different from that recommended for an active tire. When a car is put away for the winter the wheels should be jacked up to relieve the tires of all weight. The tires should then be pumped to a sufficient pressure to enable each to retain its normal shape and then wrapped securely with burlap or heavy paper to keep out the moisture. It should be made certain that the rim is perfectly dry both inside and out before it is thus covered, for dampness will cause rapid deterioration. It may be well first to remove each tire from its rim and to paint the letter with a rust preventive.

Here is the latest triumph of a company which has originated practically every improvement in electric vehicle construction.

That has factory equipment for the manufacture of every type of electric vehicle, from the smallest runabout or brougham to a mighty 5-ton truck—

—And whose experience, gained in the making of this unlimited range of electric, enabled them to evolve this most elegant, comfortable, and convenient of all four-passenger electric.

Without such experience, and the knowledge gained thereby, such an achievement would hardly have been possible.

It took the company who built the first coupe electric—the first electric with the high efficiency shaft drive—the first electric which could take either solid or pneumatic tires—the first electric with full elliptic springs and patented drop axle construction—and the first five-passenger full-view-ahead electric to originate and design.

### The Silent Waverley Limousine-Four

In this wonderful car four separate Pullman chairs replace the usual forward and backward seats. These face forward, the fourth or "tray corner" in front at the right.

Thus affording full four-passenger capacity without obstructing the view of the driver who sits as usual in the left-hand rear seat—the pleasant and visible position, with steering in the front of the other occupants of your car.

This arrangement insures simple and delightful amusements and absolute freedom from crowding. No straddling of backless seats and wraps in the Waverley Limousine-Four—while permitting of greater luxury and greater elegance than has ever before been possible in a four-passenger electric.

The side diagram shows this unique placing of seats, and how golf clubs, parcels, bags, etc., can be stored out of the way behind the two side chairs. A small tray, package, box can also slide freely to center.

Waverley patented drop axle construction permits of a beautiful, graceful low body riding on full elliptic springs as shown in the illustration—a combination which insures easy riding over every road and with any type

while saving current, reducing mileage and guaranteeing year-round service and joy.

Enter on our listless run outside the car—on lifting out of cushions with gray hair, on getting with water or labor-saving tools.

The Limousine-Four will be on exhibition at the leading automobile shows, where progressive electric car owners can personally judge of its perfection.

—and decide if such a splendid car, the last word in four-passenger electric, could have been designed and perfected except by past masters of electric vehicle construction—men who from long experience know the mechanical requirements of every type, from the most luxurious pleasure car to the massive delivery truck.

Let us send you the Silent Waverley Electric Year Book which illustrates and describes the Limousine-Four, the Empire Limousine-Five and the other Waverley pleasure car models illustrated in the left-hand panel.

A beautiful production with decorations by a famous artist—fit to grace an elegant reception with the Waverley Commercial Car Catalog showing types ranging from a light delivery wagon to a 5-ton truck. Address

# REGULATING THE DRIVER

BY H. S. WHITING

**T**he behavior of a motor-car forms the most serious criterion by which we judge the character of the driver. A car is not "dangerous" unless made so by the man at the wheel; there are no evil overtones from the side of the road to the other, through congested traffic, that can cause for a "faulty steering gear"; the time when the automobile was an unknown quantity and when its mere noise was more a matter of presumption than of positive knowledge was long since passed. To be sure, it is perfectly possible for a driver to "lose control of the machine," but also time out of time in the operator's fault, due to high speed or careless running over a dangerous road. And often this loss of control of the car is caused by the driver's "loss of head."

If a sixty or a sixty-two-horse-power motor-car can be driven at a snail's pace through crowded streets and around tortuous turns, it is certain that the manufacturer is not an accident that will occur whenever while the machine is running a sharp curve at sixty miles an hour. Also if this same high-powered car is able to run almost evenly along a road of noise, it is manifestly the driver's fault if the city streets are made hideous day and night with the rattling and rattle of the mangled exhaust. The driver or owner may even be held to be responsible for the noise made by the mechanism of the motor and transmission, for every part of every modern car is ground or finished to fit accurately, and it is only through neglect of valves, gears, or bearings that an undue amount of lost motion will occur and result in disagreeable sounds which mar the machine's run.

Therefore, inasmuch as the modern car is a faithful machine, built only to do the bidding of its driver, it is evident that restrictions must be placed upon the owner or operator rather than upon the size, power, and general specifications of the automobile itself. To limit the size of the motor or the power that they develop is out of the question, for a low-horse-power machine could wreck damage in congested traffic in the hands of an inexperienced operator. Likewise to attempt to regulate the speed of a motor-car is impracticable as well as unnecessary, although such legislation has been suggested many times. In fact, even bills as proposed for presentation before several of the State legislatures have stipulated that every car should be so geared that a speed of more than twenty miles an hour would be impossible. Such a restriction is manifestly absurd, for there are privately owned speedways in many parts of the country where a speed of a hundred miles an hour can be maintained for an appreciable distance without danger to occupants or other vehicles or pedestrians. As long as the automobile is safe, therefore, when properly constructed, the tendency of all modern legislation should be toward restriction of the activities of the driver rather than regulation of the capabilities of the car itself.

The most stringent legislation that has been enacted to regulate the driver is that of compelling every operator of a motor-car to possess a State license that is obtainable only after the proper registration or examination. In many States the chauffeur who is to drive a car for hire must pass a written examination in which he is required to answer questions regarding the operation, construction, and design of cars and their parts. In addition to this, he must demonstrate his ability before the examiner to handle a car properly and must present certificates of good character, sobriety, and a general "sound record."

This is intended to keep motor-cars out of the hands of incompetent and those who are reckless and fecklessly by nature. The owner, so a rule, does not need to undergo an searching examination. It is assumed that a man who is willing to invest from five hundred to five thousand dollars in a car will be fully certain of his ability to operate it and that he will not take risks that are likely to damage the machine—over though he should not be concerned of the comfort of pedestrians or occupants of other vehicles. He must register, however, and carry with him a license that will identify him as the owner of the car.

Such measures, however, have not served to make conditions perfect for the drivers nor popular automobile-ownership though he should not be concerned of either, for that matter. A misguided hundred thousand or so of the nearly a million drivers of automobiles in this country possess certain bad-temperaments that have made necessary several municipal regulations in addition to those already imposed by the State. One of these drivers seems to believe that the automobile has been produced solely as an instrument of noise, and they therefore are unable to run their cars ten blocks without blowing their horns or opening the muffler. This trait has resulted in the enactment of restrictions regarding the use of warning signals, and now a motorist is in danger of arrest in some sections if he blows his horns or toots his electric siren for any purpose other than to avert collision with a pedestrian or another vehicle. Some of these measures may seem rather stringent, but the offending few of the motorists have brought such restrictions upon the entire fraternity. In meeting, as in many another sport or occupation, the interests of the majority must suffer for the offenses of the guilty few.

One of the most annoying of the bad-temperaments possessed by many a driver, and one that has required municipal legislation to render conditions bearable, is the habit of excessive noise. The motorist is necessary to increase the power of the motor. This belief, added to the love of noise and desire to attract attention, is possessed by some owners of motor-cars, has resulted in the habit of "cutting out the muffler" on any possible occasion—even when added power is not necessary. As a matter of fact, the elimination of the muffler adds but a very small percentage of power to the motor—a power that is never required in the city, where the car should be run at but a third or a half of its full ability at the most. It is only in country touring, when the last ounce of power is required from the motor, that the removal of any material benefit except a warning signal. Therefore, to use the ratchet on the city streets is to be sure open to the charge that it is rilling for its best means of power for work that runs the smallest and cheapest of the modern automobiles can perform with scarcely more noise than that given forth by a well-designed elastic vehicle. The constant and needless use of the ratchet, however, is undoubtedly his case, but those should be restricted in the country roads or the privacy of the garage or driveway. Many cities have already adopted regulations prohibiting the use of the muffler cutting on the public highways, and others are following their example wherever it is found that the motorists are so blind—so deaf, rather—as what represents courtesy to the majority of the public.

It might at first thought seem strange that the boards of health should concern themselves with the automobile, and yet many have taken an active interest in the question of the physical effect on the popu-

lar of the smoke emitted by many of the motor-cars. These dense clouds of smoke-like smoke are caused by an excess of oil that reaches the top of the cylinders and is there burned by the heat of the explosion. This arises from over-tilting of the valves or whatever other device are used to prevent the oil from reaching the combustion chamber. Although these boards of health probably realize the truth of the advice, "Too much oil is better than too little," they have also discovered that the fumes from this burning excess lubricant contain an unwholesome proportion of carbon monoxide. Two parts of this gas to one thousand of air constitute a mixture that is dangerous to breathe, and as twelve parts of a smoky exhaust can be compared to carbon monoxide, it will be seen that the air in an enclosed space into which such a motor may be exhausted would not be poisoned. It is hardly probable that smoking motors could violate the outside air to a really dangerous extent, but it has been decided by experts that the poisonous gas can be present in sufficient quantities to affect the general health of the population. These remarks have resulted in the passage of municipal laws regarding the driver of a smoking automobile liable to a fine or revocation of his license. A faint trace of blue smoke emitted from the exhaust is not harmful and is an indication that the motor is well lubricated, but the dense clouds thrown out by some cars are entirely unnecessary, and the drivers of such cars are the offenders against whom these laws have been aimed.

Improvements in motor-car lighting systems have been considered a few years ago. Practically every motor car nowadays, whether of high or low price, is provided with powerful head-lights of the acetylene or electric type. These lights are sufficiently strong to throw a beam several hundred feet, and are therefore exceedingly useful for night travel over dark or unfamiliar roads. They are hardly necessary on the well-lighted streets of a large city, however, but many motorists use them merely because "they have them," and it is so simple a matter to turn a switch that will throw the current from a dynamo or battery to the headlights that many of the most powerful motorists. But these intense rays of light blind the eyes of those upon whom they shine and make it impossible for approaching motorists to distinguish the road or other vehicles which they are out of range of the glare. Consequently, in many cities the use of these blinding lights is restricted to the sparsely settled districts where the street lamps do not furnish sufficient illumination for the roadway, and it is an offense punishable by a fine to employ the full glare on the principal thoroughfares. A sheet of semi-transparent paper pasted over the lens affords an easy means of reducing the brilliancy of the light, but this is a makeshift that cannot be removed readily when it is desired to use the full power of the lamps. Arrangements are provided that enable some lights of the acetylene type to be turned down, while older devices consist of a dull metal disk interposed between the source of light and the reflector. This latter attachment is suitable for either the electric or acetylene type of lights.

Motorists who have a deep regard for the rights of others are largely in the majority, and they are willing to support any legislation which has for its object the regulation of those drivers who are a menace or annoyance to the public, as well as to automobilists themselves. Grounds extended and fair restrictive legislation never less, and never will be, opposed by representative motorists.

A deep-water inhabitant of the Indian Ocean. It carries a lamp at the end of its elongated snout.

A monster of the Arabian Sea. It inhabits the depths 1,000 feet below the surface, and its entire head is phosphorescent.

This denizen of the Pacific carries a luminous lure at the end of a fishing-rod, to attract its prey.

This fish, which was captured in the Atlantic deeps, can swallow fishes much larger than itself, the stomach extending to the tip of the tail.

## FROM FATHER NEPTUNE'S WHITE-LIGHT DISTRICT

## THE ANSWER

In the make-up of the Packard "38" carriage are more features directly appealing to the owner and driver than ever before have been embodied in any one motor vehicle

### *Left Drive*

Avoids the necessity of stepping into the street. This result in connection with other far-reaching improvements.

### *Electric Self Cranker*

Easily and simply operated from a driving position.

### *Centralized Control*

Complete mastery of the car from the driver's seat. A compact arrangement at the finger tips operated with the slightest effort.

### *Electric Lighting*

Controlling switches at the centralized control board.

### *Magneto Ignition*

A high tension dual ignition system, with magneto and storage battery, both of which are entirely distinct from the starting and lighting equipment. Insures Packard efficiency at all speeds.

### *Short Turning Radius*

The Packard "38" turns in a street forty-one and one-half feet wide.

### *Hydraulic Governor*

Avoids "stalling" the motor in crowded traffic; prevents motor racing when the clutch is disengaged; affords agreeable uniformity of road speeds without requiring skillful use of the pedals.

### *Six Cylinders Perfected*

Flexible, efficient, silent, giving motion with no sense of exerted power.

### *Dry Plate Clutch*

Proof against burning and certain of engagement without "grabbing."

### *Forced Feed Oiling*

Especially desirable for "slices." An auxiliary system feeds oil directly to the cylinder walls and is automatically regulated for different power requirements.

### *Six-Inch Depth of Frame*

Prevents body distortion and cramping of doors.

### *Size of Crank Shaft*

The diameter of the crank shaft is 2 1/8 inches. Ample size of bearings insures maximum period of service without refitting.

The sum of these essentials is to be found in no other car. This comprehensive solution, in one motor carriage, of all the chief problems of recent years, compels the consideration of the critical patron.

*The Packard "38" will be exhibited in Madison Square Garden, New York, January 11 to 18 and in the Coliseum, Chicago, February 1 to 8*

**A BID FOR THE CANAL TRADE**

How Denmark is Constructing a Free Port at Charlotte Amalie, in St. Thomas

By John L. Mathews

The good old shelter port of Charlotte Amalie, on the island of St. Thomas, West Indies, is coming into her own again. In American times through the blockade of our boats, it has remained, as the Danes say, an uncut diamond. Now it is to be cut and set among the largest of the Danish crown jewels.

Long ago Denmark was a great nation and Charlotte Amalie a refuge port for ships of all sorts, except the lowly whale of the Indies, a harbor of refuge and repair. It has sheltered on the lee side of the island, with the constant trade winds blowing every second it and the gun emplacements across upon its mountain-top side and around. His Majesty's Blackland's vessels stand brooding at each other as in the by-gone days, and the ancient pirate schooner Lightfoot meets this century old, has carried the mail and occasional passengers for fifty years between the three principal islands of this little group under the Danish ensign.

Many a lot of interceptors and many an armada led in these windward channels or anchored under the lee of St. Thomas. Ever since the steamship came this old port has been ready for it, come whenever it might. No trouble was too great to be remedied at St. Thomas. There was no repeating ordinary or extraordinary that could not be done for any ship that frequented the cove on its lee or twenty years ago. Even today any ship which came from the sea was sheltered in the harbor of Charlotte Amalie and drew up to the coal-docks, and nearly everything that runs in the Indies was lifted out of water on the floating dry-docks. Ships under 3,000 net tonnage can be drawn out on the marine railway.

A shaft leading to a single well with well-equipped laundry and the efficient workmen of this little city. They can erect a new propeller or a single wheel as easily as build a whole new boiler and set it in the ship. Any part of an engine or even the cylinder can be replaced, and, if needed, a completely new shaft. It costs nothing but steel and storage on the goods to land a cargo and load it again, going seawards into the dry-docks to have a plate replaced or any other underwater repairs. Everything that goes up into the city to be sold has a duty of three per cent, but everything which lies on the docks or is stored in the warehouses is in free port and pays no duty nor has any duty.

All sorts of supplies for ships are here in abundance, water brought from the sea and consumed at a penny, made into great concrete storage cisterns, sailors' clothes, stowage supplies, and, best of all, the steaming coal, which comes from the Virginian Capes goes into the hoppers; every ship drawing 275 tons can sit at the coaling pier to take on her fuel. All around the old harbor are warehouses, some of them four hundred feet long, set parallel to the shore and, in fact, built practically up from the water's edge with a track along the front of them to deliver freight in the several doses. Each has a short pier for unloading of cargo. The harbor itself, surrounded by gently rising hills and with the pretty colored city set directly opposite the entrance, is one of the most beautiful to be seen in the Caribbean.

When, in 1902, we made our latest bid for the purchase of the Danish West Indies the Danish people protested. The proposal was refused by Denmark. They the following year that the Danes should make the islands self-supporting, and since 1902 Denmark has been invested in cotton plantations and the Danes will not receive that the group now stands on the crest side of the high-water.

When we reached the port and grabbed Panama and then preparing to build the canal the Danes had a new inspiration.

"Here we are," they said, "directly on the route from Europe to the west. The port of Charlotte Amalie and her islands will become Denmark's roving port with all commerce and traffic in the free port of St. Thomas will be Copenhagen transplanted into a new world. There at the gate of the canal, on the coast of the island, we will set up a great port to be built, we will set up an export and a depot.

"We are six hundred miles away from the American ports, we have no land of our harbor; we must take advantage of our position, our cheap fuel, our manufacturing sites right on the water's edge, our industries and trained people, and get a good share of the South American and the Pacific trade, as well as that of the United States."

A fine lion, and practically, Denmark will now stand as charter for a company with a capital of 20,000,000 kroner (100,000,000). This sum was to be spent largely in the construction of massive piers, which it sold from Berlin in the Danish style, with great warehouses and ships, a large dry-dock, and all the equipment of a fine wharf.

As it happened, there was but a million dollars subscribed, and the company therefore withdrew its charter and the subscribers. In the meantime, however, the Danes, with the aid of the King and Parliament, formed a new company called the West Indian Company. The work is already being put under way. A big dig is being built close to deep water in one part of the harbor, on a narrow, shallow bottom of the shallow flats. The whole operation changed in to be dredged and the material obtained filled in on the flats behind a concrete retaining wall. Concrete piers will be built out into the deepened harbor so that all sorts of big ships can enter and land.

Charlotte Amalie is close to our route, on the direct route from Europe to the canal, only 1,025 miles from the sea, six hundred miles nearer than New Orleans, and can import anything from any part of the world, and make it duty free, and manufacturer without paying duty. All these manufactured goods can then be sold at an 10 to 15 per cent in any market in the world without having to pay duty. Paid waste money for land transportation, or paid any government tax, if any port will enter the port of destination.

**Butter and Margarine**

It has been brought out by recent statistics that the country which produces the largest relative quantity of butter consumes the largest quantity of margarine. That is, the United States, which uses every year some thirty million pounds of margarine for a population of two and a half millions, or at the rate of one and a half pounds per capita per annum, is the most butter-consuming inhabitant. The farmers of Denmark prefer to sell their good butter to the English and consume it margarine, which amounts to about nine and a half pounds per capita for each inhabitant. The French like margarine, but the quantity of margarine is very great and the quantity of butter is very small. The Germans use margarine for the most part of their butter, but the quantity of margarine is not so great. In Sweden every thirty million pounds of the margarine are used annually by a population of two and a half millions. The smallest need in Norway is relatively more than twice as much, for there the population is only some two million, whereas the consumption of margarine is 25,000,000 pounds. In spite of the large per capita consumption of butter in England, there is an additional use of margarine amounting to some million pounds annually. The largest total consumption of margarine takes place in Germany, whose entire population of 60 million consumes every year over 200,000 tons of the fat. A great deal of ghee has been cultivated against margarine by the producers of butter, and when it was sold as a substitute for butter or an adulterant it was well sold, but it should be sold on its own merits at a lower price than butter. It quickly establishes a place for itself in the markets of the world.

**Why Is It?**

It was a fly across on the crystal glass of the window near a dining parlor and flew if going in a straight line downward. The fly never makes its descent without striking the window pane. How invariably some great with their backs to the sea. Can't ever expose their backs to the sea. The majority of cases they bring their left side toward the sea. Dogs, on the contrary, bring their backs as nearly as they can to the point from which the sea comes. Dogs have the strange habit of jerking their heads which is less easily followed and so it is with the placid gazelles. Farmers for this reason sometimes put their "retainers" in out-of-the-way places, and the result of the sale will be lured by the difficulty of escape. And, inasmuch as it may now, almost any day, be seen in the market, the result of the best-known Oriental "retainers" said that she began her career by getting out of a room and supporting her head on her feet every day for a few days. At the end of five or three months these animals have her and had every appearance of having been in the sea the time drew near. She stretched their bodies and then the habits of the very noticeable species until she had mastered her "trade."

*Overland*

**\$985 Completely Equipped**

**WE** are, and have been, over 3000 cars behind immediate shipping orders ever since last August—when this model was first introduced. Dealers contracted for 39,000 cars before we made a public announcement; one dealer alone took 4000; in thirty days Europe had arranged for \$1,000,000 worth.

We have planned and prepared for a 1913 production of 40,000 cars. Eight thousand skilled mechanics

in a factory covering over eighty acres are working night and day to fill present and persistent orders.

There are over 3000 Overland dealers in all parts of the world. Look up the one in your town. See this car, and you will more readily understand what a really brilliant and remarkable achievement this exceptional value is.

Our catalogue is big, beautiful and interesting—and it's free.

# Vitalized Rubber calls a halt on "Short Mileage!"

At last science gives you more rubber shod mileage.

## Diamond (No Clinch) Tires

now made of VITALIZED RUBBER—a scientific combination of pure rubber and a toughening compound.

**A perfect 3-Point Rim Contact tire at last**

## You can get Vitalized Rubber in Diamond Tires—NOW

A tire containing too much rubber fails to give the necessary mileage because it is not tough enough to withstand road usage. And the tire containing too little pure rubber has not the necessary staying qualities.

Our chemists have discovered the secret of how to mix pure rubber and a toughening compound in just the right proportions. The result is additional mileage for you. The pure rubber we use comes direct from the trees of the tropics—it is fresh and contains all the vitality of youth—it is elastic and easy riding. Then we mix this pure rubber with the secret toughening compound, which gives it the necessary vitalizing, wearing, *more mileage* quality.

This scientific combination has been vainly sought after for years by tire makers. After 15 years of successful tire making we have solved the problem—and you enjoy the benefit of our really wonderful discovery—in "Diamond" Vitalized Rubber Tires.

Add to this the Diamond proven principles of proper construction—nothing inferior in rubber, fabric or workmanship—and you have as perfect a tire as money can buy.

Here is a combination of easy riding and more mileage advantages you can't get in any other tire today—*Vitalized Rubber, Perfect 3-Point-Rim-Contact, No-Pinch Safety Flap*, and, if you wish, the now famous Safety (Squeegee) Tread—made to fit all types of rims.

So this time specify "Diamonds"—you can get them at any one of the

# 25,000 Diamond Dealers

always at your Service

*NOTE—If you are not entirely satisfied with the mileage you are getting now—if you wish to reduce your tire upkeep—send today for our new book, "How to Get more Mileage Out of Your Tires." It is free to every tire user. No matter what tire you ride on, you simply cannot afford to be without this valuable book, so send the coupon today.*

Fifty per cent of all tires are ruined through lack of perfect rim contact.

Perfect 3-Point-Rim-Contact is just as big an advantage in tire construction as 3-point suspension in the automobile.

Diamond 3-Point Rim Contact Tires hold with a vice-like grip absolutely preventing the tire from breaking above the rim, insuring no rim skid—no rim cutting—no rim trouble at all.

Our engineers have mastered the principles of Rim Contact construction, and you can get the Diamond (No-Clinch) Tire, with a perfect 3-Point Rim Contact—an important advantage that has been overlooked by all other tire makers.

**No-Pinch Safety Flap**  
absolutely protects the inner tube

The No-Pinch Safety Flap that comes in every Diamond (No-Clinch) Tire will cut your inner tube bills in half—because it forms a substantial wall separation between the inner tube and the rim, making it impossible for the inner tube to be pinched or cut under the rim, or injured by rim rust.

This No-Pinch Safety Flap is made of the best grade of fabric, and is finished with a "Feather Edge" as a further protection against inner tube cutting.

There is no rubber in this flap to adhere or vulcanize, so that the inner tube can be quickly and easily removed at all times—another big Diamond advantage.

**Mail This Coupon TODAY**

THE DIAMOND RUBBER COMPANY, Akron, Ohio. **DR**  
If there is a way for me to get more mileage out of my tires, I would like to know it. Without charge cut me the book, send me the coupon, and please, by return mail, give me book. (Use in Get More Mileage Out of Your Tires.)

# Each a Lucky Car

By R. E. Olds, Designer

Even when cars are skimped and rushed, an occasional car gives wondrous satisfaction.

No costly repairs, no troubles, no breaks. The man who gets it tells his friends he got a lucky car.

But every buyer of Reo the Fifth gets a lucky car. This is how I insure it:

## Endless Care

In 26 years spent building cars I've learned what strength is needed.

To insure that strength I twice analyze every lot of steel.

I test my gears with a crushing machine of 50 tons' capacity.

I have another machine to test my springs for 100,000 vibrations.

Then, to make doubly sure, I give each driving part 50 per cent over-capacity. Each is made ample, by actual test, for a 45-horsepower engine. That means immense margin of safety.

## Extra Cost

Drop forgings, on the average, cost twice as much as steel castings. But steel castings often have hidden flaws. So in Reo the Fifth I use 190 drop forgings.

Roller bearings cost five times as much as the usual ball bearings. But ball bearings often break. So in Reo the Fifth I use 15 roller bearings, 11 Timken and 4 Hyatt High Duty.

This year I have added 30 per cent to my tire cost to add 65 per cent to your tire mileage. Note how big my tires are for a car of this size and weight.

## Enduring Luxury

Each body is given 17 coats to insure enduring finish. The deep Turkish upholstery is of genuine leather filled with the best curled hair. So it doesn't sag and grow rusty.

Two front lights are electric, set flush with the dash. The old-style side lamps have been abandoned. The rear light is also electric.

This car in every detail shows the final touch.

## Center Control

This car alone has my center control. All the gear shifting is done by moving a small handle only three inches in each of four directions.

No side levers; no brake levers—nothing in the way. Both brakes are operated by foot pedals.

This arrangement permits of the left-side drive, now considered essential, to bring the driver close to the car he passes.

When you see what these things mean you will not go without them.

## Ending Trouble

To deal with low-grade gasoline I doubly heat my carburetor. I use a hot air intake, plus hot water wrapping.

I use a \$75 magneto to end ignition troubles.

Each engine is tested 20 hours on blocks and 28 hours in the chassis. There are five long-continued tests.

Every car in the making gets a thousand inspections. Parts are ground over and over to get utter exactness. And I limit my output to 50 cars daily so nothing is ever rushed.

## What Precaution Costs

I could build Reo the Fifth without all these precautions for some \$200 less. But this added cost saves the average buyer several times as much. It insures a car that's flawless, durable and right.

So we save in other ways. We build only one model, which saves some 20 per cent. We have cut down our profits. We employ wondrous factory efficiency.

As a result, we give you a car such as I describe at a price that's unmatched—\$1,095.

I build it for men who want beauty and luxury, combined with all the hidden worth that any price can buy.

Write for our 1913 catalog. Then go to the nearest of our thousand dealers and see this new-model car.

## Inter-State -45

SIX CYLINDER 45 HORSE POWER

\$2750

Electrically Started and Lighted—Four Speeds Forward—  
Left Hand Drive—Center Control—132-Inch Wheel Base

If you possess even the smallest automobile knowledge, you have, in your own mind, built "The Perfect Car."

We have built the Inter-State just as you would have ordered it built had you been our Chief Engineer.

In millions of miles of automobile-travel, certain standards have proven their fitness just as certain defects have uncovered their unworthiness.

By the process of elimination the motor car buyer has succeeded in locating the real source of his satisfaction or dissatisfaction.

He has expressed a preference for a recognized standard in the essential parts of his car.

He has done more—

He has demanded a superiority in the assembling of those parts that will forever free him from trouble and annoyance.

And you, in turn, have condemned as not wholly complete, any car that failed to include every essential for your comfort and convenience.

We have done exactly the same thing—

Out of the most exacting and careful engineering experience has grown the Inter-State Six—showing all of those tried and proven specifications—any one of which alone would characterize a car of higher price.

Sound and sane manufacturing methods have made possible this splendid car—at so attractive a price.

Our attempt to build "quality"—not "quantity"—to build integrity into every nut and bolt and screw has produced "your perfect car" at exactly the price you want to pay.

And one more thought:

If you pay more than \$2750 for these same specifications that mark the superiority of the Inter-State Six; then—

You have paid the price of "advertised-popularity;" or—

You have spent your money with far less care and thought than we have used in the building of this "perfect car."

**THE LONG STROKE MOTOR**  
6 cylinders, cast air flow, 4 inch bore and 5 inch stroke, enclosed valves, capable of developing a full 45 horse power to the wheels.  
The longer stroke means a longer step on steep hills and better results.  
The longer step means more power—steady power—less effort—less heat—less oil—less pollution.

**UNIT POWER PLANT**  
The unit power plant of the Inter-State Six centralizes the weight of the motor, transmission and clutch, thereby eliminating an uneven balance and an unnecessary quantity of structural joints.

**ELECTRIC STARTER**  
The Agip Motor Dynamo Electric Starting and Lighting System built specially for Inter-State cars is used on this model. The continuous delivery of heavy current from this starting and lighting system on other Inter-State cars has warranted its adoption for our model 45, not as an experiment, in any sense of the word, but as a time-tried, absolutely reliable starter of six per cent efficiency.

The turning of the gasoline motor is accomplished by the throwing of a switch which is conveniently located at the driver's left.  
It will revolve the motor continuously for 20 seconds if necessary or until the gasoline motor glides up under its own power, at which time the system is automatically discontinued as a starter and operates as an electric generator, furnishing and storing current in the storage-battery, where it is in all cases available for starting, for ignition and for lighting.

**ELECTRIC LIGHTS**  
The entire lamp equipment of the Inter-State car is electrically lighted.  
The two powerful Alcon head lamps with special Fry Lens, non-heat effect, capable of throwing their piercing rays 300 feet, two handsome side lights, Flash Dash Trips, built to seal flash with the dash, and tail light illuminating the license number, one spot-lamp light, all lamps lighted or extinguished separately or together at the will of the driver by simply turning a button conveniently located at his left.

**LEFT HAND DRIVE CENTER CONTROL**  
In building the Inter-State Six, we have adopted the left hand drive center control because of the added convenience to the passengers in front, allowing them to enter or leave the car from the curb.  
For your greater convenience we have added a four speed forward and reverse transmission, direct drive six shaft speed.

**BODY DESIGN AND FINISH**  
The body is a special design straight line effect, seats five passengers. Has the sport effect in front and the windshield is built in as part of the body. Twenty-one coats of paint and varnish are applied to every Inter-State car.  
The apparatus would be the same if we applied hot steam.  
The remaining two are your protection against a quarter, bracer car after the first trip over newly roads or half a dozen washings.  
Inter-State upholstery is 11 inches deep, upholstered with the best leather we can possibly buy.

**EQUIPMENT**  
The Inter-State comes to you as "discharge-ready condition" in any 100-mile maintenance town here in the U. S.  
Mudole trap, side curtains, ventilating main vision type windshield built into body, speedometer and clock, complete kit of tools, gasoline gauge, are an example of what we consider fully equipped.  
28 x 4 1/2 tires, front and rear Demountable Rims, 13 Double Ignition, Magneto and Concoctivist Trigger and Distributor with coil for starting and auxiliary system.  
Men high tension magnetic driven by extension of water pump shaft.  
Adjustable handle and clutch pedals.  
Pressure feed to carburetor.  
Nash and pressure lubrication.  
Motor driven fan group.  
Tireless levers with flexible cord routing any part of the car.  
Your Inter-State is ready for you the day it leaves our factory without the necessity of further adjustments or further expense.

The Land of the Blood Feud

By Charles Johnson

Men from Durham, who know more about Albania than any man in western Europe and who have been before the Nationalists, a charming story which sheds much light on the spirit of these few uplanders. He was walking with a young mountaineer concerning religion. He then set forth his faith: "I am a good Catholic," said he, "therefore I am of blood feud with the Moslems because they are unbelievers. I am of blood feud with the Jews because they eat the Lord to death. I am of blood feud with the Slavs because they do not pray to Him in the right way." He at blood feud with these people did mean that he was at home and satisfied a theological grievance against them. It meant that he took a rife from the shelf and went to shoot them up himself. Hence his Martial was done more than any of his earthly possessions.

The blood feud is, indeed, the great intellectual bond, the bed-rock institution of Albania. It runs from the twelfth century. Compared with the Albanian practice, the feuds of the Kentucky mountains or of the old South before the war were feeble and unimportant. In Albania almost anything may start the trouble. In a casual gathering in the hills where brutal strokes were done in sixteen seconds in a dispute over a carriage supposed to be stolen, but afterward found in the belt of its recently departed owner. And the matter did not end with those sixteen sudden deaths. Rather it only began for one man then he questioned a healthy and robust blood feud to his family, who were bound in their turn to wipe out the murderer or his slaves or their brothers or cousins or uncles or sons. For the blood feud is itself a treacherous and cunning thing. It arises from petty quarrels among men. A word or a blow even accidental may start the chain of events. It is the hills for generations. But may a feud must be laid to the charge of the several families.

It is the truly Oriental custom in Albania to betroth boys and girls still in infancy at seven, nine, or thirteen, included in the making-up of the dowry. It is one of the ways in which the boys are torn out of the maw of the burgals in life. But the maiden, when she comes to riper years, may well find her predestined spouse not at all to her taste. Do not imagine that she can simply get off and "take a husband" as they say in France. Not at all. The maiden has but few ways of escape. She may assemble witnesses and in their presence solemnly devote herself to perpetual virginity; or she may, if sufficiently reckless to run off with some male relative, else to run off with some other fellow man to her taste. On hearing of the betrothed couple party you must do your well-wisher Martial from its books on the wall, give up your carriage belt, and go forth and lamentably and the loss of your prospective father-in-law. Failing him, one of her brothers will do, even the youngest of the family. But her father is best. This, if she is seeking more criticism, you must hit in ambush and shoot to death your lucky rife; or if he, well aware of the expense of an engagement, has skipped across the frontier to Montenegro, you may content yourself with being one less in the family.

—No fellow, his brother, his cousin, if any other game is to be had, a boy of seven or eight will do, but that is in some districts considered an important life and either poor play. So far, as you can see, the matter is complicated. Slighted honor is appressed. You may put your Martial back on the shelf. But you will do so rather as you in your mind that you have slain five hundred new blood feud and that two families are now pursuing after you the life of your late prospective father-in-law and the relatives of the lucky trait. They will, if opportunity offer pick you off from hiding, or they will come in the evening. They will run make opportunities. So you will have something to remember you think you owe it to be independent for the cleansing of the two new slains that you yourself used to shoot. But they will hardly do for both. But you have brothers, uncles, cousins, a father. They will do. So the red work goes on.

Do not suppose that all this does from mere bloodthirstiness and indistinguishable of murder. On the contrary, the blood feud springs from a deep religious sense of the obligation of honor, it is part of a many-sided, absolutely blind of

code, and if the code made the Albanian spare he would spare even if he own his paid for it. The obligations of the code are sacred, above all obligations of hospitality. Not only must the mountaineer receive and feed the guest who asks him and he must receive him with hospitality for him and will make it matter of blood feud should any one insure or hinder his guest, even though he has set out on his journey again. A Montenegrin committed some crime of violence and covered the withdrawing fled months across the frontier into Albania. He asked hospitality and refuge of a mountaineer, who was obliged to receive him and make his quarters his own. The Montenegrin authorized set a price on the head of the refuge—gold pieces and a new pair of shoes. But the mountaineer, the Albanian had could not be tempted, but his younger brother was less firm, buying the Montenegrin as a good Albanian should. So he shot the refugee in his elder brother's absence and delivered his head to the Montenegrin authorities, claiming and receiving the rich reward. When the elder brother returned home, the younger told him what he had done.

"What did they pay you?" asked the elder brother, sternly.

"The younger brother told the price."

"It is not enough," cried the elder. "Take this money and buy your younger brother a gun. Never has one of our boys betrayed a guest. And some of our boys will again."

The work will again. These warriors have a hard enough time. As among the Indians of the plains, the women must perform not only the domestic duties of cooking, weaving, caring for the children; they must also do nearly heavy outdoor work like the plow and the sowing and the sowing and the sowing. There may be a second room for the woman's having to work, but she is almost not so much a responsible being, is not subject to the blood feud. No matter what quarrel may start, she is almost not so much a responsible being. Therefore, it may happen that, all the men of her household being slain, she is almost not so much a responsible being, she may have to drive the flocks to market or go herself, laden with heavy bundles of kindling-wood or charcoal or stam for sale.

In their tribal organization these uplanders carry like the language of the Scottish Highlanders, carrying two ages. The clan bond is everything; the national bond hardly exists. The Albanians of the north are not so much as they are the southern members of the Church of Rome. Some of the south and east are converts to Islam, who by their conversion for there are a few Albanians who belong to the Greek Church. But these denominational differences are hardly a skin-deep. The primitive barbarian, warlike, hospitable, daring, bound by blood feud and custom, conservative, whether he venerates Rome or Jerusalem or Mecca. For him Christ and Mohammed are the same, and he is the same, and where the one seems to fail he will turn readily enough to the other. He remains what he always was, in spite of the thin veneer of Western or Eastern faith.

Albania is about as large as South Wales and its people number only 1,000,000. Of these three-fifths are Moslems, but by descent from Turkish conquerors not by descent from Turkish conquerors. Not by descent from Turkish conquerors, but from a cheerful opportunism which distinctly recognized that the most useful religion was the one which the national churches than did the Sermon on the Mount. There is every prospect that the Albanians will be Christians when the prestige of the Caravans wanes and they find themselves surrounded by Christians. The Albanians are not so much as they are the national churches than did the Sermon on the Mount. There is every prospect that the Albanians will be Christians when the prestige of the Caravans wanes and they find themselves surrounded by Christians. The Albanians are not so much as they are the national churches than did the Sermon on the Mount. There is every prospect that the Albanians will be Christians when the prestige of the Caravans wanes and they find themselves surrounded by Christians.

The Elastic Globe

To the human nothing may seem more rigid than the globe. You may see men of opinion tell us that it loads and bulges appreciably under the pull of the heavenly bodies. The modern science has shown that the globe on opposite side of a tidal basin approaches each other at high tide. The globe is not so much as the rigid ball, for example, is so much greater at that time that the tide rises a trifle and the ocean rises a trifle. The globe and the English come together together. The bulging of Liverpool and Dublin may be fancied as being in one another across the Channel. The deformation is the particular being about one inch for every sixteen miles. It has also been shown that the globe is not so much as the rigid ball, for example, is so much greater at that time that the tide rises a trifle and the ocean rises a trifle.

The Pullman of the Open Road

but inadequately expresses the superior and exclusive features embodied in the motorcycle which has created a sensation wherever motor vehicles are known.

for 1913 is the only motorcycle in the world with a Self-Starters and Two-Speed Free Engine Hub—an exclusive feature which at once makes motorcycling more than ever a sport for gentlemen. The original and improved Spring Frame and Spring Fork make all roads boulevard, and the full flow height ball-bearing motor gives the power plant flexibility not found in any other motorcycle engine.

Write for art catalog fully describing the famous motor-cycling "4-4" and "7-7" "Valley" models.

**The Restoration of Paintings**

One of the cleverest restorations of a painting ever made was that conducted under the supervision of a New York expert not long since. By reason of the great age of the picture the canvas, which was about six feet square, had become rotten. The first step in the work of restoration was the gilding by means of a vegetable compound, of a thick piece of muslin paper the size of the picture. The picture was then turned over and from its back there was picked, piece by piece, all the rotten canvas. This delicate operation required four days for its completion. At the end of that time all that remained of the original work was a delicate shell of pigment, glued by its face to a piece of paper.

The rest of the task was comparatively easy. The expert covered the bare back of the painting with strong fish glue and fastened to it a new piece of canvas. The new paper was then, by means of hot water, removed from the face of the painting. There was the picture the same as before, but now upon a strong, new canvas.

The commission appointed some time ago by the British Minister of Public Instruction to ascertain whether several paintings by old masters in the Florence galleries, which have been washed or restored, had suffered any damage, has accomplished its task but as the three commissioners failed to agree in their conclusions they have drawn two separate reports.

The painter, Sartorio, deplores the results of the restoration. He says that in order to cover of paint in the old paintings constituted, as a rule, an integral and essential part of the execution of the work, he very often the aspect of the painting depended upon the varnish. Hence, he contends, it is a mistake to remove it, thereby the characteristic features of a picture are thus altered.

The other commissioners, Casaroghi and Pagliaro, defend the restoration. They admit that some of the washed paintings have lost their original patina and color, but on the other hand, they have not been damaged. These commissioners estimated each painting restored and reached the conclusion that the mistakes in the treatment adopted may have been remedied, as the restorers did not succeed in preserving the original harmonious colors, but that the washing was necessary to save the paintings from decay.

Regarding the work the restoration has been practically approved by two commissioners who are both experts in the art of restoring old paintings, the Fine Arts Departments decided not to allow other paintings to be washed in future unless the proposed restorations are fully approved by the Superior Council of Fine Arts.

Of the strange vicissitudes through which many of the world's famous pictures have passed, perhaps none are more odd than that of "The Fortune in Disguise," a picture which was painted in the residence of Lord Leila in Wexborough, England.

One remarkable picture for many years appeared to be merely a painting of flowers. The floral study was, however, finally pronounced by an artistic art-dealer to be in reality a mask for another painting. With the permission of the owner he caused the painting of flowers gradually to be removed, whereupon there was discovered underneath a very fine portrait of Charles I. by Van Dyck.

The authentic record of this masterpiece has been found. It is supposed that the portrait was disguised by some English in order to guard against its detection by the French during the Revolution.

**Nitroglycerine**

NITROGLYCERINE does not always behave in the same way. One day, it is said, the little explosive will "go off" at the slightest shock but the next day one might find it had the tenacity of a stone and that even a run of the same substance will not be able to kill the stone. Nitroglycerine is so cautious or reticent to explode doubtless depends upon its quality. One "run" of such may be so washed and cleaned and another may be full of impurities. If a can be filled to the cork so that the substance within has no opportunity to seek against the sides, it is thought that it will not explode so easily as one which is three-quarters an inch or eight full.

It is an interesting sight to behold the nitroglycerine workers at their task. Usually the building wherein the stuff is made contains several large wooden vats, a few pails and barrels, an engine, and a great iron kettle-like receptacle. This receptacle is called an "acidifier." It consists simply of a small kettle within a large one. The space between the two is kept constantly filled with a stream of cold water. The inner kettle is filled with several pounds of water by a crank.

One will see about fifteen hundred pounds of acids, sulphuric and nitric mixed, poured into the smaller kettle. A thin but continuous stream of glycerine slowly flows, the engine begins to pump, the crank revolves, the paddles churn the glycerine and acids, and the manufacture of the powerful explosive is under way.

The flow of glycerine is controlled by a stopcock, the workman the while observing with unflinching vigilance the agitator and the thermometer that registers the heat of the perfidious mixture.

Nitroglycerine is formed by the action of nitric and sulphuric acids upon glycerine. When the fumes begin to show the greatest caution must be observed. They indicate that the oil is on fire, and should the mixture attain too great a degree of heat the explosion will follow. When the mixture in the thermometer indicates fifty degrees Centigrade, it becomes safe not to linger too long in a nitroglycerine factory. The stream of cold water constantly circulating about the base of the agitator keeps the mixture cool. In warm weather ice must be used.

After leaving the agitator the product is thrown into the "draining tank." Then it is transferred to other tanks and carefully washed. At the end of a period of four hours the milky, water-filled nitroglycerine is removed and evaporated in cans. These cans are deposited in a bare iron safe and the explosive is then ready for the market.

Much nitroglycerine is used by oil-well "shooters." The "shooting" of oil wells is done by the action of nitroglycerine at the bottom of the wells in order to increase their flow. Nitroglycerine, rather than the safer dynamite, is used because it can be exploded under water.

**Furniture Casters**

MANY furniture casters are made of bushing, the casters being being cut out and cemented and compressed to form the wheel. The wheel is then put into a ball and turned round on the base. Bits of metal are stamped on each side of the wheel to serve as levers for the axle that pass through the wheel. Such casters are used for use on hard wood floors. Casters of compressed felt are also designed for this purpose.

Another kind of casters may be mentioned those of plate, designed to serve for purposes of insulation, and ball-bearing casters, one style showing an wheel, but instead a ball which, when the furniture is moved, revolves on a circle of smaller balls within the outer fitting.

Then, too, there are roller wheels made of porcelain and of rubber, of figam stone, and other hard woods. Great numbers of casters are of iron and steel.

**Taxing German**

TAXES has been an United States of taxing nothing has ever come so far from Germany. Germany, the law, adopted a system of paying a tax on the value of the property owned, not on the value of the property, but on the value of the property. A standard, the number of acres owned, and the value of the property, are taken into account. Single men between the age twenty and thirty-five years receive a tax of one cent on the value of the property. When a man has more than three children he receives ten per cent more than the standard rate. For every child over five children, and fifteen per cent more if he has seven children. A similar system has been in operation in Prussia for some time with this difference, that the excess allowances for children are paid directly to the mother.

**Living Trees as Telegraph Poles**

ON a telegraph line constructed in eastern Africa living trees, instead of iron poles, have been used over long distances in order to escape the danger of white ants, which attack the poles but not the trees. The latter are planted along the line with their branches cut off. They readily take root and need only to have their branches trimmed from time to time. The wires are affixed by means of tarred cords of hemp, which serve in place of insulators. It is the intention eventually to replace the trees with iron poles.

**The Sleep of Plants**

REAR, a German botanist who gave his attention to the attitude of the leaves of plants during the day and compared with their attitude in the night, noted that many plants take each a position for the night that they never so frequently exhibit and at the same time be sheltered from the dew.

**The Only Electric Car That Has A Two-Speed Planetary Transmission**

You will realize immediately what that means. You know what a handicap your gas car would be under if it was forced to operate exclusively on high gear.

Yet the Church-Field is the only car that eliminates that handicap in the electric field.

The Church-Field has both a high and a low gear.

It thus combines, for the first time, all the simplicity of control, the economy and convenience of the electric, with the power, reliability, and general efficiency of the gasoline car.

The Church-Field Electric Automobile marks a new era in electrically driven vehicles.

Here, at last, is an electric car that retains all the characteristics and advantages of its type and yet possesses that ability to do things—that sturdy utility that has hitherto belonged exclusively to the gasoline car.

**Church-Field Electric**

is out an experiment—for three years it has stood the test of hard, constant usage, under most trying conditions.

The superior advantages of its exclusive features have been demonstrated beyond question.

And these exclusive advantages include, in addition to the two-speed transmission, the Church-Field ten-point speed control—giving extreme flexibility.

The Church-Field safety locking and interlocking devices on the control lever.

The Church-Field reverse, three-quarter elliptic springs.

And a multitude of smaller refinements and conveniences that contribute materially to the luxury and efficiency of the car.

The Church-Field is the electric you have been waiting for. A demonstration will convince you.

Write to-day for the beautifully illustrated catalogue and the name of nearest dealer.

## AMERICA'S GREATEST AUTOMOBILE SHOW

The biggest motor-car show ever held in America is now on exhibition at Madison Square Garden and the Grand Central Palace, New York City. Seven hundred and two cars are on view—a record number—at prices ranging from \$395 to \$7,300. The exposition is divided into two parts, the first composed of pleasure vehicles, the second of commercial cars. The photograph on this page gives a general view of the Madison Square Garden exhibit.

one of the reasons why the WEEKLY would like to see the Republican party do more honestly with the situation down there and stop giving money to little cliques and machines that can never win any popular support. For so well-to-do of the South can be content to see its political life unhealthily different from that of the rest of the Union.

#### Castroville

GOVERNOR TRACY recommends to the legislature of Pennsylvania to revoke the charter of the borough of Castroville because of the failure of the people of that borough to punish any of the persons implicated in the burning of the negro, WALKER, in August, 1911.

MR. CHAPMAN, then, who held the commemorative prayer-meeting at Castroville last summer and whose remarkable address there was printed in the WEEKLY, is not the only person on whose soul the Castroville crime lies heavy and who thinks it should not be allowed to be forgotten.

#### The Navy

We have much sympathy with the objects of the so-called Navy League, headed by General HONORÉ FORTIER and Colonel R. M. TOWNSEND of this city. As we understand the petition which the League will address to Congress, there will be two main requests.

The first is that the law be so altered that officers of the navy will come to important and responsible commands while still in the prime of life and that in case of war or any other emergency it shall be easy and natural to get reasonably young men—say, say, say, or GRANT was at Appomattoh—in command. We do not understand that it is sought to render intelligent men of advanced years who nevertheless retain vitality and energy and are generally recognized men of superior capacity. As we take it, the ideal arrangement in this regard would be to have a list of such available, the NORTON and NELSONS without displacing the LANS and FARRINGTONS.

The other main demand of the League is one which has often been preferred in these columns. It is that in the matter of the building and upkeep of the navy we follow a systematic and reasonable policy, instead of dealing with the matter year by year according to the whims and fancies of particular Congresses. In a word, it is that we adopt a policy or programme and adhere to it. It may be wise for us to have a large navy. It may be wise for us to have a small navy. It may be wise for us to have no navy at all. It cannot be wise for us to have a navy without any settled policy as to how big an outfit to be met with continual variations on the subject. Surely, nobody can think it a good thing that the naval appropriation shall be, as it was last year, determined by the feeling of individual Congressmen concerning the amount of "perk" they were allowed for their respective districts.

The League proposes a commission or council, composed of the lords of Great Britain, to keep track of other navies and recommend the amount and character of the increases needed in our navy. Such a body would, of course, take into account precisely what our navy will probably be called on to do and what, in case of war, it might have to do. Such constant forwardness seems to us advisable. It certainly seems preferable to us forwardness of this kind also to the plan of building men-of-war, not according to the probable need of them, but according to the probable popularity or unpopularity a Congressman will win by voting for them.

Nevertheless, we are quite alive to the importance of "what the people want," and we believe it advisable, representing the views and knowing what their navy has done for them in the past, want it kept up to the highest point of efficiency consistent with a reasonable economy.

#### Restore the Canteen

The present movement for the restoration of the army canteen is pretty strange. Mrs. ALICE INGRAM, representing the wives and daughters of the enlisted men of the army, brought last week to the House Committee on Military Affairs a petition for it signed by twenty-three hundred women. Secretary SHREVE here witnesses that since the canteen was abolished the health of the army "has gone from bad to worse"; Surgeon-General TRACY estimates from statistics that alcoholism has increased one hundred per cent. since the canteen was abolished. It is to us army in the world," he says, "which has such a bad health record as the American army." Major-General WOOD says:

A soldier's club is the solution. There is no real danger, plus a glass of beer, and have a glass of beer.

The enlisted man is now driven into the lowest class of dives simply because he cannot find elsewhere that recreation coveted by every young man.

There seems no room for doubt about the effect of the abolition of the canteen on the morals and health of the army. Has not this experiment now gone far enough? Congress knows the truth. It is perfectly well aware that it would not permit the influence of the Women's Christian Temperance Union to prescribe the beverages of its own members, and that past Congress, in permitting that influence to abolish the canteen, have done the army a great injustice and damage. And Congress must also be aware that its predecessors in dealing with this subject have been pained by; that they have not considered the good of the service nor the health of the enlisted man, but chiefly politics; and because the W. C. T. U. and its allies could influence, a good many votes and the army very few, they have sacrificed the army to the threats of political women.

The experiment has been made, and it has failed. The experiment found the army in a fair condition, and it left it with the worst sick report of any army in the world.

It is time the anti-temperance experiment ended; time that Congress had the manliness to do for its words, dependent on its will for favorable conditions of life, what the most responsible authorities declare to be essential.

#### The Supreme Court Advances

We see no reason why the Supreme Court should not be permitted to learn. People who called the Standard Oil and Tobacco Trust decisions "immunity baths" certainly have no right to object if the court, in dealing with the Pacific railroad, profits by that criticism. If it be true, as is not yet admitted, that the court has used a plan of dissimulation that did not disclose, or if its decision of guilty operated to reward the convicted parties for their misdeeds, is that a reason why it should not be permitted to do its work more effectively next time?

Really, it is hard to talk to some people. They really would, it is hard strenuously insisting on the quality of courts, that is, that it is not then for a supposed assumption of infallibility, is the readiest also to ridicule them the minute they do something that looks like a confession of fallibility and a disclaimer of omniscience. Why not reverence readily that in this business of dealing with the big corporations we are all in a manner feeling our way? Above all, if you are going to drag that man on the bench here any more than the rest of us, you will permit them, like the rest of us, to learn all they can!

#### Mr. Rockefeller and the Pujo Committee

MR. WILLIAM ROCKEFELLER has, we think, made a great mistake in taking the measures he has taken to avoid the summons of the Pujo committee. We have not a particle of animosity to Mr. ROCKEFELLER. On the contrary, fully believing that he is a sick man, we sympathize with him. Moreover, on the other hand, we are not particularly enthusiastic about the committee. It has, we must admit, brought out more facts of importance, and of a nature, if there is sensibility, to lead to a reform that we at first hoped for. We would not say we have not liked its apparent aims and some of its methods.

All that, however, is beside the mark. The committee is properly constituted. It is fully authorized to obtain any witness it requires. It has proceeded according to precedent. It may have oversteered the testimony of Mr. ROCKEFELLER, but we feel that it has the right to do so. If, in practically defying it, Mr. ROCKEFELLER has practically defied the government under which he and all the rest of us are living.

He and his physicians may honestly have felt that such a course was necessary to save his life; but if that was their motive they were mistaken in their procedure. Mr. PUJO and his associates are not to be trifled with, and there is no reason to suppose them callous to the impulses of ordinary humanity. Mr. ROCKEFELLER and his advisers would have been wiser to accept service and then submit evidence to prove that he was physically unable to go to Washington to testify, or even, if the facts justified such a plea, that he was unable to testify at all.

Instead, he and they have chosen for months to use the power of money to evade service altogether. They have exhibited a kind of lawlessness with which the American people are already only

too familiar. They have added fresh fuel to a flame of discontent in this country which was already bright enough, in all conscience. They have not learned, but appreciably increased, the feeling against the man who has very often, in the words of Mr. ROCKEFELLER himself, They have given countenance and support to the conviction that there are men among us who hold themselves superior to the law. All things considered, they have made a very grave mistake.

#### The President and the Jews

We do not wonder that President TRAY should mention the other day when the order of B'Nai B'rith presented to him the medal which it annually awards to the man who, in the judgment of the order, "has contributed most to the welfare of the Jewish race."

Really, it was a surprising performance. Here these Jews forgotten their coming? Have they directed themselves of the characteristics attributed to them by all the comic papers? Don't they know that President TRAY was overwhelmingly defeated in the election and is shortly going out of office? What can they expect to make out of paying him such a compliment? Or is it that since they are their own best and only obtain men to which they did it merely to make to them capable of gratitude and appreciation, just like other folks?

Well, we for one are quite obtuse enough to be taken in by the measure. We do credit them with these humane and commendable emotions, and with a very graceful and timely honoring of a man who, after several years' exposure to all forms of injustice and commination, is now doubtless happy in the thought that he can attribute civility to men who bring him gifts and compliments. It is true that he has had and used occasions to render services to the Jewish race, and it is natural that he should appreciate their appreciation of what he has done.

Not, however, we should well have done anything else. He promptly endorsed a snobbish attitude toward Jews in one of the services. He stood out, with Congress, against the discrimination of another country against Jews in the matter of honoring American passports. He has time and again in public speech denounced narrowness and proscribed as it is against citizens of Jewish extraction. He all this he has done, and he did not minimize his performance. But it is hard to imagine an American President taking any other attitude. With an American private citizen it is different. Any one of us can recall countless instances of yielding to the very prejudice President TRAY has so steadfastly repudiated, but as a people we are thoroughly committed to the broader and juster view of racial differences and prejudices; and it is no mystical assumption, it is a fact experience demonstrates, that an American President stands in such matters for our common American principle and ideal.

It is a principle and an ideal which will yet conquer the world. For it is not merely morally impressive, it is justified economically and practically. The state that denies to any race or to any class its actual deserts is bound in the long run to be weakened by its prejudice in the searching competition of modern life. In this respect, as in all others, there is no truer saying than that justice is the health of the state.

#### Riot

If you are compelled to go back under unattractive conditions, you go back with your mind made up that it is the most difficult thing in the world for the capitalist to get food prepared by members of your race.

So the newspapers reported JOSEPH ERSON, the revolutionary from Los Angeles, who had been attacking hotel employees of January 29th. The hotel men are displeased with ERSON and are for having him put back into jail. And perhaps that should be done if the law of the state provides for doing it. But it would seem that ERSON at large and smiling freely and carefully reported with made very much more rapid progress toward civilization than ERSON under lock and key and reduced to compulsory silence. The people who have most call to settle with ERSON are the strikers whom he addressed and to whom he seems to have given ruinous advice. It is to them far more than to the public that he is dangerous.

#### One and Inseparable

Women has always been man's companion, ready to share his exile, repulse his enemy, and buckle his armor.—Mrs. EMERSON.

"And man," we hear about a million women issue, "has always been, and still is, woman's companion, ready to share anything she has, to experience personally, and look her up on the back."

# FIRST AID FOR LAZARUS

The New Science of Almsgiving and the Training Required of Those who Direct Our Charities To-day

BY CROMWELL CHILDE

DRAWING BY F. VAUX WILSON

ON a stage in an assembly-hall in a big American city, one evening within the past year, a dozen or twenty fashionable young men and women presented a series of beautifully staged Austin Dobson "Dialogues." The old-time French comedie au glorieux the audience that was the first curtain came down a happy moment was sent around to the "green room" for the players not to change their costumes, but to appear at the dance that was the second part of the programme just as they were. They consented, and for the rest of the evening marquis and marquise, valet and waiting-maid wore the original fashions.

A grizzled, keen old banker was introduced before the night was over to one of the "stars," a graceful, magnetic young man who looked exceptionally well in courtier's costume and seemed to bear his honors as a matter of course. There was something familiar to the banker about this young man's name, and then he remembered he had heard of him as one of the very popular boys of the day. The banker was no lazeur with the personality of the youth that he contrived to have more than one brief talk with him.

"Doubly," he said to his pretty daughter, as they rode home in their car, "what does that young man—Poundworth, your name—do? It's a long while since I've seen any young fellow that's impressed me so. I'd like to have him in my office."

"Oh," said Dorothy, "he's the new secretary of the Christian Aid. He was in Yale with Cousin Harry and afterward took a course in a school of philanthropy somewhere."

"Nonsense!" put in the banker. "Men of that sort don't go in for that kind of work at all. You must be mistaken, my dear."

"Indeed, I'm not," answered Miss Dorothy. "He certainly is the new secretary. They had to make a hard fight to get him, and increase the salary ever so much. Jennie Smith told me about it. She ought to know, for her father's on the board. Two charity societies out West wanted him, and they all bid against one another. He's getting eight thousand here. Oh, and he's a splendid dancer, let me tell you."

It happened a day or so later that the banker met Smith of the Christian Aid Board at lunch. Young Poundworth was uprightness in the banker's mind. He began to ask some questions. While well informed in many lines, he had never gone very deeply into modern practical social science and charity organization management. He was surprised at what he learned.

"Yes," said Smith, "that's right about Poundworth. He's a 'fad,' he's a clever lad, too—knows his value to the letter of a dollar, and is as practical as they make 'em. We never paid more than four thousand a year for a man for that position before, and we're paying him eight. Why? Because, Ransom, the charity organization of to-day, big or little, in any city or town—when I say 'charity organization' I mean any society that has to do with philanthropic work, the reconstruction of human beings, the bettering of conditions for children, housing conditions, whatever you will—has come to be a business proposition. It's got to be handled by experts who know and have executive ability, just the same as if it were a factory. It's a question of the careful spending of thousands of dollars. And let me tell you, Ransom, the men and women that run these things are hard to get."

"We had to find a man who 'measured up.' There were only four men in the country that we could discover who did. Three of them had positions just as good, and couldn't be tempted away. Young Poundworth knew the conditions and he simply made us pay. But I tell you he's worth every cent of his \$7,000."

"Probably you—like a thousand others who are good to us and outside when we ask—have an idea that within the past few years philanthropy, the actual management of the big charity movement of America in all its phases, has grown into a distinct profession. Skilled executives and trained subordinates have become necessary in it like everything else. There is so much money to be spent that it has to be spent wisely. You wouldn't take anybody else your banking-house unless he had ability in your particular line of work. I wouldn't put a man on my dry-goods staff that didn't seem adequate. It's the same way with every sort of charity organization now. There are schools of philanthropy to train men and women for the work of Charity in its various fields has become so specialized that it would be exactly as sensible to take an untrained young man out of the street and make him one of the engineers of a big railroad as to put the ordinary, and directly qualified man or woman into one of our organizations."

"But a man of the personality, the magnetic force of young Poundworth," began the banker, "a high-class business man of good family connections—"

"There are the sort of men and women we are looking for and must have," answered the director. "They are deadlier in demand, and they are so selective that it takes very little difference how much we pay them. The only trouble is that the supply of the really good

ones is so limited and the demand has increased so enormously that in every section of the country we who are interested in the work of modern applied philanthropy don't know which way to turn."

It might be called the problem of the Poundworth and the Miss Poundworth, too, for, if everywhere in America young men of thirty or thereabouts who have special skill and knowledge in the handling of charity appropriations are urgently needed, there is precisely as great a demand for able young women who can adequately fill secretarial positions, go on investigation that need experienced eyes and well-ordered minds, and make clear reports on complicated inquiries. The schools of philanthropy over the country are turning out such men and women by the score, but not enough for the constantly growing market. Naturally many graduated from such institutions—New York and Chicago have the two big technical schools of the sort—do not prove to have the practical ability, though they are well informed on theory. The situation today is a curious one and has been much commented upon. Over the country there are constantly at least a couple of hundred good positions in the report philanthropy field that cannot be filled. Probably there are many more than that. In the case of men these positions are worth from \$2,000 up to almost any figure, in the case of women from \$1,000 to \$1,800, and here and there even higher. The positions cannot be filled because there are too few really competent men and women in the new science of spending money to help the poor.

It is only a few months ago that a dramatic search was made for one of these Poundworths. The event was one of the great philanthropic conferences of the country. There are many of these held throughout America each year. As a general thing they get very little mention in the newspapers. The managers discuss some their lips and say that they are dull. Yet social science is greatly made in them, despite the fact that the talk always grinds slowly and laboriously in streams of "papers" and long, complicated discussions. This conference was a big event in the Middle West. It was a conference of nation-wide importance in its special field of philanthropy. From everywhere delegates and experts were gathered, many of them young. In addition, there were several scores of others, men and women who were quite widely out in this profession, but whom they led its interests at heart—progressive, unostentatious, plain people, plain in conditions to and board directors of the movement in one town or another.

Conferences like these are multiplying these days.

# WHERE PROBATION FAILS

BY JOHN J. FRESCHI

City Magistrate of the City of New York

DRAWINGS BY H. L. SLUMENHRL

WHAT would you say of a truly conscientious parent who threatened dire punishment of a child if it did not keep its face and hands clean, and, thus, having delivered this warning, neglected to furnish the necessary soap and towels?

Does this strike you as a parable question?

Consider, then, the probation system in our courts. Obviously the prime interest of probation is punishment. It is based on the sound theory that where there is the slightest hope of reforming a transgressor it were better to administer that to punish, in such cases, there sentence is suspended, the law in the conscientious parent and the probationer the crying child.

In contrast with the general public I long regarded the probation system as the same of innocent misdeeds of correction. Thus the court admonishes the offender: "You have offended, but there is hope for you. You will be given a chance to amend your ways. Do not transgress again or you will be punished. Repeat this as a lesson."

Having applied and observed the working out of the system from the bench in many cases, I have perhaps modified my views. Experience, the best teacher of all, has taught my administration. We have heard much of the tremendous success of probation, but we are not here of the innumerable cases in which it fails; and, so far as I know, none of the truly earnest, enthusiastic men to have discovered, at least to have pointed out, the one vital weakness of the probation system—the weak link, so it were.

That weak link is that the paternal law, saying to the transgressor, "Beawful be clean," fails to see that the moral soap and towels are supplied. Probation has met with gratifying success in spite of its weak link, and this is a glorious vindication of the theory itself. In countless cases where it failed it might have succeeded. My experience has been that where that weak link is strengthened the failures are practically nil. They occur only in the few cases in which probation could be ineffective in any event.

Last the subject least interest to the righteous citizen, let me point out that the lessons to be drawn from the failures of legal probation, have a far wider, more personal application than appears off-hand. There is an relationship in life, an attraction in society, no home, from the cottage in the pines, in which probation, under whatever name, does not place a part in our daily life. Says the father to the child, "If you three say more whom I shall whip you"; says the wife to the husband, "Unless you stop drinking I shall leave you"; says the mistress to the servant, "If you speak more gibberish I shall discharge you"; says the doctor, "Unless you alter your habits you will die"; and so on of infinitesimally. As long as we live we cannot escape admonition, which is simply another name for probation. Probation fails in private life for exactly the same reasons as those which cause it to fail in the courts. And here is thought for the world at large: that no transgressor is laid before the courts but who, there without number, has been placed on probation—given another chance—by relatives or well-wishers. Almost invariably when the warning is passed we feel that our duty is done, we do not try to improve or establish the conditions which inspired or led us to such transgression. It is as if in the court, if it were the court, we were to be sure, the court will never be able presently to improve conditions about the probationer; but it could, and should, and must—if it would mark probation as unqualified success in that conditions necessary to improve by those friends in whose charge the transgressor is placed.

It is almost every case that has come before me the complaints served on such or were to be placed on

probation than the offenders against whom they complained. Let me give you a concrete illustration.

Before me was brought a pretty girl of about eighteen, charged by her parents with incorrigibility. The girl had previously been placed on probation by me. Briefly, this was the history:

The girl, a stenographer, had been in the habit of sitting down and smoking, in which her mother had no particular objection. But, coming home late in the evening, it had been her practice to take her shortcuts into the general hallway of the apartment house, turn out the gas light, and there in the darkness sit on the steps for an hour at a time. The neighbors, sensibled, told the mother. Her advice and finally

her threats to the girl had been unavailing. Then, in what she conceived to be her duty, she had taken her before a magistrate to have her arrested late tractability.

And now the girl was before me for breaking her parole. The mother told how she had discovered the girl was derelict, lying, hypocritical—suspicious in her, as a maid, of what might be expected unless a halt was called. The daughter was obstinate, young men on the district corner. The girl was timid and had nothing to say for herself. I advised her on the dangers of her course, of her duty to her mother, and finally explained that I could commit her to a reformatory for three years. She was tearfully protest and promised to obey her mother—and meant to. I was sure.

"Remember," I said, continuing her on probation, "from now on consider your friends at home."

It was but a short time after that the mother in an argument of fact had the girl before me again. The daughter had not only broken her promise, but was making herself. Pretending to call on girl friends, she had been meeting a young man in the back rooms of a cafe, and had even called upon him.

There was an charge that this girl had taken the last step; indeed, one had only to talk to her to find that she was not viciously inclined.

Although the mother was in terror for her daughter, she wanted her give another chance on probation. She wanted me to care her again, although she had been scared before without effect.

Before I would agree to this I ordered an investigation of the home life of the girl. Although the mother was obviously respectable and conscientious, one remark of the girl had set me thinking: "I'm ashamed to have company at home!"

Thus I got to the kernel of the whole affair. The father of the girl, I learned, was a drinking man who in his rags was quarrelsome and profane. In the congested apartment the increased frictions between the parents could be heard distinctly in the parlor. It was the father's practice to stand in the middle of the room with his back to the door, and make snoring comments. The mother, besides of the strain she was under, was also irritable, discouraged for visitors, and made things generally uncomfortable for them when they came.

In my own way probation failed in this instance? There was a girl at an age when all normal girls crave the attention of the opposite sex. To have ministers her he believed right—a right that was reasonable, inevitable, because human—in a primal instinct. No man-made laws, no preaching, no threatening, will ever successfully combat normal instincts. We can direct mark instincts into wholesome channels, but we cannot prevent them. That is what those parents had attempted. Granted that the girl's actions showed correction, they were about it improperly.

The parents were responsible for the dereliction of that girl from the very beginning. She had first transgressed her contract in the dark hall, because her home was unpleasant. Then, after she had been placed on probation, the parents had failed to better conditions—the conditions which first drew her out in fact, but made things even more uncomfortable. Then she had sought the covers in answer to that primal instinct, and finally, in a moment of weakness, had fled away from her father's wife and a man's attentions.

I tried an experiment in that case, being assisted by a lady engaged in practical household work. She was at the head of a boarding-house for self-supporting women. The girl was placed on probation in her charge. She was to have absolute freedom to come and go so long as she worked it, and was to be allowed

They were intent upon saving him from damnation

to entertain respectable young men without being spoiled.

The reports were transcendently gratifying. The girl's room that violated our opinion. Everybody loved and trusted her. She was affectionate, treacherous, self-respecting. Indeed, long before the production she was out in the most brilliant body that to our hearts is her eyes. She had a favor to ask. Might the young producer be married? Why was she fearful?—

—No. Was there anything wrong, was marriage necessary?

The lady grew highly indignant. Wrong! No, indeed! The ideal! He was a fine young man—a devoted husband in every way. She was crying because they all would see the girl so much at the house.

This case continued me that, instead of simply making the error that they must be good, the courts should pry deeply and seek to discover the contributing causes. There is a cause for every first transgression in whatever nature, and it is common sense that cause that brings about the lapse of the probationer. Nine times out of ten the fault lies with the very well-wishers of the transgressor—the ones who seek his or her reformation. They may lack understanding, sympathy with human frailties. They may be ignorant of one who has erred, thinking that this will drive home the evils of sinfulness. They may be overrigid or over-lenient in their care of the probationer, or they may continue the improper environment.

A lesson for parents to be drawn from the experience of the courts is that efforts at reform in probation that fail miserably are far worse than an effort at all; rather they make the transgressor more defiant, because he thinks the warnings are all "nothing" or they have "nothing" by insisting him with the idea of the hopelessness of his own case.

There came before me another striking failure of probation, the transgressor in this being a young married man. He had been before me, magistrate previously, charged with quarreling immorally with his wife, annoying her, and finally striking her. Sentences had been handed on his promise to mend his ways.

He had broken his promise. He had met his wife coming from a theater with a party of lively friends, her escort being a man. The husband had assaulted the man and made a public demonstration of his wife's conduct.

Before sending him to jail I investigated and ascertained some illuminating facts. The husband was of an intensely jealous disposition, the wife a mild, unassuming, shallow sort of a creature who had never got over her fondness for man's adulation. Her animus had inspired the original violent outburst of the husband which led to his arrest.

Who, then, was responsible for the disastrous scene outside the theater? I do not think that it is wrong for every married woman to be with an escort other than her husband, but in this case the wife was decidedly at fault. She continued to create conditions which had led to the original trouble in court. Fully aware of her husband's disposition, she had continued to comfort herself in a manner that would inevitably lead to domestic disaster, and this fortunately, because a judge had told the husband that he must "mend his ways."

It is a heavy is a positive fact that an escort other than her husband is a positive fact that it is wrong for every married woman to be with an escort other than her husband, but in this case the wife was decidedly at fault. She continued to create conditions which had led to the original trouble in court. Fully aware of her husband's disposition, she had continued to comfort herself in a manner that would inevitably lead to domestic disaster, and this fortunately, because a judge had told the husband that he must "mend his ways."

When I had realized that man on probation and given the wife a lecture, I think she felt that from then on she was as much on probation as he. The trouble in this was not legally an easy discovery. It is this probation will fall again, just as probation fails in thousands of cases from precisely similar causes.

Always remember the judge who assigns sentence upon a probationer dies as at the request of the very

people who make the complaint, this especially when the latter are friends or relatives. Their motives vary. Some earnestly hope for the reform of the transgressor, others, as in the case of this woman, desire the man at liberty so that he may continue to support them. But whatever the motive, the way is open for a law that will strengthen the weak link in probation. Before suspending sentence, make it obligatory upon those who plead for the prisoner to conform to restrictive regulations in their care and association with him or her.

The failure in probation crop up in redoubt variety, almost all pointing to the same conclusion. Take the case of an individual who had broken his parole. Drunkenness, failure to support his family, and staying out late every night were some of the charges. And his explanation, backed by other testimony, was that the wife was a gossip who was forever visiting, neglecting her house, and leaving the copper for him to prepare after he got back from work. After copper had to tidy up the place and look after the children, and then, in disgust, he would go off for just one glass of beer at the corner saloon, where he met jolly companions and everything was pleasant. One drink led to another, of course, with the result that he spent all his money, stayed out late, and went home drunk and as a delinquent offender.

Being placed on probation the first time, he had

Jealousy is an instinct that no court order can curb.

"swore off." But the wife did not alter her usual habits. The court hadn't warned her to mend her ways, and she was a highly indignant woman when, after a month of reform, he "started off" again.

Not in this act of thing confined to the very humble classes. I recall the rather prominent professional man who was before me on a substantially the same charge. His wife was an "advanced woman," the leading spirit of various women's clubs which were working for the education, and twice or three times each week were various gatherings at her apartments. He positively hated such things and sought solace in the rules, with the usual result. Does that he had been placed on probation there was to be expected lapse when the wife had tried to regenerate him by attempting to force his attendance at the uplifting gatherings she continued to cultivate.

With her failure it is to arrest a man for assault upon a woman, and then suspend sentence on his promise to offend no more. If his story that he is persistent reform, how is he going to rest and sleep will be put to rest unless he goes? When they come back to court again on the old charge, the angry and righteous judge that these conditions are beyond help—that for them probation is impossible. And so it is and will be with probation, the law provides a way for them to be helped to their feet. As it is, one might as well expect a drowning man who cannot swim to get ashore without assistance.

And what of the girl, the stranger in the city, who, perhaps to keep from starting, perhaps for pleasure, goes astray and is arrested before she has had a hope-

less distance along the road to despair? She has been saved. How? Reason with her, you say—put her on probation. True; that would answer were it not for the weak link.

Shall we know her love, without money, without friends save the father, and expect her to win a glorious victory over the temptations which lie so near her in a reform institution, where they too often seem to split by keeping before the girl the fact that she is fallen—no matter how many reforms she may apply to help in those dull surroundings and grateful that she be permitted to serve her seal in seclusion and safety?

An investigator once told me that he had never known such a girl ready to reform. What an attainment of severity? I have no solution to offer, but I will do for the moment the best I can. I will not apply, not as we apply it now, but as we will apply it some day, when the world renounces frankly that in fighting with the temptations which surround her, apply a system based on an understanding of and consideration for the weaknesses which are the very cause of human failure.

I had a boy before me—a bad boy, incorrigible, a runaway. His parents were Scotch middle-class people, frugal, religious, and an intent upon saving the souls of their children that they magnified petty infractions until they took on the hue of dire, soul-warping felonies.

They felt themselves disgraced. The father in particular seemed fearful that I might think the boy had gone wrong because they had spoiled him. They need the law more particularly.

The lad was before me for breaking an entire probation. This I gathered, consisted in causing away from home for a history of his case and see how you would judge of his action.

This boy of sixteen had consorted with bad companions—that is to say, he consorted when he was allowed out of the house. His friends were vicious, so, to enjoy companionship, this boy played truant from day and Sunday schools, took his trappings as a necessary part of plans, modifications, and was so branded incorrigible. By and by he did become a pretty bad boy, although he was not vicious—except if he violates his law, and dandy, and dirty, and crib money to secure some of the pleasures that most boys never without being led.

What happened after he had been placed on probation? The parents agreed that he had been frightened, repentant. Why did he run away? Remember this boy was already under the burden of changing his life from what he had been attempting to make one thing. And what course led his parents take to assist him? They had prevailed on the idea that he was because a headstrong, a rebellious, a resistant, and so on, so we sought to discipline him, rigidly. They kept him in the home atmosphere, denied him reading matter save "improving literature," swindled him on the occasion of every petty law he had broken, and of the penalty suspended over his head.

And there you have it! They thought they did right. They were hated upon, crying him from damnation. His case called for rigorous treatment, they held. Yet had they been offered from outside they would have called on a physician, who would have prescribed certain rules for his treatment. His physical burdens would have been lightened, his appetite tempted with delicacies; he would have been given

But this being a social dispenser altered the case. They could not understand that the boy needed the action of sympathy, but they were not. They were not what he could be given strength, and a wholesome diet at pleasure to take the place of the unwholesome diet which he had long been used to.

It is because the theory of probation, despite its failures, has proved itself so great and benefited a mass of moral regeneration, possibly for this reason, that the weak link should receive strengthening without loss of time. Every case that seems worthy of a suspended sentence should be worth a thorough inclusion of sympathy from the home, where sleep and fitness and not overburdened with duties. Then, too, there should be some legal means of placing under that moment on probation those who wish, the transgressor will be thrown in constant contact while working out his probation. And it is not even by the only satisfactory direction of the environment and material things.

What is necessary is what might be called a character physician, who, like the modern doctor of medicine, who does not cut the man out, but prescribes the remedy for each individual, rather than, as now, be satisfied with trying to cure more dead by combating their symptoms.

True, it might cost considerable money, but if considering good members of society counts for anything, it would be money well spent. A hundred years of reform spent now would of a certainty be saved five times over later on in the lowered expense of maintaining the probationers, the reformations, the peace-keepers, and the workers.

## A CHILD AT THE WINDOW

BY M. F. PATTON

God is the heaven,  
Who made little me,  
Why haven't I  
Got wings to fly  
Like other things I see?  
Why reason I  
Go sailing high  
Like bird or humble-bee?

God is the heaven,  
Who made little me,  
Why is it I  
Wear clothes they say—  
Not wings to the knee?  
Why wasn't I  
Dressed in a dyer?  
I'd so much rather be.

God is the heaven,  
Who made little me,  
Why was it I  
Dropped down near by  
Not up to the moon and stars?  
Why is it I  
Am made to lie  
In bed when birds go free?

God is the heaven,  
Who made little me,  
Why is it I  
Came down all by  
Myself, alone, unaided or three?  
Please tell me why  
That I am I,  
And not a chickadee!

# THE MIRACLE OF THE MATCHES

BY  
HERMAN SCHEFFAUER

Illustrations by  
GORDON GRANT

**M**ANG HYPAN and his two friends, Huang Hia and Huang Gah, heard the evening gong boom from the village monastery of Da-hupet and knew that it was time for supper. So they ceased their work in the wet fields, stepped the hillside from the wooden plow, and flung the yokes over their shoulders. Then, leading the hoes by the nose-ropes, they went splashing through the brimming rivulets on their way home. It was in one of the northern districts of Upper Burma on the Irrawaddy, and the month was Wain, when the rains are heavy. The silver gong rang on as they picked their way along the banks and then down the mass of narrow paths through the jungle that bordered on the village. White egrets and herons flapped overhead, swarms of tiny green parrots rattled by. The three boys stuffed their pipes of lambee root with yellow tobacco, and lit up to smoke. The pipettes glowed in the darkness like five comets, as, as Huang Hia would have said, like the red-pine eyes of the sculptured devil heads that guard the pagoda path.

Mang Hypan was their leader. He had long, black hair which he fastened in a topknot and bound up with a turban of pink silk. He wore a long white shirt, and his petrifaction was of lightest red cotton, tucked up between his legs for comfort at his work, and fastened at the back. On his short, sturdy legs and thighs the black silks of his trousers showed plainly. The younger boys stood in great awe of Mang Hypan, for his words, despite his years, were full of wisdom, and his eyes of strange divinity. They spoke of the nature, the rule hermit-dreams of Burma, the great annual feast of village life, and of the gods they would court in the evening. Mang Hypan was devoted to the center of Huang Hia, the little Ma Shou Sun, whose eyes were like those of a gazelle. Now their voices ceased and their feet, for the gong had ceased, and the silver bang heavy, and the tropic twilight patterned blue.

Suddenly there was a haunting noise, and a sport of flame and smoke shot from the pocket of Mang Hypan's shirt. In two courtesies dead stock still for a moment, transfixed with terror, then with yells of "Amoy! Amoy!" they ran toward the village. Mang Hypan smiled, bent out the flame in his hand, and pulled forth a scintillating ball-burst ball of smoking asbestos which had accidentally ignited in his pocket. He threw them lying into a puddle and hobbled after the other boys. He heard their cries and yells and smiled strangely when he perceived the Nat-hammi, the demon that marked the entrance to the village from the north.

"A miracle! These had burst from the pocket of Mang Hypan's shirt!" "A miracle! a miracle!" The village elders and trustees of the pagoda were at once, starting with their families on the veranda of their houses. Each held in his lap a small red burgee bowl of rice and fish paste which he ate with his fingers and re-filled with a wooden spoon from a huge bequest bowl that stood on a two-tier table in their hall. They held their heads tightly as the two ball-burners had dashed shouting through the village.

"How has burst from the side of Mang Hypan a miracle?" "We have seen it with our own eyes!" "The times since I was a boy in the monastery have I heard that tale," said U Po Tin Hwa, the oldest man in the village, "and I've three it was a lie."

"What! Mang Hypan, the Nat-ster, to know such gao!" said another. "An son might have

heard of you by heart. None we shall hear him say that he saw divine ground and find hidden treasure."

"And here comes Mang Hypan himself," said a third, "and a hair of his singed."

They called out to the boy as he passed, demanding to know what truth there was in the tale told by his comrades, but the lad smiled proudly and passed on without answering. He went straight to his father, U Hwa, who sat on his veranda beside his wife and brother, Ko Ingti. There was an empty place beside the lacquer table, reserved for Mang Hypan. Forthwith his father, mother, and uncle hung their questions at him, adopting the name which elders use toward the younger.

"What is this tale, Ngn Hypan, that we hear told of thee—that flame has burst from thy body?" "Is it true, Ngn Hypan? Tell us, is it true?" shrieked his mother, frantically. His uncle was very calm.

"You must tell us what has happened, Ngn Hypan," said he, and made a motion to the boy's father to send his wife into the house. U Hwa grumbled something, and cuttily the little brown woman stink away.

"Now tell thy tale," said the uncle.

Then the boy told of the lot of matches which had suddenly caught fire in his pocket. While they were seeking a light came pouring up to see the youth who had been favored by the sign of the god. But his father and uncle had him enter the house and not show himself. From an inner room, crouching beside his mother, Mang Hypan heard his uncle tell the simple villagers that the miracle was indeed a mighty and a veritable miracle, that fire from heaven had shot from his nephew's flesh, and that, having been touched by the divine, it was next that he withdraw himself awhile from the common gaze. Perplexed, astounded, and awed, the villagers and neighbors went away.

"Ko Ingti, ruler, royal givers," hailed the monk. The two men made a low obeisance before him and took off their sandals, with ill-concealed eagerness U Warranda listened to the tale they brought him. His pricking brown hand which rested upon the head of one of the crimson dragons that flanked the entrance steps opened and closed.

"Ashu gya," began U Hwa, "in the days of the Burmese kings what power was yours?" "At these words a livid light over-shadowed the face of the monk and fire flew in his eyes. The wondering ambition in him was touched. Great visions of power opened before him as he listened to the story of the miracle.

"My royal disciples," said he, significantly, "by the sign of fire, was given a privilege that it is the will of God that we spread the tidings of his onerous price, Mang Hypan."

"How has burst from the pocket of Mang Hypan's shirt?" "A miracle! a miracle!"

"We have seen it with our own eyes!" "The times since I was a boy in the monastery have I heard that tale," said U Po Tin Hwa, the oldest man in the village, "and I've three it was a lie."

"Alas," was U Hwa's doleful reply, "we are, in truth, under his heel!"

"Constantly Ko Ingti began to unfold the great plan that had sprung to life in his brain—like the snake to his snake's fork."

"You have seen," said he, "how the people will have it a miracle. They know well that when flame bursts from the body of a man it is thus a sign of the emanation of the deity incarnate. In what this miracle so related in the holy scriptures of Eastern the Buddha? And in the West? And, believing, do they not worship? and, worshipping, will they not pay—pay much tribute? And are not laws, laws, the rules assigned to Ko Hwa Cyl, the master leader? And all these things being thus and so, U Hwa, is it not best that we convert these people into a flock?"

U Hwa stared before him into the darkness and granted, but less definitely than before.

"We must have faith," Ko Ingti went on, "with U Warranda, village monk and guardian of the pagoda. Roughly he takes the government, for in truth his greater power was his in the days of the Burmese kings. By this sign has Mang Hypan been proved his being, a true child of deity—only whose feet are fit to tread on the people's necks and smelt a throne."

"It is good," younger brother," said U Hwa, "lifting the spirit of belief in his speech. My sluggish hazy eyes to stir his faith that is troubled by a fire. For three hours that night he sat smoking their great cigars on the veranda in the moonlight, their heads nodding close together as they built up their plots and plans."

Early the next morning, when the sun was but just pale over the hills, they went to the pagoda to confer with the village monk. They found him striding in his early morning in the courtyard, beside the brick incense-burners. The golden, bottle-shaped door of the pagoda glowed like a living coal; beyond it in a garden the white stone walls of the monastery shone like silver, there in the shadow the young schoolboys sat crouched over their books. U Warranda, the monk, was dressed in bright yellow. His head was shaven, his expression was sober and ascetic, but when he speaks a look of guile and worldliness crept into his face.

"Is there permission to confer, royal teacher?" asked Ko Ingti.

"Ruler, royal givers," hailed the monk.

The two men made a low obeisance before him and took off their sandals, with ill-concealed eagerness U Warranda listened to the tale they brought him. His pricking brown hand which rested upon the head of one of the crimson dragons that flanked the entrance steps opened and closed.

"Ashu gya," began U Hwa, "in the days of the Burmese kings what power was yours?"

At these words a livid light over-shadowed the face of the monk and fire flew in his eyes. The wondering ambition in him was touched. Great visions of power opened before him as he listened to the story of the miracle.

"My royal disciples," said he, significantly, "by the sign of fire, was given a privilege that it is the will of God that we spread the tidings of his onerous price, Mang Hypan."

"How has burst from the pocket of Mang Hypan's shirt?" "A miracle! a miracle!"

"We have seen it with our own eyes!" "The times since I was a boy in the monastery have I heard that tale," said U Po Tin Hwa, the oldest man in the village, "and I've three it was a lie."

"What! Mang Hypan, the Nat-ster, to know such gao!" said another. "An son might have

The word "fire" was about to fall from his lips. Then came the fourth miracle

"Hark you, elder brother," then said Ko Ingti to the father of Mang Hypan. "Although this is no real miracle yet surely it is a blessing such as by God, and he that has the wisdom to make use of such blessings is not whom God will not help in this existence and degrade in the next."

"What use can be made of the matches that caught fire in the clothes of my son?" asked U Hwa. "It means nothing more than that I must buy a new shirt for him."

and then glared at the monks and the crowd that stirred there."

"Constantly he sought upon their hearts and brains as they sat crouched in their seats. He spoke bravely of how religion had been honored in the days when there were kings in Burma, before the Kelaps, the star of his tribe, had disappeared from the earth and their fathers had departed."

Like a fire of error the gospel of Mang Hypan began to ravage the district. Presents and pilgrims flocked to the pagoda. They bought the costly pictures, the images of Buddha, great and small, and laid

Interfudes

THE UTILITARIAN

WE sat around the stove discussing of mighty deeds that we had done; of stragpling up the Alps and forcing our way to summits thro' masses of fights with lions and hyenas, or facing gnos and ghostly shapes, of dodging basilisks and aspsenas, and many perilous combats.

And one sat by, doctornight and gloomy, and listened to each stirring tale; his beard was long, his eyes were rheumy, his nose was red, his aspect sabb. And this old pilgrim, dear and hoary, on all our plemures drew the nose; for, at the end of every story, he'd molly ask: "What was the use?"

I told of how I went a sailing to Europe in an open boat; the billows raved, the winds were walling, till I could scarcely keep aboard. The salt sea spray was on my features, I heard King Neptune's angry shouts; I fought with whales and other creatures, and was pursued by waterpoets. I sailed those seas for weeks together, and here my life in either hand, and very often doubted whether I'd ever bring my boat to land. But still, resolved on winning glory, I sailed along like Captain Loner. The old man broke into my story, and mildly asked: "What was the use?"

Jones told of how, appointed Ghiky (the third for glory named his brother), he scaled the heights of Mount McKinley and placed our flag upon the crest. He played the bug to thwatt the secret, the doubter, and the man cetera; and then the old man in the corner looked up and asked: "What was the use?"

Brown told of how a oak he entered and fished o'er the Horseshoe Falls, and how all eyes for months were centered on him; in cottages and halls the people joined to sing his praises or leered at his head shone; the old man heard his burning phrases, and mildly asked: "What was the use?"

We made him proudly in our anger, resolved to cook his ancient gress, and still, above the dirt and clanger, we heard him ask: "What is the use?"

WALT MASSON.

HIS INTENTIONS

"You're man," said Major Blackstone, with a leering glance at Chelle. "I happened to see you last night with your arm about my daughter's waist. May I inquire your intentions, sir?"

"Why, sure, Major," replied the blushing Chelle. "I intend to put it there every chance I get."

THE SOCIAL FAILURE

New Tradefoot Willson for all of his pains, was never quite popular out on the plains. He told a good story, and told it right well, and held all his brains entrained in his spell, in humor, in pathos, plain fun, or in wit, old Tradefoot Bill was ne-

verthortly it, but spite of all effort to save his poor life he couldn't get his green peas with a handle!

The case was a dream. Like a lion's it rang, and the whole blooming rump stood transfixed when he sang. Big Bushwhacker Jim, and his old Deputy Ike, and all the old settlers out there on the plain, wherever in song Billy's measures were heard, wiped the

tears from their eyes as they murmured, "Some bird!" But he spite of it all Willson never could learn when eating his soup to make sounds like a churn.

At shooting—well, Bill was no more at that. He'd playfully and never shake through your hat with never a fear that he'd take off the skin stop of your bald spot that has hid within. No bull's-eye e'er made could escape Billy's aim, and yet he got nowhere in spite of the name. He never could seem to grow grateful at all in chewing a toothpick when making a call.

At poker the bad was a wizard, they say, and clean as a whistle was over his play. Deputy Ike and his pals didn't mind when they lost, or saw a red shank whatever the cost. You catch a rare pleasure to notice how Bill heartlessly took his good fortune or ill. But yet there was something that caused them to sigh when the spook in his cut-throat struck in his eye!

Good fellow, good pal, and as square as they're made; a friver in all trouble and never afraid; as brave as old dog as the camp ever knew; at least solid gold giving perfectly true—yet Tradefoot Bill to the camp's sore distress could never be made quite a social success. The men liked him well, but the dames thought him crude when so much of his lip showed his taste for his food!

HONORÉ DOUG GASTON.

A PLACE FOR ALL THINGS

WYATTSMAN was seriously watching the time, and as the minutes passed, and it became evident that the train could not, by any possibility reach its destination on time he turned wearily to the porter and began wearily:

"Oh all the d-d-d-d-d-d-d-d-d-d old heads of Jack this side of the earthquake but this railroad of yours is without any exception there—"

"Excuse me, boss," said the porter, with a courteous wave of his whisker toward the rear end of the train, "but dere's an observation car on de end of dese yer train, sah, an' if ah might take de liberty of makin' a suggestion, sah, you might go back dere, sah, an' make de observations now dere' in ya mind. De greases de ladies on dese yer cars, sah, is such excuse for makin' de suggestion."

Whereupon Willoughby retired to the rear platform and started his observations along the track with such effect that one of the ties was seen to be shaking long after the train had passed it.

THE OFFICE-SEEKER

"What are you doing here?" asked Hiramshower, as he perceived Higgelshank standing outside the White House.

"Looking for an office, like the rest of those chaps!"

"No, ah-ah," said Higgelshank. "I believe that the office should seek the man. I'm just standing here waiting, so that when the offer comes out on the march I'll be where it can find me."

SHE HAD

"Have you any named daughters, Mrs. De Willoughby?" asked the visitor.

"Oh yes, Mr. Vanderhook. My daughter Minnie was announced last week by Judge Cotton of Reno," replied the lady.

HIGH AND DRY

# SEEKING A FAMOUS TROPHY

Under the Leadership of the Duke of Westminster, Britain's best Polo-Players will Try Again to Recapture the International Championship

BY WILLIAM INGLIS

The leader of the American team, Captain Harry Payne Whitney, and the pony on which he did most of his work in defending the International Polo Cup in 1911

Photograph by Charles C. Cook

**L**ADIES of equal sport in all parts of the world will be straining their eyes next June to catch the reborn of the glister of handbouts and the flash of mallet on ball from the green field of the Meadow Brook Club, at Westbury, Long Island. For the stouthearted warriors that the long arm of England can broken from any quarter of the world will come here with all their skill and all their ponies to try to recapture the International Polo Cup. This cup is more to be desired than great riches. It is emblematic of superiority at a game which the English believe is peculiarly their own. It was brought to this country from England in 1909 by a team of hard-riding, hard-hitting Americans, headed by Harry Payne Whitney, kept here by a team under his captaincy in June, 1911, and will be defended once more by a team of which he is the captain.

Is the cup safe? Is the question that rings in every mind upon hearing this news, and by way of response echo an only answer "safe?" For the question is indeed difficult. On the American side Captain Whitney probably will lead to the field those daring riders and masters of precision, the brothers Lawrence and J. M. Waterbury, and Devereux Milburn, that son of Aesch who loves to gallop down the field in pursuit of the ball and send it flying backward far over the heads of the enemy by using his right-headed mallet as accurately as a standing guller would use a mallet-iron. That is to say, these four who so ably defended the cup last time will defend it this time—unless some of the young players who have since come to the highest form shall surpass them. For, with the honor of the country at stake, the American Polo Association will appoint the team of defenders with efficiency as the standard. The spirit of sport, reckless little with gentleness or prudence of past deeds.

England last time sent to the sun-baked plains of India her best team, a spirited and undulating as played in the loose, open, dashing style characteristic

of Americans, rather than in the close order that Britain at home has long believed correct. What England will do this time is still unascertained. One thing is certain, John Bull is saying to his players about the same thing that St. Paul declared in the ninth verse of the sixth chapter of his Epistle to the Galatians: "And let us not be weary in well-doing; for in due season we shall reap, if we faint not." The American invaders had a hard task to get the trophy out of England in 1909, and a harder one to keep it here in 1911; so they know they will need all their skill and speed and the quick thinking that the game demands if they are to keep the palmet, overstriking Britons from capturing across this time.

In the formal challenge sent by Major F. Egerton Greve, Manager, on behalf of the Hurlingham Club, he made the following suggestion:

"If convenient to the Polo Association of America it would suit best to play the matches as early in June as possible, as the English players would thus be able to return to England in time to compete in the Champion Cup Matches, which have been fixed to commence on Monday, June 23d, the final to be played on Saturday, June 24th."

In accepting the challenge on behalf of the American Polo Association, Secretary William A. Howard wrote that the committee selected Tuesday, June 19th, for the first game, and Saturday, June 24th, for the second, leaving the date of the third game, should one be necessary, to be arranged later.

"The organizers," Mr. Howard added, "desires as far as possible to meet the wishes of the Hurlingham Club in regard to all matters connected with these events, and hopes that the dates named will have your entire approval."

Should a third game be needed to decide the international championship, the British players would have very little time to spare in getting home for their national championship; yet they would be the last to impede the success of the international match for the sake of an event of narrower importance. In view of the facts in the case it is difficult to see how the date

of the international contest could be set any earlier than the 19th of June. There is, indeed, a possibility that the field of the Meadow Brook Club may not be in the best playing condition as early as that time. Those who follow the game remember that in 1901 the Americans had in no deed of their practice on the fields of Mr. Gault's Georgian Court, at Lakewood, because the sandy soil and the summer climate there gave a good, firm, playable footing, when the Long Island field was still soggy and slippery after the spring rains and thaw. The Americans had had a brief time for practice at Meadow Brook before the international matches began. The deed of gift under which the International cup is held provides that the matches shall be played between June 1st and July 31st.

The same programme that was followed in selecting the cup-defending team in 1911 will be followed this year. Captain Harry Payne Whitney will be in sole charge of the players and the various committees will aid him in every way possible. There will be a preliminary series of try-out tournaments on the fields at Georgian Court as soon as the frost is out of the ground and the footing is firm enough to let the ponies be worked at a stiff gallop. While Mr. Whitney, whose efforts have been twice rewarded with brilliant success, will lead the defenders, the make-up of the American team will not be decided until the Lakewood try-outs are concluded. It has been officially announced that competition for places on the team will be open to all players of the first class; yet ponies have indicated that the defenders of 1911 will again take the field against the invaders.

As to ponies, the Americans will have an abundant supply to draw from without having to send to California; while the British team under the leadership of the Duke of Westminster, will have the pick of the best mounts in the kingdom. The Britons, by the way, have decided to defer their departure from home as late as possible, so as to begin play within a few days of their arrival here. This, it is believed, will bring both players and ponies on the field in better condition than if they had spent a few weeks in the climate of

# THE LURE OF THE FILMS

BY OLIVIA HOWARD DUNBAR

ILLUSTRATED BY WILSON C. DEXTER

ADVENTURES to discover how and where the rest of the world amuses itself are truly as novel as they sound. But the adventurer of proper spirit is usually content in witnessing the rapturous joy of the multitude, however gently amused by one less facile spring of mirth. Usually enough, an attempt is made in witnessing the rapturous joy of the multitude, however gently amused by one less facile spring of mirth. Usually enough, an attempt is made in witnessing the rapturous joy of the multitude, however gently amused by one less facile spring of mirth.

Does all the world demand the "film-show" and then withhold its approval from their captives? And why does it bring so steadily to-day to the very performance whose lack of stimulus it must have discovered yesterday and the day before?

On the other hand, if a random assemblage of this sort gives mysteriously few evidences of active enjoyment, it gives fewer still of displeasure or scorn. To watch it is to discover that it is infinitely tolerant; completely and bloodily immune to boredom. It even betrays no appearance on being gently approached from behind by some deputy of the management, and sprays, as a level touch, with strong, indelible awe. Daily and hourly—for their patronage is so great that they open either at noon or at nine in the morning—these theaters offer thousands of cases in disproof of all that has been facetiously said in regard to the restless energy of the American. You wonder how it can be possible, in an alleged busy world, to secure this magnificent total of leisure—the amiable daily, and for long, blank periods, so many people who have nothing to do and who are obviously not worrying about it. Every day, under these roofs, has the stagnant and maddening air of a holiday. And while it may be true that shirking household and trivial children are never missing, it is nevertheless an interesting fact that three-fourths of the spectators are always men.

Hardly does such an audience betray any emotion, actively or passively. Its posture is indifferent and relaxed; its jaws moving mechanically in time with the rhythmically-repeated machine ground out by some dumb automation—at least, one pretends to believe it an automation: its dull eyes unresponsively meeting the shadowy glimmers on the flickering "film."

Are these pleasure-seekers really enjoying their enjoyment? If so, they appear to be half asleep. It is true that all the conditions combine to seem conno-

isseurs—the subdued whine of the machine; the unnatural "contaminations" of the exhibition, hour after hour, without a moment's interval; the lack of sequence or climax, as of one oddity literal drama succeeding another—varied, at long intervals, by a bolder picture that introduces the strange, adobeous turbulence of nightmare.

In spite of the lack of enthusiasm, there is an indelible atmosphere of experience and accustomed awe. Nobody but yourself is unfamiliar and lacking. There is rather too suspense and excitement than you will remember in a truly-ent. You begin to suspect that the phlegmatic audience, having come a great many times before, is quite prepared for the fact that some-thing of the programme will be padding and that it does not stand in the best. There is not so much as a change of the expression, much less a sign of applause, as a company of shadow-soldiers are assembled and drilled; parade—a dark kiosk trail their hurried length

across the curtain; foreign cities flash out glimpses of their characteristic scenes; ships are hoisted, cornerstones are laid, medals are presented, and laboratory experiments demonstrating some feature of popular science are painstakingly performed. All "films" in fact, that may be classed as education or even indirectly instructive, as well as the occasional ones that are of a genuinely artistic interest, meet with frank but unreluctant indifference.

For an hour this may continue. Then you are conscious of a stir in the aisle behind you, and a man's distinct voice begins to enlighten the woman who is with him in precisely the same fashion that the people who have not behind you at the theater all your life have gratefully explained and perfectly listened. You raise yourself, look about, eyes glassed at the forgotten curtain to discover what it is that has relieved an apathy so general and so profound; and discover that, far from being some unimagined marvel, it is merely a street scene in New York. And you wonder why the "Film Trust" should go to the trouble of rearing historical "playlets" in costume, through which audiences sleep contentedly, when what really stirs them is the representation of something that they see every day of their lives—the familiar figure of a policeman, a truck car, a crowd on Broadway. But this is not, after all, a new phenomenon. The viewer experienced by persons of a certain degree of shyness in regarding on the stage a familiar object no character has never been explained, although previous must have been realized and referred to, in an incident in many kinds of drama. It has so often been reported that audience betrayed a feverish delight in the introduction into a play of a cow or a horse then in the exploits of the most accomplished actor. Having one long afternoon of widely varied cinematographic devices, the only genuine success was achieved by a youth who drove out before the curtain and made a sound like an automobile. This bit of simple realism did with the sleeping audience from the dress and gave them an unmistakably poignant pleasure which they expressed without restraint.

These flashes of sympathetic response are rare and fleeting, but may always be evoked by one other element—the broadly farcical. And it is perhaps unnecessary to explain that, the more nearly the audience (or perhaps here) approaches that of the comic supplement, the wicker and rarer immediate its success. An illustration, a practical joke, a chase, are of course the entering themes, a chain of anything by anything, however unimportant, has being the acknowledged favorite. Particularly popular are the pictured disputes between an impossible scientist and an unscrupulous agent, in which the most melodramatic triumphs are farcical interpretations of the love-making of an engaged couple, or merely street scenes in which people trample over each other and suddenly give thanks for an

## Paying the Piper

GOVERNMENT BONDS TO THE EXTENT OF HALF A BILLION DOLLARS TO BE ISSUED SOON AFTER PEACE IS DECLARED

**F**IGHTING the number of men engaged in the Balkan War at a little less than a million, and the expense of the war at about \$2,000,000,000 a day per man, the total cost of the war works out roughly at \$200,000,000. In a report just made public, the Italian Minister of Finance gives \$175,000,000 as the amount paid out by the army and navy departments during the course of the recent war in Tripoli—which means that including replacements, pensions, and other attendant expenses, the war must have cost Italy at least \$175,000,000. Here, then, during the year just ended was an expenditure for actually carrying on war not far from four hundred million dollars, but only \$175,000,000 was spent by the government to get their armies on a war footing and keep them there.

Anticipation of the cessation of hostilities and optimistic prediction as to the effect on the markets ought, therefore, to be tempered by the realization that while the total is undoubtedly over, the income of what has happened is manifestly still far from a good thing to come. The French, in other words, to speak, but the bill still remains to be settled. Carrying on wars or even getting ready to carry on wars is an expensive pleasure—in this particular case not the powers recovered will ever bill a billion dollars. That has not got to be made up. Depleted war-chests have got to be refilled, to be paid up on current resources during the progress of the fight was all very well; there being, in fact, no other alternative. But now that hostilities have ceased and it is again possible for these powers to raise money by selling bonds, look for the market to be sold in order that the cash spent may be replaced. So far the expense of the war has fallen on the various governments in the following order: France for \$100,000,000,000, Great Britain for \$100,000,000,000, Belgium for \$100,000,000,000, Italy at \$100,000,000,000, Greece at \$100,000,000,000, Serbia at \$100,000,000,000, Austria at \$100,000,000,000, Hungary at \$100,000,000,000, Rumania at \$100,000,000,000, China for \$100,000,000,000, Norway for \$100,000,000,000, Rumania for \$100,000,000,000, Sweden for \$100,000,000,000.

Stripped of the war and in getting themselves prepared to go to war government financing—that is to say, borrowing by governments—is an entirely superfluous device. The public is going to be asked to lend at least half a billion dollars and afford what other investments are necessary to make it willing to do so. How about the money so borrowed, what is it going to be used for? Good? It isn't going to be used. It was used, as a matter of fact, several months ago. It is not because they need half a billion dollars to build railroads or anything else that these governments want to borrow that big amount of money. The reason they want to borrow is because, in the conduct of the war and in getting themselves prepared to take a hand in it, if necessary, they have expended their treasure-chests and are now under the necessity of filling them up again. It is not that the money may be used in any other way, but that half a billion dollars is to be asked for from the investing public on this side of the ocean and the other. It is equally true that the money may be locked up in treasuries depleted as a result of the war.

Where is the money to come from? From investors who will buy the government securities to be offered, of course. But suppose that these governments were not asked to borrow—how, in that case, would the money be raised? In any other way, naturally—bonds and other securities. It is not that capital to the extent of half a billion dollars which would otherwise be available for investment is going to be diverted into the treasuries of the various governments, there is practically life. Furthermore, that industrial activity which is to obtain its fresh capital by the sale of securities will have to put out its securities in competition with the new government issues being offered.

How does that affect us here in the United States? The question is at once raised. We don't go in for Balkan wars or Turkish or Italian loans. How much American capital, otherwise engaged, is to be put into the war, will coverings of bonds of that sort absorb?

Here, perhaps, then a good many people inquire. A month or two when the market was so low, the money funds hadly and was unable to raise the money at home it was to the New York market that appeal was made. And now, when the market is so high, the American bonds here, at least in any considerable

quantity? Yet when the American government offered the rate it was willing to pay, it found little difficulty in finding lenders here willing to undertake the fate of what the American government was offering as a new thing in the market? On a six-per-cent basis the bonds of a power like Austria were too attractive to pass by. To quote the London Standard, even though they were a class of security little known, could be an easy thing. And that, indeed, turned out to be the case. Nearly five million dollars of American capital found its way into the new bonds within the space of a very few days.

The American investment public has asked, it is true, been educated to the point of putting its money freely into foreign government bonds, but that the experience of this American issue will be repeated and the funds of other governments sold in this market on a considerable scale during the next six months is altogether probable. A very high rate of interest will be offered by the borrowers, that has already been shown. If such a rate as Austria is willing to offer, the very cost to pay close upon seven per cent, for money, what rate will the minor governments have to pay? The Austrian loan, it is true, runs only for a couple of years, and the rate paid for the money is, therefore, considerably higher than if the issue had been for a long term. But even making the fullest allowance for that, it is certain that if a big power like Austria finds it necessary to pay six and a half or seven per cent for its money, the lesser powers will have to pay a good deal more than when they are willing to have the loan run over a long series of years.

The effort will be largely to overcome the chief objection the American investing public has always had to government bonds, namely, that they yield no real rate of interest. A government not bearing three and a half per cent, indeed is a different proposition from one bearing six and a half per cent, or six. In this country there is an opportunity to invest money profitably for bondholders to take any interest in securities yielding the former rate, however small that may be. But let a government not bearing three and a half per cent, and the chances are that the investing public will not be able to take advantage of the opportunity.

It is not at all the present time when there is so much agitation against the railroads and the big industrial concerns, and investors are in such doubt as to what to do, that the government securities of established securities may be worth. Issues having public-service bonds all testify to the extent to which this question is being asked. With these new government bonds it will be the same thing. They will not, perhaps, have the safety of British bonds or French notes. But any one who looks in will at least have the assurance that he is buying a security legally issued, and that when he picks up his paper in the morning he need have no fear of finding that the government has brought a dissolution suit against the company. To a greater degree than many people realize, confidence in existing investments has been impaired. Very large sums of "flighted" capital, it is certain, will withdraw the opportunity of investment in securities which, while yielding a full rate of interest, are not subject to the influence of the government. The investment markets into their present state.

Probably not a very great amount of railroad and industrial securities will be offered for investment to re-invest the money in the new issues, but that the new issues will compare strongly for fresh holders with a whole lot of later issues will be true, that because of the very large amount of financing which has got to be done during the next six months, is an important consideration. Aside from the new money needed by the corporations, the market itself \$200,000,000,000 has got to be raised between now and the end of June merely to take care of maturing bonds and notes.

That the competition afforded by the offering of half a billion dollars' worth of new government securities here at a high rate of interest will not make the proceeds any easier to place enough, so far as the offering of maturing obligations is concerned, that will be strange enough. But the maturing of the new issues will be a heavy burden on the market. Just recently a bill has been introduced to issue \$100,000,000 of new currency arranged to take care of them by means of the "Federal Reserve Bank." The bill is high. The railroads and industrial companies having bonds and notes coming due during the next six months will be forced to turn to the market for the money to meet the accommodation. And similarly with borrowings of fresh capital. With governmental bonds being freely offered at a high rate of interest, it is not surprising that it stands to reason that industrial and business enter-

prises will have to be given a high rate of interest to make them make at all.

From the investor's standpoint that isn't a bad thing. But from the standpoint of business and the market it is. Business, in order to go forward, needs capital—plenty of it and available at low rates. Scarcity of capital, resulting from the diversion into government bonds or any other cause, is one of the most effective restraining influences to which trade can be subjected.

But considerable as is the amount of industrial capital in this country which will be displaced by the issue of these government loans, it is small in comparison to the amount which will be displaced abroad. We have already placed \$25,000,000,000 of American bonds, and still probably run our purchase of foreign "government" bonds above the wire-figure mark before we get through; but even so that the whole amount placed here will not amount to more than one-fifth or possibly one-fourth of the total placed abroad. If the issue of the new bonds is to be an influence on the market here, it is to be an influence far greater importance on the markets of Europe. And that means, of course, that there will be a positive effect on the market here, for as clearly as the European and American markets stand that nothing can so strongly influence the one without influencing the other.

From the American standpoint, what particularly counts is that the bringing out of the great mass of money into the foreign market means that for the next six months the foreigners will be very fully occupied attending to their own financing and will not be able to help us much with our foreign government bonds that are to be sold. With the best of our wish, very large amounts of money will be released for investment all over Europe. But even so that, and making the fullest allowance for potential absorptive power, the issue of \$200,000,000,000 to \$200,000,000,000 of new government securities within the space of six months is an influence calculated to find the markets to their utmost capacity. Pared with the problem of raising that amount of money that foreign markets can only be expected to hold their reserves will not be able to pay to us requests for accommodation from any other source.

It is, it is to be expected, as we say to be to assist it, we do need foreign help in the financing of the three hundred million dollars out of bonds and notes that are to be sold here and the market of the year. If these securities a very considerable part are held in London and Paris. Where, therefore, they become and notes—many of them are notes—some day, and the corporations which have issued them try to arrange with the holder to take new issues of securities in payment, instead of cash, the financial position of the holder is not one of our difference. If we are to pay in kind, the chances are that he will cheerfully acquiesce in the proposition to accept new notes instead of cash. If, on the other hand, his position is such that he feels that he needs his money for his own use, the refunding proposition is not so likely to appeal to him and he is likely to demand payment in kind instead of new securities.

Some of the notes falling due within the next six months will be asked to be renewed, but the great bulk of them will not. There is no reason why the terms offered for renewal will be made as attractive that the holders will be content to let the obligations be renewed. With so large an amount of new securities of their own to look after, the foreigners, if they are not content to do so, will start fresh legislation if that is indicated on, are certain to refuse to renew. To do so would be virtually to make us fresh money out of thin air. The market is not likely to be overgrown. To rise of their own requirements for cash can hardly be expected to do. While the marketing of this great mass of new government bonds is going on, the market for industrial and other securities will be depressed.

We can consider ourselves fortunate, indeed, if the displacement of capital resulting from the issue abroad of half a billion dollars does not start fresh legislation of foreign-held American stocks and bonds. If the selling movement which started with the outbreak of the war, Europe's speculative holdings of American issues" were greatly reduced. But repurchase, it is known, have been on a considerable scale. With these holdings as a result of the war, it is possible to be displaced from the market. That depends largely upon the amount of difficulty experienced in distributing the new bonds. If the issues are readily taken up, the market will be able to absorb the new issues, foreign holdings of American stocks are not likely to be greatly disturbed. If, on the other hand, the market is unable to take up the new issues, it will be forced to pay up the money wanted by these various governments can resort upon having a further consideration of "American" money on this market for sale.

**Curious Trade Unions**

According to a recent report of the Registrar of Friendly Societies in London, there are nearly seven hundred trade-unions in Great Britain.

Next to Lascarisburg, London shows the highest number of such unions. It also possesses the oldest trade-union in existence, that of the United Society of Bricklayers.

Out of one hundred and forty-two London unions forty-one have fewer than one hundred members, the smallest being the Cabinet Makers' Federation with but twelve members. Many of these small trade-unions relate to occupations requiring kind of an ordinary life. The Paper Makers' Union, which has been in existence for fifty years, has only fifty members. The Tin Painters and Powdered Putty Case Makers have but forty members. The Barometer and Thermometer Makers have a trade-union membership of thirty-two.

An interesting instance of a small trade-union is that of the canal, river, and dock watchmen, who number thirty-four. Even the keepers of coffee-stalls, which the livery Londoners patronize after the coffee, are represented here, having elected at 12:30 A.M. have their union. This has been in existence for eleven years and owns a membership of thirty-eight. Another little union is that of the United Kingdom Street Sweepers and Paviors, of which there are forty-two members; and here is a "Birds' Traders' Brotherhood" which has thirty-two.

DR. CARL ALBERSH, RECENTLY APPOINTED TO BE THE CHIEF OF THE DEPARTMENT OF ASSAULTS.

**Africa's Dreadful Snakes**

Between Australia, India, or Africa, in the world place on the list for poisonous snakes, the last named is quite bad enough. In central East Africa one must always beware the ground cautiously before approaching a blanket for a seat or bed, and the natives have acquired a remarkable amount of wisdom in deriving deadly reptiles, which usually resemble the reputation of their name. On the other hand, the semi-toxicous kinds are often most conspicuous in our country, the moccasins, which has a white skin marked with blood-red stripes, being the only known example of a white snake in America. The poisonous ones occur in trees and elsewhere as well as on the ground, and there is a black one which coils in the trees, and its deadly bite, where it kills many negro honey-gatherers. Another is a scolded grey, and accounts for the death of large numbers of cattle and mules. A broader body found one seven feet long encoiled in the hollow base of an elephant trunk in its warehouse and thought it worth while to pull the whole place in pieces to make sure of getting rid of it.

The white and widespread puff adder has a way of creeping for warmth into the blankets of sleeping men. An elephant-hunter relates that one very chilly night in German East Africa he had wrapped himself in his blankets and was falling asleep, when he realized that a snake had slipped into his bed and between his legs. In his honorable predicament, where his slightest movement probably meant his death, he kept his wits about him and,

FOR BROWN'S Chamberlain's Powders IDENTIFY  
THE TRADE MARK

explained the situation to his men, but then very carefully lit away the covering. This they did, disclosing a large snake, which they quickly grasped by their hands under his shoulders, and with a quick, strong heave dragged him out of danger.

A small black-and-white snake is much dreaded because it hops from the tall grass at noon or animals passing. Still more difficult to guard against are certain large greenish snakes which lie in wait on the branches of trees exchanging a path, and strike downward; they are almost invisible to the fangs. At a village in German East Africa a native woman started to walk in another village, carrying on her head a basket of oranges, and as she walked, severely hit, her child. As she went the instant set up a sharp cry, but was presently quieted, and the mother never suspected, till she had reached her destination, that the baby had been struck on the head by a snake and was already dead.

**Transatlantic Navigation**

Proponents of the probable dimensions of Albatross liners have hitherto proved over-estimates. At the first International Congress of Maritime Navigation in Philadelphia last May it was estimated that in 1920 the twenty largest boats of the Atlantic fleet would have an average length of 1,100 feet, with a beam of 600 feet, and a draft nearly 30 feet of water. A previous forecast, however, for 1923 mentioned in 1915, provided for the new tonnage at Tiffany Dock possible for a length of 1,250 feet, a width of 120 feet, and a draught of 31 feet. The Star Line, which has the largest tonnage of receiving ships of the size of North American liners, is to be departed to 20 feet by 1915.

These estimates an appreciable difference between port accommodation in New York and Havre. The water in the French port has at low tide a minimum depth of 10 feet of water. On the other hand, in New York harbor the Ambrose Channel has a depth of 30 feet.

Big liners to-day cannot wait for the tide. All companies attach importance to sailing on schedule, and the consequences at Havre, hence there are in course of reconstruction there works that will soon give the port a big increase in water, a quay of more than 2,000 feet, along which there will always be at least 20 feet of water.

**A New Use for Beggars**

A HOTELKEEPER in the suburbs of Paris, having been much troubled with mosquitoes, and not knowing what to do, turned to the building, and there it was placed a sign reading: "Charity deprives both him who gives and him who receives. Turn this wheel one hundred times and you'll get a free."

Numerous beggars applied for leave to turn the wheel, but the discovery was made that the force employed was sufficient to drive water from a well which served a provincial market by a nearby orchard and laundry. Thus, according to the story, no beggars were seen in the vicinity.

**Willow Life-boats**

American use of the ships which sit between London and Boston, they have recently installed a species of life-boat which is quite novel. These boats, which do not weigh more than the ordinary life-boat of wood, are made to hold thirty-five people and are composed of several concentric layers. The exterior is of willow, that comes a layer of wood, then another of canvas, a second layer of wood, and a second layer of canvas. The interior of the boat is of wood. Experiment has demonstrated that this kind of life-boat is practically "indestructible," and it is constructed to make it a kind of steel which so early overtures the ordinary life-boat. It is also expected that this new boat will keep about indefinitely in the stormiest weather.

**The Harmony of Colors**

Yar principle that the sensation of white results from the equal excitement of all nerves produced by the three fundamental radiations, has been supported from an analysis of the rules of the harmony of colors. Colored lights do not mix at all of the same point, and the eye must see different distances at the same time in order to see when different colored rays touch. The difference of refrangibility of the different colors rays causes some colors to stand out and others to stand back. Red is the most "flying" or "tearing" of the colors, and red always appearing to be farther away than a blue object, though it is seen on the same plane and in the same light.

# Send coupon for this Kipling FREE

Beautifully Bound in Cloth, if You Send the Coupon at Once for the Authorized Uniform Edition of

## O. HENRY

in 12 Volumes

If you paid \$125 for the only other uniform set of O. Henry in existence this doesn't interest you. Otherwise you can't afford to miss it.

For O. Henry is the American Kipling, "the American de Maupassant," the American master of the short story.

Other nations are going wild over him. Memorials to him are being prepared. The best-books of English literature are including his stories; colleges are discussing his place in literature; identical firms are vying for rights to dramatize his stories.

Each story—civil, human, real—may lay bare some cruel social wrong, or just a quaint, dear glimpse of good and happiness and fun—the Arabian Nights of New York—"his tales of the big city—catch the glimmer, the romance, the elusive sparkling spirit of the "Four Million."

Each story may spring a surprise, or lead you greatly along, only to turn and laugh a you in the ear.

If we could show you a bit of the 21 stories in this wonderful set, you would send the coupon at once just for the promise of interest in the bare titles.

**O. HENRY**  
12 volumes, bound in green with cloth and gold. Gold tops, illustrated, 200 complete stories.

**KIPLING**  
6 volumes, 179 stories, gold points, and with cloth, gold tops.

**Why Such Giving Away**

The only uniform edition of O. Henry ever made at \$125 a set before it was planned. Now, to get this 12 Volume Uniform Edition, you pay the low price we are making here, or send order a big edition—and have enough money left over to pay it! So we give three sets of Kipling away to get the first order of O. Henry in quickly.

**Send Back Both Sets If You Like**

Send the coupon without money today. It will bring the 12 complete volumes of O. Henry and the 6 complete volumes of Kipling at all charges prepaid. When you get the sets, examine the forewings carefully, examine the gold tops, the gold stamping—the paper by every standard you know, try the production of the type. Look for flaws. Then sit down and read. If you don't think that that the set of O. Henry is so well made as to be the best there the money, and that the Kipling is so good-looking that any body would be delighted to have it, send both sets right back at our expense. And if you don't think that these 18 volumes contain more joy and merriment, more big emotions and big thoughts than you ever expected to find in the covers of 18 volumes—send the books back.

Send the coupon a instant a rent of money. It will save you nothing, puts you under no obligation. It will leave you no debt and no bargain. But do it.

To get the Kipling free you must reply right now. This is an offer that won't wait for you. It differs. Send your coupon today without money, and you will get the 12 volumes of O. Henry and the 6 volumes of Kipling. If you don't like them, you can send them back at our expense. If you do like them, you can keep them for 12 months for 12 cents. For 12 months you can keep them for 12 cents. For 12 months you can keep them for 12 cents. For 12 months you can keep them for 12 cents.

Menageries

The habit of keeping wild animals in confinement first appeared in the form of sacred menageries. Of these dumb deities the ox and the serpent were chiefly popular, although certain cities manifested a speciality of other kinds of animals and reptiles. Such animals were kept and fed near the lower portions of temples. The sacred lion of Heliopolis was domesticated in the temple of the Sun and had reserved for him the best cuts of mutton, while his meals were eaten in the modern fashion, to the accompaniment of music. Unusually tame live animals were confined with the lion, which attacked and devoured it. Sacred crocodiles were an highly esteemed that they had captured near their temples and rings at their claws. It was the custom to feed these creatures with cakes and scraps of meat, for which they would come at call. Even now in Japanese temples a similar fashion obtain, except that tortoisene replace crocodiles.

In Egypt such menageries had attached to it a plot of cultivated ground whose yield sufficed for the maintenance and upkeep of the animals. Parents, when their children were ill, would realize on their hair to lay offerings in propitiate the sacred heaues. The tabernacle preferred more or less domesticated animals as stock for their menageries. The lioness, on the other hand, fed with wild meals, for fighting, chiefly. At one time rich citizens owned private menageries and gave exhibitions of the animals at receptions, etc.

Today the number of menageries is legion. But these establishments have ceased to be regarded purely as places of entertainment, and it is sought to turn to account their scientific value. The menagerie promises to be a kind of sanatorium where animals will exercise their muscles.

"HOW FAR IS IT TO MARS?"

The Solitary Wasp

THE remarkable qualities of the social instinct of animals is shown by the "solitary" bee which, by laborious effort constructs a few cells in a hole in a wall or in an old shell abandoned by one of our builders of the hive. At the bottom of the second cell of the wasp's work, the female constructs for one of the family of the solitary wasp, built to its own little bits of earth. The nest is then shaped and then covered with a sheath of plaster of mortar.

When ready to deposit her eggs the female enters either grille or entrance, paralyzing her killing prey by stinging their nervous centers, and drags them home to be preserved, still living, until needed as fresh meat for the young. Her pouch filled with provisions, she lays in it one egg, which she hangs to the top by a thread of her own spinning. This done, she detaches the neck of the pouch, seals the mouth, covers the whole, and goes, leaving the nest to mature. The egg matures and the larva comes forth and feeds upon the caterpillar, paralyzing her, and returns to take note of the result of her efforts.

The *Odynerus apicatus* of Europe works in a different way. She makes the future cradle in the ground in places exposed to the rising of sun and, and hollows out holes twelve inches deep. Many wasps of this species may dig in the same place at the same time, but each works for herself and takes no notice of her neighbors. In case of danger, workers fly to safety and take the other workers back out for themselves. Usually the ground shows a hard and a thread of soil, which is properly before she has dig. In measure as the work progresses the insect uses the ground thrown up in building a sort of chimney around the opening. When the nest is dug the mother larva sticks it with soil, and covers her eggs, breaks down her chimney, and uses its material to stop the opening, and seals the whole work with other material.

The Convenient Cycle-Car

The increasing popularity of the cycle-car is easily understood. It supplies the needs of locomotion that come of the car and motor-bicycle. Only lately has been possible for a man in modern circumstances to buy and use a cycle-car which machine to carry a man and his family.

The cycle-car is a great piece of machinery. Many cycle-cars look but little over two cubic feet. Among other advantages are the initial cost of the machine, ease of storage, and general adaptability, which render it a very important of the public. Month after month designs of cycle-cars are constantly being brought upon the market.

The displacement of motor-cars by certain persons by these machines is almost threatened. A small delivery van cycle-car possess the advantages of lightness and easy manipulation in traffic. For the delivery of goods, where house-to-house visits are necessary, such devices are rapid "picking up" and showing down. The use to which the cycle-car is well adapted is in the service of traveling salesmen. Here what is wanted is a machine simple in price and, at the same time, reliable, which can be used in any circumstances, be fairly speedy, and, above all, not require too much attention.

The Sleep of the Elephant

It is doubted whether, in the wild state, elephants ever lie down. Gordon Young thought that he had discovered a mark on the ground that the adult bulls had struck themselves out at full length for a few hours at night. It might be, but he concluded that the young and the cows always remained on their feet. Another authority, Nelson, has expressed doubt whether even the old bulls lie down. He tells of one herd that he knows to have been sleeping and lying throughout the twenty-four hours. "Except when milking in mud and water," he says, "it is held that an African elephant never lies down during its whole life."

However this may be, the most competent authorities seem to agree that this animal sleeps less and more lightly than other animals. It is believed that the sleep of the elephant is characterized by an occasional slumber taken standing up to average about four hours in the twenty-four, and this estimate has been employed by the ton in an amusing passage for one of his "Milk and Honey" wherein the sleep of the elephant is represented as consisting of an hour's dozing on one side and a similar period's dozing on the other, followed through the rest of the night, "by long, low, rumbling rattlings."

A Promise and—A Performance

One year ago, on January 1st, The Pittsburgh Post took its readers into its confidence and told of its aims and hopes for 1912.

The success which has come to THE PITTSBURGH POST during the last twelve months has come by fair means.

We have made as good a newspaper as we know how, fair in politics, fair in its policy, clean and generous in its news columns and clean in its advertising columns. Many newspaper readers do not fully realize what it costs a newspaper to be clean in its advertising columns and large the money in contemporaries not only accept, but seek. Other Pittsburgh newspapers print advertising not one line of which could appear in THE PITTSBURGH POST under any conditions, no matter what the price.

But there is a reward—the success which THE PITTSBURGH POST has made is almost incredible. In 1912 THE PITTSBURGH POST gained over the previous year

January gain,	14,696	Agate Lines
February	23,352	" "
March	28,854	" "
April	61,696	" "
May	82,572	" "
June	78,906	" "
July	63,008	" "
August	90,464	" "
September	94,542	" "
October	132,314	" "
November	138,544	" "
December	107,254	" "
One Year's Gain,	916,588	Agate Lines

916,566 agate lines of paid advertising

Let those who say they find the public is unresponsive. We know better. To those who help our 1912 success we say this, "All that we did in 1912 we shall do in 1913—and more."

ABBOTT'S BITTERS

An Ancient Operation

When the medical profession is agreed that a certain form of surgery has been existing from very remote times, it has always been a matter of wonder that so complex and delicate an operation as trepanning should be also one of the simplest.

It is authentic record of this operation dating back to the time of Hippocrates, who wrote treatises on fractures, dislocations, and a number of the head, wherein he described the method of procedure to be followed in the case of a fractured skull. It is also known that a file was used for this purpose, which, at a time when modern anesthesia was unknown, must have been, to say the least, a fearful operation.

According to Helms, the operation of removing pieces of bone was performed during the Middle Ages, and he states that the skull was easily seen after death and was visible as long as the bones are preserved. From inspection of every skull of the later stone age in several States there has been derived the conviction that some of the operations of craniotomy, which must have been performed with a stone implement.

Sun-Dials

SUN-DIALS are of great variety—spherical, conical, pyramidal, and portable. Of the last description one of the Pyrenean peasantry consists of two wooden cylinders, the smaller carrying a stylus and fitting into the other. The oldest sun-dial on record was that of King Amshank about 740 B. C. It is a cylinder of copper, and is placed in a square upon rock in the Grande Riviere in France may be seen a reproduction of it. The most recent and most beautiful one is the dial in Sicily and is made of metal. Its design and construction is that of a dial. It is 17 1/2 in. in diameter and is placed in a horizontal line, with a vertical surface, and measures about 13 feet in height and 2 1/2 feet at the base.

Music and Mosquitoes

In some parts of India, where mosquitoes abound, it is impossible to play the violin because the male attracts the insects in great numbers. When the first notes are heard the mosquitoes swarm in clouds around the player and make the movements of the hand impossible.

## THE NEXT PRESIDENT OF FRANCE

Raymond Poincaré, who has been elected by the National Assembly to succeed Armand Fallières as sixth President of the French Republic. He is fifty-two years old and filled several Cabinet offices before becoming Premier in January, 1912. The skill and enterprise which he displayed in localizing the Balkan conflict, won him a high reputation, and his election was the result of a decisive popular mandate. An account of M. Poincaré's career appears on page 9

## COMMENT

## Mr. Wilson's Speeches

Hasn't he got to be about time for Wall Street to remove its blue glasses and take a square look at the rest of the country? Nobody else is hearing spasms over Mr. Wilson's speeches. Why should the Street that May Be Straight, but is Sometimes Called Crooked? And why did it try to get things straight, too? Here, for example, is our neighbor, the Stag, whose accuracy of statement is proverbial, printing the following in its financial columns:

In these addresses it was made that it is the next President of our country and it is to have a party friendly to him in control of both Houses of the national legislature has declared that the business men of the country are substantially dishonest and must change their hearts; that the banking system of the country stands already "convicted" of selfish and dangerous practices; that society in the country is in need of general reformation; and that he, the President-elect, has started out with his ear pinned on and holds a whip in his hand to hurry the reformatory process. And it was added that if business dishonesty results from all this it will be because capitalists have conspired to bring it about and for which they will deserve to be hanged as high as HANAN. It has been agreed in defense of Mr. WILSON that in speaking as he did he spoke extemporaneously and was carried away by emotional affluents.

Now let us see about this. We have read Mr. Wilson's speeches, but we found nothing of this sort in them. He did not "declare that the business men of the country are substantially dishonest." On the contrary, he evinced belief in their integrity and good intentions. That he did say frankly and truly that the country needed to be convinced of their uprightiness and usefulness, and that it was up to them to do the convincing.

There was no novelty in this assertion. Senator ELLIOT HOOR, who represents in Congress downtown Manhattan as well as up-State New York, who used to have a law office in Wall Street, and who ought to know what the country needs, made the same declaration far more earnestly and with much greater emphasis in his recent speech to the Chamber of Commerce. These were his words:

There are hundreds of thousands of people outside the great industrial committee who think you are a set of thieves. There are hundreds of thousands of people who think that the country needs the same declaration far more earnestly and with much greater emphasis in his recent speech to the Chamber of Commerce. These were his words:

The distinguished Senator then went on to urge his hearers to strive to overcome this impression by their acts. And that is what Mr. Wilson did—just that and nothing more. Mr. Wilson's language was less language than Mr. Root's, but he was not at the same thing, and the country needs the view! If not, we for one don't know what good advice is.

Then again Mr. Wilson did not say that our banking system stands "convicted of heinous and dangerous practices." He said it stood convicted of general dishonesty and specific dishonesty to treat the needs of the country—which is just what every man in and out of Wall Street has been saying for years.

And Mr. Wilson did not say, in either Chicago or New York, that "if business dishonesty results from all this it will be because capitalists have conspired to bring it about," and ought to be hanged "as high as HANAN." What he did say

was that if unscrupulous persons should try to fetch on a panic to serve their own wicked end or to discredit those who are trying to accomplish reforms, they ought to be and would be held up to derision and scorn—held up or hung up as high as HANAN.

Well, who wants to deny the rightfulness of that proposition? If he had said higher than HANAN, he would have been right. Panic can be held up very bad things, and no punishment is too severe for anybody caught encouraging them. Maybe it wasn't necessary for Mr. WILSON to say that at this time; it might probably it wasn't, but what he said was all right.

It may be that "it has been agreed in defense of Mr. WILSON" that he spoke extemporaneously, and "was carried away by emotional affluents," but if so we should like to know who did the agreeing. Surely Mr. WILSON would not admit that he did not speak deliberately, and there is no reason why he should, for he didn't say a thing that wasn't true. He did speak extemporaneously, to be sure, and that was a mistake, because only organized and misrepresentative portions of his City were speaking out into the Madison square, but that is the only ground for criticism we have found or can find.

The Times' financier, after due consideration, reaches this sage conclusion:

There was an undercurrent of hope that the responsibility of office, once it actually rests on his shoulders, will lead Mr. Wilson to weigh more carefully the effect of his public utterances; and the sentiment of the Street in respect to the influence to be exerted by the issuing of the new administration was probably reflected in the course of price of the Stock Exchange. It remained true, now the fact, that interference, perhaps well founded and perhaps well justified, to do with the market, but by Mr. Wilson's words as had the direct statement of his views as he expressed them. The Street's own interpretation, in other words, brightened the effect of his words, but his utterances, as they were heard by him in his address at Chicago a week ago, and in his later statement, in which he dealt with the policy which he expected to pursue in the selection of his Cabinet. In this last fact the possibility that the market effect of this factor was

The "real sentiment of the Street," we believe, is "a very accurate reflection in the course of prices on the Stock Exchange." It is an assumption, moreover, to see an effect "brightened by the Street's own interpretation." Sometimes, too, it does happen that the market effect is "overdone" by speculators.

Well, that is Wall Street's business. It isn't Mr. WILSON'S. And it isn't the public's. If there are those who think they can make money by selling stocks on their own "interpretations," that is their privilege. It is also the prerogative of others to buy shares for the same purpose on their own judgment.

Let 'em do it, we say. There isn't any pain or any sign of a panic, and all the stockholders combined couldn't make one in a time like this if they thought they. Investors are not alarmed, and have not the slightest cause to be. They haven't been selling any shares, either. It is a strictly "professional" market and unworthy of a moment's attention from Mr. WILSON or anybody else associated with him in gauging real public sentiment.

## Two Improvements Suggested

Mr. CHARLES FRANCIS ANAMS thinks he knows of two improvements that should be made in our system of government. Just two. Others he deprecates for the present. He doesn't care to popularize the government; doesn't care for the referendum or any of the rest. He respects very much the constitution in its form, and would let it alone in all particulars. We think that it is also on January 16th in a Founder's Hall address at the university of South Carolina. But he favored two changes. He said:

I would substitute for the present brief tenure of the Presidential office a tenure well enough longer in the comparatively simple days which precede our Civil War, but in all particulars. We think that it is also on January 16th in a Founder's Hall address at the university of South Carolina. But he favored two changes. He said:

That is one change. The other concerns the method of choosing legislators. Mr. ANAMS said:

Our legislature does not fairly represent the average good citizen of our community, taken as a whole. Hence it is not inclined to follow in the course of the law as to common-sense reforms. It fails so to do for two reasons. It is chosen by the people; I have not opportunity referred to as the voting of ones, and, moreover, by an arbitrary law men binding that law is the start-halt-choke that coming of times is localized. It is not a body of men, but a body of men, and legislative, we refuse prohibition to a system, and install it as such. It has become the stronghold of

inequality—the average to office of the second and third rate men, who wish always to enjoy the share of a little brief authority, to have, alas, a taste of public life. In this respect our American system is a better one than that of any other country. It is the system of Parliamentary election existing in Great Britain—based upon a gross criticism. In Great Britain it is a system of election by the people, where he can find it; or the constituency seeks the man whom it recognizes him. The present Practice Minister of Great Britain, Mr. Balfour, represents a small Scotch constituency in which he has resided, but by which he was elected more than twenty years ago, not through which he has since conscientiously remained in office. The other side of the other side is the extravagance of the system now and traditionally in use with us. To get into public life a man must not only be elected by the majority of the voters of the district of the locality in which he lives, but he must continue to be in sympathy with that majority; or, at any election, like Mr. CANNON in the election just held, where for any passing reason a majority of his neighbors in the locality in which he lives fail to support him, he must go into retirement. Such a system simply gives one man individuality and sets a premium upon submergency. His operation and influence may be studied to-day in our halls of legislation—state or national.

Both of Mr. ANAMS's suggested changes aim at the same thing—the revision in legislative service of men whose training, experience, and abilities make them the best men for the job.

This is too big a country to be run successfully by green hands, even with the assistance of all the newspapers. That was recognized by the provision of six-year terms for Senators, and by the plan that not more than about one-third of the Senate shall be renewed at any one election. Representative, like the Senators, must be elected on the basis of the status of the locality, but they should not be inhabitants of the Congressional districts whose voters elect them. Any citizen of Massachusetts, otherwise qualified, can be sent to Congress from any district in Massachusetts. Any district in Illinois could send back I feel sure to his familiar duties at the next election. That much privilege of changing the status of the locality is what we have, and sometimes they use it, though rarely. Moreover, it would be an easy matter for any citizen to become an inhabitant of a state that wished to send him to Congress.

But we see no signs of inclination to vary much from our present localized system of choosing legislators. The only change that the thinkers are talking of is that Mr. ANAMS desire. At the last election Mr. McCALL of Massachusetts was omitted from the House. We believe he represented Mr. ANAMS's district, a district unexcelled for general intelligence, but his party split under him. Mr. McCALL is one of the ablest men in the present Congress, and it is a pity to lose his services. Perhaps it is the fact that prompted Mr. ANAMS's suggestions. Massachusetts tried to send him to the Senate, but Mr. WELLES beat him. Now, would any constituency anywhere like to send this admirably competent gentleman to Washington? Perhaps if due assurances could be given him he would inhabit some other state.

Do we hear any loud?

## Is Congress Free to Sew the Country?

Chairman GLASS, of the House Currency Committee, made a statement the other day that ought to challenge the attention of the country. It raises a question that the country cannot afford to neglect.

One of the reports called by the committee had been giving his experts, but it favored the same general plan for altering our banking and currency system which has been favored by the great majority of the experts and men of experience that the committee has heard from. He remarked incidentally, that the opposition to it was mainly sentimental. Whereupon Chairman GLASS made a statement to the effect that the opposition to the plan might be, there was an insuperable political obstacle to adopting it.

Is this true? Is it true that Congress is not free to adopt any particular plan or policy, even if through investigation shows it to be, on the whole, best for the country? Is it true that in this matter, peculiarly requiring, as it manifestly does, a scientific and dispassionate handling, the hands of the new Congress are going to find themselves helplessly bound by a partisan mandate? Is it true that they cannot even permit it to be treated as a non-partisan question? Is it true that they must deny to themselves and their followers the right to study it with open mind and to vote on it in accordance with the best information they can get and in obedience to their honest convictions?

There is no exaggerating the gravity of such a situation. If Chairman GLASS is right, then he has brought a terrible indictment against party government, and in a way against representatives

government. This journal is not contented in assuming easily the practical significance of his announcement, but the circumstances that it did all it could to prevent the Democratic party from putting itself in the predicament in which, if Chairman Glass is right, it now finds itself. Away back in the preliminary campaign we implored Democratic leaders and candidates not to go off half-cocked on this financial issue. We said we could keep them from making it a party question. We take no credit for that course, for any man of sense must know that on such a complex question as this the pronouncement of a political convention in its dying hours, when we must debate are reaching for their last, ought not to be imposed authoritatively upon sensible legislators and responsible executives. It is no comfort to remember that the Bull Moose crowd at Chicago adopted an even more culpable vote-seeking plank than did the half-led delegates at that furnace of a convention held at Baltimore. All that is past and irremediable. We must face now the situation as we find it.

Is Chairman Glass right?

**We Think It Is True**

We readily concede that he and others who think as he does may be sincere and conscientious—just as sincere and conscientious as we and others who think differently. But we cannot concede, we cannot believe, that Congress is not free in this matter. What is more to the point, we cannot believe that any Democrat in the Sixty-third Congress will not be free to use his own best judgment and to vote for whatever plan of banking and currency reform he himself may like best for his country.

The main reason why we think so is very simple. It is that nothing on earth can ever make it the duty of a representative of the people to speak or to vote against the real welfare of the people as he sees it. It is from them, after all, that he takes his commission and his pay. If they and not a party that he promises to serve when he takes his oath of office, it is in order to serve them more effectively that parties exist; the honest loyalty to party becomes disloyalty to the common welfare if it becomes disloyalty to country. It becomes nothing better than a sort of diluted treason.

That, we repeat, is the main consideration. It should be the controlling consideration. Nevertheless, we have respect for men anxious to harmonize patriotism with their party obligations, and to such we commend a study of the actual facts concerning the most unfortunate plank in the mainly excellent Bullmoose platform. It was put in that platform under an arrangement by which the whole was to be submitted, before adoption, to the candidate for President, and no such thing was done. It was, moreover, worded so ambiguously and ignorantly that it condemned as a plan for a "central bank" a plan which, according to the best judges, is so such thing. It was a plan for bringing together all the banks of the country to maintain a common reserve, issue a stable currency, and in these and other ways intelligently regulate credit and guard against panics.

That plan as it stands is of course open to criticism, to improvement. We trust that Congress will exercise its fullest intelligence in finding faults in it, and will reject it if it is unwise. But it is the plain duty of Congress to enact into law any features of it that are essential to the thorough and complete reform and modernizing of our financial system. Nothing like political convention has, done or can do, any possible free Congress from that obligation. What is true of Congress as a whole is equally true of every individual Congressman, Republican, Bull Moose, or Democrat.

**The Philippines**

"Do you recall," said the Chief Executive, "that to-day more people speak English in the Philippines than Spanish, and this considering the fact that the United States has conducted the islands for less than three years, whereas the Spaniards have been there three hundred years?"

Yes, and if so, it is an interesting fact, though the English speakers are doubtless newcomers, born or brought in within the last two to fifty years. Even at the Old St. James Mr. Tary would hardly mistake that the Spaniards who have been there three hundred years are speaking good English.

But as to the intentions of the Democrats about the Philippines, Mr. Tary has a right to be interested for he has much at stake in the matter, and his interests are near his heart. We guess there

will not be legislation on that subject without such freedom of contemporary knowledge, gathered by qualified criticism when our people know and trust. Legislation on the Philippines should be based considerably on the views of people who have been there, and have gone about and seen what is going on. We have a large, expensive, and very arduous duty there to do about a third of the kinds of people, all of whom have to be considered in any plan for getting out. The Philippines are our territory. We hope to cast them loose just as soon as they can make steam enough to navigate, but we can't hitch their line to a lanyard and turn them adrift.

**The Cheap Magazines in Politics**

Everybody knows now that "Chauntiquary" count in politics. La FOLLETTE'S discovery of them as a factor in national politics was like Joan QUAY'S discovery of the French Canadian vote in Massachusetts. QUAY tried his state with that uncalculated vote several times before the Republicans found out what he was up to. Similarly, La FOLLETTE, by his clever use of Chauntiquary meetings, made things uncomfortable for various Senators for several years before they found out just what he was doing to them.

Both discoverers have been used quite as effectively. Much-riding went on for some time before people waked up and began to understand how much he was cutting in national politics. Some important public characters went down rather ludicrously before it—and it must be confessed that some of these got no more than a B. C. degree. However, naturally, the use of the first to observe its importance, and promptly exhibited his perspicacity both in protest and in cajolery. There was, after a while, a marked repudiation of it. But it was not exterminated. Bright young fellows and cynical old fellows who live by writing for cheap magazines have been used quite as effectively. Much-riding went on for some time before people waked up and began to understand how much he was cutting in national politics. Some important public characters went down rather ludicrously before it—and it must be confessed that some of these got no more than a B. C. degree. However, naturally, the use of the first to observe its importance, and promptly exhibited his perspicacity both in protest and in cajolery. There was, after a while, a marked repudiation of it. But it was not exterminated.

Here, for instance, in one of the month's magazines, is an article on "What Wulver Is Up Against," by a regular cheap-magazine writer who is sufficiently characterized as the author of "The Forces Behind Tary." Neither in the present nor in the earlier articles, which we happen to remember, is there a shadow of evidence given for any statement; yet both are thoroughly calculated to upset any good citizen. President Tary, if he had read the earlier one, would have been astounded at the proportions of the conspiracy to reject him. If Governor Wulver reads the present one, and believes it, he will undoubtedly take to the woods and refuse to face what is awaiting him at Washington. We feel quite sure he still is not at all comforted by the repeated assurance that he is not only a "political comar" but "the best political economist in America." That assurance, if Governor Wulver, no doubt, if Governor Wulver had ever set up for a political economist at all, but even then it would hardly stretch him in face of these authoritative revelations of the perfidious designs and inner motives of Speaker CLARK, OSCAR LANGMUIR, and others, who have got things all fixed to suit him just as soon as they get into the White House.

We repeat, a great many people do read this sort of rot, and they know nothing of the sort of people who write it. They know nothing of the cheap-magazine business. Many of these are good, simple people, to whom it never occurs to ask whether or not for a moment, know what he is talking about. They read, and they believe, and they vote accordingly.

It is about time to begin to try to fix the responsibility for this sort of reckless misreading of public opinion.

**Home Rule Wins a Battle**

One small dose did not make a summer. Outpourage of a Home Rule bill through the Commons also does not turn into glorious summer the long winter of the discontent of Ireland. That happened once before, way back in the days of Gladstone and the "Home Rule" party. It was in the day of Asquith and Russell, the veto of the Lords will be effective for a time. Two years must elapse, and the Commons must stand firm and main pass the same bill, before the objection of the Lords shall lose its force.

Nevertheless, a great victory has been won. The want margin by which CLARK overpowered his bill,

and which of itself indicated ultimate failure for it is now turned into a majority of over a hundred, which justifies Asquith and Russell in their confidence. That confidence is further justified by the extreme measure of the opposition in openly threatening civil war if Home Rule is consummated. The three will still deter Asquith and Russell from going on to consummate what CLARK and PAVLEY began. Neither do we believe that the threat will ever be made good.

**From Premier to President**

There are a great number of Americans who could not instantly name the President of England. Most of us also know who is Chancellor of the German Empire. A smaller but still considerable number of us keep up with French politics sufficiently to know who is for the time being—and it is usually for a mighty short time—the French Premier. But there are lots of us who have a hard time to think before we can say who is President of France.

Now the French Premier, M. PAULLEY, is to become the President. He has made himself pretty widely known as Premier. In that capacity Europe has recognized him as a real force. He has appeared to be something of a man. Nobody was so surprised, therefore, that he at first was reluctant to run for President. Now, however, it is predicted that as President he will continue to be decidedly more than a figurehead; that he will not be content with the skillful expenditures of the large sum France allows her President for entertaining foreign politicians and making a good appearance on state occasions.

We trust those predictions will come true. The lack of real power in the President has been a cause of adverse criticism of the Third Republic; and the Third Republic is, as we have more than once remarked, the most encouraging fact in the world to believers in democracy.

**"What Good Is Life at Sixty?"**

No such depends on the point of view!

For example, it is proposed to give pensions to the pensioners and the pensioners who are pensioned shall be paid as under discussion. We read in the Times that the younger clerks favor having such pension payable on demand after thirty years' service, irrespective of age or disabilities. Older men say that would result in pensioning off some men while still in their forties, and suggest still a further step in the direction of a pension, with a free vote, reports CHARLES GUTCHER, a Madison Square letter-carrier.

What good is a man's life to himself when he's sixty years old and over? Give us our brains while we are young and use them as long as we can in peace. Work as till we are over sixty and you work us into the shadow of the grave, in a few cases, and actually into graveyards at the other ones. We'll like to get up one to my old age a little earlier, if I'm to have a chance at it at all.

Sixty is a little on to begin life, but CLARK seems to have original ideas about pensions. The common view, as we have seen, is to give a pension, still is that they should be a provision for what are called "declining years," and by declining years is meant not necessarily the years in which men decline to work, but those in which their energies decline.

Unluckily at sixty we are in the shadow of the grave, but so we are at fifty, at forty, at thirty, at six, and at one. All life goes on in that shadow. It may go on at sixty mightily well and easily to the satisfaction of the subject. CLARK does not be discouraged. If he lives wisely, drinks little, keeps his health, and manages to secure a little work, he may find life more profitable at sixty than he has ever found it yet, and whether he gets a pension or not. If he will read CLARK on Old Age he will get some good points, though sixty is by no means old age.

But, gentlemen! how folks are working out for pensions!

**Editor Bailey**

ELIAS PRITCHARD BURTON, of Plover, died last week. For the last thirty years he had been editor of the *Plover Observer*, a Democratic journal with which he had been connected nearly all his life. He was a good man, a good Democrat, and a good editor. Not all good editors are locally beloved, but he was, always, and not only locally, but wherever he was known, and he had a wide acquaintance and reputation. If there were enough railroads like his in the country, he would be a most valuable asset to the world. He would not have to worry as much as we do about government and courts and legislation. Our newspapers would take care of us.

Honor a dutiful man who stuck to his job all his long life and was always good to it. CLARK, Mr. BURTON.

the popular quarries. There is a curious fact about the rhyme poetry, but that has been remarked by many regular and habitual readers of the Congressional Record—that is, the constant recurrence of certain stock lines and phrases. For instance, and being known that are fairly reliable—considering the amount of material sifted—Gray's stanza beginning "The sound of liberty, the pomp of power," has been used at least 25 times during the last decade; Longfellow's "There is no death," 15 times; Bryant's exhortation, "No life, that when thy name comes," 24; and Mark Antony's tribute to the dead Brutus,

"His life was gentle,  
and the elements  
so mixed in him, that  
Nature might stand up  
And say to all the  
world, 'This was a  
Man.'"

has been used so many times that memory fails to give the figures. These several media have been used, more or less, every year since the first of the popular lines from "Yonakopia," the "Ode on the Death of the Duke of Wellington," and the "Psalm of Life," occur year after year with the regularity of sunrise and harvest.

Mark this persistent repetition, and in spite of one's conventional reverence for "discretion," the wonder will intrude itself that when a Representative or a Senator finds his self "hooked" for a ceremonial address, he does not "hew up" on what his colleagues used the year before, and the year before that, then seek a new quarry. It is almost inconceivable that the lines of all our dead legislators were "gentle" and the atmosphere in them is precisely the right property that Nature might boldly cite them for unspiced and unadorned. Where are our public men of rugged independence of dynamic power, of apostolic grandeur? Mark Antony's tributes culogy seems to have reduced all our dead legislators to a common denominator.

And now to be statistical—and stopped!—for a little. That is, to be comparatively statistical, for in such a case figures have no reality. Scanning thousands and thousands of the slowly printed, warped, fast-yellowing pages of the Congressional Record, one is apt to miss many short quotations, and sometimes, in short

sentences, to see double. Using round numbers, there were some twenty-eight hundred quoted quotations used in Congress from 1861 to 1901. Of this number, there were hundreds the investigator could not trace, several hundred from current periodicals, songs, and maxims, and several hundred recognized and located, but which cannot be classified as to authorship. But as it is possible to get an impression conformable with facts even from partial and fluctuating figures, I set down a few of these waxy figures. They will at least give a general idea of the main content of the stonem quarry.

Shakespeare has been quoted some 230 times, so far as I was able to recognize him, or almost always given a session. "Hamlet" is the leader, the name of his play being used in company following, come "Julius Cæsar," "Macbeth," and "Othello,"

the intrinsic value of a name.蒲田's family on every, and similar will extend part 2. The number are never quoted, nor the Shakespearean poems, nor many of the purely partial and 1862, the same passage.

Next to Shakespeare, provision-wise, come Youngson, with 58, highly drawn from the "Ode on the Death of the Duke of Wellington," "Jockey Hall," "The Star of Dawn," and "Blood," with a ball from from "In Memoriam" Langfellow is next, with 61, the lines being from "Designation" and the "Psalm of Life," the same lines as with all from "The Good Hope," most of them the closing division of that poem. "No life, that when thy name comes," Thomas Gray with 46, all from "The Epitaph," Whitman with 26, from "The Eternal Goodness," Alexander Pope with 25, from "The Essay on Man," with a very few from "The Universal Prayer," Oliver Goldsmith with 23 from "The Deserted Village," and James Russell Lowell with 21.

At the end of the procession, "Citizens in Carriage" as it were, come Byron and Keats, with 20 each; Milton with 17; Wordsworth with 15; Tom Moore with 12; Addison and Tom Hood with 6 each. The Address lines being from the Speeches, Formulation on High," which was written by Andrew Maxwell, a fact somewhat too revealing for Congress; Fitz-Green Halleck with 7; "Honor Be the Part above Thee," and "The Address" with 6 each; Bulwer, an old-fashioned name, is naturally known in America; and Byron with 6 each; Theodore Tilton, with 6, all from "The Bazaar of the Cross"; William Keats with 5, from "Why Should the Spirit of Mortal Be Proud," said to be Lincoln's favorite poem; and the Bible is quoted many times, as in the Common Hymnal.

The smaller they arrive all the end of the end of the procession contain some 80 historic names of British and American poets, fairly well known, many living writers of neoclassical and romantic verse, and fairly historical names more or less obscure. Among the first, some of the prominent poets, some of whom are quoted above three or four times, are the Brownings, William Cowper, Leigh Hunt, Anna Montgomery, Coleridge, Keats, Thomas Buchanan Hood, George Murray, Charles Kingsley, Oliver Wendell Holmes, Nathaniel P. Willis, Dryden, Colver, Mrs. Barham, Marcella, "Lays of Ancient Rome," Owen Meredith, Chaucer, Spenser, Keop, Mother Goose, and Shakespeare's Elizabeth!

The typical Congressional quotation is of the obvious sort, the meaning on the face of the words, and no chance for mistake. It is the stereotyped thing to hear symbolic, imaginative, or philosophic poetry quoted in the Senate, and never, or hardly ever, in it heard in the House. A good half of the quotations are lines popularized by common usage. The quotations are not woven into the texture of a speech; they are so formal and mechanical. The poetry is not in the blood—it is in the book, whence it is taken out, brought over, and inserted mainly in the speech as part of an academic program.

In twenty years the poetic habits of Congress, and particularly the House, have changed for the better. The growing tendency is to use shorter quotations, to abandon the formal introductions, to quote extempore, and to use slightly finer material. A quarter of a century ago the poetry was apt to be of the extremely unimpassioned sort of the United sort—either weak and weedy, fery or stammerous, didactic or lugubrious. Now you hear, for instance, Browning sometimes, Chaucer and Keats, and Fitzgerald now and then. The reason for this change are too far to seek here, even were it possible to find them in the intricate and traditional social conditions that go to make our federal legislative body what it is. Birth, privilege, education, family tradition, environment, individual factors and temperament, conventional culture—the "season" is deeply bedded in these far-etched things.

Congress probably listens to more poetry than any other body of working men

"Henry VIII," is quoted from 12 places, "Lear," 3; "The Merchant of Venice" and "The Tempest," 12 each; "Romeo and Juliet," 9; "Antony and Cleopatra," 7; the remainder of the Shakespearean quotations being scattered here and there, a sort of an "also ran" vote. The quotations are almost invariably popular lines from Hamlet's "To be or not to be" soliloquy,蒲田's advice to his successors, Webster's farewell to power, Juliet's scene of

# THE FIRST CITIZEN OF FRANCE

Raymond Poincaré, the Next President of the Republic, and His Remarkable Career

BY CHARLES JOHNSTON

RAYMOND POINCARÉ stands out as the foremost man in France today. Until last summer he was not widely known beyond the frontiers of France, or known only as one among many brilliant parliamentarians. Then came his journey to Russia, with vital conferences between the Tsar and his ministers and the Prime Minister of France, and later the Triple Entente. Almost immediately followed the Balkan War, and then, at last, events gave the true measure of Raymond Poincaré, who stood out as one of those few men working with the power of genius to preserve the peace of Europe and Asia, for both would be involved in one general war. Wisely, carefully, with courage and conviction, and with keen intuitive insight, Poincaré met our perilous situation after another, in such one gaining a victory for peace and a victory for the bond of France. A few days ago, speaking in the French popular house, the Chamber of Deputies, he described the steps of his world policy:

"From the beginning of 1912, without a moment's break, we have been exchanging ideas on the situation with our friends and allies, and in these daily conversations, which showed a hearty agreement between Russia, England, and France, those three nations set themselves to bring about a general good understanding among all the great European powers. We held that we owed it to our ally to give a striking testimony of our effective and active fidelity. Honor and interest equally commanded this course. And our task was made easy by the clairvoyance and safety of judgment which M. Koltchouff showed in his last speech. As for England, our relations with her have never been so cordial and close. Therefore, it is in full consistency of view with our friends and allies that we are working the course of events. But France has not been content to remain on a systematic opposition of international groups to solve the difficulties of the moment. On the contrary, we have held that the hope of arriving at a peaceful solution depended wholly on the possibility of bringing about general negotiations, and we have worked from the outset to open the way for these negotiations.

"So the powers considered the possibility of offering their collective mediation to the belligerents. But in order that this offer might not be rejected by the victors, it was necessary to guarantee to them that some of the mediators sought to appropriate all or a part of the fruits of their success. Therefore, France proposed, in the offer of international mediation, to insert a clause of disarmament. None of the Balkan States misunderstood our purpose and all have expressed their thanks to us. While receiving our rights and respecting the interests of others, we were able to propose to the great powers the repudiation of all territorial annexation. This was, in regard to the Balkan States, an act of wisdom and of justice. That will an agreement be reached? That is the secret of so-worship. If, suddenly, a rupture should take place the role of Europe will not be ruined. Europe could not show indifference before a renewal of hostilities which would risk new, perhaps, more than ever the expansion of the area of conflagration. Europe would, we think, refer to her best ideas of mediation. France would in any case continue with all her power to second and, if necessary, to urge the efforts of the other powers. But her ever sincere aim was our pacific intentions, of which, since the beginning of the crisis, we have given repeated proofs, yet we are firmly determined to defend our interests and our rights without yielding, to maintain the great traditions of France in the Orient, and never fail, in order to reach the noble and sacred truth which is called national honor."

These sentences reveal the man better than any description: his idealism, his logical logic, his concrete conviction, his courage, his high ideal of honor. While these qualities were innate, his life and training did much to develop them. He was born at Bar-le-Duc in 1856. His father, Nicholas Poincaré, belonged to an old family of the Meuse Valley, was a man of culture and scientific attainments. A few years earlier was born at Nancy, just my father, Francis, and his wife, a cousin on his father's side, Henri Poincaré, the world-known mathematician, who died last year. The generation of Frenchmen in which they belonged was marked by a certain severity. "The breath of the best professions" has killed their hearts. As M. Raymond Poincaré himself has said, the profession of a Lawyer, adopted in 1870, in necessity of simple attire, "made a man is better informed, more modest, more sensitive. He need make no effort of memory to recall the trials of the law. They have left behind us only an engrained trauma which we are not affected."

Raymond Poincaré passed his school-days at Nancy. For his first day in the profession of a Lawyer, adopted in 1870, in necessity of simple attire, "made a man is better informed, more modest, more sensitive. He need make no effort of memory to recall the trials of the law. They have left behind us only an engrained trauma which we are not affected."

For his first day in the profession of a Lawyer, adopted in 1870, in necessity of simple attire, "made a man is better informed, more modest, more sensitive. He need make no effort of memory to recall the trials of the law. They have left behind us only an engrained trauma which we are not affected."

second side of his character. The practical lawyer had had his opportunity. It was now the turn of the cultivated scholar.

After eight years, Dupuy's cabinet fell. The second Dupuy ministry was soon organized, and this time Raymond Poincaré became Minister of Finance. On the fall of Dupuy, Ribot formed a cabinet in which Raymond Poincaré had the second time held the portfolio of Public Instruction and undertook a thorough reorganization of the primary schools, bringing into them new energy and enthusiasm. This was in 1893. For the next two years he was vice-president of the Chamber of Deputies and leader of the "party of progress" in the popular house. He was steadily gaining the confidence of the nation as a man who made no pretensions that he did not keep, who was conservative in design and daring in action, who was the source of upright loyalty, at once lucid and full of energy. All these qualities were manifested in the first few years of the chaotic days of 1893 in the Dreyfus scandal, which shook France to the depths and whose echoes within the last few days have shivered the French people.

About this time Raymond Poincaré began to show that clear insight into the dangers in national and individual liberty which are hidden under the glowing promises of Socialism and became one of the group of French statesmen who have brought about the re-orientation of French politics in the last few years. The changes in the political landscape brought Poincaré back to his practice at the bar, and there his high gifts of insight, lucid eloquence, and force won him a considerable fortune. But his born parliamentarian was not destined to remain long without a leading part in the direction of France. M. Sarrien succeeded M. Henri as Prime Minister in 1896 and asked Raymond Poincaré to become his Finance Minister, an offer which was accepted. Then Sarrien fell to the unstable optimism of French parliamentary groups, and Georges Clémenceau, "the old diplomat," who had hitherto been a destroyer of ministries, was called upon to construct a ministry in his turn.

Under Clémenceau, Poincaré held a less conspicuous place, but with not less conspicuous distinction. Further verifications of the wheel of political fortune followed, and at length Raymond Poincaré was called on by President Failloux to form a cabinet of his own, as a result of certain Central African questions which compelled the retirement of his predecessor. He succeeded brilliantly, constructing a "cabinet of all talents" which contained men men of genius and more distinguished parliamentary leaders than had ever before composed a Council of Ministers in France.

One of the chief internal questions which he and his colleagues have had to face is the new militant policy of the revolutionary Socialists, the policy associated with the words "syndicalism" and "sabotage," which means collective violence and destruction applied as a weapon in "the struggle between capital and labor." We have had illustrations of the spirit of this new movement in this country. We shall in all probability have still further illustrations of it. And when we realize the full scope and its menace to the very elements of personal and national freedom we shall be better able to understand the work which has already been done in France to counter it by men like Georges Clémenceau, Aristide Briand, and Raymond Poincaré.

Of the great external problem which the Poincaré ministry has been called on to face, the Balkan War and the danger of a general conflagration, we have allowed M. Poincaré to speak on his own behalf. In both internal and external difficulties he has shown himself a man of the greatest calmness, vigor, courage, the soul of honor and rectitude.

# Triumphs of the Bridge Engineer

BY J. B. STRAUSS, C. E.

**L**ONG continuous spans that meet its kindred spans, but no less marvelously in its development, is the modern art of bridge-building. Only a hundred years ago the maximum length of a single span scarcely more than a few meters. There were only two types of structure, both of the most limited range—namely, the timber bridge and the stone bridge, and movable bridges were limited to mere toys, while the science of stresses and strains was as yet unborn. The modern achievement of building single spans of steel up to 200 feet in length and cast-iron and suspension spans of nearly 2,000 feet in length, of combining steel and concrete in significant ratios of appropriate size, and of constructing bascule and cantilever bridges so large as to admit all developed simultaneously with a complete and exact science, marks an era of progress unrivaled in any other art. In spite of these achievements, the bridge engineer seldom comes before the public eye. He deals unobtrusively. Unlike the architect, the physician, and the attorney, he hides in a silent waiting, alert, persistent, with all his trained faculties in touch, constantly struggling with the difficult problems created by the necessities of modern traffic, solving such new ones as it gives, preventing and retarding the creation of communication by land and rail and water, so that our commerce, our markets, our comforts, and, in fact, the well-being of the nation itself may be furthered.

With the commercial development of steel the science of bridge-building took its first mighty leap forward. The second advance was simultaneous with the transition from iron to steel. Then came the era of reinforced concrete. At present the reinforced concrete structure and the steel bridge stand equally vast fields of usefulness, the former with its largest possibilities in such spans for highway bridges, the latter serving both highways and railways for their longer and heavier spans. Illustrative of heavy steel bridge-work is the magnificent Hell Gate Bridge, a remarkable conception in steel, which, when completed, will stand for centuries as a monument to engineering skill. This structure forms the main section of the New York Connecting Railroad, a link between the Pennsylvania Railroad and the New York, New Haven & Hartford Railroad, saving the long haul by sea ferry through the harbor of New York. The amount of steel required in its work is so great that it will take the capacity of two of the great American bridge-manufacturing companies for the greater part of a year.

New York is unique in having other notable examples of the bridge engineer's best work in steel, such as the Hamblin Bridge, the Mackinac Island, the Williamsburg, and the Manhattan bridges. These structures give this metropolis a distinctiveness and independence not equaled by any other city in the world. But outstanding even these wonders is the mammoth Quebec Bridge, several hundreds of miles inland, now extending under the direction of a Canadian chief engineer. With an sweep of its arms this great cantilever will stretch from shore to shore of the St. Lawrence, standing on the site of one of the few great bridge disasters that marred the forward march of the American bridge engineer.

Hardly less notable than the above are the massive concrete arches of 280, 250, and 200 feet, which,

A double-leaf city bridge of the trussion type at the entrance to the port of Copenhagen, Denmark

graceful in spite of their size, loom up in the environs of Philadelphia, Cleveland, and elsewhere, of the remarkable concrete viaducts of the South, with

A single-leaf trussion bascule railway bridge

seek after arch straddling its spanned across the way for a dozen miles, forming a solid road-bed which is impervious to wind or wave effects. Throughout

the country, across brook and stream, over railway tracks and boatlands, in city, village, and country, a kindred bridge of concrete flings upon the vision by the hundreds, now arched, then girdered, and again viaducts, some stately in their boldness of design, others beautiful in their graceful contour and pleasing architectural treatment.

All movable bridges the foremost type is now the so-called "bascule" bridge (from the French word "bascule" meaning a scale). At one time an object of interest because of its rarity, the bascule is now a standard construction throughout the United States and Canada. Almost every street which crosses the tortuous Chicago River is served by double-leaf bridges of the bascule type, while in Milwaukee, Cleveland, Winnipeg, Quebec, Montreal, and other cities throughout the continent these bridges appear in ever-increasing numbers. Bridges of this bascule type are quick operating and easily controlled. They are safer than swing bridges for street traffic because they block the open ends of the street. For the smaller craft they are only slightly lifted. Often, therefore, they may be raised and closed and traffic resumed, while the old-fashioned draw, which must turn through the entire angle for all vessels, large and small, is still swung up.

The bascule bridge, like most other bridge types, originated in Europe, and there found its highest development in the great Tower Bridge in London, built in 1890 and still in satisfactory service. In this country, however, it has reached a far greater development, and the types produced in the United States, and more particularly in Chicago, have now surpassed almost all the earlier types developed in Europe. Excellent examples of American types of bascule are found in the double-leaf "trussion bascule" bridge at the entrance to the port of Copenhagen, Denmark, an unusually artistic structure, and in the great Puller Bridge at St. Petersburg, Russia, leading to the Winter Palace of the Tsar, across the great Neva River, 1,000 feet wide and 60 feet deep. This structure will be 90 feet wide and will cost when completed \$2,225,000.

It is in this country, however, that every prediction as to the maximum length of bascule spans has been exceeded, and the limit of size and weight of spans is still being advanced. Across the Calumet River at South Chicago the Baltimore & Ohio Railroad has just completed a single-leaf, double-track bascule of the trussion type, which is 235 feet from center to center of end bearings. This bridge, when open stands rather than an eighteen-story office-building. Its construction involved 1,500 tons of metal, while 2,000 tons of concrete counterweight are used to balance the weight of the leaf. This balancing is so exact that the bridge can be fully opened and closed for the passage of trains in two minutes. The operation of this structure, and bascule generally, is wholly electric, the operator being housed in a little cabin at the side, with his controller, brake, and signals by which he controls his great charge with absolute precision and instantaneous ease.

Across the United States Ship-canal at Sault Ste. Marie there is now under construction another noteworthy "trussion bascule" bridge with two leaves instead of one, these two leaves so designed that as they close they automatically interlock to form a single span 318 feet in length between end supports. This will not only be the longest bascule span ever attempted, but the boldest design ever undertaken.

Among the types of movable bridges introduced into America is one in which the span to be lifted moves vertically. Up to the present the only way this could be accomplished was by means of cables or chains, as in the case of an elevator. Recently an outstanding advance was effected by the elimination of the cables and chains and the substitution of a system of counter-balanced levers, a novel departure, opening up immense possibilities.

The achievement of the bridge engineer is a task almost the foremost factors making for his success. His is the first task. With the aid of his fellow-engineers he gives the way over the foundation levels. Now, some would perform whether or not they could be accomplished so much with greater facility and less really than that which distinguishes the true bridge engineer.

# CHICAGO AS A FINANCIAL CENTER

BY THADDEUS S. DAYTON

**C**HICAGO is among the youngest of the great cities of the north. A little more than three-quarters of a century ago it was a frontier trading post where the mediums of exchange were fella and powder and bull. There were neither banks nor money in the days of Fort Dearborn. To-day only three cities in all the world outrank Chicago as centers of finance. Two of them—London and Paris—have been capitals of money kings for many hundreds of years in New York, which was nearly two centuries old before Chicago appeared on the map of the United States.

As the capital devoted to the banking institutions, to their resources, deposits, and clearings, Chicago is the second city in America. Its bank clearings almost equal those of Boston and Philadelphia combined. They are not little less than the total clearings of the ten next largest cities of the United States. Last year the exchanges of the Chicago clearing-house amounted to nearly fifty and a half billions of dollars. The latter is something the immensity of this sum, let us suppose that it should be divided equally among the inhabitants of Jacksonville, Illinois, which had a population of 16,228 at the time of the census of 1910. If such a distribution of this money should be made it would make every man, woman, and child in Jacksonville more than a millionaire.

The tremendous growth of Chicago as a financial center has been within the last forty years. When the Chicago clearing-house was organized in 1863 its business was about \$200,000,000. Compared with the figures for 1912, the increase has been 2,743 per cent. There was a gain of 10.5 per cent. in last year's business over that of the year before. New York's gain was 9.1 per cent.

The great fire which destroyed Chicago in 1871 was a blow that would have obliterated financially a less vigorous community. But, two years later, in 1873, the banks of Chicago were a greater power than ever in the Empire of the West. In 1872 there were thirty national, state, and private banks with a capital of nearly twelve million dollars. Today there are sixty-five banks in Chicago and their combined capital is nearly eighty millions. Their deposits are close to a thousand millions, and their business considerably more than half that. Beside these figures those given by the first clearing-house statistics, showing deposits of a little more than four millions, seem insignificant.

Chicago's first banker was Gerard N. Hubbard, He first in a log cabin near the growing stockade of Fort Dearborn, away back in the days of Chicago's history. He had some money on deposit in a Buffalo bank. Hubbard did open a lot of business in selling exchange on Buffalo, which then was called the metropolis of the Middle West. Chicago's first real bank was a branch of the Illinois State Bank. It opened for business in 1823, at the corner of La Salle and North Water streets. In the first three months the deposits averaged around \$200 a day. It furnished a little less than two years—until the "crash of '32," which our grandfathers used to tell about, when the whole country was swept with financial disaster. Chicago's first bank received a mortal wound at this time, but Hubbard as an expert died 1843.

These were the all-but-forgotten days when most of the actual currency in circulation was city and private scrip. It was an era of fortune for George Smith, a New-England man who came to Chicago in 1834. Smith was the first of Chicago's long line of great bankers. He received a private bank in Chicago from 1839 to 1867, and then retired to London to enjoy the fortune

—big for those days—that he had accumulated. It was a day of "wildcat" banks, but never a paper of paper with George Smith's name on it that was redeemed on demand. In the course of his career as a banker he had millions of dollars of his private scrip in circulation throughout the West, and contributed in a great degree to the development of the city of Chicago and the region round about. The financial part of 1857 put one of the private banks out of business. Only one of the money banks that were in existence then still survives.

The National Bank Act dates from March 23, 1863. It was not until May 16, 1864, that the bankers of Chicago announced that on and after that date they would receive on deposit at par and pay out at par, only legal tender notes, national bank notes, and the notes of such other banks as members at par in the city of Chicago. This marked the beginning of the era of national banks in Chicago. A little more than a year later there were seven national banks in the city.

The next great crisis was the day of 1873. While the city was still a banking ruin its bankers met for a conference. They feared that when they came to open their vaults they would find only ashes instead of money. The question was what percentage of their deposits should they pay on demand. The president of the Currency advised the question by notifying the national banks that they must pay their depositors in full as he would not allow them to open at all. This made the bankers' hearts sink, but it restored the confidence of their country correspondents. When the results were spread and their outside funds unshaken there was a sigh of relief. No run on the banks ensued, and in a little while they had greater deposits than before.

Chicago entered upon its present era as a great financial center of America about fifty years ago. Millions of dollars of funds for the organization of new enterprises were placed in its banks. Several corporations capitalized at forty, fifty millions of dollars and were here launched or underwritten by Chicago

bankers. Its banks furnished a considerable proportion of the capital for these vast enterprises. They also began leading money on a large scale in New York, London, Paris, and Berlin. Whenever money orders go out elsewhere the Chicago banks always have tens of millions to loan on good security.

A view of Chicago, looking northeast from the Republic Building

the reason for Chicago's tremendous growth as a financial center is its strategic location as a distributing point for practically the whole United States east of the Rockies. It is the commercial and industrial as well as the financial capital of a vast territory of incredible richness. It is the world's greatest railway center, the greatest lumber mart on earth, and the most important meat-collecting and distributing point. It is the largest shipping port on the Great Lakes—the tonnage of its vessels makes it one of the biggest ports in the world, in fact.

All these things make Chicago the metropolis, the center toward which is drawn a vast amount of wealth. By the force of circumstances Chicago has become a huge mart for money as well as for merchandise. There are many thousands of country banks that have money on deposit with the great financial institutions of Chicago, just as there are other thousands of big and little banks that, as a convenience of their business, place millions of dollars on deposit with banks in New York City. Indeed, Chicago's banks and trust companies have as their clients and depositors just as many as if not more out of town banks than New York City's bankers have. There is one bank in Chicago which has the accounts of about six thousand of these "country banks." The president of this Chicago bank—which is one of the largest in America—was a farmer boy. No man in America is richer than he, the small town throughout the United States than he is. Every afternoon he sits down from his routine duties to devote to studying the country newspapers. That is one of the things that have made him great and it is because there are so many such men in Chicago, who realize that the greatness of the city is due to the natural wealth of the Western Empire that Chicago has advanced the financial pre-eminence that it has.

Ask any Chicago banker where the financial center of the world will be a century from now and he will answer unhesitatingly, "Chicago." That it will be in the United States is hardly beyond question. If things have run in a few years for the longest part of the earth's cities in population. It will not be long before it passes Paris and makes third. Thirty years ago its population was half a million. Now it is nearly five times that. In its workshops and on its streets it makes the language of Babel, yet as a city it is typified America. No one would be much wiser to say that some day it may not become the financial capital of America. If it may, it is a long stride from the petty market of East Abbeville (in France) to Chicago, of today.

The famous Chicago wheat pit, where financial Robinets have met their Obvans

# CHICAGO AS A DISTRIBUTING POINT

The City as a Natural Gateway for Transcontinental Traffic

BY ROLAND HARTLEY

**T**HE military camps of the all-American hero, General Sherman, and the trading posts of the all-pervading Plains Indians determined the location, many centuries ago, of the city of the universal cities of the Old World. The sites of the cities of America were determined by the same factors: by the pioneers, the trappers, and the traders who dealt with the red men. The lakes and rivers were the great thoroughfares. Trading posts and forts were established at points where was the greatest facility for receiving and distributing objects of barter.

The narrow passage between Lake Michigan and the Des Moines River was the "natural accident" that determined the site of Chicago. East and West and North and South there stretched an empire greater than that of the continent of Europe in extent. Between the mountain walls beyond which the sea rose and as there stretched the thousand miles of land comparatively flat, threaded by water highways that led from the edge of the Arctic to the edge of the tropic zone.

This first made Chicago a great distributing point while yet it was only a dot on the edge of the sea horizon. It has been the tireless energy of its citizens in these latter years that has enabled it to keep world supremacy in this respect.

Floets of steamer and sailing craft, huge whalebacks and great lumber rafts, the masted and masted north to Chicago. Over tens of thousands of miles of railways cross on-line processes of freight trains loaded with goods from the mountains, valleys, and mineral. The city receives it all. Some it transmits in its vast manufacturing. Some it ships throughout the great territory that is tributary to it. Some it receives and spreads upon the continent for sale. But the larger part of the raw material, especially the foodstuffs, is distributed in its original form from this central point. By land and sea, it goes to every corner of America and of the world.

One way of measuring Chicago's growth and greatness as a distributing center is by its manufacturing. In a sense of way—helped by its easy accessibility of boundless treasury-bosoms of raw material—Chicago has become one of the greatest manufacturing centers of the world. The city stands at the natural gateway for transcontinental traffic. Land and sea are comparatively cheap and always have been. The array of domestic and foreign lines that meet in Chicago for their supply of manufactured products is increasing tremendously every year.

Ten years ago the value of Chicago's manufactures was but a little part of the thousand-million mark. Last year it reached the astounding total of nearly two thousand millions. So has been the increase—so will be the pace set by Chicago's manufacturing interests—that municipal agencies dealing with public utility, education and recreation have had to be supplied with almost countless inquiries in order to be abreast of the city's needs.

Chicago in itself is a great factory. Its dirt and grime and smoke and worn pavements that hardly can be removed fast enough are indicative of the ferocity of its toil. The myriads of people surging through its streets and its streets opening all the longways of Europe and all the dulcets of America, have been attracted thither by the stupendous tasks that have to be performed to meet the insatiable increasing demands for more and more machinery and more

A general view of Chicago's stock-yards

household and foodstuffs and other things for which Chicago is famed throughout the world.

The city is surrounded by a curtain of tremendous manufacturing plants, as Paris is surrounded by double and triple lines of forts. But around Chicago every look in the skyline, every shining furnace cap, every high-walled elevator or factory, is adding to the wealth of America.

The Chicago manufacturer is on progress and has as much pride as any citizen in the world. He takes a keen interest in the government of the city. He realizes that good schools and plenty of them, good parks where the people may rest and breathe pure air, and all the other things that make for good citizenship, are the fundamentals of the city's growth

and power. He makes his plant the most modern of its kind and he tries to attract every new invention he can get further than that. So that his workmen may be of the best, in skill and health and intelligence, he makes his plant the most modern and safe and as attractive and sanitary as possible. Therefore, some of the great model industrial communities have been developed in the vicinity of Chicago's manufacturing plants. The best in similar communities here and abroad has been adopted.

Twenty-five years ago Chicago's manufacturing employed less than a hundred thousand workmen. Today this industrial army is more than five times as great, and the total of its annual wages reaches a quarter of a billion dollars.

Last year the sales of the leading packing concerns aggregated not far from a thousand millions of dollars. A leading grocery concern sold the value of a hundred millions all over the globe. And so on through the long list of things that people use.

Chicago's wholesale and retail establishments count more than double as much money in change hands as do its factories. Its department stores are mammoth affairs, some of them the largest in the world. Chicago is the metropolis of America by the country beyond the Mississippi. Its commercial domination extends outward until it acrotes that of New York and North and South America, where it sends its goods from all over the great territory buy their goods in Chicago.

From the granary of America, by rail and water, come the wheat and corn which are sold in Chicago. A portion of this tremendous volume of foodstuffs stays in Chicago and is converted into staples. A large quantity, however, remains in the grain elevators only a short time, and then is distributed from the Great Lakes to the Gulf, from the Mississippi to the Atlantic, and to lands beyond the sea.

Chicago is famous the world around for the products of its packing-houses. No other city on earth prepares for food so many sheep, hogs, and cattle in refrigerators and in steamships. Chicago's dressed meats travel fast. Chicago's canned meats are eaten almost everywhere in the world. If this one industry should cease, millions would go hungry until they found some other food supply.

The tourist and pleasure fully leads to Chicago. Fully half its revenue or embark on new journeys with other methods from this great mark. The stupendous scheme of distribution is marvellously well

It would take a volume of statistical tables to tell exactly and accurately what Chicago does as a distributing center in the course of a twelve-month. But mere figures cannot convey a graphic idea of Chicago's supremacy in this respect. Neither does the statement that Chicago is the center of the world in the immensity of such operations, or that the combined value of its production and distribution last year were more than four billion dollars. A single day's systematic sight-seeing in industrial Chicago will impress one more than a year's reading.

## HOW A GREAT HOTEL PROTECTS ITS GUESTS

The Safeguards Which are Thrown About Their Every Movement

BY ERNEST J. STEVENS

**T**HIS ideal hotel proprietor twenty years ago was the first to see whose principal aim was his guest's safety. The man who could afford to go to a great hotel for the first time in the art of convention was generally considered the best man. The various safeguards which are always in operation in a "first" in these days the service, comfort, and accommodation afforded to the guests and the matter of safety and protection from the various dangers which are always in operation were seldom thought of either by the guest or the hotel proprietor. The hotel was not even considered as a commercial institution until it operated with much regard to business principles.

The operation of a great metropolitan hotel today is a thing which is not only a matter of business but a scientific institution and the same great principles of scientific management are applied. The most important thing in the hotel is the one conducted by a man who realizes the importance of specialized effort, through attention to details, scientific division of labor, physical and chemical analysis of the various articles and products that are employed in the operation of the business, cleanliness and the character and condition of the employees. In a modern hotel property especially there are a number of things which are employed for the sake of protecting the health, pleasure, and lives of the guests.

The greatest safety of the guest in the room is carefully considered. Each room is equipped as if it were a separate hotel. The floor is in strips of a special cork, and it is so arranged that all the details of the guest's comfort and safety are given minute and satisfactory attention. No one can step in to the floor by way of either the elevator or the stairs without being seen. The elevator has an operator to call upon a guest must first obtain from

the floor clerk the information whether or not the floor is in and orders to see him. A record is kept of every access to guests' rooms. The employee whose duties require them to enter the rooms are before entering a room, and are carefully searched. Each one is well recommended and furnished a bond.

All one time there was a great prevalence of hotel fires, but now modern scientific property managed hotels today have special fire-fighting force equipped on the police force before becoming connected with the hotel has fitted them for the work. These men are constantly on duty day and night.

The prevention of disease and the cleanliness of employees and of all articles used in the hotel are important to the progressive manager. In order to prevent the carrying of contagion of any kind into the rooms each employee is examined by physicians periodically, and an allowed process and an one living under such conditions as to be capable of transmitting disease is permitted to work in the hotel.

The linen used in bedrooms and bathrooms, as well as the restaurant linen, is thoroughly washed and sterilized every day. Each room is carefully inspected every day by an assistant housekeeper. In the hotel hotels today avoid many are employed whose duty it is to take the lockers and rooms of hotel employees in a sanitary condition at all times. The clothes they are examined and fumigated in a special chamber, and the result is recorded. Extraordinary precautions are taken in the employment of cooks and all other kitchen employees. Each must pass through a special medical and sanitary examination, and he is required before going on duty each day to make himself thoroughly clean and dress himself in clean, freshly washed and thoroughly laundered and sterilized the previous day.

The greatest possible care is exercised in buying foodstuffs, preserving and serving food. The elevator is a great hotel is an expert lawyer and he purchases

only the purest and freshest articles obtainable. Chemical analysis is made of every article and analyzed the various foodstuffs used. Milk is kept to be a reliable of contagion, and for this reason every gallon of milk is analyzed, and the milk is treated for bacteria and better fat before being put into service. Butter, lard, eggs, canned goods, coffee, vegetables, and other articles are analyzed in the kitchen at all times. An expert inspects every piece of meat, poultry, and fish which is delivered to the hotel, and he must reject everything not absolutely fresh.

As a precaution against adulteration and fraud in the handling of wine and liquors, a large hotel maintains a chemical laboratory of its own. The alcohol is almost as complete in equipment as those installed in modern breweries and distilleries. All wines purchased by the hotel are analyzed, and the results are chemically analyzed. This chemist makes hourly tests of the drinking water and daily tests of the ice manufactured in the hotel. The water which is used is thoroughly washed and sterilized after each service, this department being in charge of a competent man specially trained in the work. There are special departments devoted to the care of the hotel's linen, which is in a sanitary condition at all times. All utensils used in cooking are thoroughly sterilized.

The prevention of fire is given the most thorough. The men who run the elevators and the engineers who operate the power plant are selected with special regard to their safety, reliability, honesty, and skill. The chief engineer of a great modern hotel runs very high in his profession. The power plant and elevator system are so carefully supervised that the possibility of their ever being out of order is never. Each elevator is inspected every night by competent experts, and no elevator which is not in absolute safety condition is operated in any way in service.

# OUR NEW INDUSTRIAL CONSERVATION

BY ROBERT SLOSS

ILLUSTRATED BY RAYMOND L. THAYER

## II.—The Responsive Element

This is the second of three articles in which the author deals with various aspects of the movement for improving the efficiency of labor and regulating its relation to capital. The first of these articles appeared in the issue of "Harper's Weekly" for November 26, 1912.

It substitutes a mere truce of bargaining for open warfare, would be but a poor beginning of industrial conservation. We do not want an armistice; we want peace with justice, and public welfare cannot exist side by side with "industrial unrest." The monarchies of Europe are flourishing in a tidal wave of it. How shall we prevent it in the Republic? "Peace affects industry much the same as does a still pass" in the insect-world. Both are based on distrust, and distrust breeds real and imaginary grievances thick and fast. It is high time to scrutinize those grievances in a national way and find out how to banish them.

Sir Robert Peck recently passed through this country, and observed that here, as in Europe, is "the necessary for a readjustment of the conception of the relationship between employer and employed. The working-classes have become educated in conditions, and they cannot much longer be deceived. They know that they are entitled to a fair share of the profits from the articles they make, and they will insist on it." Thus a British railroad capitalist and contractor points one side of the shield.

John Kirby, Jr., president of the American Manufacturers' Association, at its last annual dinner recently, painted the other: "No country can exist half free and half throttled by criminal combinations, for encouraging which he blamed 'men and women who are carried away by whimsical notions about 'philanthropy' and 'spells.' They mean well enough, but they are given to washing leads and don't get under the surface of things."

There are two of the grievances. If the public would get under the surface of things it would find that the most potent encouragement ever given to "criminal unions" came not from a lot of expectant philanthropists, but from the very practical philosophy of one man—George Nord, the father of syndicalism.

Syndicalism lay at the root of England's great coal strike. It has pervaded her industries to such a degree that Lord Northcliffe lately opined in the Daily Mail "a sort of grand impost of the nation into the cause and significance of the ferment." H. G. Wells, who was the first to contribute, advanced the view that England has definitely entered on a revolutionary period. He says: "The real task before the governing class—that means past government—is not to get the better of the argument or the best of the bargain, but to lay hold of the imaginations of this drifting, sceptical, suspicious multitude which is the working body of the country."

Mr. Wells believes in socialism—the oppression of private property by the state. George Nord and his syndicalists simply ignore the state; it is not worth bothering about, they say. They are not strikers for themselves; they go the socialist's one better. "We are something more than they are," says George Nord in his *Reformation in Industry*—"public enemy, however, more really without a God, without enemies without a country." In Europe, and especially England, if Mr. Wells is right, the attitude of labor has changed thus: First, from unionism said, "Give us our fair share of the profits." Now socialism agreed "Turn your property over to the state, and let the state manage it for the public welfare. Lastly, syndicalism threatened, "We will get your property, and we will manage it for us."

Writing quietly but persistently in a little French journal the publication of the first article of this series was the last proceeding for the establishment of a Congress on Industrial Relations that has ever been held, and President Taft has nominated the following men to serve as members of the committee: It represented public-opinion (George Northcliffe), of Great Britain; H. C. Wells, of the Cause, America; and Charles B. Street of Georgia, in representation of a Democratic member of the United States Senate; Louis Brandeis of New York City; and Ferdinand C. Schoups, vice-president of the National Association of Manufacturers, of Pennsylvania; Austin W. Chadlow of Iowa, president of the United Textile Manufacturers; J. B. Connelley, president of the U. S. C. of C. of America; O. C. Wood of Washington, D. C., chief representative of the laboring element; and J. C. H. of the same organization to Congress at San Diego. Its final report is due in 1913.

town, George Nord has made this his dominant force in the industry of France within the last decade. It has permeated European industry; it has invaded America. It seems distinctly an anti-American idea. Are we going to find something else to lay hold of the imaginations of our working body or are we going to "let George do it?"

Let us not be abstractists; let us understand syndicalism. It seeks to accomplish its purpose by the "general strike" of an entire industry—all its industries if possible—and called because of specific grievances, though grievances are seized upon or invented to boost it. It is called agile and agile as grievances serve, kill finally the employer's business as become an unprofitable that he gets out in disgust; gives the whole thing over to the workers in so doing as they please.

Between strikes there is an era of mobilization. By sabotage of the "irritation strike" a continuous effort is kept up to cripple the employer, to put him out of business. Every powder is shot out in the bearings of machinery; rumor goes abroad that the workers in a certain factory are slipping powdered glass in the bread—in a brutal, cowardly way the "wob" seek to crush their opponent with no care for the effect of their acts on any one but themselves.

Syndicalism is no bad; it is almost a demerolium. In 1909 Mr. Brandel told the Socialist Congress at Paris that the general strike was the best weapon of labor for covering the non-productive middle class. If labor walked out it is a body, he said, the state would feel its military arm too short to cope with disorder, and would have to choose between making immediate peace or arming labor itself. Ten years later Brandel, as Premier of France, was overthrown by a general railway strike full of shaking violence. He suppressed it like a man, though it cost him eventually his political emporium.

That strike was fathered and fostered by the U. S. T. (Confédération Générale du Travail), founded in 1902, the hierarchy of syndicalism in France. Only about one-third of the trades-unions of France belong to it, and such has but one vote, irrespective of numerical strength. But the remarkable thing about the U. S. T. is its apparently respectable spirit—the spirit of George Nord—that faces up and lays hold of the imaginations of wage-earners beyond the belief of any one that does not "get under the surface of things." Violence is an assumed feature of that spirit, at least in France, where it has added to the trade-unionism the anarchist element and the militant socialist element of the industrial community.

What is to be opposed to syndicalism? Not the state's military arm if possible. The syndicalists make the most of anarchy and anarchy. They are seldom exempt, knowing about the right of free speech in this country, and when they exercise it—as in New York the other day—requiring a strong police force, plus the sheriff and his deputies, to prevent them from leading the flag. But we must deal with them more wisely than we did with the Chicago anarchists, years ago. If the syndicalists are given sufficient "sympathy" and numerical strength, we may have repeated in the nation the situation some years ago in the strike at Tripoli Creek, when the Governor telegraphed to know "if he should send troops and a member of the State Legislature replied, "No need of troops; mine is general possession of the mine."

How long the present process of the industries of a country by the syndicalists would last we need not inquire. The thing to remember is that we are not dealing with a mass of drowsy in industry in this country, but with a mass of human nature under certain conditions. We must learn an opinion of those conditions. Even in France the syndicalist general strike of the postal, telegraph, and telephone ser-

showed in the spring of 1909 flaked out though California has lack of it, because public opinion was adverse.

Public opinion was phoned on American soil six years ago when W. D. Hays, Governor of California, and his associates, socialists, and anarchists formed in Chicago the Industrial Workers of the World—the I. W. W. Recently it was shaking very anxiously with public opinion in San Diego, California. The I. W. W. was carrying on what it calls a "free speech" fight out there. The citizens don't seem inclined to hear about it. George Soudy's motion picture depicting the strike since a score of bombs were discovered in various houses and an attempt to dynamite the city's water supply was thwarted. The I. W. W. has formed thousands into Daylight Vigilantes and have already done one rather successful job of tearing and leveling. They may acquire the role of the California boys, but they are determined to drive out all the I. W. W. and all its works. "We are fighting for our homes," said one of them, "nothing but troops sent for our protection can stop us."

This sort of public opinion in California may be regarded as encouraging or deplorable, but it is not industrial peace; it is not conservatism; it is very close to anarchy unless the State can cope with it. We must oppose something more than force to anarchy. We need to know just what grievances, real or fancied, have made our considerable body of American workers so "angry" that they will listen to leaders who revile the flag of our country.

The mill hands of Lawrence, Massachusetts, complained that they did not get enough out of their work to keep body and soul together. In whom were they to appeal? Not to their employers; they did not consider it good business to look into such a complaint. Not to the United Textile Workers, the union of their industry, that had been beaten and almost annihilated at Lawrence in the clash of collective bargaining. Not to the State; entitled to provide by law sanitary factories for those to work in, the State had never paid attention to the matter of the mills. Not to well-meaning philanthropists had ever made a "survey" of the conditions in which they were compelled to live. Finally, they had never heard of their union! Haywood and Ekers, the high priests of anarchy, in London, had been told the same story told held the striking mill hands at Paterson, New Jersey, but with less violence. Yet they maintain that they are not anarchy; they are with "the pauper labor of Europe" have not yet formed an opinion as to whether their conditions were receiving a living wage or not.

We contrast ourselves with the assumption that they are terrible barons. England's striking conditions were not terrible foremen; yet syndicalism held hold of their imaginations. The action decided that they should not receive less than a living wage, and they returned to work. So far the dreamers of the district committee as to what that minimum wage should be have caused intense dissimulation among the miners, who are threatening to strike again.

The U. S. has one very national "survey" of the actual conditions of industry. The British know that they must have one if they are to make good the text of the Hanks of Wallington. But they are not to revolution in England without Act of Parliament. We need a thorough "survey" in this country. It only to test the truth of John Stuart Mill's assertion that there is no psychological reason why a man cannot be made as proud to carry a shovels as a market. We have found out more about psychology than we know, yet we have not yet managed to make the idea of the "dignity of labor" under our flag lay hold of the imagination with any approach to the appeal of religion or even violence. But "days will be fighting for a cause; there is satisfaction in working for a cause. What romance have we set up to work for in industry?

"The country needs business patriotism and patriotism from business on," says George W. Perkins. But there must be something for the people to be patriotic about. What is that something in American industry and how much of that something is lacking? That is the big question a Federal Commission on Industrial Injuries must answer for us.

Getting under the surface of things, it might find one very practical reason why a man might prefer to carry a shovels instead of a clock. He is actually under with the market. Since Alva Stewart Mill wrote the dead and wounded in industrial accidents amount to more than the toll of all other deaths in the United States ever fought. We need one inventive genius and speed machine to make war "safe." The United States—Steel Corporation has spent \$100,000,000 in the past five years on industrial safety and has reduced the number of preventable accidents in its mills by

sixty-six per cent. The safety of war is a theoretical absolute; the safety of work is a practical possibility. Our allowance to make it an actuality has aggravated one of the worst spots in industry.

What is a fair one to indemnify a man injured at his work, is a constantly recurring question that has done as much as anything else to make employer and employee. Employers as a class have pointed out the antecedent fact that most avoidable accidents are due to the "contributory negligence" of the injured man or to that of some "follow-servant." Besides, they say, if a man engages in a hazardous occupation it implies "consumption of risk" on his part. These defenses the common law allows in damage suits. The employer has taken the attitude of getting all he possibly can for an injury, and the employer has fought every claim irrespective of its humane aspect—not because it is inhumane, but because it has seemed to

HARPER

They will listen to leaders who revile the flag

his "good business" to even tip his accident expenses in this way.

We are beginning to see that it is poor business. A scoundrel gets considerable damages for a slight, perhaps a broken injury; a disabled man unemployed becomes a public charge—in either case we pay the bill. That has been recently recognized in the State Board of Public Charities, in a law under which workmen injured in hazardous pursuits are compensated directly from the State Treasury, claims being investigated and settled by a public commission. In twelve other States laws now exist making it either compulsory or elective for industries to adopt some scheme of general compensation of workers for accidents. Laws making the elective either abrogate or modify the common law doctrine of corporations in avoided suits. In Kansas, for instance, the law declares that an injured employee's claim cannot be thrown out by merely proving "contributory negligence" upon him; the negligence of the employer must also be considered—where the one is slight and the other gross, or vice versa, damages must be fixed accordingly. This law has just been declared constitutional by the Supreme Court of the United States, and the doctrine applied to the law for the States, thus to modify the common law.

Meanwhile a Federal act providing compulsory compensation for all employees injured on duty on interstate railroads was passed by the Senate by a vote of 64 to 12. The compensation is "exclusive"—that

is, when accepted precludes further claims under State laws, and an employee is provided in making judicial default in an effort to wipe out avoidable litigation in future. There was much filibustering against the bill on the part of the Democrats, because they feared the loss of a large number of claim lawyers, consultants of certain Senators, would be ruined. The bill was passed after an extensive investigation by a new panel of the Senate. They permit the employer to play the expense of compensation for injury squarely upon the employer, by him to be passed on in some way to the consumer. They also require that good business then to have heavy accident expense and will come to regard safety as an indispensable asset.

Some of the States are most endeavoring to profit by the example, but they have not yet succeeded in establishing public standards of proved merit. Illinois has a most progressive Department of Factory Inspection. The whole movement needs actualizing. We have already a Federal Bureau of Mines that is doing efficient work in deriving and securing the adoption of safety devices and appliances. That is because some districts, taking such heavy losses had in our appalling loss after another, here at last stirred the public conscience and action. They have begun reporting industrial accidents throughout the land, not only so that we may appreciate their terrible total, but so that we may study the conditions under which they occur and find out who are the really "dangerous parts" of machinery. No one, for instance, would think there was much harm in a well-used on a restaurant, till statistics showed that it is one of the most fruitful sources of injury. It should be corrected.

We need equally the uniform reporting and study of occupational diseases—the butters' "slakes," the painters' "rot," the painters' "collie and "wrist drop," . . . the brass-makers' "rhinitis," the boiler-makers' "silicosis," the glass-blowers' "cancer," the miners' "phthisis." In twenty-seven trades the workers are constantly mangled by acute poisoning—in one hundred and thirty-four by lead poisoning—no one does the work of the world our First National Conference on Industrial Diseases two years ago, when we learned from a committee of engineers that the average worker in this country of illness annually from industrial diseases in this country, involving a money loss of near three-quarters of a billion dollars. At that month of the incapacity to work can be avoided. Yet it was not till last year that we prohibited the use of white phosphorus in our match-factories, being the last civilized nation to banish from industry this inevitable breeder of horrible nervous of the jaw.

We need a national inquiry into the whole question of human waste in industry and a national public opinion about its prevention. At no point on conservation of industry begin with greater insistence to the public welfare than here. The efforts already begun, if vigorously persisted, will go far toward securing permanent industrial peace. Herbert Hoover the worker has said of the employer: "He regards me as of less account than a mere piece of machinery. If I break down, he is done with because I can be so easily and cheaply replaced. I need not get all I can out of the whole while I last. He knows that feeling by conservation of safety and health and you have struck a heavy blow at the doctrine of Borel, that if you are a permanent asset the system you should be a permanent all the way around to dynamic.

Borel, it is a business proposition. We are finding out that inefficient employees do not "go to the wall." In a recent address, William C. Redfield, a progressive and successful manufacturer and member of Congress, pointed out that the report of the Tariff Board showed that in a large proportion of the machinery in our wooden mills have been in use over a quarter of a century, while the entire development of many of our industries has taken place in that time. A great majority of our industries, says Mr. Redfield, are not nearly so up-to-date in mechanical equipment as we usually suppose them to be. He says that the cost of new equipment and modern methods of production for improvement, better adjustment, and replacement. Even where this exists and the results have been good, Mr. Redfield says, "The trouble is that we are not studying profitable. He says: 'The man is infinitely will worth study and infinitely more difficult to study than the machine. . . . You are not studying the man; you are studying the man, with his human mind and heart! But if the pattern is reversed there is in the man the responsive spirit and the machine is not. The spirit, but the man, guided and set toward, in a given direction of which the wind of it is to do not rest without. If it is not the able, or so may not, its product depends. With it the age of industrial accident opens to us."

## THE SHORE LIGHT

BY ETHEL TALBOT SHEFFALER

Hang my soul next! haul up your nets!  
Stern gables in the reef.  
Now on the shore the bag tick froes—  
The sea prepare their tent.

Under your wealth of eucalyptus  
Wend from the mountain's night,  
Heard the wind's cry and lesson called  
Hood for the double light.

Out of the profile, cheek and nose,  
With known heads looking in,  
With laboring ears through blind scarves  
Until the light you was.

And down the margin path again  
Between the long low hills  
Through the white stream of wind and sail  
Ratt as a woman's heels.

Utr, no words but spin delay—  
Up with your loving soul!  
Heard the wind's cry and lesson called  
The gray wings of the gale.

But sudden round the point to come,  
And make you side by night  
For all night long to open your house  
Shines clear the double light.

# HOW CHICAGO TAKES ITS PLEASURES

BY STEVEN D. THATTON

**C**OMMERCIALLY and industrially, Chicago is a magnet that attracts hundreds of thousands of visitors each year. Other myriads come to the great metropolis that is built on Chicago. The city entertains three great crowds with a freshness of enthusiasm and civic pride that is unique. It is a hamptable city.

Chicago has some of the best hotels in America, and that means anywhere in the world. It is the ambition of Chicago to become as beautiful as well as a useful city. It will not be many years before Chicago has the greatest park system of any city on the globe. Its plans in this end are being carried out rapidly. It is adding to its earlier places of amusement every year at an incredible rate. The summer sightseer should not miss seeing Chicago's parks. They are already so great in extent that it will take some little time to visit and explore them all and to traverse the wide driveways that connect them, but this time will be well spent.

Ultimately Chicago's system of public pleasure-grounds will cover nearly 40,000 acres. They will grade the city of the future and breed healthful places will be situated at the doorstep of every resident, rich or poor. There will be parks in the densely populated centers of the city within the area bounded by the present park system and Lake Michigan. Lincoln Park will be replaced. There then will be an outer belt of forest and meadow parks connected by broad driveways. These will encircle the city of to-morrow. Ultimately will come the complete bordering of the east edge of the city along the lake shore for its entire length, except where parks or boulevards exist already.

Chicago's parks had their beginning in 1860. Eight years before that the city had secured a tract of 85-acre area between Webster Avenue and Meigswood Street and Clark Street and the lake. There was an epidemic of cholera in those days and this land was intended for quarantine and sanitary purposes. It cost a little more than \$6,000. It was a sandy waste, a bit here and there clumped with scrub oaks and willows, until about 1864, when the first steps toward its improvement were taken. At first it was called "Lake Park." In 1865 its name was changed to "Lincoln

Park," its name today. In 1869 the necessary state legislation was secured, park commissions were established, and the acquisition and beautification of large tracts of land for park purposes actually began. In 1870 the park area had grown to 1,367 acres, and in 1880 there were more than 2,000 acres of parks. The movement for the present great park system was started in 1890.

As the years went on, Garfield, Humboldt, Douglas, McKinley, and Gage parks on the West Side were established and became places of beauty. Garfield Park contains 116 acres, Douglas about the same number, and Humboldt Park 206 acres. They are connected by magnificent driveways. With its connecting boulevard Lincoln Park's present area is more than 500 acres. It is the most popular playground in Chicago and the most famous park in the West. Its magnificent gardens are among the most noteworthy in the world. Its arboretum and conservatory are also remarkably fine. The most striking among them are those of Lincoln and Garfield.

On the total area of the north parks and their landmarks is about 2,000 acres. Jackson Park is especially remembered as the site of the Columbian Exposition. It has magnificent drives and vistas. Its beauty is enhanced by its splendid water front and the lagoons and wooded islands that the skill of the landscape architect has created. Then there is Great Park on the lake front, which has been much enlarged of late years, and a score or so of parks of lesser size. These smaller ones are more than mere breathing-places. Many of them have gymnasiums, hotels, and other things which make them particular centers of neighborhood interest.

In addition to its park system, Chicago has a highly developed plan of municipal playgrounds. These are scattered throughout the city and are thronged with children every day in the coldest weather.

In country clubs—the places of amusement and recreation for the well-to-do—Chicago is particularly rich. These places are, for the most part, outside the corporate boundaries of the city. The "Newport of the West"—Lake Forest—in the home of a club that is famous for its golf and polo grounds. Another big country club is just outside Blue Island and is one of the largest in the Middle West. Up along the north shore it is still another—at Highland Park.

One of the newest and largest to date on the "south shore" is the edge of the South Park system. In fact, hardly a residential suburb of Chicago is without its well-appointed country club.

For those who live in the city or for visitors there is no lack of indoor amusements. Chicago has about fifty first-class theaters. Some of them have been established for many years, as Chicago reviews history. They are "old" only in their traditions of the famous men and women who have played there. There are many other theaters which date back to the nineteenth and still more that are of recent construction. By continual reconstruction and improvement the older theaters have kept pace in modernity with the newer ones. Many of Chicago's playhouses are interesting in size and magnificent in their appointments. Each one has its own device to enable its rivals in luxury, comfort, and convenience.

One has a wide choice of amusements in Chicago. The grand opera is firmly established there, with some of the greatest singers in the world appearing each season. The Tremont Orchestra, one of the three or four great musical organizations of the United States, is a permanent institution. There are a couple of dance theaters where one may see the reigning musical or dramatic successes of New York, London, Paris, or Vienna. There are ten or fifteen big amusement places, like the Cullinans and the Hippodrome, which seat thousands of persons. Vanderbill fills a large number of playhouses every evening. Chicago is one of the most important cities in the far journeyings of the vaudeville artists who range from the cities of England and continental Europe to those of America. Chicago's prominence as a theater city is further evidenced by the steadily increasing number of important plays that have their first production there. First nights are becoming more and more numerous and significant. The number of electrical companies sent out from Chicago to tour the South and West is beyond computation.

At hotel city Chicago stands in the front rank. Some of its older hotels are as famous as any in America. Its newer ones cannot be crowded anywhere in the world in their perfection of appointments, general attractiveness, and excellence. The city has so many hundreds of thousands of guests to entertain each year that its hotels are all progressing in the highest degree.

# RUNNING A PUBLIC-SERVICE CORPORATION

BY WILLIAM H. HODGES

**I**N few lines of industry is there a more insistent demand for large amounts of additional capital than that which comes from the electric light and power, gas, and street-carway companies. Thirty years old, the electric light and power business in the country represents but less than two million dollars, or more than twice the money stock in the cradled oil and gas industry, while the total amount of electric-utility ratings still in the electric capital is considerably more than the two first mentioned combined.

As well as the physical property is that it has behind the funds and stock held very widely by the investing public, the work of development and construction is a constant task, although the period of experimentation is closed. So rapid is the normal growth of the business of these corporations that the urgent necessity for physical expansion continues in increasing measure, and the financial markets are constantly

called upon to supply the cash. There is at present a tendency to look in Europe for part of the heavy capital financing. It is not a difficult task to interest capital on the other side of the Atlantic in industries where there is the commercial hardiness of American utilities in times of stringency and depression.

It is estimated that the new capital actually required for the proper development of the electrical industry alone now aggregates \$2,000,000,000 yearly. The gas industry does not require nearly so much, but electric railways probably can absorb probably as much or more.

The American investor no longer has any doubt of the normal earning ability of well-managed utility properties. He has been convinced that these utilities are more profitable and more reliable investments, are of common use and necessity, vital in many ways to the people, capable of returning a satisfactory yield on capital, and not liable to the vicissitudes of the rise and fall of commercial property.

The result of many an investor's hesitation before placing his money in utility corporations is what he

reads in the newspapers regarding public ownership, agitation to lower the rates charged for service, and the fact that many of these utilities are now controlled or actual competition from public or private plants. He fears that where there is so much trouble there must be some fire and sometimes, without investigating further, he decides not to risk the probable burning of his money in this particular way.

As matter of fact the financial benefits which he collects are more possible than probable, provided his money is invested in a company that has the benefit of public ownership. The public's distrust has with the public-ownership movement, principally abroad, where individual profits long ago produced a license class content to direct the activity toward the public.

## THE PORT OF MISSING MEN

### Interludes

#### THE CLASS IN HUMOR

"TODAY, young gentlemen," said the Professor of Humor, "has been set apart for your essays in what scientific students in the art of humor term the Progressive Idiocy School. What is the leading branch of that particular style of humor called, Mr. Babson?"

"The Fun-the-Guy-Section, Professor," said Mr. Babson, hesitantly.

"That is correct, Mr. Babson, and consists of what, Mr. Babson?" said the professor.

"Intervoluble puns, sir," replied Mr. Babson.

"You may give us an example, Mr. Babson," said the professor.

"Well, sir, if you should meet an intoxicated chad-

fer on the street and you should ask him his name he would reply that he was the guy that put the gin in the engine," said Mr. Babson.

A spasm of pain crossed the professor's face, but he pulled himself together and went on.

"And suppose, Mr. Babson, you were to meet a Kansas farmer on Broadway, wearing a rain whisker three inches long, and were to ask him who he was, what would be his reply?"

"Why, Professor, said Mr. Babson, "I imagine his reply would be that he was the guy that put the post in poster."

"I am afraid that would be the case," sighed the professor, swallowing a tablespoonful of smelling-salts. "And if you were to meet the chairman of a senatorial investigating committee coming out of the Capitol, Mr. Babson, and should ask him his business, he would pause and reply—"

"The the guy that's looking after the wash in Washington, sir," replied Mr. Babson.

"Referring to Bushy Wash- ington?" continued the professor.

"No, Professor," replied the bright young man. "In this instance it would be a case of White-Washington."

"Is there any purely British variation of this particular style of humor, Mr. Babson?" asked the professor, levelly.

"Yes, Professor," said Mr. Babson, bursting into tears under the nervous strain. "I regret to say, sir, that there is. A man having been pointed out to a British visitor by the United States as the guy that put the fish in efficiency, the Briton returns to London, and—oh, Professor, must I go on?"

"Yes, Mr. Babson," quavered the professor. "The students under the endorsement of our School of Applied Humor require me to insist upon an answer."

"Well," trembled the quivering student, "the British visitor returns to London and endeavor to repeat the joke, and—"

"Oh, on, Mr. Babson!—let's get through with this as fast as we can," cried the professor, clanking the sides of his chair.

"And he tells his hearers at a public banquet that in America among other interesting sights he considered the guy that put the acid into the conscientious performance of his duty tasks," ground the unhappy student.

It was at this point that the lamp in the professor's humorous umbrella exploded and completely wrecked the class-room, causing an adjournment until further notice.

#### A DISTINCTION

"How do you pronounce the word P.A.P.A. Miss Jibby?" asked Hicklebeep—"pop-pet, or poppet?"

I am writing an article on 'How American Girls Speak.'"

"Why, I say pop-pet, of course," replied Mrs. Jibby. "I want to distinguish my father from my fiancé, who is my poppet."

#### FINE!

"THERE," said Mrs. Straggled, as she held up her baby daughter, "don't you think she's a pretty fine specimen of a girl, even if her mother is a Suffragette?"

#### THE CLOCK STRUCK ONE

"She certainly is a fine, neatly little tot!" said the diplomatic Duke.

#### STRAIGHT FROM THE SHOULDER

"WELL, now really, Miss Jermell, I should like to hear what you would consider the ideal man," said Dibble. "Define him for me, won't you?" "I couldn't," said Miss Jermell with a pleasant smile. "The terms are essentially contradictory."

#### NOT BECOMING

"I don't think Mrs. Straggled looked very attractive at the opera last night," said Dibble. "But why, usually she is radiant—what did she have on?" asked Winkletop.

"A large-sized grouch," said Dibble.

#### SHAKESPEARE ON THE ROAD

HAMLET had just been hit by a cold-storage car. Whereupon he turned gravely to his audience.

"How truly spoke the good Macbeth!" quoth he. "Something is rotten in the State of Denmark!"

THE SHOW-BAND IS CERTAINLY THE ONLY COSTUME FOR LAST AVIATION

# WONDER-WORKING FARM IMPLEMENTS

BY HERBERT RICHARDS

**P**OWER and power-driven machinery are very largely the basis of modern civilization. Since James Watt increased steam, larger and larger engines have run grinders and more complicated machines, and more of them, bringing workers together in numerous groups to do bigger things than ever could be done achieved by the same number of men working as individuals. Power control in the factory created during the last century our great modern industries. With the substitution of the steam locomotive for the horse-driven stage coach and of the steamship for the sailboat began the modern era of transportation. About a decade ago the use of power and power-driven machinery began to spread to the third and greatest field of human endeavor, agriculture. Since earliest history the greatest task of mankind has been that of plowing every year the whole cultivated face of the earth and of cultivating, tilling, and harvesting the crops. In the farm the industrial revolution that has made such progress in other cities and in our transportation systems is just beginning, and already the American farmer uses more horsepower horsepower than all other industries combined. The American farmer invests an investment in farm machinery aggregating \$1,300,000,000.

Nearly six hundred millions of dollars have been added to the country's farm machinery investment in a decade—more than sixty per cent. in the investment for such acre—so, as fast as the need for greater production grows, inventors equipped with machines that keep the farmer that can afford them in control of the situation.

The high cost of labor makes it imperative that farmers use all the labor-saving machinery possible. The farmer, as yet, cannot control the market price. He can increase his profits only through cutting unit costs—either by increasing yields or reducing operating expenses.

Until after the Revolutionary War, the farmers of this country used the same tools as were used by the Egyptians and Assyrians. As late as 1837 the iron plow was rejected by New Hampshire farmers on the ground that it plowed the soil, checked the growth of useful plants, and promoted the growth of weeds, a state of mind as commendable as the ancient belief in Greece as the founder of agriculture, and the fear of losing her wealth by adopting any change in methods.

The modern plow, the grain drill, the binder, the threshing machine, the harrow, disc, and pulverizer; the mower, rake, hay loader and baler; the corn planter, cultivator, binder, chaff-cutter, chaffer, and grinder, with the combine harvester on the side; the cotton planter, and soon the cotton picker; the potato planter and the digger; the stationary engine and the tractor—all these have constituted distinct steps forward in general economic, as well as items in promoting individual comfort and prosperity.

Three-fourths of the corn crop stays in the neighborhood where it is grown and makes its public appearance as stalks and cobs. But even outside of value wheat, oats and cotton combined, and the total possible savings in its production by using machines in place of hand methods would mean that by the end of crop of any one of these three. That is why we are now teaching our children to sell cereals and hinders along with threshing machines.

A man ran out and shut an acre and a half of corn a day. Two men, the old and the younger, and one horse did as much as three men employed. With the corn chaffer another man is added by a horse and the remaining man merely acts and drives—an additional spectator, with nominal duties. The corn binder, with one man and three horses, cuts faster and binds the stalks in addition. The corn picker substitutes itself for two men and three horses and manages to pick the corn in the same time, at the same cost.

The basket of corn takes more labor than wheat, or about fifty one minute, but it took nearly four hours before that. In 1855, before the development of corn planters, cultivators, and binders for cutting. Less than one-third the former labor cost is put into each bushel. The farmer reaps more for the same cost, and the consumer can pay the profits of handling all along the line, and still get cheaper corn than the second or third generation back. Shelling runs for the "chaff-cut" takes but one per cent. of the time that it did eighty years ago, and the energy consumed in the operation is negligible compared with the former tedious millage-producing experience.

A hand even sheller lets one man do what thirty men do by hand. A small power sheller, run by an engine, will shell and sack eight hundred to twelve hundred bushels a day, and the cost per bushel for the cost of it all.

A typical one-man mow's cotton and mow equipment costs about \$30, often including a rickety old mule—so compared with \$130 for an average four-

farmer's cow machinery, and the mow works five times as long and as hard on an acre in consequence.

In these days of automobiles the hay crop may not seem as important to the city man as it did in former father's time, yet hay often makes up more than a third of the farm's income. In the ten or twelve years since 1910 the world of hay may have been, where did want six years ago, to pay for thirty the labor of the hardest back-breaking work.

A cubic foot of hay may weigh four or five pounds. After being it weighs sixteen to thirty pounds, and the conventional farmer can store his whole crop in a smaller barn with less hay for one dollar's hay supply. A dollar a ton converts hay, a bulky, easily inflammable product, into a light hay, an article with value in a wide market, sufficient to pay a profit on the balance as well as the fertility it conveys from the soil.

The grain drill saves in labor and cut over hand methods. It does not get the seed, and by accurate and uniform placing the yield is increased two or three per cent. Broadened seeding, like broadened weeding, helps save overhead charges and still maintain production costs, by giving way to the more concentrated methods.

The old method of skimming milk by hand yielded from twelve to fifty pounds of butter per cow every year.

The modern cream separator skims within one-tenth of one per cent. perfect and only the extraordinary amount dairy cows could produce enough to waste a dozen pounds a year from a single cow.

The harrow saves the driver a walk of fifteen to twenty miles a day, over soft ground. The binder-carrier saves a mile of walking to the acre, and the automatic chaffer cuts it all out. The shock harrow and the hay-binder make the team do all the lifting. The mow-scraper saves the work of scattering the hay and does it more efficiently than the man can do it. It has been necessary only to name a few that he it supplied.

Farm machinery of all sorts has been substituted for men, but, in reducing the labor and increasing the profits from quantity production on virgin fields, we have gone too far in the wrong direction. When machinery made it possible for a man to market a bushel of wheat with only three cents of his own labor represented in it, the expert market man to take our cheap surplus. The million upon millions of dollars' worth of soil fertility from our capital stock was sold in foreign countries.

## A FLORAL ZOO

BY JOHN KENDRICK BANGS

DRAWINGS BY PETER NEWELL

His looks were made in eggs and I am  
He kept some pigeons with a pair his labor,  
Placed above at hand that he might be to shape  
Should any one of them try to mope.  
Another held in check with steel have said  
A herd of Dandy Lions, frow and bold,  
And when his daily basis were singly set  
Birds need to sit outside and hear their roar.

And still a third he called his Panther Lair  
And raised a greatly crop of Catnip there,  
Which grew, he liked to think, "with quality  
form."

And ere one knew it covered all its bed,  
He kept some Tigerkins with a pair his labor,  
He built a small pen the bar behind,  
In which he kept the Tigerkins with a pair his labor,  
And Birds entered that he could hear it  
growl!

WHEE! Horsey Binks, the Keeper of the Zoo,  
Had reached the ripe old age of sixty-two,  
Work with his labors hard, the most and stiff.

Pink of the Panther's, then the Keeper's life,  
He thought 'twere well to grow up after toil  
And live on his accumulated spoil.

And started, then, a little garden patch  
Which for a Zootic interest soon was match.

Mindless he had and Fingert glories;  
And for his cock-hood Fingert glories,  
For he could do it from the night was shock—  
Was just a small patch of wild Hippopotamus!  
Then for a hedge about this wondrous spot,  
To keep it from the highway, that, hot,  
He placed a line of back to state of grace,  
Of Black Bear oak, sit outside for Beals.

And now at once he sits and looks at the  
With a well-worn considerable  
Succeeded by the floral symbols that  
In all comparisons, he might be  
The look of the form and now that they  
Was nothing he can give to night or day,  
A faithful Dogwood tree beside his door,  
The Indian pipe in hand—he wants no more!

**First-Mortgage Real Estate Bonds**

By S. W. Struss

The depreciation of standard investment securities all over the world during the last six years is one of the most serious financial problems. The securities are most felt by the investor who has been compelled to market bonds this year at a loss of many points from the high prices paid last year. Ever since the interest rates have been steadily going upward, there has been a widespread demand for capital. The need of Europe has been rising.

As a result the able securities, bearing low rates of interest, have been municipal, public utility, and even government bonds, has fallen in price.

It is a curious fact that even conservative the bond, generally speaking, the more it has declined. United States government bonds have fallen from 100 to 85. The government bonds of Holland, bearing 5% per cent, interest, have dropped from 75 to 65. Danish government bonds are now quoted at 78, a decline of fifteen points. Three-per-cent bonds of the German Empire have fallen from 84 to 75. Austria's bonds show a loss of three points, from 99 to 96. British consols, bearing 3% per cent, interest, are now quoted at 112. Three years ago they stood at 112. French notes, bearing 5 per cent, interest, 75% points to 65.

The decline in railroad bonds is a familiar story. Municipalities have suffered more, although to a less extent. Many forces have been at work all over the world reducing the interest rate for money, but it is not so with the rate for silver today, which borrows at 3% per cent, for any of its railroads, no matter what country was offering.

This decline in prices has served to concentrate the attention of investors on one point which has led to a new era of stability. Standard investment bonds, such as municipal and government bonds, which are so stable and so far less affected in price by the rates which affect the stock market in general. The most conservative government loans on both sides of the world have declined in the last ten years.

"Stability" is only a relative term when one speaks of securities which have been bought and sold on the stock exchange. The investor who demands absolute stability in value and certain interest will be disappointed will never appreciate and will always be worth no hundred cents on the dollar, the most conservative of investments.

The only security, so far as I know, which are absolutely stable, which never depreciate in value, which are bought with one hundred cents on the dollar, and which are never affected by stock market fluctuations, are the modern first mortgage real estate bonds.

For generations mortgage-borrowers have been looked upon as the strongest and most conservative of investors. A property owner does first mortgage an improved real estate, with an ample margin of security, in as safe as any security in the world and has the further advantage of receiving a higher interest rate than any equally safe securities. By their very nature mortgages do not fluctuate in price for the simple reason that they are not bought and sold in a broad general market, and their figures are not subject to a loss of supply and demand.

But mortgages usually come in awkward and irregular amounts and are not convenient for general investing. The first ten years ago in Chicago a great improvement was made in real-estate securities as great as the volume of participating bonds.

Annual dividend ..... \$1,155,281,996  
Deferred dividend ..... \$2,672,210  
Total ..... \$3,827,501

Perhaps the greatest reason for the great popularity of non-participating insurance is the fact that the people who have accumulated a fortune of insurance in their lives before. They evidently prefer insurance of a guaranteed cost and are not so much attracted by the possibility of having a portion of their premium returned each year as they are by the guarantee that the cost shall never exceed a certain stipulated price.

cost, thus giving these bonds a ready market and making them so adapted to the needs of first money readily convertible than some issues listed in the stock exchange. The Chicago issue, in fact, has the record of never having failed to purchase a security from a client, on request, in the thirty years it has been in existence.

First mortgage real-estate bonds, then, combine all the advantages of real-estate mortgages and of bonds in general. They are safe, they are sure stable in value than any other bonds whatever (not even revolving government bonds themselves) they return an attractive income, and when loaned by the better grade of investment loans, which make good investments for a market for their owners, they are readily convertible. Indeed, I know of an elevator company which offers many advantages to the conservative investor.

**Non-participating Life Insurance**

The Extraordinary Growth Within Recent Years of Guaranteed Cost Insurance

In the early days of the legal reserve life-insurance business, when but little was known as to the actual operations of the mortality table as applied to a few thousands of lives insured in a single life insurance company, the insurance managers, in order to retain the permanency and safety of the insurance institutions, added to their policy contracts, besides the amounts necessary for the life-insurance fund or reserve and current mortality costs, a very large additional sum which was described as the "loading," out of which expenses were to be paid, and any balance remaining was credited to the company's surplus account.

After a few years it was noted that the surplus account was growing very rapidly; in fact, it appeared so though an unnecessary and needless asset of money was likely to be piled up from which no benefit was to be derived by the policyholders.

For reasons that are readily understood, insurance managers were not inclined to curtail surplus accumulations by reducing premium rates. Therefore the plan was devised of paying back to policyholders at the close of each policy year such portion of the surplus as the expense had been individually made and so, in the opinion of the insurance managers, each policyholder was amply satisfied.

Not wishing to concede the fact that the premium rates were entirely too high, which conservative would have, naturally, secured a demand for lower premium rates, the board thought occurred in the insurance managers that these surplus accumulations should be included as "dividends," in addition to the amount of the loading, according to the insured that the individuals who had insured their most conservative and profitable lives are insured for a dividend as his policy each year.

With the passage of time the facts as regards so-called dividends on life-insurance policies have been brought forcefully to the attention of the investing public, with the result that not only is that form of insurance declining in popularity, but also the insurance companies have to the development of guaranteed cost, or non-participating insurance.

Ten years ago the United States was about 30 per cent. of the total world population. Now by the proportion of non-participating insurance has steadily increased until, as the following figures, taken from Rev. L. L. L. Insurance Bulletin, from the various kinds of insurance in 1911, show, the volume of non-participating insurance written is about half as great as the volume of participating business.

Annual dividend ..... \$1,155,281,996  
Deferred dividend ..... \$2,672,210  
Total ..... \$3,827,501

Perhaps the greatest reason for the great popularity of non-participating insurance is the fact that the people who have accumulated a fortune of insurance in their lives before. They evidently prefer insurance of a guaranteed cost and are not so much attracted by the possibility of having a portion of their premium returned each year as they are by the guarantee that the cost shall never exceed a certain stipulated price.

**Duplication**

The first copying press to be used in America was made by Benjamin Franklin, who made the ink of his manuscript with every end and aim, passed the manuscript between rollers, which were covered with highly polished pewter plate. This received the impression from the copy, from which numerous copies could be

made by the copper-plate printing process. In 1790 James Watt adopted the principle of printing transparent, porous paper against the copy manuscript, so that the writing would be transferred as on a letter, and then read from the reverse side. Business soon began to prosper quickly, cheap and successful duplicating processes for handwriting and, later, for typewriting. American genius did not stand still. In 1874 the British patent and most noted inventor invented the wax coated paper commonly used. He used the earliest form of wax, the writing—the same—altogether with the wax of the Greeks and Romans. He used a paper instead of wood or iron. This sheet of tough paper that performed well in conjunction with a steel plate of exceedingly fine lines, and then forced ink through the perforations of another sheet of paper, thus making a real facsimile copy in every detail. This process was known as microphotography. The ink of the acetate was made from the black fluid of the cuttle-fish or of lamp-black, charcoal, or gum, some of which several ingredients are still in use. The acetate ink are supposed to have been more durable than those of the present day. The writing on ancient Egyptian papyrus is legible even after the lapse of thousands of years. The microphotography of writing are just as legible today as when first used. Microphotography is the most perfect method for the help to business and its popularity is now spread the world over, so that it is highly required as the standard process. The basic principle of the process have never been changed by the waxes, nor has any one discovered accidentally or inventively purposed some better process or method to take its place, though many attempts have been made. With it any thing that can be made with pen, pencil, or as a typewriter can be reproduced in practically an unlimited number of copies. The micrograph will also print in colors.

**On the Subway Train**

The editors queried me "I'm home. The factory boys are making me. So look out both with work I like. The quiet of the Subway Train."

The guards cry out: the doors are closed. The slumlord: The factory ladies pray: Then I shut my eyes with us. And I can close my eyes to pray.

I do not care: I do not feel: I think of silent things: And I can close my eyes presently. And across me walk shining wings.

The sailors and the rush of life: Go striking, whirling round: A quiet central place of peace. Where God sits in a silver cloud.

His never speaks: He never stirs: The altar is so deep: And I can close my eyes to sleep. And never comes to you his sleep.

Some days the train stops suddenly—I am surprised to see That all the other people, too, Sit thinking quietly.

I wonder if they like the train: And if they try to close their eyes: What I can when I shut my eyes, The spot where God sits silently.

M. F. FARROW.

**Fencing**

FENCING as a pastime has much to recommend it. It is convenient for men who work in towns or country, does not consume as much time as golf, and is not so liable to get wet weather. Hitherto the expense has been against its popularity. On the other hand, there are several students of fencing who had subscriptions charged by schools would show statement. In France, for instance, the cost of an almost unimportant and complicated and a compulsory subject, so to speak, for army men, expense are quite moderate. The cost of a fencing outfit is \$4.50. This includes a pair of foil, jacket, mask, and glove. A pair of small sword runs from \$2.50 to \$3.50. This is the most really valuable of the foil, which falls for a preliminary training with the sword. Practically all fencing equipment comes from France.

It is suggested that fencing clubs be established on the lines of athletic organizations of golf and boating. Good fencing masters can be secured on the continent of Europe for a moderate fee, which if it were not in compliance by private lessons. French teachers are best, not so account of their nationality, but because they are particularly likely to teach.

**At Your Service Instantly The New Food Drink Instant Postum Requires No Boiling.**

Those who have tried this new table beverage are enthusiastic about it.

There are many reasons that pleased people give us, and here are some:

"It has a rich flavor that we have been unable to get out of coffee although we have tried several brands."

"Instant Postum has broken as of the coffee habit. 8 days after leaving off coffee I feel absolutely better—but what an appetite."

"It has relieved me of nervous headaches and of all nervous with when drinking coffee."

"It fits in because it can fit myself in a few minutes. If I am tired after a long day, I can well fall right after using Instant Postum."

"We find a better and more healthful than coffee."

You can please yourself with this wholesome, healthful hot drink by ordering a tin from your grocer.

100-cup tin, 50c.  
50-cup tin, 30c.

Or if you desire to try before buying send us a 2c stamp (for postage) and let us send you a 5-cup sample tin free.

## The Mystery of the Fig tree

ALTHOUGH the fig-tree has been cultivated for thousands of years, there are many matters concerning its mode of reproduction and its relation to the fig-wasp that have only come to be understood in recent years. When fig-trees were first introduced into California they quickly established themselves and flourished—but they have failed. The reason for this was discovered to lie in the fact that pollination did not take place, owing to the absence of a certain insect, the blow-flie, which belongs to the wasp family. The right insect was introduced from the Orient and the manufacture of the fig was established, and with this the fig industry became possible in California. Dr. Maggiore Biondini has been making a more minute study of the life history of the fig-tree and of the fig insect in Italy, under the direction of Professor Tschudi of the University of Rome. He studied the wild fig-tree and thus found some interesting facts about the history and behavior of the cultivated plant.

The fig-tree produces "imperfect" flowers; that is, the stamens and the pistils are never fused in the same flower. The flowers are very small and occur in crowded clusters or heads, which one might compare to the head of a daisy, except that in the fig the receptacle bearing the flowers is hollow, with the flowers on the inside, and having a narrow opening to the exterior. In the wild fig there are three kinds of inflorescences or heads. In the spring there is a head that bears sterile flowers, known as sterile pistil flowers; in other words, the stamens produce little pollen, but the pistils can never bear seeds. Next there are another set of heads in which there are only fertile pistillate flowers and no stamens. Finally, in the autumn, there are inflorescences which bear only sterile pistil flowers. It is evident, therefore, that only the summer flowers are capable of producing fruit. Spring inflorescences drop off after the pollen is removed, but the summer heads become enlarged when pollination takes place or set; however, if pollination does not take place, the seeds will not ripen. The fall inflorescences remain on the tree throughout the whole winter and, hence, ripen.

The blow-flie lays her eggs in the sterile ovaries, and within the few minutes inflorescence, one egg in each pistil. The eggs hatch during the winter, in the hollow receptacle, and the fertilized females immediately fly out and lay their eggs in the spring inflorescence. From these eggs the young hatch out as a short time, the males emerging first. These animals have no wings and very poor eyes, so they do not travel about much. But they crawl about inside the growing fig and lay their little containing the females.

The females crawl out and fly about in search of a place suitable for their eggs. By this time the summer inflorescence is open, and into this the wasps come in large numbers. As they enter, they thrust the narrow opening of the spring inflorescence they are obliged to crowd past the open stamens, and their bodies become covered with masses of pollen. This pollen is thus introduced into the summer inflorescence of fertile pistils. The insects do not lay their eggs in these flowers, their instincts seem to limit their egg-laying in the sterile or so-called "gall" flowers. Thus the summer inflorescence is pollinating the fig-tree. These females, however, which hatch out very late in the season, are the first to enter the fall inflorescence, which bears, it will be recalled, not sterile flowers, and there deposit the eggs which develop during the winter.

We may thus see the close adaptation between the life history and habits of the insect on the one hand, and the habit and reproduction of the fig-tree on the other.

The early cultivators of the fig proposed the most serious means of cutting, rather than through the use of seeds. This method has the obvious advantage of giving plants in a shorter time, but obviously is not using this method they unconsciously produced distinct varieties of the plant. For a branch of the wild tree that bore spring inflorescences in set out as a cutting, the resulting tree will bear only spring flowers; the latter are sterile and sterile pistillate flowers. If a branch is set bearing the summer inflorescence, the resulting tree will bear only the summer type of inflorescence; and similarly for the wintering branches. As the so-called cutting or stock fig is also capable of bearing the wasp during the growing period of the latter, the cultivators have been obliged to grow numbers of these "vegetative" or "stock" trees of their groves; or they would make use of the corresponding branches of the wild fig tree. Hence, the stock fig is the one that the correspond would be used in the cultivated tree, and thus the wasp emerging from the spring inflorescence was unable to opportunity to pollinate the summer inflorescence, leading to the ripening of the

latter. This explains the origin of the practice of "castration." It is by this means that the tree that "bears" figs are kept sterile, so that the pollen which pollination not only fails to set, but they do not dry properly and so cannot be preserved in the usual way, although they may be eaten fresh, and are consumed in this state in large quantities.

The recent investigations here shows that the early form of cutting "stock" fig-trees are not in reality two distinct varieties. For one thing, the two forms have been shown to be identical by growing cuttings from different branches of the wild fig-tree. Another proof lies in the fact that the pollen from the seeds of the "true" fig-tree is shown from the seeds of flower buds, the same as the wild tree. Moreover, it has been argued that as the fig wasp can fly a short distance, the ancestor of the cultivated fig must have borne the stamens and pistils upon the same tree, in some grove, where it has maintained themselves with the help of the wasp that caused by its tree to live, in a state of sterility. Of course it is possible that some other insect, instead of prolonged flight, performed the office of the fig-wasp for a distant ancestor of the fig-tree—that is, some plant which the stamens and the pistils are produced upon separate individuals, as in the case of the modern cultivated fig, but the latter evidence is quite convincing.

Through many years of careful selection, the cultivator has been able to succeed in establishing a true variety of fruit-bearing fig-tree, which yields a large, sweet, and seedless fruit that requires little or no ripening, and that is a fine pollination for its "ripening." This fruit has, in addition to the advantage of ripening at an earlier date, the other, for the labor of "castration" can be saved entirely. The only drawback lies in the fact that the seedling must be kept isolated for shipping or preservation, as the old-fashioned fig can. But perhaps the scientist will overcome this defect in time.

## The Amber Industry

THE business of obtaining amber from the ocean has been long and a state monopoly in Prussia. The chief source of the amber is the Baltic Sea, off the coast of Prussia. The gathering of the amber goes on throughout the year, but it is most profitable at the time of the maximum storms, when the winds and the waves strike it ashore. After a storm the fishermen of Prussia go to the beach, and the local people the strand, where the women and children pick out the pieces of amber lying among the seaweeds. The pieces are scattered according to size, color and form. The value of a piece of amber is enhanced when it bears the impression of a plant or animal. The weight of the pieces vary from about 15 cents to 75 cents, but may reach to \$100 or more. The average price of the pieces from about \$1.25 to \$2.50. A very large piece sometimes attains the weight of five or six pounds. The color of the amber varies from a pale yellow to a deep, almost blackish brown, and it may be reddish brown or even red when it is very old. The total yield is valued at \$1,500,000 a year.

## A GOOD BREAKFAST

Some Persons Never Know What It Means

A good breakfast, a good appetite and good digestion are the three things that a man, woman or child who has anything to do, and wants to get a good start toward doing it, must have.

A New man tells of his wife's "good breakfast," and also says, made out of Grape-Nuts and orange juice. He says: "I should like to tell you how much good Grape-Nuts has done for my wife after being sick for weeks. For the last 18 years, during part of the time, everything would stay on her stomach long enough to nourish her, finally at the suggestion of a friend she tried Grape-Nuts.

Now, after about four weeks on this diet her stomach has become so good she is picking up most wonderfully, and seems as well as anyone can be.

"Every morning she makes a good breakfast on Grape-Nuts eaten just as it comes from the package, with cream or milk added; and then again the same amount of Grape-Nuts with her coffee.

"We can't speak too highly of Grape-Nuts as a food, and one of our neighbors' name given by Postum Co., Battle Creek, Mich. Read the little book 'The Way to Well-Being,' in 32 pages. There's a Branch."

Ever read the above letter? A new one appears from time to time. They are interesting, true, and full of human interest. P.

# Three Stages in the Wonderful Electrical Development of Chicago

1887: Chicago Edison Company organized with \$500,000 capital.  
 1892-3: World's Fair Period; Mr. Inoué accepts Presidency of the Company; Harrison Street Power House built; load jumps to Quarter of a Million 16-Candlepower equivalent.  
 1903-1913: Central Station Demonstrates its Economic Right to Supply Entire Electric Requirements of the City; Fisk Street and Quary Street Steam Turbine Power Houses built. Chicago Leads the World in Producing and Setting Electric Energy. First Section of Northwest Power House Built and in Operation.

**T**HE Commonwealth Edison Company, Chicago, stands for the greatest Central Station development of electricity supply in the world, it is the first in the total capacity of its generating equipment, first in the breadth of the system, and first in the world in the sale of energy, first in the total output of electric energy, and first in the actual number of customers supplied.

The present company is the successor of several smaller companies, each among which was the old Chicago Edison Company, whose territory included the business center of the city. This company commenced business April 29, 1887, consequently the quarter century has been passed; it is not generally known that on Chicago on April 25, 1912, when Mr. Samuel Inoué, who has been president of the Commonwealth Edison Company and its principal predecessor, the Chicago Edison Company, since 1902, addressed a gathering of some twenty-five hundred engineers in Orchestra Hall, his subject being "Twenty-five Years of Central Station Development in Chicago."

The first stage of development consisted in introducing Central Station electric service for lighting and power to the people of Chicago, and the gradual building up of the generating and distributing systems, from a small start in what was considered at the time to be a special utility; the erection of the power house at Harrison Street and the south branch of the Chicago River. In these days (1892) the connected load amounted to 98,350 horsepower (100,000 kilowatts), 1,500 horsepower in electric plants, 2,500 acres are lit up, and 1,190,000 incandescent arc lamps or better service, the total equivalent being 155,000 lamps of 16 candlepower, or approximately 10,000 horsepower.

Compared with present figures these were small beginnings, still unworkable. High electric power was regarded as a novelty and entirely of the Chicago River. In these days great numbers. But in spite of the most conservative opinion, the principle of Central Station electricity supply being fundamentally sound, its importance was demonstrated in a great variety of applications, and the volume of business as indicated the connected load increased 100% from 1891 to 1892, and 62% from 1892 to 1893.

Aggressive selling methods continued to increase the necessary connected load, and additional equipment was constantly installed to take care of it. During this period the wonderful inter-connected system of principal and subsidiary power lines, for which the Chicago central station introduced the famous, as they were really world possessors in all this development, was built up and transformed from a widely distributed equipment achieved from various small companies to a homogeneous system, each part of which was able to do its own or some other part as conditions required.

Aside from the usual electric-tyl or industrial general run, normal lighting, a great deal of work was done by the well organized and well equipped department in introducing electric light into the average home in the great north districts of the city.

Many losses were noted for the use of electric light in a short while a mutual agreement was effected. The connected load of the two companies increased rapidly until, in 1903, it was over that a still better course of physical development of the Central Station system, providing for a more universal application of its output, would be justified.

With electricities came and forthright the great Fisk Street power house was projected and planned in the fall of 1892, and the first 10,000-horsepower turbine steam turbine electric generator in the world installed there and put into service. This departure from the prevailing type of prime mover attracted worldwide attention, but

was a pronounced success from the start. By the time the fourth unit at this station was ordered, capacity was considerably increased. This power house now contains ten units of 10,000 kilowatts each, a total of 100,000 kilowatts, or 150,000 horsepower. There is now being built for this station the largest turbine-unit in the world, which will shortly be installed there.

Long before the Fisk Street Station was built for completion it was seen that the requirements would far exceed even the greatest provision, and the Quary Street power house was started just across the river from the Fisk Street Station. Here are 24,000 kilowatts, 35,000 horsepower turbine generators have been installed. This enormous equipment, matched by the simultaneous development of the entire distributing and transmission system, was the direct outcome of the long plan of the first who

direct central station enterprise in Chicago. Their object was to supply not merely light and power requirements for private residences, factories, office buildings, and houses, but to supply a very broad foundation for the operation of those common power houses on the most highly economical basis by entering into large-time contracts with local transportation companies for the supply of their large requirements of energy for the operation of surface and elevated traction systems. All this has successfully been brought about, and voluntary annual rate reductions for electricity supplied in the greater amount now rendered possible by the continued operation of these master policies.

Showing ten 10,000-horsepower steam turbo-generator units in the turbine room of the Fisk Street power house, Commonwealth Edison Company, Chicago.

In 1908 Elwyn W. Stone was instituted to assist in developing the public to the use of electric service in all applications in the home. It is a beautifully appointed store carrying over ten thousand things electrical, and intelligently located at the corner of Jackson and Michigan Boulevards.

A progressive advertising policy has been pursued, the general trend being the daily newspaper.

The broad-gauge policy of the company toward its employees deserves a word of mention. There are fine club and shower baths for the use of power-house employees, and reading-rooms and rest-rooms in the office buildings.

The Employers' Savings Fund is a generous provision for encouraging thrift and affording opportunity for the employee to become a stockholder. The Service Annuity System provides for the payment of substantial sums annually to employees after the retiring age for long and faithful service. There is a fine club and shower bath on a West Street. There is a well-stocked library with the total up to something like \$200,000,000 loaned in various company properties.

The company action of the National Electric Light Association offers exceptional opportunities for education, both along broad general lines and specifically in connection with the company's business. It has over 1,700 members strong in every part of the world. The directors, the organization of the women employees, is more for recreational purposes, although its members participate in many of the advantages of the Commonwealth Edison Company in so much as advances in its public policy and its policy toward employees as it is in the material growth which we have heretofore outlined.

This most remarkable record was not achieved without the able financing. It was necessary time and again to increase the capital stock, and from time to time bonds have been sold, the company's securities finding a market both here and abroad, even in the financial straits through which it has passed. Starting with \$500,000 capital in 1887, it has reached the sum of \$2,754,000 in 1912, its bonds and other outstanding securities bringing the total up to something like \$200,000,000 now

actually invested in the business. On this large capital the annual income is now approximately \$16,900,000. The total output of energy in 1912, as compared with 1902, the company employs a total of 2,500 individuals, of whom only 500 are holders of the company's stock. Over 1,000,000 tons of coal are burned each year. The thousands of handwired and bit-wired electric meters are supplied with electric energy. Annual taxes and municipal contributions are together considerably in excess of \$1,000,000. The total area supplied covers a territory far greater than the city of Chicago, as there are lines reaching out in connection with other Central Station enterprises, supplying more than 2,000 square miles in northern Illinois. The total estimated connected load December 31, 1912, is as follows:

	Kilowatts	Horsepower in the City	Equivalent in the City
Light	200,000	4,000,000	325,716
Tramways	175,000	3,500,000	284,544
Railways	120,000	2,400,000	175,965
	545,000	10,900,000	7,865,225

Commonwealth Edison stock pays seven per cent dividends; the rate of interest on the bonds is five per cent. There is responsibility here limitation in the market quotations for these securities, and they are bought by unskilled investors on a five-per-cent basis.

Northwest power house, Commonwealth Edison Company, Chicago, from architect's drawing. Part of the section shown at left is built and in operation with two 27,000-horsepower units.

The bridge to the third or present stage of the Central Station business in Chicago. Numerous indications of more and more aggressive business-growth methods, together with absolutely fair and impartial dealing throughout its entire history, have built up the business at the rate of 100,000 kilowatts of 16 candlepower per year, which growth has been maintained for the last three years.

The present rate for electric light and power to the average consumer is practically one-third or less of what it was only six or eight years ago. To improve the situation, the Commonwealth Edison Company supplies one-third reduction from thirty-two to twenty for one-third loss in billings per year than one year's bill for one-third reduction.

Quary Street power house, Commonwealth Edison Company's properties at Quary and Fisk Streets and the Chicago River. Quary Street power house contains six 21,000-horsepower steam turbine generators. The capacity at Fisk Street will be 215,000-horsepower this summer.

# The Marvel of the Silent Salesman

Their Park with Garden, Lily Pool, and Pergola

It is only a matter of seventeen years since Sears, Roebuck & Co., of Chicago, began business with their silent salesman as the only agent they sent to their customers, and yet within that short space of time their sales have grown to the astounding total of \$50,000,000 for the year 1914 and are expected to reach nearly \$60,000,000 in 1915. The story of their success is as amazing as the tale of Aladdin and his lamp, yet it is a tale which to a very simple man one receives it into its elements.

1. To use printer's ink as their only medium.
2. To sell direct to the consumer, thus giving him the profits that would otherwise go to jobbers, agents, commission houses, retailers, etc.
3. To call things by their right names, giving in their catalogue an exact description of every kind of article sold, and to refund cheerfully the price of any article returned by a customer—giving him all his money back and charging not one cent for freight or expressage on the goods in either direction.

Very simple? Yes. How is it very simple to build a store building with light by merely pouring an electric battery, but before that simple act could accomplish its brilliant result there had to be a great deal of planning and planning and many days and nights of the hardest kind of labor. To describe Sears, Roebuck & Co. merely as "catalogue retailers" or a "mail-order house" is very far from telling what they are and what they do. To begin with, they laid the foundation of their business upon the proposition that they would supply to American consumers the best that the world's markets afford at a price which should not include a scrap of profit to unscrupulous middlemen. They believed that the people could be well served by delivering to them the products of the world and factory at a price as low as that which represented the bare

The Main Dining room of their Restaurant

cost of production plus the small percentage of one low profit.

Think for a moment how this plan cut out the usual expenses of selling, packing, shipping goods by wholesale, thus receiving, preparing, repacking the same goods through the hands and noses of the various costly agents who get between the maker and the user. Then, as an additional incentive to business the firm guaranteed "satisfaction or your money back." This was no boast; it was a solid fact. The money was returned not grudgingly, but promptly, cheerfully, willingly, and helpfully.

Hopefully, and the hope was well justified; for the attractions of this selling plan were too good to be resisted. The customers looked at the catalogue in which the goods were shown, were drawn into them, naturally and proved lower than anywhere else. He made up his mind and sent his order; the goods were shipped in him immediately, and then, if he could be like them, he could send them back and get every penny of his money returned to him right away. Under these generous conditions it is no wonder that very few purchases are sent back by the customers.

Old merchants envied, rivals trembled or clanked in imitation, but the business of Sears, Roebuck & Co. grew enormously. Year by year it doubled or tripled, until early in 1904 the firm had to buy a tract of forty acres in the heart of a populous residential district on the west side of Chicago, and there began to build the new plant of the

great merchandising business of the world. The most expert engineers and architects made the plans. The City Council of Chicago, after sessions of ninety-seven days on the various buildings should not be limited in size. The forty acres of land were transformed into a beautiful park, and in the midst of this the five enormous buildings were built for the carrying on of the business were erected. Seven thousand laborers, inventors, artisans, etc., worked on the job every day for more than a year. In all the buildings, which are of brick and terra-cotta construction, growing five acres of an aid light on every side, the following materials were used: in casements for foundations, sixty-five thousand cubic yards of concrete, in the superstructure, twenty-eight million bricks, twenty-five thousand barrels of lime, one hundred and thirty thousand barrels of cement, fifteen million feet of lumber, twelve million cubic feet of hundred thousand pounds of steel and iron. Yet the mere figures indicate very little as to the colossal size of the plant. Consider a moment: The average lumber producer in finished hardwood lumber net more than five thousand feet to the acre. To supply the fifteen million feet of lumber used as a small part of Sears, Roebuck & Co.'s building, thirty thousand acres of forest were had been—a tract as big as a town.

The merchandise building alone is almost a quarter of a mile long, a full city block in width, and nine stories high—equal in space to more than three hundred average city stores of forty by eight feet, with three stories of height. In this enormous storehouse there is kept constantly on hand goods worth more than an million of dollars, which are divided almost sixty-five different departments.

In the administrative building the president and executive officers of the company and the clerical force which

General View of the Plant, Printing, Administration, and Merchandise Building

receive the mail and dispatches the orders to the merchandise building have their headquarters. This is a fine, fireproof structure, almost fifty feet long, more than one hundred and forty feet wide, and four stories high. In the beautiful and splendidly appointed show window of twenty-five hundred square feet, they make the records and handle the correspondence involved in the great business. Here the orders for the goods are entered and the order tickets prepared for the various merchandise departments; here the merchandise is noted by the routing experts so that the customer will receive his merchandise as the shortest possible time and at the lowest possible transportation expense, and these orders, when noted and ready to be filled, are carried by an elaborate system of pneumatic tubes down through the tunnels and up to each department in the merchandise building. As each of these tubes will deliver twenty cartons per minute and there are dozens of these tubes, you may well imagine the rapidity with which this enormous volume of order tickets is despatched when it is noted that they handle as many as one hundred and five thousand in a single day of nine hours.

One of the striking features of this building is its wonderful arrangement of floors and offices, which are so laid out that the use of artificial light is seldom necessary at any hour of the day. In one room in this building occupying a floor space of ten thousand eight hundred square feet, five hundred and fifty genuine writing desks, and every corner of this vast office is illuminated by the use of electricity or gas. Architects have contemplated enthusiastically on the remarkable feature, inasmuch as it is believed to be the only office building of its size in construction so planned that daylight reaches every inch and corner within it. Those who have been compelled to work by artificial light will make here such the means to the thousands of pairs of eyes which pour the books and records of the business from day to day, how much more satisfactory it is to work by daylight than by artificial light.

In the index department—a large room filled with filing-cabinets—are the records containing the names of more than six million customers, with a complete record of their purchases and their names. In the order department, where from five to six hundred young women are daily employed in entering accurately the orders received from customers. They write up the order tickets for the tremendous quantities—often fifty thousand to one hundred thousand a day.

The Press-room with a Capacity of 7,000,000 Catalogues Per an Hour

More than ten million letters are written each week by means of two hundred

Cutting room of their Tailor Department

An Aide in the Department where they sell Everything for the Baby

young women experts in the stenographic department. Every letter received is answered within two hours. Most of the letters are first dictated by the writers upon graphophone cylinders. In the traffic department a corps of most competent and widely informed men make a constant study of the quickest and safest way to get the customer's goods to them. In the routing department the shortest, fastest, and cheapest routes possible are chosen for each shipment, so that the customer may receive his order in the shortest time and at the lowest expense for transportation. The space on this paper does not permit a description of the fifteen miles of pneumatic tubes used for shipping letters, orders, or papers from one building or department to another, part of the intricate network of tubes for parcels extending from every part of the merchandise building to the shipping department on the lowest floor. To see that accuracy is maintained through really simple machinery at work is to look on at the thing of things, and one wonders here it is possible to create order out of the whirling, spinning mass of activity. Yet everything is done accurately, though at the highest speed. And no part is the system of checking and inspecting that a mistake is the most thing in the world—practically never happens.

The government of the United States maintains a branch post-office in Sears, Roebuck & Co.'s establishment for their side use. There said is sent by special wagon mail twice a week to the main post office. By this division of the operations of time-shipping, packing, and examining the letters, and by the aid of machinery, the orders are handled in the rate of twelve thousand an hour. Thus they are examined in the manufacturing department to make sure that the manufacturer enclosed corresponds with the order; after which the goods are shipped. In one day's mail the firm has received customer orders accompanied by checks, drafts, currency, express and post-office money-orders, up to the amount of \$500,000—which would be a fine amount of business for the ordinary successful merchant during an entire year.

Their own Freight Sheds accommodating 40 Cars at a Time for outgoing Freight

Yet, after all the wonders of the establishment have been seen, the greatest interest centers in the Silent Salesman—the enormous catalogue issued twice a year by Sears, Roebuck & Co. Within the covers of this book one can find accurately described, pictured, and priced almost any article that he needs to use or wear or use. And since this catalogue is the silent selling agent of \$50,000,000 worth of goods in one year, it fully deserves the title of the world's greatest salesman. The book is eleven feet high, eight and a half inches wide, and two inches thick. It weighs nearly four pounds, and contains more than thirteen hundred pages, in which are contained practically all the material things that man can desire. Five and a half million of copies of this catalogue are issued annually. They are not scattered broadcast, but distributed systematically among customers and persons likely to become customers. It requires \$300,000 worth of print paper, \$250,000 worth of highly colored paper, and \$50,000 worth of ink.

To make the great catalogue and the special catalogues, as well as to do other printing for the business, a five-story building, ninety by two hundred and fifty feet, is used. Here twenty of the most modern printing presses are daily used. In the course of one year three million copies of white paper forty-and-a-half inches wide to wrap nearly ten times around the world. The mail can hardly guess these figures. For postage alone the firm pays the United States Government \$3,000,000 a year. To appreciate the marvels of the establishment one should see it.

## THE CENTRAL GROUP OF THE BELL TELEPHONE SYSTEM

THIRTY-FIVE years ago there was not a telephone within the boundaries of the state of Illinois, Indiana, Ohio, Michigan, and Wisconsin.

Today a single unit of the Bell system, known as the Central Group and embracing the Chicago, Central Trust, Wisconsin, Michigan State and Cleveland Telephone Companies, is devoting its energies to meeting the demand for telephone service in those five great states.

An instance of present-day development is found in the City of Chicago. The Chicago Telephone Company employs no solicitors nor does it make an active canvass for new business, other than through a rigid and exact system of advertising in the daily press.

Applications for service, however, pour in to the Commercial Department at the rate of 330 for every business day, the largest daily average of any telephone company in the world.

The Company's efficient organization enables it to handle this enormous business economically and expeditiously.

While the age of the telephone marks a span of thirty-five years, its most wonderful development has been attained within the last fifteen years, and its inevitable obsolescence, even as it now could not be born of a single telephone, the Central Group has met in 1911, directly and through connecting companies, 1,630,043 stations, equipped up by 2,253,000 calls daily, or 1,630,000,000 for the year, and, in addition, the long-distance calls, averaging daily 54,350, totaling for the year, in retail numbers, 1,900,000.

The figures, some of which can be approximated rather than comprehensively, serve to illustrate the magnitude and importance of the Bell's Central Group of companies in relation to the business and social life of the mid-western communities.

Some statistics touching the investment and human factors entering into the telephone equation presented by these connected companies will prove interesting.

The investment value of the associated properties in 1912, was \$104,000,000.

The value of land owned, as of same date, was \$1,200,000 and the value of buildings, \$175,000.

Of the 147 owned buildings, 130 are exchange; the balance being construction headquarters, warehouses, repair shops, station, etc.

In the exchange buildings, all of which are fireproof, the Bell system provides pleasant, healthful, and sanitary surroundings for its employees.

In 1911, the number of people employed in the five companies was 29,357, of whom 17,499 were women and 12,858 were men.

The expenditure of the Group for wages and salaries for the month ending June 30, 1912, amounted to more than \$7,000,000.

In Chicago, the Chicago Telephone Company has recently erected a new office and exchange building twenty stories high, at 22-23 1/2 1/2 1/2, located at Nos. 212-228 West Washington Street, which is practically completed and will be ready for occupancy in the early fall. As it will be located the executive offices of the Central Group Here, B. E. Soney, President of each of the five operating companies, formulate their business policies and, with the executive officers, exercise control and control over an area of 30,000 employees.

The organization is not unlike the military in its formation and operation. President Soney and his staff, directing the business conducted throughout the territory, constitute a body analogous to the General Staff. The General Managers, one for each of the five states, may be likened to Division Commanders, while District Managers, one for each of the five states, may be likened to Division Commanders, while District Managers serve to carry the same still further. And as it results down through the organization to the line and staff, all officers — "The men behind the gun" — all work to form a well-trilled and thoroughly equipped and trained unit moving with only one purpose in its battles against time and the elements. This business may move with military and discipline.

In addition to the conflicts incident to progressive commercial activity, the Central Group has had the storm-center of a

warfare, which has made it necessary for those charged with the responsibility of promoting the efficiency of the organization, while meeting the attacks of competitors, to face more complex and delicate problems than usually attend the Bell system.

It was in the Middle West that the independent telephone movement reached its highest stage of development. But while formidable at the outset, elements of weakness soon appeared which doomed it to its permissibility.

There was no central financing organization, with an established credit investment circuit, upon which to lean in times of stringency. Adequate provision for investments and shareholders had been overlooked.

A most serious flaw, also, was the refusal of independent operators to recognize the well-established principle, inherent in telephone practice, namely, the abnormal increase of rate relative to the increase in business the primary (1) to the increased use of the service which requires the employment of more operators and expensive extensions of equipment and facilities, (2) longer lines involving greater cost of maintenance, and (3) the accumulation of substantial returns per telephone as the exchange in completed networks to the more sparsely settled districts and on business at lower rates.

In the early days of independent operation there was no lack of capital. Men of affairs readily subscribed for the independent telephone securities on the proposition that Bell rates were too high and that Bell rates would be cut generally in half and still show handsome returns.

As a matter of fact Bell companies, outside of metropolitan centers, were making no money. The business was new and the demand for service so great and the charges in appearance so frequent and expensive that every dollar of earnings and much more besides had to be put back into the properties, and an opportunity financially less profitable than the Bell System could not have successfully met the demands made upon it.

The independent companies seemed unable to cope with the situation and the demand for funds to meet replacement and increased operating charges became acute that credit was strained to the breaking-point.

A further complication appeared at this juncture, when financial difficulties befallen large, namely, a country-wide demand for the abolition of dual currency. In many communities this was a complete reversal of public sentiment.

The most recent and noteworthy example of the change in public opinion to be found in the order of the Railroad and Warehouse Commission in Michigan authorizing the purchase of the Home Telephone Company of Detroit by the Michigan State Bell Telephone Company, which was in part:

"On the question of expediency, the Commission is likewise persuaded that the direct or complete sale of the various properties is in the furtherance of the public interest, as there is every reason to believe that such a disposition will result in improved facilities and better service by the exchange properties. In the City of Detroit, as in the country generally, no doubt, the development of telephone facilities has been much promoted and stimulated through healthful competition, but it is now generally understood that the greatest ultimate good cannot come either to the private interests or to the general public which use and support them, through their dependence upon a divided service. The telephone, from its very use as a natural monopoly; it will not, in its full efficiency, until within the limits of the territories themselves any one who has a telephone can converse with any one else who has a telephone. Hereafter reasonable rates and the extension of service have been produced if not wholly untrammelled by competition, but competition cannot develop the highest degree of telephone efficiency, machinery effective to insure adequate facilities and proper service at reasonable rates, beyond the extension of telephone facilities to economic waste and a limitation upon the fullest possible use."

As a result of the various circumstances of Wisconsin, New York and Ohio have made similar rulings where questions of competitive telephone operation were involved.

## Commercial Banking Service

Coincident with the marvelous growth of Chicago and the area of which it is the center, Chicago banks have grown to properly meet the demands of this great commercial territory.

## THE FIRST NATIONAL BANK OF CHICAGO

is now and since 1863 has been one of the great commercial banking units in the United States; and it has attained this place by the experiences of nearly fifty years, during which time it has kept pace with the development of Chicago.

An intimate knowledge of the demands of manufacturers, merchants and other business men has been gained by the official organization of THE FIRST NATIONAL BANK, and in that knowledge lies the value of a connection with this institution—the ability to serve that is appreciated by financial and commercial interests from coast to coast.

Correspondence is invited relative to the facilities offered and the accommodations extended by this old, strong and conservative banking institution.

**The North-and-South Railroad and the Panama Canal**

One of the troubled waters of doubt and conjecture as to what is going to be the effect on railway earnings of the opening of the Panama Canal one fact gives us—the presence of a rocky headland—namely, that whatever else may happen, there is bound to be a strong drift of traffic down the Mississippi Valley to the Gulf of Mexico. How much business the Western transportation companies are to lose is a good deal of a question. So is the amount that the Eastern trunk lines are going to gain. But about the fact that the opening of the waterway is going to mean a great deal both North and South roads which get down to the Gulf there is no question. Making the best allowance for the not unseasonal outflow of those leaving the Gulf ports and making allowances at least, it is nevertheless plain that when the Canal is opened, a lot of additional business is going to be routed down that way. New Orleans is not less than 1,000 miles from Panama; Galveston less than 1,200. Why freight originating in the Middle West and headed for the Canal should get via these ports instead of being dragged all the way to the Atlantic seaboard and sent around from there, has evolved into a question of fact. It will be a good thing for the north-and-south roads—there is no doubt about that, if the manufacturing territory around Chicago and to the south there requires a tremendous amount of tonnage which now flows east, but which, when the Canal trade is open in operation, will naturally seek the nearer outlet to the Gulf. Then, in addition, there will be all the Canal-bound business coming over the trunk lines from both directions into the surrounding yards at Chicago and St. Louis and Kansas City and what, when shipped southward. No wonder that the log railroads has its representatives in the southern ports, watching, calculating, preparing for greater facilities. No wonder that by those who have looked a little into the matter, the various prospects of the roads are in line to get the benefit of all this additional business now posted in remote bars.

There is hardly a north-and-south road running down through the middle of the country that will not be benefited, but the location of certain properties, especially favors them that they challenge particular attention. Of these the most important are Illinois Central, Missouri Pacific, Texas, Kansas City Southern, Louisville & Nashville, Chicago, Rock Island & Pacific, and St. Louis & San Francisco.

When a north-and-south route from the Lakes to the Gulf is opened, of the first of the properties mentioned, Illinois Central, comes naturally into most people's minds. Double-tracked practically throughout, the road is in possession of facilities which few, if any, of its competitors can rival. A water grade line and the shortest route to the Gulf are on the north and New Orleans on the south, Illinois Central is particularly in a position to bid for Middle-Western business southward.

A combination, both of time, and of funds which cut down from earnings, and strikes which brought about a year or two of operating expenses, resulted in Illinois Central's being temporarily pushed out of the show of roads that are in position over their divided requirements, but no one believes that that will be for long. To have the road, for its first year opened but since that date it has been in the amount needed to pay the dividend, divided was unpleasant, but in view of the road's great record earnings, not particularly disquieting. Everybody knows that as a result of the floods and the stoppage of the Illinois Central has, for the time being, been "up against it" and that the property is a wonderful one and that the road is a wonderful one, not only a successful one, but one that is generally paid. A good many incidents, indeed, are coming to pass that by trades partly temporary the property has been put in a position where its progress in the opening of the Canal will be even more striking.

Very much the same thing is true of Missouri, Kansas & Texas, which has lost very considerable tonnage mileage. By the floods the "Katy" was hard hit—so much so that during its last fiscal year the road showed a deficit, after payment of the dividend on the preferred, of over half a million dollars. How that deficit about will be made is seen when it is considered that year transportation and traffic receipts were forty-five per cent. of gross earnings. Cost of conducting transportation alone was up forty-one per cent. The road was able to pay its first year bill three per cent more

than the average for the past five years. Operating under such circumstances, it is no wonder that nothing was earned on the road.

Missouri, Kansas & Texas has not back of it the same accumulated resources as Illinois Central and, therefore, you will not be surprised to find that it is in a position to assume that it will be a good while before it is able to pay its dividend on the equity. And since the end of the last fiscal year, the road has been rapid, not excepting for the few months showing an increase of no less than 100 per cent. Operating under normal conditions and getting the benefit of this season's big corn and cotton crops, "Katy" should show a substantial profit percentage earned on the common this year. Indeed, it is, a year or two from now, when the road is getting the benefit of the north-and-south traffic which will be developed by the opening of the Canal, earnings should be on such a scale as to warrant the commencement of dividends. At the same time, it would be anything but surprising to those who realize the road's capabilities for doing that.

Kansas City Southern, whose main line practically parallels that of the "Katy," has so much business in its territory in traffic which after the Canal is opened will be southbound, but, in effect that, has a situation—namely, that its management with Union Pacific which assumes it of a very large amount of through business. In its line made a full outlet for traffic originating in the West and east and west, indeed, has Kansas City Southern's principal flow of profit from the putting into operation of the Texas and the Gulf, Union Pacific and one or two of the other big roads that get into Kansas City desire to use Pacific and for some time to the terminal on the Gulf, the amount of business going over Kansas City Southern would result in earnings, assuming the stock's being put on a dividend basis in short order.

Further over to the east, Louisville & Nashville is in line dropping straight down from Cincinnati and Louisville to the main ports on the Gulf, and has located that it will not only get the benefit of the new business in that territory. As against this lack of competition from other southern roads, there must, however, be considered the fact that, the further east, the loss will be the southward drift of traffic induced by the opening of the Canal. In addition, it must be borne in mind, have very greatly superior facilities, and the big Eastern trunk roads will naturally make every effort to get Canal-bound business originating along their lines, to flow east into the south. And for some time to come, at least so far as the territory east of Chicago is concerned, they are apt to be partly successful. For the same development of the Gulf ports will tend to counteract the outflow, but in the mean time, in the territory in which the Louisville & Nashville system, the amount of new Canal-bound business developed will be a good deal less than in the territory lying a little farther west.

Rock Island is not generally thought of as a north-and-south road, but does get a considerable amount of business to Fort Worth, Texas, and from there, over the Trinity & Brazos Valley (control of which is held jointly with Colorado & Southern) into Galveston. The fact, however, that Rock Island's lines extend so widely in the east and west will enable it to be routed over its Gulf connection, Rock Island, however, is such a big system that additional business considerable as it will be, is hardly likely to make much of a difference in the total of earnings.

St. Louis & San Francisco is similarly benefited both with regard to its north-and-south line and its ability to gather an local traffic, and with the increased difference that its connection with the Gulf ports is made over a piece of line owned by another system, the added and purpose this connecting link, the Houston & Texas Central, is part of the Texas and the Gulf, the system that it is owned by some one else and that continuity of the north-and-south line is thus broken.

Of the new business St. Louis & San Francisco will get its share, but as in the case with the Rock Island, the system is so big that the additional tonnage, not, probably, greatly influence the total. In the long run, however, the general development of the territory represented in the Trinity Valley is expected to follow the opening of the Canal might greatly to help the road's earnings.

# 6% AND SAFETY

With the cost of living constantly rising, and the purchasing power of the dollar constantly diminishing, conservative investors are demanding a better income yield on their securities than in past years. This demand seems to have crystallized about 5% to 6% per cent, yet investors are unwilling to sacrifice safety in the slightest degree to obtain this attractive income.

To meet this widespread and increasing demand, we offer First Mortgage Bonds, secured by the highest class of improved, income-bearing, centrally-located Chicago real estate, in denominations of \$100, \$1,000, and \$5,000. We purchase these bonds under contract and offer them direct to investors. Taxes are guaranteed. The value of the security, in every case, is at least double that of the bond issue.

The safety of these securities is best attested by the fact that no investor has ever lost a dollar of principal or interest on any bond or mortgage purchased of us in the entire history of this office, covering thirty years. These securities are readily convertible into cash.

Write for Circular No. 1008, and for The Investor's Magazine, which we publish twice a month.

## Tyrian Purple

The announcement of the purple pigment which the ancients prized so highly that it was actually sold for its weight in gold, and is said to have been the basis of the commercial purple of Tyre and Sidon, has been long in the air. It was known to have been derived from certain marine gastropods or "snails." Professor Raphael Thoms, the physiological chemist of the University of Leipzig, Germany, has succeeded recently in reproducing this pigment.

The purple is derived from snails of two genera, *purpura* and *marginata*, the latter a breeding porcellan nautilus called the rock-snell. The purple of the former genus was *Purpura fucina*, while of the *Margia* there are two species available, *Ancasteria* and *Helix*. These species yielded coloring matter of three distinct shades. The *Ancasteria* gave the most brilliant pigment, which corresponds probably to that produced at Tyre. The species *marginata* furnished a methyl purple, which was actively prepared at Vienna. The pigment from the *Helix* is of a deep violet, more red than blue, having a shade intermediate between the other two.

It is not at all improbable that the dyers of olden times mixed coloring matter from the purple of Tyre with that from the echinoid shell, even in large proportions. This seems to have been a common practice in Tyre, and there are still the remains of an ancient Roman dyeing establishment, but whose are traces of the shells of these snails to be found.

In the cavity enclosed by the "muscle" of the snail there is found, in addition to the shell and other organs, a small whitish gland which secretes a colorless fluid. Under certain conditions this fluid acquires a pink or violet tint, and this was the original procedure for the dye, and is the secretion Professor Dabene finds an insoluble ferment or "enzyme," which he calls *purpurase*. The ferment is present in all three species, and is identical in all. Dissolved in the secretion there is a substance which is called *tyrian*. This is different in each species, and is acted upon by the ferment in such a way that the purple results. The *tyrian* is present in all three species, and is identical in all. Dissolved in the secretion there is a substance which is called *tyrian*. This is different in each species, and is acted upon by the ferment in such a way that the purple results. The *tyrian* is present in all three species, and is identical in all. Dissolved in the secretion there is a substance which is called *tyrian*. This is different in each species, and is acted upon by the ferment in such a way that the purple results.

The method of dyeing followed by the ancients has not only been followed, but the researches of Professor Dabene make it clear. According to Florio the Romans were dipped in a juice made of green grass, and the light and air did the rest. It is also known that the ancients placed the glands of the animal, as soon as removed, into salt or lime. We can see here that this not only prevented the putrefaction of the previous material, but also retarded the action of the *tyrian* and inhibited the fermentation of the purpurase, since the salt or lime rapidly removes the water in the glands, thus removing the material from the drying salt or lime, the dyes added water, and immediately the ferment is set free to act upon the purpurase, producing the yellow or greenish liquid. The boiling of the glands in a juice made of green grass, and the orange seen was then obtained off. After washing the cloth to be dyed in lime, the dye is placed in a bath of light, and the change is made from purple to purple resulted. It was then necessary to remove the glands, and the cloth was again boiled. As it is impossible to extract this substance entirely, the purple tints of the dyed material obtained would give off the characteristic odor whenever it was moistened by the rain.

It is very likely that the dye of commerce which the ancients powdered and used was not "purple" in color, but of a yellow or green tint, and that it was kept always in the dark. It is impossible to dye the purple as a dye, since it is quite insoluble.

**The Arsenic that We Eat**  
It is known that arsenic exists naturally in the tissue of many of the plants of our food chain. It is a constituent of peas, almonds, and lentils. Fresh lettuce, especially the variety called "iceberg," contains arsenic, and beans, peaches, walnuts, etc. The foodstuffs richest in arsenic are the banana, wheat, and lentils.

# ASSETS REALIZATION COMPANY

ALTHOUGH organized primarily for the purchase of estates in liquidation, the Assets Realization Company has of recent years confined its operations largely to the financing of established enterprises which are handicapped by inadequate capital.

In this particular field the Company stands virtually alone. It possesses a large, efficient and highly specialized organization, which is capable, on short notice, of making extended and detailed investigation of properties located in any part of the United States, and has, in exceptional cases, gone beyond the confines of this country, although it is contrary to its general policy to do so.

In cases in which the investigation discloses indubitable underlying security and well-established earning power, the Company is prepared to fund outstanding obligations and provide working capital through the purchase of bonds or notes of relatively short maturity. Such financing is undertaken with the intention that it shall place the enterprise in a position to make its permanent financial arrangements on a sound and economical basis. Special attention is always given to the character of the operations of the contracting company, and its ability to meet its new obligations at maturity. With this end in view, a statistical department is maintained for the specific purpose of keeping in constant touch with the affairs of the borrowing company until the new indebtedness has been retired.

While the Assets Realization Company purchases securities primarily for the investment of its own capital and surplus, which now exceed \$11,000,000.00, it has a large and steadily growing clientele which finds such securities particularly desirable for funds which require certainty of payment at maturity, combined with an attractive rate of yield.

The Assets Realization Company was established in 1886 to acquire the liquidation business established by Messrs. Ira M. Cobe and John W. McKinnon, whose partnership relations began twenty years ago. Messrs. Cobe and McKinnon still retaining their connection with the Company, as managing officers of the Chicago and New York offices, respectively. The activities of the Philadelphia office are directed by Mr. George E. Shaw, president of the Company.

### TROY LAUNDRY MACHINERY CO., LTD.

Five more than a generation Troy has been known as the greatest producer of shirts, collars, and cuffs in the world. The various brands it manufactures and their makers have become almost household words and its reputation first has spread to throughout the city a unique reputation.

Troy's laundries have kept pace with its factories and it has only been in recent years that the phenomenal development of the power laundry has robbed it of its other title—"The world's greatest laundry city." For years the critical factor was accustomed to send his linen hundreds of miles to secure the care and skilled attention for which Troy was famed, and today the same is a by-word for quality in laundry circles.

Efficient as their machines were at that early day, compared with the crude and primitive appliances in general use, a number of Troy's progressive businessmen realized that as another quality was required did they meet the standards they had set themselves as the demands of their rapidly developing business. They formed a partnership in 1879 for the manufacture of laundry machinery, under the name of the Troy Laundry Machinery Co., which became the present corporation three years later, in 1882.

The pioneer in the building of laundry machinery, the Troy Laundry Machinery Co., Ltd., has grown consistently along the same line that marked its establishment. Its founders were practical, successful businessmen, thoroughly familiar with the needs and problems of the laundries. The machines they built were the outgrowth of their practical experience and not the result of actual service in their own plants, for they were originally designed before they were offered to the trade at large.

The company has remained true to its traditions in all stages of its growth, and never more so in its last ten years when its output has increased tenfold. No Troy machine goes into a laundress's plant until it has passed through months of taxing tests. No ordinary efficiency control is sufficient. Because a machine does good work and is thoroughly satisfactory to its purchasers has been its reason, why the quality of that work should not be bettered if possible. It is a revolution in painstaking thoroughness to follow a Troy machine through the various stages of construction but a greater one to watch the later changes that make it even more efficient, prompted by the results kept in its records. It is the founders of the company had little use for theory and their successors held the same view.

One of the most interesting exhibits in the country's showrooms is the representation of the growth of one of its mighty twentieth-century leaders of its two plants: that in which its business life began and the present factory, whose several floors have twice the space of the original plant, and this representation of material growth is but an index of the increase in the number of machines manufactured and the improvements in their quality. This is no disparagement of their quality of the earlier days. The machine built in the last twenty years may as well be the "Best Water" attainable, and the machine "Best Construction" that has been the company's watchword was equally manifest.

At an early date it was found desirable to locate a plant as close as possible to the convenience of distribution and as near to the source of supplies. More and more business was done at Chicago until the Troy factory was finally moved. Although the growth of the business had been gradual, the development within the last ten years has been notable. Buildings have been erected to care for the larger volume of business, only the most modern used and renovated the building of additions as great as the original structure.

In 1902 the first part of the present building was completed. It was believed to be large enough to meet any increase that might be expected with its four acres of floor space. Hardly was the company located in its new home when it was discovered that more room was needed. Plans

doubled the plant's capacity. This at the market was completed in the fall of 1911. The factory now occupies the entire block bounded by South LaSalle Street, West Twenty-third Street, the Rock Island tracks, and West Twenty-second Street, and contains ten acres of floor space. When another addition will be needed is only a matter of time. It will be needed as certainly as its predecessors.

The factory has been regarded as a model in its equipment, organization, and administration, and as such has been studied by trained observers of industrial conditions. That these contribute to the quality of the product is self-evident. No more gratifying tribute to this has been paid the company than this letter from one of the best-known authority critics of industrial problems, after a comparison with others in his line: "As I think of your plant in comparison with other manufacturing similar lines of goods I am impressed with the fact that the high quality claimed as your advertising is discernible in your factory. The work appears to be high-class machinery and they seem to be working for quality instead of quantity. You could not 'spend' your money so that they would turn out their present output, but, of course, the quality would be reduced. I am rather surprised that you find a profit on so much painstaking work on the various articles which you are manufacturing. It should assume that your competitors usually manufacture more cheaply than you and that their reliance is placed on the fact that your customers want the best, even if it cannot be had so cheaply."

Despite its amazing growth in its recent years the laundry industry is still in its infancy and its greatest development is yet to come. The Laundrymen's National Association by its patriotic campaign has directed the attention of the public as never before to the merits and advantages of the power laundry. This is leading to a larger patronage, and a patronage covering a much wider range of items. More people are patronizing the commercial laundry than ever before, more, too, are sending more work to the laundry, and many a household is recognizing its superiority over the unwholesome unsanitary methods.

The laundry's largest development will not be in the commercial line, but the institutional one—hotels, asylums, and the like. The increasing care shown the unfortunate and the generally assumed is not confined to the broad scale institutions. The homes set apart for them in smaller territorial divisions, the county asylums, or penitentiaries, are being equipped with modern laundry equipment, able from charitable and economical motives.

Of later years the development is more pronounced than that of the institutions is the modern hotel. The great city and resort hotels have many of them different plants. The modern hotel plant makes provision for the laundry, and the laundryman is no longer a stranger to the laundry-machinery builder for the practical use his experience has given him.

The industry and just as the Troy Laundry Machinery Co., Ltd., has continued in point of the path to more and better business. It has deemed it its duty to discover new avenues of profit for the laundress and the means of entering them rather than to avoid the laundress demands of the latter.

Troy plants and machines are to be found today not merely in every American town but in every European country and every continent. Through its publications, printed in three languages, it has made its name known Spanish—the *Hojar* of Troy visits each month every known plant in the world, bringing the latest news of the state and a message of practical helpfulness. Its representatives are to be found in the world's great commercial centers, giving in the trade what prompt, intelligent, and complete service that is the company's pride.

And its growth has been rapid, for it has been the twelve years since Mr. H. R. Wilson, for thirty years in the service of the company, came to Chicago as its treasurer

## One of Edison's really great benefactions —the invention of the Mimeograph Duplicator —today an office necessity

THE history of the world is divided into many epochs. Each has done its share towards developing the world as it is today. The present is the commercial age—the age that stands for progress.

It is, therefore, also the inventive or creative age. Man combines the elements and creates new things that will do the bidding of his genius. He conserves his powers for greater fields in the march of progress.

When business developed requiring duplications of writings in exact facsimile, a way was found to do it perfectly. A stencil process was invented by Edison—the greatest of all business benefactors. This came into exclusive the Mimeograph, and which time has proven is one of his really great benefactions. The Mimeograph has become such an office necessity that today it is being used in all lines of business the world over.

Through its adaptability it has been a great factor in business progress, and who can say the world is not better for it? Its uses are innumerable, extending from the simplest notice or office form to the personally directed circular letter that builds up vast fortunes. It is both a great office aid and a business builder. Its special advantages are, convenience, quickness, quality of work, any office help can operate it, work done in privacy much cheaper than the printer, etc.

Put your name and address and business on a card, add the word "Mimeograph" and we will send you free the advantages they include that you will find very interesting and instructive on the subject.

## GAGE MILLINERY

GAGE BROTHERS & CO. CHICAGO

GAGE BROTHERS & CO. have, since 1856, conducted continuously in Chicago a millinery business, which has grown until, at the present time, in addition to our twelve-story building in Chicago, and our New York headquarters, we occupy two factories which manufacture "Gage" products exclusively.

Our designers and foreign buyers are in constant touch with the world's Fashion centers, with the result the Gage Hat is recognized by the trade as authoritative in style. We also manufacture Gage untrimmed shapes and popular priced hats for street and informal wear.

## Elgin National Watch Company's Factories

ELGIN, ILL.

The Elgin National Watch Company was incorporated in the State of Illinois, in 1864, and began making watch movements in the Spring of 1867, producing two thousand during their first year. Their total output during forty-five years has exceeded seventeen million watch movements.

Prior to the establishing of watch-making as an industry in the United States, all watches were made in Europe. They were made by hand; the output was necessarily limited, and prices were very high. The Elgin National Watch Company was one of the first institutions to adopt the distinctively American principle of watch-making—that is, the production, with automatic machines, of large numbers of duplicate parts, which are assembled, timed, and adjusted by skillful watchmakers. Necessarily, their equipment in those early years was crude as compared with that of today, but even with the tools they then possessed they were able to produce good watches, and ready found a market for them. Each succeeding year has added improvements to their machinery and appliances, with consequent reduction in cost of goods.

The Elgin National Watch factory produces three thousand watches daily. In addition to physical and chemical laboratories for testing materials, it owns and operates an observatory for taking and recording time, which is the most completely equipped institution of its kind in America.

To illustrate the reduction in cost brought about by the Elgin Method of manufacture, the B. W. Raymond, a trade-marked watch made in 1867, cost the consumer at that time in the neighborhood of \$60.00. The B. W. Raymond movement made today costs the consumer \$27.00, and is immeasurably superior in quality to its predecessor of that early day.

### National Bird Reservations

Wise birds, like wild men, enjoy a special system of protection. The bird reserves set apart in the United States and her dependencies for breeding and shelter during migrations number fifty-six and with few exceptions are either small rocky islands or tracts of marsh land. These protected areas vary greatly in extent and most have yet to be surveyed. Among the smaller reservations are Green Bay, Wisconsin, which contains two acres; Pelican Island, Florida, with one thousand acres; and Mingo Lake, Florida, of about twenty-seven. On the other hand, the Osprey Reservation, Nebraska, covers between five thousand and twelve thousand acres; Klamath Lake and Malheur Lake reservations in Oregon each comprise big strips of marsh lands; the Yukon Delta Reservation in Alaska takes in the tundra between the mouths of the Yukon and Kuskokwim rivers; and the Hawaiian Islands Reservation includes the islands in mid-Pacific over five degrees of latitude and twenty degrees of longitude. All birds on these reservations are protected by State game laws and by special act of Congress.

In the Gulf preservation district, which includes the reservation in Florida in Louisiana, and one in Porto Rico, the principal protected birds are brown pelicans, roseate spoonbills and white ibis. At Pelican Island the only species which breeds in the brown pelican, and as the various birds are listed about this coast are chiefly water birds. Herons of several species frequent Mosquito Lake and other marshes on the coast of Florida; Florida, at Passaic Key, Brown Island, and East Tanager are to be found laughing gulls and terns of different sorts where also nest about this coast and that of Louisiana are breeding colonies of brown pelicans, while the Hawaiian Islands Reservation affords a haven of refuge to ducks which winter in the delta of the Mississippi river.

Call ducks and white pelicans are the most frequent divers in the Lake district, which comprises two reservations in Michigan, two in North Dakota, and one in Wisconsin. The two in Michigan contain the largest known breeding colonies of the breeding pair of bald eagles, and the reservation at the mouth of Groves Bay, Wisconsin, has as well a breeding colony of these birds. The reservation in North Dakota, which is frequented by breeding grounds of several species of ducks. At Lake Lake are considerable numbers of white pelicans and ring-billed gulls.

With the exception of Nickerson Reservation, Nebraska, noted as a knowledge-ground for sharp-tailed grouse and prairie-chickens, and that at Lock Kazine, Wisconsin, reservations in the mountain district are located on Reservations. Some are reservoirs and chiefly valuable as refuges for waterfowl and shore birds during spring and fall migrations. Other group contains twelve reservations in the Rocky Mountain States, North Dakota, and Nebraska. Reservations in the Pacific division include three in California, four in Oregon, and eight in Washington.

### The Length of the Day

SCIENTISTS have indulged in some interesting speculations as to the possible increase in the length of our day.

It is pointed out that when more of the earth has settled in motion about an axis, no matter how the motion came about, it must, of course, continue forever and of the same rate, thus making the day always of the same length unless something is happening or will happen to interfere with that motion. Now there are several causes in operation that of level the period of the earth's rotation, some of which tend to make the period longer and others to make it greater. The influence of each of the causes is, of course, very small. They are generally easy to understand. A very simple experiment illustrates one of them.

A stone is attached to one end of a string which is held in the other end of which is whirled around a circle. When its speed has become constant, the string is allowed to wind up on the finger. It is noticed that as the string absorbs the velocity increases and the stone begins to wobble, forming the earth should in any manner drawn nearer the axis of rotation, it would move faster and the day would be shortened.

If rotational loss of heat a shrinkage of the earth is probably in progress, and although the process is exceedingly slow, it certainly tends to diminish the period of rotation. In the other hand, more loss of matter from the outside will

increase that period and make day longer. There seems to be no doubt that the day will continue to grow longer, but the question is whether the effect of matter being passing

through the atmosphere. Their influence is supposed to act in such a manner that of any earth shrinkage that may be taking place.

The most important interference with the rotation of the earth of which we have knowledge is that of the tidal waves, which are due to the attraction of the sun and moon. The more highly of the latter. It is easy to see that this is a resistance against which the earth turns, and its effect is to increase the length of the day.

Astronomical observations extending over a period of two thousand years have failed to show any such change in the day, but the influence of the tide-mass became evident after the lapse of a great many months. The authority has declared that the day may lengthen until it is at least fifty-five times as long as it is at present, and that would also be the period of the revolution of the moon about the earth. A day of thirteen hundred and twenty hours is not, however, likely to come for some millions of years.

### The Mole at Work

THE mole at work presents an interesting sight. His nose sticks into the soil as he pushes forward, and he is in a twinkling half the creature's head is buried from the surface. The mole's body is a foot sliding close along the side of his nose. The fact, which is a kind of burrowing motion, is so rapid that he is still in the soil if he is as far forward as his front teeth will permit, then with a sharp motion he pulls his head and shoulders from his hole as he makes an opening. Very quickly the left foot performs the same operation on the other side, and meanwhile the point-pointed nose has continued to bore.

In a few seconds his body is entirely cast behind and the entire tunnel is visible. In three minutes, it is said, a mole will tunnel for a distance of a mile, and he is the best lawyer to go about his business.

A naturalist once conceived the notion of ascertaining the amount of work a mole could accomplish in a given time. Accordingly the experimenter turned a large apparatus into the middle of a large field, and after the mole had after this mole received its freedom, it had burrowed out of sight, and the observer, with his assistants, dug a shaft of the astonishingly refined and built the little digger had at work.

The start was made at eleven in the morning, and the direction taken was to the east. By six o'clock in the evening this mole is said to have dug some twenty-three feet in an irregular course, keeping, however, in the same general direction and not attempting any side paths. The first hole was five feet deep, and the tunnel had been driven thirty-one feet farther, with a number of side galleries, when the mole had been seen to emerge, promptly making fifty-eight feet of the main line and thirty-six and one-half feet of branches, at a total of fifty feet of tunnels dug in twenty-five hours.

The bottom of the tunnels was very rough, about four inches below the surface. At several points the mole was obliged to dig, measuring one and one-half inches in width by two inches in height, and sometimes it was necessary, measuring two inches each way. The surface of the ground was usually craked and raised about an inch along the course of the tunnel.

### Cholera and Tobacco

FOR a long time it has been held that cholera virus is conveyed by means of mephitic substances, especially cadaver. Dr. W. K. Pfeiffer, of the Imperial Institute, Berlin, has found that the mephitic substances in water containing suspensions of cholera in water containing 1,000,000 cholera bacilli per cubic centimeter the microbes were destroyed in a course of twenty-four hours. The same doctor has proved that tobacco smoke rapidly kills the cholera germ. In a laboratory experiment he found that the number of cholera was found among the smokers during the last great epidemic, though they were not affected, most affected by the plague.

### Birds and Cyclones

It has been suggested that birds habitually make use of cyclones in traveling from one part of their range to another. It is pointed out that if a bird cannot find shelter it is forced to seek the most comfortable of the wing than on the ground during a storm, because in the former case it has to be blown about like a swimmer in a strong current.

## THE DRAGOMAN

By George K. Stiles

PREDICTIONS are always hazardous, but the publishers of "The Dragoman" believe that this book has in it qualities which will make it one of the most talked of and successful novels of the new year.

The heroine is an American girl. The hero is a young Englishman. The scene is Egypt—not the Egypt of hotels and tourists, but the grim hinterland of the upper Nile, where few white men ever venture. The East and its mystery, the inner workings of international diplomacy, the mighty power of Mohammedanism, are all elements which make the story one of extraordinary and fascinating interest.

## CONGRESS HOTEL COMPANY

N. M. KAUFMAN, President

# Kohl Castle Company

HERE are innumerable units in the theatrical business of the United States, some of them relatively small and unimportant, and others imposing and influential. Each metropolitan city has its predominant theatrical interest, and probably no one familiar with conditions would deny that the Kohl Castle Company is the ranking theatrical influence in the lively, and by no means shrinking, city of Chicago. Length of service, extent and success of operation, and scope of financial and theatrical business might be considered as a test of relative importance, yet comparisons are odious, and need not be carried to the extreme of irritation. It is enough to say, on the theme of precedence, that the Kohl Castle firm has been fundarily known in

Chicago for a quarter of a century, and now, passing toward the second generation in ownership, has broadened out in scope until it is the dominant influence in the theatrical affairs of Chicago, managing standard dramatic houses, the leading vaudeville houses, popular price theaters, and booking innumerable other theaters in Chicago and elsewhere through the big agency belonging to the firm, and called the Western Vaudeville Managers' Association. The principal theaters in Chicago owned by this interest are the Majestic and the Palace, great and beautiful vaudeville houses, the Chicago Opera House, the Olympic, and the Academy. Outside of Chicago the Company is interested in dozens of theaters, and is closely allied with the big Cuyahoga Circuit and the United Booking Offices of America. The late and deeply lamented Charles E. Kohl was the principal architect of this great business, the preeminent influence of which is now exerted with brilliant ability by his widow, Caroline E. Kohl, and his eldest son and namesake, Charles E. Kohl. The other big capitalists and operators active in the management are Martin Beck, George Castle, Morris Meyerfeld, and Max Anderson, all of them conspicuous figures in the most important theatrical combinations.

## Progressive Methods Are Back of Byllesby Securities

**T**HE bonds and stock of public utility companies operated by H. M. Byllesby & Company rest upon a great deal more than modern, well-maintained physical properties.

They are sponsored by an engineering-managing organization of seasoned ability, constantly advancing in the front rank of progressive utility operation—an organization imbued with high commercial ideals and the determined spirit of constructive accomplishment.

The motto of the Byllesby operating companies is "To serve." They are conducted in harmony with enlightened commercial standards and the public sentiment of the communities they are helping to build up.

The largest holding company of the Byllesby interests is the Standard Gas and Electric Company. Its bonds are listed on the New York Stock Exchange.

## The World Before Your Eyes

**T**HE motion picture is, by far, the most tremendous and vital influence in the amusement and culture of our present day. The motion picture brings the world to you. It delivers the universe to your theater seat. The motion picture is not a makeshift for the playhouse—its dignity and importance is far greater. It is good, wholesome, clean entertainment, lecture and amusement all rolled in one. In its highest effort it stands above literature and ranks far above the puny functions of the tawdry show-house.

## Selig's De Luxe Motion Pictures

represent the highest possible achievement in the art of cinematography. The Selig Polyscope Company is recognized as the world's largest and foremost producer of motion pictures. Perfect production facilities, original and unique scenarios by the world's best authors, expert technical and camera men, competent producers, popular players, selected properties and settings, strict censorship and close attention to detail—these are the things that have made the name of Selig famous throughout the entire world. If you want to see all that is cleanest and best in motion pictures attend the theater that exhibits Selig Films.

## A WEDDING OF NATIONAL INTEREST

The marriage of Miss Helen Gould to Mr. Finley J. Shepard, Eastern representative of the Missouri Pacific Railroad, which took place at Lyndhurst, New York, the bride's country home, last week, was an event of national interest. Miss Gould's life of modest philanthropic activity had endeared her to all classes, especially to the men of the military and naval services, who presented her with gold and silver loving cups. Over the head of the Beverly pool were feasted in celebration of the occasion. This photograph of the bride and bridegroom was taken immediately after the ceremony.

## COMMENT

## The Pulp Inquiry Focus

The Pulp investigation has come to an end for the time being and probably for this session. Mr. ESTERMAN will now write a report, and the committee will pass it on to the House and to the people.

There has been a good deal of jangling for and against this inquiry. To our mind it has been a good thing. Whether anything practicable in the way of remedial legislation will be evolved is a question yet to be determined; possibly the report will afford an answer.

But the testimony has been enlightening and helpful. It has contributed to that better acquaintance of which the country stands in need. Folks know a great deal more than they knew before about the theory upon which our great financiers act and do business. They may or may not approve it, but at any rate they have actual information instead of mere speculation to base judgment upon.

That is all to the good. Two facts are certain. Nobody can help admiring and appreciating the candor and spirit manifested, especially by Mr. MERRY and Mr. DUNBAR. And no fair-minded man can complain of the way Mr. ESTERMAN has conducted the investigation. He has been firm and impartial, as he had to be, to get results, but he has been courteous, thorough and commendably patient under unmerited criticism.

Now let us have his report and get down to business, and see if some way cannot be devised to fetch our antiquated banking and currency system up to date.

## Knox and Taft for the Defense

Secretary Knox is a good lawyer. It is also very probably true that in preparing his answer to Sir EUGENE GARY about the Panama Canal toll he took counsel with another eminent lawyer, but the President. At any rate, the answer, considered merely as an argument for the American side, as a defense of the position America now occupies, is a strong and able one. Even that point of view there is no cause to be admitted of, or to feel that the Secretary has not held his own as a diplomatic negotiator. It is excellent in form, and it is a safe guess that the line of defense taken will strike many of us as one we had not thought of at all.

A paragraph can do no more than indicate how the Secretary applies it to the main point in controversy, which is, of course, whether or not the exemption of our coastwise trade from paying tolls constitutes an infringement of Great Britain's rights under the 1845-46 Victoria treaty.

In answering Sir EUGENE's claim that it does, Mr. KNOX does not attempt any interpretation of the treaty at all. He simply takes up the two specific complaints of Sir EUGENE and replies to them. The first is that certain regulations would not prevent our toll-free coastwise vessels from entering in what would really be foreign waters, since foreign cargoes might be landed on one side of the continent and then shipped in exempt vessels to the other side. But that, says

the Secretary, is merely a supposition as to what may happen, and we cannot arbitrate a supposition. And we do look, as to the other complaint, which is in substance that the exemption will prove inoperative to British and other foreign vessels, since it will throw upon them more than a fair share of the upkeep of the canal. Not only says Mr. KNOX, is this a mere conjecture, but it is a conjecture right in the face of the facts up to date. For the President's proclamation, which actually fixing the tolls, and they are fixed on a basis which includes our estimated coastwise trade. In other words, they are just what they would be for all other trade if there were an exemption at all; the burden of the exemption falls, therefore, on the United States alone; it is merely a subsidy, such as any nation has the right to grant.

So the Secretary argues that there is as yet no occasion to arbitrate anything. Great Britain, of course, has the right to question and investigate his statement of the facts, and if she decides to contest it, then a commission of inquiry might be in order, and for that this country is willing to make provision.

It is one clever line to take—probably the strongest line open to our official advocates in this matter. That is not saying, however, that we think Sir EUGENE GARY will be unable to find a rejoinder. Neither is it saying that the controversy will probably be adjusted in the way the Secretary proposes and to match his exposition. Mr. KNOX gives Sir EUGENE some new information about the tolls, and that it is another step from Sir EUGENE, and he that this it will be so close to March 31st that the next step in discussion will doubtless be left to Mr. KNOX's answer.

Unless, meanwhile, Congress cuts in and settles this troublesome matter by an amendment to the canal bill which will dispose of the question based on the treaty. And that, we hope, Congress in its wisdom may see its way to do, especially since the country seems very mildly interested in the resolution of the tolls on our coastwise ships, and since a great many very decent people are very much convinced that we shall respect our treaty obligations to the letter at whatever cost to ourselves, which in this case would be nothing.

## Inaugural Ceremonies

The responsibility for the elaboration of the ball from the inaugural ceremonies is Governor WYOMING's, however.

It is, also, it is a responsibility which he may well accept with pride and satisfaction. The function had become worse than absurd, worse than vulgar; four years ago it was a positive disgrace. We hope the hand-shaking foolishness will be eliminated, too. It is a ridiculous and dangerous practice, and it ought to be abolished altogether. Even a President is entitled to some consideration.

## Overriding the Baby Act

It was an excellent point which Congressman KIRBY made the other day at one of the tariff hearings. The Ways and Means Committee was, as usual, testifying to the same old plat that American manufacturers cannot compete with foreign manufacturers without protection because we pay such high wages in America. As it happened, it was the cotton people who were denouncing this old refrain when Mr. KIRBY brought them up sharply by calling attention to the use foreign manufacturers are right now making, in neutral markets, of precisely such statements as these American gentlemen have been making.

As everybody knows, the cotton men and other American manufacturers do compete largely, on equal terms, in countries like China with European manufacturers. Yet less they are denouncing their inability to compete on equal terms for their own home market! According to Mr. KIRBY, their inability in this effort are being identified in fact, and they are as evidence of the inferiority of American goods when sold as cheaply as German and other European products.

There is nothing whatever the matter with such reasoning as employed by European manufacturers. If it is true that our manufacturers must have protection to sell goods here at home, then we can try possibly sell in Manchester or South America goods as cheap as those of Europe at prices equally low.

Fortunately, it is the fact that they do compete successfully in such foreign markets. It is a fact which will have to be recognized, notwithstanding their able protests to this and other Ways and Means committees.

## Facing the Situation

In our judgment, the Southern textile manufacturers, led by LAUREN PARRISH of Columbia, a really able man, are showing better judgment than their friends from the East. They have gone before the Committee on Ways and Means with proposals and suggestions which plainly accept the fact that this country is best on reviving the tariff downward—substantially downward. They have something to show to the committee what cost in the dollars they can stand, and why, and what cuts they think they can't stand, and why.

Quite possibly it will not do for the committee to accept their specific recommendations, or, as one says, "take their word for it." The committee cannot content itself with taking the word of any interested party. But the committee will naturally be disposed to listen to men who have the industry, and who credit the country with some sense on this tariff question. On the other hand, the committee and the country will be only human if they show little patience with men who act as if there had been no election, as dimensions of the tariff question, no reproduction of the stand-pat controversy which is now the committee what cost they met meeting things.

We have no animosity to the New England cotton men and other manufacturers who still think that the only way to deal with government is to play OFFER Twist and keep holding out the board for more. As CHARLES TAYLOR, "All are our countrymen." We go farther, and freely admit that we do not think that it is creditable to folks, if they have not the notion that our government can be worked to the limit. We merely suggest to them the idea that after March 4th Washington is not going to be like it used to be. However, advising people who want government pay is not advising in our line.

## Shall Congress Pay the Militia?

Our neighbor, the Evening Post, may be a bit too inclined to take things seriously, but we fear it has only too good reasons for taking very seriously indeed the entire scheme for paying state troops out of the Federal treasury. Congressman STANLEY of Texas, in a very able minority report to the Ways and Means Committee, has set forth four excellent reasons why we ought to think a lot before we enter on any such policy. Of course, nobody objects to the Federal government's paying militiamen whenever they are called into the nation's service, but the idea of its paying them at all—no matter how little—for services rendered in their states and while they are still altogether under state control is something very different and far too big a change to be made for any but the most prudent reasons.

Mr. STANLEY and the Post fail to find any such reasons for this radical innovation, but they are more concerned with the reasons against it. They remind us of the astounding history of the growth of our militia, from a point on which the danger of getting such a highly organized and influential body as the National Guard into the habit of demanding money from Congress. They argue that the Guard would prove even more politically potent than the Grand Army, that such demands invariably grow by what they feed on, and that the Guard, if it would grow steadily in numbers and in influence under this new policy, would be of the pressure of the first step in the new direction, Congressman STANLEY puts his anxiety in a single very disturbing sentence:

If it is difficult to resist such pressure now, how infinitely more difficult will it be in the future to resist it, when the Government has a great standing militia, flushed by the victory of its passage of the bill, and encouraged by it to make further demands and to support them by the methods that have already been found effective.

It is no attack on the National Guard to entertain such anxiety; it is simply ordinary prudence based on a knowledge of human nature and of our own experience. Neither, on the other hand, does such reasoning commit one to the position that the Guard is all it should be or that we can do nothing to improve it and to curtail it more effectively with the regular army. We can do what we are doing something about that line. But what good reason is there at this time for making, in the face of such obvious dangers, such a radical and extreme departure from the usage that has prevailed ever since we have had either regulars or militia?

## The Rockefeller Foundation

The House has passed the Rockefeller Foundation bill by a two-thirds majority, which sends it very promptly on its way to the Senate. (Scribble) It was last submitted to Congress—it has been modified.

feel in various particulars. Provision has been made to dissolve it and distribute its funds at the end of fifty years by a two-thirds vote of its trustees, or at the end of a hundred years if Congress so directs. The endowment has been limited to a hundred millions, the income to be spent and applied to the education of the children of new trustees to be subject by a vote by the majority of these persons; the President, the Chief Justice, the President of the Senate, the Speaker, and the presidents of Harvard, Yale, Columbia, Johns Hopkins, and Chicago universities. Finally the charter is to be subject "to alteration, amendment, or repeal at the pleasure of the Congress of the United States," at any time whatsoever.

We are willing to let it go at that, and shall not lose any sleep if the bill goes through as it is. The Springfield *Republican*, always vigilant, will feel easier if dissolution and distribution are made mandatory at the end of a century, and if the body which is to have a veto on trustees include the presidents of Wisconsin, Kansas, and California universities, instead of the presidents of Yale, Columbia, and the University of Chicago. Its reason for this last proposal is that:

The five university presidents named are the heads of privately endowed and privately managed institutions. Harvard, Yale, Columbia, Johns Hopkins, and the University of Wisconsin, are likely to be during the next century, moreover, conservative in leadership and atmosphere. There is but one Western university present in the list, and that institution happens to be the creation of Mr. Rockefeller's money.

#### Will the East be Conservative?

We don't accept this conclusion that the Eastern universities are likely to continue for a century to be more conservative than the Western ones. Perhaps they may for another generation, but it seems a fair possibility that the West will have more reflection than the East in the next few years, and then a harder reaction. In many ways the East is much more liberal than the West already. It is less Puritan, and more jealous of restriction of personal liberty. The East is the frontier now, and not the West. All the new money that is churned up in Europe hits this coast first, so do also all European revolutionists. As the West gets richer and more populous and emerges more from the simple life, it will think more of protecting its own property and a little less of devising means to get other folks' property away from them, and the East will be the only power and is extensively repopulated in its farming districts by new immigrants from Europe. It will doubtless give its mind more and more to theories and experiments looking to the provision of equality of opportunity. Nothing works harder to make countries radical than the pressure of population on resources of a country, as England, and that pressure the East will feel before the West.

#### Some Tar Head Anecdotes

We gather from Brother JOSEPH DAVENPORT's paper, the *Raleigh News and Observer*, that there is some feeling between the HENNINGSEN and the BREWER two prominent families in the State of North Carolina and Brother JOSEPH's state. It appears that certain representatives of the two families had a little controversy recently, with the following net result:

DR. HENNINGSEN has about a dozen ugly wounds, his eye is swollen, his nose bruised, his jaw broken, and a hole in his right hand broken. He has a bullet in his forehead, one in the left side, and one in the right side in the left thigh, another in the right leg, and one which seems the back of his left hand. His forehead was creased by a bullet early in the fight and his face is broken to a pulp.

BROTHER PETER has a stab wound on the left wrist, a stab in the right leg, and a serious knife wound in the left chest, leading down into the abdomen, over the liver about the fifth intercostal space.

BROTHER JOHN has a stab wound in the left chest, penetrating the lungs, and in the left shoulder and a cut back wound under his left arm. He is able to get around.

NAAP HENNINGSEN has the arm of a brick on his face below his left eye.

These were the only gentlemen who participated in the exercise, but it is added:

SAM BREWER, the government, had a cut by his left side removed by a lead of buckshot.

According to local public opinion so duly reported by Brother JOSEPH's representative, they will probably be another meeting when those various parties get out of the hospitals. We venture the prediction, however, that peace-maker BREWER will not again attract his services on the gathering. As Brother JOSEPH's withholds editorial

comment, we are left in doubt as to whether the proceedings at the first meeting are considered progressive or reactionary.

#### Mothers, Babies, and Education

College trustees will perhaps take issue with Dr. CANNON's recommendation that the Government should at a recent address before the college women's club in Washington inquire, "When her little baby is born, what is a young mother to do? and what are the problems in solid geometry?"—Springfield *Republican*.

If the baby is sick enough, the mother will send for a doctor whose mind has been prepared by CANNON and solid geometry to give intelligent consideration to the baby's case. Latin and mathematics are intended to develop the power of the mind, especially the guessing power. More and more the medical schools require proficiency in these preparatory branches from applicants for medical education. So far as is yet known, the studies that improve men's minds also improve women's minds. The mother of the sick baby who has had these more intelligent means applied to her having had her turn at CANNON and solid geometry. But those studies in themselves are mighty little good to a sick baby, and if the mother has passed them to the exclusion of practical knowledge she and the baby will be losers.

Latin and mathematics are the preparation of the soil where the good are not the roots. That must follow them; must be planted and harvested; and unless there is a crop the preparation is futile work. We see fine crops of ability and achievement grow without this preparation, and we see quantities of preparation that seem never to get to the productive stage. This last is what makes the study of education in the United States so mind-boggling, and that makes so many people impatient with the expenditure of public money in teaching in the public schools so many things that are not likely to be practically useful to the scholars who are set to learn them. We suspect that if the whole of what DR. CANNON said to the college women could be put into effect it would be enough. If you can give only a limited amount of education to children, the thing to do is to teach them how to live, to give them the necessary rudiments—reading, writing, arithmetic—and then the sort of knowledge that qualifies them to take hold somewhere and help do something for the human race. The average "educated" girl of twenty and upward don't know about the ordinary business of life is appalling, and makes one feel that the best schools for girls, after all, are those that are kept, at home, by competent mothers.

But schools that sort seem to be scarcer than they used to be. For lack of their own public schools have tried to undertake the duties, and now compulsory-education laws may tie the hands of such mothers as are competent. A school trustee in a rural New York county complained grievously the other day about that. The children of his district, he said, were crowded in their settlements to study things which they had then were hopelessly unamiable, and were thus worthless as a preparation for the out-of-door agricultural lives for which most of them were destined. And as for the girls, he said, the compulsory-education laws deprived mothers of even the emergency help they needed at times from their own schools. If a woman had a sick or a lame baby, without means to employ a nurse, kept her ten or twelve year old girl at home to help her bear up confinement, down on her swooped the transient officer, and drove the girl off to school. And if the school trustee refused the child the trustee officer took the child in his face and sent the girl back to her studies, leaving the mother and the new baby to shift for themselves. Repeatedly, said this trustee, this thing had happened in his district, and it would continue to happen, and he could do nothing. And yet what is there a twelve-year-old girl can learn in four weeks in a district school in rural New York that is so valuable as four weeks of practical experience in taking care of a mother and a baby?

#### Candidate Dies

The venerable FRANK SAWYER writes to the Springfield *Republican* that as a result of discussion with Republican leaders in Massachusetts for a candidate "at the back of the bench" of Gov. M. LOVELL and now Mr. WEAVER to the Senate, "Cassius Biss is likely to be the next Governor of Massachusetts, having already the allegiance of the only staunch Republican daily in Boston, the *Advertiser*, and, of course, that of the expanding *Journal*."

Mr. Biss made a very energetic entrance last

fall and came out pretty well in votes, funds, and personal condition. He seemed to enjoy running and disclosed unexpected proficiency in oral speech. We should like to see him run again when his candidacy is not implicated with that of any Presidential third-term candidate.

With Mr. Biss in the field as candidate for Governor the Republican leaders in Massachusetts cannot afford to feel much with the feelings of their constituents.

#### Still Learning

To a friend who asked him how he could vote for WILSON, MR. SAWYER said (so he reports):

We had got to have a President, and nothing would induce me to vote for ROOSEVELT or TAFT, and I never saw a candidate who was leaving his lesson faster than WILSON, so I voted for him to encourage progress in politics.

Governor WILSON as President-elect is learning quite so fast as he did as candidate. Last Saturday he visited Ellis Island, last Sunday he met a company of social workers at Hudson, and at both places he gave out and took in information. The paper says the social workers felt that they had him with them, and to doubt they have. But he failed to feel any of the social workers' Federal control of child labor so most of them want is contrary to Democratic states' rights and must not be expected. What the general government can do in that line, he said, is to gather and arrange information, and that is an important and may be a very effective service.

#### The Lincoln Memorial

Those people who want the LINCOLN memorial to take the form of a road from Washington to Gettysburg are still talking about that project and pressing it on Congress.

It is to admit their blessed assurance.

The appetite for roads is more or less praiseworthy, but it is hardly entitled to precedence when states and counties furnish the money. If the numerous road-builders succeed in heaving into the national treasury, what will be the end of it? To build a road as a memorial to LINCOLN is nonsense, of course, especially in view of the ability of the motor-cars to go a road up in five or six days.

The general sentiments of FRED JOE CANNON lately expressed on this subject were sound; something it has not always been possible to say of his views on matters concerned with art. He favors a memorial bridge, which would be a true memorial and scenery. Another proposal is that the monument should take the form of a great statue building and convention hall, and there is something to be said for that, especially for the convention-hall end of it. The fact that there is no fit place in Washington in which to hold an inauguration hall shows the city's need of a convention hall, though as for the hall it is no less not to have it.

#### Pipe Amused

It is our scholarly neighbor, the *Evening Post*, that observes that:

The most important shirt fronts in New York, sheltering the largest diamond studs, are to be re-estimated at the annual ball of Tammany's district associations.

Please attend, and for "sheltering" read "sheltered by." When the plain shelters the plain the shirt front will shelter the diamond stud.

#### Why is a Bagpipe?

Where, we desire to know, did the Scot get that name for the bagpipe? It is a musical instrument? Or isn't that the idea?—From the *London Globe*.

What Scot ever called the pipe a musical instrument? Isn't Brother KN HOEG a practical man? Surely he knows the origin of the pipe. In the old world days hands of predatory English marched over the border. They were as bold and sturdy as Scotchmen, and they had in number, CLAYTON McWHIRTER, the Laird of Gilmerrich, in desperate need of a sure defense, invented the pipes in secret and cover led a skirt out of them till he faced the invading Scots-wench on the bloody field. Then CLAYTON blew a melody so fierce, so exhilarating, so grunting and blistering that the Scots that every champion dropped and slunk his way through the English lines, intent on only one thing—in coupe the toothful scorching of the pipes. And that is why every grateful Scot to this day cherishes the bagpipe, the progeny of Scottish independence. He has beaten his sword into a plowshare, but he will always uphold the pipe to last the land.

## Charles Elliot Norton

By John Jay Chapman

Professor Charles Elliot Norton was an important influence in undergraduate life when I was at Harvard; in some ways he was the most important man there. He took a personal interest in the student. You heard about Gossens; you heard about Laver; you heard about Stoughton. You heard about the student who was a member of the first magazine, a good individual though when the best traditions of American college life were continued. He gave to his students not only what he knew, but what he was. To do this he implied reverence: not that he meant to be kind of greatness that men are judged, whether they be teachers or men of action: if it is this unique part of a man that makes his value. If in his quiet eye back over the last half-century in America we should not see so many good individuals that are forgotten, it may be because he kept the figure of a great professor. There has been an age of management, not of ideas or of men. Our problems have long problems of transportation and housing, not of thought. Our great men have been executive figures, whose merit was to serve the public consciousness in practical ways. Our greatest pedagogues have generally been mere administrators. As for teaching in the mystical and personal manner—teaching in its religious and spiritual meaning—we do not do that any more. Yet that is what he did. His sagas were in our generation. Some of them have been masters and under-masters in schools; some of them have been private preceptors—men of character of eminence. Let an acknowledgment be due to those men as so abundant in a work that has been called by the larger interests of humanity, and our children's heritage has passed through their devoted hands.

One of these sagas was Professor Norton. The most powerful part of his work was not that which played itself out in the great hall, but that which he did in his enormous influence over the youth who met under him; and his image as it rises out of the past carries inspiration to professors everywhere. He was a man of much complexity of disposition, and it is impossible for any one to give a true account of him who does not know him as slightly as I do. But I will tell my impressions of him—both the earlier ones and the modifications of them which came about through time. For, as Norton grew older, the core of his being to me grew stronger in its quality of truth. He was a man who was plainly nothing else than a drilling old saint, with a few esoteric hobbies which, when you went to see him, he drew from his cabinet and showed you with glow-rod philosophical generalities. These things were not at all important; but they were what made his himself was everything.

In 1880 he was a man of fifty-three whose face showed massive character. He had the stoop of the student, the accurate, accurate speech of the New England man of letters, a manner of speech, indeed, which betrayed all things at a clip. It betrayed early play, later scepticism, the interest of the amateur in the fine arts, consciousness of race, immense force of character, and a fascination with the gods which betrayed a concealed a certain feeling of interest and kindness, a real motherhood and power of service which was the managing of his life and was the cause of his massive utility.

Yet in spite of this shining quality there was in Norton something that belied his greatness; and it was something that he was like a man, I could say permitted to say of Norton that even his greatest admirer or best friend felt in him an element of malice—some which might be called a quality of the power that made him. He was not a bad man; he was good; but you felt that he was putting his feet down somewhere and was prepared to resist. Even before you spoke you received an ultimatum. This quality is often expressed in the way in which people who live in an unaccustomed domestic atmosphere. A sister here among Philistines is apt to hate it, or a Philistine here among saints. It is the price of victory often paid by strong units who assert themselves unreservedly against the many. I imagine that the one governing theological interest in the household of his father, the famous Amos Norton, found in the young Norton antagonism of kindred strength. Let me remember that this strength and these early acts of war were what made Norton what he was. It was not that he was not for them his countrymen would not be writing memoirs of him.

At the time I first knew him he was a widower, and his many children surrounded his head and filled his comfortable home at Wood Hill. To this home he brought many a student for dinner or for supper with the family. There was nothing to would not do in the way of opening books, and of showing objects and inducing his children and his young guests to read upon literature and the history of the day. The household itself made a happy picture, and one of Norton's penitents was to fill his home with the poor and the needy. His Christmas Day he made of study his refuge for all the students who came from such distances that they could not be taken to the city. But Cambridge was not Norton's only home. He had a country home at Ashfield, Massachusetts, and in this

commonly he made of himself a village master, a friend of the country-folk. There was told at Ashfield a yearly harvest-home feast at which he led in song and dance. William Channing Bryant was often invited to make speeches. It was a charming and a never-repeated, not showed that most of all phenomena in America, the visitation of the man of intellect to the soil.

It was in the family feeling of innate power across out of the family felicity of class and country. They nations and small cities have had it. It is the foundation of art and of character. It is the invisible arm behind the stroke of wit. It stages intellect and makes every man dissent with the culture. What is the reservoir of sentiment behind and above him a man is a bag of clothes and his personality is tined. The constant change of habit of man in this country, and our jumble of nationalities, is like the tossing of the Pontic prism in a mirror; it makes men alien and non-constructors; they die for lack of rest in one another.

Norton knew or felt this, and he fastened himself to the ground by such anchors as he had inherited or had forged for himself. This making of a part of the strong side of him and it resulted, as we shall see later, with a habit of curdling at his own nation, as if he were some sort of foreign-born man-over-sea. To do this, however, in a human fashion to which any man may ever be disposed, is a democratic and a noble thing. It is never here far from South Boston, and one evening while dining at the Burdette Assembly he slipped and fell to the ground. He arose at once with great aplomb, remarking, coldly, "Thus cursed America."

Ethnologically Norton was weak; he had the stiff New England brain which (naturally) had never come in contact with the fine arts in childhood, but had burned them as a grown man leaves French. It was this, however, that made him a democrat in regard to all the subjects which became the passion of his life. He handled these subjects well; he was not a part of them. Most of us occupy the same somewhat fragile relation to the plastic arts, and we have grown very far from the art of a democracy as regards it. In regard to all the subjects which became the passion of his life, he handled these subjects well; he was not a part of them. Most of us occupy the same somewhat fragile relation to the plastic arts, and we have grown very far from the art of a democracy as regards it. In regard to all the subjects which became the passion of his life, he handled these subjects well; he was not a part of them. Most of us occupy the same somewhat fragile relation to the plastic arts, and we have grown very far from the art of a democracy as regards it.

When settling down at Harvard, Norton had not only the fine arts in his mind, but he had fallen in with that brave band of Britons who had also discovered the fine arts (especially the fifteenth century), and he became a friend of BROWN, and of all these extremely popular, artistic, and literary English people—our pre-figures. It was a hard or pang that he joined in England. That was the trouble with it—it was a movement. Norton stood toward this group of men in the position of a satellite, then strongly attached to his division, but he was twice as powerful a moral man, in which was never satisfied to anything or to anybody) and a slightly flimsy outside understanding, which in early manhood had left him in this school.

It was just this whole attitude which offended the young and set unaccustomed student who accepted the hospitality of Thady Hill, yet viewed under the powerful proximity of its master. There was something in all the members of the Boston group which made them a part of the world of the day. With the exception of Thomas, they were all men who did not belong to Boston, the Boston Puritan had a pace. I rather believe that all literary sets have a pace, just as actors often have; and to persons who are in the world's eye, it is a part of their life. But the pace of the Italian appears to be the very young person to be unhardened and superficial. Professor Norton was particularly kind to me and often asked me to his home; and yet I did not move there. It was not that I had a certain amount of work to do. It was done with the assumption that he knew more about all things than you could ever learn. He had that false relation to the things of the mid-century night rail, the Platonic fiction, for he was in good luck to be in a man's life. It was not that they were playthings and that he knew the game.

The man who dealt with ideas in this paternalizing manner was no mere dilettante. He was a patriot who had distinguished himself in the army of service, but who had served his country throughout the war in the unseen, obscure, and moral work of the Local Publication Society. He was a whole-hearted man whose devotion to his friends, whose public spirit, whose faith in the President Lincoln, whose work with the Good Men of the Pulpit and with the Stanzas Critics of Boston.

Everything that Norton did had a certain actual force in it. He belonged to the Puritan, and was one of the great men of his time. He was a man of God to a pity for the poor, an extreme hardness and goodness toward poor student. 31. Shaw] with Essay

an inappreciable obtuseness as toward things unorthodox; creative, poetic, and of the temperament. In fact, he was very like Emerson. He resembled Emerson in his affection for the fine arts, but he was not so much of a man. I mean say that Norton's life-work consisted in making the unlettered, rough youth of America understand that there were such things as architecture, painting, and sculpture. Norton could do this on a grand scale in a two-hundred year old man. He did it with great strokes of natural power, often with him in his eyes, sometimes with sarcasm, sometimes dogmatically, but always successfully. More men have felt what Norton did for them in opening their understandings to the influence of the fine arts ever spoken to me of all the rest of Harvard's professors put together.

It was strange to see doctrine which—intellectually speaking—was in his mind of collection, being laid out like a bed subjected to the laugh and shivering youth of America. Yet the sincerity on both sides was perfect, and the needs both of the giver and of the receiver of the doctrine were satisfied. It was only equality that Norton did not understand; to supply him was no event at all.

He had another quality which combined oddly enough with his wit. He loved to tease; he was simple. He liked to see his scepticism in religious people; he liked to see the conventional-minded people; he liked to make disparaging remarks of their own countries and about their all-conclusive definitions. The enjoyment of a society which came out of those smart sayings and old-fashioned whimsicalities of the nineteenth century was a matter to Norton; but it must also be classed as a little. His own personal pearls were apt to have a more for him, because from his early youth he had gone his own path and followed the best of his own character and talents. The most serious of his little devices to be recorded for his own sake. A college man of Boston's who travelled in Italy wrote home to a friend, "At Florence I ran across CHARLES NORTON—sawing his 'four oaks'." It seems to me now that the identity of these oaks is a democracy in America; are in themselves a blessing to his generation of their own kind; that all of Norton's beliefs were no nothing compared with his merits. In England and France people take pride in the mental nobilities of their great men; people in Italy take a pride in their great men together. At the time I first knew him Norton was often dogmatically irritating; and it required some philosophy that most American are members of to forgive him for his silliness.

It was in the last years of his life that Norton was writing, in writing memoirs of his friends, in editing letters, in preparing prefaces for many kinds of works, in being an accurate reader and faithful slave to good literature, I think no one can deny that his time was in debt to him. He was not a man of many fields of work. There, too, in editing and writing (as in teaching), he had a grand far ability. He regarded himself as a useful drudge, and up to his very last years he engaged in serving the cause of some scholarship to the end of his power. During his last years he lost all his acidity and he retained all his affectionateness. He most have found out that his earlier earnestness and pose of cultivation were not worth keeping up, for they dropped from him, and left him very, very old. He was a human little old gentleman with a nose as sweet as an eighteenth-century organ—such an organ as you find in the hallway of an English country house—flowing, kind, and trusting in his retirement. He remembered his school days, and he was not a man who was made ready to see them, and he really became beautiful as a picture and a presence. Happy are they who have him to look back upon in his lives.

How impossible it is to predict which of two young men has the more talent, and how it will be made to see them, and he really became beautiful as a picture and a presence. Happy are they who have him to look back upon in his lives.

How impossible it is to predict which of two young men has the more talent, and how it will be made to see them, and he really became beautiful as a picture and a presence. Happy are they who have him to look back upon in his lives.

# TURNING LEMONS INTO PEACHES

What Happens when an Irresistible Opportunity Meets an Immovable Business Acumen

BY CROMWELL CHILDE

DRAWINGS BY J. J. GOULD

**S**OME twenty-five years ago a West-coaster found himself facing ruin. His silver mine, which he had thought would bring all his dreams of riches to realization, had come to be a silver mine no longer. There was metal enough in the vast hole in the ground where he had been steadily grubbing, but it was a base, a comparatively worthless metal.

A few years later the "lemon" had turned out to be a "peach." The depressed metal, copper, was making millions for him. It had become one of the great producing properties of the West, with every acre finding an eager market. His dreams had not only realized, but had been as large, even to his wildest dreams, as his reality.

Every day many such business transformations are taking place over America. "Lemons" are being turned into "peaches," success built up on failure. In one man's hand an enterprise that is full of promise and seems worthy of the investment of any amount of capital goes, drops, and finally goes under. In another's, or perhaps because of a change of circumstances, it revives and develops triumphantly. Sometimes, again, a project that has the promise of out-looks to begin with slides into great poverty because of the far-sighted, practical view of some man.

A creek in a Colorado valley was nearly swamped with debt. A dispassionate observer would have called that creek of the world a "lemon" if there ever was one. It was away off from numbers and there seemed no possibility of ever paying off the \$4,500 with which it was encumbered. The coming year-prospect that this was all wrong. That creek proved one of the most profitable pieces of land in all the world. On it now stands the town of Cripple Creek, a gold region that is scarcely surpassed for production anywhere on the face of the globe. Scores of millions and hundreds of lower standard lights to-day can testify to its having proved truly a "peach."

But Mother Luck is not the sole or even the big factor in transformations like this. Relatively little in the march of prosperity depends upon chance and fortune. Men who think and use a pair of good heads and their muscles for the real fairy godmothers. Take the case of the vast recent lands of the Northwest.

When, not so many years ago, railroad processes of the Northwest commenced a great, all but unbroken country with strips of steel they received that land grants. Even as gifts these big ranges of country seemed anything but worth while. Nothing could have been more valueless. Hundreds of acres from the outposts of civilization, nobody would buy them, no one would visit them. It was recorded, it is true, that in time the country would grow out to these lands, but that meant several generations, a calamity in all probability. A kingdom large enough to rival almost any European prize might later have come from them. Such a monarch would have minded its isolated grandeur.

So, year after year, the cross-continent railroads completed, trains ran across these valueless lands. There was nothing for them to stop for. Never was there a "lemon" of this size. Nobody would buy them. Nobody had not even started thinking. They thought to

good purpose. They organized great colonization schemes. Family after family was placed on farms, lemons were earned to be left to electric hoaxes, left for and helped to stand on their feet. Every new-comer meant dollars in the near future. The suburban was beginning to be of value.

Now all that great Northwest territory has come to be worth millions. The "lemon" has grown into a "peach" so famous commercially that it can scarcely be believed there was once a day and within the memory of middle-aged men when a square mile would not have been thought worth the taking. It is difficult to realize anything that looked more hopeless than these spreading, unoccupied lands of thirty to forty years ago.

Heads and a settled, consistent policy are what generally turn the scale. Real opportunity is what makes the typical "lemon" into the typical "peach." The business man who, given a certain situation, knows just what to add or leave out is the customer who makes success out of failure.

The methods are as simple as logic when they come to be told that it would seem as if any man ought to think of them. When, in a few years Southland, drawing a large income from the biggest shoe-store in his part of the state, brand back in his automobile and considered his rapidly growing investments, he sometimes wondered why under the canopy the same ideas hadn't come to him that had to Grating. They were the only really logical ideas. And yet it was undeniable that before Grating joined forces with him he was going their and faster downhill.

He remembered the days when business could be believed to come, when the most tempting "ads." were "fracks," and work in and work out he found himself on the ragged edge. It was not because he was not a good musician and a good trader as well. Grating frequently complimented him on his skill in both. But he himself could not get the trade.

Grating was one of those men who have a grain for discerning a business man down at the bed and all but hopeless, buying an interest in it and trans-

They began to sell shoes that first day

forming it. He looked in at Smithkin's shop one day, bought a pair of shoes, and got talking. He came from a city several counties away and was keeping his eyes open for a good business opportunity. He had a few, a very few thousand dollars to invest. "These wasn't enough money," he told Smithkin a few years later when everything was booming along, "to buy an interest in anything big. I had to find something little that had possibilities. Your store pleased me. It was lawful; you were evidently a smart man in your special field. The store was of the better path, in a side street away from the crowd. That meant very low expenses. The question was, could I earn the crowd in coming there? I studied over it and I see I could."

When Grating arrived Smithkin was tied head and feet. He had a lease to run three more years. If he had been able to get out and more there was no available store in the little city's center. The crowd of trade was away from him. He had an excellent stock and by force of personality could sell and please every man, woman, and child that came. But few did come. Any one else than a man of Grating's ingenuity and special qualifications would have said that here was only an opportunity of throwing good money after bad.

The new partner before the papers were signed made some very particular stipulations. These were eagerly agreed to, for any part in a store is acceptable. Smithkin realized that by himself he would be in the backwater corner within a year. Grating arranged with Smithkin to buy the stock and sell it. His was to be the end of getting the customers in. Here will you do it, said Smithkin, and that real hope for many months swelling in his heart, flitting carefully under his eye. "You'll see," he said. "You'll see!"

The next morning's papers contained nothing about Smithkin's unworldly bargain, but a simple announcement to the effect that for the next six days five ice-cream soda checks, good at the most expensive "fontaine" in the city, would be given with each purchase. The afternoon's papers contained the same statement, and those of the next day and the next. Smithkin-Noda-Noda-Noda was just about all these "ads." contained. Every reader was surely supposed to know just who Smithkin was and where to find him. As a concession to the possibly ignorant the address was stuck down in one corner in very little type.

Smithkin was astounded at the way the customers kept coming in. He and his clerk were fairly swamped. They began to sell shoes that first day. The second day more and more people poured in and they kept on coming. The ice-cream soda bill, small as it was, aroused attention. By the time three or four days had gone by the other shoe-dealers were worried. Location and continued prominence did not avail aside the lure of the checks good at the best drugstore.

Before a week had gone by several other dealers were offering soda checks too. But it's bloom was of this sort. Grating was now announced with soda checks were still prominent the concern would present two

Anybody could come in and get this coffee free

street tickets with every article sold. This gave the store an added boost and increased popularity. Advertising did not stop here. He thought up other "free gifts," he could work in each instance, always keeping ahead of his competitors, constantly advertising his feature.

The scheme held good through the unexpired three years of the lease, trade growing so that it was with difficulty the sale-staff there could accommodate the thronging. Meanwhile, marketing was keeping his eye like a hawk on every possible location on the main street. He finally picked his store and the corner corner. By this time it had come to be the most talked-of store in that part of the street and its fame brought it business from other nearby stores. It was the fact that circulating his great flyer for trade, carrying out an idea which had long been written but not made effect. He reversed the policy from the first day the corner was secured. He now did more on a grand climax than on one was prepared for, the opposition dealers lost of all, and it seemed talk that was worth pages of paid advertising.

Crattin's new home-stall was very clear and bright. No more chocks or blocks were to be given away. That took would see the last of them. Instead, on each side there was to be a straight relation. The new cents—that is, with every purchase the customer got in effect, a present of ten cents to be given what he wanted after he wanted it.

He had taken a sharp, sharp, break change of three years. The "house" had vanished and in its place was a "grocery" that every one wanted. A well-meaning, hard-working young man in an Eastern town had made the address also fell help to the department store that his uncle had owned. A generation before this departed store had possessed the best of the community's trade. It still had some part of it, but never and never up-to-date firms had made serious inroads, very much increased by the fact that in his later years the old man had been "set" and "crochety." The youth, though he had little of the store's keeping, could not help but see the gravity of the situation. It was not a question of immediate money being needed, for the old provisioner had left some trade, but the certainty that the establishment was very verily running down hill. The young man saw all his resources, except all, and that very soon. Besides his competitors his establishment looked old-fashioned, shabby, poorly supplied. And the new owner could not see what to do.

"It's a 'house' for sure, Tom," said his friend, Clement Hopkins, a leading lawyer with out much of a business but with indelible energy. "I should think it would make you sick to see that." He pointed across the street to the trim windows of Burgenstrom's, the newest and the crick store of the town. A dozen people were looking into the windows. Not one was paying any attention to Tom's, opposite.

"The little lawyer took of his hat with a sweeping bow as a token of his respect with an open-looking face.

"Miss Anna trade with you folks, Tom?"

"No," grumbled the young storekeeper, disgustedly. "No, Geoffrey, let's make her. Tom, you haven't got the plank and got of a mouse. I—oh, well, Tom, what's the good of talking? You know my law practice ain't much and it never will be. This proposition of yours—my, Tom, take me in as a partner and give me some, won't you?"

"I suppose, with unexpected streak of luck could have come to the young helpless business man. He had the same sort of relief that a swimmer would get about to drown when he suddenly touches solid ground.

From the time when Clement Hopkins stepped into

that store the next morning a new spirit began to come over it. The former lawyer started in to draw trade. He had no trouble in instantly finding a way that inside of a week began to be talked about all over the city. Its basis was a card index of people. The card index was really only a part and portion of the new store policy of looking for trade, but it was the striking feature of it.

Every clerk was instructed, if he failed to sell in any one, to get that person's name and address and, if the customer had a telephone, to get that too. This information, together with a note as to what the prospective customer seemed to want and had not obtained, was sent to the office. Within a few hours it had been carefully typed on a card, and as fast as they were received these cards were classified by the clerk himself, who started the card and handled it alone with it got too big for him.

That did not lag for some months, however. Sometimes the new manager was familiarizing himself with hundreds of names and their wants. A woman, for example, would inquire for a certain kind of lace. It would be shown her, but she would devote the price was greater than she cared to pay. She would come again when there was some less expensive one sale.

thought of. But somehow there was to appeal to the general public in it. A profitable business had never developed and the owner was disgusted. It was evident that he would be willing to sell at almost any price.

The loss of the energetic person who was looking for something down at the level and capable of being built up so that the public was not at fault in not patronizing the store. Though his lifings were mostly, they had not getting it. While highly to meet his customers and fraternize with them. The store did not seem to be reaching out for business was was with the public. The price was high and respectable and with its credit still good, it was a failure.

Various inquiries convinced the energetic man that the city as a whole did not know this. The store itself had not lost any reputation. People generally did not feel that they were being done wrong. As a matter of fact, they did know it. There was little advertising, and that at a steady rate. Conservative location, for the most part, patronized it. Finding the goods available and the prices reasonable. In addition to the small trade, a relatively heavy amount of credit had to be given, an additional factor. The owner, the new manager had been running the place in just that way for four years. Every year he had made money and every year he continued to increase it.

It took but a short time for the energetic man to analyze the whole situation and make an offer. It was a low offer, but it was accepted immediately. The owner was like a boy when he was given credit his inroads. He confided in the lawyer, so soon as the papers were signed, that he had tried his best but he could not get the "hang" of it. "I ought to have succeeded," he went on, mournfully. "I don't know why I haven't."

Interest is not confined in books, art, or invention. There is the talent that in even care and in some ways more previous and important, that of meeting people as they are, especially if they are not conscious of what they are explained to them. The energetic man possessed this talent in a high degree. In an exceedingly short space of time he transformed this store and commenced to attract trade.

To hold the conservative patrons this had to be done with dispatch and not a moment's delay. The energetic man's first move was to tear out all of the wooden shelving, replace it with glass shelves, and cover the rest of the wall with mirrors. Then all the wooden counters were out and glass counters came in. It was a well-lighted store, as has been said, but now everything was lit with the relatively dark places made every square inch of it as light as the street.

People noticed that store. It was worth visiting. The new proprietor made it still more attractive and talked with his customers. He altered the way of work, when the best of hot coffee was served, made on the spot in a percolator. He even cleared a space for lunch tables, and the people noticed. Anybody could come in and get that coffee free, no matter whether a customer or not.

Before six "afternoon" nearly had seen off ten pretty young actresses of the city, fairly well known and specially engaged, were to be seen twice a week showing how to prepare a cold bath. All visitors could look on, give opinions and get a few more. Once a month or so a gas-range was put in a prominent place and pretty was made in it, this to conclude. The matter was so good, by the way, that every crumb of it was readily disposed of.

A second-hand agricultural implement emporium was going through very hard times. A bright young fellow from an adjoining town came along one day. He knew the proprietor and stopped to sympathize with him. They got to talking more and more and finally the young man said:

"Mr. Ross, I can double your business in thirty days."

"You couldn't," answered the middle-aged man, despondently. "Yes, I could. No, you can make some money out of this. Look here."

The two talked seriously, and the upshot of their talk was that the young man became a partner. He put in some money toward the emporium, and to purchase a second-hand motor-car. His method of building up the business was simple. He secured the best of the machinery and the most satisfactory on hand down, or as assignment, practically every piece of machinery they desired to get rid of. These he had repaired and painted. Then he made an attractive catalogue.

He called personally on every farmer, explained the nature of his business, and left a catalogue and a price list.

The old implement looked every well the same as new, but they were second-hand and were sold as such. The putting in of money toward the emporium had needed wonderful transformations, and it was not long before the firm had sold all of the old stock on hand.

All the year round the firm shone and the very highest standard of reliability was maintained. The second-hand atmosphere of the store had been changed and the young man's activity. Truly, he was a fine and able man, and the emporium soon became one of the biggest money-makers in the region.

He called personally on every farmer and explained the nature of his business

By the new system she would be called up the very day that law arrived. She would be pleased and complimented. Hopkins, outside his card-catalogue scheme until it included the special wants of those men and even outwitted some of the city's bargainers, who he realized would be valuable to them because they talked. It got to be almost a mark of honor in that town to be known as being on the card-catalogue list. It seemed to indicate you were worth taking into account. Hopkins quickly appreciated the aid and added all the names he could.

After a while young women were sent out each morning to inform possible purchasers that the articles which they had asked for some days before and had not been able to get were now ready and at their disposal. The telephone service was but one end of the new service, and the business was now just all possibility of not succeeding. His activities had given it a new look, that of prospect.

In the midst of a certain energetic man a grocery-store on the "Business" of a mid-Western city seemed to be waiting its opportunity. This store had a low business in the town and was well lighted. It paid a high rent, had no trade, and was well

# THE SITE FOR THE LINCOLN MEMORIAL

BY JAMES BARNES

**T**HE grandchildren of the present generation, if it is to be hoped, will see in the national capital a city very different from that which the fathers of the Republic saw in their youth.

It is over a century since there was laid out, by a gifted Frenchman named L'Enfant, who had come to America at the time of the Revolution, a scheme embodying state avenues, parks. Eleven years ago, when the National Park Commission, composed of Daniel H. Burnham, Charles F. McKim, Augustus Saint-Gaudens, and Frederick Law Olmsted, reported their plans for the development and improvement of Washington, they practically adopted those submitted by this long forgotten and unknown engineer, who died with no promise that his work would ever be carried into effect. Indeed, one of the architects of the Capitol, from this pathetic pen picture of the man who first sought to make Washington beautiful. Under date of August 12, 1808, he writes:

"I hadly through the city stalks the picture of fantasy, L'Enfant and his dog. The plan of the city is probably his, though others claim it. This singular man, of whom it is not known whether he was ever educated in his profession or not, had the courage to undertake any public work that might be offered to him. He has not succeeded in any, but was always honest and is now miserably poor. He is too proud to receive any social aid, and it is very doubtful in what manner he is supported."

The original plan of L'Enfant consisted of spreading avenues diverging from the Capitol, and a wide parkway or esplanade stretching to tree-bordered walks and promenade from the Capitol to the Potomac. The first park commission, when they adopted this, saw fit to place the proposed Lincoln Memorial on the roadside at the end of this parkway, on the axis made by the dome of the Capitol and the Washington monument. This site is in what is now known as Potomac Park, and is near the approach to the memorial bridge that will connect the city of Washington and Arlington.

The Fine Arts Council that was appointed by President Roosevelt, a body of thirty artists—sculptors, painters, engravers, and landscape gardeners—confirmed this judgment. Later, on May 17, 1914, a Commission of Fine Arts, created without pay, was appointed under an act of Congress by President Taft. It was composed of the following distinguished members: D. H. Burnham, F. D. Millet, Thomas Hastings, Daniel French, Charles Moore, and Frederick Law Olmsted, Jr. In their report of July 17, 1911, this commission unanimously concurred in the views of their predecessors as to the most advantageous site for the memorial.

They, a man of taste and judgment, had in these words given his opinion:

"A I understand it, the place of honor is on the main axis of the plan. Lincoln, of all Americans next to Washington, deserves this place of honor. He was of the immortals. You must not approach too close to the memorials. His monument should stand alone, remote from the common habitations of man, apart from the business and turmoil of the city; isolated, distinguished, and serene. Of all the sites, this, near the Potomac, is most suited to the purpose."

The Commission of Fine Arts placed in nomination for the position of architect for the Lincoln memorial Mr. Henry Bacon, of New York City, and the Lincoln Memorial Commission, made up of President Taft, Senators Shelby M. Cullum, R. B. Money, and George

Proctor Wetmore, and Representatives Joseph G. Cannon, Champ Clark, and Samuel W. McCall, appointed Mr. Bacon to design an appropriate memorial. Two or three other sites have been suggested, but Mr. Bacon, after a careful survey, also became convinced that the Potomac Park site was the only proper one. With an eye to the natural surroundings, which are capable of great development, he evolved a plan, comprehensive and dignified, whose position is shown by the accompanying illustrations. In some measure resembling a Greek Temple, the memorial is, in quote from a recent description: "A rectangular, windowless building, being surrounded by a colonnade composed of thirty-six Doric columns forty-four feet high and seven feet two inches in diameter at the base." The material will be white marble.

This colonnade, with the building it incloses, will stand on a terrace bounded by granite walls. The thirty-six columns will represent the states in the Union. Lincoln's tomb in the Union which he preserved. On the front over each column will be carved in high relief wreaths made of pine and laurel, and in the right of each of these will be cut the name of a state; while on the other, the extension of the colon appearing above the cornice, will be carved memorial portraits of founders of independence and what, one for each state in the Union at the time the memorial is erected, which, presumably, will be forty-eight.

Thus the building will typify the Union, the great idea which was conceived by the builders of the Republic, and which Lincoln helped to preserve and perpetuate—the idea which survives. In no better way could Lincoln be memorialized.

The size of this memorial will not be alone its claim to one of the world's great monuments, yet the terrace will be 256 feet long by 100 feet wide, the colonnade will be 118 feet; the cells will measure 133 feet by 85 feet, and the ceiling will be 60 feet above the floor. The interior trais columns being 50 feet in height.

It is in the intention that a statue of Lincoln will stand directly opposite the main entrance and that on the walls will appear at opposite ends the immortal words of Lincoln's forty-seventh speech and his second inaugural speech. Fronted by a wide marble-rammed lapone, led up to by the long vistas of the tree-lined avenue, and surrounded by the open verdant-centered spaces, this memorial should have a character of isolation typical of the great man in his loneliness of soul and not particularly close, but separated by a grandeur all his own like a monument.

The reports of these various commissions have received the approval of the United States Senate, and the matter, having been brought before the House of Representatives, has been referred to the Library Committee.

It is to be hoped that before long the work on this memorial will be begun. It will be a step toward the beautifying of Washington and a worthy monument to Abraham Lincoln.

The Memorial will occupy this site along the axis of the Capitol and the Washington Monument

# HOW MOTOR-TRUCKS ARE SOLD

## The Methods and Qualifications of the "Corporal's Guard" of Salesmen who Bring the Purchaser into Touch with the Manufacturer

BY THADDEUS S. DAYTON

**I**f takes one type of man to be a star salesman for pleasure automobiles, a man of quite another type, although his entire talents is required to sell motor-trucks.

Early one morning a scholarly, scientific-looking person, bag in hand, walked into the office of a motor-truck salesman on Broadway, New York. The bag was heavy and its owner seemed tired. His bag good reason to be. For a week he has been working sixteen hours a day in the plant of a big Middle-West factory studying its transportation system. A one-hundred-thousand-dollar order hangs in the balance. There was a good chance to replace an expensive lease equipment with motor-trucks, and the task that he had in hand was to prove that substantial operating economy would follow.

The bag the man carried was full of papers, calculations as to what the lease-versus-vehicle, load done, and the field that was to be covered. He was the engineer of the company, the special expert whose job was to study and report on conditions of prospective customers. After consultation with the company's executive and the salesman who had originally opened up the business, he set his staff to preparing charts and a detailed technical report. Leads of a week these figures, finally reduced to a few tables, had been in the office of the salesman.

The consultation took place, diagrams and charts worked over. Before the work was up a week, only a hard cough-cure was needed. The ground had been covered and most of the work was done. It was shown that with thirty motor-trucks they could actually save seventy thousand dollars in their delivery system each year at an installing expense of less than that amount. There was no delay in closing that contract.

It is in ways like these, or very similar, that motor-truck selling is made possible. The salesman who wins honors does not need much of the imagination, cleverness, and adroit tricks of talk that have long distinguished the salesmen of automobile firms. Usually he is not a "pitcher" at all either in it revealed that he be a "price of good fellows." He is most commonly a practical man who has but one idea: the lower cost of operating with a motor-truck—an idea that he has carefully systematized figures to prove. There is nothing spectacular about the way he goes to get business. He has a product that will sell on its merits, because it means economy that justifies a large investment.

The motor-truck salesman by no means always needs the aid of his company's engineer and the kind of the concern to close his contracts. But that is recognized, as being a very ordinary selling company. The interests at stake are very big. An order of the value of from forty thousand dollars to one hundred thousand dollars is not unusual for motor-truck orders. It is not as if a standard type of automobile could be sold in such a way in the different problem of exactly fitting a product to a customer's needs. "Clever talk and 'hot air'" might land many a contract. Merely getting a contract, however, simply selling leads to sell the motor-truck manufacturer's sale. He must get business, not just a sale. He must get leads to lead each sale a marked success. On this the entire future of his market depends.

So a salesman who is not a student of looking at a sale from the customer's point of view is first secured. Then a cleverly devised supporting organization is put back of him, a group of men that can be called upon at any time to supply money. The salesman who succeeds is the man who makes it his first and only purpose to discover what the probable customer's needs really are and to fill them as no money, rather than to sell all that might be bought in the enthusiasm of the moment. This principle prevails very generally among salesmen of the better sort and the greatest ambition in all lines, but among those who sell motor-trucks it is far more developed. The reason is plain. Just what a motor-truck order will do for a factory or department store that has a well established and complicated delivery system and is willing to make a change from horse, if it can be shown that it will pay a customer of the better sort, is a matter of calculation. The salesman of motor-trucks, therefore, often sees his company's chief technical man and the brand view

and experience of his executive, and so much actually to "lead" the business so to make certain that the buyer in getting a contract that will be advantageous to the motor-truck seller, will not be misled. The man who has the most skill in the motor-truck business is the man who has the most skill in the delivery system capable of being operated by satisfactorily few trucks and with the minimum of expense, offering a company a chance to develop probably and soon to need more trucks. Here is where the salesman serves very greatly in his own benefit in the larger concern of his firm. But with a big proposition that is almost never the case with the salesman, he has had his engineer study this particular motor-truck man carefully as a better idea of the nature of the person he is selling to.

Even in the cases where there is this supporting organization at its back and engineer and provision of general manager, the salesman, nevertheless, and very often, it is difficult to get proper business. The motor-truck proposition is altogether too new. It is too uncertain and its history is too untried that any other American business. It has comparatively few affiliations with the automobile business as it was understood five years ago. The clearest automobile salesman are active in it. A mass of unusual characteristics has to be found by look or touch. He must be, however, an enthusiastic, and possessed of a knack of estimating correctly the present and future business of other people and appreciating conditions. In the ordinary case he does not need to be a selling expert, but he must be able to do so. He must be very much at a lawyer does win advice in emergencies and whose advice is invariably found to be good.

The man who can sell motor-trucks, that he pleases buyers, first convincing them, then having his vehicles prove themselves in the cold hard light of business, there is one New York salesman—that is, his home office is in New York, though he travels all over the country—who shows at least forty thousand dollars a year in business. His concern needs at other salesman than he. He keeps the plant busy. The way he does it is interesting.

He has a number of men whom he calls his five year men—men expert in the delivery problems of certain lines of trade. "Males" is used advisedly instead of "men" as it is not always a man who is a very good question today as when he first began. He does not attempt to speculate upon too many different business lines. If he did, he could not get under the skin of each as effectively, and this is essential. His specialties are those with which he began and where he already saw the biggest, most profitable market—department stores, coal-brokers, and brewers. Though personally he is not a widely known man, a score at least of the best delivery systems throughout the country in those special businesses were created by him. His ideas in the rough were worked out, changed here and there, elaborated and "backed up" by the scientific men of his company, and further improved by suggestions from his chief executives. But in each case the original plan was his.

This salesman spends at least five-sixths of his time in study and observation. He is traveling about constantly, seemingly with no fixed purpose. His visits to the factory to buy trucks is his latest big order. One day, he being heralded his return by him he drops into the main office. Out in St. Louis there is a manufacturer whom he has introduced or helped out a great merchant in Boston or an industrial plant in Baltimore. He knows just what the proposition is for a given year and he is ready to make a great deal that have to be with. Then he would thirty vehicles or forty! Should all of them be of the same type, or two greater amounts be developed by another man? He has a number of men who are referred to as the "M. O. P." fleet of trucks they built last year. They would not be just the thing for this new proposition, although they are. The salesman goes into conference with his chief executive and the head of the engineering staff. He informs them in detail regarding the best conditions of the lines where the trucks are to be operated. He even provides a synopsis of the weather—heat and cold, rainfall and snow—of the region, and the right kind of engine, covering a period of five years. No point can be made except his.

"Well," he says, finally, "it's Wednesday now. If we can't get it all done by then, we'll have to wait on Thursday of next week. Could we have Paster and that crack now, drag out of his in this

afternoon to make a preliminary check-up? I think perhaps I'd better stay right here and work on this with you. If I get the time, though, I'll run over to study your files. I'll be back in the afternoon, but that may be all up with this proposition. It may not do it at all, but, at any rate, I ought to get posted on it."

All this is very different from the usual salesman of the sample-truck class or his higher colored brother who sells bridges or executives at other things in big contracts. These men know their market well—it is established—and their business is to take away their first-truck every day's worth of it. They know the motor-truck salesman has an established market. He has to create one by his ingenuity, special knowledge, and observance of conditions. With time proximity and recognition are so little required, compared with expert skill, that they are almost negligible qualities.

But sales men are trained? Experts say so and that the securing of first motor-truck salesmen is one of the most difficult problems. Out of all the great selling staffs of the pleasure-car factories there has come scarcely a corporate guard of men who can lead the big motor-truck orders.

From the beginning the sale made was largely by "enthusiasm." Sales were made out so much by "enthusiasm" as by "enthusiasm" of talk—"enthusiasm"—most of the months of men who had good experience and who were very sure of their own ability about what they were selling. They did not need him. The customer bought a motor-truck for his own pleasure because his father never saw that that particular make of car, or because his own wife or daughter liked the look of it, or for any one of a hundred other reasons. The motor-truck salesman, however, had the great advantage from the manufacturer's point of view. It was never a business investment. The motor-truck is it. It is something that the customer buys to be used, or to be used, or to be used, and without which he is losing money.

The real advantage is on the side of the motor-truck salesman. In the beginning the sale made was largely by "enthusiasm." ## GHOSTS

BY WESTMORE WILCOX, JR.

What pale, forgotten lands do I behold—  
"Tis but the storm-wind whistling through—  
That with a low, familiar touch the field  
Of the dead, the dead, the dead, the dead  
The thicket of earth: whose heads appear and cold  
Tall with a clinging mist of damp, grave-mold.

In that the cry of some lost, wild, unlighted  
Clothed in the wind that follows after,  
Or that of one who fell to memory preferred,  
The wail of the wail of the wail of the wail,  
'Tis but the fantasy of memory stirred,  
Stranger! How like a voice long since unheard.

Oh wretched wind that shakes my window-pane,  
And bids me lie in late awake,  
Basking my quiver, light feet across the lane,  
To-night will I wail, more and more,  
Over your course, across the hills again!  
Tell me, wild wind and whistling driving rain!

# CODFISH AND HUMAN LIVES

A Hospital-Ship is Needed on the Newfoundland Banks. Shall America Follow the Example of France and Protect the Lives of her Fishermen?

BY CONSTANCE D. LEUPP

**D**OWN on T Wharf, Boston, there is a man piddling shoelaces. He is a young man and lanky, but he has left one leg, so that his present occupation measures the extent of his capacity for the rest of his days. Despite his lameness conversation with him is friendly conversation and he will talk to you about anything he likes. He was a fisherman and of Gloucester, and during his watch one stormy night off Nable Island, on the Newfoundland coast, a heavy sea came thundering down the deck, sweeping everything before it and striking him with the rest of the

to France with the fleet; and however critical the seas on board, the Americans must return to their own seaboards. For the Grand Banks, where the French fleet gathers, are fished only in summer, whereas the fleets from the American ports fish the year round up and down the smaller banks of the Georges, inside Miram, Harperton, and Miram. Prior to the rest of the year line over from the French for four months of the year. Many more miles to the north on the Labrador coast lies the chain of hospitals established by Dr. Grenfell and his associates, which we, in the best way we think of the geography of remote places, have assumed the care of all American fishermen in that part of the world. A glance at the map and a minute's thought show how absurd that idea is.

"Why," argued Dr. Schuman, "do you not have our own American hospital-ship to patrol the smaller banks the year round?"

He discussed the subject with fishermen and considered the matter over and over and worked out a scheme which all agreed upon as practically a hospital-ship of trucks or more berths, built for comfort and safety on the lines of modern ocean travelers, to make four trips a month throughout the year between Boston and the fleet, transporting cases needing prolonged treatment in the Marine Hospital, treating other cases and giving dispensary aid on board. It should make the rounds of the smaller banks at regular intervals so that each captain would know about when to expect her and signal accordingly. Such a hospital ship would cost \$100,000 to build and equip and \$30,000 a year to maintain, and its actuality bids the Public Health and Marine Hospital Service.

Congressman Gardner of Massachusetts became interested in the situation and placed the request for the needed appropriation before Congress last session; but Uncle Sam was feeling the effects of the high cost of living, and so the fishermen are destined to go at least one more season without their hospital-ship. This year we shall have again the annual crop of thirty wives and happy children ripened into widows and orphans mourning a hapless evidence on the leasly of neighbors and friends; we shall have, as in the years past, a few few old-fish-heads wailing, a few more maimed steering vessels.

And an interesting feature of it is that the annual appropriation of \$20,000 that the fisheries protection calls for to square Uncle Sam's account with the fishermen is the exact sum our venerable uncle spends on coal alone every time he sends a man-of-war from New York to Europe.

Dr. Grenfell has said, "When a fisherman is your

friend you have nothing more to desire in the line of friendship."

If you want to test that statement, if you question whether those men are worth Uncle Sam's money, go down to the foot of State Street, Boston, where the masts and spars of the schooners break the line of houses that looms against the horizon, marking off T Wharf from the rest of the city. Here you will find fishermen as plenty in part for a day or two watching their last catch, provisioning and bargaining for luck. A specially developed race of men these, reticent, with quiet, skilled ways, experienced, with well-worned skins. There is nothing of the drunken, dissolute sailor about these fishermen; they are peaked men, hardy from every climate and nation. A curious thing about the men who supply the markets of the United States with its annual few million dollars' worth of cod is that hardly any of them are natives. The bulk of the men who use the docks east of Boston and Gloucester are Canadians; the remainder are everything except Americans.

The captain, however, is usually native, banking back to the time when men from the Maine and Massachusetts coasts went out as fishermen; they are a simple, free-hearted folk who are glad to tell you of their life at sea.

The statement that I was interested in the hospital-ship was more than an introduction; it was open season. Every one who does business on T Wharf seems to know and heartily indorse the plan.

Captain Hanson, owner of one of the boats of the fleet, invited me aboard to gratify my curiosity as to how and where this (as a landlubber's crew) few cable feet of snow he could store away, as he headed he could, eighteen men and 200,000 pounds of fish.

The forward cabin, where he let down the table, which was hooked in some mysterious way in sections to the rollers, was reminiscent of Led's vivid picture of the inland fisherman; he describes there in a cabin shaped like the interior of an empty egg, grouped about a table which took the exact shape of the room, leaving but the narrow surrounding bench on which they sat; built against the wall behind their heads the shoulder-ribs of benches which seemed to be carved out of the thickness of the wall.

Just aft of the cabin is the cook's galley; the stove of provisions and coal, and her aft are more banks built about another table. From the counter-light and lockers were displayed (the captain called the latter a "barge") and I looked and listened for a moment, and then the crew gathered in bad weather when there is no fishing. Sometimes they spend days together in this cabin, with the result that you experienced fishermen were not to be a man-of-war crew. The missions kept the schooners supplied with great piles of magazines.

The deck the men were loading blocks of ice into the hold where the fish are stored in a series of bins, the best sides of which are slipped into place as the cargo increases. Forward were the seats of stores, nine in each set inside one another like glasses on a restaurant shelf. There are a sail and four trawl tacks to each story, and an item of three and a half miles of trawl; "was a mile and one-half mile. And when you consider that each man spends his days setting and hauling in his three and a half miles of trawl, you can see that the only lady man aboard, for he is sure of four or five hours' sleep every night. When the dories come in with the day's catch each man throws his fish aboard, then climbs over the side himself. The deck is divided into a series of pens

(Continued on page 21)

The schooner "Alice" of Gloucester, a type of the Newfoundland fishing smack

work-ship. His skipper told him to make his comfortable with a crate of good pork according to the directions in the first Aid book. But he had sustained a compound fracture, and before the catch was over and he could get where in a hospital the harm was done and the leg had to be amputated.

The story is simply told, for your Newfoundland fisherman is a self-contained man and he does not reason about the dangers of his calling.

Inquire among the fishermen on T Wharf and you will stumble on other cases. You will find that the shoe-string tender is but one of these fishermen who have recently come out of the Marine Hospital in Boston with one leg gone. In each case the report in the newspaper has been saved if the patient had received prompt surgical care.

A few years ago, when the United States was engaged in one of those periodic disputes which arise with England over the fishery rights off the Canadian coast, a representative of the State Department went to the scene of the trouble in certain points which could not be settled from Washington. He went from Boston on a revenue cutter, and Dr. Thomas W. Nelson of the United States Public Health and Marine Hospital Service was medical officer on board.

Word passed about the fishing fleet in the treaty by Newfoundland that a dory was aboard the revenue cutter. It was unexpected both for the dory crew, and the doctor was faced with the strange bones, administering medicines, and treating stubborn "gummy sores."

The experience crystallized in the mind of Dr. Nelson an idea which had been in solution there some time.

Why, he reasoned, should Uncle Sam, who subsidizes the lives of seamen on shore with a series of hospitals that girdle the coast, neglect the thousands of fishermen on the Newfoundland Banks who are engaged in the most dangerous trade there in America and one of the most important?

No other nation allows her fishermen to run the necessary as well as the necessary risks of the trade. The neutral fishing-banks of the North Sea are patrolled by three hospital and four dispensary ships sent out from England, and on spring when the French fleet sets sail these sails with her the St. Francis d'Assise, with her complete dispensary and hospital equipment and her scientific outfit and ships. All summer she cruises off the coast of the Grand Banks, and schooners from all ports, when they have a sick or wounded man aboard, fall her with a half-masted flag. Many a schooner out of an American port has been fortunate enough to fall in with her in time of need, and there is but one opinion among those who have experienced her hospital as on the Malabar and expert crew displayed by their French boat.

But, in the fall the fishing hospital must go back

## THE INVENTIONS OF BIGGS

HE was a renowned looking sort of individual, and it was with a certain commendable hesitation that he approached the office of the Stranded Inventors' Friendly Aid Society to seek its possible assistance in putting his great idea on the market. Biggs was a wizard in his own way, and just as Edison had invented many articles of undoubted value to the world, Biggs had put in much time in the devising of schemes of no use whatsoever. His schemes, for the chance which could not only be used for the obvious purposes of the inventors, but could be looked on as well on the mouth of a horse or a watering pot for use in the garden, but failed rather. But, as had also his pocket on the table devised to ward off the effects of the unnecessary noise of a great city, so the jangled nerves of sensitive citizens. Now, however, he had the masterpiece of his career.

"Is the manager in?" he asked of the postman behind the mahogany desk.

"I am the manager," said the obsequious individual addressed. "What can I do for you?"

"I have an invention here, sir," said Biggs, "that I believe will have a great sale if I can find any one to put it on the market."

He handed to the man at the desk an umbrella, with a horn handle shaped and made a metaphor on a small scale.

"Humph," said the manager. "What's this? I don't see anything very novel about this."

Biggs resumed possession of the umbrella, and, holding it up with the handle directly over the seat of the manager, passed a small button at the side, and immediately the diamond sculpture of his coat disappeared.

"You have a diamond scarf pin, I see," said he.

"Yes," said the manager, placing his hand bravely on the spot where that treasured possession had been, and then, drawing his knee, he leaped to his feet.

"Hold on a moment," said Biggs, stepping back and opening the umbrella. "Don't get excited. There's your pin—inside the umbrella, sir."

"Grossness!" cried the manager.

Biggs laughed, and, after closing the umbrella once

"You still have, but watch," said Biggs, as he pressed the button a second time. The manager watched, and in a moment had the nervous liveliness of seeing that roll of bills pop out of his pocket and disappear into the metaphoric mass of the mahogany.

"Disfranchisement!" he said. "What—what do you call that infernal thing any more?"

"It is my patent vacuum pickpocket," smiled Biggs.

"DOROTHY, WOULDN'T YOU SAY 'HOW DO YOU DO' TO MRS. DOBBERN?"

"I CAN'T, MOTHER. I DON'T KNOW HER NUMBER."

"FOR ME ON CRUMBED THROATPIECES, NAKED TRAINS, FIFTH AVENUE SMITHSIES, AND OTHER PHASES WHERE PERKETS DO MOSTLY CONGREGATE. IT IS A SORT OF VARIETY CLEAR-OUT, DECORATED IN SWEET SAFE, AND GLOWING THE MILBERTS ADJACENT AND HAZARDOUS LENSES OF THE PROBABILITY WEAVER. COULD YOU PUT THIS ON THE MARKET?"

"Why—yes, I suppose so," said the manager. "But look here—if this thing works the way you say, why don't you work it yourself? There's a steady income in it."

"Yes," said Biggs, "but you see I'm honored. I could never become a pickpocket myself, but if we could form a company—well, dividends are different. I'd take a dividend where I couldn't run off with a man's purse."

It was at this point that the manager faltered and Biggs walked forth into the world with an umbrella fairly bulging with personal property of a portable nature.

### INSIDIOUS

"My tablet gives me a haunch every morning," said Charlie.

"Ah," said Slickers, "it's a sort of encephalometer. I suppose."

### DIFFERENT AGAIN

"By Jove, Dobbers," said Clamphigh, "you don't really mean to tell me that a nice girl like that, my only daughter

of a charming widow worth seven million dollars, doesn't interest you?"

"Not in the least," said Dobbers. "I'm interesting myself in her mother."

### A FINANCIAL EXPLANATION

"What, sir?" cried Mr. Rickop, "what does this mean? My daughter sitting on your lap, sir?"

"Yes, your Mr. Rickop," said Sluggly. "You see, sir, I have just suggested a consolidation of our interests, and I have undertaken to act as a Holding Company until the merger is completed according to established forms."

### A SUGGESTIVE SUBSTITUTE

Henry had finished his prayers, all but the Amen, and there he stood.

"Well, dear," said his mother, "do you—you know the last word—Amen?"

"No, mother," replied Henry. "I ain't gone to say that my name. I have read it; your little book on good manners, and it says R. N. N. P. is the proper form."

### TOMMY'S QUESTIONS

Yes, Tommy's at it day and night. In questions here he takes delight.

"Why don't the four-fives roar?"

And "Who discovered Europe, paw?"

"If Mister Bulling wanted to send a telegram off to a friend,

Would he string lines of wire over a row of telepoles on the slope?"

And once he asks at five and said,

"If Mister Roundshaw was dead,

And through with all his miser hum,

Would he become a Roundshaw?"

"Paw, what becomes of all the noise

That's made by little girls and boys?"

And "If a Chinaman should drop

'Pon a rock, hop, hark, hark,

Would he go right to smash like all

Our china plates do when they fall?"

And "If the sun shines on a day,

Why ain't it always just today?

And "If a widow has a pane,

Could mother make it well again

With one of all the things I have to take

Whenever I have stomach-ache?"

"How much d'ye think a couplet

Would better pay to show his foot

If he were shewn and rubber boots

Ye cover up his foot-sole-woods?"

"Did Nook have shectors on the ark?

And how he saved the whale and shark

If ye a new he kept 'em down below

The carried 'em along in tows?"

Yes, so it goes both day and night.

In questions here he takes delight.

He seems to think that I am a

Complete Encyclopedist!

# NEW YORK'S NEW GATEWAY

The Remarkable Features of the Grand Central Terminal, the Splendid Structure that is Opened to the Public this Month, as the Consummation of a Prodigious Task Wonderfully Accomplished

BY WILLIAM INGLIS

**J**ULIEN CENEAR was a good man in his day, but he could not tell where to place the gate of a modern city. When he built a gate it was in a city wall, strong enough to fence out the enemy on occasion. He wanted a good broad road into and out of it and considered the job done. If Cenear should pass to New York, the thing that probably would bewilder him most would be to discover the city gate at the very heart of business and traffic—in Forty-second Street, half-way between the river.

One can imagine the architects and engineers of this most wonderful city gate—the new Grand Central Terminal—kindly explaining things to Cenear and, at the same time, working him with these polite words: "Yes, we have fortifications for our gate, but you can't see them from here. They are down at the end of Long Island Sound, one hundred miles to the east, and at Paddy Black, a score of miles to the south. We don't try to fence out the barbarians; we welcome them by the millions every year and put them to work at good pay and make each one a sovereign if he'll bother to take out his papers. The gate of the city that you see here is made only to bring people in and take people out without losing a moment of time.

The one thing that scares every American odd is the fear that somehow he may lose one moment of time. To save that moment he will put his neck in peril every hour. Here we have a great gate to the very hub of the city. Its chief function is to save time. Those who enter or depart travel scores or thousands of miles by steam or by electricity. They come in at this hub, stop instantly into their proper paths, and reach each city and silently as a breath from a mirror. It is in the simple truth, O Cenear, that we would bring in here all the legions you ever commanded, drain them, and send each man on his way home—east side, west side, up or down the town—in one moment.

Hadn't they been enlightened by the kind architects and engineers, one can imagine Cenear staggering back in his grateful bewilderment and nodding and sighing words. Yet they would have told him one-truth of the whole truth about the wonders of the new and beautiful terminal. Even a modern man cannot believe them unless he actually goes and sees for himself—perhaps not even then. The achievement is so stupendous that it strains the senses. During the last eight years an army of skilled men has been tearing down and setting away more than one hun-

dered log buildings and many small ones from the newly acquired acres of twenty city blocks; blasting, quarrying, and clearing away from the north their sites three million cubic yards of stone; piling upon the thus completed site of thirty city blocks, or eighty acres, the mighty buildings and myriad interlocking tracks that go to make up this most astounding railroad terminal as a total cost of one hundred and eighty millions of dollars. It is useless to quote more figures here, for by this time millions seem as common as sparrows and the mind refuses to take them in.

All of this was done without disturbing traffic, without halting or delaying the eight hundred trains that come in and go out every day, without hindering the movements of the two millions of passengers who use the terminal every month. (Millions again! This word is stopped.)

Engineers are the true miracle-workers of these days. Doctors have been known to take out a man's stomach and put him together again, so that after a long rest he could resume his day's work. But in this case the operation was performed by the use of one million pounds of dynamite, the lightning was done in and upon the midst of a continuous, and, at the same time, all the functions of that region were discharged in a perfectly normal way—just as if the population whose stomach was removed had mainly gone on reading and answering letters, signing contracts, making successful deals, etc., all while the doctors were cutting away and moving him together again. Frequently even those who sigh for the good old times that are no more will confess that this was a feat—a true operation.

And what is the result? A colossal and beautiful structure, which, it is hoped, will accommodate the traffic for the next forty years—broad, not assured. One has but to look back a few decades to see how well founded is the doubt of the permanency of this giant of the terminals. When Mowbray Lincoln was a young lawyer he was sent to haul the cars of the new railroad from a depot just about City Hall to the little station at Fourteenth Street, where trains were made up and coupled to their locomotives. Then they hauled a few low stables in Fourth Avenue from Twenty-sixth to Twenty-seventh streets. That was in

The main concourse for passengers upward bound. The New York City Hall could be placed in here with room to spare

1857, but only twelve years later the first Grand Central station was begun in the open country (originally known as Forty-second Street, and when it was finished ten years later people came from far and near to see and marvel. Within ten years an addition had to be built to accommodate incoming trains, and in 1868 the whole structure had to be trespassed and greatly enlarged so as to afford room for five thousand passengers a day. This was the station that had to be torn down to make room for the new terminal. Therefore, in this world of impermanence, where nothing is certain but change, we are justified in wondering what the next Grand Central will be like and whether we'll be here to see it.

He who travels north along Park Avenue from, say, Thirty-ninth Street, gets the best view of the astounding railroad city that has been built in the center of New York. As far north of Forty-second Street as the eye can see the group of buildings included in the new terminal stretch away. Dominating the picture is the main building, fronting Forty-second Street, with Park Avenue split and carried along on either side of it in a broad elevated roadway of steel that begins at the corner of Murray Hill. In design the main building the architects had in mind an expression of the ancient story of a man's end, which is a gateway to a city. Therefore, one finds himself looking upon a front facing an effort of huge, stately portals enclosed by Doric columns, while the central part of the facade is surmounted by a triumphal arch of monumental proportions. Upon this arch a huge clock dial is shown surrounded by a stately group representing Progress supported by Greek and Roman forms. The exterior of the building is of granite and Indiana limestone; the style is of Doric motif modified by the French Renaissance, with only enough ornamentation to relieve the severity of the classic lines. Concerning the aspect presented by the main building, it is well worth to quote these lines from Mr. Whitney Warren:

"The architectural composition consists of three great portals crowned by a sculptural group, the whole in stand as a monument to the glory of commerce as typified by Morrissey, supported by Doric and Ionic columns, and the central part of the facade is surmounted by a triumphal arch of monumental proportions. Upon this arch a huge clock dial is shown surrounded by a stately group representing Progress supported by Greek and Roman forms. The exterior of the building is of granite and Indiana limestone; the style is of Doric motif modified by the French Renaissance, with only enough ornamentation to relieve the severity of the classic lines. Concerning the aspect presented by the main building, it is well worth to quote these lines from Mr. Whitney Warren:

"When a party of visitors was going through the new terminal the other day a young man with a strong, deep, reflective eye asked one of the officials this question: 'How much money was expended in making the plans that give this station so many courtesies and beauties?'"

"Oh, a few hundred," was the official's reply. "That is a few hundred suggestions of courtesies we tried out the sug-

A cross section of the terminal, looking east. Observe the many greatly sloping ramps leading down to and from the surrounding streets and local lines of transportation

# THE PEANUT KID

BY KATHARINE BAKER

ILLUSTRATED BY ARTHUR W. BROWN

MARY AGNES NOLAN was the wildest little white agnon you ever saw, and her usual abode was in the aisle length of the Arcade was no loath bed for her.

There she roiled thoughtfully amid her glistening glasses, and held forth with dreadful frankness to those whom her blue-gray eyes and blue-black hair attracted more than her tongue repelled them.

Yet Mary Agnes's reader was no reviewer, compared with the frantic conversation of her half-brother Hugh in the next stall.

The demonstrator for Madame Privet's Beauty Preparation stretched her pink-and-white nostrils leather across her chin-rose.

"It's a pity that Nature couldn't do more earlier in life," she commented, sarcastically. "Then in spite of her children exactly his own age! It certainly lowers the tone of this low Arcade, in turn it into a day-mare for sick kids."

Oblivious to hostile criticism, the huge young Suede in the last booth pointed away at his sidewalk sign. "Here Jena's, Pearsa's and Peppers," pronounced the sign.

The sick kids, their cream-colored hair bristling in two thousand various directions, their dust-colored clothes for as the road is dusty, and obviously with hold by an restraining, maternal hand—the sick kids slowly and resolutely filled paper-lugs with pins, cutting each alternate out as they proceeded, and tossing the sheets unceremoniously on the Arcade floor.

"Hey, wouldn't that jar you?" asked the demonstrator. "This place is just to look like the South Street Market Day."

Mary Agnes had no metropolitan experience, and South Street on Market Day was a new scene to her, but she got the idea.

"I'm gonna get it," she announced, determinedly, opened her little gate, and marched down to the peanut booth. "Look n-here, what do you kids think you're at?" inspired the spirited Mary Agnes. "This is a high-class place, and you can deposit your peanut stuff in the rubbish can, like it will you?"

The sign-posting Suede held his crooked brush and held reminiscent eyes on this snapping, fiery visitor. His range of speech turned over and lay down. Transferring his gun to the offensive kids, he impudently rescued the youngest and dirtiest, who was gloriously balancing on the topmost step of a ladder. Mary Agnes observed that the Suede was not clean.

Now the scrawny infant, frothing the spit of some affinity behind that hostile front, approached Mary Agnes, bearing a handful of peanuts, and with an engaging grin stuffed them into the pocket of her stately little apron. To accomplish this he stood on his toes, and his fat necks suddenly jerking under him, here down heavily on the pocket.

The fluffy stuff flew beneath the strain, and his fingers left a gray print on the pocket edge, but

nobody minded except Mary Agnes. All the others seemed approval.

"Somebody hit a box, Mary Agnes stood with half-open mouth. The peanut man got under way at last.

"That's right, Mom," he supported her. "That's right, kids. Get the brown."

But it appeared there was no brown.

"Well I'll learn you, I volunteered the eldest kid obligingly to Mary Agnes.

Mary Agnes, however, had had shillies nowhere all her life. She was not going to drift into any such relation with this trash.

"You'll need a brown every day, she said feebly. "Get one of your own. Then you'll have it."

"That's right, Mom," agreed the peanut man. "A double of the kid's behavior crossed his mind. "You must excuse their manners," he urged, anxiously. "They got no mother." His face clouded.

The demonstrator surveyed Mary Agnes on her return.

"Well, you made quite a hit with your Morsum friend. He looked liked to drink. Ain't he asked you for your steady company?"

"No, I gotta get me a few dozens of new agnon in these pants stays here," was all Mary Agnes answered, as she resolutely walked the polluted peanut.

Mary Agnes was destined to become a cult. Next day the eldest peanut girl, aged eight, began to tie up her rebellious hair with a black ribbon. Within the week she appeared in a juttled little apron, a mockery of Mary Agnes's hair originals, a thing of coarse muslin and jagged stitches, which he half an hour took on the aspect of a dishcloth.

"I'm Lena. I got a nut like yours," she called,

perfectly good years?" asked the demonstrator, in deep disgust.

"If there's one thing in the world I'm crazy for, it's a devilish crab for look," Mary Agnes addressed the demonstrator over her morning.

"They say you can get the grandest ones you ever saw at the delisettes, a block down the boardwalk," coaxed the demonstrator. "I don't eat 'em myself. My gentleman friend says they don't contain a balanced ration, and I got too much regard for my complexion."

Mary Agnes had an scruple. She removed her little apron at once. Starting forth on her errand, she found the youngest peanut had passed to her gate, regarding her with rept attention.

"Go away," she directed him peremptorily. With difficulty the peanut kid parted his fat, adhesive person from the gate, and turned to walk by for side, a thoughtful, stony hand engaged in hair.

Mary Agnes shook his off. Grief without remedy marred his radiance at this unresponsive reception. Dividing that his dream would have been too lonely, he rolled in her wake to the boardwalk outside, where the bathing crowd on the beach below was his first interest.

Mary Agnes, following, took his lead, saw the elder peanut children walking along the perilous edge of the boardwalk outside the fence. Filled on his knee, the youngest was wiggling between the rails to join them. His about eyes noted anxiously above the sand.

Mary Agnes dropped her crab with a brittle crash and seized the scandalously infant. She set him down vigorously on the boardwalk.

"Don't let me see you do that again," she warned him, and caught up her discarded crab, that now creaked only inside its paper. "You older kids ought have some sense," she denounced the file outside the rail.

The crab was badly damaged in appearance, and bits of shell had gone all through it.

"It does seem to me unfortunes," grumbled the demonstrator, "that the world's got to be simply down with kids so you can't hardly avoid stepping on 'em."

"I promise it's because so few of 'em live to grow up," retorted Mary Agnes. "They're always venturing out beyond their depth, or fallin' off the board walk, or runnin' in front of autos. Anyway, I warn that kid's life for his success. But he won't last long."

The tall, well-blended body of the peanut man emerged from his booth and came swinging down the Arcade.

"Bingham Young's comin' to call," announced the malicious demonstrator.

Behind him, with larger severity of welcome, trailed his yellow-headed fellows.

The Suede sat down on a high stool and fixed his satisfied gaze on Mary Agnes.

"We got a brown," he reported, brightly, after a long pause.

"No I see," Mary Agnes was discourteously brief and cold. "What 'ill you have?" she inquired, presently.

The Suede looked around for inspiration.

"Well, want a grape short, kids?" he appealed to his crew, who had now come sweltering to his booth.

They approved. Mary Agnes began to show balls of violet-reduced ice into ball glasses.

As she filled the first glass a slight connection attracted her eye. The youngest kid had climbed from the gate to the counter, and was just setting his feet on the first row of a pyramid of bottles.

Mary Agnes leaped to detach him. The infant collapsed against her and clasped his arms about her neck as closely himself. In generous acknowledgment of her timely support he then pressed his open mouth against her cheek with a fatuous smile. Mary Agnes handed by her heart.

"It's gonna be a sister," explained the Suede, removing his child from the counter to a stool. "He's gonna be a nurse, if you don't look out,"

pointing before Mary Agnes's banner. "I'd do my last hair, you see, too."

"It's an aw for a kill to do her hair," decried Mary Agnes, adverse to her own old remark.

"Oh yes," they reassured her. "I'm plenty old enough. I'm eight. Nina's seven," she declared further, "and Coffin six, and there's nobody five or four, and the baby's three."

"An, what was the use of wastin' three other two

"If she marries a Lutheran, that's what she gets"

spurred Mary Agnes, tartly, and earned the wet kiss with her backhanded.

There was a silence while the violet lace diminished and disappeared.

"We got tickets for the movie tonight," remarked Mr. Jensen, as he laid a half-dollar on the rubber mat.

"What's your movie?"

"I started hopefully at her."

"I gotta' read to business. I don't think you'll be hazarded," returned Mary Agnes in a discouraging tone.

The Burde's face fell. She felt slightly ashamed. It did seem like lying a cold hand on the heart of his staid old friend.

"I'm afraid," she said, "that the ladies' league, then turned and followed the ribbon line of kids toward his own stall."

"Isn't that the terrible number?" asked the demonstrator, innocently. "I do love to see a man take his children along with him when he goes to court."

"Yes, Miss," the demonstrator held a bottle of face cream in a group of customers. "The number is certainly kind on the complexion. I don't do what you would look like if I didn't use this cream regular. Yes, of course it might seem expensive, but you can't expect the best ingredients in the cheap ranges. Yes, ma'am, this is truly a bottle, but then you know what you're getting! A lady's complexion is more important to her than the difference. No, I don't keep any more priced cream. We prefer our customers to like the best, and we think they appreciate it. Just try that. Bah it is well."

And much laughter, the customer, a half-dollar, well dressed young wife, had dabbed experimental touches of cream upon their faces.

A curiously wandering fire-peddler, coveting their luxurious air, set down his double snail case beside them, and opened it.

"Irish cows, very cheap," he began, incoherently.

"I wish you had stall near the low merchant opposite. His taxes prevented him, then it's Syria. The peddler glared at the stall, and the foreign babel arose and fumed like Adams and Phipps, rivers of Damascus.

"Ah, who's the matter with you?" objected the outraged demonstrator, finding her sales endangered. "Why can't you of you take look at me, without explain? If any of you see a penny pass him up, he's bound to have been here."

"Yid!" cried the angry merchant. "He is American, I am Syrian. And he has no right."

"That's so," asserted Mary Agnes. "Naham got the job here because of this plan. You'll have to move on."

By that time the prospective customers had fled. Perceiving this, the Armenian moved daintily away. At his heels followed Naham's blighting force.

"Keep read, Naham," advised the demonstrator. "You've wasted most everything on to him, I guess. This is a Progressive crowd all right."

Naham returned to his stall. But in a few minutes he returned the aisle, leaving a small hare bag the laid at on Mary Agnes's counter, smiling gratefully.

"I am obliged. Yes," he declared. "Mary Agnes was not overzealous."

"That ain't business," she retorted haughtily. "Nobody gets rich handle' out graft like that."

She waved away the bag, Naham was highly pleased. He admired economical women.

"I'd ain't d'ed," he informed her. "Doesn't our dress-makers, A, B, and C. Id is only C."

"Still Mary Agnes took her head. There from the side of her eye she beheld the peasant man's snarling expression. Sheer before she caught a surly look on his olive face. Mary Agnes smiled brightly at the Syrian.

"I'm glad to see you, Naham," she said. She hung the bag upon her arm, and traced the effect from different angles.

The Burde scratched his eye, then a mill in the wall, and snuggled up to the bench, leaving the sick lady in charge.

"I'm a strong! Naham, all of a heap. By it ain't white," gurgled the demonstrator, sympathetically.

Then Mary Agnes took the new hare bag, Gless C, under the counter, between the shelves and the back of her own chair.

"Not anything," asked the Fairy Fruit man, who dwelt not beyond the Princeton preparation.

"The first man ever screwing up, back head, and a murderer. E-factly there was nothing about him that would prove altering to a lady. The demonstrator made indifferent answer.

"None, Naham's secretary money spared my sale. How's trade with you?"

"Appreciated," appreciatively gurgled the fruit man. "These former folks think they gets here a bit months' expense before they can be highly diverted to a model. There's a good deal of the devil, anyway. People won't spend while they keep stirring up this here tariff question. It's fair, and you'll be sure to see it in a while, and your profit's some high in business there's no profit for anybody."

He split a peach and laid half of it below the demonstrator.

"I lose money right along," he declared, gloomily, swallowing the other half. "And every year they raise the rat on us."

"That so?" asked the haughty demonstrator. "Why if you can't run a business!"

The fruit man began to speak, sought himself, looked at her disapprovingly a moment, and withdrew into the cell.

"I got too weary of these chronic knackers," confided the demonstrator to Mary Agnes. "That fruit man don't use his head to think with. And ain't he gorgeous!" She lifted the half peach with affected delight, examined it, and laid it carefully down again.

"I don't dare to eat anything so valuable," she declared. "It would weary my customers' friend if I accepted such gifts. From a stand-patler, too. My customers' friend's a single leave," she continued, dreamily. "He'd hold in any party. Neither do I. I'm a sufferer, myself. What do you suppose is your Swedish friend's convictions?"

"I don't," said Mary Agnes, contemptuously. "They're a hard-head and my father says. You can't persuade 'em of anything, and they always vote solid."

"Well, my gentleman friend says, however they vote, there's something can't be bought," offered the demonstrator. Mary Agnes, with the laudable consciousness of a total necessity, refused to admit virtue in this line.

"I guess they're no abolitionists," she suggested. "In Mary Agnes's knowledge, her father's vote re-verted with every wind of fortune."

When the Swede returned, he came straight to Mary Agnes's booth, and his face had cleared beautifully.

"They come that singer again," the demonstrator began to press herself. "My gentleman friend wouldn't like it, if he seen the way that fellow jukes me. But, my dear, you gotta have some pleasure. He's a right 'n of took his vacation early, if he'd expected to keep me excited."

The plans of the short-haired beauty was silent by a half. The youth whose exact figure operated without manual direction, while his tireless huge-poued both naturally, now rising from his polished stool, snatched her by the wrist.

The demonstrator hastily adjusted an available hair-pin, and passed a chain over her nose.

"Want a stationer's card, my good friend, mindfully, morning a business order."

The indelible youth struck his hands in the pockets of his slick jacket, and bowed gracefully against the counter.

"I'm lookin' for a girl to take my old girl's place," he sang into the air, "but she's gone, so I'm asking, with my voice of leave to a potential secrecy."

"Were you thinkin' I'd do it?" she inquired.

He studied the lovely delineation of a ribbon in her face.

"I've seen worse," he admitted. "This Princeton stuff's all in the good. That pink necktie means would do. D. Wiley. I'll surely take a lot of it home to my winter girl."

"You have your nerve with you," declared the impassive demonstrator, "but her just, it is also expensive the way your winter girl would like to look, and can't. It grew on me. However, for three dollars I'll give you a good deal of it, but I'll not give for actual defects than any other range."

"Three dollars!" echoed the singer. "Manum! Your stuff don't cost three dollars!"

"It costs you that," asserted the demonstrator, grimly. "I'm it costs about four and a half cents a box, but we gotta make it a small box, and a small box."

"Oh, look!" interrupted Mary Agnes. "What's that crowd around the handstand in the hand's corner? What's up?"

There was indeed a group of men in black, thick around the hand-stand, and the players were forming in matching order.

"I've seen Jean's game get a model for lawyer, shrike in a small box, resting by."

Little boys know everything. The hand-stand watched leisurely to the press, both, and there stopped. The silk-belted men advanced.

Mary Agnes was startled. It is known to run a present stand, while all the other young men of your race bring their little gifts to the fair, and she is not to be outdone."

"I'd heard some demonstration was scheduled," remarked the singer.

"I'm sorry," the demonstrator replied, "I'd heard it with my own interest, what's he done?"

Mary Agnes looked on.

"It's the fellow roared several men last spring, and got his leg broken. Captain Elmer was drowned, and his wife was killed, and her child is dead. I think I'll go view the remains."

"I'll go along," stated the demonstrator, slipping out of her stall. Mary Agnes wanted to go too. But of course she wouldn't.

"You oughtn't to leave your place," she said. "You'll miss me."

"You oughtn't to do anything you want, in this world," returned the demonstrator, "but I'll go along, if you generally do. These Princeton people ain't got no trick on me as it is."

"Elmer was the best man I ever saw, and the singer, as she fell into step with him. "Left his all them baby-crooked kids in support, just when he can't do this summer, second of his leg. There's that hand little tight, and he's a good man."

The youngest present-vender, returning from a visit in the crowd, was running round the crowd, vainly striving to pierce the congest mass. Presently he gave up the attempt, and withdrawing to the sun-bomb outside, snatched laboriously to attend the lot.

The hand had ceased playing. One of the silk-belted men began to speak. Hanging over the front of his head, he said, "I'm sorry, but I'm not a member of his numerous friends, as he passed the heroic virtues in review."

The song he sang the present man had been a foreman. With courage appealed in Mary Agnes. But she grew impatient at the glittering show of generalities.

Defiant she turned a short into a glass, and held the next small one in her hand, and she could do it. "I think I'll go view the remains."

"You oughtn't to do anything you want, in this world," returned the demonstrator, "but I'll go along, if you generally do. These Princeton people ain't got no trick on me as it is."

"Elmer was the best man I ever saw, and the singer, as she fell into step with him. "Left his all them baby-crooked kids in support, just when he can't do this summer, second of his leg. There's that hand little tight, and he's a good man."

The youngest present-vender, returning from a visit in the crowd, was running round the crowd, vainly striving to pierce the congest mass. Presently he gave up the attempt, and withdrawing to the sun-bomb outside, snatched laboriously to attend the lot.

The hand had ceased playing. One of the silk-belted men began to speak. Hanging over the front of his head, he said, "I'm sorry, but I'm not a member of his numerous friends, as he passed the heroic virtues in review."

"I'm looking for a girl to take my old girl's place," he sang

He opened an immense hat on the counter, displaying an absolute product set in silver, and freed Mary Agnes' steady with blue eyes like fire.

Mary Agnes's eyebrows began to stir, and to their depth, but she mounted, unalarmed, friend. The new accession of gift-bearing had educated her in poise.

"What's that for?" she asked, with excessive brevity.

"You're paid' with me," explained the Swede, now virtuous in his tone. "You can give back the love too."

"Oh, indeed?" said Mary Agnes, critically, recollection of an audience in the next stall. "My, ain't your family best big enough already?"

Mary Agnes, with false interest.

The demonstrator gurgled.

The Swede lowered his eyes. He coughed almost while in his lamed face that began to flash about, the unvarnished case upon Mary Agnes as she watched that glistening watch, a dangerous, slow fairy outside her experience.

"But there's nothing to be done," she fortified herself, and obediently knowing him, she spoke in the demonstrator. "There's an Irish lady loses our silver's married to a Swede. He gets drunk and beats her senseless and, and the police gets interested regular."

Mary Agnes began to polish the counter absently, coming ever closer to the Swede's unsharpened case. "I will try for him, though, at least he's got a man's job. He's a fisherman. Some are more useful."

Even Jensen began to speak, but thought better of it. He felt that he had no business to be there.

"If a Catholic marries a Lutheran, that's what she gets," observed the inimitable Mary Agnes, "and it's what she deserves."

Taking the witness stand, the present man withdrew. It was true, there was nothing to be done, but his kneeling had worked fit to set the place silent as he stood back to see some business.

## AN AMERICAN PRIMROSE

MEET ELISE FENICOM, THE STAR OF "PRIMROSE," THE DRAMA FROM THE PROMPT OF DE FLESH AND CHALLANTY WHICH HAS BEEN PLAYING IN THE NEW YORK CITY THEATRE.

# Repair Expense in One Million Miles Averaged 29.2 Cents per 1000 Miles

## SWORN Statements

Every figure in this advertisement is supported by the SWORN statements of car owners whose names, addresses, and reports appear in our Upkeep Books.

## Mileage Registered

The mileage credited each car was made by a regular stock-model Winton Six in the individual service of the owner, between the following dates, and was registered by odometer:

1912 records—April 1, 1912 to Nov. 30, 1912  
 1911 records—April 1, 1911 to Nov. 30, 1911  
 1910 records—April 1, 1910 to Nov. 30, 1910  
 1909 records—Nov. 1, 1908 to June 30, 1909  
 1908 records—Nov. 1, 1907 to June 30, 1908

## TOTAL Repair Expense

The repair expense charged against each car is sworn to by the owner as "the total cost of repairs on said automobile between said dates (exclusive of fire repairs)."

## Passed Upon by Judges

Each mileage and expense report was passed upon and accepted by a Committee of Judges having no connection with the Winton Company. These Judges exercised their own judgment without restriction, and have themselves sworn to their annual decisions.

## Trustworthy Figures

Every possible precaution has been taken to render these reports free from error, in order that automobile buyers might have their consideration an absolutely reliable set of figures showing the actual cost of keeping a high-grade car in operation after purchase.

## Here Are the Results For Five Years:

YEAR	CARS	TOTAL MILEAGE	TOTAL REPAIR EXPENSE
1912	20	290,759	\$131.96
1911	20	294,233.9	20.88
1910	10	165,901.9	5.96
1909	10	118,503	127.30
1908	10	63,827.4	15.13
TOTAL	70	1,035,185.2	\$302.25

Grand average—29.2 cents per 1000 miles.

## WINTON SIX

## Repair expense is the acid test of a car's merit

Low repair expense means vastly more than money saved.

When repairs become necessary, expense is only part of the owner's loss.

For, every time a repair is needed, the car owner loses some of his respect for his car, some of his pride in its ownership, and some of his faith in its merit.

Every time a car goes into the repair shop, the owner suffers the loss of its use.

So that, financially and otherwise, the man whose car is undergoing repairs is, temporarily at least, worse off than the man who has no car at all.

## Utility or Expense?

The motor car is a utility, pure and simple.

Its only value is in its ability to carry its passengers from place to place.

And the measure of its value increases in proportion as it is able to do this safely, quickly, quietly, comfortably, and surely.

A car in the repair shop falls in every one of these respects, and its failure costs the owner a repair bill that makes the car just that much more of an expense to him.

And the chagrin and humiliation of it all is that the owner thereby pays an additional price to make his car do the very work, service, that he supposed he paid for in the purchase price.

Little wonder, then, that repair bills and the losses they represent are the bane of motorists.

Little wonder, either, that car buyers want cars that will free them from repair expense, laudible, annoying, and losses.

## These Owners Are Satisfied

Winton Six owners know the joy of freedom from repair bills.

These seven figures show how Winton Six owners, traveling stupendous mileage, in all parts of the country and in all seasons, during five years, were free from the repair-expense bugbear, and had always at their service a car ready and able to carry its passengers from place to place, safely, quickly, quietly, comfortably, and surely.

Winton Six owners know from experience the meaning of satisfaction.

What the Winton Six has done for five years in the service of these owners it can do for you, for the Winton Six today is the same car we have been making continuously since June, 1907; it is now on its sixth year without having required a single radical change in design or construction.

Let us send you our library-size catalog, and also our Upkeep Book that gives complete data covering the cars that placed the world's lowest repair expense record at 29.2 cents per 1000 miles.

Write today.

## King George's Coach

English royal coach of state is an old and honorable institution. This carriage was built in the year 1731, being first used at the coronation of George III. Designed by the architect, William Chambers, it is deemed a magnificent piece of state furniture. It weighs about four tons and is covered with gilt.

The body is supported by four tellons, and the coachman's box is on a large wheel surrounded by designs of sun plants. The design of eight pairs of ladies with spears is emblematic of the victories won by Great Britain over her enemies.

On the roof are shown figures of three boys adorned with flowers. They represent the United Kingdom, and they support the imperial crown on their heads. In their hands they hold the scepter, sword of state, and other insignia of authority. The panels of the upper portion of the coach are of beveled glass, the lower of copper painted in enamel.

The wheels of this coach are in imitation of those of the triumphal chariots of the ancient Romans; the harness is made of red morocco leather with ornaments of silver gilt. The reins being of crimson silk and the saddles of crimson velvet embroidered with gold.

The royal coach is not the only armorial equipage that figures in British state ceremonies. There is the Speaker's state coach, which is the oldest carriage in England. It is still in usable condition. This coach was built in the seventeenth century and there is a tradition to the effect that Oliver Cromwell once rode in it. The seat occupied the Speaker is occupied by the chaplain and train horses. Earl Spencer has his coat of arms and coat inserted among the details of the sides of the coach.

State carriages, which once to be used in England about the middle of the nineteenth century, were discontinued from many. The first coach ever made in England was ordered by the Duke of Rutland in 1765. Twelve years later they were in general use and much rivalry existed with regard to their splendor and the number of horses drawing them. In 1818 the celebrated Duke of Devonshire introduced London by appearing in a coach drawn by six horses, and the Earl of Northampton, a year later, was seen to modestly show himself in a coach drawn by eight horses.

The first seat of the seventeenth century the decoration of state coaches marked its highest degree of splendor. The interior was lined with brocade silk or velvet; the wheels also were most sumptuous; the seats were thickly cushioned; the seats were upholstered and carved and carved or painted.

In the old days the coverings used in connection with state carriages were did all kinds of magnificence. There is record of one built in 1625, for the marriage of the reigning Duke of Farnham with Princess Marjorie of Tuscany. The interior woodwork of this equipage was covered with damask and colored silver; the exterior was lined with crimson velvet and gold thread. The roof was supported by eight silver columns and upon these red steel light cases, also of silver, containing lilacs (of the material) in full bloom. In the center of the roof was placed the device of a sun with eight rays on the sides and four long curtains of crimson velvet with silver fringe and gold fringe on the leaves, while at the top of the standards, from which the ends of the curtains were hung, were placed silver suns with faceted silver fruit.

The wheels and the pole were also plated with silver. For the interior of the horses was covered with crimson velvet and embroidered with gold and silver thread. It is said that this coach cost twenty-five thousand ounces of silver and that twenty-five of the best Italian workmen were employed on it for two years.

them. They wished to take the fort, which without artillery, was manifestly impossible. Finally some crossing beam devised a scheme that came near to being successful.

Between the fort and the nearest house there lay on the plain, without carriage and making upon pieces of wood, twelve guns which the French had not had time to take into the fort with them. The position of the guns exposed them to fire from both sides, so it was not thought they would be interfered with, though by way of precaution two of the guns of the fortification were kept loaded upon them.

One night the sentinel heard a noise. He did not the sound continued and did not immediately call after other soldiers, though it seemed to draw further off. When daylight came he was seen under cover of darkness, the insurgents had reached the nearest gun, attached a rope to the barrel, and then, fastening the rope to a captain in the nearest house, had attempted to haul the piece away.

Had it been a military man who tried the trick, he would have succeeded, but the postmen did not know enough, in three volleys under the gun before loading, and consequently the French did not dare fire into the soil which soon became deep enough to stop further progress.

Nevertheless, the besieged were much irritated by the awareness and determined to prevent a repetition of the affair. One mounted the house from which the report issued, but when the walls fell they found that the report was in the air and consequently, uninjured, although blocked for the time by debris. This did not prevent them from firing. The sergeant of the fort remembered having seen stored away in it somewhere a quantity of muskets. He selected twelve of his coolest men, passers and grandees, clothed them in this armor, and covered with steel from head to foot and carrying spears and banners, the men started heavily, but were met at the fort and moved in dead silence toward the covered guns, the white smoke curling about their mailed figures, and bullets pattering harmlessly against armor plate and corselet. Many of the passers were hurled, struck and believed the report. Some were shot, but the soldiers, while after the first action moment was passed, their own corselets, helmets, and shields broke like ordinary run of halberd.

The twelve letter-by knights returned safely from their raid, having spiked the guns and cut the rope. Though many times hit, they had not one wound among them. The sergeant was so satisfied with what he had strangely acquired as a "brassard," so that it fell off and left his arm exposed. The insurgents were disappointed, and though the blockade continued, there was little more fighting and the besieged were soon relieved by their friends.

## Always on Guard

No matter where a ship may be along the American coast, no matter how dark, or cold, or stormy the night, the coast guard is on watch, patrolling the nearest beach or rocky cliffs.

This man, always on guard, could, by his own unsupported efforts, do little to save life, or to guide ships away from perilous points.

As a unit in an efficient system and able, at a moment's notice, to command the service of his nearby station, he becomes a power to whom all ship owners and passengers are indebted.

In the same way, the Bell Telephone in your home and office is always on guard.

By itself, it is only an ingenious instrument; but as a vital unit in the Bell System, which links together seven million other telephones in all parts of this country, that single telephone instrument becomes a power to help you at any moment of any hour, day or night.

It costs unwearingly effort and millions of dollars to keep the Bell System always on guard, but this is the only kind of service that can adequately take care of the social and commercial needs of all the people of a Nation.

## The Last Fight in Armor

The last fight in armor occurred during Napoleon's time. In 1799, the main army of the French having withdrawn from the town of Agincourt, a body of some 1000 horsemen remained on the plain, whose halberdiers were well disposed toward him. But the remnants of the retreating army were holed by horse and, rising in revolt, pursued the town and drove the Frenchmen into the fortress, which was small and had not provisions enough to hold the insurgents of day with its garrison.

These insurgents numbered ten or twelve thousand. They hurled the sword and bayoneted the houses so that they were safe from attack, but this did not satisfy

## Ceylon Tea

Tea plantations in Ceylon have been in existence since thirty years, but the annual output of black tea is estimated to reach \$20,000,000 in value. Formerly coffee constituted Ceylon's main industry, but after a disease of the plant in Java in cultivation was discovered. Many planters, however, reared themselves by tea and rubber. The acreage is not large, but the output of southern India. A better variety than from sight to six years create a tea while a second's salary averages \$200 a month.

Plant necessary to tea cultivation is costly but very labor-saving. The work itself is not hard, only the climate makes it unclean. What is wanted is a man who knows how to watch moisture and food of the soil, to keep the weevils away from the tea, to keep the tea from being too dry, but not too wet, and to keep the tea from being too dry, but not too wet, and to keep the tea from being too dry, but not too wet.

## HARPER'S MAGAZINE for FEBRUARY

### The Guest of an Unknown People

MR. VILJALMIER STEFANSSON, whose recent Arctic explorations have awakened world-wide discussion, describes in this installment of his story the first night he spent as a guest of the Carosution Bay Eskimos, who had never before seen a white man. Mr. STEFANSSON presents a remarkable picture of the home life of this primitive people. Illustrated with photographs.

### Casting Ships Away at Sea

The crime of deliberately wrecking or foundering a vessel in order to reflect the insurance upon ship or cargo is known at law as barratry. GEORGE HARDING recounts some daring instances of this practice on the high seas and what followed. It makes a thrilling story, strikingly illustrated with sketches by the author.

### Recent Achievements of Industrial Science

Professor ROBERT KENNEDY DUNNAN discusses some of the latest triumphs of industrial research, such as the preparation of synthetic rubber and ammonia, controlling the amount of nicotine grown by the tobacco plant, fireproofing cotton dress goods, and other extraordinary and interesting advances in science.

### Days in an Ancient Hindoo Capital

MR. F. B. R. HELLENS recounts the quaint and interesting features of "Udaipur the Unspoiled," an ancient city of India still wrapped in the spirit of past centuries. Illustrated with photographs.

### Some Titans of the Prado

An entertaining survey by CHARLES H. CAPPIN of the portraits and other paintings by Titian now gathered in the Prado at Madrid, with some interesting anecdotes of the great Venetian artist's home life and intercourse with royalty. With reproductions of Titian's famous paintings.

### Americanisms in Our Speech

Professor THOMAS R. LUNNBERY offers in his first paper on "Americanisms" a glimpse of some earlier linguistic sins of the same type, which were known as "Scotticisms." An instructive discussion on points of local usage, including both odd and familiar instances.

### Where the Government is Short-sighted

Although Americans are pre-eminently a business people, their Federal government is conducted in some astonishingly unbusiness-like ways. ROBERT W. HUYER discloses some startling conditions in our tax bookkeeping methods at Washington.

### 7 Short Stories and Many Pictures

An unusually varied and engaging assortment of stories by well-known writers. Over seventy illustrations, including drawings in tint and color.

Gilbert Parker's Great Novel—"The Judgment House."

The Gentler Vice

BY FLORIDA PIER  
Virtues and Vices

If people could ever be made to believe that their vice was a virtue, they would doubt, change them at once. But we are each of us convinced that what other people regard as our vices are in reality our most laudable virtues and that criticism of them is more crippling to us, as perhaps never any. Thus, habits or traits of national character, that be national and stick in customs is merely so being a pleased grin to the multitude flow of the nation they portrayed. One does not object to being called material and money mad. She likes it. She caters to it as a tribute to her progress. No other address being called foolish and narrow. She mothers under her mouth. "My strength" and even so does it occur to her that the change was serious, deserving attention. Nations and human beings have the same sort of self-protection, but of the soil being the thing most worthy of protection. No matter what the soil is, they feel it to be the thing that gives them whatever else they may have. The precise kind of characteristics that is so protective of them is a thing they have as an inalienable part, and it is impossible for them to doubt that the world shares it with them. We are all like the woman in the Phillips fable. When the other dairy-maid threw salts on his clothes, he was comforted to know that she at least loved life. He will admit that she has health, but think how well we get on in spite of it. If fairly confident another virtue. We could surely change if we positively desired to. Think of our heterogeneous inheritance! We are potentially everything and anything. If we wished to develop a trait, it is almost superfluous and unnecessary to say that it would be impossible for us to do it. Yet we do change more than the vocabulary! We keep one or two characteristics to struggle with, just as we choose one or two virtues to use in our morning exercises. When we talk about our moral generation with the same disapprobation validity with which we discuss our physical generation. We think them both extremely creditable performances, and having the thing systematic in this way saves the expense of keeping a constant lookout for new needs. It is as though every one had an eternal tooth for the purpose of the purpose of having it filed at stated intervals. It is a type of prevention most internally popular. If by attacking criticism does one's own way it permits of a moral hazard and extremely heated refutation, with a wounded reminder of his being a self-knowledge that you struggle one steadily.

There comes a time in every woman's life when she regrets that "Home, Sweet Home" has already been written, as she goes on cheerfully enjoy creating a new afresh. The feeling comes after one has gone back to try and secure recognition for what one's family consists of, and one's own. The start of awfully and small, one's family pushing valiantly from the rear, and saying "Good luck, good luck" would have been very well, but "Justice must be done you," which is somehow the perfect phrase. One goes down and gets through in somehow, though one has constant difficulty in remembering one's reason for being there. One's value is almost instantly when one asks for justice—nothing to say, one does not justly those words—and one begins to feel at the bottom of the world, as if the way to be truly an unappreciated public, so that one is a little frightened at the thought that that figure will have to be taken about to one's own. When the order is over one returns and is received by one's family. They love you as an exhausted, and of course you are. It is very exhausting demanding to be appreciated. They ask to hear of anything you do and everything the other people said. You tell them of all the forms that remembrance down give you an impression. You recall any devil of a fellow. They chuckle at your recollections. Then they ask, "How did they receive you?"

"I was very reluctantly." "Well, they were a little bad at first; they just stared at me." "The family says." "That would be because they had not seen you and had the way you do. You probably startled them." "Yes, say, with clumping halberds." "Perhaps." "Do you recall, then, that you've brought those atoms?" says your family, and you go with looking heavily reply. "I'm really," says one's family, "it can't be anything else. They're justice because you're so clever." "It is of this point that you want to sing with a perfect bond of creative necessity." "Home, Sweet Home."

Life on the Planets

If the scientist cannot affirm that the planets are inhabited, he knows that some of them are inhabited. Actual life, as we know it, demands oxygen and a medium temperature. With the exception of the moon, the visible spheres have atmosphere comparable to that of our earth. No mental picture of life on Saturn, Uranus, or Neptune can be formed. Saturn has one hundred times less light and heat than the earth, Uranus three hundred and sixty times less, and Neptune thirteen hundred times less. It thus appears to Neptune the great Saturn's year is twenty-six terrestrial years and 161 terrestrial days long; Uranus's is 47 or 48 terrestrial years, with winters of twenty years. Neptune accomplishes its annual revolution in a period equal to 164 terrestrial years and 226 terrestrial days. The three so-called exterior planets are worlds of night and ice, unless an unusual coil, of some nature and volume beyond the conception of the human imagination. And yet they were comfortable medium planets, and their crusts permitted the growth of the considerable warmth of their slowly lying hearts and favored the growth of gigantic plants and animals. A time they the earth was cooling but a drop of ice. The inhabitants of Saturn saw probably the stars, as long as above their heads, the luminous rings of the planet, gilded by the sun, silvered by the changeable light of their traveling moon, or darkened by Saturn's shadow. The human mind cannot imagine life on a planet this kind, but in the atmosphere of Mars and Venus, and in the atmosphere of the earth, it is within the power of the imagination to picture life as those of the terrestrial type. Mars is like that of the terrestrial part regions; the temperature of Venus like that of the terrestrial tropics. Although man could not breathe the atmosphere of the moon or maintain the vital warmth on where cold as Jupiter, he cannot affirm that nothing could live under such conditions of temperature. There are microbes that live without air by fermenting and decomposing oxygen directly from the substances that surround them. Oxygen is found everywhere in the form of chemical combinations, metal oxides, acids, etc. It would be strange could it not be found in the cells of the moon and in the bodies of life on the planets, though there is no oxygen being that exist by extracting the combination of oxygen from the materials known to exist on the planets.

Not in the glacial cold of Neptune, Saturn and Jupiter, and if there is no life on those planets. A planet dense as the sun will do, slowly, in measure as the central fire cools. During the period when an inhabited planet is created the atmosphere inevitably of the planet's surface leads to the means of producing heat, and the means are provided the provisions may become habitable not in retrogression of heat so that every surviving generation is born in a life without it. The species are transferred to the cold, as the planets surface the sun long ago, but all the dead planets were at one time warm and in their warmth there probably existed fauna and flora.

A Famous Pie

On all the great ever cooled, one has attained the magnitude of the pie ordered by Frederick the Great 180 years ago for a feast given in honor of 20,000 soldiers at the end of a campaign. The pie was brought in the table in the most dramatic manner. Toward the conclusion of the feast a strange vehicle drove up the horses drove into the range grounds. The load seemed heavy and every one was curious as to what vehicle it was. The driver of the vehicle's "surprise." The pie, which completely filled the vehicle, contained 1,000 eggs and 100 gallons of milk. It was cooked in an oven built for the purpose in the woods. After the soldiers had partaken of the pie, the driver was left alone to find the way to every one in the village near which the army had been quartered.

Platinum in Jewelry

It is the setting of many precious stones that is now greatly favored over gold. Platinum possesses the property of not detracting from the beauty of any jewel. It is the only metal that does not yellow whereas gold is most obstructive and injures the effect of the fine settings. The price of platinum is, however, about that of gold, and that of right-angled gold and the waste is greater.

Platinum exhibits such a degree of ductility that one ounce of wire made of it may be spun so thin that it will reach many miles.

THE WELL IN THE DESERT

"Well, little man, did you listen to the sermon?"  
"Yeh."  
"And what part did you like best?"  
"The place where you took a drink of water."

Diamond  
(No Clinch)  
Tires  
made of Vitalized Rubber

are built with extra air-room

It's the extra air-room that does the work. The more air-room in your tires means more resiliency, and a greater ability of the tire to absorb the shock of the road, insuring more comfort for you and your passengers—more comfort for your tires.

This more air-room tire does the work easily and will not strain under road usage.

The extra air-room is gained for you without lessening the thickness of the tread or weakening the side walls.

Write today for our new book "How to Get More Mileage Out of Your Tires" - it explains all about the discovery of Vitalized Rubber, also Perfect 3-Point Rim Contact and the Non-Pinch Safety Flap for added tire protection, including the famous Diamond Safety (Squeeze) Tread. Address: The Diamond Rubber Co., Akron, Ohio.

## THE ENCHANTED CITY

All the world knows New York as the relentless city, the workshop of captains of industry, of kings of finance, the lofty temple of the great god Success. How many know its aspect when darkness sweeps its towers of steel and stone? Every worded suggestion is required, and the blinding lights reveal a strange and fascinating fairyland. The photograph above is a view of the city's newest skyscraper, the tallest building in the world, seen from Chambers Street, overlooking City Hall Park.

## COMMENT

## Facing the President

The proposed constitutional amendment adopted by the Senate limiting the service of a President to a single term of six years is substantially identical with the CLAYTON resolution reported to the House by the Committee on Judiciary at the previous session. It reads as follows:

The executive power shall be vested in a President of the United States of America. The term of the office of President shall be six years; and no person who has held the office by election or discharged the powers or duties, or acted as President under the Constitution and laws made in pursuance thereof, shall be eligible to hold again the office by election.

The resolution was adopted by the votes of all of the thirty-one States and the District of Columbia, of seventeen regular Republicans, and of two liberal Republicans—CUNNINGHAM and WOLFE. Although practically a Democratic measure, having originated in the Baltimore platform, it was passed by a non-partisan majority. This fact prompts approval by the House of Representatives, especially by the President, and submission to the rate legislatures for ratification. If thirty-six states should ratify during the next four years, the immediate effect of the amendment would be (1) to extend President WILSON's term to six years and (2) to bar Mr. WILSON, Mr. TART, and Mr. ROOSEVELT from again serving as President.

The only opposition, apparently, will come from the friends of Mr. ROOSEVELT upon the claim that the amendment was aimed at him and him alone. The fact, of course, is that he has far less ground for complaint than Governor WILSON, who would be re-nominated almost surely in 1916; and certainly no more than President TART, who could and would readily resign such a candidate, as CLAYTON did, without impairing the three-years tradition. But that makes no difference to DeWitt and the others, who have burned their bridges and seized their own political hopes in the possible re-nomination of their chief.

What Mr. ROOSEVELT himself will do or try to do about it remains to be seen. His position was somewhat peculiar, in view of his own resignation as a third-term candidate. It will be even more embarrassing for him to take a stand against a great reform measure simply because it bars realization of a purely personal ambition. There is no doubt that the country wants the change; it voted for it, in fact, when it elected the Democratic ticket. Mr. ROOSEVELT, then, could have done to approve the proposed "will of the people" on a constitutional question and try to change their views as a matter of personal loyalty to himself. We doubt if he will make the attempt. And we are quite certain that he will fail if he does. The ROOSEVELT election crushed the top notch last year and, since election, has been steadily retiring ever.

Mr. WILSON's position is wholly different. He is not bound in any way by the Baltimore declaration, as we can demonstrate by the satisfaction of any fair mind, if the necessity should ever arise. That he has refrained thus far from expressing even an impassioned view is a matter of credit, in the pending election. We think, however, that the change as directed from the standpoint of governmental expediency cannot be determined

from anything that he has said or written. That he would be the last to resist a movement initiated by a two-thirds vote of both Houses of Congress, for the sake of any political advantage to himself, the country may rest assured. Moreover, his sole object is actual accomplishment in the interest of the whole people, and nobody familiar with the handling of a President desiring a re-nomination can doubt for a moment that he could get infinitely more done in a fixed term of six years than he could possibly achieve in two terms of four years each. President TART put the practical phase very clearly when he said in the Lotus Club:

I don't care how many times or indeed a President I don't care how determined he is that he himself will be re-elected, and I don't care how many very few indeed who go to that extent, still his subordinates equally interested with him in his re-election will not be divided either way, they will support their influence and divide their line between the public service and the effort to secure their chief's re-election and re-election.

It is difficult to prove the whole administration from being a part of its effectiveness for the public good, but the first and the most important part of the first of such administration. Were this made impossible by law, I can see no reason why the energy of a President and that of all his subordinates would not be divided either way, and a great record of efficiency in the first and only term than in seeking a second term for that purpose.

We are convinced that the change would be a matter of congratulation to both the country and Mr. WILSON for the first six years of his presidency he should have a perfectly free President, able to view every proposition, relating to appointments to less than to legislation and administration, strictly upon its merits and from the viewpoint of efficiency alone. The advantages sure to accrue from such a condition are simply innumerable.

As for Mr. TART, he is likely to have the opportunity to sign a bill which will definitely and irrevocably fix his future status as that of a private citizen. He will do it with his usual good grace, of course, and, if we mistake not, without a quail of regret.

It is a great thing, this amendment, if we can but insist to devote most of its energy to its preservation. DEWITT, HANCOCK, and all of the other disturbers are for it. Now let the Colonel be a sport and make it unanimous!

## The Senate and the Patronage

It is an interesting note to which the Senate has declined to devote most of its time from now until March 4th. President TART has made it something like thirteen headed gnomes to Federal offices, most of them, we presume, post-offices. If confirmed, most of these appointees will hold for four years. If they are not confirmed, President WILSON will have to fill the vacancies. The Republicans, of course, want to confirm the appointments. The Democrats want to keep the places open for Democratic appointees. That, so far as we can see, is the substance of the controversy—practically all there is to it.

This whole patronage business is a curious thing. President TART, we have no doubt, would have been glad to escape the bother of choosing among the applicants for all these offices. It was utterly impossible for him to make for himself a fair examination of each individual case, and he knew he was bound to make mistakes. On the other hand, we are equally confident in the conjecture that President-elect WILSON has no joy in looking forward to the job of making out another list. What is more curious still, the very Senators who have no objection to the present system, would look forward with anything but pleasure to the task they are setting themselves by their partisanship. They know that if their present fight is successful they will themselves have to make recommendations, and that that will involve tedious details; and that they will probably make new enemies and friends by exercise of their prerogative. What President TART has made the central blunder of his administration—the murder of denying to Progressive Republican Senators and Representatives the patronage to which custom entitled them—he did not merely hurt himself; he immeasurably strengthened them. One of them, Senator DEWITT, said at the time that he felt as if a milstone had been taken off his neck.

The only comment is CONGRESSMAN'S: "Go forth, my son, and see with what little wisdom the world is governed."

## Party Policy and the Philippines

It is so pronounced a Democratic cause as to Representative MURPHY of Kentucky, but had the courage of I wonder to speak out what he

felt about the Philippines, quite without reference to party. Like the ENTIRETY question and the Panama canal question, the question of our policy with the Philippines is our that never ought to have been dragged into party politics at all.

It is either a colonial question or a question of foreign relations. The contention of the very men who are resolved to treat it in a thoroughly partisan way, that it is a foreign relations question, and that it is precisely the kind of question on which it is least desirable to draw party lines. On that point there is practically universal agreement among people who consider public questions with the least regard to the claims of partisanship. When an English statesman is charged with any connection with the Philippines, he is a matter of course excused to be Whig or Tory, Liberal or Unionist, and becomes merely an Englishman. It is the same way with a French statesman or a German or a Russian. It usually is, and always ought to be, the same way with an American statesman. When the question is of colonial rather than of foreign relations, the obligation to impartial attention is only a little less binding. Did we repeat, the men who want to make the Philippine question a party question are precisely the same group who insist that it is a question of foreign relations, not of colonial policy.

There is another way of looking at it. Both the great parties are responsible for our present unpopularity with the Democrats. The other party was represented among the signers of the Treaty of Paris. Democratic votes in the Senate were essential to the ratification of it, and it is notorious that they were forthcoming at the behest of the man who was then the party's recognized leader, Mr. DEWITT. It is now, therefore, simply propositionally necessary to talk as if our Philippine policy up to date were a wholly Republican policy. It has been neither a Republican policy nor a Democratic policy. It has been an American policy.

All this, of course, has no bearing on the practical question whether or not we ought now to know a future date on which we shall be ready to withdraw our troops from the Philippines. The great party, nobody doubts that it would be either wise or honorable to withdraw at once. If anybody thinks he knows precisely when that step will be wise and honorable, we for one must decline to take issue with him; he evidently has sources of knowledge or powers of divination denied to ordinary mortals. It is living only moral and ordinary we can't help attacking such an assurance to the judgment of men like President TART and CUNNINGHAM FOSBERG, who have had the best opportunities for studying the problem and who agree that, while we ought to keep before us, as our ultimate goal, independence and self-government for the Philippines, it would be wrong as well as preposterous to fix any precise date for that consummation.

## The Cabinet

Of course much of the talk and conjecture about the new Cabinet has been either cheap and silly. The public wanted a lot on that subject, and the papers, seeking to meet the demand, have had less than they could get.

Nevertheless, the public's very keen interest in the subject is by no means a reflection on the public's intelligence. It is natural and reasonable. It shows a correct instinct. The public is entirely right in attaching much importance to the President-elect's Cabinet choices. It is entirely right in attaching much importance to the Cabinet. The very fact that they are going to choose this country, with fully recognized functions, goes to sustain this view. As is well known, the Constitution makes no mention of any such body. It refers once to "the principal office in each of the executive departments, and that is all. Apparently, even the writers of the Federalist did not find fault with the limit of the President's authority like the Cabinet as it now is. HAMILTON was particularly pleased because so "conceded" had been provided to leave either the authority or the responsibility of the President. The Cabinet, therefore, is distinctly an outgrowth of the actual work of our system. It is something Presidents have had to have; and something that as the years have passed has grown more and more a thing of its own as well as in functions. The President-elect is one of the publicists that have fully recognized the very great place it now fills in our government.

He has recognized, too, how much the choice of a Cabinet has to do with the character of an administration, and that to choose a set of men of whom one can say very much, is as a thing of its own as well as in functions. The President-elect is one of the publicists that have fully recognized the very great place it now fills in our government.

the "execution" of our government rests on a single hand, then surely the President should not shift that responsibility at all; he can only do so, as indeed he must shift, the actual performance, in the first instance, of some of the prodigious and ever-increasing number of executive functions. But in naming these "chief officers" he does far more than merely trust them with executive charges. His confidence, he presumes, declares what general character he means to give to his administration, and he also gives to the men chosen great power to aid in carrying out this design.

At the present moment, in the present state of parties, this general decision of the President-elect will be bound to be the country and the world. He himself shows every sign of awareness that this is so. In all probability no act of his administration will more powerfully affect the course of events than the batch of nominations which he will right at the start, send to the Senate. Let us all treat that, in this, his first great act and the one he will exhibit to the country and the world, that combination of firmness and moderation, of poise and purpose, which is wisdom and statesmanship.

#### The Lincoln Memorial

The President signed last Saturday the Congressional resolution providing for a memorial to ABRAHAM LINCOLN in Westland Park. An appropriation of two million dollars is expected to follow. This disposes, we presume, of the Gettysburg road project and of the memorial bridge and the convention hall. No doubt Washington will get them all in due time, for they are all well-enough known, but the memorial at LINCOLN. What form the memorial at Westland Park will take seems not decided yet, but whatever will look in at the Architectural Society's exhibition now open here will be encouraged to hope that we have the talent and the skill in the country to raise a monument to LINCOLN that will be worthy of his fame.

#### Should the Churches Shut Doors?

IT SEEMS THAT PROFESSOR WILLIAM O. FISHER, of Wesleyan University, at Middletown, Connecticut, lately disclosed in public his belief that religion would benefit by a closing of all the churches for several weeks. President SARGENT felt called upon to invite him to the Wesleyan faculty as being out of place in Wesleyan University, and Professor FISHER did resign forthwith without delay and without complaint.

We have not seen a full report of Professor FISHER's remarks, but if they were merely to the effect above indicated, we fail to see why he should have resigned. His suggestion of the closing of the churches for several years is a bit novel, but there is no harm in it. Indeed, it is an interesting remark and worth debating. How much good do the churches do at this time and as at present conducted? How near to Christian are they and how necessary to the proclamation of the Christian religion? If they all shut doors for a time, what sort of substitutes could be devised for them; and when they started again, with what changes would they resume business?

Perhaps it was to promote the discussion of points like these that Professor FISHER said what he did. It is obvious that nowadays the propagation of the Christian religion goes on very extensively outside of the churches. People are less dependent on preaching for their spiritual food than they were before every one could read and everything got into print. The annual volume of religious reading that is put out is enormous. There are many who think there is more religion in current life and current politics than ever was known before, but the churches don't show it. They go along about as usual. We read that in the *law of the Men and Religion movement* last year, which was a special effort at Christianity-awakenings, "the total increase for all the churches for 1912 was 178,852, a decrease of 15,484 from the figures of 1911." It is to smile, really, at this first evidence of the result of applying business principles to the spread of the Gospel.

It is a fact that many people whose disposition is entirely favorable to the churches, are nevertheless unwilling to perform the full duty of a function as well as they should and whether they could be bettered. If that is what is *going on* in the mind of Professor FISHER, what's the harm? It is as though a mill inspector should be asked to resign for saying that the machinery in a certain mill seemed to him out of order, or that a mill letter should stop, for a time. It might be a sound

opinion. The operatives in the mill probably would not like it, and perhaps they would do what President SARGENT has done.

For at least a generation we have heard the complaint that the ministry was not getting the men it was entitled to.

Why not?

It may be that Professor FISHER thinks he knows.

#### Sensational Opinions

Senator FLETCHER of Florida shows a notable and not unamusing liberality of spirit about the carabales question. The papers quote him as saying, when asked for his views:

I do not favor the abridgment of the toll question nor the repeal of the law, but it should become a question of the people, and I am willing to have the whole question passed upon by our own Supreme Court.

That would be like saying to a complainant who alleged an injury: "I don't think your contention is sound, but I will ask my lawyer to give you an opinion." More to the point is the sentiment of Senator TOWNSEND:

If it should reach the point where it would be necessary to refer the matter to the Senate, I would prefer to refer the law.

#### The American Town Needs Studying

A young writer in the *Athletic Monthly*, EATON R. BOVARD, starts a line of inquiry that ought to be followed up. He makes a study of an American town. He chooses a suburban town, striving to retain its "naïf" against the adjacent city's encroachments, and in that, we think, he follows opportunity rather than judgment. Suburbs are not very representative. He also, we think, neglects some of the most vital features of the life of American towns. He has probably worked in some city, subject to territory influences. But his idea is a good one. Millions of Americans live in "towns" of one sort or another, and a competent account of the life of the various sorts of American towns, done with sympathy and imagination, would show us a lot about ourselves. It would have economic values. It would make many of us realize what we are about, and how we are daily accepted, and how much better we and our neighbors might be doing. It would give definiteness to latest public spirit. It would help quite appreciably to the present vigorous but unguided endeavor of Americans to make their own lives interesting otherwise than by the mere mimicry study of the lives of other peoples.

#### Many Tastes in People To-day

On the question of women smoking the Bishop of Ripon (England), who has been visiting in Boston, was asked for an opinion, and gave it. He said:

If the men find it a pleasure to smoke why should that pleasure be relegated to the men and not to the women? There are women in England who do not think of what she smokes. There are many others in the balance, so there are many tastes in people to-day. What may be a pleasure to the men may be given to the women. Smoking among women will sooner or later adjust itself. There will be always women who will smoke the ordinary or provokes criticism, and there will be women who will retain their womanly traits and stand for the highest and noblest that there life and will not tolerate vice smoking as a pleasure.

He does not like it, but would not forbid it. It is a matter that will adjust itself. This seems a wise bishop. Would that he might preach for a time to the people of the United States, so many of whom incline to regulate by main strength and legislative things that ought not to be so regulated, and which if left alone will sooner or later adjust themselves.

#### The Open Winter

Nothing is certain about Mr. WILSON'S Cabinet, but it is continued to look a good deal like this: for an inauguration day. The oldest inhabitant says something like another January, and nobody else. The Hudson River, being still open at noon on January 30th (close up in our time of going to press), looks a record of thirty-nine years and seems disposed to emphasize its disposition toward winter inaugurations. At this writing the papers say there is no ice harvested yet in the Middle States, and the ice-machines have laid off their furnaces and put on their thinking-caps. The ice-machines can make ice, but can they make enough or anywhere near enough? Devises of HENCKENSBACH prophesied an ample supply of hard weather in February, but as far forecasts do not justify his claim to be in the confidence of the stars. It has been a mighty uncertain winter, and we know how much the crop will suffer the poor

man's measure and less, much the shortage of far as is affected by the country's diminished need of coal and by the advantage of an open winter to the railroads of the north. We have one comfort. However abnormal the season is, it is not a thing that we shall be expected to cure by legislation. And though winter has lagged remarkably, we may get it yet.

#### Our Beautiful New Railroad Station

Our public here was greatly interested in the opening, last Sunday, of the new Grand Central Station in New York. At midnight on Saturday there were thousands of people in the new station examining it and admiring it. All Sunday it was full of people, and it would have been crowded if it had been a very big day.

It is a beautiful public building, a magnificent embellishment of the city, and a splendid monument to the men who conceived, planned, and built it—particularly to Mr. WHITNEY WANNER, the architect—and to the country that pays for it. Greatly to be the spirit of it, a great work splendidly and ably done through.

Our great and beautiful buildings in New York are getting more and more to be public buildings of one sort or another; railroad stations, apartment-houses, city buildings, office buildings, libraries, art museums, schools, shops, hotels, and the like. Time was, and only a little while ago, when most of the more attractive buildings in New York were private residences. But that has passed. Not only are few new private dwellings of special importance going up, but we seem likely to lose the best of those we have. Mr. HERTZ built some beautiful houses on Fifth Avenue and they are all being torn down, and only a few are being kept. Mr. FINE is a builder, and he intends to put something out of common on the Lenox Library lot, but he is an exception. Rich citizens seem disposed nowadays to give up great town houses and do their building in the country, contenting themselves with apartment-house buildings in the city. How many twenty-five years ago the City Hall, the Madison Square Garden, and a few churches were about all the public buildings we had of special distinction, now we have the two splendid railroad terminals, the new post-office behind the Pennsylvania Station, the new Public Library, the Cathedral of St. John, the Cathedral of the Holy Child, the Municipal Office Building, and hotels, garages, schools, and monumental office buildings, far, far too many to enumerate.

Our city is growing splendidly. To visiting architects from other cities it is exceedingly interesting, and what is done here that is good has its influence on building in all the cities in the country. That is one blessed thing about art. It is not local. When beauty is developed all the country profits. Such an edifice as the new Grand Central Station will have an enormous influence on public taste.

#### Mr. WATTSON'S Dismissal

MR. WATTSON'S letter on page 6 discloses that the *Christianity-awakenings* were discussed in the WEEKLY, that Mr. SARGENT is appropriate for moving to New York to make a living, is not a view that enjoys Mr. WATTSON'S personal support.

MADE HENRY is in Florida, and happy there, we hope, even when views get into his paper that he deprecates.

Perhaps we should have known better than to tie us up to him individually this particular opinion about Mr. SARGENT, but we guessed wrong.

#### Liberty and Order

The Republican party stands . . . for the retention of the *Christianity-awakenings* law.

The first Republican national convention after the war with Spain announced that it was our duty to confer "liberty" upon all oppressed peoples. They haven't got it yet.

Taking all the inhabitants of the Philippine Islands into the count, haven't they got more liberty to-day than they ever had before, and are they not getting more all the time!

Our impression is that they have, and they are.

When we say "Philippines" we usually think of a part of the people who live in the island of Luzon, but the Philippine problem includes them and all the Moros, the Igorotes, and all the people on all the islands.

There cannot be much liberty without a fair degree of order. We keep order in the Philippines, and according to the best information we get, liberty is increasing there.

When we let go, unless we can transfer our trust to hands competent to maintain order, it will be hard holding for liberty.

# THE MAKING OF A SALON PICTURE

BY BRIGGS DAVENPORT

**C**PLAIN pictures are produced in our present culture are devised as an architect plans a building, a palace, or a pleasure garden. The making of the second type of picture may have a high technical level, but chiefly for artistic theoretic reasons. The first type comes to its maturity by a process either largely spontaneous or resembling the essay of nature in evolution. And the artistic maturity (in the making) of a great picture of this kind must have an appeal for almost every one.

At the Avenue du Maine in Paris, not far from the Invalides, in a modern building of outward appearance

The first pen-and-ink sketch

most primary, with a characteristic, pale, and insipidly exterior. The most remote from any suggestion of the stuff of which dreams are made. It is traversed every day, however, by many persons who mostly live in a world of dreams. Up one flight of steps into a dreary corridor, softly brightened by a

turquoise mask in plaster over a hotel, and you come on the left the door of Robert MacCameron's studio. Here was a small, airy and most interesting sweater of dreams; yet a slinky surprise met you when you glanced around you in his chosen den. To his carefully frank about the matter, it looked more like a study room in a theater than the studio of a distinguished artist. In fact, as the experienced eye is apt to imagine it. It was crowded with canvases, some finished, some unfinished, with easels, empty, set, occupied, with discarded pictures, with quaint furniture and draperies, with oils and turpentine and palette in their appropriate vessels. There was a shaded alcove for certain poses, also much considered, and only in the middle of the main room was there a comparatively clear space, like an oasis amid dunes. There the artist worked. From all sides there peeped out of your life newly created beings emerging into consciousness and dark interstices of the complement of things, until, despite the incongruity of the general setting, a certain sense of harmony came from his very distinguished work as a portrait painter, was something of a mystic in art. The sources of his inspiration were mostly largely subjective, and this in part may explain how it is possible for him to produce in such a room, the kind of work of which he was fond. It simply proves, as this work itself shows, that he could consistently in the living form of his imagination, seeing, where at the time, what he might bring and such things as he delighted to reflect upon his canvas. This mysticism is the dreamer's industry of reality, of making humanity in his par-

are real enough, peignantly real, in fact, but they express an unconscious and vague philosophy, the absolute negation of the doctrine of the lack of, the self-absent, the morally blind as well as the usually protected, the suffering saint as of the inner vacuum; a philosophy which actually explains nothing, but which ever suggests that a wonderful, searching, all-comprehending, perhaps terrible explanation exists, which, however, it is useless to seek. In this philosophy is concentrated the mysticism that is so dominant a feature in the late Robert MacCameron's painting.

His making of a whole picture, therefore, was not one of the usual things in art.

Two months before MacCameron last departed for America he began the larger picture which (as *Les Femmes*) will be exhibited in the Elder Salon of this year (1913). It is in my good fortune to have been the confidant of his earliest conceptions of this work, and I minutely watched its progress until its completion on the day before he left Paris.

"I believe that whatever success I may have had in painting, and the notice which the French government has given me as an American," said MacCameron, "are due primarily to the fact that the poor creature that I depicted—while I am resting, so it were, from

Half color, half charcoal. The plan has now assumed definite shape

MacCameron sought her many weeks the models that he has used in this picture. He insisted that he could not paint from forms that did not reveal a certain sentiment in harmony with his inspiration of the moment. "None of his models had passed before. Most of them he found in the streets. The pathos of a smile, the way glances of a despairing eye, might cause him to pause and to question a passer-by. The helpmeet kind of the picture came to him in London, in the small hours of the night, while he was walking on the Victoria Embankment along the Thames. Every one who has made this excursion knows the agonizing sense which it awakens of the wretchedness of the human creature who are seen there. In the chill, fog-impregnated gloom they were a stiff cluster on the late benches, waiting for the early dawn, when they may go elsewhere in quest of a pillow of bread and butter, stretch themselves, by virtue of the County Council, on the great grass of one of the public parks. There is a great variety in the physical types, the structures, and the degrees of abandonment of these creatures.

"Let us each of their faces," said MacCameron, "I discovered the trace of an selfish yearning that some time or other had filled their souls. 'What was it? Not quite a hope, I think. Praying, prophetic instinct of a better dawn for humanity.'"

Among the earliest models was a homeless man of sixty-seven years in a bit of rags and a cap. He is the first on the left in a pen-and-ink sketch of the initial composition of the picture which MacCameron went out one in a scribbled sketch. In what MacCameron described as "a poor little flower of the pavement, with the unadmirable look of some dialectic in the primitive painter, Masaccio." The third figure is a gauntish pattern of seventy-two years, a victim of alcohol. "It seemed that he must die before the group as its first form could be placed upon canvas. The head is strangely symbolical. He might be called the 'Old Man of Florence.'" All the other form of life, the last three of a dingy color, seem to glow in his bleared and warily seeing gaze. There is redemption in each feature. The brow in demerol, the nose delicately aquiline, the nostrils sensitive. The lips were still to retain something of tenderness. I said one in the lecher old man. "You are like Verelina the poet." His hot pride for an instant flattered to the surface and he stammered, gladdened by the slight compliment. "Ah, Monsieur, I am not much of a poet, but I did write verses in my day." I could well believe this and also that noble aspirations had often been

The first charcoal sketch on canvas, showing the projected grouping

my portrait work—were not merely types, but express an emotion which in the art of the past has only been seen in the faces of saints and martyrs. This idea of the sanctity of humanity, even in a fallen state, seems to me to be an artistic motive not now met rare and most valuable."

The Madonna appears in place of the girl with the ether hat

This old man was produced to be the central figure of the group. Given the painter's poetic and mystic temperament, it was produced, first, that the personality of the model should assume an ideal imagination at one stage of the work, a highly spiritualized character that gradually the more, sweet face should become, even to the unpeppable misery, at most Christ-like; that a soft, broadly protruding chin should show above and around it. It had a certain more impressive, sympathetic Christ-like face that which in the instance the painter wrought. In the wry eyes, fixed on some mystic point in space, there was a half-waiting, half-despairing look with lowering, faint glimmer of questioning lips. The

The girl with the ether habit

sitting form was slightly bent forward, the head sinking on the breast. The large kindly hands, emerging half-naked from the worn mantle, were expressive (as eloquently as by tongue or pen) of dejected desolation.

Two other figures stood, as in a sphinx, or like the dumb, knotted brow of India heron at the back gathering in the upper chamber at dusk, the note of contrast. These represent the vicious phases of human deterioration. The faint outlines of Saint Stephen's tower at Westminster are barely discernible in the background. The nearest foregrounder of a greenish, slightly light blue through the mark of the fog at the entrance of the dawn.

The studies of MacCarren's picture were begun in London. Between the Houses of Parliament and Blackfriars he would at a night bring half a dozen ragamuffins on the Embankment benches to sit still for ten or twenty minutes while he swiftly sketched them. Then they would gratefully accept a shilling each and hasten away to a coffee-house or tavern to fill their long-suffering stomachs. MacCarren first thought of naming the picture "The Embankment" and, later, "Waiting for the Dawn" or simply "Life." But as the universal nature of the subject gradually took possession of him and his conception of it developed, he concluded that to call it after Jack London's book would be best. And as it will figure in the catalogue as "The People of the Abyss," "I have no desire to preach," he said, "but I believe the picture that poverty most prizes are those that are not heard that are intensely heard."

The longest march made by the artist was for a substitute for the "poor little dower of the pavement" and a fitting complement to the remarkably central figure. One of the several successive models for the face of the woman was a beautiful girl of the street who was irresistibly addicted to the use of ether. In appearance she possessed all, excepting respectability, that is desirable in a model. But her disposition rendered it impossible to march her in this particular. All that could be got from her was motion, profound, most heaving, but no elevation of sentiment nor trace of aspiration. One day I found the artist in his studio in a great fix. The girl, heberly sure thus seven-teen years of age, was so weak, white and death-like in the extreme. There was a glass stem in her eyes. She seemed as she were dead and to me. Her breath filled the place with the odor of the drug.

Meanwhile on behalf of the artist six persons were looking for a model to succeed her. On my next visit I saw several girls presented for the pose. MacCarren tried each and each of them was so weak, white and death-like in the extreme. There was a glass stem in her eyes. She seemed as she were dead and to me. Her breath filled the place with the odor of the drug.

leg to see, he remarked in English: "It's a wonder how some women bear their poverty. I painted this so-called girl twenty years ago when she stood at the corner. She had just been married and was sitting alone by Dugan Bouever's 'Madison.' But I no longer employ professional models."

The girl with the ether habit was really too much in the Burke-Jones style, and I was glad when the ultimate model suddenly appeared. The accent obscured the individual individual in the dress it was seen that she could serve the purpose.

"I've found her—I've got her!" cried MacCarren, an enthusiasm as a boy. "Look at her! Just the face I've been in mind a year!"

Before the end of the work she had been "painted in" beside the "Old Man of Fidelity."

The order of importance in this was second great change in the picture. The final wall of the street had given place to a Madison Boulevard of the modern under-world. On the slumbering face were written all the painful emotions, all the successful passions, of an ill-fed life. The features drooped palsy, like the petals of a heavy blossom. They belonged to that order of beauty which Raphael heralded as natural goodness, tender, explicitly noble. "I have tried," said the artist, "to paint the soul of Eve and the grief of Mary."

I must speak in further detail of the photographs which were made at my request to show the series of notable changes which the picture underwent. Up to this point I have tried to indicate the vital human sympathy that radiates from it—that sympathy that is always akin, however it may be developed, in the sanest religious sense. Robert MacCarren in this work is not very far from equating the sentiment of van der Weyden's "Kestemont of Christ" in the "Old Galley."

In the first charcoal sketch on paper, with its rough three-line outlines, the feeling of the ultimate grouping was already to be found. Some detail referred into the primary cloth on canvas also in black and white. The faces of the early models were sternly defined. But some of these models were inadequate, particularly the one who sat first in the middle of the group. He was always in a half-solennized state of intoxication. On the left the man next to the street girl looked half a veteran soldier and half an English church leader fallen from his respectable estate. The third man was plainly a Jewish peddler, who might even appropriately have been recasting his wares on a lodging-house in the Ghetto after a day devoted to the hawking of shoe laces.

In the next stage of the picture two of the faces and parts of the three more important figures were painted in color, while the rest was still in charcoal. Very radical changes had been made in the faces of the middle old man and the one next to him. These changes were distinctly for the better and constituted a long step toward the realization of the artist's meaning. They rendered possible in a large degree by the fortunate discovery of the man with the alcoholic habit who acknowledged that he had been a part in the youth. A further phase of this kind of progression is revealed in the photograph in which the whole upper part of the canvas is shown in a coloring of gray. Here the final type of the middle face has been clothed in an expression of profound significance, and the heathy visage, to the right, is so admirably delineated that it is a pity to give a new pose to this figure in order to add to

face of the middle old man seemed to very belie it all the sorrows of the age. The man next to him had no hidden law face upon his nose. Only the son of the father end, looking a strong center at a restaurant who had drunk up his last hope of shelter, remained without notable alteration. The evolution of the picture had advanced with marvelous rapidity. What was to come next?

The artist was fascinated by the strange head of his middle model. Unusually, day after day, as he

The Christ head, which was afterward transformed

worked before it, it seemed to grow in refinement, to become more subtle in outline, more and more the mark of the unending mystery of human pain and human hope. One day, as I entered the studio, I was quite startled to behold in the middle of the group on the canvas a half-built Christ, wearing a look of immeasurable sorrow and appearing to bend under an infinite burden of discouragement. Again, when I returned a few days later, the eyes were slightly less veiled. A warmer light had crept into them and around the head was a faint glow, the moral glow, melting into shadow. One could easily at first glance have taken it for an optical illusion.

"I had to do it!" exclaimed Mr. MacCarren. "I could not help it. As the French say, it was stronger than I. And now that I have done it I dare not keep it. I fear it is going too far. Really this is a wonderfully significant idea. It's a break in tone and a fresh, an idea incarnate. The beholder would interpret it as he could. The question is, Would my own idea be understood?"

A great French artist helped MacCarren to solve these doubts. Before my next visit the head had been accomplished. I received a shock almost equal to my former surprise when I saw that the Christ head had been added. The middle figure was again only the old Man of Fidelity with the canvas almost held over the thin, drooping hair had lately been, and the expression less subtle less spiritualized. This change was definitely only a few more strokes of the brush now, strengthening the accumulation of the dominant note, and the picture is done.

The woman's error is fatal; but no world say that her soul is dimmer is very remote from life. The old man's error has not struck on lots from his starchy philosophy. The two gray eyes are unimportant. With him the days are past when the future was to be questioned. The rest is unimportant, unimportant.

The two other persons in the group are absorbed in a British shawl, an psychological series could not then even be drawn.

The finished picture, "The People of the Abyss," as it will appear in the Salon

the picture's progress of the group. It was immediately after this that the girl with the ether habit was discovered. Although her complete presentation on the canvas was intensely paid and proved deeply unsatisfactory, the artist espoused it unhesitatingly.

Then for the first time appeared the Madonna's face. The change made at this moment proved all the previous ones. The half-built, half-erect on the left had become an unshamed veteran, who, in fact, had fought in the Franco-German War. The

# A FANTASY OF CITY LIGHTS

BY GEORGE BUCHANAN FIFE.

Two milling men were gazing into a jeweler's glittering window. Upon its carpeting of black velvet glowed an arranged array of diamonds. In the center, set prominently there, were two long chains of diamonds fit for the Nawab of Bakhawapur. Side by side, they traced a straight, leading pathway, almost the woman's width, across the number plate. Flanking their double line of light were other jewels, some in intricate, daisy clusters, some in radiant stars and crescents, some in the high state of solitary brilliance—rubies, emeralds, sapphires, diamonds. The colors gleamed and changed from a thousand hues. It was splendid and quite bewildering.

The first man gazed awhile in a sort of fascinated silence, and then one of them, so his eye again swept those the dazzling line, said, with a quick smile:

"It looks just like upper Broadway at night, doesn't it?"

It did indeed suggest Broadway—as, sometime or

Twenty third Street, from north and south and east and west, will surely identify the similar lights come creeping in. Blazing rows, with belts that could be called to fibers, pursue one another end-to-end. Motors with creaky cogs and hoisting gears the ground as they wing into the shadows, the fiery lights of carriage flitting away before them. Many wonders stand their luminous brightness, for here the world of warring lights asserts itself, here begins the glitter of selfish, worldly upper Broadway. The poor monks with their tapers are shown into most dark confusion; their sacred line is broken; they search up their rows and live in horrified dismay. Some of them gather for safety in Madison Square, where they peer through the trees at the terms from which they have providentially escaped. They cover the same sufficient passage to return to line, and they may save there any night, not in pairs, but unbrotherly separated and their presence particularly objection to the throngers in danger on the benches. And, further in confusion, they should they raise their eyes. Dances of the Tower, outlined by their lightfeathers, swing high overhead, drawing her suddenly into the wind and not making the slightest effort to adjust her robes (dust) there.

But on the other side of this market-place tumult and glare, and as near it as their dignity will permit, the Avenue lights retrace their sacred task and fly placidly northward. Now come the rows of shop-windows which are patterned at night chiefly by New York's "friends from out of town," and those who long for window-gaze. To dock these glowing windows the workshops of the world have been unweaved. These precious goods, these gems and diamonds, gold and silver things, these fabrics and flocks, richly patterned and soft, these wares of fashioned ivory and lace and wool whose form and color and worth are here so normally displayed, have been some because beggars and language of hand and water to trumpet an alien purse in the electric brightness of a Fifth Avenue window. And what different lights these

things have known in other, earlier night seasons, in the hours of wonderful darkness behind this mass of incandescent glows—the hazy of amoky toques, the roll and cry of an unfamiliar tongue, and the rattling, creaking progress of a curran; the flash of swaying lanterns in glowing berths, the crashing harbor, the heavy bristling and the pad pad of bare, black feet as a gangplank; the red up-lump of bow-lights, the line of stars beavers with their shimmering heads, the swish of hot, clinging sand, the splashing shade into the cooling water—how high, wide-high—and the waiting head a shadow, slender thing in the night, the white of the placid moon and stars set in an infinite silver, and, far below them, a great ship with a trosser in her lightless, guarded holds, driving through the sea.

Beyond those evanescing ships is a cynos of homes, the houses dim and reversed, seen a bit hazy in their own circumstance, and all slight behind those heavy hangings. The smooth driveway between them is streaked with the twin lamps of incandescent incense. They are backing upon the low serious beams of the night, and as they speed by their second glaring glimpses of fair women and fair-voiced and lucky men. If the Avenue lights look in, it is by chance, a look that is far too brief and too impersonal to be important. For what is dominating characteristic of these lights is their character of indifference to the life which goes on beneath them. There is a stalling self-absorption.

But go into the lower precincts of the city where streets and lanes are narrow and ill-favored, there the lights are towards of their quarter, pray to its peculiar and intimate affairs, and to the limits of those who stand and freeze through its mysterious lights. They know every door and wall and window within their vision. The children who play their instrumental games upon the sidewalks are known to them by name, for they hear them called in shrill, interrupting exclamations from upper stories. The gangs of young men who usually loiter along the dark in favorite corners, the old men and old women who struggle and quarrel through their hair and inamovable seasons, are alike known to them. They catch the rapid, unobscured progress of countless dozing carriages, and at the proper time, as if they looked away, provide the shadow for the playful roughness of a kid. And when at last the street has fallen into its restless sleep and there is a solitude in the darkness, with a man's quiet, crossing eye, then dead silence save for the ch-ch-ch-ch of feet spurring along the lights, loyal again, guard the corner the obscurity he seeks. They know the corner, just as on another night they know the gift, but there's an end to it.

The red-lit glare of Broadway and the cold blue whiteness of Fifth Avenue are not more faithful to an arched scheme than the glimmer of these poor relations downtown. It is for these to check rather than to reveal what lies about them. The sturdy, crowded houses are all free plain at sundown; at night they are permitted to shrink behind a curtain of darkness through which, toattered squares, gleams the dingy array of window lights. The highways themselves are blessed by the dust which sweeps in a heavy air.

None of the lights of the city and story and red-rod in the narrow cells of shop windows, "doing them" with a self-absorption, a narrow long slow hope-fulness of expression at work. Still others are nervous facing things a street where a man is not in warning, but as a lure to the craning craft and a wardrobe of a written anecdote. From a corner's vantage-point they observe what is usually polished news, spread, still, out, their

Where a Subway viaduct is transformed into a magic bridge

other, we shall become familiar with it from air-ships on the nights.

The lights are set up for alignment, and illumination, and one sees them with the eyes of his mood. When every game is a man Broadway at night is irresistible. We make for the highway with our spirits chinking in our pockets. We see something akin to a wink in the international flashes of an electric sign. The glow that falls astern the sidewalk from door-lamps along the way is a raptur to divert our willing feet. We gather where it is brightest, and there we laugh our merriment, talk our wildest, and spread our jewels and our silks to catch the glitter.

But when the world is old the glare of Broadway is a luxury impertinence. It obscures the dust and the frayed edges she had taught ourselves to hide. It peers into tents and taverns and flags before us the crowded shadow of our shuffling walk. We pull down our hats to hide the ugly lines it depicts about our wrinkled mouths, and at the first side street we veer away. For Broadway's leader either invites us to non-trivial familiarity or bids us be off about our miserable business.

What a different leaving have the lights of Fifth Avenue! Although inside her lanterns, their long reach of this thoroughfare and set them glow-gobies at nightfall, one's idea of it after dark centers upon the tall, blue-white light, in occasional places, which hedge its smooth, clear roadway. Who could imagine one glimmer of solitation in their radiance? Their sole task is the ancient and honorable of showing the way, and, engendered in it, they look down upon an imperially and incuriously in their methodical spaces, in the rigid distance they maintain between themselves and earthly things, we note their dignity and purpose. If they convey a certain suggestion of sanctity, it is not wholly without reason. Beneath the Zuluon cross, bearing due and mysterious in its high place, the great white arch glows in Washington Square like the portal to the green cloisters of the park. And from this wide doorway, two, on moon's lean tapers in their closely-bred, the lights go up the Avenue.

Aside from the banality of Eighth Street, with its windows aglow from porch to counter, like rapid lanes in a gallery, and the noisy crowd at Fort Tenth Street, where the city's frolic goes racing through, there is little to disturb the serenity of these outside lights. They have the highway to themselves and meditation and the companionship of certain archaic, old-fashioned boroughs of the town. Not at

Fairytold on the Harlem River

brilliance, and  
down to earth  
dripping money  
at the bar.

Across the way  
a small market  
essays a rivalry  
with a row of  
disintegrated gar-  
rets, like elevated  
footlights, behind  
which, as in  
piped music, are  
rows of legs of  
natives and a  
"peary ballet" of  
feathered children.  
Encouraged by  
the stage man-  
ager—in  
father's costume—  
the audience  
moves freely in  
and out behind  
the scenes, and  
hesitating eyes  
to give a familiar  
sledge to the  
members of the  
east, and fre-  
quently taking a  
glance one out to  
supper. Behind  
the street, strategic  
movements transpire  
for competition, a  
kitchen's wagon  
trucks beside the  
curb, an air of permanency  
is afforded to it by the worn-out, heavy wooden  
benches of the shafts. Two noisy, rowdy  
fellows smoke at the tail-board, dividing their attention be-  
tween the possible vegetables about them and an  
old woman who is waving greetings from a post-  
office's cart. As a sort of barometer stick in the  
corner, several children are wearing bits of  
wood and paper into the anger of a blaze in the gutter,  
settling an ominous red dancing on near-by walls.  
The very first trial in the market, the first  
at its post at the corner waters the children with  
its crimson eye over the heads of the unaccustomed multi-  
tude.

Such are the lights which live on terms of easy  
friendship with the affairs of the quarter. They are  
not set, close to the street, along lamplines in their  
turns, the highest of them well within reach of the  
talk and gossip of the people. Their interests are the  
interests of those about them, and those they serve,

Where the Bowers journeys onward

even to the diamond, least ambitious flicker of the  
hoop that marks the street-repair gang's uncompleted  
task.

The Bowers finds a wondrous "mixed company" of  
lights awaiting her. They roam with simplicity and  
with tranquility, from the nonchalant benevolence of the  
stock over Cooper Union in the half-dimmed glitter of  
the archway under the elevated tracks at Chatham  
Square. The Bowers's croon has ever been with a  
strange crew, and so it is with her lights. Many of  
them are far too good for her, far too bright and  
steady; many are ineffective leaders along the curb, and  
some are out-and-out deceivers. At Chatham  
Square, where her dominion begins, the very street  
lights convey the disquieting suggestion that they are  
lying in wait for some one behind the spent pillars of  
the overhead railway. Close at hand, around the  
corner of a wall, the alien lights of a crowded Chinese  
street look almost upon the highway. They illustrate  
familiarity more or less their own, with the Bowers

for an indignant and much-valued patron. A little  
farther on the glare of an electric search lamp  
from a music-hall doorway upon the door faces of  
men who are hunching, shuffling along in line for a  
handful of bread. These are the men for whom the  
Bowers has long had employment, as never her solemn,  
sincere words, but she feels them, perhaps to keep  
them from answering her. There comes the lashed  
trolley of the shop windows, which, for a moment, has an  
avoidable fiery glare. It seems inevitable that salt  
and "paste" and bits are not consumed in the blaze  
which explains them. But one night, a long time ago,  
the proprietor at an "Emporium of Fashion" made  
two lights to burn where only one burned before, and  
the change was too plain to be ignored by his  
competitors. And that is what brought the lights  
trooping in upon the Bowers. Year by year they be-  
come brighter and more numerous; better buildings,  
better men, follow them, and the crafty old street who  
sees it all elevates his badly painted eyebrows and  
reduces the price of whiskey in his rent's glass.

No accompanied by her army of good lights and  
bad ones, the symbols of lowest trades rubbing elbows  
wildly with the beams of heaven from the street, the  
Bowers journeys northward with Cooper Union stands  
squarely in her path and bars her further progress.  
Her racing traffic is cleft into two swift, narrow  
streams as by a great lower rock. And from the  
moment the venerable clock looks down upon the lit-  
taught highway and her diversions, an uninvited, un-  
welcome guest, but the first to come and the last to  
leave.

From the Bowers the brightness vanishes quickly  
and so does it. It fades, light by light, in the squares  
of sober pavement and in the factories that stretch to  
the shadowy river edges. There, for miles and miles,  
is a glowing chain, run the noisy water-front lamps,  
in the moment the venerable clock looks down upon the lit-  
taught highway and her diversions, an uninvited, un-  
welcome guest, but the first to come and the last to  
leave. From the Bowers the brightness vanishes quickly

# WILL ANY MILK DO?

BY H. W. CONN

THE conditions of the milk industry  
are likewise here such as to put a  
Tremendous upon your quality and  
carefulness in production. Most  
articles of commerce are bought and  
sold according to their quality, and  
the public realizes that a higher  
price must be paid for a good than  
for a poor product. Unfortunately  
the milk business is the most widely  
used article of food. Milk, provided it comes up to  
a certain rather low standard set by law, has commonly  
been sold as much as any other article of food, and  
sold at one level price. This of course results fre-  
quently in cheating the purchaser. But a worse effect  
than this is that the inevitable result of such a  
condition places an inevitable temptation upon those  
producing and handling milk. Since their receipts are  
dependent upon the quantity and not upon the quality  
of the milk they sell, the thing that is placed  
upon them is to produce and sell as large a quantity  
as possible, rather than as good a quality as possible.  
Cheap methods of producing milk in large quantities  
are common to the trade, and the popular level of prices  
has become the one that produces the largest quantity  
of milk, which means also the poorest quality. The  
result of this has been that a kind of standard of diluting  
milk with water, and the level of now that this  
diluted cow milk has become the most popular  
and best payment for quality and not for quantity  
has everywhere had the effect of reducing the grade  
of milk, of cheapening the methods of production,

and of increasing the quantity at the expense  
of quality. As a consequence it has been found nec-  
essary to pass laws that set a minimum standard of  
milk that can be sold, and this standard has a ten-  
dency to be set at the lowest grade that is produced  
by the cow that gives the largest quantity and hence  
the lowest quality.

It has become sadly proved in recent years that  
while milk may be the cheapest food it is sometimes  
the most dangerous, the danger always lying due to  
foreign substances getting into the milk. The many

many of the evils connected with the milk supply  
are due to a lack of stimulus to produce quality, have  
started in the past few years. The public has been  
led to believe that it is a very difficult and some think an  
impossible one, due largely to the fact that the milk is  
sold as much as any other article of food, and that all events some  
steps in the direction of grading milk are being  
taken. A National Commission of Milk Standards has  
recently strongly advocated that milk should be  
graded, and the public has been led to believe that  
all the romance, all the mystery, all the wonderful  
story of the milk business has been revealed.

A dairy farm that aims at quality

epidemics of typhoid fever, scarlet fever, and dip-  
theria, the thousands of cases of tuberculosis, infantile  
scum throats, and diarrhoeal troubles that have  
been traced to the milk business, all milk supply has  
proved the need of grading this product. It is a  
demonstrated fact, no longer a theory, that tens of  
thousands of children live their lives yearly from the  
drinking of the milk that is sold on our markets.  
These dangers are all due to the contamination of  
milk with something from without and are the result  
of carelessness in handling this product. The principal  
factors are that carelessly produced, dirty milk is a  
menace to the health of every child in a city, and that  
the general custom of paying for milk by quantity  
rather than by quality inevitably results in carelessness  
that is sure to be attended upon the desire to  
produce the largest amount of milk irrespective of  
quality, at the lowest price.

Public-health authorities, having realized that

Probably the chief obstacle in the way of this  
important reform lies at the consumer's end of the  
problem. It will be perfectly feasible to bring the  
producers and dealers into line with this change if  
the public can be educated to realize the meaning  
and its necessity. Unfortunately the public at  
large still believes that "milk is milk," and is quite  
unwilling to pay more for good milk than for poor  
milk, provided the latter is properly white and shows  
a cream line. This is sometimes due to domestic  
conditions; and it occasionally happens that the very  
dishes who advocate the pure-milk campaign pay no  
attention to the milk bought in their own households,  
leaving this to a housekeeper or servant. Under  
these conditions the public is not likely to be led to  
pay more for anything but quantity, quality, and  
care in the price; and if the intelligent people re-  
sist to "interfere with domestic affairs," it is diffi-  
cult to make progress. But it is well assumed to find  
educated people willing to pay a cent a quart more for  
good milk when they find they can get an ordinary  
milk cheaper. If the public could be led to appre-  
ciate the fact that it is cheaper to pay a little  
more for a good quality than to pay less for a poorer  
grade of milk, the public would be led to pay a  
premium for quality. The question whether the milk supply can be  
generally improved depends thus upon the consumer. The  
New York Milk Commission in doing a great work  
in being the first to set a standard of quality, and  
supply it as an attempt to put this product upon  
the same basis as other food products, and by giving  
a premium for quality, has shown the public that it  
is possible, and is thus becoming one of the efficient aids  
toward the improvement of the public health. The  
public is still assuming to pay for quantity, and  
supply it as an attempt to put this product upon  
the same basis as other food products, and by giving  
a premium for quality, has shown the public that it  
is possible, and is thus becoming one of the efficient aids  
toward the improvement of the public health. The  
public is still assuming to pay for quantity, and  
supply it as an attempt to put this product upon  
the same basis as other food products, and by giving  
a premium for quality, has shown the public that it  
is possible, and is thus becoming one of the efficient aids  
toward the improvement of the public health.

# THE MAN WHO GAVE UNCLE SAM HIS DUES

A Glance at the Achievement of William Loeb, Jr., the First Collector of the Port of New York to Make the Customs Service Thorough

BY WILLIAM INGLIS

HERE should never have been any reason for writing this page of his life. The thing is done by some of the United States customs dues at the port of New York ever had been collected since the March, 1908. At that time President Taft appointed William Loeb, Jr., Collector of the Port, and during the four years that have passed since then Mr. Loeb has really collected the customs. That state of facts on the face of it may hardly seem worth writing about, but to say one really well informed as to the history of the service it is as startling as if the collector had made a field of what grew new where only a few straggling blades of grass were before. Mr. Loeb found the customs dues being collected with a sieve; he promptly threw away the sieve and substituted a basket that never misses one drop.

Incidents in the customs service were characteristic of the time, emphasizing good-natured American way of doing things. For generations the Collector of the Port of New York had been in a fine position, one of the right-hand men of the President in power; an able politician, who might or might not have some knowledge of the revenue laws, but who never gave any jobs to "the boys" who came properly recommended by national or state or district leaders. Excellent men have occupied the position. One of the charming and courteous Chester A. Arthur, became President of the United States. No one could improve the character of any of the Collectors of the Port any more than he could declare that the customs duties were honestly and efficiently collected. Tainted from top to bottom with politics, the service was not of favoritism, of fraud, and of incompetence. The gentle art of smuggling, which the law denounces as a crime and which many of the most righteous men and women practice or condone, flourished in the highest degree. Foreign goods brought in from Europe wore clothing of lacustrine than the low country shipped something in something else, and escaped paying. Women of good birth and breeding, of high social standing and great wealth brought in silks, in. ex, and jewels worth hundreds of thousands of dollars, and never paid a cent—often. Thousands of men and women, many of them women bought their liberties out of bondage their fathers or husbands had acquired through the high protective tariff; yet they bribed and bribed and evaded their way through the barriers of the tariff law without a scruple. The practice was so systematized that it was quite common for smugglers to look for an inspector with a white flourish in his button-hole—the device being the white ledger of bribery.

As for the inspectors of foreign wares, one needs both telescope and microscope to scrutinize their operations. Scattering among customs houses arranged a highly organized fraudulent system of undervaluing and overvaluing goods for the purpose of their duty. Many millions of fraudulent goods—and gave a few paltry thousands of dollars to the workers. Thousands men who worked at the frauds, bylaws, demands, bribes, profits, and put down good rich on the spoils of their corrupt partnership with the lowest government employees. In ports of women goods, silks, furs, flowers, calico, and spirits—anything and everything—went with one another in clearing the coast. No branch of trade was so small in profit in a grand scheme as to collect a very little fortune by smuggling in liquor stills. (Curing stills were in a constant of fraud) and the thing that things had seemingly nobody cared. It was a trade over between smart social leaders, shrewd millionaires, scoundrel merchants, really efficient, and common sense to see no could. Uncle Sam, next advent and profitable. Since Bobby Burns's day, and long before that, mankind has looked leniently upon smuggling. It has been a business that never been carried on upon such a gigantic and thoroughly organized scale as at the port of New York. At that port, one-quarter of all the customs revenues of the United States, which is equivalent to forty per cent. of the entire revenue of that government. Think of it—millions of dollars have been returned in a crooked, rotten shew!

When Mr. Taft became President this condition appealed him. He determined to cure it. There was

low enough to work the case, if only he could find the man. . . . Presently it was telegraphed throughout the country that William Loeb, Jr., late secretary to President Roosevelt, had been appointed Collector of Customs at the Port of New York. . . . Fine for Loeb! That's what he gets for being faithful to Teddy. Was the consensus of the public, who then got on all about Mr. Loeb and went on with their regular business of getting rich—most poor—rank, or reforming the world, or getting votes for women, or reading for the home sake, or whatever else they liked to work or play at. As a matter of fact, there was a great deal more behind that appointment than the public dreamed of, though there was not so good a time to talk about it as now, when the Collector has finished his appointed task and is going to work for a private concern that will pay him twice as much as Uncle Sam did. Before making the appointment, Mr. Taft asked the former secretary whether he thought he could close up the New York customs

laws that even set with a time-lost. He looks the prospect, dominant business man.

Mr. Loeb had the most remarkable advantage of having to fight hard to acquire all the learning that is his. Having had sunny means, he was favored early to earn his own living, and as he was graduated from high school at Albany, New York. He became a proficient stenographer and worked in a railway office and in an insurance office, in each of which he obtained good business training. He was during four years a stenographer in the District Attorney's office, and for three years of that time he diligently studied law. He earned more money meantime by serving as an extra stenographer for the official reporter of the state legislatures. Moreover the new Collector had enjoyed special opportunities for becoming familiar with the work he must do. He was secretary to J. Nath Farnett while Mr. Farnett was Collector in 1899. He thus gained intimate knowledge of the personnel of the duty of three thousand men that collected the duties at the port of New York. He knew the intricate problems that came up in the administration of the office. A few years later young Loeb was an extra stenographer on the staff of the Executive office at Albany. When Theodore Roosevelt became Governor of New York in 1898 he made young Loeb his private secretary, and when he was elected Vice-President took him to Washington. So that, thanks to his New York City experience, the young man knew a good deal about the customs business, while at Albany and Washington he learned a bit about the general principles that held his friends, knowing the perils of the new position he was going to accept in March, 1908, offered him the post-announce that friends on offer give.

"New York will be the great joy of my population," they told him. "You can't close it up."

"But if I do not set it right," he replied, "that will be a real sorrow." Now, and hence the collector from time immemorial for the Collector of the Port of New York to sit in state and receive his duties. He was surrounded by carved golden American eagles that perched on the walls and on the ceiling, and by portraits of worthies and heads of Lincoln and Grant. He smoked long and silky cigars, and received his messages, inquired in substance for the fish traps, and he held important conferences from time to time with great men in the city, and in the various departments in the customs service came in at proper intervals and told what he had to do. They were given a sneak of it as they thought was good for him to know—and went on their way untroubled by any interference from above. But the new collector was different. He knew the customs business. Indeed, several heads of departments came in to pay their respects to the new chief and tell him what they were doing—and remained to receive instructions. Now and then he told one of three gentlemen things about his department that he himself had never known, and he was sure that any one else knew. Furthermore, instead of placidly receiving what he was told, he would inquire about things that any one else knew. Furthermore, instead of placidly receiving what he was told, he would inquire about things that any one else knew. Furthermore, instead of placidly receiving what he was told, he would inquire about things that any one else knew.

"Suppose the newly elected president of a railroad should give orders that every man on the road must obtain for himself a new pair of shoes in any form, or that every employee must sleep also bare out of each twenty-four, that would follow, the ability of the army of railroaders to grasp the idea that the new chief meant what he said. As yet Mr. Loeb has no charge at the Custom House, in Building Group, he has no charge at all revolutionary. "We must collect all the customs dues, fully and honestly," he told me. "There are many ways to help me to the relief of your ability. If you fall you will be disappointed. If you succeed you will be promoted as high as you can get. It will be the only thing that counts in this office. Politics is out of it. Remember, you must collect every penny that you can get from every goods into this country—the biggest merchant to the lowest trader."

"Volume drew me in to order and talked it over. The new Collector means well, but you see it is to be so or not to be. I am not a politician. Loeb seemed to be a new young fellow—and he didn't know. Certain parties, knowing great political and public affairs were about to come, would put the pressure on him, and they'd know what was what and what to do." (Continued on page 26)

William Loeb, Jr. WHO RENOVATED HIS FELLOW-CITIZENS BY SHOWING THAT THE COLLECTION OF CUSTOMS OF THE PORT OF NEW YORK CAN BE ACCOMPLISHED EFFICIENTLY AND HONESTLY

and make it efficient. Mr. Loeb said he believed he could; at least he'd try as hard as he could. He got the job, with only one condition attached—that he must do the service honest and thorough. What qualifications had the young secretary for a task that required the abilities of Hercules, Solomon, and a few other supermen faded into one? First of all, character: he had been diligent, honest, and faithful in many things; a hard and loyal worker; an unsparring student; a model of neat, a genius of keeping his mouth shut. He had also the faculty of grasping a multitude of details, of classifying and analyzing them, and never forgetting them. Also he had youth, health, strength, and enthusiasm. He was forty-two years old, a trim fellow six feet in height, with a big, heavy frame well packed with spry muscles. As he would stand, or he seems today physically the type of a football guard or tackle, with perhaps a shade less knock-out—an excellent self-starter against men, but a knock-down, well-protected boxer, speaking casual that appears a big well-balanced head, proud on a strong neck, broad heavy eyes, nose, set well apart, strong mouth, revealing firm, a big, lighter nose; deep, broad chin, slanting forward, and hard

### SOME SUGGESTED VALENTINES

**H**AVING looked vainly over the field to find suitable valentines to fit into the needs of certain special classes of men and women, we venture to supply an unfortunate lack with the following suggestions. These, if cut out and pasted upon a piece of card-board or the back of a postal, may be mailed to the party of the second part by the individuals to whom they may appear useful.

*(For a College Boy Free To Face With a Defiant)*  
Dear Father, send me dollars nine,  
And I will be your Valentine.  
If so you wish, don't fail to pay  
The check for ten.

*(For a Retail Dealer To Read To His Tailor)*  
Dear Shop, I cannot pay your bill;  
I have no money in my till.  
And as the tank I'm down so low  
The customer's manner's cold as snow.  
But I have not forgot you, Shop,  
Nor would I give your bill the slip,  
But just at present I incline  
To simply be your Valentine.

*To Read To The Young Lady Who Has Rejected You*  
Nive to my suit you answered, "Nais!"  
I shall not be your Valentine,  
But to the girl across the way  
I'm sending stacks of them today.  
I call to-night, but, say I go,  
Accept my thanks for saying "No!"

*(To Read To a Somewhat Unappreciative Employer)*  
If you will raise my salary  
Your Valentine I'll gladly be,  
And mark me well, if as you don't,  
Hooch, I walk!

### A STRONG SERMON

"THAT was a strong sermon you preached on Lent and the vanities of life, Dr. Prang," said Mr. Roddyman.  
"I'm glad you found it so, Mr. Roddyman," said the reverend gentleman.  
"Yes, sir—and what you said about ostentation was especially pointed and true, and I have decided to reform my ways in that respect. Instead of getting a thousand dollar check in the photo on Easter Sunday,

sir, I am going to content myself with a neck and lovely two-dollar bill," said Mr. Roddyman, giving the rector's hand an affectionate squeeze of appreciation.

### THERE'S A REASON

"MAYN'S father has forbidden everybody else house during Lent but me," chortled Chaffin.  
"Oh, well, I suppose he thought he ought to impose a penance of some kind on her," said Cyrus.

TROUBLES OF A PREHISTORIC PROFESSOR  
TURNING OVER A NEW LEAF

### AN AWFUL BLOW

"Yes," said Siffers, "Makley was my dearest friend, and I shall never cease to mourn his death. It was a terrible blow from which I shall never recover."  
"Why—I thought you married his widow?" said Jansson.  
"Why—of—about—why, yes, I did, but—"  
Here Siffers subsided into a deep and uncomfortable silence.

### SERIOUS THINKING

"You really should put your mind on serious matters during the Lenten season, Mrs. Frevde," said the rector, gravely.  
"Oh, I do, Dr. Fourthly," said the lady. "You haven't an idea what a lot of serious thought goes into the selection of an Easter hat these days."

### NO TROUBLE AT ALL

"No," said the summer girl, "I have no difficulty at all in keeping my Lenten vows. Every year I refrain during the Lenten period not to stroll on the moonlight; not to stroll in a hammock; not to stroll with any young man during the two-

light hour; and not to frivel in the bushy dell with every fluffy-haired college athlete that comes along."  
"Noble girl!" said the visitor, as he put on his fur overcoat and went forth into the raging blizzard, resolved to lead a better life.

### A USEFUL CITIZEN

"WHAT sort of a chap is Dabberton, Griggs?" asked Whackoon.  
"Dabberton?" said Griggs. "Oh, Dabberton's the sort of chap who will deliver a lecture on the Honor of the Mercantile Earl of Shaftesbury at a time when everybody else is looking for advice on how to reduce the high cost of living."

### THE KIND

"SAM WOODMAN is the most futile dreamer I ever met," said Dabbs.  
"Really? How does he show it?" asked Wimpleton.  
"Why, Sam's the sort of man who would actually go to a public dinner to get something to eat," said Dabbs.

### NOT UNLIKELY

"Well, my boy," said the visitor to Bobby, "I suppose some day you expect to step into your father's shoes."  
"Oh, I suppose so," said Bobby, gloomily. "I have wanted 'em ever 'til this' else he sure since mother learned how to cut 'em down for me."

TRACK TEN—THE FINAL HEAT

## WHEN IRISHMEN

The interior of the Irish House of Commons in College Green, Dublin, as it appeared in 1790, one year before the abolition of its licensing law within two years, despite the veto of the House of Lords, makes this picture of 18th-century Ireland. Granton (holding the scroll) referring to Henry Flood, while Lord Chalmers (seated) is watching him earnestly. The 2

## RULED IRELAND

of the Act of Union, which abolished the Irish parliament. The passage of the Home Rule bill last month, and the probable Philip Curzon is shown addressing the House, over which Speaker Foster presides. On the right of the picture is Henry man at the extreme right (seated, with the curled wig) is Sir John Parnell, great-grandfather of the famous Irish statesman and J. HAYTER, APPEARED IN THE ISSUE OF "HARPER'S WEEKLY" FOR FEBRUARY 26, 1907.

# THE FORBIDDEN ROAD

BY JANE ANDERSON

DRAWINGS BY W. H. D. KOERNER

EVERY afternoon, at sundown, Wanda stood in her side doorway watching the negroes ride by on their way toward town. The postmaster's Mexican glances her head were no broader than her mouth, and she wore two bands of scarlet beads around her hair.

She knew that there was not one of the men who did not want to stop and be with her; and it pleased her—as it would have pleased any woman.

In town, at night, the negroes talked of her beauty; but the women shrugged their shoulders and wear elegant gowns with their hands. They said that she was a chola—which is to say that there was both Indian and Mexican blood in her veins—and that she was without caste. All of which was true.

One day there was a new rider with the men when they came in from the ranges. He was young and straight and rode well forward in his saddle, looking neither to the right nor to the left. The sky was brown, but it was the brown of wood and stone—for his eyes were blue.

Wanda waited for his coming every day, walked with the misgivings and small fears of a child who does a forbidden thing. But each day he rode by, silent, looking straight ahead. And Wanda was glad. When the shadows of the penitentiary deepened in the twilight she watched for him, but she did not want him to stop. She was afraid, then, he did not come in from the hills with the others. The next day Wanda wore her prettiest bracelets—wrought her slender arms with them. She braided her hair in two heavy plaits and wound them around her head, fastening them with a narrow band of silver.

She went down to the gate that overlooked the road. Her eyes rove close to her but she could have reached out and touched him. But he did not look at her. It was then that she saw the fine of white on his neck where the sunburn stopped.

She went back into the house, drew the blankets across her deer, and looked at herself a long time in her small mirror. "Look," she said, under her breath. She took off the heavy bracelets and threw them on the floor, where they rolled around, flung back at her in the candlelight.

But the next afternoon he came in to talk with her, and since he was a white man he brought one of the negroes with him, so that the introduction would be convincing. In town, before they went away the negroes asked for the red man in her hair, and she gave it to him and laid it into the horse's mane, and the red man looked up from her work, Wanda laughed.

"He is just a man, when all is said," she said. But she was very happy. It is named Clay Livingston—which is a pretty name."

"He is of another people," said the old woman. "It is better to let him be."

"His eyes are good blue," Wanda answered.

Her father sat at one side, listening. He was an old man, fast returning to the shabby ways of his tribe. He said no comment.

When the negro had finished the night's work and had gone back to the reservation Wanda went out and sat on the low doorstep of the veranda. With her hands clasped around her knees, she watched the moon look above the mountains, and the shadows of the night-banks circling on the sand. She thought of Clay and remembered the warm pressure of his fingers on her eyes. Then she tried to put him away from her, and hunched back against the door, staring up into the thick, close leaves of the tamarind. She made pictures out of them, and figures of people, half hypnotized by her own devices, like a child who brows out giants and great white sheep in the moving clouds.

Far away she heard the patter of a pony's hoofs, but it became a part of the noise of the night, and she did not listen. When they stopped before the gate she looked up and saw Clay coming up the path toward her. For a second it seemed that he was but one of the pictures she had made.

But he came and stood beside her, looking down into her eyes, smiling.

"I have come back," he said, and sat down on the doorstep beside her.

"Oh," said Wanda. She had taken down her hair, and it hung over her shoulders in two heavy wavy bands. She lifted one of them and wound it around her wrist, trying to hide the trembling of her hands.

"I don't know. You don't mind my coming?" She glanced up at him from under the shadow of her hair. "No—I am glad."

"I—I felt like I had to see you again."

Wanda stirred out her slim, brown hands, looking at them in the moonlight. She did not know how to answer him, and she was suddenly afraid to meet his eyes.

"I don't understand about you," he said, slowly. "Have you been here always? You talk sometimes in Mexican, then English. You seem—"

She smiled, but she drew back from him. "No. I speak two tongues, also the Indian. It is not strange. Many people here in the country of Arizona do so."

"You are Spanish?"

"My mother was of the Chulilla, and most beautiful. My father is of the Indians. I am like those of his tribe."

"Tell me about yourself. . . . I don't seem to be ready—but tell me all about yourself—all of it. I want to hear."

He leaned forward, his face eager and bright in the soft light.

"There is little to tell, when—"

"Tell me," he said again.

She smiled, throwing her fingers in and out of the long bands of her hair. "When I was little—no," she said, slowly, "there was a barber, of course. It was before my mother—"

He laughed happily.

"But, even so, it is a odd way to speak—? There is no 'I was' and 'I have'—I cannot get close to any one."

"But when you were a little girl—"

"Then—"

"After a time, my mother went away with a man—she was not her own people, it was very long ago, and to me my father would never speak of it. . . ."

"Then, my father did not care what happened to me, and my mother was not there to see. But it was not like this with me always. The haircuts was most beautiful—but now it is all, and the doors of it are all earth, according to the ways of my father."

"Are you happy—are you happy here now?"

Wanda looked down thoughtfully at the twisted line of her shoulders. "Perhaps I would like to go away—I do not know. There are other places beyond the hills."

"Yes, there are other places—then, and it is different there."

She found her father alone

She leaned back and looked up at the rustling leaves above them. "I will be happy, then," she said, softly.

They waited, each conscious of the nearness of the other, silent, afraid to speak. A kind twittered drearily in the transparent air, and an answering chirp came from the blossoms near him.

Wanda stood up and brushed her hair back from her face. "It is late," she said. "We have been talking long."

"No—please don't go in."

"I must go," she said; "we have been here very long."

"It doesn't seem like a long time. I wish I could tell you how it here like here—here with you. How—! He put his hands out before me in gesture of despair. "Even if I could tell you, you wouldn't believe it—it would sound so queer. But let me come again, like this."

"I will let you come," she said. "And you will tell me about the cities beyond the hills."

He stood up beside her, and she thought that he was tall, much taller than she. "He has known many women," she thought, carelessly, and she put her hands up to her throat with a quick gesture of pain.

"You must walk down to the gate with me." There was a sudden accent of command in his voice, and it pleased her.

They went down the path together, silent, not looking at each other, the full of words that could not be said to try and talk about better things. At the gate, he turned to her.

"There is one thing," he said, quickly. "You must promise me—"

"—if, please?"

"You gave away that flower today—you took it out of your hair. I—didn't want you to give it to him."

She laughed, but there was a look in the laughter. "I promise I will not again."

"I ought to have had it."

"You did not ask."

"It really belonged to me," he said. "Didn't it?"

"Perhaps," she answered.

He lifted both of her hands in his. "I shall come every night."

"Every night?" he said, again.

She nodded, and she felt his fingers close down suddenly on her own. "Goodly—just till the morning light. . . . Wanda."

"Alone," she whispered.

When he had gone she stood at the gate, bewildered, half afraid. He had come back. . . . But she was not content, she was not thrilled by a sense of her privacy. She was afraid. She felt before, afraid, caught up by some strange tide that was sweeping her along against her will. She did not know how to fight against it. She remembered a whisper that she had seen battling against a sandstorm in the desert.

"I am like that," she thought.

She crept into the house and into her own room on tiptoe. She lighted the candles and stood watching the flick shadows that fluttered on the wall behind them. Finally she looked into the mirror at her own serious, colorless face. She turned away quickly, fastening her dress with trembling fingers, she blew out the candles and felt her way across the darkened room to her bed. But she could not sleep. Through her open window she could see the half-moon above the tangled trees. She thought that it looked like a small, transparent bell filled with pearls. . . . When she slept, she dreamed of blue eyes that were fixed on her own, dominating, overbearing. She tried to run from them, but she could not get away. Wherever she looked, they waited for her. . . . And she awoke in her sleep.

Clay came to the bedside every day as he had said. And they sat together on the doorstep, forgetful of everything save that they were together. He told her about himself, all there was to tell—his hopes, his fears, his dreams. And Wanda, listening, trembled every word of it, because it made her feel very close to him, a very part of his life. Some times she talked to him of the secret things that she had kept locked up in her heart for so long. And the life that swept them along became greater and greater, a revelation, terrible then. . . .

One night Clay came to the house early. She ran down the path to meet him, her cheeks flushed, her eyes sparkling under their half-lowered lashes.

He caught her hands in his. "We're going to ride out on the desert—no more here, and I want it."

She hesitated, but he drew her along with him toward the corral. He pulled her pony for her, while she stood on one side holding the leaders close to her head.

He led the pony out into the yard, but she walked, with her hands on the saddle-horn. "I do not know."

He bent down, gathered her up in his arms, and lifted her into the saddle. "Are we going?" he asked, laughing.

"Yes—yes—yes—yes—yes."

"I already have—decided. I'm going to do it lots of times."

"I wonder," she said, smiling down at him. "I know I will."

She looked away. "But this is not going out on the desert," she said.

She ran across the yard to get his pony, and she rode around to meet him in front of the house.

"I'll see you," he said.

So they went down the road at a run, their horses close together, so that her skirts brushed against his stirrups. They cut around the foot of the house and out into the open, at the head of the hill, where Wanda gained a little, leaning forward in her saddle, cradled over the neck of her pony, Indian fashion.

"You win!" he cried. She smiled in her pony, laughing.

Clay rode up beside her, and with his coming everything was changed. She saw that his face was serious—the light mood of a moment before forgotten.

His smile had been but a cloak to cover other things. . . . She felt as if she must turn back.

"There's no one trying to run against you," Clay said, slowly. "You will win—you will win any day."

"No," she answered; "if I was now I will lose later. There is a spring of my father's people, 'if the gods give much, they take much in return.'"

"But you don't believe in the Indian gods—and everything."

"I believe the things that are true, no matter who speaks of them. And, too, I am like my father's people. I do not want to lose—I cannot help it. I look at the old man, Ostar, at his work. . . . I will be like that—some day. It used to be a terrible thing to be old. He is dead, and there is no color in his hair—it is dull and black. She cretes for nothing. And I will be like that."

"You are never to be like that, Wanda. I've seen the wrinkles of the tribe over there behind the hills—you could not stay there." He rode close to her, leading now her. "Wanda—Wanda," he said, softly.

She drew away. "No—no—"

"Wanda, I want you to go away with me—you

from her. In the low houses the cypress were calling at the yellow moon, but it seemed as if there were in some other world, rolling across great wadis, their cries growing fainter and fainter, ever widening. . . . She no longer tried to struggle. She swung toward him and he put his arms around her. "Don't help us," she sobbed, and hid her face against his shoulder.

They rode on together, their horses finding their own way. They tried to talk, but the words would die in broken phrases. And the moon looked down on them from the shadowy sky, and in the saddle a cypress called and was answered by his mate.

They went to her father that night, and Wanda told him why they had come. He answered her in low tones, standing a little apart from them, his worn orange wrapped around his shoulders.

"I have waited for this," he said. "This will go away with you."

"To the cities beyond the hills."

Her father laid his hand and muttered something that she did not understand.

"Tell him, Wanda," and Clay. "Find we want to be married at once. That we want to go away."

They rode on together, their horses finding their own way

have no time to stay here, I want you—I've waited as long as I can. . . . don't—don't, you know—I don't have to tell you, now!—Wanda, look at me!"

She bent her head, looking down at her rings and twisting them in her trembling fingers.

"What is it, dear? Don't you—don't you—"

"—I am trying to remember the things I must remember."

"—I know to me, Wanda. I—"

"I will not listen," she said. "I do not want to listen."

"Don't lie to me," he caught her hands, and she could feel the throbbing of the pulses in his wrists.

"No—no!" she cried. "I cannot—I cannot. I feel that it is wrong—I know that it is wrong. . . . I have seen the old man at his work. Go away while you can go—and leave me alone."

"Think, dear—you don't know what you're saying."

"—I am trying to remember."

He lifted her hands to his face, holding them there.

"What does it matter?" he said, softly. "What does anything matter—but this?" He pressed her hands against his face, and something tightened around her heart, hurting her. He drew her toward him, and she tried to fight against him. But she was weak and trembling, and everything seemed to be slipping away

The old man lighted his pipe and watched the tobacco turn red in the bowl. "If they are to be married, Wanda, it shall be by the laws of my people. I know—I know. . . . For when it is time he will go. He is a white man."

"What does he say, Wanda?"

"That we are to be married by the laws of his people. He will say the words."

"No—it can't be like that. We're going into town, where there is a priest."

Wanda hesitated.

Her father laid his hand on her shoulder. "If they would marry him, Wanda, then must do as I tell them."

She turned to Clay. "Let it be as he wants it—he is an old man, now too."

"We will go to the priest afterward!"

"If you will," she answered. "We must do as he bids us."

No they kept down before him like two frightened children, and the old man lifted his hands and muttered the half-forgotten words of his tribe. He took Wanda's hands and placed them in Clay's, asking his words to be kind to them. Then he went away and left them, and Wanda, watching, saw now that he walked slowly, as though he were very tired.

Clay drew her to her feet and kissed her. "Let us go now," he said.

"But something seemed to hold Wanda back. 'We must stay here—a little while to rest.'"

"No—some way walk me now."

"But how could she walk so away with him, she could not? Not yet, for she had to be seen and drew him toward her own room. She fastened the heavy curtains across the doorway and lighted the lamp. Then she came to the window. The moonlight made new shadows in her face. She seemed to look into a woman, such as she could be. Then she saw a crowd of people, and she could not be patient, she would rather die than be happy."

"Oh, mamma," he said, and took her in his arms and kissed her on the forehead.

"But they did not go to the priest, for Wanda would not."

"We are married," she would say. "How do the words differ if not in your tongue or in mine?"

And she did not want to go away with him. She no longer cared about the dreams of the city beyond; she wanted not one thing—to be with him, and to be forever present to him. So they stayed in the old shadowy passages, shut out from the world by the great towering trees. Wanda sang over her head and he, and at night she prayed to the gods of her father's tribe, asking them to keep a smiling face toward her.

But one morning Clay told her that they were going away, and looking at him, she knew that it was no time to resist that of the city beyond. He left her hold on him as a very tender thing.

"But we will not go far," she said.

"I will not go far," he said.

So Wanda made her simple preparations for the journey. Taking her wraps and packing them, made Clay's direction, in the small trunk that he had sent her some days. She thought to look at it with an extraordinary thing in power, and said that she would rather keep it with her than leave it. It is the woman's happiness of a train. Clay looked at her, and said that she was a child, and kissed her. But Wanda's heart was heavy.

One night before she was to start she came to the window of her father's tribe. She stayed by the lamp with the woman, talking to them, and they would answer to her over years. She did not want to leave them.

She went away with Clay the next day, and her father stood on the doorstep to watch them go. Wanda looked back from the great distance of the towering trees stretched out his hand, and his eyes came into her eyes. But she turned away so that they could not see.

The train started as a breeze that to her. She sat on the plank seat beside Clay, her hands lightly held down the steps of the car, and Wanda looked about beyond their window.

"I've got a house for us down there," he said, and a living girl to do the work. I think about it all the time."

Wanda did not answer. And in the early days they entered the first city beyond the hills. Clay helped her down the steps of the car, and Wanda looked about him in the station, bewildered by the habits of towns around them. She wondered if the people there were sleep. Clay put her into a cab, and the driver drove the door behind them. They passed through many streets lined with darkened houses, and she felt as if she were going deeper and deeper into some dark and mysterious place from which she could not return. She walked hurriedly for the circles of light around the corner lamp-posts for some reason she gave her courage.

The house was at the end of the sidewalk, and the little Mexican girl was waiting for them in the light doorway. Wanda went wearily up the steps, and it seemed to her that Clay, the driver, the girl in her white apron, were just figures in a dream. She went through all the rooms of the house, because Clay had her to look at them. Of all that she saw she remembered only some sparkling glasses on a table. She went back to her room, and she found the door closed and stood with her back against it. The bottles and the silver-plated bottles on her dressing table glowed under the electric lights. She crossed the window before she could return to the meeting of the journeying trees in the yard at night. She passed her hands against her forehead. I want to go back! I want to go back! I want to go back!

When Clay came in she was sitting in a small nook at the head of the bed, very still and straight, her hair bright in the candle light.

He bent over her and kissed her. "Do you like it?" he demanded, lifting her face in his hands.

"Was it all here—like this?" She pointed to the bright things on the wall.

He laughed. "I don't think you're ever going to grow up. Do you like it?"

She lips trembled and she could not answer.

"I write to all my men of story for all these things—and write to the girl to sit up to look like mine, right off the top. I wanted to surprise you. Besides, I know a few little facts about and they'll be coming in to us—"

"That's Mrs. Carter—"

"She's just Mrs. Carter, and she says her daughter has come back from school now. I used to know Ethel when she was a little, remember? I wasn't much more than a kid myself. Perhaps she'll come and

see me—"

He hesitated, looking down at her, and a foot of red rubbed over his face.

"Do not say that. When do they come?"

"To-morrow—"

"Not to-morrow."

"Why not?"

"I have had other dresses," said Wanda.

Clay laughed and drew her to him. "I guess you've given up, after all—"

"He tried to kiss her, but she would not let him. She was so angry that she drew the door back through the town. Wanda, watching the people passing and repassing on the streets, laughing, found on many sweet moments, thought that she had been as a very contented thing, passing my understanding. The little dusty town, provincial, crude, seemed to her a veritable city of wonders. She was a three-story side building on a corner, its windows lit with many electric signs. She looked at it with the wonder of a child.

Suddenly she turned to Clay. "Why do we ride when others walk?" she asked.

Clay thought. "I thought—"

"Mind and body, her lips smiling.

In the afternoon she put on the strange new clothes and looked at herself in the long mirror that stood between the windows. It was a white dress with a little black at the wrists. Her hands seemed very brown against it.

Clay came in and stood looking at her. She was so angry that she would not let him. A man would not kiss. Wanda said to herself!

But Mrs. Carter did not come, although Wanda was sure that she would. She was so angry that she would not let him. The little Mexican girl pointed them out and said much of Ethel Carter's prettiness—a thing which Wanda did not have to be told, since it was the woman did come to see her that day—a woman wise in the ways of the border-line countries, generous, asking no questions, Wanda got in the small park with her and with Clay, a simple creature of the same class and nature as the woman, but she was not the same. Her father's name, however, and she sat at one side, shy, afraid, almost unconfident.

Clay smiled and talked with their guest, and the days of the old business seemed very far away.

One day Clay took Wanda to her home to see her, but Wanda would not go again. She stayed alone in her house, watching the people come and go in the streets. Sometimes Clay would not come to visit late at night, but she did not ask him where he had been that night. She kept his always with her. She wore her prettiness and wore bright beads for her hair. She tried all the prettiness, but she did not let her hair be as she had been. But she did not let her hair be as she had been. But she did not let her hair be as she had been.

"All men are like that," she would say to herself. "I have to have other things to think about. I must be getting here."

"You're not happy here," he said, once.

"I am happy," said Wanda. "For so long a time as I have been here, I am happy."

But after a time she got the whole dress in the chest of her room and took out her lightest wraps and accessories from the small trunk. When she put them on she wanted to cry. But she could not. Even at night, when she waited for him to come back, she could not cry.

One day she saw Clay and Ethel Carter ride by the house. He was leaning toward her, laughing. Wanda watched them until they passed beyond the curve of the road. She found herself wondering if he had told Ethel about her, she shut the thought out because she felt that it was dishonest. But she knew in her heart that Clay had not told her.

"Let us go back," she said to Clay that night.

"Back where?"

"To the hacienda and my father."

He turned and looked at her. "Why are you dressed up like that?" he asked.

"I don't want to look like me to be dressed up!"

He did not answer.

"Let us go back," Wanda said again.

"Yes," he said, "we can go back now."

She was so angry that she would not let him. She was so angry that she would not let him. She was so angry that she would not let him.

"I cannot be like this," she would say again and again. "It is all wrong. Why should I try?"

She was so angry that she would not let him. She was so angry that she would not let him. She was so angry that she would not let him.

She was so angry that she would not let him. She was so angry that she would not let him. She was so angry that she would not let him.

She was so angry that she would not let him. She was so angry that she would not let him. She was so angry that she would not let him.

She was so angry that she would not let him. She was so angry that she would not let him. She was so angry that she would not let him.

She was so angry that she would not let him. She was so angry that she would not let him. She was so angry that she would not let him.

room across the foot of the bed and she reached out for it in the darkness. She held it in her arms, burying her face in it.

"Do not say that. When do they come?"

"To-morrow—"

"Not to-morrow."

"Why not?"

"I have had other dresses," said Wanda.

Clay laughed and drew her to him. "I guess you've given up, after all—"

"He tried to kiss her, but she would not let him. She was so angry that she drew the door back through the town. ## The World's Great Forests

There is an immense and continuous tract of forest lying north of the St. Lawrence River, in the provinces of Quebec and Ontario, extending northward to Hudson Bay and Labrador, a region measuring about seventeen hundred miles in length from east to west and a thousand miles in width north and south.

By some it is held that a much larger continuous area of timber lands exists in the State of Washington and northward through British Columbia and Alaska. But this contention is limited to North America, for, if it has been pointed out, there lies a forest in the valley of the Amazon, embracing much of northern Brazil, eastern Peru, Bolivia, Ecuador, Colombia, and Guiana, a region at least twenty-one hundred miles in length by thirteen hundred in breadth.

Then, too, there must be considered the forest area of Central Africa, in the valley of the Congo, including the head-waters of the Nile to the northeast and those of the Zambezi to the south. According to reliable estimates, Central Africa contains a forest region not less than three thousand miles in length from north to south, and of vast although not fully known width from east to west.

The spruce which clad the mountains of the greatest forest has been placed in another light by an explorer who is reported to speak of still another great forest region of the globe. This authority has noticed a great portion of the vast pine-land, and cedar forests of Siberia.

Siberia from the plain of the Obi River on the west to the valley of the Indigirka on the east, embracing the great plains or river valleys of the Yenisei, Obi, Irkutsk, Lena, and Yana rivers, is one great timber belt, averaging more than a thousand miles in breadth from north to south, being fully seventeen hundred miles wide in the Yenisei district, and having a length from east to west of not less than three thousand miles.

Unlike equatorial forests, the trees of the Siberian ranges are mainly conifers, occupying places of several varieties, fir, and larches. In the Yenisei, Lena, and Obi, and elsewhere there are thousands of square miles where no human being has ever been. The long-stemmed conifers rise to a height of a hundred and fifty feet or more and they stand so closely together that walking among them is extremely difficult.

The dense, lofty tops exclude the pale arctic sunshine, and the straight pole trunks, all looking exactly alike, so bewilder the eye in the obscurity that all sense of direction is soon lost. Even the most experienced trappers of sable dare not venture into the forest trunks without taking the precaution of "blazing" the trees constantly with bullets as they walk forward. If lost there the hunter rarely finds his way out, but perishes miserably from starvation or cold. The natives avoid the forests and have a name for those which signify "places where the man is lost."

### Some Pessimistic Statistics

ESTIMATING the world's population at 1,800,000,000, the whole human race at present living could stand comfortably shoulder to shoulder in an area of five hundred square miles.

Taking the number of generations in the past a thousand years as two hundred, the room taken by them all on the above plan would only be half the size of Georgia, or less than the area of the state of Colorado. To bury all the people on earth would require a graveyard a little larger than that area.

If the dead left by each hair be situated at an interval of a cubic yard, which is a liberal estimate, it would cover only forty square miles to a depth of about

three feet. This estimate seems being indeed, it is pointed out, compared with the great cities and other large deposits built up in the midst of their methods.

### The Bulgarian Servant

THE BULGARIANS have a curious way of permitting servants at two periods in the year—the 25th of August, the 25th of April and on the 25th of October the slaves of the capital are filled with servants who come to find for employment. The latter who explain their pass by in a street reserved especially for this strange "market" and examine and interview the applicants. The average wages is four dollars per month out of which the woman servant manages to save enough for a husband, but on the occasion of

## Use the Broadway Limited Between New York and Chicago

It leaves Pennsylvania Station, in the heart of New York (one block from Broadway at 32d Street) at 2:45 P. M. to-day. Connecting electric train leaves Hudson Terminal (five minutes from Wall Street) at the same time. It arrives Chicago, Union Station, at 9:45 to-morrow morning.

Returning, it leaves Chicago 12:40 P. M., and arrives New York 9:40 next morning.

It is all-steel, all-Pullman with parlor-smoking or club car, drawing-room sleeping cars, dining car, compartment cars, and observation car—all of the newest and brightest design and electric lighted. It has a library of best current literature, and the latest periodicals and newspapers, terminal telephones, a bath, barber, ladies' maid and manicurist, a stenographer, and a trained crew picked for their efficiency.

## It is The Time Saver de Luxe

It makes the over-night run at comparatively low speed over a rock-ballasted smooth-riding roadway which is the short line between New York and Chicago—the best guarantee of promptness and comfort. The dining car service is exceptionally high grade.

It presents Pennsylvania Railroad service in its very best form—a service that has been the standard of America for more than half a century.

It is the most convenient, comfortable, complete, and reliable service between New York and Chicago.

### The Grinding of Lenses

By far the greatest quantity of lens-grinding optical glass available for business is imported from Germany and France. This glass comes to us in pieces a trifle larger than the size of the lenses to be made. The surfaces are polished sufficiently to enable the expert, as he passes through the glass, to see that it has no defects.

It is very important that before the actual work of grinding is begun the rough blocks shall be examined with the greatest care and that the thickness of the slightest veiling or layer of unequal density, all work upon them will be spoiled. Care and the time taken in grinding the disks shall be perfectly answered. The test in this relation is made by polarized light. Two kinds of glass are used in the construction of lenses—crown and flint. Grinding is accomplished on an iron disk of the proper curve, revolving in a trough trough, which is placed upon the operator perfect freedom of movement. Fedders emery and water are thrown upon the wheel from time to time.

When the glass under treatment has been ground to approximately the required shape, it is placed upon another slowly revolving turn, a fine grade of emery and water being employed. If it proceeds to still rougher, where it remains until very nearly the right size has been reached and the glass has gained approximately the required curve. The final grinding of all is the most important, and of course, calls for the greatest care and skill. The selection of the emery plays a very important role in all stages of grinding, since a coarse emery is liable to scratch the surface of the lens in a few days, and in many cases, ultimately ruin the glass.

After the "fining" as the last stage is called, has been accomplished, the lens is taken to the polishing department. The work is still more delicate, a sawing of the glass in the workman's hand. It must be remembered that by a saw or even an operation connected with the tool, a scratch or even a crack in the face of the glass in the workman's hand. It must be remembered that by a saw or even an operation connected with the tool, a scratch or even a crack in the face of the glass in the workman's hand. It must be remembered that by a saw or even an operation connected with the tool, a scratch or even a crack in the face of the glass in the workman's hand.

Considerable care and skill are required in this line. The workman holds it in his hand, as indeed he does for most of the time in all stages of grinding, and from time to time he adds a quantity of the mixture mentioned.

When the lens has been polished to the right degree a rigid test is employed to determine that every curve is absolutely true to the radius calculated before the work was begun. The next step is to render the lens upon a machine that renders the edges of precisely equal thickness all around.

The glass is still inspected. There follows an operation demanding the utmost delicacy of manipulation of the surfaces of the lens in order that each ray of light shall be brought to one exact focal point.

### Cold-storage Eggs

It is up to all the folks that have been told about cold storage, this method of preserving food has many advantages. In the case of eggs it has been shown that the cold-storage method compares favorably with the best preservation method, a lack in the case of most common food. After six or seven months in cold storage, the egg has not changed its appearance, whereas the egg preserved in lime has become yellowish. The egg in cold storage may be eaten from the shell after three to four months; in this time the unpreserved egg has acquired a distinct flavor.

The development of methods for maintaining low temperatures has had an important effect upon the egg industry. Bureau experts every year save more than 2,000 million eggs worth \$22,500,000. The importation of eggs into this country amounts to \$21,000,000 a year and our exports come to \$17,000,000. Denmark exports \$2,500,000 a year and Constantinople is said to import in cold storage 75,000 cases, each case containing 100 eggs.

However, the usual method for keeping eggs in cold storage leaves much to be desired. While the low temperature prevents the activity of decay bacteria, it does not prevent them entirely. Within the egg-shell, now from 10 percent up to 25 percent, they are still present in their complete activity. A French inventor, Fernand Lemerle, has devised a plan which overcomes these difficulties. His method consists of keeping the eggs in an atmosphere of a inert gas, as nitrogen or ox-

gen dioxide. This prevents oxidation completely, and, among other things, prevents evaporation. The eggs are placed in tin cases, each containing 500 eggs. These cases are placed on wooden racks so as to allow for circulation of air between them, and each is further provided with a pane of calcium chloride which absorbs the moisture. The racks with the tin boxes are now put into airtight chambers from which the air is exhausted. This removes the remainder of the little air that is inside the shell of each egg and that may be absorbed in the atmosphere. The gas is then used in first sterilizing and then closely introduced into the chamber until the normal pressure is restored. The boxes are then withdrawn from the chamber and the opening of each is soldered up; the boxes are now placed in a room having a temperature of thirty-five degrees Fahrenheit—thirty-three degrees above freezing. No attention need now be given to ventilation or to the atmosphere of the room, for the eggs do not oxidize, and the air is absolutely sterilized even after ten months of storage; and in this length of time the atmosphere does not become in the least deteriorated.

### The Indian and His Canoe

When the red man of the old type wants to construct a canoe, he falls a tree, and he has to make a complete trunk of the dimensions he desires. In either case he proceeds to cut out a section of the trunk, and he has to make a hole and hollow out the log, leaving a smooth surface upon the sides and bottom from end to end. The log is turned over and the outside finished.

The log is hollowed by boring and chipping. The log is turned over and is so carefully worked and so skillfully directed that what the boring is followed, with a piece of skin or a piece of hide, with a careful scrutiny from here to there. The whole canoe surface is left so evenly and neatly shaped that when the surface is worked down to the second timber by the use of a back-saw there remains but little alteration to be made.

The log is turned over, with the hollow side down. A slow fire is employed to shape the exterior and cure more the surface is nearly worked until the second timber appears.

Since the coming of the white man the Indians have, for the most part, followed the lead of the white man, but in the old days this was accomplished by burning out by stone implements, the canoe was so shaped as to insure the position where the canoe was to be built. When the interior and the exterior of the canoe have been finished to the liking of the builder, his next step is to "steak." Without this operation the craft would be entirely unworkable. To make the canoe seaworthy, it is set level on a firm solid foundation and filled with water. A fire is then built and stones of a red heat are thrown into the canoe until the water boils. This boiling is maintained until the walls of the canoe, which are more than an inch thick, become as pliable as sole leather and capable of being stretched a foot or more beyond their normal width.

The builder's attention is now turned to the adjustment of cleverly fitting struts put in transversely along the gunwale, increasing in length from the ends to the middle. By means of these struts a cedar log four feet in length. The width of the canoe varies, of course, with the length.

The sides of the canoe having been brought to the desired curvature, the water is then emptied out and the shell allowed to dry thoroughly, but without cracking.

The finishing touches consist of a steering, handle and out with fish-out, together with various decorations in brilliant colors.

### New Chinese Currency

TAIPEI is being printed in this country a vast sum of paper money for the Chinese republic. This is the first money authorized by the new government of China. In the design of this money the Chinese are to be distinguished from the United States in that it has made the American dollar the standard of value for this money. The Chinese dollar is printed in Chinese on one side and in English on the other, thus making the language of the Chinese money as easy to read as ever, a thing that has been a quite a problem in the past. The new notes will be issued in denominations of \$1, \$5, \$10, \$20 and \$100 and will bear the portrait of the philosopher Confucius, who stands in the foreground of the Chinese Republic, and in the background of the Chinese Republic only to Confucius.

# Monarch

## Light Touch

THE extremely light action of the Monarch Typewriter endears it to all operators who use it. The typist who takes pride in her position finds great satisfaction in being able to turn out as much work, and as good work, per hour, toward the end of the working day as during the morning. Other conditions being the same, she can always do this on a Monarch. There is

“No Three O’Clock Fatigue”

for users of this machine. The mechanical reason for the Monarch light touch is found in the action of the Monarch type bar, an exclusive and patented feature which gives this remarkably light touch.

We would remind the business man that Monarch light touch means more work and better work, because less physical strength is expended by the operator. Therefore, cost per folio is reduced, making the Monarch a business economy.

### SEND FOR MONARCH LITERATURE

Then try the Monarch, and be convinced that Monarch merit rests in the machine itself, not merely in what we tell you about it.

THE MAN WHO GAVE UNCLE SAM HIS DUES

(Continued from page 12)

here to show about this firm: way of collecting customs. So there was not much change in the ancient methods, and the rusty customs were still hit a great deal of Uncle Sam's golden revenue drive away.

Mr. Loeb left the drag on the machine, and determined to remove all doubt from the minds of his men, as to whom all the men who had say doubtless. He reported the situation to the President at Washington, and received from Mr. Taft this reply:

"Go ahead and hit them between the eyes, no matter how it hurts. In the collection of customs and in the new and startling conditions. A young watchman at the pier who inherits had earned his pay by seeing nothing done every evening and then going home to sleep, summed up the situation in a phrase. He said: 'The 'dues on a ship will not be known by business.'"

Customs revenue at the port of New York suddenly jumped from three millions a week to nearly five millions. And they have not dwindled yet, although nearly four years have passed. Incorrupt managers, who now yield readily half a million dollars a year on the clothing, hats, shoes, jewelry, etc., that they brought home from Europe, yielded two million two hundred thousand dollars during the first year of the new administration. The customs have fallen off considerably of late because the passengers have insisted that they can't smuggle in more than one pair of neckties and one watch in the commodities they need to "bring in" report a large increase in their importing business. They fear the detection and punishment of underweighing and undervaluing in the import-business seems to fill the air with hot messes. Three millions and one hundred thousand dollars have come in from this source alone. The two million dollars penalty recovered from the fraudulent sugar importers alone is still less in this year's summary. Besides all this, five million dollars in penalties has been recovered, making a total of eight millions and a half.

The revolution in customs methods was not accomplished without trouble, many tragedies, some even led to prison, and some died under the ignominy of exposure. Two hundred and fifty of the customers were seized as importers or as simply posted in confusion that they could not change their ways, and they were thrown out of the service.

There had to be a great deal of readjusting of the scales, of fitting round pegs into round holes and square pegs into square holes before the job was properly under way, but under the direction of the new Collector the job got itself done. The United States Civil Service Commission helped in many ways, giving Mr. Loeb considerable freedom in making promotions. The whole business is an enormous haul now. Mr. Loeb believes, and the government is getting its customs revenue in full and honor.

To look after the list of persons who were tried to smuggle silks, furs, jewels, and diamonds into the port of New York was very the leading a great social register of the United States, and most of the offenses have been the well-known ones. They simply would not, could not, should not understand what they paid pay duty on things they brought in for themselves. They never had paid duty and they never would—until the newly reinforced and cleaned customs machine came to them. Customs, diamonds, furs, frowns, threats, appeals to political "pull," all were to vain.

So "corrupt" to every one who tried to wrangle, but he firm. "Not the order from the Collector. Not infrequently it happens that the owner of a diamond mine or a rare of pearls explained with the air of one who proposes an unassailable proposition that she had brought in the jewels years ago duty free, having had the "cartouche" of the port" established by her.

"Yes," said he. "Mr. Loeb's inevitable and smiling reply to this: 'but the law at that time demanded the payment of import duty, and you owe pay for that. Of course the government was lax at that time in failing to collect; but the government will not accept the jewels as if it would in a case of smuggling, but will simply accept your payment.'"

The veteran travelers who had "brought in" an extraordinary of clothing, shoes, neckties, etc., once after several years stated when they found they had to pay duty. One old friend of the Collector

SAVED IN TIME, OR, THE PROFESSOR'S DILEMMA  
By Hunk Shannon © "The Herald"

dash of a telephone on the pier and protested that he would leave his trunk on the pier and the government was willing to keep them and he said that is the bargain.

"Oh no, Harry," Mr. Loeb replied. "The government doesn't want your clothes. You go back to the inspector and tell him you want to surrender your declaration. He will accept the amendment. You had no intent to defraud. Pay up like a man."

Mr. Harry paid up like a man. So did thousands of other travelers, when it had been made very plain to them that the good old days of your erstwhile past were over. A whole book could be written about the revolution in the customs service. It is an enormous three hundred million in forty-six different lines of trade run voluntarily to the Collector's office and is more than three millions of dollars of duties that they had artfully evaded. Perhaps they did not contribute voluntarily—quite voluntarily; but they knew that the merchandise, spoiled, had to be sold for a price, and the Collector's office would not accept them. They were a bitter blow to some of those cases—merchants who have been coming out of college and were about to enter their father's firm made haste to square accounts with Uncle Sam so that the boys might start life in their business.

Another party is in power, and Mr. Loeb is awaiting the day next month when he may turn out the office to his successor and go not late private business at twice as much salary as Uncle Sam has paid him.

"It is going," he said to me. "I have only one regret—that I must leave the work I like and the men who have helped me make it a success. I hope we shall see me on the way—and I believe it is rapidly approaching—when executive positions in the government require, not only technical knowledge but extensive to produce the best results, may be retained or able men regardless of party affiliations."

MADE IN FRANCE

The New Catholic Bible

WHEN the Order of Benedictines last year completed the revision of the Latin Bible whereas it is now engaged, it is reported that the Roman Catholic Church will possess the best translation of the sacred books that has been made.

The task which the Benedictines set for the revision is the recovery, as far as possible, of the Latin version made by Saint Jerome in the third century. Jerome, naturally, had access to the original Hebrew and Greek of the original Scriptures, and so his version is considered. It is assumed that his version has made new by comparison with the translations made at a later time, and better even than those Greek and Hebrew versions that have been copied time after time and are full of the errors of the copyists. The Latin Bible now in use in the Catholic Church was established in 1593 by the Council of Trent, after a commission had labored on it for forty years.

Men are engaged this week in the various libraries of Europe where Biblical manuscripts are found. The comparison of an ancient manuscript with the Clementine Bible is completed, the annotated sheets are sent to the headquarters at the Benedictine order in Rome. This part of the work is finished. It is said, and not completed for five or six years, and it will probably take as much longer to make a reliable comparison of all the Hebrew versions and decide which reading must be the work of Saint Jerome.

**WANTED—SALESMEN AND SALESWOMEN**

The Overholt Rye is a fine, pure, and healthy beverage, and is a valuable tonic for the system. It is a well-known fact that the Overholt Rye is the only one of its kind in the world. It is a well-known fact that the Overholt Rye is the only one of its kind in the world. It is a well-known fact that the Overholt Rye is the only one of its kind in the world.

Burned by Cold

WHENEVER has applied a medicinal ether to a case of frozen feet, the patient will remember the painful experience thereby gained of the fact that cold, as well as heat, can blister the skin.

There is a remedy in the production of extremely low temperatures. For this, the French investigator, Jarnot himself, used a compound of ether and alcohol, and he has shown the effects were so remarkable that he deemed them worthy of description to a body of scientific men.

It appears that there are two kinds, or degrees, of cold rye. In the case of the low degree, it is the kind of an acute frost, but because Marie the next day. The indicated cold rye, and a period varying from a month to six weeks elapses before the rye is cured.

The contact with the cold substance, however, need not be complete. A drop of rye on the part of the foot is sufficient, which did not completely freeze the rye, with a second drop of the rye, which will cure the same, as he had in ten to twelve days.

## THE NEW EXECUTIVE SECRETARY

President-elect Wilson's first appointment is that of Joseph P. Tamm, to become executive secretary under the new administration. Mr. Tamm has served in the New Jersey legislature with distinction, was Governor Wilson's first secretary, and is now clerk of the state Supreme Court. His new position is regarded by many as on a plane with a cabinet office. Mr. Tamm is not yet forty, but is wise politically, noted for tactfulness, and said to possess many of the qualities which made the late Daniel Lammont famous.

## COMMENT

## Our Governor

Is Governor Stetson not deluded so high in his own estimation, he wouldn't have had so far to fall in the opinion of the public. Pardon to his piece!

## A Chinese Remedy

Let the subway contracts be submitted to a vote of the people of New York—*The World*.

Surely the last thing the people of New York should wish done. As a body they know nothing whatever about the merits of the Subway contracts, and ninety-nine hundredths of them could not possibly qualify themselves in form of intelligent opinion about them. For the hundredth voter who might learn about them if he took the time, it would be a waste of time to try to inform himself. It is a case where, for good or ill, the doctors must decide. To submit it to a vote of the people would be like the Chinese method of curing sickness by beating drums. Submit it to the people and then let the gods; the multifarious Heaven gods; the Pi Uttra gods!

Oh, yes!

It is a question about the venereal appendix of New York. Leave it to the doctors. They may decide wrong, but they are a thousand times better qualified to decide than the patient ever can be.

## The Income-tax Amendment

The Sixteenth Amendment may be accepted as resolving a doubt about the meaning of the Constitution, rather than as making a clear and positive change in that instrument. It is true that the Supreme Court has declared unconstitutional a particular law of Congress imposing a tax on incomes. But the decision was attained by the narrowest of margins. Eminent members of the court, including the present Chief Justice, protested against it in language of extraordinary force. Eminent lawyers all over the country, including many of decidedly conservative leanings, questioned the correctness of it. Members, members and statesmen have ever since been urging that an income-tax law could be framed which would avoid the objections offered to that one. So it is plain that a very great and respectable body of public opinion has all along held an income-tax to be constitutional without any amendment.

That of itself helps to make the amendment welcome, and it is also indubitable that an overwhelming majority of the people desire Congress to have the power in question. The amendment is welcome for other reasons. Not the least of these—though, of course, not of itself sufficient to justify criticism—is the amendment itself offers that it is still possible to amend the Constitution without any war or other violent disturbance of society. Indeed, the method of its passage is far more reassuring than was the case with its immediate predecessors, for their validity has been seriously questioned on account of the measures which an extremely partial majority in Congress took to secure them.

Still another reason for welcoming the amendment was merely set forth by Congressman HULL,

of Tennessee, who will probably draft a new income-tax law, when he remarked:

One of the important results of an income tax will be the curbing of unnecessary Federal expenditures. When a great part of the government's income is derived by a direct tax upon the citizens of the nation, they will scrutinize more carefully the appropriations made by Congress.

Still, we are not out of the woods in this matter. It remains to see how wisely and justly Congress will use the power which it will henceforth indisputably possess.

## Tariff Reform and Peace

Maybe the interests and high-principles of protection have something up their sleeves, but by our observation the *Times* is right when it remarks their utter failure to care people any more with the old talk about disaster as the sure concomitant of Democratic tariff reform. If there were a word of truth in what they said about the panic of 1893, they then business should be doing better having exemption fits. Comparing dates, we are now very much closer to tariff reform than we were when the disturbance of 1893 began; yet there is not the slightest sign of anything like it.

Probably it is not worth while to rail that old lie again, but we never can resist the temptation. Of all the inviolable perceptions of fact that ever were foisted on the American people by any man or any party, that about the panic of 1893 was about the most impudent and the most persistently adhered to. Apparently it also paid. For fifteen years the Republican party lived on it with occasional relief from Democratic blunders, the chief of which was the failure to pitch in and exploit it. To tell the truth, the right was right on working till a large element in the Republican party itself, the original impostors, or Progressives, got sick of certain impositions in the Dingley law and in repudiating them repudiated it. Now that we are in sight of real tariff reform, it is only fair to give these men their due. In their initiative, the Democratic party might still be delaying to take full advantage of its strongest issue and the country might not now be proving, as it is proving, that the Democrats were right all the time about the relation of tariff reform to business.

## Change for the Finest

The people will allow a Congress, an government, an President, to break the good faith they have pledged. There have been too many years of peace. In a hundred years more the population of this continent will have grown to five hundred millions, and the population of England in proportion. They will keep their faith. There is only one way, let them keep their faith, these people. Let them keep their word. And I for one am not afraid.

That is the way JONAS H. CHUBB at eighty looks at the Panama Canal tolls question as between this country and England. Mr. CHUBB has ever been a good lawyer for something like half a century, and he thinks the HANOVERIAN treaty was written by men who understood English and who meant what they said. He is not likely to be responsible to any man, but in his view of this international controversy as to Secretary KNOWLTON, to which we have also tried to do justice. Indeed, we decidedly prefer Mr. CHUBB's view of "the people's" real concern in the matter to that of gentlemen who represent them as highly indignant at Great Britain's interference with their "domestic" concerns.

Let us hear the other view of the "people's" feel is right, and Mr. CHUBB is risking unpopularity. Even so he can remain cheerful. He remembers the unpopularity of Cowley and other Englishmen who sympathized with us during the war, and also that of the English government which a little later yielded to our just demand and satisfied the Hawaiian claims to arbitration.

## The Tea Yellow Peril

Really, it doesn't strike us that the country is at present very much troubled over the supposed danger of a war with Japan. Nevertheless, we seem to be getting a lot of assurances that we ought not to lose too much sleep about it. The Editor of the *Brooklyn Herald* has lately had out there and talked to the Japanese about peace, and both, when they came back, made reports of a nature to quiet any nerves that Captain HOBSON may have set up. Now BRITAIN HARRINGBURY is on hand, and while he hasn't yet made any report as to the probability of an immediate invasion, we are assured by the *Daily* that his private letters are decidedly comforting. Moreover, they show indications are

confirmed by Mr. WILLIAM ARNOLD, who has not only been to Japan, but has reasoned the thing out and come to the conclusion that Japan would make a mistake if she should wade into us, and that the Japanese have quite enough sense to refrain from anything that in the long run would be an obviously foolish. If Captain HOBSON is going to make good in this matter, he will want to hurry up. He predicted, we believe, that Japan was going to jump on us about something or other before the completion of the Canal; and now here is Colonel HARRINGBURY talking about sending a ship through the Canal this year!

It is significant that all these gentlemen who have been to Japan and made such comforting reports are made good in the situation which is really disquieting. They agree that there is a real "yellow peril." But they do not find it in Japan. They find it here in America, where it is known as the yellow press. Like all other students of the Japanese people, they find them a high-spirited lot and accordingly view with some apprehension the possibility of a threat of some national article about them and us in American newspapers of a certain class. Quite apart from any question of fighting, the good-will of Japan for America, based on historical relationships and which we are assured still exists, is a thing very decidedly worth keeping. So is the good-will of Americans for Japan. Any one who recalls the American sentimentality of the time of some of the Spanish War will hardly wonder that both President ELLER and Dr. HARRIS, as advocates of peace, should have found yellow journalism a pertinent theme in their discourses to Japanese audiences. We trust they persuaded the Japanese not to be influenced by it. If they did, then by all means let us have those discourses repeated here at home.

## Eller and Home Rule

Londonderry has sent a Home-Ruler to Parliament to succeed a Unionist. That is a curious commentary on the Unionist talk about Ulster's probable violent resistance to the Home-Rule bill if all of it were carried out. For Londonderry does not stand alone. There are other constituencies in the north of Ireland that send Nationalists to Parliament. It is the simple fact, really, that Ulster is closely divided on the question. Probably a majority of the Ulster people are Unionist and Protestant, but the majority is not by any means overwhelming. Not all the Protestants are Unionists. The new member for Londonderry, Mr. HUNT, is himself a Protestant. If "Ulster" is really going to indulge in insurrection, therefore, it will probably have to begin, like charity, at home. It will be necessary for the insurrectionists to look after their loyal neighbors before they go forth to meet the "British bogymen" that the Unionist leaders are talking so much about.

Yet this fact is studiously ignored in Unionist oratory and the Unionist press. On the very eve of the by-election at Londonderry Mr. BOYAN LAU, after gracefully expiating his own swift abandonment of his announced position on food duties, was heroically demanding of Mr. ASQUITH: "Does the Government intend to give Ulster by British bogymen?" And the London *Times* was saying editorially of Mr. ASQUITH's speech at the end of the Home-Rule debate:

Every argument that can be drawn from history to support the Nationalist cause has its counterpart north of the Boyne. Mr. ASQUITH seemed to feel that the Ulster feeling and pride of race had no place in Ulster.

On the contrary, Mr. ASQUITH recognizes, what the *Times* does not, that there are at least two kinds of religious feeling in Ulster and two kinds of pride of race. He also recognizes that Ulster is only a part of Ireland and that the whole is greater than the part.

## Cutting Some Corns

DEAN JONES, of Yale, has ordered that "Tap Day" shall be a private festivity hereafter, the public being excluded from the Yale campus and buildings.

It was time! Tap Day is not alone in its sorrows. The New York Stock Exchange is also suffering a black bond on its hat, and "the Finest" are disconcerted by internal disturbances.

Advertisement is a great thing, but it is tiring to the permanency of established institutions. Blessed are the mark, for they shall inherit the earth.

## The Children in the Snowden Mills

There are mighty few questions that haven't too often to them. It is troublesome and some-

times even dangerous to persist in examining carefully both sides every time, it is almost the only way to be sure of being just, even in the case when one finally leans completely and positively on one side and not in any compromise position. It seems to be that way with the child-labor question, particularly in the Southern cotton mills. There are sincere and admirably philanthropic people who have sincerely advocated for the poor children who work in those mills at a pretty early age. But there are also people, whose sincerity we see no reason to question, who feel very differently about it. They contend vigorously that the children who work in the mills and live in the mill towns are incomparably better off than they would have been if they had been left on their small farms where most of them, with their parents, have come; that they live much more hygienically because of the change; that they have better food and better houses and better health and a better chance to learn something, and are really happier. Such is the testimony, for instance, of MAMM HARBURG CARTER in a letter to the Times.

Of course, even if these pleasant accounts are correct, they need not be the last word in the matter. Granting that the state of those little Americans has been bettered, that is as reason why it should not be still further improved. But we cannot gain any fact as to the child labor question that depends on economic conditions. Meanwhile, however, it is worth knowing, and perhaps not sufficiently well known in the North, that in the very states where those mills are located there is a vigorous interest in everything pertaining to children, including child labor. There are active groups at work on the problem, not only in the North, and good men and women who are thoroughly mindful of their own and their states' responsibilities.

#### Tot, Tot!

There was HARTWELL, a romantic soul, a kind of poet-pragmatist, EDGAR ALLAN POE, with a twist for the supernatural. He was a talented writer, very well in his way; but the trouble is that we, his native fellow-countrymen, regarded him too seriously.

So Mr. FLOYD DELL, a talented writer of book reviews in the *Ivory Chalice Evening Post*.

Frey, Mr. DeW, why do you do that? Why when Chicago is pecking up so handsomely as a literary center, do you choose to smother it between the eyes like that!

HARTWELL was a magician. If you have no taste for magic, that is your misfortune. But when you brag of it over your name in the excellent *Chicago Literary Review* which you edit, you damage Chicago's reputation for literary perception.

But up the half-pipe, Mr. DELL, and welcome, but respect the great people; not on their account, but on your own and Chicago's.

#### Some Female Laws

By a vote of ten to three passed the bill which is a modified form of the measure. The bill was the first matter on the House calendar. Mr. HAYES of Michigan offered a resolution which would nullify the prohibition on the use of any pen with a point protruding more than an inch beyond the crown of the bal and substitute a prohibition on the use of any pen the point of which is provided in such a way as to prevent the injury of any use who comes in contact with it.

Mr. FARRER, of Maryland, opposed the amendment on the ground that it would revolutionize the use of a safety device, and he thought this the thing to be avoided.

Mr. McGRATH, of Boston, thought the protrusion provision would lead to endless litigation, and the length of the pen makes little difference, he said, if a man gets it stuck in his eye.

The amendment was adopted on a voice vote, after which the bill was made to be disagreed without discussion.—Boston *Purvey* last week.

Legislation in Massachusetts is apt to be much respected and isolated in other states, but let us stop and think. As our Mayor often says, We should do nothing in a hurry, especially laws. In one of our local papers we read last week this item:

Using a halpin as a weapon of defense, Miss ALICE TAYLOR, of No. 2 Jackson street, City of Boston, last night fought and overcame a man who attempted to rob her on the elevated platform at Ferry and Washington streets. The man, who was described for her by her neighbors, she picked up from her belt and jabbed it deep into his body.

The would-be robber retired sharply and jumped back. He seemed to have made a mistake in his aim, but she was the pin into him again and screamed for aid. Justice of the Peace HEWER BRIDGES and several other men went to her assistance, and she was then dashed down stairs, but was caught after a chase covering two blocks. He said he was HEWER BRIDGES, of Boston.

In another local paper we read last week this item:

A thrilling fight with a green snake in the court at Nassau was the experience of two Berkeley College girls who arrived to-day from the West Indies on the *Yacht Lark*.

While lying in the shallow water at Nassau two weeks ago, Miss GLENNON was seized by the tail of her bathing slipper and thrown. She screamed, and Miss GLENNON was a huge money-gripping her companion's foot and lashing its ovine body furiously in an attempt to drag the girl into deeper water. The girl, upon seeing her helplessness, seized the basket it was fastened to and hurled it into the sea. It was found on the beach the following day. It measured four and a half feet in length and was about as thick as a snail's arm.

We call attention of Representative McGRATH, of Boston, to above evidence, naturally gathered, that the halpin has uses of defense as well as offense. Here in New York under the SULLIVAN law it is the only weapon allowed, and we should appropriate legislation to regulate it.

We observe in the daily papers also the following dispatch:

JEFFERSON CITY, Missouri, February 20.—Representative TAYLOR, in the opinion of the House, is still prohibiting women from wearing dresses that button up the back unless the buttons be as large as a dollar.

The bill provides for a fine of \$1 to \$3, with jail sentence for persistent offenders.

In view of the insistence of women suffrage, particularly in states so far west as Missouri, we suggest to gentlemen legislators everywhere that they try to entertain themselves by some other means than having fun with women's apparel.

#### Should Change Its Name

The committee of the free library at London, Tennessee, by latest resolution has destroyed its copy of *Tom Jones*. It stood many years heroically on the shelves till recently a member of the committee happened to take it home to read and was shocked—shocked—shocked.

Well, Tom *JONES* is a coarse book, written pretty faithfully about pretty coarse people in a fairly coarse generation. But if it is too coarse for London, Tennessee, London, Tennessee, ought to change its name. It should not consent to be any longer the namesake of the coarse and sinful metropolitan of a coarse world supposed to folk. It should still be *Tom Jones*, but it should be *Tom Jones* as it still imperfectly suggested. It should call itself *Heath or Elms* or by some name not corrupted by association with people still enumerated by the flesh.

#### Pauline

Pauline, the White House cow, will be the only member of the outgoing administration to join the "back to-the-farm" movement.—The *Buff Street Journal*.

Well, now! Haven't you heard! Pauline is not going back to the farm. She is to go to New Haven with Mr. TAY and his family, and her portrait is to be in the Yale Campus, and she is building for her in the cellar of Hesper, and it is hoped that she will have descendants and that there may be always a Pauline within sight of Old South Middle in remind Yale that she loaned the country a President.

#### What is Mr. Burgess' Dept?

Professor HENRY BRIDGES has come here from France to lecture on philosophy at Columbia University. He is an accomplished scholar, and his lectures are very popular. We hear of three thousand applications for seats in a lecture-room that looks for hundred.

Professor BRIDGES has some ideas to convey. The newspapers hereabout have devoted a great deal of space to him and to his dogs. About himself, by diligent reading and looking of it picture, we, the public, have come to know a little something. But about the dogs we do not really get any information. We do not recall so great an effort made by the papers and so much space devoted to publishing wide-spread and disparaging results as this effort to impart the pith of the ideas which Mr. BRIDGES has brought with him. It must be something that the newspapers can't tell, or else that the uninitiated mind cannot receive. Perhaps it is the latter. We have talked to people who had certificates that they knew of something which they thought, but they were not able to communicate it. We know the electricity is turned on because the lamp glows, and we know that Mr. BRIDGES has been turned on because the paper has been about him. But the nature of his current remains a mystery. They who know cannot tell, and those who tell do not know.

Probably you have to take him like the writers

at Saratoga—large glasses often filled, and give your mind to it; samples no use.

#### The Harge Canal

It is a lapins to see our Mr. BRISOL, of New York, stand up to speak for his canal. He did it in Washington on February 4th before the Washington Association of Engineers, and illustrated his disclosures with moving-pictures. He gave the engineers' figures about our New York canal and said it was unskilfully being constructed at the same time as Colonel GILCHRIST'S canal, which costs three times as much and is somewhat thought not so very much larger and gets all the free advertising that the papers bestow on canals. But Mr. BRISOL said that his canal, though little superior in length, would cost that it cost the GILCHRIST canal twice by 400 miles, that it has about 375 locks to GORHAM'S, that 95 per cent of it is under contract and 60 per cent completed, and that it will be finished in 1915.

We like to hear Mr. BRISOL, king of his canal. Let us all keep it well to him without credit. Certainly he has given the public by many respected authorities that New York's Harge Canal will never be worth the hundred millions it will cost or anywhere near that sum. There is nothing that would be better than to have these eminent authorities hammering in their opinions by the hundreded facts. We should have to see the Harge Canal succeed and have the expenditures of a hundred millions of our money justified. Apparently our speculation is being efficiently dug and with honesty and economy. At as any rate, little transpires to the contrary, and presumably the work will be completed in two years, as Mr. BRISOL says, and then we shall see.

#### Victor Precourt at Allen

One gets the impression that the trial of F. O. BRUIT at Allen, South Carolina, has been, considerably, a provision for the entertainment of the native population. Perhaps the local sentiment is that the visitors here had more fun at Allen than the natives, and that it is right to improve opportunities to get even. So far the trial has seemed enjoyable to everybody.

#### Take It With Salt

Some of the London papers allude to "an invasion of England by negroes, especially Americans, which has been proceeding steadily for two years" and as to which it is observed:

London is the Paradise of the black man, and the American negro has discovered this fact. Every ship from the United States brings fresh arrivals to swell the large colony which is already here, where they are treated on an equal footing at the lodging-houses and boarding-houses and sit at the same table with whites. For the first time in their lives they are permitted to sit with white women on social equality. This has created a grave peril, which is becoming worse every day.

Take all such reports with salt. They are very much and very often so, as is pointed out, by Southern ministers of a certain order when they are told about Boston. No doubt London is, as yet, a more comfortably place for well-to-do negroes of education and refinement who want to associate with white people than any American city. But just as soon as there comes to be enough negroes in the United States to be counted, its special social advantages as a residence for negroes would vanish. At the bottom, the Anglo-Saxon or Teuton or Celt is the same person, with the same racial instincts, whether he lives in the eastern hemisphere or the western one.

#### Interest in Woman Suffrage

St. Bridg's Day, which we passed in the calendar about a fortnight ago, was appointed, it occurs to us a day of our own initiation and intercession for the women-suffrage movement of Great Britain at services to be held in Westminster Abbey, St. Paul's Cathedral, and other cathedrals, churches, and chapels throughout the country. A memorial asking every one to participate, was signed by CLARA BRIDGES, Mrs. W. G. BRIDGES, and laymen and laywomen. It is to wonder how the good people who attended those services directed their meditations, especially in regard to Mrs. FREDERICK MANSBURY. Would she figure offensively, do you suppose, in the intercessions as "THEY, OURSelves, FREDERICK" or "that woman who never used to be the woman she is now?" We wonder, and indeed still more very much on the knees of the gods and it is a mighty good prayer-acting topic.

# "Yuxtree Yuxtor!"

by  
William Inglis  
Drawings by  
F. Strothmann.

**T**he red extra barber I ever saw was running and roaring up Broadway on a hot July day. He was on the dollar side, about Prince Street if I remember aright, and the air for blocks around overburdened with the howlings of his scullion. "Woo! Woo!"

"Woo! Woo! Full account of the boom!"

"Gid dat not er! Full account of American best de English! Yuxtree Yuxtor-er!"

He was a lucky big fellow, the barber, and a commanding figure that I stood opposite to, with neither eye nor ear for his partner, who was running and roaring on the opposite, the job-side, side of Broadway. His high-crowned hat of Mackinac straw was tilted far back on his head, his red and dripping face was stretched in a triumphant grin that seemed likely to wrack loose his stubby yellow mustache. Across his right forehead, like a hair of bath-towel, there were draped a bundle of more crumpled papers, all unfolded and fast as they had come from the press. The man took all the crime that was heaped to him, whined off a stamp, but newspaper for each buyer, but gave nobody any change. And nobody seemed to care for my change. Every man grabbed his paper as if it were the bulletin of his own individual good-fortune, and read it with dancing eyes not once in a while a few straggled lipsticker, and paid no more attention to the barber, who trotted on northward, shouting "Woo! Woo!"

For this was the day that the four-crowned crew of Columbia University beat the best crew in England for the Yuxtree Challenge Cup of Hockey. And although it was away back in 1878, no other American crew has won as heavily since. Indeed, those able Columbian fans the only American crew that has ever won in England, though a few had tried before them and many have tried since. It was a great treat for me in those days to sit under a tree down on a Saturday; and although on other Saturdays I had many wonderful adventures, such as running Broadway at Father's side, and when my horse and wheels might kill or cripple a fellow if he didn't step lively, and stealing ribs on the ends of tracks, and getting into fights with American crews that were bigger than I was, or they couldn't remember this particular Saturday the best of all because of that red-faced barber and his beautiful, bewitching song of American triumph over John Bull.

The last extra barber I have heard of in the neighborhood a few evenings ago as we sat, after dinner, looking out of the window at the Whittier arrangements all definite gray-blue mist that brooded over the dark Hudson, pierced here and there by the red or green fire-fly that meant a hurrying logboat, or by the long fire of faint and far-flung topmasts that indicated a raft of lumber, sailing down by tide. From far up the hill in Twenty-ninth Street, beyond West End Avenue, came the ominous high-pitched clatter, now by distance not so loud, of a horse-drawn cart.

"Yux-tree! Yux-tree!" cried a high baritone.

"Full account—beyle be of 'ille-dub-dub-blah-blah!"

He had his partner's head from across the street. Then the two voices blended in a confused, ominous cry that belched and yet wailed, that threatened horror and death yet gave nothing clearly.

Madness seemed to drive men out of their homes away from home—traveling on ships that might be wrecked or trains that might plunge in the ditch, straggling in boats that might be wrecked or men in blazing funeral pyres—ran out in trembling haste, or went out to buy the newspapers those men were reading. Battered with violence of blows or stinging of the beloved, they could hardly command their eyes to read the printed lines. And yet, in spite of their pain, or in spite of the nature of their wounds that there was no wreck, no fire, no "beyle be loss of life," no horror of any kind that the barbers, with their lightening and peevish eyes, and their voices proclaiming with such blood-curdling yell. The papers they carried were more solid early editions of the morning sheets, printed in many a printing-house. The letters who sold them at five or ten times the regular price were more than petty thieves. They were veritable highwaymen, using their terrible sales as weapons to scare anyone who might carry a pocket, just as the common thief who sells at Mackay. Who wonders if they could not be courted of soldiers, or of crims, and imprisoned for long terms. That might do some good.

Nowhere else in America, or in the world, do we witness of extraordinary news so much as we witness the converted appalling crisis that characterizes the barbers of New York extra. The men who say "Woo-er!" through the streets of New York, on Derby or St. Ledger day as they sell extra, and the fellows who hunt so plianterly along the Park side streets as they sell their extra, are as different from the New York barbers as are the Mack-

ay, and yellow boys who dash down the Park and across the Park Central on Saturday afternoon shouting "Woo-oo-oo-oo!" The New York barber, besides being often a poet, is unique in his habits, in his sense, in his development. Probably he is unique, too, in his origin and history. Who knows? Fortunately there is one who knows about all sorts of old New York history, one who was born on Manhattan Island when it contained one small city and any number of sprawling villages, yet who is still a young middle-aged man without a gray hair to his head—Mr. Charles White, of Culture House, in the old Seventh Ward. At first he was for showing me the similarity between the local barbers and Philadelphia, who ran all the way from Marathon to Adams, and "Nag!" and died, their likeness to the ancient British who ran, shouting victories of the distant legions through the streets of Rome; but when it was pointed out that these were the precursors of all news bulletin service, while our local barbers are highly specialized and very different, he related:

"Our barbers began in an altogether different way," said Mr. White, "and it is a curious thing to see that the barbers they used at first in London out one another's cries are used now in partnership to shake the public into buying papers. The first fellows to run and shout extra through the streets of New York were the carriers who delivered papers at the time of the American Revolution. In answer to the cry of the British House Run of the city in those days. Little old New York was pretty small then, and she supported four newspapers. James Livingston's Royal Gazette made the most of every victory of the King's troops, and every time the Constitution was Mr. Lewis reached out as extra of the New York Mercury and General Advertiser. As these newspapers had no war correspondents or reporters, and as such things as telegraphs or telephones or railroads had not even been dreamed of, you can imagine how every battle was

"The papers in those days—funny little sheets—were served by carriers who were over certain regular routes, so far north as Greenwich Village on the west side and Corlies Hook on the east. In times of the wildest excitement the most enterprising carrier might work so far north as Kips Bay, while the Thirtieth Street ferry of to-day, about the same road runs the river and on to Brooklyn, Williamsburgh, and even to Bushwick."

"Don't you see those old-time carriers—lucky young fellows they had to be run far and big a load of papers on their arms, and still be able to yell. Many a time I think of 'em, in their old three-cornered hats and low-kneeling and big, square-tailed shoes, clanking up the Broad Way or Queen Street. How goes a pair up Cherry Street, making the people out of their beds—"

"Yux-tree! Yux-tree! Extra edition Royal Gazette! Full account of the Royal Army's loss in the Jersey! The rebel Washington must lead the extra Royal Gazette!"

"That's all very well for the Tory barber, but now listen to the patriot barber, across the street, getting back at him!"

"Yux-tree! Mercury no Advertiser! Great American victory over Monmouth! General Washington kills the red-coats at raptores the red. Don't believe Johnny Livingston's lie! Read that extra!"

"Those fellows served papers along the same route

—some lower than others. Generally the rival papers had different publication days, so the carriers didn't clash; but when the war strains were loosed they always tried to outrun one another and outdo each other. Believe me, the big black scum-heads and the following barbers didn't begin with the Spanish War."

It was most entertaining to hear Mr. White sketch the history of the barbers. They didn't stop their chance when they talked of the defeat of Lord Cornwallis brought peace. The old New York shipping merchants, who lived above their counting-rooms above South and Front streets, and Park and Centree and Barling ships, used to advertise their rival papers in the rival newspapers. Then the carriers would try to get the most of the rival papers. "Yux-tree! The good ship Princeton is in from Canton with fifty tons of tea. Don't miss that grand arrival at Mr. Brown's warehouse at ten o'clock to-morrow morning!" against which advertisement the rival carrier would say: "Extra! Extra! Full account of the good ship Polly's loss, just in with coffee and rum and molasses from South America, due at the warehouse at Mr. Brown's at ten to-morrow!" Extra! Extra!

James Livingston's "Royal Gazette" made the most of every victory of the King's troops

reported at first as a victory for each side. The result at Bunker Hill was published both ways in New York. Why, even the battle of Monmouth, right at home down the Jersey coast, was falsely reported, and fought days the little old town was wildly excited, patios and restaurants each hoping for the best of it, while the farmers, waiting to see which way of the fence it fell on, was so worried they couldn't sleep.

rival extra advertisement

"Don't go to the John Street Theater! They have a lame Tompkins, and the real tragedian, Patrician in the John Street Theater and witness the greatest tragedy of the age!"

They reviled it tragely in those days, gentle souls, but they had to see it, and they had to have it having it thrust upon them gratis in railroad wrecks,

# THE ETHICS OF THE BENCH

As a Result of the Archbald Impeachment there has been Established a Code of Judicial Conduct

BY A. MAURICE LOW

WASHINGTON CORRESPONDENT FOR "HARPER WEEKLY"

WHEN the Senate brought in a verdict of guilty this morning, the proceedings against Robert W. Archbald, judge of the United States Court of Appeals for the first time in a century that a United States judge has been stripped of his judicial office and the first time since the foundation of the government—something more was done than to prove that the machinery of the Constitution is not obsolete and that the new-laid device of the recall of judges is unnecessary. By removing Judge Archbald from the bench and further punishing him by declaring that he is forever disqualified from holding any office of trust, profit, or honor in the gift of the United States, the Senate approved, in the language of Representative Clayton of Alabama, the chairman of the Impeachment Committee and the chief of the board of managers appointed on behalf of the House to initiate the impeachment proceedings, "a code of judicial ethics for the first time in American history." Hereafter there has been no code of judicial ethics, now one has been established. Not only did this trial establish a precedent that will have far-reaching effects, but it created two other equally important precedents that will not only tend to keep the bench "straight," but will make it easier for judges of the Federal courts who have an unenviable development to be removed.

With the charges brought against Judge Archbald the public is fairly familiar. They can be summarized in a few words for the benefit of those who did not closely follow the proceedings. He was charged with using his official position as a judge of the Commerce Court and it is in that court that he was heard from the Interstate Commerce Commission—improperly to influence the Erie Railroad Company and other carriers to sell him other stocks, and with having relations and dealings with them and other persons that, in the language of Mr. Clayton's report made to the House, "under all the circumstances, was reprehensible and prejudicial to the confidence of the American people in the Federal judiciary." With this conclusion the Senate agreed. It is worth noting that in impeachment proceedings the Senate, which sits as a court and acts both as judge and jury, only simply being in a verdict of guilty, which automatically "recall" a judge, or it may punish, or it may acquit, by declaring the convicted person ineligible from holding any further office under the government. In that respect it is not really power by which a man can be removed. The President may pardon any person who has been convicted of a crime against the United States except one who has been convicted under impeachment proceedings. That, the constitution expressly prohibits.

It has always been held heretofore that when it sought to impeach a judge the offense must be one that could be an indictable crime of law. Thus, it would be easy enough to impeach a judge charged with bribery, because bribery is a crime and is punishable by statute; but a judge could not be impeached simply because he had done things that were manifestly improper, although not of themselves a crime, and which tended to cast discredit upon the judiciary and bring the judge into disrepute. The first judge to be impeached was Judge Pickens of New Hampshire in 1803. Pickens was undoubtedly insane, but insanity is not a crime, so he was charged with drunkenness and using improper language from the bench; and as a person who gets drunk or uses improper language can be tried in the courts the Senate held that he was properly subject to impeachment.

It was the charges against Judge Archbald, Mr. Clayton came to the conclusion that, while a judge might not have committed a crime that would render him liable to criminal proceedings, it might be well to have the ability of such a man to be such an improper person to be on the bench. Mr. Clayton is the only member of Congress who has been a manager on the part of the House in the impeachment of a judge; his former experience having been in the proceedings against the late Judge Swann about six years ago. In that earlier case it was held that either appointed receivers of a Southern railway he was provided by the railway with a private car, furnished with the company's coal, and that he was on a long trip to California and elsewhere. This was not a crime, but, he say the least, it was highly improper. It would naturally create the impression in the mind that Judge Swann, because of the favors he had received, could not hold the scales of justice level. Mr. Clayton held there were three grounds sufficient to cause Judge Archbald's removal from office. First, his unethical conduct. It is a curious thing, but his Clayton points out, that while the American Bar Association and the bar associations of the various states have a well-established code of ethics governing lawyers, and have no difficulty in enforcing them, there is ethical or unethical conduct on the part of their members, so although law ever been made to apply similar rules to the conduct of judges, probably, Mr. Clayton suggests, because of the somewhat different character is always a man of high character and could do nothing that was not proper. But the conduct of Judge Archbald showed that he was not a man of such an assumption and that it was necessary to have it clearly established that it was no great a crime against society for a judge to be unethical as it was for him to be

guilty of a crime defined by law. In his report Mr. Clayton thus justified the said judge:

"A judge should be the personification of integrity, of honor, and of scrupulousness in his daily walk and conversation. He should hold his exalted office and the administration of justice above the world's devices to accumulate wealth by trading or trafficking with what he forbids if whenever he is guilty of misdemeanor. What constitutes good behavior needs no elaborate argument. To define 'misbehavior' is more difficult, but Mr. Clayton relied on the known facts. A judge unbecomingly held, when he used his official

in the article of impeachment found by the House was charged with having been guilty of misdemeanors and embezzlement. In drafting his indictment Mr. Clayton had investigated the legal weight to be attached to the meaning of the terms "high crimes and misdemeanors," and found that it had come down to America from the English Parliament. It was there used to mean, as to speak, as a convenient catch-all word it was necessary to impeach a person on general principles and without having to name to define the offense of which he stood charged. It was in such law very much what "conduct unbecoming a gentleman" is in military law, a specification on which hundreds of officers in all services have been tried and found guilty. Again by analogy, Mr. Clayton held that the Senate was absolutely able to determine what was "a high crime and a misdemeanor." It was both a crime and a misdemeanor, he contended, for a judge to induce a railway company to sell him a cable book

The Representatives who conducted the impeachment trial of Robert W. Archbald, judge of the United States Commerce Court. From left to right, standing, are: George W. Norris, Nebraska; Paul Rowland, Ohio; John A. Steiwer, Illinois; John W. Davis, West Virginia; Sitting: Edwin T. Webb, North Carolina; Henry D. Clayton, Alabama; and John C. Floyd, Arkansas

position for pecuniary profit, when he sought to take advantage of his power for personal gain. The misbehavior might be particular or general; it was sufficient for the Senate to be convinced of the misbehavior to find the judge unworthy to be retained in office. "He has prostituted his name of moral responsibility for his pecuniary desires," Mr. Clayton said in his report. "He has degraded his high office for personal profit. He has attempted by various transactions to convert his high office into a source of personal gain, and he has been guilty of such a course as to bring into disrepute the confidence of the public in his judicial integrity. He has violated the condition upon which he holds his commission and should be removed from office by impeachment."

Finally Mr. Clayton argued that it was not necessary that the judge be charged with an indictable offense or even an offense involving violation of positive law, but it was sufficient if he was guilty of an act that degraded his office or destroyed respect for the judiciary or impaired the confidence of the public. The Constitution provides that a person shall be removed from office on impeachment for and conviction only of "treason, bribery, or other high crimes and misdemeanors." When the case came to trial Judge Archbald's attorneys argued in favor of the Senate that, as their client was not charged with having committed treason and there was no allegation of bribery, he was not guilty of an offense cognizable by the Senate, for

or to use his influence to procure the sale of coal lands, and this contravened the Senate's intent. Mr. Clayton believed that the effect of Judge Archbald's impeachment and conviction will be salutary. "It shows," he said, "that there is no necessity for the recall of judges, nor need a person be regarded as an unbecomingly as a judge or dishonest man is appointed. In such case we have the remedy. There has been some criticism that impeachment proceedings are slow, clumsy, and costly, and that some method ought to be devised by which they can be expedited. It is not one that has been a good thing. It is a serious matter to attack the integrity of a judge or to cast discredit upon the bench, and the proceedings ought never to be initiated in a fit of passion or without due deliberation. The one reform that might well be instituted and which has been proposed is that, instead of the entire Senate sitting as a court, the testimony should be heard by a committee and the Senate should then pass upon the report of its committee, which would save the Senate the necessity of suspending all public business while the impeachment proceedings are in progress and prevent congestion. That is the procedure in the case of a Senator who resigns in his old is relinquished, and as a Senator he could be expelled by a two-thirds vote, the same as in impeachment, there is no reason why the method followed in the case would not be equally as efficacious as the other."

# SOME FALLACIES ABOUT FAT

By Leonard Keene Hirschberg, M.D.

"Why is it that I may devour with impunity a sweetened behemoth and remain an emaciated specter?"

**D**ACTOR, how is it that I, a most temperate eater, devoting my nights to the study of a non-fattening diet and my days to rigid restrictions of caloric content—if there be such a word—foods, still was rotund and glabrous?"

No waste to the use of my friends the other week, and as some smother my days with impunity a sweetened behemoth and remain forever an emaciated specter? Meanwhile others who live exclusively upon the flaccid bouillabaisse, the tobaccoed circumambient atmosphere, and plain beer acquire an apron of dangling adipose tissue, affix the envy of reformers and the abominations of politicians! Why is that? Let us, as it were, examine into the grave matter, consider with scrutiny, and if possible, reveal the why and wherefore.

Professor Weissmann has established to the satisfaction of most intelligent scientists the fact that no habit that is acquired can be passed on to coming generations. That is to say, that characteristic traits or habits picked up during your father's or grandmother's lifetime are not inherited by you. Considering this liberally on your part to the inheritance of good and bad traits learned by your ancestors, you are more than blood- and distasteful to the transmission of all of the inherent changes in the nucleus, leucoproteins, leukotrienes, and intracellular and physical qualities of these cells.

Next to the avoidance of alcohol, glycosuria glycosuria is most helpful

antecedents. These appeared on generations the third and fourth generations. Mendel's *Pea* was a base only investigation were brought to the notice of scientists about a dozen years ago, proved that if an animal acquires fat during the lifetime future generations will have no disposition over the behavior. If, however, an animal that inherits a fatty tendency intrinsic in its tissues is mated with an animal with a slender tendency to be was and narrow, the first generation offspring will both be fat. If these two are mated—brothers and sisters mated in the plant and animal world—to each other, the young ones will be three fourths to one that is thin. Moreover, if these thin offspring are mated, all that follow are thin, while one of the fat ones breeds all about parties, and the other two glabrous brothers will produce children mark on their parents' feet—that is, those of rounded form to one of the singular, arrow type.

All this sounds more formulaic than witty; yet Sir Francis Galton, the great British statistician and father of the science of eugenics, as well as the teacher of the finger-print system to Bertillon, discovered from Mendel's laws that man inherits one-half of his traits from his parents, one-quarter from his grandparents, one-eighth from his great-grandparents, and so on back to Noah.

What has all this to do with the fair, fat, and forty years of a man's life? Let's! It means all the difference in the world, whether, in fact, you have come by your adipose tissue honestly, deviously, or maliciously aheretofore. It means resistance or susceptibility. Partisan self-denial or a gay life. For if, as you look through the central-olive ported gallery of your forehead, you find those hollow-looking, swollen, yellow, lean, and varicose, hairy to the nearest degree, except his features that what not to eat, and fare forth to become a sad and wise recluse amid a veritable jungle of poverty.

If, however, you gaze into the form and then see that the gallery of your forehead and ancient nostrils is thoroughly radiant, sleek with carbon points, with sufficient, downy, ruffled-like papillae, if their front border surpasses the narrow ridges of the lower framework, seek out the nearest griled palce of raw and juicy pork pulled back, your habbing wine, your shellfish, in ribs and continental, for the fat is in league against you. The stern drama of Darwin, Mendel, Galton, and the science of eugenics are applied you.

The common fallacies now laid with compulsion are an anemous as the potent medicine anti-fat procedure, as transferred with the least risk of there are few physicians alive to tell of ever having seen that rare disease known commonly as a "fatty heart." This is the name of the disease, the champagne, the trout, magenta, and the post-meridian commercial traveler, the hypodermis and other fatous elements lay the fat in the vein linings of the great superfluous pretenses.

Yet mark my doze. Next to suggest there is no greater source of adipose tissue than a few drops of alcohol or milk liquor, which it is mental in extra and alcohol molecules. The species of drinkers known as *opimus* whites are, perhaps, in this respect the worst offenders. Yet any slave, you may mark, you may drag as you will, the thirty man grows fat.

Next to the avoidance of alcohol, glycosuria glycosuria is most helpful. In your bath or beside a hard slab of wood or marble may be used. This, alone, together with regular exercise, means, really disease of the superfluous fat. For he it from me to suggest

DRAWINGS BY M. L. BLUMENTHAL

"How is it that I, a most temperate eater, still was rotund and glabrous?"

a strand jacket or corset; yet one of the latter made of compressible bands that fit snugly around the stomach region and forces the fat upward without embarrassing the respiration will assuredly reduce the amount of abdominal fat.

Curiously enough, true gymnasium exercises, such as Turkish, Russian, or other backhand habits, the much-praised pack-saddle horse riding, golf, tennis, Boston walk, and analogous exercises are much like other horse exercises. That is to say, doctors advise them by tradition, and because they have ever had visible evidence that one barley corn of weight was thereby removed. Heavily wrestling and rowing, working and carrying, calisthenics and bicycling, are all in vain, while, on the other hand, carrying heavy weights seems to aid in the absorption of the nutrients from the compression provided. Hence I advise my patients to bow, stand, draw water, look after the furnace, bring up baskets of coal, juggle the piano, and practice with a steamer trunk.

No more superficial fallacious assertions prevail among the special pleaders of medical and lay opinions than the admission of avoiding certain foods, eating others, and abstaining from water at mealtime. There is no greater source of unappetites, inefficiency, illness, and even death than this prevailing regime. Physicians like names and sleep, initiate and obey an authoritative leader. If Dr. Gable writes that the old dog young there will be almost unanimity among physicians that improving it with diet, hence when a doctor's contemporary stomach specialists false pretty much everything but bread, hickory, tea, and water, the metabolic rate of starvation does, even though the death certificate applied to my son.

Unhappily, most of us eat too much of everything, but as long as the vital forces, the alimentary juices, the oxidizing and peptonizing ferments ever successfully with the intake of nutrients, as long as an equilibrium is maintained, the system of fat cannot be sacrificed to the establishment. If, however, there is an unstable state, a lack of balance which holds the food scale down on the side of the tissues, there is suggestive evidence that too much food is entering the body or that too little of that which is often become involved into non-removing products.

The correct procedure, it seems, does is to eat a little less of everything but not to the point of harming your mental and physical efficiency. Thus arrange the hours during so that such a balance as you take become properly oxidized, oxidized or excreted is at its maximum at breakfast and then become rapid. At six o'clock in the evening the oxidizing ferments are almost completely used up for the day and since this is the case it would seem that the intestine remains and empty of the night. Then will all the oxidized fat now—over these with three-quarters inhibited adipose slumps—be freed from hypercritical laughter and the will of the multitude.

# OUR COUSINS OVERSEAS

## Some British Traits as Seen from the Viewpoint of a Celtic Painter

BY J. B. YEATS

ILLUSTRATED BY THE AUTHOR

In these we shall get rid of the major creative, but who will not let us of stand applied before it is symptomatic wonder, as when we see a great mass or a great best-thing, or tiger, or Spanish bull—standing at bay among its enemies and striking back? And so no admiring the false civility the spiritual tongue.

A famous Canadian painter was of English birth, lived at Eton and at Oxford and was a professor, a continuation that would be a confirmation of the same, of someone anterior, to be lived in and equipped for ever and over. Nearly every one who climbed that particular eminence knew from his personality something of value; a policeman or a tax gatherer or public prosecutor might have a kindlier feeling for his fellow-actors—such an array of black in the circumstances of any man inevitably tends to dry up the well-springs of tenderness and leave the field open for pre-emptive and mortal strokes. I remember, twenty years ago, when he gave the world a keen opinion of his deservings in cruel speech. The school of Irish controversy was passing through an acute stage; the people had become extraordinarily poor and wretched, Protestant and Catholic, pouring into Canada and America. At the psychological moment the professor wrote to his papers, saying that as he always despised the Irish he despised the English; he found it may be known who was the Protestant, for while he "the Irish" he spoke in the language of the English people and with wit and wit. He refused and reworked round the world of Protestant and racial hatred. He drew from the natural history books, where it is used to describe the monkey, which, we know, has a large jaw very much beyond forward, it smacked of scientific precision and carried with it an air of authority. It meant that hereafter the Irish Protestants were to be known as men and the Catholics as monkeys. For a few weeks the professor flourished in his Protestant and Catholicism with the word "progrressive" a word sacred to the tongue of scientific conceit. And even now, though the professor is dead, his spirit would still live on, like a half-wilded potato, to out into the house of national pride and reverence. Again and again he had discussed it with his English Irish friends, and now I get it successfully to the last of a lot. "Let us," said, "wonder all over Dublin, and if you show me a single parish where there is no English man, there is no English man in it." The professor was nailed. With his big eyes he found something which he looked at with a keen interest, but which was not progressive at all. Let us describe an incident in his life and what this something was.

It was twenty years ago. I was young and every afternoon I went for a ramble along the roads of his beautiful neighborhood of mountains and water, and coming to a Protestant clergyman. He was a true Catholic man, I found him the most charming of companions, since he came at once upon me with the most complete of men. He was all through and all over his own religion and a man of God, and one of his peculiarities was that he never said anything without a pair of eyes glowing so that he might catch every one and then and "search the horizon" for the spirit or some of a Protestant church. Scotland he was as he was, I had been supposed to have "leaned toward Pope," a suspicion obstinately clinging to him from ministry is say of the disciples as he with his eyes on the ground and so that at the time he was without employment. An exile within his own land. It was with an exile's passion that he looked at the three scattered churches. I am sure he had never heard of the Canadian professor or his new application of a French scientist. The only way he came to know of the professor was as a newspaper, and an form of reality, now this well-worn set of rhetoric phrase-making would have been to him even as familiar as the words that of this simple man was just as discerning as the distinguished professor, since with lucid confidence he also could pronounce, as regards every man we

met in this populous district, whether he was Protestant or Catholic. It would come from him in a whisper and as if he was talking to himself. One day I expressed to him my appreciation of his immense knowledge of the people of the County of Kerry. He looked at me with surprise and asked: "Do you not know that the Catholic always takes the lower part of his face, while the Protestant lets his head and nose?" So, after all, it wasn't such a difficult thing to know the Catholic from the Protestant, only you see it would have added no fuel to any fire if the professor had simply said that the Protestant kept his head and the Catholic set it off. My friend was in his way a man of genius, as is every man who turns truth for his own sake. The professor was much cleverer than anything of that sort, and his self-appointed task was to evade the cool and set people to look each other. It was such a double-edged sword for some people look for glory!

Between the Ulster Protestant and the Ulster Catholic there is no difference in physical type.

otherwise he would have been exterminated. He fought first of all that he might stand, and he fought for the sake of watching the men as he was met with a sort of wild gawdy and laughter, as if in his passion of fighting there was something broader—namely, joy in an intense consciousness of strength and destructive energy. Now fighting breeds valor, but it also breeds friendship. For that reason the fighting Irishman makes a bond of comradeship, as any English soldier would tell you. We have a saying in Ireland that either is better than intercourse, which is another way of saying that comradeship is better than either. Hence, though we often fight, we do not encourage the cold enemies that beat. The professional man, one letter, doctor, and architect do not spend among themselves; in this, Ireland being very unlike England, where there is little fighting but much quarreling. The Irish man raised to strike is at all times ready to be struck, and if he holds out that hands may grasp. Fighting and comradeship are two instincts indissolubly linked together. The Irishman fights for his friend or with his friend, and if the enemy prove himself stout and valiant and fights fair he will love him for his fighting. The evil side of war was not so often enough remember; its good side is the growth of comradeship. I remember all the details of the fight over "The Playboy" in the London theatre. The shouting and the cheering and all the organized uproar continued night after night and yet it ended peacefully. That "Playboy" was right and that "Stage" was right and that they were wrong and outwitted themselves besides. The most distinguished among the Irish players in America have told me that he was "having" for the Dublin audience. Irishmen love the word of the good and the friendship with their friends and in the give and take of war with their enemies and as quickly as possible they change their enemies into their friends.

It was once present at a great meeting of the Sons of St. Patrick, where I had a seat on the platform, and as he was there and the other Irish men staying here, I thought I never saw a finer type of man; and all thought to strike as at all times ready to be struck type. They were not men of thought or sentiment, either of impulse and of action, every movement of their bodies, and as quickly as possible a force acrobatic seemed to leap from their eyes. Englishmen and the round should be of an aggressive type of life, even to its love, and can afford to be mediocres and occasional Irishmen are only listening to speak a long think and have no leisure for the future, it is abundant in the Irish camp. The doorway of the present of a railway or Kerry has become legendary.

Naturally it is fashionable among some artists to design the human form and face according to geometrical laws. Following this plan, I found that the human form was the shape and the skull of the Irishman might be inscribed in a square, whether you see in the shape of a square or a circle, and lead are always a circle, and the Newfoundlander is a long parallelogram—these whether you see in front or in profile. And as we are continually asked to suggest a circle, for they are frequently handy and lead.

Some characteristic racial types as seen through Irish eyes

Whatever original difference may have existed has disappeared long ago. For one thing, they are both highly Celtic and Scandinavian; and besides there is "Dias Caid" who through all the years has kept open his marriage books night and day, not who, having no religious scruples, is delighted with incest as merely to link a Catholic with a Protestant in the holy bonds of matrimony.

The mark of an aristocratic race is the ease with which it produces of tall men it needs. So do not forget that if such walling has come from Irish shores, behind all this have been men who never favored, men of the type I have called short-crooked and square-faced, and that behind the humor, which is honest and playful and sophisticated in its odious, rounded in most charming looks and stories, has been another humor, lower-class, hard, and terrible which has no such humor. There is nothing except in the writings and actions of "the mad Irish peasant," Donn Byrne and lastly in the plays of Synge. The Irishman is a fighting animal, since

the Scotchman, and assured the Frenchman that, for the same reason he takes to associate with his services, they make such incomparable partners, while the Irishman and the Scotchman consort with their equals. As to liberty, equality, and fraternity, they are to John Bull but moonshine. The innumerable ideas that have come elsewhere with the quackered and reasonlessness do not stir his stagnant mind—these are a flock of bright spring birds that will almost every country, yet have never alighted on the cliffs of Albion. He is hardly a brother to the one brother-lessly should he concern himself with the brotherhood of man? Even the scholarly Englishman is variously wretched here. Who was not a laughing stock, otherwise his work. "Am I my brother's keeper?" would have made him the first Englishman instead of the first scold.

Yet, notwithstanding his headlong opinion and his disdain for platitudes, let us never forget that the first Englishman, by whom it seems the nation profited in its natural order, and that his right aristocratic front who comes here staggering about being English and anxious to show how ill-mannered he can be in the fashionable English way, stands in the world's history for three things—liberty, law, and fact. For these he has an instinct, which is native as the grass in the sod. Within these limits he is free with a spontaneity and a naturalness that are not to be found in either of the other nations. He is orderly—liberty a rule of conduct most better than his ideas, which only distract him, and he has an unshakable sense of fact which makes him solid with the universe. He sends his roots deep into his environment. And though the words "Am I my brother's keeper?" are repulsive to the ear and full of sinister suggestion, we who have read history know what an ocean of misery and cruelty has flowed from the opposite doctrine, "I am not my brother's keeper"; indeed, no such brooding on this latter would make us ill at ease, so that we have one sense of the true unweariness of liberty. For no sympathy at all is better, all things considered, than such of it, sympathy being a vice that quickly spoils and more so because it clogs and flows, but because it is inevitable and easily becomes antipathy.

Here is John Bull's method, whereby he preserves his peace: every morning of his life he takes his sleeping draught, a strong dose of British stupidity, if I may so describe it, whereby he believes that, since he is living in England, he is living in the best of all possible worlds, where the institutions need only to be kept going to become perfect, and where all the customs and ways and ideas are what they ought to be. The Times newspaper is infallible, and every scoldman who has wealth is not only a gentleman, but a model of all the virtues; while the scholars all read their Greek and Latin classics, leaving science to the scientists, as they leave public order to that well-trained body, the police. Meanwhile the American drinks his daily cocktail of democratic error, thenceforth in his private life he is corrupt and every law and every newspaper the child of corruption administered by corruption. Over the happy English land there spreads a blessed atmosphere which nothing can disturb except, perhaps, an occasional German war. If it be true that the Englishman sleeps and that, on the other hand the American cannot sleep at all, he has in his better jawed with all kinds

of money aspirations, every idealism, and discontent, while the royal English three wretched itself in snoring complacency. When will America have her bird-sung notes and quiet dreams?

The English nation is like water a well compacted of round stones, not through its openings all the winds of heaven can play and waft, making wild music. The Irish and Scotch, on the other hand, build their social walls of custom and habit, with stones filling so closely that there are no openings through which the winds can play. Here we find all kinds of "Scottish" characteristics and of their intellectual freedom among themselves? And every Irishman who comes to America either starts a club or joins one already in existence. In his own country he is often a conspirator. These nations are both very too ready to part with personal individuality for the sake of the collective individuality, while the English have even their private clubs on the idea of a complete retrogression among the members, so that it is a breach of club discipline for one member to speak to another without a formal introduction. It may be said of every Irishman that he is "close" to some other Irishman and of every Scotchman that he is "close" to some other Scotchman; the same can be said of Englishmen with Englishmen. Yet all the Englishmen lacks the scoldish charm he overcomes his temptation; having a particular desire to be friendly with his neighbors, he can, if the rare fit be on him, more easily be honest with himself; even the Scotch mind sometimes nobly gravitates toward the royal truth rather than toward that which is ultimate. To be honest with one's neighbors is good and pleasant; to be honest with one's self makes the truth of art and poetry; it is not a matter of the intellect or of the moral consciousness. It belongs to the domain of the personality and of the emotions; it is, perhaps, the rarest and most difficult kind of truth, yet without it there is no art, and for those who have it, human nature itself loses its nerve and its self. Its abundance and its variety. It is this kind of truthfulness making expression which makes the best without which friendship and the possibility of love itself are lost pale convulsions.

English politics affects us like a spectacle at which we laugh with jolly laughter, but we seldom laugh with it, while Scotch gravity is infectious, were behind it is always the "whole light" of intellect appraising the national mind and sympathetic tenderness and every other sort of social virtue. Irish geniality, like American decency, is a form of destructive criticism and a distrust of the spirit, yet it gathers something and keeps all its directions when its subject is flat, by himself and by others, but especially for himself, mark the word—and mark the word—pressure, the great English Party. The Irish may not care much for the divine form of naked truth, but we do enjoy stripping a human filth he shows in his shirt. Still that not have him even his shirt, for the great Deas breaks no one's leaders, and we may call ourselves cynics and lament that we are without convictions, yet we have the virtues of cynicism, one of which is sincerity, with its organs and organs speech, while our lack of conviction makes us all the quicker to detect the false movements, the false ruin of others. It was No. 1's sincerity that made him so terrible, and Godsmith's that made his weakness so gorgeous; all St. Sago's have come from

his deep and being and anxious sincerity, and if some of us objected to him it was because every ill-advised individual had fallen for once under the English spell. These things are true, and one to me "had should not be told." Shaw's belief in socialism seems him in some degree from Irish cynicism, but by his gift of severity and bold utterance he is Irish of the Irish; like a hand of merry music, his plays and poems have shot arrows of light into the English fog of gushing sentimentality, self-decoration, self-complacency, self-inspiration, and self-orientation; for inconsistency—that is, the keeping of things "dark," the constant protesting that things are other than they are—the Englishman's religion, it has its virtue and its grandeur, and its service of eternal good. Shaw is Irish of the Irish, only, being of middle-class extraction and training, he has the refined and the provincial, and of less grace as the dream of wit and logic, and preached in woman and out of women the middle-class doctrine of "practical ethics" whereas St. Sago, coming of a family with aristocratic traditions who had never learned the depressing doctrine, held these people like a brother. Indeed, he lived among them and became one of them, and so gave us the drama of a people who live in a reckless phantasm and use the language of phantasy. A friend in New York told me that when he returned to Ireland his servant assured him how glad she was to see him back, "see" said she, "there was the color of loneliness in the air while you were away." The gratuity of the Irish peasant is not in the least like the gratuity of the Irish noble; rather is it the strong drink flowing in a narrow cup. Leaving out of count the "upper classes," we are chiefly useful to themselves, the Irish are a great people, with truth and poetry in their hearts. These people are poets in intention, and if any one would teach them to think individually they would be poets in achievement. Unconquered with them, Godsmith learned how to describe the lunatic's gape, contrasting with them and fighting their battles, the captured St. Sago and his powers of ferocious criticism, for those kinds of people have a humor which smokes like a sledge hammer. St. Sago's heroes, though pure as snowed sunshine, sentiment, as we know, talks like Dr. Hodge. The Irish literary movement which is gathering in the minds of young men and young women all over the country draws from the elements all of its inspiration; in that deep well Irish poetry has been sleeping three many years.

It seems to speak of the Irish fate of the long and type. To this type belong many Irish priests and many Irish mothers, and in this type have always belonged the most beautiful women of every age, nation, and class. Doubtless my mother Eve, who presented Adam, was of this type; otherwise she would not have persuaded when the arguments were all against her. There are also the Venus de Milo and the Venus de Medici, and the Virgin Mary has so appeared to all the painters. Peppie Miki, the woman of the fighting type with the flashing eye and intrepid tongue, who would have sought her lover at the gates of hell, is unperished, for the intimidators; and the critics were right when they said that she is not the highest type of Irish woman. The other knows nothing of conflict, being in continual harmony with herself, a perfect woman, a perfect mother, and, like the morning stars, reveal with the primal poetry of the earth.

# A REMARKABLE ART SHOW

The International Exhibition which Opens next Week in New York, at which the most advanced Painters and Sculptors of Europe and America are for the First Time adequately Represented. This Exhibition is unquestionably the most extraordinary Display of Pictorial and Plastic Art ever Assembled in America

BY FREDERICK JAMES GREGG

(See the double-page of Illustrations in this issue)

**T**HE Exhibition of International Art (February 15th to March 15th), at present the main landmark of the Association of American Painters and Sculptors, a body incorporated under the laws of the State of New York, was planned to introduce to the public the works of a number of foreign artists, who, though they are well known in Europe, are for the most part but names to New York and America. The method adopted, however, was not to choose an "extreme" contemporary at the heads of the public, but to show, by a process of selection, from what they had developed. No figure was taken as the starting-point, the line continuing with Delacroix, Courbet, Corot, Daubigny, Pissarro, Van Gogh, Gauguin, Cezanne, Matisse, Picasso, and the "Futurists."

Until the present occasion the most that Americans knew, in America, of the "movement" abroad, outside some few examples shown at certain small exhibitions here, were the works of certain young men who had gone to France and become immediately and liberally, perhaps, sensitive to their new environment. Many of them were but weak imitations. It seemed that it was the extravagance of the new foreign painters and sculptors that excited them, and of that extravagance they were the facile detectors, all the strength of the originals having evaporated in the process.

The result was the natural one, the public looked on the productions of these disciples as a joke, and could not be convinced that it had any real or valid reason for its existence. The association, in bringing over the work of the men so eagerly imitated wished to allow Americans to see among other things the difference between the substance and the shadow, between what has set a fashion unwittingly and what was merely fashionable. In the case of those who are now really influential there can be no difficulty about surpassing a man's early with his later work. It will be found, on comparison, that the change is the result of a certain logical development. Each step has been in a definite direction and follows the one before. It was not a case of "going somebody one better," or intended to cause surprise or even astonishment. If there was an explanation offered, though it might not explain, at any rate it gave people something to think about.

It was found by Mr. Davis and Mr. Kahn, the committee of the Association of American Painters and Sculptors which was sent abroad to select works for the New York exhibition, that most of the German Post-Impressionists were mediocre, the result being that very little of what they had done had any real significance. A German of Cologne, speaking at the academy of his fellow-countrymen, said that they were becoming "ultra-intellectual" as distinguished from "ultra-intelligent." That, they went so far, deliberately, as to make their work "stupid." As for the English advanced men, or so-called advanced men, with certain notable exceptions, their work did not exhibit much force or show real development, which in the same way they are not more widely represented. At the same time there are British painters and sculptors not shown here who ought to be here. But, owing to the shortness of time, all committees, foreign or not as America, found it impossible to cover the field. This is why, for instance, the English Modernists, who are affected by the subtle faith set of the empire, are not shown.

As for the "spikes" believed in selecting the work, it is to be kept in mind that the entire exhibition is the result of a plan of the committee. It decided to go over the old American and foreign art that it considered suitable to the purpose. This it did. But it is hard to consider American work that it had not invited, in cases where artists asked to have their paintings and sculptures inspected. It is to be observed that this is a very difficult matter from sending the best works which would have to be regular jury. In fact, the association might not give to any man had a special purpose in view in arranging it. We did not try to put as many pictures as view, or wish to give an opportunity to exhibit in this, that, or the other person. We desired to give our public the chance to see what has been going on abroad, as it is important for us to have to what extent we have not come under the influence of the period, whatever they may be.

It is natural that the artists most interested in the notable group made up of Cezanne, Gauguin, and Van Gogh. The first, the old man of Aix, "was made possible, and good," whom his friend Edouard had not understood, though he drew the painter's portrait as a young man. In 1872, he made his own after a life of neglect and even contempt. His friends were not moved him from Impressionism. Cezanne did not believe in "breaking his predecessors," or that "the old masters exist to reveal us what it is avoid," as was said recently. He used to insist the Louvre gallery as Van Gogh used to find the Dutch galleries. He became a heretic not through hatred of "humanity," but through conviction, as at night, as he had from his

A portrait of a girl, by Matisse

One of Gauguin's Tahitian landscapes

ascended in painting, as the ascended first from his life. His determination to let an ear "get his grappling-iron" on him but showed his determination to work out his own development as his own line. Richard of the Salen with Pissarro, Claude Monet, and Seurat, he and Emile went beyond Impressionism, while Courbet and Daubigny were among the men whose work helped his progress.

Gauguin, no more than Cezanne, stopped his art anywhere. But whether in Tahiti or in Brittany—he let an assured career the duck-outrage to make painting his profession—he sought after simplicity, a simplicity leading to the artistic—simplicity and strength. If his drawing is false, it is voluntarily so. Whatever "fault" he has has its purpose. That is why he paints the vulgar.

Van Gogh, the third of the Titans, is revealed, not only in his paintings, but in his wonderful letters to his brother and Emile Bernard, letters that have a deep meaning. Although he gave painting his whole attention only when he was twenty-five, and died by his own hand at thirty-seven years of age, a great career was crowded into the interval. A leader in new paths, he, too, believed that "as long as there are those who are living, the dead will live." His theory was of the chief thing in it: afterwards men will not only through reality, without any preconceived plan and without any watered-down belief, Paris. He showed his belief in the inter-relationship of art when he painted not an ear as was said that the early Italian, the German Primitives, the Dutch School, and the later Italian school fundamentally constitute a group, a series.

Next in big masters of the Modernist movement, Cezanne, Gauguin, and Van Gogh, come a lot of men whose names even have not been known to the present rank of American artists. There is a group of sculptors, of various nationalities including Maillol, Brancusi, Lehmbruck, Maillo, and Amisano. Maillol, who is no longer young, is a Spaniard who came to the front only recently. Although his work was thought highly of by even conservative sculptors for years, he had difficulty in getting it shown. His portrait of his friend and admirer, Mr. Kahnweiler, is one of his most notable performances.

Brancusi, his youth had to be a conservative, exhibiting at the Salon. He disappeared from view some years ago and emerged from his hiding-place with a new manner. He now dwells in his studio at a trade-school. He at the art school in Bucharest, and five at the Beaux Arts in Paris as "fifteen years of waste" and the early work from the sale of which he still makes a living as "a new bookshop." He goes further than Maillol in the direction of making his sculpture "objective." His work is in fact to show how the subject affects him, not to suggest representation. He is a great believer in the use of the chisel

## "NAB"

BY LAWRENCE MOTT

ILLUSTRATED BY ANTON OTTO FISCHER

**M**R. ALAN MAC WITHERS, late of Liverpool-shire, but at present out out by the firm of Crowden Brothers to take the chief engineer's berth on one of their freight-ships, the *Therapia*, came briskly down the last pier. At his heels trailed two longshoremen, staggering under the load of a brace-bound sea chest, while the beautiful stinkship of a Scotch terrier that was ever whined fretted awkwardly before. Its crooked stumpy legs making hard work of a heap of wire coils, piles of lumber, and the many other odds and ends that litter a big freight pier.

"Here she is, sir!" one of the longshoremen gasped, letting his end of the chest drop. The other red came down with a crash.

"Ye're on frae Scotland, air ye?" Mr. Mac Withers asked; but the delicate snow was lost on the pasting Irishman.

"I'll sign aboard yer. Bide ye here till I send you her box." The longshoremen started in astonishment as the wily Scotchman scrambled nimbly up a very steep plank, the terrier a close second. At the ship's red Mr. Mac Withers stopped; the terrier stopped; man and dog gazed love and aft with scrutinizing eyes. Then Mr. Mac Withers looked down and the terrier looked up.

"Nab, 'tis a dirty sea-ban!" The dog's little pointed ears drooped and its wire-bristled tail wagged dispiritedly.

"Nab's no like our said Aberdeen, is the Nab?"

The terrier was dejection itself at the line in Mr. Mac Withers's wavy hair. Cool dust cling to everything. Here and there patches of white paint straggled to show through it, but almost in vain. Monotonously his whiskers clanked and ponderous druck bones swung backward and forward to the billowy slaps and—two—three of white steam. *Maidsy and Lawson* scurried along the red-rusted iron decks, while from down No. 2 hatch came the hoarse voices of men stowing away the last of the cargo, over it all the hot afternoon sun. Glimpily peering his way, the Scotchman made for the upper-deck ladder.

"Nab, I'm tellin' ye many times that ye wrenn built for terrier-ship; be mad, affectionately, as ye stowed the terrier under his arm; 'as' for sic a scunner, neither am I; but there will be squabble better, Nab—'tis the good Lord's will."

When up the narrow iron ladder and on to the bridge deck he released the dog. Nab scurried across, peered over the side at the silny water, and vanished beyond the high sill of a door. He was back in a moment, whining softly.

"So be—the said sea, eh?"

Just then a yellow hand was dexterately laid on Mr. Mac Withers's arm. He turned.

"Bosser Master no show dog on ship, air! Ye thinker go Hong-kong? Mebbe please way? See Bosser Mate; talker-talker; teller you ever'ting."

Mr. Mac Withers looked the Chinaman up and down, then took the end of the neatly plaited queue and brushed a few grains of dust from his sleeves.

"Same said Chinoo, Nab? Nothing new?"

The terrier squatted in the shadow of the bridge, waiting.

"Ye teller Bosser Master fustan shaft cross—'tis that's Arabic, Nab, air! Ye'll an be understand by sic a folk! Caller Bosser Master—'twould fare?"

"Steward!" followed a voice. "wha the devil is aintin that ye outside?"

The Chinaman disappeared. Mr. Mac Withers made himself very comfortable—in a deck chair, and Nab

craved beneath it. The dust of the last of day's work was settling slowly, and the blasts of ferruginous came less often as the Scotchman counted the minutes by his watch.

Shipper Witherton came out of his room, saw the figure that crouched placidly in the deck chair—

"Come, come, my man, ye should have asked the agent for a passage. I am not empowered to do any thing for you. Is that your dog?" The hearty English skipper, stalwart in his authority, gazed at Nab.

"I do not allow dogs on my ship," he added.

"Wall, Skipper, an' 'has air ye ever'ting? Ay, ye're an awc bit terrier. I was thinkin' maybe ye'd—"

"No, I cannot do anything, and I'll thank you to take yourself and your dog home."

The Scotchman got up slowly. "Come, Nab, we'll be gettin' our gear aboard!" Without a look at the sea thoroughly angry skipper, the wry little man went to his room.

"Below there, on the deck!"

"Aye, see?"

"Fetch up me hat-ban an' show it in the chief engineer's room. An' dis- an' drop it—'as' I'll be down among ye!"

Flicking his eyes ash away, Mr. Mac Withers spun on his heel and faced Witherton, whose face was appalled—

"'as' I'll thank ye, Skipper, to have a chief engineer when ye see one! It been me built that the parcel I run' out on broke a valve some thousand miles off Sandy Hook, so as I'm a wee bit late. D'ye intend leavin' the vessel?"

"Ye're—sir! Where are your papers? Leave that rhead on the main deck!" Witherton raved.

The Scotchman gazed at him incredulously for a moment. "Eh, man, but the sun an' the whiskey air too much for ye! Reasonably I'd advise ye to give up fate to Witherton!"

The skipper started for the cabin, but the latter slipped aside on the Englishman's dress pants and pushed an envelope into his hands. Witherton had in read his contents.

"So you are my chief engineer?" he said, indignantly.

"Na, man, I'm in 'your chief engineer'—'as' thinkin' the English man. 'I've been chief engineer of the *Therapia* ever sin' I put by o'er her drive an' and 'as' in the employ of the Messrs. Crowden Brothers. D'ye get that remark—the last one? We've got kind permission I'll be na see o'board taken to me room." He deliberately turned his back on the rising skipper and called:

"Bide there, rery aft!"

"The dog can't go, anyway, steward!" Witherton's fellow crewed deck-hand, a scowder, and the crew to look up. The Chinaman appeared instantly.

"Na, man, I'm in 'your chief engine' "

Interfudes

COMPOUND COMMUNUTED USURY

A YOUNG negro at Louisville, Kentucky, who had accumulated a big roll of greenbacks shooting craps along the levee, put one hundred dollars of it in the savings-bank as a safe allowance for "winter use" before starting out as a regular gambling rover among the restaurants on the steamboats down the big river. He was so lucky that he did not come back to Louisville for a long time, and when he did return he was prosperous, but he commended his money and thought he might as well get it. He went to the savings-bank—which, by the way, was owned and managed by negroes—and walked up and down the front office. He was smoking a good swag, his clothes were new and neat, his durbill-tong shoe were polished like black mirrors, and diamonds flashed on his hands and in his shirt front. He walked up to the window marked "Cashier."

"What de cashier 's' d'olger bank?" he inquired, loftily.

"Hush be in, right bank," was the equally lofty reply of the hair-shirted black man at the window, twirling his respectable blacky eyelids side-whiskers. "I is de cashier, sah. What 's' a do fo' you, sah?"

"Ma sa'm's Henry Fleming Jackson," said the stranger, loftily. "Fo' yuh sah ag' 's' avah ah dose 'pound er hundred' dollahs in d'olger bank. B'yuh's ma paan-bank. Ah wants ma moary."

"Yassuh, ah, yassuh, I 's'p' 'y' doos," the cashier answered. "But h'ol' passah on de regularity 'o' yo' solikation, fo' de hona' be mook er 'restintion on de accumulation ob de cash'."

The cashier was gone five minutes, ten minutes, while Henry Fleming Jackson paraded to and fro, filing the bank with the aroma of his good swag. At the end of eleven minutes the cashier returned. His face had turned gray, but his voice was as smooth as ever and his manner most convincing. He said:

"Nitch Henry Fleming Jackson, he d'ahs de 'pound yo' moah was five yuh ag'—not 'o' yuh. Yassuh, yo' 'pound dat kind' dollahs fo' yuh ag' six months ago, an' seven dat time, sah, de interest—interest' done er yo' hundred dollahs all ag'."

SUBTLE

"Am you doing yourself anything this Lent, Bobby?" asked Winkler.

"Yes," said Bobby. "I am denying myself to my creditors. She's't me anybody I owe for six weeks."

"Dish—yo'll be huzant. Won't you?" said Winkler.

A PERFECTLY NATURAL QUESTION

Dr. ———, who is an exceedingly eminent and busy New York physician, goes to many clinics and sees hundreds of patients weekly, so he has never had taken about a few days ago when, in response to a telephone call, he took up the receiver and heard a thin, elderly, foreign American voice say these words: "Victor, I want you had verb. What shall I do agud?"

AS THE MINSTREL TAULD IT

RAN out to Wallie's house to spend the evening in debonair and edifying conversation, Wallie invited Rah to be the house, and like any top a chair on either side of 't' inglishah Wallie drew out his knee always "havy-jach. An' took er forget-me-nots, filled his pipe," lit it, and drew whiff after whiff in grand contentment.

Rah offered the rock and looked at the wreath of 't' handling you.

"Oh, Wallie," said Rah, "yo's a grand 'havy. Whim'd yo' got it?"

"Aye, Rah," said Wallie, "fo' a grand 'havy. I had it wad down fo' Yiddiserrah."

SOME EUCENTRIANS AND A HOSS-BACK HORSE

Wallie smokit an' smokit at his pipe. He made no offer of his 'havy.

Wallie Rah said: "Wallie, will yo' ple me a match?"

an' Wallie g'ah him a good match 'o' a blue hoo."

Rah snatched his right 's'at pocket an' his left out

Wallie smokit an' smokit at his pipe. He made no offer of his 'havy.

Rah snatched an' took up his said furr 's'ap.

"Tis a 'perry," he said. "I mean tin ewa' hame an' get ma 'havy."

Wallie smokit an' smokit at his pipe. He made no offer of his 'havy.

"Well," said Rah, "I mean just dang awa' hame fo' ma 'havy."

"Aww," said Wallie, "very dere an' 'pawby, 'if yo' wad gang awa' hame, Rah, will yo' please gie me awa' match?"

HIGH OFFICIAL AMENITIES

"Good morning, Mr. President," said the President-elect.

"Am you going to give up anything this Lent?"

"Why, yes, Governor," replied the President. "I think I'll give up the jump and supremacy of power somewhere about the Fourth of March."

MAKING AN IMPRESSION

BOB DWYER, fresh from college, opened a real-estate office in an attractive suburban neighborhood and hoped to make his fortune. For days he sat unharmed in his little office, staring out at the dusty roads or twiddling his thumbs. In the afternoon of the fourth day he saw a most crossing figure stride diagonally toward his door. Scarcely this was a customer. He must be made to feel that business was flourishing.

As the man stopped over the threshold Bob held the telephone receiver at his ear and was talking earnestly into the transmitter.

"That's correct," he said as the man stood before him.

"Right. We will accept your \$100,000 cash in mortgage and let the thirty thousand remainder stand on a five-year mortgage. What? Yes, I'll bring the deed around at eleven to-morrow morning. Good-by."

Bob hung up the receiver and turned an important visage to the visitor.

"Not 'em," he said, "what can I do for you?"

"Why, I just came over," said the man, grinning.

"To connect your telephone instrument with the wires."

YE BROKEN VIEWS

A LITTLE OVERDOSS

I wass all awate, and thra-ah me—

Dear Chio came along, and she

Raised her sweet lips in summer shy,

Well, atyook.

I was a fool to make that vow,

And he'd be there a week, but

Who'd dismount a girl like that!

I wass off all tobacco, too,

And meant to keep the vow all through,

When to me wass great regard

Dear Phyllis lit a cigarette

And passed it over with twinkling eyes,

And I—

Well, it's no joke,

But vava like that all out in smoke.

I wass I'd had a hermit's life,

And flew away from worldly strife,

And spend an' could work away

From all the joys of life so gay;

And on the second day—well, true

Have into view,

And smok'd on me with each new grave

Honoring her lovely face

Th' I—

Ah me! Oh me!

What me the hermit truth to tell!

'I'll never, I left you!"

And left that hermit stand to change

Who have no stir left in their stumps.

MORALS:

To keep your Leaba, curra and curls

Go somewhere where there are girls!

CAROLINE SPIER

'CHONS-EYED UNFORTUNATE: HANG IT ALL! I'VE LOOKED HER STRAIGHT IN THE EYE AND SHE DOESN'T KNOW IT

pockets an' snatched his right waistcoat pocket an' his left waistcoat pocket, an' slipped the right pocket of his brooks an' the left pocket of his brooks, an' then shook his head.

"Aww!" he said. "I haw left ma 'havy at home."

"AMN'T THAT A SHAME, NAME! THERE WAS A WIDOW WITH ENOUGH RIBBON TIED TO IT TO TIE HER HAIR UP THE WHOLE FAMILY."

# UNCLE SAM'S WOMEN FLAG-MAKERS

BY WALTER L. BEASLEY

**T**HE vast array of flags that "went up" the one hundred and thirty-three was recently assembled in New York, forming a glittering mosaic of color twenty miles long, was one of the most impressive and picturesque sights of the great naval program. Few, however, who viewed this spectacle knew that all these beautiful outlines, brilliant in many hues, with a wealth of choice embroidery, were the exclusive handiwork of women. The United States Naval Department has trained a group of fifty expert needlewomen in the New York Navy Yard who cut out and finish the varied flags for the battleships, amounting to some 20,000 in a year.

The flagroom is on the third floor of the Bureau of Equipment Building. On entering the large room the visitor's first impression is a blaze of color. Rolls of bright hasting are heaped up, waiting to be cut, while long lines of electrically driven sewing-machines, with women operators, are moving of and putting the finishing touches to American and foreign ensigns of many different hues and patterns. The flags are cut out from measurements arranged on chalk mark lines and metal markers on the floor. Large strips and certain designs can be seen continuously stretched in the air. Daily this crowded section of the floor is thronged at all hours with different flags, with the women cutting and sewing in close on the machines, each of which is swiftly run by a small electric motor. Some of the women are of the same age as the stars; others are skilled in finishing parts of the flag. The thousands of

white stars used on the flags are cut out by an ingenious machine, especially devised for this purpose, operated by electricity. Only a few years ago the stars were cut out by hand. Now a plunger, fitted with steel knives the shape and size of the star wanted, with a single down stroke cuts out from fifty to one hundred stars at a time. Some eight different sizes of stars are used, each having a special cuttting.

A good idea of the number of flags that must be carried by a large battleship can be gathered from the considerable pile fifteen feet long and almost shoulder high, recently finished and sent aboard the United States Steamship Hoquiam. The foreign flags are crossed in thick paper bags. The name of the country is stenciled on the bottom. The remainder, including the flags for ordinary use, signal wire, the international code, etc., are not wrapped, but tied in round bundles and lettered. The pile contains 480 different flags, the regulation number every large war vessel of our navy has in its cargo. The material and making of which cost the government just \$2,000 for

each ship. This sum, multiplied by the number in the service, adds up to hundreds of thousands. It is necessary to equip them for all forms of ceremonial and official occasions, sailing and starting, both at home and at foreign waters. With an extensive array of flags stored on board, the ship is prepared to meet all high-rank officials of any nation who may come aboard, or into whose waters the vessel may enter while on a cruise, and to observe the proper etiquette.

The largest flag made in the United States ensign No. 1, with 48 stars, which is 30 feet long by 19 wide and cost \$40 to make. The President's flag requires the longest time of any to complete, as it takes one woman a whole month to finish it. This consists of a blue ground with the coat of arms of the United States in the center. The life-size eagle, with long, outstretched wings, and other emblems, are all hand-embroidered and involve the most patient work. This flag is made in two sizes, 10 feet by 14 feet, and 2 feet by 3 feet. The ensignoid silk used on this and other designs costs 80 a pound. The foreign flags are

25 feet long and 15 feet wide. Certain of these are full of animal shapes, curious designs, and marine landscapes. They are, therefore, difficult to make, and require a surprising length of time to finish. This is notably the case of the flags of the Central and South American republics, one of the most interesting being that of Salvador. This has for a large centerpiece, a regular landscape consisting of a hissing volcano, a rising sun, set in a curved design of draped banners, cactus branches, cactuses, and other emblems. The top is a curved diamond, with the date of the independence of the nation inscribed at the top. Nearly one hundred different designs are used in this flag.

## A REMARKABLE ART SHOW

(Continued from page 15)  
by the artist himself, finding modeling in clay "too raw." His example has been followed by a lot of the younger men, of Brunner's severity, there can be no doubt. The enthusiasm for the work of other artists when his studies in, like his love for music, a sort of passion. He does not believe in the quality of any artist's style, and believes that he will never on changing indelibly.

Archipenko is a native of Kiev. He used to be an adherent of the Cubists, but is such no longer. It is said that he thoroughly disapproved of the great influence of Picasso in the direction of extravagance.

Matisse is better known here as a painter than a sculptor. He is a graduate of the Beaux Arts, but came early under the influence of Cezanne and Bonnat. He has a wide following and his work is in great demand in Russia and Germany.

The name of Matisse naturally suggests that of Picasso, a Spaniard who arrived in Paris at the age of seventeen, and has been active ever since. From the first his paintings had a marked, very fresh character, an inherent quality and freshness and precision of color which has brought his earlier work. He has been of initiative, against whom the charge is made that they do not express their own emotions or conceptions, but are concerned only in suggesting the method of their idolized master.

One of the most interesting of the moderns is the

late Henri Rousseau. He was a custom-house officer who took to art in middle life, working on Sundays. His friends used to consider it a great joke to tell him that he was a great man and well on the way to becoming famous. The strange, developments of the students who perked at Cezanne, could have before his contacts at the Independents. But the fan-makers were astounded prophets. Henri Rousseau, whose funeral even was half a job with some, is now recognized as a true master by the very whose judgment has authority.

Bonnard, formerly the pride of Jullien's, became through the influence of Rousseau, a follower of Gauguin and Roden. He paints big pictures, and has demonstrated his collaboration with Bonnard and Vuillard. One of his pet theories is that artists ought not to accept official honors of our sort.

Delaunay is the philosopher of the moderns, and is noted as a teacher. Some say that his work goes to prove that a man cannot be a great theorist and a great original artist at the same time. One of Delaunay's notable works is a series of water-colors distributed the "Little Flowers" of St. Francis of Assisi. Dufy, like Bonnard, has hidden himself from the world for the purpose of growth. He does decorative work for public-house purposes. Gleizes used to be an impressionist, but now strives to conceal any signs of that influence in work.

Nouze's work is very scarce, and since his death has fetched big prices. He is akin to an artist to

Sorval. They became friends when they discovered that they had been going along parallel lines without knowing it. Vuillard is best known for his black and-white work and his vigorous use of the line. He is noted, among other things as a portraitist. The lithographs of Toulouse-Lautrec were exhibited in this city some years ago. Nonat-Carlson is a Portuguese whose paintings have a great vogue in Moscow and Berlin.

Here are some remarks made recently which are worthy of the attention of those who go to the exhibition at the Sixty-ninth Regiment Armory.

A man prominent in art and literature in Berlin said:

"The smallest always attracts attention as the initiator for the 'new grandeur'; the independent work is done by the collector of the initiator of the French moderns, the very men who formerly bought pictures by Kirind and Delvaux."

The noted Munich said: "What have I to say about my present style of painting? It is as I feel at present. Maybe the word 'thing' I will be with and definite, or dark and gloomy. My work of today represents a period only."

Leon Marcia said: "Van Gogh is a great personality, but not a great artist. Cezanne and Matisse began to paint where he left off."

The moral is that there is nothing dead in art, so last word, and that the main thing is not to be taken in one hand, and not to be filled on the other.

Costly Furs

London is one of the great fur markets of the world, and it is claimed that a year's auction sales in that city after amount to more than twenty million dollars.

Many curious incidents and episodes of the London market are recorded. For instance, ever since the Middle Ages ermine has been the fur of royalty, and it is recorded in the *Chronicle* of the great garments of kings and queens. In time, however, it fell into disfavor with women of fashion. White ermine skins became as cheap as the Canadian, Siberian, and Chinese furs, and no longer sent them to market. About twenty years ago, however, the west wind arose from some mysterious fashionable source that ermine should be once more the mode. Whereupon all the buyers began to demand ermine skins and the price went up in a high figure. As might be expected, the market was soon glutted. Chinese buyers went to London no fewer than ten thousand ermine skins in the spring of one year. And thus they promptly went out of fashion again.

The ermine is white with the exception of the tip of the tail, which is black. These tips, dressed with the white fur of regular lengths, make the spotting of the skin in most of the extreme of ermine.

One of the roughest of furs is the American sable, which is valued because it is said to be rapidly around the point of extermination. This little ermine, known to scientists as *Martenia arctica*, has about eighteen inches long, with a bushy tail and a sharp whiskered nose. It has a remarkably red ear, dark brown black, and very lustre.

The Imperial Corri at St. Petersburg has always declared that he would like the sables to be reserved for his use. They are known as "crown sables."

Kitchens of Other Days

The kitchen of olden times seem to have been of extraordinary size, judging from the investigations recently made by an English historical society. At Hurstmonceux, for example, there was a kitchen twenty-eight feet high, with three huge fireplaces, and a bakehouse with an oven fourteen feet in diameter.

There is an old Welsh kitchen near Llanfahan, dating from the fifteenth century, which has many peculiar culinary contrivances, some obsolete or superseded by modern devices. Among these curious devices may be mentioned a meat-jack with a firebrick, a steel heating stand, and a fat-burner.

At Battle Abbey there is a curious old kitchen containing much of interest in the antiquary, and a kitchen at St. Mary's Hall, Coventry, is remarkable for the famous "bunnet" post, in which, it is supposed, rich noblemen were frequently attached by way of punishment.

There is a medieval kitchen at Westminster Abbey, although little remains by which to identify it aside from the public flooring, the battery boiler, and an adjoining cellar. Thomas Court, Palace shows its "great big boys," with vaulted roof and set of stairs on its walls. Englishmen at the present time fully recognized the advantages of a large kitchen. There is extant an order, dated April 13, 1376, wherein John de Nevill is commanded to have the king's kitchen at Clarendon roofed with shingles and to make four new kitchens to be covered, one at Marlborough and the other at Ludlow-hall, in which "to draw" the royal dinners. In this order it is stated that the king particularly desired that his kitchen shall be provided with a furnace sufficiently large to roast two or three oxen.

The Pumpkin

There seems to exist considerable doubt as to the origin of the pumpkin. It is certain that the pumpkin, in all its forms, is nowhere more highly esteemed than in this country, and it is not without some reason that it had its birth in America, although some authorities claim that it is native to our continent. They contend that the aborigines of America planted it with their maize.

Authorities incline to the view that the pumpkin is of Asiatic origin, while others yet contend that pumpkins have been cultivated either as a curiosity or as an article of food in England since the year 1576.

Even in these days America has no monopoly in the culture of this attractive product. The pumpkin, in one form or another, is grown in various European countries, notably France, where the market gardeners near Paris use their pumpkins more in April in a hotbed under glass and nurture them carefully until they are transplanted to the open ground.

The College Man of 1413

GREEN UNIVERSITY is composed of twenty-one colleges. Among the lapses of the one that, although it has stood for five hundred years, is still called "New." It was built a hundred years before the discovery of America by William de Wykeham and was an expression of the most advanced ideas of education attainable in his day. Not far from architecture and plan of the buildings concerned, the few restatements that have since elapsed have suggested but little that better. English and American college-builders still follow de Wykeham's model.

The undergraduate in de Wykeham's time, in order to obtain his B.A. degree, studied the logic of Porphyry and Aristotle, something of Aristotle, and enough of arithmetic to enable him to read Euclid. Three years more were usually spent in studying geometry, astronomy, and astrology.

He lived in college. His allowance of money was one shilling a week. His breakfast was a piece of bread and a pot of beer at dawn. His dinner was eaten at ten in the morning. He was given one meal of chicken yearly. Three times a year each student was required secretly to test the masters of the minor-hall of his fellows, who then received "competent satisfaction."

The rules laid down by de Wykeham prohibited visits to taverns or "public houses," the keeping of dogs, the playing of chess and other "nocturnal and illicit sports," shooting with arrows or other missiles, dancing, running, wrestling, or other insanities and inordinate amusements.

The only recreation permitted was the assembling around the fire on winter nights to indulge in "singing or the reading of poems and chronicles of the saint and of the wonders of the world." The refuge was summoned to dinner by two poor scholars, who ran the quadrangle shouting in bad Latin and French: "Tempus est comedere, O comederis!" The scholars were obliged to eat to satisfy silence.

The Mexican Cadets at Chapultepec

MANY incidents in the Mexican War are still recorded to the honor of Mexicans. One of these occurred during the defense of Chapultepec, a defense that was as gallant as was the attack. It is this fourth-century Mexican order, among others, that lives. The story is a stirring one.

For many years the celebrated Castle of Chapultepec, where Montezuma held his barbaric court in the surrounding grove of cypresses, which, in the perspective of centuries, lived the ancient vicerege of Spain and where Maximilian made his imperial home, has been the West Point of Mexico.

When General Scott had taken the plaza before him, the brave boys of Chapultepec, Mexican cadets, only fifteen years of age, seeing the fall of his country in peril, most of his comrades being already slain, decided to fight to the banner from his place, would it attend his body, and still down, intending to slunge over the precipice under any other colors from falling into the hands of the enemy.

That act of heroism being frustrated, the brave boy, with the banner still wrung around him, fought until he was slain in pieces. Fortunate that the boys, ranging in age from fourteen to twenty years, lie buried in one grave at the foot of the castle, where the Mexican cadets of Chapultepec draw flowers upon this spot.

Ships' Lucky Coins

It has long been a superstition among seafaring men that the possession of a hoard of the mementos of a newly built ship for luck. It is considered profitable that the coins of the ship should be well done. The coin should have the date of the year wherein the ship is built; and before being placed in the chest, it is carefully wrapped in cotton. Its resting place is the stripping of the equipment.

Naturalists are aware of this practice, and the contents of the chest, as old ship is broken up, rapidly analyzed. There is always a gathering of coin over broken instruments along the coast. It is said that one collector obtained in this way a specimen of the rare American dollar which, when it was examined a high price for many years.

It thus appears that, by reason of this one coin, many lives have been preserved. The only silver Scottish penny, known as "dixie," that is known to have been so said, found in some old Scottish ship.

that it would be impossible to give the subject due consideration in the few remaining days of the present session.

We think this decision was a mistake. The Republicans should have been compelled to fish or cut bait. If they were not to be pardoned—which we must doubt to make a purely personal issue of a great reform measure, they should have been forced to go on beyond that effort. Moreover, thirty-eight state legislatures were in session were in a position to act promptly.

Nevertheless, in view of the pressure of the appropriation bills, it is difficult to see how Chairman CLAYTON, in his performance of his general duty, could have done otherwise.

The matter now goes over to the special session, and we shall soon know whether a Democratic Congress will violate a direct party pledge and stand like a lump of inactivity and faithlessness in the way of a constitutional amendment greatly needed and earnestly desired by the great body of American citizens.

**T. J. and W. W.**

Speaking of President TAYLOR's *over* covering into the classified service all fourth-class postmasters not already included, and thereby extending the terms of 40,000 Republican officeholders for life, DR. CHARLES W. HEART, president of the National Civil Service Reform League, says frankly and fully:

I greatly regret to criticize a President of the United States, and I greatly regret that a President of the United States should issue such an order as that issued just after this election. The fourth-class postmasters were patronage appointees. They are to be continued in office now simply because of the application of the spoils system. Do they have been drawn from the capital at great expense?

Whereas our notoriously unprincipled neighbor, the Tribune, is so ardently agitated, dear! dear! Dr. ELIOT mistook his dates. The previous order was issued "three weeks before the election of 1912 was held." How, then, was it possible for Mr. TAYLOR to be influenced by the spirit of partisanship? Well, it wasn't, of course, if he felt sure that he, and not Mr. WILSON, was going to be elected. How could a Tribune think he did?

What nonsense! The Tribune can squint all it likes, but Dr. ELIOT is absolutely right, and everybody who possesses sense—including the Tribune—knows it. Maybe Mr. TAYLOR would have extended their 92,000 terms if they had been Democrats. What! It was a plain, impudent grab made in the wholly transparent guise of "civil service extension," and if we were in Mr. WILSON's place, the order would be revoked right quick, if they say down South. The idea of imposing Republican postmasters for life upon the people of Alabama, Mississippi, Georgia, and all of the other states where Democrats have had to become Republicans to make enough Republicans to hold the jobs, and are wholly out of accord with the wishes and sentiments of their communities! Is that right or fair or decent!

Dr. ELIOT says it isn't. He doesn't propose to have his livery stolen to serve the devil in, anyway. Possibly he recalls that JOHN ANAS and his gang tried the same trick on one THOMAS JEFFERSON, only to get what was coming to them before the most surprising lynch could shake its tail.

T. J. was a true Virginia squire when used wrong. W. W. is like him in a good many ways. We hope this is one of them.

**In an Interesting Condition**

As-forever Theological Seminary, after drifting along for a good many years as an endowed institution with an income that scarcely met its needs, is spending it on, moved to Cambridge. The move, it seems, has been successful. At any rate, the seminary now has students, and is in that interesting condition where the prospects of an increase in its faculty warrants it in calling on the Congressionalists for funds. In its barren present, which lacks a vessel which scarcely can sink, but not, with returning fruitfulness. It stands glad for half a million dollars for the proper fulfillment of its fine opportunity. It seems to have come fully back to the normal. It wants a donation wing (\$15,000), several new chairs of instruction, and so on, like all the active colleges.

**We Urge the Congressionalists will come down.**

Our Worship of Apparatus  
Not on its sporting page, but in its consecrated column of religious news, the Springfield Republican records that "Rev. DR. WILLIAM HAMBRO, pastor of the South Third Street Methodist Church, Williamburg, New York, noted last

Monday, after having preached twenty-one sermons in twenty-one consecutive hours, beginning at midnight Saturday, and ending at nine o'clock Sunday night."

The details of this interesting exploit are as follows:

Each sermon was from a different text and each required from forty to forty-five minutes for delivery. The view of Dr. HAMBRO was a bit hazy today, but he said it would be fit to recite Sunday and be worth the effort. His congregation included a pair of sixty-two members of his church by reason of his long-extended discourse. For each hour of the twenty-one hours which Dr. HAMBRO preached a sermon, there was a leader who read a few verses from the Scripture, suggested the songs to be sung, and offered prayer. Then Dr. HAMBRO, following his usual custom, took the hour and a half to read the hands of the clock indicating that the service for the next hour should begin. The largest attendance, about four hundred persons, was present on the smallest at four o'clock Sunday morning. During the services frequent pots of coffee and many sandwiches were sent in by the workers from the parsonage and sent down to the church.

Well, you see just that? Who will deny that Brother HAMBRO has soul; who that he is fully up to date! He goes about filling his church by just such means as the theater managers use to fill their seats, the newspaper publishers to fill their advertising columns, and the college presidents to fill their colleges. He advertises; he makes a sensation, and his jaws fill up. Some day he will be to Professor FURNACE's suggestion that the churches shut down for a while, in which President SHAWKIN, of Wesleyan, found a reason to accept his resignation.

In this land and generation, and for a generation or two past, we have been giving enormous attention to the strengthening of apparatus. That seems to be the biggest part of our contemporary work. Of course, Mr. HAMBRO'S twenty-one sermons in twenty-one hours in total, but what he is after is to build up his church, get circulation, make a strong machine. That is what CAMERON does, DR. KEETLER does, HEART does, and all the hard-working managers of colleges and schools and hospitals do. Who will say it's not necessary—not the most necessary kind of thing that man can do, but necessary at this time and it half to laugh and half to cry at it. We have it dinned into us that education is lost for the time being in the halls of its factories; that the schools wobble immensely, but the scholars are not trained. We don't hear that complaint about the churches, for the churches seldom attract such occasional energies as Mr. HAMBRO'S, and are consequently not so open to criticism. But if they were we should hear—should hear that sixty-two new-collareds to church are nothing to the good unless they are fed with truth when they get there; that a million readers of a newspaper are nothing to the good unless the truth is fed to them; that there is more education in the mind of a great teacher than in a fifty-million-dollar university; that what comes out of the college goes further and lasts longer and has more effect than what comes out of the pocket.

Some day we shall wake up and discover that apparatus has dwarfed the mind, and then teachers who know something worth teaching will begin to get their jaws, and preachers who can preach in large the life will be more valued than bankers, and newspapers will be printed and given per directly in proportion to their ability to discover the truth and tell it.

**Mr. Reid Wants a State Newspaper**

Meanwhile ex-Candidate DIMM, of Massachusetts, is after the newspapers of that commonwealth a little. He has ceased to be introduced in the Massachusetts legislature a bill, whereby the two chief paragraphs read as follows:

Resolved, that the governor, with the advice and consent of five persons, citizens of this Commonwealth, one of whom shall be designated an chairman, for the purpose of conducting a campaign, shall cause to be printed and published in newspapers and periodicals are published in a false or misleading manner or intentionally suppress for political purposes or other ulterior motives; and the result of newspapers or periodicals relative to the preference of their public duty fully, fairly, and impartially to ascertain and disseminate the truth, including relating relative to political events, and current opinions, and freely and fairly to comment upon and criticize the same; the conduct of such newspapers or periodicals relative to such campaigns and elections and their relation to candidates for office and political parties; and also for the purpose of investigating the desirability of the establishment of a newspaper to be conducted by the Commonwealth.

The commission shall investigate other laws and existing conditions in other states and countries, shall correspond or confer with commission and commissions in other states regarding the same subject,

and shall report in writing to the next General Court on or before the second Wednesday in January, 1914, as to the advisability of further legislation for the regulation of newspapers and periodicals relative to false or misleading matter and the suppression of news, or the dissemination of news, and whether it should be conducted by the commonwealth, cooperating with the report such drafts of bills as possible, if any, as may be deemed desirable in order to carry out the recommendations of the commission into effect.

What is interesting, but COLMAN wrote a verse, to wit!

The river Rhine, it is well known,  
Both wash your city of Cologne;  
But what, my friends! that flows down  
To make you think the river Rhine?

The state might clean up the newspapers, but then what would clean up the state!

Mr. Bam was displeased with what his house newspapers—except Brother McVey's *Journal*—printed in the late Roosevelt campaign. They wouldn't print what he thought they ought to print, and what he thought was due to his candidate for President and in himself as candidate for Governor. Now he wants to have them looked after, and he wants the state to print a paper that the people can rely on to do its duty to the public.

We sympathize with him.  
Do it yourself, Mr. Bam. There is no other way. A state paper would be very, very dull. It is a great art to tell the truth in a newspaper. It is some art even to be acceptable. Your state couldn't do either. Its paper wouldn't circulate. You would have just another piece of apparatus, and so on and so forth.

Do it yourself. You see the habit has been for a long time for the extra honest and able men in Massachusetts to be paper-makers and bankers and cotton-mill agents and super-mine owners and managers and beneficiaries of Harvard College, and such men as these, in the management of newspapers to persons not able to establish themselves in more lucrative and respected vocations. It has been much the same in other places. If you could get enough leading citizens and very promising young men in Boston to stop making money and attend earnestly, strenuously, exhaustively to making newspapers, you might in time, if they were sent out enough, make the management of newspapers to persons do not seem to us as any wicker than the average of those we see.

But the best way to get dear the job you want done is to do it yourself. It is a job that takes great ability, and absolutely requires personality. A newspaper is not a ham-bill; it is a weapon; the sword of the spirit that handles it. The state can no more make a real newspaper than the state can paint a picture. Neither can more money do it. It requires a man, and a very, very scarce man at that.

**Bar Harbor Democracy**

Bar Harbor's laws having voted two to one last week to ask the legislature to repeal the special law having to do with the management of newspapers that must be reckoned, we suppose, an another triumph of the people over the interests. Every-where else the motor-car is an emblem of luxury and ease, but in Bar Harbor the emblem of that is the two-horse survey, and the motor stands for the simple life, commerce, transportation, and the vote.

**Missy Loves Company**

Now there will be an income tax, and there should be one, and of course it will be painful. But of course our representatives in Congress will share it with us, and so help us bear it.

**Scott, England, and the Poles**

NEWMAN, dying in triumph at Trafalgar, commended Lady HAMBRO to his country. CUMMIS II, a republican but no coward, bopped those about him as he died not to let poor NELL GUYTON starve. SCOTT, a hero and no hypocrite, dying for the ideal for his defense and glory, sent from his icy death-couch a message equally human and simple. He asked his great and rich country to contribute for those who were dependent upon him and his dying comrades.

The storm-swept ice-plains, the dustless march, the cruel disappointment, the slow and agonizing surrender to death—some of those things had kept the slightest change in man's nature, which is always, at bottom, so simple as a child's. At the last and foremost, simple human love was paramount and supreme.

England will not fall or prove unworthy. Neither Yale is here, but both are monuments forever in the unshared devotion and heroism of Englishmen.

# THE HIGH COST OF BEING CITIFIED

BY ROBERT SLOSS

ILLUSTRATED BY J. A. GOULD

**I**f you are determined to be citified, there is, of course, the question of what sort of place will suit you. You cannot support a family in New York, and keep a decent margin between pay and expenditure, for less than \$12,000 a year. In any other American city you can do it for twenty-five per cent. less than that. If you are content with the census classification, you can be called "urban" as soon as you live in a cheap little town of 2,500 inhabitants.

listed about 7,000 butcher shops, and 7,000 small variety stores. These three lines alone mean one merchant with at least ten clerks to every thirty-five families. Indeed, you will find a staggering number of New-Yorkers engaged in keeping shops and doing no more than make the purchase and delivery of goods quiet and convenient. And if you glance through the whole Directory, you will gather that, if New York is typical, it is distinctly citified, for most of the people make a business of simply doing things for one another—things that in the country people either do for themselves or do without.

of riders on New York's street railways has increased more than twice as fast as the number of inhabitants. Five years hence the transit facilities of the city will have been tripled. Then nearly a tenth of the adult males will earn upward of \$75,000,000 a year merely by holding the rest of the people aloft.

It is distinctly urban to use the telephone. New-Yorkers make 20,000,000 calls a day, and there is one instrument to every ten inhabitants. It takes 9,000 people to keep them working.

It is distinctly urban not to share yourself. In New York you can be shaved, manicured, hair your shoes shined, smoke a pipe, and read the paper, all at the same time. There are 6,000 barbers successful enough to have their names in the Business Directory. That is one shop to about every 250 men old enough to grow a beard. As for musicians, bookbinders, cigar stores and news-stands, they are too numerous to need their names in the Directory.

Perhaps it is not distinctly urban to drink alcoholic beverages, but there is one saloon to every 500 inhabitants in New York. Even if we assume that all adult males and a fourth of the women and minors patronize saloons, it takes at least four New-Yorkers to serve every 100 inebriates.

Among more dignified and equally non-productive occupations in the Directory there are about 28,000 agents and brokers—one to every 170 inhabitants. There is but one newspaper to every 2,500. Evidently in New York it is much easier to get a broker or a lawyer, a hardware or a haberdashery, or do something for you than it is to get a carpenter.

Still, the latter is not difficult, for to the city come its quality numbers the men whose work adds value to material things. New York is digging a new aqueduct and new subway—undertakings altogether about double the magnitude and cost of the Panama Canal. These will have given employment to upward of 50,000 skilled and unskilled laborers before completion. Another array of mechanics is kept busy merely housing the city. New York spends close upon \$200,000,000 a year on new buildings; her belated skyscraper represents an investment of over \$15,000,000.

Of what use would these mammoth buildings be in Wyoming, or the Subway in South Dakota? Such great works would be impossible without New York, and the net result of the well-labored work expended on them is nothing but the improvement of New York's public and private real estate, the buying and selling of which keeps busy every broker in the city. And everybody knows that every "sky-scraper," and school-house, every tunnel and transitway, every asphalt pavement and elevated apartment complex in the city meant increase the tax rate or raise the rent of New-Yorkers.

The black states lost part of their rural population during the last census decade, those dotted failed to maintain their increase by 3 per cent. or more.

A generation ago (1860) nearly three-quarters of us were engaged to be called "rural." By 1930 nearly half of us had determined to live in communities of 2,500 or more. The big shift came with the present century. Of the nearly 14,000,000 souls added in the United States since 1860, less than 5,000,000 were recruits to our rural territory. At that rate, the nation will be more than half citified by the end of the next Presidential term.

Where in the farm if we want to release our wheat? Even the Roosevelt Country Life Commission admitted that "advantages" must be provided to hold folks on the farm. Advantages are easily in the country, and the farmers are slow to cooperate in providing them. Who blames the farmer's boy for not going there where they are already provided in profusion? And why not in New York? Most of that city's successful men come from somewhere else, they say. And if the farmer's boy succeeds there, isn't the country all the better for it? It would be shortsighted to make a country clerkship the goal of our village Hampton.

True, the farmer's boy must capitulate his wife to the city—but his count will win his battles: "Doctor, lawyer, merchant, chief, rich man"—he must be somebody to enjoy New York's advantages, and not become "poor man, hazy man, thief," though even these are the city advantages.

Apparently a good many farmers' boys have felt that way about it. In the New York Business Directory are the names of nearly 8500 doctors—more than in the whole Dominion of Canada. There are also the names of nearly 14,000 lawyers—more than in the British Isles. In no area on earth are doctors and lawyers so plentiful among the inhabitants as in New York. But if the learned professions stay in the city they necessarily provide there the churches and schools, the medical attendance, and the litigation living in the country.

The merchant in New York also gives and gets advantages. Even the small tradesman brings his wares to every door, and the patronage of a dozen families gives him a better start in business than could a whole country village. In the Business Directory about 14,500 grocers and delicatessen stores are

It is distinctly urban not to walk to work. And when the farmer's boy comes to New York he rides a good deal. The city has 1,563 miles of railroad track within its limits, more than in the whole of Portugal, where there are about an equal population. The number

Where 77,000,000 of us are already citified

THE 44 BOTTLED REPRESENT 1/25,000 OF THE AREA OF OUR COUNTRY. HERE ALMOST THIRTY PER CENT. OF US ARE MAKING A LIVING BY SERVING URBAN SUBJECTS, OR IN NEAR OR BY LABORING CITIES, AND HERE THE POPULATION IS INCREASING AT A SPEED NEVER DUPLICATED IN EUROPE.

There is but one other sort of productive work possible in New York—manufacturing. And in this line, by virtue of output, New York stands first. To maintain this pre-eminence for her requires the labor of only 600,000 operatives—less than a seventh of her inhabitants.

The farmer's life is not likely to join them. Farm labor in the Northwest is worth \$2 a day, while in the factories the same grade of work brings no more than half that. It pays better to become a doctor, a lawyer or a banker, or a railroad or a mill owner, a hawker or a broker, or even a carpenter, a mason, a housepainter, or a "man-hag," the work of all of whom is made easily in the great cities, where the advantages and conveniences to be enjoyed and paid for strictly within the city limits. And unless the farmer or his family comes to pay for them, six in every seven New Yorkers could not make a living, as now, in these profitable pursuits.

Thus, when the farmer's boy comes to New York, he practically joins a class which is not to be added to in new members in order to pay running expenses. No matter the city prices float on almost doubling in twenty years—without the membership there, in living costs, have almost tripled.

Yet, so far, ahead and advantageous New York has induced only about five per cent. of us to join her ranks. More than forty per cent. of us have remained elsewhere. Maybe it suits the farmer's boy better to come and build up our modest communities of 200 or so, and to grow them into New York cities that are lacking in rural life. In that case, even with a slight majority of an urban, it is easy to imagine the United States, by 1920, thickly dotted with five little towns, bringing out inspiration and culture not cumbersome closer and closer to the country.

The Census shows that we have towns containing between 2,500 and 5,000 inhabitants. All told, they contain fewer people than New York City. Twenty years ago such towns contained only a third more of our population than did New York, and now New York contains upward of a fifth more than they do. In that time New York has been absorbing our population just five times as fast as they.

We have had to add Chicago and Philadelphia to New York to find exactly the number of people now living in all our towns of between 2,500 and 10,000. For twenty years these three cities of over a million have been absorbing our population almost four times as fast as such towns. And if we again add all our villages of less than 2,500—not even dignified as urban by the Census—we find that all the advantages of the 12,500 towns of less than 10,000 have not yet attracted twice as many people as our three largest cities. Twenty years ago such places contained nearly three times as many people as such towns.

Apparently the towns of less than 10,000 seriously suit the farmer's boy of all. The people of the Pacific have been orientating themselves during the last decade at a rate unprecedented in the history of the world. California is now more urban than New York state with New York City left out, more urban than Illinois or Pennsylvania with Chicago and Philadelphia left in. The net result of that remarkable movement is that more than 4/10 of the people of our big Pacific states now live in their down-hill regions of 25,000 or more.

Less remarkable is it that now the most urban section of our country is New England. More than 1/10 of New Englanders live in communities of 2,500 or more. But nearly half of them are found in communities of 25,000 or more, and all but four of these are in our two great middle-sized states, where but 4 1/2 per cent. of the people remain rural.

Neither in the East nor in the West are the advantages of the small town on a comparative basis. More than two-thirds of all our transients have now settled in cities of over 25,000. When that many people gather in one community they have already set up the same sorts of activities as we see in our highly advantageous in New York. And when they prove to be

100,000, so one will guess that they are completely settled.

Around forty-seven cities of 100,000 or more the Census has drawn circles with a radius of five miles. Within these are now living upward of 27,000,000 souls, with probably another 3,000,000 just beyond, but actually more than a third of our people completely settled in habit and occupation, all crowded within 1/20,000th of the area of continental United States.

On the map these clustered circles appear by no means isolated in the midst of rural territory. Most of our communities of 25,000 and even of 2,500 have grown up close to the water. And the farmer's boy is determined to be settled. It will suit him best to go north of the Ohio and east of the Mississippi or west of the Rockies, leaving the rest of the country less urban than was the national average a generation ago. And it is most likely to suit him to settle in one of his forty-four black blocks that represent so many more than half of us who are already completely settled, and where at the present rate more than half of us will be living by 1920.

It is to plain from the map that, whatever they may do for the farmer's boy, our most settled folk have passed the farmer himself farther and farther away from the rural advantages. Over the whole of New England the rural population has in ten years decreased five per cent. It has either decreased or failed to increase sufficiently in twenty-five states, all lying within or just on the edge of our most intensely urban territory. The great majority of our transients must now feed themselves from afar, and get only pay for their work—of which they are already becoming an specialized urban distribution. The process is illustrated by a railroad president who cites a railroad of Wisconsin. The Southern farmer got five cents apiece for them; the railroad, seven cents apiece for hauling; and they sold for sixty to seventy-five cents apiece in the city. The flock sheep went all the way to the farm, to the Mississippi. What a splendid investment for the farmer's boy to get a job on the railroad or, better still, to go direct to the city and share in the handsome profits of the new producers!

When the boy who left the old farm ten years ago says it is a vast to-day he finds that the old man, too, thinking where to get on the edge of our most intensely urban territory, has not only gone round any more. The boys, by leaving him so thoroughly on the farm, have inadvertently made him prosperous. And when he in his turn visits the city he will be sure to find some some of the only city advantages that are for "farm-people."

The boys are anxious for him to buy. They have worked hard to build up the factories. They have doubled their investments in them during the decade, and have induced people to work in them forty times as fast as the old man could possibly induce anybody to work on the farm. The result is that the factories now bring for sale over \$100 billion dollars' worth of products a year. As yet they have managed to sell but a scant two billion dollars' worth of those abroad, and the boys are rather depending on the old man to take a good share of the rest. For if he did, the city folks would have to lay them all, since some one must pay for the 12 billion odd dollars' worth of materials, the 4 billion-odd dollars' worth of labor, and the 4 billion-odd dollars' worth of expenses that enter into them.

The factory payroll for 1909 was \$4,265,612,600—almost exactly 4 billion more than the farm payroll. Yet scarcely 4 billion turned out that year products worth \$4,265,612,600—a couple of hundred million more than all the values actually added to materials in manufacturing, half of which were city rent, taxes, power, and overhead expense. Economically the farmer is losing the balance of trade with the country. And the farmer is becoming a good customer, for if he ever thinks of the old days when most of the things he needed were made right in the neighborhood of him, 2,500, without having the rising costs of raw ma-

terials, city real estate, advantages, and conveniences added to them, and when he could dispose of most of his own products without much help from the railroads, he will remember that that life he did not have money in the bank to buy much of anything.

By leaving the farm and taking the factories with them, the boys have virtually doubled the freight loads in twenty years. The railroads could not have been built up otherwise, but passenger traffic has been greatly increased and the movement of crops has almost to one-third of the annual tonnage. The other seven-eighths—the movement of raw materials and manufactures in and from the cities—has enabled the railroads to be employed in the way of their own producers. And since the railroads are the best customers of the factories, they have absorbed the productive labor of at least 1,000,000 mill-hands who were all the things needed in railroading.

Thus our transients have bonded the farm, the factory, and the railroad—these three vehicles of our production—by taking of at least 1,000,000 highly educated men in every six or seven years becoming either non-producers or producers only of values in city real estate. And this has not so to triple our prices for raw materials, double our freight bills, raise the cost of raw materials, and yet probably still contribute 10 billion dollars' worth of manufactures a year.

Strangely enough, most of the objections to this head-on system come from the urbanites who have built it up. There is just another in the cities about public markets, dealing with the farmer direct, and abolishing the middleman. But if he were abolished, half of our urbanites would have nothing to do. Some of the boys in the city are urging the old man on the farm to buy more land and raise bigger crops to lighten the load supply. They are offering to educate him up to better farming methods, to let him have more money on mortgages and crop movement. They are even offering to establish special banks for him and to build more railroads. The same railroad president, dealing with the farmer direct, says we need 27,000 mile more tracks in the Northwest right now if it is to be to him to stem the nation's closing food supply. If we build them, it will require close upon 200,000 more new producers to run them and an equal number of railroads to manufacture the iron and steel. They are also urging the old man to buy because of high living costs, and lowering the day when the railroads will be allowed to raise their freight rates.

If the old man on the farm is waxy, he sees that the one thing the boys in the city are set offering in is more back and help him get the crops in and out. What one set new railroads to open up new farms without new farmers? What of the 10th acre in Maine and New Hampshire and the abandoned wheat areas in Ohio? There is still land enough right in our most urban territory to lighten the food supply if it were put under intensive cultivation. But even if we could spare farmers from the West, they would not be expert enough to work these lands to capacity. Only fifteen per cent. of all our farmers have received any education other than that afforded by the little red school-house, and agriculture is not taught there. What one to educate the farmer at all unless he can buy sufficient labor to carry out improved methods? That is the very kind of "help" the boys in the city are most inclined to give him. They can't even spare him a few factory hands, and they are not putting themselves out a bit to see that he gets his quota of the foreign labor, who come here, presumably, to take the boys' places on the farm.

The doctor and lawyer and merchant-and-politician, whose prosperity depends on the raising of these aliens, are not seriously driving them out to the farms. Our urbanites are all too busy providing advantages to attract more aliens to provide more advantages.

By the game goes swiftly on toward 1920, and, if we are determined to be settled, there is always the fifth bill.

## PAINTINGS FROM THE WORLD'S OLDEST ART GALLERY

BY W. L. BEASLEY

PICTURES from the oldest art gallery in the world are now being placed in the Museum of Natural History, New York. These are reproductions of the wonderful polychrome

paintings and frescos by the paleolithic, or early prehistoric, inhabitants of France, Spain, Italy, and probably other parts of Europe in the Stone Age. The accompanying photographs show a lion and

group of horses from the most famous of all the caverns, that of Altamira, on the western coast of Spain. The scene is that of the life of the Stone Age, some 25,000 years ago.

These reproductions are from two drawings by cave-men who lived some twenty-five thousand years ago in northern Spain. They are among a number found upon the walls of a cavern, and are now being placed on panels in the New York Museum of Natural History.

# SCOTT'S TRIUMPHANT FAILURE

Robert Falcon Scott

**C**APTAIN ROBERT FALCON SCOTT, of the British navy, lies dead, with four of his companions, in the storeroom waist of the *Admiral's Cockade*. He died on March 29, 1912, while on his homeward journey from the South Pole, overwhelmed by a blizzard and too weak from hunger to struggle on eleven miles farther to a camp stocked with provisions and fuel. No man again has happened since the ill-fated Greely Expedition of 1861-62, when all but seven of the party died. To find a close parallel one must go back to the year 1847, when Sir John Franklin and his men perished in the Arctic while on their homeward journey from the discovery of the North-west Passage.

Scott reached the Pole on January 18, 1912, and found there the flag erected by Roald Amundsen, the Norwegian, at that spot only one month previously. It must have been an unrelenting experience for the men who had made their objective point at such a sacrifice to find that they had been forestalled. Yet Amundsen had gone with the avowed intention of reaching the Pole, while Scott's expedition was to have been scientific and not spectacular; he did not hurry, and meant to reach the Pole, if possible, but not as his chief purpose. The hungry, exhausted men who struggled to safety carried with them no less than thirty-five pounds of geological specimens.

Those who died with Scott are Dr. Edward Wilson, chief of the scientific staff; Lieutenant H. B. Bowen, of the Indian Marines; Captain L. E. G. Oates, in charge of the transport animals; and Petty Officer Evans. These were the picked four who had been selected by their leader to accompany him in the final dash for the Pole. They should have been back at their base in early March—corresponding to our September—before the opening of the rigorous winter season, to that month provisions were deposited in the camps along their route. But the end of March found them still miles from Cape Evans and safety, and eleven miles from the *Top Camp*, where they could have saved their lives.

In October of last year Scott's ship, the *Terra Nova*, which had been unable to reach the exploring parties in the preceding months, on account of ice, left New Zealand to join them on board, and reached Cape Evans without delay. Not only did this save the lives of the men there, but it also saved the lives of the men on board, who were in charge of the exploring party, carrying provisions for the three months, and returning westward. When the *Top Camp* was reached, and it was seen that Scott and his men had not visited that spot, little hope was left that

they had survived. Nevertheless, the party pushed on southward, and on November 12th came upon the explorers' last camp, still standing. Tracks were found the bodies of Scott, Wilson, and Bowen, the two others having died earlier in the year.

Almost till the last moment Scott had written an account of his journey. Besides a sketch of the progress the following was found, which gives a graphic picture of the last struggle:

### MESSAGE TO THE PUBLIC

The reason of this disaster are not due to faulty organization, but to accidents in all the risks that had to be undertaken.

First, the loss of the pony transport in March 1911, obliged me to start later than I had intended and obliged the limits of the staff transported to be narrowed.

Second, the weather throughout the outward journey, especially the long gale in 83 degrees north, stopped us; the stiff snow in the lower reaches of Beardmore Glacier again retarded the pace. We thought these estimated events with well considered, but it did not enter our previous views. Every detail of food-supplies, clothing, and depot made on our ice sheet, and on the long stretch of 100 miles to the Pole and back, worked out to perfection.

The advance party would have returned to the glacier in fine form and with a surplus of food but for the astonishing failure of the men whom we had most expected to fail. Norman Evans was thought to be the strongest man of the party, and Beardmore Glacier is not difficult in fair weather, but on our return we did not get a single completely fair day. The dry marches, these circumstances came on very suddenly, and our wreck was certainly due to this sudden advent of severe weather for which there was no satisfactory cause.

But all the facts above enumerated were as nothing in the course which awaited us on the latter. I maintain that our arrangements for returning were quite adequate and that no one in the world would have expected the temperature and surface which we encountered at this time of the year. On the summit, in latitude 84 degrees to latitude 86 degrees, we had snow 20 to 30 feet deep.

On the barrier in latitude 82, 10,000 feet lower, we had snow 20 during the day and snow 41 at night pretty regularly, with continuous head winds during the day marches.

These circumstances came on very suddenly, and our wreck was certainly due to this sudden advent of severe weather for which there was no satisfactory cause.

I do not think human beings ever came through such a storm as we have never through, and we should have got through in spite of the weather but for the shortening of our miles and the shortage of fuel in our depot, for which I cannot account, and finally but for the storms which have fallen on us within eleven miles of this depot at which we hoped to secure fuel supplies. Surely Antarctica could scarcely have exceeded this last fate. We arrived within eleven miles of our old *One Ton Camp* with fuel for one hot meal, food for two days. For four days we have been unable to have the fuel and a pole has been blowing about us. We are weak. Writing is difficult.

But for my own sake I do not regret this journey, which has done us the Englishman one entire hard-slip, help one another, and meet death with as great bravado as ever in the past. We look risks. We know we took them. Things have come out against us and therefore we have no cause for complaint, but

how to the will of Providence, determined still to do our best to the last.

That if we have been willing to give our lives to this enterprise, which is for the honor of our country, I appeal to our countrymen to see that those who depend upon us are properly cared for. That we lived I should have had a tale to tell of the hardihood, endurance, and courage of my companions which would have stirred the hearts of all Englishmen. Those rough notes on our dead bodies must tell the tale, but surely a great, rich country like ours will see that those who depend upon us are properly provided for.

(Signed) R. Neave, March 25, 1912.

Evans died from exhaustion of the brain on February 17th. The next to go was Captain Oates. He

Scott's ship, the "Terra Nova," off the Ice Barrier

lost the use of both hands and feet from frostbite and suffered intensely for weeks. The manner of his death was heroic. (On March 17th, realizing that he could travel no farther and that his comrades would not leave him, he crawled out of the tent into a blizzard. "I may be gone some time," he said. He never came back. "We knew he was waiting for his death," writes Scott in his diary, "but though we tried our best to dissuade him we felt that it was the act of a brave man and an English gentleman.")

Scott, Wilson, and Bowen then set off again toward *One Ton Camp*, but on March 21st they could proceed no farther, for they had enough fuel to heat one meal, and supplies for only a day or two. A nine-day storm held them there until they died. A ruse and cross were cooked by those who found them, and the bodies were left there.

While Scott and his companions were struggling northward from the Pole, Gerrard and Demerit, attached to the western party, were pushing north to meet them. They reached *One Ton Camp* on March 22, but seven days later were compelled to withdraw, owing to illness and lack of food. Scott was overcome by an unparalleled combination of misfortunes.

Some remarkable experiences befell the northern party of the expedition under the command of Chief, Leonard Campbell. They had been headed at Cape Jarek in January, 1912, endeavoring to make a short sledge journey for scientific purposes, and carrying only a single month's supplies. When they returned to the coast there was no ship to be seen, an atoll island, the remainder of the ice had made an approach as possible. They were forced to make their way toward Cape Evans, two hundred miles distant, but the journey could not be attempted until the ice had broken over. A tiny igloo was constructed, and here six and a half months were spent, the weather apparently making the sea journey impossible. The appearance of seals, which were killed and added to the scanty harvest, alone saved their lives. Their diet was seal meat and blubber, with a minute portion of ship's stores and cream; they lived in their summer clothes, which were soaked through with seal fat. Euteria attacked the party, but in spite of this they continued their observations until climatic conditions made the return journey possible.

Scott is dead at forty-three, but the purpose of his expedition has been accomplished, and the scientific results are only in the hands of the rescue party. The most pathetic feature of the event is the presence of the explorer's wife on board the *Thalanda* in New Zealand, widowed his almost a year after his death. The outcome here affected Gair had more deeply than any calamity of recent years. It is anticipated that a special revenue will be made to the explorer's home on behalf of the families of those that perished.

The tragic end of Captain Scott's expedition marks the first fatality that has occurred in the Antarctic, though the number of victims of the Arctic since the ill-fated expedition of Sir Hugh Willoughby, in 1573, is estimated at about 250.

The long road which had no turning

# Washington, the American Mecca

BY A. MAURICE LOW

WASHINGTON CORRESPONDENT FOR  
HARPER'S WEEKLY

Illustrations by Frank Coeg

**M**ORE and more Washington becomes the Mecca of the United States. Every year an increasing number of people come to Washington, some on pleasure, but some with their hands so full of serious business that they have little time or inclination to think of pleasure, some who study medicine to my business with pleasure, to the profit of both. There was a day when Washington was abandoned by every one who was not compelled by stern necessity to go there, and when Washington was so unattractive that it was not to be wondered at that to one went except those who had to do business for their sakes. In those days Washington was a snail-hole, a slattern among cities, unkempt, sprawling, shabby and ill-shaven, uncleaned of its patches, and in the afternoon shivering in its dirt and general squalidness. There are persons still living in Washington who remember when they were children the perils involved in crossing the street, so deep and thick and foul was the mud; and who have vivid recollections of their carriage ("coaches") they were called in those days being stalled in the mire when they went to evening parties, and in that prohibitive time parties began when the sun went down and cooled long before the moon came up. Now parties are arranged in Washington on the reverse schedule. It is not unusual for them to open about the time the moon rises and for the ladies to be dressed to be played as the sun is beginning to show its unobscured face. In the prohibitive era people went to Washington because they had to and not for pleasure or amusement; the way was long and hard and there was little or nothing on arrival to compensate for the hardships of the journey. Washington had neither comfortable hotels nor fine shops nor beautiful streets. It was a place to avoid if possible or to get out of as quickly as one could.

As it grew in years it grew in beauty, although its youth gave no promise of its rich maturity. There

An impression of Pennsylvania Avenue

are some ugly girls who develop into distinguished-looking women and become partners with their years. Washington suffered under a long period of "Uncle-Sam-like" childhood, but suddenly found itself, and from the ashes of its squalid past, forth the princess. In the transition stage it had little to offer and, like some

of its own several chambers of trade. It was so unattractive to be accepted by the great that it was treated with the scorn and properly stunted, just like our present-day offenders. There it was the exclusion of every body and grown to spots of Niagara and to work hours from the moon to the sun of the running stream, but now Niagara is a back number, and Benedict brags Heavily to Washington, where they get more for their money and in greater variety, for there are shops in Washington where Heavily can enjoy herself to her heart's content and where Benedict can buy his favorite brand of cigarettes. Will some moral philosopher explain why it is that the first thing the stranger in a strange city does—especially if the stranger be a stranger—*is to go shopping?* One can understand the fact that about half the American or the shops of New York for a Georgian from a cross-roads afterward, but why do Boston women in Washington for a day or two always find there are things to be bought in Washington, just as the Washington woman in Baltimore on a casual visit is ungladly unless she has done the shops? It is a problem less credit for any one visit a woman to answer.

But the change in marriage fashions, that now leads the bride to Washington instead of to Niagara Falls in typical of the whole changed attitude of the country toward its capital, and that change means rather an interesting study. As the people more and more come to Washington and look to it as the center of things, as they go less and less to their state capitals and look to them less to regulate their affairs. It is a new and altogether delightful phenomenon, and Washington people have become Federalists, and Washington sympathize Federalists. They rely on the central government rather than on the governments of their states to regulate, to control, to improve, to correct, to prevent wrong-doing. This may be discouraging to Democrats, with whom a centralized government is equivalent to the doctrine of democracy, and the enlargement of the powers of the Federal government is an invasion of the powers and rights of the governments of the states. That phase of the question I am not discussing. I am simply stating a fact, the proof of which is nowhere so apparent as it is in Washington.

In the days past the state capital was the "big" place politically as well as socially. Whatever was to be done or left undone, to be picked up or to be prevented, must be originated or settled by the state legislature. It was by its meeting place the politicians went, the news of the interests of the people was its influence. There was good reason for this. In the first place, Congress exercised less power than that in its entirety might give us power in the states, which were indifferent about the exercise of their power. Another reason given stronger was that Washington seemed a place very remote and somewhat foreign, but the state legislatures or high courts of legislators and other officials, but after all, Assemblyman the Honorable William Jones was to the majority of his constituents only "Bill," farmer or small merchant or lawyer like themselves, and Bill Jones's constituents stood it no particular awe of him and, as a rule, had been pretty carefully misled up to that point. There was a very easy set of a place where there was little formality and much hospitality.

Washington is different. No farmer took his seat to Washington, for Washington was a steep-hearted oligarchy who had neither time nor inclination to bother with such trifling details as the faces a trustee might see fit to change or small merchants or trades. It is true that when there was a tariff to be made Washington was all important, but the making of tariff laws at long intervals, and the farmer was wise enough to admit that his wisdom wasn't great enough to enable him to comprehend the mystery of the tariff. He took what was given him, satisfied or

not as the law might be usually construed that, while it might be a great deal better, nothing could be much worse. And Washington was not only remote physically, but far removed spiritually. There was none of the racy freedom of intercourse of the state capital. Bill Jones, Assemblyman, was known to every one who voted for him; Congressman William Jones was known only to a handful of the voters, and was nothing but a name to the rest. The average constituent could have a very good time at the state capital, but at Washington he had a very dull time. And then there was the question of expense, by an average an important question in those days, when every one was poor and every one lived the simple life and every one was happy and there was no easy or unorthodoxness in the benefits of men, as the modern chroniclers tell us. It cost more to come to Washington than it did to go to the state capital, and the hotels were more expensive and the individuals more unscrupulous. If one wanted to get away from the farm or the shop or office and have a change and see life, the state capital was the place.

All this has changed because in the last thirty years or so the entire political and social life of the American people has changed. Beauty is a thing no longer stored up, art is now regarded as of more value than the material, utilitarianness has to be overthrown. The big sprawling city all by its arms, with its tall, tall and very much more a more a female woman of the world, proud of her beauty and conscious of her power, Washington, the middle-class, is now a thing of the past. Washington is now a place to visit. The past and the which have gone with the old customs and the old ideas. Bread and well-paid streets, stately five-lined avenues, public buildings that have not sacrificed one to beauty, but in remembering one, have not forgotten art; hotels and restaurants of the first class; theaters and shops and many fine residences make Washington one of the most attractive capitals in the world. Formerly people used to come here, see they live here, which is the difference between transience and permanency. It is no longer fashionable or considered necessary for one statesman to carry their democracy with them to the table or to show their love for the people by their contempt for good manners. A statesman may lived at any time in building for the rights of the non-tradition, and still wear clean linen. To talk in no longer the stigma of degeneracy. To live in a hall bedroom in a boarding-house is not the worst way to maintain a certain amount of respectability. In a word, the world has moved very fast during those last thirty years and Washington has moved with it. There are now many people living in Washington who have no connection with the politics, but who are not interested in the tariff or the trusts, to whom it makes no difference whether the Republicans or the Democrats are in the majority, and who are in Washington to see they find his life more agreeable than that of other cities; they are more interested in patterns than in schedules, in things means means something, and politics little, if anything. To the ordinary tourist, to Heavily and her Benedict, to the third business man and his wife who want change and diversion, to the school boy or girl, to the man or woman seeking a holiday, there is always much to see and interest in. To the statesman, the person who comes to Washington with letters of introduction there is no other city in America where he will meet so many interesting men and women.

This bringing of Washington closer to the people by the people coming to Washington and knowing it as it is, instead of seeing it through the haze of a distant, unimportant, and uninteresting, and uninteresting, which would lead to have beautiful results. The more intimately the operations of government are studied, the greater will be the understanding of the problems that must be solved if government is to fulfill its true function of doing the greatest good to the greatest number.

# THE WRECKLESS RAILROAD

The Search for a Safety-stop Device and Automatic Signaler to Eliminate the Uncertain Human Element

BY THADDEUS S. DAYTON

**T**he operating expense of the railroads of the United States—the cost of “getting the train over the road”—is about one thousand million dollars a year. The wreck bill of the railroads is approximately one-fourth that—two hundred and fifty million dollars. The greatest problem of the railway management to-day is how to cut this down. But, though there has been a gain of over twenty per cent. in the safety ratio in the last fourteen years as compared with the time preceding, the vast sum annually paid for the ruin, damage, and waste of wrecked locomotives. The wreckless railroad seems an ideal that may never be realized. For the ingenuity that will provide some new way of eliminating wrecks, a vast fortune, suitably bestowed, will be reaped.

The greatest need of railway operation in America and everywhere in the world is some practical safety-stop device which can both halt trains and signal them simultaneously when danger lies in their path.

The reduction of the wreck waste of one year by ten per cent. would be a saving as great that railway dividends could be increased by two per cent. If half the waste could be eliminated, the net savings of American railroads would be one hundred and twenty-five million dollars. This would be about ten per cent. of the total capital invested. It would solve the financial side of most of the transportation problems. It would transform the railway business by eliminating its chief element of loss.

Injuries to persons, damage to freight and property, and clearing wrecks are only one-fifth of the wreck bill. The other two hundred millions are made up of the lives of thousands and repairs to the rolling stock caused by wreck damage directly or indirectly. Beyond that is still another total that never can be calculated—the cost of interruption of traffic. This increases faster than the rate of arithmetical progression. On a busy line a stoppage of traffic for sixty seconds means a loss of \$250. In an hour this loss may reach \$25,000. It is more than trebled the second hour, and goes on increasing until in the third hour the blocked railroad is losing a thousand, two thousand, five thousand dollars a minute—one can easily calculate how much. The material damage to property becomes insignificant compared with it. Traffic piles up on both sides of the obstruction, and an increasing number of employees are idle. Also the longer the delay the greater the hazard of more serious events.

The railroads appreciate better than the public that safety is cheaper than wrecks, and do not hesitate at the expenditure of great sums for block-signal systems. These investments have saved many times their cost, but they do not put an end to wrecks. They have decreased the human element in railway operation, which is the weakest spot, but there is still a huge margin left for further improvement. The Board of Block-signal and Train Control is still seeking a mechanism which will not only signal the presence of danger ahead, but stop moving trains, and do it without human agency, without uncertainties, without the fallibility of complicated mechanisms, and without regard to weather conditions. When this is found the golden age of railroading will be at hand.

According to data which have been compiled by transportation experts, less than two per cent. of all accidents on railroads are due to hidden or latent defects or “acts of God,” about thirteen per cent. are caused by the negligence of the public, and eighty-five per cent. are due to the negligence of employees.

In the opinion of the chief transportation experts of America that wreckless railroads will come when

A temporary wireless telephone station for operating trains

wreckless railroading goes. The officers of the railroads have not been idle while waiting for the improvement in safety devices. They have been busy attempting to educate their employees—to teach the human part of the great railroad machine to be more efficient. They have been trying in one way and another to make their men take an increased interest in their work by commending and promoting they have striven to reward concentration of effort and to lift the railroad employee's task to a dignity that is higher than the questions of wages, discipline, or the interest of organized labor. The Union Pacific Railroad, for instance, for the last three years has had a bureau established solely to increase the efficiency of its employees and prepare them to fill better jobs. The chief object of this bureau has been to eliminate lost motion—wasted energy, which is more expensive in large bodies of men than it is in machinery. Saving this waste is the keener economy in railroading. It can be cut down somewhat by teaching men how to do their work intelligently and efficiently. It may be eliminated when there is also sustained attention to work. On the Union Pacific this is stimulated by the knowledge that the railroad will not only reward the efforts of its men, but that it will do its utmost to elevate them in their duties so that they may be able to climb up the ladder of promotion. Other railroads in other parts of the country in other ways are trying to track their men what Napoleon did his soldiers—that every one of them carries in his knapsack a marshal's baton, the possibility of becoming a commander.

If it were simply a question of railroading by rule there would be no wrecks. There are rules to cover almost any emergency, just as there are laws for guiding guidance and punishment in every contingency of life. Yet rules have not made a perfect railroad man any more than a multiplicity of laws has made a perfect citizen. Discipline among railroad men is almost as strict under normal conditions as it is in the army. Theoretically the book of rules is the Bible of the railroad man, and to go contrary to it is considered as bad as disobedience in a clergyman.

As a matter of fact, however, there is hardly a trainman or engineer who makes a trip without violating one or more of the rules of the standard rule. The constant cry of the operating department is to “get the trains over the road,” and this has to be done very often in defiance of the book of rules, time-card fast-times, and extra incentives. For the man who now common sense without being careless there is nothing but “train.” The man who sticks closely to the rules gets into trouble more or less. The proper knowledge of when and how to violate certain rules where such a violation is safe and means expediting traffic is the fruit of years of actual experience and train service. It is just how, however, that the human element steps in and is at its best—and its worst.

Within the last year or so a number of the big railroads have organized “Safety Departments.” These comprise a central safety committee, composed of high officials of various departments; an each operating section there is a division committee, and at each

Two views of the underground switch-signal “tower” at the Grand Central Terminal, New York. On the left is shown the tower director viewed in front of the diagram of the tracks on ground level, the movement of trains being indicated therein by lights. On the right is shown the electric switch-signal system.

EVERY CLOUD HA

DRAWN BY AN

MAC DONALL

# THE BLUE JAY'S NEST

BY ELMER BROWN MASON

ILLUSTRATED BY W. H. D. ROEBNER

"Then that find a blue jay's nest, if they look left, still see a little sign on it. The other is good left, other, no health. If it touches the ground, the, it will be a sign."—The little landman.

**I**n the valley soft shadows spread a veil of mystery over the buildings of the lumber-camp, through which the weather-beaten gray of un-painted clapboards shone no silver light as the faded lining of dark clouds. On the mountainside, stripped of spruce by the reckless lumbermen, the quick-growing popple and white birch scarred hairy leaves from brown but endless—a mat of greenness. Above, saved by their inaccessibility, the spruce and balsam grew thick and black, outlining sharply against the evening sky, the rugged contours of the ridges.

"Now still flung on the summit. The air breathed a vague sweetness—the earth's scattered soil of rot from the water's strain.

On a ledge, which the sun's rays still reached, a boy sat looking out over the valley. His small chin rested in the hollow of one strong, brown hand, the other was clasped about his elbow, his muscled feet dangled over space a sheer drop of a thousand feet to the scarred slope below. In the absolute loneliness of his splendid young body there was the same suggestion of wildness and vitality as in the pose of a leaping deer—it required but the quiver of an eyelash to make it a pulsing life.

Words and sounds ran fast lavishly through the great silence; the air bore his feet to race her hand and her eyes came sweeping back to her avowed protection. The boy shifted his body infinitesimally and the movement, slight as it was, told a considerable story. Something was coming quite noticeably through the thick birch-ery of the bark of the cliff.

The shadowy waves above parted and a girl stepped out on the rock. She barely hesitated—time enough only for the boy to realize her presence, and then meeting swiftly to him, slipped to a seat on the edge of the precipice and with unconscious inclination leaned her warm cheek against the palm of one hand and let her hair stream rest in the other.

The shadows were deepening. Darkness, which filled the valley like a velvet sea, hid the lumber camp. The misty green of the mountainside was tipped with purple, the mountains themselves seemed to float. Far, far down the slope, a stone, hewn by the winter's frost, fell with the quick clank of two silver coins striking together.

The boy spoke:

"It's he."

The girl's eyes flew to him:

"It's mine," she said.

"I want to see the hell of it," he continued, and as though inspired by the sound of his own voice, "and beyond. I want a lot out there, I'm strong. I'd send money home," he added, defiantly.

The girl's eyes were very dark and she was very still. The night was coming on swiftly, and when she spoke her voice was low as though uttered in the shadows.

"Why don't you go?"

"I'm scared."

"You know I can't get no start. I can't leave now. If I could get a start, get money in Iowa behind, I'd go. I'd go now."

The girl nodded comprehensively. It was a common place; the tiny mountain farm, work in the lumber camp that brought the simple means of subsistence for the woman who lived high up in the forest clearing a few stony fields to till, and then the same mountain

man story, repeating itself over and over again under the great shadows of the mountains. Four years had slipped by since his father drifted away on the spring drive and never returned. His mother waited always and hoped hopefully, her one haunting fear that her son would follow in his father's footsteps.

The last rays of light were lingering on the mountain-tops as they slipped through the cherry bushes. At their very feet a blue jay rose with its harsh scream. The girl grasped the boy's arm with a little cry. He shook her off good-naturedly, much as a large dog pushes away a puppy.

"I'd like to find that nest with the star you are always talking 'bout," he laughed. "I could go 'way here."

"We'll look for it tomorrow," she answered.

**II**  
There is little to do on a mountain farm. A few days' plowing with an old horse, for whom, later, he would be sad that he saw life; some fowling to be hunted and split, and then time, time stretched and uncounted, flowing by like some smoothly worded paragraph, wind for common, rain for serenade, trumpet for release, and the changing seasons for the terminal

She stood looking at the rude handle of sticks

period, while always best metals from the valley and cold winds blew from the mountain-tops.

The boy was not quite sixteen, a child of the great silence, strong as the everlasting mountains and unconsciously filled with the mysticism of wide spaces. It was this, perhaps, that carried him unawakened through the primitive vines of the lumber camp. He knew them, but they were no part of him; he obtained them as instinctively as he avoided the black-dotted leaf of the poison sumac or refused to crush the unwholly, green-tipped shrub ridings. Quite as slightly he accepted the language of the girl who left her numerous brothers and sisters in the valley and came up the mountain. Their companionship had spread over four years and she was no such a part of his lonely life as the drifting clouds or the deer that stopped in gaze at him—and no less so.

The spring plow was over, water had broken earth, the potatoes were in the ground, and the garden "man" was carefully tacked into the best wind-protected corners. There would not grow on the mountain farm; the season was too short, the soil too poor, and the wind too restless. There was little for the boy to do but to dream of the "beyond."

The sun was hardly up before the boy and the girl found themselves on the ledge which had tacitly become their meeting place. The whole day was before them. The tremors of the wilderness lay stretched at their feet.

"Let's find the nest," she said, eagerly. "Birds are just hatching now."

"I want food," he answered. "It will be warm when we get to the tunnel hole."

Unconsciously she followed him down the mountain, slipping along a trail indicated only by the lightly perceptible break in the tree-trunks, and slipped, at the lower levels, in dry warm air in an old pasture. The boy snatched a broken and dilapidated spade with which he turned over the sod, while the girl picked up the wailing earthworms and dropped them into a circle last hole. A snake inhaled up and down at a respectful distance, non-interfering with evident satisfaction the lady which was being opened to him. A diminutive shrike-like, with all the assurance of his race, perched on a nearby bush.

The girl tossed it half of a worm when she thought the boy was not looking, and, with true feminine level, before he spoke when he grunted contemptuously and suggested that, if she had to feed the birds, she might use something for the blue jays.

They worked with surprising rapidity and mutual comprehension. Every movement of the boy found its supplement in the girl and as an inevitably short time the hill top was heaping full.

Passing with hardly a glance over the turbulent stream, down which the logs had gone in the Connecticut—fish do not survive log-drives and dynamite—they stopped near the mouth of a small tributary. There two five-foot willow stands were set, and with three feet of the mud a sharp bank, the warm barely protruding over the bank, the bank was complete.

The water was still rid from the melting snow above. The broad struck now, like lightning, and then were gone. These two banks, were masters of their art, and the basket was rapidly filling with fish of fair size.

Always the stream grew smaller as they ascended through the water in the mountains, and at last at the edge of a fatal clearing, it was barely a foot across, its tiny pools scattered at wide intervals. Here, in the character of the forest changed, a heavy growth of spruce, hemlock, and yellow birch was intermingled, and the popple and white birch had disappeared.

It was high noon when the boy and girl reached the edge of the clearing, their basket brimming with fish.

Protected from the wind, they nevertheless sought the straight and were soon engaged in cleaning the fish and cooking them on green birch twigs over a hot fire. They shared their labors and equally disposed of an enormous amount of food. The boy and girl were parched—too well they knew what a marvelous snack meat in the forest—they lay back with their stomachs content while some came from food longed for in the open air.

A chipmunk, rambled in the leaves. For away a distance, participating in the work of the boy and girl, on the mountain-side, whistled softly to her lover. Suddenly, rambles with treacher, the scream of a hawk broke from the treetops.

The girl sat up quickly.

"There's that jowly bird of yours," said the boy.

"You're the one who wants it, not me," she answered, quickly.

Something in her voice jarred on his dreamy composure. With an unconscious mental resentment at the necessity for movement, he turned on his arm and looked at her.

She was sitting bolt-upright, her lips half parted, her eyes fixed on nothing, her frankly unweary young bosom rising and falling rapidly beneath her coarse laces. Had he got her wrong? It was wonderfully beautiful, like a wood nymph, a creature of the forest, child of the warm sunbeam and pure airwaves.

Some hint of this reached her mind, however, in resentment at the heavy loadback of lace that had so lately escaped from the somewhat untidy pile at the side of her head and momentarily hid her face. The spell broke with her eyes.

"There ought to be some. They say there is. There are lots of blue jays and an owl ain't found no nest. That's funny, what? If there was a nest, you could sell it for . . . for a hundred dollars, maybe, and then you could go to beyond."

The boy smiled.

"That would be enough. I could work and go all over the world. I'm strong," he said.

"Yes, you're strong," she admitted. "What would you do?"

"First I'd earn a big stack of money, then I'd get a big nest and a dove like the one you had. Well, I'd be a man," he concluded, somewhat faintly.

"Would you smoke cigars," she asked, "and get your drink like the walkin' horse?"

"Suppose so," he answered, dubiously, not quite liking the prospect, but recognizing necessary social amenities.

"You'd send money back to your ma?" she asked, breathlessly.

"You bet, and I'd find out and send him back too. You'd like that better, wouldn't you?"

They talked the matter over again and at the main stream equally divided the booty. The girl started down and the boy up the mountain.

As he climbed through the close second growth a clear trail came to him from below.

"Well that nest just got," it said.

## III

The days lengthened out into long summer evenings. The woods were a riot of bloom, and the low grassed and scale apple trees, planted in the valley, looked as though fights of fairies were resting on their heavy branches.

The boy and girl wandered over the mountain or, with inactive caution, curiously avoiding all human habitation, explored the valley.

There were a million things to see, a thousand mysteries to solve, and endless forest happenings to be discovered, and each always in fascinating circumstances about the blue jay's nest.

The vines who made her make under the shadow of the precipice was carefully marked down by her prospective family and used as prey when winter should have made her fat of value, the baby curls, whose life began before the snow had gone, friddled contently on the edge of their nursery nest in their mountain den for food, only to find that the noise which surrounded the chick, a parent's warning, came from the ridiculous laughing human beings below; even the sportive and dowered wood duck looked eyes as bright as her own peering down on her as she sat down, as her nest.

With such adventures and interests the days fly by. There was always something left unshown, always expeditions left undischarged.

The sense of enjoyment was roused when, in wandering aimlessly for a while, they came upon the unmistakable tracks of a bear. The day's work was done, further investigation, but no enthusiastic expedition was planned for the morrow.

It was still dark when the boy and the girl met on the precipice, two shadows, one of which carried the woman's only necessity—a tin. A few whispored words and they started up the mountain, a light breeze stirred, which heralded dawn, blew down to them as they crossed the next to highest ridge and went clear to the virgin spruce.

As light came they picked up the tracks where they had found them the day before, and set down close to pillow, on a huge rock, to cut a new trail.

"Don't know," he answered, "hope so."

"You won't shoot it if it's a she?"

"Not now I have to. You know me."

"You won't hurt the cub if she has any? I ain't never seen none."

The boy laughed gently and shook his head. They took up the trail.

From the place where they had found them, the cub of the tracks made, the man picked for a mile or so, and then went over on a rim of rock that surrounded a dip in the topography. It was a mere dip on the mountain's back, a very heavily wooded hole about half a mile across.

They followed the edge, silent as shadows, peering into a shade below, until they had all but climbed it when the girl, with a quick intake of breath, threw her down to the rocks below her. Together they peered into the space and fifty feet below found the object

of their search. A great she bear lay in the snow-drift out of a rotten hemlock box, two fat cubs above and beside her belly. She lay half-tamed from then, up and her great head swaying as if reading some Marconi message from the slight breeze. A dip in the snow current brought her some faint of the walkers. She was on her feet so quickly that the eye could not follow the movement, and, spilling the robe without ceremony, circled about, her nose high in air and her little eyes examining every nook and cranny of the cliff, the cave after one involuntary spring landed beneath her. The boy and girl held their breath. For fully five minutes she stood sampling each wisp of wind, and then, apparently reassured, relaxed and sank back into the hollow which fitted her great body, a moment which the eyes instantly interpreted as an intention to breakfast.

"Ain't she a beauty?" whispered the boy.

"Them cubs in like kittens," breathed the girl.

"As fat as a hog."

"None that he is nowed?"

"No, no," bowed the boy; "she'd be afraid he'd eat 'em."

They watched in strained silence but minutes more, and daring to stare, then the boy suddenly raised his rifle and aimed it up the snow bank.

She was sitting bolt-upright, her lips half parted, her eyes fixed on nothing

below to shoot; the girl knew that he did not intend to shoot.

"But I could kill them two cubs to eat," he whispered.

"No, no!" gasped the girl and put out a restraining hand.

By the impetus of his position the touch on his arm added just the final break. His finger tightened on the trigger, the muzzle jerked up, and the heavy bullet went hurtling through the tops of the spruce.

With a roar of fear and anger the bear was on her feet, the frightened cubs huddled behind her. For a moment she hesitated and seemed about to charge up the cliff, and then turned and, driving her cubs before her, with incredible rapidity for so large an animal disappeared in the heavy growth.

The boy's brow was crimson as he faced the wide-eyed girl.

"Ain't I jowly smart, ain't I?" he said, though clenched teeth, and tamping back the back track, the girl, trying in vain to control her sobs, following.

It was barely noon and their day of happiness was done.

In the afternoon the girl slipped into the woods she did not intend to go up the mountain, but climbed to the right, climbing slowly. Impenetrable she edged ever toward her goal, until, with brainiac self-deception she tried to persuade herself that she was compelled to find it out (a few rods away). As she hesitated a flash of blue darted from a young spruce

to be followed by the raucous cry of a blue jay in mid-air. Her heart nearly ceased beating as she cautiously approached. There was a rustle in the branches, and not five feet above her the mother blue jay left the nest.

For a long time she stood looking at the lone handle of sticks. A bird came back, perched on a spruce by tree, and was gone. The nestlings raised hungry heads, all mouth and throat, and demanded food.

There was the "hey-ay!" for the boy. In the next by the talons that would open the gates to "good luck no rickon," the key to the world that would make him a man with a "diner" like the walkin' lion, a fat one, and furnish him real manly dressin'—and would take him from her forever. With a sob she fled down the mountain.

Above, the boy, a lonely figure, was waiting on the ledge.

## IV

The wind came and blew away the night. Starvation-hungered down and thirstily drank up the dew. The children and tiny grass-creepers thinned out from the top of the rock night and all began to sing at once because they were glad.

Slowly the girl went up the mountain trail, her eyes very bright, her head high.

Slowly the boy came down the mountain trail, his eyes dark with thought, his head bent.

"I've heard it. I've found it, and a real find here," she said, "the blue jay's nest?"

"You still think of it?" he asked, breathlessly.

"Think? I've found it."

He followed her from the trail to the young spruce. Two flashes of blue left the tree and flew like jets, landing with excitement, perched on a purple hundred yards away.

"There's them!" She pointed at the nest.

The boy never took his eyes from her. Her mouth was trembling, her breath came quickly, her eyes had the dewy appearance of violets.

"Get the stone," she begged. "Don't drop it. You can have everything you want. I ain't ever back."

"An' I ain't go 'way 'no' be rich, an' never remember," he asked.

The light died from her eyes. Blinded, she leaned forward, nearly reaching him.

"You want to go so jowly bad," she whispered.

"Hell!" choked the boy, the area wet and red gathered his in like a tired bird, he left the crowd, mere presence of her body against him, and as his lips met hers he knew he had found the "hey-ay!"

Two blue jays returned nobody to their nest. They knew they had secured a great pearl, but some-thing unaccounted for had taken them that thought directed, they had to return for their lives.

## Interfudes

### NOT THE LEAST OF HIS MERCIES

**M**EN and women of a downy nose and a score of languages and dialects come and go in the big savings banks of New York, and the clerks are masters of many tongues. Some of them go so far as to guess a depositor's error by his appearance, and greet him in his native speech. These polyglots find it quite possible to make mistakes, though, as young Mr. Cashdollar, of the People's Home Savings Bank in the Bowery, learned the other day to his discomfort. A short, stout, blue-eyed old fellow with curly reddish-yellow hair came to the desk of the paying teller, and Mr. Cashdollar, without waiting to be asked, pushed out a \$1000.00 bank to him. The old fellow filed it out for the effect that he wanted forty dollars, and pushed it back under the paying payment.

"You haven't signed it," said Mr. Cashdollar. "The yellow-haired old fellow looked as if he didn't hear."

"You'll have to sign your name," said Mr. Cashdollar.

The old fellow favored him with a bowing stare from his blue Testino-looking eyes.

"I s'pose you're a Greek?" asked Mr. Cashdollar, looking kindly, pointing at the check. "I s'pose you're an Arab, tell me."

"Heard me, young man," the old fellow interrupted. "I'm a Jew. Oh, may be a little deaf, but thanks be to God, I'm not dumb!"

### THE RURAL PHILOSOPHER

"Of course I approve of a college education," said the Rural Philosopher, "but all the same, ye can't teach a hog how to leer later with a piece of chalk on a blackboard, any more'n ye can teach a bear to make the kind of pie hee makes better made by himself" in a series of lectures on the History of the Ancient Greeks. Farmers by long-distance telephone haven't plowed no fields, nor harvested nothin' but yer olden's yit."

### CHIEF AT THE PRICE

"Bill," said Mr. Burghalind, "when the R. F. P. man comes around this mornin' tell him I want to see him, will ye?" "I'm thinkin' of tellin' some o' them new-fangled parrot-words the gov'ment's arter for their own fence around the chicken run. They say they come to about the cents a peck, 'nd they's cheap'r's cuttin' 'em."

### THE ECONOMIC VIEW

"Water paid me just any how," roared the exasperated laborer.

"What good an it?" returned the fat. "Why, dat, I'm a consumer, and I'd like to know what would become of the farmers if there weren't any 'consumers'."

And the old man went out into the barn and threaded the wisest without an inch of his life.

### AS TO THE BOYS

"Yass," said Uncle Zeb, with a smiling glance over the hardy youngsters that constituted his devoted party, "boys is peculiar. I notice that when so he's long-haired, they're bestickin' Bill's advice to be found on deck lookin' after his share as helpful as a mother hen after her chickens. When the curly-locks is on the table an' the pinks is in the pie, as the poet might

### SINGING THINGS IN PRESHYTERIAN DAYS

he' said, my boy. More ain't any kin back'n'is in claims' his share, and on them popular occasions when the hard rider's hair's passed around, an' the jug gets to 'sumpin', ye kin hear his share a gurglin' down his throat, an' ye begin to worry some about your own, or so ye kin't had it yit. But they's one share

garden behind the barn, and ye'll find a year's supply 'o' pull manin' for ye right clear among them three weeds."

### BUFF!

(With Apologies to Rudyard Kipling)

If you can just dare make when all about you  
Are flying bridge, and grinning hard at you,  
While halfpennies with snore and jingling float you  
Because you like the job you have to do,  
If you can smile the while your younger sister  
Has fallen faint, and you sit by the wall,  
And when you feel the grove-ward member's blower  
Don't ever show it outwardly at all;

If you can pass a growing bargain table,  
And never even pause to glance at it;  
If you can go to bed and 'mid the label  
Glide out one thought to how your garments fit,  
If you can hear a fall-out purely snuggly  
Any never whisper it to any one;  
If you can greet a glance that's cold and haughty  
With smiles as fresh as shimmer from the sun;

If you can bear to hear the words you've spoken  
Tossed and turned for talk-talk at tea,  
In such a way that friendships long are broken  
By gossips alive as a pack of lies;  
If you can rock such you as once your mother  
In days of old was always said to be,  
And satisfy a husband, son, or brother,  
With any god-darned thing your fingers make;

If you can greet your husband home returning  
With smiles, no matter what a slob he is,  
And squawk within your every natural yearning  
To help along some silly fad of his;  
If you can sing, while he is raising thunder,  
And when he rages keep your tongue still—  
Well, truly, dear, you'll be a perfect wonder,  
And what is more, you'll be a jake, my child.

HONORABLE CLARENCE

### AT 2 A.M.

MR. DE WARD A VERY IMPORTANT COMMITTEE MEETING AT TWO THIRTY P.M.

MR. DE WARD WAS ON HIS FEET, AND HIS HEAD WAS

they's allers willin' to give up to each other with a smile face like the kind-hearted little comes the he."

"And what is that?" asked the visitor.  
"The philosopher!" roared Uncle Zeb, with a wink at the boys, who nodded their approval of the old man's sentiments like the good blind toothy they were.

### A VALUABLE INFLUENCE

"I tell ye," said the grizzled old veteran of the farm, with a broad grin on his face, "these here lectures they give before them society people up in town on the subject o' farmin' is mighty fine. My darter Mandy attended a dozen of 'em up in New York while she was visitin' that dead winter, and by Gorry, what she don't learn about improvin' a cow's head, raisin' water lilies, and growin' roses on an old-time m'or ye kin read the catalogue in a small city flat without attractin' the attention o' the Board o' Health, hasn't worth interestin' 'em."

### A PLENTIFUL STOCK

The Product had returned, and was trying to justify himself.

"Of course I've been a failure," he said, ruefully, "but how could I have been otherwise? You can't get anywhere in this world today without pull. Wherever you look it's pull, pull, pull—sneaking but everlasting pull. In politics, it's pull. In literature, you can't get anybody to look at your stuff unless you have pull. In business, if you haven't pull you might as well put up the shingles before the sign—read what you want to, and unless you've got the pull of a lame leg, you can't get a word out of 'em."

"That's all right, 'course," said the other. "Ye know it's some right hard here. There's a lot of 'em to get what ye need. You go out and get 'em."

### THE NEW DOWN

MR. DE WARD A VERY IMPORTANT COMMITTEE MEETING AT TWO THIRTY P.M.

Doris Keane and William Courtney in "Romance," at Maxine Elliott's

Ethel Mc Gee, with the Irish Players

A scene from T. C. Murray's tragedy, "Erlingrigh," as given by the Irish Players at Wallack's. The players, from left to right, are: Eileen O'Doherty, Sydney Morgan, J. M. Kerrigan, and Fred O'Donovan

## PLAYS AND PLAYERS

WHAT THE THEATERS ARE OFFERING

## Human Fossils

The study of human fossils first became established as a recognized science in 1844-45. Darwin meanwhile had assumed the existence at a certain period in recent geological times of an animal type of man or "missing link" between humanity and the big ape. In 1868 Huxley made a guess sketch of the creature in question, whose discovery he declared would soon take place. Twenty-eight years later Dr. Dubois ascertained a Java bone which corresponded to the assumptions of Huxley.

In 1868 there was found in Germany the fossil skeleton known as the "Man of Neanderthal." This was a man five feet two inches in height, of robust build and well-developed muscles, and possessed of great animal vitality but a limited intelligence, since the skull, although large, contained a relatively small brain. Of later date and more evolved was the "Man of Cromagnon," discovered among other skeletons in 1908. In him also the brain development was slight. Both these fossils are dated from the middle of the Quaternary age and the other from the end of the same period, are inferior not only to the white man of today, but to contemporary humanity in general.

There remains the third example of the third type of prehistoric man, the "Man of Trinidadi," as christened in honor of the reigning family of Monaco. He is also called after the Red Rocks graptolite that grew directly on the sea near Monaco. There are also in number and of the Tertiary period. To determine the age of the fossils it was necessary first to ascertain that of the strata, to which tradition ascribed various dates. Superficially estimated, in 1912, these strata were subjected from 1905 to 1902 to a methodical search, which resulted in the discovery of some fossil skeletons. From 1904 to 1908 four new specimens were brought to light, which, with those already found, made a total of sixteen. Of these, which all belong to the earlier end of the Quaternary period, fourteen resemble the "Man of Cromagnon." The other two, a young man and an old woman, call for a new definition.

## Dickens as a Criminologist

Dickens selects Lombroso as a criminologist. The law's delay and its attendant inconveniences serve as an advertisement in many of his works. In *Barnaby Rudge* it is to be found a complete history of the criminal code.

"Crime has tempted many authors, but it was Dickens who discovered the crime." Kuroda, the anthropologist, maintains that the descriptions of the English authors reveal the makefactor in a new light, with a quite peculiar psychological organization. Certain it is that Dickens was first in the field with his allusions to the facial and other physical characteristics of the criminal. See, for example, his description of Jack Dawkins, the youthful pickpocket: "He was a scabbard, but broad, common-faced boy enough, short of his age, with rather fat legs and little, sharp, ugly eyes." Moreover, Dickens laid stress on the theory of heredity.

Where Dickens shines especially is in his delineations of the economic factors of crime. Poverty and misery have been depicted by him in all their aspects and involving agonies. Unfortunate and crying children, that frequent the sordid alleys of the city, is shown up by the author as the doomed and often irresponsible victims of criminal surroundings. Another favorite theme of his is the conduct of a prison haunted by the recollection and scorned by the long concealment of a crime.

## Artificial Clouds

In order to preserve crops from frost, the idea has been taken up, in cold and semi-cold regions, in Europe, of producing artificial clouds of smoke, or burned oil to retain the heat in the soil. The smoke clouds are produced by tar, resin, or petroleum, according to the abundance of the particular product in the locality where it happens to be needed.

The success of the system is said to depend entirely on the promptitude of its application, in which case results are instantaneous. Vats of tar or whatever substance to be used may be, must be at hand at the various points necessary, and immediately after a sufficient fall of temperature the laborers must be instructed to produce the cloud by the application of slowly kindling kerosene to the substance at hand.

A system has been perfected for some large areas by which one man can fire a line of vats. The explosion is produced by means of a wire.

## A Princely Coupe—The Cadillac

Aside from the fact that it is a Cadillac with all that the name implies, we believe we are justified in describing this as the most sumptuous car of its type ever built.

You may key your expectations as high as you please. There is no danger of disappointment.

Consider first, convenience. You enter the Coupe at either side. Your foot presses a lever and the engine starts. You press a button and the electric lamps are lighted.

You are ready—immediately. And you ride in such luxury that the indignation cannot surpass it.

By luxury we mean both motion and the "creature-comforts."

Let your critical eye turn where it will—there is nothing that is not super-excellent. You literally cannot conceive a more princely equipage.

It is an every-day-in-the-year car, always comfortable, winter or summer, rain or shine.

Oh, if you wish, with an additional body you may transform it into an open car. And, it is a Cadillac, the Prince of Coupes. The price is \$2,500. F. O. B. Detroit.

## The interior arrangement

The illustration shows the interior arrangement of the Cadillac Coupe. The driver's seat is about 8 inches forward of the side seat. This gives greater elbow room. To allow entrance from the driving side, the driver's seat folds back. There is ample room on the wide rear seat for two passengers beside the driver and the fourth passenger occupies the front seat, which may also be folded up if desired. The trimmings and appointments are elegant in the extreme. The four side windows may be lowered and they are specially made to be vibration proof, whether up or down.

CADILLAC MOTOR CAR CO., Detroit, Mich.

## CAMP LIFE IN THE WOODS

## Tricks of Trapping and Trap-Making

A comprehensive volume on building camps, canoes, traps of all kinds, all the professional tricks of trapping, but recipes, and methods of caring for furs. Numerous illustrations embellish the text, and information is given about the habits of birds and animals.

A treasure-book for sportsmen, young and old, and of convenient size for carrying on trips.

Illustrated. 300 Pages. Price, \$1.00

## SIMPLE ITALIAN COOKERY

By ANTONIA ISOLA

THIS book of Italian recipes was compiled by an authority who has lived much in Rome. Though frugal, the Italians are excellent cooks. The American housekeeper will find many interesting suggestions for preparing not only the numerous varieties of macaroni and risotto, but also many new ways of cooking soups, meats, vegetables, and sweets. It shows that Italian cookery is far from being all "garlic and macaroni."

## WHO ARE THE BLOND ESKIMOS?

MR. STEFANSSON describes in this instalment of his experiences in the Arctic his first meeting with the strange, unknown people of Victoria Land—people with blue eyes, blond or reddish hair and beards, and heads and faces of distinct European cast. MR. STEFANSSON'S discussion of the various theories as to the origin of this race will be found of extraordinary interest. With photographs.

## THE GREATNESS OF THE GREAT

LAKES—Few of us realize the greatness of our inland seas; their beauty and their vast industrial importance. Yet the ports of Duluth, Chicago, Buffalo, and Cleveland are among the great ports of the world, and each year play a more important part in our commerce. EDWARD HUNGERFORD gives a vivid account of the entire lake system, which is brilliantly illustrated by W. J. Aytre.

## A BARN-DOOR OUTLOOK BY JOHN BURROUGHS

—From the door of his study in an old-fashioned barn, the veteran naturalist has looked out on the world in which he finds so much of interest which most of us neglect to see. A delightful nature study with many charming observations of bird and animal life.

## MR. HOWELLS IN SEVILLE

Another of MR. HOWELLS'S charmingly graphic glimpses of one of Spain's most famous cities and the countryside around it. Illustrated with many drawings in tint by Norman Black.

## THE UNDERGRADUATE AS THE PROFESSOR SEES HIM

—The college undergraduate is the subject of much discussion and condemnation. Yet after all he is a likable person, and if he often neglects his real opportunity, is he to blame or should the responsibility be placed on his parents and his teachers? Prof. HENRY S. CANDY, of Yale, contributes a thoughtful and charmingly sympathetic paper on the subject.

## PRESERVING THE FERTILITY OF THE SOIL

—Here is the problem which the farmer has neglected, and which the scientific experts are trying to solve. A. D. HALL, of the Rothamsted Experimental Station in England, gives an interesting account of the work which is being done in this field, and what it is accomplishing.

## SEVEN COMPLETE SHORT STORIES

Notable among them are stories by MARGARITA SPALDING GERRY, JAMES OPPENHEIM, FANNY HEASLEP LEA, GEORGE SCHOCK, CHESTER HOLBROOK BROWN, MARGARET CAMERON, Mrs. HENRY DUDENEY, and others. ;

## "The Judgment House"

## Good Winter Weather

W'e's Grampa's give you our own tracks  
As' and show you get those red checks.  
An' things that you on whole all  
speak.

W'y, it's "good winter weather."

W'e's Gramma's hibern pump it where  
Like it was said, "It's plow."  
An' let's hang up an' freeze—  
Nou it's "good winter weather."

W'es Grampa opens our front door  
An' gets his "spies" all out before  
He sees how cold it is some more.  
Nou it's "good winter weather."

Mus' in "best twenty years to-day"  
Ole Mercury went down an' stay  
Right in his silver lath—be "w"  
'Cause it's "good winter weather."

W'es Gramma told her best an' all  
She got a draught from th' front hall,  
Mo' frozen say, "Ain't cold at all."  
It's jus' "good winter weather."

My Grampa's ladder that he sees  
W'if sometimes—be will light 'cause he's  
All 'stead th' chicken's comb will freeze  
W'es it's "good winter weather."

But w'e's th' yellow fur skins down  
All over an' my "w'arm coat"  
An' it's "so still your voice will come"  
In th' "good winter weather."

My Grampa gets "th' cutter" out  
An' W'if jingle-lull—era in my "spies" about  
Tou see in "mud w'at she's about?"  
An' it's "good winter weather."

My Gramma's fun' th' buffle robe,  
Safe from th' "Maid" in "Southtown  
Glede"  
(T'N her' ma's' look in Comin Job).

'Cause it's "good winter weather."

My Gramma's "let th' sunset here,"  
(O'ay her' will like a nice warm spot)  
'Cause "Father's" wa'ite' like an' act"  
In th' "good winter weather."

W'es Grampa let th' parson there,  
'Ray, 'w'ay behind w'at his new map,  
He say in "how—be" w'at he's thinkin'—  
An' it's "good winter weather."

MADE LOUISE TORRENS.

## Jet

JET, that substance from which many classes of ornaments are made, very extensively used in the manufacture of coal, from wood and vegetable matter. It differs from coal in that it contains a much smaller quantity of earthy impurities. There is soft jet and hard jet; but only the latter is of much use in the making of ornamental articles.

While the jet industry in England has never attained great importance, it is one of the oldest that country knows. Extraction has been carried to the point where ornaments were popular in Britain during the bronze period, so there is but little doubt that jet ornaments were among the very first to be worn in the British Isles.

Aside from England, the chief jet-producing countries are Austria, Spain, and France, where it is easily obtained. Much imitation jet has been made from volcanic ash and sand.

The German jet is found associated in large quantities with amber. Since the latter substance is of considerable commercial value in the making of pipes and various ornaments, jet in Germany is treated merely as a by-product and allowed to go to waste, or is used for fuel, if demanded. There it is called "black amber" by reason of its similarity to the more valuable commodity.

## Some Curious Petrifications

Petrified objects are found in a great many sections of the world, most of them in sections where limestone is prevalent. Petrified wood is quite common. This is wood preserved in its original shape as the more common, but in some places whole logs are found, and these are so well preserved as to show the bark as well as when the tree was growing. Different kinds of wood petrify. It depends more on the amount of time than on the quality of timber.

In Arizona whole trees are petrified, and, in fact, whole forests have been turned into stone. In some places the petrified trees are to be found there. The petrified trees are sometimes cut up and converted into various articles of value.

Petrified wood is found in many places. It is very beautiful. Petrified grasses, stems of trees, and petrified seeds and fruits have been discovered in some places. Petrified reptiles and small animals have also been found.

Cobs from which the grains of coals

have been removed make rather curious petrifications. One of the most curious found is that of a pine cone honeycombed, turned into solid stone, but showing every honey cell perfectly shaped and equally distributed, and as if the cones were built it. If the comb had contained honey the water had dissolved that, for the cells were empty.

Petrified wood remains are not uncommon. In some of the crevices in sections where limestone prevails in abundance hollows have been filled to correspond to other crevices, and they were found to be turned to stone.

## Apple Rust

What the apple-rust is in operation there may be observed certain deep, rich, golden-brown or golden-red spots scattered by the junction of the apples, or they gather in the crevices. This characteristic hue of color is almost as pleasing to the eye as the flavor of the fresh sweet juice in the same of taste.

A French chemist has shown that the apple contains a coloring ferment which produces the golden-brown or reddish color of color. The manner in which this substance produces oxidation can readily be proved by any one who cuts an apple open and leaves it exposed for a short time in the air. The red particles gradually form and are the oxygen of the air united with the juice; in the end, the apple ruts.

Roasting of an apple may also be brought about by simply maintaining it for a short time breaking the skin. Everybody knows that apples that have fallen violently to the ground are covered with a reddish brown with the browned rind. In this case the oxygen is derived from the air contained in the dust or introduced among the tissues of the fruit, and it becomes active through the breaking of the cells that enclose the oxidizing ferment.

If an apple is exposed to the air its skin is broken its tissues do not oxidize when exposed to the air. This is explained on the supposition that the oxygen and the ferments are destroyed by heat.

## The Velocity of Light

The first determination of the velocity of light was made by ROYCE. The method was based upon the observation of the eclipses of Jupiter's satellites, phenomenon of frequent recurrence and easy of observation. Assuming that light requires time to travel to move from place to place through space, a considerable difference in the time between successive eclipses would appear so short when the earth is approaching Jupiter as to be almost imperceptible, and so long when it is receding therefrom. ROYCE found in his observations that such was the case and that the interval was modified by the rate of speed at which the earth changed places relatively to Jupiter. From these conclusions ROYCE computed that light required about one second to travel 186,000 miles in crossing the earth's orbit. From this it deduced a velocity of about 186,000 miles a second.

## How the Locust Breathes

DR. JOHANN REEVE, a professor of Natural History in Ypsala, has conducted a detailed study of the respiratory apparatus and mechanism of locusts. The apparatus is composed of a crystal tube with an aperture at the end. In operation in this locust, in the effort to extricate himself, turns over, bringing his thorax into contact with a level of a ball in the tube. In this way, thanks to the ascending and descending movement of the ball, the air is drawn into the apparatus. The movements of the thorax are registered on a plate or metal leaf. It is thus possible to study the movements of the thorax and the length of each breath of the insect and, what is more important, the strength and action. By this means has been ascertained that insects respirer in a manner directly the reverse of mammals. We are required to put the neck into the air, drawing in the air while expelling it is largely automatic. The locust, on the other hand, inhales automatically, but expels it with more force.

## Thibetan Tea-making

An Englishman, while in Thibet, visited one of the tea and learned the art of making a special kind of tea. The method appears to be somewhat as follows:

For six persons he took a brazier of iron. Three pieces of water he measured out, and brought down to a point of boil the infusion into the churna, with a pound of butter and a small ladle-quantity of salt. These are mixed in combination of the consistency of cream.

The Thibetians pour butter hot in it. The best is added forty, fifty, or even sixty years old.

## The Evolution of the Organ

It is a far cry from the pipes of Pan to the great organ of Westminster Abbey. Yet the roads down by the river were the first civilized line of the "king of musical instruments."

The growth of this "king" has been slow and its evolution has seemed to most exactly keep pace with the development of art and civilization in the human race. Certain it is that some of the greatest achievements of cycles of human skill and ingenuity.

The legend goes that Pan pursued Syrinx, a water nymph, who to evade him, turned into a reed. Pan cut the reed into seven pieces, bound them together, and drove a hole through each section. So this instrument was ever after called the Syrinx. The Emperor Nero was much interested in the Syrinx and encouraged makers in its improvement.

Oddly enough, the Chinese, who cannot be counted among organ-builders, were the first to invent an instrument which really foreshadowed the modern organ.

Another form, very like the Scottish bagpipes, was known in pastoral Greece in the fifth century before Christ. Aristophanes mentioned "double pipes" and Plato makes an allusion to them. It was centuries later before the instrument took the form which really entitled it to be called an organ. Christian of Alexandria about 300 a. d. made the first instrument in which the air was supplied by a hydraulic system. The wind was forced by the "efforts of water to rise to its own level."

The hydraulic organ had, after Christian's, many builders who introduced improvements, but water continued to be the power for a long period even after the invention of the pneumatic organ. Two hydraulic organs, partially drained, were used in the ruins of Pompeii and are now in the museum at Naples. They have fifty nine or ten pipes made of bronze, and all of the same diameter, which would indicate that men did not know of the regulation of sound by the size of the pipes.

The pneumatic organ to which the wind is supplied by bellows, but not in the manner of the modern organ, was first used in Constantinople in the sixth century according to Theodosius the Great, a. d. 391-395, are seen two small organs placed in wood and supplied with detached bellows.

An interesting point in its history is the time of its use in the church service. The organ is said to have been in the time of Pope Vitalian I, about a. d. 666, though other authorities declare it was known in Spain much earlier.

Byzantium was the first to become an important center in the art of organ-building. Pippin, king of the Franks, father of Charlemagne, in 752 sent a dedication to the Emperor Constantine stating that an organ might be sent to France. It arrived in due time and with great ceremonies was placed in the church of St. Corneille at Compiègne. Charlemagne's great love for the organ caused the Caliph, Haroun al-Rasid, to present him with one built by an Arab in 822.

All this time the organ was very far from being the instrument we know. As an old drawing in Trinity College, Cambridge, represents two men playing and four men blowing the bellows. Six men to be using sound out of a small affair of fourteen pipes and one limited bank of keys! Originally there were two rows of such bellows and often ten or twelve blowers needed. It took several hundred years to cut out that row and couple it to the wind and now era that one is supplied by electricity, though in many small churches he may still be seen working his small staff at the bellows.

As to the appearance of the keyboard activities seem to differ, some say that the first one was used in the organ of the Cathedral of Singapur at the close of the thirteenth century. It was made of iron and of six inches broad. These many keys had to be pushed with the fingers of the hands. It was so inferior that there could have been no discovery of touch or rapidity of action, and the sounds were crude and unharmonious.

"Bardamuth," the name given the organ by the Anglo-Saxons of the thirteenth century, would seem to have been singularly appropriate.

Narrow keys to be struck by the fingers did not come into use till about the fourteenth century. The keyboard also given in this century till it reached three octaves. In the "St. Cecilia" of the thirteenth century, the John Ford (thirteenth century) there is seen a keyboard very much as we know it now.

The development of the organ in Europe for more than two hundred years does not surely any record of an advance in organ-building. In the thirteenth century it was greatly extended by the clock moved from the Latin and Greek churches declaring against its use. The Latin Church was opposed to the

in the Greek organ has never been reinstated.

The fourteenth century saw enormous strides in its development. Almost every church had its organ. These were portable, so that they could be moved to different parts of the edifice as the service required. In 1312 an organ was built for the church of St. Andrew in the cathedral of Geneva led the world in the building of organs. In 1356 a monk of Trier became one with forty-two pipes.

Dutch builders ranked next to the Germans, the French doing very little at any amount and the English even less, though now and then they were excellent workmen. In France scarcely anything remains of its early work except the organ made in Lyons, which goes back to the seventeenth century. It has five manuals, a pedal organ of two octaves in complete, twelve pairs of bellows, and forty-nine sounding stops.

One of the greatest achievements of the eighteenth century was the organ of the Bowdoin-Henriette at Weingarten set up in June, 1750, after six years of labor, and thirty steps and an enormous number of pipes.

English organs were behind all others till the nineteenth century, when they took a great stride forward and stood with the best. One reason for England's backwardness may be due to the fact that she was too busy with the French war. Organs were denounced as "weapons of the devil," and in 1644 an ordinance was passed in London, which gave back to the seventeenth century. "The destruction of monuments of idolatry and superstition." This was the second edification of the eighteenth century for fifty years. Soldiers rode into the churches, battered down the railings, and tore away the organs. The organ of St. Paul's, York, Durham, and Lincoln cathedrals and Christ Church, Oxford, Organ-builders left the country or were forced to work as carpenters and joiners.

Organ pipes for fifty years have been importing its workmen and is now well supplied in organ-building by any of the countries of the world. The first electric organ was sent to the Exposition in 1876.

Organ pipes have been manufactured of all sorts of materials—wood, brass, iron, copper, glass, paper, tin, silver, and gold, but the English tin has been found to be the best. The organ is made of wood, and its susceptibility to change of climate. Valves could be written about the different forms of ornamentation, the organ from the early baroque ages, modern, and gilt splendor down to the classic dignity and simplicity of the Renaissance.

## Birds' Tongues

A German scientist has gathered some curious facts with reference to the tongue of birds. As he points out, many persons suppose that woodpeckers use their sharp-pointed tongues as darts with which to attack their prey. It is true that the woodpecker, like the humming-bird, can dart out its tongue with extraordinary rapidity and that its mouth is furnished with an elaborate mechanism for this purpose, yet investigation shows that the object of their swift motion is only to reject the prey, and to pierce it. For the woodpecker it is a woodpecker, and the woodpecker's tongue is furnished with a sticky secretion.

Just as it possesses the power of imitating speech, it is not surprising to learn that the parrot's tongue resembles that of man more closely than any other bird's tongue does. It is not because the parrot is more intelligent than many other birds, but because its tongue is better fitted for articulation than theirs that it is able to amuse us with its chatter.

In some respects the humming-bird's tongue is the most remarkable of all. It is double-barreled from end to end, so that the little creature is able to grasp its prey very much as if its mouth were furnished with a pair of fingers.

## Taste and Temperature

Some of taste resides in little flesh-shaped papillae imbedded in the skin of the surface of the tongue and in the upper part of the throat. Each of these has a ball of a nerve connecting it with the larger nerves of its region. Anything to be tasted is first dissolved in the saliva, and then comes in contact with the interior of the papillae, and differences in taste depend on the varying influence by which the impression is transmitted through the nerves. It is not surprising, then, that the tongue is very much influenced by temperature and may frequently be stopped altogether by extreme heat or cold. The organ of taste is destroyed at a temperature between fifty and sixty degrees, Fahrenheit.

## We Specialize on Style

We can hardly make HoloProof Hosiery wear any better. We pay an average of 74 cents a pound for Egyptian and Sea Island Cotton Yarn. Common yarn sells for 32 cents. We send to Japan for silk. Common silk won't do for "HoloProof." Our process are the latest and best. Ninety-five per cent of our output has outlasted the guarantee for the past thirteen years.

Therefore, most of our time and effort are now being concentrated on style.

The result is an ideal hose for occasions where formal evening dress is required—especially at dances and balls, where stylish, their hose that will wear are a necessity.

Because of this double quality, a million people are wearing "HoloProof."

## FAMOUS HoloProof Hosiery FOR MEN WOMEN AND CHILDREN

Six pairs of cotton hose must wear six months. Three pairs of silk hose must wear three months. That is guaranteed. And it means every stitch.

If a thread breaks, we replace the hose free.

Look for the signature, *East-Prichell* Stamped on every pair.

The genuine "HoloProof" has a *z* on your hose. Dealers' names on request, or we'll ship direct when there's no dealer near, charge prepaid, on receipt of remittance.

Men's cotton "HoloProof" cost \$2.00 to \$3.00 a box of six pairs; women's and children's \$1.00 to \$2.00 a box, extra; \$1.00 a box of four pairs. All others guaranteed six months. Men's silk "HoloProof" cost \$3.00 a box of three pairs; women's, \$1.00 box of three pairs. All guaranteed three months. Write for free book, "How to Make Your Foot Happy." See how wonderful hose can be made.

HOLOPROOF HOSEIERY COMPANY, Milwaukee, Wisconsin

The Postal Bank

HOW IT SHOULD BE MADE TO SUPPLEMENT THIS PARCEL POST

By Don C. Betts

The announcement that the newly inaugurated parcel post carried 400,000,000 packages in the first month of its operation is an interesting indication that there existed a long unmet want. The unmet want was an "air-mail" service. The unmet want was a service that would deliver the goods between the producer and the consumer in the shortest time possible. These are the reasons for the parcel post.

There are two reasons for the parcel post. The first is that the cost of the service is too great for the profitable transportation of farm products and the mail of weight too heavy. The second is the lack of financial facilities for country people—and for that matter the average city dweller as well. The ordinary citizen does not have a bank account outside of the savings institutions, where check-drawing is not permissible. Many city banks require balances that cannot be maintained by the run-of-home-keepers. While banks are plentiful in the cities even if not in the country, the country is poorly supplied, and the farmer who wishes to use checks or to cash them is forced to march to a bank, something he desires to avoid.

But an expansion of the postal savings system can correlate with the post and create a nation-wide convenience. Every post-office should become a depository and paying-point. Facilities should be provided with check-books. The stamping of the check by the postmaster would mean the certification. The change machinery of the postal-order system would disappear and the uncertainty of the registered letter be done away with. It would not be necessary for the government to pay interest on these accounts. The sum of the benefits afforded would be a national system on the deposit, if the interest system is retained, the placing of a one-cent stamp upon the check, and the bringing a large return to the government and be but a small tax upon the depositor, as against the present cumbersome money-order system.

In this way farmers and countrymen would be provided with a safe and convenient form of exchange by which they could do business directly with each other at infinitesimal cost with great mutual advantage. It could displace the existing financial institutions, because it would serve people outside the pale of banking.

Under present conditions, it is impossible to finance parcel-post transactions conveniently, and this limitation serves as a great check upon the reaching of full success. There is nothing contemplated about the plan advanced. The machinery exists for its successful operation. The office in every town in the United States has ample room, and in nearly all cases plenty of clerical help. A certified check from one office to another means nothing but clearing.

The cash-balancing will be made as the checks will be in a large way, but each other, just as they do in the clearing houses at the banking centers. Checks either then postal notes collected without loss by the simple method of not allowing them to be drawn against until the money is received. No bank poses such a means of identification that prevails at the same post-office. It is the one place in town where everybody has a check. In no case does the money have to be paid until the return is safely in hand. It would prove a business without risk and a facility beyond measure.

Hippopotamus Ivory

One of the curiosities of African trade, now far more much more than ten years ago, is the "ivory" of the hippopotamus. These teeth are much harder than those of the elephant, and for a long time were used by the manufacturers of false teeth, which were skillfully carved from that material. Of late Vaillant remarks, in his African Travels, now more than a hundred years old: "It is surprising that Europeans, especially Frenchmen, should make an article of commerce out of the teeth of the hippopotamus, for with the help of science they are made to replace our own, and we may see them flashing delightfully in the mouths of a pretty woman." Science has found a better substitute for this, and the trade in hippopotamus teeth has fallen off. The making of spectacles, or whips, from the hide is still a flourishing industry; and during these hard times, the manufacture of a solid mass strips of the thick hide at a selling price to a thousand of Cuban "cigars" is really calling the attention of the world—that is, one dried head. The tooth of the walrus was once used to replace elephant ivory, and now is used in Japan for small carvings, and found ivory from Siberia has long been used in China.

JUSTICE OF THE PEACE. "And now that you are man and wife, let me say that I hope you will be happy."  
STRONG-MINDED WOMAN. "If we ain't happy, Judge, I'll know the reason why."

Cold and Appetite

As everybody knows, there have been developed various methods whereby severe low temperatures have been attained.

While the arctic regions prove so factory cold weather—many, many at seventy-five degrees below zero, Fahrenheit—the scientists have been able to surpass nature's achievements in this line, and when they wish our hands and feet to be a hundred and fifty degrees below zero they can obtain it. How this is done it is unnecessary for us to state, but it is interesting to note the effects of such low temperatures on animal life.

Dogs, when induced to stand in an enclosure, withstand it well, provided they are covered in blankets and wool mats, provided the experimenters of about six degrees. But a curious fact is that when they emerge from such a temperature they are fearfully hungry.

Having seen that dogs stand the experiments well, one experimenter tried the effects of intense cold upon himself and went down into his "cold pit" carefully dressed in warm clothing and furs. The temperature was maintained steadily at one hundred and ten below zero. Fahrenheit—some hundred and sixty-six, Fahrenheit. After four minutes the experimenter felt very hungry and was more so when he got out and to the experiment, coming out of the cold after eight or twelve hours, he took a hearty meal and enjoyed it thoroughly; and this served all the more strange, since for years he had not known what it meant to be hungry. Appetite had been a word without meaning to him, and the digestion of such food was exactly what a painful process that he ate very little and water enjoyed it.

He repeated the "cold experiment" daily for a week and after eight cold baths of eight or ten minutes each, his pain and distress after eating vanished. Appetite was restored and digestion became painless.

The Peopling of Our Continent

Voyagers to Oregon and the State of Washington are impressed by two features that possess a particular degree of significance. The Columbia River is one of the marvellous chains of estuary valleys comprising Mount Tacoma, Mount Hood, Mount St. Helens, and other great peaks.

This part of our country was once abandoned to regard as being a great future in store. But in one sense it may have been no less great. According to various authorities, it was here that the entire of migratory originated from which the American continent was peopled. As the Avianes thousands of years before Kolumbus began to cross the Atlantic.

It is interesting to note that there is a kind of pathway across the Pacific which follows the shortest course, a great circle of the globe, and begins with the Archipelago in the Columbia River basin. It skirts the shore of Asia on one side and that of North America on the other, being thus a mile course for voyagers at a time when the art of navigation was in its infancy.

If this theory is correct, a very interesting, though perfectly natural, fact would be to fight the migration, thus by opening them to the action of radium. A German who has devoted himself to this study has obtained remarkable results. He has brought up a number of birds and kept them in a box with a small quantity of radium. At the end of a week the transformed birds are as follows: white pigeons had become yellow; blue, green, violet, blue, white-colored doves; red; black, white.

Radium and Gems

It is possible to change the color of precious and semi-precious stones by exposing them to the action of radium. A German who has devoted himself to this study has obtained remarkable results. He has brought up a number of birds and kept them in a box with a small quantity of radium. At the end of a week the transformed birds are as follows: white pigeons had become yellow; blue, green, violet, blue, white-colored doves; red; black, white.

Aeroplane Tires

It is in the demand for special tires for aeroplanes that it is not long since one big concern has made the production of such tires a branch of its business and found a ready sale for the output. The special requirements of aeroplane tires are strength coupled with extreme lightness and resilience. They must be strong for the work they have to do when the machine is on the ground, and yet so light that they shall add but little weight

Sold at all first-class hotels and by John W. LARSEN & SONS, Baltimore, Md.

Get Away from the Idea of Evans Ale

In a single beverage for good drinkers. It also makes good "chickens." Contains the maximum amount of food and vitamins. Get it in bottles, half and whole. Sold by the Home Store.

## MRS. CLEVELAND'S SECOND MARRIAGE

The former Democratic mistress of the White House was married a few weeks ago at Princeton, New Jersey, to Professor Thomas J. Preston, Jr., of Wills College. The ceremony was performed by President John G. Hibben, of Princeton University. Mrs. Cleveland's marriage to the twenty-second President of the United States took place on June 2, 1886.

# TO WILLIAM H. TAFT: GOOD MORNING

From "Harper's Weekly" of March 6, 1908

Good morning, Mr. President.

To you we prefer to turn with serious eyes. Solemnities drop less naturally from our pen, we must own, in this greeting than in that tentative farewell we have just been pronouncing. We can imagine you saying what Charles Sumner said while Sir Oliver paid his respects to Brother Joseph: "If they talk this way to Honesty, what will they say to me by and by?" And we could fall into that mood; for, strange to say, we seem less in doubt about you at your coming in than about this other at his going out. Certainly you do not suggest painful reflections on the exoteric of human nature and life and fate. Rather you invite to joviality and matter-of-fact.

But we are to watch your every act, listen to all your words, to praise and dispraise you, for four years, perhaps for eight. Frankly, we have much love in you, and it is hard to believe we shall ever feel bound to assail you with bitterness, to taunt, to deride. You have our liking—in common, we think, with that of nearly all your countrymen. But you know how hard it will be to keep from being this well-nigh universal goodwill. For Lord Russell was right, and the poet wrong. Government causes and cures countless ills. You cannot for a day exercise your vast powers without helping and hurting thousands. Wise or unwise, right or wrong, your acts will cut deep into human lives. We trust that you sleep well.

Frankly, again, there have been some things we do not like. Like your predecessor, you in your youth revolted against that system of so-called protection which, in its present phase, we count as indefensible surrender. First of your party, and then of the government, to greed; and you, like him, here failed to defend in plain words this acquiescence of mankind against that rebellion of youth. When you touched upon your change of heart, speaking to young faces, in the place of your youth, your words went lame. You said then that you still approved of your youthful principles, that you held them still orthodox and sound—"if only the application of them is not carried to such an extreme as to interfere with the public welfare." You certainly cannot believe that free trade or any other *laissez-faire* principles run riot in our present tariff laws. Now that you have declared yourself a protectionist, however, we will not ask you to act as if you had never crossed to be a free-trader. We should like you to study the life of Sir Robert Peel. But so will be content for the present if you will merely insist that Congress shall squeeze the sheer robbery out of the schedules, although the real protection remains. All you have said since Election Day indicates that this is your purpose. Since you have progressed thus far, we have our hopes concerning the next step.

Frankly, again, we could wish there had been, in your campaigns for the nomination of your party and then for election, less apparent dependence on the help and favor of your predecessor. It were, alike to your rivalry with other leaders in your own party and to your contact with the candidate of the opposition, a character not unaccomplished in our history. That Van Buren was similarly championed has not been to his credit with historians. But we Americans understand personal loyalties, and respect them, too, when they do not mean disloyalty to principle or to us. Let us feel that in office you hold yourself

responsible only to us and to principle, and we will not ungrudgingly keep you in mind of the manner of your elevation. But we do not envy you the difficult choices you will have to make between independence and gratitude. There is but one safe rule, we think. Do the right, and be careless of interpretations. We shall probably understand and approve; but since you are only one man, charged with the interests of millions, it is not justly of the first importance whether we do you justice or not.

Frankly, again, we do not like your apparent participation in an insincerity which your party has too long practiced successfully. Every four years it goes before the country with words which can only be interpreted as a demand for interference by the government of the nation between the two races now living together in great numbers in the Southern States; and yet, though in full control of all departments of that government, your party takes no such action as it seems to demand. We could disapprove the practice as barren, since it deceives few; but lying is objectionable in itself. It is unbecomingly in this instance to the intelligence of the country, and particularly to that of the unfortunate race most concerned. We believe you will in time set yourself against this practice.

For of the things we like there is none we like better than your impassioned declaration in the heat of your campaign that you did not wish to be President of half your country, and your decision to break all precedents of nearly half a century and go and offer yourself in person to our fellow-citizens of the South. We cannot help thinking that your thorough awareness of our place in the world as one great republic precluded you to this malice and rancor. We cannot afford to keep a Poland, an Ireland, in our system. But sheer sentiment played its part. You would be rid of the dominance of "old unhappy, far-off things." You know already how warmly the South responds to your challenge. We think we can assure you that your course has alienated no Northern friends worth keeping.

Of course, the problem of the African in our body politic, as in our industries, our social relations, remains. You do not, we are sure, fancy you have solved it; nor are we ready to tell you how to solve it. We are not at all sure there is any solution, and fancy it may be misleading to use that word, or "problem" at all. What we have to do with is a situation, a condition, desperately permanent, yet measurably changing and changeable. No mere inequity will transform it. Evasion and dodging will not avoid it. Violence usually heightens the difficulties inseparable from it. It will always be in your power to stir its embers into angry flames; your power to alter it for the better is doubtful. We commended to you, therefore, the spirit and the methods, the infinite patience and sweet reasonableness, of that our strong our predecessors who did, in fact, nevertheless deal with this perplexing situation more boldly than any one else ever did. You are less fortunate than he, in that in kind it presented a reasonably plain question of right and wrong. You are more fortunate in that you can freely take counsel with the true and accepted representatives of both these two great masses of human beings, who find their destinies linked together under one flag. We are confident that at

least you will not, by flying in the face of facts, and contradicting racial human nature, aggravate what you cannot alleviate, merely disturb what you cannot change; yet that no force or agency which makes for human progress will find cause to upbraid you for coldness or neglect.

We are glad you have been a judge. Granting your concentration instead of ambition, we think you will find that to do justice among men will be your most constant function, though you wear no ermine. Our hope is the greater because you have propounded no theory of life, profess no allegiance to any one principle in your own life, but have merely risen from task to task by virtue of efficiency and good nature. You will not set *abster dicta* above decisions. The case itself will be your business, and you will wait for cases to come up before you decide them.

In nothing will that habit and procedure serve you better than in your effort, following your predecessor's lead, to make government stand for right as between man and man, class and class, force and force, in all its relations to our upspringingly complex industrial system. To proceed from one specific evil to another, to formulate no rules not based on actual experience, to try no new experiments—to go on step by step—this, simple as it seems, is the sole secret of England's success in free government. She arrives at generalizations only by amassing precedents. Her genius is the distrust of genius, and her caution and foresight consist in keeping pace with the demands of her civilization, not in running ahead to meet them.

It is better to go slowly than to go wrong. You do not possess, we do not think you imagine that you possess, the colossal genius to direct into new channels the immense social forces now contending on this continent as on others, to devise and impose a new plan for producing and distributing wealth. But you have the training and knowledge to correct abuses of the plan now in operation. At many points we have broken with the individualism of the past, though we once thought it the essence of our democracy. Perhaps we are moving toward socialism. If it is the best and final form of society, however, we will attain it without forcing our pace. We do not know our goal, and must yet hold fast to all that has proved soundest in our past experience.

Your limitations, therefore, commend you, Mr. President. Our greeting is the more cordial because we do not take you, and you do not take yourself, for a man of destiny; because we are not moved to make our salvation an violence.

Nevertheless, we commended to you all the inspiration to be got from considering the magnitude of your trust, the terrible weight to which you are lifted up by our will and choice. Your station is like Caesar's, or Charlemagne's. It is not less because railroad and steamship, electricity and the press, bring far things near and make the mysterious commonplace. Because you hold it, Europe and Asia are daily mislead of you. Maintain it, then, so we have no doubt you will, with dignity, and be conscious always that the great mass of your countrymen, of all races and parties and creeds, know instinctively the line between that criticism and opposition which a republic permits and that which patriotism sternly forbids.

Good morning, Mr. President—and good fortune!

# TO WILLIAM H. TAFT: GOOD EVENING

Good evening, Mr. President.

And pray believe us when we assure you of the same hearty good-will with which we bade you good morning four years ago. You were then taking up the most difficult of roles, and we sincerely wished you well in it. To-day, in laying down your great office, you are taking up a rôle almost equally difficult—that of a private citizen who has been President. In that rôle, too, we heartily wish you well.

More than that, Mr. President: the good-will of a single journal is not important, but we are also convinced, strange as it seems in view of the overwhelming character of your defeat, that you still have the good-will of the mass of your countrymen. Not of all, of course. You have been assailed with almost unexampled bitterness, and we cannot doubt that a considerable number of your assailants sincerely felt the animosity they expressed. Perhaps we should go farther still and concede that this animosity can by no means be attributed entirely to personal disappointments and resentments. Much of it doubtless comes of a respectable and entirely disapproval of what, as President, you have done and failed to do. Nevertheless, we are quite sure that in respect of the real feeling of the mass of your countrymen toward you the tone of the press and other organs of public sentiment is a better criterion than the returns of the election. As you fortunately possess a sense of humor, we venture to assure you that we, the people, have voted you out of office with much the same friendliness with which we called you to our highest service.

Here, you will agree, is matter for reflection. An epigram promptly suggests itself: The man is popular, but not the President. But we do not like epigrams. They get rid of difficulties; they do not solve them. This one does not explain the disappointment of your administration. For it has been a disappointment, a great disappointment. With your admirable candor you have frankly told us that you yourself share with us all precisely that feeling about it.

Why, then, has it been a disappointment?

Assured of our liking, you did not resent our equanimity of the barest view of the matter. Indeed, you here came near taking it yourself, for from the beginning you have expressed doubts of your fitness for the Presidency, along with a preference for another kind of public service—namely, the judicial. Looking at the matter broadly, we feel bound to agree with you, though we nevertheless admit rather than merely deprecate the several decisions you have made in conformity to your own self-knowledge; for we believe that you took the Presidency, as you took the governorship of the Philippines, from a sense of duty and not from preference. Still, we do agree with you, and mainly for the reason you yourself have given—to wit, that you are not a politician.

Do not mistake us; we mean no flattery; we use the word in its proper sense, and not at all as a term of reproach. For four years politics has been your business; and it is not a low business. It is really a high and noble business. That low men, governed by low motives, constantly engage in it does not prove the contrary. The show of political skill by such men—the Cardinal ASTORIAS, the MARSH, the BURNS and QUINCY and PLATTES—make no case against the splendid use of it, for the welfare of great communities, by the CAVENS and BANCROFTS, the GLADSTONES and JEFFERSONS and LINCOLNS.

That skill, that art, for it is an art, you clearly have not possessed. The want of it is quite as apparent in the most praiseworthy as in the least

defensible of your Presidential endeavors. When you set yourself to establish the entirely sound policy of reciprocity with Canada, you defended it with an indiscretion of speech that potentially helped its enemies to defeat it. When, with the best of motives, you essayed to conciliate the South, you fatuously continued to listen to counsels which you should have known would be fatal to that patriotic enterprise. Worst of all, after fully committing yourself to the plan of an honest Republican revision of the tariff and leading the country to expect, as you yourself expected, that it would be a revision downward, you put yourself and your policy into the hands of men whom every instinct of a true politician would have prompted you to distrust. Then you capped the climax by accepting, at the worst moment, the worst conceivable advice, and in violation of your own good nature, your own sense of justice, you used your power of patronage against men who had done you trust and in behalf of men who had undone you. It was a thing to make the angels weep. We cannot forbear reminding you—though perhaps you never knew it—how, at that crisis of your career, we fairly went on our knees to you to take the opposite course.

It was lamentable. To great numbers of your countrymen it was also the cruelest of political surprises. For they had known you as an admirable judge; competent critics have said, a great judge. But to review action judicially, justly, is one thing; to use good judgment in the stress of action is another thing—and the higher of these two gifts you have not displayed. You have also failed to display certain other gifts that go to make a great Executive, a great man of affairs, a great politician. You have shown good sense, but not inspiration; sound principles, but not the grand style in presenting and defending them; you have the power of clear and reasonable speech, but none of the eloquence that stirs the blood and moistens the eyelids; you win men's liking, but not their devotion.

And yet, by the irony of fate, it was your lot to face a situation from which only a very great politician could have emerged with credit! You were the leader of a party which had lost its pristine virtue, which has fallen under evil influences, which was already breaking into bitterly hostile factions. You were the chosen heir of a great political character, who thus left you to face the dangers he had himself avoided; of a man who, having seen the wind, permitted you, in the name of friendship, to reap the whirlwind.

Well, you have reaped it; in the language of the street, which even SHAKESPEARE sometimes found indispensable, you have "got what was coming to you." Your party is disrupted. Your administration is accounted a failure. And the man whom you thought your best friend, and who had the most to do with your elevation, has sought to win his own way back into power on the strength of your discomfiture!

Why, then, do you ask, are not we also, and others like us, since we began as your good-wishers, now reproaching you! The best answer, Mr. President, is the smile on your own lips, the twinkle in your eyes, the undiminished sanity of your entire deportment. You have lost, but you are a good loser. You have been humiliated, but you have not whined or whimpered or sunk into melancholy. Best of all, you have not sought to throw the blame on your associates and subordinates. If you have failed as President, nevertheless, as an American man—

But no, the epigram is still misleading. Even

as President you have had successes. Even when, as President, you have seemed to fail most obviously, there is room to question whether the failures may not have been in some measure only apparent, only temporary. You did not persuade your party to revise the tariff honestly; in the crucial moments of that struggle you were pitifully hoodwinked. Nevertheless, you have faced the issue, you have not run away from it; and therefore the reform is imminent. In that regard the outcome of your leadership still permits, as its beginning suggested, a comparison with Sir ROBERT PEEL'S. Sincerely, you have failed, too, in your still more commendable endeavor, steadfast and long continued, to quiet the mood of wild expectation in which, by the extraordinary vagaries of your predecessor, your countrymen had been left. That mood still prevails; there is still danger that it will, before it wanes, do some damage to our institutions. But your steadfastness in sanity has not been altogether wasted. What is left of your party still stands for preservation and not for destruction, for sense and not for sheer and unbridled impulse. Even in the midst of your enterprises, and the boldness, you have not failed entirely. The arbitration treaties are indeed concluded; we do not wonder that you hesitate to sign them. But they are not dead. It is quite believable that a century hence they will be accounted the beginning of the world's permanent peace. The glory of it will be America's, even if it is not yours.

In all probability glory will not be your portion, Mr. President. We are speaking with entire candor and that is our impression, as it is also, quite likely, your own. Still, we know what change time can work concerning the esteem of Americans for their Presidents. It is even now working a great change concerning the reputation of your unfortunate Ohio predecessor, President HAYES. To the multitude his name is still a signal for ignorant depreciation. Nevertheless, to the trained and competent historians who are beginning to review his administration he appears more and more as a man greatly underestimated, as a President who, notwithstanding the cloud which will always rest upon his name, rendered to the American people services that are simply incalculable. He was the true initiator of civil-service reform; he was the first President after LINCOLN who honestly tried to treat the Southerners as his countrymen.

But we forbear, Mr. President; the worst of Job's afflictions was his comforts. What we had in mind to do was not to offer you smelling-salts, nor yet to read you lectures, but to make you our respects.

You have chosen, wisely we think, to become a teacher of young Americans, and you are amply equipped for your new duties. You will not, we are confident, teach them bitterness. You will not only their "white shields of expectation." You will, on the contrary, try to prepare them to do their best cheerfully, in all circumstances, for their country. Nevertheless, there will come at times, in spite of all your good-nature, intervals of austerity. For you have walked the heights of human destiny; you have sounded the depths of human weakness and depravity. Sometimes, to leave your smile, you will wear that air of "grave and melancholy reflection" which MACCABAY praised in Theophrastus. And it will be well. It will be well that these young minds shall learn from you, though you will not wish to teach it, something of the human weakness that lead to great glories, something of the helpful human passions that keep us all, nations and men alike, forever on the verge of tragedy.

# OUR NEW INDUSTRIAL CONSERVATION

BY ROBERT SLOSS

ILLUSTRATED BY RAYMOND L. THAYER

This is the last of three articles in which the author deals with various aspects of the movement for improving the efficiency of labor and regulating its relation to capital. The first and second of these articles appeared in the issues of "Harper's Weekly" for November 30, 1912, and January 25, 1913

## III.—"Humanizing"—An Overhead Expense

**I**N INDUSTRIAL "peace at any price" is not what we want. We want peace at the right price. None of us are afforded to be shortchanged if we want to secure general industrial peace at anything like the right price. It has been said that the real question between capital and labor today is not how much wages shall be paid, but whether those wages are a fair proportion of the earnings of the business. It is a vital public question. Strong combinations of labor run exact from capital more than the business will stand. That would mean speedy ruin, were it not possible for strong combinations of capital to pass such inequalities on to the public.

It is an universal habit to explain all sorts of industrial ills by the disease, "Corporatism here has no soul." Our only national method of furnishing big corporations with a soul has been expensive and spectacular lawsuits in breach of law. These are always accompanied with such political heat, and most people also are trying to do a legitimate business feel that the dust has got into the public eye. Why should America be afraid of anything simply because it is "big" they say. "American should be able to tackle the biggest proposition." Secretary Sargent has recommended a proposed Federal Commission on Corporations with supervisory powers, on the order of the Interstate Commerce Commission, of big business. From the president of the "Steel Trust" down, have declared themselves in favor of public regulation, even to the fixing of prices. They suggest that a body of independent, respectable business men be selected to settle disputes between corporations and the public, and that corporations be entered into a permanent federal court, appointment to which shall be no such employees as specialists in the Supreme Court of the United States.

Our attitude toward corporations has not been constructive. If we discontinue suit after another we have simply made capital "wary" without settling the conditions of doing business. "Why don't you dissolve the business Trust?" asks capital—and with reason, for in our individualistic prejudice and superstitious stupidity we have forgotten that corporate labor also has a soul. So we have some capitalists because about this time they are buying space in the newspapers to advertise the doctrine that "trust-nationism must go."

We have managed to get ourselves into pretty much of a squeeze about industry. But public opinion has not been tapped at the cost of thoughtful efforts to abolish combinations of either capital or labor. Each one has outgrown modern industrial conditions. Ancient industrial conditions were ripe in the days of the "cotton mills." They were the first "closed shops." They differed from the modern ones in that they were residentially with employees and employers were working together harmoniously for the public welfare. Can we no longer modern conditions as to reorganize industry along this spirit of the medieval guild?

The answer can come only from the special study of specific conditions. The study need to be impartial; attention, if any, must be made upon a business basis. The present study of investigation in the interest of the public good is being hindered by hard-line business men, not in favor of the moderate labor leaders, nor intimidated by popular clamor for low prices. It is time going to other industrial conditions everywhere need pay his fair share of the expense.

It is for example it is true that the operators in our woolen mills and cotton mills are not receiving a living wage, we should see that they get it. If we are to have peace at any price, it is we should pay a little more for our textile mills. The policy of a protective tariff is that "the American workmen need not compete with the power labor of Europe." A tariff on textile mills that before the Lawrence strike the operators in our cotton mills were receiving less than is paid in similar mills in Europe.

It makes no difference that the Lawrence strike was "unfair foreclosures." Foreclosures are allowed but by our cry of "no protective tariff" and we are committed to the policy of assisting them into

American shores. We cannot do that merely by "keeping order." We ought to know, for instance, precisely why "ignorant foreigners" is the usual reason still given. "Cosaak, Cosaak" is the motto of the "Consolidated of Pennsylvania." We need to know more about costs of living, domestic environment of workers, and earnings of the business, not only in the coal region but in all industries, so that we may set what is a fair price for us to pay to prevent "paper labor" in this country—and if we can't get a fair price otherwise, we should use the "police power of the state" to secure it in the interests of the state.

Now years ago a family of ignorant foreigners, just landed and passed through old Castle Garden, were walking up Broadway, New York. The man came first, smoking a pipe; after him trailed his wife leading a child by the hand and carrying a heavy trunk on her head. Suddenly they encountered an Irish "cop." Despite difficulties of language, he made it clear to the man that if he wanted to walk through the streets of an American city, he must abandon the trunk himself. The ignorant foreigner was "actively within his rights." Probably neither he nor the "cop" knew that. The foreigner relieved his wife of the trunk. He had been taught a valuable lesson about American institutions. The "cop" had interpreted "without due process of law," the "police power of the State" to include something more than the mere keeping of order.

The Supreme Court of the United States interprets it, and has sustained under it recently the right of the State to abrogate the common law doctrine in damage suits, in order to put an end to the

it will be shown absolutely out of work. It will mean that the "free public" will have to pay considerably more for the burden of unemployment than of peace.

If we need a minimum wage law to prevent pauper labor we need all the more a maximum wage law to prevent "gagging." If we are already under heavy expense to "prevent pauper labor" and to "assistive foreigners" we should be able to say, when the locomotive engineers and the Brewster demand \$22,200,000 a year. "You are getting on pretty comfortably as it is; you can't have a raise unless you prove to us that the business will stand it and that the additional cost of it won't be passed on to us."

On the other hand, the match industry furnished a splendid opportunity for the "police power" which hardly interfered last year. By that time we had piled up a shocking record of disabilities and deaths from "phosphy jaw." There is only one way to prevent the match worker from contracting it. All nations but our own had taken that way and excluded white phosphorus from the industry by law. The "Match Trust," which controls sixty-five per cent of the industry, was willing to retrocede its patent rights to the process that would make this possible. Ninety-five per cent of all the match factories were willing to abandon the old method. The remaining five per cent held out for it because it was a little cheaper. But still Congress stepped in with the "police power" to accomplish the abandonment. The additional cost of this change to the public amounts to about five cents per factory per year.

Here is an example industrial concentration at its best—less than one cent per capita yearly, not only to save the workers in the industry, not only to save ourselves from the cost of their inevitable illness, blindness, and ultimate poisoning, but to save the babies in their own homes from the danger of getting hold of these deadly white phosphorus matches and causing them, almost inevitably from their own stupidity, as abjectly heavy.

Yet for upward of a quarter of a century, despite the example of other nations, we were unable to seize this opportunity, because capital was too busy carrying on the carrying on of the business, and labor was too busy striking for more wages, and the public was ignorant and indifferent regarding its approach. Can we then put a soul into those three great pillars to industry—capital, labor, and the public, with a common spirit of accord? That is the ultimate great question to be answered by any study of investigation into the conditions that confront us.

A partial answer has already been furnished by the private initiative of some half dozen men, the majority of them the largest. They, they represent but 500 of the nearly 200,000 men in the United States who are employed in the country, but their example and the boldness of their efforts make an excellent book out of business conditions here. That is what a man who has helped to organize some of our largest unions says. He says that business is in need of to-day. It does not mean altruism, philanthropy, or charity; all that is necessary is that it be understood that these employees have begun the study and development of the human element in industry.

The fresh purpose is to conserve the best working condition of the human element in the industry, and to improve it, has been made on the purely physical side. Progressive employees not only provide themselves with the best of the physical law requires, or more so, but they carry attention into the private life of the working community. They are providing proper housing for their workers. They are better taking instances where this sort of "colonizing" has been done by employers. But it is not enough to have a factory in a town where workers work, where the most amicable relations exist.

The company has recently acquired land on which it is erecting modern houses for its employees. Most of them now commute from the city, consuming energy and wages. Hence better than can be obtained in the city and at lower costs will be a high level of work and the "police power." The fact that it is not to be offered in any other way. The power is to conserve the power to produce.

He made it clear to the men that he must shoulder the trunk himself

useful and embittering fight struggle between capital and labor. But though the Supreme Court may be inclined to interpret the "police power somewhat broadly, it is not the law "up to" the state to require that power at its capitalistic body. Only Constitutional Convention made provision for a minimum wage law that would authorize the legislature to require hours of employees and employers to say what that wage shall be. The latter adopted the new constitution last fall, and this is the first state to follow the constitutional example of the British Parliament. But who raises the new question as to what minimum standard of efficiency in the worker is necessary to earn the minimum wage. If it stands and is established, those who are unable to come up

with the working community. They are providing proper housing for their workers. They are better taking instances where this sort of "colonizing" has been done by employers. But it is not enough to have a factory in a town where workers work, where the most amicable relations exist.

The company has recently acquired land on which it is erecting modern houses for its employees. Most of them now commute from the city, consuming energy and wages. Hence better than can be obtained in the city and at lower costs will be a high level of work and the "police power." The fact that it is not to be offered in any other way. The power is to conserve the power to produce.

offered by the company. The undertaking amounts to a voluntary raise in wages.

Medical attendance in both factory and home, lunch rooms, rest and recreation rooms, baths, gymnasia and physical culture, and the active encouragement of athletics and outdoor sports are features of the working community that is ahead of the times to-day. None of these things are free, and great pains are taken to make the worker feel he has a financial interest in them. Experience has taught that otherwise he will have nothing to do with them. If they could be given free, it would still be good business. Says Congressman Redfield to his fellow-manufacturers: "Does it not occur to you with anything of a shock that we are all careful to have a machine heavy and strong enough for its work, but that we rarely think whether a laborer may have some heart trouble or some other physical weakness that makes him unfit for the heavy lifting we ask him to do?"

The principle suggested by the question has been carried several stages of progression further than mere medical attendance. Campaigns of instruction in healthful living and domestic science are features of many industrial communities. Two charts for injury during work were recently made upon the treasury of the State of Washington under the new law. Upon investigation it was found that one man had trimmed a corn too deeply and then wrapped his foot in an old sock. Infection had followed. The other man had suffered from ptomaine poisoning as a result of eating soup made from starchy peas. Both cases were thrown out. It would pay in the long run to teach such people, perhaps "ignorant foreigners," something about aseptic handling and pure food. A large life-insurance company that does a big business among the industrial classes has found it good business to start a great campaign of instruction in disease prevention. It reduces death claims, and other companies are following suit.

Ignorance is industry's arch-enemy. A workman may know just enough to get through his day's task, but must know something more to be efficient. That is why no employer has undertaken educative work, not only to improve the physical condition of employees but also to promote their intellectual, moral, and spiritual outlook. Clubs are formed among them for frisking intellectual recreation and social intercourse, such after the manner of the modern social settlement. Night schools are provided where both general and special knowledge may be acquired. One large department-store even has carried this work to great lengths, providing means for his employees to learn about anything from stenography to music. It results, of course, in cash girls and counter-jumpers leaving his stores for higher spheres, but he feels that while they stay they give better service to him and his customers.

One of the most valid complaints against trade-unionism is its failure to set any standards of skill or efficiency for its membership. It is more concerned about limiting the number of boys that may learn a trade than about the technical education of its own offspring. An example of educative effort on the part of labor is furnished by the Workmen's Circle, a national organization 80,000 strong. It has \$200,000 invested in government bonds. It has established Sunday schools where 12,000 children

Medical attendance, baths, gymnasia, are features of the working community that is ahead of the times

members are taught by the Ferrer method, that economic conditions are all wrong and that the strike is the only means of righting them. They against this stand the splendid technical schools long established by several of the large industries where skill is essential. In these the children of employees may be trained up to take their fathers' places and to meet the demands of expanding business.

Technical instruction as a business proposition has taken a great hold also outside the industrial field. The American Bankers Association is preparing to spend money to teach scientific farming the country over, as some local bankers' associations have been doing and West to supplement the inadequate efforts of the States. Three-fourths of our railroad mileage is owned by companies that are actively educating the farmers along their roads. The railroads want bigger crops to move and the bankers want more money to handle. One of the largest mail-order houses has just put up a cold million dollars to establish one thousand trained agriculturists in as many counties of the country to improve the yield of the land by instruction to farmers. The firm frankly says that the more money the farmers have the more business they do with them, and they are ready to put up another million if the first does not.

Do these humanizing activities in industry, after all, answer the assertion of labor that it is not getting its fair share of the product? Large employers, led

by the great railroads, have voluntarily provided savings and loan systems, insurance schemes, systems of compensation for length of service, including retirement on pension. This is the American approach to the problem which England has sought to solve with her strike-protest, and England and Germany with compulsory state insurance. The American Telephone and Telegraph Company and its associated companies has just established a ten-million-dollar fund, the benefits from which will be enjoyed by their employees entirely without assessment. The United States Brewers' Association is about to adopt a most ambitious program along these lines. The National Electric Light Association has inaugurated one no less ambitious. Of it, President Inghill of the Association said, significantly: "The best test of this welfare work will come when we propose to include these various matters in our cost to customers, which has to be passed on by the public authorities." It is, after all, the public that must pay for the rehabilitation of industry, and the public must stand outside of seeing that it pays on a business basis. The public should insist on co-operation by which all parties interested will enjoy the benefits of the business. That was the situation during the regime of the guilds of the Middle Ages. Their spirit was "price of production"—employer and employee working harmoniously together to give the public its money's worth.

### SPRING STYLES IN MOTOR-BOATS

THE SEVENTH ANNUAL MOTOR-BOAT SHOW RECENTLY HELD IN BAYVIEW SQUARE GARDEN, NEW YORK CITY, WAS THE MOST IMPORTANT EVER HELD IN THIS COUNTRY. EVERY STYLE OF GREAT RENOWN IN MOTOR-BOAT EQUIPMENT WAS ON VIEW, FROM A SHIP 61'50" (ACTUALLY 50') IN LENGTH TO "SPRIT SPINNERS" 14'6" WITH 27 H.P. THE HARBOR WAS TRANSFORMED INTO A GREAT PIER, WITH A REPRESENTATION OF THE OCEAN LEAVING MORPHED ONE ON EACH SIDE. THE DISPLAY OF THE SPRING LINE FORGED THE PROMENADE AND BOATWORK OF THE TWO MAIN SHIPMAKERS, AND HERE WERE EXHIBITED ALL VARIETIES OF MOTOR-BOAT ACCOUTREMENTS.

# THE MOTOR-TRUCK AND THE FARMER

BY THADDEUS S. DAYTON

**T**HE Commission of the State of Kansas completed its report on the returns for 1912 a few weeks ago. In it there was very striking evidence that the motor-truck is now being used on farms in Kansas faster than there were four years ago. 18,000 more motor-cars and motor-trucks, and 20,000 more motor-trucks, were sold in the past year alone than the state had 18082 horses. As short a time ago as the summer of 1908 there were 1,200 motor-cars and tractors in all Kansas. Now the number is very nearly ten times that, and it is said that since March 1st, when the assessment was made, 5,000 more and motor engines have been bought by Kansas farmers.

Kansas is typical of all the Western states in the way in which her people have taken to the motor-truck for agricultural purposes. The Western farmer first bought a motor-car partly for the pleasure of himself and his family, partly for convenience in getting into his market and landing farms, and partly to save his horses. Being a practical man, fertile in expedients and with more or less knowledge of machinery, he quickly found it possible to make use of the motor of his new possession as a power generator in a score of different ways. He moved wood with it, chopped feed, shelled corn, pumped water, ran his alfalfa tractor with it. It was a very useful portable power plant, a thing to forty-horse-power engine on wheels. Though he had bought it chiefly for his own use, keeping no horse about keeping it at work all the time, and his lack of carrying small loads of crops and possibly for running a mill, he soon discovered that it became immediately apparent to him. Unless his farm was too small to make it practicable, in a year or two he was carefully looking into the merits and possibilities of making a substantial investment in one, keeping his original machine just in case.

All over the West the faithful horse is being superseded in this way. The motor-truck is doing the work of about six per cent. a year. He has been found an unnecessary expense except at certain points here and there in the farm and on the highway. It is the most progressive farmers that within a very few years there will be nothing out in the open that a truck or engine cannot handle more cheaply and better. Already traction engines are doing the most of the plowing and doing it far better, breaking ground that is too hard for a horse to break. When it comes to speed, for long journeys or short, about the farm or around the neighboring country, or carrying heavy loads, there is no comparison. The horse is so inefficient that the Western farmer has no hesitancy in getting his vehicle to begin with to be completely supplanted.

The farmer has this advantage: he is his own chauffeur and his own mechanic. He has no chauffeurs, and few cases where his truck or car is not operated to perfection and run at the minimum of cost and with almost no repairs at all. The manufacturer has found these new patrons as intensely satisfied. Comparatively these country folks to the west of the Mississippi River are the best buyers of motor vehicles today. A farmer must be a practical man and a shrewd one to have a truck or car of any sort. It is with him but a question of pride, half of good judgment, and the other half of common sense, to buy such more profitable and much more pleasant.

The motor-truck and even the ordinary car has made a great difference with the farmer boy. The farm is infinitely more interesting to him than the city. There is nothing that has done so much to arrest the movement of the young men on the farms toward the city as the installation of power trucks. Farming by the aid of machinery has this advantage to lose all its monotony and tedium. It becomes a fascinating pursuit quite as scientific as a great factory in a city, and the boy on the farm has now possibilities of efficiency output, production at a small percentage of the ordinary cost, and inspired methods of marketing. He has a vision of a life many times larger than his father's and sees himself a great factor and a man of fortune in the new mechanical agricultural world.

A great proportion of the motor vehicles now sold through the West are for the farm. The cities and large towns have long since had very nearly their full complement of pleasure automobiles, and while there is a steady market for cars the real business is in trucks. As nearly as the manufacturer

can figure he gets the cars west of the Mississippi are trucks for serious agricultural use or automobiles that are really farm cars. These range from the inexpensive passenger car for five to six tons and the more expensive touring car for eight to ten tons in service, at one thing or another, all day and will last into next spring, and the motor farm wagon that will haul a ton, or make quick time at doing it, up to the twenty-ton tractor that are being used in Arizona and are proving immensely successful.

The farmer of the West is not satisfied with one truck. He usually has several. In addition to the stage of a single car or truck and some money in a "fleet," such adapted to some special purpose. Along with a motor truck he has some on the farm for the part of such over to save time and labor cost and eliminate hot action as much as possible. Thus the progressive man nowadays who has an unlimited number of acres gets a traction engine for plowing and for hauling his wheat, or whatever his crop may be, to the railroad for shipment. His may be two tractors, but still another truck in addition for carrying his produce rapidly. In any event, he will have, besides, several smaller cars and a runabout for his own use in driving his fields and entertaining. Nobody walks over a Western farm in these motor days. It takes too much time and uses up altogether too much energy. The big and powerful require too much fuel, and the smaller and lighter vehicles make the trips to market, yet still lighter vehicles carry the workers to and fro and run the crops, and they are not so expensive. They can be saved by a hurried trip into the nearest town.

The saving is tremendous. With his motor vehicle the farmer can do his work in half the time and with half the cost per acre could not be pushed before him. Any good motor truck now does it. It is fully forty per cent. less than the horse and man to plow ground that is too hard for horses and men to turn up without immense labor.

Work one finds farms today with three or four horses, where four or five years ago there were thirty to forty horses and men. The farmer has found that the motor-truck is doing the work of about six per cent. a year. The extra tax laid upon the charge has come a marked improvement in the quality of farm-hands. The old yard rule is being quickly replaced by the one which is not only an agricultural expert, but a skilled mechanic. He is a man of the normal labor that it was. There is practically no more brute force and sweat left about it. It is the interesting business of machinery, the power itself doing the real work, the man having to guide and control. The new farm-hand costs the farmer more money a month but he does twice or three times the work of his predecessor. What is more, he is satisfied. A day's work does not wear him out. After his day's work is done, in place of sitting idle around the cottage he takes out into town for a walk in the middle class. The motor-truck has done so much to improve the condition of agricultural labor that the farmer who has not a truck of any kind is a very difficult thing these days to get reliable and efficient men. The men worth while will not work for him, they will go to seek their own with the heaviest of the labor market.

In a word, the motor-truck is rapidly becoming a part of the newly developing, progressive farm. The farmer now has a telephone, bath-tub, piano, radio, graphs, and a lighting plant. The motor-truck is becoming an adjunct to all these. It provides the cover for the sheep, effective, and reliable power. The farmer looks upon himself as a manufacturer. If he is not, he is sufficiently big in a business way and reasonable, he has a frame building in a central location, his office, with roll-top desks, a stenographer, a bookkeeper, and a private telephone over his head. He simply says: "I will have a truck of any kind, but I will have it in his own little way, watching his machines as carefully as if they were all gathered together under one roof. He "spontaneously" in cost production precisely as if he were running a factory.

Of course comparatively few farmers, even in the most progressive sections, have managed to build up a large business. But those that may have done so are working along in that direction and, if need be, borrowing money to make payments on power wagons of this kind. They are not so afraid of the motor-truck as no longer grow crops high-priced and then bewail the price he gets from the middleman. Nowadays he is constantly studying two things: first, to lower his

cost of production materially; secondly, to get his goods to market more cheaply. The motor-truck has proved that it can solve both problems for him, and the more the goods he is increasing beyond all probability, the more he is increasing his local agricultural conditions everywhere and increasing new trucks and wagons to suit special needs.

In the question of getting to market," as well as managing his own affairs, the big or little more economically, the motor-truck is starting a revolution. A vast amount has been done for the past three decades as to better methods of getting to market, but the days are gone to date, when the rail-line country is considered. Close to the big cities and cities from metropolitan to metropolitan there are few roads, and the situation, it must be acknowledged, is steadily improving.

But there still remain thousands of miles of wretched rural roads. It is these that worry the farmer, and naturally. They are a great obstacle to his prosperity. No matter how able he reduces costs on his farm, he cannot be fully successful if the roads from his lands to his trading town are in a wretched state.

Still now the farmer has been used to growing—effectively. Today, with his expensive motor-trucks behind him, he hesitates. The investment of the farm is beginning to grow so great that the farmers have a new power. They have analyzed hauling costs and find them running high. With even moderately good roads, the cost of the farmer's hauling expenses of transportation will be so reduced that the value of farm land will rise appreciably. The farmers who have been buying land for a city or a town, or who have been so slow to get a stake that they will not tolerate any further delays. Thus the question of good roads is not, as it was in the West, coming to the issue. It is essential that it should.

For this much has been discovered by the analytical farmers who have traced themselves out of the slough of debt and out of the city mortgage days and are now prosperous in the new motor-truck era: on the average in this country it costs twenty-five cents a mile to haul a ton of produce over a good road, and it costs eleven cents per mile per ton in Europe. The average load of the American farmer from his fields to his house is some miles. The extra tax laid upon him is, therefore, very evident. On the average a ton to a ton and a half is a fair production for an acre.

With roads approaching the excellent highways of Europe it would be quite possible to make these transportation costs down to the figures of the European farmer. Until he becomes a through-passed business man and a keen money-maker, with motor-trucks taking the place of horses, the American farmer never seriously fought for superior roads. Now he sees that his property value is being diminished. Experts calculate that with proper facilities of haulage the American farm will be worth ten dollars to twenty dollars an acre more. It is this realization that is the great reason why the farmer is building his own splendid national highways which will eventually connect up all sections of the country with a series of perfect roads.

Out in Nebraska there is a country that used thirty horses. It had a four-horse team, three two-horse teams, and four one-horse teams. The owners found that a single motor-truck could do all the work of this large stable. The truck was installed and had a motor farm of four or fifty miles each day over country roads, hauling fifteen tons of milk and while it is not engaged in delivering milk, thirty-five tons of grain.

One's judgment farm is a broken truck which, with a trailer, carried fifty dollars in twelve hours by hauling twenty-five tons of corn over three loads. Three horse teams would have been required to do the same work. Yet another truck in the same region hauled 11,500 pounds of alfalfa twenty-one miles in the same time that it took a team of four horses to draw 2,000 pounds six miles. These figures are interesting and conclusive. If there were only a few scattered motor-trucks over the West they would not be especially significant. But if they were to be used as they are becoming almost universal among American farmers.

A Wisconsin farmer should be mentioned. He saw one of these trucks and he was very much interested. He bought a truck for a town twelve miles distant. Before he got this truck he had to keep three teams running and a driver to take care of them. Now he runs a daily run of sixty-two miles and his motor-truck has made it possible for him to dispose with four teams. And the work is done in half the time.

## A SONG OF VIOLETS

BY LOUISE COLLIER WILCOX

Here are purple violets  
Born to die for you,  
Born to grace my trinkets  
Born to die for you,  
Just when doubts all repress,  
Let them die this year,  
Here are purple violets  
Born to die for you.

They shall do as I would do,  
The trinkets you could  
Not a trinket is granted free,  
They shall do as I would do,  
Let them die this year,  
Live their little while,  
And then do as I would do,  
Do beneath your smile.

But from ashes odors the  
Of sweet violets dead,  
Sifted down the memory place  
Of the violet that has  
Will you not mind the signs  
And our words once said,  
What from ashes odors the  
Of sweet violets dead?

Dear, the world has been before,  
The black bones death to send;  
Sons are falling fast and sweet-  
Dear, the world has been before,  
What from ashes odors the  
If he break Louis' heart?  
Dear, the world has been before,  
The black bones death to send.

With each new height another picture presents itself

An evening stroll by lantern-light

# WINTER IN THE CATSKILLS

BY A. W. DIMOCK

**I** was midwinter when she came to us in the big city—the beautiful Southern girl from Alabama. We christened her "The Comet" on the day of her arrival, and were sorry the next day, the name was so absurdly inadequate. I introduced her in the snow in the streets, and she wanted to take a horseback ride out into the country of snow. When I refused to go with her she threw snow at me, and if she had had the least idea how to do it I might have been compelled to call on the police for protection. Two days later the snow in the streets had changed to sleet, and The Comet upbraided me because of it. Still I told her that I wished she was snowed up in one camp in the Catskills.

"Why not go there now?" she asked.

"Because you'd have to tunnel through banks of snow and climb mountains of ice to get to the camp," I answered.

"Well?" she replied, and, like the historical com. I saved time by coming down promptly. The next day we started for the mountains, and we slept that night in a small town on the Hudson River. When we left the train on the following morning, at a little station in the Catskills, the girl wouldn't trust us alone to lead up a trail. The owner of the village stables laughed when I told him what I wanted, and said:

"I couldn't get you through. You don't know what kind of a road that is."

"You'll have to try it," I replied. "You don't know what kind of a girl this is."

Then The Comet took charge. She was told her of the narrow road along the side of the mountain, dangerous even in summer, the drifts that might be responsible, and said she didn't dare to risk sending her over a precipice or leading her in a snow-bank for the night. The girl fastened her big brown eyes on his face, and began, reflectively, in her soft Southern drawl:

"I don't reckon I ever heard a man, down where I live, say he didn't dare do anything I asked him."

Then, apparently, "I never saw road snow before—"

There was an excuse for my writing any longer, so I went to the store and bought supplies for a few days' camping. By the time the goods were ready a double sleigh was at the door, with The Comet, strapped in robes, sitting beside the proprietor of the

stables on the front seat. He explained that he would drive, as he thought we would be safer with him than with his men. I looked reproachfully at the girl, and she had the decency to blush. There were two hot bricks for me of the back seat, but for those in front there was only one, since our driver seldom suffered from cold feet. Two shovels and an axe in the bottom of the sleigh attracted the attention of The Comet, who expressed a hope that she would have a chance to dig in the snow. The driver was able to comfort her with assurances on that subject.

For six miles the road had been traveled and the sleighing was fair. Thereafter the snow was unbroken, the road was a mere trail through the woods, and soon the horses were stalled in a drift, from which they turned inquiring eyes back upon the sleigh. We tramped and shoveled a path, while the girl, standing waist deep in the snow, tried in vain to coax her horses out of the robes which entangled her.

"Women are harder to manage than men," she whispered, as she waded in the horses, which had become restless and were plunging about. She waded there with the risk, mellow tones of her voice as she pulled and pulled the ice, and when I shoveled a way for the girl, she called back:

"What do you have about horses?" she was brought up with 'em."

There were more drifts, and then the road became a steep trail cut into the nearly vertical side of a mountain of bare black rocks. The trail was filled with snow, which sloped from the wall of rock on one side to the precipice on the other. In many places we had to level it with shovels, and often stand on the inside runners of the sleigh as we passed the narrow places.

Where the hill was steep and the road dangerous the driver walked ahead of his team, and his passengers scrambled along behind the sleigh. The horses, playful at the start, became serious-minded, and while the ice axe hugged the vertical wall of rock which rose beside him, his mate ran and retreated away from the back of the proprietor at his feet. There, when a foot of the snow here stopped over the bank, he rose straight up on his hind legs and, leaning away from the trail, nudged his fore feet over the back of his mate. It was the call of the girl behind the sleigh, "Steady, boy," that held the frightened stevedore until the driver could reach the horizon and lead the team past the dangerous point.

Many times we stopped to rest, and always I wan-

dered at the proprietor that had so long been hidden from me by the green leaves of summer. For a space our road lay beside and beneath a smooth wall of rock a hundred feet high, over which rills of water had trickled and turned to ice, until the frost of a winter, two hundred feet wide, had been formed of immense columns, girdled by great stalactites and fringed by huge icicles. The sun was so high in the heavens as it gale in the Catskills in midwinter, and although hidden from us by the top of the opposite ridge, its cold rays were reflected with dazzling brilliancy from the ice-bound cliff above us. For the first time since I knew her The Comet was quiet, and remained silent so long that I asked her if she was tired.

"Tired?" she exclaimed—and as she looked in my face and laid a small hand upon my shoulder, her lips quivered and tears filled her eyes—"tired, of the mountains, the snow, and this? I never dreamed of anything so lovely. I want to stay here forever."

There was a sympathetic laugh at the ingenuous enthusiasm of the young stranger, and the girl came back to earth. She was once talking over with him, which never ceased to hold with us stopped before the cabin of logs which we called our camp. On its north side snow was piled to the eaves, but the door on the south was nearly clear, and a big blaze in the fireplace soon drove darkness and cold from the cabin.

From the beginning The Comet took charge of the camp. She assigned rooms and appointed dishes, loaned the mule, cared for the horses, and in her spare time waded in the deep drifts, climbed hills, and slid down steep planes. She crept among ice-caves in the hollowed eaves of a ravine through which the brook tumbled, and I followed her as she wandered among stragglers and beautiful skeletons of bushes in thirty feet long, in masses that weighed tons. When the orbit of The Comet became too eccentric for me I persuaded the driver to trail after her, not to keep her out of mischief, but to save her from his company. The girl called me to account later, and when I had confessed the instructions I had given, demurely asserted me that he had carried them out conscientiously. For three days we persisted and stayed in the snow, free from care as the slaves in the West, and on the fourth came back to the bareness that grows upon most bare—in a city.

The consequence of this was a summer in New England and his sisters in the South, the glories of the North and never sees the living North, with its activities, closed masses. Making out from

Ice-choked streams and fields of dazzling white

Footstep of melted snow rush through the streams

An ice-encased waterfall by moonlight

clear skies; quick fountains springing from bleating stambers; roaring waterfalls rising out of shimmering snow; exuberant fish, herds of their kind, rippling trout, vegetation that grows visibly, and cooling breezes which make restless nights rare and snoring unknown.

I had summaged for years among the potterous peaks of the Catskills without knowing them. I had heard that the green leaves of spring, the fancies of summer, and the blazing foliage of autumn made up the beauty of the mountains. It was that midwinter visit which taught me that the best, excepting the evergreens, were but temporary veils drawn over the fascinating face of nature. For the first time I really saw the black, vertical walls of rock through which caverns opened and over which streams of water leaped. The new view of familiar cascades and waterfalls, heavily fringed in ponderous ice, fringed with fanciful designs and underlaid by massive monoliths built by the Frost King, was a revelation.

Now it is the solemn beauty of the silent woods in winter which irritates me irresistibly, and the grandeur of the snow-capped mountains that beckons me to their summits. The forest, which in summer hides everything within it, conceals nothing in the winter, and opens its snow the corner of every crevice that passes is registered, in characters which vary from the clay imprint of a mouse to the solid signature of a bear. The feet that show in the snow from behind a tree two hundred yards away can be seen, and the partridge

that flies from the thick foliage of the talus beside you finds no hiding place in twice that distance.

As you drag yourself up the steep bluffs, clinging to the splittings of maple or fragrant branches of birch, the slipping of a foot or the breaking of a twig drops you into a drift, out of which you crawl snow-covered like Santa Claus. With such raw height you scale, however beautiful it may be, another picture, never to be seen in summer, precedes itself. From every mountain-top there is spread before you a panorama of peaks and valleys, rock, forest and snow clad, or rock-creaked streams and fields of dazzling white; and of dark green patches of balsam and pine, in otherwise leafless forests. Even the outline of a building on some distant peak, or the fat-of-neck that curls upward from a locomotive, is powerless to plague your spirit, supplanted by the solemn beauty of the snow spread out before you. The peace of the wilderness presses you, the risk of civilization fades out of your memory, and you quite forget the service you brought from the city.

In the dry air of the Catskills one may be much alarmed by the thermometer, but the cold will not hurt him. I have seen the same man, working with bare hands, photograph snow-snow, some of which accom-

pany this article, while the thermometer marked twenty degrees below zero. As we waded through deep snow of clouded, ice-croaked rocks and hills, we wore canvas shoes that ching to the ice, and thick sudden socks which graduated our feet in zero weather and worse. With iceless feet our fingers and feet were pulled over our ears, we tramped the dry snow that crunched beneath our feet, waded through drifts in the valley, and climbed by ledges with no other danger than that of getting overheat.

The privation of winter in the mountains are of the hairless fabric of dreams. You may be fifty miles from a doctor, but you are five hundred from the need of one. Instead of causing any appetite with excursions, you bring to each meal a healthy hunger, born of exercise, fresh air, and freedom from care. It is in winter in the mountains that one can best learn the luxury of warmth of which a furnace-heated home never gives more than a pale imitation. In the early darkness comes in the mercury in the thermometer outside your door passes the zero mark on its downward course, you pick little sticks of Scotch birch, or hickory on the open fire. Then, as you sit in an easy chair, with a book in your hand, a pipe in your mouth, and on a stack beside you apples, nuts, and a jug of cider, you think with compassion of friends whose existence are cramped within the limitations of city life. Sometimes, as the clock strikes twelve, while you drowse in your chair, the silence of the night's night is broken by a long, tremendous roll, followed

Huge stalactites of bluish ice

by the crash of a tree-falls, and you dream that Herold Hudson and his jolly crew are at their games again, and wondering, wonder how much of the enormous ice came down with the avalanche that arrested you.

Even people become picturesque in winter in the Catskills. With each new fall of snow, men are out at dawn, with yokes of oxen, breaking paths through the drifts. Young children come down from the hills and for miles through the valley to the little school house in the woods. On an ex. stop, in a sleep, in pairs on a horse's back, or more frequently walking through the drifts on foot, these infants come, even in arms weaker, more faithful in their attendance at school than the average child of a city.

Some live long in the Catskills. One said last Sunday a man and his wife came wading through snow to our house. They had traced from the valley beyond by a mountain road. Their sleigh was buried in a bank of snow three miles distant, with a mile away their house was waiting as he dug out of a drift.

In the final struggle of the season, when softening spring winds warm rains upon hill and valley, they are sometimes seized by winter as they fall. These peaks are glazed with ice, horizontal bands beneath their borders; the rays of the rising sun light up a landscape blazing with gems which flash back the colors of the spectrum, from the red of the rocky, through tawny yellow, the deep green of the conifer, and the bright line of the alpine up to auriferous violet.

The solemn beauty of the silent woods

Familiar cascades fringed in ponderous ice

# Interfudes

## DISASTROUS

UNCLE JUD was enjoying his first experience in the line of military travel. For years the trains of the P., D. & Q. had thundered past his farm, and the old gentleman had watched them plunging madly ahead, confident of not one thing, that sooner or later something would happen to lead them to the ditch. He had often vowed that the Lord hadn't intended man to be whizzing along at so lively a pace, and added that he for one wasn't going to trust him by trusting his premises such to suchlike no rockers. But the years passed and the train continued to speed by, and finally Uncle Jud's loss of terrible consequences faded away, and now all that he had yielded to his son's frequent invitations to get aboard the Flyer, and come to visit him in the city. The train was thundering at a terrific rate of speed, and then the thing happened. An open switch turned the track that Uncle Jud had for years been anti-parting. The engine was derailed, and the plunging cars went after it, but the latter being of steel construction, no serious damage was done to anybody. Uncle Jud's car twisted, turned, overturned, and finally landed on its side at the side of the road, ending in a nice soft spot that seemed almost to have been made for just such an emergency. The old gentleman gathered himself together and gazed about at the wreckage, and then observing his eyes-glasses rattled beyond repair at his feet, he groaned.

"There, gold-dust?" he muttered. "Ye've gone an' busted my spectacles!"

## A SOLEMN ODDITY

IN spite of the suddenness of the anti-quarantine, there are still some few old epitaphs that have not been published. A regular has brought down from northern New York the following example of early nineteenth-century elegance:

Burst here of premature grief before,

Pluck'd from the parent's breast;

The eldest son of the state,

And here's a receipt for the pen.

## APPROVED

"I see," said the second-story man, as he glanced over the paper, "that there's a society in New York for the suppression of unnecessary noises."

"And a good thing, too," said his pal, "if they'll only get after them there bagpipers. They never alarmed a bagpiper yet."

## WORTH ALL IT COST

"Well, Sidas, after you have scamped and snored and dawdled yourself a lot of things, you'd naturally like to have, to send your boy (via through college, are you satisfied with the results?" asked the victor.

"Ye bet I be," said the old man.

"Ye learned something, did he?"

"Ye bet," smiled the old man. "I not Gas down in the corn-field dicitio" has had summer's vacation, and

## AFTERTHOUGHT

MISS SERVENS: "WOULDN'T IT BILLY IF WE SHOULD RUN UP AGAINST THAT BRICK WALL?"

SPARKER: "PERHAPS NOT INSTANTLY, BUT I'M AFRAID WE'VE NEVER MET OVER IT."

What with his chin' an' his collage roll they weren't a dud-gadger ones that come over the place all summer."

## HAD FOUR LEGS, ANYHOW

CHARLES had decided to give up the sporting life and settle down to business, and was now buying a cow.

"Now here's a cow," said the agent, "that I can highly recommend to you. She has won several prizes at our county fair, and—"

"Really?" said Charles, looking the animal over minutely. "Is—trotting or sleep-trotting?"

## OLD SAWS MADE NEW

"Prayer who live in glass houses shouldn't throw stones," said Jamerson.

"What some one?" said Wiggley. "In these days of plate-glass insurance it's the safest thing in the world."

## A SAD CONDITION

"Yes," said Biddis, sitting back comfortably in his chair. "I must confess that I've got almost every thing I want."

"Poor chap!" said Diddisigh, sympathetically. "Not a thing left to look forward to, eh?"

## NOT WORTH TANNING

"Er it wasn't for one thing I'd take the hide off 'em," roared the trade hunter to his son.

"Who's the one thing, Dad?" asked the boy.

"Tannin' the snail enough to pay for the trade-hide!" returned the old man.

## IN LENT

When Bucks would borrow some rare tome I'd much prefer to keep at home because it is too fine to lend in any one, even though a friend, I love the sound of the sob, after that, with nothing to show, or word I later might repeat, I can reply:

"Alas, it's Lent."

Old Gent!

I'm mighty sorry, but

it's Lent!"

When Jimkins for a trip afar would commandeer my motor-car, the which I fear he'd muddle later along the dirty muddy jibe, I love this season of restraint imposed on avarice and no more, because with naught of detriment to truth the answer comes:

"It's Lent."

Old Gent!

I'm mighty sorry, but it's

Lent!"

And when old Spange with wild eye observes me painting pretty big, and says a handsome dollar note hid in the pocket of my coat, and asks the loss, that season's blood that helps my cause and interest, enabling me to fail his best by saying:

"Sorry, but it's Lent."

Old Gent!

It grieves me deeply,

but it's Lent!"

THEY MAKE IT?

# SPRING THAW

BY EDITH RONALD MIRRIELEES

ILLUSTRATED BY FRANK TENNEY JOHNSON

It was a relentless weather. Jennings, shuddering beneath the blankets of his bunk, was yet alive even in sleep to the wisterly gray of the air. He was aggrieved before he awoke with a subconscious knowledge of raised ice in water-bucket and frost on stove-top. When he did wake he lay huddled beneath his covering, one eye, one nostril, a strand of white-rimmed moustache exposed to the biting air, and pondered. It was the twenty-second day of March. By all the rules the ground should have been almost ready for plowing.

"And it ain't been above zero in three weeks," the cabin attendant blazed. "Well—gals to get up sometime!"

He reached an instantly assumed hunch for his trousers and boots, drove them toward him—and set up lightning.

There it was unmistakably, the tiny sound which had disturbed his sleep. It was clearer in waking moments—a little grilling of displaced snow, a shifting and heavy breathing close beside the wall of the cabin. To man-trained ears there was no mystery in it. Something—solid or shrouded dog or wandering bobcat—was at the strip of lichen bare lying outside the door.

Jennings discarded boots for socks, stole across the room on stockings feet, and lifted down his rifle. He had an instant's glimpse, as he opened the door, of a black head, head and forelegs lost in a willow of snow. Next instant it was only a black streak of light.

The waterer fled too successfully. The third time, as the dog rose for a fence, his shot was rewarded. There was a hoot, a sudden crumpling of the lean, crumpled body.

"Get him that time!" the marksmen rejoiced. He knifed a handful of shavings, laid on wood, and set flaming about the blaze. Nook waited and as if that wasn't enough, thrust a stick of light.

"Wonder if I killed him?" the avenger speculated. He crossed to the door window and surveyed the ridge. There was no break in its white surface. Evidently the snow had settled sufficiently to cover the animal or it had been able to drag its way toward home.

"That 's what O'Farrell says," Jennings muttered, with not unexpressed anticipation. "If that dog of his gets loose about—"

He let his eyes travel along the line of half-buried fence-posts to the grove of cottonwoods a mile away. There was a thicket of snowdrift waving above them—near his own, the only snowdrift in a radius of twenty miles. He could picture the letter of the ribbon from which it came, the hills, the early, early, grizzled Irishman challenging among his brethren, the arrival of the dog on the threshold.

"I told I would!" the avenger justified himself. "I always said if that dog of his come back'd round here—What's he keep a hound for? Macque's and mine!"

It was comfortable to have a cause for work on a morning when every circumstance demanded inaction. By the time he had finished breakfast he had fairly established a grievance. "Mirrielee's! The dog was nervous, think you ain't?" Mirrielee, surveying the line with a neighbor crumpled up against you.

The water-bucket had thawed sufficiently to discharge its glacial ice. He packed it up and drove on cap and mittens for a journey to the spring. As he pulled open the door his breath expelled itself in a puff of grayish exhalation. The dog was surely gone. And across the field from the group of cottonwoods a muffled figure glided its way through

the snow—a watchful figure, too, for with the opening of the door it stopped to shoot something which the distance rendered indistinguishable. In thrust its arms into the air in a gesture of defiance.

"Jennings set down his basket. "He's mad," he warned himself. "He's crazy mad."

Automatically he reached through the door to his rifle, and, carrying it, started slowly toward the wire fence which surrounded the cabin. There was about the advancing figure a glittering something—it might be no more than a buckle on a frock-coat button—which flashed out now and then in movement and on which he fixed his eyes. He held his own weapon conspicuously.

With his advance the continuous monologue of the avenger began to be intelligible. He could catch the word dog many times repeated; his own name; the fragment of a threat. The little man was breathless from haste and difficulty of walking; but the steady stream of his abuse poured forth without ceasing.

"... shoot my dog ... show you if you'll shoot my dog? ... You stinger to keep a dog yourself? ... You shot ago!" said Jennings, in a sudden shout. He modified his terms instantly. "I don't care what you say! Talk all you like, but I tell you one thing: Don't you come across that fence! You set foot on my land!"

For answer his opponent broke into a run. "Don't you do it," Jennings warned. He brought his rifle up level with the individual lip.

O'Farrell had already reached the line. His mittened hands grappled with the strands of wire. He talked continuously. "... tryin' to scare me out! ... This 'narrow race first you own the place! ... the round about! ..."

The wire gave, twanging. As he stopped to force his way between them his eyes came up to meet his adversary's; his hands drew suddenly back to his sides.

"See—!" he began. And instantly with the downward pressure of his knee, Jennings fled.

The body of the shot man had been pressed against the wires. Their points rasped it for a moment; then, with a little stir of iron clinking, it slumped down upon the snow. Jennings dropped the barrel of his rifle, swung round, and strode toward his cabin.

He was not cold any longer. He hung his weapon on the rack in a gesture of satisfaction. No O'Farrell thought he wouldn't shoot! Well, he'd show him! He'd show my man! He guessed the place was his! Any man try to come on his place—!

He began moaning about, pulling the room to rights, replenishing the store of shavings in the wood-heap. It occurred to his proximity that he was, finally, nearly dry and throat constricted. He turned toward the bench on which he was accustomed to throw his water-bucket, and, mistaking it, stepped to drink. None enough, he had taken it out. He had been on his way to the spring when O'Farrell—! All set was he aware of an immense posthumous at-the-thought of being outside for the bait, at the vision of his journey to the spring to fill it.

"Too cold to go," he devoted himself. He dimmed a little candle from the breakfast grounds and prepared satisfaction.

But his effort would not do. He grew commiserate. He snatched open the door at last in a rage of irritation. It was to be expected the little man would be gone as he started. It was not so. So that was O'Farrell! So that was O'Farrell! The heartiness of the thing, the shoving offness around! When he knelt down at the spring he was colder still at ease to have that increase at his back. He freed himself looking over his shoulder in an immediate, though unobtrusive, glances.

It was while he was looking that a new anxiety arose lower in him. A real man along the outside of the fence! It was no absurd man, the little figure, distastefully, that he must answer the obstacle. He had been entirely justified in his shoot; he was entirely

prudent if, but still the sign of the shooting 1904 he removed.

He approached the body unwillingly, stopped, forced himself on. It was only a body. He recognized himself; it was no more than a dead sheep. Through his hands the corpse gave forth a long moan.

He was inside the cabin before thought came to him. He found himself breathing hard, uttering in broken phrases.

"... just thought I heard ... nervous ... I shot a fool ..."

He looked out through the open door. There was a glare of sun on the snow. There was the shimmer of its own brightness above it. And, yet, something for that—

"He's mad," the waterer decided, with conviction. "He's mad over on his side."

At once, with the certainty of assurance, the whole person was shifted. O'Farrell was alive, O'Farrell, out there in the snow, was alive and freezing.

He turned his back upon the skirt. He pushed about the door. But the end was fortuitous.

"No harm to take a look at him," he excoined himself. "I got 'em!"

The body was still tangled in the lower wires of the fence. With labor he released it, turned it over. There was a stamp of frozen blood beneath. The back of the coat below the right shoulder was stained and stiff. Evidently the bullet had entered there.

Obviously, the thing was clear to him. He had shot the man in the back. He turned back, but turned to obey, and in the net of obedience he had shot him from behind.

For a moment a kind of paralysis held him. Next seemed to be the wounded man in his arms, was stumbling with him toward the cabin.

The wound was a trivial thing to see when he had slipped away the clothing from it—a tiny puncture, a surrounding rim of blue. It began to bleed again under the influence of warmth in little, smart, snow-falling drops. He hoisted packed snow on the place to stop the bleeding, rolled snow, too, on the fractured face—stood still then, watching his work, perplexed.

There was an doubt that O'Farrell was alive. He twitched, sighed occasionally, there was a mounting pulse in his wrist. He began, presently to pluck at the covers and thrust them away.

"He's going to be out of his head," Jennings recognized, fretfully.

He slipped on slars out at the drilled road. It was a three hours' journey to the nearest ranch. By the time he could reach up a horse, get to help, get home again—

"He'd be froze," the waterer decided. "Well—I got to arrange, then. If somebody'd come along!"

The wind was not a prayer, for it lacked the element of hope. He gave over his survey and went back to the bunk. O'Farrell's fever was rising, he tossed his arms, muttered. As Jennings bent over him his voice rose to a shriek.

"I'll show him! You wait—!" He struggled to rise.

"Now you lay still! Now lay still, Mike," Jennings retorted him.

He sat down on the edge of the bunk and began to draw in the snow—stirring, scoldingly, without concern, the whole man's motion.

O'Farrell talked, too. Part of the time he threatened. Part of the time he was excoining every thing he wanted.

"Now then, Mike dog! ... Steady now! Steady till I die!"

"And it was no shot him," the listener concluded himself, bleakly.

He let off his efforts when the patient became quiet, and stole a few more times to take up his part of the watch. There was always the bare chance of some one's passing. And if some one did pass it need inevitably be the doctor. Only a doctor or a man the best of our kind of our world venture along such a road on such a day.

He sat down to keep watch, but he must have done it in his own back in himself with a start in exaggerated sense of danger, passing down to him. As he raised his head he saw that clouds

lead thickened outside, that the fire had burned itself out; it was beginning to grow dark in the cabin. "I'm from the back eyes," Miller stated at once sternly, firmly, with resignation.

"Jeannus rose instantly. "Awake, Mike? Feel better?" he asked. He crossed the room and laid an unguessed hand on the sick man's wrist. "Fret's gone down some. Buck hurt you much? Want a drink?"

"No," was an answer, only the unobtrusive regard of fever-distorted pupils, and suddenly in the presence of that regard Jeannus found himself hideously embarrassed. It had not been the look in O'Farrell's eyes, but the look in a reflection of the shooting only, but only of the indistinctness following it.

"You want to lay still," he admonished, speaking for the sake of speech. "Head cleared up pretty well? Can you remember?"

"No," said the sick man, whistlingly. He had been altogether silent before. Now suddenly he was verbose. "No—something 'most w' hit me. I don't remember."

The questioner got up from his place. He went to the stove and heat above it, his back to the bed, pretending to have himself with its rattling. All at once he recognized the look in O'Farrell's eyes—the watchful fear that he had seen in the eyes of rabbits and trapped wild things. Not remember? Oh, O'Farrell remembered!

"But what's wrong with him?" the observer wondered, peering at the coals. "Ain't I brought him in and took care of him? What's he scared of?" The question broke off unfinished. He sat down with a plop, the poker clattering out of his hand. If O'Farrell got well—when O'Farrell got well—what of him, Jeannus, a possible murderer. When you begin a thing like that—and left it unfinished—

He got up and lit a lamp. The light shone in the invalid's face; he raised the table and sat down beside it, interrogating his shades.

"Now you go on to sleep," he ordered. But there was no sign of sleep in O'Farrell's eyes. It was an anguish to the watcher to see the strained expectancy of them—an anguish and an irritation.

He scraped himself in his chair until he could not see. "What's he think I'm going to do?" he explained. "Take a shot at him? He'd ought to know—But what will I do? If he gets well he'll get me. If he once gets of this place—"

It drew in all the closer with thinking, the victims work of consequence, knotted, every one of them, to that first individualist movement of lifting down his gun. If he had let O'Farrell get beside the cabin; if he had wanted long enough even to be sure that he was armed, but he had not wanted. He had shot at him as he had shot at the dog—made with no more intention. It was his own look of intention which most appalled him.

"I must 'a been crazy," he argued, mused. "But he's got me now. I'd got ten years—more's that. Oh, he's got me all right!" A spitting of bitterness against the injured man began to stir in him. He had brought O'Farrell in and taken care of him, hadn't he? He had done him twenty kindnesses in the year; they had lived neighbors—pleasant kindnesses. And yet Jeannus to-day his right forefinger for one single second had reached around a piece of metal—

He folded his arms upon the table and let his head drop forward on them. Let O'Farrell do the thinking for a while. If he wanted to be there staying—All at once a thread of cold like the passing of a drop of icy water, spread down his spine. Suppose O'Farrell had looked him armed when he rose? There—if he had—his gun was in his clothing still. Suppose with those watchful eyes and his gun, his hand was reaching, reaching—The thinker jerked round toward the bed. O'Farrell was lying exactly as he had been.

"But he's got his eye out," Jeannus noted. He set down the other for a while till the passive presence of his hand was insupportable. Then, with a sigh, he resumed his earlier attitude.

"Let him do it! If he wants to do a trick like that—"

For a single, relaxing instant sleep surged up toward him. Next instant, somewhere in the remote corners of the cabin, a bug had croaked, and instantly he was awake, open and attentive of him quiveringly conscious of the man at his back. It was an hour after his taking his place that, with a faint realization, he again moved his head forward and set his back over his ears.

"Now then! I don't care what noise, I want—What's that?"

He lay still, listening through opened fingers. This time there was no doubt of it. The other shape had been him, always, all of them; this time beyond a question O'Farrell had stirred. He snatched a second, two seconds. There was no further movement, an crash nor shock of bullet. He sat up.

O'Farrell was risen on one side, his head bent forward, eyes upon the distant window. Every fiber of him trembled.

Jeannus listened low—listened and heard. From across the snow came the ruck of falling snow.

"Somebody on the rack," he interpreted, aloud. He strove to make the announcement usually. "Find right—far outside—You get down—You get down—You start that thing to breathing—"

In spite of himself his voice shook. He looked at the man upon the bed and saw the way in which he spread clear in front of him. Plainly O'Farrell would not ask him to sustain him. No long as his nerves straggled with him, O'Farrell would never ask. And he was desperately weak. . . .

It need not be violence; it need not be any active cruelty. Only to let the wheels creak past to their destination. Only to let the man whose neglect him a little—All at once he found himself at the threshold.

"Hey there! Hey! Hey Nipples!" The terror of his own voice clattered back at him.

There was an instant cessation of the creaking, an answering shout. Jeannus pushed out the door.

"It's Nipples, all right. He'll fix you up—" He broke off and laughed. "He'll fix us both, I guess," he said, and sat down at the table.

He did not rise even when the doctor bent across the threshold—a figure monstrous in form, bristling with the irritations of winter.

its banked coals. He would not look round, he would not! If O'Farrell was pointing at him, whispering—he heard the man retreat once and set his teeth at the sound. He heard the quick, crisp rattles of the doctor's reply. It really was not a long time before the worker disappeared from the back and spoke.

"Now hell do. Keep him warm and perfectly quiet." He dragged the table back to its place and began fidgeting his feet. "The wound's not very serious—more loss of blood than anything else. How did it happen?"

"My gun," said O'Farrell, suddenly and faintly. "Gotta" through a fence—no gun—"

"Some way you made out of her get shot," the doctor agreed, but his eyes were not upon the speaker.

He recognized the look in O'Farrell's eyes—the watchful fear that he had seen in the eyes of rabbits

"Miserable sight! What's wrong, Jeannus? I thought you were being murdered. If it's anything that takes time—"

The slight sight of O'Farrell in the bunk and was beside him.

"What's the trouble? Has he been unconscious like this—No, he's not dead! That some whiskey?" By the time Jeannus had produced the flask his outer shaft was discarded, lamp and table moved close to the bed. From his more distant place the watcher could see the swift, deft movements of his hands about the sufferer's body, could hear his voice, distinct with encouragement.

"All right, O'Farrell. You fainted for a minute. Now, lying some blood? Just a minute till I get you turned. Some water, Jeannus! You might help—" He looked up suddenly and loudly. "You're spilling that water. Here, give it here. I guess I can manage—"

"I guess you'll have to," said the owner of the cabin. He crossed to the stove and stood poking among

"Well, keep him quiet, Jeannus." They heard him shuffle through the snow.

Jeannus stood still by the stove. A night more overwhelming than his fear pressed down upon him—a burden of despondent gratitude. No Mike meant to let him die. He meant to let the thing go. It came over him that he must say something to O'Farrell. If he could ever get something real, some force his eyes up to meet those of the neighbor he had tried to kill. With an effort like that of a man caught in quicksand he turned and took a step or two toward the bed. It was the lastest thing of all that O'Farrell was watching him as he came. Involuntarily he put up his hand to ward off that regard. His tongue stanchered over the unthought name.

"Mike—I didn't—"

The door was thrust open from without, and the words were drowned in a puff of new-risen wind.

"Black a thanksgiving service, somebody." The doctor's voice demanded. "It's begun to thaw." See here, Jeannus, there's one of O'Farrell's hands outside with his leg tied up. Want to let him in?"

## ONE OF OUR CONQUERORS

A recent portrait of Miss Billie Burke, who is appearing on tour in Powers's drama of London theatrical life, "The 'Mind-the-Paint' Girl." Miss Burke plays the part of a "Gaiety girl" whose success was made by her singing of a song with the angular and piquant title mentioned above.

# Greatest Automobile Test

## The World Has Ever Known

**I**NDIVIDUAL owners have put their Winton Six cars to a test of strenuous service covering **more than two million miles.**

Figures compiled from the sworn statements of 215 owners appear on this page.

Seventy of these 215 cars established the **world's lowest** repair expense record of 29.2 cents per 1000 miles.

The performances of the remaining 145 cars are shown in the table.

And the grand totals for 215 cars show that in traveling 2,362,093 miles the whole repair expense averaged only \$1.43 per 1000 miles—**one-seventh of one cent per mile.**

This was the most exhaustive automobile test the world has ever known.

The only kind of test that proves anything for individual buyers—the test of service in the use of the owner.

Look over these figures, and then send for a copy of our Upkeep Book, which gives the records in detail.

This book is full of interest for every man who owns a car and pays repair bills.

### WINTON SIX

### Same Model—Sixth Year

We are the pioneer makers of sixes exclusively.

Our present model is the same car we have made for five years **without a single radical change.** Now in its sixth season.

It is the original self-crinking car; has been a self-crinking car since June, 1907. Our self-crinking motor is no experiment.

This car represents all the quality a motor car can have, and, because we do business on bed-rock business principles, we can sell it profitably at \$3000.

If you want to know its worth, compare the \$3000 48 H. P. Winton Six with cars priced as high as \$5000 and \$6000.

And remember that the Winton Six is the only car in the world whose repair cost is definitely known through the sworn statements of individual owners.

We shall be glad to send you our Upkeep Book that gives the million-mile facts and figures in detail, together with our thoroughly descriptive catalog.

### THE WINTON MOTOR CAR CO.

### Complete Record of All Cars Traveling 5000 Miles or More in the Five Annual Winton Six Upkeep Tests of 1908, 1909, 1910, 1911 and 1912

CLASSIFICATION	Number of Cars	MILEAGE		REPAIR EXPENSE		
		Total Miles	Average per Car	Total	Average per Car	Average per 1000 Miles
Cars making the world's lowest repair expense record	70	1,035,185.2	14,788.3	\$ 302.25	\$ 4.52	\$0.292
Cars making the poorest records	37	391,970.0	10,438.6	\$769.18	74.84	7.16
*Cars running without repair expense	35	408,837.8	8,541.0	.....	.....	.....
Cars not otherwise classified	33	471,079.4	8,888.5	\$20.12	6.04	.68
Totals for five years	215	2,362,093	10,986.4	\$331.55	\$15.77	\$1.43

\* Not included in any other classification.

Average repair expense for 215 cars, traveling 2,362,093 miles, is \$1.43 per 1000 miles. All these cars were regular stock-model Winton Sixes, driven in the service of their individual owners. Each owner made monthly reports of mileage and repair expense, supported by his sworn affidavit.

France's National Scourge

FRANCE now has to face the serious problem of her depopulation. On November 23 the congress of an extraordinary parliamentary commission, for considering the depopulation of France, convened and immediately began its work in the Palais National at Paris. The congress consisted of more than five hundred members, subdivided into five committees. The Minister of Finance, M. Klotz, made the welcoming address, setting forth the importance and extent of the evil to be fought.

The figures are alarming for France. For example, the average of births over deaths, in the year 1910, was in Germany,

479,112; in Austria-Hungary, 573,250; in England, 412,175; in Italy, 461,771; while in France, it was only 71,418. Military inferiority, economic inferiority, a weakening of France's power of expansion in the world, these will be sooner or later the inevitable consequences of the increasing infertility of our people," said M. Klotz.

One of the chief evils to be overcome by the congress is the great number of still-born children. The general cause of these calamitous births is the well-known fact that the working mother is obliged to continue her daily toil during the entire child-bearing period because she has not sufficient means of support if her work were ceased. To ameliorate this unfortunate condition of the French working mother, the congress will take immediate steps toward establishing a system of maternal insurance such as Germany has already begun. The definite object will be to enable every expectant mother to take four weeks of repose before and four weeks after the birth of her child. But the important fact is that the government will now coordinate financially, to a greater extent than it has hitherto done, to all the efforts of assistance to mothers which may be established or furthered by the congress.

The congress will also study the subject of abortions in its relation to fertility. As to the voluntary limitation of children, the press code covers only a certain branch, the sex matters, and other causes cannot be reached by any legislation, but only by a re-awakening of the public conscience. However, that encouragement may be given to well-to-do parents by a modification of the present provisions, giving more liberty to the father in the partition of his property, and to the power by the erection of cheaper habitations and more convenient assistance when the number of children has passed a certain limit.

M. Klotz's view went so far as to ask why colonies should not be started in order of the same time to decrease the taxes upon the families who emigrate. In 1908 there were in France 1,350,000 emigrants more over thirty years of age, and almost the same number at present. There were besides 1,004,710 families with six children at least, and 2,238,780 only four children at most. The most recent statistics relating to French families have just been published by the Minister of Labor. According to those figures, the average number of children born is only 2.2 per family. Categorically, most children are born to laborers and mechanics, the next to workmen, and fewer still to employers. Generally stated, the productivity of French mothers, as observed, diminishes with the increase of the family fortunes. This state of affairs, M. Klotz explained, is fatal to France.

But it is a tragic social condition under which a father and mother sacrificed themselves and their two children, as the French papers reported the other day, because they could no longer sustain their struggling family in poverty. If the new congress can save the children in such families as that, it will accomplish a feat for which the world has long been waiting.

Yet France has already done much to preserve her diminishing population. She has taken the most efficient laws vigorously known as those for the protection of young children, she has organized work for the most advanced and the most children in the world, and constantly gives succor to families in distress—besides the immense number of private charities and those of Catholic institutions which accompany much of the time of every noble and disinterested woman. But the direct help to the mother has waited long to be accorded. For fourteen years this measure has lain dormant in the slow-moving Senate of the Luxembourg, and only a few days ago was reconstituted and brought again before that body. The December 8 measure was passed at last by the Senate. It is now believed that the Chamber of Deputies will confirm the new law without delay, thanks to the pressure brought to bear on public and legislative opinion by the new Congress for the Repopulation of France. L. M. NIEL.

GOOD NATURED AGAIN

Good Humor Returns with Change to Proper Food.

"For many years I was a constant sufferer from indigestion and nervousness, amounting almost to prostration," writes Montezuma, Tex.

"My blood was impoverished, the vision was blurred and weak, with moving spots before my eyes. This was a steady daily condition. I grew ill-tempered and eventually got so nervous I could not keep my books posted nor handle accounts satisfactorily. I can't describe my sufferings."

"When I began to eat Grape-Nuts I happened to notice Grape-Nuts in a grocery store and bought a package out of curiosity to know what it was."

"I liked the food from the very first, eating it with relish, and now I buy it by the case and use it daily. I soon found that Grape-Nuts food was supplying brain and nerves here as nothing in the drug line ever had done or could do."

"It wasn't long before I was restored to health, comfort, and happiness."

"Through the use of Grape-Nuts food my digestion has been restored, my nerves are steady once more, my eyesight is good again, my mental faculties are clear and active, and I have become so good natured that my friends are truly astonished at the change. I eat younger and better than I have for 30 years. No amount of money would induce me to surrender what I have gained through the use of Grape-Nuts food." Write again for a return Co. Battle Creek, Mich. "There's a reason." Read the little book, "The Road to Wellrich," in size.

Ever read the above letter? A new one appears from time to time. They are genuine, true, and full of human interest."

The Sword

Countless legends and superstitions have attached to the sword since the days when fighting was the principal occupation of life. No highly was the sword revered that Mohammed, in the Koran, declared it to be "the key to Heaven and Hell."

The warrior or knight gave a name to his sword; he vowed at the altar never to draw it in a false cause; it was his companion and friend and descended from father to son for many generations. One sword, named "Brother of the Lightning," had a golden hilt inscribed with magic words. In times of peace those who used it to slough, but before a battle "they glowed red as blood."

It was believed, moreover, that a sword after long use acquired a life of its own. Many famous swords were said to utter cries before battle, and after a weapon had killed five or six men it became blood-thirsty and longed for its work at the approach of a foe. Certain swords were said to refuse to give a wound in a bad cause. Among these was the broad Excalibur, which was given to King Arthur by a fairy and which Richard Coeur de Lion professed to own.

The family of Coopers, in England, who their estates and have held them for centuries by virtue of their possession of an old-fashioned sword which according to tradition, they asserted that a knight, their ancestor, stole the famous Dragon of Wandering.

In the East superstitions reverence is still paid to the sword. The Dhimshah of Japan, when the first sword surrounded their rank, kept, as a rule, the wonderful Masam which had been landed down from the mountains to generation, and some cases for more than a thousand years, and which had absorbed, as they believed, some of the character and life of the men that it had owned.

Following the Same Line

It is related that one day, as an English statesman was walking through the New Forest, he came upon a laborer mowing his lawn. When, in response to the statesman's question as to his name, the man replied "Parkins," the statesman said, "I thought so much."

He then asked the laborer whether he was descended from the line-burrows of that name who carried away the body of William Rufus when he had been slain by Tyrell's arrow. The man replied that he was; whereupon the statesman shook hands with him and congratulated him on his long descent and on bearing one of the oldest names in England.

In Scotland one of the most famous of long continuance is the name Knapke but honorable condition is that of the House of Lockhart, who are traditionally alleged to be descended from a man who came to Scotland in the twelfth century and who in any case have been famous in Scotland since the Reformation. Curiously enough, there is an almost parallel instance even in a family of almost identical name in the east country—a, the House of Cranston, who, until recent times, continued to hold the lands given them by the father of Queen Mary—"The Gate Man of Ballingaleich," to Jack Houston, a plowman, who received that notable passage from the gypsy.

Rock Cannon

When the island of Malta was under the rule of the Knights of St. John, they defended their fortifications with cannons bored in the living rock. Each one of these strange weapons contained an entire barrel of powder, which it was not possible to vary the aim of those cannons they were made ready, facing various directions from which the enemy might approach.

When the fame of these arms of defense became known in the world, the idea was taken up of transporting rocks to attempt to serve the same purpose; but it was soon recognized to be impracticable, and the cannon of Malta, but in solid rock, have passed into history as the sole weapons of the kind ever known.

Beer and Sunlight

The color of the bottle in which beer is contained is of great importance, because the article, when exposed, has a injurious effect on this liquid. A German employed by a large brewery in Berlin has recently made the following experiments: He says that there is a crystal, whatever may be its color, that serves to protect beer absolutely against the deteriorating effects of sunlight. Although bottles of certain colors protect it more than others, Dark red is the color that gives the best results.

BUFFALO LITHIA SPRINGS WATER

"In Uric Acid Diathesis, Gout, Rheumatism, Lethaemia, and the Like, Its Action Is Prompt and Lasting."

George Ben Johnston, M.D., LL.D., Richmond, Va., Ex-President Southern Surgical and Gynecological Association, Ex-President Virginia Medical Society, and Professor of Gynecology and Abdominal Surgery, Medical College of Virginia: "If I were asked who mineral water has the widest range of usefulness, I would unhesitatingly answer **BUFFALO LITHIA WATER.** In Uric Acid Diathesis, Gout, Rheumatism, Lithaemia, and the like, its beneficial effects are prompt and lasting. . . . Almost any case of Pyelitis and Cystitis will be alleviated by it, and many cured. I have had evidence of the undoubted Diuretic, Solvent and eliminating powers of this water in Renal Calculi, and have known its long continued use to permanently break up the gravel-forming habit."

"In Uric Acid Diathesis, Gout, Rheumatism, Lethaemia, and the Like, Its Action is Prompt and Lasting."

Geo. W. Johnston, M.D., LL.D., Prof. of Medical Medicine, University of Virginia, and President of the Virginia Medical Society: "I have used BUFFALO LITHIA WATER in dozens of cases of Uric Acid Diathesis, Gout, and Rheumatism, and have seen it relieve the most severe cases of these affections. It is a powerful diuretic, and directly facilitates the elimination of uric acid from the body. It is also a powerful solvent, and its use in the treatment of uric acid diathesis will be found to be of the greatest value. It is a most valuable remedy in all cases of uric acid diathesis, and is highly recommended by prominent physicians."

Medicated testimony on request.

### The Late Joaquin Miller

UNUSUALLY HEINZ KUNKE knows to the world as Joaquin Miller, died in his home on the hills overlooking San Francisco Bay on February 17, at the age of a very old man. The boy was burned on a stove pipe which he had craved for the purpose of his recreation. He had been ill for years.

Miller was California's most picturesque character. The name Joaquin was given him by the public on account of his delivery of a famous lecture named Joaquin Maestre who once terrorized the district in which he resided. He was born in Indiana and was taken by his parents to Oregon when ten years old. He labored in the California gold mines, served under the illustrious Walker as newspaper editor-in-law, and was for some time a county

big on a chestnut. It is thought that while sometimes iph against ships in their attempts to rid themselves of their unwelcome tenants.

Notwithstanding their feeble power of vision, harrises cannot live long when deprived of light. Almost always found in salt water, there are still certain kinds that live in fresh water. Darwin speaks of a kind that he discovered fastened to the tail feathers of a bird. The organism not only ate the snail but "saw shells" which suggest the marks between tide marks on the ocean.

Huxley's description of this creature is highly picturesque: "A harrise may be said to be a creature that sits on land and kicking its food into its mouth with its legs."

### To Charles Major

Died February 13, 1913

Sove with a wreath of laurel, and come with a wreath of bay—  
But I with a heart-bone word or two that I know not how to say.

With a wreath of bay, I indeed friend who has loved the further way.

None with a wreath of roses, and some with a wreath of oak.

But I with a word I cannot frame that I have sought never to say,  
But I thought you knew, for the long ago made it lasting, deep and true.

Some with a laurel tribute, and some with a wheat right—

But I with a word I know not how to express or even say,  
For they are too deep, all these thoughts we keep of the golden days gone by.

Friest of the kindly speeches, friend of the chipping hawk—

Whether in marble spaces far, or near in an answer hand,  
All I would say to you to-day, I know that you understand.

WALTER D. NEMER.

### Joaquin Miller in his last days

Miller, in 1870 he went to London with a volume of poems, *Songs of the Sierras*, which had been rejected by many publishers in this country, but was accepted there and made a sensation. Returning to America, he engaged in newspaper work in Washington, and finally, in 1887, settled as a hermit in the little cabin which occupied until his death. On his little property he built other isolated cabins for his mother, daughter, and visiting relatives and indigent poets, all of whom were welcome to come and live in it without invitation or ceremony. About his home he planted thousands of evergreens, which formed a huge cross on the mountainside.

Among his works are *Songs of the Sierras*; *Life Among the Rubies*; *Songs of the Sierras*; *Love and a Novel*; *The Drama of the Sierras*, which was dramatized and enjoyed a successful run in New York.

### The Trembling Pillar at Rhine

"The trembling pillar" at Rhine presents a curious problem to architects. The Church of St. Severin is surrounded by a wall of masonry to prevent the walls from sliding. At the entrance of the church is a bell tower. The one of the bells is so heavy the phenomenon of the trembling pillar is observed. When this bell is rung or even touched the top of this pillar wavers.

It goes and returns about seven inches on each side, although the base of the pillar is immovable and the stones are so firmly cemented that it seems like a solid piece of stone.

The authorities, after a careful study of the recently reported phenomenon, which is a satisfactory solution is offered, state that what is most singular about the pillar is that although the four bells are about the same distance from the trembling pillar, only one of them has any effect upon it. The others may be rung singly or all together without moving it.

In 1773 a little window was made in the roof of the church opposite the pillar. A board was placed on top of the pillar and it was put two inches of water. Then the bell was rung, immediately the pillar began to sway and at the fifth stroke of the bell the two gallons were thrown off.

The existence of this bell has an effect on the pillars between the "phenomenal" one and the tower, and on any of the others. This fact was proved by the fact that which swayed, that it became immovable, and some years ago the one next to it became the eccentric one.

### Scientific Discovery by a Cat

The cat has often served the purpose of mouse, but recently and to her own comfort and profit, with the loss of her life. One cat in Australia, however, proved her usefulness in the advancement of human knowledge by the way she compelled to survive herself on the altar of science.

This cat belonged to a member of an expedition to the interior of Australia. The day it brought to its master a strange little animal which was very like a mouse. The trouper had captured among the rocks. The trouper treated the animal over to the anthropologist of the party, who saw at once that pussy had made an important discovery.

The animal she had caught was a new and apparently rare species of the little insect-eating mammal belonging to the great family of which the giant kangaroo is the most conspicuous representative.

Perfect Lighting  
Convenience

Without Sacrificing  
Safety—Reliability—Economy

The Prest-O-Lite, or any other good automatic lighter, makes gas lighting superbly convenient. From the driver's seat, you can light or extinguish any or all the lamps. The flow of gas is automatically regulated by a reducing valve to produce exactly the proper height of flame at all times.

But should the automatic lighter ever fail—you have temporarily lost only its convenience; you are not left in the dark.

Open the lamps—strike a match—and you still have perfect light.

Any lighting system that is merely convenient, without being dependable, de-

tracts from the value of the car, and exposes you and your family to serious risk.

Prest-O-Lite is not merely as good a light as any—it is absolutely the best practical road light you can get.

In Prest-O-Lite, you have a system that everybody understands; that has no serious troubles or repairs; that never keeps you waiting for a factory expert to come and re-store its usefulness.

And it costs less to operate and maintain than any other efficient lighting system. Just one repair bill on any complicated, delicate system might easily cost more than years of Prest-O-Lite service.

No matter what self-starter you have on your car—insist on gas lighting. Self-starter convenience is safeguarded by the use of the crank in emergencies. It is even more important that lighting convenience be safeguarded by the use of a match to insure light in emergencies. Almost any manufacturer will equip your new car with Prest-O-Lite and an automatic lighter if you insist. If your new car is now equipped with Prest-O-Lite, any dealer or any of our service stations can install an automatic lighter at small expense.

By all means, before you decide on any lighting system, send for the vital facts on automobile lighting. The coupon attached will bring you a free book on this subject by return mail. Send for it NOW and know the facts.

# HARPER'S WEEKLY

A Journal of Civilization

EDITED BY GEORGE HARVEY

WEEK ENDING SATURDAY, MARCH 8, 1913

[No. 1,431  
Vol. 30, 1913.]

## Public Service and Public Journals

*As earnest supporters of the Administration, we hope to discuss all its measures temperately, and when we differ to differ as friends.—HARPER'S WEEKLY of March 11, 1871.*

HARPER'S WEEKLY disclaims all party allegiance and maintains a wholly independent position toward men.—HARPER'S WEEKLY prospectus for 1881.

Two principles in journalism are fundamental: (1) The chief function of a public journal is the watching of public service; and (2) the first requisite of full exercise of that function is perfect freedom.

GEORGE WILLIAM CURTIS initiated the movement which struck the shackles of party subservience from the American press and gave to it the spirit of independence which makes it to-day the greatest power, save Christianity, within the nation.

"Serenity to party spirit," he declared at Utica in 1861. "It is the abdication of that moral leadership of opinion which is the great function of the political press. It is a subservience which destroys the independence of the paper, but it does not save the party. There is not a party in the history of this country which has been utterly overthrown, not the Federal nor the Whig nor the Democratic party, that might not have survived long and victoriously if its press had been courageously independent. Its press should be led by party leaders, while its duty is to lead leaders."

"The journalist," then, "revels a successor of Mr. CURTIS at New Haven in 1868, "must be independent not only of politics, but of his community. His responsibility is to the whole people, but to perform fully his part he must be independent of the whole or of any portion. Above religion, above labor, above wealth, above poverty, above class, and above people, subservient to none, quick to perceive, and relentless in resisting encroachments by any, he should stand as the guardian of all, the vigilant watchman on the tower, ever ready to sound the alarm of danger, from whatever source, to the liberties and the laws of this great union of free individuals."

HARPER'S WEEKLY has never been subservient. It tolerated BREXIT; it supported LEWIS with fervor, and held fast to the Republican party till 1854; then it broke away upon a moral issue and three times stood staunchly with GEORGE CLEVELAND; it rejected free-soil Democracy in 1856 and 1860, but upheld sound-money Democracy in 1864; it supported TAYLOR in 1868 and opposed him in 1912. Its record is candid; its judgment has been justified by the people in all instances save two; it offers no apologies; it harbors no regrets.

For an even half century its candidate invariably was a name; never sure did it think its duty, not for a moment did it waive its right to comment, to praise, to criticize, or to condemn the acts of an individual. And then it deliberately disowned the principle enunciated at Utica in 1861 and reiterated twenty years later at New Haven.

Seven years ago, on this very day of this very week, the following editorial appeared in this place:

At a dinner given the other evening by the Lotus Club of this city it has been, as we ventured to suggest the nomination of President WOODROW WILSON, of Princeton University, as the Democratic candidate for President of the United States.

It was not a hasty or ill-considered utterance. And yet, though based upon careful conviction and due reflection, there was no expectation that such a suggestion of this very day would evoke substantial response. That it has done so justifies a reference to the subject in these columns. Elsewhere we reprint some of the journalistic comments based upon the meager reports in the daily papers. Is a more personal way, verbally and by letter, we have received a surprising number of approving messages, which we are not now at liberty to quote. It seems worth while, therefore, to invite consideration of some of the reasons that might properly be adduced in support of the proposal.

(1) Mr. WILSON, as we stated, were that the accomplished scholar, the practical educator, the competent executive he has known himself to be; he is, in truth, a statesman of breadth, depth, and exceptional sagacity. (2) He is an idealist, yet not a visionary. (3) He is a genuine orator whose words ring true and bear conviction. (4) He stands for everything that is sound and progressive. (5) He holds the respect of every one with whom he has come in contact, and the admiration and affection of all thoughtful men. (6) His fidelity to the interests of the whole people is as unquestioned as his integrity. (7) He represents an class, an era, a nobly, no vain language. (8) He is at the fulcrum of his power in age and experience. (9) He has profound convictions from instinct and reasoning and the courage of heroic expression. (10) He has an economy in his own style. (11) He possesses in a degree unexampled since the days of BLAINE that indefinable quality known as personal magnetism. (12) He is not only high-minded, but broad-minded and straightforward. (13) He was born in Virginia and held from New Jersey.

His nomination would be a recognition of the South which the South nobly deserves. His election would be an everlasting pledge of a country united in fact, in determination to solve all besetting problems, in aspiration to fulfil America's highest destiny. Such is the man, and such a man is needed by the country, from whatever political party he may spring. We have no hesitancy, therefore, in inviting serious consideration of the suggestion.

For the first time in its long life this journal is-verse an advocate, not merely of a party, but of an individual. To make clear the reason for so abrupt a departure from the course pursued undeviatingly for half a century, it is necessary to recall the situation which then existed.

It was 1896. Political conditions were worse than disheartening; they were appalling. The present party had grown so drunk from power and assurance that it was threatened with disruption from within. In the White House was a rampant caste; in the Capitol was a senseless oligarchy. Back of both as partners were as partners were the illegal, illicit, and irresponsible aggregations of transportation, industrial and financial corporations. Whichever of the two contending forces in Washington should win in the inevitable struggle for supremacy, here lay and would continue to lie the actual authority. The great mass of honest-minded, country-loving people were as pawns upon a chess-board, in the face of an impending peril. Underneath was a sin-

ister smoldering of the embers of discontent and resentment.

And there appeared no way of escape. The party of the opposition, the time-honored party of liberalism, of constitutional government, of true Democracy, was torn in twain. Three successive times, twice as a radical and once as a conservative, it had gone down to foredoomed defeat. It utterly lacked coherence; it had no purpose; its very reason for being seemed to have disappeared. Clearly, as was quickly proved by the event, no hope of success lay in the preliminary triumph of one faction over the other. Clearly a new standard must be raised, a new leader discovered, and a fresh inspiration found; else the very fabric of popular government was imperiled by possible collision of the greed of statutory and the rage of the mob. One has but to pass in review what has happened since 1908 to realize the gravity of the situation as it then appeared to thoughtful and far-seeing minds.

Argument had rendered the Republican party ineffectual to afford relief or achieve reform. Wretched was the condition of the Democracy. It alone pointed the way of hope. But the road was dark. Twice its most winning personality had failed and was doomed to fail again. Appeal to vaunted common sense had been made in vain against an aggressive and spectacular leader of hosts.

But one resource remained—a reversion to faith in the power of ideals as embodied in an individual. To set forth forcibly, even convincingly, the merits of an abstraction and the need of its support was not difficult; it had been done for us long by many—but aimlessly and without avail. Not ideals alone, nor a mere individuality, however vivid, could suffice. Personalization of ideals was the absolute requisite of success. The condition not only justified, but compelled subordination of all other considerations to the mere possibility of rendering public service through specific performance. The question, as ever, arose: Who is the man?

It is a mere statement of fact, set forth as such simply and for no purpose of either seeking credit or inviting debt, that this journal thereupon proposed WOODROW WILSON for the Presidency, and began a direct and unqualified advocacy which, having a brief interlude of silence for which it was in no way responsible, it has continued undeviatingly to the present day of complete fulfillment. A partial summary of its endeavors is published elsewhere in this number for the gratification of those readers who manifested accord with the purpose from the inception of the movement.

It is a mere record. The somewhat difficult preliminary task of stimulating sound prejudice against the scholar in politics seems to have been done with sufficient patience and thoroughness.

The quick recognition of inaccuracy that the candidacy of a Southern-born man had become an advantage instead of a barrier still possesses happy significance. As time passed and the idea began to take root and form, partly in consequence of certain efforts in the field of practical politics which call for us recital here, welcome camping was evolved. Advocacy so zealous and so persistent, involving constant explanation, careful interpretation, unqualified praise, and unremitting defense, was pronounced unwelcome, in questionable taste, of doubtful value, "idolatrous," and generally violative of the highest standards of journalism.

The warrant for these criticisms could not then and cannot now be gainsaid. But there was no false pretense. The attitude of HARPER'S WEEKLY toward Mr. Wilson during these seven years has not been judicial; it has been that of a lawyer to his client. As an advocate, urging the greater accomplishment, it neither could nor would be distracted by minor faults, if such there were. Weighing of the large and broad against the small and narrow forbade recognition of petty and trivial things. There was but one goal in sight, and there was but one way to reach it. That is the reason, the quite simple and most excellent reason, why an insult or suggestion of criticism of Woodrow Wilson has ever appeared in these columns.

Not, of course, in consequence of, but happily coincident with, the efforts of this journal, the aspiration tentatively adventured, but vigorously—perhaps too vigorously, too earnestly, too determinedly—pursued upon attention is now realized. The credit and honor of the achievement belong to the man himself, whose keen intelligence, remarkable insight, and amazing self-reliance bore him and his cause to triumphant issue. It is only the estimate of personal attributes and the precedence of eminent events on the part of HARPER'S WEEKLY that has been confined; only its intent to fulfill its obligation as a public journal that merits passing recognition; only the joy of service that could constitute full reward.

The period of advocacy now finds a natural and proper ending. A President of the United States stands upon the highest pedestal in the world, far above the plane of possible competition. He wants no exploitation; his every act is noted. He seeks no defense; his deeds make answer to accusation. He needs no interpretation; his faintest whisper carries farther than the combined speak of hundreds. He requires no spokesman; his own is the voice of the people. For there he stands as their chosen tribune, immune to unjust criticism, sure of deserved rewards; necessarily alone, but serene in his solitude and consciousness of right.

No argument is needed to show that inferior-intending praise would not only be an unkindness to a President of the United States, but would come unworthily from a public journal.

"The press," said Mr. Cramm, "is never a more beneficent power than when it shows the country that, while loyal to a party and its policy, it is moral and honest and patriotic. It is the palladium of liberty because it is the only power in a free country that can stand withstand and overthrow the crafty conspiracy of political demagogues. If it does not lead, it is because it chooses to follow; it is because it does not know that no office is so great as that of molding opinion which makes parties and Presidents; that no patronage is so powerful as the just fear of an unqualifying criticism brought home to every wool and every ear of every public man, and recommending its judgment to the intelligence and the conscience of every citizen."

HARPER'S WEEKLY reaffirms the principles of its great editor. It repeats nothing that it has done; it rejoices in the re-establishment in power of the party which—bold and can be great, liberal, and

truly Democratic; it feels that it has peculiar reason to wish for the administration of President Wilson the greatest conceivable measure of success.

To that end and in that hope, as a natural sequence of the month accomplished, it now resumes the exercise of its normal and highest functions as an independent Journal of Civilization, free and glad to commend generously all that it deems justly merited, and equally free and ready to criticize frankly or condemn unapologetically whatever it may justly deserve of censure.

From this day forward the attitude of HARPER'S WEEKLY toward the administration of President Wilson will differ in no respect from its attitude toward the administration of his predecessors.

No holder of public office can be as big as his party; no party as great as the nation; no group of politicians as potent for good or ill as a fearless and independent press.

#### "All Forward-looking Men in My Side!"

Everybody hopes that Mr. Wilson will prove to be a sound political leader and will eventually receive the support of all the political truth-seekers who understand him.

But whence will transpire the intelligence to understand him?

In the closing words of his inaugural he says: "I summon all honest men, all patriots, all forward-looking men, God helping me. I will not fail them if they will but counsel and sustain me."

When are they coming from, these forward-looking men to whom his summons thus goes out? Where is the requisite natural power to estimate Mr. Wilson's character, penetrate his political intentions, and rank him if they are sound?

Of course he is the Democratic President and we look to see the Democratic party furnish him, at first, his chief support. But Mr. Wilson's mind and his spirit are very interesting faculties. Few people even think they understand them as yet. To the great majority Mr. Wilson is an unknown quantity, or he is followed and he is followed because known and gradually understood and will attract or repel support for mental reasons. Folks who comprehend what he is after and think it desirable will cleave to him. Folks who think otherwise will obstruct him if they can.

In the present condition of parties, wherever there is the brains to understand Mr. Wilson, he may get supporters. Almost everybody will enough afforded to him, but almost everybody is more or less in doubt about what he is and what he means. But after a while most people will think they know whether he is their kind or not.

Then it will be very interesting to watch the realignment. There are very able men concerned with "the interests" and not all of them are money-blind. They will watch him closely and if they conclude that he is the doctor the country needs they will be for him, no matter how great the shock of their support may be to him. And there are hordes of wild asses, some of whom he may lose by disregard of details that they think all-important, or by taking kindly on matters about which their thought is unclouded.

Mr. Wilson's appeal is going to be to the intelligence of the country. Wherever that intelligence exists, among Democrats, Republicans, or Bull Moose Futurists, he may enlist it on his side if he can convince it that it belongs there. Wherever there is the brain to understand him he may and probably will get support.

#### The Inaugural Address

President Wilson's inaugural address is short and readable. It is not up to his own best course in literary quality, but it should rank rather high among inaugural addresses considered as "mere literature." It does not show any of the "artistic" qualities. It has not the persuasive quality of Jefferson's first. It, of course, hasn't the directness of either CLEVELAND's first or his second. There is nothing of WASHINGTON's formalism shot through with purpose, and nothing of the biting quality of the ADDRESS. To tell the truth, the address is fuller of resignation than of commitment. It tells us that it needs a man very much more, very much more, but not disposed to make a fool of himself. Evidently the new President understands that the Presidency is not a medal to be worn, a prize to display, but a troublesome undertaking to be approached warily. We suspect he is right.

Barring some misadventure, possibly necessary

the rest of the day, it is a pretty shrewd document. The President understands the things that ought first to be done. They are: Tariff reform; banking and currency reforms; reform of our industrial system (a large order; naturally, not reduced to specifications); the improvement of agriculture, both scientifically and by better financial arrangements; conservation; the guarding of the health and vitality of our people.

These aims are admirable. They are more than that; they are the inevitable aims of any administration in the United States at this period; that is to say, the period of the disappearance of the frontier, the period of the realization of the limits of our resources; the period in which we find ourselves developing some of the problems of older nations. After all, it is generally that countries that they used to call "civil geography." The bottom of politics is economics. In the main, the day-to-day fellows who consider the physical issues of history and neglect all but a few men are right. Economic causes turned Roosevelt a radical, just as they turned Calhoun a radical, just as they made Lincoln to be a liberator. President Wilson, too, is in their grip.

But he is not their slave. There is the truth "fell grip of circumstance," but it is not all. Nature imposes economy, but not injustice. That is the affair of men. The new President is entirely right to take account of necessary economies, to sum his expenditures, to set his majorities to accept limitations. But he is equally right to insist that moral count, that ideal count, that men count. We wish he had insisted more on the way parties count, for the success of his administration depends on the way he manages a party. But, at any rate, he has not forgotten, in his careful recognition of the times, the other factor in affairs—that is to say, men, with their wills and consciences. That is the hope of his inaugural address—the comfort of it. The new President has given us no reason to doubt that he will do his best and exact the best of those who will serve beside him.

#### The Scandal of the Park Burn

President Tarr's budget message, though sent in on the eve of his retirement and of the adjournment of the session, is a most interesting one. For one thing, it was worth while as the most effective answer to the absurd contention of Congress that a President must not send in a budget or anything like it; for that was what Congress meant, if it meant anything, by ordering the heads of departments to send in their estimates directly and separately. The President, of course, has complete authority to demand any estimates he wants from the departments, and it is not merely his right, but his duty, to communicate to Congress anything concerning the state of the Union that he thinks important.

And surely nobody can right now question the importance of this matter of regulating government expenditures. We are about the worst and again demands attention to it, but it had already found itself to the front, through the performance of the new defense Congress, until it overshadowed every other question of national legislation. Take the entire list of the appropriation bills of the short session, the way they were put together, the way they were passed, the way they were carried, and the distribution of those amounts, and they constitute a national scandal of the first magnitude. The present method of Congress in dealing with appropriations indicate nothing less shameful than a fall failure in one of the greatest functions of representative government—a function which is of course utterly essential for the country, and which violate every principle of sound business; they work in a fashion utterly ungracious of the general welfare—the only lawful object of any money bill; they are in themselves unethical, immoral, dishonest. For a Congressman has no more moral right to vote away the people's money to promote his own hobby, a ambition than he has to steal it and put it in his own pocket, for they violate One's natural impulse is to go after the men who have done that thing. Notwithstanding the difficulty of fixing responsibility, we trust the press of the country will do all it can on that line; that is to say, in the way of punishment. But the main thing, of course, is to try and find means to put a stop to the practice which has been bringing the country and plunging the taxpayers of the country.

#### What Can We Do About It?

Here, briefly, are the worst features of our present usage with appropriation bills:

There is no plan or device to insure that they shall, in the aggregate, leave any proper relation

to the government's income. In this all-important matter nobody is responsible, for nobody has any real control.

They bear no proper relation to one another, but are prepared by separate committees, each intrusted by jealous of its own power.

They do not follow any comprehensive plan of public development, but spend the public money speculatively, unsystematically, often quite uselessly, nearly always unprofitably.

Individual issues in every one of these are simply expedients to demands of individual Senators and Representatives, obtained by bargaining and log-rolling, for the benefit, not of the public, but of small communities or of special business interests or of the individual lawmakers themselves.

Is it possible to stop these things?

It will certainly be extremely difficult. A proper budget system, such as they have in England, would undoubtedly work wonders. But this journal has already pointed out why we cannot have such a system. It presupposes a relation between the executive and the legislature and between the two Houses of the legislature, which simply doesn't exist in this country. Even in England a great constitutional change was recently necessary in order to establish the present happy relation between the two Houses of Parliament.

We can, however, have some sort of a budget system, and President TAYLOR is probably right in reluctantly agreeing that a budget committee of Congress will be better than none at all. It should at least secure some preliminary consideration of the appropriations as a whole, and the executive will have something to say on the subject; if it will have nobody else, we see no reason why there should not also be a committee for the executive departments. The statements and reports of the two bodies might still further promote publicity and stir up public opinion.

For that, we fear, must be, after all, our main reliance for effecting the needed reforms and intelligence of the country. It is slow to act and often clumsy in action; but surely it will not remain forever inactive in the presence of such a national reproach as the forever growing pork barrel. It cannot devise a perfect escape with money bills, but it can make it dangerous for any party or any public man to be any longer complacent with this outrage.

#### Delay and Diligence

An irrevocable and purposeful Washingtonian, who had dined with diplomats, was once moved to inquire why the district messenger service would not do the diplomatic work that regular mail, as well as the established machinery, with its numerous and expensive formalities. It struck us at the moment that he had an idea. Of late it has struck us that there is an idea he hadn't composed.

Look at this Panama Canal talk business. Suppose we had tried to settle that by telegraph and cable. Suppose the United States had wired or telegraphed our position to Great Britain and Great Britain had had to reply with equal readiness. Where should we have been! The only safe answer is that we should have been in an elegant room, with no prospect of agreement until somebody's head was broken.

Behold, therefore, the wisdom of expediency, the utility of pluck breeches, the horse sense of going through forms. A few months ago the English sent us over this thing—and some of us were pale. Since then nothing has happened except that nothing has happened. There has been an exchange of notes. Time has elapsed. Both Americans and Englishmen have had a little thinking. Englishmen have stopped talking foolishly. That has permitted Americans to listen to CINCINNATI and not some other place. It does nothing of the kind. An honorable exit that is also possible is no longer despairing of. On the contrary, the best bet is that the United States will do the right thing—as England did in the *Alabama* matter—and that England will not even have seemed to threaten us.

Our friend was wrong. The district messenger service couldn't have done it.

#### Congress and Prohibition

The so-called Wren-Kayton liquor bill is a job. Plenty of good people probably accept it as a bill sincerely intended to prevent the shipment of intoxicating beverages into states that have passed state-wide prohibition laws. It does nothing of the kind. It merely prohibits the shipment into prohibition states of liquors to be used in violation of the laws of such states. No state law forbids the consumption of liquors. All the state laws do is to forbid the sale of liquor. Even if the Wren-

Kayton bill is passed over President TAYLOR's veto—no it may be before this is printed—anybody living in a prohibition state will still be perfectly free to order from another state alcoholic drinks for his own consumption. If it is found and proved that he is ordering the stuff to sell he can be prosecuted. But that is equally true now, under the state laws, without any intervention of Congress.

There is the remote possibility that federal agents may be in some way used to help the prohibition states enforce their own laws. That is the only way in which the Wren-Kayton bill can count at all. We hardly think it will count that way even if it is passed. It is hardly likely that federal district attorneys in prohibition states will give the incalculable amount of time and energy necessary to discover how many of the intemperate shipments of liquors into their districts are for purposes of sale rather than consumption and to the accumulation of evidence sufficient to convict juries.

The law amounts to nothing. We are cynical enough to add that if it had amounted to anything it would never have been passed. Maybe, however, it will help Representatives and Senators in what constitutes the political situation in this country. Mr. Wren, for instance, is a bright young man, very well liked, with a rather serious constituency, the more intelligent part of which will doubtless condone his efforts to consolidate the law intelligently.

Meanwhile it is to note that the actual consumption of liquor in this country during the past year was not so great as when Federal agents do derive from the facts any confirmation of the hope that people can be legislated into the habit of temperance. Sincere and honest legislation can do a good deal to protect young people from temptation and to stop the indelicacy of the liquor traffic, but it cannot cure drunkenness.

#### Amalgamation

In view of the *Courier-Journal's* double-barrelled insistence that Congress "divorce the Mexican divorcee" and "authorize the President to invite Great Britain, Germany, and France to join us in sequestrating Mexico," we are less disposed than we might have been otherwise to regret that Mamie and her children with the admiral will not be so great as it would have been under Taylor.

#### Hypocrisy and Humbug

The Tribune, still spinning, quips and says:

The idea of imposing Republican postmaster for life upon the people of Alabama, Mississippi, Georgia, and Florida was also grand when Federal authority had to become necessary to make enough Republicans to hold the job and saw wholly out of accord with the sense and sentiment of the community: Is that right or fair or decent? Dr. Fayer says it isn't. He doesn't propose to have his liver stolen to serve the end, in anyway—HARPER'S WEEKLY.

Dr. Fayer doesn't say anything of the kind. Get up to date. Dr. Fayer repudiated the alleged quotation criticizing Mr. TAYLOR for classifying those 40,000 postmaster. He and the National Civil Service Reform League, of which he is president, have commended the classification. He has recent utterances that says he found no fault with Mr. TAYLOR, but merely disapproved the question of possible examination of incumbents of unclassified places precedent to their classification.

We accepted the original statement of Dr. Fayer's views mechanically. Our authority was the Tribune. We haven't happened to see the revised version acted, though we accept with equal readiness the same authority. But did President TAYLOR direct or does the Tribune approve competitive "examination" of incumbents precedent to their classification? Hardly. Nevertheless, adds the Tribune, promptly, "Mr. TAYLOR has directed that the postmaster on the South for life they can be re-elected if found unsatisfactory." Try, can, on they? Why, certainly. But "found unsatisfactory" by whom? By post-office inspectors, to be sure, every blessed one of whom is a Republican.

Fisher? The forty thousand faithful are blind as to if the Tribune's "re-election" means that fall wall and blow it. It also knows, when it hints non-theologically at our wanting "a whole-sale distribution of spoils," that we wish for nothing of the sort, but that what we do object to is wholesale grabbing of spoils under cover of "civil-service reform."

#### Loney or Doyage

The TAYLOR veto of the immigration bill was the act of an executive who carried only two states in the Union, and who had no protection, and no credit, and positively that he executed the will of the people in

vetoing a bill favored by a large majority of both branches of Congress. If it is wrong for the courts to thwart the popular will by nullifying laws on constitutional grounds, it is equally wrong for a President to thwart the will of Congress by vetoing the wisdom of certain legislation does not agree with the opinion of the legislative branch of the government.—*Springfield Republican.*

Did the people vote for a "literary test" at the latest election? We hadn't heard of that. And does the Supreme Court seem "wrong" when it pronounces a full payment conditional, even though by doing it it "tests" what somebody declares to be "the popular will"? Has Springfield become a hog-house?

#### Official

Department of State—Special Order No. 1: All ambassadors, envoys, and ministers are hereby directed, when appearing before kings, etc., to wear cocked hats.

#### Nearly Wet

MR. MORRIS THE NEW ZEALAND PEARL DIVER, STAYS HOME FOR 92½—LARGE YACHT LEADERS IN MR. REAR'S PAPER.

Thousands of them sold, W.T., for much less than that.

#### You see?

Instead of being sold at a bargain-counter price, steel leads were used to buy up the stock of the various companies needed. Every one of these leads represented its full face value in these purchases.

Yes, and when a dollar was worth, say, seventy-five cents in Civil War times and you paid a hundred dollars for something, every dollar represented its full face value, but what you bought was something worth seventy-five dollars. So when you buy something with a hundred worth one hundred on its face and seventy-five on the counter, what you get is something supposed to be worth seventy-five.

You should not trick your readers with deceitful statements, W.T., you know better.

#### Don't Grumble Too Loud

THE GOVERNMENT OF PA. (CALABAR), of Louisville, is a letter to Representative ANTHONY, in which he objects to exorbitant hotel rates in Washington during the inauguration, is wholly reasonable.—*Courier-Journal.*

No doubt; but speak softly! The coming Congress has liberal ideas and wants to make the people comfortable, and is quite liable, if you complain, to drop a couple of five-million-dollar dollar-walk Washington hotels into the next pork barrel.

#### Petty for Purists

HARRISBURG, Pa., Feb. 25.—It will be a mischievous mistake to give to a candidate for Congress that has no law "thoroughly cleaned" since its last preceding one if a bill passed by the lower branch of the Pennsylvania legislature had slight become a law.—*Evening Item.*

First! And it is fewer years than you could count on your fingers since it ought to have been a mischievous act in Pennsylvania to give the country a legislature that had not been "thoroughly cleaned" since its last preceding one. Was it a duly purified lower branch that passed the "purifying-board bill"?

#### He is Not Dead

MR. WICKHAMBER has earned the hatred of big business and the rebuff equally of every trust promoter and every trust beneficiary in the country.—*The World.*

He may have earned it, but we should be greatly surprised to know that he has received it. What he has received is the respect of all hands. He has conducted the Department of Justice according to the standards of a high-class lawyer and of a gentleman. Such men do not incur the hatred of opponents. Mr. Wickhamber has conducted, admirably, what may be expected of a first-class corporation lawyer when he takes a reindeer from the people.

# TO WOODROW WILSON: GREETINGS!

Good morning, Mr. President!

To you, indeed, it hardly seems needful that this journal should offer assurances of its own goodwill and good wishes. In all its life no political enterprise has ever evoked its sympathies so devoutly than that which ends to-day as you take your solemn oath of office. But to you, too, we can offer whatever heartening there may be in our conviction that you also have the goodwill and the good wishes of the majority of Americans.

We have no fear, Mr. President, that you will overestimate the value of our own or any other assurance in that matter; even if you agree with them, you will not vainly imagine that your present great prestige and popularity are a secure possession. For we feel sure that you are not politically short-sighted. We feel sure that you do not need to be told that the more conspicuously a man enters upon a great trial of his quality the more he has to fear from anything like failure to meet it worthily. You have shown convincingly that you understand the momentous nature of democracy's demands and the necessity of meeting them continuously, unflinchingly—of fighting all one's battles through, as Grant said—if one would survive politically.

In that clear-eyed enlightenment of obligations and of dangers we find, indeed, one of the chief sources of our hope in your administration; for we regard it as one of the many proofs of your political competency.

On this point, no doubt, we differ with many other observers of your career. For we do not in the least share the apprehension that your long years of devotion to academic tasks will be found to have dimmed your eyes to harsh realities. On the contrary, we take comfort from the circumstance that you have all your life been studying in quiet such problems as now confront you, such careers as you yourself are now attempting. You are happy to feel that, like most Americans, but unlike your immediate predecessor, you like politics; that you understand politics; that you have already proved yourself an excellent politician. We shall be disappointed if, before the end, you shall not have proved yourself a great politician.

So shall we all be, Mr. President, and so will you be; for none of us has indicated a clearer comprehension than you have indicated of what the times and the country's mood really demand of you. Administrative skill, executive efficiency—these, of course, are always demanded of a President. But you know that to-day, for you, they will not be enough. You know that you face a crisis; that you may, quite conceivably, inaugurate an epoch. Before we take up, with other journals, our constant duty of unsparring criticism, perhaps you will permit us briefly to indicate what we conceive your full task and opportunity to be.

It is to lead democracy in a fresh advance which it now clamors for. It is to guide democracy wisely while it compasses and overcomes a new kind of opposition that for some generations has been creating itself among us; a kind of opposition to democracy which, in all the more baffling and confounding because it is, in the main, an outcome of democracy itself; because it is, as if, in our started battling with it, a giant stroke with his own giant offspring. In this respect the curious instinct of the cartoonists is no false leading, but a true indicator of our real predicament. For the real foe of democracy in this country

wears no form that privilege has ever worn before. It is not monarchical, it is not aristocratic, it is not military, it is not clerical. It is entirely economic and industrial. The seat and source of it is neither court nor camp nor church; it is the common marketplace. The essence of it is, to be sure, monopoly, and monopoly is old. But this kind of monopoly, self-created and self-sustaining monopoly, is new. It is young and vigorous. Of all the forces that make against democracy it is the youngest and most vigorous now extant in the world.

That is your giant antagonist, Mr. President; and democracy expects of you nothing less than that you forthwith prove yourself its Jack the Giant Killer.

A great expectation, truly! For the movement you must lead, like most of democracy's perilled uprisings and self-assertions, is vague and instinctive, as well as tremendous. But we cannot doubt that you both comprehend its sweep and are striving to find for it definite aims and reasonable methods. Fortunately, you are in deep sympathy with it; otherwise you could never hope to guide it. But fortunately, too, you have yourself written the history of another very similar movement—the movement by which the people, with Andrew Jackson leading, once before "took possession of their government." Turn to the skillful phrases in which you yourself have pictured that advance, estimated alike the gains and the costs of it, praised and blamed its leadership, and you will find there many a true word and many a sound reflection that should to-day be helpful to you and to your fellows in leadership. For the present age seems plainly to demand of you that in many respects you be like Jackson. But it is a later age; may it not therefore demand more? You have had a better training than Jackson's, and no such harsh, embittering antecedents; may we not, therefore, expect of you less of error and violence and excess, and more of restraint and of just consideration and calm foresight, yet without loss of firmness in essential?

Yes, Mr. President, it is a great expectation, a daunting expectation. We should be inconceivably disappointed if you should be merely flattering you—or any other man alive, for that matter—if we pretended an absolute assurance of your proving entirely equal to it. It is enough that, like your party and like the country, we should account you, of all men visible now to the nation, the man most likely to prove equal to it.

We do not neglect to note your handicaps; we shall not forget them when we fall back into our ordinary function of watchfulness and criticism. It was your immediate predecessor's misfortune to lead a party which had been too long in power; it is your misfortune that you lead a party which has been too long out of power. It lacks the training power alone can give. It has the habit of irresponsible protest and criticism, not of responsible action. You will be surrounded by men who can speak only from conviction, not from experience. To keep your leadership, you must be, perhaps, complacent with ignorance and prejudice. Do not, we however, you, be too complacent; for that may prove your greatest danger. We do not underestimate the necessity of tact and consideration and whatever else may make for harmony, but we would, nevertheless, fortify you in loyalty to your own superior training and instincts. For it must be with you as with every other man

lifted up in high place and great power. There is no way to spare you the duty of self-reliance; there is no way to spare you the loneliness of your great station. If you believe it will be a kitchen cabinet, we, for one, shall not be too generous.

Your party is also hungry, for it comes in from a long wandering in the desert, and from this cause, too, you will face temptation and must endure a yearning impetuosity. More than that; because your party is unaccustomed to power, it will not be at ease in power. Part of your great task in leadership will be to teach it self-confidence; yet it will be equally necessary to hold it back from over-confidence and extravagance. There will inevitably be required of you a constant and apparently difficult balancing of restraint and energy, of sympathy and strictness, of courage and caution. For the full test of you and your party will be nothing less than this: that though you democracy shall win victories and yet shall not abuse them.

But if, Mr. President, we are thus candidly mindful of all that confronts you, we are also happily mindful of much, of very much, to hearten and to help you. Happily for you, as for us all, you are the choice of no one section, but of the whole country. As your election entails no one section from power, you will escape a kind of bitterness that has borne hard on many of your predecessors; and yet you will not lack the fine inspiration to be drawn from the peculiar pride in you of a particular section, a section strong in loyalties. Southerners, it is your privilege to restore the South to a full share in the country's affairs, to help her prove her fitness for it, and to strive, let us hope forever, the great tradition of her spacious patriotism in the early days of the Republic.

Less than this, perhaps, but far from little, will be the inspiration of your academic memories. At every crisis there will be the inspiring consciousness that to an extraordinary degree you represent in American public life the training and ideals of American colleges. There will be something still more poignant—the passionate, intimate appeal of your own ancient university, calling upon you, as with bells and songs, to win for her still greater honors. If need be, *alma mater* may see you better still. If the worst comes to the worst, if the path of duty becomes the way of sacrifice, if it so happens that you may lay down even popularity itself on the altar of patriotism, you can still see the tall tower with which she commemorates that other President of whom, in the hour of his seeming failure, you yourself wrote:

"The men who assess his fame in the future will be no partisans, but men who love candor, courage, honesty, strength, unshaken respect, and high purpose such as his."

Yes, Mr. President, the task is great, the dangers manifold, and manifold the temptations. But all your youth will now, surely, rise up and re-inforce your manhood. The great thing has happened—has happened to you, of all men. Surely you will not quail before it. Surely you will not lack in the face of opportunity and of danger the supreme human quality; you will not lack courage—the kind of courage that is one with sincerity. As you go to meet Fate's call, the time's demand, your country's summons, your mood will not be one of pride or self-sufficiency; yet surely it will be as if, in your own heart, a drum beat, or a trumpet sound.

## OUR DEMOCRATIC PRESIDENTS

# WITH CAP AND BELLS

BY KENNETH GROESBECK

ILLUSTRATIONS BY T. VICTOR HALL

**A**BOVE the cluster of the dishes and the cluster of the citrus fruit around the long table rose the voice of Gaston Beauséjour.

"You there," he cried, smiling around at them expansively—"you others do not fire, is it not? 'Tis only I taste of the like strong wine when I fly through space an' thousands are drunk. That is life for you, if you will!"

They all awoke at once and looked at him affectionately—the clerics and the horse-riders and the animal-tamers—a madley crowd, still in their ring costumes, for the evening performance was yet to be given. And the lion tamer, in the silence that followed the Frenchman's outburst, drew his:

"We others, we don't do nothing! but earn our livin', Gaston. An' no' much o' that, 'tween bet's hard!" But Gaston Beauséjour was standing, his dark eyes shining with excitement.

"I stan' on the little platform an' all below are the crowd—siln, silent. I rub my feet in the rut—so—as' fly into the air, down, down, with the wind whist' in my ear. The trapeze he fly to me—so—then, whiz! up, up, an' the turn in the air, an'

always I come erect to the same spot in the platform of arrival. An' up from the crowd come loud applause, then roar, motion—'tween that I am an' else none!"

He looked about him apologetically at the still silent table, while the lamps flickered and the candles burned gratefully above his crisp curls.

"The start me," he said, smiling ruefully down at the proprietor's daughter beside him. "So does my 'What conceit little Frenchman have!' She say how hard is our life. Monsieur et madame, all my love's, I ask you' pardon!" And with the most charming of bows he left them to stroll under the stars until the people should begin to arrive.

"You did start him, Dolly," smiled the fittest woman in the world, leaning maternally at the girl opposite. "And he's a dear, even if he does think she acts the only thing going."

"It's good stuff, too," growled the heavy voice of Ryan, the proprietor, from the head of the long table.

"There's not another man this side o' the ocean that can do the dip o' death like that Gaston. That's why I got him!"

They pushed back from the table with a noisy clatter and trooped to their dressing-rooms in the various wagons, most of them to rest up for the evening performance. But Dolly Ryan, otherwise Miss Deemouille, champion lark-bark-er of the world, went out to join Gaston, who was smoking the single cigarette he allowed himself daily, in harmony with the peaceful stars.

They came in shortly arm in arm, stopping to look at Dolly's little sister Frances, the pet of the whole company. Together they stood a moment beside the portable table, and the man smoothed the damp curls back from the baby's forehead with infinite tenderness.

"Sweetest things in the world, babies, isn't?" he whispered, smiling down at the sleeping child.

"Next to ourselves!"

"Next to nothing, pettie," he said, slowly. "Except you!"

It was that very night that Gaston seized his grip on the slender bar of the trapeze as it swung through space to move him and set into the net below. And though he climbed nimbly back and was successful in his second trial, he landed poorly, and the roar that came to his waiting ears seemed to lack something of its usual enthusiasm.

Ryan said nothing on this occasion, nor did he speak when the fall was repeated twice in the following week. But when he came upon Gaston drinking from a pocket flask and eating shortly after, he shook his massive head solemnly.

"This won't do, old man," he said, laying his huge paw on the other's arm. "Cut it out or 't'll get you!"

But Gaston flung away with an angry gesture and Ryan looked after him doubtfully and called his daughter.

"Dolly, my girl," he said, slowly, "Gaston's drinkin'. You've got to be alert. If you want to marry him, it's ruined away a crack twidder before this, and it will be him. It means he'll fall down on his act and lose his job. I believe you know it he'll be down and out. Have a talk with him."

But even to Dolly's grating remonstrance Gaston turned a deaf ear and shook his head angrily from his seat.

"I am no child, I," he snapped. "I know what to look, eh? My nerves they go, and one small drink before I go on, it steadies them. So I become my old self once more."

The girl looked up at him hopefully. "Please stop," she said, slowly. "Please, for my sake. I know what it will lead to, Gaston."

His eyes flashed angrily. "If you have not confidence in me, Gaston Beauséjour, do not trouble with me. Perhaps—who shall say?—I am not worthy of it. So your father, then, say so." He walked away proudly, his hands in the pockets, only to return at once in a motion several of feeling and kiss her head.

"I ask your pardon, eh? I am set myself. Soon I will give it up, entirely—so soon as my nerves they come back to where they were." He smiled at her with all his old charm and left her. But the girl stood still, a far-away look in her eyes, and her lip trembled.

Through the month that followed they did a series of one-night stands, and Gaston Beauséjour went to give with undying regularity. He was over thirty and graying at the age when all acrobats must begin to think of giving up the most seasonal of their acts. This his constant improvement, and the liquor he used in greater and greater quantities worked his will downward. He was nervous, over-cautious, uncertain. With his former member of the company he showed his irritation, except with little Frances. To her he was always the same gentle, kindly soul, ready to ride her all about the circus grounds on his back, or to tell her by the hour the most wonderful stories in all the world.

Then came the fatal day. Decided by all that little company, when Ryan called Beauséjour into his office in the proprietor's wagon and laid his fist down. The fat woman saw him go and wiped her eyes. And the animal-tamer snore softly and kicked the ground savagely at his feet.

"My boy," began Ryan, gently, "you've got to give up your act. It's getting dangerous. I don't know what it is" (he knew well enough), "but we must find another job for you. And an matter what you do you've got to give up the drink if you want to marry Dolly. That's final!"

There was a red spot in each of Gaston's cheeks as he rose to his feet. "You have no right to干涉 me," he said, his voice shaking with anger. "I give you my resignation!"

"Sit down, Gaston," Ryan's voice was very quiet, and he shook his great head patiently. "Think it over. He swears your father, you know?"

"What are you suggest'?" said the younger man, coldly. "What work is left for me to do, since I am a failure at what I love to do?"

Ryan looked at him sympathetically. "There's a particular branch of the profession that pays mighty well for the few men that do it here," he said, heartily. "What most addition you take?"

But Gaston rose to his feet, trembling with passion. "It is not possible," he said. "That you are supposed I become a clown?" (he be laughed at, necked at, by a common mob? I, Gaston Beauséjour?)

Then it shot up the tent pole and crowded madly

the President, the Secretary of War, the Secretary of the Navy, the chairman of the committee on appropriations, foreign affairs, military affairs, and naval affairs of both the Senate and the House, the chief of staff of the army, an officer of the army of high rank to be selected by the Secretary of the Navy, the president of the War College, and the president of the Navy War College.

The history of this bill is typical of all propositions to appoint a governmental committee of a scientific, non-political point of view. A brief review of it follows:

On the 19th of May, 1910, Representative McClatchey, of California, introduced a resolution in the House of Representatives calling upon the Secretary of War to inform the House as to the condition of the country for defense in the event of war, and to recommend the means necessary, if any, to avert a transmissible disaster against successful invasion of the United States territory. This resolution was passed by the House, in which appeared to be a general feeling, on the last day of the session. The official staff of the army spent the following summer in full in the preparation of a reply to this resolution, and on the 14th of December the Secretary of War submitted it to the House. The report was of such serious import that the Speaker returned it the same day on the ground that it contained confidential matter which, under the rules, would not be received, but was held from publication if received by the House.

It would not be vouching any confidence to say that the report did not excite the interest of the House, the standing army, but rather emphasized the necessity for a change in its organization and, above all, that the attention of the House should be directed to this policy, and to this end recommended the creation of

a permanent Council of National Defense. Although the report did not officially get any further than the Speaker's desk, the last recommendation was not carried out. It was not until the following year that the report was returned to the War Department Representative Nelson introduced the bill providing for such a council, but it did not come to a vote. At the session of Congress, and a similar bill was introduced in the next Congress in the form described above. This bill was reported favorably by the Naval Committee of the Democratic House, February 8, 1911, and was embodied in a plank in the Democratic platform of the National Convention, which met on the 14th as the calendar of the House on August 6th a prominent Democratic member objected to its consideration. It never came up again. The Naval Appropriations bill in the House of Representatives is now a "ride", but this was ruled out on a point of order.

The bill was reported to the bill before the House Committee on Naval Affairs of the Fifty-sixth Congress it was endorsed by Secretary of War, Dickinson, Secretary of the Navy, Meyer, General Wood, Admiral Mahan, Admiral Waterhous, General Waterhouse, Representative Hull, then chairman of the Military Committee of the House, and the Secretary of the War.

Secretary Meyer expressed the opinion that "this council would result in a definite policy and would result in a more efficient organization." The bill was passed by the House on August 14, 1911.

General Wood considered the bill one of the most important measures for military efficiency that had ever been considered.

General Waterhouse said: "I consider this decidedly the most important measure that has ever been considered since I have been in the army in forty-two years."

## MILWAUKEE'S NON-PARTISAN GOVERNMENT

### The New Scheme of City Administration which Drove the Socialists from Office

BY WARREN B. BULLOCK

**MILWAUKEE**, by its non-partisan movement, is setting a new code of business ethics for municipal officials throughout the West. In following business success, and its methods are being copied by other cities. This movement was inaugurated by the city of Milwaukee, a great business enterprise. It should be conducted by the municipal officials as such.

What the Gallatin and De Motte committees are the directors, elected by the voters, who are the stockholders in this business enterprise.

Under party control of public affairs, such a business management of the city as should be, is not, and cannot be.

This is the outline by Dr. Gerhard A. Bading, mayor of Milwaukee, of the method under which he believes the city of America should be managed, and the error of the which he is trying to avoid. He is a Socialist, but a municipally, but as a big business, whose financial interest is over five millions of dollars annually.

He is a Socialist, but a municipally, but as a big business, whose financial interest is over five millions of dollars annually.

Admiral Mahan, in a letter to Secretary Meyer, said:

"The principal purpose of the bill seems to me exactly right. It would result in the organization of a number of men whose special services are especially needed, but are not brought into formal recognition by the present law, and who will be better able to advise the Government on the subject of national defense."

"I believe that Congress, the ultimate arbiter in matters of military provision, would be enabled to do far more effect through the institution of this proposed council."

Secretary of War, Dickinson, writing to the Independent, April 19, 1910, said: "A bill is now pending before the House of Representatives to establish a Council of National Defense, comprising representatives of both Houses of Congress, the heads of the various departments of the War and Navy departments. The establishment of some such organization would, in my opinion, go a long way toward securing the most efficient and best use of our military and naval resources."

Congress has appropriated annually upward of a hundred million dollars for the support of the army. The country does not receive an adequate return for this large expenditure, as has been pointed out repeatedly by officers of the army. The appropriations are made very rarely in accordance with the estimates of the War Department, but the department rarely complains.

The wastefulness of the expenditures is due, therefore, to faulty organization, which in turn is due to poor planning. The Government is expending an overwhelming sum of the people's money on an inferior fighting force can be created only by the most judicious selection of men, and can be assured only by establishing a Council of National Defense.

## THE READY REPLYER

A COMPENDIUM OF TITLED CONVERSATION FOR USE IN EARNESTNESS MOMENTS

(For a Young Man Who Has Been Forbidden the Honor of Sight on the Intoxications by her Father.)

FATHER (with great show of heat, as he nervously swings his right foot to and fro): What the dickens are you doing here? Didn't I tell you never to darken my front door again?

YOUNG MAN (with a pleasant smile on his countenance): You were ill, Mr. Winkleside, and let me tell you, sir, that never in the whole history of speech was an idea more clearly and convincingly conveyed than by your good self when you imparted your wishes to me on the suspicious occasion of my last visit here; for which reason I have not only paid heed to your words, but have also followed your instructions to the limit, taking them in their most liberal interpretation. To avoid darkening your door I have chosen the evening for my arrival when the conditions were such that no act of mine could add an atom to the general opacity of things, the night itself having already darkened your door to such an extent that even I could not by any stretch of the imagination be suspected of darkening it further. Moreover I have brought along with me this little electric bulb, which, as you will observe, sir, upon the pressure of this little button on the side, produces a miracle, but since the less perceptible, augmentation of the light, so that in reality I have brightened your door rather than otherwise, which considerably sets on my part, added to the fact that I am possessed of a naturally sunny disposition, has enabled me not only to carry out your instructions to the letter, but to go a step further for the general illumination of all concerned.

FATHER (interfering with a supreme effort of the will to control a natural inclination to remove the visitor summarily): You know well enough that I meant that you were never to come through my front door again!

YOUNG MAN (most obediently): Even that intimation, sir, I have endeavored to the full extent of my power to respect, in pursuance of which endeavor I beg to assure you that I did not come through the front door at all, but at great personal inconveniences to myself climbed up the fire-escape of the house next door to your roof, and entered by the skylight on your roof, causing considerable personal peril in that upward climb, as well as laying myself open to the possibility of arrest by the police as a burglar engaged in the nefarious project of breaking in. I might have come in through the back door and still remain within the strictness of your prohibition, but I assumed that when you used the word front door you meant any door, so that you cannot fail to see in every way possible I have shown complete understanding of and respect for your wishes.

At this point back away slowly toward the window, and, if the old gentleman happens, drop an hour and ask for the daughter's hand, and if, on the other

THE ABROGANCE OF THE HONEYMOON, WHO CARES FOR THE OLD WORLD, ANYWAY!

"HEILA, MISTERS! How's EVERYBODY IN CHINA?"

hand, his right leg swings backward like a pendulum, with his heavily booted foot held rigidly poised for a forward plunge, dive through the window, and take your chances of landing on a tolerably soft passage by the highway outside in order to break your fall.

### PREMONITIONS OF SPRING

I can hear the birds welcoming that the gentle spring is coming on the way; and beneath the eaves and among the trees feel the green things growing that will make a forest showing in the May. Far above old winter's hoarder I can see the sunny gleam of the robin with their blossoms all a glitter, while the early raven twitter is despite the long exiles of the leaves.

I can see the gleamy plumber getting daily gladder, gladder, full of cheer, as his profits for gas-fitting and his joy for sitting, sitting, on a frozen poppet biting, slumbers.

I can hear the rook's rasping grating, and his hard led new hawmousing, as he sits, that there'll be no cash in fuel when the snows in their dust show old winter hard and cruel crushed to bits.

Oh, the lovely days of springtime, with their hawmouch and their swag-time, soon we'll spy, on a certain soft sundown in the general infusant and the presence of all men, sir, prophyl!

HOWARD DOUG GASTRIE.

### YET IT PAYS

The American genius for advertising, so often and so justly praised for its fervor and its artistic excellence, at times shows the need of a restraining hand. An honest Broadway hatter recently displayed in his window a mound of hats, with the placard, "The genuine pseudo-Panama." Not far from him was an establishment that here stood aloof from this flattery sign: "Bergin's! Bergin's! Wadsworth's! Underhill's!" They are rare, too. In many streets one of late a hawking company that is big enough to know better has been prancing an appealing life-size portrait, in color, of a bottle of beer, endowed with the following rhyme in pseudo-New-Yorkish dialect:

"Minister empty bottles soon run into wine.  
That's why we pay for their return."

### REPARTÉE

"My only fear is to meet in woman's college," said Mr. Bullfinch, "is its possible effect upon the public life of the future. Woman's love of a bargain would cause her to go in for cheap education."  
"Yes," said Mrs. Bullfinch, with an indignant smile. "Well—look at the pile of illustrious romances you see are still selling like hotcakes!"  
Whereupon Mr. Bullfinch began to look like a slump-speaker, but nothing came of it. His eloquence was not equal to the occasion.

### A REASONABLE PROPOSITION

"Buy your own time for a fellow you was good forty miles an hour," said the constable.  
"Hush—hush!" whispered the driver, sotto voce. "I'm trying to sell this car to that old chap in the town, and I've speeded up the motor seventy-five per cent."  
"It's—all right, boss," said the constable. "You gimme twenty-five per cent. of the profits, and I'll let you off."

### HURRY UP!

"Naw's the time for a fellow to win fame at the wire end of a telegram," said Hobbs.  
"In what way?" asked Wilton.  
"Just telegraph a friend in a newspaper that you have been offered a place as Mr. Wilson's outcast," said Hobbs.

THE LAUNDRY ARTIST  
IN "MARVEN" SHE IS CERTAINLY FINE.  
SHE CAN TURN OUT A "WASH" THAT'S BOUND,  
AND LIKE ALL, ON HER HONY  
SHE IS NEVER CONTENTY  
THE GIRL SLEW HER WORK "HUNG ON THE LINE."

AFTER HIS TWENTY-YEAR SLEEP

"IS THIS THE VILLAGE OF FALLING WATER?"

## The Gentler View

By Florida Poe

## Premature Critics

By the terms and trends, ideals and activities, are making toward any agreed goal, it is toward a happier, sweeter, simpler and of the same time more interesting life for each individual. With this as the surface destination, it becomes a small contradiction that we look with disdain on the few people who have already arrived there. We each of us know so fully that success is the requirement of the model family of the future, it lies outside the city, yet near enough to come to it for the home. It is home in a place of such perfection that it lends them dignity, yet does not force splendor upon them, and is so air of elevated atmosphere, or perhaps it would be more accurate to say of its aristocracy. The husband and wife work at the same thing, these activities are many, but principally carried on inside the family circle. Their children are masters of healthy pastime, their education, the best combination of genuine beauty understood by their possessor. The kindness, originality, and tolerance of each member are above the average. They are precisely the product which idealists and reformers, each in his own way, hope to create by the thousand.

It would seem obvious that they should be studied with fervor. They are professors of the future, and if we believe that to be authentic we should give them our closest attention and imitation. What we actually do is amazingly different. The majority regard them as queer, spontaneous and unorthodox coupled with intelligence being for some reason increasing to the many. There are others who advise such a family, if they be so fortunate as to know one. They glance over each detail of their lives. They are beset with questions from friends who delight in the family as a novel thing. Their delicate simplicities are lauded to the skies. The felicities themselves are loved, their ways are justly imitated, their ideas they make in modern life is a tonic and refreshment. Yet there is a mortification in the approval bestowed upon them. Instead of being visited as a group that is living as it should, and alone out of all the world seems so change exempt about in the world, they are seen as a delightful but wholly natural fairytale having an airy connection with the rest of civilization.

We go to them as we would to "Peter Pan," sure in advance of the beneficial results of so innocent and healthy a practice. When we come away we feel it to be a return to kind ground, a descent, a fact, from Peter Pan's tree-top. It is

just possible that the weight of our own morality brought us so far, for, though we like to see Peter Pan living in the tree-top, we do not see a moral balance that the tree-top is a feasible environment for the majority. We go farther, and wish a generous, firmness of opinion to insist first that a residence in the tree-top cuts one off from the great masses of people who are living on the ground, that to be cut off even by being markedly alone is to be somehow in the wrong. We feel that the residents of tree-tops lead a life that is more certain of those below them, when and unless entirely of their own choice. The pleasant but apparently isolated existence of our delightful family is, we feel, but much nearer the clouds than it is to solid earth. We, of the earth, take our solemn pleasure in this. The heights have their advantages, we gratefully admit. They give a broad view of existence, but the advantages arising from normal life, while every one else is reduced to the scuffling space seen in a bird's-eye view. When we have gone so far as this the cheerful faces become disquieting, we find that our perfect family has a little the effect of being a selfish little group, and that the very thing helping that its content is premature.

Why we should insist upon rating this moral high life is it impossible to tell. It might be traced to Puritan disapproval of happiness, and, if it were, it would be a novel and a few harmonious friends also some of normal size, while every one else is reduced to the scuffling space seen in a bird's-eye view. When we have gone so far as this the cheerful faces become disquieting, we find that our perfect family has a little the effect of being a selfish little group, and that the very thing helping that its content is premature.

Whatever the reason, we cannot sleep away our feeling that these groups remain lovable and diverting along everything, they are somehow elevating. They might be so strong and their nature so pleasing and disinterested as we are. If we have to go through these unpleasant phases, it was not friendly of them to have failed to go through them with us. Here every word and every sitting down and taking their own under the tree of Arctive-Northern-And-Kew-Continued, while we wander along within view, appears, in the light of our own self-pity, a heartless thing to have done.

## Forcing Plants with Radium

Professor Hermann Mesner, the famous Austrian botanist, who has been experimenting with the growth of plants for many years, has been working on the effect of radium emanations upon the rooting buds of trees. He placed small tubes containing a quantity of radium against the terminal buds of a lilac bush for from one to two days. After a certain length of time the buds that were treated sprouted, whereas the others remained in the resting state. After a treatment of 24 hours with a tube containing 400 milligrams of pure chloride of radium, the buds opened a month later, instead of in the following spring. This method of forcing led to the development of a theory, namely, that the buds of trees are not as hard as they are treated other experiments in which the radium was made to act upon the buds, and in these tests the results were more nearly uniform.

Curiously enough, the effect of the emanations of the radium could be obtained only if the buds were treated in the latter part of November, or in December. After treatment in September or October there was no result whatever. On the other hand, if the treatment was delayed until January or February, when the resting stage of the buds was coming to a close, there was no acceleration evident. Indeed, in some cases the effect of the radium was actually to retard the development. This would indicate that the bud may not be completely formed in the autumn, until several weeks after the leaves have fallen from the tree.

To produce any effect at all, the treatment must not be too short, for there is a point below which the radium seems to have no influence upon the plant whatever. The buds of trees are not as hard as they are treated other experiments in which the radium was made to act upon the buds, and in these tests the results were more nearly uniform.

For buds can be forced by other vapor and by warm water. Similar positive results were obtained with several other plants, such as the chestnut, the lily, the Norway maple, and others. Some plants, however, remained indifferent to the treatment, among these were the gladiolus or Japanese "maiden-hair fern plantain," the plantain, the horch, and the lily. The horch and the lily also failed to give results when treated with ether and with warm water.

## The Metal of the Standards

There are, undoubtedly, no products of finer skill or which a greater degree of care is expended than the standards of weight and measure in use among the civilized nations. Two things, in particular, must be considered—accuracy and durability. Nature does not, it is contended, furnish any single metal or material which exactly answers the requirements for a standard of measure or weight that shall be as nearly as possible unchangeable.

It is held that the best substance yet produced for this purpose is an alloy of ninety per cent of platinum and ten per cent of iridium. This is called iridoplatinum, and it is the substance of which the metric standards prepared by the International Commission of Weights and Measures are composed.

It is held that it has been offered by first that any pure metal, it is practically unobtainable, or not subject to rust, and it can be fairly engraved. In fact, the lines on the standard measures are hardly visible to the naked eye, yet they are smooth, even, sharp, and accurate.

It is said that if crystallization should ever be lost and pieces of it should be discovered in some lighter age in the various letters, which would be made by higher technology in its character than these standard measures of iridoplatinum.

## Travel In Comfort

When you travel, be comfortable.

The tracks and trains of the Pennsylvania Railroad are built for comfort.

The roadbed is rock-ballasted and evenly graded; and the rails are solid steel. The cars, both Pullmans and coaches, are all-steel, heavy and easy riding. The through express trains have parlor smoking or club cars with moveable easy chairs, and a la carte dining service that is unexcelled. All sleeping cars are the last word in appointments; the coaches are cheerful, commodious and restful.

Limited trains, like the Broadway Limited between New York and Chicago, the 24-Hour St. Louis, The Pennsylvania Limited, Congressional Limited, and Chicago Limited have Pullman observation cars on the rear with moveable armchairs and large windows, as well as an open platform, for viewing the passing scenery. Up-to-date libraries, current periodicals, daily papers, and courteous attendants are features of the Limited train service.

Pennsylvania Railroad service enjoys the reputation of being distinctively high grade and comfortable.

Try it.

## WANTED—SALESMEN AND SALESWOMEN

Wanted for the sale of the new and improved "The Ways of the Planets" by Martha Evans Martin. The book is a masterpiece of scientific fiction, and is being sold by Harper & Brothers, New York. The book is a masterpiece of scientific fiction, and is being sold by Harper & Brothers, New York.

## The Peanut Industry

This peanut, sometimes called ground-pea, or ground-nut, is known in our Southern States as the pine nut and ground-pea. The Pinck call it *pinus de terre*. It is generally believed to be a native of Africa where it is the principal food of the natives of the Congo tribes. Four or five species of the nut flourish in Brazil.

Our cultivation of it has successfully attempted in Spain. In this country it is raised chiefly in the states of Virginia, North Carolina, Tennessee, and Mississippi, but has not succeeded in California.

The culture of the peanut is not at all tedious, and may be easily learned by the raising of peas or melons in general, and care is taken that there be nothing in the soil that would stain the shells.

Planting begins when the danger has passed from frost has passed. The ground is plowed five or six inches deep, and then harrowed. The sets are taken from the pod without breaking their stems and are planted two or three together in rows about three feet apart and twenty inches from left to right, being covered with two inches of earth.

In October, when the sets are ripe, the farmers dig the earth and pull up the vines, to which the sets adhere, and turn them over to dry. The pebbles this task only in pleasant weather, when the ground is dry. When the vines have lain in the sun for a day, which is sufficient time for them to dry, the greater shells are broken and a shuck about five feet high.

The vines remain in stack from three to five weeks, after which the sets are packed in places in sacks and shipped to market. A view under favorable conditions often bears more than a hundred sets, and the yield per acre frequently exceeds forty bushels.

The greater part of the Virginia and North Carolina crop is made in more than two-thirds of the whole crop of the country, is marketed in Norfolk and Petersburg, and is used to make soap, stoves, large metal cylinders, from which they pass through the axle, in which a strong current of air separates the fully developed nuts having sound hearts from those imperfectly filled, and the nuts are packed in bags, which fall through the bags upon sorting tables, where those that are diseased are taken out, and the light ones are put on table marks that will catch hold about six hundred pounds of nuts. Each sack is marked with the brand that indicates the grade of the contents.

The dark and the partially filled nuts are shelled, and the kernels are used by ready manufacturers.

Generally speaking, three varieties of ground-peas are grown in this country—the white, the red, and the Spanish. The white, the most important variety—has six or two leaves with pink shins; its vine spreads along the ground, in this respect unlike that of the red variety, which grows more upright and is a bush.

The pod of the red nut holds three and sometimes four kernels, and has a deep red skin.

The Spanish is a much smaller nut, with a richer skin and richer flavor than either of the others possess. The entire crop is shelled, and used especially in the production known as soap.

As the ground-peas are a most useful product than most people think it to be, besides its use in the rounded form, there are considerable uses to which it is put.

The nuts contain from forty-two to fifty per cent of a nearly colorless, hard, fixed oil, resembling that of the olive and used for similar purposes.

More than twenty-five years ago there was a great loss in Virginia the manufacture of peanut-oil, of which a particularly profitable kind is made. North Carolina has long made much of roasted peanuts, and it is also cultivated for oil, and is used as a substitute for coffee. We all know the hot water peanut butter is now manufactured and sold.

The peanut is most nutritious. The negroes in many districts in the South employ it in making "ground-peas," and they also make of it a kind of beverage.

The vine furnishes a shelter as good as clover hay, and helps fattens up what they feed on the fields after the crop has been gathered.

This error has been traced upon by writers of sensational fiction. They have dwelt on it with incidents where the murderer lay in the course, long identified to traces of the "picture" of him well left upon the retina of his eye. The idea is, of course, that as the victim of a murder looks on the murderer, the murderer has taken and retained, as it is put in a picture, a "picture" of the murderer's face which will endure in various parts of the world. Certain investigators, it appears, and scientific photographers, with the aid of the "eye photograph," have been at some pains practically to demonstrate the fallacy of the belief. The experiments were not for obvious reasons made with human eyes. Indeed they were used the eyes of rabbits, not only those of dead rabbits, but of living ones as well; and every effort was made to determine whether the retina of the rabbit's eye would receive and retain an impression even remotely resembling a picture of a "picture." The results were such as to dispose for sure and all of the idea of the "eye photograph."

There is no "eye photograph" subjected to suitable tests showed nothing whatever resembling any picture.

## Echoes Louder Than Sound.

In mad progress it would seem impossible to avoid the eye of publicity, not only sound that produced the echo, but under certain rather peculiar conditions this is really true.

When a revolver is fired into a hollow the report is sharp, but not so loud as it would be if the gun were fired on the surface of the earth.

If the hollow is up something like two thousand feet higher, there will be a few seconds' silence after the revolver shot and then a roar or deep rumble will be heard from the earth.

If an explosive is lowered from the top of the hollow until it hangs a few hundred feet below, and it is discharged in an electric fire, the explosion in the hands of one of the spectators, there will come to the ears of those above a report like a revolver shot, and then a few seconds' silence, followed by a peal of the loudest thunder ever heard.

When an explosive is blown up about or above the hollow into the water or upon the surface of the sea, the air is many degrees below. Thus, when the sound-waves penetrate the denser lower strata of air and then the solid earth, the echo produced is in the nature of the resonance of the hollow far louder than the original sound.

## "Down Brakes"

In newspaper accounts of railway collisions one frequently encounters this statement:

"On seeing the danger, the engineer 'hooked' down brakes" and "reversed the lever."

As a matter of fact, the expression—"down brakes"—has been obsolete for a long time. What the engineer really does when a collision seems impending is to slack off steam, apply the air brake, and open the sand valve. This takes about five seconds, and in that time all that remains left is able to accomplish for the train and passenger safety. Down Railway engineers are instructed never to reverse the engine after the air-brake has been applied, because the reverse reduces the stopping power of the hanks.

## Eskimo Lamps

It is believed that the Eskimo lamp was invented here at presenters originated from their original home, which was probably located near and near the northwest. But the form of the lamp becomes more specialized the higher the latitude is. The shape of several Eskimo lamps is each edge of two inches, while those of Point Barrow and another throughout have each edge of several to thirty inches. The lamp is employed for melting snow and ice to obtain drinking water, for cooking, lighting, and for heating the body in the arctic. It is also a social factor and the sign of the family unit, each head of the family having his lamp.

## Wood-pulp Sponges

Tattlers with chloride of zinc, wood pulp forms a viscous mass. When salt is added and the mixture has been raised with alcohol and compressed a fair imitation of a sponge results.

Two steel vestibule trains, representing in workmanship and artistic finish the perfection of the car builders' art, have been put into service between Boston and New York. They form the "Merchants Limited" of the New York, New Haven & Hartford Railroad, the 5 o'clock five-hour train between the two cities.

These new trains are practically indestructible; they are built like battleships. They are made of steel, reinforced underneath with two immense steel girders running the length of the car.

Each of the new trains will consist of six cars, exclusive of the diners. There will be four parlor cars, a combination parlor and baggage car, and an observation smoker. All of them have a stiff exterior and an interior of inlaid Mexican mahogany. For rich, yet unobtrusive decoration, they surpass anything heretofore turned out from the Pullman shops.

The usual drawing room has been eliminated in the parlor cars, giving them 36 chairs instead of 28. These chairs, upholstered in tapestry, with self-adjusting backs, are models of their kind.

These cars are the first to have the new, indirect system of lighting. From a dozen brocade lacquered domes, each containing a 100-watt lamp, light is thrown upward against the white ceiling of the car. This reflected and diffused, the light has the softness of twilight, and yet the finest print can be read without eye strain.

Each car carries its own lighting system, generated by a dynamo run by a belt from the car axle.

The old system of hot-water heating has been discarded for direct steam heating, while drafts are eliminated by the Garland system of ventilation.

The interior finish of the observation smoker, with 40 leather chairs, differs from the others, in that it is of rich cocowood. A buffet, in which hot coffee can be made quickly by electricity, is attached to this car.

The traveller will find himself in surroundings calculated to afford all the relaxation he needs to make his journey between the two cities one of positive pleasure.

## Eye Photographs

Nearly everybody knows that we see objects partly by light that returns to the eye. But of this fact, doubtless, there is some of the popular belief, assuming that the rays that are reflected from the "pictures" may be seen in the eye of dead men.

THE GREAT WESTERN LIFE INSURANCE CO. HAS THE BEST INVESTMENT RECORD IN THE HISTORY OF THE WORLD.

## The Old Sea-Clock

Changes came late into Europe during the thirteenth century. There is evidence to show that they were employed at a much earlier period than that, although it is probable that for the most part they were regarded as mere curiosities. The first form was that of the "balance clock," the construction of which rendered it impracticable for use at sea. Its movements were irregular and its utility was nullified by the rocking motion of vessels.

Ingenue had made pendulums for the regulation of clocks on shore so early as 1656, and in 1675 his application of spiral springs as regulators of watches, made them, in a measure, available for use at sea; but the fact remains that the real introduction of timekeepers, when by standard time could be carried to any part of the world, and longitude, as well, be determined, came at an late period as the eighteenth century. With the invention of John Harrison. The rise of modern navigation may be dated from the improvement of the sextant in 1731 and the invention of the chronometer in 1753.

With the compasser of today, and the ingenious instruments on board every ship, there is now no difficulty in ascertaining the time, and, consequently, the longitude.

But such was not always the case. On the vessels of the old days, before the inventions referred to, and when only the wind-vane remains were known, seamen frequently had recourse to curiously contrived devices. These, nevertheless, served the mariner from chaos and destruction; and, even though he could not name the hour with any degree of certainty, and was often misled as to his longitude, he at least knew the day of the week—no small comfort on the high seas.

Relapses of the moon and the positions of the stars afforded some assistance to

the old-time skipper. He was, however, greatly handicapped by his lack of astronomical knowledge and the inferior quality of his "eye-glass." Moreover, eclipses could not be seen for every night in the month, and there were dark nights when the stars could not be seen.

A popular form of sea-clock in the old days was the sand-glass. Many of these glasses were timed to run twenty-four hours and, prior to the departure from port, the ship's glass was set exactly at noon. If it were carefully watched and turned as soon as the sand ran down, the skipper could reckon the days with a fair degree of accuracy.

Side by side with the large glass were placed half-hour and minute glasses. The man at the helm carefully watched this sea-clock and announced the time at regular intervals by striking a bell. It was customary to estimate the duration of any incident by so many glasses. "To dog the glass" was an operation very congenial to late seamen. It consisted in turning the glass before all the sand had run down, so that the watch was appreciably shortened.

The twenty-four-hour glass was even employed, aside from keeping a rough record of time, for the purpose of estimating longitude. The difference between the twenty-four-hour glass and the time by the sun was estimated, and this difference was held to represent the longitude east or west, according as the sun's time might be before or after the "time" returned by the glass.

"Taking the sun" was a queer operation in the old days. Those quadrants and sextants were killed, toward mid-day the captain appeared on deck to perform his sextant function. After making a scrutiny of eyes and waggings of the quadrant, the master would level out to the mate, "Make it! ————!"

are stimulated directly similar contractions take place in all the three kinds of cells. For example, an electric shock, or a mechanical blow, will cause the skin in *Scomber* pale. It is not certain, however, whether these stimulations act directly upon the cells or indirectly through the nerves connected with the cells, as a reflex. The slowest response was dark color in the temperature produced simultaneously.

Especially interesting are the results obtained from experiments on the influence of light upon the skin. In these experiments care was taken to determine not so much the action of light impressions received through the eyes, and that of light acting directly upon the skin, but the action of the skin color to changes in the light and especially, that of the skin color to the eyes of fishes. Earlier investigators had observed a contraction of the pupillary cells under the influence of intense illumination in eels and in several members of the salmon family. Dr. von Trosche could get no results when he repeated the experiments. But with other species of fish he obtained quite different results. When one of two similarly pigmented fish was placed in the dark the skin became pale in a few seconds. This is true even after the fish has been blinded. The same result had been observed in minnows; but it was later discovered that here the change in the skin is brought about by the direct action of the illumination upon the skin, but as a reflex result of stimulating the so-called "third eye," a little outgrowth on the surface of the brain. This "epiphysis" probably corresponds to a third eye, since it appears like an eye in the early stages of development, and certain reflexes the resemblance to the eye is complete. Moreover, when this lump of tissue is cut away, the fish will without injuring any other part of the brain or nervous system, the animal reacts to prolonged illumination by a contraction by change in degree of pigmentation of the skin. When this "eye" is present, however, the minnow's skin can be made to change color by directing a beam of light upon the top of the head, even after the fish has been blinded. In some species experimented with by Dr. von Fritch the change can be brought about by playing a beam of light upon a limited area of the skin, or by causing a deep shadow on a limited portion. This no effects was produced by merely illuminating the head. And in all the species tested the red and yellow pigment cells take part just the same as the black.

Changes in color through "paralytic" stimulation are quite common in fishes. It is this species that the change may be brought about by disturbing the nervous system of the animal in some way. In one species of fish the animal became pale when it is mechanically stimulated with the finger! In another species excitement produces a darker color. This difference is compared to the fact that human beings may become pale with anger, or flushed under the influence of the same emotional disturbance, and the analogy is a true one. In both cases the color change in appearance of the skin is brought about through nervous currents from the sympathetic nervous system, or from the spinal cord.

The adjustment of the minnow is the color of its surrounding. It is brought about by the expansion or contraction of the red, yellow, and black pigment cells. In a red, green, and white bottom, the reaction of the fish is the same as that to a stay of a certain shade, according to the illumination. Thus the apparently perpetual readjustment of these pigment cells to their surroundings are brought about without anything corresponding to consciousness or purpose, but are the direct results of the construction of the animal and the constitution of its cells.

## TO MEASURE EARTHQUAKES

THE LABORATORY SEISMOGRAPH IN THE WORLD, RECENTLY PRESENTED TO THE NEW YORK MUSEUM OF NATURAL HISTORY, IT RECORDED THE LATEST EARTHQUAKE IN JAPAN, 2,300 MILES DISTANT, FOR TWENTY MINUTES.

## Color Changes in Fishes

It is a well-known fact that the color of the skin of fishes changes from time to time, apparently under the influence of external conditions. Many animals have been made of this phenomenon, and it has been found that certain cells of the skin, those containing the black pigment, contract when acted upon by certain stimuli, thus reducing the total amount of black exposed. The state of the red and yellow pigment cells has been much more difficult, for the reason that these pigments are dissolved in alcohol, so that the material is not readily prepared for microscopic study. Dr. Karl von Fritch, of

Munich, has carried on experiments that help to understand the workings of these color changes. He finds that the red and yellow pigment cells are connected with the spinal cord and with the sympathetic nervous system by means of nerve fibers, the same as the black cells, and like the latter they are made to contract by stimulation. This is in marked contrast to the reactions found by Fritch, since in certain fish, in which the black cells expand while the yellow ones contract, and vice versa. Dr. von Fritch found the same conditions for many species of fish, belonging to several families.

Another series of experiments led to the discovery that when the pigment cells

## Synthetic Food

For some time chemists have been trying to prepare a synthetic nitrogenous food. It is known that in the work of digestion the nitrogenous materials which are absorbed go to the cells to form the protein of the animal in some way. The organism assimilates them in the simplest possible form. Accordingly, the artificial food must offer to the organism nitrogenous elements relatively simple. A liquid named Hirsch had the residue of the manufacture of artificial nitro-bases, and drew from it the sugar which it contained, washed it, pressed it, and mixed it with carbon dioxide. This change in this way at the end of two or three days a solution in which the nitrogenous present itself in a form which the animal could assimilate. The study recently finally obtained possessed a very pronounced taste of the food of the animal not less than three times greater. Trials of this food made in Brussels by doctors are said to have been highly satisfactory.

The Match

ONE would naturally think that so important a discovery as that of phosphorus must have at once led to the invention of the match, but the fact is our hundred and fifty years elapsed after such discovery before a more chemical match was introduced upon the principle of the present "friction-stick." This principle was that the friction of phosphorus between rough surfaces—for example, two pieces of brown paper—produced a flame.

During the early years of the nineteenth century it was found that potassium chlorate, in combination with leaf sugar, kindled when brought into contact with sulphuric acid. This fact was at once utilized, and attractive match boxes, containing one hundred sugar and potassium-tipped splints, as well as a plant containing sulphuric acid saturated with sulphuric acid, soon made their appearance. They cost a penny each, or about five dollars. The device was not, however, long popular, not so much because of the price, which was ultimately reduced one-half, but by reason of the acidity of the acid for water. It absorbed moisture from the atmosphere in such quantities as speedily to make the device inoperative.

Then it was suggested that if phosphorus were heated in a glass match case formed within upon the glass, and a sulphur-tipped splint were dipped therein, it would ignite on again contact in contact with the outer atmosphere. The great object of phosphorus operated against the general adoption of this idea.

The first friction match, or "hozier," as it was called, was invented by John Walker, a chemist, of Stockton, England. This consisted of a splint dipped in a compound of antimony sulphate and potassium chlorate. Ignition was obtained by rubbing between two pieces of wood, as operation that proved objectionable since the heads were apt to fly off without igniting the match.

This phosphorus was substituted for antimony. This match was known as the "Congress," and gradually it was improved, other experiments being the place of the potash, until the perfect match was developed.

Today phosphorus is the chief ingredient of the tip of most friction matches. The splint is added to insure inflammability of the tip, and the wood may be thoroughly ignited. The characteristic peculiarity of such variety of matches is that the phosphorus is the tip of the tip is red lead, silver, or some other substance securing a proper amount of oxygen to feed the flame. The remainder of the tip is phosphorus, and gum or glue to secure the stability essential to inflammability.

Almost any light wood furnishes a suitable match splint. Birch has the preference in Europe, while white pine is the favorite in this country.

By sundry processes the wood that is to be made into splints is sawed into blocks two inches square. These are fed to machines that instantly reduce them to well-shaped match splints. As rapidly as the splints drop from the machine—round round matches are desired—they fall in regular order upon an endless belt that carries them to the drying trough. To obtain a round match the wood is first forced through dies.

In the dipping trough the splints are brought into contact with a wheel-brush revolving in melted sulphur. Pressing on, they reach a second trough where the phosphorus mixture that provides the match is, in like manner, applied. Then they go to the drying-iron.

These matches are, for the most part, derived from the employment of red phosphorus. The theory of the safety match is to separate the phosphorus and the chlorate, which are united in the head of the ordinary match. The dipping incident for the match is of potassium chlorate or chlorate, antimony sulphide, and glue. This match will not kindle unless it is rubbed against a surface containing phosphorus. To fast some manufacturers put a small quantity of phosphorus into the match itself, so that it is not a safety-match.

The Japanese produce a variety of peculiar matches, some of which are made by hand. The first was made with an evenly distributed flame—no smoking—no pre-vents, a red hot ball of glowing white matter.

Animal Trials

MANY curious experiments are found in the laws of Europe in the Middle Ages. For instance, in the case of a child accused by a pig or a snake bitten by a bull, the trial was conducted roughly as if the animal had been actually responsible. It was inflicted, placed before the ordinary tribunal, and, on conviction, brutally given over to execution.

The treatment of Baringould shows

"THAT GROUND HOG WAS A LIAR. ALL RIGHT!"

Necessity was the Mother of the Remington

WHEN the need of the typewriter came to the business world, the Remington came. Others followed.

Remington was the first typewriter—it is still the first typewriter.

First in the field, the Remington organization began building experience, step by step, from the actual practice of typewriter users—always a step or two in advance of the user's need. Other makes followed.

Today the Remington typewriter stands unique as the greatest revolutionizer, the greatest energizer the commercial world has ever seen. And by no means least of its benefactors are all other makes of typewriters—for the Remington created the typewriter industry and blazed the way—for the others to follow.

1,600,000 Remington-written letters mailed in New York City alone every business day in the year.

That tells the story of Remington pre-eminence, of the confidence of

captains of commerce in it, of the faith of tens of thousands of efficient employees, of the limitless selection in choice of operators and choice of positions—the machine that has made work for the millions, and millions for the work.

Remington—the first Typewriter.

that, during the fourteenth and fifteenth centuries, guinea animals suffered death on the gullews, rocks were heated at the stake, and processes against trials, fire, water, and other ordeals, etc., etc., common. Where the ordinary course of justice failed, pulpits, and some men, usually well known, but of no ecclesiastical rank, were summoned by the bishop, because children resorted there to no effect.

A curious trial was that pertaining to the Protestant chapel at La Rochelle, which was conducted by de Beaulieu in 1653. The bell had a tale that was quite dull. It was shipped as a punishment for having assumed the office. It was gathered and disintegrated in order to represent its new birth in passing into the hands of the Catholic Church. It was cut down, and had to reply. It was compelled to recant and promise never again to relapse into sin. It then made simple and laconic recantation. Lastly, it was recanted, leapt, and given to the parish which bears the name of St. Bartholomew.

When the governor, who had sold it to the parish, asked for payment, the answer made him mad that it had been Hagston; that it had been newly converted, and consequently had a right to demand a delay of three years before paying its debt, according to the law passed by the king for the benefit of those newly converted.

Sugar

It is not known who invented, or discovered sugar, but it seems to have been known a slave the dawn of history, but not in all countries. The Chinese appear to have delighted in the taste of sugar for more than three thousand years; and it was known in India earlier than in Europe, being made from a juicy root or cane.

One of the generals of Alexander the Great is said to have carried sugar to Greece in the year 325 B.C., as Sir Walter Raleigh, some two thousand years later, carried tobacco from Virginia to England. But even so late as A.D. 1500 sugar was still a rarity in Europe. The famous physician Galen used it as a remedy for certain malady.

Experiment has demonstrated that sugar has remarkable sustaining power when taken by those suffering with diabetes. The invention of the first process for refining sugar is ascribed to the Arabs, and Venetian merchants are said to have purchased the secret from them and introduced the process into Sicily. The refining of sugar for use in some of its various uses was first practiced in England about 1626.

The Regeneration of Organs

MANY inferior animals have, as is well known, the power of replacing various parts of the body when lost, such as the tail, ear, or eye, or even a limb. A worm may sometimes be divided into various sections, and each section will proceed to live its separate existence. Experiments made by naturalists to obtain a better understanding in this regard, usually resulted in the loss of limbs and extremities have grown again after being almost wholly extracted. Also the horns of oxen have been regenerated with the results. An eye, which has been lost, or an eye which commences with the outside world, and those eyes have been regenerated. Although practically useless for purposes of vision, it is established likewise that the eyelid, eye, or eyelid, which is lost, or taken off, will grow again, although it will be smaller than the principal eye. In some cases, however, in the naked eye, the trunk and bladder, as is well known, can grow new claws.

Artificial Ears

ARTIFICIAL EYES are so skillfully made that they may with difficulty be distinguished from natural ones, it is claimed. When the individual who has lost an eye applies to the manufacturer for a substitute, there is made a pair of eyes, one of which is made of the material of the other, a mold of that part also must be taken for each eye. The fitting of the artificial Manufactures assert that as two ears are made, and that it takes a skilled workman to prepare an ear for the mold of wood.

When finished, the new ear is placed in the mouth, or in the ear, and is fastened to the back of the ear. It is really only the first artificial ear that is expensive, the rest are made of wax, and are made in the same way. Artificial eyes, which are made of glass and silver, have been made in such a way that they are not distinguished from the natural eyes.

## THE TRIUMPH OF AN IDEA

BEGINNING AND CONCLUSION OF SEVEN YEARS OF PUBLIC SERVICE

WOODROW WILSON

PROPOSED FOR PRESIDENT OF THE UNITED STATES IN MARCH, 1906  
INAUGURATED PRESIDENT OF THE UNITED STATES IN MARCH, 1913

COPYRIGHT, 1916, BY R. F. HOLMANS

## WOODROW WILSON, PRESIDENT OF PRINCETON UNIVERSITY

FROM "HARVARD WEEKLY" OF MARCH 16, 1908

If he can regain the Jersey voters as well as be a drill instructor or write history, he would be a winning candidate.

### From the Knoxville "Tribune"

HARVARD WEEKLY suggests that the Democrats nominate President Wilson, of Princeton, as their next candidate for President. Such a proceeding would give Bryan and Board and lots of their followers a shaking up that would be the opposite of profit.

### From the Baltimore "Sun"

George Harvey nominates President Woodrow Wilson, of Princeton, for President of the United States. This might stop Harvard from getting all the big offices.

### From the Columbia "Journal"

The suggestion of HARVARD WEEKLY to the Democrats to try a scholar for a Presidential nominee next time has created a favorable impression.

MAY 25, 1906

### From the "Brooklyn Eagle"

Since the dinner at which the editor of HARVARD WEEKLY suggested Woodrow Wilson, president of Princeton University, as the Democratic candidate for President in 1908, things have happened rapidly. Democrats at that time did not see things so clearly as they see them now. The threatening danger of demagoguery in the specious dress of one or all of its various "isms" which are now being exploited were not an evident in thinking men as they are to-day. There had not at that time been heard the call of democracy to all who believe in the principles of Thomas Jefferson to rally to the defense of the party and the union.

It took Colonel Harvey's leaves a full minute to make up their minds whether or not the speaker meant

what he said. The assemblage of eminent men gathered about the table in that brief minute did some of the most rapid thinking of their lives.

After the dinner was over and the dinner had gone home they continued thinking about Woodrow Wilson in the new relation which Colonel Harvey had suggested. If the suggestion had been intended as a joke or as a compliment it would have ended there. Dr. Wilson would have understood the joke and would have appreciated the compliment, the perception is too keen, his mind too sane, to permit any misunderstanding on his part. When Colonel Harvey made his speech the idea was as new to Dr. Wilson as to the other guests. Weighing all the facts at his command, he considered, as any man of good judgment and sound sense would have considered, that Colonel Harvey did not mean to be taken seriously. He dismissed the matter from his mind.

But Colonel Harvey was seriously serious. He meant exactly what he said, that in his opinion Woodrow Wilson was exactly the kind of a man to make a President who would give to his country the best possible administration; that he was not only the kind of man, but the very man, to command the united support of working-men of all parties in all parts of the country; that he was the right man to guide the union through the threatening breakers of capitalism.

Colonel Harvey was not the only one who did a lot of thinking that night and the next day. The majority of the men at the dinner were Republicans, but they were men of distinction; men of strong minds and clear heads. These men are still thinking of what Colonel Harvey said. It mattered not to them that the speaker had named Dr. Wilson as a fit man for the Democratic candidate. The question which each one asked himself was whether or not Dr. Wilson would measure up to the requirements of a man to succeed the very active, very energetic Theodore Roosevelt. Measured by any and all standards, the answer was yes; was that Woodrow Wilson was such a man as the country required.

One of the objections which is likely to be raised to

the possible candidacy of Woodrow Wilson is that he is not a politician, that he has never "won his spurs," as the saying is, in the arena of practical politics.

At first thought this objection seems a valid one. Looked at more closely, it loses much of its force. By the admission of all well-informed men there is no one in the United States who is more thoroughly familiar with the historical development of this country than Woodrow Wilson; there is no one who knows in large and in small the results of all the different policies under which the country has been governed; there is no one who has seen more clearly than Woodrow Wilson the threatening approach of popular revolt against the accumulated power of the vested interests of the country, and there is no one who, in argument, at all events, is better able to dissipate the threatening clouds of revolt against the privileged class.

Another objection raised against the candidacy of Dr. Wilson is the allegation that he is a student and not a practical man of affairs. This allegation, as all who have ever known Woodrow Wilson can abundantly testify, is based upon mis-observation or lack of information. It probably arises solely from the fact that he is the president of a university, and the popular idea of a university president is that he is an academician as contrasted with a man of affairs. One of the professors at Princeton, in speaking of him a few days ago, said:

"Woodrow Wilson is not only the finest scholar I have ever known, but he is the shrewdest business man I have ever known. He is not only a sound thinker, he is above all else a man of action."

Some have raised the objection that the people at large do not know who Woodrow Wilson is. That in its certain sense they and the fact that it is true, rather than an intention to promote his candidacy, is the reason for this article.

Woodrow Wilson is a spare man, of medium height, noticeably wide forehead, very expressive eyes, and very attractively personable. He was born in Stratford, Virginia, on December 28, 1856, and today in his 51st year is at the height of his mental vigor. He

was graduated at Princeton in 1879, studied law at the University of Virginia, received his degree of Ph.D. from Johns Hopkins University, was a member of the faculty and afterward at Wesleyan University. He accepted the chair of jurisprudence at Princeton in 1892, and upon the resignation of the incumbent was elected to succeed him as the trustee for the rest of the university.

Under his administration Princeton has grown in every respect more rapidly than the most successful universities, both here and abroad, as America's foremost living historian in that field which deals with the political and social history of the United States.

Woodrow Wilson is put down as a conservative, a Democrat of the old school as opposed to the latter-day Democrats, who are technically known as the "radicals."

"The radicals are in control," says the practical politician. "Nationalism of the present type now is advocated by the Democratic party. If nominated, a conservative cannot be elected. It is certain since Woodrow Wilson is a conservative. He is a conservative because he believes it is the duty of the elected representatives of a people to learn from experience, rather than act upon theory. He believes it is their duty before taking any action leading to a change of policy to gather all available information, to sift, to examine, to deduce, and so to learn why failures have been made and how to avoid future failures. He believes that every American citizen should be taught to think for himself and to be ready for himself. He believes that the only way to have a better reason for being a party man than because he was born of certain parentage or in a certain place is to be a party man."

His views upon public questions are not hard to collect from his public utterances. On the questions which now agitate the American body politic—very strong views, definite, but not all those, and these views can hardly be called conservative. He believes that the present political unrest, of which "Socialism, Municipal Ownership, Socialism, and other similar movements are but symptomatic, is the logical and inevitable result of our defective policy of government, and that the only way to save the party. Dr. Wilson's view of this policy is that it consists of nearly half a century of legislation, systematically based upon the principle that the welfare of particular vested interests. He believes that the American people have already come to see this in a vague way and that their vision is rapidly clearing.

The real issue in Dr. Wilson's mind is whether or not these strongly entrenched vested interests will be permitted to continue this policy at the expense of the public at large.

Dr. Wilson firmly believes that the time will come when the nation must find a way to subordinate the accumulated power of these privileged interests to the general interests of the country at large; and he believes that when this time comes the welfare of the people must be met, it will be the old-time Democratic party which must meet it. Thus he believes there will be a call for more "government," which he knows what they are talking about.

The views of the American people may not clear sufficiently to let them see the real issue. It is entirely conceivable that the "radical" element, the revolutionists who win a phrase such as "free silver," "municipal ownership," "socialism," and so on after it should be plainly, may lose its way again. But sooner or later will come the new line of thought, and there will be a struggle to battle the forces of the people against those of the privileged interests.

Dr. Wilson does not believe that the method of reform will be the destruction of the corporations and trusts, the great modern instruments of business, for he believes that the natural and indispensable machinery of modern society. He believes that the method of their reform will be such an amendment of the laws as will leave away from them all official advantages such as, for example, the tariff gives many of them, and such a clarification of the law, both civil and criminal, as will fix responsibility in an unmistakable way upon the responsible party. The country has never known so much as this in the Republican program. "The country is like a young man who has himself heir to a rich estate," says the conservative. "By neglecting his duties he has squandered his income. But he knows he has a large account and in the fullness of life he draws steadily and recklessly, and he must stop. The end of the time when his fortune will be spent." It is a notable fact that every discredited economist in the country believes that the United States are using up its capital rapidly.

The economists, who are at the same time practical men, know that it will be some time before the nation at large see the truth of this doctrine. The younger element enjoys rapid living. Replenishment is a word which young men do not understand. They are not so-called savants. It implies thinking ahead, planning for the future. The element in the American population which stands for this is the young element elected into Congress through the use of "retrogressive" tactics.

"The nation is great and strong," say the young men everywhere. It is growing daily greater and stronger. They returned to the United States after administration is developing the country, and more than that, it is developing the world. It has made a world power. It will be the greatest world power. Let the distant future take care of itself."

Dr. Wilson is a practical man as well as an economist. He knows that the young element in Congress is at least, most prevalent. And there is just enough truth in it, so far as the capacity of the nation's progress

is concerned, to make it temporarily defensible. Unlike some of his fellow-economists, he does not believe that the young element is so much the present betwixt of the United States to enjoy itself, even though the nation is spending its capital. He is an economist of the old school, and he believes that the end of the path in plenty of time to change to come. And yet, conceding all this, Dr. Wilson believes that the young element is so much the present betwixt of the nation in what the truth and the end of the way. In other words, it should be the duty of the young element to bring about a change which is necessary to reach sound economic living, which is living on the income without reckless extravagance and waste.

In regard to the conflict between capital and labor Dr. Wilson is, as in other things, a consistent believer in the free market principle. He has no prejudice against a capitalist of any class, and he has no prejudice against a laborer of any class. He believes that the only way to settle the conflict itself. It becomes necessary to let the market rule, and the other is permitted to take an unfair advantage. He believes that the only way between capital and labor the law should not take sides, but should hold the balance true at all moments. He believes that if both sides act without malice or false advantage—acting as umpire, never as parties.

## MARCH 31, 1908

It is interesting to note the further comments, newspaper and individual on the suggestion of Woodrow Wilson, president of Princeton University, to be nominated for President in 1908. An important characteristic of the comments, which we quote on another page, is their invariable recognition of the merits of Mr. Wilson. *The Troy Press*, for example, which is inclined to treat the suggestion implicitly, is forced to admit the truth of all that is said in the suggestion of the president of Princeton for the national office. After quoting with approval the tribute which appeared in *HARPER'S WEEKLY* of March 19th, it asserts that Mr. Wilson cannot be nominated, and cannot be elected if he is nominated, because he is comparatively unknown, and therefore it is opposed even to the suggestion of his name. According to this critic, Mr. WILSON has proved himself to be a "competent executive"; that he is "a statesman of breadth, depth, and excellent sagacity"; that he is a notably sane idealist, and that he is a genuine orator; that he "stands for everything that is sound and progressive"; that he has the respect of all men of good will; that he is a man; that he is faithful to the interests of the whole people; that he has profound convictions; that he has no enemies. In a word, it is admitted that Mr. WILSON possesses qualifications for the Presidency in an extraordinary degree, but it is insisted that all these will not count with the Democratic party because he is not well known to it, and that if he were nominated, the country would not elect him because he would be such a recent acquaintance. It is, of course, a mistake to assume that WOODROW WILSON is not widely known. There is no man who writes on government and on politics, who is so generally and so favorably known. However, the fact is not only opposition to Mr. WILSON as a candidate that has not been expressed is put on the ground that the Democratic party will not nominate an exceptional man whom it does not know to-day, and that the people will not elect a man of acknowledged ability and high character, who is not well known to it, and that if he were nominated, the country would not elect him because he would be such a recent acquaintance. It is, of course, a mistake to assume that WOODROW WILSON is not widely known.

Dr. Wilson is, as in other things, a consistent believer in the free market principle. He has no prejudice against a capitalist of any class, and he has no prejudice against a laborer of any class. He believes that the only way to settle the conflict itself. It becomes necessary to let the market rule, and the other is permitted to take an unfair advantage. He believes that the only way between capital and labor the law should not take sides, but should hold the balance true at all moments. He believes that if both sides act without malice or false advantage—acting as umpire, never as parties.

The insertion made by *ST. JAMES ALBION B. PARKER*, during his recent tour in the South, that the next session of the Democracy for the Presidency ought to be a Southern man, has attracted a great deal of attention in Washington, as well as in the states directly concerned. Judge PARKER pointed out that during the last ten years it has proved impossible to secure harmonious action on the part of Western and Eastern Democrats. Mr. WILSON'S name was discussed by Eastern Democrats in 1896 and in 1906, while Judge PARKER himself in 1904 failed to poll the full Democratic vote in the West. The deduction from these facts is that prescience dictates the selection of the next nominee from a different section—to wit, the South, which has no enemies within the party, because it has been so long the Democracy for the Presidency, and neither whether he has been a Western man or an Eastern one. It may also be pointed out that, since the South's manufacturers have acquired considerable development, a Southern man would no longer be accused or suspected of hostility to a

protective tariff, though he could undoubtedly be trusted to advocate the revision of certain chapters of the Dingley act. He would therefore appeal very strongly to the Republican revisionists, of whom there are so many in the South, as well as in some other states. We add that, as there are few, if any, great fortunes in the South, and as the railroad interest is comparatively unimportant, the masses of Northern voters would not regard a Southern man of being a tool of railroads or monopolies.

## MARCH 31, 1908

From a letter by Henry Lozier Nelson in the Boston Herald.

An exceedingly interesting movement is in process of organization. It is a movement which is striving to bring about an end to the present system of management of the Democratic organizations—at least it cannot yet appear to them. Its origins develop wholly upon the way in which public opinion directs itself, whether there is enough dissent in the existing conditions in both parties to stir up a sentiment which will make of managing politicians a negligible quantity.

The will of the combination between politics and money-making are no longer the knowledge of a few. The world knows how corrupt, how base, how unwieldy all kind of control, and to all men self-interest, and the fact that the government is controlled and business. From the Senator receiving fees, to the man of the street, the public mind is now so much soiled by the part of newspapers in the South and West, but of a large number of men who are in the public eye, but who have been convinced that politics in this country must be elevated to a higher plane than they are.

Revolutions which have recently been made have stirred the country, and there is thinking going on. The will of the combination between politics and money-making are no longer the knowledge of a few. The world knows how corrupt, how base, how unwieldy all kind of control, and to all men self-interest, and the fact that the government is controlled and business. having these qualifications, however, for the farther reason of their availability. However this may be, it is an idea that we should not lose sight of. Men and strong men for our political places who will give us better government, government which is not marred either in its motives or in its results, by a revolt which is sure to be inspired by the spirit of extravagant ostentation.

It does not matter much at present whether those who are thinking in this way are few or many. It is important that a good many respectable citizens are at least in agreement with the idea. At a good many who have agreed to find their profit in carrying public life have at least been convinced that a pure and intelligent government will do more for the welfare of the individual citizen of government. It does matter whether Woodrow Wilson be a possibility or not, it does matter that there is a notable disposition to find the question of the tariff important. It is a man which is entitled, whatever may be the conviction in which it is issued, to respectful treatment. It is an all important question, and the importance of such a name would be met by an inquiry as to his standing with the best-known of the "boys."

The question suggests itself, are we looking for a man at the end of the kind of politics in our country which is so like the politics of the gentlemen of three and Italy who were accustomed to relieve themselves of their money on the highway in order that it might be distributed among themselves and the goodwife? It is certainly not to be hoped for. At any rate, the kindly manner in which the mere suggestion of Mr. Wilson's name has been received indicates that some people are reflecting as to the possibility of changing the politics and relieving the character of our politicians by putting superior men in service. That the South is taking an interest in this particular person is shown from the fact that he is a Virginian.

Here is a man who was born in Virginia, who is trained in the knowledge of the history of his country, who shows that he thinks like a statesman, who has been so successful as an administrator that his experiment at the politics and relieving the character of our politicians in education, and whose relations for many years have been with a Northern state. It is wonderful this fact that in the most interesting work that he has done in education, and whose relations for many years have been with a Northern state. It is wonderful this fact that in the most interesting work that he has done in education, and whose relations for many years have been with a Northern state. It is wonderful this fact that in the most interesting work that he has done in education, and whose relations for many years have been with a Northern state.

HENRY LOUIS NELSON.

#### From the "Troy Press."

In giving due weight to these considerations, we object to his nomination on the ground that the people would not be benefited by the election of Woodrow Wilson. It is our opinion that the election of Woodrow Wilson will answer the purpose, demonstrated by history, which must precede a Presidential nomination. The election of Woodrow Wilson will answer the purpose, demonstrated by history, which must precede a Presidential nomination. The election of Woodrow Wilson will answer the purpose, demonstrated by history, which must precede a Presidential nomination.

This booklet is the compliment of one scholar to another, and an excuse for directing widespread attention to Woodrow Wilson.

#### A Letter from an Educator.

RAMON, N. B. Mox's 1st, 1904.

To the Editor of Harper's Weekly: I read your recent editorial regarding President Woodrow Wilson as the proper Democratic candidate for the next year. I want to commend you upon having the foresight and good sense to take this stand. I know how big a name you have and how much respect you have while I was a member of the faculty at Princeton. It has often occurred to me that he would make an ideal President for our country. I read your editorial in your article I wrote about him some years since. He is my model gentleman, and I believe that there is no man in this party who is more worthy to be elected in this country. Let me haste to say that I am an independent in politics, but my motives be independent. I shall feel that in anything I can to help on this issue you have started.

I am, sir,

NATHAN WELLES BIRM.

#### NORTH AMERICAN REVIEW, APRIL, 1906 Whom Will the Democrats Next Nominates for President?

BY A JEFFERSONIAN DEMOCRAT.

It is high time that thoughtful Democrats should begin to consider the question, on what issue they mean to appeal to the American people in 1908, and that standard by which they must be judged their basis of victory. A new Federal House of Representatives will be chosen in November of this year; so will many Governors; so will many State Legislatures, which, in their turn, may powerfully affect the composition of the Federal Senate. The rank and file of the Democracy will be immensely encouraged in their efforts to pluck victory from the coming contest at the ballot-box, if they know that their leaders, far from maintaining an expectant attitude, and allowing things to drift, have agreed upon a sound and attractive policy, and are

prepared to name a candidate for the Presidency who shall be "available" in the true sense of the word, through his power to inspire confidence, to command respect, and to secure the anxious support of the Independents, who in 1884 and in 1896 proved themselves able to turn the scales.

I.

So far as the framing of an issue is concerned, it should prove a much easier task for Democrats than for Republicans. As regards the two great questions of tariff revision and the regulation of interstate railways and other great corporations engaged in interstate commerce, the Republican party seems to be irreparably ruptured. Only with the help of Democratic Senators, at all, can Mr. Roosevelt take any place whatever in the embroiling his personal views upon the statute-book. It follows that government control of consolidated capital cannot be made a pivotal issue at the next Presidential election. It is true that the Democrats may justly claim to have upheld from the outset the popular demand for Federal control of those railway combinations and all other all formidable trusts; but the Republicans may as justly say that the same demand was recognized and pressed by their Executive chief in the White House, by many of their Senators, and by all but seven of their Representatives. It would, therefore, be difficult, if not impossible, to make the tariff issue, or that of 1908, or that of 1912, the *Trois* issue. It is otherwise with the question of tariff revision. The Protectionist Republicans, or Stand-paters, have shown themselves absolute enemies of their party, in both the Senate and the House of Representatives; for, if they permitted the House to pass the Philippine tariff bill, it was the duty of the Senate to withhold its assent to its grant in a Senate committee. President Roosevelt, who, some time ago, was an advocate of tariff revision, seems to have bowed to the inevitable, and, of late, has evinced no inclination to any relaxation of the Dingley Tariff. On the other hand, the Republican friends of revision in the fifty-first Congress, though not entirely free, are resolute and impassioned, and have betrayed more than once a willingness to organize a revolt against the dominant element of their party, and their spirit of insubordination is strengthened by the knowledge that, in many sections of the country, the movement for revision is gaining ground.

It is not surprising, therefore, that the Democrats, if we doubt if it would be possible to find a single independent—by which, of course, we mean a man who in theory and practice is non-partisan; who is not also an avowed and earnest revisionist. Under the circumstances, the Democrats are not so much called upon to make a tariff revision the axial issue of the contest as they were in 1902 and 1908 as they are to accept frankly and openly an axial issue already made for them. That they will bail such an issue with enthusiasm is obvious. A party which in the past has demanded a tariff for revenue could not fail to welcome revision as at least a step in the right direction.

We see, then, that tariff revision, which events have made the main plank in the Democratic platform, will strongly commend Democratic candidates, provided these are wisely selected, not only to the great sea-turning body of Independents, but also to that large and growing minority of Republicans whose party allegiance is slack compared with the devotion of the Democrats to their plain reductions of the Dingley tariff. Under the circumstances, Democrats should be able to repeat in Massachusetts the triumph gained by Governor William L. Douglas two years ago. In New York, where the Republican party is rent by faction, the Democrats certainly should be able to do much better than Governor Odell's plurality to lose their next down Governor Odell's plurality to lose their next nine thousand votes. They ought not to miss victory in Pennsylvania, where their nominee for State Treasurer was elected less than five months ago. Bright also is their prospect of carrying Ohio, where their candidate for Governor was successful at the recent election. They in 1902 successfully revived Missouri, which only for transient reasons gave her electoral votes to Mr. Roosevelt in 1904. They have a right to expect considerable gains in Maine, Illinois, Michigan, Wisconsin, and Iowa, where there are more tariff-revisionists in the Republican ranks. On the whole, the Democracy may pretty safely count of preponderance in the next House of Representatives.

II.

Having that proved successful in the preliminary skirmish, what step should not be taken by the national Democracy in order to win the great battle for the Presidency? It will not avail them to

have the right platform; they must have the right candidate as well. They had the right platform in 1880, and if, with or without his consent, they had nominated Samuel J. Tilden, feeble and mercurial as he was, they would have proved as irresistible as were the Christian cavaliers of Spain when they charged with the dead Gid at their head clad in his armor and propped upon his war-horse. That they had the right platform in that year is evident from the fact that President Arthur soon after recognized the necessity of revision, and sought almost immediately to amend the law for the purpose. In 1884 the Democrats did not win by virtue of their platform, which was an evasive one, but because a large fraction of the Republicans in pivotal states led from Mr. Blaine and voted for Mr. Cleveland. In 1888 Mr. Cleveland stood on the right platform, but the non-partisans won in 1896. Four years later, Independents rallied; and as there was simultaneously a good deal of discord among Republican leaders, caused by Mr. Harrison's frigid treatment of many of them, Mr. Cleveland's victory was monumental. It is our judgment that in 1904, after Judge Parker's electrifying telegram to the St. Louis Convention and Missouri's vote, the Democrats would have stood on the gold standard, the Democratic candidate could not have been beaten by any man except Mr. Roosevelt, who, although not, by principle and by practice, a Jeffersonian Democrat, as Senator Tillman justly says, had at that time proclaimed his approval of two Democratic demands, that, namely, for the Federal supervision of those railway combinations of interstate commerce generally, together with that for tariff revision. Having stolen the Democratic thunder by his advocacy of federal supervision of interstate railways and of interstate commerce, Mr. Roosevelt remained the eternal-compelling Zeus, and kept his place upon the summit of Olympus. It is, in view of the splendid record of 1904 did not turn upon platform at all, but solely upon the rote-getting qualifications of the candidates, and, naturally, as Chief-Judge Parker was comparatively little known, and may possibly have lacked Mr. Roosevelt's magnetic personality, he had to succeed.

To which of the great sections of the Republic should the Democrats now turn for a candidate? Nelsons and some other Western states declare that we ought to put forward William J. Bryan for a third time. We have never questioned the ability or the patriotism of the eminent Nebaskan. We believe that, if elected to the White House, and kept in the temper of his own peculiarities, he would evince sobriety and candor, severity and foresight. Neither have we ever seen cause to doubt his loyalty to Chief-Judge Parker, the nominee of Mr. Bryan's party in the last Presidential campaign. Traitors there unquestionably were among pretended Democrats; but William J. Bryan was not one of them. It is, however, almost his misfortune when they confuse a superior feat that he was born under an unlucky star! Never in the history of this country has an American citizen been elected Chief Magistrate who twice previously had been a candidate for that great office and twice had been defeated. Only twice in our country's history has a man been elected after he had been re-nominated and elected. We refer, of course, to Jefferson, to Jackson, and to Cleveland. The only other man whom Western Democrats would be at all likely to propose is Governor Folk of Missouri. He is relatively a young man, little more than eligible, in respect of age, for the Presidency, and is not so well known, as well as by the letter of the Constitution. His career, which promises great distinction, has but begun. He, if any man, can afford to wait. As for the status east of the Mississippi and north of the Potomac, they present at the hour when we write no man whom the national Democracy would be at all likely to nominate. It is possible that Mr. Hearst would even come forward as a candidate before the next Democratic National Convention, unless he should here be successful in obtaining the Governorship of New York. Mr. George B. McClellan has solemnly declared that he will accept a nomination for no other office so long as he is Mayor of New York City. It is possible that Mr. Hearst would be chosen this year Governor of Pennsylvania, but there is reason to fear that this state would still prove inoperably Republican in a Presidential year. We may add that no Pennsylvania Democrat can be said to have a national reputation. We should next point out that the day is distant when either the Democrats or the Republicans will take a nomination for the Presidency from the states west of the Rocky Mountains. That section has yet much to gain in respect of population before it can pretend to such an honor,

APRIL 14, 1906.

depth, and exceptional sagacity; as an idealist, who, at the same time, shall be exceptionally sane. It needs a man who, although steeped in Jeffersonian teachings, can be trusted at a given crisis to subvert what Jefferson did a century ago, but what Jefferson would do now. It needs a man whose nomination would be a requiem of the South, which the South nobly deserves, and whose election would be a decisive proof of the fall restoration of the Union. Such, unquestionably, is the man whom the country urgently requires, by whatever political party may claim to be his champion forward. Such a man is Woodrow Wilson, of Virginia and New Jersey. We add that he is a Democrat, and of course a tariff revisionist. In a word, he meets all the exigencies of the situation.

APRIL 14, 1906

From the *Sarasota "Press"*

Princeton already has one President in her midst, and in our opinion he was one of the best the nation ever had. He is a scholar, in some ways a littérateur. President Roosevelt is an historian and an author who writes interestingly about lions and Federalists.

In this line Woodrow Wilson is superior to either. If his history is open to some criticism from a Southern viewpoint, the volume on *The State* is above reproach. The distinguished author went to school when he was a boy in Augusta, where his father was pastor of the First Presbyterian Church in the Georgia city. The *Press* has watched his career with interest and enthusiasm. Several years ago his paper announced him for Chancellor of the State University. Naturally, he was promoted to be head of his own alma mater at Princeton. He may have been born in Virginia, but he is a Georgian, married a Georgian woman, and might be considered to be head of the Georgia side to become a candidate on the Democratic side. We presume, of course, that *Harper's Weekly* is boosting him for the Democratic nomination. With the understanding we are for him.

From the *Columbus (N. C.) "State"*

Mr. Harvey is generally supposed at the public reception given the suggestion that the Democrats make Woodrow Wilson their leader, although he says his remarks in the *Lotos Club* were not hastily made or ill considered. The idea of having a statesman for a Presidential candidate is somewhat novel, but nevertheless it is attractive to the non-politician, and Mr. Harvey has grouped quite a formidable number of names favorable to Mr. Wilson.

There is no reason why "serious consideration" should not be given to the suggestion. Presidential history is not too plentiful, and Presidential history of the reduced variety is alarmingly scarce. It might be a terrible shock to the American people to have such a man as is described by Mr. Harvey appear to the Chief Magistracy, but they would get over it; it could be shown that there was precedent for such a thing; there were statesmen in the long ago, and they did quite well. In fact, much need to be done by Americans in a quiet way. The "big stick" was always the favored policy; it is an outgrowth of modern methods.

From the *Kansas City "Times"*

Woodrow Wilson, whom *HARPER'S WEEKLY* suggests for the Democratic Presidential nomination, is, perhaps one exception, the most excellent Democrat in Princeton, New Jersey.

APRIL 7, 1906.

It is suggested by friends of Mr. WILLIAM J. BAYES that he has made up his mind not to seek the Democratic nomination for the Presidency in 1908. Where, then, will the national convention of the Democracy look for a candidate? Mr. JOHN SHARP WILLIAMS, of Mississippi, maintains that it should not look to the Southern states. If the opinion is based on the assumption that a Southern candidate for the Presidency would provoke a national sentiment at the time, we believe Mr. WILLIAMS to be mistaken. A more plausible objection is that it is impolitic to take a candidate from a part of the country which the Democrats are sure of carrying. Politicians have long been in the habit of selecting candidates for the Presidency from states that are or have been divided. This objection on the other hand, may only be met by the selection of a man born, brought up, and educated at the South, but who, subsequently, by long residence at the North, has acquired an intimate knowledge of his fellow-countrymen in that section. As we have formerly pointed out, such an ideal combination of qualifications is presented in Woodrow Wilson, president of Princeton University. No objection to his candidacy could be made on the ground that New Jersey is irretrievably Republican. Local pride plays a great part in that state, and although it was swept by the Republicans in the last three Presidential years, it gave its electoral votes to them and to BREWER and TRUMAN, and not to Mr. CLEVELAND. We add that in 1904 a change of less than 5,000 votes from one side to the other would have defeated the Republican candidate for Governor.

The suggestion that WOODROW WILSON be the Democratic candidate for President in 1908 continues to excite comment from the newspapers of all parts of the country. The most serious effect of the suggestion has been felt in the South and in New Jersey. This is natural and logical, for Mr. WILSON was born in the South, and his boyhood is remembered not only in Virginia, his native state, but in Georgia, where he attended school, where his father preached, and where he married his wife. He has always been as well seen from the remarks of the *Sarasota Press*, in high favor with the Georgians, and was once suggested for Chancellor of the State University. In New Jersey, where he was a student at Princeton, and where, since he has

quiet. The Southern newspapers indicate that their part of the country quite understands the loser that a nomination of a Southerner would be to their action, but they also show that they are chiefly glad that a Southern man is talked about, not because of the place of his birth, but because of his worthiness for the highest office in the land. Mr. WILSON is not mentioned because he is a Southerner, but being mentioned because of his own personality, his own character, his own accomplishments, and his own ability, he also happens to be a Southerner. This makes the incident especially gratifying to the South. Another very significant statement is to be found in the closing paragraph of an editorial of the *Trenton American*, which we look upon to quote in full this week. It says this newspaper, Mr.

Richard Watson Latta President Woodrow Wilson W. H. Howells Henry Mills Allen  
At a dinner to Mr. Allen in Franklin Square in 1906.

been professor and president, the suggestion is as cordially received as it is in the North. The *Sarasota Press* says that it is in favor of Mr. WILSON for President on the understanding that he is to be the Democratic candidate. The original mention of his name was as that of a man very worthy to be the Democratic candidate. It is not quite accurate to say, as the *Press* does, that *HARPER'S WEEKLY* is "boosting" Mr. WILSON. It is doing nothing of the sort. It has recognized in him a man eminently fit to be President and to be the Democratic candidate for President. The statement of this fact alone is a complete answer to the other statement that the *Weekly* has put him forward as its candidate. We would, it is true, be delighted if the Democratic party would consent to make so sensible and proper a nomination as this would be. Not only New Jersey but Pennsylvania welcomes the suggestion. New England newspapers treat it respectfully, while one Western paper shows its appreciation of Mr. WILSON by ranking him with ORVILLE CLEVELAND.

To the *WEEKLY* the interesting feature of all this comment is the evidence it affords that a good many Democratic newspapers realize the value of character, of dignity, of intellectual equipment for the Presidential office. Faith is shown, too, in the strength of repose and in the power of

WILSON be nominated, he will unquestionably have back of him the men of both parties whose ideals are the restoration of primal principles and a return to constitutional government." From all this it will be seen that much good has been accomplished by the mere suggestion that Mr. WILSON's candidacy is one which the Democratic party ought to take into serious consideration.

This advice may not fructify into action, but at least the suggestion has excited comment, and may excite discussion, that must benefit the party and the country. It has made serious editors lift their eyes from the crowd of politicians who are running along in the old rut to contemplate a man who has what we might call real Presidential ability and Presidential virtues—that is, ability and virtues which are his own, and which distinguish him from a mass of people who have mere availability. When it is considered that supposed availability has been the leading virtue of all the Democratic Presidential candidates who have ever been defeated, it seems odd that it is still a virtue so highly considered by those who make dates. It is probably true, however, that no Democratic candidate ever will be successful without a preliminary victory over the date-makers. Therefore it is gratifying to a political onlooker to note the pleasure with which thoughtful men receive a name that would never occur to a pro-

possible that the views expressed are. The characters and tone of the article are such as we might expect from John G. Carlisle, but he is probably not its author. Not one of it is attributed to Judge Parker, although the ideas presented are very similar to some that were expressed by the eminent New-Yorker in recent public addresses in the South. It is, perhaps, an easy way to conceal identity to attribute to any man "privately" as "the ablest Jeffersonian Democrat left, for there are no good many Jeffersonian Democrats left, in spite of the admitted excess of a Democratic bias shown in the among the Jeffersonians during the past third of a century.

The suggestion that the president of Princeton University should be the next Democratic candidate for President of the United States is based on two propositions. First, that the rank and file of the Democrats are Parker's admirer by naming a Southern man (President Wilson was born in Virginia and grew up there); second, that the rank and file of the Democrats are "out of touch" among "the great masses of the higher education." Mr. Wilson is named because, in addition to being a Virginian and a Democrat, his education is his bond that "he is by nature and education, a statesman"; that "he is a genuine historical scholar, who has proved himself a competent executive"; "a statesman of breadth, depth, and exceptional sagacity"; "an idealist who is at the same time" "exceptionally sane"; "a man who would lead in a crisis"; "and whose Jefferson died a century ago, but who Jefferson would do so."

Importunately this is the sort of a President the country needs. The editor of *Mr. Wilson's Weekly* with such quick force that frightened Democrats are in agreement that "the country needs relief from the vicissitudes and humiliations of the White House." We can agree with him that Judge Parker "would have been elected had he not been elected," but who Jefferson would do so? We are not yet out of the woods into which idealizing has led us. But surely we shall get into the open again before long.

There are several university and college presidents in the country who are admirably fitted to hold the reins of office that the great people desire. Eliot, of Harvard, is undoubtedly qualified, and his elevation to the Presidency of the nation would be, perhaps, the best thing that could happen. Fiske, of Princeton, is another good man. The Southern advocates are certainly an important element of his strength. It is a good thing to pro-claim him, and the need here in this *New American Review* article is not wasted.

From the *Columbian (The "Lodge")*:  
 HARPER'S WEEKLY is identifying Woodrow Wilson as nomination for the Presidency. He would find a solid South behind him.

From the *Boston "Record"*:  
 Colonel Harvey of *Harper's Weekly*, has thirty-two compelling reasons for choosing Woodrow Wilson, president of Princeton, as the Democratic candidate for the Presidency. First, he is a Southerner, full of force and magnetism, an orator of broad views, a Southerner resident in New Jersey. He would be an excellent public orator, and his name is already in vogue; we were slow and he neither a political influence as he was in 1902, nor a bad Harry, the idea would be considered. But who is the present Democratic organization would regard it seriously?

From the *Washington (The "Every Evening")*:  
 HARPER'S WEEKLY says Woodrow Wilson, president of the University of Princeton, is the best Democratic nomination for President of the United States in 1908. President Wilson is a Virginian by birth and a Democrat by adoption, thus being ideally prepared in old-time Democratic nominations. His ability is unquestioned, and he would make a candidate for whom thousands of good citizens could vote with perfect satisfaction. But as he is lacking in real political ability of the character that lead to high political government, nothing is more imprudent at this time than to name him as your man.

From the *Michigan "Scout"*:  
 HARPER'S WEEKLY stands its ground in the matter of its choice of Woodrow Wilson as Democratic candidate for President in 1908, and points with satisfaction to the latest issues of *Every Evening* as its evidence. Amalibably wise, there can be no reasonable question of the wisdom of the choice.

It is to be regretted that Mr. Wilson would be a good thing for the country as betwixing a return of his party to historic party ideals and first principles, and a subsequent up after the nation's present condition which have belittled his resources and alienated its sympathies during the past twelve years or so. Theoretical Republicans would welcome a nomination of the man of Mr. Wilson's high character, but would not best, even though he might be a better man in fact than the pale man that, say, a Democrat like Hayes, whose nomination also would be a good thing, were he not acting on the country another campaign of disheartening, harrow, and oppression.

The high character, broad political, profound knowledge of American history and institutions, executive capacity, and personal integrity for the Woodrow Wilson, in the gift of the American people of Western origin, are good things, which would do us back. The best men of both parties could regard the prospect of his election with a sense of at least security. In the "common people" of the North, it is well known that if the Democratic nomination were a matter of preference to the party mark and its such as expressed in the chief of our best learning, it is well known that we have a thousand among that sterling and representative America, the president of Princeton University.

From the *Tribune (The "Herald")*:  
 Woodrow Wilson has been nominated for President on the Democratic ticket by HARPER'S WEEKLY. There is at least an suggestion of left tinter in the name.

From the *Union (The "Banner")*:  
 When such strong Northern sentiment has HARPER'S WEEKLY goes to talk about a Southern man like Woodrow Wilson for the Presidency, but this for the Southern people to begin to take interest in such a movement.

JUNE 2, 1906

A commentator on the suggestion that Woodrow Wilson would be a good Presidential candidate for 1908 is troubled with a new thought. It is this:

As a rule the man who writes history is not regarded as possessing the peculiar characteristics of the politician which qualify him to make it; it is a government which derives power through popular acclaim.

If it be true that the man who possesses the arts of the modern politician is the only man who is reasonably sure of success with the people of this United States, this reputation has to rank as a very high political and social level. Moreover, if the people of the United States are so shallow that they can be led by the transparent wiles of the party leader, or hawk, or tout—whichever he may be—to prefer the man who is seeking place for his own or his party's gain, in a man who has the wisdom and the knowledge of a statesman, they are in no such a way that some one, for them, ought to consider seriously the propriety of their surrendering the right to govern themselves.

From the *Indianapolis "World"*:  
 HARPER'S WEEKLY has suggested President Woodrow Wilson, of Princeton University, as a possible and practical candidate for the Democratic Presidential nomination in 1908.

Why not? This country has during the past decade witnessed the passage of several acts of unwise legislation—the Presidential chair—McKinley, Roosevelt, Cleveland, et al. Bryan, national; Parker, judicial candidate for the Supreme Court; the lax laws that have been passed beneath an unstable of Republicans voters; Roosevelt, advocate of the strenuous life, bar-basher, man of all trades; in whose opinion the only correct method of attaining the administration may be to "use and employ the "log stick" or else appeal to the mob. The United States has had enough of Roosevelt. That he is not a man of executive and executive respect cannot be denied. That he was, generally speaking, one of the best we have had for a long time is a statement which is made by history, and yet can we ever doubt for a moment but that a continued policy along the lines laid down by our present administration will lead to a more rapid disintegration than the establishment of a common power? Roosevelt has done well enough—but we have had enough of him.

Experience, bitter experience, told by the count of the ballots, proves that American Democracy, under the influence of a man of strong conviction if he would make any bid whatever for success in the Presidency, is not to be counted on for more than a few years. But not two years before. A strong but conservative, a well-managed but firm man is the character whom we should desire to lead us by the hand; and yet can we in naming President Wilson, Colonel Harvey has made a wise, a noble selection, at the same time paying tribute to Wilson's qualifications as a man.

SEPTEMBER 1, 1906

To William J. Bryan: Greeting

Your public utterances, my friend, are with me of interest. Most of your theories have been stolen and applied somewhat feverishly in practice, but you may have others and new ones. If so, permit me to pray quietly that they be so wise. You are doubtless aware that if the Democratic convention should be held in St. Louis, you would receive a third nomination for the Presidency by the United States by acclamation. It may please you also to learn that a vast majority of citizens are firmly convinced that there is only one Republican who could hope to withstand the effect of your present popularity. Truly a gratifying and happy honorarium, which without precedent, and surely most comforting to one who has in his life, in the United States by acclamation. It may please you also to learn that a vast majority of citizens are firmly convinced that there is only one Republican who could hope to withstand the effect of your present popularity. Truly a gratifying and happy honorarium, which without precedent, and surely most comforting to one who has in his life, in the United States by acclamation. It may please you also to learn that a vast majority of citizens are firmly convinced that there is only one Republican who could hope to withstand the effect of your present popularity. Truly a gratifying and happy honorarium, which without precedent, and surely most comforting to one who has in his life, in the United States by acclamation.

The sole rejoinder for the re-establishment of the Democratic party upon an enduring basis are an Issue and a Man.

The issue: Extinction of tariff taxation now bearing upon the poor, and the substitution, for revenue purposes, of graduated inheritance and income taxes to be paid chiefly by those whose incomes have been acquired through privileges accorded by the State and opportunities afforded by a democracy.

The man: Woodrow Wilson, of Virginia and New Jersey.

The Democrats of New Jersey possess a rare and glorious opportunity to point the way, and make a striking contrast by naming the Man as their candidate. The United States Senator to succeed JOHN F. DWIGHT.

Can they rise to the occasion?

DECEMBER 22, 1906

"What is all this talk we hear about Mr. Woodrow Wilson, of Princeton, N. J. In the dimensions of a mild and fugitive intellectual sensation which might readily have passed as a mere distraction of the idle curiosity it has grown of late for more considerable and authentic. At Washington, just at present it may be said to have reached the proportions of an animated discussion, a discussion, too, of no particular geographical or political restrictions. What does it all mean? Is it that we are asked this early to believe that Hazzer was really the salvation of the Democracy? We confess that we should have been gratified that disagree"—*Leading Editorial in the New York "Sun" of December 2.*

APRIL 6, 1907

No Deal, Square or Otherwise

It is difficult to believe that any one who will carefully read and consider Mr. WILSON'S speech can fail to recognize not only its soundness and accuracy, but its essential Americanism. The proposition that there should be no deal, or class in this country favored by our laws is fundamental democratic truth; and Mr. WILSON clearly points out that we have departed from this general principle; that we have built up whatever law-obtained special privileges we possess; and that a strong conviction, perhaps a growing conviction, is forming in favor of the protection of our erstwhile favorites while we retain the vicious principle that has created and fostered them. Mr. ROOSEVELT'S own refusal to consider tariff reduction, his belief that it is comparatively immaterial, are evidences of the prevalence of this sentiment. His loyal advocacy of the evils of trade-protection, of his mono-polistic features, of its demands for the recognition in law of minorities as composing a favored class, although they are a minority of labor, is another evidence. Mr. WILSON is opposed to all class legislation, and it is this view which we have in mind when we say that his statesmanship is not only sound, but it is essentially American because it is essentially democratic. The difference between this statesmanship and another which has captivated some minds by its seeming fairness is illustrated by the following extract from Mr. WILSON'S speech:

If we are to restore the purity of our law and the integrity of our government, we must have a high and all-fairness—that is clear whatever is given artificial privileges or advantages, and that our life must be made free of all such favoritism, whether legal or otherwise class. What we need is not a square deal; but an deal at all—undivided equity and equality of conditions, a purged business and a purged law.

How much nobler and higher than the other is the ideal of Mr. Wilson will be seen at once by all who have not forgotten or rejected the Republican own ideals of individual liberty and equality. It is one of the hopeful signs of a doubtful time that Mr. WILSON'S speech is so fair and so candid, and cordially by the independent and Democratic press throughout the country.

MAY 4, 1907

Some of the Candidates Suggested

In looking about for some one who might be the candidate of a real opposition party, many names have been suggested. Governor JOHNSON, of Wisconsin, is a recent one and will have great aid by the name of Judge Gray and of Justice HANCOCK. All these men have elements of strength among the Democratic voters. Judge Gray and Mr. HANCOCK, perhaps, especially among the Democratic voters of the Southern States. Both of them possess also the respect of the better element of the Republican party with whom they have come in contact. They are public men of character.

patriotism, and they possess those qualifications of statesmanship which, in England and in all European parliamentary countries, almost invariably insure their possessors continuous public careers. It is especially worthy of note in discussing this subject or in mentioning contemporaneous phenomena that the serious suggestion that, next year, the Democratic candidate ought to come from the Southern and not the Northern. It is the well-known fact that the Southerners themselves hesitate; they are not sure that it is yet their time, or that they possess precisely the man whom they would be willing to see nominated. There is no name that is constantly recurring to the minds of men who are looking for a Democratic candidate from the South, whom he will put an end to spectacular tariffism; who will be a true reformer, but who will not be willing to break the law or to play obstruction politics for the purpose of securing what he regards as reforms. Mr. WOODROW WILSON's candidacy was first suggested, in print, in these columns. It was accepted kindly, not only by the South, whence he came, but also by the North, but at first the suggestion was often regarded as academic; but it becomes more and more apparent, as time goes on, that it was a very practical suggestion, so that the thoughts of serious men are coming back to it again and again, as was pointed out in the article copied from the New York Times in the last number of the WEEKLY. As far as the South is concerned, the man who most satisfies the desires and convictions of men who for good and patriotic reasons would like to see a change; who think that Mr. ROOSEVELT's administration is injurious to the country; and who will strenuously desire to defeat any candidate whom he may oppose upon the Republican party—do not seem to obtain their wish, have severely rebuked by more than one prominent Republican newspaper.

JULY 27, 1907

**Woodrow Wilson on Liberty**

WOODROW WILSON has spoken a great many wise and statesmanlike words, but he has rarely spoken more wisely, more patriotically, and more convincingly than he did at Jamestown on the Fourth of July. Several great truths were spread forth in his speech, and one among them is especially pertinent to the subject now before us. In his speech of government to look the objects of those who are administering it by evading, or tampering, or in other ways defying the law. The foundation of this government, he said, "was the law,"—not more law, nor less law, nor even better law, but "the law they could rely upon and live by." The law, in this, was not to be evaded or tampered to meet the needs, desires or whims or fancies or dreams of those charged with the duty of administering and executing it. And again he said: "Too much law is too much government, and too much government is too little individual privilege." All this has a bearing upon the efforts to control, to restrict, to destroy, individual effort by laws that give to government powers which are hostile to individual liberty. Mr. WILSON does not believe that corporations and their business should be destroyed; that the community should be deprived of their services; that the growth of production, so wonderful within a hundred years, with its cheapening of products and of their transportation, should be stopped or checked. In the hands of individuals holding office, it may be, in the corporations they have been guilty of crimes. Punish the guilty individuals, is his contention, but do not deprive the world of the beneficent work and its results of which some of the criminally disposed have taken advantage. And this is sound statesmanship, and the opposite is dangerous, or worse.

AUGUST 5, 1907

**On the Main Line**

HARPER'S WEEKLY is this afternoon to receive "a safety and sanity" in the Democratic party, given a good deal of attention in its last issue to the qualifications of Senator CLEVELAND in Texas as a Presidential candidate. Mr. CLEVELAND, it was pointed out, should cause HARPER to abdicate his "legal and official" of 3 years ago. President Woodrow Wilson of "Democratic Unity" (1) in the Presidential caucus ought to be able in matters of "logic"—New York Tribune.

We have never designated President Wilson as a "legal candidate" (for the quite simple reason that we do not know what a legal candidate is; maybe he is one who, if elected, would not appear in the legal profession. In his case the New York meeting on the main line, has been going particularly strong since he declared that he would

and his advocates to fall instead of rally in support of them for political effect, and his name will be presented to the next Democratic national convention by the still sovereign state of New Jersey.

AUGUST 24, 1907

**The Ideal Candidate**

WOODROW WILSON, a native Virginian at the head of a great Northern university, was a Democrat by birth, training, and conviction, would honor his party as a candidate and his country as a President. But his political writing intimates awarded by New Jersey, there is little chance of his nomination, although there are good grounds for believing he would be strong at the polls. He would be a man of strength with the great and growing independent vote of the South. Furthermore, his scholarship, his mastery of the principles of political economy, and his unswerving intellectual capacity for the Presidential office would compel the respect even of his opponents. The probability that the Democratic party will not adopt Mr. Wilson for its standard-bearer implies not that it might do so with credit and advantage. At any rate, Colonel Casserly is one of the few men who would lead the worthy Democrat to lead his party in 1908. It is not commended for standing stanchly by his candidate. And, if he stands himself as it should, but in its crucial action in convention, it shall cause nobody worse than Wilson—Troy News.

JANUARY 15, 1908

**A WINNING TICKET**

Wilson and Johnson

**For President**

From the New York "World"

If the Democratic party is to be saved from falling into the hands of WILLIAM J. BRYAN as a renegade nominee, a Man must be found—and found. Dissociated opposition will no longer suffice. There must arise a real leader around whom all Democrats undetected by populism, and thousands of dissatisfied Republicans, may rally with the enthusiasm which springs only from a certainty of deriving success and at least a chance of achievement.

*The Man's principles must be sound.*

He must be a defender of the Constitution, but not the worshiper of a fetish. He must realize that "a return to the old ways" of government by Placatory, Privilege, Protection, and Plunder is impossible; that the moral regeneration begun in violence must be conducted in a peaceful way. He must be opposed, as a matter of policy, to gross extravagance in the use of public funds, and he must devote, on principle, any taxing of the people beyond the actual requirements of their government. He must fear immediate reduction of the tariff. He must be a later in equal measure of paternalism to the South, as he must set the example of his own government ownership of railroads, initiative and referendum, government guarantee of bank deposits, and all other populist notions. He must demand from all corporations publicly, obedience to law, and recognition of the superior rights of the whole people, but he must also observe the obligations of the state to protect its own artificial creation in all legitimate and authorized undertakings. He must favor the dignifying and rigorous punishment of individual wrong-doers, not merely the flogging of an impersonal corporation. He must be a radical conservator, not a destroyer, of both public and private credit. He must be an opponent of militarism, materialism, and jingoism. He must prefer the little government to too much government, and must insist unswervingly upon rigid application of the basic principle of government by the people through their authorized representatives in Congress in preference to any government by commission.

*The Man's personality must be inspiring.*

Certain personal attributes are essential to successful candidacies. Known fidelity to high ideals, unquestioned integrity, veracity, courage, caution, intellectuality, wisdom, Experience, Achievement, Breadth of mind. Strength of body. Clarity of vision. Facility of expression. Freedom from contaminating associations. Universal respect and confidence of his fellow-men. Simplicity in manner of dress. Eloquence. Human sympathy. Alertness. Optimism. Enthusiasm. In a word, the rare blending of uncommon intelligence and plain common sense in what might be termed "State Idealism." Finally and practically:

Such are the requirements—many and exacting. One Democrat who unquestionably meets these qualifications is WOODROW WILSON, president of Princeton University.

Dr. WILSON is primarily a scholar—an historical scholar—who in the course of his work and growth has become a statesman of breadth, depth, and

equanimity, a true Democrat who, though steeped in Jeffersonian doctrine, who set what JEFFERSON did a century ago, but what JEFFERSON would do now; a able theorist, but a no less competent or executive, who has had much administrative experience as the head of a great university.

Not only is Woodrow Wilson qualified in every respect for the great office of President of the United States, but he is an available candidate.

Who else could surely carry New Jersey? Who would stand a better chance of carrying New York? Who would more certainly restore Missouri and Maryland to the Democratic column and vindicate all possible doubts of the result in any other Southern state? Who has stronger political feeling, fewer class prejudices, and a stronger national interest, so commitments to capitalism or disorganism?

Who would more surely command the individual support of the powerful independent press? Who would appeal more strongly to the latent moral sense which twice defeated CLAYTON? Who would inspire a more hopeful feeling of security and stability in the minds of all business men engaged in honest enterprise?

The World has already pronounced JAMES A. JOHNSON, Governor of Minnesota, as an available Western candidate for the Democratic nomination for President. But also it has pronounced WOODROW WILSON as a Southern candidate, to less available and with Presidential qualifications exceeded by those of no man whose name will be presented to any national convention.

JANUARY 25, 1908

**A Candidate from the East and South**

IT IS A great pleasure to me to find that WOODROW WILSON's candidacy for the Democratic nomination that was brought out in the World, is the first place should be noted certain considerations suggested by the facts that he is by birth and raising a native of Virginia; that he was admitted to the bar in Georgia, and practiced in Alabama until he resigned the office for the sake of education; and that the lady whom he married was a native of Massachusetts. There is no doubt, then, that he would be accepted all over the country as a man of the South, although the JAMES MONROE, he was used as a young man in Princeton, and as our the candidate. It is not only so, but the fact that the next Democratic nominee for the Presidency should be a man of the South? It is not admitted by the Democracy in general, but it is so by all Northern Democrats and all Independents, that the South, although nominally restored to the full privileges of citizenship, is still practically discriminated against so long as her men are practically debared from the highest honors by the fact that they shall we ever witness a variable name, not of law, but of heart. It is not, with the casual occurrence of a large part of the North, a Southern man, that I would not be able to do so. Another truth that cannot be driven home too often or with too much emphasis is the recognition of the question of the Democratic nomination of the Presidency with the imperative necessity that the first post-bellum Southern administration shall be indubitably that of the Democratic party. If we are independently that the temper of the Republicans, if beaten in 1908, shall be so revived and emboldened, for they will remain masters of the federal Senate, and vindictive and defiant, could paralyze all the efforts of a Democratic Chief Magistrate and a Democratic House of Representatives. The only remedy, therefore, we see in our hands, after nearly two years, that if a Southern President is to have behind him a bright record of constructive statesmanship and useful legislation he must himself be a man of the active support of the whole country; and each post-bellum party is to be guided from a conviction, duly implied in the Democratic party, that the only safe and secure position can rest upon his sympathy, and, above all, upon that intense sympathy without which any party in the South is dead. It is not the mere sympathy exists with reference to WOODROW WILSON. To such all-embracing sympathy, such intimate and comprehensive sympathy, that will be the true interest of all sections of the Republic just now possessed by any other distinguished man of the South? That is the question. It is not the mere nomination of WOODROW WILSON might not only exercise a healing and unifying influence upon the sections, but also have a liberating and invigorating effect upon the Democratic party. He is a man of the active and true of military men, professional or amateur, considered in the light of candidate for the Presidency, he is a man of the active and true of men, and even of judges. He has become liable to the fact that, as things are now, the intellect of the entire South and North is being paralyzed by the mere day the right of consent and lifted words in the educational field to challenge the highest effort in the gift of God to American people the heart and of availability. As a matter of fact, even in the past may be found precedents for the selection of such men for the Presidency. There is, for example, the great American statesman, General BRANTLEY, who was Secretary of the Navy in the Van Buren administration, and subsequently governed the country in London and in New York. He was a prominent lawyer, but in 1821 was made Secretary of the Treasury, and in 1823 was made Secretary of State, and in 1824

who have said that they are afraid New Jersey with Governor Wallace might be top-heavy." If so, so much the better for the state. But is not our Newark contemporary unduly modest? Out of fifty-two states and territories, New Jersey stands sixteenth in population and sixth in industry. It has \$716,000,000 of capital invested in manufacturing, pays 296,000 wages—worth \$125,000,000 a year in wages, and turns out worthily \$500,000,000 of products. Only New York, Pennsylvania, Illinois, Massachusetts, and Ohio surpass her in this respect—and Ohio, despite her vastly greater area, is very little ahead. Even among cities, the home of the Standard Oil stands sixteenth, and its neighbor, Jersey City, seventeenth, in population. A little state! Not at all. It is one of the biggest in the Union, and it ought to

have in its Executive Mansion—which also it ought to have, but hasn't—its very biggest man. In view of the fact that Mr. Tamm got a plurality of 82,000, it may not put him there, but—you never can tell.

AUGUST 6, 1910

## The Effect of a Candidacy

The governments that are best regulated and have most vitality are those which, by means of their institutions, can renew themselves. And the way to renew themselves is to bring the government back to its original principles.

This was the utterance of a statesman who lived centuries ago.

I want to find the best man for the office: the man who is most acceptable to the rank and file of the Republican party and the independent voters.

He, as revised for publication, in view of certain criticisms!

If I am consulted, my position is that we must find not only the best man for the office, but the man most desired by the great bulk of the Republican and independent voters.

This was the utterance of a politician of the present day.

The two modes of procedure thus indicated are widely divergent. With respect to the making of political issues, the one upholds reversion to principle; the other adheres expediency. Applied to the selection of candidates for public office, by the one character is considered its prime requisite; by the other, availability. It matters not to the directive politician what may be the real purposes of a nominee, so long as he has given no offense

to one or more of various classes, and consequently, upon grounds of negation, can be expected to evoke the votes of all. The sole aim is success at the polls, and all means, however disingenuous and seemingly dishonorable, are held to be justified by the end in view. For contrast, to the mind of the patriotic statesman, triumph upon such terms seems unworthy and is consequently avoided. The ultimate effect of precedent established by the adoption of wrongful methods is reckoned more harmful than the temporary gain thus acquired, and no politician is felt in putting the burden of justification of his conduct on the mind of the understanding of the future. But, we are informed, except such as this is idealism, and attempt to apply it in an intensely practical age would be futile.

Surely, if this be a statement of fact, thoughtful citizens must regard the immediate future of the Republic as a little gloomy. But is the premise correct? Is the assertion true? Admit conditions whose existence cannot be denied. Grant that an ignorant and selfish character, by virtue of his attractive personality, appealing eloquence, and helpful environment, has virtually controlled one great political party, to its infinite hurt, with respect to its position before the voters, for sixteen long years. Grant that another adventurous spirit, by exercise of sheer daring and matchless cunning, has, in the same historic interval, achieved unprecedented personal ascendancy in the dominant organization. Grant that a rapacious class has treated an honest and able statesman, for sixteen long years. Grant that another adventurous spirit, by exercise of sheer daring and matchless cunning, has, in the same historic interval, achieved unprecedented personal ascendancy in the dominant organization. Grant that a rapacious class has treated an honest and able statesman, for sixteen long years. Grant that another adventurous spirit, by exercise of sheer daring and matchless cunning, has, in the same historic interval, achieved unprecedented personal ascendancy in the dominant organization.

We begin to ask—and we have reason to think not. The reason is this:

For a score of years an important Eastern state has been misruled by utopians of a party whose authority has been sustained by official patronage—federal and state. The people have chafed under such supervision and have craved a change; but the sole alternative offered by the opposition, provided no better, was not acceptable.

No matter rested, with every prospect of yet another disheartening campaign involving a choice between candidates named by two trading "machines," until a certain recent day, when suddenly there appeared, like a meteor from the sky, another party—well equipped and most eminent citizens would accept his party's nomination if it should come to him unsought and without entreaty. His message was simple and direct. He had no wish for the place; he had other work of the utmost importance on hand; he did not say, but all knew, that his election would involve great personal sacrifices; he would prefer immeasurably to remain at the head of a great university—but, all his life, he had preached the duty of citizenship, all his life he had launched the tendency to civic public responsibilities, all his life he had urged subordination of personal inclinations to public service. Then, at the moment, a large number of his followers sincerely believed that the occasion demanded him as his party's candidate, he could not fail to heed the call, regardless of the result at the polls, without giving the lie in practice to all that, as an educator, he had preached.

Behold the effect! Immediately the managers of the party in power awoke to the necessity of revising their calculations. The "average" candidate would not now serve. They must find a man of the highest standing to cope with such a one in opposition. Their most outspoken public journals enthusiastically declared the state to be "already in the event of their failure or refusal to do so. Instantly, too, precincts were changed throughout the state with respect to candidates for the Legislature. The opposing party at last beheld a chance to win under inspiring leadership if only they should nominate their best man. To effect this something more than a party in power possess the need of naming their best. The entire face of state politics was changed and the standard of fitness for public position was raised overnight by the simple declaration of a conscientious ethics.

Beyond the boundaries of the commonwealth,

moreover, the effect has been no less marked and gratifying. New life has been injected into the dormant and apparently dying-out party of the masses, demands for some platform and strong institutions have been well-nigh universal, a higher level will surely be attained, by the party in the hope of scoring at last, and by the other as the only possible means of holding its own.

WISCONSIN WILSON may not be elected Governor of New Jersey. He may not even be nominated. He is not really an "available" candidate. The likelihood of results throughout the country, and a higher level will surely be attained, by the party in the hope of scoring at last, and by the other as the only possible means of holding its own. Wisconsin Wilson may not be elected Governor of New Jersey. He may not even be nominated. He is not really an "available" candidate. The likelihood of results throughout the country, and a higher level will surely be attained, by the party in the hope of scoring at last, and by the other as the only possible means of holding its own.

The governments that are best governed and have most vitality are those which, by means of their individual activities, have the capacity to attract to themselves a few of the government look to its original principles.

That is not Reactionism. It is not Reactionism. It is prudent Progressionism. Upon that broad platform, we must accept, Wisconsin Wilson will surely fall, as the case may be with the severity of one who has satisfied his conscience by expressing his willingness to perform a civic duty.

That the election of a man of such unadorned ability, courage, and character would be stimulating and a godsend to the entire country is, we believe, beyond question. But the most important achievement of the new candidate is the moral standard which has proved his expression of willingness to become—in the oft-faded phrase—a true servant—not a willful master—of the public, proves conclusively that the American people have been fooled this time so long as they can be fooled, and await with eager anticipation to show that they have not renounced their allegiance to ideals, have not forfeited their self-respect, have not parted with their common sense. So much at least has been accomplished.

SEPTEMBER 10, 1910

#### President Wilson to the Lawyers

Everybody seems to agree that nowadays, right here in free America, democracy needs a lot of looking after. The tide of law-and-order confidence and optimism on the subject, once so common, is fast ebbing away. Few are ready to admit the precise character of the danger. While some fear that "the interests" will simply go on increasing their power, others are more concerned lest there be a sudden rebellion to Socialism. But that there is danger to democracy in the way business is now carried on, and that something must be done about it—something serious and thought-provoking and difficult—this feeling is in the air. Along with it goes the desire for guidance and counsel, the demand and yearning, more or less unconscious, but more and more urgent, for leadership. Now this demand is directed toward the politicians, now toward the law-keepers, now toward the clergy, and those committed to good works, now toward the very centers in business whose power is the most disturbing feature of the situation. In an address before the American Bar Association at Chattanooga last week, President WISCONSIN WILSON, of Princeton, touches it full upon the lawyers.

His speech is so small a fragment, and the reasons he gives why our present emergency presents to his profession a peculiar and transcendent opportunity and obligation cannot be lightly dismissed. It is hardly too much to say that he makes out his case; that he shows that the bar is the profession, that the lawyers are the men, whose aid and help our democracy in America is at present peculiarly in need of.

#### Democracy in Need of Legal Aid

To show how President Wilson sees this would be to give in different form a great part of an address that would surely be better read than it is by himself gave it; but to indicate briefly the train of thought he follows may be permissible. Our present struggle, he points out, like all the past struggles of society, is a struggle for law. The history of liberty is a history of law. What we are fighting for is not right ideas about this new order in business, about corporations and

trusts, about our own and other people's rights and duties, but the embodying and establishing of these right ideas in law, so that society shall be actually conforming to them. And the need is so severely for law; but for a kind of law that lawyers will not readily find or frame. It comes, first, at a time when the understanding of law, particularly constitutional law, is far less general than it used to be, and also the interest in law; at a time when legislators listen with impatient to constitutional discussions; when the great mass of lawyers have been themselves drawn into these distinctly lawyer-like activities which characterize the age, when the understanding of law, particularly the service of particular interests. The lawyer-statesman is the only man who can meet the precise need of society today; and the call for him is all the more urgent because it comes when law and statesmanship seem to be so near a complete divorce that an able lawyer needs a group of good lawyers framed our Constitution. Expert legal knowledge and instinct, exercised in statesmanship—this is the requirement.

It may be put more specifically. The dominant device of the time is the corporation—so distinctly a legal device that it is in great measure a legal creature. In the nature of its existence its nature has substance, the legal mind judges it and raised up a few to a height where they are practically freed from individual responsibility. To rehabilitate the individual—by removing the onerous, by making responsible the corporate and over-privileged—is the task in hand; and this calls for a man of such kind of skill that has created the corporation and made it impossible so lawlessly effective. More specifically still, the problem for the lawyer-statesman, the problem of the corporation, is to "stand on the right point the fatuous, anticipated, and quite unnecessary fiction which treats it as a legal person," and is the appropriate illustration.

The trouble of the old Constitution, which we had to abandon because it failed to govern states and could not command individuals.

And there is a wealth of amplification and enforcement of the central appeal which makes it, one would say, irresistibly by men of any nobility. It would be hard to find in the history of reform a more direct, more positive, more vigorous act a new standard of conduct with public institutions, another taking account of our present state which goes straight to the vital issues, or offers so practical a lead.

SEPTEMBER 24, 1910

#### Well Done, New Jersey

It is a great day for New Jersey and a great day for the nation when a man like Wisconsin Wilson comes forward to help maintain and vivify our political life.

So says the *Evening Post* and so say they all—the *World*, the *Times*, the *Nax*, the *Springfield Republican*, the *Indianapolis News*, the *Louisville Courier-Journal*, the *Richmond Times-Dispatch*, the *Charleston News and Courier*, the *Boston Herald*, the *Philadelphia Record*—all of the big independent public journals of the country. No less vital and significant is the attitude of the press of New Jersey. The Democratic newspapers, led by the faithful old *Trenton True America*, are enthusiastic, of course. That was to have been expected. But New Jersey has strong independent newspapers. The ablest and highest-minded in the United States is the Newark *Evening News*, which says:

Wisconsin Wilson is the savior of the Democratic party by Governor. He is more than that, though. He is the candidate of thousands of Jerseyans, who have turned to him for help and comfort in their political life. No bar as the Governorship goes, the campaign this fall is not to be conducted on strict party lines. Two of the ablest men have been chosen in this year of grace and emergency.

The crying demand throughout the country is not for party government, but for good government, for representative democracy. It is not for a party government, but for good government, for representative democracy. It is not for a party government, but for good government, for representative democracy. It is not for a party government, but for good government, for representative democracy.

A noted student of governmental affairs, he has always been a student of political history. A political economist, he has stood consistently for a square deal in both labor and capital.

As the law and moral integrity he has insisted that personal wrong be shown, even when paraded in cooperation roles, most thoroughly punished.

He holds that no question in the public service, or

NOVEMBER 8, 1910

## Next Tuesday

We are not a real prophet, but as a guesser we beat them all in 1894 and 1898. So we guess again.

That ROSSWELL will lose New York by 100,000. That WOODROW WILSON will carry New Jersey by 40,000.

That BALDWIN will carry Connecticut by 5,000. That HAMMON will carry Ohio by 25,000.

That the results in Massachusetts and New Hampshire will be close, with the chances in favor of Foss and Biss.

That BRYAN will be beaten.

That the Democrats will have a majority of forty in the next House of Representatives.

That Democrats will succeed the Hon. CHAMBERLAIN M. DEWEY and the Hon. JOHN KEAN in the United States Senate.

Amend! So be it!

NOVEMBER 12, 1910

## The Oratory of the Campaign

Again, after the deluge of campaign speaking, the inquiry is pertinent, What has become of eloquence, of high art in oratory? We have all been reading speeches every day for a month or two. Some of us have even had the time to go and listen to a few of them. Can any one of us declare that he has either heard or read a single one that could be called great? Is there so much as a single paragraph that sticks in one's mind because it had the thrill of genuine eloquence—of high thought, suffused with strong feeling, nobly phrased? Our hands do not all go up at once, and, if, after a while, anybody answers, the answer most likely to be mentioned are probably the late Senator DOLGEMAN and WOODROW WILSON'S. Dr. WILSON'S is certainly the one oratorical reputation that the campaign has most distinctly enhanced. But the papers, although they have reported him liberally, have been writing or unwriting in his view or newly epigrammatically in his language than in determining his claim to the really highest attainment in public speech. They have, as a rule, left out altogether the passages, particularly the peroration, in which he sought to move rather than merely to convince his hearers. That seems to be the fashion of present-day reporting, and possibly it is in part responsible for the apparent dearth of eloquence in our oratory. But a more probable partial explanation is that the orators themselves are too much in the habit of speaking to the papers rather than to the audience in front of them. For true oratory is like writing, the highest effort of which it is capable, is immediate, direct. They can be repeated by the aid of print only as the reader is stirred to merge himself in an imaginary audience. If we read the papers we should doubtless not only go offener to hear our public men speak, but also have more exciting public speaking to listen to.

NOVEMBER 15, 1910

## Incidentally

We made two guesses, viz.: That TRIN, HARRISON, BALDWIN, Foss, and Biss would win.

That BRYAN, DEWEY, and KEAN would lose.

That the Democrats would elect a majority of forty in the next House of Representatives.

And (10), that WOODROW WILSON would carry New Jersey by 40,000.

Most people think that the last guess was crazy. We have to confess, it wasn't a guess at all. It was what HENRY BULLOCK called a prophecy. We knew, all the time.

The nine guesses came true, too.

## A Clean Slate

The following excerpt from the Trenton State Gazette of November 4th fairly illustrates the type of argument that was used by the Republican press of New Jersey during the recent campaign:

The Democratic machine of city, county, and State, spending more money than it has since 1864, is in a hurry to find the will of the people.

Where do they get it? Every dollar of it comes from the corrupt operation interests of Wall Street. These forces are led by JAMES H. HANCOCK, JR., JAMES NICHOLS, and B. V. LAMBERT, the self-appointed committee, who lured WOODROW WILSON into the part of the thoughtless Democrats of New Jersey.

The effect of such slander upon the minds of the people is accurately measured by the election returns. But, now that it is all over, we shall say flatly—and we know whereof we speak—that

Mr. Wilson's majority will be about forty thousand. That's all.

## Looking Ahead

We now expect to see WOODROW WILSON elected Governor of New Jersey in 1910 and re-elected for President in 1912 upon a platform demanding radical economic democracy—HARPER'S WEEKLY of May 15, 1909.

At the expiration of sixteen months since the above appeared in this place, we perceive no occasion to revise our calculations.

OCTOBER 22, 1910

## The Campaign in New Jersey

It is a novel and remarkable canvass that WOODROW WILSON is making in New Jersey. Abandoning all partisan claptrap at the outset, he went straight to the heart of his subject, and not once, in a small multitude of speeches, has let the main theme slip through his fingers. The foundation of his argument is the simple fact that the Republican leaders owe as much to the special interests which have helped to keep them in power that they cannot honorably break the alliance. He makes no claim that Democratic leaders would have acted otherwise under like circumstances. He perceives the difference between the avowed principles of the two parties and more at all between the great masses of voters who comprise them. He meets his case solely upon the condition which has tied the party in power hand and foot and has left the other free to at least to act in the interest of all the people. Whether it can or will so act, if given the opportunity, Mr. Wilson does not assume to say. But he does think the time has come when a test should be made, in view of the hopeless entanglement of the directors of the Republican party.

This is new doctrine, but men can guess its logic or soundness. That it is welcome is indicated by the size of the audience which have gathered in the cities and by the wide-spread attention throughout the country. Probably never before have the utterances of a candidate for Governor constituted the theme of so many editorials. And there seems to be no cessation of interest either within or without the state.

It is not to be concluded that the entrenched opposition continues in a state of stupor. How to cope with him intelligence, perfect order, and obvious sincerity seems to be beyond their ken. At present they are grasping vaguely at straws. The Republican candidate, Mr. VINCENT M. LEVINS, an amiable and estimable young man, first appeared to uphold his stand—post platform, but has now virtually repudiated it and has taken allegiance to the old regime, in which likelihood he has been unwaveringly faithful and to which he owes his nomination. Not so the Old Guard itself. True to its title, confident in the power of its bureaucracy, and disdainful of aroused public sentiment, it marches silently along the same old road. "We stand just as the candidate and the platform," was that key word uttered by former-Governor GORGE as a preliminary to sneering allusions to "the schoolmaster in politics." "He is running for Governor," added Senator KEAN, contemptuously, "with the idea of reforming the whole state, although he never considered it worth while to give the people the best of his advice until he became a candidate for Governor"—possibly because his time was somewhat occupied as president of Princeton University. "They say he is a scholarly man," clipped in DAVID BAIRD, a candidate for United States Senator, "but he doesn't know anything about running the state. When he got through there wouldn't be any states there would be a revolution." Mr. GORGE sees that there is a million and a quarter in the treasury and he wants to manage that. Now don't you people worry about South Jersey on Election Day, for we propose to lick this man." And so it goes.

Meanwhile, Mr. WILSON continues placidly on his steady, unswerving and unflinching course, with simple directness and telling force. That the Old Guard, backed by its beneficiaries with unlimited funds, will make a desperate effort at the finish to defeat him by fair means or foul may be taken for granted. But the people will render the verdict on November 8th as between this most exceptional man responsive to a call of civic duty and the group of men whose impelling motive is mere lust of the power which they have yielded so long to personal advantage and to the shame of the state. The result may be attained with equanimity and the surest of confidence.

financial affairs, or in corporation control is so high as to relieve individuals from moral responsibility for their acts.

By his personality and by his beliefs, Dr. Wilson has thus become, as the result of a Democratic nomination, a candidate who is more than party-wise. His nomination marks a new era in New Jersey politics. His election has raised the political standard to a new high level.

Dr. Wilson has not been named primarily because of his availability as a vote-getter. He has been chosen for his ideas, for the platform, for the Executive of a great state. And, of course, the recognition of that ability means votes.

New Jersey voters will honor both themselves and their state by electing Dr. Wilson.

Another is the Jersey Journal, which for thirty-old years was the sturdy spokesman of the Republican party, but now speaks up frankly and pointedly:

The Democrats have nominated not only their strongest man, but one of the really big men of this country, for Governor. If the Republicans fail to nominate their strongest man, WOODROW WILSON'S majority will probably make the Mease landslide look like a stage performance in comparison.

As a selection of Dr. Wilson stands as a party matter. He is not a politician or an office-seeker. He is a type of the very highest citizenship, an original thinker, a man of great courage, force, eloquence, able, fearless, down, and patriotic. The people understand that the promises he makes and those of the platform upon which he advances will be kept.

The November election in New Jersey promises to become historic.

A third is the Newark Sunday Call, which perceives "abundant cause for the general satisfaction which is expressed on every side, in all parties and factions, by men of principle in the nomination." "The Sunday Call," which has heretofore supported the Republican party, albeit with some qualms, will turn to Dr. WILSON with confidence and with satisfaction. His career, his literary work, his speeches, and his personality have raised him to a position high in the ranks of statesmen, and his is an odd-blooded intellectuality. He is a cordial and sympathetic and essentially modest man, yet he has shown that he can fight and he has led a wholesome life, inspired by high ideals and guided by settled principles. If he is elected, there will be found in the executive office at Trenton a gentleman, a man of honor, a Governor who will command respect for himself as well as for the office he fills."

## True Leadership

The Sunday Call also notes the fact—it was a fact—that "the unrest and deep dissatisfaction of many Republicans with the Republican party in the state and with its failures of administration would have made the election of almost any respectable Democrat a possibility, and the attention to use such a condition for the benefit of honest men here is considerable. That the leaders took a broader view and determined to rehabilitate Democracy, as well as win an election, was gratifying in the extreme." It was, indeed. When former Senator JAMES SMITH, Jr., in one of the most effective speeches ever made in a political convention, declared that practically none of the two hundred and forty delegates from Essex had ever seen Mr. Wilson, that personally he knew him very slightly, but that all were animated solely by a desire to make the highest possible standard, he spoke the exact truth. When ROBERT DAVIS was asked to deliver the time-honored precedent of Hobson voting as a unit, he did not hesitate an instant to voice his strong personal inclinations in the common interest. There followed an absolutely "open" convention, in which each and every one of the fourteen hundred delegates spoke what he liked and voted as he pleased. This was the very basis of leadership; it was leadership of the highest order. Mr. WILSON paid due and fitting tribute to the breadth and unselfishness of those two leaders, in particular when, in accepting the nomination, he declared without reservation of any kind:

I did not seek this nomination. I have made no pledge and have given no promise. Still, more, we will pledge asked, but, as far as I know, none will desire.

If elected, as I expect to be, I am left absolutely free to serve you with all my strength of purpose. It is a new era when these things can be said, and in connection with this I feel that the dominant idea of the moment is the responsibility of desiring. I will be free to serve the state, not in order to please the honor of being at its head.

Heartening words, these! It is, indeed, the beginning of a new era when such things can be truly said. No wonder, as the Evening Post remarks, "it leaves the Republicans absolutely stunned."

not one dollar was asked from or contributed to the Democratic campaign fund in New Jersey by any "corporation interests," corrupt or otherwise, nor by any corporation in or out of Wall Street, nor by any individual associated in the remotest degree with Wall Street or anything connected with Wall Street.

### Results Talk

It appears, therefore, that Wilson in New Jersey has a plurality this year which is about one-fifth of the total vote of his state five years ago. The plurality of HARPER and Foss are in each case about one-fourth of the 1908 total, and that of Dix in New York is one-twenty-fourth of the total. Judge BALDWIN needed a plurality of about 8,000 to give him

and New Hampshire would be close, with the chance to leave of Foss and Dix. Both put there, apparently, the former with a liberal margin. That Harvard would be beaten, he was, it seems. That the Democrats would have a majority of 49 in the next House; they were 40.

And, consequently, the Colonel's prediction that Democrats will succeed the Hon. Chaney M. Dewey and the Hon. John Kras in the United States Senate appears a pretty safe one.

The Colonel, as he says, may be a "real prophet," but as a guesser he is not to be reckoned on the third way.

New York, November 5, 1910. J. W. E.

### FROM SUSPICIONS FREED

HARPER'S WEEKLY insists on having WOODROW WILSON for the Democratic candidate for the Presidency.

After Wilson crossed the Delaware and beheld the political Elephants at Trenton, many of the vanquished became his fast friends  
FROM "HARPER'S WEEKLY" OF DECEMBER 5, 1911

relatively as big a victory as Mr. Dix won in New York.—Harper's Times.

Put in another way, the comparison (taking the combined Republican and Democratic votes as the total of two years ago) stands thus:

	Total vote.	Democratic vote.	Republican vote.
New York	1,517,000	397,000	1,120,000
Ohio	1,025,000	234,000	791,000
New Jersey	447,000	132,000	315,000

There can be no question as to who won the greatest triumph and now holds the lead among Democratic vote-getters of the U. S. A.

NOVEMBER 10, 1910

### Echoes

#### A PALM FROM NEW JERSEY

Colonel George Harvey is entitled to the palm. He predicted that New York, New Jersey, Ohio, Massachusetts, and Connecticut would go Democratic and that Democrats would succeed Chaney M. Dewey, John Kras, and Harvard in the United States Senate. Colonel Harvey was mistaken as to his comparisons in only one instance. He predicted that New York would give Mr. Dix 500,000. In the other States his estimates were below the mark.—Harper's Journal.

#### A CUP FROM NEW YORK

To the editor of The New York Times:—In the light of what has just happened, a consideration of "Col. Harvey's Views," recently published by the Inquirer, should be interesting. The Colonel said Roosevelt would lose New York by 300,000. He lost by about 100,000. That Wilson would carry New Jersey by 400,000, he did it by about 51,000. That Baldwin would carry Connecticut by 51,000, he succeeded through with something like 3,600. That Hanson would carry Ohio by 25,000, he did it over twice that. That the results in Massachusetts

and New Hampshire would be close, with the chance to leave of Foss and Dix. Both put there, apparently, the former with a liberal margin. That Harvard would be beaten, he was, it seems. That the Democrats would have a majority of 49 in the next House; they were 40.

And, consequently, the Colonel's prediction that Democrats will succeed the Hon. Chaney M. Dewey and the Hon. John Kras in the United States Senate appears a pretty safe one.

The Colonel, as he says, may be a "real prophet," but as a guesser he is not to be reckoned on the third way.

New York, November 5, 1910. J. W. E.

### FROM SUSPICIONS FREED

HARPER'S WEEKLY insists on having WOODROW WILSON for the Democratic candidate for the Presidency.

Brooklyn, he declares Dr. Wilson as "the foremost American Democrat." Do you hear that, Mr. Bryan? Are you listening, Governor Harrison?—Harper's Journal.

### REPUBLICAN JUDGMENT

Colonel George Harvey, editor of HARPER'S WEEKLY and a militant Democrat of the old-time battling school, has shown himself an excellent judge of men to a small effect in making Dr. Wilson's candidacy possible. Colonel Harvey believes that a party which is represented in Ohio by Harriman, and in New York by a Taylor, is worthy of a Wilson in New Jersey. New Republicanism need not the meeting of such worthy forces in the field as a tonic which would ultimately be inadvisable in the best interests of their own cause. A weak and dejected Democracy clinging to ancient and abandoned issues is a menace. An established Democracy, however, which stands on a platform of regulation in taxation, regulation of corporations, and economy in administration, is an inspiration.—Great Rapids Press.

### STILL CIVILIZING

HARPER'S WEEKLY under George Harvey's management is still a "journal of civilization." It was happily instrumental in giving the Jersey Democracy a leader to lift it to higher political levels.—Trenton Advertiser.

### LOOKING AHEAD

Well, if Colonel Harvey isn't the prophet himself, he must be one of the Colonel's creditable editors. When we are looking for a political "chance," hereafter, we shall go straight to Franklin Square.—Trenton True American.

### INVITED TO DINNER

For the third time Colonel George Harvey has hit the nail on the head, but it had an eight-day lead. In the middle of HARPER'S WEEKLY of the 24th of November, pointed quite a week before the day of election, contains the complete result.

Good! We declare you in with that dinner which Joseph Pulitzer is going to give another prophet the first Monday in December, 1911. And the star-spangled flag.—Louisville Courier-Journal.

### A CITY OF SMALL BIRDS

All the papers are full about George Harvey's guess about the result of the elections in the pivotal states this year and how nearly he hit it. Says the Washington Evening Post: "Colonel Harvey is a wonder. This year Colonel Harvey is a wonder every year, and the other he gets and the more guess he makes the more wonderful he seems. It is now the intention of the Board of Foreign People of Richmond, Ohio, to have him speak here before the season is over about the rights of women, and the ball will not be big enough to hit the people who will want to hear him.—Richmond Times-Dispatch.

### OH, VERY WELL!

George Harvey didn't do it all, but he did some, and some helps a lot.—Charlotte News and Observer.

### CHEEKY CHARLTON

George Harvey predicted the result absolutely, following in its track.—Charlotte News and Observer.

### PURSUINATION

The most attractive of the political creatures of yesterday is obviously Woodrow Wilson, of New Jersey. Long known as a capable thinker concerning politics and government, he proved himself a leader of a stamp a candidate, and yesterday he demonstrated himself to be a vote-getter of great power.

Except those who would not believe in the state as a nation, there has never had a Presidential candidate. There is far proof that he is the man. All over the country Democratic thought will turn today to Dr. Wilson as the appointed one for 1912. His probable rival, Governor Thomson, of Ohio, was a member of the cabinet, and he was a member of the cabinet, and thus (and so) an argument against his availability. In his color academic retreats Dr. Wilson has been identified with neither Democratic faction.

Dr. Wilson, besides being a Jerseyite, is a Southern boy, and he has a Southern party in the Southern heart of Southern birth since Lincoln. When he comes to meeting up delegates to the national Democratic convention, he will not be met by Mason and Dixon's line that he is able to sing "Dixie." A progressive Democrat who is able to escape the anger of the Southern Democrats, and a Southern man who has filled himself out of western strife, Dr. Wilson is plainly being chosen by destiny.—New York Globe.

### DEMOCRACY'S GREATEST ACT

The greatest act of the Democratic party in the election of this year was the nomination of Woodrow Wilson, President of Princeton University.

The national significance of Woodrow Wilson's established reputation as a vote-getter can hardly be overestimated. He has won at once as a prominent candidate, and a prominent nomination, a possible figure on which the conservative interests of the East, the middle of the West, and the managing Democrats of the South can unite. The man is a possible figure that fitness and justice from him could be depended on. He is a native of the Hazy South, born in Staunton, Va., where the state is Virginia, and at Annapolis and Annapolis, and he, raised in the bosom of the Mother of Presidents; he trained here in the University of Virginia; he studied law at the University of Pennsylvania; he became a college professor. He knows the feelings of the South as few men possess in the North, and he knows the feelings of the North as few men possess in the South. He is a President's administration. It is a matter of even greater importance in a national contest where the South as a vote Democratic action must hold the balance of power.

It is entirely possible that New Jersey's election of a Governor has given to the national Democracy a suggestion of the spirit in which it will meet the year. It is a gratifying reflection to Democrats in every state in the Union—Harold's—Eugl.

A SAMPLE FROM THE SOUTH

The fact seems to be that, since the repudiation by the Democratic party of Grover Cleveland, Wilson in the New South has been regarded as a man who was contented the respect and confidence of the safe and sane element without which Bryan has three chances removed to five against his election next November. Wilson seems to be thoroughly sound on the basic principles of Democracy and beloved by the sane Democrats of the South. His record in office is almost faultless upon the Democratic machine, to the disgust and derision away of every state and section of the New Democratic party. He has no enemies in any choice. He seems to be imbued with a noble idea of liberty and individual independence, absolutely honest and reliable, a noble fighter, a man of sound and logical doctrine, of Roosevelt and Bryan, on the one hand, and on the other the selfishness and partnership and treachery and conspiracy of Taft on the other hand. Well, it needs no...

We believe all the signs of the times point to the nomination of Wilson by the Democrats in 1912 and the consequent triumph of a more conservative and complete turning-point in American history, the ending out of all the small kind of cowards, opportunists, demagogues, and reactionaries. It is the popular feeling of the hour, and a return to the simplicity of first principles—Greenback (South Carolina)—New Jersey.

FIRST IN THE LINK

It is obvious that his impressive victory, due in great part to his moral stature, in the recently held election with the country, has placed him in the group and command he has also shown of the coastal elements of the national situation, most put him in the best rank of the new leaders. He has the promotion to the highest national honors—New York Times.

WATCH AND WAIT

The victory which Woodrow Wilson has won in New Jersey is not wholly one of personal conquest of the man who have voted for him. It contains more in the leader by the people of a mass of opinion, unconsumable, as his leader in dealing with the large issues of the hour, of a man whose life has been dedicated to a profound study of political institutions, whose books, orations, and speeches have shown him competent to lead in a large-minded and dispassionate way with the theories of governmental institutions which has no equal. His election brings him before the people of the nation as a man whose convictions and beliefs fit him perfectly to lead in the hour of national emergency. If he succeeds as well while Governor as he has as a pioneer for the opportunity to serve in that capacity, he will become a formidable national political nomination to the Presidency. And this is the more favorable in view of his peculiar appeal to the South, where he was born and in part educated. His friends would expect him to lead in the Northern man, should his record as Governor lead to discussion of his name as a Presidential candidate, and it could be expected that he would lead in the powerful appeal he could make on the platform. How practical and efficient Governor Wilson will prove to be under the stress of political conditions at Trenton remains to be seen. Those who have known him longest and who have studied his method of administration during his remarkably successful tenure of the state are confident that he will not be disappointing. The practical politicians of both masses have had a chance to know him and they will be all but glad that everything will be done on the assumption that once the people know the facts they will vote right action. Watch Wilson; that's all—Boston Herald.

IN THE MINDS OF DEMOCRATS

Mr. Woodrow Wilson is yet to be nominated in New Jersey in the subject of wide comment. The present Governor, a Republican, was elected by a majority of about 40,000 votes. He is a man of high character and was his election by a majority that in between 40,000 and 20,000. If he makes good as Governor, higher political offices will be open to Governor Brewster and Governor-elect Wilson are already being spoken of for the Democratic nomination for President. Governor Harrison has the advantage he can carry his state by a majority of 10,000. Mr. Wilson did, and also because he has a record as an administrator that invites confidence. But both are the sort of men to whom the people are attracted in his Princeton address. They are the sort of men the people are looking for. They are certain to get the public interest before they can be a political advancement. Neither may be nominated in 1912 for President, but at this time both are in the minds of the Democratic party as men to mention to that high office.—Harrisburg Times.

JOSEPHUS DANIEL'S JUDGMENT

The country is turning away from the charlatan like Roosevelt, no matter how brilliant, the North-Brawley like Taft, no matter how personally amiable; and is turning to legislative leaders like Roosevelt. They are looking for men to lead who will serve the true welfare of all the people, one no obligations to any special interest, and who will be able to lead in their leadership. Machine politicians and money demagogues have pulled on the public. They are all alone and making a bad case of the New Jersey campaign while carrying all business, large and small. Jersey has assumed all the depths of national politics, subversive to trusts, obedient to railroad domination, the making merchandise of color and of illegals. The Southern and small editions of Aldrich and Bryan. On the other hand, the kind of administration, the other has had his high office to try to

secure favorable legislation for his own business. There has not been a Congressman of the first order for the past twenty years. The men who have led both parties have been treated friends of the trusts, and the people have had no representatives.

This was the last year for New Jersey to repudiate business and trust interests. The Democrats turned Grover Cleveland and John D. Rockefeller into candidates. He is the foremost American college president, and his looks on government are authoritative in this country and abroad. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition.

The people of North Carolina take great interest in Mr. Wilson and his career. When his father was governor of the First Presbyterian Church at Wilmington Mr. Wilson was for a time a resident of this state. His nephew, Professor W. L. Latta in the University of North Carolina, has written a book on the occasion of his election as law at the University of North Carolina. The law graduates went to Chapel Hill to see him, and never did an orator do so well. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition.

A SOLITARY "IF"

New Jersey needs at this juncture a strong progressive leader. It is the home of many great corporations which wield a power in and far beyond that recognized. If Woodrow Wilson, who has won so high a reputation as a prophet of better things and evaluated himself as an efficient champion of the people, were to take on the higher mission, he would surely have the good fortune to regain supremacy in national affairs.—Greenback Times.

TO BE RECOGNIZED WITH

Probably the most remarkable victory won Tuesday in the election of Woodrow Wilson, who was elected Governor of New Jersey. His success in the election of 40,000. It was at first thought that the plurality would not be more than 25,000 at the outside, but it has been increased to 40,000. It could be said that it is almost unprecedented. Only three times, and then on the vote for President and in extraordinary years, has the margin been so large. It is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition.

It is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition.

NOVEMBER 28, 1910

MURKIN

By the New Democrats, which Colonel Editor George Harvey is a January, Dr. Woodrow Wilson was induced to resign as president of Princeton University for Governor of New Jersey. He has his own political popularity and the strength of the Democratic principles and doctrine which is typical of the New Democracy. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition.

A SERIOUS TEST

By the way, the fact that Colonel Harvey has proved a good governor on the election. The News

carefully proved his predictions in HARPER'S WEEKLY of the 26th, having seen that they would be a whole lot for what they were. It is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition.

AN AEROPLANE IN SIGHT

Hats off to George Harvey, editor of HARPER'S WEEKLY, as a prophet. When he wrote that at least "we all at guessing in 1904 and 1909, the paper a few days ago made the guess which made his letters hats off to him. It was a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition.

A SLICE KIBBON

Brother George Harvey of HARPER'S WEEKLY will get the blue ribbon as a political prophet—Boston Herald.

BEHOLD THE RESULT

Colonel Harvey, who supplied the silver platter for the people, has shown us a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition.

DECEMBER 17, 1910

A MATTER OF HISTORY

Henry Woodrow Wilson, who has won so high a reputation as a prophet of better things and evaluated himself as an efficient champion of the people, were to take on the higher mission, he would surely have the good fortune to regain supremacy in national affairs.—Greenback Times.

Major Harnhill is right and James Harnhill is wrong. As Major Harnhill usually is.—Boston Herald.

ADMINISTRATED, NOMINATED

Colonel Harvey is already electing Woodrow Wilson President in 1912, and is a getting to be an dangerous near a career political prophet that it almost seems like prophecy.—Boston Herald.

TAKING NOTICE

Colonel Harvey, who had more to do with promoting Woodrow Wilson to become a candidate for Governor than any other man, and more to do with the election of Governor Harrison, is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition.

HEAVY HITTING

After a careful perusal of the current HARPER'S WEEKLY, it is concluded that it is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition.

A BUREAU THING

Editor George Harvey, of HARPER'S WEEKLY, is inclined to admit that Governor-elect Woodrow Wilson, of New Jersey, is likely to be the Democratic candidate for President in 1912. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition.

APPLAUSE FROM THE GALLERY

On election day we rejoiced Colonel George Harvey's forecast of the election from HARPER'S WEEKLY, and the editor has the all so sagaciously on the head of the Democrats. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition. He is a man of letters who has written with his own hand, and who has written books, but he knows men and, and the vital problems that need to be solved for men of every class and condition.

not as food for pleasing comparison with the actual results.—*Maxon News.*

**THE NAME**

Colonel Harvey of Harper's publications had much to do with the nomination of William H. Wilson for Governor of New Jersey, and later he made a remarkably accurate prophecy of election results in various states. Governor Harvey's latest political forecast is of special interest. It is as follows: "We fully anticipate the nomination of Woodrow Wilson for President at the national convention of the Democratic National Convention of 1912, as against William H. Taft, Republican candidate."—*Boston Herald.*

**CHIEF OF**

Editor Harvey of *Harper's Weekly*, has his paragraph again. This time he guesses—and will fall far behind in the accuracy of his guess—that the elected National Convention of 1912 will nominate Dr. Woodrow Wilson, of New Jersey, for the Presidency, and that the Doctor's Republican opponent will be William H. Taft, of Ohio.—*Washington Herald.*

**REASONABLE EXPECTATIONS REALIZED**

Quite as we expected, *Harper's Weekly* nominates Woodrow Wilson for President next year. *Harper's Weekly* was the original Wilson man.—*Windsor Telegram.*

**IN DUE TIME—NOT YET**

The keen eye of the editor of *Harper's Weekly* has found on Woodrow Wilson now for a number of years, and the paper has been forwarding his fortune with the accuracy of a seismograph. He has seen prophecy as to its final economic, economic relations, and new statements in its current issue, also said.

It is now fully anticipated that the National Convention of 1912 will nominate Dr. Woodrow Wilson for President at the National Convention of 1912, as against William H. Taft, Republican candidate.

Colonel Harvey anticipates the prophecy. While the time for the fulfilling of the last has not yet arrived, it is entirely possible that it will, indeed, highly probable, especially if we view in conjunction with the past performances of the prophet.

But the most important of all prophecies is yet to come. Will Woodrow Wilson be elected President of the United States? Of course, it will be highly probable; but the most certain prediction is the prediction, or snuff, after. Whenever, it will be interesting.—*Vorpost Ausland.*

**PARTNERSHIP**

*Harper's Weekly* joins the *Washington News* in advancing the nomination of Woodrow Wilson for President in 1912.—*Windsor Telegram.*

**DECEMBER 24, 1906**

**A BIG PLACE RESERVES FOR TEXAS**  
March is our favorite month, and Colonel George Harvey is giving trouble again. Because of his political and personal for jumping the fence and getting into the Republican line in 1906, he has, at the same time, we have kept his hatred of late years because we could not trust him to stand with us west into Texas to get the mail and the country. So do not do it because as a result of this protest that we decided after the dawn of the Democratic era of justice the other party would have had some trouble and to give him the freedom of the pasture in which to kick up his heels and snort.

We find we shall have to turn to the post again to resume our ordinary business. Now before we have had time to discuss a Thanksgiving turkey and lay before the Lord of Hosts the expressions of gratitude which have been the result of our work here is Colonel Harvey nominating a candidate for President for us.

"We now fully anticipate," he says, "the nomination of Woodrow Wilson for President of the United States by the Democratic national convention of 1912, as against William H. Taft, Republican candidate."

Put it from us to inasmuch the availability of Dr. Wilson. For he is certainly only feelings of admiration, respect, and confidence in him, and a number of which he is proud. In character, statesmanship, scholarship, and democracy he is a credit to the party, and an honor to his country. He is a man of a high order of honor to an appreciative people. His election to the Presidency would be no less an honor to the people, and a credit to the party. There is no one who is not to be disappointed in him that we can object to him that we can object to him that we can object to him.

But, Colonel Harvey, we haven't reached the nomination stage yet, and you must remember that a lot of the boys are to be consulted before we flip any banners in the breeze. There are other Democratic men who are entitled to be considered, and it is a fair work and availability—and we must carefully weigh the merits of each after we have prepared for the work. We are not ready at present to give up the receipt upon which we are to go to the country is yet to be made. Dr. Wilson, Governor Harrison, and the other leaders are to be consulted, and the people are to be asked of that record. We will be better able to settle the question of availability after all this has been attempted in.

It will be a year before the party has even begun to see the light with respect to the Elect of 1912. We must nominate the candidate for President in 1912, being the chief consideration, sure it is naturally admitted that Wilson, Harrison and others are in all respect to us in the rank in the party, and we must not forget that. And then when the time comes to nominate, we must let the people have a say. Considering Colonel Harvey's power, we shall be able to furnish them with the need for the cause, and they will have our approval, we expect have the matter in his hands straighter.  
So if he persists in plunging the dinner bell before the fire has been built in the kitchen, we shall have to call him down. We have a new appetite for the

thoughts to some Democratic government, but let all things be done in order. At present we are reconciled to see the Congress as we are going to see make a Democratic victory possible.—*Denton Post.*

Our defiance with Brother George Bailey is limited. Write us by way to receive it, his heart beats as to the right as the possible result. It is in such a question of time when his clear call will take its allotted place in the procession, will up in front close behind the band.—*Edison.*

**OMIX NOMINATED AS YET**

Colonel Harvey has already nominated and elected Woodrow Wilson for President in 1912. He is no longer and likely to be nailed up under the red, white, and blue in—*Harper's Chronicle.*

**VICTORY IN SIGHT**

The Democratic victory was well-nigh accomplished. It seems that he has been in a party with a wide-spread support to its own cause. The state of North Carolina, which seemed to have been holding two years ago, has received itself entirely and has regained the three Republican districts, creating a solid Democratic delegation to Congress. Instead of being weak and unimportant, the Democratic party has led itself up, and following the advice of Colonel George Harvey, has indulged in some "pious and pig-headed fighting." It has not only done so, but it has been in a position to do so, and it will be in this for 1912, and has shown itself not only worthy of confidence, but also entitled to a Presidential victory, which is apt to come—*New York.*

**THE FIGURES OF THE HOBBERS**

Harper's Weekly must be given credit for the discovery of Woodrow Wilson, an anti-imperialist and economic political figure. As far back as 1900 Editor Harvey picked out the president of Princeton as a fit and fitting candidate for the Presidency. He was not only a student of the President's life, but also a leader and a consistently steady to it ever since. In the mean time Dr. Wilson has been growing on the country, and has become a prominent figure in the country. He is well to the front amid the rank of the Democratic leaders for the nomination.

It must be noted that there is no higher or clearer figure on the Presidential horizon than Dr. Wilson, and it is all probability he will be a strong candidate for the Presidency in the national Democratic convention of 1912.—*Maxon News.*

**NOTE WHATEVER**

George Harvey insists that he knew all the time that Woodrow Wilson would get there. Well, now that's got there, in there any reason to assume that he will stay in—*Washington News and Courier.*

**FRONT AWAY BACK**

Many men pride themselves upon being political prophets, but there is only one in America in the year 1910 who has made good to the claim. Early in the year 1904 he believed in the triumph of the Republican in our victories. Colonel George Harvey, editor of *Harper's Weekly*, looked for big Democratic gains in our victories. He is a prophet—*Maxon News.*

**WELL, WELL, WELL**

Colonel Harvey's newspaper campaign, though unjustifiably cruel, was well arranged and carried out. It was a success inasmuch as it has the effect of making the interests of Professor Wilson's opposition were well understood among the Philadelphians and New Yorkers. As the names of the party are not yet in the New Jersey contest than they did to those within their own borders, with, perhaps, a single exception, that of *Windsor Telegram*. It cannot be said "all honor," but it can be said all credit to the sagacity of the expert politician who planned and worked out a successful issue the scheme to elect the Democratic ticket in New Jersey. They were master minds and made that led the work.—*Windsor Courier.*

**JANUARY 28, 1911**

**The South Asks No Favors**

*From the Assemblée—Maxon*  
The editorial in the *Windsor Telegram* is an amazing editorial article with the interrogatory heading. "Will the Democratic Party Consent to...?" As the Democratic party still has a political existence, it has never been in a position to do so, but it has at various times evinced a strange inclination for a second reading. It has a demonstrated capacity for doing so, and a demonstrated capacity for doing so in a republican party is known as "the power of the past." The lack of permanency in the party is the result of its failure. It was with reference to the reputation established by the party's conduct in the past rather than any matter of political principle that the question was asked by the *Windsor Telegram*, but it is also warranted by existing conditions. The question is asked, "Who, then, can prevent the election of a Democrat as President?" And this is followed by the question, "Is it not a question of the party's interest?" The *Windsor Telegram* looks with apprehension to a solitary figure in the West that would lead the party, and in the hands of his hands for nearly two decades and eyes now throbbing to give the prospects of success. But with the visible aid of the party in the hands of his hands, he has been able to do so, and has shown himself not only worthy of confidence, but also entitled to a Presidential victory, which is apt to come—*New York.*

With this array of leaders—now, strong, and successful, with the control of the House of Representatives in the hands of the Democrats, and the other issues at all cost, and with a divided Republican party in opposition, the prospects of the Democracy seem to be bright. It is not to be wondered that the editor of *Harper's Weekly* asks what of the House, and declares that of those, "permanently stands the tariff." This is the issue of the day, and it is to be expected and courageously by the Sixty-second Congress.

When the attention is carefully surveyed this combination of circumstances, it is not to be wondered that the tariff issue. It was in the tariff that the House was won, that in the tariff law a Democratic majority of the House was secured. The tariff has always been a profit of disunion, and the discussion of the Payne-Adams tariff bill revealed lack of Democratic principle. The tariff is not a question of revenue, as it is a question of protection. It is a question of the welfare of the people.

There is a correct statement of the party's historical position. The North American Review under elaborates the position of the party. It is a question of the support of its position. "Such," it says, "is the Democratic creed, established by Jackson, amplified by Polk, sustained by Lincoln, and confirmed by Grant and Cuba. It is the policy, not merely of the party, but of the whole people. Wherever it has been adhered to in practice, the party has been successful and the country has prospered. Whenever it has been discarded, the party has gone down in defeat and favored interests have come into complete control of the government."

The trouble with Republican tariffs has been not much the result of protection to business, but of the fact that they created a class of "patrons" of which the editorial article in the *North American Review* speaks. They have been partial tariffs, awarded to favored interests. They have not protected the trusts, instead of safeguarding the "infant industries," and the public interests in general.

The country would prosper under a new tariff framed on the traditional Democratic policy, and the country is ready to see the party stand with honor. It will still be in an honest effort at sensible and impartial revision. Robert J. Walker, Secretary of the Treasury, has advised the party, and the tariff of a tariff that served the country for a number of years, now under which the Democratic party had a long record of success. He has said, "The duty should be so imposed as to operate as equally as possible throughout the Union, discriminating against no one, and giving no one any special interest. The new industries of the South will not get protection other than that a properly regulated revenue tariff would afford. The tariff is not a question of protection, and no sectional discrimination. Andrew Jackson said in his second inaugural: 'While the chief duty of the tariff is to protect the industry, it should be so adjusted as to encourage manufacturers.' In this adjustment, however, it is the duty of the government to be guided by the general good." This is the tariff policy of the Democratic party, and it is the basis of the success of Democracy, and it is the basis of the success of the party.

It is the majority in the House of Representatives in the coming Congress and made the chief declaration of the party platform in 1912, the Democratic party will be in a position to do so. The tariff will be in a position to do so. It will be in a position to do so. It will be in a position to do so.

The tariff will be in a position to do so. It will be in a position to do so. It will be in a position to do so. It will be in a position to do so. It will be in a position to do so.

The tariff will be in a position to do so. It will be in a position to do so. It will be in a position to do so. It will be in a position to do so. It will be in a position to do so.

**FEBRUARY 4, 1911**  
**Knight Arrives of the New Democracy**

The somewhat serious controversy over the Seventy-third New Jersey ended in a decisive victory for Governor Woodrow Wilson over Senator Allen. The result was a triumph for the struggle between the New Order and the Old, and the result was inevitable. Governor Wilson was handicapped from the beginning by the inferior quality of the "primary" candidate whom he left in honor bound to support, and necessarily he had to receive the charges of personal impropriety because of the fact that he was nominated in a makeshift manner to Mr. Surra's endorsement. But he could not escape the conviction that even a half-baked primary law must be upheld and, highly as he esteemed Senator Surra personally, he did not see how he could honestly ignore the fact that former Governor Surra, regarded by the people, rightly or wrongly, as the personification of honorability, as an ally of the opposition. So he went straight to the voters themselves and aroused public opinion to such a degree that the members of the legislature found it impossible.

We doubt if a more daring act was ever performed in American politics. Governor Wilson not only won the election, but he won it on a platform, but also he won his political fortune. He could not just know that, in taking the stand he did against Mr. Surra, he was inviting the antagonism of not just established leader alone, but of all like him throughout the country. Most men would have hesitated long before taking a

step which might easily have proven fatal, and we are not sure that the public would not have held such conduct pardonable, under the circumstances. But the Governor did not fancy the incredible suspicion that he had either been a party to feeding the people or had been fooled himself. So he took the risk and he had scarcely turned neither to right or left, never flinched, kept his good humor—and won in a walk.

What effect the controversy will have upon the reform legislation to which he is pledged cannot be foretold, but it is a fair guess that the dominance which Governor Wilson has already attained over the legislature will be still secure. Moreover, Remond is not only a strong partisan, but a good sportsman, and we have no anticipation whatever that he will try to subvert the new administration in any way.

So far as the country is concerned, Governor Wilson's action has won universal commendation, and his daring has captured the imaginations of the people more completely than anything, except possibly CLAY, BLAINE, and HOWLAND, has succeeded in doing before. Already, in contrast with DEW and HARMON, he is hailed as the Knight Errant of the New Democracy, and as such will be nominated for President in opposition to WILLIAM H. TAFT.

FEBRUARY 11, 1911

## Champ Clark

New York, Jan. 1, 1911.

To the Editor of Harper's Weekly:

"SINCE I have just read Mr. Bryson W. Jennings's commendation addressing the constituents of Champ Clark (soon to be Speaker) by the Democratic national convention, which suggests some thoughts—"

"The other day Mr. Jennings, in his capacity of an editorial which is a mass of other things, correct and incorrect, made these statements, that are absolutely true, and we cannot get away from the truth of them, "As to getting the credit for the fact that the people who are taking charge of the Harmon movement are such the same people who organized the Allen B. Tucker movement in 1904, and proved themselves able, capable of holding within a trifling or many votes as the Bryan force could hold."

"The Democrats need moderate who, while not being Mr. Bryan, shall be able to command the sincere support of Mr. Bryan. . . . It is plain as a palmetto that no Democrat is more to be elected in 1912 who has Mr. Bryan distinctly opposed to him."

"If the Democratic party has not one man of Presidential size and confidence, without knowing either the support of Mr. Bryan, without driving away all the moderates in the party, then its chance of winning is nearly gone."

"Champ Clark has never been one of Mr. Bryan's close counselors—Bryan's Missouri John Archer has always been Bryson's closest ally, and has shown a splendid face, able politician, and great tactician. Yet Mr. Bryan would gladly support Mr. Clark for President, and I know what I am talking about. And it makes not a bit of difference whether you love or hate Mr. Bryan—and nearly all men seem to do so or the other—his control is at least a million votes. At least one million men believe in Champ Clark and patriotism to the extent that they will vote as they think he believes. At least a million men who ordinarily vote for Bryan, and who will vote for Mr. Bryan, he realizes this and knows now that there is no use in not now, and perhaps this will be true as long as he lives."

"Another thing: If the Democracy wants the certain to fall on its again, and this time forever, let it try the experiment of electing a President without knowing whether he can work in harmony with his party in Congress. Then was Cleveland fell down and took his party with him, and then was McKinley elected, and we took our work seriously with Democrats in Congress; he got those together when he did not have even a committee organized in good shape, and then those men who whipped the country, and won a great victory at the polls. He found the Democrats of the House a mob; they are now a solid phalanx, and they are a solid phalanx without exception. This is the kind of leadership the party has long needed; hasn't it sense enough to recognize it when it comes? We elect Harmon or Wilson, and we will have more votes than perhaps he will be able to sort of get along with his party in Congress? I am not sure if the man who has proved it or not?"

I am, etc.

OAS PATRIOT.

NORTH AMERICAN REVIEW—March, 1911  
The Political Predetermination of Woodrow Wilson

Whether predetermination is absolute or conditional is a question which of course arises before the Candidate and the American who determines it is essential to the purpose of the following argument. Equally foreign to need in holding the chain of reasoning is decision of the question of dominance over the world—whether of a personal God as of the power of Nature. But two assumptions as to the part of the candidate in the determination of his destiny: (1) That the laws of logic, growing out of conditions and circumstances, are irrefragable as applied to human affairs, and (2) that, even so, irrespective election of an individual, without refer-

ence to the use he may make of his moral agency, cannot be resisted.

'Tis on this hypothesis we confidently base the prediction that, barring accidents of a physical nature, the two opposing candidates for President of the United States in 1912 will be William Howard Taft, Republican, and Woodrow Wilson, Democrat. We do not presume to impute to dialectics the nomination of the former. That, frankly, must be taken for granted. The reasons for his nomination, however, are sufficiently obvious to require no candidate. (1) He controls the federal patronage. (2) He has won the confidence and respect of the people in large measure and is gaining favor daily. (3) He is gradually acquiring the active friendship of the inevitably conservative business men, without whose support no candidate has been elected President since 1852. (4) He will be supported by Roosevelt. (5) He is the practical reason that defeat or election will spell the ending of his career as President, probably immediately, but surely at the expiration of four years. (6) His rejection by the National Convention would be unprecedented and would prove certain defeat of the party at the polls.

But we are particularly in his favor because of a single practical reason that defeat or election will spell the ending of his career as President, probably immediately, but surely at the expiration of four years. (6) His rejection by the National Convention would be unprecedented and would prove certain defeat of the party at the polls.

But we are particularly in his favor because of a single practical reason that defeat or election will spell the ending of his career as President, probably immediately, but surely at the expiration of four years. (6) His rejection by the National Convention would be unprecedented and would prove certain defeat of the party at the polls.

Logic predicates antithesis. Circumstances, conditions, uncontrolled and uncontrollable, demand it. History decrees it. Invariably the opposing candidate has been named, not by the opposition, but by the party taking the lead—by all but three instances by the party in power.

Shift the records! Sharp alignment of political organizations was first made in 1840. Prior to that time the elements constituting general opposition had been segregated and their strength divided. Four candidates had entered the race against Van Buren, and each had his own political and electoral college, but Jackson's (3) He had had a majority over all.

1840—Van Buren wept when Jackson had won and his administration was a failure. Nevertheless, his nomination was universally accepted as a certainty when representatives of the new party met in the city that had just elected the electoral college, but Jackson's (3) He had had a majority over all.

1840—Van Buren wept when Jackson had won and his administration was a failure. Nevertheless, his nomination was universally accepted as a certainty when representatives of the new party met in the city that had just elected the electoral college, but Jackson's (3) He had had a majority over all.

title, the nominee was noted chiefly as a lawyer and an orator. The leading candidates before the White convention were Clay, Daniel Webster, Scott, and Zachary Taylor. Clay was still the idol of his party and Webster its greatest statesman. Both were lawyers and famous orators. Bark, now rejected. Of the two famous cooperative measures and secured their enactment, thereby so weakening the Whigs in the North without strengthening them in the South that the reunited Democrats aggressively demonstrated their confidence by holding their convention in advance of their opponents. On the forty-ninth day they nominated Franklin Pierce, an inconspicuous and ineffective Governor of New Hampshire, who nevertheless embodied the spirit of the "young democracy." Two weeks later the Whigs assembled. Fillmore was the natural or "logical" candidate and led on the first ballot, but on the fifty-third General Winfield Scott, who had been the best favorite of the young civilian, Pierce, was nominated.

1852—Fillmore had succeeded to the Presidency upon the death of Taylor, and now rejected. Of the two famous cooperative measures and secured their enactment, thereby so weakening the Whigs in the North without strengthening them in the South that the reunited Democrats aggressively demonstrated their confidence by holding their convention in advance of their opponents. Harpes

TARY IN THE EXECUTIVE OFFICES AT SEA GIRT

of Grant; and on the twenty-second ballot not a vote was cast against him.

1872.—Grant again! Grant the sturdy, silent, soldier President; Grant the Democratic turned Republican. Against him, Greeley the journalist, Greeley the genius orator, Greeley the Republican turned Democrat.

1876.—Hayes, the cosmopolitan, the "safe-and-sure" Governor of Ohio, had been designated by the Republicans when the Democrats met in June. Hendricks of Indiana wanted the Democratic nomination. A far stronger, more popular, more appealing statesman than Hayes, his superior, led by the capable McDonald and aided by powerful Tammany, were more than confident of securing for their favorite the prize. But he, too, was a mid-Western Governor; he, too, was prudent, conservative. Tilden, the reformer, the radical, was named on the first ballot, and the men from Indiana in their seats as if stunned, refused to make the vote unanimous. They felt betrayed when, in fact, only the inevitable had happened.

1880.—Garfield was not named as a chief, but as a statesman. He had been the chief figure in the House of Representatives, had just been elected to the Senate, and was regarded as the most eloquent and persuasive speaker of the land. Hayes was the most fit Democratic candidate, as he was the foremost Democratic statesman and orator, but therein he resembled Garfield. Tradition pointed unerringly to Hayes, graduate of the Military Academy, the "superb soldier" who never possessed an assumed, no possess any knowledge of public affairs or any capacity for civil government.

1884.—Blaine at last—the dazzling leader, the experienced statesman, the brilliant orator, the Plumed Knight. Agnis Hayes was a candidate. But he, too, was a Richard; he, too, had served in the United Congress; he, too, was a Republican. For the staid Cleveland, who then was feared only for common sense and sturdy courage, who atoned platitudes monotonously, who had never served in a legislative assembly, and who had never even visited the national capitol.

1888.—Cleveland renominated! But a different Clark, a different Cleveland, a different Hayes, an ardent fair reformer, almost a free-trader, held to be a radical. Against him Harrison the ultra-conservative, "unconqueringly in favor of the American system of protection."

1892.—Again Harrison vs. Cleveland.

1896.—For the second time the opposition took the lead. McKinley, the steady, friendly, polished, painstaking, serious McKinley, was named on the first ballot. Three weeks later the Democrats met in Chicago. The radicals were in full control. Free Silver was the only cry, and Bland, the apostle of Free Silver, was regarded as an almost certain winner. But Bland differed little from McKinley. In its management, its method, its Congressional service, its previous attitude toward silver, even in manner, they were not unlike. It is commonly said that Bryan won the nomination with a striking speech. But who can tell what would have happened if that oration had not been delivered? It was a contention of radicals seeking a radical candidate. Bland could not have satisfied, nor Boies, nor Pattison; nor Campbell; nor any one bearing the slightest resemblance in thought, word, or deed to the prudent McKinley. The nomination of a Bryan was inevitable—prescribed by the Logic of Circumstance.

2000.—Again Bryan vs. McKinley.

1904.—Boswell had succeeded to the Presidency and had been unable wholly to resist the impulse of his ardent temperament to break away from the traditional policies of his party. Already he was recognized as embodying the spirit of the times which has since been termed progressiveness. He had, in fact, appropriated to many of Bryan's notions that the political indications of the two could hardly be contrasted with marked effect. So potent was his tendency that, but for the death of Hanna, the controlling elements of the Republican party would probably have tried to defeat him in the convention. However, he was nominated without dissent.

Bryan had then been absolute master of the Democratic organization for eight years. He held undisputed control of the National Committee, and his great personal popularity had not waned perceptibly. Had a Republican nominee of the McKinley type been designated, his power would have been such that he would have named the Democratic candidate. But the nomination of the towering radical Boswell forced the outcome of the Democratic convention irresistibly. With all his authority and personal following Bryan could not hold even the one-third essential to the defeat

of Parker, when he had attacked viciously; and the staid and sober judge was named in opposition to the fiery Boswell.

1908.—Back again to the pendulum. Roosevelt's progressiveness administration was reaching its close. Taft was nominated—Taft the workman, the peacemaker, the judge, confident, patient, kind, the natural and proud successor, as he has since declared, of his prototype, McKinley. The old Republican leaders breathed more freely. After all the Roosevelt disturbances might prove to have been only an episode.

Such was the condition when the Democratic convention assembled in Denver. Only four years before the conservatives had dominated completely. They still controlled the National Committee. But they were as helpless in the face of the Taft nomination as Bryan had been in the face of Roosevelt's candidacy. Again the fettering orator became the standard-bearer of the Democracy and achieved the customary party disaster.

Such the record! In each and every instance the type of opposing candidate, if not the man himself, has been marked by the party making the first declaration. Invariably someone whose record certainly has yielded to the greater power of the single issue of protection—the irresistible demand of Circumstance for Antithesis.

NUMERICAL

1840.—The assumed nomination of Van Buren compelled the nomination of Harrison in place of Clay.

1844.—The nomination of Clay compelled the nomination of Polk in place of Van Buren.

1848.—The nomination of Cass compelled the nomination of Taylor in place of Clay, Webster, or even Scott.

1852.—The nomination of Pierce compelled the nomination of Sevier in place of Fillmore.

1856.—The nomination of Buchanan compelled the nomination of Fremont in place of McLellan.

1860.—The assumed nomination of Douglas compelled the nomination of Lincoln in place of Sevier.

1864.—The renomination of Lincoln compelled the nomination of McClellan in place of Seymour.

1868.—The nomination of Fremont compelled the nomination of Seymour in place of McClellan.

1872.—The renomination of Grant compelled the nomination of a Greeley.

1876.—The nomination of Hayes compelled the nomination of Tilden in place of Hendricks.

1880.—The nomination of Garfield compelled the nomination of McClellan in place of Hayes.

1884.—The nomination of Blaine compelled the nomination of Cleveland in place of Bryan or Randall.

1888.—The renomination of Cleveland compelled the nomination of Harrison.

1892.—The situation reversed.

1896.—The nomination of McKinley compelled the nomination of Bryan in place of Bland or Boies.

1900.—The situation reversed.

1904.—The nomination of Roosevelt compelled the nomination of Parker in place of Bryan or Cockfield.

1908.—The nomination of Taft compelled the nomination of Bryan in place of Parker or any conservative.

Therefore, in

1912 the renomination of Taft will compel the nomination of Wilson in place of Harmon, just as the nomination of La Follette would compel the nomination of Harmon in place of Wilson.

Why?

Obviously but one theme of inquiry demands consideration: Who is the real Antithesis of Taft? Bryan? Yes, as in 1908. But Bryan's record have been run. Gagnor? Yes; but Gagnor is disqualified by Fate. Feltz? No; but Feltz clearly is outclassed.

Champ Clark? Theoretically, perhaps, but practically only as a petty compliment. Dix? The carrier of water upon both shoulders! The upholder of party faith, on the one hand, and the source of pretexts to leaders on the other! Neither opposite nor opposite is Dix. Bryan Harmon may be the man, but not the man in the Antithesis of Taft! Until the meeting postulate.

In but one essential particular—that of age—is marked a greater dissimilarity between Taft and Harmon than between Taft and Wilson; and that seriously to Harmon's disadvantage, in view of the facts that the average age of Presidents at inauguration has been under fifty-five, and that of the three elected within more than sixty-four died within the year.

The contrast is complete, conclusive; the evidence overwhelming. The figure of Presidencism, guided by Logic, Circumstance, Conditions, and

History, points unerringly to Woodrow Wilson, Democrat, as the opposite of William H. Taft, Republican, in 1912. Blessed Columbus!

Echoes

MARCH 11, 1911  
THE SCHOOLMASTER IN POLITICS

From the St. Paul Pioneer—Press  
Just at this writing Woodrow Wilson issues upon the political horizon, casting considerable of a shadow. Likewise his situation is one involving some hazard and some uncertainty.

For some months prior to the fall elections Brother George Harvey kept HARPER'S WEEKLY an issue yielding the Wilson story by the way of a President of the United States. He was not a man who would be so easily won over.

This cautious support resulted in Wilson renouncing Bryan and his robotic restraining very grave suspicions of Woodrow Wilson. It argued that Mr. Wilson was, perhaps, too acceptable to Wall Street influences.

Mr. Wilson, promising to be a real Governor, sought New Jersey and immediately started in to be a real Governor. He came out strongly with his own government, the Oregon plan, and other reforms, and he started a fierce battle against the bosses of his party three hours after he was elected. The bosses turned on him with terrible abuse and attempted to seize him out. He would not waver. They tried to batter him and he would not be "bait" for the only attack.

He went to the finish and beat the bosses and corruptors out of their heads.

And Wilson's cabinet leader was laudably beaten, and all honors of Governor Wilson's term in doing just what he told the people he would do if elected.

Now Mr. Bryan comes out and says we are mistaken in Wilson, that he rejects to do his honor, and commands him most kindly as a true and triumphant influence.

Mr. Wilson now stands in the position of being the only Eastern Democrat who has won the regard of the Bryan influence.

The question now is, Did Wilson make his fight on corruption, and especially in winning the Bryan victory, only retain an effective strategy.

At any rate, the former president of Princeton has proved that he is a real leader, a fighter, and a politician of keen insight and effective strategy. He swept his state because he proposed the position that he would fight the gang, he kept his word. Conservative, radical, and generally scorned as a dresser before election by the sporting politicians, he submitted them all—and he did it by keeping faith with the people and taking an advanced stand on behalf of the principles of popular government. He had the nerve to jump into the uncharted waters in his state and leave the legislature to keep faith with his people, while the interests objected the prominent house added the wisdom of an executive dictating to the legislature.

No the schoolmaster has become a national figure, and a commonplace of his virile administration thus far will make him a commanding figure in the next national convention of his party.

THE CANDIDATE OF THE PEOPLE

From the Detroit "Journal"  
What about the "action" of the "super-republican," the "horrorful" Governor Woodrow Wilson of New Jersey—now? He has elected his man, James E. Marshall, the primary of the United States Republic in a fierce contest fought out in the New Jersey legislature. James Smith, Jr., yesterday withdrew. James

## The Problem, the Solution, and the Man

For first that we live in an age of action, not of thought, is charged with new meaning for us than for those of idler countries. They have as guides the beaten fields of their own histories, but the conditions confronting us are without precedent either at home or abroad. Hence the vital need of pausing at intervals in order that we may determine, so far as possible, whether we are being swept un-aidingly along a torrent to certain doom or are gliding peacefully down the river of natural progress to a haven of peace, equality, and common happiness. For while examining our souls with the reflection that the misfortunes heaped upon us are those which never cease, it nevertheless behooves us, as a prudent people, to remedy artificial evils, which invariably have their genesis in want of thought, by the application of thought itself. The poet Lowell expressed the idea in homely but perfect fashion:

"— Leave the man who is ready to stand,  
— He cannot afford to quarrel for the freedom to think;  
And who has been thought, to his course strong or weak,  
Will still do either half for the freedom to speak.  
Caring naught for what transpire the mob has in store,  
Let that mob be the upper ten thousand, or lower."

## THE TARIFF AND BUSINESS

What, then, is the one great problem upon whose solution depends the entire of our country and our people, that in its solution we shall have it as economic good without strife. That, in a sense, it is moral may be accepted as an obvious fact. Recent manifestations of the instinct of an alarmed people to seek and concentrate upon the concrete result behind the impression that it is the tariff, that the tariff is not a problem. It is not a problem that a pharisee could realize in. Whether impost should be laid for revenue or protection is a question of importance, to be sure, but of far less importance than in former years when unaided judgment outweighed practical considerations. It would be the height of folly to blind our eyes to the conditions that now exist upon any other than a humane and realistic basis. Our old-fashioned governmental extraneousness, but none can deny that application of the most rigid economy would counterbalance but temporarily the increasing cost of administration of a rapidly growing commonwealth. Despite the enormous revenues now derived from various sources, such may add up to more than a thousand dollars to the debit, and this sum would have been doubled by the enactment of the absurd position law recently approved by the House of Representatives. We must, moreover, accept as a fact that actual needs will multiply rather than diminish.

How are these colossal needs to be obtained? By reducing the tariff to a moderate level? In part, perhaps, but by no means to an extent sufficient to meet the requirements. Let us not deceive ourselves in this regard. No intelligent man now advocates the destruction of our great manufacturing industries through the adoption of free trade with other nations. The utmost that is sought is a leveling of the playing field and production on a standard that would ensure reasonable competition to bid monopoly. The effect would be a reduction in the cost of products to the consumer, and to that extent it would be beneficial. But, clearly, there would ensue an material increase in revenues unless the manufacturer were driven out of business, or unless a drastic rate of tariff and duties be levied. There is an ill-grounded belief that manufacturing profits, as a rule, are excessive and should be brought within bounds to the advantage of the consumer, but since there is no thought of abolishing them altogether the industries will survive and prosper, though more moderately, and will continue to meet the needs of the people. The only way in which any increase in revenues approaching adequacy from a levying of the rates. The tariff, as we have said, is no more than a phase—a phase, indeed, of only a part of the real problem, because essential as the procurement of money for government undoubtedly is, it is as a beguile compared with the colossal results.

## THE PARADOXICAL PROBLEM

The vital problem now confronting the people of the United States, the problem involving the perpetuity of five institutions, the problem which transcends all economic, political, and moral issues, is how to make equitable distribution of the combined earnings of labor and capital without robbing the fabric of popular government. The aphorism of Ricardo, still upheld by certain,

Muswell, he asserts as "it." His prophecy is based on the premise that Mr. Taft is chosen by his party as its leader, failing which Governor Wilson must stand aside for the present and await a more opportune season.

If the Republican party should turn from Taft to La Follette, there would be grave reason for Wilson, the shrewd, old-fashioned statesman, as an effect, as an antidote to "Bob son of Biddle" of Wisconsin. This may sound illogical at first blush. Why not nominate the far grander, the far more able, and more universally as against a Democrat? The answer comes from the Tariff table published with the article showing the nomination of the candidate. The nomination of Taft is set down as "profrat," Harmon as "reaction," and Wilson as "daring." It is "brave" the incumbent of the Executive office, and "timid" as a candidate, as seen in "read controlled," but Wilson is "quick, serious." This table of characteristics goes through the philosophical process of elimination, and is designed while the others are mortal. The point sought to be made, however, is this, that La Follette and Wilson are far more able to stand the test of a more severe campaign. In support of this contention Mr. Harvey goes back seventy years to show that national conventions have the "law of attrition." To go no farther back, the nomination of Roosevelt by one party compelled the nomination, not of Bryan, but of Parker, by the other party. The nomination of Taft, the judicial, mildly progressive Republican, brought Bryan to the front the next time.

All this sounds so plausible we are almost ashamed to confess that we are "stumped."

## GIVE THE VOTER A CHANCE

From the St. Louis "Times"

Mr. Harvey's article is a splendid example, which has succeeded in amassing the simple-minded on more than one occasion by the accuracy of his predictions, has been an article of the highest quality. In the *North American Review*, in which he maintains that if the Republican party nominates William H. Taft in 1912 he will be elected, in view of numerous precedents, it will be necessary for the Democrats to nominate Woodrow Wilson, of New Jersey.

In the other hand, it is by some revolutionary process the Republicans are to be nominated by La Follette. It would seem necessary for the opposite party to name Jackson Harmon as their leader.

The first thought arising from this "programme of predestination" is that it seems amazing that the average voter is still the tool of a few men who represent nobody as yet, and who have no voice, and who have no consideration for anything save strategy.

The voter is, theoretically, the man who elects a President; theoretically, again, the candidate who is to be made from among the suitable men of the nation. But as a matter of fact his privilege of voting is narrowed down to the choice of one man, and he has no choice, and for neither of whom he may entertain a very high opinion. The few who make the selection have, according to Mr. Harvey, no special thought as to the fitness of the man, other than as his fitness consists of a good chance to defeat the other fellow.

The second thought arising from the plan Mr. Harvey has napped out is that the Democrats seem destined to play in bad luck to the end. For Mr. Wilson, we believe, is a little representative of the "Progressive Democracy" any individual that could be found.

The party of Jefferson seems to be gaining in opportunity to be supplied with everything save promising candidates.

## REMOTE POSSIBILITIES

From the *Spencer Post-Standard*

George Harvey has an article in *The North American Review* in which he says that the nomination of Woodrow Wilson. It is an attempt to predict the nomination of the national convention of 1912 by electrical analysis, to use one take note of the effect which the nomination of the dominant and re-touched party has had in determining the selection of the minority party with reference to the future of Mr. Harvey's argument—that the logic of events points to the nomination by the Democratic national convention of Governor Wilson as a candidate.

Mr. Taft, says the writer, will be re-nominated. It would be unprecedented in the Republican party to select him the nomination of a rival to Roosevelt. The first hint of his administration will be more general favor than he closed the first year and with the prospect of gaining rather than losing popular support.

Taft is conservative, and will be nominated by the Democrats must nominate a radical. Revising the elections from 1840 to 1900, he shows that the party out of power has always nominated a candidate similar to the nominee of its opponents, but dissimilar. While the Democrats have won the radical Bryan nomination in 1908, the Republicans have nominated the conservative Parker against the radical Roosevelt; and the anti-labor party is willing to elect Wilson rather than La Follette for the same reason as between Wilson and Thurston, the only two whom Colonel Harvey recognizes as serious candidates for the nomination of Wilson will be preferred.

Well, Colonel Harvey will admit, such may happen in the next year.

## Among Democrats

You are here made from the measure if you choose, you are desirous to kill me, and I am desirous to see you off and turn away from me, but you cannot deprive me of power so long as I consistently stand for what I believe in. You are not interested and legitimate demands of the people themselves, I believe, and I believe in this which promises to be a historic conference in the annals of the party of the state, you are settling the question of power or influence, or the leadership of the party to which the people with a singular generosity have offered the control of their affairs.

These sentences of Governor Wilson were spoken

in the course of a prolonged conference with the Delegates of the House of Assembly of New Jersey in which he urged them to live up to the letter and the spirit of the platform on which he and they were elected. They are, perhaps, not very extraordinary sentences—certainly a forceful sounding of his faith that cannot be called new. But they were spoken long after—long after—the election; he had not the least even a word of them; to me who know that he meant what he said and that he would not hesitate a moment, if there should be need, to go from them straight to the people and by "publicity, pitiless publicity," make his words good. Must they not also here tell that what he said was not merely sincere, but true; that he would not shrink at withstanding the will of the public and the gift of speech, cannot be deprived of power so long as he keeps faith with the people and will not be made afraid. The future of the party, not in New Jersey alone, but in the nation, does depend on its keeping its pledges. For that party to-day, honesty is the best policy, and it is the best course with which it judges the wisdom of such leadership, but he considers how much stronger Wisconsin Winsor himself is at this moment than he was during the campaign, brilliant and convincing as he was when he was making the pledges which he is now so steadfastly insisting upon keeping. Or consider why Wisconsin is so well kept in mind in predicting that the next New Jersey legislature will be Republican, while across the river Republicans as well as Democrats are expecting New Jersey to remain Democratic.

## The Two Kinds of Democrats

Such leadership is not merely wise; it is essential. Nothing could be more shallow and absurd than the notion that because a party or a people that democracy is any dispensance with leaders. The contrary is every much more being true, and so, if our country is ever to get on its feet, it is not the "interests and legitimate demands of the people" may control the actual working of government, it is simply indispensable that there shall be leadership, and the franker and more open the leadership is, the more clearly its character and character of the letter it will serve, because the better will be the opportunity of the public to express its will effectively.

Unquestionably there are two kinds of leadership offered to the Democratic party throughout the country at present, and a certain division in the party is indicated by the differing choice of different communities, different states and sections. To one group of leaders and their followers the term "progressive" is coming to be used infrequently applied. It is not a good use of the word. That title belongs to one of the Republican factions, "Progressive" and "conservative" are the correct names for the two wings of that party, and they are, in fact, for the two wings lead the party in general for the progress of our country. For the two wings of the opposing party, the party of individual and local self-interest, the party of liberty, the best general terms are "moderate" and "radical." But they do not perfectly fit the division, such as it is, among the Democrats in this country to-day. The latter is a little irregular. It is to such effect, to the two groups of leaders and their followers of the same self-interest against which one of the Republican factions has revolted. "Theosophical" and "half-hearted," or merely "divergent" and "insincere," would be, for the time being, rather more accurate designations of the two kinds of Democrats which the party contains and which are ready-made for every one to apply. They are in the nation. The contrast is none the less real and important because it is confused, because the lines of it are ill-defined. Upon its outcome depends, of course, the control of the platform and nominations. But more than that is involved. The character and the aim of the party for many years to come will depend upon its immediate future control of the government is involved. The fate of the other party also is involved, logically and directly involved, for if the Democrats fail to play their proper role the insurgent Republicans will essay it.

It is by making clear the choice open to all that we may avoid the dangerous leadership as Governor Winsor's is of no great, if any, estimable service at the present juncture. In the other party other men are playing a part somewhat like his; but no other Democrat in the country is so making of his words and deeds—in fact, of his very nature—into such a touchstone of other men's Democracy.

powerful but short-sighted classes in England, to the effect that the laborer is entitled to just enough food and clothing to keep the machinery of his body working until it shall wear itself out, finds no advocate here. We have advanced at least far enough to recognize that humanity is a best, and a very large part, of political economy. But this is only a step. We have now only to begin to insure the laborer the evolution or revelation as an effective force in the development of civilization. Our colonial fortunes have sprung into being so quickly that there has been hardly time to effect a readjustment of the relationship of Wealth to the State which conserves it, but no thoughtful mind can fail to appreciate that readjustment must be effected as a condition of the relief of Labor, but quite as much, if not more, for the protection of Capital itself. We cannot cultivate fortunes. "When two men ride a horse, one must ride behind." Nor would we, if we could, sound the death knell of individualism. But we can try to correct methods and influences which have already shown themselves to be unwise, unneeded, cannot fail to make the disparities yet more enormous. True it is that now before and nowhere else has Wealth been so sensible of its duties as it is now and here. It builds hospitals, libraries, schools and colleges without number, but such remedies never only to palliate the disease. It does not neglect the education of the masses, however, is artificial, discriminatory, and offensive, if, not indeed destructive of, the self-respect of the masses. Less charity and more justice is what the American people want and what they are entitled to receive.

## INTERDEPENDENCE AND COOPERATION

That is the problem. Whence lies the solution? Primarily in the spirit with which the subject is approached. Not independence, but interdependence, has become the law of life in this country. Cooperation, a drawing together in frank and unselfish tolerance of one another's opinions, as positively essential to the settlement of every great question. And this concurrence must be general, must come not only from all groups, but from all sections. Invariably and naturally the older and richer community is the more conservative, the more reluctant to accept innovation, the more obtuse in recognizing either the qualities or needs of the new. The West, we must appreciate the extent of its obligation to the East is apparent to the most casual observer, but no less manifest in the East's obscurity in ignoring the teachings of the West. The historian, Woodrow Wilson, depicts with insight and accuracy "the moral of our history."

"The East," he writes, "has spent and been spent for the West; has given forth her energy, her young men and her substance for the new regions that have been a-making all the century through. But has she learned as much as she has taught or taken as much as she has given? The westward march has stopped upon the first steps of the Pacific. Populations now turn upon their old paths, fill in the places they passed by as neglected in their first journey in search of a land of promise; settle to a life such as the East knows as well as the West—many, much better. With the change, the pause, the settlement, our people draw into closer groups, stand face to face, to know each other and to be known; and the time has come for the East to learn in the same broadness her understanding of political and economic conditions to the scale of a hemisphere. Let us be sure that we get the national temperament; send our minds abroad upon the continent, become neighbors to all the people that live upon it and lovers of them all."

## THE SOUTH AS TEACHER

This is the true spirit—the essence of patriotism indicative of the brotherhood of man. We need not dwell upon the West's resentment against the East nor the East's distrust of the West. But we do know and must recognize that these unhappy sentiments have retarded the two sections in the past and here not yet wholly eradicated. The cure lies in better understanding, to be acquired through fuller acquaintance. The South is the natural teacher because the South, civilized and prosperous, more philosophical as a consequence of favored conditions, has become less dependent upon its neighbor across either the West or the East. By virtue of the position for stationableness and clear thinking which it developed in the early days. It was the leader for scores of years and should be the leader now.

Its duty is plain. Out of the happy outcome of its own patient sufferance it may well indicate to

the impatient West the advantages to be derived from the exercise of tolerance. From its own bitter experience it can point out clearly to the East that, while great possessions may be lost temporarily to a community, that which a few people come to recognize as a vital truth can never die, that the test of a man's strength and worth is not in the number of his adherents as a selfish view, but that lesser weight loss than brain and brain loss character, that even from a selfish viewpoint it is easier to lift human beings up than to hold them down, and that the soundest security for property lies in interesting the largest number of individuals in its preservation and the smallest number in its destruction. Hence the value of the "middle class" to all, of equitable distribution of the combined earnings and accumulations of labor and capital.

How to obtain such apportionment is the question. Not by violence surely. The exercise of mere force, whether physical or legislative, is destructive, not creative, and at best can only insure a temporary setting of things to rights. We must. Not by decreasing a new system of government as one would order a new suit of clothes, for the simple reason that the tailor does not live and never has lived who could make it fit. And yet not by resumption of principle which has been aptly described as a good enough umbrella for purposes of shelter, but essential, in this land at this time, that our methods should be orderly as that our aims should be rational.

## THE SURETY TAX

May it not be that the remedy lies in direct taxation? Why not frankly acknowledge that our government can no longer be fed by those who have little and are constantly getting less, and must be supported by those who have much and are steadily acquiring more? Attempts have been made from time to time to impose adequate taxes upon incomes and inheritances. State have been instituted; all for one reason or another have been abortive. Is it not now time to undertake the task with resolute determination to succeed? Can a better solution of our most vital problem be devised?

Adrocity of legislation making such imposition does not involve annual upon a class. It is not a question of the class at all, but of the right of man to recognition of the natural rights of free men to establish a system under which all members of each present and succeeding generation shall possess substantially equal privileges. A tax upon incomes is not, as is so frequently said, a tax upon industry. It is not a test of exceptional opportunity, a just reward for peculiar ability, or one levied in proportion to the pains derived from their exercise. And a tax upon inheritances is not a tax upon the carrier, but upon the beneficiary who, having played no part in the making, should be willing to share his bequest with the state whose aid was essential to its acquisition and whose protection continues to be requisite to its preservation and in proportion to the pains derived from their exercise. And a tax upon inheritances is not a tax upon the carrier, but upon the beneficiary who, having played no part in the making, should be willing to share his bequest with the state whose aid was essential to its acquisition and whose protection continues to be requisite to its preservation and in proportion to the pains derived from their exercise.

We are accustomed to regard our very rich as leaders and more generous-minded than the very rich of other lands, and we set forth in evidence their magnificent benefactions. But making big gifts is quite different from paying big taxes. The former not only gratifies vanity, but presumably serves the way to a place among the angels, while the latter merely discharges a just obligation. So we must expect that the opposition will continue as strong as ever, and that the usual arguments must be confuted in fairness and reason. But this is not difficult. There need be no question of double taxation and no antagonism between state and nation. Cooperation is essential. It is useless for a commonwealth to impose a tax which can be evaded by a mere change of residence. But the federal government can make such a tax general and conserve all state prerogatives by allowing a reduction equivalent to the amount paid under similar enactment to the state. The only design would then be compelled to leave the country, avoid bearing his fair share of the total burden. And the justice of the proposal is indicated by the fact that there is no civilized land from England to Italy to which he could go and obtain better terms than the highest we would think of exacting for the protection of his property.

## SECURITY

Other questions, other issues, there are, to be sure, but all are allied with and subordinate to that which is vital and fundamental. We have seen that governmental needs not only exceed present revenues, but must of necessity increase, along with growing population at home and multiplying

responsibilities abroad. Clearly, under these conditions, other sources of income must be found before ordinary business produce will permit the general lowering of tariff rates so much as a shadow to the average basis. The pending reciprocity bill is a neighborly and commendable act, but more can be done if its practical effect will be a very considerable increase in the general deficit, by opening them, by operation, to the extent which fails to indicate simultaneously an alternative method of meeting the enhanced deficiency, is political rather than statesmanlike, a mere expedient to appease public wrath, not the inauguration of a policy which could be made general. Proper taxation of incomes and inheritances, however, could not only meet the development possibilities, but, and greatly advantageous to the tolling masses.

## THE BOND OF INDUSTRY

No less direct is the relationship to our old problem of all proposals to lessen the hands of representative government by the substitution of primaries for conventions, by the election of Senators by general vote, by the extension of the term of office, and so forth. The genesis of these questionable devices is the common and warrantable belief in the minds of the people that the poor bear burdens that should be borne by the rich, and that the failure, so far, of popular will to find expression through enactment of laws proper for the relief of the masses, is a sad indictment. The present trend toward populism, as a substitute for the government of delegated powers established by the Fathers is directly traceable to the obduracy of that alliance of Greed and Wealth which for so many years has controlled the dominant political party. Whether or not the present trend toward populism is a question which need not now be considered. It suffices to point out the causes of its origin and growth—and these are manifest. Can any one believe that assaults upon the principle of representative government would ever have attained their present proportions but for the conviction in millions of minds that the many are being grossly discriminated against in favor of the few, especially in the matter of taxation, and that refusal to tax incomes and inheritances has been deliberate in order to make necessary for revenue purposes heavy imposts upon products essential to maintenance of very existence? There can be no question as to the extent of the many being grossly discriminated against in favor of the few, especially in the matter of taxation, and that refusal to tax incomes and inheritances has been deliberate in order to make necessary for revenue purposes heavy imposts upon products essential to maintenance of very existence? There can be no question as to the extent of the many being grossly discriminated against in favor of the few, especially in the matter of taxation, and that refusal to tax incomes and inheritances has been deliberate in order to make necessary for revenue purposes heavy imposts upon products essential to maintenance of very existence?

## NO MORE FROM THE REPUBLICAN PARTY

Who is best equipped to meet the situation? One can perceive little ground for hope from the Republican party until it shall be put out of power and be kept out long enough to disperse its accumulated special attachments. However good the intentions of a Republican Congress may be, recent history proves conclusively that they count practically for naught. The party is tied hand and foot, has made so many treaties with all sorts from Mormon to Mormon, has accepted so many favors, has become so dependent upon the power of money, that it is utterly helpless to break its ties. The Democratic party is impoverished; it may be recast, it may yet be given life if capable. But it is a fortunate circumstance that nobody in recent years has considered it worth while. Consequently it is at least free, so being, to do its best without fear or favor, and so being, should be preferred.

## LIBERAL OR CONSERVATIVE

Fifteen months hence the two leading candidates for President will be placed in nomination. One will be labeled Republican, the other Democratic. But the time has passed when a firm issue can be raised between new appellations. The sharp line of demarcation once drawn between the two great organizations has worn away in the wearing loam of time. The reality will find one regarded by the people as a conservative and the other as a liberal or progress-ive. Assuming, as we may with reasonable certainty, the re-nomination of President Taft, but one question in practical politics will confront the two camps. That which will relate to the treasury of the great body of voters. Is it toward liberation or conservatism? If the former, then clearly the Democrats, if wise, will name a man generally recognized as more progressive than Mr. Taft; if the latter, they will designate one regarded as less liberal. The relative personal merits of proposed candidates will

symptoms of disapproval of the conduct and sayings of Governor WILSON. It began to sneer at him as soon as he started off on a short vacation to get acquainted with the folks out West, and it seems likely to continue the practice with a persistence that has become characteristic. If not indeed unique. It now calls him "the Governor Hiram," who, "withstanding the result in general, rejecting it as applied to judges, at once tickles the neck and revivifies the reactionaries that, after all, he is rather of a conservative sort of demagogue as demagogue goes." This was apropos of Mr. Wilson's remarks in Portland, to wit:

While I heartily favor the use of the sword for all dangerous offenses, I do not approve of it for the judiciary. On the theory that one of the greatest dangers with which we are least in our efforts to secure better government is ignorance. We are prone to use too much haste to take too many short cuts. I admit that locally it is unwise when one who differs with us have the right to recall them, but I don't see a proper place for legs.

Many people will think they perceive a good deal of horse sense in this declaration; but it doesn't suit the *Sax*, which also would have disapproved OLIVER JOHNSON'S assertion, made in the course of the BREWER-TILLEY case, that he was "a Spiritualist, but not a damned fool." The way is one the *Sax* has. It is always disappointed and disposed to be resentful when one who differs with it obstinately refuses to show himself a damned fool.

Certain persons who used to run things over in New Jersey feel the same way. What they objected to last winter was Governor WILSON'S methods as recalled (apologies?) by the *Evening Star*:

The Hon. WILSON, the peripatetic Executive of a neighboring state, addressing the Yale, Harvard, and Princeton clubs of San Francisco, in joint dinner assembled, said:

"The debate as to whether things are wrong is settled. Things are wrong. Now, so must get up a debate on how they may be right."

But the only sort of just debate that Governor WILSON has any use for is one in which he does all the talking, as when he sat for the members of the legislature at Trenton and conferred with them for many hours in a speech in which he outlined what he wanted and assured them that he was going to get it, if it took them all summer to give it.

We fail to see how the Governor could have prevented others from talking even if he had wanted to, so to which, in the words of Mr. WILSON, he didn't. But perhaps the best answer, with respect to the remedial legislation to which the *Evening Star* refers, is that he did indeed get it without encroaching unduly upon even the happy springtime, to say nothing of the lilywhite summer. That is how he happened to have time to travel about awhile in order to see how other Governors and legislatures are doing things. A writer in Brother JAMES SMITH'S *Newark Star* was duly horrified and demanded that the salary of the Governor be stopped during his absence from the state, but so far there has been no general uprising.

In point of fact, the one thing most needed in this country at this time is better acquaintanceship. It would do Brother Dr. EDWARD P. MINNELL, a lot of good, for example, to go to Kansas and Arkansas and Oklahoma. He wouldn't get as good golf as he now enjoys at Baltimore or Morrisstown or wherever he plays, but he would fetch home a deal of valuable information and could leave behind just the variety of conversations that Kansas might chew on to advantage.

It is wholly unnecessary to assure our regular readers that these humble suggestions spring, not from a captious spirit, but from an inherent desire to do good. We would not scold the *Sax*. On the contrary, we would cheer it up, and as evidence of good faith will even now relieve its mind of its most ponderous burden by asserting with the utmost positiveness that if the Democratic convention shall offer the nomination for President to Governor WILSON he will accept.

Also that he'll get it.

JULY 8, 1911.

#### Reforming New Jersey Cities

Trenton, New Jersey, has adopted the common form of government, and New Brunswick and Hoboken have rejected it. So, concludes the *Waterbury American*, "Governor WILSON has suffered his first big defeat at the hands of the politicians." To this extent the statement is accurate: The machines of both parties bitterly fought the measure, and their efforts were supported by the use of the office of New Brunswick and Hoboken was rejected. But these forces combined could hardly have prevailed but for a gen-

eral disposition on the part of the voters of New Brunswick and Hoboken to await the results of the experiment in Trenton. No exception can be taken and none has been taken by Governor WILSON to this evidence of prudence. Trenton is a typical good-sized American city, and will afford an excellent illustration for the assistance of its neighbors, who naturally prefer an objection somewhat nearer home than Galveston or Des Moines. If the experiment should turn out well, the change will be, as the Springfield Republican observes, "not the least of the Governor's achievements during a remarkable administration," from which he will "gain credit in the most ample measure for which he could so during." The bi-partisan machines will continue to fight

He is a little too advanced on some of the questions of the day, which are not questions at all; but he has ability, character, and courage, and would make an ideal President."—*Richmond Times-Dispatch*.

"A good many people feel that way," adds DEWEEN HAZARD, in his most sententious manner.

AUGUST 26, 1911

#### Utopian Thought

If every man in the country read HARPER'S WEEKLY and believed every word in it we should think that Governor WILSON would have a fair chance to become President.—*Philadelphia Inquirer*.

And it would be a country worthy of its President!

# HARPER'S WEEKLY

EDITED BY GEORGE HARVEY

Price 10 Cents

the reform, of course. They must. Their very existence is at stake. But such temporary expedients as they have won in New Brunswick and Hoboken will serve only to tighten the hold which Governor WILSON already has upon the people, whose battles he is fighting, and time will do the rest.

#### Down in Old Virginia

Said a Virginia of fine reputation and distinguished ancestry and much personal service to the state: "There is some other but WILSON WILSON the Democrats can nominate for President. He is just as sure to get the nomination as the sun shines, and if he gets the nomination he will also get the election.

SEPTEMBER 2, 1911

#### Why Governor Wilson was Nominated

Dr. WILSON was nominated for Governor because he was regarded as a highly respectable and widely respected citizen, who would make a glowing stand in favor of the Democratic machine and its big business favorites.—*Evans News*, in the *Post*.

Perhaps some persons so regarded him, and possibly there were enough of them to have prevented his nomination if they had known in time what manner of man he was, and had wished to prevent it. But no one of average perception, who had never, though a superficial acquaintance with Dr. WILSON, could possibly have estimated him as

man who would make a dead pigeon for any machine. Mr. WOODROW is likely to find, if he goes deep enough, that Governor WILSON'S nomination was due to an impression long and strongly held that he was a first-class man, of firm character and remarkable qualities and equipments, who was needed as a leader in Democratic politics.

SEPTEMBER 5, 1911

## The Same Man He Was

A strange and inevitable metamorphosis is exhibited in the case of the Governor of New Jersey. In Dr. WILSON, university professor, he was cautious and conservative.—Boston Advertiser.

Our Boston brother cannot have informed himself of Dr. WILSON'S career at Princeton. He was no stand-patter college president. He introduced the tutorial system to get more effective instruction for the young gentlemen, and he tried his best to reform and democratize the social machinery of the university. The *Advertiser* thinks that "at some previous time" after he became Governor he concluded that conservatism was not going to be popular and pitched it all out of his head and restacked his mind with more marketable intrusions.

That is all nonsense. The late president of Princeton and the present Governor of New Jersey are the same man to a hair, using the same head and with very few changes in its furniture. The Governor admits that he has changed his opinion about the initiative and referendum and has come to regard them as good means for political house-cleaning. In fact, he got Dr. Princeton some notices that he thought were good, and tried against bitter opposition to get others, in the same mind that in the Governorship has reached out for what it has considered to be political benefits for the people of New Jersey, and that with enlarged opportunities would reach hold of out for what he thought would benefit the people of the whole country.

There has been no metamorphosis. To distrust Dr. WILSON and reject any or all of his views is the voter's privilege, but he is the same man he always was and true to the same fundamental convictions.

NOVEMBER 11, 1911

## For President: Woodrow Wilson\*

There are many reasons why the Democratic party would do well to nominate Woodrow Wilson for President. I shall set forth a few.

Because he is a thoroughly equipped, self-reliant and successful business man.

A good inheritance from a virile ancestry is a great help to one who has to make his way in the world. Money has its uses in this country. Titles are not to be despised in other lands. Good breeding is desirable everywhere. I am more valuable than all combined are the attributes of a good character. Those constituted Wilson's heritage. The stock from which he sprang has produced the best type of American. His grandfather, James Wilson, and his grandmother, Anne Adams, were Scotch-Irish, born in the County Down. His maternal grandfather, Thomas Woodrow, was English. Wilson served his apprenticeship under William Duane on the Philadelphia Gazette, and himself became a publisher of marked ability. Woodrow was a militant minister. Both were Presbyterians, firm in the faith, strong in conviction. Wilson's son, Joseph Runkle, married Janet Woodrow in 1849, and to them a son, christened Thomas, was born in Summit, New Jersey, quite after five hundred years. Character, conscience, convictions, he inherited. Character he developed under the tutelage of the scholarly divine who was his father.

Thereafterward to this day Woodrow Wilson has been fitting himself for public service. Political economy was the passion of his youth.

The facts of government and the social and scientific discursive phrase, became the dominant interest of his mind. He mastered theories and studied the results of practice. He longed to enter public life and work out political problems at close range. The legal profession seemed to provide an avenue, and he obtained admission to the bar. But he established to study and to learn through toiling.

It is not needed to mark the necessary steps in the untold advancement of the poor minister's son to the presidency of a great university. The progress was steady and sure, because it was based upon intelligence and industry.

CONVULSION seems to be a highly desirable condition. It obviates mistakes and at times averts any unpleasant consequences. Presidents have utilized it to the advantage of the country. Mr. Hayes might have wrought immeasurable harm by attempting greater things than his intelligence could hope to achieve. His wisdom, a commonplace mind in the White House was perhaps the most useful. But greatness was the requisite in Lincoln's day, as in Jefferson's and as now, at the beginning of a period of essential readjustment of the relations of people to production, of government to industrial development and enterprise, and of individuals to direct and indirect taxation.

This problem cannot be expected to solve themselves. Mere negation no longer suffices as a national policy. Constructive achievement is the pressing need. Here common sense, even such extraordinary common sense as is possessed by our present Chief Magistrate, falls short of the requirement.

Intelligence of the highest and rarest is peculiarly essential in a President at this time. And such is the order of Wilson's. His sense is anything but common; it is most uncommon—keen, searching, penetrating, going straight to the root of difficulty, intent upon finding, not a palliative, but a cure. In his case is a most unusual quality of expression rests upon clarity of thought. Wilson is not an orator in the accepted meaning of the term. He does not utilize sound in public speaking. His phrases are not rounded for purely rhetorical effect, and he never declaims. Yet an American now living can hold the attention of a crowd. He does so, not by means of the force of the utterance. And the intuition is correct. Wilson invariably has a reason for an opinion, and always has it ready for use. Although positive, he is never dogmatic. Telling why he thinks as he does is what gives himself no less than his hearer the greatest pleasure and satisfaction. That Wilson has "his own ideas" respecting theories of government than another, or perhaps any other, is not surprising. All his life has been given to its acquisition. But it is not enough to possess knowledge. One must be able to impart and elucidate his lessons. And thanks to his experience as a teacher, few will deny that Woodrow Wilson speaks with authority for Madison or for Hamilton, and stands today actually pre-eminent.

Because his conception of public service is true.

But is he "sound"? I am not his proposals "radical"? What about his advocacy of "referendum" and "recall"? Let us see, in the first place, whether the relative merits of candidates for the Democratic nomination for President. It may be well, then, to note at the beginning that each and every statement whose name has been mentioned in this connection has pronounced in favor of the Initiative and Referendum as a method of giving popular government its true force. I have quoted in this issue as before, three have, expressly in so far as Wilson would restrict its adoption sharply to the obvious and pressing need of a community. Observation convinced him that the system has worked well in Oregon, and he frankly said so. But he added with characteristic prudence:

"I do not go so far as to say that it will work out with the same satisfactory results elsewhere. Its application generally throughout the country in states where conditions are different, seems to me, should be matter of expediency rather than of the principle involved. I believe most thoroughly in self-government, and each state, having local conditions and local needs, must choose for itself the method of applying the principle."

The idea of this method of action is not to supersede the ordinary law-making bodies, but to furnish a means of action to be used, when and if necessary, in order to keep representatives constantly under their dependence upon public opinion and the judgment of their constituents. It is nowhere sought to substitute these methods of action for those now in use. The object is to secure the necessary use of revocation, restraint, control.

The same may be said of the recall; that is to say, that the ordinary powers of an officer and electorate must be used upon occasion. This is merely a means of securing a more direct dependence upon the people, properly safeguarded by the law can only be effectively used for any other purpose. Its intention is to give the people in the field of administrative action the same sure and dependable control which they

possess in the field of legislative action.

In short, these are methods by which we are not attempting to destroy but to conserve that which is essential to repair—the great institutions which have been servicable instruments of our liberty.

In other words, he upholds the referendum and recall, not as a substitute for, but as a guarantee of, truly representative government. It is "the run behind the door," to be used only in extreme cases against those who have betrayed their trust and violated the confidence of the people.

It is as "a method of action," not as a fundamental change, in a government of delegated powers that Wilson supports the referendum and recall and even so draws a sharp line between administration and interpretation of laws. Speaking in the heart of the section whose people, not without cause, distrust man-made and corporate-made judges and feel the need of direct control over them, Governor Wilson said positively:

"That is all wrong. Judges are not lawmakers. Neither are the administrators. Their duty is to determine not what the law should be, but what the law is. It is the responsibility of the legislature to make of freedom should be hampered and prevented."

"But," he was asked, subsequently, "if a judge misuses his office to serve a man like Lorimer, should not the people have the means to recall him?"

"I cannot," he replied, "bring myself to further dangerous legislation. It is only a matter of waiting in the case of a mischievous man. The remedy comes at the end of their terms of office. But to apply to judges the principle of the recall is to set up the idea that determinations of what the law is must respond to popular impulse and to popular judgment. No, no; that is all wrong. I do not believe in the recall of judges."

Here we have the basis of a positive conviction and intelligent discrimination characteristic of the man—the reasons why, simple, plain, convincing, conclusive. Whether a like distinction is held in mental reserve by candidates who consented in general terms the referendum and recall will doubtless be made manifest in course of time. Caution invariably awaits revelation of the effects of frankness.

In any case, by his own confession, Wilson stands convicted of inconsistency. Speaking in Norfolk, he bravely declared:

"For twenty years I preached to the students of Princeton that the referendum and recall was good. I have since consistently and earnestly urged those students. It is the safeguard of politics. It takes power from the bosses and places it in the hands of the people. I want to say with all my power that I favor it."

In the recent review published in *The Outlook* one finds this passage:

"You have certainly shown that you are not afraid to charge your mind, Governor."

"I hope I have grown," he replied, "For fifteen years I might say, because that is not what I am, I would not have worked. I can prove it now, but the trouble is they do."

If such inconsistency be a crime, the most may be made of it rightfully, because fuller illustrations may be had at any time. Persistence in error is the mark of a weak and unstable nature. It is only abandonment of truth, self-reliance, and self-respect that has been in the wrong may be reckoned a certain atonement, for the simple reason that to one of his upbraiding concealment of fact is no less heinous than deliberate falsehood. Most men are technically truthful. Wilson is honest in his mind. Unconsciously he is incapable of acting under the lie. When he says as he may do, wise or unwise, politic or impolitic, tactful or tactless, has been or will be done in the open. His ends are always on the table.

From this conception of conduct Wilson has based his every act as a public servant. If it be regarded as unusual, then truly his election to the Presidency would make for apprehension, for he knows no other way.

Because his proposals are radical.

Whatever it is, is conservative. The referendum is required to effect a change in fundamental law. A proposal to eliminate it would be radical. So is a suggestion to extend its application to statutes. Objection is made on the ground of expediency, but any change whatsoever that is made in principle, interest the opposition team is applied indignantly by the one who considers himself most concerned. From this viewpoint the very provision for making a change contained in the Constitution itself is radical. Again, what was radical yesterday is not conservative today. To five years ago the radicalism of the recall movement was in this country, because the act not only violated

property rights as guaranteed by the Constitution, but was done in frank disregard of the technical provisions of that great instrument, under the vicious guise of military necessity.

Now with the proposal to free the people by restoring to them the power of governing themselves. That is the first and dominant article in the creed of Woodrow Wilson. Not that they are now deprived of that prerogative, as might have happened through the substitution of a monarchical form of government. Nothing is to be lost to them. Only this: that the process has been rendered so difficult that, instead of governing themselves, the many have come under the dominance of the few, who act by infiltration and under cover of the darkness of secrecy to achieve their own purposes. Whether or not this is the actual condition may be a matter of opinion, but it is obvious that we have watched and analyzed the work of state legislators, and more particularly that of the federal Congress with respect to the tariff, it seems a potent fact. Moreover, the constant anarchy of the masses during recent years bears evidence of their feeling that the need for effective legislation has been made too tedious to treat.

Wilson says: Open an avenue through the jungle.

But how? By direct primaries for all elective offices, President and Vice-President included. By popular election of Senators. By open conventions, caucuses, and committees. By legislation in the full light of day. By the constant review now before the faces of the people. *And when necessary*, by initiative, referendum, and Recall.

These are the means proposed. They are radical because they involve change. But the purpose aimed at is conservative—conservative of republican institutions. If it be not achieved, our theory of government is belied, our faith in majority rule as the best method of humanity is crushed, our confidence in the desire and willingness of a democracy to safeguard both property and personal rights is forever. This way, and this way only, safety lies. To conserve the Nation through intelligent legislation. Why not? How else? Let it stand at that.

*Let us be constructive and effective.*  
Innocence may be destructive; passion often is; intelligence never. To-day, in this country abounding in resources, energy, and skill, industry pauses, business lags, development has practically ceased. What? The answer is universal: Uncertainty, resulting in lack of confidence. In such a condition, it is the chief cause of failure. It is the chief failure of popular government; a revival of the recognition of mutuality of interest.

"We have passed the time of excitement, of general complaint, of indiscriminating condemnation," says Wilson. "There has been hostility enough all around. What we need now is to take the common sense as to the means to be used for the good of the country and of the several communities in which we live and earn our bread and also our happiness. We need frank, outspoken, friendly opinion. We need criticism which is not intended to damage, but to create a better understanding all around. To have any power or favor as to the government, is to be in every standard of public duty. We want to put ourselves on a sound basis and with the assurance that when we have done it we have not destroyed anything, but have reconstructed. We want definite information as to what the law means and what it provides. We don't know now how the offense is to be met and the remedy made."

Some assume, to think otherwise, but are disposed to temporize when asked to elucidate. Wilson, he it observed, never blinks a fact. Nor does he hesitate to speak as plainly and explicitly to a powerful aggregation or organization as to an individual. He does not believe that Labor can win by championing inefficiency and idleness through unfair rules, and says he became he "knew of no other standard by which to judge these things than the interest of the whole community," and surely "the laboring man cannot benefit himself by injuring the interests of the country."

So, too, with the captains of industry, who must come to recognize that they are "trustees, not masters," of properties whose management "determines the development or decay of communities" and is "the means of lifting or depressing the life of the whole country." Such men "should regard themselves as representatives of a public power" and act accordingly, because the responsibilities of all are in the same hands, their savings absorbed, and their employment determined by these agencies.

All Wilson asks of corporations is that they give the people broad service at a reasonable rate, not with the primary idea of squeezing and exploiting them, but with the primary idea of serving them. Nor can he perceive any advantage in dissolving corporations, however great, who so doing serve only to throw great undertakings out of gear, to the infinite loss of thousands of innocent persons, and to the great inconvenience of society as a whole. Regulation, not liquidation, is Wilson's remedy for existing evils, without touching the "size or might" of the corporation, "if you will not abandon the fatuous, antiquated, and unnecessary fiction which treats it as a legal person, as a responsible individual." He would be loath to surrender the "efficiency and economy" which tend to stimulate rather than destroy competition, and he would applaud and encourage the builders of properties, however great, while sternly condemning and exposing more manipulators who deceive and enslave the public.

In working out these problems, moreover, "the Democratic party must be a party of law and of service within the law. If we cannot serve the people under the law, we must urge the people to change the law. We must not take it upon ourselves to change it without their consent."

Upon utterance such as those Woodrow Wilson was elected Governor of New Jersey. To carry out his pledges he was obliged to win the support of a Republican Senate and to beat down the opposition of his own party.

He both by speaking directly to the masses and played upon the statute-books a record of constructive and effective legislation unmatched in the history of any state. Destruction followed—destruction of the control of state government by a public-service corporation; that and no other.

*Let us be constructive and effective.*

We have the highest authority for the declaration that no man can serve two masters; and yet how many in public life have tried and are now trying! Not willingly, many; not wittingly, some; but perform. One owes his advancement to a class, another to a political machine, a third to an individual. We have had such Presidents. One cannot get by not recognizing the claims made to each of the three factors in about equal measure. Being a just and grateful man, he made recompense accordingly. Upon the class he helped to confer great pecuniary benefits; to the "organization" he gave the offices and opportunities to plunder; the individual he raised to a position of honor and respect over all. Conscience and conformity with the customs of his party and with the seeming acquiescence of the people, despite the facts that the class was not ready, but greedy, that the "machine" was shamless in appropriating public moneys to its private uses, and that the individual was the most barren corruptionist the country had ever seen.

When, then, to whom he was most directly indebted, had been satisfied, the good President, who sincerely believed himself to be most fair and honorable, paid devoted attention to the welfare of the millions whose votes he had received, and became, in common parlance, deservedly popular. His motto was to serve, as to a public duty, people were regarded as no more than just reward for services rendered in saving the people from themselves.

Under blame should not attach to the individual for such a performance, even though it be in effect a betrayal of trust. Corruption is a mighty power, and it is not easy to resist it, especially if one is not a great man. If circumstances and environment, too, are most potent agencies. Few have attained great political prominence without making alliances and incurring lasting obligations in the successive stages of advancement. Nor can money withstand the influence upon perspective of association.

It is not, then, so much a matter of condemnation of others as of congratulation upon the mere likelihood that Wilson is free. Whether or not, in like situations with others, covering years of office-seeking, he would have become likewise entangled, is beside the mark. It is the fact that is important and peculiarly fortuitous at a time when, if ever, the President must be free to reward or to punish the whole people as his one and only master.

That such is indeed the case with Wilson hardly requires demonstration. It is evidenced conclusively by his ever word and deed. To the leadership which effected his own nomination for Governor upon a platform summarizing specific measures the President really is indebted, but when that leadership came into conflict with faithful performance of public duties he could

not and did not hesitate to choose and to carry the one master to whom he had pledged his own allegiance. He did not attempt to evade obligations, one against the other; he did not temporize nor try to harmonize. The straight and narrow path pointed out to him in his youth was the only one he knew—and he took it, disdaining of personal criticism and hostility of personal consequences. That exceptional credit should be accorded for so doing, does not follow necessarily. The force behind his conduct was an inherited conscience and developed character, agencies, however, as valuable in the public service as they happily have proven to be irreplaceable in the man.

It is as a highly important fact, too, rather than as a matter of personal merit, that Wilson's environment, associations, and early endeavor have tended to keep high his ideals, to broaden his vision, and to intensify his resolution. To have achieved great prominence and the rich emoluments which accompany success at the bar would have been a meritorious performance and worthy of all praise, but in no way commensurate with the magnitude of the values of an enforced industry, from enforced fragility, from enforced association and sympathy with those who, like himself, were compelled to earn their bread and rear their children with the product of brain and toil.

Such necessity and such environment make for that freedom of understanding which is but the requisite of a great magistracy; that freedom from political obligation to any except to all.

*Breathes he a Democrat.*

That may sound trite or commonplace. Let us see. When the time came for the new Republic to put into practice the admirable theories which its founders had put upon paper, the actual application thereof was entrusted to one man—not even Jefferson—at the time of Washington's inauguration had dreamed of any other possibility. A mighty step forward had been taken. For the first time personal liberty, no less than the protection of property, was guaranteed. Equal rights to all white males were also assured, etc., but the responsibility of the government to the people, as well as the responsibility of the people to the government, was not then defined as a matter of course, upon those fixed by birth, education, and training to bear the burdens safely and solve the problems with sagacity. It was to be a government of the people necessarily; else it would be no government at all. But how was the responsibility to be defined? In the interest of the people ever known, carried on in their interest and with their acquiescence, by the very best and most conscientious governors ever known. This was as far as the Fathers get under Washington and Adams and the other patriotic aristocrats who, during the first twelve years of the Republic, were known on the bench and in the two Houses of Congress.

Government by as well as of and for the people was first proposed and put into practice by Thomas Jefferson, who thereupon became the first real Democrat. As a student and philosopher he beheld danger in heeding the customs of the past and the theories of the law-abiding aristocracy which the possession of actual governing power had afforded. He felt the need of broadening the base of government to insure the stability of the structure of democracy. To do so involved implicit faith in the wisdom and sense of justice in the entire body politic. Not this he had, and, acting upon his judgment, admonished by precept and example to livify the theory, he broadened the base of government to the people. Declaimed as a radical, even as a revolutionist, he grew stronger and more determined under opposition, until what had been only an impulse originally became a passionate conviction. Reaction followed as a matter of course. Habit and mind is not changed permanently with ease.

But such a mind is not killed. It flashed forth inconspicuously for a time in Jackson, then wandered through long years, until it burst into flame in Lincoln, only to subside again in a period of great development and common prosperity, until there arose from stealth and indifference another governing class—the Republicans. It is the President who has really ruled the Nation, as with red and iron, even through two administrations which were nominally Democratic and one as sporadic as Jackson's, to the present day, and it is breaking down at last only under the added weight of heaviest greed.

The time is ripe and the people are now ready for a fresh manifestation of the spirit of democracy, which alone can safeguard personal

and property rights by perpetrating the Republic. It is to be found in Washington, the natural successor by birth, instinct, training, ability, courage, and faith in the people of Thomas Jefferson.

*Because it would be elected.*

I have tried wisely to set forth a few of the reasons why Mr. Wilson ought to be elected. That he would be speaking, of course, from the present outlook—hardly requires demonstration. But this is one of the years when the people must associate as well as read. Will they do it? That is the question—the only one.

GEORGE HAVLEY.

NOVEMBER 18, 1911.

### The Famous Victory

Mr. Woodrow Wilson is down and out. Dear, dear! Who would have thought that! But we may not blink a fact—and this one we have upon the highest political authority. Ex-Senator JAMES SMITH, Jr., emerging from the capacious shell which he has inhabited since he was elected to stay in Newark, doubtfully shakes his wise head, and his good friend, the *Sun*, finds that the Governor has suddenly become a candidate *en route*. It is because of that. Because Mr. Smith has been "repudiated" by his state. Because the "magnificent Democratic organization" of New Jersey has been disrupted by his cantankerous insistence upon keeping party politics. Because, speaking frankly, he fought the lion boss and licked him. Because, as an inevitable consequence, the next legislature will be Republican. But that's what really happened! The Springfield Republicans sum it up neatly:

"The New Jersey House was had because of Essex County, which is the home of JAMES SMITH, Jr.; the loss of Governor WILSON's political aspirations; and Essex County being impossible, from the standpoint of view, to be secured. But SMITH succeeded in convincing anti-Wilson Democrats. The Governor did not contest the county. Outside of it, his followers made gains, and the Senate is more likely Democratic than before."

Supplement this statement with the further information that the next Senate, as well as the next House, would be Democratic if the party had carried Essex County, that the machine candidates for the Assembly were definitely picked by resolutions to oppose reform legislation, that the Republican and Democratic houses alike engaged a sheriff for "legislators," and you have the whole story.

Fear, the cause of good government is not likely to suffer from the presence in Trenton of devout Republicans in the place of puppets of the deposed Democratic chairman when the Governor's constituency kicked out of his office, but it was, indeed, a famous victory. Fresh supplies of oil can now be found for the Department machinery, the entrepreneur can approach his fellow-bosses throughout the country with reinforced blindestness, and the naturally amiable *Sun* can continue to exhort with glee. We need not begrudge them their satisfaction. Rather let us extend felicitations, especially to our neighbor, the *Sun*. It is a shame that one so brightly assumed should feel obliged to go about forever cawing like a crow when it should be exulting like a lark. Time was when its breakfast food was as toothsome as the lightest of muffins, but of late it has run to pickles in variety and quantity. The President has given hopeless, the Attorney-General more than an anarchist, the Speaker or blabber-tongued, the New York Governor distractingly filthy, and the Massachusetts Governor a leech-matched baronet, to say nothing of Brothers BLAINE and ROOSEVELT and other stock objects of satiric preference. The only ray of light that has relieved the gloom of the year is a meagre one, has been an occasional fervid compliment to Uncle Jim. Having met Dr. Syntax on the hip at last, with the aid of the distinguished ex-Senator, the *Sun* can now assume the side of Mrs. Partington in relation to the Atlantic Ocean with pristine vigor and characteristic selfishness in the use of Latin phrases. Let us rejoice and be abed!

### The Voice of the South

Last Saturday the Democratic State Committee of New Jersey picked sixteen counties of New Jersey for Woodrow Wilson's election. It was a strange people, but it formally honored Governor Wilson's Presidential hopes upon the highest political news. About the same time the *Wilson* in its editorial with Governor WILSON's mouthed the little bonnet for 1912, announced as follows: "The call of the day for leadership is for Wilson, and we will organize the South, the rightly interpret public opinion and who

are ready to make that opinion operative." So wonder the Democrats of New Jersey rallied around the Princeton. They in a leader who has made it his life study of the political situation, and who has shown exceptional courage in carrying out the people's will as Governor of New Jersey, a leader who will dare to do as President what he has done as Governor. Wilson maintains that the big question of the day is one of adjustment between economic problems, public opinion, and our system of government. He is not a President, but he is a Governor of New Jersey, and he is a man who will do the adjusting. The campaign of 1912, we predict, will revolve around the one big idea of adjustment, and Woodrow Wilson will be the man who will do the adjusting. From the White House, beginning March 4, 1912, Congressman Edward P. Kirkwood, who lauded his Wilson as Governor, has written and published that "if Governor Wilson is nominated at the national Democratic convention, nothing but the hand of God will prevent his election. The country will, we believe, retire to the present failure in the White House, who, with 'great swiftness of heart,' turned down the people's choice of tariff revision on daily necessities—'Sugar (Alabama),' 'Joneston.'"

### The Men Behind Wilson

Little indeed do they know Governor Wilson who have not changed the political landscape of the State by the failure of one county in the State to elect a set of candidates for the legislature of whom everybody knew that they were not his followers. Still less do they understand the kind of loyalty WOODROW WILSON has inspired who fancy that the men who, great and far, welcomed him to the leadership will leadership will continue to be anywise changed except as they may now see it with an increase of confidence and zeal. Governor Wilson has not shaped his course or his opinions by any imagined demands of his own interests or fortunes. His followers have not perceived his leadership because of his personal success in his respects. He has conducted himself singly with the extraordinary service which he has found a chance to render to sound democracy, to free government, to a state long peculiarly unfavored to sinister and ignoble selfish interests. His nation-wide following has come to him because they saw in all over the country quickly recognize him as not merely an unconsciously well-equipped and a fighter who fought for the good of the State, a champion of good causes who could neither be frightened nor enjayed, a man to whom they could give at least the loyalty they had so long kept undevoted, waiting for a leader they could trust. Such men will hardly be disappointed because he has not made sacrifices without breaking even. They will hardly be surprised because the most extraordinary and successful assault on machine rule ever achieved in this country did not find favor with the machine itself.

### The Boss of Bosses

With respect to the distinguished ex-Senator, under compels the admission that he has now fully qualified as the leader of the anti-Wilson forces, as the Boss of bosses. Already he had paved the way. Shrewdly foreseeing that no Wilson Assemblyman were likely to be elected in a county where no Wilson candidates were running, he went back into the West and Winckled all. The Times told us all of it the time. In its issue of November 14th, we find the following account of his activities:

The return of ex-United States Senator JAMES SMITH, Jr., of Newark, New Jersey, from a trip to the West, which was supposed to be a purely business one, has revealed the fact that he spent much time in conference with men who will oppose Governor WOODROW WILSON as a Presidential candidate. At the same time, however, SMITH conversed with several of the former boss of the Democratic party in New Jersey, who are under the blue administered to his political ambition by Governor WILSON. It is known, we are told, that SMITH is in the West and is endeavoring his attempt to return to the Senate.

Mr. SMITH is not talking for publication regarding his trip to the West, but he has had several of his friends. He is said to have told them of the strong sentiment in the Middle West for Governor WILSON, and he is said to have been in the West to see Mr. SMITH himself in for Governor THORNTON, and back upon Representative the in W. WILSON, of Alabama, as an ideal man for the second vice-presidential ticket.

Mr. SMITH is said to have been while in the West that he saw the anti-Wilson Democrats there in a strong sentiment for Governor WILSON, and he is said to have been in the West to see Mr. SMITH himself in for Governor THORNTON, and back upon Representative the in W. WILSON, of Alabama, as an ideal man for the second vice-presidential ticket.

Among the statesmen with whom the ex-Senator continued regarding the state of the Union and

prospective campaign funds, the Times names the Hon. BOZER BLOW, of Illinois, the Hon. JERRY B. SULLIVAN, of Iowa, the Hon. DANIEL J. CAMPBELL, of Michigan, and the Hon. THOMAS TAGGART, of Indiana. The report continues:

It is said that in the East Mr. SMITH counts very highly the New York and New Jersey on the assistance of National Chairman NORRIS E. MARK. There have been persistent rumors that Mr. SMITH and Mr. MARK figured in a recent conference of party leaders in New York, and a candidate for President. The ticket for 1912 is said to have received much attention.

And outside:

The former New Jersey Senator is credited with being the main force behind an anti-Wilson movement in the New York and New Jersey on the opening of the WILSON sentiment throughout the country, but more especially in the Middle West and in the South.

It will be seen, therefore, that the ex-Senator was, in a sense, on trial in the recent election, not before the people, of course, but in the eyes of his illustrious confederates. Clearly, as we have already observed, he qualified as the leader of the bosses in their great movement to battle up the Democratic party. From this time forward we shall expect to see him receive from his comrades, as we ourselves shall cheerfully accord him, faithful recognition. We begin immediately by sternly rebuking the *Evening Post* for saying that "it would be a grave mistake to regard the opening of Wilson as a candidate for the Presidency, to allege that he had suffered heavily from the vengeance of a boss whose power he had defied and broken," and the Springfield *Republican* for declaring that "the fairest inference is that the Democratic party ought to be proud of Governor Wilson because of the endorsement he qualified as the leader of the bosses in their great movement to battle up the Democratic party. The people must be saved from themselves at all hazards, personal grievances must be heeded in selecting a candidate for President, a barrel must be opened to 'keep the organization together,' bosses must stand or fall together." "Demagogues" must be crushed "open mouths" must be closed, private arrangements with the other side must be lavished; tradition, in a word, must be respected—all in the name of THOMAS JEFFERSON. Hail, then, to the new chief, the Boss of bosses, the combiner of all forces opposed to the man who stands for free government as the trustee of the whole people!

NOVEMBER 25, 1911

### He Takes a Lot of Killing

We do not wonder at a certain gravity in the criticism Governor Wilson gets from such as began some time ago to be sure of the imminence of his downfall. His behavior has certainly been most inconsiderate of the feelings of people committed to that view of his career. Although he has been in office less than a year, his egotism and egotism has cost him an extraordinary number of disappointments in their reasonable expectations.

Some of them began to form such expectations even before he went into office. They were quite sure, and naturally so, that when it came to regular campaigning and stump-speaking before millions of men in office less than a year, his egotism and egotism would be disposed himself and fail entirely to get in touch with the crowds that cordially would bring out to hear him. But he inadvertently threw himself into this experience with positive enjoyment, and he developed a ready sympathy with the throng and the intellectual demands of it. He was not a politician, and was, to say the least, contrary to all the accepted traditions concerning fastidious scholars in contact with plain business men and working-men.

Of course, however, when he was actually in office he was going to prove indulgent to the wishes of the people who had always run things and who had been his friends. He was going to be obliging to conciliate respectable people. He was well-meaning, no doubt, but what could be so against the really practical politicians who were using him? Well, he was this time quite as inconsiderate of the practical politicians as of the people who saw so clearly that he was going to be a new figure. He was not only unacquainted with the fact that he was going to exercise the party leadership in which he had been chosen, but he did exercise it to an extent quite unprecedented. The gentlemen who were going to manage him were greatly disappointed at his irregularity and forsook him in disgust, even leaving him unaided to make his appointments. He was not only unacquainted with the fact that he had previously meant to let him help them to think,

But then there was the legislature and the T'opian legislative programme which he had gone about the state stirring people that he and his party really intended to put through. There, of course, would be the end of him—the end of taking his own actions. The old hands would never dream of letting him get through such a thing as the promised election law, or direct primaries, or a law to regulate public-service corporations that might really force the corporations to pay some attention. Yet at this crisis his contumacy was worse than ever. He was no longer merely incoherent; he was actually defiant and successfully outrageous of all precedents. And successfully, too; that was the worst of it. He not only defied the machines of both parties and insisted on keeping his own party's pledges, but he carried the legislature with him. He got that preposterously honest programme through and the legislature adjourned without a bit of conventional jollity such as the old hands of course expected.

It was the same way when he went out West speechmaking. There were two bundles of contradictory character, but both inevitable, which he declined to make. He did not, in excessive eagerness to conciliate a supposed Western sentiment, make any attempt for making a show of doing so, to show his independence, disregard and antagonism Western sentiment. He merely remained himself and talked his convictions and took the West sympathetically—and the West accepted him with astonishing readiness of comprehension.

His latest feat of contumacy in his worst. This time he went to his own country, to the land of giving every man a vote in favour of his collapse. He let them see it, fearlessly who had all along predicted it none at all announced it. But he capped the climax by repudiating his repudiation—he and his friends also. He and they refused to accept even the positive announcement of his downfall. They pointed out that he had done so, but his enemies, who had been really beaten, really repudiated. They proved that the results of the election showed him to be really as strong as ever. Then it also promptly appeared that his friends and supporters throughout the country, instead of deserting him, were actually aligned to a still more active activity in his behalf.

No wonder such a man has serene certainties. His persistent and obstinate refusal to accept the logical downfalls they predict for him is not merely unreasonable, but extraordinary.

DECEMBER 9, 1911

The Voice of the East

All over the country the editors of newspapers are now discussing the Wilson movement. You find opinions expressed in the metropolitan journals and in the country weeklies. You find newspapers, magazines, in trade publications, and in religious journals, as well as in the daily press.

And these expressions have no possibility of doubt of the universality and the vitality of the Wilson movement.

Yet sometimes you do not purchase without. It could be bought with the biggest campaign fund ever gotten together.

It is simply the spontaneous, honest opinion of the men who are citizens of the newspaper, who in every city and town in the country—who are trying to determine the pulse and convictions of the people. And the more you read of these opinions, the more conscious are the resolute head of the nation.

You see sometimes by individual newspaper men. You see sometimes by individuals in the country. You see sometimes by the support of nearly all the newspapers in one town.

But nobody would believe that you could buy newspapers from the Atlantic to the Pacific, and from the Lakes to the Gulf, newspapers in country seats and in state capitals, newspapers that would be in the fingers and others that cater to the factory employes, newspapers in the mining districts and in the lumber districts, newspapers that would be in the hands of newspapers that are satisfied with some hundreds of readers and others that boast of hundreds of thousands of readers.

Yet fully as comprehensive as all this is the newspaper support that is being given to Governor Wilson for the Presidency.

The average citizen's support is itself is not of primary significance. You must go back of the newspapers to find out what is really going on.

The average editor will breathe a long sigh before he advances the candidacy of a man whom he believes to be out of sympathy with the readers of his newspaper. He feels that his readers are his neighbors and friends and he has no desire to antagonize them. He talks with them, receives letters from them, and reads their criticisms. He reads their criticisms in their discussions in the public places. He feels the sting of their criticisms and rejoices over their contributions. He then to find out what is really going on, he is "in touch" with the constituency in which he lives.

Occasionally he is influenced by the views of those with whom he is in intimately associated. These occasionally he tries to think, as they think, not to feel as they feel, and promptly the sentiment of his favorite becomes his sentiment, and the next thing he knows he is passing these ideas into his news-

paper. So that, speaking generally, the views of an editor are representative of the views of his neighbors and friends, of the readers of his newspaper, if you will.

And that it is fair to presume that the overwhelming newspaper support of Governor Woodrow Wilson from coast to coast of the country is the better expression of the universal desire of the people of the United States that Governor Wilson be called to the leadership of his party in the next Presidential campaign.—*Trenton—True American.*

DECEMBER 9, 1911

New Jersey and the Boss of Bomes

My, but our philosopher and friend of the second paper, our eminent citizen, HARVEY H. BATES, discoverer and custodian of the WILSON BOSS, is becoming popular. This New Jersey boss, SIR SURRA, who made Mr. Wilson Governor and was sitting by the side of the state over the state, is the only one and a lot of newspapers, including the one which shows for all, have insisted that the return of New Jersey to the Republicans was a question of the Democracy's favorite not for President.—*Waterbury Standard.*

Here are the majorities for Assemblymen as shown by the official returns for the past three years:

	1908	1910	1911
Essex County.....	7,969 R.	1,939 D.	1,939 D.
Other counties.....	32,642 R.	9,531 D.	10,308 D.
Total.....	40,611 R.	11,470 R.	13,047 D.

There is the whole story. Despite the great help of Mr. Wilson's personal candidacy in 1910, resulting in a plurality of 20,000 for Governor, the Democratic Assembly majorities outside of Essex County show an actual increase of 457 votes in 1911 over 1910. Those candidates were supported by Governor WILSON. The candidates in Essex were not. They were nominated by ex-Governor WILSON and elected to oppose Governor WILSON's proposals. Result:

Democratic loss in Mr. SURRA's county.....	10,227
Democratic gain in other counties.....	457
Net Democratic loss.....	11,720

And yet the state went Democratic by more than three thousand as against a Republican majority in 1909 of 41,000. It is remembered, too, that for the treasurer in Essex County the Democrats would have won both Houses of the legislature for the first time in twenty years. It is a very rough way to see who knocked out that 40,000 Republican majority in 1910, as well as whose policies men really favor in 1911. The Boss of Bomes may derive happiness from having created a general attack on the Governor of his party, but if he can feel any ground for pride in the size of his own following he is, indeed, a wonder.

Oh, yes, Mr. Waterbury Standard, the vote in New Jersey was in fact a "repudiation," and a mighty sharp one, too. But it was repudiation of Governor WILSON, not of Wilsonism. If you will see when New Jersey rolls up another 50,000 majority for him for President next year.

No Occasion for Alarm

Mr. SURRA, former chairman of the Democratic State Committee of New Jersey, declares that he will see to it that delegates favorable to the nomination of Governor WILSON for President at the National Convention will speak for him. He has no uneasiness, Mr. Republican!

So! Well, the Democrats of New Jersey will have an opportunity to choose between Mr. SURRA and the President of the United States. The result will speak for itself. Have no uneasiness, Mr. Republican!

Not Inexperienced and Not Misunderstood

One of CLAVELAND'S biographers gives a conversation with him that leaves quite a lesson in the present preliminary campaign for the Presidency. CLAVELAND was asked if he did not feel that he had been unfortunate in coming to the Presidency without the long experience in national politics which most Presidents had enjoyed. He answered that; that any disadvantage he had suffered from that point of view was fully offset by his coming in free from the political debts and all compromises and accommodations which such careers almost invariably entail. It was, in fact, rather fortunate that his experience as an Executive had been in a different field.

It was also, so I should, thought by many that the point of Mr. WILSON did not understand him and what he stood for nearly so well as they ought

to; but that also proved a mistake; the election returns did not sustain it.

Some people are making the same two mistakes about WOODROW WILSON. His experience has been, in fact, exceptionally well adapted to fit him for the real requirements of the Presidency. Compare it in that respect not only with CLAVELAND, but with LINCOLN—never a national figure until two years before his election. Yet it leaves him extraordinarily free-free to obey his own convictions, free to serve the true needs of his countrymen. And his countrymen do understand him and what he stands for better, we believe, than at the corresponding stage they understood CLAVELAND or even LINCOLN. His outspokenness and the uncommonly significant and revealing character of his public acts have made it easy to understand him. Straw ballots and newspaper comments are, no doubt, frequently misinterpreting facts of public opinion concerning public men. So, too, are "many letters" from writers already committed to a particular leader. But there are always a few men exceptionally clever at getting at the drift of opinion and sentiment. CLAVELAND, it is said, used to take to the smoking-rooms of the cars when he wanted to find what people were really thinking of him. He was a man who was, and apparently, indeed, rarely surprised at his own discoveries, reports from a Northern state that by the careful estimate he has been making WILSON led his chief competitor by about eight out of ten. "The people," he says, "like Mr. WILSON'S aggressiveness. They consider him honestly, upright and straightforward in every letter, and his discovery that he is peculiarly strong with a certain particularly thoughtful kind of voters; for precisely the same thing has been discovered in the West.

It is always dangerous to make any judgment or calculation on the theory that Americans are either slow or stupid when it comes to understanding character, to discerning the true quality of a public man. They are not infallible, but that is the best thing they do, and they do it better and more promptly than most politicians suppose.

JULY 15, 1912

The Issue Joint

After much herring and hawing, the Democrats rose to the occasion at Baltimore and nominated their strongest candidate. Granting the probability of the election this year of any reputable statesman who could hold substantially the same sort of course, it is not to be wondered that WOODROW WILSON will poll at least half a million more votes than any other whose name was presented for consideration.

The nomination of a conservative, however liberal-minded, would have served only to open the door to Mr. BOESMANN. A "dark horse" either slow or stupid when it comes to understanding character, to discerning the true quality of a public man. They are not infallible, but that is the best thing they do, and they do it better and more promptly than most politicians suppose. The nomination of a conservative, however liberal-minded, would have served only to open the door to Mr. BOESMANN. A "dark horse" either slow or stupid when it comes to understanding character, to discerning the true quality of a public man. They are not infallible, but that is the best thing they do, and they do it better and more promptly than most politicians suppose. The nomination of a conservative, however liberal-minded, would have served only to open the door to Mr. BOESMANN. A "dark horse" either slow or stupid when it comes to understanding character, to discerning the true quality of a public man. They are not infallible, but that is the best thing they do, and they do it better and more promptly than most politicians suppose.

No Democratic national caucus since JACKSON'S has been suggested more anxiously. The points of vantage may be summarized briefly as follows:

A Democratic year. The people are disgusted with the Republican party and eager for a change.

Disruption of the opposition. The differences of the two wings, for the first time since the Republican party was born, are irreconcilable.

An open and honest convention. In marked contrast with the doings at Chicago, there was at Baltimore an arbitrary action on behalf of one candidate, no suggestion of bribery in the interest of another.

The main issue. At last the line is sharply drawn between excessive protection and a revenue tariff.

An unpugged candidate. Nobody pretends that Mr. WILSON is under the slightest obligation to any man or group of men for his nomination. Elimination of bosses. So far from offering to

## OUR MRS. PARTINGTONS AND THE DEMOCRATIC OCEAN

FROM "HARPER'S WEEKLY" OF NOVEMBER 2, 1912

Drawn by C. J. Todd

those accustomed to court, Mr. Wilson defied them. He had not hesitated to denounce Mr. Murray, Mr. Perkins, and Mr. Tamm by name. His sole appeal was to Public Opinion.

Removal of the blight of Bryanism. Mr. Wilson owes nothing to the marplot who schemed to obtain the nomination for himself. Nor is he bound in any way to recognize the vagaries which for so long have discredited the party in the estimation of the country.

Independent support. Almost without exception, the powerful public journals have already pledged the exercise of their utmost endeavor on behalf of the Democratic standard-bearer.

Moral sentiment. The wide-spread revulsion of conscientious citizens against political depravity which Mr. Roosevelt has tried with consummate skill to capitalize for his own advancement now issues to the advantage of Governor Wilson, to the great relief of millions who detested Roosevelt but knew not where else to turn.

A vivid personality. Mr. Wilson has demonstrated matchless power of effective appeal to the masses generally, and to active, enthusiastic, younger men in particular. This means that his canvass will be conducted with the same electric, persuasive energy which achieved his nomination.

Such are some of the weighty influences whose tacit recognition has already induced a common belief that Mr. Wilson's election is a virtual certainty. It is our own prudent judgment, influenced by the bilious enthusiasm of the moment, that he will win. And yet the possibilities ever attendant upon the performance of a great political drama are not to be ignored with impunity. Many a Democrat has been elected in July, only to be buried under an avalanche of votes in November. Mr. Tarr's prospects are now at their lowest ebb. First driven by treachery and shameful abuse to the extreme of unqualified personal defeat, then fought with unexampled bitterness in his contest for a deserved re-nomination, and now confronting not only an open detachment from his own ranks, but also a most successful and daring Democratic opponent, his record of accomplishments upon which he must ultimately rely is for the moment collapsed. But the fact that few Presidents have rendered more valuable service under trying conditions remains

Mr. Tarr's fidelity, his conscientious endeavor, his singleness of unselfish purpose, his purity of intent, his notable achievements, are forgotten only for the time. They will be recalled with gratitude and emphasis with effect.

The value of experience to the mind of the country also is to be reckoned with. Since 1884 no man who had not rendered service in the federal government has been elected President. May it not be possible that, in the final judgment, the advantage necessarily derived from actual practice will be accorded serious consideration? How thoroughly the people are convinced of the practical efficiency of President Tarr's policies and methods with respect to our present problems is undoubtedly a question, but such as they are they at least stand revealed by application, and are no longer subjects of speculation or foolish fears. The temper of the people, we take it, is now strong for change, even though it be experimental, but craving for novelty often subsides under the proverbial sober second thought.

As a matter of history, moreover, nobody since JACKSON has been elected President who did not hold the confidence of that great and powerful group commonly referred to as the business men of the country. If there is any serious menace to the present glowing prospects of Governor Wilson, we should say that it lies in apprehension of official acts, springing from prize-money aspirations, which might tend to retard instead of general prosperity. That Mr. Wilson will avail himself of the first opportunity to make evident that there is no real cause for such solicitude may, however, in our judgment, be assumed with confidence.

Finally, the Republican party is not dead. Though seemingly sleeping for the moment, it will soon be at wide awake and determined to win as ever before in its successful career. And it is still the strongest, most our past, best equipped, and most skillfully directed political organization the world has ever known.

The menace of ROOSEVELT, we rejoice to believe, is removed, but none can gainsay that his activities will inject a new and perplexing factor into the contest. Will his rivaling ever come to weaken Mr. Tarr, or will it attract a sufficient number of rebels from both parties to upset all

calculations? These are pregnant questions to which, in our opinion, answers cannot now be made with any degree of certainty.

One feature of the situation at least is peculiarly gratifying. In view of the sharply defined issues and the repute of the two leading candidates, there is every reason to expect that this will be a campaign of issues which, though illuminative and exhilarating, will be conducted upon a high plane and kept free from personalities such as in times past have effected discredit upon American citizenship.

JULY 20, 1912

## Not a Kick, Just a Hint

CHAIRMAN HULLAN'S initial pronouncements begin like a dirge: "The Republican party," he says, "approaches the Presidential campaign with confidence in the solemnity of its cause." We guess it does. If over there was a time when confidence that gloom overshadows all was warranted by the facts, this is it. Nevertheless, Mr. HULLAN burks up and says, stoutly:

More has been accomplished in the last three years under administration of President TARR than was ever before accomplished by an American President in the same period of time.

Oh, come! Everybody knows that Mr. TARR has done the best he could, and has really accomplished quite a lot, as we have had occasion to remark more than once. But if Mr. HULLAN will tuck a lock into WASHINGTON WILSON'S *History of the American People*—one of the very best histories printed, believe us—he will discover that there was considerable doing in the last three years of LINCOLN'S term, to say nothing of a few others'.

ANYWAY, we are cheered by the reflection that "Upon the solid rock of the rights of the individual as granted by the Constitution the Republican party builds its structure of optimism." The party couldn't do better. That is one of our very best rocks, quite capable of upholding all the policy that Mr. HULLAN has now or is likely to have for some time to come. But we what the wicked Democrats are up to. "Such liberties," declares Mr. HULLAN, frankly, "are now assumed by those who advocate the overthrow of the independence of the judiciary."

Quite true? We venture heartily. But who advocates it? Not the Democratic candidate. He is as not as the media-house against the recall of judges. Who, then? T. R. W. Well, of all things, don't call him a Democrat!

Before leap in the future, Mr. HILLIS. Humbly is going to get short shrift in this campaign.

### Enthusiasm for Wilson

TO THE EDITOR OF HARPER'S WEEKLY:  
SIR,—I have read HARPER'S almost every week since 1868, not so much for the political opinions as for the wit and humor of your editorial "Whiter in face than a man of iron or against them. When you asked Wilson to "run" again a year or two before the best Democratic convention, I did not think you would please to be a good prophet. I did not then know the Princeton reform, but all of us have come to see that you were right and I defy any but to HARPER'S. Your judgment of man proved to be admirable. At most every one here, whether in academic circles or not, and regardless of political creed, an enthusiastic Wilson's nomination and many Republicans joined Democrats in tributes to Bryan and others in the convention urging the nomination of the New Jersey Governor. For my part it seems that the Democratic party has won a new lease of life by this new and progressive move. Public opinion in this part of Chicago is in favor of the nomination. You deserve much of the credit for calling its attention to this remarkable leader and statesman.  
I am, sir,  
WILLIAM E. DAVIS.

JULY 31, 1912.

### To Resign or Not to Resign

The resignation of Governor Wilson has not yet been received. It is curious how many good reasons can be found for not doing a thing which one does not want to do—*Veritas*. "Handspit out."

There is no personal reason why Governor Wilson should resign if he doesn't want to. Governor CLAYMAN didn't. Party considerations, however, deserve to be had approximately the being taken into account. If Mr. Wilson should resign, New Jersey would almost surely elect a Democrat as its successor in November, for a full term of three years. If he should resign after November 5th, the president of the state Senate would succeed him for the unexpired term of the one year. The present Senate is Republican. Whether the next will be is a question, but the chances seem to be about even. Advice in such a case amounts to little, because the advisers are pretty certain to recommend either what they themselves want or what they think the recipient wants. It is a question which Mr. Wilson will have to decide for himself. Whichever determination he reaches can evoke no just criticism.

### A RESPONSE IN ADVANCE

The *Baltimore Evening News* quotes the following from the Democratic platform:

We believe in the preservation and maintenance in their full strength and integrity of the three coordinate branches of the federal government—the executive, the legislative, and the judicial, each keeping within its own bounds and not encroaching upon the just province of either of the others.

It then inquires:

This plank virtually pledges Governor Wilson, as event of his election, to keep his hands off the legislative branch of government. It is most revealing since it is in no way anything at all new. What, to be done as President? Will be applied to the pledge of his party platform not to interfere with the interests and purposes of Congress, or will be repeated that plank and use the "big stick."

On August 29, 1912, Mr. Wilson was quoted in this journal as follows:

When I was running for Governor I frankly said that, if elected, I should like my executive as a mandate; a declaration of the people of New Jersey that I was required to be the leader of the state, the representative for the executive control of its government. My opponent said that if elected, he intended to be a "constitutional" Governor, that he would make many resolutions in the legislature, and then leave the legislature alone to do—without his recommendation—the entire should be carried into effect. I said that if that was what was meant by being a "constitutional" Governor I intended, if elected, to do it. I had a mandate from the people of the state not only to recommend reforms, but to carry every reasonable means to improve them. I had been elected. I offered myself as a leader and the people of New Jersey accepted my offer.

This is the answer.

### Big Politics

Dr. Wilson's election means—  
If Dr. Wilson were elected—  
As with the tariff, if Dr. Wilson were elected—  
Dr. Wilson has been at the head—  
While Dr. Wilson was less vigorous—  
—T. R. W. in the "Gaiter."

WISCONSIN WILSON has been the head of the New Jersey platform for nearly two years. Most people are given as his motto: "But not every THOMPSON. Why? do you suppose. The answer is easy. It is because he thinks the Plain People distrust all high-brow or learned men as being out of touch with themselves, and so to shrewdly utilize every opportunity to recall to their minds the fact that the Democratic candidate was once a college professor. Ain't he the case now?

### AUGUST 10, 1912.

### In Fine Form

MARSH HENRY is in fine form again. For the time being he is out of the awful struggle of Kentucky politics that to one but a Kentuckian understand, and speaks frankly on outside topics. Hear him:

WISCONSIN WILSON had not escape election if he were. He will accept the country. His change is but the same, by simple choice, to that state that he carries every state in the Union.

That's a lot of ahead of fifty dinners. Think of the fine constitutional stability of a man who would buy fifty dinners on one election; all of them, of course, to be paid for and eaten.  
Again he says:

Either the writer of the *World's* tariff article should be "lured" for the simple, or else holes should be dug in the gutter down to let the darkness out.

That is because the *World* has not squared with what the marking Colonel in all Kentucky conceive to be sound Democratic doctrine on the tariff. The language in which General BRYMAN defined our future Colonized WATSONS to define the positive tariff, and any Democrat who varies much from that definition had better not let MARSH HENRY catch him.

### "The Commoner's" Future

Speculation as to happenings to follow November 5th strikes us as somewhat premature, but the following from the observant *Savannah News* is worth passing notice:

There is speculation as to whether or not Mr. BRYAN would be offered a place in the Cabinet if Governor WILSON were elected President. The fact that he has contributed one thousand dollars to the Democratic campaign fund will have the effect probably of stimulating this speculation. The fact that the *Commoner* has had under considerable attention to Mr. BRYAN, but he isn't the sort of a man to let a personal obligation to any other party with what he believed to be his duty to himself, his party, and the people generally. If he believed that Mr. BRYAN was the best man in the party for Secretary of State or Secretary of the Treasury or for other high positions, he would naturally incline to invite him into his Cabinet, not because of any service he might have rendered him in getting the nomination of Governor WILSON, but merely because of his ability to contribute to the success of his administration.

As a matter of fact, Governor WILSON owes nothing to Mr. BRYAN; that Mr. BRYAN didn't advocate his nomination. He planned to bring about his own nomination at Baltimore, and his plan failed, mainly because Mr. Wilson's head was away from him. In the campaign that is just beginning Mr. BRYAN may render such good service that he may place his party under obligations to him, but if he does, Governor WILSON will not sacrifice any personal or party interest to reward him. In shaping his administration, in view of the obligations to will regard Mr. BRYAN as the most of candidates available for the positions to be filled.

It is close to the bull's-eye, in our cautious judgment.

### An English View by Sydney Brooks

One of the pleasantest kinds of Mr. Woodrow Wilson's nomination—I am looking at it from a purely British standpoint—is that there is no end of some strong play of the ball-bowling between the two parties. The outside world, on the basis of mutual understanding. For the past sixteen years the Democratic have been in such alternate from foreign as from American opinion, but to-day they find themselves at any rate through all the imaginable continents—read by the Chicago and Baltimore conventions, the streets of Washington, and the news columns record improvement in Democratic prospects and policies.

There is no sign of any serious public man in that they have never been grounded in the fundamentals

political reform. They rarely depict the state of a social, military, background of reading, culture, and philosophy. Their political views are usually the politics of personalities and committee-room. It would be no small part of Governor Wilson's strength that he had not only as an American, but as a world leader, had not only as a writer and professor applied his knowledge to the Government, criticism, and dissemination of important political and social questions, but also supported a sustained and all-round experience in the steady work of administering a great university, but also that he was a man whose politics was the politics of ideas rather than of personalities. It is true that he is elected in November, as I talk it for granted he will be, the White House for the first time since the Civil War, and it is not surprising that he is not a man of "politics," but of the ways and means of America. His campaign for the Governorship of New Jersey seemed to be a character stroke in American politics; but was none of the usual party election and vituperation, no effort to give any meaningless party lines and traditions, no dealing in common generalities. From first to last Mr. Wilson appeared to reason and to convince. He discussed nothing but specific and powerful issues, and on each of them he stated in plain and simple language. In language that the most ignorant could understand and the most fanatical could appreciate and be stirred by, with no appeal to party loyalty or to honor or distinction, keeping always to a high elevation of thought and feeling and practicality, and eloquent with the propriety of it, is only born of conviction and policy. Mr. Wilson had laid the stones of New Jersey politics and industrial organization, clearly outlined his programme for their reform, and asked for a full and complete change in the Government, the support that would enable him to carry it out. Republicans and Democrats looked to the merits and the merits of the man who would carry it out, and as clearly and as steadily what he promised to do as frankly and modestly; Republicans and Democrats joined in praising him as a statesman in a language that had been heard for the first time since I, at any rate, have had the pleasure of knowing it, New Jersey is a self-governing state, and its political system is beginning to show some approval of the requirements of a modern country. Even in England we were able to follow the Governor's platform with the same interest and vigor and understanding.

I do not think that since his election Mr. Wilson has ever shown so much interest in the real stuff of statesmanship. For all his years in the lecture-room there is nothing "demish" about him. The usual politician, who is not a man of his kind, his grandeur, his calm, clear face of talk is flooded with a strong and spontaneous humor; his whole bearing speaks of freedom, ease, and of confidence, every word of his is of a native confidence in his own American with a will or a sharper vision or one so inflexible of aims, business, and the serious form and appearance of a man of affairs. If any one can knit the heterogeneous units of the Democratic party into a single, effective whole, it is surely he. I would like to see him in England, he would like to offer my congratulations to his countrymen on being forward such a man as such a hour.

AUGUST 11, 1912

### Progress of the Campaign

It was a thoroughly democratic and very political idea of some Democrats that gathered at New York to discuss the campaign and the progress of acceptance. Instead of JAMES in making the formal nomination, he took occasion to lambaste the pretensions of Mr. WATSON's faction, but the candidate showed himself a very different man, and generally took a merely philosophical view of conditions and events. Indeed, his speech primarily was most noticeable for its moderate and conservative tone, and its lack of anything like the Republican party and he paid no attention whatever to the BRYAN platform. If he felt that Mr. Tarr had been successful, he would have been glad to try to link him with BRYAN; he gave no sign, he made good his initial statement that he should speak and act as an independent man, and in fact showed a conviction of the people deeply stirred by the conviction that they have come to a critical turning-point in their moral and political development. He outlined his own programme for the campaign in very specific terms: he merely pointed in clear and beautiful phrases the state of his own beliefs, and he did not show any intention of attacking or attacking, not of strife and destruction but of patient cooperation.

"The Nation" he declared, "has been unsuccessfully unsuccessfully in when these two wrongs come principles of right and of fair dealing which might and should have bound them all together, not as rivals, but as partners. As a matter of fact, we are in a position to undertake the great duty of securing modernization and adjustment."

In the end of saying citizens, as Mr. Tarr agreed, then, to vote in a certain way to win back government, he pointed the wider way.

"What we are seeking," he said, "is not destruction of any man, but a new era of the rule of right and of common advantage." Again, "It would be a chapter of misadventure to be a failure in the campaign of the year." And again, "One task now is to effect a great adjustment, and get the forces of the whole people on one side, and get the forces of the whole people on one side, and get the forces of the whole people on one side. If we are to do it, we need only one point of view and one new spirit and spirit of courage!"

He paid an encouraging, though perhaps unnecessary, compliment to the administration of Governor Wilson, and in the meantime of his is not necessarily incompatible with his best good sense and business success.

"It is a happy hour," he remarked, "that they

Drawn by R. W. Kenton

## THE FINISHING TOUCH

FROM "HARPER'S WEEKLY" OF NOVEMBER 2, 1912

Governor Wilson could hardly have acted differently. One is not obliged to be a great even to avoid seeming rudeness. But the situation itself would never have arisen if the campaign management had possessed an atom of experience or capacity. The mist of a great campaign is in its mass and a critical state is no place for the running of unnecessary antagonism through the smouldering of individuals. If Mr. Wilson feels that Governor Du's renomination would endanger the national ticket, he has a perfect right to say so, and perhaps should say so, in as duty bound, frankly and manfully. But there is no reason why a Presidential candidate should permit himself to be dragged into factional quarrels at all either to help a local aspirant or to gratify important newspapers. When it comes to campaign management, Mr. Du does not seem to hold a complete monopoly of what the World calls stupidity.

## The Difference

The discussion of "Wilson's second term" in HARPER'S WEEKLY seems to be about as much a case of good printer's ink as anything the country has ever seen.—The Evening News-Mad.

It may be wonderful, but it surely lacks the imagination involved in inventing a third term for T. ROOSEVELT or anybody else.

SEPTEMBER 24, 1912

## Echoes

## KEEPING AT IT

In other words, Colonel Harvey raps the Democrats' rascal-chaucers. He warns danger and knows Presidential elections are not won at headquarters, at White House, in thirty-six-story buildings, nor yet in private yards, nor in the clubs of the aristocrats. The wisest men the all-wise officials of the New York Democratic newspaper which flippantly affirms that the Roosevelt movement is all faith, while their news columns note that the colonel spoke to thousands on his late tour through New England, supposedly an "evening's company" for T. E.

Meanwhile, he is doing his best best to stir the Democratic directors to get—Johnston's Tribune.

## TWO PREDICTIONS

HARPER'S WEEKLY warns the Democrats not to "underestimate the strength of the Bull Moose, intimating that he may be a closer competitor than Taft. Colonel Harvey has proved himself something of a political prophet in the past, but it does not follow that he understands the situation in the country at large in 1912 as he did the situation in New Jersey in

1910, when he predicted the election of Wilson as Governor by substantially the majority which he actually received. Unless the Republican party has gone to pieces completely, Taft will get practically all the electoral votes that do not go to Governor Wilson.—See Johnson's Express.

## THE MAN TO BEAT

In a recent issue, HARPER'S WEEKLY makes this wise suggestion:

We respectfully suggest to the directors of the Democratic caucus that William H. Taft is not the man whom Woodrow Wilson has to beat.

It is well to remember that those who are in the habit of belittling the efforts of Theodore Roosevelt, Roosevelt and Bluffe though he be, will probably be very much surprised at the result of the November election.

Judging from conditions as they exist now, as far as it is humanly possible to forecast elections, it looks now that Woodrow Wilson will be overwhelmingly elected. It would create no surprise if he carried two-thirds or three-fourths of the states. Still the baneful influence of Roosevelt's personality has been so potent that he will no doubt get a very large popular vote in nearly every section of the country, and will be very likely to get the electoral vote of several states.

Doubtless, HARPER'S WEEKLY is right; Taft is not the man Governor Wilson has to beat.—Pennsylvanian's Journal.

## KEEP TOGETHER! GET BUNNY

HARPER'S WEEKLY advises the Democrats to make no mistake, and that it is not Taft but Roosevelt they have to fight. This is a long run into the stream, but it may be wise. Roosevelt has had some astonishing successes. He has been able not simply to turn defeat into victory, but actually to make defeat appear to be victory. His last performance in this kind, and we do not know how many people will believe it, The Democratic press appears inclined to ridicule Mr. Roosevelt's performance, but it would be better to give serious warning to the people, if it is imagined that the campaign is already won.—Malden Express.

## "A VOTE FOR WILSON"

For several weeks, in HARPER'S WEEKLY, Colonel Harvey has been giving the Governor of New Jersey that to win the Presidency he will not have to beat Mr. Taft. Evidently the advice has not gone astray, and if more good were needed than Colonel Harvey's word, it comes from the Vermont election. The Keizerbender Press has called attention many times to the fact that something is happening in national politics. After Vermont it seems almost certain that the tip will go out from Republican national headquarters before another month has passed to beat Roosevelt. The only way to beat Theodore Roosevelt, it may appear, will be to vote for Woodrow Wilson. Roosevelt is in an unenviable position as President of the United States at this time, but as they say in the metropolitan, if Governor Wilson makes one false step, all is lost.—Keizerbender Press.

## Mr. Hillis at Work

Hello! Wilson is a traitor. Mr. HILLIS made the startling discovery last Sunday. Taft having carried Texas and the election being over, the Republican chairman took up his well-thumbed copy of the History of the American People, and his eagle eye lit like the business end of a wax on the following paragraph:

The proclamation, when it came, was no law, but only his (Lincoln's) deliberate declaration of policy for himself and for his party; and through, as he meant that it should change the whole air of the struggle and of politics as well.

Mr. HILLIS threw up his hands; he was shocked. Then he took pen feverishly in hand and wrote:

It is safe to say that not even the most violent re-construction Southern man would attribute to Lincoln this motive, which it remained for the historic William Wilson alone to discover, that LINCOLN abolished slavery to further his own political ambitions and those of his political party.

Yes indeed, it is quite safe to say that. It is equally safe, possibly, although preposterously silly, to say that Wilson wrote that LINCOLN issued the Emancipation Proclamation to "further his own political ambitions," when he never wrote anything of the kind. What he did write and what Mr. HILLIS quotes—namely, that President LINCOLN seized the opportunity to clarify the whole situation by adopting a war measure to solidify the moral sentiment of the North—is the exact fact. President Taft put the case quite clearly, on the same day that Mr. Hillis had his fit, in those words:

Mr. LINCOLN suffered greatly by the criticism and abuse of those who thought he did not act quickly enough in issuing the Emancipation Proclamation, and later from the attacks of those who thought the act was a great mistake. Now, as we look back upon it, we realize that his selection of the time was most fortunate. He delayed action until he could take it as a war measure under the Constitution and could demand what he did so within his lawful power as commander-in-chief of the army and navy in the prosecution of the war.

The emancipation did not free all the slaves. It could not free those who were in territory not within the arena of war, but after he had issued this proclamation the completion of the step needed to secure the abolition of slavery as a constitutional amendment was a necessity and only a matter of time. It is not, then, that Lincoln's should be held up as a hero, as the man chiefly responsible for the freedom of the negro.

If Mr. HILLIS had seen this first, he might have been spared his epiphany. ETC'S, WE'LL SAY—SAY BOTH

log could have prevented him from adding that "apparently, if he could," Governor Wilson "would close every American mill and buy in foreign markets, because, in the first place, he is an aristocrat born and bred, and because he wants the American people to buy where they can buy the cheapest."

It is pretty terrible, no doubt, that one should want the American people to buy where they can buy the cheapest, but that one should wish "because he is an aristocrat"—i. e., the son of a hard-working, under-paid Presbyterian minister—is inexcusable wrong.

Mr. HALL has our sympathy. Moreover, as everybody is remarking these days, "Poor Mr. —!" Never mind who.

### Hot Air in Kansas

The following is from the press report of Mr. ROOSEVELT's speech in Topeka:

He insisted that Mr. Wilson's knowledge of what he did when President was pointed in the audience of the classroom at a time when Mr. Wilson was still being the position of an international banker and was being earnestly groomed for the Presidency by GEORGE HARNEY and other representatives of the Wall Street interests.

It is difficult to see what difference it makes whether Mr. Wilson received his knowledge of the important thing that he got it, and has it still, as the Colonel is finding out, somewhat at his own expense.

If, in the midst of his derivation of bleeding Kansas, the Colonel can receive satisfaction from designating it as a representative of Wall Street interests, the pleasure, in the words of Mr. Wilson to Mr. FERRIS, is all his. No, not quite. A little must be spared to his seventh little Governor, the Hon. CHARLES S. OSBORN, of Michigan.

The difference between the two seems to be that the Governor's moral obligation is buried in his mental chambers, while the Colonel stands forth as depicted by Deverax.

"A man so various that he seemed to be

Not one, but all mankind's opinions;

HE is omniscious, all-seeing in the wrong.

Was anything by starts and catching long;

But in the course of his career

Was chymist, flatter, statesman, and buffoon."

### The Answer

Part 1. TAPPAN cannot be elected.  
Part 2. ROOSEVELT can be elected.  
Part 3. WILSON might be elected.—BURNETT MURPHY.

Engo, vote for WILSON.

### Philip, Sober

ROOSEVELT SAYS:  
The key to Mr. Wilson's position is found in his statement that he is a student in a history of the limitation of governmental power, not of the increase of it." This is a bit of outward academic doctrine which is kept in the classrooms and the professional study for a generation after it had been abandoned by all who had experiences of actual life.

Mr. Wilson's declaration is undoubtedly the "key to his position." It was the key, moreover, of the position of the American people when they recognized in their fundamental law that a monarchy, no less than a king, may become tyrannical, and enacted the great constitutional device forbidding the taking of property without due process of law, guaranteeing equal protection under the law, safeguarding "the freedom of speech and the press, and in all other ways preserving the personal liberties which they had won by revolution against the exercise of too great governmental power.

### Progress of the Campaign

Governor Wilson has been going through the Middle West and making it plain foolish to his audience, who evidently like that kind of talk and are willing to hear as much of it as the Governor can give them. At Longmont, Indiana, he said his respects to one of the G. H. P. devotees. There was a time when former Senator HERRING believed that holding with outside control in the hands of the White House, but Deverax could not get of the job or took up with a more promising party, and Mr. HERRING is now content to be a humble follower working in the Bull Moose position with visions of perhaps an embryo, or even—for anything may happen on a private ship—wed at the captain's table. HERRING was perturbed, but if Governor Wilson is elected President he will be "less controlled." To play this game, which really must be very disturbing to Mr. HERRING, says the "New York Times," is the third reason, Governor WOOD said: "The way you can tell whether a man is going to be controlled by the masses or not is to judge whether he is really a boss or not," and then the Governor gave this concise definition of a boss:

"A boss is a political agent of certain special interests, who see to it, through his, that people they are in the habit of obeying, and that the interests are not out of the status-quo; and the man who does that are the men who are interested in the great interests of the country."

Having given the definition, it is a pity Governor WOOD did not follow it up with a practical illustration of the Governor's definition. Governor WOOD has added: "The special interests that put Mr. Roosevelt into the Presidency by subscribing to his campaign fund did not want the tariff reduced, so Mr. Roosevelt, although he was offered for more than seven years, kept a revised tariff law of the statutes-books." Governor WOOD's long experience in the classroom among freshmen has the casual way to convey knowledge in by a concrete example.

Crowds are deceptive. Nothing is so easy as to draw a crowd, nothing so easily thrown even the best-balanced man off his feet as the presence of a large, shouting and cheering audience. There has never been such a turnout at a political gathering since Jackson spoke, one self-important commissionaire, recalling hourly tradition, tells the candidate: "You made the circus look like a law firm (the First Baptist Church), another tells him, and the candidate would be pleased to hear that. He says, "I don't believe it and want to add to convince himself that the whole village or town or city was assembled to hear him. Making a speech to a cheering still it is not without significance that Governor WOOD has had rising auditors on his tour, some of the streets going so far as to say that the enthusiasm of the crowd exceeded that when Mr. Wilson was in the height of his fame and could sweep an assembly off its feet by a mass of unvoiced platitudes delivered in a strong voice. The same voice, however, of course, to see and hear Governor WOOD, curiosity because he is the candidate of his party, because of the rivalry with which he has come to be associated because of the things he has done and the courage he has shown, because he peculiarly appeals to popular feeling and because the people often do not see but they have their inspiration; and after curiosity has been satisfied he makes a higher appeal. He talks calmly and his words are clear and simple. The impression he made in Pennsylvania has been deepened by his tour of the West. There is an explained this matter of political managers that the moral Agency is in the middle. The people are men to be enticed and are doing their own thinking.

The difference compels that Governor Wilson is following "an outside philosophy." To a man who has thrown him into the sea-ship and regards truth as a joke and honesty a discarded virtue a great man, that is, a man who has been in the "war," but the great public steadily stings to the factitious.

OCTOBER 12, 1912

### A Message to the West

We have received the following communication from a resident of Des Moines, Iowa, who is engaged actively in business:

To the Editor of Harper's Weekly:

I beg an ardent admirer of President TAPPAN. I firmly believe that he will be entitled to another term and hope that the Republicans will come to their senses in time to give him the party vote as he deserves. If not the party vote will be divided in the event that he is not to have the endorsement of the voters and I pass to Mr. Wilson, who is certainly not fit to be President. TAPPAN is the only man of the altitude of the business world of the East toward the New Jersey man? Is there any man who will lead to trouble? Have the people become that mental attitude that dare no more toward making trouble when there is a Democratic President? There is now no man in the country who is doing more to make us getting so far away from that narrowness that formerly served that with a Democrat in the Presidency. The Democrats are doing nothing to help us get along just as well with Wilson. Democrat though he is, as with any other reputable man in the office. Have we become great enough to imagine that a Democrat can be a patriot and a man who is the very best possible for his country? I was raised a Republican and for many years thought that the Democrats were a party to be despised, but the feeling now, but how about the people generally? It is the mass of men and women who determine such things. It is the people who determine such things. HERRING's fall as what is likely to occur in the East if the election results favorably in Woodrow Wilson?

I am, sir,

A. C. PUGH.

And we reply: There is no objection whatever in this part of the country of unhappy consequences ensuing from Governor WILSON's election. The Republican and ROOSEVELT parties are doing their best to win the voters, but everybody realizes that they are only haggling at their last-ditch. It is an old story and it is plain out.

The fact is, Mr. PUGH, that folk-heralds have grown, not merely skeptical but weary, of famous intentions that one-half of our people want to ruin their own and their country's industries. Nothing will "happen" here when it becomes known that Wilson has won. But deep down in the hearts of the thoughtful men of the country, the stake in common prosperity there will be labor-relief and such relief—aid at the downfall of a dangerous upstart and moving over to the interest of the personal of popular government which the Republican oligarchy has kept standing

so long and so persistently upon its apex. Governor Wilson is not the only one who will "thank God and take courage." He will have as company his entire country.

If by any chance you should surmise that our judgment to this effect is colored by our desire to seek you, Mr. PUGH, to read what President TAPPAN said yesterday. He congratulated the country upon "existing property" and the "assurance" of its continuance afforded by quite obvious confidence among business men. Now when you consider—no, of course, you do not want—these headlines, does not a fully informed election of Governor WILSON, you can easily draw your own conclusions respecting their state of mind.

Instead of a pair there will be an era of exceptional prosperity, not for a single year as a consequence of longer crop, but of long duration because of a firm conviction in the minds of people that their levels will be normal and that its blessings will be shared by all in such proportions as may conform to the just rewards of individual efforts under laws which confer special privileges upon none.

### A Pertinent Query

Can anybody imagine WILLIAM H. TAPPAN, while he was running for the Presidency, writing from the White House to the Honorable WILLIAM MCKAY, and the purpose of the letter calculated to bring money from a source as well written to the late Mr. H. H. HARRIS in limit? It is a matter of fact that he did not do it. It is in the hands of GEORGE CLAVES, CHARLES A. ARTHUR, JAMES A. GARDNER, RUTHERFORD B. HAYES, or ELLIOTT S. GALT—T. H. ROOSEVELT.

(What is that noise to the point—WOODROW WILSON?)

### The Difference

If you want to maintain the prosperity of America, if you want to keep the tariff, the sugar, and the savings-banks accounts full, and the insurance policies from lapsing, and the twenty-five million children in the hands of the present generation, then the kind of what I am sure you are all proud, vote in preserve the public policy of protection for American industry, industry which we have grown so great and strong and prosperous, vote for TAPPAN—ROOSEVELT.

And so larger and contented. But the Senator is quite right. If you want to preserve the PAYNE-ALDRICH bill or get another revision upon you, vote for TAPPAN. But if you agree with Governor WILSON when he says:

"We don't want to disturb the industry of the country. We are not here to disturb the industry which these men have built up. But we are here to take the control over the industry of other people which these men have established and which makes it impossible for us to have grown so great and strong and prosperous, vote for WILSON—ROOSEVELT."

Then vote for WILSON.

OCTOBER 10, 1912

### Wilson and Roosevelt on the Trusts

As the campaign has progressed, Governor WILSON's speeches, instead of falling off, have been steadily getting better. His line of what we are already a remarkable series of discussions of great public questions. Before he was nominated an eminent college president predicted that if he were named his public discussions also would prove of incalculable value to the country. The remark is already justified. Not within the interior of the present generation has any candidate for the Presidency done so much to illuminate issues and to clarify public opinion.

There was never such doubt that on the leading issue of the campaign, the tariff, Governor WILSON would be more than a match for his two adversaries. Neither of them has ever shown the slightest concern that issue, and the fact, moreover, has indicated that it favors the Democratic position. As a result, the Democratic candidate had a clear and increasing advantage every time the tariff has been touched.

That being obvious, some may therefore be inclined to criticize his judgment for giving so much of the tariff issue to the front, and fully. It must be thought that in this regard it would have been better policies if he had not met Roosevelt's challenge so promptly and completely.

President WILSON was right—right in his judgment as well as in his conscience and his conscience. He was right for three reasons. The first was the tariff issue for the first time in the history of the country has again and again pointed out, in fact, to be correct in holding that the tariff is the most potent cause of monopoly in the country; and that phase of it cannot be hidden. The second reason is that ROOSEVELT'S

## TWO AMERICAN GENTLEMEN

"CONGRATULATIONS, MR. PRESIDENT" "THANK YOU, MR. PRESIDENT"

DRAWN BY C. J. BUDD

EMPIRE "HARPER'S WEEKLY" 10 NOVEMBER 5, 1912

trust programs, artfully contrived to mislead well-meaning people, demanded analysis and exposure. The third reason was that Governor Wilson knew exactly how to analyze and expose it.

He has done it, and done it so well that nobody should ever need to do it over again. He has done it so well that no intelligent man has any right to be in doubt any longer as to what Roosevelt's and Bryan's trust program really means. Neither has anybody any cause for uncertainty as to where Governor Wilson himself stands on this question.

#### The Issue Absolutely Clear

These enlightening speeches ought to be read in full by every unenlightened American concerned for the future of his country. But it seems to us possible to put into a more paragraph the essence of the matter as Governor Wilson explains it. Indeed, he has by a single phrase put his finger on the heart of the unenlightened of the entire Democratic proposal. He has called it a proposal "to legalize monopoly." When that was said, pretty nearly everything was said that was necessary to enable us to condemn the plan. For the phrase is absolutely correct. ROOSEVELT and BRYAN, of course, prefer the word "regulate," but to regulate is to legalize, it is to accept, it is to validate, it is to legalize. It is, as Governor Wilson has made plain, to endorse and to pardon the methods by which monopolies have been established, methods which are at last understood, and can therefore be attacked by law. It is to give the hands of government. It is in effect to undertake to a thing which democracy has been fighting for centuries.

This is not rhetoric. It is cold fact and clear reasoning. It brings us up with a jerk and makes us realize the actual peril we are confronted with, that it is about as startling a distinction as there is to be made in the matter of justice to follow any longer the leadership of loose-thinking men like ROOSEVELT and his present associates.

Nor is Governor Wilson one whit less clear in stating his own position. He does not, like ROOSEVELT, talk as if he knew all that can be known about this problem of great dimensions. He does not treat the subject of the matter or pretend that he has and be alone has completely mastered it. But he tells us plainly where he stands and what he will do and what he will not do. He will not, he pledges himself, consent to legalize monopoly without considering the methods by which it has been attained. He will not consent to the fact of oligopoly as a proof of itself of superior economic efficiency. On the contrary, he will do all he can to prevent the achievement of monopoly by unfair methods—and he specifies the methods that are unfair. He will go farther and do all he can to destroy monopolies that have been established by these unfair methods and to give superior efficiency. He will thus stand for freedom in business, for the freedom of both the big and the little enterprises. He will thus stand for freedom and for real efficiency, and he will stand for honesty and justice.

There is the issue, gentlemen of the electronic. ROOSEVELT says, "Monopoly is inevitable, let us accept it and try to make the monopolists be good to us." WILSON says, "Monopoly is not inevitable, except in those industries which economists have all along recognized as 'natural monopolies.' The other sort of monopoly I will not recognize. I will not accept it. I will not legalize it. So long as I have a right to my body I will fight it, for in fighting it I am fighting for democracy, I am fighting for freedom, I am fighting for the ideals of this American Republic."

OCTOBER 25, 1912

#### Governor Wilson His Own Interpreter

Last week, impressed with the extraordinary excellence of Governor Wilson's speeches on the trust question, this Journal and many others had a try at putting his contention into fairly brief editorial paragraphs. Some of us, we think, did pretty well, but for our own part we are quite ready to admit that since our effort Governor Wilson has done the job a lot better himself. We have a copy at Wheeling, West Virginia, and we credit this paragraph:

I want to say just about the Democratic party program. The thing that has created the trusts, that has created the monopolies, is unscrupulous unfair competition. If we can only bring it about that new cases shall have a free field, I will not legalize any of the offenses in the trusts, because then the most intelligent competitor will get the market. The only way to get rid of the trusts is to have them broken by the legislature of Congress and by special laws from the government. We can do that by having

Federal laws throw all this system of cure with statutes which make it criminal to do what these gentlemen did to build up their monopolies and which will give them the means when they should offend the law time to think it over in some building from which they will not for some time come out. I am not afraid that the practitioners will be crushed as soon as the law takes hold of these things and men are held the law who want to ignore nobody in particular. In minimizing parties, especially, the policy of favoring of us will advance and there will be another law upon affairs in America.

Especially Governor Wilson needs neither an interpreter nor a condenser. All he needs is a reporter—and that people should read what he himself has said. We think that most of those who do will agree with us in the judgment that his handling of the trust issue is easily the masterpiece of the campaign.

NOVEMBER 2, 1912

#### Our Prediction

I venture to suggest the nomination of President Wilson by the Prussian States as the Democratic candidate for President of the United States.—*Harper's Weekly of March 16, 1906.*

II

We have a shrewd suspicion that the Democrats of New Jersey will nominate Woodrow Wilson as their candidate for Governor in 1910, with a view to presenting his name to the Democratic national convention of 1912.—*Harper's Weekly of November 29, 1906.*

III

We now expect to see Governor Wilson elected Governor of New Jersey in 1910.—*Harper's Weekly of May 15, 1909.*

IV

At the expiration of eleven months since the above appeared in this place we perceive an occasion to revise our calculations. Mr. Wilson's majority will be only three thousand.—*Harper's Weekly of September 24, 1910.*

V

We are fully satisfied that the nomination of Woodrow Wilson for President of the United States by the Democratic national convention of 1912, as against WILLIAM H. TAFT, Republican candidate.—*Harper's Weekly of November 12, 1910.*

VI

We and the entire press prophesy with a prediction that Woodrow Wilson will be duly elected President of the United States in November next.—*Harper's Weekly of July 23, 1912.*

VII

We now predict that Woodrow Wilson's majority over all in the Electoral College will exceed 300.

(Note here: It was 339.)

JANUARY 25, 1913

#### Mr. Wilson's Speeches

Isn't it getting to be about time for Wall Street to remove its blue glasses and take a square look at the rest of the country? Nobody else is having spasms over Mr. Wilson's speeches. Why should the Street that May Be Straight, but in No-Name-Called Crooked? And why not try to get things straight, too? Here, for example, is our neighbor, the Star, whose content of statement is proverbial, printing the following in its financial column:

In these utterances the aim that is in the best President of our country and is to have a party friendly to him in control of both houses of the national legislature has been clearly and emphatically set out. It is that the country are substantially disclosed and most change their hearts; that the banking system of the country stands already "overwhelmed" by unscrupulous and dangerous practices; that society in the country is in need of general reconstruction; and that he, the President-elect, has staved out what may be called a bridge—a bridge to carry the reconstructing process. And he has said that if business disturbance results from all this it will be because competitors have been crushed. To bring it about and how which they will deserve to be named as high as HAVAN. It has been agreed in advance that the President-elect, who is speaking as he did so expertly and so bravely, was carried away by oratorical effusions.

Now let us see about this. We have read Mr. Wilson's speeches, but we found nothing of this sort in them. He did not "declare that the business men of the country are substantially distressed." On the contrary, he advised both in and out so frankly and truly that the country need not be concerned of their spiritlessness and unbelief, and that it was up to them to do the constructive.

There was no novelty in this proposition. Senator East had said it when the Congress drove from Washington as well as up-State New York,

who used to have a law office in Wall Street, and who ought to know what he talks about, made the same declaration far more sensitively and with much greater emphasis in his recent speech to the Chamber of Commerce. These were his words:

There are hundreds of thousands of people outside the great industrial companies who think you are a den of thieves. There are hundreds of thousands of people who think that the manufacturers of the country are no better than a set of confidence men.

The distinguished Senator then went on to urge his hearers to strive to overcome this impression by their acts. And that is what Mr. Wilson did—just that, nothing more. Mr. Wilson has done less than a law lawyer than Mr. East's, but he stated at the same time. And wasn't it good advice? If not, we for one don't know what good advice is.

Then again Mr. Wilson did not say that our banking system stands "overwhelmed by unscrupulous and dangerous practices." He said it stood convicted of general incompetence and specific inability to meet the needs of the country—in just what everybody in and out of Wall Street has been saying for years.

And Mr. Wilson did not say, in either Chicago or New York, that "if business institutions were required to bring it about," and ought to be named "as high as HAVAN." What he did say was that if unscrupulous persons should try to fetch on a panic to serve their own wicked ends or to discredit those who are trying to accomplish reforms, they ought to be discouraged. March 15, 1912, he said and seems—held up or hung up as high as HAVAN.

Well, who wants to deny the righteousness of that proposition? If he had said higher than HAVAN, we shouldn't object. Panics are bad things, very bad things, and no punishment is too severe for anybody caught encouraging them. March 15, 1912, he said and seems—held up or hung up as high as HAVAN.

The Times' financier, after due consideration, reaches this sane conclusion:

There was an undercurrent of hope that the responsibility of other, one it actually rests on the shoulders of the President-elect, and the really the effect of his public utterances, but the real sentiment of the Street in respect to the influence is carried by the incoming of the new administration was pretty accurately reflected in the course of prices of the Stock Exchange. It remained true, now the less, that individuals need to do with the effect produced by Mr. Wilson's words as had the direct statement of his views as he expressed in Eastern papers; but that is the only real ground for criticism we have found so far.

\$4.00 a Year]

## Beginning of the New Administration

THE beginning of the new administration is more than pleasant; it is exhilarating. We doubt if any previous inaugural address has won the universal acclaim that was accorded President Wilson's frank and eloquent statement of his aspirations.

Mr. MARSHALL, too, spoke with a homely simplicity that was truly refreshing. We confess our inability to grasp the full significance of his metaphor of the harness, but there can be no doubt of the inadvisability of using blinders when they obstruct the vision; nor can the value of a stout breeching be overestimated when wearing a perilous descent. It was a quick jump from *crispers* and the like to "the golden network of honor," but we like that, too. It fetches back to mind LOWELL's delicious remark about LASSING, to the effect that "he continually trips and falls but never his metaphor of classical geometry."

Not that Mr. MARSHALL fell or even stumbled. Far from it. His footing was sure and firm, and his penetration in favor of righteousness the world around was in every way commendable. In fact, the only portion of the Vice-President's address which we find unsatisfying is his declared intent to enter upon a four years' period of silence. It is true, sincerely that he will reconsider this unhappy determination, and we tend to mitigate whatever of "severity" his good lady thought she detected in the manner of our new Chief Magistrate.

It was no easy job to construct a satisfactory Cabinet out of existing Democratic timber, but the consensus of opinion seems to be that President Wilson did as well as could have been reasonably expected. Three of the appointees are positively first-class—Mr. McBRIDE, Mr. LANA, and Mr. HOWARD. Each of these possesses rare equipment for the job before him. Less certainty is felt regarding perhaps two of the others, but there is no disposition to prejudice or belittle them. It has often happened that those from whom the least was expected have shown up best in the final accounting.

Mr. BAYAN naturally overbalances all except, of course, the President. He has been a conspicuous figure in our public life for so long—much longer than Mr. ROOSEVELT—and has held so tenaciously to his theories of government that his final triumph over repeated failures adds peculiar interest to his vital personality than to his domain as a responsible officer of state. The ways and whereabouts of his appointment hardly call for further discussion. Mr. WILSON simply followed the precedent established by JOHN QUINCY ADAMS, LIVINGSTON, and HARRISON. Whether or not in the back of his head he deemed it safer, as Mr. DORSEY put it, to have Mr. BAYAN "in his bosom than on his back" is of little moment. The real reason for the appointment appears clearly in Mr. Wilson's own public declaration made a year ago in these words:

We have differed as to measures; it has taken us sixteen years and more to come to any comprehension of our community of thought in regard to what we ought to do. What I want to say is that among the most striking things in recent years is that with all the fire and fuel of particular issues, with all the odds and ends of particular projects, there has been one interesting focal point in the history of the Democratic party, and that focal point has been the character and the *doctrine* and the teachings of WILLIAM JEREMY BAYAN.

I, for my part, never want to forget this—that while we have differed with Mr. BAYAN upon this or that, and upon that in regard to the specific things to be done, he has gone severely on pointing out to a mere and more convinced people what it was that you, the matter. He has had the steadfast vision all

along of what it was that was the matter, and he has not only more than ASHER JACKSON did, we heard his career upon education, but has based it upon principle.

Surely one need go no further than this to find the audacity and justification of the President's selection. Simultaneously, it is interesting at this time to recall that Mr. BAYAN himself fixed the basis upon which choice should be made. Writing in his paper so long ago as January, he said plainly:

Cabinet positions ought not to be regarded as currency with which to pay debts. They are responsible positions, and in the hands of those who do not should look to the future and not to the past. A public official has no right to discharge political obligations at the expense of the public. The man selected by Mr. WILSON for the Cabinet should be selected not because of personal service rendered to him, nor even because of past service rendered to the State. The individual counts for little; the cause counts for much. An individual, if he has had a proper motive for working hard without compensation in the triumph of ideas, principles, and policies, he does not need the commendations of others. Others should be used to strengthen the party and to advance the cause for which the party exists. It is not a reward for those who have been faithful, where that reward can be given without sacrificing public interests, but where just service is considered it is better to consider it as an assurance of future service than merely because it has been rendered.

The President declines to discuss cabinet possibilities, but it ventures to express the hope that Governor WILSON will be governed by a higher motive than gratitude in his selection of his official household. A great responsibility rests upon him, and he will need the assistance of the best and bravest for his work. He ought to feel free to select for each office the man best fitted for it; in no other way can he hope to measure up to the expectations of the public. He need not—should not—consider any service but the service which he owes to the people. Mr. BAYAN has been abundantly rewarded for all he has done, and does not feel that the party, through his selection in the party, owes him anything. If he ever holds any office, it ought to be given, whether by appointment or by election, with the view to the service that can be rendered in connection with the work yet to be done, not with the idea of rewarding him for anything that he has done. And the rule which is here laid down for Mr. BAYAN has the rule which he believes should be laid down for all. In other words, the welfare of the party and the welfare of the country, not the ambitions of men or the interests of individuals, should be considered.

Nothing could be plainer than this. It quite dispenses of the action that Mr. BAYAN felt that he was entitled to the first position as a reward for services rendered. In point of fact, so far as our awareness goes, he has never set up a claim upon Mr. WILSON'S sense of gratitude. Those who shout so loudly that the nomination of Baltimore was purely incidental to Mr. BAYAN'S real plan have no occasion to scream; you haven't a doubt that he would say, if indeed he has not already said, the same thing himself. A view of these declarations and attendant circumstances, it seems hardly just to either the President or the Secretary of State to say, as our neighbor the *Star* says, that Mr. BAYAN enters the Cabinet "not as one chosen for manifest fitness, but because of supposed political and personal expediency."

To doubt the question of expediency was considered. There is no man who who is not to be had here. It is the first duty of a President to strengthen his administrative forces in every legitimate way, and if Mr. BAYAN'S great personal popularity could be availed of to that end, it would have been a deviation on the part of Mr. WILSON to refrain from doing so. Nevertheless, as we have indicated, if one but reviews the entire and the handsome job of discharging another, all the evidence goes to show that Mr. BAYAN was ap-

pointed Secretary of State in recognition of what Mr. WILSON considered his true worth rather than of his prominent political position. That, to our mind, is quite as it should be.

Even so, of course the question of Mr. BAYAN'S actual fitness remains and will remain unanswered for some time to come. We are interested to observe that the Springfield *Republican* is just as sure one way as the *Star* is the other, though why it should say in the same breath that JESS BASSER MOON "knows everything Mr. BAYAN does not know in the field of diplomacy" we have difficulty in comprehending. One might almost suspect—but no, one simply cannot suspect the Springfield *Republicans*. A bit of interest, that is all. But very high praise of Professor MOON, to be sure, very high indeed, what!

Our own judgment is that the appointment of Mr. BAYAN is one of the best things that have happened in this country in a long time. He has been jostling around on the outside long enough. It will do him a lot of good to assume responsibility. Some time will be required, of course. A habit of mind cannot be shaken off overnight. And yet we what has happened! On his way to Washington Mr. BAYAN stopped at Raleigh, and, of course, was called upon to say a few words. "Peace" seemed to be a live topic, and he spoke freely, advocating disarming, peace—will to men, etc., etc. It was the same old speech—very good, too—but the circumstances had changed. As Secretary of State, Mr. BAYAN very quickly manifested an indisposition either to dismount our battle-ships or to take the rifles away from our colonial standing army.

And what is this we hear from Cuba! The outgoing Congress and President—a lot had—had enacted an amnesty bill freeing a thousand criminals, more or less. It was all done in the regular way, as provided by fundamental law and statute. The government were being governed with the consent of the governed, precisely as THOMAS JEFFERSON recommended. And yet, say the sheet-punch:

Mr. BAYAN today sent another note couched in the secret terms, in which he said the amnesty bill made justice a job, and besides violating the interests of American citizens whom the Cuban officials have fraudulently taken the terms of the PIATT amendment, which requires Cuba to maintain a government which is adequate for the protection of life and property.

Quite right and proper, of course. But suppose Mr. KROG had sent that sharp note a year ago, just as Mr. BAYAN was about to deliver his famous address, beginning, "Behold the Republic!" Would the world have rung! It would.

It was new habit of mind, moreover, that predominated when Mr. BAYAN made his official speech to the employees of the State Department, saying:

I am not prepared to discuss terms of office. My own tenure as I was about to see tried, but my own term had not begun. I am sure your tenure is, therefore, not more uncertain than mine. I have got and time to leave from the President the general policy that will be impressed upon the various departments, but it is not necessary for us to discuss them. I am sure you can look back upon the past, each other's acquaintance, and I hope that when the time comes for me to reassemble you to instruct you in any necessary case, you can look back upon my acquaintance as the entire Service. So delighted shall I be to see you, and I shall look forward with pleasure to becoming better acquainted with you as occasion brings us together.

True, he didn't really say anything; he was only "about to say"; but the correspondents and politicians immediately set up and took notice. On the morning after, therefore, the Secretary had pooled the whole matter and wondered how any-

body could be so stupid as not to see that his remarks were "jovial"—no think that was the word. Anyway, when Mr. Bayss appeared at the White House, the President, who also has a lively appreciation of the witty, greeted him with the grand old Princeton song: "Here's to you, my jovial friend!" And on Sunday the Secretary of State was a top-notch "think of that!"

Of course there is going to be a clash. Everybody says so. When an irresistible force strikes an immovable body, etc. But is there? We guess not, though that may be because we attach no importance to terms than a good many people do. Make no mistake! Mr. Bayss is a very able man. He knows what he is doing in the country, and so does the President. There is nothing to be gained by anybody from squabbling and there is no cause for disagreement between statesmen whose purposes are identical and whose attitude is one of respect and admiration. Makers of mischief will lay themselves, of course; that is what they are for. But there is plenty of room for all under Mr. Bayss's metropolitan harmonies, and all are needed too, if the Democratic party is going to justify itself before the country.

Although happily, as we remarked at the outset, the new administration starts generally, it is in fact most serious and fully conscious of its heavy obligations. The evidence is everywhere, and needs no doubt. It intelligently is beyond question. Its sense alone awaits demonstration.

#### The President and the Pe-Hunters

We dare not predict that the President is going to succeed in protecting his time and energy against the hunters. But his stand is commendable. He announced, immediately after taking up his duties, that he would see no applicant who had not himself invited to a conference, and that all applications must first be made to the heads of departments.

We are not sure the attempt to use the Cabinet officers as buffers is wise. As a matter of fact and usage, they have less to do with appointments than Representatives and Senators of the party of the President for the time being. Moreover, like the President himself, they are busy men, charged with great responsibilities, and ought to be protected from such importunity.

But there can be no doubt that the President is right in setting the public business ahead of his prerogative and duties as the man behind the pincener. The distribution of patronage is, of course, a part of the public business, and an important part. There is nothing whatever to indicate that he thinks it profitable or is going to neglect it. The trouble is that if he gives it to one-tenth of the time the office-seekers demand he will have no time for anything else. Moreover, the worst way he could go about attending to it would be to yield himself to personal solicitations. If he did so, he would have little or no chance for real investigation of the applicants' merits.

The only question is, Can he enforce his rule? Can he keep the applicants at bay? We trust so, but we are not entirely confident. Plenty of people have refused to be interviewed, and have nevertheless found their remarks on the front page of next morning's newspapers. Yet the reporter's ingenuity and artifice is as nothing to the American office-seeker. The latter's ambition is in truth one of the most extraordinary things to be found in human nature. Nobody has ever quite done justice to it. To caricature it is impossible. The degree of it is in inverse proportion to its reasonableness. There is no reasoning with it, any more than there is with a fever of nature.

Perhaps there is a better way to deal with it, and perhaps President Wilson is the scientist who has discovered the way. At any rate, we sincerely trust so.

#### A Matter of Qualification

"I was elected by the Congress," said Mr. Wilson to a reporter, "on the theory that I was literary."—*Reviewing Post.*

And to Chevy Chase on the theory that he was a scholar. That explains all. Knowing well himself, he accepted the vote election and declined the other.

#### The Secretary of Agriculture

DAVID F. HANCOCK, Secretary of Agriculture, stands very distinctly for one way of choosing Cabinet members. So far as we can make out, he had only one "claim" to any such preferment. That was fitness for the place.

The Secretary of Agriculture is at the head of a big establishment, and of a large group of men devoted to two general aims. One of these

is scientific investigation; the other is teaching. The department acquires and accumulates information which is of use mainly to the farmers of the country, though some of it is of use to the rest of us as well; it also endeavors to impart this information—that is to say, to teach, on a very wide scale. Mr. Hancock's peculiar fitness for his new position mainly from the fact that he has successfully headed three large establishments—one college and two universities—devoted to the same kind of work—that is to say, to investigation and to teaching. Moreover, the three establishments investigated and taught agriculture.

Perhaps we ought to add that Mr. Hancock, as we might infer from this record, is a man of full education and established character for intelligence, firmness, and integrity. His political "claims," however, are practically nil. Though a good citizen and a student of politics, he contrasts as you will observe, never "delivered" a denunciation on anybody in his life, and is not likely to. While Mr. Hancock is very clear that there is no need of politics in his department—indeed, the crying need there has long been to get rid of politics—we are nevertheless afraid that plenty of statesmen and some others will find this appointment surprising. We can only hope that future Cabinets will offer more and more surprises of precisely similar nature.

#### Old Boy and Her Neighbors

New England is out of it. For the time being her representation in the governing group at Washington is nil.

It is interesting, to our mind, it is a mistake. But New England has little reason to complain. For a long time her conscience and patriotism have had little representation at Washington. Her wealth has been over-represented there. She can hardly blame the rest of us if, taking her at her word as to what representation she wants, we have for the moment left her comparatively void.

Nevertheless, there is still plenty of conscience and sense in New England, and we predict that before the end of the new administration it will be called on and will not refuse the summons.

#### No, Mr. Tarr

On Monday, March 24, President Tarr went to the Unitarian Church, where he had worshiped for the last four years, and addressed the congregation. The papers say that he said, among other things:

It always has been a wonder to me why all the world is not Unitarian. I think all the world is within it, that is to say, I think the doctrine of true fellowship, of love of God, of love of Jesus Christ, and tolerance for every faith which depends on a great principle of love, of Christ, which makes for progress toward morality and higher religion. The one trouble we suffer from—if it is a trouble at all—is that there are many churches of other churches who do not sit in the jaws of our church. But that means that ultimately they are outside us.

No, Mr. Tarr, you are going to them. The Unitarians church, those last when the other folks have become more comfortable, the Unitarian church has ceased, we believe, to gain membership. The American people, Mr. Tarr, have a great and just regard for you, but they never would appoint you a candidate of one to go out and ascertain which way the tide is running.

We will not say, Mr. Tarr, that if St. Paul had been a Unitarian, Christianity would have been known in history as a sect in Cappadocia. But we will say that if St. Paul had been a Unitarian, it would not have been necessary to collect his epistles for us, which would never have been enough market for them to warrant it.

#### A Candidate

They do things thoughtfully down in the Tarheel state. At a grand jubilation over some report or other last week Governor Cass said: "I see our own citizenship commensal all the way." and Mr. A. H. Evans passed up a petition for an office reading: "In the first place, any candidate is a non-entity in the second place he is a Christian; last above all he is a Democrat." Surely that ought to last him.

#### Harvesters

The Harvester Trust is under fire just now. Some of the testimony which the papers report in the suit being tried in Omaha casts much doubt on the supposition that Beecher GEORGE PIERCE's grouping trust gets all the farmers' money. For

GEORGE SWANSON, of Crawford, Nebraska, testified he owned 1700 acres of land, 900 acres under culti-

vation. He valued his farm implements at \$3,350, of which amount harvesting implements represented \$230. His testimony also brought out something about the Harvester Trust, and the fact that he had been receiving for the last two years about double the price of ten years ago for what he sold, while prices for what he bought had advanced but very little, and advanced insignificantly and in many instances had declined.

GEORGE SWANSON seems to be doing fairly well, though of course he may be buying Brother GEORGE PIERCE for much for harvesters.

There is one man who had been in the harvester business. He was opposed to all trusts, and to the Harvester Trust with the rest, but out of his experience he had this to say. He said that when the country was full of competing harvester companies, the selling agents sold the farmers more machines than they needed or could pay for. Too many farmers bought new machines, gave orders for them, and let pretty good old machines stand out-of-doors and rot to death. Then the notes came due, and were very hard to collect. That was wasteful. But the trust didn't find it good business to sell more machines on credit than the farmers could afford to pay, and didn't try to do it. The trust was content to get the business that existed. The competing concerns continually got business that didn't exist, and lost money on it.

But we all know that, had as monopoly unquestionably is, unobscured competition has led its change to make this earth a paradise, and somehow slipped up on it.

#### The Republican Leader

From the Congressional Record:

MR. HANCOCK. I have been called over the telephone since five and told by a lady that her young daughter was so one of the State and a coffin placed on the spot and buried her daughter.

MR. MASS. Her daughter ought to have been at home.

MR. EAKER. She ought to have been at her own home. The gentleman might be so advanced of himself to make such a remark.

So he ought. But was he? Could he be? Some think he isn't much of a Mass, however you spell it.

#### Dr. Friedman

It is certainly to be hoped that from the visit of Dr. FRIEDMAN to this country some good will come, directly or indirectly, some benefit to the vast number of sufferers from the disease he has promised to cure. Not to them only, but to the multitude of others who are suffering with them, whether as the bearers of their burden, or from the love of them as individuals, or merely as generous hearts that would be indifferent to any such mass of misfortune scattered over the world. For Dr. FRIEDMAN'S visit has at least served to bring before us all in truly heart-breaking fashion the proportions of the White Plague's silent and ceaseless work. It has at least served us to be for a moment mindful of the sickening expectation with which we gaze upon the multitude who are now promised their relief. Surely, therefore, it will stimulate philanthropy and science to more persistent efforts in the search for the longed-for cure.

In announcing this expectation, in promising the cure, Dr. FRIEDMAN has taken on himself a terrible responsibility. The whole world knows of his promise, and in his promise he makes the most perilous, unshakable, the current criticisms of his behavior, he will take his place forever with the greatest benefactors of the race. If his professions are false, may God help him, for mankind will never forgive him. It will not be possible for him even to sink away into the miserable company of the countless swindlers who have made their money quick resolves on the poorest and most ignorant of consumers. Compared with what he will have done, Dr. COX'S performance, even if we put the worst possible construction on it, will seem a mere trivial episode. Quite apart from the incalculable value of the discovery, Dr. FRIEDMAN'S very attempt to cure mankind, we think, will do the honor of human action, that he may be found to have some truth in his claims.

#### Incidental Aid

It is not a fair distribution of felicitations to say that if THOMAS ROOSEVELT had never lived, or if Charles had never made him President, WOODROW WILSON would stand the present all at March at Princeton University still without post-graduate books. Mr. ROOSEVELT largely owed out from the high right of the Presidency, gave astounding expression to the liberalism which had been the dominant atmosphere of the nation, infused Mr. WILSON, and caused a complete about face in his attitude toward government.

He did contribute somewhat to the net result, we must admit. But perhaps that isn't quite what you mean.

## Pensions

That is a good letter on page 9, in which a correspondent discusses "Pensions for Government Employees."

But the great pension question is not—the pensioners desirable? There are two great questions about them: Where are the money coming from to pay them? and Where are the money coming from to pay them?

It is likely enough that a pension system for government employees will be devised presently. Our opponents' arguments about that are very appealing. But what about all the employees of the great organizations and societies? What do they come in for? When they are used up as work-machines shall there be no pension for them? Should not everybody have a pension for old age or disability except the farmer, and then should not the farmer have one?

Government, local or otherwise, whatever, as it is, to keep all people and helpless persons from starving, and spends vast sums in that duty. How much farther than that government can go depends upon the wealth of the country. But some part of the relief now given might, doubtless, take the form of pensions with good results.

## Two Ambassadors

It is not easy to get the facts relating to the activities of our ambassador in Mexico, but there certainly is a lot of smoke. On the face of things it looks like the substitution of a competent man of level head would not be undesirable at any early date.

There is one resignation, however, that ought not to be accepted so promptly. It is that of Ambassador LEAVELAND, who ought to have a chance to show that he has not made improper use of his prerogatives. If he can do it, well and good; but if he can't ought to be dismissed in such a way as to discourage wrongful practices on the part of representatives of the United States in foreign lands.

## The Crossing of Races

President ELDER, as is well known, is a stickler for purity of race. He objects to the idea that the United States is "the melting-pot of nations," and says against it what a chance offers. In a recent letter to the Springfield Republican he discusses the crossing of different races, and says:

The East seems to me to look most emphatically that it is always and everywhere a bad thing, so bad that the process resulting from such crossings in part set out and in part refer to me here. The other is their real generation. In the East the white race has crossed with all the native races, and the progress is still going on, and both physically and morally to each of the races that have crossed. The term "Fusionism" is a term of contempt all over the East, and justly. The results of crossing often to twenty varieties of what people with native races are seen most clearly in the Sandwich Islands, where the white man has crossed to be good, not over the cross between the Chinese man and the Hawaiian woman, which all agree is the best race crossing in the world. Unfortunately the East does not supply demonstration in figures on these subjects, because what we call vital statistics have not been kept there till very lately.

The East also shows on a great scale that different races can live, and have lived, on a harmony made by sale on the same soil and under the same government, and another showing with respect to the mixing which subsisting as our racial characteristics. The East also illustrates the fact, often illustrated in Europe and elsewhere, that the best and related races can intermarry without harm, and produce vigorous and durable descendants. Thus the Germans, Scandinavians, and the English, and also our noblest minority without harm. It is not so clear that the best of the same race intermarry solely with people of the same blood, but instances of such marriages occur; but there are also many unsuccessful, supposed to be traceable in the present population into somewhat distinct types, and in consequence the new race of China has five or six different colors; but they are probably related or kindred people, and these people are supposed not to have intermarried much in China, and yet the Chinese are a tolerably homogeneous race. In America we may also see the mingling of kindred stocks and the preservation through many generations of strong strains that have preferred to marry each its own strain. In the South, the Scotch-Irish, and the Jews.

The general conclusion which I draw from these and similar large-scale studies is that the effects of intermarriage in the United States were but better seen and entirely the hypothesis that the different national stocks of the United States amalgamated into a somewhat new variety of the human race. The actual knowledge supplies no successful instance of a race being entirely destroyed, or, if once a small proportion of a race is introduced, that race has sometimes been apparently absorbed into a larger proportion of another by successive intermarriages with the stock. The Jews have intermarried somewhat with most of the European races; but in a few generations the descendants are thoroughly Jewish.

In this country we can hardly help founding our ideas of race admixture on the breeding of white with black in our Southern States, mostly as a result of the slave trade, and the carrying trade of Africa slavery. Surely this is not an instance of successful amalgamation. The North-American people are not so much mixed as the people of Africa have done; but the half-breeds have on the whole proved to be neither a large and useful addition to the total population. The experience of the world demonstrates upon an immense scale that people far advanced in the scale of civilization are not profitably mixed with people of a lower grade. The purer a race is kept, the more likely it is to maintain itself and prosper. The Japanese forcibly illustrate this proposition; still it is to be remembered that the mixture of kindred races is unobjectionable.

The fitness of one people to another in this country is not to be overlooked and to be regarded without approving the question of assimilation by intermarriage, school, public employments, places of public education, and the habits of the whole people in buying and selling contribute to produce that external sort of assimilation. So does American equality of rights, and how much more so between the different levels of social life. In hundreds or thousands of years this external assimilation will probably be followed by internal, and then it is not; but that is a question for a remote future. Those who advocate or imagine the amalgamation of different races are not, I submit, a part of the benefited experience of the world, and therefore no sound reason for taking action in this direction. The different races that come, or are now coming, to this country will take care of themselves in those respects and may safely be left to do so. They will promptly Americanize themselves in all respects, but it is there will easily remain diverse and apart.

We have quoted at some length from Dr. ELDER because this matter of race-admixture is such a nightmare to many people in some parts of the country, especially in the South. It will be observed that he negates entirely the idea that a race can be so coming to this country as to take care of themselves in those respects and may safely be left to do so. They will promptly Americanize themselves in all respects, but it is there will easily remain diverse and apart.

## A Contrary View

The view maintained by Dr. ELDER is shared by Mr. CHAMBERLAIN, the author of *The Foundation of the Nineteenth Century*, whose consideration of the value of purity of race amounts to a hobby. The contrary view is communicated to the Springfield Republican by Mr. MERRILL STONEY, a well-known writer on a disinterested and high ground. J. S. HERRICK, in his recent book about South America, and S. M. BRYCE, by no means as correct as Dr. ELDER in his conclusions about the evils results of racial admixture. He also quotes Mr. SIMPLY OLIVER, a former governor of Jamaica, as saying:

Whatever undesirable characteristics, moral or physical, are introduced by cross-breeding, it is certain that from the point of view of social utility and efficiency it is not the mixed blood class, it says, that is dominant in Jamaica.

Mr. STONEY agrees that prejudice, which has divided the Europeans, a false class in Asia, may have had much to do with keeping them back, and he protests against a similar prejudice against mulattoes in this country. With only too much justice, he says:

There are to-day in this country millions of our fellow-citizens who from an inheritance of their own age and color are suffering, and who are doing a thing of ambition and ability from their white parents. Their path through life is strewn with thorns and they have difficulty in reaching the goal. It is the duty of every man at this time when the prejudice against them is so widely fostered and so quickly growing, to stand by them in their struggle, to defend their rights and the ideal of justice from which they are suffering. We are bound in every way to help these men and women up.

## A Suggestion

I would spend my last dollar for an American citizen's life, but I would not split one drop of blood to give an American citizen's dollar. — President MANNING.

We don't know about that. Suppose a foreign citizen should strike you in the White and then whip you on the Indian-style baseball-stick. What then?

## Remarkable

Our friend DYER LYONS, of Mexico, New York, writes to us to say:

Dear Sir,—I have just read your editorial "Comment" in the Weekly of this date and write to inform you that I have already written you in advance of the negroes. And as I fully appreciate your courtesy, I relieve you from the trouble of consulting to mail my copy of the WEEKLY.

We turn in some perplexity to the WEEKLY of Mr. LYONS, and find it thus worded:

The word for us Anglo-Saxons—English, German,

Jewish, Polish, Arab, African—for all of us, in fact, is patience.

It seems to be a matter of precedence that has driven Mr. LYONS to satire.

## Remember!

When you hear of Scotch-Irish descent in the White House, and a gentleman whose derivation is partly Irish in the great office of Secretary of State, it ought not to be necessary for us to point out to Mr. LYONS that the order of names in type is quite a casual matter, and that the head of the table continues to be wherever McGuffin sits.

## Bull-Moose in Massachusetts

We should like to print the whole of the dissertation upon Bull-Moose politics in Massachusetts, which was communicated from Boston to the Springfield Republican by a "Victorian Observer," who is undoubtedly our venerable and respected contemporary, Hon. FRANK RAYMOND. "These Bull-Moose," says Mr. SAMPSON, "are no more in a normal frame of mind than is a Malay running amok, or a Methodist camp-meeting in the hands of a skilled revivalist."

And then he lets go at them as follows: For the most part the progressives are new to politics, and have written of them as if they were prominent in political activity, the entire campaign—and it seems to have about as many women as men—and they are not so much as they are. They know little or nothing of what has been done in politics before them. They are ignorant of the facts of the case, and are prejudiced, prejudiced, self-satisfied, and active in their own trying to solve political problems, to restrain the exploding hand of wealth, to protect the weak, to save the children, to feed the hungry, to relieve the poor, to secure good pay for all. As well-known with no history the masses have taken the political stage, and they are not so much as they are. They see the evils of the times, and because the evils exist, assume that nobody else has noticed them or made any attempt to remedy them. They do not know the facts, and they do not understand themselves. Their one aim is much simpler and less complicated than theirs, and they are not so much as they are.

Most of the moose have hitherto been of Republican complexion as far as they have taken an interest in politics, and some progress has been made. The plain truth now is that the Moose party has been formed, and is easily nothing but straight and narrow, and is ready to accept of any platform, in what may be formed right propositions—help for women, provision of child labor, minimum wage, child insurance, child pensions, inheritance and inheritance, and so on.

Now that 8-14 is rightfully, historically, and really now the possession of the Democratic party, the progress and progress of this kind of legislation is perfectly well known. Ever since the Civil War it has been under way. It does not begin with the industrial revolution, and it is not so much as they are. It begins with the poor people who are suffering for lack of the reforms demanded. The history is long, and it is not so much as they are. It is the agreement of the workers. It goes back to the struggle for the ten-hour day. It deals with the oppressive conditions of the working class, and it is not so much as they are. It is the employer's liability law, the opening of factory doors outward, the construction of fire escapes, the protection of mechanics and landless more highly necessary and important measures. These always originate with the poor people to be helped.

Help us always, and give us New Economic party. New Economic party. It has always been on its job, faithfully and without retreat. . . . If these moose had shown in the past a tenth of the interest and progress of these reforms would have been several years ago.

Perhaps Mr. SAMPSON will succeed in convincing his Bull-Moose neighbors that they are Democrats and don't know it. If not, events will presently convince them, and in due time we shall have them voting the Democratic ticket as they should.

## The Voice from New England

We have observed that New England is comparatively voiceless in the new administration, but, with all that, we say that New England is chosen to be the constituent of Mr. RAYMOND to be Secretary of Commerce. The opposition from home to the appointment of a gentleman from Boston to that place is understood to have been very intense.

## For Captain?

# "SEEING" MEN

The Art of Picking Winners in the Business World

By Cromwell Childre

DRAWINGS BY J. J. GOULD

The old man put question after question in quick succession.

**S**EEING men is an art. It amounts almost to a science. Often, it is a business "flair" some men make in a way spontaneously and rapidly in the lap, or even to it. He does not seem to have greater trading ability than many others, but has been favored by a large capital or a more magnetic personality. But the faculty of "seeing" men has been the magical force.

"Seeing" men means recognizing, perhaps under an approving exterior, what a man really is or may grow into, and attaching him to an organization or staff. There are business executives that are generous in doing this. Their success is brought about in great measure by the efficiency of the body of men they have picked in this way. It happens many times that a captain of affairs heads for years for a treatment of certain qualities. He finds him at last, in Cincinnati like work, far down the commercial ladder, a person a hundred other men who really wanted a man of just this type, have passed unnoticed over. They could not "see."

It is no trick at all to discover the man who has triumphantly made a record, who is already a personality in this trade or that. Unfortunately such a man is not usually ready. What he has done, moreover, is no positive guarantee as to his future exploits. Men of great reputation as lieutenants may time pass great disappointments when they shall. The chief who "sees" picks a man whose reputation is yet to be made, and thereby gets the profit himself.

A business man who is now doing splendidly in a certain business organization, one of his able employees, then well down the line, found himself up against a stone wall as regards increase in pay. He had kept by degrees up to a salary of \$1,000; repeated requests could not seem to get him above this. He quietly took himself off to a rival company which gladly paid him something more.

That the big chief knew of him, except possibly by name, he never suspected. But one day, some months later, this occurred. In a moment, the famous employee of affairs, who seemed always to be aware of everything without asking and who at times would cleverly rearrange his man like pieces on a chessboard, and suddenly:

"Get Jones."

He did not add a word to that succinct statement, and passed on to other matters. His assistant, however, understood, however. They knew that they were to bring back the man at any figure he might name, under any conditions he might impose. The command was absolute. Their leader had "seen" where they had not. The great organization is going to have this man who appeared by an unseen agency.

Whoever walks into the central offices to-day and has business up at the top will in all likelihood meet this man, who some years ago, was "seen" by the boss brain at the bottom. In any case he will be of him. For, quietly, Jones has gone past men of far more brilliant records. Why, they, too, did not "see" at the time the command to "get" him was given, his admiring associates of the present moment do not know.

"Call tomorrow morning at nine o'clock" said the president of a big bank in a city of the far West.

The man he addressed was shabby and weather-beaten. In the handsome private office just off the great banking room of gold and marble into which he had just been ushered by hotel valets, he sat out of place. He had entered ten minutes before, nervously, but with a despondency he could not quite conceal. A succession of men had been looking him like the tramp he seemed.

The man and rough clothes, the unkempt appearance, the air of one who is shagged and in luxury had blinded man after man. For an entire day, at any hour, the stranger could have been bought, body and soul, at the price of the market pitiless. The man who turned him carefully aside or would not even look at him, perhaps, he blamed. It is possible, not business to give opportunities to every tramp-like make. However this may be, one man's eye and brain did go beneath the shabby garments and the general air of "down and out." The curious thing about it was that he was the biggest and richest man of the "tramp" had attempted to see. He sat up as far as the board office. "This was no accident that the stranger tried overthrowing the first, and came into it last in pure desperation.

The big banker "saw." He could not, perhaps, have told any one how. The shabby man's personal appear-

ance did not concern him. There was something beyond that in his make-up. What all the other banking men who had had the chance bitterly regretted afterward that they did not do this one man did.

He noticed the shabby man to a chair, and, while staring at his story, deftly analyzed him. The man's story was simple. It was very quickly told. The stranger had held a good position in a bank in the East. He had left this to search for fortune in Alaska. A shipwreck had beggared him. Even the letters he had from his old bank had been carried away with his other property. No man would possibly be more sorry.

It was a short interview, very short. The shabby man had nothing to say that night, but he chuckled at that. He had found work. He knew that one man had the capacity to look beneath exteriors. The big banker, on the other hand, softly laughed as the content, with a totally different eye, went out. As a matter of formality there went out from the bank within an hour a telegram addressed to a city in the East. But there was really no need for it. An expert had been discovered, one that a dozen other ordinarily able men had been too blind to see.

Both men, the discoverer and the discovered, were in the banking office early the next morning. The banker was eager to see his quick judgment confirmed. He placed his "find" in an inconspicuous corner, but where knowledge and experience would tell. The newly dressed clerk looked at the man over his shoulder. That person steadily kept pace with them. What was their surprise when, at noon, the president stepped over to the stranger, and said:

"I am going out to lunch—join me."

The rest of the meeting has been devoted. Over the lunch-table the man who a few hours before had been a despairing, hopeless struggler was told plainly that a future was awaiting him. An advance was arranged for him. Within a month the man who had tramped from door to door, shabbily of the shabby, begging for the work he must have, was beginning to attract marked attention in the financial circles of the city. His sudden checks had filled out. When well dressed he presented an engaging figure. Three months later he was second assistant cashier. In two years he was the president's confidential man. To this day the other banking men of that section, who have seen many a better foot to them since his arrival and credit is power, do not understand how they could possibly have let a man of that ability slip past them. They could not see what was meant by they were told that it was because they were men who could not "see."

A master in the steel trade was looking over a assembly statement with much complacency one morning. Nothing was further from his mind than adding to his selling force. It would be difficult for an organization to be in better trim than he was just at that time. He was good-natured and let a clerk-employee slip in and get his car. That individual was some time ago a man.

Now the above paragraph did not want any new trousers, and he was not given to buying what he did not need. He was known as one of the most hard-bargained business-owners in the entire country. But there was something about the employee's talk that fascinated him. He let him on on. With rare generosity he made the sale and dismissed the individual.

His sole occupation had been eating three meals a day.

eluding him, he felt that salesman a sorry case of wife, hanging out every ounce of skill the dresser had. The salesman had an idea but that it was merely a matter of a few yards of cloth. It was, however, an ingenious "try out." The master of cloth "saw" of the had come across a salesman of rare powers, and he meant to have him.

He brought the cloth. "There's a cunning, though," he said, grinsy looking out from under his shaggy eyebrows. "It's this: that you go to work for me. I'll make it all right with you. What are you getting out of it?"

Confused, for this was one of the great commercial prizes that he was standing before, the salesman commenced to stammer. The result was of his ability had been almost too sudden and dramatic.

"There thousand, you say? I'll double it at the start. Come before the end of the week, if you run. It's a crying shame to waste that gift of gift you have on trouser stuff, when with the same toil you can be selling shirt tails."

This was one of the most brilliant salesmen born in one of the biggest of American industries. It was behind a desk had "saw."

Bob Dwyer, an agent for an oil company, had the rare gift of obtaining business where others failed. He had a plan of campaign all his own. He did not claim that the oil he sold was better or cheaper than his rivals.

He cleverly conceded that there was no difference in the quality of the price. The young man offered to show any man who would buy from him how he could out down his oil bill materially. This was a bold and astute made a capital issue for him, and that ended it. Nobody ever thought of proclaiming him a wonder.

One day he looked in upon the manager of one of the great oiling companies. It was a peculiar impossibility to sell in this manner except for a certain oil company. He always stood by his friends, and Dwyer's chief opponent in the trade had many times gone out of his way to favor the old gentleman. But Dwyer thought he would try. He remembered that he had several times stormed commercial fortresses where there was only the ghost of a chance, just as in this case, and had "won out."

Because was this business druggist's name. He did not make use of the conventional modern method of keeping himself in oblivion. On the contrary, he delighted in showing himself to all visitors, glaring and growling at them from behind a wire grating.

He had heard of Dwyer and was a little curious. He noted that his usual gruffness fell on adoring ears. His guest, "I have oil from a company I am satisfied with, sir. I would not take you off if you gave it to me," did not seem to have any effect at all.

Dwyer simply asked if he would not be interested if he could show him how to cut down his present oil bill fifty per cent. Naturally such a question brought

In the handsome private office he looked incongruous and out of place

forth a certain answer. It was given unvoluntarily and grumpily, but it was an admission.

The order Dwyer was after came inside of a quarter of an hour. The young man was pleased. It was one of the most difficult little battles he had ever fought. It was, however, not so much unlike the others, and he was surprised when, as he started to go to the old miser laid his hand down heavily on his knee and said:

"No, Walt. He stopped, and then went on. 'You're in the wrong business, boy. We need you in mining.'

The old mining manager was one of those who could "see." He had never set his eyes upon Dwyer before, but that made no difference. Men who can "see" see quickly. Long afterward Dwyer came to understand the whole story. Mr. Because had been looking for you for a succession. In all the organizations over which he was master, comprising in the aggregate several hundred men outside of the

hunting forces, there was not one to whom he could trust. The young man steady, sure, but he was smart. It was his habit to get the best of every man he dealt with. He was not one to be outwitted.

**and a -ol Exhibits.** Some the death of the man who... at for what he was at first sight, that in... he has looked into... have had... important exhibitions, has reduced... has acquired a railroad... to meet... several times he visited companies in different parts of the West. Other managers saw in him only the ordinary oil drummer who made fair money.

A man-manufacturing concern was a deep water shoal. It made good soap, delicately perfumed and artistically wrapped. The company was small. Like most unpretentious men they thought the people would fall over one another to buy their soap. When orders did not come in they could not understand. There was something of a reorganization, and a minority element which had more or less business experience climbed into the saddle and forced through the appointment of a new sales manager. The new man took three days to study the sick business. Then he telephoned his decision.

"Your soap is good, but your salesman are no good." Thereupon he commenced the building up of a new staff. Among the applicants that filed past his desk was a tall fellow of careless though pleasing address. Inside, to the ordinary observer, would have seemed to have no business talents at all. He had no business experience, he confessed that he did not. His sole occupation in life, he acknowledged, had been eating three meals a day provided by indulgent parents. He was getting a little tired of this, he went on, and thought he would like to do something else.

The new sales manager had so difficulty in understanding that. From the strict business viewpoint this was the most unimpressive kind of resume ever had come across. But there was something about the boy-eyes, there was something, what it was he did not know. But he could not let that pass. Without one jot or tittle of evidence, against what would have been the judgment of wise business men set of seventy-nine out of a hundred, probably the "saw" in this untried, unformed young fellow a great salesman, the one man he needed.

Did the lad who knew nothing of business succeed? Walt and hear the story, which is one of the most curious of business romances, some incredible, but in its every detail true. The sales manager trusted in his own intuition, and sent the boy out into an adjoining state. The soap was not even selling in the first town he entered. In the very first store he met an experienced salesman in the same line of business. Despite that handicap he looked one of the largest orders placed in that section for years, with a special discount for each on receipt of bill of lading. Inside of two weeks he was as depleting the soap stock of his concern that the factory was running a night shift to keep pace with his orders.

How did he do it? Nobody knew; nobody has ever been able to say. He was simply a matriarchal salesman that no one had been able to recognize. The great odds in any line of action is always "seen" with difficulty. The commonplace man is invariably accepted before him. The reason is that the exceptional man needs an exceptional client. It takes a man of extraordinary capacity to discover the extraordinary.

# HAWKING WITH THE ADWAN ARAB

BY WILLIAM COFFIN

IT is not often nowadays that one has a chance to go hawk-hunting. The glory of the sport has long gone by in Europe, its ramiary vocabulary is almost forgotten, and it exists there only as the lad of a few medieval romances sported.

In the East, where the art of falconry prizes is regarded, it flourishes still. Riders from the Jordan Valley in the west, where we stumbled upon an unexpected prize in the end

of a journey, a day's good sport with Arab hawks, which befell thus:

The Adwan Bedouins had come down from their holdings near Hebron and had been encamped for some three weeks at Tel Nizrin. We crossed the Jordan by the ferry at Danek, rode down the east side of the Jordan Valley, and in the middle of the afternoon drew rein in front of the woe of our friend Hebron Noed.

The check was from loose, but there were many of his camp to come up and give us welcome. We off-

loaded, a carpet was laid in the guest tent, cushions and thickly wadded quilts were brought forth, and the heavy sound of the coffee trays rang out.

Before noon, a man came, black faced, top up and we went forth to greet him. I had not met him before, but Whiting and Karen were old friends of his. Bedouin also, an even as respectable as them, and Nasid was conspicuously satisfactory in his known abode, on long gray mare with her bowled saddle-bags and sword scabbard. Hanging on the pommel was Rihb Nasid's fellow. He had been hawking

# InterSudes

## A FLIER IN REAL ESTATE

**B**LANKIN had joined the eager gang of fortune-hunters who, instead of digging in the earth for the pure gold of substantial returns, had sought the short-cut to affluence. In company with thousands of his hungry fellow mortals he had deemed it wise to go into a real-estate speculation that promised quick returns.

"Even if the returns don't return so quick as you'd like," he explained to Wingford, "the land is always there and you know what you've got. You can see it in plain sight."

Unfortunately it remained in plain sight overlong, and after carrying the venture along for a couple of years Blankin began to yearn for just a glimpse of the five thousand dollars he had been induced to put into it. So he sought out the agent who had sold him the property, and whose aluring promises had first led him into thinking that the future was secure.

The agent was delighted to see him. "What can I do for you this morning, Mr. Blankin?" said he. "Want to buy another block of Everbody's Magnificent Villa Sites Preferred?"

"Not on your life," said Blankin. "I'm long on E. S. V. S. F. of this very moment. Fact is, I'd like to have you take that land back."

"Oh, really," said the agent. "Well, real estate is my business, and I guess you have come to the right place."

"Good," said Blankin, gravely. "What'll you take the place of my hands for—on, rather, what'll you give for it?" asked Blankin.

"Fifteen hundred dollars," said the agent. "Fifteen hundred dollars?" echoed Blankin. "Why, I paid you five thousand for it, and you guaranteed a return of thirty per cent. on the investment."

"I know I did," said the agent. "That's how I got the figure. Thirty per cent. of five thousand dollars is fifteen hundred."

But Blankin never heard. Before the agent had finished he had led to his own office and locked his door.

"Good!" said he. "I guess I'm lucky to save my socks with a chap like that around."

## WORKING BOTH WAYS

"That's my," said Biddis, reading a farm paper, that giving hickmahk to calves never works.

"No?" said Pottlehog. "That's funny. Since I began drinking hickmahk my waist has disappeared altogether."

## IDENTIFIED

"In that your Prudential Sam?" inquired the visitor to Uncle Zeke's farm, pointing to the youth who spent most of his time swinging in a hammock.

"No," laughed Uncle Zeke, pleasantly. "He's my fatted calf."

HOW TO HAVE A SQUARE IN A HATBANK

## THE AMATEUR FARMER

"Yes," said the dealer, "I have cows to sell. What kind of cows do you want?"

"I—I don't know," said the amateur. "I guess one with four legs and a couple of horns will do."

## A FINANCIAL COURTSHIP

"Come over here to the counter, Justin," said Hinks. "I've something I want to tell you."

"Sorry, Tommy," said the young woman. "but I

heard on my last night that the Supreme Court had decided that corners are illegal under the Sherman Act. If you want to get a controlling interest in me—you'll have to choose some other method."

"All right," said Hinks, folding her in his arms. "How does an interlocking directorate like this suit you?"

## EUPHEMISTIC

"What is old Jimmerson, anyhow—a poverbisher?" asked Hilly.

"Well—yes," said Delamere, "only he wouldn't put it just that way. He'd probably call himself a bookbinder if there were such a word."

## A DEDUCTION

"How old is a man in the editor of the *Times*?" asked Wilcox.

"I don't know exactly," said Wilbraham, "but judging from the way he treats every manuscript I read him I judge he has reached his declining years."

## A POSSIBLE DERIVATION

"I wonder where the appropriation arose that the stock brings the bakers?" said Mrs. Jimpson.

"I guess the man who started it was thinking of the doctor's bill," said Jimpson. "The size of it suggests the real."

## A REAL SURPRISE AHEAD

"What are you doing, Polly?" asked her mother.

"I'm knitting. Mamie died," replied the young woman. "I heard George say the other day he was afraid he'd have to buy a new mother for his car, and I thought I'd knit him one as a sort of surprise."

**QUEEN BEE:** OFFICIAL, WITH WHAT IS THE PROPOSED COURSE?  
**PAYING BEE:** NEGOTIATING SECTION V, STATE MAJORITY, WHICH STRICTLY FORBIDS A MAN TO VISIT THE PORT-FIELDS.

## A GOOD NAME

"I've got a perfect lady's car," said the manufacturer, "and will give a thousand dollars for a good name to advertise it."

"Fark over," grunted Jimmerson. "Call it 'The Last Word,' and every woman in the land will insist upon having it."

## A GREAT CONVENIENCE

"I wish I knew what to do with all this broken crockery," said Mrs. Flatwheeler. "There isn't any place to throw it away, now."

"I have all," cried Mr. Flatwheeler, his eyes aglow with the firm of gums. "Put 'em in the paravels post and mail 'em to some fitful address in the first zone."

## UNTIMELY JESTING

"Mortimer is all well enough," said Jettrocks, as Broder's car skid into the mud up above the barn, "but there is such a thing as running it into the ground."

"Don't waste your wit out here in the old, Jettrocks," retorted Broder. "Go hire a head. We need it."

## NOT A SATISFACTORY ASSURANCE

"An. Maric." Politely murmured ecclesiastically, "I warrant the very grandest you walk on."

"I had all," cried the fair girl, bursting into tears. "Why, when Duddy bought me that new electric I don't walk at all!"

## A GOOD BUSINESS MAN

"What, Mr. Shillford," said the doctor, "it is my pleasant privilege to announce to you that you are the father of twins."

"Well—say—see here, doctor, don't you knock off something for a wholesale order of that sort?" asked Mr. Shillford.

## WHAT IT CAME TO

"I've figured the whole thing out, father," said Habel. "The car to begin with will cost \$5,000 which at six per cent. is \$200 a year. If we charge ten per cent. off for depreciation, it will come to \$240 more. A good chauffeur can be had for \$125 a month, or \$1,500 a year. I have allowed \$50 a week for gasoline, and \$5 for repairs. The chauffeur's uniform and

"GEE WHIE! IT MEYS BE EENSIE TRYING TO GET ABOUT IN THOSE UN-GOODER TINKERS"

fare will come to about \$200. Now let's see what it comes in. Three hundred plus five hundred—

"Isn't that a lot, my dear—I know what it comes to," said the old gentleman.

"What?" asked the girl.

"It comes to a standard, right here and now," said the old gentleman. "Three—here's five cents. Six out and take a toll—right—right."

## RATHER SPEEDY

"How fast is your car, Jimpson?" asked Harkway.

"Well," said Jimpson, "it keeps about six months ahead of my income generally."

## THE PHILANDERER'S EXCUSE

For eyes I love them deeply blue, that rival heaven's fairest hue, and sparkle like the twinkling star up where the hudson planets are; that envy in their slightest glance a gleam that causes hearts to shiver—such eyes, indeed, no girl my gaze when Phyllis o'er my pathway strays.

For hair I've ever been inclined unto the russet golden kind, as burnished as the copper coin that lights my way when day is done, and brings the comfort trod and true—when all my labors hard are through—such locks, indeed, as glorify the world when Phyllis passes by.

For brows the alabaster hue has ever been the kind I'd covet. Not overbrow, nor yet too low, as wrinkled as the fresh-strapped oar; that speak of an intelligence that's normal rather than inferior. In short, just such a brow as Fate always presents unto the view.

In lips—well, you cannot but the figure that is styled "petite"—the slender sort that moves with grace however fast or slow the pace. No gutters would do at all in answering my ardent call, but just a perfect—Venus, say, the dainty Violet or May.

A silvery voice like dew Rubric's; a tripping toe like fair America; the wit of Cleo; and the glass and honey virtues of sweet Jane—these are the points that make for me the perfect most whose head I'd be, and where, I ask, in all the world one all be found in just one girl.

BLANKET GUAT.

# THE BEATITUDE OF JIMMY O'MEARA

BY ELMER BROWN MASON

DRAWINGS BY W. H. D. KOERNER

W

INTER was two weeks old and it was eighteen degrees below zero, which means solid slidding for the lumbermen when Jimmy O'Meara walked into camp. In the first place, he was completely sober, wiser enough to show. In the second place his grub was beyond belief; a cork hot, with a heavy morning hand, a fresh-out of the wood-chimney pot, an extremely discomposed pair of trousers of the best lumber-jack type, and high-leather, button-patch-boaters which made him walk like a small boy making his first attempt at the outer edge. His hair and socks were matted against the cold in the folds of a linen duster, twisted every way, from which one cold blue eye glared balefully. The other had been permanently eclipsed.

To my we were curious who he got it mildly. We knew Jimmy for the best driver that ever rode a proled shaft in a thirty-mile forest, and the wildest stage when the drive was over that ever mixed the whiskey with hot Irish blood. The eclipsed eye had been lost in a river brawl, and he had acquired such a reputation for brutal quickness with hands and feet that he headed, and with reason, that he was the length of the Connecticut shore to "sell" him a police term for robbing the drink-overseer lumber-jack of his winter's earnings. In fact, it was hard to credit him with one redeeming trait, but, in spite of all his riling ways, it was impossible not to like Jimmy.

Our firstayers of words were already straggled off and drying before the stove, and we could hardly wait to flank the evening meal, eaten in that wordless silence prescribed by lumber-camp etiquette, before lumbermen in the incipient.

To eager inquiry and outrageous conjecture, however, he remained equally silent until a white-haired, down-to-the-ear-of-his-shoulders, bearded, in downy tones: "Tell us something, Jimmy, as 'niver mind the truth,' you know we wouldn't believe you, anyway." The leucodermis and violence of Jimmy's answer left no further opening for questionings. We had anticipated a treat of Babalashian adventure and we left choiced and indignant. Our only alternative, physical redress, was out of the question with Jimmy, and the wretched of his apparel and condition remained unaltered and in time ceased to be an object of conjecture.

Memorable, twice daily, perched on a chain-hooped head of leg, Jimmy gazed four hours down a road of which the perilsome obstructions ended only at showing upstaircase of the "loadings."

One Sunday, some six weeks later, I lay in great comfort on the bar from Invermudde River of the "office," which I shared as sleeping-apartment with the camp boss, cook, and cook, my head on a sweater with an extraordinary number of socks. Outside it was morning. I knew the kind of day it would be—warm during daylight, the fakes striking and nothing, while, as evening rose, snaked snaked-jacks or wet rubbers would freeze solid, and bed-covers and outside world slip on half-frozen legs that seemed to be ground. How very pleasant, by contrast, was a pipe-smoke beside a red-hot stove.

The clear, rapid, letting in a cluster of Canadian French and pure Irish from the burrows, as the sleeping-quarters of the men, was Jimmy and Jimmy colored. "Have you any 'chewing,' Scaler?"

The question was part of a formula. I left out the "and never" line the next section by leaning over my neck of Union Leader. Jimmy proffered the more potent "Sticks," but nevertheless filled his pipe again with the same bag. It was some ten minutes before he noted the previous part. The Sunday paper game would soon be on. I awaited the usual request for a stake, but it seemed long in coming. Instead we fell into desultory conversation. The report that a wild eighty-four Elliott-foot-the-haying of the road from No. 2 camp, and other happenings that made up our daily life, made it hard, not believed at a considerable. It was broken by Jimmy. He took a long, deep breath and his one eye grew steady.

"Do you know what about missionaries, Scaler?"

I set up in utter surprise. "Missionaries, Jimmy?"

"I said missionaries," he answered, tranquilly. "The bestest kind. Listen to me, now. When did you see me last?"

"You were making the usual face of yourself after the drive, at Woodville." I responded promptly, a vivid recollection of the scene coming to my mind. Jimmy, now with the concentrated frown of a week of discovery, had been looking with swollen cheeks his initials in the nose low over ceiling of an sanctuary hotel, in the interval of having drinks for a resort of other fools who had, for the most part, reached the saddle stage.

"I left Woodville for down-river, then I went up-river, then down again," said Jimmy. "I had money. After that I don't know where I went. It ended with me taking a beam and pushing a cartload of lumber with me." Here he stopped and considered me carefully. I felt rather bewildered. It was a round-about way for a "look," and I was out of cash, saying.

"I'm telling you this, Scaler, not because I need your help, but because you don't blink." He passed to let the stick in, watching me stily the while with his one cold blue eye. I added gravely, and without father promise he took up his tale.

"I was headed for anywhere, and that's where I arrived. It was dark when I started out, and morning when I woke up in the woods, and—and she was leaning over me."

"Grieved. Here, at last, was a woman! A woman of the lumber woods with Jimmy—Jimmy for her! His single eye was fixed on me, lit with an intensity of emotion. At her expression, however, emotion was promptly reflected to disgust.

"Hello!" he said. "she was sixty, if a day, and wore a shawl."

I relapsed. "What did she do, Jimmy?" I asked, hungrily.

"She didn't do anything. What would you have her do?" he answered, sulkily. "I got up dripping like

from every pocket and winking eleven stars wouldn't chase one another all over the sky. I felt like a lot of people look," he added, significantly.

"'Good morning, ma'am,' I says, polite."

"'Will yer have a cup of coffee?' she says. I kind of stammered myself and looked at her. It didn't sound like an answer exactly."

"She just laughed, and then she reached out and took my hand and led me down a little path till we came to a shack all painted white and covered with vines. There was a red on the door-step, washing at all my sins, and, beside the kitchen looked as clean as after a rain. All of a sudden the sun stopped shining around stove-like, and piled up on one another. I felt then that very and stopped inside. I weren't very steady, and then on a chair, and she brings me a cup of coffee. And she showed me a little image with white shawl on the bed."

"We peered uncomprehendingly. I kept an still as a statue. The camp red jumped in the floor from somewhere with a noise that sounded like an earthquake. Jimmy didn't notice it."

"I was sick," he continued. "I was damn sick. It used have been two or three days. All the time I kind of felt she was looking after me, and I heard talk about missionaries and beatness all mixed up with the sick things I saw. It was not all plain-like, though, every thing got very still, and I guess I must have went to sleep."

"When I got out of bed it was early morning. I felt awful shaky and hungry. The sun was shining into the window—only one of them, this time—and my clothes was folded up on a chair. She must have undressed me, and I often wondered how she did it. She was so thin-like, I wondered about lots of things before I was through, though. Well, I went into the kitchen, looking for something to eat. It was clean and awful shiny, but the only thing I could find was three potatoes under a pan. I can't pretend to raw potatoes, so I lit a fire and put a kettle on. It was time to tell them when she came in. My, but she was a weak, little old lady! The only strong thing about her was her eyes. They were just like fire, but it was a kind of soft fire."

"'Good morning, Albert,' she says; 'come like your man.'"

"You can guess how I felt, Scaler. I'd been drunk, and I'd been sick, and the only mother I ever had used to kiss me with the face of a Balacon. But she just showed three kind of smiling-like and wanted, and, and I did it."

"Now you take the path to the store," she says, "and get some sausage and tea and coffee and flour, and have it hung up to me."

"Yes, ma'am," I says, and walks out. There was another little path beside the one we had come—remembered that—and I took it. It led to the village. I'll be telling you the same later," he added, heavily, and with infinite cunning at my look of inquiry. "Well, I found the store and bought everything I could think of."

Scaler was growing in my soul. "Jimmy," I said, "how did you know when to charge it to?"

"I didn't know," he confessed, with no signs of perturbation. "I paid for it."

"Jimmy," I interrupted, still more solemnly, "how could you pay for it?" It was axiomatic that Jimmy's wealth was hidden somewhere in the week's store, and this one appeared to have lasted some hours.

"Lack was with me," he continued, calmly. "I was wondering how to pay for it myself when I happened to remember that me and another sport started to smoke money at one stage of the game. I took my pipe and pulled a four-dollar bill out of it only a little while ago. Money don't smoke only."

I shuddered. I knew his capabilities, and after all, anything may be true. "I paid for it with the bill," he said, and we both looked. "I had her I see! You had never seen her but, Scaler, she must have been nearly starved—her hair had turned white, and she could always talk like she bid, all the same."

"Head it" Africa "

was eating, too. As soon as the fishes were washed she ate down in a rocking-chair and went to sleep, and I went outdoors to look around. It was awful pretty. There were flowers and rose-bushes everywhere, mostly blue-bells and common-like flowers that don't seem dressed up—just flowers. I found one rose-bush all brown and dead-looking, and it smelled of whiskey. She must have poured my bottles on it. It made me want a drink something awful. I looked through my clothes, and they were quiet, so as not to wake her, all over the house. Nary a drop could I find and I must have had the matter of twenty joints on me when I got to the shack; I remembered I jugged like sleep-bells. Then I started down the little path I had come first. I have three men's houses where I had dropped when she found me—I never got these, though." He passed for a few moments. It seemed to me that the psychological process he had gone through was obvious. "I got tired, and it was painful-like around the shack."

"At night, after we had an supper, she got out some knitting and worked and talked." "I just sat on a chair. It seems I was her son, Albert and a missionary. What I was missing I don't know. She talked

"How?" I asked.

"I persuaded them," he answered, grimly. The modest spread of Jimmy's personifications was primitive.

"Don't be interrupting. I was tired of hanging around, anyway, so I put a job chopping. I'd be off at five and back before it got dark. She always got me breakfast, but she never thought of lunch, and I didn't want to bother her. I'd steal something the evening before. When I got home I'd tend to the hens—she bought some hens and built a place for them—and worked around the garden. After dark I'd sit and smoke. She liked to have me smoke and wouldn't begin to talk till I did, then I'd listen to her soft voice, and maybe go to sleep, and then she'd wake me and come and she'd make me kiss her and we'd go to bed. It was awful quiet, somehow. There was one day that was awful, though. I got home late and she sat me at the door. There weren't no supper cooking and her eyes were wild. "What did you leave me for, all these years?" "What did you leave me for?" she asked. "Ain't I always been a good mother to you?" and she began to sob and moan and twist her little old hands some-

it. The day before I went, while I was looking over things in the night, she sat right, she asked away and was good till night. I was tired. When she came back she had a big package. In the morning my clothes were gone, all but my pants, and she made me put on a shirt and was the place to see her," he continued, grimly. "She and they were over outside."

"What did you say her name was?" I asked in the silence that was the place to see her.

"I hated myself the moment afterward, Jimmy was equal to the question, or his simplicity was deeper than mine."

"They called her in the village the little old lady—never woman, always lady," he said, proudly. "They was called her, I know she was lonely." He remembered, "but it was such a good thingness. She just didn't seem to remember things very clearly from day to day. Kind of only kept the general run of them."

We both sat in silence. I was situated, in my the look. Jimmy, perched lightly on the edge of the croaker's basket, gazed absent-mindedly at a highly elaborated lithograph on the wall exhibiting the excellence of a race for horse-cats. I had drawn myself up to a sitting position on the pile of socks and the sweater, and stared at the stove. A valley of lumber-jack earth, unpopulated in villainous by any productivity on earth, came from the "bar," where the poker game was under full holiday.

Jimmy spoke:

"I'll give you a letter, Saker?"

I slowly got a pen, paper, and envelope, pulled out the soap-box that served me as a writing-desk, and wrote:

"Read it, Alfred," he announced.

"But, Jimmy," I said, "the post-mark . . ."

"Alfred," he rebuked, positively.

"Dean May—I take my pen in hand to tell that the letter of mine which is straight in the hand of a friend of mine who is another missionary going to Woodsville."

He passed her for breath and in gas at me triumphantly.

"All is fair and steady on the missionary job, and all send their thanks. The hundred thirty dollars is a part of what you gave me when I was a kid, and I pay back with much thanks. There is more coming. I come back after that drive. Yours respectfully, Jimmy. I mean Albert," he corrected himself.

"May I change it a little?" I asked.

"Do your damndest," he assented, gloomily. "It took me two days to make that up."

I wrote as follows:

"I have money—This letter will be mailed to you by a friend of mine who is straight in the hand of a friend named the lumberman at Woodsville."

"I need thirty dollars to pay on the amount which you advanced me as my salary and will send more later."

"All is well with me, and I shall be with you in the spring. With love,

Your son, Albert."

I read it slowly to Jimmy, and he nodded. Then he pulled a ten and four five-dollar bills from his pocket and gave them to me. I slipped them into the envelope with the letter, and sealed it.

"Have it registered," I said, as I handed it to him.

"You let your own," he answered, and went out the door, down the road toward the company's store. I was called on to write several such letters during the winter.

The drive was over. The New England spring was fairly opening with warmth and sweetness, so though each day would make up for the rigors of the winter.

The men had been laid off in the morning, and had taken complete possession of the town. Lays, he questioned the mystery of the absence, especially as by his fitness, was fast doing his daily work. By nighttime the place was a hell, the few rural representations of the last season.

I had the misfortune, early in the afternoon, to offend a drink-whisky knight of the pick-poke, and escaped my share of the night's bad luck. I was told he was hunting me, and so was positively quoted, intended to stamp out my gait. (Quite frankly, I was looking for a place of refuge. I found it when I came to another inn in the evening in the back room of a hotel. A roaring poker game was under way, but it was the nearest in a quiet place in the whole town; when the doors were shut and barred, I got a chair, I slept uncomfortably draped over the back of a chair the better part of the night, waking now and then to realize Jimmy had been sitting quietly, principally because he was the only other man in the room. Hearing came at last, and I arose wearily, and took the road toward the company's store. Jimmy was seated out of the door with me.

"I suppose you saw going back," I hazarded, for want of a better letter to say.

"Oh! You mean that damned lie I told you in the woods," he answered. "I'm going to get drunk."

The morning was silent, and Jimmy was always I perceived positively, as I paced my half-hour walk and down the station platform, on the absolute destruction of all things. I held myself in Jimmy for up on letters as a sort of a cure, and so was positively told the news back in his pocket. It was not a meeting for the first time.

Nothing was so exact by a figure emerging from the mist across the tracks. It was clad in a loose shawl, high hat, and foot-out, and walked as though in an uncertain state. One bright blue eye gleamed nervously to the right and left.

Just then she came up over the New Hampshire hills, and a man, as I had said, was sitting beyond question that the morning figures were wide open and caught the fragrance of lavender in the soft summer air.

"When I woke up in the woods she was bending over me"

all the time and kind of to herself. I had answering at first, but she didn't pay any attention or it seemed to bother her, so I stopped saying "yes, ma'am," and just sat. I found out a lot about myself by and by. I had to be careful, though. Now and then she was awful smart. I lost my eye in the cranberry field, and then, without thinking, falling down-stairs. It took a long time explaining that, and I'm not sure she believed me. She'd shoot a question at me and then put her eyes on an old tinning, and I had to answer quick. I got after it, though, and it didn't matter much, because she forgot right away, mostly. For about a week we went along just the same, me working in the garden and fixing up the wood pile, and she sleeping a lot when she wasn't cleaning everything. I found out she kept her money in an old tinpot; there was eight cents in it, and I put the rest of the ten dollars there. He never noticed it. She told me she had passed a lot of stuff I had brought from foreign parts on the white nose-bark. She thought it was cheap to make it grow. Perhaps that it was good for some diseases, but it was bad for others. I didn't deny anything. She was looking at me very sharp. Anyway, she never said nothing about it again or about me being sick. I kept thinking all the time that I'd go back to camp and sleep, but I didn't feel like sleeping. I was all right—not having a good time, but powerful-like, different from what I had been before. Well, then I found out she owed forty-two dollars at the store and they was going to bother her. I made them stop."

thing awful. I got supper, but she wouldn't eat nothing, and just kept asking me why I left her, and getting worse and worse. I finally went crazy. At last she got crying so that I couldn't stand it. I just grabbed her up and carried her around, and that kind of quieted her. She didn't want nothing, so I just humped her up and down till she began to shiver and my she was rdy. I heated some water and got her hot in it, and went by six went to sleep. It was awful."

Jimmy's mouth was twitching and good looks of sweet steel set on his forehead. I looked at the right, slender bulk of the man and marveled.

"It happened the same way once when I was late again, and once when a drunk billed one of our hens and here it is seven on a juicy hen, but that was all. He checks back to get a head of light-bredder every day, and she looks more heavy, and often, in the evening, she'd put down her knitting and sing hymns, mostly the thin, kind-sounding kind. It was great. She'd talk about missionaries by the hour and how few it was of me to devote my life to teaching some word or other—some a river boat."

Jimmy was silent a long time, slowly revivifying the past in his mind.

"Why did you come away?" I asked, softly.

"The chopping job got out, and there was no water worth there. We had only a little money—but the store was paid," he asked, in parenthesis. "I mean I was missionarying," he added, defiantly. "I took a month to break it to her slow till she got over

BY FRANKLIN ESCHER

## The Fifty-per-cent Drop in Stock Exchange Seas

In 1906 \$95,000,000 was paid for a seat on the New York stock exchange. Recently a similar seat has been sold for only \$100,000 in just seven years. In other words, the price of membership in the exchange has fallen 99.95 per cent.

Does it mean that the value of the privilege of doing business on the Exchange in the United States has fallen, or is it merely a case of the price of membership being temporarily depressed? Not a bit. The fact that the price of membership has fallen so far below its former value is not a sign of a general depression in the exchange since such a fall as this would be reflected by a general depression in the price of all securities. It is merely a case of the price of membership being temporarily depressed. Not a bit. The fact that the price of membership has fallen so far below its former value is not a sign of a general depression in the exchange since such a fall as this would be reflected by a general depression in the price of all securities. It is merely a case of the price of membership being temporarily depressed.

Intelligent answer to that question depends upon appreciation of the causes of the decline in the price of membership in the exchange. These are threefold. The first is the war which has been waged on large-scale enterprise, industrial and railroads. The second is the general depression in the price of securities, and the third is the general feeling against speculation which has been developed and which has been reflected in the price of securities. The first is the war which has been waged on large-scale enterprise, industrial and railroads. The second is the general depression in the price of securities, and the third is the general feeling against speculation which has been developed and which has been reflected in the price of securities.

There the first of these things, the war on big capital combination and the general depression in the price of securities, has operated to restrict the buying and selling of securities in the stock exchange. The second is the general depression in the price of securities, and the third is the general feeling against speculation which has been developed and which has been reflected in the price of securities.

Very much the same thing has been true with regard to railroad share-ownership. Many have brought against the railroads. The result has been that the price of railroad stock has fallen so far below its former value that it is now almost worthless. The same thing has been true with regard to railroad share-ownership. Many have brought against the railroads. The result has been that the price of railroad stock has fallen so far below its former value that it is now almost worthless.

That is the first thing that has hurt the stock market. The second is the general depression in the price of securities, and the third is the general feeling against speculation which has been developed and which has been reflected in the price of securities.

That is the first thing that has hurt the stock market. The second is the general depression in the price of securities, and the third is the general feeling against speculation which has been developed and which has been reflected in the price of securities.

has by no means been completed, but real progress has been made and before long the market will be able to provide a more reasonable relation between business and the government. We have been going through a period of such a nature that economic life and during the process of reorganization have become less and less dependent upon the government. We have been going through a period of such a nature that economic life and during the process of reorganization have become less and less dependent upon the government.

The second thing which has hurt the price of stock-exchange memberships is the war which has been waged on large-scale enterprise, industrial and railroads. The second is the general depression in the price of securities, and the third is the general feeling against speculation which has been developed and which has been reflected in the price of securities.

There is an market outside in Union Pacific or Steel or the copper or anything else actually dealt in on the Board. But the market for the exchange is on a big scale and it is almost impossible to get a list of all the securities that are traded. It is not listed on the exchange at all. It is not listed on the exchange at all. It is not listed on the exchange at all.

Development of an outside market in which large-scale securities transactions could be carried out would be the effect of making stock-exchange memberships more valuable. But this has not been done. It is not listed on the exchange at all. It is not listed on the exchange at all. It is not listed on the exchange at all.

Waxman is a member of the speed market of the age or something else, according to the dean of the rhetorical corps of the nation. He is a member of the speed market of the age or something else, according to the dean of the rhetorical corps of the nation.

The first thing which has hurt the price of stock-exchange memberships is the war which has been waged on large-scale enterprise, industrial and railroads. The second is the general depression in the price of securities, and the third is the general feeling against speculation which has been developed and which has been reflected in the price of securities.

One planter gathered twenty-seven barrels from his fields, and the following year could get thirteen barrels more. Bringing the land through deep soil till in the second year, he could get twenty-seven barrels more to match all they can and prison the rest with thousands of dollars worth of fertilizer. He could get twenty-seven barrels more to match all they can and prison the rest with thousands of dollars worth of fertilizer.

## Egypt's Debt to Earthworms

The fertility of the valley of the White Nile is renowned. British scientific surveys report that its remarkable productivity is due in large part to the presence of earthworms. It is estimated that for thousands of years, earthworms are reported showing that during the entire six or seven years the castings of the worms brought to the surface there amount to about 200,000 pounds an acre. Several soil casts there would make an appreciable annual layer. Darwin estimated that the castings of five worms would make a layer of soil one inch thick. In the Nile valley the layers of soil are several inches thick. The worms equally numerous after the war appear to be the cause, because the productivity of the soil is much greater than it was before. It is estimated that for thousands of years, earthworms are reported showing that during the entire six or seven years the castings of the worms brought to the surface there amount to about 200,000 pounds an acre.

## The Basque Language

It is said that though the Basque language, which speaks in the Pyrenees, is one of the most difficult of all languages to acquire, the youngest child, conscious of his own mother tongue, can speak it perfectly in it. It is asserted that, in vigor and workmanship, this is the richest of all languages. It is said that though the Basque language, which speaks in the Pyrenees, is one of the most difficult of all languages to acquire, the youngest child, conscious of his own mother tongue, can speak it perfectly in it.

## 50,000-H.P. Lightning Bolt

The "horse-power" of a bolt of lightning, which struck a house in Illinois last week, was estimated by a Viennese scientist at no less than 50,000. The calculation was based upon the fact that the lightning instantly melted ten tons of iron. The current of 200 amperes and 20,000 volts might, it is said, have accomplished the work in one second, but it took it a very small fraction of a second.

## STRENGTH

Without Overloading the Stomach. The business man, especially, needs to be strong. The stomach is not overloaded. The business man, especially, needs to be strong. The stomach is not overloaded. The business man, especially, needs to be strong. The stomach is not overloaded.

That was I was unable to give a breakfast food that had sufficient strength to load the stomach, but give me strength for the day. The business man, especially, needs to be strong. The stomach is not overloaded. The business man, especially, needs to be strong. The stomach is not overloaded.

## A Plaque of Crayfish

A CRAYFISH of theoretical brain almost as large as that of man is the crayfish of the United States, and in some places a decided obstacle to agriculture. They dwell in various streams, which are not only a source of annoyance to farmers, but also a source of pestilence to man and stock together. Some species of crayfish are very destructive to man and stock together. Some species of crayfish are very destructive to man and stock together.

## PLAYS AND PLAYERS

## Mr. W. Burdett-Coutts and "Greyfriars Bobby"

Mr. W. BURDETT-COUTTS, the English playwright and publicist, who was the inspiration of the late Baroness Burdett-Coutts, has been reading *Greyfriars Bobby*, Mrs. Eleanor Atkinson's touching story of a dog's life-long fidelity. The Baroness Burdett-Coutts received a memorial to faithful little Bobby in the Edinburgh annual which contains the grave of Bobby's master, where the dog slept for so many years.

Mr. Burdett-Coutts has written to Mrs. Atkinson the following letter, which is published by permission:

January 16, 1913, London.

IT IS A PLEASURE to the second joy give of the association of the "Grand Lady"—by which term in its fullest meaning you very perfectly denote the late Baroness—with the human little dog in an eloquently written, and review so many memories which are dear to me, that I cannot refrain from writing to you on the subject.

The Baroness noble reveal and accurate sympathies made her, in a sense, belong to the world, and your reference must be widely appreciated. But I am entitled in speech in the warmer terms of personal gratitude for the loving tributes to her embodied in the closing part of the book.

I only wish she could have read it all; and I am sure her eyes would have lingered at your sympathetic biography of the small but important percentage on whom such adoration is bestowed, and subsequently a small honor. As you know, she placed death animals very near to heaven, in the trust and knowledge of her long life, and she would have thanked you from her heart for the book, not, perhaps, because of anything in it concerning herself, but because it gives, by a natural and attractive method, heart and effect to the ethics and sentiments which made her love and protect animals.

If I had known of your intention to write about *Greyfriars Bobby* I would gladly have placed at your disposal some illustrations which might have been of use and which now hang at Holly Lodge. It was there, in the summer, that the Baroness had her good time with the dog—being, I believe, a member of the "family" as I see them now, looking back over forty years; and one turned almost like a kitten being by her sympathy, and the acute mysterious sensibility it seemed to evoke. They had a good time, too.

But as it is, all I can do is to ask if you will allow me to send you a photograph of the Baroness, which I will retain until I know this letter has reached you. It is not a large photograph, but the last and best of the ever loved lady. I had a few copies done for her birthday, and on the first anniversary of her death; and it would be a pleasure to send you one.

Believe me, dear madam, with renewed acknowledgments and regards,

Yours very faithfully,  
(Signed) W. BURDETT-COUTTS.  
To Mrs. ELEANOR ATKINSON.

## Torpedo Development

INVENTED IN 1863, the torpedo made its first appearance in 1877 during the battle of the Whitehead and the British dreadnought of 1877 weighed nearly two hundredweight, and carried thirty-three explosive pounds. The first model had twice the weight of the Whitehead, while that of 1898 carried seven times the explosive. Experiments made in 1900 of the 2,000 yard limit with the 1897 torpedo showed its speed up to be 20 knots, its penetration almost equal to a diameter of about twenty-one feet. Prices also advanced. The first models cost \$1,000. Today, \$2,000 and \$3,000 represent the values of torpedoes, although it is hoped to augment the destructive power of the machine without proportionately increased expense. Several kinds of motors have been tried. The Blue-Devil engine is favored. Experiments are generally directed toward speed development and range capacity. Rough weather and a movable target both militate against accurate shooting. Proving the object of attack to be stationary, the torpedo takes 25 minutes to cover 2,000 yards and at a light current, it is easy to make a mistake of three to four knots in the speed of the vessel pursued, and a few yards here lead a mile from the spot also actually occupied. On the other hand, the damage inflicted

by a torpedo goes far to offset this one. In the Russo-Japanese War a Russian cruiser struck by a torpedo had a hole of four square yards torn in her hull. Torpedoes remain but accessories to a ship's big guns. Not long ago it was thought impossible to engage in a naval artillery duel at 2,000 yards now four times that distance and more is possible. Meanwhile the torpedo's carrying power has increased from 700 to 2,000, perhaps 4,000 yards. True, though the proportion of gain made with the torpedo, the advantage in carrying power is in favor of the older gun. Guns, again, have the advantage of speed in loading compared with the time required to recharge a tube. The decisive phase of a naval artillery duel, in fact, will be too short to admit service of the same into trials.

Fatality today is only partly reduced in the torpedo boat, which can only attack successfully at night. The speed of the torpedo boat has increased in proportion to that of the battleship, especially in bad weather. Also, as a protection against destruction it has become necessary to arm torpedo-boats with guns, and their tonnage has, in consequence, increased by leaps and bounds. From 50 to 1,200 tons.

## Control of Wireless

AT MIDNIGHT on December 12, 1912, wireless telegraph stations in the United States, by virtue of a set of regulations recently passed by Congress, were placed under the control of the government. The enactment of the act transferred to the hands of the Secretary of Commerce and Labor. While it is realized that most wireless operators are not likely to interfere maliciously with important messages, the idea of the regulations is to make it impossible for those who are less considerate to interfere without becoming subject to severe penalties. The violation of the principal regulations is made a misdemeanor punishable with a fine of \$500 or imprisonment for one year.

Such interference has been a grave menace to the system ever since the installation of radiographic communication, and the necessity for some sort of authoritative supervision over it has been recognized from the beginning. Late disaster at sea emphasized this necessity, and resulted in Congressional action. The London International Conference last June, to which the United States was one of the signatories, fixed the status of the stations doing international business, and it was on this basis that the regulations were enacted by Congress.

The regulations fix the wave lengths of the licensed stations and provide that they shall at all times be in charge of a licensed operator. They fix regular license terms both for stations and for operators personally. To insure the unobstructed use of the air by government stations the outside stations have to "keep out" in the first fifteen minutes of each hour, during which time government stations can send without interference. All licensed shore stations also are required to listen for not less than two minutes at intervals to such any distress signals that may be going. In case a distress signal is sent from any vessel, the station receiving it is to be in which the call is addressed must keep out until all business in connection with such a call is finished, which station sending out a fraudulent distress call is guilty of a misdemeanor.

Under the present law, one thousand ships under the government regulations that are compelled to carry wireless, and provided with the necessary apparatus, furnish power to the ship's radio apparatus in case of accident to the regular machinery of the vessel. Practically no means for ships without interference distance of a government shore station to operate with wireless electrical power, even in case of distress, they are required to use any power or any wave length. The Department of Commerce and Labor has authorized about 324 licenses to operators, and this number will steadily increase.

## Cutting Glass with Cord

A very ingenious and simple way has been found to cut glass tubes. A brass rod a meter and a half long is attached to the point where the cut is to be made, and a wire is hooked to the middle of the rod, causing enough friction to raise the temperature of the tube. This without loss of time, the tube is pulled from the cord and inserted into a jar of cold water. The change of temperature fractures the tube at the point of contact, exactly and with ease as pointed out as if the operation were performed with a mechanical instrument.

"Coldwell" is a national name in lawn mowers.

The first lawn mower made in America was made in 1857 by Thomas Coldwell. Franklin Pierce was President then; few had yet heard of Abraham Lincoln.

Today the Coldwell Company operates the largest lawn mower factory in the world.

Coldwell Hand Mowers. Made in all styles and sizes, to meet all kinds of local conditions.

Coldwell Horse Mowers. Guaranteed for quality and wear.

Coldwell Motor Mowers. One does the work of three men and three horse mowers. Over 25% greater capacity.

Always use the BEST. The BEST is the cheapest. Coldwell Lawn Mowers are the BEST.

Write for illustrated booklet, "The Care of Lawns." See, present, on request.

A New Novel by the Author of  
"The Divine Fire"

## THE COMBINED MAZE

By May Sinclair

WITH broad, clear strokes Miss Sinclair has drawn the characters of this story of love, disillusion, hope, and fate in a London suburb. We know them all; love and hate them and sympathize with them as we do with the people we know and our fate. There is the hero son of a small chemist, with the passion of a Greek athlete for physical development, and his girl friend at the gymnasium. The sprightly freshness of their love is destroyed by Violet Fisher, a woman of a more sensuous type, who makes him ashamed of what he now looks upon as the undeveloped sentiment of a boy. When he is married to Violet he discovers the selfishness of her nature and the mistake he has made.

How the lives of these three cross, part, and recross just as they did first in the gymnasium's maze is told with infinite skill and sympathy.

With Frontispiece. Pp. 268. Cloth, \$1.25 net.

Gipsies

The gipsies are the most unchanging race in the world. Wherever they are found, and they are found everywhere, from Spain to Mexico, from Central Africa to Siberia, they are the same: a race of outcasts, despised by the people among whom they dwell, yet loving their own ideal unchangeable life to their bitter hair, jealous of strangers, always ready to make a living from the weakness and weaknesses of the people to whom they come. Climate seems to make no difference to them. They are a living remnant of the medieval days that "Man in the evolution of his civilization," for in all environments they remain unchanged, the same "dark faces, the same black, lank, heavy, inscrutable eyes, the same bronzed skin; change in food or conditions of living makes no mark on them, and they only take on the customs or beliefs or costumes of other races. In order the better to cheat and swindle them, a race without nationality, without laws, without a literature, without a religion, for it is said that in their tongue there is no word for God, none for the soul, none for immortality.

Where did they come from? From Iberia, say the French, but they are not really Iberian, nor more northern than those elsewhere. From Egypt, they sometimes say, themselves, to get a better price for their wares. But there is nothing peculiarly Egyptian about them. It really they came from India. Their strange language shows that; patently gleaned from the knowledge of strangers, it has yet been learned, little by little, and comparison shows it to fall of Hindu words, words that you may hear, even now all over the north of India, from Peshawar and Gipsy's country, the Indus and Ganges valleys, to the Hissai and the Bay of Bengal.

Surprising, perhaps, at first blush, that there should be nations of low-caste or outcast Hindus scattered all over Europe, and even wandering through the byways of America, but what strange because we do not think about it. It is reality. Europe is full of Asiatic peoples. For long centuries they came pouring in, especially through the gap between the Ural Mountains and the Caucasus. The first to come, "Scythians the Russian and you led the Tartar," may remind us that the great Tartar invasion, under the grandson of Genghis Khan, conquered all eastern Europe and swelled the Tartar tribes all down the east Yelge Valley, across the steppes, and along the shores of the Black Sea. "Mongols" is the name of the Tartars, as it is in the heart of Russia, but the Tartars are also Asiatics, so are other peoples, like the Finns. No all eastern Europe is soaked with living blood, and if so many people came from southern Asia, why should it be incredible that one race should come from southern Asia?

It seems probable that the gipsies drifted into Europe in the wake of their Khasia invasion, when he came down the Rasia with his vast forest-troops of Tartar hordes, built a million of his tents. The gipsies came from central Asia, whether they had been driven from India, by the Sapharids and distributive in the reign of Mahmud of Ghazni, after also hundred years ago. It was about 1235 that Batu Khan and his host-cavalry from beyond the Caspian Europe. And a century later, driving bands of gipsies were scattered through eastern Europe—Moldavia, Hungary, and Poland. But a horde of gipsies made their appearance in southwestern Germany, claiming to be Chaldean gipsies, from little more than their Christianity was about as genuine as their Egyptian origin. Their distinctive, vagabond character was already manifest then, and they were driven from northern Germany, to begin their perpetual wanderings there, every thirty or forty years, and in the time to cross over to America, in the wake of the white-men, as they crossed from Asia to Europe in the wake of the Tartars.

But the great bulk of them still remains in the Danube Valley, where they find agricultural more profitable than any. In Romania, there are between a quarter and half a million of them. In Transylvania, which is no doubt corner beyond of Romania, there are a hundred thousand more, while Serbia and Hungary had thousands more from their own considerable differences in the different countries. In Servia, the leveling power of which has effected a unity, they are, however, the object of being the alien, either on the condition of the mass of the peasantry. In Serbia, therefore, though they still are their own race, and are not allowed to exercise the rights and powers of citizenship, the gipsies are perhaps, in their own right, the most persecuted race in any other country in Europe. In the Serbian war of liberation,

the gipsies fought valiantly by the side of the Serbians, and they have a certain dignity and the comparative wealth of a more or less settled community. In India, they were in all probability a caste of smiths, which in part explains their own industry, for so smiths as they were they show considerable knowledge and skill. In Romania, on the contrary, the gipsies were formerly captured, they were captured, and held as slaves, and were treated with a savage ferocity and cruelty that even the worst of our modern slavery never approached. They were without rights, without protection, with no legal name, and in the estimation of their cruel owners, they lived in their number and without any money, and they were sold for less than many of the lowest negroes. Happily, however, the present ruler of Roumania, King Charles, has completely removed the last vestiges of this disgrace from his country; the Roumanian gipsies are completely emancipated, and those among them who pay taxes are given the privilege of casting a ballot.

Names that Cheer

Between Jacques An, the first name in the New York City Directory of 1911, and Marie Zemanek, the last, there are many additions, some of which were compiled by the editor of the World-Telegram. With the exception of February, September, October, and December, every month in the calendar has a living triumphant. Mary May is the prettiest. The list of the names is as follows: Miss Alice Cook, James Cook, Andrew J. Miller, Charles Henry, William Ferry, Ronald to glory are Marie Angel, Elias Apostle, Thomas Henson, Charles F. Pander, and Oscar E. Saint.

The reader is always with us, as witness William J. Brown, Agnes D. Tread, J. Harvie Dew, John F. Frost, Harry H. Hunt, Elizabeth G. Smith, E. B. Hancock, Mollie Wray, and A. Wind. The loveliest names are Lucy Darling, Etanah Fair, Tom Hagg, Pauline King, May Linsky, Mary Lorenz, Sarah Thiry, Mollie Peahy, Mary West, by way of whom we find Mrs. Hensley, Alan, Lager, Fort, Eickey, Sherry, Winnet, and Wierbraye. Naturally, too, we discover Frank Healy and the following social and industrial reflections: Commodore Frank, Frank Abraham Eagle, Harry Fallon, Julian Paul, Alfred R. Goldbach, Irene Horn, David Long, Barbara Low, Edward M. Parrot, W. J. Fagan, Edward Sealover, Henry M. W. Swan, Joseph Eberhart, A. M. Ford, John H. Helm, J. Ed. Lamb, A. Lou, A. Lova, Benjamin Muir, Sid Tiger, A. Wolf, Fred Ives, Axel Smith, A. Knack, Joseph Wray, Anna Worm.

Pine and Hemlock Paper

One of the interesting examples of governmental assistance to special industries is that of the cooperative work conducted at the Forest Products Laboratory, Warsaw, Wisconsin, by the Department of Agriculture and a pulp and paper-making association. The growing scarcity of spruce and hemlock, the approved paper-making woods, has led to attempts to utilize other woods, and industry has developed several promising by-products of pulp-making. Experiments to determine the value of hemlock and larch pine as substitutes for spruce have been particularly successful. Not only have very promising sheets of pulp been obtained from hemlock and larch pine, but paper has been made from them on commercial machines which has all the strength, flexibility, and appearance of high-grade paper. The use of this cheaper material would seem thoroughly practicable. Pulp composed of mixtures of hemlock, larch pine and spruce also shows good paper.

Gluttonous Birds

Chorus in proportion to their weight, probably eat more than any other living thing. It is a mystery to naturalists how the orange-footed booby gets so accreted meat. The dove was found with 600 peas in its crop; another, in captivity, was known to eat 100 bushels of grain, but a third devoured 600 acorns. The robin often eats 15 times his weight in trout-fry before he is full, and a hen with chicks has been observed to devour 475 times in the course of a day. The duck is reported to eat 100 times as much as 2,000 mice in the course of a month, besides other food. To the month of a young bird were found three trout, and a hen was seen to devour 100 mice. Another was found with over small trout in its mouth, a mouse, and a thrush, evidently in the way to lay. The honey-creeper bird seems to have an appetite equal to that of the adult.

## The First Act of President Wilson

When President Wilson declared, in opening his inaugural address, that "there has been a change of government," he spoke the literal truth. It was a change from government of the people by an individual and from government for the people by an oligarchy, to a government by the people, acting through their chosen representatives. But government itself "still lives," vibrant and wide-voiced, unshaken and unchangeable.

It was but natural that friends of the new administration should deplore its unhappy legacies. Even so, it was not the problems themselves that made for apprehension; it was their insolence. The question of time with respect to independence of the Philippines could await impartial investigation. The granting of stretched or territorial rights to Porto Rico was a matter which obviously demanded painstaking consideration. The diplomatic embroilment with Great Britain must take its normal course. But Mexico was a burning issue, Cuba was threatening, and South and Central American republics were on edge. Time was of the essence of understanding, of declared purpose, of definiteness.

Truly, the situation was disconcerting; and yet, is it not already apparent that the circumstance was fortuitous? For the occasion faced the man. A timid President would have procrastinated; a vainglorious President would have issued vain pronouncements. Mr. Wilson did neither. He acted with the requisite promptitude, with the requisite firmness and consideration, and with the calm dignity which befits the responsible head of a great nation charged with mighty obligations to weaker peoples.

We believe that we are well within the mark when we say that no act of any President in twenty years has produced results more immediately beneficial, from combined reasonance and indicated resoluteness, than this initial act of President Wilson. The peoples for whose fair opportunities to cultivate peace and prosperity we have become so largely responsible are informed at the outset precisely where they stand in the estimation of their virtual guardian, and precisely what they may expect in the way of protection and encouragement. And so do we of the United States—which also is of vital importance.

Better even than the definiteness of this understanding and the promptness of its declaration is its rightfulness.

"The United States," says the President, "has nothing to seek in Central and South America except the lasting interests of the peoples of the two continents, the security of governments, intended for the people, and for no special group or interest, and the development of personal and trade relationships between the two continents, which shall rebound to the profit and advantage of both and interfere with the rights and liberties of neither."

Here is no violent protestation at unfounded as-

pendencies, no baitment, no assumption of either moral or physical superiority, no one of the many careless expressions which have proven so exasperating in the past; nothing, in fact, but a simple voicing of the real spirit of our own people; simple, but convincing.

And yet it must not be understood that tolerance of lifeless, that we are mindful of our duties to civilization, or that we forever for our moment the basic principles of popular government. The Monroe doctrine, sanctioned by the world for nearly a century, still lives as an integral and inalienable part of our national existence. Primarily for our own protection, conformably to usage among nations from their beginning, no foreign monarchy shall establish itself upon this continent; but incidentally, though no less essentially, respect and oppression of the helpless is forbidden. One has but to contemplate what might, what surely would, have happened in South and Central America during these many years, but for the restraint enforced by our great declaration, to appreciate the magnitude of the indebtedness of the feeble sister republics to our own powerful nation. In return for this service of incalculable value, we ask what? Territory? No. Concessions? No. Advantages over others for our citizens? No. What then? President Wilson puts it clearly.

"Co-operation," he says, with tactful consideration, "is possible only when supported at every turn by the orderly processes of just government, based upon law and not upon arbitrary or irregular force. We hold, so I am sure all thoughtful knowers of republican government everywhere hold, that just government rests always upon the consent of the governed, and that there can be no freedom without order, based upon law and upon the public conscience and approval. We shall look to make these principles the basis of mutual respect, respect, and helpfulness between our sister republics and ourselves. We shall lead our influence of every kind to the realization of these principles in fact and practice, knowing that disorder, personal intrigue, and defiance of constitutional rights weaken and discredit government and injure none so much as the people who are unfortunate enough to have their common life and their common affairs so tainted and distorted."

Others have rights, others whose lives and possessions are at stake, others whom, forbidden by us to seek protection from their own governments, we are in duty bound ourselves to protect from the ravages of unconscionable strife. That we would deny to any people that which Washington declared as "the divine right of revolution" is unthinkable, but sharp must be the line between justifiable revolt and the anarchy of self-seeking.

"We can have no sympathy," adds President Wilson, becoming more specific, "with those who seek to seize the power of government to advance

their own personal interests or ambition. We are the friends of peace, but we know that there can be no lasting or stable peace in such circumstances. As friends, therefore, we shall prefer those who act in the interest of peace and honor, who protect private rights and respect the restraints of constitutional provision. Mutual respect seems to us the indispensable foundation of friendship between states as between individuals."

"From these principles," he concludes, "may be made so much of the future policy of this government as it is necessary now to forecast; and in the spirit of these principles I say, I hope, he permitted with as much confidence as earnestness to extend to the governments of all the republics of America the land of genuine, disinterested friendship, and to pledge my own honor and the honor of my colleagues to every enterprise of peace and unity that a fortunate future may disclose."

So it transpires, perhaps to the surprise and surely to the chagrin of the ZELAYAS and the CARRAN, that a change of government or of governing principles and governing men does not and cannot mean unshelved license so long as "the government at Washington still lives." The doom of "dollar diplomacy" does not and cannot imply encouragement of lawlessness and riot and subversion of that peace and order which is "based upon law and upon the public conscience and approval."

That the warning was needed is apparent. The worst element in Cuba lost no time in inviting it, and the picture, shown by the reception accorded the susceptible Venezuela at the Executive Mansion in Albany, were waiting and watching, like vultures eager to spring upon exhausted and helpless prey. But now they know, as they never understood so unmistakably before, in whose behalf this nation stands ready to "lead its influence"—its influence "of every kind."

It is a statement, says the *Evening Post*, "justacular enough for its purpose, and no more, combining a maximum of impressiveness with a minimum of offense."

"The President is quite right," admits the *Tribune*.

"In short," says the *Sun*, "the Wilson administration will not be hoodwinked and is not to be trifled with."

"There is not," says the *World*, "a word of encouragement here for the big exploiters, not a word to lighten a mindless uprising, not a word to stir the greed of a dictator disguised as a deliverer, and not a word to predile the sales of stocks and lands in the United States by marauding corporations. It is all for liberty, independence, justice, and democracy, the national honor and good neighborhood. It is true that it contains a warning, but there is also a benediction."

And so throughout the country.

Great is the power and inestimable the value of intelligence in high places.

## The Bill, Small Voice that is Crying

The orator picture-show has shut up and moved to Chicago. It was a noticeable show, and we are glad to have seen it. It was a great many inquiring minds took in what Mr. KENNEDY (C) had to say about it in the WEEKLY last week. So many clever and sincere people have talked about the exhibit in a fashion that showed perplexities in the minds of the simple that Mr. C's own speech was comforting and much appreciated.

This is a very exciting world just now, and full of futurists in all the lines of endeavor. Our good friends the social-split folk seem to need working as much as anybody. Their new sensation about the wages of girls is capable of making much mischief unless it is handled with judgment. That it is a wholesome sensation, and so is the prevalent disturbance about prohibition, which is had to talk about, and all the more needs to be discussed. We seem to be suffering from too much commercialization of life. The apparatus in all things has been developed at too much cost of the living creature, and the living creature is now getting situated. That is right, and good will come of it, but will come, as does, in the old-fashioned way, and we must, in the end, to wade the mountains and break the rocks, an earthquake, a fire, and after the fire a still, small voice. And it will be that voice, and not the gale nor the earthquake nor the fire, that we shall finally see embodied in legislation.

Just when we are now in this process is neither for the personal judgment of the simple, which is had but it blew hard and the mountains of politics were rent, and we had a shake-down, and there seems almost warrant enough already for listeners for the still, small voice to be attentive.

## Reasoning

People who keep in mind the way our tariff bills have been made, and the way tariff-reform movements have usually been defeated, might well have been troubled at some Washington correspondence of the Charlotte (North Carolina) Observer, printed on the 11th, which began as follows:

WASHINGTON, March 11th.—It became definitely known to-day that since Congress adjourned, Senators SIMMONS and ORINMAN have been very industrious in the formation of a group of Senators from states adjoining North Carolina.

It is thought that these Senators, who will be prepared to stand together for the protection of the interests of the Tar Hill State when the time comes for re-adjusting schedules in cotton, tobacco, and other state industries.

This movement is being looked out for, and, for defense, groups have long ago started giving of warrent. A group of Democrats from seven Middle Western states initiated the idea, and the Senators from the cotton mill states of the South are simply looping in. It was rumored to-day that the Non-Confederates are also forming a similar organization to protect their manufactures.

The Observer's correspondent went on to state that similar sectional groups, with similar sectional objects, were being formed in the House. In other words, he pictured the precise state of affairs which to sincere low-tariff men would seem most ominous, and to protectionists most encouraging. Naturally, however, being a protectionist paper, he rejoiced editorially.

It is, therefore, highly reassuring to note that as promptly as possible Senators ORINMAN and SIMMONS contradicted the statement of the Observer's correspondent. What they say is worthy of prominence, and for obvious reasons low-tariff papers would do well to give it publicity as a matter of record. It is over their own signatures, in the Observer of March 11th, as follows:

To the Editor of the "Observer":

We have just had article in Observer, March 11th, under the name of GEORGE H. MANNING, in which it is stated that there is a combination between certain Southern Democrats, including ourselves, with a view to support to tariff duties on certain Southern products. We wish to state with all possible emphasis that the statements in the article, as far as we are concerned, are without a scintilla of foundation. If there is any such movement among Southern, Western, or Northern Senators as described in Mr. MANNING'S article, we have never heard of it, and we are our own best in such movement.

LEW. S. ORINMAN,  
F. M. SIMMONS.

WASHINGTON, MARCH 12TH.

Let us not promptly and gladly accept as entirely sincere the statement of these two eminent Senators. Let us not be led by the Democratic Senators who are similarly under pressure from protected interests in their own states will stand by the platform and principles of their party, support the President, and obtain from every form of log-rolling. Even such Democratic Senators

as sincerely believed that it was right to grab what they could in the making of a protective tariff by Republicans must see that the case is different where it comes to a far-revenue tariff undertaken by Democrats. Even a Republican protectionist may well feel that the time has come to try a Democratic tariff, and that it would be wrong to defeat or confuse the experiment by any of the old methods.

## The Tariff Reform Republicans

The new tariff, we repeat, ought to be made by Democrats. It ought to be made by Democrats who believe sincerely in the tariff-for-revenue policy, and both the Democrats and the Republicans who believe in the tariff-for-protection policy ought to give them a free hand. That is the best way to carry out the will of the country as expressed in two general elections.

There is, however, another factor in the situation. There is a group of Republicans, headed by Senator LA FOLLETTE, committed to some measure of tariff reform. These men have not the least objection to the tariff-reform policy. In the House they supplied an impressive percentage of the majorities that carried the DUNDON bills. In the Senate they fought the PAYNE bill stubbornly and ably. Naturally, in view of the doubts that long prevailed as to the Democrats securing a working majority in the Senate against the Democratic disaffection, tariff reformers have kept these men in mind, and have considered the possibility of having to call on them for help.

And as we are of the prospect that this may not be necessary, there is still no reason whatever for ignoring these men, no reason why we should not accept, wherever appropriate, whatever support they may continue to give. On the contrary, policy and justice alike demand that we recognize cordially and candidly the value both of what they have done already and of what they may do in the future.

President WILSON is now, of course, the leader of the tariff-reform forces, and evidently that is the way he feels about it. His inviting LA FOLLETTE to a conference was a natural expression of that feeling, but he had already expressed it in public speeches. We see no good ground for criticism. Certainly, if recognition of any kind is to be extended, it should be open and above-board; it should not savour of intrigue and concealment.

After all, the main thing is the brighter and brighter outlook for a genuine and thoroughgoing tariff reform. We are not yet out of the woods, or free to relax vigilance. We shouldn't be till the bill or bills shall be actually signed. But the good odds are, indeed, in a good way. It is permissible to feel that the bill or bills that are now pending will lift our eyes and hearts to a prospect that the promised land is at last truly in sight.

## The Bull Moose University

Now that Colonel ROOSEVELT'S public speeches may be regarded rather as lectures than as battles, there is no reason to worry over their being so long. It is not as if they could be so counted now in the one at Philadelphia the other night, except perhaps his recognition of the fact that the Bull Moose party is not going to run the country yet while, and that its plans must be shaped accordingly. True, he isolated that all his and their present "studies" of public questions are to be left to the committee, and that they must for some time continue to be left to the party in power. It would seem that the only immediately practicable part of the Colonel's admonition to his followers is the advice to study things hard and correctly.

That advice we feel bound to commend. There are plenty of things in this country that need earnest study, and the Colonel's following ought steadily to benefit by the opportunity to study them. Hereafter, there has been need of so much hurry in the Bull Moose movement that such an opportunity has been denied. Indeed, our prominent Bull Moose actually got and proclaimed the notion that anything like deliberation was out of place in such a movement, and that the only thing to do was to pitch right in and do everything at once. We are glad to see that idea authoritatively refuted and outlaw given that it is quite reasonable to think and even "study" a bit before transferring our faulty politics and circulation. We do not, however, understand that this deliberation is going to be restricted to anything in the programme of action which was adopted before deliberation began. Its object is merely to determine the best ways to get that programme actually enforced.

Even so, it may well be worth while. It may possibly raise in some few Bull Moose minds a question as to whether there may be any way to carry out a plan of universal and immediate modification of everybody's led by government in a world that has hitherto proved a trifle difficult to govern at all.

## Going Too Far

The present President of the United States is a progressive, but it is not going too far to say that he might not have been a progressive if the advanced example had not been set for him by a past President.—The Chicago Evening Post.

To say even that is going much too far. MAY on the safe side. Say that the present President would not have been a progressive if he had never been born. That is probably true.

## France

Few Americans understand European politics. We do not pretend to. We try to avoid the usual intimations of complete intimacy with the affairs of a dozen states on the other side which our friends, amusingly enough, in various American newspapers, usually insist on making us understand. Mr. BISHOP has done a bit for it. So has the Associated Press. We wish, by the way, that Brother Simon would treat his own country's affairs with the same scrupulous intelligence with which he tells us what he thinks we can stand of European affairs.

We suffer from the A. P. dispatches that Empege is still unusually ill at ease; that Germany is particularly so; that Russia is unusually exultant; that England is about where she always is—reasonably in funds, and in hearing of the sea; that Italy is still obedient to the vast impulse of Cæsar's genius, and therefore still lean, in spite of poverty, to the lack of capture, on imperial enterprises; and that France is once more the center of the continent.

Once again, for the how many hundredth time! In both arm and navy Germany is far stronger. The cry "Oh in Berlin" was almost enough, as we saw recently, in 1918, when Prussia was only one of many little states, and not a great one. Yet we are told it is bound. We are also told that in Germany stock exchanges are paucity. There are no proprietary utterances from the Emperor. Germany is spending more money than ever on her prodigious army, but is nevertheless disturbed because the French Chambers also are apparently about to be taken captive, on imperial enterprises.

What does it mean? We sincerely trust, nothing. But in Europe, armed to the teeth, anything may at any time mean something. Read PAUL CANTAR'S articles on Germany, now publishing in one of the magazines, and you cannot escape the idea that there are limitations to the German character as to that German energy which has been for so long a time assembling this world. Read something worth while about the French and you will hardly escape a kind of supposition that they will keep on forever, in spite of their weakness, playing the phœnix and upsetting all calculations. Let a Jovis of Am or a Napoleon arise, and there is nothing that cannot be done.

Certain it is that there is happening in France a resurgence of national spirit. They have elected a man for President. Their writers are moving away from salubrious to parity. They have outdared the world in serenity. They have neglected the landmarks of Paris, but built up something that German energy which has been for so long a time assembling this world. They are extremely modern, but still, to all appearances, they are quite as resolutely France—and seem to be nothing else.

It is no wonder that Germany should be talking and worrying about Alsace and Lorraine.

## College Clubs and Merit

Wood comes from New Haven, by way of the newspapers, of social revolution at Yale, and the signing of pledges by virtually all the Sophomores not to join any of the senior societies ("Bones," "Keys," and "Wolf's Head") "until all society is abolished and the new chosen as merit clubs." "Merit" is the basis of merit! First, scholarship, public-utility, manners, money, or efficiency in athletics!

For a successful club, except where it exacts special qualifications, the only form of merit that counts for much is the merit of being acceptable to the existing members. That merit includes all the others. On the basis of that, and not otherwise, is the membership of the little college clubs as those at Yale be recruited. The Yale senior clubs will get along better if they will cut some students in their gear (little tonlike houses, abandon public life, and settle

shown into organizations of young gentlemen who like one another. Their mutual mysteries are out of date. As they now exist their university has outgrown them. They were created by it as a kind of a few hundred members, and they have managed to maintain a struggle-like procedure in the undergraduate affairs of a university with thousands of students. That is absurd. They ought to welcome readjustment, and very likely they do.

#### In Very Bad

This LADY (likely daughter-in-law) of (China) was of the best, moral, feminine kind.—*Harvard Current.*

Good heavens! "The female, normal, feminine kind"! And when did it become normal feminine to be feeble? Will the *Current* stand up—in the context, please—and explain!

#### Brother Bird of the "Journal"

On page 6 of this paper is a letter from ex-Candidate BIRD of Massachusetts, in reply to some comments of the WEEKLY of February 22d, on his suggestion that Massachusetts should publish a fair show in which everybody's policies should have a fair show. We urged Mr. BIRD not to look to the state to do this duty, but to attend to it himself, and it was a great pleasure to find shortly afterward in the new columns of the *See*, this item, to wit:

Boston, March 10th. FRANK A. MERRICK brother of the Boston Journal at MATTHEW HALE, National Committeeman for Massachusetts and state chairman of the Progressive party. Mr. HALE, of course, represents some of the honored ones of the Bull-Moose, including FRANKLIN SHERMAN BIRD of Walspole, and CHARLES H. HAYS of Cambridge.

We hope this news is true, and that Mr. BIRD is one of the gentlemen implied as above, and that there is no warmer now for us to speak of him as Brother BIRD of the Boston *Journal*.

This item makes his letter all the more interesting, though it was written before the *Journal* changed hands, and apparently before Brother MERRICK determined to sell it. He had been flogging with it for some time, and it had not gone to suit him, as he raised the price to three cents, and gave out, the paper, say, that if it did not do better on that basis he would give it away. Since it was the sole organ of the Bull-Moose party in Boston, and the only paper that Brother BIRD could count on in the late campaign to print all his speeches in full, there had to be something done, and we read that MATTHEW HALE, the Bull-Moose BANNERMAN of Boston, took steps at once as above recorded, and dropped the *Journal's* price back to one cent.

That's good, and now we shall watch with the liveliest interest the paper with which Brother BIRD is reputed to be concerned, and we hope it is going to be the very best paper in Boston and one of the best in the world.

Certainly enough it seems to be extra hard to make a first-class paper in Boston. Since it is not many of them, anywhere, but a world-wide expectation to be one of the places where they grow, and, to be sure, the *Transcript* is first-class of its kind, yet hardly, one would say, a great newspaper. Brother FRANK MERRICK, who is reputedly rightly spoke of Boston as the graveyard of children, would it be odd, but Brother STANLEY ought to know, for his memory is large and accurate. It is a fact, though, that no Boston newspaper has been able to maintain a standing and an influence equal to that of the *Republican* in Springfield, of whose founder Mr. BIRD speaks. That is a paper that no letter open without acknowledgment, not named with others, who are named, takes by its name. Who is paper in educating and civilizing the community it serves?

Brother BIRD wants to translate the newspapers. The best way to do that is to beat the bad ones with a good one and get their circulation away from them. If he can do that he will be a service of immense value.

#### Is Journalism a Respectable Profession?

Brother BIRD says, in his letter: "I have believed that journalism was a great and respectable profession."

Was he mistaken about that? Has journalism ever been respectable?

We have often wondered and passed for a noble. Journalists they have been who were respectable.—BRYANT, SAMI BOWLES, and others. Newspapers they have been and are that were respectable: the Springfield *Republican*, the Boston *Journal*, the *Evening Post*, and several others, that was justly taken by and largely ever respected! Was it not in the line of BRYANT and SWIFT, or FRANKLIN, of the elder BANNETT and

the  *Herald*, of DANA and the *Star*, of PLETCHER and the *World*, of HENNER and the *Morning Journal*? Respectability is founded on the opinion of other people, on a different matter from self-respect. Respectability rather a clinging attribute in a newspaper. The great success in journalism seems to be made by men who are rather indifferent to it; superior to it in some respects, inferior to it in others.

Respectability may be too much aimed at, too much sought, and a newspaper, that grows in an careful thought, but the key to it is that decent people are fallible and that the numbers and the methods that they respect are not always so worthy of respect as some things that they resent and disapprove. They usually hate publicity and publicity is the great medicine of demagogues. The office of a newspaper is to reveal, to offend, to often destroy, and sometimes shocking. It is seldom consistent with politeness and so it is seldom respectable.

#### Usualy

Perhaps Mr. CARR is better known as architect of the Cathedral of St. John the Divine—"St. New."

Perhaps so, but usually an architect is better known as a man whose design by himself than by something done by some one else. The Cathedral of St. John, as will be remembered, is, so far, almost entirely the work of HUNTS and LA FARGE.

#### Quit Kidding Captain Bird!

Remembering upon the reported return to Texas of Captain BIRD, Mr. DUNHAM, lately chief of Texas Rangers, has observed:

Where is the white southern, bigger than Rhode Island? Where are the long climbing boots, the mirror of the Ranger and bridle than the highest mount. Where are the drab trousers and the drab horse boots, those boots, those boots, those boots? Where is that eye to threaten and command, that voice of thunder and stern tone, that heart of gold? Where is the boundless confidence of Texas? A word should be revealed. Captain BIRD McDEVITT, the terror of Texas and the pride of Washington, must be kept on eye.

This is naughty of the *See*. It cannot be that it has never seen Captain BIRD. Certainly if it looks for a person to fit the description it gives of him it will always find somebody else. Captain BIRD is an excellent man, and one of the most unobtrusive people ever. The point about him is that he is efficient, and, like other efficient men, he works with the minimum of noise and display. Captain BIRD's remarkable qualities are all qualities of the spirit. He has no show-bill clothes, no display-head neckwear (Rhode Island size), no monumental feet. He is the kind of a decent, ordinary man that you would like to have sleeping in the basement of a girls' school subject to attack by troops or rogues.

But he is a discreet, efficient instrument of justice. His line is not clothes, but character. His specialty is order. Think of the debt this country has incurred within five years to its discreet instruments of justice. Think of BRASS and the union dynamite; think of WHITMAN; think a little, maybe, of FRANK A. SMITH, to whose epithet among the West Virginia striking miners, "The Scourge of Satan" is a proper name. Think of all of others whom there is not space to specify. Then think of all the white-slaver murderers and all the black-head and red-head scoundrels who still go loose, terrorizing, kidnapping, bomb-throwing, destroying life and peace, and will keep at it until they are hunted down and killed. Think of these, and think with respect of our discreet instruments of justice.

It is a mighty high calling in these days to be a discreet and efficient instrument of justice. But Texas, they say, is pretty well cleaned up. The country's great frontier towns are now New York and Chicago.

#### Julian Hawthorne

It has never occurred that this was quite a real world to JULIAN HAWTHORNE. Son of a great reformer, he has apparently lived more in an imagined world than in this one we know. And he has been better equipped for his imagined world than for ours. When somebody put him up a question about the distribution of wealth among people who know the world for what it is and are using shares for what they are look it for granted that the prospective profits of the mines were imagined profits. They did not believe in them themselves, but they easily believed that JULIAN HAWTHORNE did; and while they deplored that his own mind should be so weak, they were, in such a way, they did not greatly by it up against him.

But people who do not know this world and its

mining shares were deceived and lost money, and so JULIAN HAWTHORNE goes to jail for a little while to do a penance.

We are sure; everybody is sure; and everybody must have their fill in an imagined world may not be so bad as in a real one.

#### More Trouble for the House of Lords

DUNHAM is an unequalled master of phrases. One can see GLADSTONE's face as the Jew killed him and his educated colleagues as a man who had just voluted. They were a disaster. But no such volute would apply, even if there were a DUNHAM to make it, to the present Liberal Government in England.

It has astonishing vitality and resistance. A little while ago, the opposition seemed confident of forcing an appeal to the country. It is doubtful if they could now really do anything. The government is so far from exhaustion or apathy that it talks, apparently, with confidence, of putting through a reorganization of the House of Lords before the present Parliament expires.

Democracy, like Christianity, is a terrible thing. It does not know its goal, but it drives on as naturally as a man does by himself than by something in which rank would count for nothing in government. We are not sure we should like to see such an England; it would be so different from the England we were brought up on.

#### Religion and the Churches

Professor FOSTER proposed that the churches be closed for a year or two to give the Christian religion a better chance, and President SHANNON, of Wesleyan, forthwith accepted Professor FOSTER's resignation from the faculty of that college, and the WEEKLY said something about it which inspired the letter from Mr. FOSTER of Flint, Michigan, which is printed on the next page. Mr. FOSTER says:

The writer of this editorial says: "It is obvious that whatever the proposition of the Christian religion goes on very extensively outside the churches." How do you mean to imply—and that will be the point, his interpretation—that this religion proposition is without the churches' approval or given impulse, or inspiration? If it means this, there are doubts in my mind.

We don't seem to imply anything, but merely to disclose an impression that there is a great deal of Christianity about which does not seem to derive immediately from any church. Also, it might be added, we suppose, that there is more or less tracking in the churches which is not Christian; but that is an old story. There always has been.

Is there anything reprehensible in the idea that the Christian religion is making gains outside of the churches? Mr. FOSTER seems rather resentful of the suggestion. Professor FOSTER, so far as we know, was sincerely respectful of the religion, but was separated from Wesleyan because he seemed to have been incapable to the churches. When you think that Wesleyan was named for the WESLEYAN, and that the special agent of the WESLEYAN was that they broke away from the roof-line churches of their time and started something on the outside—in the fields; anywhere they could find people to listen—the honor of the churchmen of that time has been made by the churches, and Bible, like the rest of that apparatus, to send drastic overhauling from time to time. So it is with the schools; so with the courts, the professions—everything. When we speak of the churches we do not quite mean The Church, which represents another idea, more inclusive and more exclusive.

Christianity exists not for the churches, but for the people. Any way as the people get it! It works outside of the churches sometimes, and always has. In the end the churches gather the crop and are helped. They should be. They are very valuable socially, religiously—every way; and they have been incapable to the churches, and Bible, like the rest of that apparatus, to send drastic overhauling from time to time. So it is with the schools; so with the courts, the professions—everything. When we speak of the churches we do not quite mean The Church, which represents another idea, more inclusive and more exclusive.

The notice about Professor FOSTER was that his talk about the churches might be in the line of a purely religious, like Dr. FOSTER's biting discourses about our colleges and medical schools.

#### A Little Of

When Mr. MERRICK took over the business of Harper & Brothers' Publishing Company, he acquired control of HARPER'S MAGAZINE and The North American Review.—*Wilmington Leader.*

Correct, except (1) that Mr. MERRICK never took over the business of Harper & Brothers, and (2) would not, if he had done so, have acquired control of The North American Review, which has never belonged to Harper & Brothers, or even controlled by them in any way.

## ENTER THE LANDLADY

BY LIONEL JOSAPHARE

ILLUSTRATED BY H. M. BRINKHOFF

**T**HE boarding-house, in the ideal, is a substitute for home. Thousands of people leave home every year, in order to live under the sway of a landlady. In her domain they learn to become citizens; to make accurate reference to the land; to hand over the banners for work; in general, to prepare, each for himself, that he is not part of a menagerie, but a free (or free) citizen living under the Declaration of Independence and the Constitution of these United States.

He is quite a connoisseur. Boarding-house rooming is an art that vies with theatrical criticism—transcends it, even. Any old corner of a boarding-house could, for a few well-chosen remarks, raise the business of a \$100,000 brokerage shop, if he were given a valance space in a newspaper, for her the advertisement—

is not taken curiously into the hold until he has met his first job on the letter. Then he is selected. Already defrauding the landlady would be looked upon with hostility. Even the gentle spirit who wanders through piazzas and parlors, and then paid a sweet tribute to home would have become a scold had he gone to live in a modern boarding-house. He knows ever so well, there will always be multitudes of the younger generation roaming board parlors and piazzas. The first station on the way is a temporary domicile, on the threshold of this place the landlady is encountered.

And so say, the wanderer is not likely to appear as the meretricious person who now stands before him. He detests her immediately. There is a wild ringing in the heart of the adventurer as soon as he is confronted by the landlady. There arises in him an ill-defined foreboding of evil, the while he is avowedly in quest of shelter, food, and varied hospitality.

At this first meeting to make the contrast between the landlady and the man's ideal of her. He expected a good, genuine, homelike, modestly dressed in old-fashioned and polite respect attire. He hoped that she and her surroundings would bespeak generosity, luxury, coziness, peace, and goodwill. Where this ideal? Perhaps from the advertisements. He had read the wail ads of Boarders Wanted. He is a prospective boarder, and he needs. He has seen curiously in her to waste him.

The advertisement had like unto this.

Large small running water, clean warm steam telephone, newly lit shaded light airy, quiet bath. Excellent appointments, excellent table.

He arranges for quarters and moves in

He rings the bell. He is humbly told to go into the parlor. There he sits and loaves nervous. What little he has already held may not be a realization of his value; or it may exceed them. In the latter case, he knows that the furnishings are probably an impulsive and brazen display in conjunction with a signally dining-room. A parlor piano is silent on the piano square.

Enter the landlady. Then and there something drops within the heart of the prospective boarder. As he gazes wistfully upon her for a glimpse of his departed vision, he knows that such tender a position. He does not believe that she has at her disposal all those beautiful things she has advertised. If she had, she would not look thus weary and forlorn. She would not enter with that nervous transparency, that nervous melancholy as if in full knowledge that a vague spirit is ever lurking in the shadow of her home.

The cause of her gloom is obvious to the experienced lover of furnished rooms. She meets so many fastidious masters of happiness (in furnished rooms) that her optimism has gone, never to return. Seeing a yard of blue in irritating work, they say—selling the substitute for a home is a task for a long time.

The visitor is shown over the house. He inspects the room on the second floor rear and on the fourth floor front. He asks a few questions. He goes to be assured in detail and cupidity. She must guard to welcome him and explain the comforts of her household. More than that, the "deposit of money" must also speak for themselves now. While the landlady is thus describing her possessions, she realizes that her visitor has formed a positive opinion upon her very exterior, and that he could not run away without speaking to her; or his opinion may have been irretrievably formed upon being told the price. Although he disliked the house at the first glimpse of the interior, or though he may have been appalled at the work, beyond the means, he must stay until he makes a pretense of looking over the appointments, or disapprovements, and then, if not satisfied, never that he will withdraw and register upon the result of his last-mentioned. All this the landlady, in her wisdom, hath known full well. She does not realize that it is wisdom that is the cause of her successful appeal. She knows that she is miserable because she has to sell the same food she serves her boarders.

Well, she treats him liberally enough, and, as his praise of this and that adds to her hope of selling him to her list of grumbling guests, she becomes more agreeable and human like. Presently he begins to like her. She has a quiet dignity that can be interpreted as hospitality and gently portions of roast.

After some deliberation he arranges for quarters and moves in. Within the course of a week or two he returns back to his first impression. He believes that she is lacking in some quality that is present in the ordinary specimen of humanity. Of course he is wrong—only wrong because he was in search of an ideal home, while she is acting in a business capacity. His dream is made the subject of dollars and cents. Now can't he say happiness unless you are willing to pay more than the market price.

However, let the landlady be described truthfully, showing at the same time, why she is misunderstood. In the first place, she has, and needs to have, what is known as infinite will power. She is a philosophical soul. She becomes more after many trials at selling happiness for so much per week. In her humble way she dabbles with human nature. In its needs and its dreams, she understands the boarder in the very depths of his soul, especially in conjunction with the market value of words and vegetables. She knows that if she were to appear more human the boarder would take advantage of the fact and inquire why he is not served with an adequate dose of beefsteak. He might even go further and demand to be informed of the mystery of mystery—why he can always sell the day of the week by the food that is served. He yearns to have a bit of choice between boiled ham and cold cutlets; and so on through the week, day by day. The landlady understands it, perhaps she does not, but she will, with her unobtainable mind, she would not order it so. And for the sake of various other details of her household she knows about the boarder. It is a matter of accurate ability and discipline. The
